 Version 5.4.7-2.1: BGP support added for x510 and x550 series
 Version 5.4.7-2.4: BGP support added for IE300 series

neighbor disallow-infinite-holdtime

Overview Use this command to disallow the configuration of infinite holdtime for BGP and BGP4+.

Use the **no** variant of this command to allow the configuration of infinite holdtime for BGP or BGP4+.

Syntax [BGP] neighbor {<ip-address>} disallow-infinite-holdtime
no neighbor {<ip-address>} disallow-infinite-holdtime

Syntax [BGP4+] neighbor {<ipv6-addr>} disallow-infinite-holdtime
no neighbor {<ipv6-addr>} disallow-infinite-holdtime

Parameter	Description
<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.

Mode Router Configuration

Usage This command enables the local BGP or BGP4+ speaker to reject holdtime "0" seconds from the peer during exchange of open messages or the user during configuration.

The **no** variant of this command allows the BGP speaker to accept "0" holdtime from the peer or during configuration.

Examples [BGP] To enable the **disallow-infinite-holdtime** feature on the BGP speaker with the IP address of 10.10.10.1, enter the command:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1
disallow-infinite-holdtime
```

To disable the **disallow-infinite-holdtime** feature on the BGP speaker with the IP address of 10.10.10.10, enter the command:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1
disallow-infinite-holdtime
```

Examples To enable the **disallow-infinite-holdtime** feature on the BGP4+ speaker with the
[BGP4+] IPv6 address of 2001:0db8:010d::1, enter the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor
disallow-infinite-holdtime2001:0db8:010d::1
```

To disable the **disallow-infinite-holdtime** feature on the BGP4+ speaker with the IPv6 address of 2001:0db8:010d::1, enter the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor
disallow-infinite-holdtime2001:0db8:010d::1
```

Related commands [neighbor timers](#)

Command changes Added to AlliedWare Plus prior to 5.4.6-1
Version 5.4.7-2.1: BGP support added for x510 and x550 series
Version 5.4.7-2.4: BGP support added for IE300 series

neighbor distribute-list

Overview This command filters route updates from a particular BGP or BGP4+ neighbor using an access control list.

You can add one incoming and one outgoing distribute-list for each BGP or BGP4+ neighbor.

The **no** variant of this command removes a previously configured BGP or BGP4+ distribute-list.

Syntax `neighbor <neighborid> distribute-list <access-list> {in|out}`
`no neighbor <neighborid> distribute-list <access-list> {in|out}`

Parameter	Description
<neighborid>	Specify an identification method for the BGP or BGP4+ peer. Use one of the following formats:
	<ip-address> Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
	<ipv6-addr> Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
	<peer-group> Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) and neighbor route-map commands. When this parameter is used with this command, the command applies on all peers in the specified group.
<access-list>	The specific software access-list used to filter routes. Specify one of the following types of access-lists:
	<name> The name of an IP software access-list.
	<1-199> The ID number of an IP software access-list.
	<1300-2699> The ID number of an IP software access-list (expanded range).
in	Indicates that incoming advertised routes will be filtered.
out	Indicates that outgoing advertised routes will be filtered.

Mode [BGP] Router Configuration or IPv4 Address Family Configuration

Mode [BGP4+] IPv6 Address Family Configuration

Examples [BGP] Example 1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 distribute-list
mylist out
```

Example 2:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 distribute-list
mylist out
```

Example 3:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.10.1 distribute-list
mylist out
```

Example 4:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.10.1
distribute-list mylist out
```

Example 5:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor 10.10.10.1 distribute-list
mylist out
```

Example 6:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 distribute-list
mylist out
```

Examples
[BGP4+]

Example 1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
distribute-list mylist out
```

Example 2:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
distribute-list mylist out
```

Example 3:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor 2001:0db8:010d::1
distribute-list mylist out
```

Example 4:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
distribute-list mylist out
```

Version 5.4.7-2.4: BGP support added for IE300 series

neighbor dont-capability-negotiate

Overview Use this command to disable capability negotiation for BGP and BGP4+.

The capability negotiation is performed by default. This command is used to allow compatibility with older BGP versions that have no capability parameters used in open messages between peers.

Use the **no** variant of this command to enable capability negotiation.

Syntax `neighbor <neighborid> dont-capability-negotiate`
`no neighbor <neighborid> dont-capability-negotiate`

Parameter	Description
<neighborid>	{ <ip-address> <ipv6-addr> <peer-group> }
<ip-address>	Specify the IPv4 address of the BGP neighbor in dotted decimal, in the format A.B.C.D.
<ipv6-addr>	Specify the IPv6 address of the BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) and neighbor route-map commands. When this parameter is used with this command, the command applies on all peers in the specified group.

Mode Router Configuration

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.34
dont-capability-negotiate
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.34
dont-capability-negotiate
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.34 remote-as 100
awplus(config-router)# neighbor 10.10.10.34 peer-group group1
awplus(config-router)# neighbor group1
dont-capability-negotiate
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1
dont-capability-negotiate
```

Examples [BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1
dont-capability-negotiate
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1
dont-capability-negotiate
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 100
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1
dont-capability-negotiate
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1
dont-capability-negotiate
```

Command changes Added to AlliedWare Plus prior to 5.4.6-1
 Version 5.4.7-2.1: BGP support added for x510 and x550 series
 Version 5.4.7-2.4: BGP support added for IE300 series

neighbor ebgp-multihop

Overview Use this command to accept and attempt BGP or BGP4+ connections to external peers on indirectly connected networks.

Effectively, this command sets the TTL value in the BGP or BGP4+ packets that the router sends to the neighbor, so that the packets may traverse the network route to the neighbor.

The device will not establish a connection to a multihop neighbor, if the only route to the multihop peer is a default route.

Use the **no** variant of this command to return to the default.

Syntax `neighbor <neighborid> ebgp-multihop [<count>]`
`no neighbor <neighborid> ebgp-multihop [<count>]`

Parameter	Description
<neighborid>	{ <ip-address ipv6-addr <peer-group> }
	<ip-addr> Specify the address of an IPv4 BGP neighbor, entered in dotted decimal notation A.B.C.D.
	<ipv6-addr> Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
	<peer-group> Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group.
<count>	<1-255> The Maximum hop count, that is set in the TTL field of the BGP packets. If this optional parameter is not specified with the command, then the Maximum hop count is set to 255.

Mode [BGP] Router Configuration or IPv4 Address Family Configuration

Mode [BGP4+] Router Configuration

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.34 remote-as 10
awplus(config-router)# neighbor 10.10.10.34 ebgp-multihop 5
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.34 ebgp-multihop 5
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.34 remote-as 10
awplus(config-router)# neighbor 10.10.10.34 peer-group group1
awplus(config-router)# neighbor group1 ebgp-multihop 5
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 ebgp-multihop 5
```

Examples [BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# neighbor 2001:0db8:010d::1
ebgp-multihop 5
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1
ebgp-multihop 5
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 ebgp-multihop 5
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 ebgp-multihop 5
```

neighbor enforce-multihop

Overview Use this command to enforce the requirement that BGP and BGP4+ neighbors form multihop connections.

Use the **no** variant of this command to turn off this feature.

Syntax `neighbor <neighborid> enforce-multihop`
`no neighbor <neighborid> enforce-multihop`

Parameter	Description
<neighborid>	{<ip-address> <ipv6-addr> <peer-group>}
<ip-address>	The address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<ipv6-addr>	The address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group>	Name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group.

neighbor filter-list

Overview This command creates a BGP or BGP4+ filter using an AS (Autonomous System) path list. This command specifies an AS path list, which it then applies to filter updates to and from a BGP or a BGP4+ neighbor

The **no** variant of this command removes the previously specified BGP or BGP4+ filter using access control lists.

Syntax `neighbor <neighborid> filter-list <listname> {in|out}`
`no neighbor <neighborid> filter-list <listname> {in|out}`

Parameter	Description
<neighborid>	Specify the identification method for the BGP or BGP4+ peer. Use one of the following formats:
	<ip-address> Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
	<ipv6-addr> Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
	<peer-group> Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group.
<listname>	Specify the name of an AS (Autonomous System) path list.
in	Indicates that incoming advertised routes will be filtered.
out	Indicates that outgoing advertised routes will be filtered.

Mode [BGP] Router Configuration or IPv4 Address Family Configuration

Mode [BGP4+] IPv6 Address Family Configuration

Usage This command specifies a filter for updates based on a BGP AS (Autonomous System) path list.

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.34 filter-list list1 out
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.34 filter-list list1 out
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.0.34 filter-list list1 out
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.0.34 filter-list list1 out
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.34 remote-as 10
awplus(config-router)# neighbor 10.10.10.34 peer-group group1
awplus(config-router)# neighbor group1 filter-list list1 out
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 filter-list list1 out
```

Examples
[BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
filter-list list1 out
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
filter-list list1 out
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 filter-list list1 out
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 filter-list list1
out
```

[neighbor route-map](#)

Command
changes

Added to AlliedWare Plus prior to 5.4.6-1
Version 5.4.7-2.1: BGP support added for x510 and x550 series
Version 5.4.7-2.4: BGP support added for IE300 series

neighbor interface

Overview Use this command to configure the interface name of a BGP4+ speaking neighbor. Use the **no** variant of this command to disable this function.

Syntax [BGP4+] neighbor {<ipv6-addr>|<ipaddress>} interface <interface>
no neighbor {<ipv6-addr>|<ipaddress>} interface <interface>

Parameter	Description
<ipaddress>	Specifies the IPv4 address of the BGP neighbor - entered in dotted decimal notation in the format A.B.C.D.
<ipv6-addr>	Specifies the IPv6 address of the BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<interface>	Specifies the name of the interface to reach the BGP neighbor over.

Mode [BGP4+] Router Configuration

Usage [BGP4+] This command is for use with BGP4+ peering. Use this command for BGP peering with IPv6 link local addresses.

Examples [BGP4+] To specify a neighbor of 10.10.0.72 over the interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 interface vlan2
```

To remove the neighbor of 10.10.0.72 over the interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72 interface vlan2
```

To specify a neighbor of 2001:0db8:010d::1 over the interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 interface
vlan2
```

To remove the neighbor of 2001:0db8:010d::1 over the interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1 interface
vlan2
```

**Command
changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for x510 and x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

neighbor local-as

Overview Use this command to configure a local AS number for the specified BGP or BGP4+ neighbor. This overrides the local AS number specified by the [router bgp](#) command.

Use the **no** variant of this command to remove the local AS number for the specified BGP or BGP4+ neighbor.

Syntax `neighbor <neighborid> local-as <as-number>`
`no neighbor <neighborid> local-as <as-number>`

Parameter	Description
<neighborid>	{ <ip-address> <ipv6-addr> <peer-group> }
<ip-address>	The address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<ipv6-addr>	The address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) and neighbor route-map commands. When this parameter is used with this command, the command applies on all peers in the specified group.
<as-number>	<1-4294967295> Neighbor's Autonomous System (AS) number.

Mode [BGP] Router Configuration or IPv4 Address Family Configuration

Mode [BGP4+] Router Configuration

When VRF-lite is configured, this command allows internal BGP loopback connections between named VRFs and the default global routing instance to be configured to act as eBGP connections, instead of only iBGP.

Usage [BGP4+] When BGP4+ is configured, this command prepends the ASN as defined by the [router bgp](#) command, and adds the ASN as defined by the [neighbor local-as](#) command in front of the actual ASN as defined by the [router bgp](#) command. This makes the peer believe it is peering with the ASN as defined by the [neighbor local-as](#) command.

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.34 local-as 1
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.34 local-as 1
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.34 remote-as 10
awplus(config-router)# neighbor 10.10.10.34 peer-group group1
awplus(config-router)# neighbor group1 local-as 1
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 local-as 1
```

Examples [BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 local-as 1
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1 local-as 1
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 local-as 1
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 local-as 1
```

neighbor maximum-prefix

Overview Use this command to control the number of prefixes that can be received from a BGP or a BGP4+ neighbor.

Use the **no** variant of this command to disable this function. Do not specify threshold to apply the default threshold of 75% for the maximum number of prefixes before this is applied.

Syntax `neighbor <neighborid> maximum-prefix <maximum>`
`no neighbor <neighborid> maximum-prefix [<maximum>]`

Parameter	Description
<neighborid>	{<ip-address> <ipv6-addr> <peer-group>}
<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group>	Name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group.
<maximum>	<maxprefix> [<threshold>] [warning-only]
<maxprefix>	<1-4294967295> Specifies the maximum number of prefixes permitted.
<threshold>	<1-100> Specifies the threshold value, 1 to 100 percent. 75% by default.
warning-only	Only gives a warning message when the limit is exceeded.

Default The default threshold value is 75%. If the threshold value is not specified this default is applied.

Mode [BGP] Router Configuration or IPv4 Address Family Configuration

Mode [BGP4+] IPv6 Address Family Configuration

Usage The **neighbor maximum-prefix** command allows the configuration of a specified number of prefixes that a BGP or a BGP4+ router is allowed to receive from a neighbor. When the `warning-only` option is not used, if any extra prefixes are received, the router ends the peering. A terminated peer, stays down until the **clear ip bgp** command is used.

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 maximum-prefix 1244
warning-only

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72 maximum-prefix
1244 warning-only

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.72 remote-as 10
awplus(config-router)# neighbor 10.10.10.72 peer-group group1
awplus(config-router)# neighbor group1 maximum-prefix 1244
warning-only

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 maximum-prefix 1244
warning-only
```

Examples
[BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
maximum-prefix 1244 warning-only

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
maximum-prefix 1244 warning-only

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 maximum-prefix 1244
warning-only

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 maximum-prefix
1244 warning-only
```

neighbor next-hop-self

Overview Use this command to configure the BGP or BGP4+ router as the next hop for a BGP or BGP4+ speaking neighbor or peer group.

Use the **no** variant of this command to disable this feature.

Syntax `neighbor <neighborid> next-hop-self`
`no neighbor <neighborid> next-hop-self`

Parameter	Description
<neighborid>	{ <ip-address> <ipv6-addr> <peer-group> }
<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group.

Mode [BGP] Router Configuration or IPv4 Address Family Configuration

Mode [BGP4+] IPv6 Address Family Configuration

Usage notes This command allows a BGP or BGP4+ router to change the next hop information that is sent to the iBGP peer. The next hop information is set to the IP address of the interface used to communicate with the neighbor.

This command can be run for a specific VRF instance.

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72 next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router)# neighbor 10.10.0.72 next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router)# no neighbor 10.10.0.72 next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.72 remote-as 10
awplus(config-router)# neighbor 10.10.10.72 peer-group group1
awplus(config-router)# neighbor group1 next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 next-hop-self
```

Examples
[BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
next-hop-self
awplus# configure terminal

neighbor override-capability

Overview Use this command to override a capability negotiation result for BGP and BGP4+. Use the **no** variant of with this command to disable this function.

Syntax neighbor <neighborid> override-capability
no neighbor <neighborid> override-capability

Parameter	Description
<neighborid>	{<ip-address> <ipv6-addr> <peer-group>}
<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group.

Mode Router Configuration

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 override-capability
awplus# configure terminal
awplus(config)# router bgp 10

Version 5.4.7-2.4: BGP support added for IE300 series

neighbor passive

Overview Use this command to configure the local BGP or BGP4+ router to be passive with regard to the specified BGP or BGP4+ neighbor. This has the effect that the BGP or BGP4+ router will not attempt to initiate connections to this BGP or BGP4+ neighbor, but will accept incoming connection attempts from the BGP or BGP4+ neighbor.

Use the **no** variant of this command to disable this function.

Syntax `neighbor <neighborid> passive`
`no neighbor <neighborid> passive`

Parameter	Description
<neighborid>	{ <ip-address> <ipv6-addr> <peer-group> }
<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group.

Mode [BGP] Router Configuration or IPv4 Address Family Configuration

Mode [BGP4+] Router Configuration

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 passive
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72 passive
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.72 remote-as 10
awplus(config-router)# neighbor 10.10.10.72 peer-group group1
awplus(config-router)# neighbor group1 passive
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 passive
```

Examples [BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 passive
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1 passive
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 passive
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 passive
```

Version 5.4.7-2.4: BGP support added for IE300 series

neighbor password

Overview Use this command to enable MD5 authentication on a TCP connection between BGP and BGP4+ neighbors. No authentication is applied by default. To setup authentication for the session, you must first apply authentication on each connected peer for the session.

Use the **no** variant of this command to disable this function.

Syntax [BGP] `neighbor {<ip-address>|<peer-group-name>} password <password>`
`no neighbor {<ip-address>|<peer-group-name>} password`
`[<password>]`

Syntax [BGP4+] `neighbor {<ipv6-addr>|<peer-group-name>} password <password>`
`no neighbor {<ipv6-addr>|<peer-group-name>} password`
`[<password>]`

Parameter	Description
<ip-address>	Specifies the IP address of the BGP neighbor, in A.B.C.D format.
<ipv6-addr>	Specifies the IPv6 address of the BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group-name>	Name of an existing peer-group. When this parameter is used with this command, the command applies on all peers in the specified group.
<password>	An alphanumeric string of characters to be used as password.

Default No authentication is applied by default.

Mode [BGP] Router Configuration or IPv4 Address Family Configuration

Mode [BGP4+] Router Configuration

Usage notes When using the <peer-group-name> parameter with this command (to apply this command to all peers in the group), see the related commands [neighbor peer-group \(add a neighbor\)](#) and [neighbor route-map](#) for information about how to create peer groups first.

Examples [BGP] This example specifies the encryption type and the password 'manager' for the neighbor 10.10.10.1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 password manager
```

This example removes the password set for the neighbor 10.10.10.1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 password
```

This example specifies the encryption type and the password 'manager' for the neighbor peer group named 'group1':

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 password manager
```

This example removes the password set for the neighbor peer group named group1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 password
```

Examples (VRF-lite)

This example specifies the password ('manager') for the neighbor peer group named 'group1' for an IPv4 address-family VRF instance name 'red', and router bgp 10:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4 vrf red
awplus(config-router-af)# neighbor 10.10.10.1 password manager
```

This example removes the password ('manager') for the neighbor peer group named 'group1' for an IPv4 address-family, VRF instance name 'red', and router bgp 10:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4 vrf red
awplus(config-router-af)# no neighbor 10.10.10.1 password
manager
```

This example specifies the password ('manager') for the neighbor peer group named 'group1' for an IPv4 address-family, VRF instance name 'red', and router bgp 10:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# address-family ipv4 vrf red
awplus(config-router-af)# neighbor group1 password manager
```

Examples [BGP4+] This example specifies the encryption type and the password 'manager' for the neighbor 2001:0db8:010d::1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor password manager
2001:0db8:010d::1
```

This example removes the password set for the neighbor 2001:0db8:010d::1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor password 2001:0db8:010d::1
```

This example specifies the encryption type and the password 'manager' for the neighbor peer group named group1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor remote-as 102001:0db8:010d::1
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor peer-group group1
2001:0db8:010d::1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 password manager
```

This example removes the password set for the neighbor peer group named 'group1':

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 password
```

Version 5.4.7-2.4: BGP support added for IE300 series

neighbor peer-group (add a neighbor)

Overview Use this command to add a BGP or a BGP4+ neighbor to an existing peer-group.
Use the **no** variant of this command to disable this function.

Syntax [BGP] `neighbor <ip-address> peer-group <peer-group>`
`no neighbor <ip-address> peer-group <peer-group>`

Syntax [BGP4+] `neighbor <ipv6-addr> peer-group <peer-group>`
`no neighbor <ipv6-addr> peer-group <peer-group>`

Parameter	Description
<ip-address>	Specify the IPv4 address of the BGP neighbor, entered in the format A.B.C.D.
<ipv6-addr>	Specify the IPv6 address of the BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group>	Enter the name of the peer-group. When this parameter is used with this command, the command applies on all peers in the specified group.

Mode [BGP] Router Configuration or IPv4 Address Family Configuration

Mode [BGP4+] IPv6 Address Family Configuration

Usage Use this command to add neighbors with the same update policies to a peer group. This facilitates the updates of various policies, such as, distribute and filter lists. The peer-group is then configured easily with many of the neighbor commands. Any changes made to the peer group affect all members.

To create a peer-group use the [neighbor port](#) command and then use this command to add neighbors to the group.

Examples [BGP] This example shows a new peer-group `group1` and the addition of a neighbor `10.10.0.63` to the group.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.0.63 peer-group group1
```

This example shows a new peer-group `group1` and the removal of a neighbor `10.10.0.63` to the group.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# no neighbor 10.10.0.63 peer-group group1
```

Examples [BGP4+] This example shows a new peer-group `group1` and the addition of a neighbor `2001:0db8:010d::1` to the group.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor peer-group
group1 2001:0db8:010d::1
```

This example shows a new peer-group `group1` and the removal of a neighbor `2001:0db8:010d::1` to the group.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor peer-group
group1 2001:0db8:010d::1
```

neighbor peer-group (create a peer-group)

Overview Use this command to create a peer-group for BGP and BGP4+. Use the **no** variant of this command to disable this function.

Syntax `neighbor <peer-group> peer-group`
`no neighbor <peer-group> peer-group`

Parameter	Description
<peer-group>	Enter the name of the peer-group.

Mode [BGP] Router Configuration or IPv4 Address Family Configuration

Mode [BGP4+] Router Configuration

Usage notes Neighbors with the same update policies are grouped into peer groups. This facilitates the updates of various policies, such as, distribute and filter lists. The peer-group is then configured easily with many of the neighbor commands. Any changes made to the peer group affect all members. Use this command to create a peer-group, then use the [neighbor peer-group \(add a neighbor\)](#) command to add neighbors to the group.

Examples `awplus# configure terminal`
`awplus(config)# router bgp 10`
`awplus(config-router)# neighbor group1 peer-group`
`awplus# configure terminal`
`awplus(config)# router bgp 10`
`awplus(config-router)# no neighbor group1 peer-group`

Related commands [neighbor peer-group \(add a neighbor\)](#)

Command changes Added to AlliedWare Plus prior to 5.4.6-1
Version 5.4.7-2.1: BGP support added for x510 and x550 series
Version 5.4.7-2.4: BGP support added for IE300 series

neighbor port

Overview Use this command to specify the TCP port to which packets are sent to on a BGP or a BGP4+ neighbor. TCP port 179 is the default port used to connect BGP and BGP4+ peers. You can specify a different destination port for the TCP session with this command.

Use the **no** variant of this command to reset the port number back to the default value (TCP port 179).

Syntax [BGP] `neighbor <neighborid> port <portnum>`
`no neighbor <neighborid> port [<portnum>]`

Parameter	Description
<neighborid>	{ <ip-address> ipv6-addr> <peer-group> }
<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group.
<portnum>	<0-65535> Specifies the TCP port number.

Default TCP port 179 is the default port used to connect BGP and BGP4+ peers.

Mode [BGP] Router Configuration or IPv4 Address Family Configuration

Mode [BGP4+] Router Configuration

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# neighbor 10.10.10.10 port 643
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# no neighbor 10.10.10.10 port 643
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 port 643
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# no neighbor group1 port 643
```

Examples [BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# neighbor port 643 2001:0db8:010d::1
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# no neighbor port 643 2001:0db8:010d::1
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(awplus-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 port 643
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# no neighbor group1 port 643
```

neighbor prefix-list

Overview Use this command to distribute BGP and BGP4+ neighbor information as specified in a prefix list.

Use the **no** variant of this command to remove an entry.

Syntax `neighbor <neighborid> prefix-list <listname> {in|out}`
`no neighbor <neighborid> prefix-list <listname> {in|out}`

Parameter	Description
<neighborid>	<ip-address> <ipv6-addr> <peer-group>
	<ip-address> Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
	<ipv6-addr> Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
	<peer-group> Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group.
<listname>	The name of an IP prefix list.
in	Specifies that the IP prefix list applies to incoming advertisements.
out	Specifies that the IP prefix list applies to outgoing advertisements.

Mode [BGP] Router Configuration or IPv4 Address Family Configuration

Mode [BGP4+] IPv6 Address Family Configuration

Usage notes Use this command to specify a prefix list for filtering BGP or BGP4+ advertisements. Filtering by prefix list matches the prefixes of routes with those listed in the prefix list. If there is a match, the route is used. An empty prefix list permits all prefixes. If a given prefix does not match any entries of a prefix list, the route is denied access.

The router begins the search at the top of the prefix list, with the sequence number 1. Once a match or deny occurs, the router does not need to go through the rest of the prefix list. For efficiency the most common matches or denies are listed at the top.

The **neighbor distribute-list** command is an alternative to the **neighbor prefix-list** command and only one of them can be used for filtering to the same neighbor in any direction.

Examples [BGP]

```
awplus# configure terminal
awplus(config)# ip prefix-list list1 deny 30.0.0.0/24
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 prefix-list list1 in
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 prefix-list list1
in
awplus# configure terminal
awplus(config)# ip prefix-list list1 deny 30.0.0.0/24
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.10.1 prefix-list list1
in
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.10.1 prefix-list
list1 in
awplus# configure terminal
awplus(config)# ip prefix-list list1 deny 30.0.0.0/24
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 prefix-list list1 in
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 prefix-list list1 in
```

Examples
[BGP4+]

```
awplus# configure terminal
awplus(config)# ipv6 prefix-list list1 deny
2001:0db8:010d::1/128

awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:: prefix-list
list1 in

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:: prefix-list
list1 in

awplus# configure terminal
awplus(config)# ip prefix-list list1 deny 2001:0db8:010d::1/128
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 prefix-list list1 in
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 prefix-list list1
in
```

Version 5.4.7-2.4: BGP support added for IE300 series

neighbor remote-as

Overview Use this command to configure an internal or external BGP or BGP4+ (iBGP or eBGP) peering relationship with another router.

Use the **no** variant of this command to remove a previously configured BGP or BGP4+ peering relationship.

Syntax `neighbor <neighborid> remote-as <as-number>`
`no neighbor <neighborid> remote-as <as-number>`

Syntax (VRF- lite) `neighbor <neighborid> remote-as <as-number> [global|vrf <vrf-name>]`
`no neighbor <neighborid> remote-as <as-number>`

Parameter	Description
<code><neighborid></code>	<code>{ <ip-address> ipv6-addr <peer-group> }</code>
<code><ip-address></code>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<code><ipv6-addr></code>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<code><peer-group></code>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group.
<code><as-number></code>	<code><1-4294967295></code> Neighbor's Autonomous System (AS) number.
<code>global</code>	Specify that the remote neighbor exists locally within the device, in the global routing domain
<code>vrf</code>	Specify that the remote neighbor exists locally within the device, in the specified VRF instance.
<code><vrf-name></code>	The name of the VRF instance.

Mode [BGP] Router Configuration or IPv4 Address Family Configuration

Mode [BGP4+] Router Configuration

Usage notes This command is used to configure iBGP and eBGP peering relationships with other BGP or BGP4+ neighbors. A peer-group support of this command is configured only after creating a specific peer-group. Use the **no** variant of this command to remove a previously configured BGP peering relationship.

The **vrf** and **global** parameters are used to create internal 'loopback' BGP connections within the device between two VRF instances. This is used to leak BGP routes between a named VRF instance and the global routing instance. This requires BGP neighbors to be configured in both the global routing instance and in the named VRF instance.

Examples [BGP] To configure a BGP peering relationship from the neighbor with the IPv4 address 10.10.0.73 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.73 remote-as 10
```

To remove a configured BGP peering relationship from the neighbor with the IPv4 address 10.10.0.73 from another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.73 remote-as 10
```

To configure a BGP peering relationship from the neighbor with the peer group named group1 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 remote-as 10
```

To remove a configured BGP peering relationship from the neighbor with the peer group named group1 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 remote-as 10
```

Examples [BGP4+] To configure a BGP4+ peering relationship with another router:

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 345
```

To remove a configured BGP4+ peering relationship from another router:

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# no neighbor 2001:0db8:010d::1 remote-as 345
```

To configure a BGP4+ peering relationship from the neighbor with the peer group named group1 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 remote-as 10
```

To remove a configured BGP4+ peering relationship from the neighbor with the peer group named group1 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 remote-as 10
```

**Command
changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for x510 and x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

neighbor remove-private-AS (BGP only)

Overview Use this command to remove the private Autonomous System (AS) number from external outbound updates. Use the **no** variant of this command to revert to the default (disabled).

Syntax `neighbor <neighborid> remove-private-AS`
`no neighbor <neighborid> remove-private-AS`

Parameter	Description
<neighborid>	{ <ip-address> <tag> }
<ip-address>	The address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<tag>	Name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor remote-as command. When this parameter is used with a command, the command applies on all peers in the specified group.

Default This command is disabled by default.

Mode Router Configuration or IPv4 Address Family Configuration

Usage notes The private AS numbers range from <64512-65535>. Private AS numbers are not advertised to the Internet. This command is used with external BGP peers only. The router removes the AS numbers only if the update includes private AS numbers. If the update includes both private and public AS numbers, the system treats it as an error.

This command removes private AS numbers for BGP in Router Configuration mode. This command is not supported for BGP4+ in IPv6 Address Family Configuration mode. This command removes a private AS number and makes an update packet with a public AS number as the AS path attribute. So only public AS numbers are entered in Internet BGP routing tables, and private AS numbers are not entered in Internet BGP tables.

For the filtering to apply, both peering devices must be set to use either 2-byte or extended 4- byte ASN (with the same ASN type set on both peers). For example, if a device (which defaults to use a 4-byte ASN), is peered with a device that defaults to a 2-byte ASN, then the device using a 2-byte ASN device also needs to be configured with the command **bgp extended-asn-cap** for the filtering to apply.

Examples

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.63 remove-private-AS
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.63 remove-private-AS
```

Command changes

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.7-2.1: BGP support added for x510 and x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

neighbor restart-time

Overview Use this command to set a different restart-time other than the global restart-time configured using the **bgp graceful-restart** command for BGP and BGP4+.

Use the **no** variant of this command to restore the device to its default state (see the default value of the **bgp graceful-restart** command).

Syntax `neighbor <neighborid> restart-time <delay-value>`
`no neighbor <neighborid> restart-time <delay-value>`

Parameter	Description
<neighborid>	{ <ip-address> <ipv6-addr> <peer-group> }
<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group.
<delay-value>	<1-3600> Delay value in seconds.

Mode [BGP] Router Configuration or IPv4 Address Family Configuration

Mode [BGP4+] Router Configuration

Usage This command takes precedence over the restart-time value specified using the **bgp graceful-restart** command.

The restart-time value is the maximum time that a graceful-restart neighbor waits to come back up after a restart. The default is 120 seconds.

Make sure that the restart time specified using this command does not exceed the stalepath-time specified in the Router Configuration mode.

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 restart-time 45
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 restart-time 45
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 restart-time 45
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 restart-time 45
```

Examples [BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 restart-time 45
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1 restart-time 45
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 restart-time 45
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 restart-time 45
```

Related commands

**Command
changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for x510 and x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

neighbor route-map

Overview Use this command to apply a route map to incoming or outgoing routes for BGP or BGP4+.

Use the **no** variant of this command to remove a route map from a BGP or BGP4+ route.

Syntax `neighbor <neighborid> route-map <mapname> {in|out}`
`no neighbor <neighborid> route-map <mapname> {in|out}`

Parameter	Description
<neighborid>	{<ip-address> <ipv6-addr> <peer-group>}
<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group.
<mapname>	Specifies name of the route-map.
in	Specifies that the access list applies to incoming advertisements.
out	Specifies that the access list applies to outgoing advertisements.

Mode [BGP] Router Configuration or IPv4 Address Family Configuration

Mode [BGP4+] IPv6 Address Family Configuration

Usage notes Use the **neighbor route-map** command to filter updates and modify attributes. A route map is applied to inbound or outbound updates. Only the routes that pass the route map are sent or accepted in updates.

Examples [BGP] The following example shows the configuration of the route-map name **rmap2** and then the use of this map name in the **neighbor route-map** command for the neighbor with the IPv4 address 10.10.10.1 in the Router Configuration mode.

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 6
awplus(config-route-map)# match origin incomplete
awplus(config-route-map)# set metric 100
awplus(config-route-map)# exit
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 route-map rmap2 in
```

The following example shows the removal of the route-map name **rmap2** in the **neighbor route-map** command for the neighbor with the IPv4 address 10.10.10.1 in the Router Configuration mode.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 route-map rmap2 in
```

The following example shows the configuration of the route-map name **rmap2** and then the use of this map name in the **neighbor route-map** command for the neighbor with the IPv4 address 10.10.10.1 in the IPv4 Address Family Configuration mode.

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 6
awplus(config-route-map)# match origin incomplete
awplus(config-route-map)# set metric 100
awplus(config-route-map)# exit
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.10.1 route-map rmap2 in
```

The following example shows the removal of the route-map name **rmap2** in the **neighbor route-map** command for the neighbor with the IPv4 address 10.10.10.1 in the IPv4 Address Family Configuration mode.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.10.1 route-map rmap2 in
```

The following example shows the configuration of the route-map name **rmap2** and then the use of this map name in the **neighbor route-map** command for the neighbor with the peer group named group1 in the Router Configuration mode.

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 6
awplus(config-route-map)# match origin incomplete
awplus(config-route-map)# set metric 100
awplus(config-route-map)# exit
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 route-map rmap2 in
```

The following example shows the removal the route-map name **rmap2** in the **neighbor route-map** command for the neighbor with the peer group named group1 in the Router Configuration mode.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 route-map rmap2 in
```

Examples [BGP4+]

The following example shows the configuration of the route-map name **rmap2** and then the use of this map name in the **neighbor route-map** command for the neighbor with the IPv6 address 2001:0db8:010d::1 in the IPv6 Address Family Configuration mode.

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 6
awplus(config-route-map)# match origin incomplete
awplus(config-route-map)# set metric 100
awplus(config-route-map)# exit
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 route-map rmap2 in
```

The following example shows the removal of the route-map name **rmap2** in the **neighbor route-map** command for the neighbor with the IPv6 address 2001:0db8:010d::1 in the IPv6 Address Family Configuration mode.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1 route-map rmap2 in
```

The following example shows the configuration of the route-map name **rmap2** and then the use of this map name in the **neighbor route-map** command for the neighbor with the peer group named group1 in the Router Configuration mode.

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 6
awplus(config-route-map)# match origin incomplete
awplus(config-route-map)# set metric 100
awplus(config-route-map)# exit
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 route-map rmap2 in
```

The following example shows the removal the route-map name **rmap2** in the **neighbor route-map** command for the neighbor with the peer group named group1 in the Router Configuration mode.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 route-map rmap2 in
```

neighbor route-reflector-client (BGP only)

Overview Use this command to configure the router as a BGP route reflector and configure the specified neighbor as its client.

Use the **no** variant of this command to indicate that the neighbor is not a client.

Syntax `neighbor <neighborid> route-reflector-client`
`no neighbor <neighborid> route-reflector-client`

Parameter	Description
<neighborid>	{ <ip-address> <peer-group> }
<ip-address>	The address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group.

Mode Router Configuration or IPv4 Address Family Configuration

Usage notes Route reflectors are a solution for the explosion of iBGP peering within an autonomous system. By route reflection the number of iBGP peers within an AS is reduced. Use the **neighbor route-reflector-client** command to configure the local router as the route reflector and specify neighbors as its client.

An AS can have more than one route reflector. One route reflector treats the other route reflector as another iBGP speaker.

In the following configuration, Router1 is the route reflector for clients 3 . 3 . 3 . 3 and 2 . 2 . 2 . 2; it also has a non-client peer 6 . 6 . 6 . 6:

```
Router1#  
router bgp 200  
neighbor 3.3.3.3 remote-as 200  
neighbor 3.3.3.3 route-reflector-client  
neighbor 2.2.2.2 remote-as 200  
neighbor 2.2.2.2 route-reflector-client  
neighbor 6.6.6.6 remote-as 200
```

Examples

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72
route-reflector-client

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72
route-reflector-client
```

neighbor route-server-client (BGP only)

Overview Use this command to specify the peer as route server client.
Use the **no** variant of this command to disable this function.

Syntax `neighbor <neighborid> route-server-client`
`no neighbor <neighborid> route-server-client`

Parameter	Description
<neighborid>	{<ip-address> <peer-group>}
<ip-address>	The address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group.

Mode Router Configuration

Examples

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 route-server-client
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72
route-server-client
```

Command changes Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.4: BGP support added for IE300 series

neighbor send-community

Overview Use this command to specify that a community attribute should be sent to a BGP or BGP4+ neighbor.

Use the **no** variant of this command to remove the entry for the community attribute.

Syntax `neighbor <neighborid> send-community {both|extended|standard}`
`no neighbor <neighborid> send-community {both|extended|standard}`

Parameter	Description						
<neighborid>	{<ip-address> <ipv6-addr> <peer-group>}						
	<table><tr><td><ip-address></td><td>Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.</td></tr><tr><td><ipv6-addr></td><td>Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.</td></tr><tr><td><peer-group></td><td>Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group.</td></tr></table>	<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.	<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.	<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group.
<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.						
<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.						
<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group.						
both	Sends Standard and Extended Community attributes. Specifying this parameter with the no variant of this command results in no standard or extended community attributes being sent.						
extended	Sends Extended Community attributes. Specifying this parameter with the no variant of this command results in no extended community attributes being sent.						
standard	Sends Standard Community attributes. Specifying this parameter with the no variant of this command results in no standard community attributes being sent.						

Default Both **standard** and **extended** community attributes are sent to a neighbor.

Mode [BGP] Router Configuration or IPv4 Address Family Configuration

Mode [BGP4+] Router Configuration and IPv6 Address Family Configuration

Usage notes This command is used to specify a community attribute to be sent to a neighbor. The community attribute groups destinations in a certain community and applies routing decisions according to those communities. On receiving community attributes the router reannounces them to the neighbor. Only when the **no**

parameter is used with this command the community attributes are not reannounced to the neighbor.

By default, both **standard** and **extended** community attributes are sent to a neighbor.

Examples [BGP]

```
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 send-community
extended

awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72 send-community
extended

awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.0.72 send-community
extended

awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.0.72 send-community
extended

awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 send-community extended
```

Examples
[BGP4+]

```
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1
send-community extended
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1
send-community extended
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
send-community extended
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
send-community extended
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 send-community extended
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 send-community
extended
```

**Command
changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for x510 and x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

neighbor shutdown

Overview Use this command to disable a peering relationship with a BGP or BGP4+ neighbor. Use the **no** variant of this command to re-enable the BGP or BGP4+ neighbor.

Syntax neighbor <neighborid> shutdown
no neighbor <neighborid> shutdown

Parameter	Description
<neighborid>	{ <ip-address> <peer-group> }
<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group.

Mode [BGP] Router Configuration or IPv4 Address Family Configuration

Mode [BGP4+] Router Configuration

Usage notes This command shuts down any active session for the specified BGP or BGP4+ neighbor and clears all related routing data.

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 shutdown
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72 shutdown
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 shutdown
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 shutdown
```

Examples
[BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 shutdown
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1 shutdown
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 shutdown
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 shutdown
```

Command changes Added to AlliedWare Plus prior to 5.4.6-1
Version 5.4.7-2.1: BGP support added for x510 and x550 series
Version 5.4.7-2.4: BGP support added for IE300 series

neighbor soft-reconfiguration inbound

Overview Use this command to configure the device to start storing all updates from the BGP or BGP4+ neighbor, without any consideration of any inward route filtering policy that might be applied to the connection with this BGP or BGP4+ neighbor. This is so that the full set of the neighbor's updates are available locally to be used in a soft-reconfiguration event.

You may need to apply this older method of clearing routes if the peer does not support route refresh.

Use the **no** variant of this command to disable this function for a BGP or BGP4+ neighbor.

Syntax `neighbor <neighborid> soft-reconfiguration inbound`
`no neighbor <neighborid> soft-reconfiguration inbound`

Parameter	Description
<neighborid>	{ <ip-address> <ipv6-addr> <peer-group> }
<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group.

Mode [BGP] Router Configuration or IPv4 Address Family Configuration

Mode [BGP4+] IPv6 Address Family Configuration

Usage Use this command to store updates for inbound soft reconfiguration. Soft-reconfiguration may be used in lieu of BGP route refresh capability. Using this command enables local storage of all the received routes and their attributes. This requires additional memory. When a soft reset (inbound) is done on this neighbor, the locally stored routes are re-processed according to the inbound policy. The BGP neighbor connection is not affected.

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# neighbor 10.10.10.10
soft-reconfiguration inbound
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# no neighbor 10.10.10.10
soft-reconfiguration inbound
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.10.10 soft-reconfiguration inbound
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.10.10 soft-reconfiguration inbound
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 soft-reconfiguration
inbound
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# no neighbor group1 soft-reconfiguration
inbound
```

Examples
[BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
soft-reconfiguration inbound
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
soft-reconfiguration inbound
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 soft-reconfiguration
inbound
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# address-family ipv6
awplus(config-router-
af)# no neighbor group1 soft-reconfiguration inbound
```

Command
changes

Added to AlliedWare Plus prior to 5.4.6-1
Version 5.4.7-2.1: BGP support added for x510 and x550 series
Version 5.4.7-2.4: BGP support added for IE300 series

neighbor timers

Overview Use this command to set the keepalive, holdtime, and connect timers for a specific BGP or BGP4+ neighbor.

Use the **no** variant of this command to clear the timers for a specific BGP or BGP4+ neighbor.

Syntax `neighbor <neighborid> timers {<keepalive> <holdtime>|connect <connect>}`
`no neighbor <neighborid> timers [connect]`

Parameter	Description
<neighborid>	{<ip-address> <ipv6-addr> <peer-group> }
	<ip-address> Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
	<ipv6-addr> Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
	<peer-group> Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group.
<keepalive>	<0-65535> Frequency (in seconds) at which a router sends keepalive messages to its neighbor.
<holdtime>	<0-65535> Interval (in seconds) after which, on not receiving a keepalive message, the router declares a neighbor dead.
<connect>	<code>connect <1-65535></code> Specifies the connect timer in seconds. The default connect timer value is 120 seconds as per RFC 4271. Modify this value as needed for interoperability.

Default The keepalive timer default is 60 seconds, the holdtime timer default is 90 seconds, and the connect timer default is 120 seconds as per RFC 4271. Holdtime is keepalive * 3.

Mode [BGP] Router Configuration or IPv4 Address Family Configuration

Mode [BGP4+] Router Configuration

Usage Keepalive messages are sent by a router to inform another router that the BGP connection between the two is still active. The keepalive interval is the period of time between each keepalive message sent by the router. The holdtime interval is the time the router waits to receive a keepalive message and if it does not receive

a message for this period it declares the neighbor dead. The holdtime value must be 3 times the value of the keepalive value.

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 timers 60 120
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 timers
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 timers 60 120
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 timers
```

Examples [BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 timers 60 120
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1 timers
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 timers 60 120
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 timers
```

neighbor transparent-as

Overview Use this command to specify not to append your AS path number even if the BGP or BGP4+ peer is an eBGP peer.

Note this command has the same effect as invoking [neighbor attribute-unchanged](#) and specifying the optional **as-path** parameter.

Syntax neighbor <neighborid> transparent-as

Parameter	Description
<neighborid>	{ <ip-address> <ipv6-addr> <peer-group> }
<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group.

Mode Router Configuration

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 transparent-as
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 transparent-as
```

Examples
[BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1
transparent-as
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 transparent-as
```

neighbor transparent-nexthop

Overview Use this command to keep the next hop value of the route even if the BGP or BGP4+ peer is an eBGP peer.

Note this command has the same effect as invoking [neighbor attribute-unchanged](#) and specifying the optional **next-hop** parameter.

Syntax `neighbor <neighborid> transparent-nexthop`

Parameter	Description
<neighborid>	{<ip-address> <ipv6-addr> <peer-group>}
<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group.

Mode Router Configuration

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 transparent-nexthop
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10

Command
changes

Added to AlliedWare Plus prior to 5.4.6-1
Version 5.4.7-2.1: BGP support added for x510 and x550 series
Version 5.4.7-2.4: BGP support added for IE300 series

neighbor unsuppress-map

Overview Use this command to selectively leak more specific routes to a particular BGP or BGP4+ neighbor.

Use the **no** variant of this command to remove selectively leaked specific routes to a particular BGP or BGP4+ neighbor.

Syntax `neighbor <neighborid> unsuppress-map <route-map-name>`
`no neighbor <neighborid> unsuppress-map <route-map-name>`

Parameter	Description
<neighborid>	{ <ip-address> <ipv6-addr> <peer-group> }
	<ip-address> Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
	<ipv6-addr> Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
	<peer-group> Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group.
<route-map-name>	The name of the route-map used to select routes to be unsuppressed.

Mode [BGP] Router Configuration or IPv4 Address Family Configuration

Mode [BGP4+] IPv6 Address Family Configuration

Usage When the [aggregate-address](#) command is used with the **summary-only** option, the more-specific routes of the aggregate are suppressed to all neighbors. Use this command instead to selectively leak more-specific routes to a particular neighbor.

Examples [BGP] To allow the device to advertise specific routes in the routemap 'mymap', which would have otherwise been aggregated to neighbor 10.10.0.73, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.73 unsuppress-map mymap
```

To stop the device from advertising specific routes in the routemap, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.73 unsuppress-map mymap
```

To allow the device to advertise specific IPv4 routes in the routemap 'mymap', which would have otherwise been aggregated to neighbor 10.10.0.73, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4 unicast
awplus(config-router-af)# neighbor 10.10.0.70 unsuppress-map mymap
```

To stop the device from advertising specific IPv4 routes in the routemap, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4 unicast
awplus(config-router-af)# no neighbor 10.10.0.70 unsuppress-map mymap
```

To allow the device to advertise specific routes in the routemap 'mymap', which would have otherwise been aggregated to peer group 'group1', use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 unsuppress-map mymap
```

To stop the device from advertising specific routes in the routemap to peer group 'group1', use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 unsuppress-map mymap
```

Examples
[BGP4+] To allow the device to advertise specific IPv6 routes in the routemap 'mymap', which would have otherwise been aggregated to neighbor 2001:0db8:010d::1, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6 unicast
awplus(config-router-af)# neighbor 2001:0db8:010d::1
unsuppress-map mymap
```

To stop the device from advertising specific IPv6 routes in the routemap, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6 unicast
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
unsuppress-map mymap
```

To allow the device to advertise specific IPv6 routes in the routemap 'mymap', which would have otherwise been aggregated to peer group 'group1', use the commands

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 unsuppress-map mymap
```

To stop the device from advertising specific IPv6 routes in the routemap to peer group 'group1', use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 unsuppress-map
mymap
```

- Version 5.4.7-2.4: BGP support added for IE300 series

neighbor update-source

Overview Use this command to specify the source IPv4 or IPv6 address of BGP or BGP4+ packets, which are sent to the neighbor for routing updates, as the IPv4 or IPv6 address configured on the specified interface. The specified interface is usually the local loopback (lo) interface to allow internal BGP or BGP4+ connections to stay up regardless of which interface is used to reach a neighbor.

Use the **no** variant of this command to remove the IPv4 or IPv6 address from the interface as the source IPv4 or IPv6 address of BGP or BGP4+ packets sent to the neighbor, and restores the interface assignment to the closest interface, which is also called the best local address.

Syntax `neighbor <neighborid> update-source <interface>`
`no neighbor <neighborid> update-source`

Parameter	Description
<code><neighborid></code>	{ <code><ip-address></code> <code><ipv6-addr></code> <code><peer-group></code> }
<code><ip-address></code>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<code><ipv6-addr></code>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<code><peer-group></code>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group.
<code><interface></code>	Specifies the local loopback interface (lo).

Default Use of this command sets a default value of 2 for the maximum hop count.

Mode [BGP] Router Configuration or IPv4 Address Family Configuration

Mode [BGP4+] Router Configuration

Usage Use this command in conjunction with any specified interface on the router. The local loopback interface is the interface that is most commonly used with this command. The use of local loopback interface eliminates a dependency and BGP or BGP4+ does not have to rely on the availability of a particular interface for making BGP or BGP4+ peer relationships.

Examples [BGP] To source BGP connections for neighbor 10.10.0.72 with the IP address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# interface lo
awplus(config-if)# ip address 10.10.0.73/24
awplus(config-if)# exit
awplus(config)# router bgp 100
awplus(config-router)# network 10.10.0.0
awplus(config-router)# neighbor 10.10.0.72 remote-as 110
awplus(config-router)# neighbor 10.10.0.72 update-source lo
```

To remove BGP connections for neighbor 10.10.0.72 with the IP address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# router bgp 100
awplus(config-router)# no neighbor 10.10.0.72 update-source
```

To source BGP connections for neighbor group1 with the IP address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# interface lo
awplus(config-if)# ip address 10.10.0.73/24
awplus(config-if)# exit
awplus(config)# router bgp 100
awplus(config-router)# network 10.10.0.0
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.0.72 remote-as 100
awplus(config-router)# neighbor 10.10.0.72 peer-group group1
awplus(config-router)# neighbor group1 update-source lo
```

To remove BGP connections for neighbor group1 with the IP address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# router bgp 100
awplus(config-router)# neighbor group1 update-source lo
```

Examples To source BGP connections for neighbor 2001:0db8:010d::1 with the IPv6 address
[BGP4+] of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# interface lo
awplus(config-if)# ipv6 address 2001:0db8:010d::1/128
awplus(config-if)# exit
awplus(config)# router bgp 100
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 110
awplus(config-router)# neighbor 2001:0db8:010d::1
update-source lo
```

To remove BGP connections for neighbor 2001:0db8:010d::1 with the IPv6 address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# router bgp 100
awplus(config-router)# no neighbor 2001:0db8:010d::1
update-source
```

To source BGP connections for neighbor group1 with the IPv6 address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# interface lo
awplus(config-if)# ipv6 address 2001:0db8:010d::1/128
awplus(config-if)# exit
awplus(config)# router bgp 100
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 100
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 update-source lo
```

To remove BGP connections for neighbor group1 with the IPv6 address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# router bgp 100
awplus(config-router)# neighbor group1 update-source lo
```

Related commands [neighbor peer-group \(add a neighbor\)](#)

Command changes Added to AlliedWare Plus prior to 5.4.6-1
Version 5.4.7-2.1: BGP support added for x510 and x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

neighbor version (BGP only)

Overview Use this command to configure the device to accept only a particular BGP version.
Use the **no** variant of this command to use the default BGP version (version 4).

Syntax `neighbor <neighborid> version <version>`
`no neighbor <neighborid> version`

Parameter	Description
<neighborid>	{ <ip-address> <peer-group> }
	<ip-address> The address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
	<peer-group> Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group.
<version>	{4} Specifies the BGP version number.

Mode Router Configuration or IPv4 Address Family Configuration

Usage notes By default, the system uses BGP version 4 and on request dynamically negotiates down to version 2. Using this command disables the router's version-negotiation capability and forces the router to use only a specified version with the neighbor.

Examples

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 version 4
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 version 4
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 version
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 version
```

Related commands [neighbor peer-group \(add a neighbor\)](#)
[neighbor route-map](#)

Command changes Added to AlliedWare Plus prior to 5.4.6-1
Version 5.4.7-2.1: BGP support added for x510 and x550 series
Version 5.4.7-2.4: BGP support added for IE300 series

neighbor weight

Overview Use this command to set default weights for routes from this BGP or BGP4+ neighbor.

Use the **no** variant of this command to remove a weight assignment.

Syntax `neighbor <neighborid> weight <weight>`
`no neighbor <neighborid> weight [<weight>]`

Parameter	Description
<neighborid>	{<ip-address> <ipv6-addr> <peer-group>}
<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group.
<weight>	<0-65535> Specifies the weight this command assigns to the route.

Mode [BGP] Router Configuration or IPv4 Address Family Configuration

Mode [BGP4+] IPv6 Address Family Configuration

Usage notes Use this command to specify a weight value to all routes learned from a BGP or BGP4+ neighbor. The route with the highest weight gets preference when there are other routes on the network.

Unlike the local-preference attribute, the weight attribute is relevant only to the local router.

The weights assigned using the **set weight** command overrides the weights assigned using this command.

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 weight 60
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 weight
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.10.1 weight 60
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.10.1 weight
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 weight 60
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 weight
```

Examples
[BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 weight 60
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1 weight
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 weight 60
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 weight
```

Command
changes

Added to AlliedWare Plus prior to 5.4.6-1
Version 5.4.7-2.1: BGP support added for x510 and x550 series
Version 5.4.7-2.4: BGP support added for IE300 series

network (BGP and BGP4+)

Overview Use this command to specify particular routes to be advertised into the BGP or BGP4+ routing process. A unicast network address without a mask is accepted if it falls into the natural boundary of its class. A class-boundary mask is derived if the address matches its natural class-boundary.

Note that you can specify a prefix length for the prefix being added, and you can also specify a classful network without a prefix length and an appropriate prefix length is added. Note that specifying a non-classful prefix without a prefix length results in a /32 prefix length on an IPv4 route.

Use the **no** variant of this command to remove a network route entry.

Syntax [BGP] `network {<ip-prefix/length>|<ip-network-addr>} [mask <network-mask>] [route-map <route-map-name>] [backdoor]`
`no network {<ip-prefix/length>|<ip-network-addr>} [mask <network-mask>] [route-map <route-map-name>] [backdoor]`

Syntax [BGP4+] `network {<ipv6-prefix/length>|<ipv6-network-addr>} [route-map <route-map-name>]`
`no network {<ipv6-prefix/length>|<ipv6-network-addr>} [route-map <route-map-name>]`

Parameter	Description
<ip-prefix/length>	IP network prefix and prefix length entered in dotted decimal format for the IP network prefix, then slash notation for the prefix length in the format A.B.C.D/M, e.g. 192.168.1.224/27
<ip-network-addr>	IP network prefix entered in dotted decimal format A.B.C.D, e.g. 192.168.1.224
<network-mask>	Specify a network mask in the format A.B.C.D, e.g. 255.255.255.224.
<ipv6-prefix/length>	IPv6 network prefix and prefix length entered in dotted decimal format for the IPv6 network prefix, then slash notation for the IPv6 prefix length in the format X:X::X/X/M, e.g. 2001:db8::/64
<ipv6-network-addr>	IP network prefix entered in dotted decimal format A.B.C.D, e.g. 192.168.1.224
<route-map-name>	Specify the name of the route map.
backdoor	Specify a BGP backdoor route that is not advertised.

Mode [BGP] Router Configuration and IPv4 Address Family [ipv4 unicast] mode

Mode [BGP4+] IPv6 Address Family Configuration

Usage notes It does not matter how the route is arranged in the IP or IPv6 routing table. The route can arrive in the IP routing table by a static route, or the route can be learned from OSPF or OSPFv3 or RIP or RIPng routing.

If you configure a route-map, then that route-map will be used in filtering the network, or the route-map will be used to modify the attributes that are advertised with the route.

Example [BGP] The following example illustrates a Class-A address configured as a network route. The natural Class-A network prefix mask length of 8 will be internally derived, that is, 2.0.0.0/8.

```
awplus(config)# router bgp 100
awplus(config-router)# network 2.0.0.0
```

Output [BGP] Figure 30-1: Example output from the **show running-config** command after entering **network 2.0.0.0**

```
awplus#show running-config

router bgp 100
  network 2.0.0.0/8
```

Example [BGP] The following example illustrates a network address which does not fall into its natural class boundary, and hence, is perceived as a host route, that is, 192.0.2.224/27.

```
awplus(config)# router bgp 100
awplus(config-router)# network 192.0.2.224 mask 255.255.255.224
```

Output [BGP] Figure 30-2: Example output from the **show running-config** command after entering **network 192.0.2.224 mask 255.255.255.224**

```
awplus#show running-config

router bgp 100
  network 192.0.2.224/27
```

Example [BGP] The following example is the same as the previous example for host route 192.0.2.224/27, but is entered in prefix/length format using slash notation (instead of prefix plus mask in dotted decimal format using the **mask** keyword before the network mask in dotted decimal format):

```
awplus(config)# router bgp 100
awplus(config-router)# network 192.0.2.224/27
```

Example [BGP4+] The following example is the same as the previous example for host route 2001:db8::/32:

```
awplus(config)# router bgp 100
awplus(config-router)# address-family ipv6
awplus(config-router-af)# network 2001:db8::/32
```

Output [BGP4+] Figure 30-3: Example output from the **show running-config** command after entering **network 2001:db8::/32**

```
awplus#show running-config

router bgp 100
  network 2001:db8::/32
```

**Command
changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for x510 and x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

network synchronization

Overview Use this command to ensure the exact same static network prefix, specified through any of the **network** commands, is local or has IGP reachability before introduction to BGP or BGP4+.

Use the **no** variant of this command to disable this function.

Syntax `network synchronization`
`no network synchronization`

Default Network synchronization is disabled by default.

Mode [BGP] Router Configuration and IPv4 Address Family [ipv4 unicast] Configuration

Mode [BGP4+] IPv6 Address Family [ipv6 unicast] Configuration

Examples [BGP] The following example enables IGP synchronization of BGP static network routes in the Router Configuration mode.

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# network synchronization
```

The following example enables IGP synchronization of BGP static network routes in the IPv4-Unicast address family.

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# address-family ipv4 unicast
awplus(config-router-af)# network synchronization
```

Example [BGP4+] The following example enables IGP synchronization of BGP4+ static network routes in the IPv6-Unicast address family.

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# address-family ipv6 unicast
awplus(config-router-af)# network synchronization
```

Command changes Added to AlliedWare Plus prior to 5.4.6-1
Version 5.4.7-2.1: BGP support added for x510 and x550 series
Version 5.4.7-2.4: BGP support added for IE300 series

redistribute (into BGP or BGP4+)

Overview Use this command to inject routes from one routing process into a BGP or BGP4+ routing table.

Use the **no** variant of this command to disable this function.

Syntax `redistribute {ospf|rip|connected|static} [route-map
<route-map-entry-pointer>]`
`no redistribute {ospf|rip|connected|static} [route-map
<route-map-entry-pointer>]`

Parameter	Description
connected	Specifies the redistribution of connected routes for both BGP and BGP4+.
ospf	Specifies the redistribution of OSPF information for BGP or OSPFv3 information for BGP4+.
rip	Specifies the redistribution of RIP information for BGP or RIPng information for BGP4+.
static	Specifies the redistribution of Static routes for both BGP and BGP4+.
route-map	Route map reference for both BGP and BGP4+.
<route-map-entry-pointer>	Pointer to route-map entries.

Mode [BGP] Router Configuration or IPv4 Address Family Configuration

Mode [BGP4+] Router Configuration or IPv6 Address Family Configuration

Usage notes Redistribution is used by routing protocols to advertise routes that are learned by some other means, such as by another routing protocol or by static routes. Since all internal routes are dumped into BGP, careful filtering is applied to make sure that only routes to be advertised reach the internet, not everything. This command allows redistribution by injecting prefixes from one routing protocol into another routing protocol.

Examples [BGP/ BGP+] The following example shows the configuration of a route-map named `rmap1`, which is then applied using the **redistribute route-map** command.

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 1
awplus(config-route-map)# match origin incomplete
awplus(config-route-map)# set metric 100
awplus(config-route-map)# exit
awplus(config)# router bgp 12
awplus(config-router)# redistribute ospf route-map rmap1
```

To apply the above example to a specific VRF instance named `blue`, use the following commands:

```
awplus(config)# router bgp 12
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# redistribute ospf route-map rmap1
```

The following example shows the configuration of a route-map named `rmap2`, which is then applied using the **redistribute route-map** command.

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 3
awplus(config-route-map)# match interface vlan1
awplus(config-route-map)# set metric-type 1
awplus(config-route-map)# exit
awplus(config)# router ospf 100
awplus(config-router)# redistribute bgp route-map rmap2
```

Note that configuring a route-map and applying it with the **redistribute route-map** command allows you to filter which routes are distributed from another routing protocol (such as OSPF with BGP). A route-map can also set the metric, tag, and metric-type of the redistributed routes.

**Command
changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for x510 and x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

restart bgp graceful (BGP only)

Overview Use this command to force the device to perform a graceful BGP restart.

Syntax `restart bgp graceful`

Mode Privileged Exec

Usage Before using this command, BGP graceful-restart capabilities must be enabled within the router BGP ([bgp graceful-restart](#) command), and each neighbor configured on the device should be set to advertise its graceful-restart capability ([bgp graceful-restart graceful-reset](#) command). The neighbor devices also need to have BGP graceful-restart capabilities enabled ([bgp graceful-restart](#) command).

This command stops the whole BGP process and makes the device retain the BGP routes and mark them as stale. Receiving BGP speakers, retain and mark as stale all BGP routes received from the restarting speaker for all the address families received in the Graceful Restart Capability exchange.

When a **restart bgp graceful** command is issued, the BGP configuration is reloaded from the last saved configuration. Ensure you first issue a **copy running-config startup-config**.

Example `awplus# restart bgp graceful`

Related commands [bgp graceful-restart](#)
[bgp graceful-restart graceful-reset](#)

Command changes Added to AlliedWare Plus prior to 5.4.6-1
Version 5.4.7-2.1: BGP support added for x510 and x550 series
Version 5.4.7-2.4: BGP support added for IE300 series

router bgp

Overview Use this command to configure a BGP routing process, specifying the 32-bit Autonomous System (AS) number.

Use the **no** variant of this command to disable a BGP routing process, specifying the 32-bit AS number.

Syntax router bgp <asn>
no router bgp <asn>

Parameter	Description
<asn>	<1-4294967295> Specifies the 32-bit Autonomous System (AS) number.

Mode Global Configuration

Usage The **router bgp** command enables a BGP routing process:

```
router bgp 1
  neighbor 10.0.0.1 remote-as 1
  neighbor 10.0.0.2 remote-as 1
  !
router bgp 2
  neighbor 10.0.0.3 remote-as 2
  neighbor 10.0.0.4 remote-as 2
```

Examples

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)#
awplus# configure terminal
awplus(config)# no router bgp 12
awplus(config)#
```

Command changes

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for x510 and x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

route-map

Overview Use this command to configure a route map entry, and to specify whether the device will process or discard matching routes and BGP update messages.

The device uses a name to identify the route map, and a sequence number to identify each entry in the route map.

The **route-map** command puts you into route-map configuration mode. In this mode, you can use the following:

- one or more of the **match** commands to create match clauses. These specify what routes or update messages match the entry.
- one or more of the **set** commands to create set clauses. These change the attributes of matching routes or update messages.

Use the **no** variant of this command to delete a route map or to delete an entry from a route map.

Syntax `route-map <mapname> {deny|permit} <seq>`
`no route-map <mapname>`
`no route-map <mapname> {deny|permit} <seq>`

Parameter	Description
<mapname>	A name to identify the route map.
deny	The route map causes a routing process to discard matching routes or BGP update messages.
permit	The route map causes a routing process to use matching routes or BGP update messages.
<seq>	<1-65535> The sequence number of the entry. You can use this parameter to control the order of entries in this route map.

Mode Global Configuration

Usage notes Route maps allow you to control and modify routing information by filtering routes and setting route attributes. You can apply route maps when the device:

- processes BGP update messages that it has received from a peer
- prepares BGP update messages to send to peers
- redistributes routes from one routing protocol into another
- redistributes static routes into routing protocols
- uses BGP route flap dampening

When a routing protocol passes a route or update message through a route map, it checks the entries in order of their sequence numbers, starting with the lowest numbered entry.

If it finds a match on a route map with an action of permit, then it applies any set clauses and accepts the route. Having found a match, the route is not compared against any further entries of the route map.

If it finds a match on a route map with an action of deny, it will discard the matching route.

If it does not find a match, it discards the route or update message. This means that route maps end with an implicit deny entry. To permit all non-matching routes or update messages, end your route map with an entry that has an action of **permit** and no match clause.

Examples To enter route-map mode for entry 1 of the route map called "route1", and then add a match and set clause to it, use the commands:

```
awplus# configure terminal
awplus(config)# route-map route1 permit 1
awplus(config-route-map)# match as-path 60
awplus(config-route-map)# set weight 70
```

To enter route-map mode for entry 2 of the route map called "route1", and then add a match and set clause to it, use the commands:

```
awplus# configure terminal
awplus(config)# route-map route1 permit 2
awplus(config-route-map)# match interface vlan2
awplus(config-route-map)# set metric 20
```

Note how the prompt changes when you go into route map configuration mode.

To make the device process non-matching routes instead of discarding them, add a command like the following one:

```
awplus(config)# route-map route1 permit 100
```

set as-path

Overview Use this command to add an AS path set clause to a route map entry.

When a BGP update message matches the route map entry, the device prepends the specified Autonomous System Number (ASN) or ASNs to the update's AS path attribute.

The AS path attribute is a list of the autonomous systems through which the announcement for the prefix has passed. As prefixes pass between autonomous systems, each autonomous system adds its ASN to the beginning of the list. This means that the AS path attribute can be used to make routing decisions.

Use the **no** variant of this command to remove the set clause.

Syntax `set as-path prepend <1-65535> [<1-65535>]...`
`no set as-path prepend [<1-65535> [<1-65535>]...]`

Parameter	Description
<code>prepend</code>	Prepends the autonomous system path.
<code><1-65535></code>	The number to prepend to the AS path. If you specify multiple ASNs, separate them with spaces.

Mode Route-map mode

Usage notes Use the **set as-path** command to specify an autonomous system path. By specifying the length of the AS-Path, the device influences the best path selection by a neighbor. Use the `prepend` parameter with this command to prepend an AS path string to routes increasing the AS path length.

This command is valid for BGP update messages only.

Example To use entry 3 of the route map called `myroute` to prepend ASN 8 and 24 to the AS path of matching update messages, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# set as-path prepend 8 24
```

Related commands [match as-path](#)
[route-map](#)
[show route-map](#)

Command changes Added to AlliedWare Plus prior to 5.4.6-1
Version 5.4.7-2.1: BGP support added for x510 and x550 series
Version 5.4.7-2.4: BGP support added for IE300 series

set community

Overview Use this command to add a community set clause to a route map entry.

When a BGP update message matches the route map entry, the device takes one of the following actions:

- changes the update's community attribute to the specified value or values, or
- adds the specified community value or values to the update's community attribute, if you specify the **additive** parameter after specifying another parameter. or
- removes the community attribute from the update, if you specify the **none** parameter

Use the **no** variant of this command to remove the set clause.

Syntax

```
set community {[<1-65535>][AA:NN] [internet] [local-AS]
[no-advertise] [no-export] [additive]}

no set community {[AA:NN] [internet] [local-AS] [no-advertise]
[no-export] [additive]}

set community none

no set community none
```

Parameter	Description
<1-65535>	The AS number of the community as an integer not in AA:NN format.
AA:NN	The Autonomous System (AS) number of the community, in AA:NN format. AS numbers are assigned to the regional registries by the IANA (www.iana.org) and can be obtained from the registry in your region. AA and NN are both integers from 1 to 65535. AA is the AS number; NN is a value chosen by the ASN administrator.
local-AS	The community of routes that must not be advertised to external BGP peers (this includes peers in other members' Autonomous Systems inside a BGP confederation).
internet	The community of routes that can be advertised to all BGP peers.
no-advertise	The community of routes that must not be advertised to other BGP peers.
no-export	The community of routes that must not be advertised outside a BGP confederation boundary (a standalone Autonomous System that is not part of a confederation should be considered a confederation itself).

Parameter	Description
none	The device removes the community attribute from matching update messages.
additive	The device adds the specified community value to the update message's community attribute, instead of replacing the existing attribute. By default this parameter is not included, so the device replaces the existing attribute.

Mode Route-map Configuration

Usage notes This command is valid for BGP update messages only.

Examples To use entry 3 of the route map called `rmap1` to put matching routes into the no-advertise community, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set community no-advertise
```

To use entry 3 of the route map called `rmap1` to put matching routes into several communities, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set community 10:01 23:34 12:14
no-export
```

To use entry 3 of the route map called `rmap1` to put matching routes into a single AS community numbered 16384, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set community 16384 no-export
```

- Version 5.4.7-2.4: BGP support added for IE300 series

show bgp ipv6 (BGP4+ only)

Overview Use this command to display BGP4+ network information for a specified IPv6 address.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show bgp ipv6 <ipv6-addr>`

Parameter	Description
<code><ipv6-addr></code>	Specifies the IPv6 address, entered in hexadecimal in the format X:X::X:X.

Mode User Exec and Privileged Exec

Example `awplus# show bgp ipv6 2001:0db8:010d::1`

Related commands [show bgp ipv6 longer-prefixes \(BGP4+ only\)](#)

Command changes Added to AlliedWare Plus prior to 5.4.6-1
Version 5.4.7-2.1: BGP support added for x510 and x550 series
Version 5.4.7-2.4: BGP support added for IE300 series

show bgp ipv6 community (BGP4+ only)

Overview Use this command to display routes that match specified communities within an IPv6 environment. Use the [show ip bgp community \(BGP only\)](#) command within an IPv4 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

You may use any combination and repetition of parameters listed in the *<type>* placeholder.

Syntax `show bgp ipv6 community [<type>] [exact-match]`

Parameter	Description
<i><type></i>	{[<i>AA:NN</i>] [<i>local-AS</i>] [<i>no-advertise</i>] [<i>no-export</i>] }
<i>AA:NN</i>	Specifies the Autonomous System (AS) community number, in AA:NN format.
<i>local-AS</i>	Do not send outside local Autonomous Systems (well-known community).
<i>no-advertise</i>	Do not advertise to any peer (well-known community).
<i>no-export</i>	Do not export to next AS (well-known community).
<i>exact-match</i>	Specifies that the exact match of the communities is displayed. This optional parameter cannot be repeated.

Mode User Exec and Privileged Exec

Examples Note that the AS numbers shown are examples only.

```
awplus# show bgp ipv6 community 64497:64499 exact-match
awplus# show bgp ipv6 community 64497:64499 64500:64501
exact-match
awplus# show bgp ipv6 community 64497:64499 64500:64501
64510:64511no-advertise
awplus# show bgp ipv6 community no-advertise
no-advertiseno-advertise exact-match
awplus# show bgp ipv6 community no-export 64510:64511
no-advertise local-AS no-export
awplus# show bgp ipv6 community no-export 64510:64511
no-advertise 64497:64499 64500:64501 no-export
awplus# show bgp ipv6 community no-export 64497:64499
no-advertise local-AS no-export
```

Related commands `show ip bgp community` (BGP only)

Command changes

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.7-2.1: BGP support added for x510 and x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

show bgp ipv6 community-list (BGP4+ only)

Overview Use this command to display routes that match the given community-list within an IPv6 environment. Use the [show ip bgp community-list \(BGP only\)](#) command within an IPv4 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show bgp ipv6 community-list <listname> [exact-match]`

Parameter	Description
<listname>	Specifies the community list name.
exact-match	Displays only routes that have exactly the same specified communities.

Mode User Exec and Privileged Exec

Example `awplus# show bgp ipv6 community-list mylist exact-match`

Related commands [show ip bgp community-list \(BGP only\)](#)

Command changes Added to AlliedWare Plus prior to 5.4.6-1
Version 5.4.7-2.1: BGP support added for x510 and x550 series
Version 5.4.7-2.4: BGP support added for IE300 series

show bgp ipv6 dampening (BGP4+ only)

Overview Use this command to show dampened routes from a BGP4+ instance within an IPv6 environment. Use the [show ip bgp dampening \(BGP only\)](#) command to show dampened routes from a BGP instance within an IPv4 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show bgp ipv6 dampening
{dampened-paths|flap-statistics|parameters}`

Parameter	Description
dampened-paths	Display paths suppressed due to dampening.
flap-statistics	Display flap statistics of routes.
parameters	Display details of configured dampening parameters.

Mode User Exec and Privileged Exec

Usage notes Enable BGP4+ dampening to maintain dampened-path information in memory.

Examples

```
awplus# show bgp ipv6 dampening dampened-path  
awplus# show bgp ipv6 dampening flap-statistics  
awplus# show bgp ipv6 dampening parameter
```

Related commands [show ip bgp dampening \(BGP only\)](#)

- Version 5.4.7-2.4: BGP support added for IE300 series

show bgp ipv6 filter-list (BGP4+ only)

Overview Use this command to display routes conforming to the filter-list within an IPv6 environment. Use the [show ip bgp filter-list \(BGP only\)](#) command to display routes conforming to the filter-list within an IPv4 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show bgp ipv6 filter-list <listname>`

Parameter	Description
<listname>	Specifies the regular-expression access list name.

Mode User Exec and Privileged Exec

Example `awplus# show bgp ipv6 filter-list mylist`

Related commands [show ip bgp filter-list \(BGP only\)](#)

Command changes Added to AlliedWare Plus prior to 5.4.6-1
Version 5.4.7-2.1: BGP support added for x510 and x550 series
Version 5.4.7-2.4: BGP support added for IE300 series

show bgp ipv6 inconsistent-as (BGP4+ only)

Overview Use this command to display routes with inconsistent AS Paths within an IPv6 environment. Use the [show ip bgp inconsistent-as \(BGP only\)](#) command to display routes with inconsistent AS paths within an IPv4 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show bgp ipv6 inconsistent-as`

Mode User Exec and Privileged Exec

Example `awplus# show bgp ipv6 inconsistent-as`

Related commands [show ip bgp inconsistent-as \(BGP only\)](#)

Command changes Added to AlliedWare Plus prior to 5.4.6-1
Version 5.4.7-2.1: BGP support added for x510 and x550 series
Version 5.4.7-2.4: BGP support added for IE300 series

show bgp ipv6 longer-prefixes (BGP4+ only)

Overview Use this command to display the route of the local BGP4+ routing table for a specific prefix with a specific mask or for any prefix having a longer mask than the one specified.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show bgp ipv6 <ipv6-addr/prefix-length> longer-prefixes`

Parameter	Description
<code><ipv6-addr/prefix-length></code>	Specifies the IPv6 address with prefix length. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.

Mode User Exec and Privileged Exec

Example `awplus# show bgp ipv6 2001:0db8::/64 longer-prefixes`

Related commands [show bgp ipv6 \(BGP4+ only\)](#)

Command changes Added to AlliedWare Plus prior to 5.4.6-1
Version 5.4.7-2.1: BGP support added for x510 and x550 series
Version 5.4.7-2.4: BGP support added for IE300 series

show bgp ipv6 neighbors (BGP4+ only)

Overview Use this command to display detailed information on peering connections to all BGP4+ neighbors within an IPv6 environment.

Use the [show ip bgp neighbors \(BGP only\)](#) command to display detailed information on peering connections to all BGP neighbors within an IPv4 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show bgp ipv6 neighbors [<ipv6-addr> [advertised-routes|received prefix-filter|received-routes|routes]]`

Parameter	Description
<ipv6-addr>	Specifies the IPv6 address, entered in hexadecimal in the format X:X::X:X.
advertised-routes	Displays the routes advertised to a BGP4+ neighbor.
received prefix-filter	Displays received prefix-list filters.
received-routes	Displays the received routes from the neighbor. To display all the received routes from the neighbor, configure the BGP4+ soft reconfigure first.
routes	Displays all accepted routes learned from neighbors.

Mode User Exec and Privileged Exec

Examples **[BGP4+]**

```
awplus# show bgp ipv6 neighbors 2001:0db8:010d::1  
advertised-routes  
  
awplus# show bgp ipv6 neighbors 2001:0db8:010d::1 received  
prefix-filter  
  
awplus# show bgp ipv6 neighbors 2001:0db8:010d::1  
received-routes  
  
awplus# show bgp ipv6 neighbors 2001:0db8:010d::1 routes
```

Output Figure 30-4: Example output from **show bgp ipv6 neighbors 2001:db8:b::1**

```
awplus#show bgp ipv6 neighbors 2001:db8:b::1
BGP neighbor is 2001:db8:b::1, remote AS 200, local AS 100, external link
  BGP version 4, remote router ID 2.2.2.1
  BGP state = Established, up for 01:03:26
  Last read 01:03:26, hold time is 90, keepalive interval is 30 seconds
  Neighbor capabilities:
    Route refresh: advertised and received (old and new)
    4-Octet ASN Capability: advertised and received
    Address family IPv4 Unicast: advertised and received
    Address family IPv6 Unicast: advertised and received
  Received 157 messages, 0 notifications, 0 in queue
  Sent 228 messages, 0 notifications, 0 in queue
  Route refresh request: received 0, sent 0
  Minimum time between advertisement runs is 30 seconds
  Update source is lo
For address family: IPv4 Unicast
  BGP table version 1, neighbor version 1
  Index 2, Offset 0, Mask 0x4
  Community attribute sent to this neighbor (both)
  0 accepted prefixes
  0 announced prefixes

For address family: IPv6 Unicast
  BGP table version 66, neighbor version 66
  Index 2, Offset 0, Mask 0x4
  AF-dependant capabilities:
    Graceful restart: advertised, received

  Community attribute sent to this neighbor (both)
  Default information originate, default sent
  Inbound path policy configured
  Incoming update prefix filter list is *BGP_FILTER_LIST
  Route map for incoming advertisements is *BGP_LOCAL_PREF_MAP
  8 accepted prefixes
  8 announced prefixes

Connections established 1; dropped 0
Graceful-restart Status:
  Remote restart-time is 90 sec

  External BGP neighbor may be up to 2 hops away.
Local host: 2001:db8:a::1, Local port: 179
Foreign host: 2001:db8:b::1, Foreign port: 50672
Nexthop: 1.1.1.1
Nexthop global: 2001:db8:a::1
Nexthop local: ::
BGP connection: non shared network
```

If available the following is shown:

- Session information
 - Neighbor address, ASN information and if the link is external or internal
 - BGP version and status
 - Neighbor capabilities for the BGP session
 - Number of messages transmitted and received
- IPv6 unicast address family information
 - BGP4+ table version
 - IPv6 Address Family dependent capabilities
 - IPv6 Communities
 - IPv6 Route filters for ingress and egress updates
 - Number of announced and accepted IPv6 prefixes
- Connection information
 - Connection counters
 - Graceful restart timer
 - Hop count to the peer
 - Next hop information
 - Local and external port numbers

Related commands [show ip bgp neighbors \(BGP only\)](#)

Command changes Added to AlliedWare Plus prior to 5.4.6-1
Version 5.4.7-2.1: BGP support added for x510 and x550 series

show bgp ipv6 paths (BGP4+ only)

Overview Use this command to display BGP4+ path information within an IPv6 environment. Use the [show ip bgp paths \(BGP only\)](#) command to display BGP path information within an IPv4 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show bgp ipv6 paths`

Mode User Exec and Privileged Exec

Example `awplus# show bgp ipv6 paths`

Related commands [show ip bgp paths \(BGP only\)](#)

Command changes Added to AlliedWare Plus prior to 5.4.6-1
Version 5.4.7-2.1: BGP support added for x510 and x550 series
Version 5.4.7-2.4: BGP support added for IE300 series

show bgp ipv6 prefix-list (BGP4+ only)

Overview Use this command to display routes matching the prefix-list within an IPv6 environment. Use the [show ip bgp prefix-list \(BGP only\)](#) command to display routes matching the prefix-list within an IPv4 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show bgp ipv6 prefix-list <list>`

Parameter	Description
<list>	Specifies the name of the IPv6 prefix list.

Mode User Exec and Privileged Exec

Example `awplus# show bgp ipv6 prefix-list mylist`

Related commands [show ip bgp prefix-list \(BGP only\)](#)

Command changes Added to AlliedWare Plus prior to 5.4.6-1
Version 5.4.7-2.1: BGP support added for x510 and x550 series
Version 5.4.7-2.4: BGP support added for IE300 series

show bgp ipv6 quote-regexp (BGP4+ only)

Overview Use this command to display routes matching the AS path regular expression within an IPv6 environment. Use the [show ip bgp quote-regexp \(BGP only\)](#) command to display routes matching the AS path regular expression within an IPv4 environment.

Note that you must use quotes to enclose the regular expression with this command. Use the regular expressions listed below with the *<expression>* parameter:

Symbol	Character	Meaning
^	Caret	Used to match the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match.
\$	Dollar sign	Used to match the end of the input string.
.	Period	Used to match a single character (white spaces included).
*	Asterisk	Used to match none or more sequences of a pattern.
+	Plus sign	Used to match one or more sequences of a pattern.
?	Question mark	Used to match none or one occurrence of a pattern.
_	Underscore	Used to match spaces, commas, braces, parenthesis, or the beginning and end of an input string.
[]	Brackets	Specifies a range of single-characters.
-	Hyphen	Separates the end points of a range.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show bgp ipv6 quote-regexp <expression>`

Mode User Exec and Privileged Exec

Example `awplus# show bgp ipv6 quote-regexp myexpression`

Related commands [show ip bgp quote-regexp \(BGP only\)](#)

Command changes Added to AlliedWare Plus prior to 5.4.6-1
Version 5.4.7-2.1: BGP support added for x510 and x550 series
Version 5.4.7-2.4: BGP support added for IE300 series

show bgp ipv6 regexp (BGP4+ only)

Overview Use this command to display routes matching the AS path regular expression within an IPv6 environment. Use the [show ip bgp regexp \(BGP only\)](#) command to display routes matching the AS path regular expression within an IPv4 environment.

Use the regular expressions listed below with the *<expression>* parameter:

Symbol	Character	Meaning
^	Caret	Used to match the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match.
\$	Dollar sign	Used to match the end of the input string.
.	Period	Used to match a single character (white spaces included).
*	Asterisk	Used to match none or more sequences of a pattern.
+	Plus sign	Used to match one or more sequences of a pattern.
?	Question mark	Used to match none or one occurrence of a pattern.
_	Underscore	Used to match spaces, commas, braces, parenthesis, or the beginning and end of an input string.
[]	Brackets	Specifies a range of single-characters.
-	Hyphen	Separates the end points of a range.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show bgp ipv6 regexp <expression>`

Parameter	Description
<i><expression></i>	Specifies a regular-expression to match the BGP4+ AS paths.

Mode User Exec and Privileged Exec

Example `awplus# show bgp ipv6 regexp myexpression`

Related commands [show ip bgp regexp \(BGP only\)](#)

Command changes Added to AlliedWare Plus prior to 5.4.6-1
Version 5.4.7-2.1: BGP support added for x510 and x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

show bgp ipv6 route-map (BGP4+ only)

Overview Use this command to display BGP4+ routes that match the specified route-map within an IPv6 environment. Use the [show ip bgp route-map \(BGP only\)](#) command to display BGP routes that match the specified route-map within an IPv4 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show bgp ipv6 route-map <route-map>`

Parameter	Description
<code><route-map></code>	Specifies a route-map that is matched.

Mode User Exec and Privileged Exec

Example To show routes that match the route-map `myRouteMap`, use the command:

```
awplus# show bgp ipv6 route-map myRouteMap
```

Related commands [show ip bgp route-map \(BGP only\)](#)

Command changes Added to AlliedWare Plus prior to 5.4.6-1
Version 5.4.7-2.1: BGP support added for x510 and x550 series
Version 5.4.7-2.4: BGP support added for IE300 series

show bgp ipv6 summary (BGP4+ only)

Overview Use this command to display a summary of a BGP4+ neighbor status within an IPv6 environment. Use the [show ip bgp summary \(BGP only\)](#) command to display a summary of a BGP neighbor status within an IPv4 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax show bgp ipv6 summary

Mode User Exec and Privileged Exec

Example awplus# show bgp ipv6 summary

Output Figure 30-5: Example output from the **show ip bgp summary** command

```
awplus>show ip bgp summary

BGP router identifier 1.0.0.1, local AS number 65541
BGP table version is 12
4 BGP AS-PATH entries
0 BGP community entries
```

Neighbor	V	AS	MsgRc	MsgSnt	TblVer	InOutQ	Up/Down	State/PfxRcd
2001:0db8:cccc::1	4	65544	20	24	11	0/0	00:07:19	1
2001:0db8:dddd::1	4	65545	0	0	0	0/0	never	Active
2001:0db8:eeee::1	4	65542	34	40	0	0/0	00:00:04	Active
2001:0db8:ffff::1	4	65543	29	32	11	0/0	00:07:03	13

```
Number of neighbors 4
```

The Up/Down column in this output is a timer that shows:

- "never" if the peer session has never been established
- The up time, if the peer session is currently up
- The down time, if the peer session is currently down.

In the example above, the session with 2001:0db8:eeee::1 has been down for 4 seconds, and the session with 2001:0db8:dddd::1 has never been established.

Related commands [show ip bgp summary \(BGP only\)](#)

Command changes Added to AlliedWare Plus prior to 5.4.6-1
Version 5.4.7-2.1: BGP support added for x510 and x550 series
Version 5.4.7-2.4: BGP support added for IE300 series

show bgp ipv6 vrf

Overview Use this command to display BGP4+ network information, either the global routing instance or a named VRF.

Use the **summary** parameter to show a summary of the BGP peers configured for the specific routing instance.

Syntax `show bgp ipv6 [vrf <vrf-name>|global] [inconsistent-as|summary]`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
global	Global Routing/Forwarding table
inconsistent-as	Display routes with inconsistent AS Paths
summary	Summary of BGP neighbor status

Mode Privileged Exec

Example To display all BGP routes for the VRF red, use the command:

```
awplus# show bgp ipv6 vrf red
```

To display the BGP routes with inconsistent-as from the global instance, use the command:

```
awplus# show bgp ipv6 global inconsistent-as
```

To display a summary of the BGP peers for VRF red, use the command:

```
awplus# show bgp ipv6 vrf red summary
```

Output Figure 30-6: Example output from **show bgp ipv6 vrf mid**

```
R2#show bgp ipv6 vrf mid
[VRF: mid]
BGP table version is 1, local router ID is 2.2.2.3
Status codes: s suppressed, d damped, h history, * valid, > best,i - internal
               l - labeled, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

   Network          Next Hop           Metric LocPrf Weight Path
*> 1.5.6.0/23       0.0.0.0                100   32768 i
*> 2001:12::/64     ::                    32768 ?
*                   ::                    100   32768 i
*> 2001:23::/64     ::                    32768 ?

Number of prefixes 3
```

Output Figure 30-7: Example output from **show bgp ipv6 vrf mid summary**

```
R2#show bgp ipv6 vrf mid summary
[VRF: mid]
BGP router identifier 2.2.2.3, local AS number 500

show bgp ipv6 vrf community

Overview Use this command to show routes that match the specified communities from a BGP instance, either the global routing instance or a named VRF.

Syntax `show bgp ipv6 [vrf <vrf-name>|global] community [{[AA:NN]
[local-AS] [no-advertise] [no-export]]} [exact-match]`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
global	Global routing/forwarding table
AA:NN	Specifies the Autonomous System (AS) community number, in AA:NN format.
local-AS	Do not send outside local Autonomous Systems (well-known community).
no-advertise	Do not advertise to any peer (well-known community).
no-export	Do not export to next AS (well-known community).
exact-match	Specifies that the exact match of the communities is displayed. This optional parameter cannot be repeated.

Mode Privileged Exec

Example To show routes that match the community 'no-export' for VRF red, use the command:

```
awplus# show bgp ipv6 vrf red community no-export
```

To show routes that exactly match the communities 65500:2 and 65500:3 for the global routing instance, use the command:

```
awplus# show bgp ipv6 global community 65500:2 65500:3  
exact-match
```

Output Figure 30-8: Example output from **show bgp ipv6 vrf community**

```
awplus# show bgp ipv6 vrf red community no-export

[VRF: red]
BGP table version is 1, local router ID is 2.2.2.3

show bgp ipv6 vrf community-list

Overview Use this command to show routes that match the given community-list from a BGP instance in either the global routing instance or a named VRF.

Syntax `show bgp ipv6 [vrf <vrf-name>| global] community-list <listname> [exact-match]`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
global	Global routing/forwarding table
<listname>	The community list name
exact-match	Displays only routes that have exactly the same specified communities.

Mode Privileged Exec

Example To show routes that match the community-list 'myCommunity' for VRF red, use the command:

```
awplus# show bgp ipv6 vrf red community-list myCommunity
```

To show routes that exactly match the community-list 'myExactCommunity' for the global routing instance, use the command:

```
awplus# show bgp ipv6 global community-list myExactCommunity exact-match
```

Output Figure 30-9: Example output from **show bgp ipv6 vrf community-list**

```
awplus#show bgp ipv6 vrf red community-list myCommunity
[VRF: red]
BGP table version is 1, local router ID is 1.1.1.1

Command changes Version 5.5.3-1.1: command added

show bgp ipv6 vrf dampening

Overview Use this command to display detailed information about dampening on either the global routing instance or a named VRF.

Syntax `show bgp ipv6 [vrf <vrf-name>|global] dampening {dampened-paths|flap-statistics}`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
global	Global routing/forwarding table.
dampened-paths	Display paths suppressed due to dampening.
flap-statistics	Display flap statistics of routes.

Mode Privileged Exec

Usage notes Route dampening is a mechanism used in routing protocols, particularly in Border Gateway Protocol (BGP), to mitigate the impact of flapping routes. Route flapping occurs when a route, typically due to network instability, alternates rapidly between being reachable and unreachable. This can happen due to factors like link failures, route oscillations, or network instabilities.

Route dampening aims to reduce the disruptive effects of route flapping by penalizing unstable routes. When a route flaps, it is assigned a penalty, and if the penalty exceeds a certain threshold, the route is suppressed. This means that the router will stop advertising or considering the unstable route for a specified period, allowing the network to stabilize.

Example To show routes that are suppressed due to dampening for VRF red, use the command:

```
awplus# show bgp ipv6 vrf red dampening dampened-paths
```

To show routes that are suppressed due to dampening for VRF red, with the flap-statistics use the command:

```
awplus# show bgp ipv6 global dampening flap-statistics
```

Output Figure 30-10: Example output from **show bgp ipv6 vrf dampening dampened-paths**

```
awplus#show bgp ipv6 vrf red dampening dampened-paths
BGP table version is 1, local router ID is 1.1.1.1

show bgp ipv6 vrf filter-list

Overview Use this command to show routes that match the given prefix-list, filter-list, or route-map from a BGP instance in either the global routing instance or a named VRF.

Syntax `show bgp ipv6 [vrf <vrf-name>|global]
[prefix-list|filter-list|route-map]<listname>`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
global	Global routing/forwarding table.
prefix-list	Display routes matching the prefix-list.
filter-list	Display routes matching the filter-list.
route-map	Display routes matching the route-map.
<listname>	Specify the regular-expression access list name.

Mode Privileged Exec

Example To show routes that match the prefix-list 'myPrefixes' for VRF red, use the command:

```
awplus# show bgp ipv6 vrf red prefix-list myPrefixes
```

To show routes that match the route-map 'myRouteMap' for the global routing instance, use the command:

```
awplus# show bgp ipv6 global route-map myRouteMap
```

Output Figure 30-12: Example output from **show bgp ipv6 vrf filter-list**

```
awplus# show bgp ipv6 vrf red filter-list mylist
[VRF: red]
BGP table version is 1, local router ID is 1.1.1.1
Status codes: s suppressed, d damped, h history, * valid, > best,

show bgp ipv6 vrf longer-prefixes

Overview Use this command to display the route of the local BGP routing table for a specific prefix with a specific mask or for any prefix having a longer mask than the one specified in either the global routing instance or a named VRF.

Syntax `show bgp ipv6 [vrf <vrf-name> | global] <ipv6-address/m> [longer-prefixes]`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
global	Global routing/forwarding table
<ipv6-address/m>	Network IPv6 address and subnet mask, entered in the form X:X::X:X/M. Where M is the subnet mask length.

Mode Privileged Exec

Example To show details on the route 2001:9876::/64 for VRF red, use the command:

```
awplus# show bgp ipv6 vrf red 2001:9876::/64
```

To show details on the route 2001:9876::/40 and any more specific routes for the global routing instance, use the command:

```
awplus# show bgp ipv6 global 2001:9876::/40 longer prefixes
```

Output Figure 30-13: Example output from **show bgp ipv6 vrf**

```
awplus#show bgp ipv6 vrf red 3003::/64
[VRF: red]
BGP routing table entry for 3003::/64

```

Related commands [show ip bgp longer-prefixes \(BGP only\)](#)

Command changes Version 5.5.3-1.1: command added.

show bgp ipv6 vrf neighbors routes

Overview Use this command to display information on routes associated with a BGP neighbor on either the global routing instance or a named VRF.

Syntax `show bgp ipv6 [vrf <vrf-name>|global]neighbors <ipv6-address> routes`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
global	Global routing/forwarding table.
<ipv6-address>	Neighbor IPv6 address, entered in the form X:X::X:X.

Mode Privileged Exec

Example To show details on the routes associated with peer 2001:9876::1 for VRF red, use the command:

```
awplus# show bgp ipv6 vrf red neighbors 2001:9876::1 routes
```

To show details on the routes associated with peer 123::456 for global VRF, use the command:

```
awplus# show bgp ipv6 global neighbors 123::456 routes
```

Output Figure 30-15: Example output from **show bgp ipv6 vrf neighbors routes**

```
awplus# show bgp ipv6 vrf red neighbors 2001:dead:beef::2 routes
[VRF: red]
BGP table version is 1, local router ID is 1.1.1.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal
               l - labeled, S Stale

```

Related commands [show ip bgp neighbors \(BGP only\)](#)

Command changes Version 5.5.3-1.1: command added

show bgp ipv6 vrf regexp

Overview Use this command to display routes matching the AS path regular expression in either the global routing instance or a named VRF.

Syntax `show bgp ipv6 [vrf <vrf-name> |global] {regexp <expression>|quote-regexp <quoted-expression>}`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
global	Global routing/forwarding table
regexp	Displays routes matching the AS path regular expression.
<expression>	Specifies a regular-expression to match the BGP AS paths.
quote-regexp	Displays routes matching the AS path regular expression in quotes.
<quoted-expression>	Specifies a regular-expression in quotes to match the BGP AS paths.

Mode Privileged Exec

Usage notes In the BGP protocol, routers exchange routing information in the form of route announcements, which include various attributes about the routes. One such attribute is the AS Path, which is a sequence of autonomous system numbers that a route announcement has traversed to reach the advertising router. The AS Path provides information about the path that the route has taken through different ASes on its way to the current network.

Example To show routes that match the AS path in 'myexpression' for VRF red, use the command:

```
awplus# show bgp ipv6 vrf red regexp myexpression
```

To show routes that match the AS path in 'myexpression' for the global VRF, use the command:

```
awplus# show bgp ipv6 global quote-regexp 'myexpression'
```

Output Figure 30-16: Example output from **show bgp ipv6 vrf regexp**

```
awplus# show bgp ipv6 vrf red quote-regexp "^6500_"
[VRF: red]
BGP table version is 1, local router ID is 1.1.1.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal
               l - labeled, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

   Network          Next Hop           Metric LocPrf Weight Path
*>i3003::/64        2001:dead:beef::2 (fe80::21a:ebff:fe94:65bc)
                                0      100      0 i
*> 5507::/64        :::

show bgp memory maxallocation (BGP only)

Overview This command displays the maximum percentage of total memory that is allocated to BGP processes.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show bgp memory maxallocation`

Mode User Exec and Privileged Exec

Example To display the maximum amount of memory allocated for BGP processes, use the command:

```
awplus# show bgp memory maxallocation
```

Output Figure 30-17: Example output from the **show bgp memory maxallocation** command

```
BGP maximum RAM allocation is 100%
```

Command changes

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.7-2.1: BGP support added for x510 and x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

show bgp nexthop-tracking (BGP only)

Overview Use this command to display BGP next hop tracking status.

Syntax `show bgp nexthop-tracking`

Mode User Exec and Privileged Exec

Example To display BGP next hop tracking status, use the command:

show ip bgp community (BGP only)

Overview Use this command to display routes that match specified communities from a BGP instance within an IPv4 environment. Use the [show bgp ipv6 community \(BGP4+ only\)](#) command within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

You may use any combination and repetition of parameters listed in the *<type>* placeholder.

Syntax `show ip bgp community [<type>] [exact-match]`

Syntax (VRF-lite) `show ip bgp [global|vrf <vrf-name>] community [<type>] [exact-match]`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<i><vrf-name></i>	The name of the VRF instance.
<i><type></i>	{[<i>AA:NN</i>] [<i>local-AS</i>] [<i>no-advertise</i>] [<i>no-export</i>] }
	<i>AA:NN</i> Specifies the Autonomous System (AS) community number, in AA:NN format.
	<i>local-AS</i> Do not send outside local Autonomous Systems (well-known community).
	<i>no-advertise</i> Do not advertise to any peer (well-known community).
	<i>no-export</i> Do not export to next AS (well-known community).
exact-match	Specifies that the exact match of the communities is displayed. This optional parameter cannot be repeated.

Mode User Exec and Privileged Exec

Examples Note that the AS numbers shown are examples only.

```
awplus# show ip bgp community 64497:64499 exact-match
awplus# show ip bgp community 64497:64499 64500:64501
exact-match
awplus# show ip bgp community 64497:64499 64500:64501
64510:64511no-advertise
awplus# show ip bgp community no-advertise
no-advertiseno-advertise exact-match
awplus# show ip bgp community no-export 64510:64511
no-advertise local-AS no-export
awplus# show ip bgp community no-export 64510:64511
no-advertise 64497:64499 64500:64501 no-export
awplus# show ip bgp community no-export 64497:64499
no-advertise local-AS no-export
awplus# show ip bgp vrf red no-export
awplus# show ip bgp global 65500:2 65500:3 exact-match
```

Command changes Added to AlliedWare Plus prior to 5.4.6-1
Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products
Version 5.4.7-2.1: BGP support added for x510 and x550 series
Version 5.4.7-2.4: BGP support added for IE300 series

show ip bgp community-info (BGP only)

Overview Use this command to list all BGP community information.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show ip bgp community-info`

Mode User Exec and Privileged Exec

Example `awplus# show ip bgp community-info`

Command changes Added to AlliedWare Plus prior to 5.4.6-1
Version 5.4.7-2.1: BGP support added for x510 and x550 series
Version 5.4.7-2.4: BGP support added for IE300 series

show ip bgp community-list (BGP only)

Overview Use this command to display routes that match the given community-list from a BGP instance within an IPv4 environment. Use the [show bgp ipv6 community-list \(BGP4+ only\)](#) command within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show ip bgp community-list <listname> [exact-match]`

Syntax (VRF-lite) `show ip bgp [global|vrf <vrf-name>] community-list <listname> [exact-match]`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
<listname>	Specifies the community list name.
exact-match	Displays only routes that have exactly the same specified communities.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip bgp community-list mylist exact-match
awplus# show ip bgp vrf red community-list myCommunity
awplus# show ip bgp global community-list myExactCommunity exact-match
```

Related commands [show bgp ipv6 community-list \(BGP4+ only\)](#)

Command changes

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products
- Version 5.4.7-2.1: BGP support added for x510 and x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

show ip bgp dampening (BGP only)

Overview Use this command to show dampened routes from a BGP instance within an IPv4 environment. Use the [show bgp ipv6 dampening \(BGP4+ only\)](#) command within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show ip bgp dampening`
`{dampened-paths|flap-statistics|parameters}`

Syntax (VRF-lite) `show ip bgp [global|vrf <vrf-name>] dampening`
`{dampened-paths|flap-statistics|parameters}`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
dampened-paths	Display paths suppressed due to dampening.
flap-statistics	Display flap statistics of routes.
parameters	Display details of configured dampening parameters.

Mode User Exec and Privileged Exec

Usage notes Enable BGP dampening to maintain dampened-path information in memory.

Examples `awplus# show ip bgp dampening dampened-paths`
`awplus# show ip bgp vrf red dampening dampened-paths`
`awplus# show ip bgp global dampening flap-statistics`

Output Figure 30-22: Example output from the **show ip bgp dampening** command

```
dampening 15 750 2000 60 15
Reachability Half-Life time      : 15 min
Reuse penalty                    : 750
Suppress penalty                 : 2000
Max suppress time                : 60 min
Un-reachability Half-Life time   : 15 min
Max penalty (ceil)               : 11999
Min penalty (floor)              : 375
```

The following example output shows that the internal route (i), has flapped 3 times and is now categorized as history (h).

Figure 30-23: Example output from the **show ip bgp dampening flap-statistics** command

```
awplus# show ip bgp dampening flap-statistics
BGP table version is 1, local router ID is 30.30.30.77
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal, S
Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
  Network          From            Flaps    Duration    Reuse      Path
  ----
hi1.1.1.0/24       10.100.0.62         3    00:01:20          i
```

The following example output shows a dampened route in the 1.1.1.0/24 network.

Figure 30-24: Example output from the **show ip bgp dampening dampened-path** command

```
awplus# show ip bgp dampening dampened-paths
BGP table version is 1, local router ID is 30.30.30.77
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal, S
Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
  Network          From            Reuse      Path
  ----
di 1.1.1.0/24       10.100.0.62         00:35:10    i

Total number of prefixes 1
```

- Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products
- Version 5.4.7-2.1: BGP support added for x510 and x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

show ip bgp filter-list (BGP only)

Overview Use this command to display routes conforming to the filter-list within an IPv4 environment. Use the [show bgp ipv6 filter-list \(BGP4+ only\)](#) command to display routes conforming to the filter-list within an IPv6 environment

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show ip bgp filter-list <listname>`

Syntax (VRF-lite) `show ip bgp [global|vrf <vrf-name>] filter-list <listname>`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
<listname>	Specifies the regular-expression access list name.

Mode User Exec and Privileged Exec

Example
`awplus# show ip bgp filter-list mylist`
`awplus# show ip bgp vrf red filter-list mylist`

Related commands [show bgp ipv6 filter-list \(BGP4+ only\)](#)

Command changes
Added to AlliedWare Plus prior to 5.4.6-1
Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products
Version 5.4.7-2.1: BGP support added for x510 and x550 series
Version 5.4.7-2.4: BGP support added for IE300 series

show ip bgp inconsistent-as (BGP only)

Overview Use this command to display routes with inconsistent AS Paths within an IPv4 environment. Use the [show bgp ipv6 inconsistent-as \(BGP4+ only\)](#) command to display routes with inconsistent AS paths within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show ip bgp inconsistent-as`

Syntax (VRF-lite) `show ip bgp [global|vrf <vrf-name>] inconsistent-as`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.

Mode User Exec and Privileged Exec

Example `awplus# show ip bgp inconsistent-as`
`awplus# show ip bgp global inconsistent-as`

Related commands [show bgp ipv6 inconsistent-as \(BGP4+ only\)](#)

Command changes Added to AlliedWare Plus prior to 5.4.6-1
Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products
Version 5.4.7-2.1: BGP support added for x510 and x550 series
Version 5.4.7-2.4: BGP support added for IE300 series

show ip bgp longer-prefixes (BGP only)

Overview Use this command to display the route of the local BGP routing table for a specific prefix with a specific mask, or for any prefix having a longer mask than the one specified.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show ip bgp <ip-address/m> longer-prefixes`

Syntax (VRF-lite) `show ip bgp [global|vrf <vrf-name>] <ip-address/m> longer-prefixes`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
<ip-address/m>	Neighbor's IP address and subnet mask, entered in the form A.B.C.D/M, where M is the subnet mask length.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip bgp 10.10.0.10/24 longer-prefixes
awplus# show ip bgp vrf red 172.16.4.0/24
awplus# show ip bgp global 172.16.0.0/16 longer-prefixes
```

Command changes

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products
- Version 5.4.7-2.1: BGP support added for x510 and x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

show ip bgp neighbors (BGP only)

Overview Use this command to display detailed information on peering connections to all BGP neighbors within an IPv4 environment.

Use the [show bgp ipv6 neighbors \(BGP4+ only\)](#) command to display detailed information on peering connections to all BGP4+ neighbors within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax [BGP] `show ip bgp neighbors [<ipv4-addr> [advertised-routes|received prefix-filter|received-routes|routes]]`

Syntax (VRF-lite) `show ip bgp [global|vrf <vrf-name>] neighbors [<ipv4-addr> routes]`

Parameter	Description
<ipv4-addr>	The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
advertised-routes	Displays the routes advertised to a BGP neighbor.
received prefix-filter	Displays the received prefix-list filters.
received-routes	Displays the received routes from the neighbor. To display all the received routes from the neighbor, configure the BGP soft reconfigure first.
routes	Displays all accepted routes learned from neighbors.
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.

Mode [BGP] User Exec and Privileged Exec

Examples [BGP]

```
awplus# show ip bgp neighbors 10.10.10.72 advertised-routes
awplus# show ip bgp neighbors 10.10.10.72 received
prefix-filter
awplus# show ip bgp neighbors 10.10.10.72 received-routes
awplus# show ip bgp neighbors 10.10.10.72 routes
```

Output Figure 30-25: Example output from **show ip bgp neighbors 10.10.10.72**

```
awplus#show ip bgp neighbors 10.10.10.72
BGP neighbor is 10.10.10.72, remote AS 100, local AS 100, internal
link
Member of peer-group group1 for session parameters
  BGP version 4, remote router ID 0.0.0.0
  BGP state = Active
  Last read          , hold time is 90, keepalive interval is 30 seconds
  Received 0 messages, 0 notifications, 0 in queue
  Sent 0 messages, 0 notifications, 0 in queue
  Route refresh request: received 0, sent 0
  Minimum time between advertisement runs is 5 seconds
For address family: IPv4 Unicast
  BGP table version 1, neighbor version 0
  Index 1, Offset 0, Mask 0x2
  group1 peer-group member
  NEXT_HOP is always this router
  0 accepted prefixes
  0 announced prefixes

Connections established 0; dropped 0
Next connect timer due in 33 seconds
```

If available the following is shown:

- Session information
 - Neighbor address, ASN information and if the link is external or internal
 - BGP version and status
 - Neighbor capabilities for the BGP session
 - Number of messages transmitted and received
- IPv4 unicast address family information
 - BGP table version
 - IPv4 Address Family dependent capabilities
 - IPv4 Communities
 - IPv4 Route filters for ingress and egress updates
 - Number of announced and accepted IPv4 prefixes
- Connection information
 - Connection counters
 - Graceful restart timer
 - Hop count to the peer
 - Next hop information
 - Local and external port numbers

- Version 5.4.7-2.4: BGP support added for IE300 series

show ip bgp neighbors connection-retrytime (BGP only)

Overview Use this command to display the configured connection-retrytime value of the peer at the session establishment time with the neighbor.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show ip bgp neighbors <ipv4-addr> connection-retrytime`

Parameter	Description
<code><ipv4-addr></code>	The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.

Mode User Exec and Privileged Exec

Example `awplus# show ip bgp neighbors 10.11.4.26 connection-retrytime`

Command changes Added to AlliedWare Plus prior to 5.4.6-1
Version 5.4.7-2.1: BGP support added for x510 and x550 series
Version 5.4.7-2.4: BGP support added for IE300 series

show ip bgp neighbors hold-time (BGP only)

Overview Use this command to display the configured holdtime value of the peer at the session establishment time with the neighbor.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show ip bgp neighbors <ipv4-addr> hold-time`

Parameter	Description
<code><ipv4-addr></code>	The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.

Default The holdtime timer default is 90 seconds as per RFC 4271. Holdtime is keepalive * 3.

Mode User Exec and Privileged Exec

Examples `awplus# show ip bgp neighbors 10.11.4.26 hold-time`

Related commands [neighbor timers](#)
[show ip bgp neighbors keepalive-interval \(BGP only\)](#)
[timers \(BGP\)](#)

Command changes Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.4: BGP support added for IE300 series

show ip bgp neighbors keepalive (BGP only)

Overview Use this command to display the number of keepalive messages sent to the neighbor from the peer throughout the session.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show ip bgp neighbors <ipv4-addr> keepalive`

Parameter	Description
<ipv4-addr>	The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.

Mode User Exec and Privileged Exec

Examples `awplus# show ip bgp neighbors 10.11.4.26 keepalive`

Related commands [show ip bgp neighbors keepalive-interval \(BGP only\)](#)

Command changes Added to AlliedWare Plus prior to 5.4.6-1
Version 5.4.7-2.1: BGP support added for x510 and x550 series
Version 5.4.7-2.4: BGP support added for IE300 series

show ip bgp neighbors keepalive-interval (BGP only)

Overview Use this command to display the configured keepalive-interval value of the peer at the session establishment time with the neighbor.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show ip bgp neighbors <ipv4-addr> keepalive-interval`

Parameter	Description
<code><ipv4-addr></code>	The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.

Default The keepalive timer default is 60 seconds as per RFC 4271. Keepalive is holdtime / 3.

Mode User Exec and Privileged Exec

Examples `awplus# show ip bgp neighbors 10.11.4.26 keepalive-interval`

Related commands [neighbor timers](#)

show ip bgp neighbors notification (BGP only)

Overview Use this command to display the number of notification messages sent to the neighbor from the peer throughout the session.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show ip bgp neighbors <ipv4-addr> notification`

Parameter	Description
<code><ipv4-addr></code>	The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.

Mode User Exec and Privileged Exec

Example `awplus# show ip bgp neighbors 10.11.4.26 notification`

Command changes Added to AlliedWare Plus prior to 5.4.6-1
Version 5.4.7-2.1: BGP support added for x510 and x550 series
Version 5.4.7-2.4: BGP support added for IE300 series

show ip bgp neighbors open (BGP only)

Overview Use this command to display the number of open messages sent to the neighbor from the peer throughout the session.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show ip bgp neighbors <ipv4-addr> open`

Parameter	Description
<code><ipv4-addr></code>	The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.

Mode User Exec and Privileged Exec

Example `awplus# show ip bgp neighbors 10.11.4.26 open`

Command changes Added to AlliedWare Plus prior to 5.4.6-1
Version 5.4.7-2.1: BGP support added for x510 and x550 series
Version 5.4.7-2.4: BGP support added for IE300 series

show ip bgp neighbors rcvd-msgs (BGP only)

Overview Use this command to display the number of messages received by the neighbor from the peer throughout the session.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show ip bgp neighbors <ipv4-addr> rcvd-msgs`

Parameter	Description
<ipv4-addr>	The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.

Mode User Exec and Privileged Exec

Example `awplus# show ip bgp neighbors 10.11.4.26 rcvd-msgs`

Command changes Added to AlliedWare Plus prior to 5.4.6-1
Version 5.4.7-2.1: BGP support added for x510 and x550 series
Version 5.4.7-2.4: BGP support added for IE300 series

show ip bgp neighbors sent-msgs (BGP only)

Overview Use this command to display the number of messages sent to the neighbor from the peer throughout the session.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show ip bgp neighbors <ipv4-addr> sent-msgs`

Parameter	Description
<code><ipv4-addr></code>	The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.

Mode User Exec and Privileged Exec

Example `awplus# show ip bgp neighbors 10.11.4.26 sent-msgs`

Command changes Added to AlliedWare Plus prior to 5.4.6-1
Version 5.4.7-2.1: BGP support added for x510 and x550 series
Version 5.4.7-2.4: BGP support added for IE300 series

show ip bgp neighbors update (BGP only)

Overview Use this command to display the number of update messages sent to the neighbor from the peer throughout the session.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show ip bgp neighbors <ipv4-addr> update`

Parameter	Description
<ipv4-addr>	The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.

Mode User Exec and Privileged Exec

Example `awplus# show ip bgp neighbors 10.11.4.26 update`

Command changes Added to AlliedWare Plus prior to 5.4.6-1
Version 5.4.7-2.1: BGP support added for x510 and x550 series
Version 5.4.7-2.4: BGP support added for IE300 series

show ip bgp paths (BGP only)

Overview Use this command to display BGP4 path information within an IPv4 environment. Use the [show bgp ipv6 paths \(BGP4+ only\)](#) command to display BGP4+ path information within an IPv4 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show ip bgp paths`

Mode User Exec and Privileged Exec

Example `awplus# show ip bgp paths`

Related commands [show bgp ipv6 paths \(BGP4+ only\)](#)

Command changes Added to AlliedWare Plus prior to 5.4.6-1
Version 5.4.7-2.1: BGP support added for x510 and x550 series
Version 5.4.7-2.4: BGP support added for IE300 series

show ip bgp prefix-list (BGP only)

Overview Use this command to display routes matching the prefix-list within an IPv4 environment. Use the [show bgp ipv6 prefix-list \(BGP4+ only\)](#) command to display routes matching the prefix-list within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show ip bgp prefix-list <list>`

Syntax (VRF-lite) `show ip bgp [global|vrf <vrf-name>] prefix-list <list>`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
<list>	Specifies the name of the IP prefix list.

Mode User Exec and Privileged Exec

Examples `awplus# show ip bgp prefix-list mylist`
`awplus# show ip bgp vrf red prefix-list myPrefixes`

Related commands [show bgp ipv6 prefix-list \(BGP4+ only\)](#)

Command changes Added to AlliedWare Plus prior to 5.4.6-1
Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products
Version 5.4.7-2.1: BGP support added for x510 and x550 series
Version 5.4.7-2.4: BGP support added for IE300 series

show ip bgp quote-regexp (BGP only)

Overview Use this command to display routes matching the AS path regular expression within an IPv4 environment. Use the [show bgp ipv6 quote-regexp \(BGP4+ only\)](#) command to display routes matching the AS path regular expression within an IPv6 environment.

Note that you must use quotes to enclose the regular expression with this command. Use the regular expressions listed below with the *<expression>* parameter:

Symbol	Character	Meaning
^	Caret	Used to match the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match.
\$	Dollar sign	Used to match the end of the input string.
.	Period	Used to match a single character (white spaces included).
*	Asterisk	Used to match none or more sequences of a pattern.
+	Plus sign	Used to match one or more sequences of a pattern.
?	Question mark	Used to match none or one occurrence of a pattern.
_	Underscore	Used to match spaces, commas, braces, parenthesis, or the beginning and end of an input string.
[]	Brackets	Specifies a range of single-characters.
-	Hyphen	Separates the end points of a range.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show ip bgp quote-regexp <expression>`

Syntax (VRF-lite) `show ip bgp [global|vrf <vrf-name>] quote-regexp <expression>`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
<expression>	Specifies a regular-expression to match the BGP AS paths.

Mode User Exec and Privileged Exec

Examples `awplus# show ip bgp quote-regexp myexpression`
 `awplus# show ip bgp global quote-regexp 65550 65555`

Related commands [show bgp ipv6 quote-regexp \(BGP4+ only\)](#)

Command changes Added to AlliedWare Plus prior to 5.4.6-1
 Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

show ip bgp regexp (BGP only)

Overview Use this command to display routes matching the AS path regular expression within an IPv4 environment. Use the [show bgp ipv6 regexp \(BGP4+ only\)](#) command to display routes matching the AS path regular expression within an IPv6 environment.

Use the regular expressions listed below with the *<expression>* parameter:

Symbol	Character	Meaning
^	Caret	Used to match the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match.
\$	Dollar sign	Used to match the end of the input string.
.	Period	Used to match a single character (white spaces included).
*	Asterisk	Used to match none or more sequences of a pattern.
+	Plus sign	Used to match one or more sequences of a pattern.
?	Question mark	Used to match none or one occurrence of a pattern.
_	Underscore	Used to match spaces, commas, braces, parenthesis, or the beginning and end of an input string.
[]	Brackets	Specifies a range of single-characters.
-	Hyphen	Separates the end points of a range.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show ip bgp regexp <expression>`

Syntax (VRF-lite) `show ip bgp [global|vrf <vrf-name>] regexp <expression>`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
<expression>	Specifies a regular-expression to match the BGP AS paths.

Mode User Exec and Privileged Exec

Examples `awplus# show ip bgp regexp myexpression`
 `awplus# show ip bgp vrf red regexp 65550 65555`

Related commands `show bgp ipv6 regexp (BGP4+ only)`

Command changes Added to AlliedWare Plus prior to 5.4.6-1
 Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products
 Version 5.4.7-2.1: BGP support added for x510 and x550 series
 Version 5.4.7-2.4: BGP support added for IE300 series

show ip bgp route-map (BGP only)

Overview Use this command to display BGP routes that match the specified route-map within an IPv4 environment. Use the [show bgp ipv6 route-map \(BGP4+ only\)](#) command to display BGP4+ routes that match the specified route-map within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show ip bgp route-map <route-map>`

Syntax (VRF-lite) `show ip bgp [global|vrf <vrf-name>] route-map <route-map>`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
<route-map>	Specifies a route-map that is matched.

Mode User Exec and Privileged Exec

Examples To show routes that match the route-map `myRouteMap` for the global routing instance, use the command:

```
awplus# show ip bgp global route-map myRouteMap
```

To show routes that match the route-map `myRouteMap`, use the command:

```
awplus# show ip bgp route-map myRouteMap
```

Related commands [show bgp ipv6 route-map \(BGP4+ only\)](#)

show ip bgp scan (BGP only)

Overview Use this command to display BGP scan status.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show ip bgp scan`

Mode User Exec and Privileged Exec

Example `awplus# show ip bgp scan`

Output Figure 30-26: Example output from the **show ip bgp scan** command

```
BGP scan is running
BGP scan interval is 60
BGP instance : AS is 11,DEFAULT
Current BGP nexthop cache:
BGP connected route:
 10.10.10.0/24
 10.10.11.0/24
```

Command changes Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for x510 and x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

show ip bgp summary (BGP only)

Overview Use this command to display a summary of a BGP neighbor status within an IPv4 environment. Use the [show bgp ipv6 summary \(BGP4+ only\)](#) command to display a summary of BGP4+ neighbors.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show ip bgp summary`

Syntax (VRF-lite) `show ip bgp [global|vrf <vrf-name>] summary`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.

Mode User Exec and Privileged Exec

Examples `awplus# show ip bgp summary`
`awplus# show ip bgp vrf red summary`

Output Figure 30-27: Example output from the **show ip bgp summary** command

```
awplus>show ip bgp summary

BGP router identifier 1.0.0.1, local AS number 65541
BGP table version is 12
4 BGP AS-PATH entries
0 BGP community entries

Neighbor      V      AS      MsgRc  MsgSnt  TblVer  InOutQ  Up/Down      State/PfxRcd
192.168.3.2    4      65544    20      24      11  0/0    00:07:19      1
192.168.4.2    4      65545     0       0       0  0/0    never          Active
192.168.11.2   4      65542    34      40       0  0/0    00:00:04      Active
192.168.21.2   4      65543    29      32      11  0/0    00:07:03      13

Number of neighbors 4
```

The Up/Down column in this output is a timer that shows:

- "never" if the peer session has never been established
- The up time, if the peer session is currently up
- The down time, if the peer session is currently down.

In the example above, the session with 192.168.11.2 has been down for 4 seconds, and the session with 192.168.4.2 has never been established.

show ip community-list

Overview Use this command to display routes that match a specified community-list name or number.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show ip community-list [<listnumber>|<listname>]`

Parameter	Description
<listnumber>	Specifies the community list number in the range <1-199> as specified by a previously issued ip community-list command.
<listname>	Specifies the community list name as specified by a previously issued ip community-list command.

Mode User Exec and Privileged Exec

Examples `awplus# show ip community-list mylist`
`awplus# show ip community-list 99`

show ip prefix-list

Overview Use this command to display the IPv4 prefix-list entries.
Note that this command is valid for RIP and BGP routing protocols only.

Syntax `show ip prefix-list [<name>|detail|summary]`

Parameter	Description
<name>	Specify the name of a prefix list in this placeholder.
detail	Specify this parameter to show detailed output for all IPv4 prefix lists.
summary	Specify this parameter to show summary output for all IPv4 prefix lists.

Mode User Exec and Privileged Exec

Example `awplus# show ip prefix-list`
`awplus# show ip prefix-list 10.10.0.98/8`
`awplus# show ip prefix-list detail`

Related commands [ip prefix-list](#)

show ipv6 prefix-list

Overview Use this command to display the prefix-list entries.
Note that this command is valid for RIPv6 and BGP4+ routing protocols only.

Syntax `show ipv6 prefix-list [<name>|detail|summary]`

Parameter	Description
<name>	Specify the name of an individual IPv6 prefix list.
detail	Specify this parameter to show detailed output for all IPv6 prefix lists.
summary	Specify this parameter to show summary output for all IPv6 prefix lists.

Mode User Exec and Privileged Exec

Example `awplus# show ipv6 prefix-list`
`awplus# show ipv6 prefix-list 10.10.0.98/8`
`awplus# show ipv6 prefix-list detail`

Related commands [ipv6 prefix-list](#)

show ip protocols bgp (BGP only)

Overview Use this command to display BGP process parameters and statistics.
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show ip protocols bgp`

Mode User Exec and Privileged Exec

Example To display BGP process parameters and statistics, use the command:

```
awplus# show ip protocols bgp
```

Output Figure 30-28: Example output from the **show ip protocols bgp** command

```
Routing Protocol is "bgp 100"
  IGP synchronization is disabled
  Automatic route summarization is disabled
  Default local-preference applied to incoming route is 100
  Redistributing:
  Neighbor(s):
  Address AddressFamily FiltIn FiltOut DistIn DistOut RouteMapIn RouteMapOut
  Weight
  10.10.10.1                unicast

Version 5.4.7-2.1: BGP support added for x510 and x550 series
Version 5.4.7-2.4: BGP support added for IE300 series

show route-map

Overview Use this command to display information about one or all route maps.

Syntax `show route-map <map-name>`

Parameter	Description
<code><map-name></code>	A name to identify the route map.

Mode User Exec and Privileged Exec

Example To display information about the route-map named `example-map`, use the command:

```
awplus# show route-map example-map
```

Output Figure 30-29: Example output from the **show route-map** command

```
route-map example-map, permit, sequence 1
  Match clauses:
    ip address prefix-list example-pref
  Set clauses:
    metric 100
route-map example-map, permit, sequence 200
  Match clauses:
  Set clauses:
```

Related commands [route-map](#)

synchronization

Overview Use this command in Router Configuration mode or in Address Family Configuration mode to ensure BGP does not advertise router learned from iBGP peers until they are learned locally, or are propagated throughout the AS via an IGP.

Use the **no** variant of this command to disable this function.

Syntax `synchronization`
`no synchronization`

Default Disabled.

Mode Router Configuration and Address Family Configuration mode

Usage notes Synchronization is used when a BGP router should not advertise routes learned from iBGP neighbors, unless those routes are also present in an IGP (for example, OSPF). These routes must be in the RIB (Routing Information Base) learned locally or via an IGP.

Synchronization may be enabled when all the routers in an autonomous system do not speak BGP, and the autonomous system is a transit for other autonomous systems.

Use the **no synchronization** command when BGP router can advertise routes learned from iBGP neighbors, without waiting for IGP reachability, when routes are in the RIB.

Example The following example enables IGP synchronization of iBGP routes in Router Configuration mode:

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# synchronization
```

The following example enables IGP synchronization of iBGP routes in IPv4 unicast Address Family Configuration mode:

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config)# address-family ipv4 unicast
awplus(config-af)# synchronization
```

The following example enables IGP synchronization of iBGP routes in the IPv6 unicast Address Family Configuration mode:

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config)# address-family ipv6 unicast
awplus(config-af)# synchronization
```

**Command
changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for x510 and x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

timers (BGP)

Overview Use this command sets the BGP keepalive timer and holdtime timer values.
Use the **no** variant of this command to reset timers to the default.

Syntax `timers bgp <keepalive> <holdtime>`
`no timers bgp [<keepalive> <holdtime>]`

Parameter	Description
<code><keepalive></code>	<code><0-65535></code> The frequency with which the keepalive messages are sent to the neighbors. The default is 30 seconds as per RFC 4271. Cisco IOS uses a 60 second keepalive timer default value. Adjust keepalive timers for interoperability as required. Maintain the keepalive value at the holdtime value / 3.
<code><holdtime></code>	<code><0-65535></code> The interval after which the neighbor is considered dead if keepalive messages are not received. The default holdtime value is 90 seconds as per RFC 4271. Cisco IOS uses a 180 second holdtime timer default value. Adjust holdtime timers for interoperability as required. Maintain the holdtime value at the keepalive value * 3.

Default The keepalive timer default is 60 seconds, the holdtime timer default is 90 seconds, and the connect timer default is 120 seconds as per RFC 4271. Holdtime is keepalive * 3.

Mode Router Configuration

Usage notes This command is used globally to set or unset the keepalive and holdtime values for all the neighbors.

Examples

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# timers bgp 40 120
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no timers bgp 30 90
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no timers bgp
```

undebg bgp (BGP only)

Overview Use this command to disable BGP debugging functions.

Syntax undebg bgp
[all|dampening|events|filters|fsm|keepalives|nht|nsm|updates]
undebg all bgp

Parameter	Description
all	Disable all debugging for BGP.
dampening	Disable debugging for BGP dampening.
events	Disable debugging for BGP events.
filters	Disable debugging for BGP filters.
fsm	Disable debugging for BGP Finite State Machine (FSM).
keepalives	Disable debugging for BGP keepalives.
nht	Disable debugging for BGP NHT (Next Hop Tracking) messages.
nsm	Disable debugging for NSM messages.
updates	Disable debugging for BGP updates.

Mode Privileged Exec and Global Configuration

Route Map Commands

Introduction

Overview This chapter provides an alphabetical reference for route map commands. For more information, see the [Routemaps Feature Overview and Configuration Guide](#). These commands can be divided into the following categories:

- the [route-map](#) command, which is used to create a route map and/or route map entry, and to put you into route map mode
- **match** commands, used to determine which routes or BGP update messages the route map applies to
- **set** commands, used to modify matching routes or BGP update messages

- Command List**
- ["match as-path"](#) on page 1734
 - ["match community"](#) on page 1736
 - ["match interface"](#) on page 1738
 - ["match ip address"](#) on page 1739
 - ["match ip next-hop"](#) on page 1741
 - ["match ipv6 address"](#) on page 1743
 - ["match ipv6 next-hop"](#) on page 1745
 - ["match metric"](#) on page 1746
 - ["match origin"](#) on page 1747
 - ["match route-type"](#) on page 1749
 - ["match tag"](#) on page 1750
 - ["route-map"](#) on page 1751
 - ["set aggregator"](#) on page 1754
 - ["set as-path"](#) on page 1755
 - ["set atomic-aggregate"](#) on page 1756

- [“set comm-list delete”](#) on page 1757
- [“set community”](#) on page 1758
- [“set dampening”](#) on page 1760
- [“set extcommunity”](#) on page 1762
- [“set ip next-hop \(route map\)”](#) on page 1764
- [“set ipv6 next-hop”](#) on page 1765
- [“set local-preference”](#) on page 1766
- [“set metric”](#) on page 1767
- [“set metric-type”](#) on page 1769
- [“set origin”](#) on page 1770
- [“set originator-id”](#) on page 1771
- [“set tag”](#) on page 1772
- [“set weight”](#) on page 1773
- [“show route-map”](#) on page 1774

match as-path

Overview Use this command to add an autonomous system (AS) path match clause to a route map entry. Specify the AS path attribute value or values to match by specifying the name of an AS path access list. To create the AS path access list, enter Global Configuration mode and use the [ip as-path access-list](#) command.

A BGP update message matches the route map if its attributes include AS path values that match the AS path access list.

Each entry of a route map can only match against one AS path access list in one AS path match clause. If the route map entry already has an AS path match clause, entering this command replaces that match clause with the new clause.

Note that AS path access lists and route map entries both specify an action of deny or permit. The action in the AS path access list determines whether the route map checks update messages for a given AS path value. The route map action and its **set** clauses determine what the route map does with update messages that contain that AS path value.

Use the **no** variant of this command to remove the AS path match clause from a route map entry.

Syntax `match as-path <as-path-listname>`
`no match as-path [<as-path-listname>]`

Parameter	Description
<code><as-path-listname></code>	Specifies an AS path access list name.

Mode Route-map Configuration

Usage notes This command is valid for BGP update messages only.

Example To add entry 34 to the route map called `myroute`, which will discard update messages if they contain the AS path values that are included in `myaccesslist`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute deny 34
awplus(config-route-map)# match as-path myaccesslist
```

Related commands [ip as-path access-list](#)
[route-map](#)
[set as-path](#)
[show route-map](#)

Command changes Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for x510 and x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

match community

Overview Use this command to add a community match clause to a route map entry. Specify the community value or values to match by specifying a community list. To create the community list, enter Global Configuration mode and use the [ip community-list](#) command.

A BGP update message matches the route map if its attributes include community values that match the community list.

Each entry of a route map can only match against one community list in one community match clause. If the route map entry already has a community match clause, entering this command replaces that match clause with the new clause.

Note that community lists and route map entries both specify an action of deny or permit. The action in the community list determines whether the route map checks update messages for a given community value. The route map action and its **set** clauses determine what the route map does with update messages that contain that community value.

Use the **no** variant of this command to remove the community match clause from a route map.

Syntax

```
match community  
{<community-listname>|<1-99>|<100-199>} [exact-match]  
  
no match community  
[<community-listname>|<1-99>|<100-199>|exact-match]
```

Parameter	Description
<community-listname>	The community list name or number.
<1-99>	Community list number (standard range).
<100-199>	Community list number (expanded range).
exact-match	Exact matching of communities.

Mode Route-map Configuration

Usage notes This command is valid for BGP update messages only.

Communities are used to group and filter routes. They are designed to provide the ability to apply policies to large numbers of routes by using match and set commands. Community lists are used to identify and filter routes by their common attributes.

Example To add entry 3 to the route map called `myroute`, which will process update messages if they contain the community values that are included in `mylist`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# match community mylist
```

Related commands

- `ip community-list`
- `route-map`
- `set comm-list delete`
- `set community`
- `show route-map`

Command changes

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.7-2.1: BGP support added for x510 and x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

match interface

Overview Use this command to add an interface match clause to a route map entry. Specify the interface name to match.

A route matches the route map if its interface matches the interface name.

Each entry of a route map can only match against one interface in one interface match clause. If the route map entry already has an interface match clause, entering this command replaces that match clause with the new clause.

Use the **no** variant of this command to remove the interface match clause from the route map entry. Use the **no** variant of this command without a specified interface to remove all interfaces.

Syntax `match interface <interface>`
`no match interface [<interface>]`

Parameter	Description
<code><interface></code>	The interface to match.

Mode Route-map Configuration

Usage This command is valid for RIP and OSPF routes only.

Example To add entry 10 to the route map called 'mymap1', which will process routes if they use the interface vlan1, use the commands:

```
awplus# configure terminal
awplus(config)# route-map mymap1 permit 10
awplus(config-route-map)# match interface vlan1
```

To remove all interfaces from the route map called 'mymap1', use the commands:

```
awplus# configure terminal
awplus(config)# route-map mymap1 permit 10
awplus(config-route-map)# no match interface
```

Related commands

- [match ip address](#)
- [match ip next-hop](#)
- [match route-type](#)
- [match tag](#)
- [route-map](#)
- [show route-map](#)

match ip address

Overview Use this command to add an IP address prefix match clause to a route map entry. You can specify the prefix or prefixes to match by either:

- specifying the name of an access list. To create the access list, enter Global Configuration mode and use the **access-list** command.
- specifying the name of a prefix list. To create the prefix list, enter Global Configuration mode and use the **ip prefix-list** command.

A route matches the route map entry if the route's prefix matches the access list or prefix list.

Use the **no** variant of this command to remove the IP address match clause from a route map entry. To remove a prefix list-based match clause you must also specify the **prefix-list** parameter.

Syntax

```
match ip address <access-list-id>
match ip address prefix-list <prefix-listname>
no match ip address
no match ip address <access-list-id>
no match ip address prefix-list <prefix-listname>
```

Parameter	Description
<access-list-id>	Use an ACL to specify which prefixes to match.
	<access-list-name> The IP access list name.
	<1-199> The IP access list number.
	<1300-2699> The IP access list number (expanded range).
prefix-list	Use an IP prefix list to specify which prefixes to match.
	<prefix-listname> The prefix list name.

Mode Route-map Configuration

Usage notes Each entry of a route map can have at most one access list-based IP address match clause and one prefix list-based IP address match clause. If the route map entry already has one of these match clauses, entering this command replaces that match clause with the new clause.

Note that access lists, prefix lists and route map entries all specify an action of deny or permit. The action in the access list or prefix list determines whether the route map checks update messages and routes for a given prefix. The action in the route map, and the map's **set** clauses, determine what the device does with update messages or routes that contain that prefix.

If the **match ip address** command results in a match against the specified IP address, then the outcome is:

- If **permit** is specified, then the route is redistributed or controlled, as specified by the set action.
- If **deny** is specified, then the route is not redistributed or controlled.

If the match criteria are not met, the route is neither accepted nor forwarded, irrespective of **permit** or **deny** specifications.

This command is valid for:

- OSPF routes
- routes in BGP update messages
- RIP routes.

Examples To add entry 3 to the route map called 'myroute', which will process routes that match the ACL called 'List1', use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# match ip address List1
```

To add entry 3 to the route map called 'rmap1', which will process routes that match the prefix list called 'mylist', use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# match ip address prefix-list mylist
```

**Related
commands**

[show route-map](#)

match ip next-hop

Overview Use this command to add a next-hop match clause to a route map entry. You can specify the next hop to match by either:

- specifying the name of an access list. To create the access list, enter Global Configuration mode and use the **access-list** command.
- specifying the name of a prefix list. To create the prefix list, enter Global Configuration mode and use the **ip prefix-list** command.

A route matches the route map if the route's next hop matches the access list or prefix list.

Each entry of a route map can have at most one access list-based next-hop match clause and one prefix list-based next-hop match clause. If the route map entry already has one of these match clauses, entering this command replaces that match clause with the new clause.

Note that the lists and route map entries specify an action of deny or permit. The action in the list determines whether the route map checks update messages and routes for a given next-hop value. The route map action and its **set** clauses determine what the route map does with update messages and routes that contain that next hop.

Use the **no** variant of this command to remove the next-hop match clause from a route map entry. To remove a prefix list-based match clause you must also specify the prefix-list parameter.

Syntax `match ip next-hop <access-list-id>`
`match ip next-hop prefix-list <prefix-listname>`
`no match ip next-hop [<access-list-id>]`
`no match ip next-hop prefix-list [<prefix-listname>]`

Parameter	Description
<access-list-id>	Use an ACL to specify which next hops to match.
	<access-list-name> The IP access list name.
	<1-199> The IP access list number.
	<1300-2699> The IP access list number (expanded range).
prefix-list	Use an IP prefix list to specify which next hops to match.
	<prefix-listname> The prefix list name.

Mode Route-map Configuration

Usage notes This command is valid for:

- OSPF routes

- routes in BGP update messages
- RIP routes.

Examples To add entry 3 to the route map called 'rmap1', which will process routes whose next hop matches the ACL called 'mylist', use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# match ip next-hop mylist
```

To add entry 3 to the route map called 'mymap', which will process routes whose next hop matches the prefix list called 'list1', use the commands:

```
awplus# configure terminal
awplus(config)# route-map mymap permit 3
awplus(config-route-map)# match ip next-hop prefix-list list1
```

Related commands [access-list \(extended numbered\)](#)

match ipv6 address

Overview Use this command to add an IPv6 address prefix match clause to a route map entry. You can specify the prefix or prefixes to match by either:

- specifying the name of an access list. To create the access list, enter Global Configuration mode and use the **access-list** command.
- specifying the name of a prefix list. To create the prefix list, enter Global Configuration mode and use the **ipv6 prefix-list** command.

A route matches the route map entry if the route's prefix matches the access list or prefix list.

Use the **no** variant of this command to remove the IPv6 address match clause from a route map entry.

Syntax

```
match ipv6 address <access-list-id>
match ipv6 address prefix-list <prefix-listname>
no match ipv6 address
no match ipv6 address <access-list-id>
no match ipv6 address prefix-list <prefix-listname>
```

Parameter	Description
<access-list-id>	{<access-list-name> <1-199> <1300-2699>} The IP access list name or number.
<access-list-name>	The IP access list name.
<1-199>	The IP access list number.
<1300-2699>	The IP access list number (expanded range).
prefix-list	Use an IP prefix list to specify which prefixes to match.
<prefix-listname>	The prefix list name.

Mode Route-map Configuration

Usage notes Each entry of a route map can have at most one access list-based IPv6 address match clause and one prefix list-based IPv6 address match clause. If the route map entry already has one of these match clauses, entering this command replaces that match clause with the new clause.

Note that access lists, prefix lists and route map entries all specify an action of deny or permit. The action in the access list or prefix list determines whether the route map checks update messages and routes for a given prefix. The action in the route map, and the map's **set** clauses, determine what the device does with update messages or routes that contain that prefix.

If the **match ipv6 address** command results in a match against the specified IPv6 address, then the outcome is:

- If **permit** is specified, then the route is redistributed or controlled, as specified by the set action.
- If **deny** is specified, then the route is not redistributed or controlled.

If the match criteria are not met, the route is neither accepted nor forwarded, irrespective of **permit** or **deny** specifications.

This command is valid for:

- OSPF routes
- routes in BGP update messages
- RIP routes.

Examples To avoid processing the routes specified by the ACL named "acl1", use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 deny 1
awplus(config-route-map)# match ipv6 address acl1
```

To match traffic according to the prefix list named "mylist", use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# match ipv6 address prefix-list mylist
```

match ipv6 next-hop

Overview Use this command to specify a next-hop address to be matched by the route-map. Use the **no** variant of this command to disable this function.

Syntax

```
match ipv6 next-hop <access-list-name>
match ipv6 next-hop <ipv6-addr>
match ipv6 next-hop prefix-list <prefix-listname>
no match ipv6 next-hop [<access-list-name>]
match ipv6 next-hop [<ipv6-addr>]
match ipv6 next-hop [prefix-list <prefix-listname>]
```

Parameter	Description
<access-list-name>	The name of the IPv6 access list that specifies criteria for the addresses to match.
<ipv6-addr>	The IPv6 address of the next hop. The IPv6 address uses the format X:X::X:X.
<prefix-listname>	The name of the IPv6 prefix list that specifies criteria for the addresses to be matched.

Mode Route-map Configuration

Usage notes The **match ipv6 next-hop** command specifies the next-hop address to be matched. If there is a match for the specified next-hop address, and permit is specified, the route is redistributed or controlled as specified by the set action. If the match criteria are met, and deny is specified, the route is not redistributed or controlled. If the match criteria are not met, the route is neither accepted nor forwarded, irrespective of permit or deny specifications.

NOTE: This command is valid only for BGP.

Example

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# match ipv6 next-hop 2001:0db8::/32
```

match metric

Overview Use this command to add a metric match clause to a route map entry. Specify the metric value to match.

A route matches the route map if its metric matches the route map's metric.

A BGP update message matches the route map if its MED attribute value matches the route map's metric.

Each entry of a route map can only match against one metric value in one metric match clause. If the route map entry already has a metric match clause, entering this command replaces that match clause with the new clause.

Use the **no** variant of this command to remove the metric match clause from the route map entry.

Syntax `match metric <metric>`
`no match metric [<metric>]`

Parameter	Description
<metric>	<0-4294967295> Specifies the metric value.

Mode Route-map Configuration

Usage notes This command is valid for:

- OSPF routes
- routes in BGP update messages
- RIP routes.

Example To stop entry 3 of the route map called "myroute" from processing routes with a metric of 888999, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# no match metric 888999
```

Related commands [route-map](#)
[set metric](#)
[show route-map](#)

match origin

Overview Use this command to add an origin match clause to a route map entry. Specify the origin attribute value to match.

A BGP update message matches the route map if its origin attribute value matches the route map's origin value.

Each entry of a route map can only match against one origin in one origin match clause. If the route map entry already has an origin match clause, entering this command replaces that match clause with the new clause.

Use the **no** variant of this command to remove the origin match clause from the route map entry.

Syntax `match origin {egp|igp|incomplete}`
`no match origin [egp|igp|incomplete]`

Parameter	Description
egp	Learned from an exterior gateway protocol.
igp	Learned from a local interior gateway protocol.
incomplete	Of unknown heritage, for example a static route.

Mode Route-map Configuration

Usage The origin attribute defines the origin of the path information. The **egp** parameter is indicated as an **e** in the routing table, and it indicates that the origin of the information is learned via Exterior Gateway Protocol. The **igp** parameter is indicated as an **i** in the routing table, and it indicates the origin of the path information is interior to the originating AS. The **incomplete** parameter is indicated as a **?** in the routing table, and indicates that the origin of the path information is unknown or learned through other means. If a static route is redistributed into BGP, the origin of the route is incomplete.

The **match origin** command specifies the origin to be matched. If there is a match for the specified origin, and **permit** is specified, the route is redistributed or controlled as specified by the set action. If the match criteria are met, and **deny** is specified, the route is not redistributed or controlled. If the match criteria are not met, the route is neither accepted nor forwarded, irrespective of **permit** or **deny** specifications.

This command is valid for BGP update messages only.

Example To add entry 34 to the route map called "rmap1", which will drop externally-originated routes, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute deny 34
awplus(config-route-map)# match origin egp
```

**Related
commands** route-map
 set origin
 show route-map

match route-type

Overview Use this command to add an external route-type match clause to a route map entry. Specify whether to match OSPF type-1 external routes or OSPF type-2 external routes.

An OSPF route matches the route map if its route type matches the route map's route type.

Each entry of a route map can only match against one route type in one match clause. If the route map entry already has a route type match clause, entering this command replaces that match clause with the new clause.

Use the **no** variant of this command to remove the route type match clause from the route map entry.

Syntax `match route-type external {type-1|type-2}`
`no match route-type external [type-1|type-2]`

Parameter	Description
type-1	OSPF type-1 external routes.
type-2	OSPF type-2 external routes.

Mode Route-map Configuration

Usage Use the **match route-type external** command to match specific external route types. AS- external LSA is either Type-1 or Type-2. **external type-1** matches only Type 1 external routes, and **external type-2** matches only Type 2 external routes. This command is valid for OSPF routes only.

Example To add entry 10 to the route map called `mymap1`, which will process type-1 external routes, use the commands:

```
awplus# configure terminal
awplus(config)# route-map mymap1 permit 10
awplus(config-route-map)# match route-type external type-1
```

- [route-map](#)
- [set metric-type](#)
- [show route-map](#)

match tag

Overview Use this command to add a tag match clause to a route map entry. Specify the route tag value to match.

An OSPF route matches the route map if it has been tagged with the route map's tag value. Routes can be tagged through OSPF commands or through another route map's set clause.

Each entry of a route map can only match against one tag in one match clause. If the route map entry already has a tag match clause, entering this command replaces that match clause with the new clause.

Use the **no** variant of this command to remove the tag match clause from the route map entry.

Syntax `match tag <0-4294967295>`
`no match tag [<0-4294967295>]`

Mode Route-map Configuration

Usage This command is valid for OSPF routes only.

Example To add entry 10 to the route map called `mymap1`, which will process routes that are tagged 100, use the following commands:

```
awplus# configure terminal
awplus(config)# route-map mymap1 permit 10
awplus(config-route-map)# match tag 100
```

route-map

Overview Use this command to configure a route map entry, and to specify whether the device will process or discard matching routes and BGP update messages.

The device uses a name to identify the route map, and a sequence number to identify each entry in the route map.

The **route-map** command puts you into route-map configuration mode. In this mode, you can use the following:

- one or more of the **match** commands to create match clauses. These specify what routes or update messages match the entry.
- one or more of the **set** commands to create set clauses. These change the attributes of matching routes or update messages.

Use the **no** variant of this command to delete a route map or to delete an entry from a route map.

Syntax `route-map <mapname> {deny|permit} <seq>`
`no route-map <mapname>`
`no route-map <mapname> {deny|permit} <seq>`

Parameter	Description
<mapname>	A name to identify the route map.
deny	The route map causes a routing process to discard matching routes or BGP update messages.
permit	The route map causes a routing process to use matching routes or BGP update messages.
<seq>	<1-65535> The sequence number of the entry. You can use this parameter to control the order of entries in this route map.

Mode Global Configuration

Usage notes Route maps allow you to control and modify routing information by filtering routes and setting route attributes. You can apply route maps when the device:

- processes BGP update messages that it has received from a peer
- prepares BGP update messages to send to peers
- redistributes routes from one routing protocol into another
- redistributes static routes into routing protocols
- uses BGP route flap dampening

When a routing protocol passes a route or update message through a route map, it checks the entries in order of their sequence numbers, starting with the lowest numbered entry.

If it finds a match on a route map with an action of permit, then it applies any set clauses and accepts the route. Having found a match, the route is not compared against any further entries of the route map.

If it finds a match on a route map with an action of deny, it will discard the matching route.

If it does not find a match, it discards the route or update message. This means that route maps end with an implicit deny entry. To permit all non-matching routes or update messages, end your route map with an entry that has an action of **permit** and no match clause.

Examples To enter route-map mode for entry 1 of the route map called "route1", and then add a match and set clause to it, use the commands:

```
awplus# configure terminal
awplus(config)# route-map route1 permit 1
awplus(config-route-map)# match as-path 60
awplus(config-route-map)# set weight 70
```

To enter route-map mode for entry 2 of the route map called "route1", and then add a match and set clause to it, use the commands:

```
awplus# configure terminal
awplus(config)# route-map route1 permit 2
awplus(config-route-map)# match interface vlan2
awplus(config-route-map)# set metric 20
```

Note how the prompt changes when you go into route map configuration mode.

To make the device process non-matching routes instead of discarding them, add a command like the following one:

```
awplus(config)# route-map route1 permit 100
```

set aggregator

Overview Use this command to add an aggregator set clause to a route map entry.

When a BGP update message matches the route map entry, the device sets the update's aggregator attribute. The aggregator attribute specifies the AS and IP address of the device that performed the aggregation.

Use the **no** variant of this command to remove the set clause.

Syntax `set aggregator as <asnum> <ip-address>`
`no set aggregator as`

Parameter	Description
<asnum>	The AS number of the aggregator.
<ip-address>	The IP address of the aggregator.

Mode Route-map Configuration

Usage An Autonomous System (AS) is a collection of networks under a common administration sharing a common routing strategy. It is subdivided by areas, and is assigned a unique 16-bit number. Use the **set aggregator** command to assign an AS number for the aggregator.

This command is valid for BGP update messages only.

Example To use entry 3 of the route map called `myroute` to set the aggregator attribute to 43 10.10.0.3 in matching update messages, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# set aggregator as 43 10.10.0.3
```

To remove all aggregator attributes for entry 3 of the route map called `myroute`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# no set aggregator as
```

Related commands [route-map](#)
[show route-map](#)

set as-path

- Overview** Use this command to add an AS path set clause to a route map entry.
- When a BGP update message matches the route map entry, the device prepends the specified Autonomous System Number (ASN) or ASNs to the update's AS path attribute.
- The AS path attribute is a list of the autonomous systems through which the announcement for the prefix has passed. As prefixes pass between autonomous systems, each autonomous system adds its ASN to the beginning of the list. This means that the AS path attribute can be used to make routing decisions.
- Use the **no** variant of this command to remove the set clause.

Syntax `set as-path prepend <1-65535> [<1-65535>]...`
`no set as-path prepend [<1-65535> [<1-65535>]...]`

Parameter	Description
<code>prepend</code>	Prepends the autonomous system path.
<code><1-65535></code>	The number to prepend to the AS path. If you specify multiple ASNs, separate them with spaces.

Mode Route-map mode

Usage notes Use the **set as-path** command to specify an autonomous system path. By specifying the length of the AS-Path, the device influences the best path selection by a neighbor. Use the `prepend` parameter with this command to prepend an AS path string to routes increasing the AS path length.

This command is valid for BGP update messages only.

Example To use entry 3 of the route map called `myroute` to prepend ASN 8 and 24 to the AS path of matching update messages, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# set as-path prepend 8 24
```

Version 5.4.7-2.4: BGP support added for IE300 series

set atomic-aggregate

Overview Use this command to add an atomic aggregate set clause to a route map entry.

When a BGP update message matches the route map entry, the device adds the atomic aggregate attribute to the update.

Use the **no** variant of this command to remove the set clause.

Syntax `set atomic-aggregate`
`no set atomic-aggregate`

Mode Route-map Configuration

Usage This command is valid for BGP update messages only.

Example To use entry 3 of the route map called `rmap1` to add the atomic aggregator attribute to matching update messages, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set atomic-aggregate
```

Related commands [route-map](#)

set comm-list delete

Overview Use this command to delete one or more communities from the community attribute of a BGP update message. Specify the communities to delete by specifying a community list. To create the community list, enter Global Configuration mode and use the [ip community-list](#) command.

When a BGP update message matches the route map entry, the device deletes the specified communities from the update's community attribute.

Use the **no** variant of this command to stop deleting the communities.

Syntax `set comm-list {<1-199>|<100-199>|<word>} delete`
`no set comm-list {<1-199>|<100-199>|<word>} delete`

Parameter	Description
<1-99>	Standard community-list number.
<100-199>	Expanded community-list number.
<word>	Name of the Community-list.

Mode Route-map Configuration

Usage This command is valid for BGP update messages only.

Example To use entry 3 of the route map called `myroute` to delete the communities in community list 34 from matching update messages, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# set comm-list 34 delete
```

Related commands [ip community-list](#)
[match community](#)
[route-map](#)
[set community](#)
[show route-map](#)

set community

Overview Use this command to add a community set clause to a route map entry.

When a BGP update message matches the route map entry, the device takes one of the following actions:

- changes the update's community attribute to the specified value or values, or
- adds the specified community value or values to the update's community attribute, if you specify the **additive** parameter after specifying another parameter. or
- removes the community attribute from the update, if you specify the **none** parameter

Use the **no** variant of this command to remove the set clause.

Syntax

```
set community {[<1-65535>][AA:NN] [internet] [local-AS]
[no-advertise] [no-export] [additive]}

no set community {[AA:NN] [internet] [local-AS] [no-advertise]
[no-export] [additive]}

set community none

no set community none
```

Parameter	Description
<1-65535>	The AS number of the community as an integer not in AA:NN format.
AA:NN	The Autonomous System (AS) number of the community, in AA:NN format. AS numbers are assigned to the regional registries by the IANA (www.iana.org) and can be obtained from the registry in your region. AA and NN are both integers from 1 to 65535. AA is the AS number; NN is a value chosen by the ASN administrator.
local-AS	The community of routes that must not be advertised to external BGP peers (this includes peers in other members' Autonomous Systems inside a BGP confederation).
internet	The community of routes that can be advertised to all BGP peers.
no-advertise	The community of routes that must not be advertised to other BGP peers.
no-export	The community of routes that must not be advertised outside a BGP confederation boundary (a standalone Autonomous System that is not part of a confederation should be considered a confederation itself).

Parameter	Description
none	The device removes the community attribute from matching update messages.
additive	The device adds the specified community value to the update message's community attribute, instead of replacing the existing attribute. By default this parameter is not included, so the device replaces the existing attribute.

Mode Route-map Configuration

Usage notes This command is valid for BGP update messages only.

Examples To use entry 3 of the route map called `rmap1` to put matching routes into the no-advertise community, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set community no-advertise
```

To use entry 3 of the route map called `rmap1` to put matching routes into several communities, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set community 10:01 23:34 12:14
no-export
```

To use entry 3 of the route map called `rmap1` to put matching routes into a single AS community numbered 16384, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set community 16384 no-export
```

Related commands

Command changes

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.7-2.1: BGP support added for x510 and x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

set dampening

Overview Use this command to add a route flap dampening set clause to a route map entry.

Also use the route map by specifying it in the command [bgp dampening route-map](#).

When a route matches the route map entry, the device enables route flap dampening for that route. If the set clause includes dampening parameter values, the device uses those values when dampening the matching route.

Use the **no** variant of this command to remove the set clause. This disables dampening on matching routes.

Syntax

```
set dampening
set dampening [<reachtime>]
set dampening <reachtime> [<reuse> <suppress> <maxsuppress>]
[<unreachtime>]
no set dampening
no set dampening [<reachtime>]
no set dampening <reachtime> [<reuse> <suppress> <maxsuppress>]
[<unreachtime>]
```

Parameter	Description
<reachtime>	<1-45> The time it takes, in minutes, for the route's instability penalty to halve if the route remains stable. The instability penalty is called the Figure of Merit (FoM). For example, if reachtime is 15, the FoM of a stable route halves over a 15 minute period, quarters over a 30 minute period, and so on. The default is 15 minutes.
<reuse>	<1-20000> The value that the instability penalty (FoM) must reach for the device to use a suppressed route again. Once a route is suppressed, it remains suppressed until its FoM falls below this threshold. Reuse must not exceed suppress. The default is 750.
<suppress>	<1-20000> The instability penalty (FoM) at which the route is suppressed. Suppress must be greater than or equal to reuse. If suppress is less than 1000, a route is suppressed when it becomes unreachable for the first time. The default is 2000.

Parameter	Description
<code><maxsuppress></code>	<code><1-255></code> A number that is multiplied by reachtime to give the maximum time in minutes for which a suppressed route must remain stable in order to become unsuppressed. The lowest maxsuppress value of 1 gives a maximum suppression time of 1 x reachtime, and the highest maxsuppress value of 255 gives a maximum suppression time of 255 x reachtime. For example, if reachtime is 15 and maxsuppress is 4, the route is unsuppressed after 60 minutes of stability even if its FoM still exceeds reuse. The default is 4.
<code><unreachtime></code>	<code><1-45></code> The time it takes, in minutes, for the route's instability penalty to halve if the route remains unstable. The default is 15 minutes.

Mode Route-map Configuration

Usage The **suppress** value must be greater than or equal to the **reuse** value.
Set the unreachability half-life time to be equal to, or greater than, reachability half-life time. The suppress-limit value must be greater than or equal to the reuse limit value.
This command is valid for BGP routes only.

Example To use entry 24 of the route map called R1 to enable dampening of matching routes and set the dampening parameters, use the commands:

```
configure terminal
route-map R1 permit 24
set dampening 20 333 534 30
```

Related commands

set extcommunity

Overview Use this command to add an extended community set clause to a route map entry. A route map entry can have a route target extended community set clause, a site-of-origin extended community set clause, or both.

When a BGP update message matches the route map entry, the device sets the update's extended community attribute to the specified value or values.

Use the **no** variant of this command to remove the set clause.

Syntax `set extcommunity {rt|soo} <extcomm-number>`
`no set extcommunity {rt|soo} [<extcomm-number>]`

Parameter	Description
rt	Configure a route target extended community. This consists of routers that will receive matching routes.
soo	Configure a site-of-origin extended community. This consists of routers that will inject matching routes into BGP.
<extcomm-number>	The extended community number, in the format AA:NN or IPADD:N.

Mode Route-map Configuration

Usage notes This command is valid for BGP update messages only.

Examples To use entry 3 of the route map called `rmap1` to set the route target extended community attribute to 06:01, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set extcommunity rt 06:01
```

To instead specify the extended community number in dotted decimal notation, use the command:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set extcommunity rt 0.0.0.6:01
```

To use entry 3 of the route map called `rmap1` to set the site-of-origin extended community attribute to 06:01, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set extcommunity soo 06:01
```

To instead specify the extended community number in dotted decimal notation, use the command:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set extcommunity soo 0.0.0.6:01
```

**Related
commands**

[match community](#)
[route-map](#)
[set comm-list delete](#)
[set community](#)
[show route-map](#)

set ip next-hop (route map)

Overview Use this command to add a next-hop set clause to a route map entry.

When a route or BGP update message matches the route map entry, the device sets the route's next hop to the specified IP address.

Use the **no** variant of this command to remove the set clause.

Syntax `set ip next-hop <ip-address>`
`no set ip next-hop [<ip-address>]`

Parameter	Description
<code><ip-address></code>	The IP address of the next hop, entered in the form A.B.C.D.

Mode Route-map Configuration

Usage notes Use this command to set the next-hop IP address to the routes.

This command is valid for:

- OSPF routes
- routes in BGP update messages
- RIP routes.

Example To use entry 3 of the route map called `mymap` to give matching routes a next hop of 10.10.0.67, use the commands:

```
awplus# configure terminal
awplus(config)# route-map mymap permit 3
awplus(config-route-map)# set ip next-hop 10.10.0.67
```

Related commands [match ip next-hop](#)
[route-map](#)
[show route-map](#)

set ipv6 next-hop

Overview Use this command to set a next hop-address.

Use the **no** variant of this command to delete an entry.

Syntax `set ipv6 next-hop {<ipv6-addr-global>|local <ipv6-addr>}`
`no set ipv6 next-hop [<ipv6-addr-global>|local [<ipv6-addr>]]`

Parameter	Description
<ipv6-addr-global>	The IPv6 global address of next hop. The IPv6 address uses the format X:X::X:X.
local	Specifies that the address is local.
<ipv6-addr>	The IPv6 local address of next hop. The IPv6 address uses the format X:X::X:X.

Mode Route-map Configuration

Usage notes Use this command to set the next-hop IPv6 address to the routes.
This command is valid only for BGP.

Examples `awplus# configure terminal`
`awplus(config)# route-map rmap1 permit 3`
`awplus(config-route-map)# set ipv6 next-hop local`
`fe80::203:47ff:fe97:66dc`
`awplus(config-route-map)# no set ipv6 next-hop`

set local-preference

Overview This command changes the default local preference value.

The local preference indicates the BGP local preference path attribute when there are multiple paths to the same destination. The path with the higher preference is chosen.

Use this command to define the preference of a particular path. The preference is sent to all routers and access servers in the local autonomous system.

The **no** variant of this command reverts to the default setting.

Syntax `set local-preference <pref-value>`
`no set local-preference [<pref-value>]`

Parameter	Description
<code><pref-value></code>	<0-4294967295> Configure local preference value. The default local preference value is 100.

Mode Route-map Configuration

Examples

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set local-preference 2345555
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-route-map)# no set local-preference
```

For related BGP commands:

[bgp default local-preference \(BGP only\)](#)

[neighbor route-map](#)

set metric

Overview Use this command to add a metric set clause to a route map entry.

When a route or BGP update message matches the route map entry, the device takes one of the following actions:

- changes the metric (or for BGP, the MED attribute value) to the specified value, or
- adds or subtracts the specified value from the metric or MED attribute, if you specify + or - before the value (for example, to increase the metric by 2, enter +2)

Use the **no** variant of this command to remove the set clause.

Syntax `set metric {+<metric-value>|-<metric-value>|<metric-value>}`
`no set metric [+<metric-value>|-<metric-value>|<metric-value>]`

Parameter	Description
+	Increase the metric or MED attribute by the specified amount.
-	Decrease the metric or MED attribute by the specified amount.
<metric-value>	<0-4294967295> The new metric or MED attribute value, or the amount by which to increase or decrease the existing value.

Default The default metric value for routes redistributed into OSPF and OSPFv3 is 20.

Mode Route-map Configuration

Usage notes For BGP, if you want the device to compare MED values in update messages from peers in different ASes, also enter the command [bgp always-compare-med](#). You do not need to enter this command if you only want the device to compare MED values in update messages from peers in the same AS, because it always does.

This command is valid for:

- OSPF routes
- routes in BGP update messages
- RIP routes.

Note that defining the OSPF metric in a route map supersedes the metric defined using a [redistribute \(OSPF\)](#) or a [redistribute \(IPv6 OSPF\)](#) command. For more information, see the [OSPFv3 Feature Overview and Configuration Guide](#) and the [OSPF Feature Overview and Configuration Guide](#).

Examples To use entry 3 of the route map called "rmap1" to give matching routes a metric of 600, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set metric 600
```

To use entry 3 of the route map called "rmap1" to increase the metric of matching routes by 2, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set metric +2
```

Related commands

- [match metric](#)
- [route-map](#)
- [show route-map](#)

set metric-type

Overview Use this command to add a metric-type set clause to a route map entry.

When a route matches the route map entry, the device sets its route type to the specified value.

Use the **no** variant of this command to remove the set clause.

Syntax `set metric-type {type-1|type-2}`
`no set metric-type [type-1|type-2]`

Parameter	Description
type-1	Redistribute matching routes into OSPF as type-1 external routes.
type-2	Redistribute matching routes into OSPF as type-2 external routes.

Mode Route-map Configuration

Usage notes This command is valid for OSPF routes only.

Example To use entry 3 of the route map called `rmap1` to redistribute matching routes into OSPF as type-1 external routes, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set metric-type 1
```

Related commands

- [default-information originate](#)
- [redistribute \(OSPF\)](#)
- [match route-type](#)
- [route-map](#)
- [show route-map](#)

set origin

Overview Use this command to add an origin set clause to a route map entry.

When a BGP update message matches the route map entry, the device sets its origin attribute to the specified value.

Use the **no** variant of this command to remove the set clause.

Syntax `set origin {egp|igp|incomplete}`
`no set origin [egp|igp|incomplete]`

Parameter	Description
egp	Learned from an exterior gateway protocol.
igp	Learned from a local interior gateway protocol.
incomplete	Of unknown heritage, for example a static route.

Mode Route-map Configuration

Usage This command is valid for BGP update messages only.

Example To use entry 3 of the route map called `rmap1` to give matching update messages an origin of `egp`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set origin egp
```

Related commands [match origin](#)
[route-map](#)
[show route-map](#)

set originator-id

- Overview** Use this command to add an originator ID set clause to a route map entry.
- The originator ID is the router ID of the IBGP peer that first learned this route, either via an EBGP peer or by some other means such as importing it.
- When a BGP update message matches the route map entry, the device sets its originator ID attribute to the specified value.
- Use the **no** variant of this command to remove the set clause.

Syntax `set originator-id <ip-address>`
`no set originator-id [<ip-address>]`

Parameter	Description
<code><ip-address></code>	The IP address of the originator, entered in the form A.B.C.D.

Mode Route-map Configuration

Usage This command is valid for BGP update messages only.

Example To use entry 3 of the route map called `rmap1` to give matching update messages an originator ID of 1.1.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set originator-id 1.1.1.1
```

Related commands [route-map](#)
[show route-map](#)

set tag

Overview Use this command to add a tag set clause to a route map entry.

When a route matches the route map entry, the device sets its tag to the specified value when it redistributes the route into OSPF.

Use the **no** variant of this command to remove the set clause.

Syntax `set tag <tag-value>`
`no set tag [<tag-value>]`

Parameter	Description
<tag-value>	<0-4294967295> Value to tag matching routes with.

Mode Route-map Configuration

Usage notes This command is valid only when redistributing routes into OSPF.

Example To use entry 3 of the route map called `rmap1` to tag matching routes with the number 6, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set tag 6
```

Related commands

- [default-information originate](#)
- [redistribute \(OSPF\)](#)
- [match tag](#)
- [route-map](#)
- [show route-map](#)

set weight

Overview Use this command to add a weight set clause to a route map entry.

The weight value assists in best path selection of BGP routes. It is stored with the route in the BGP routing table, but is not advertised to peers. When there are multiple routes with a common destination, the device uses the route with the highest weight value.

When a route matches the route map entry, the device sets its weight to the specified value.

Use the **no** variant of this command to remove the set clause.

Syntax `set weight <weight>`
`no set weight [<weight>]`

Parameter	Description
<weight>	<0-4294967295> The weight value.

Mode Route-map Configuration

Usage This command is valid for BGP routes only.

Example To use entry 3 of the route map called `rmap1` to give matching routes a weight of 60, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set weight 60
```

Related commands [route-map](#)
[show route-map](#)

show route-map

Overview Use this command to display information about one or all route maps.

Syntax `show route-map <map-name>`

Parameter	Description
<map-name>	A name to identify the route map.

Mode User Exec and Privileged Exec

Example To display information about the route-map named `example-map`, use the command:

```
awplus# show route-map example-map
```

Output Figure 31-1: Example output from the **show route-map** command

```
route-map example-map, permit, sequence 1
  Match clauses:
    ip address prefix-list example-pref
  Set clauses:
    metric 100

address-family

Overview This command enters the IPv4 or IPv6 Address-Family Configuration command mode. In this mode you can configure address-family specific parameters.

When using VRF-lite, you can enter IPv4 Address Family Configuration mode for a specified VRF instance before configuring that instance.

Syntax [BGP] address-family ipv4 [unicast]
no address-family ipv4 [unicast]

Syntax (VRF-lite) address-family ipv4 [unicast|vrf <vrf-name>]
no address-family ipv4 [unicast|vrf <vrf-name>]

Syntax [BGP4+] address-family ipv6 [unicast]
no address-family ipv6 [unicast]

Parameter	Description
ipv4	Configure parameters relating to the exchange of IPv4 prefixes.
ipv6	Configure parameters relating to the exchange of IPv6 prefixes.
unicast	Configure parameters relating to the exchange of routes to unicast destinations.
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance to enter IPv4 Address-Family mode for.

Mode [BGP] Router Configuration

Mode [BGP4+] Router Configuration

Usage notes To leave the IPv4 or IPv6 Address Family Configuration mode, and return to the Router Configuration mode, use the [exit-address-family](#) command.

Example [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# neighbor 192.168.0.1 remote-as 100
awplus(config-router)# address-family ipv4 vrf green
awplus(config-router-af)# neighbor 192.168.0.1 activate
awplus(config-router-af)# exit-address-family
awplus(config-router)#
```

Example [BGP4+] `awplus# configure terminal`
 `awplus(config)# router bgp 100`
 `awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 100`
 `awplus(config-router)# address-family ipv6`
 `awplus(config-router-af)# neighbor 2001:0db8:010d::1 activate`
 `awplus(config-router-af)# exit-address-family`
 `awplus(config-router)#`

Related commands [exit-address-family](#)

Command changes Added to AlliedWare Plus prior to 5.4.6-1
 Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products
 Version 5.4.7-2.1: BGP support added for x510 and x550 series
 Version 5.4.7-2.4: BGP support added for IE300 series

address-family ipv6 vrf (RIP)

Overview Use this command to enter IPv6 Address Family configuration mode. In this mode you can configure address-family specific parameters associated with a VRF instance specified by its name.

Use the **no** variant of this command to remove the IPv6 address-family configuration from the device configuration for a specific VRF instance in RIPng.

Syntax `address-family ipv6 vrf <vrf-name>`
`no address-family ipv6 vrf <vrf-name>`

Parameter	Description
<code><vrf-name></code>	The name of the specific VRF instance.

Mode Router Address Family Configuration

Example To enter RIPng mode, then IPv6 address-family mode, and configure parameters associated with VRF instance 'blue', use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# address-family ipv6 vrf blue
awplus(config-router-af)# redistribute connected
awplus(config-router-af)# exit-address-family
```

To remove the IPv6 address-family configuration from the device configuration mode for VRF instance 'blue' in RIPng, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# no address-family ipv6 vrf blue
```

Related commands [exit-address-family](#)

Command changes Version 5.5.4-1.1: command added

address-family ipv4 (RIP)

Overview This command enters the IPv4 address-family command mode. In this mode you can configure address-family specific parameters for a specific VRF (RIP) instance.

Syntax `address-family ipv4 vrf <vrf-name>`
`no address-family ipv4 vrf <vrf-name>`

Parameter	Description
<code>ipv4</code>	Configure parameters relating to the RIP exchange of IPv4 prefixes.
<code>vrf</code>	Apply this command to a VRF instance.
<code><vrf-name></code>	The name of the VRF instance.

Mode Router Configuration

Usage To leave Address Family mode and return to Router Configuration mode, use the [exit-address-family](#) command.

Example In this example the address family “green” is entered, and then exited by using the `exit-address-family` command.

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf green
awplus(config-router-af)# exit-address-family
awplus(config-router)#
```

Related commands [exit-address-family](#)

arp

Overview This command adds a static ARP entry to the ARP cache. This is typically used to add entries for hosts that do not support ARP or to speed up the address resolution function for a host. The ARP entry must not already exist. Use the **alias** parameter to allow your device to respond to ARP requests for this IP address.

If VRF-lite is configured, you can add ARP entries to either the global cache or for a specific VRF instance.

The **no** variant of this command removes the static ARP entry. Use the [clear arp-cache](#) command to remove the dynamic ARP entries in the ARP cache.

Syntax

```
arp <ip-addr> <mac-address> [<port-number>] [alias]
arp <ip-addr> <multicast-mac-address> [<port-list>]
no arp <ip-addr>
```

Syntax (VRF-lite)

```
arp [vrf <vrf-name>] <ip-addr> <mac-address> [<port-number>]
[alias]
arp [vrf <vrf-name>] <ip-addr> <multicast-mac-address>
[<port-list>]
no arp [vrf <vrf-name>] <ip-addr>
```

Parameter	Description
<ip-addr>	The IPv4 address of the device you are adding as a static ARP entry.
<mac-address>	The MAC address of the device you are adding as a static ARP entry, in hexadecimal notation with the format HHHH.HHHH.HHHH.
<port-number>	The port number associated with the IP address. Specify this when the IP address is part of a VLAN.
<multicast-mac-address>	The multicast MAC address for which you are adding a static ARP entry, in hexadecimal notation with the format HHHH.HHHH.HHHH.
<port-list>	The list of port numbers associated with the IP address. You can only specify multiple egress ports when the MAC address is a multicast MAC address.
alias	Allows your device to respond to ARP requests for the IP address. Proxy ARP must be enabled on the interface before using this parameter.
vrf	Apply this command to a VRF instance.
<vrf-name>	The name of the VRF instance.

Mode Global Configuration

Usage notes One use of this command is to limit packet flooding when using services like Microsoft Network Load Balancing (MS-NLB). With such services, packets destined for server cluster virtual address must be sent to all servers in the cluster. The server cluster can operate in multicast mode, in which it uses a multicast MAC address. To support this, this command allows you to create a static ARP entry with a multicast MAC address, and specify which ports the packets will be forwarded out.

Creating a static ARP entry enables the switch to correctly forward server cluster traffic. If you want the switch to also respond to pings from the server cluster, you need to also enable server cluster support, using the [arp-mac-disparity](#) command.

Examples To add the IP address 10.10.10.9 with the MAC address 0010.2533.4566 into the ARP cache, and have your device respond to ARP requests for this address, use the commands:

```
awplus# configure terminal
awplus(config)# arp 10.10.10.9 0010.2533.4566 alias
```

Example (VRF-lite) To apply the above example within a VRF instance called `red` use the following commands:

```
awplus# configure terminal
awplus(config)# arp vrf red 10.10.10.9 0010.2533.4566 alias
```

Related commands

- [arp-mac-disparity](#)
- [clear arp-cache](#)
- [ip proxy-arp](#)
- [show arp](#)

arp opportunistic-nd

Overview Use this command to enable opportunistic neighbor discovery for the global ARP cache. This command changes the behavior for unsolicited ARP packet forwarding on the device.

CAUTION: *Opportunistic neighbor discovery can make your device more vulnerable to ARP/ND cache poisoning attacks. We recommend disabling it unless necessary.*

When using VRF-lite, you can use this command to enable opportunistic neighbor discovery for a named VRF instance.

Use the **no** variant of this command to disable opportunistic neighbor discovery for the global ARP cache.

Syntax `arp opportunistic-nd`
`no arp opportunistic-nd`

Syntax (VRF-lite) `arp opportunistic-nd [vrf <vrf-name>]`
`no arp opportunistic-nd [vrf <vrf-name>]`

Parameter	Description
<code>vrf</code>	Apply this command to a VRF instance.
<code><vrf-name></code>	The name of the VRF instance.

Default Opportunistic neighbor discovery is disabled by default.

Mode Global Configuration

Usage notes When opportunistic neighbor discovery is enabled, the device will reply to any received unsolicited ARP packets (but not gratuitous ARP packets). The source MAC address for the unsolicited ARP packet is added to the ARP cache, so the device forwards the ARP packet. When opportunistic neighbor discovery is disabled, the source MAC address for the ARP packet is not added to the ARP cache, so the ARP packet is not forwarded by the device.

Note this command enables or disables opportunistic neighbor discovery for a VRF instance if the **vrf** parameter and an instance name are applied. If a VRF instance is not specified, then opportunistic neighbor discovery is enabled or disabled for device ports configured for IPv4.

Examples To enable opportunistic neighbor discovery for the global ARP cache, enter:

```
awplus# configure terminal
awplus(config)# arp opportunistic-nd
```

To disable opportunistic neighbor discovery for the global ARP cache, enter:

```
awplus# configure terminal
awplus(config)# no arp opportunistic-nd
```

Example (VRF-lite) To enable opportunistic neighbor discovery for the VRF instance 'blue', enter:

```
awplus# configure terminal
awplus(config)# arp opportunistic-nd vrf blue
```

To disable opportunistic neighbor discovery for the VRF instance 'blue', enter:

```
awplus# configure terminal
awplus(config)# no arp opportunistic-nd vrf blue
```

Related commands

- show running-config interface

clear arp-cache

Overview This command deletes dynamic ARP entries from the ARP cache. You can optionally specify the IPv4 address of an ARP entry to be cleared from the ARP cache.

When running VRF-lite, this command deletes dynamic ARP entries either from the ARP cache of a specific VRF instance, or from the ARP cache of the Global VRF instance. To delete all ARP entries from both the Global VRF instance and all VRF instances, use the command with no parameters. You can optionally specify the IPv4 address for the VRF instance to clear an ARP entry from the ARP cache.

Syntax `clear arp-cache [<ip-address>]`

Syntax (VRF-lite) `clear arp-cache [vrf <vrf-name>|global] [<ip-address>]`

Parameter	Description
<ip-address>	Specifies a specific IPv4 address for a VRF instance whose entries are to be cleared from the ARP cache.
global	When VRF-lite is configured, apply this command to the global routing and forwarding table.
vrf	Apply this command to the specified VRF instance.
<vrf-name>	The VRF instance name.

Mode Privileged Exec

Usage notes To display the entries in the ARP cache, use the [show arp](#) command. To remove static ARP entries, use the no variant of the [arp](#) command.

Example To clear all dynamic ARP entries, use the command:

```
awplus# clear arp-cache
```

To clear all dynamic ARP entries associated with the IPv4 address 192.168.1.1, use the command:

```
awplus# clear arp-cache 192.168.1.1
```

Example (VRF-lite) To clear the dynamic ARP entries from the VRF instance named blue, use the commands:

```
awplus# clear arp-cache vrf blue
```

To clear the dynamic ARP entries from the VRF instance named blue with the IPv4 address 192.168.1.1, use the commands:

```
awplus# clear arp-cache vrf blue 192.168.1.1
```

When running VRF-lite, to clear the dynamic ARP entries from the global VRF-lite and all VRF instances, use the command:

```
awplus# clear arp-cache
```

commands**

[arp-mac-disparity](#)

[arp](#)

[show arp](#)

clear ip bgp * (BGP only)

Overview Use this command to reset all BGP connections, either by fully resetting sessions or by performing soft resets.

If VRF-lite is configured, you can reset BGP connections for all VRF instances or for a specified VRF instance.

Syntax

```
clear ip bgp *  
clear ip bgp * in  
clear ip bgp * out  
clear ip bgp * soft [in|out]  
clear ip bgp * in [prefix-filter]
```

Syntax (VRF-lite)

```
clear ip bgp * [vrf <vrf-name>]  
clear ip bgp * [vrf <vrf-name>] in  
clear ip bgp * [vrf <vrf-name>] out  
clear ip bgp * [vrf <vrf-name>] soft [in|out]  
clear ip bgp * in [prefix-filter]
```

Parameter	Description
*	Clears all BGP peers.
in	Indicates that incoming advertised routes will be cleared.
prefix-filter	Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration.
out	Indicates that outgoing advertised routes will be cleared.
soft in	Soft inbound reset causes the neighbors to resend all their updates to the local device, without resetting the connection or clearing the entries in the local device. So, the local device stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory.
soft out	Soft outbound reset causes the device to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries.
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.

Mode Privileged Exec

Examples To clear all BGP peers, use the command:

```
awplus# clear ip bgp *
```

Example (VRF-lite) To clear all BGP peers in VRF instance red, use the command:

```
awplus# clear ip bgp * vrf red
```

To clear all outbound BGP peers in VRF instance red, use the command:

```
awplus# clear ip bgp * out vrf red
```

Command changes

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for x510 and x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

clear ip bgp (IPv4) (BGP only)

Overview Use this command to reset the IPv4 BGP connection to the peer specified by the IP address. When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax [BGP] `clear ip bgp <ipv4-addr> [in [prefix-filter]|out|soft [in|out]]`

Syntax (VRF-lite) `clear ip bgp <ipv4-address> [vrf <vrf-name>] [in|out|soft [in|out]]`

Parameter	Description
<ipv4-addr>	Specifies the IPv4 address of the neighbor whose connection is to be reset, entered in the form A.B.C.D.
in	Indicates that incoming advertised routes will be cleared.
prefix-filter	Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration.
out	Indicates that outgoing advertised routes will be cleared.
soft in	Soft inbound reset causes the neighbors to resend all their updates to the local switch, without resetting the connection or clearing the entries in the local switch. So, the local switch stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory.
soft out	Soft outbound reset causes the switch to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries.
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.

Mode [BGP] Privileged Exec

Examples [BGP] To clear the BGP connection to the peer at IPv4 address 192.168.1.1 and clear all incoming routes, use the following command:

```
awplus# clear ip bgp 192.168.1.1 in
```

To apply the above example to clear the BGP connection to the peer at IP address 192.0.2.11 for the VRF instance blue, use the following commands:

```
awplus# clear ip bgp 192.0.2.11 vrf blue in
```

Command changes Added to AlliedWare Plus prior to 5.4.6-1
Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for x510 and x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

clear ip rip route

Overview Use this command to clear specific data from the RIP routing table.

Syntax `clear ip rip route <ip-dest-network/prefix-length>`
`clear ip rip route`
`{static|connected|rip|ospf|bgp|invalid-routes|all}`

Syntax (VRF-lite) `clear ip rip [vrf <vrf-name>] route`
`<ip-dest-network/prefix-length>`
`clear ip rip [vrf <vrf-name>] route`
`{static|connected|rip|ospf|bgp|invalid-routes|all}`

Parameter	Description
vrf	Apply this command to a VRF instance.
<vrf-name>	The name of the VRF instance.
<ip-dest-network/prefix-length>	Removes entries which exactly match this destination address from RIP routing table. Enter the IP address and prefix length of the destination network.
static	Removes static entries from the RIP routing table.
connected	Removes entries for connected routes from the RIP routing table.
rip	Removes only RIP routes from the RIP routing table.
ospf	Removes only OSPF routes from the RIP routing table.
bgp	Removes only BGP routes from the RIP routing table.
invalid-routes	Removes routes with metric 16 immediately. Otherwise, these routes are not removed until RIP times out the route after 2 minutes.
all	Clears the entire RIP routing table.

Mode Privileged Exec

Usage notes Using this command with the **all** parameter clears the RIP table of all the routes.

Examples To clear the route 10.0.0.0/8 from the RIP routing table, use the following command:

```
awplus# clear ip rip route 10.0.0.0/8
```

Examples (VRF-lite) To clear RIP routes associated with the VRF instance 'red' for OSPF routes, use the following command:

```
awplus# clear ip rip vrf red route ospf
```

To clear the route 10.0.0.0/8 from the RIP routing table for the VRF instance 'red', use the following command:

```
awplus# clear ip rip vrf red route 10.0.0.0/8
```

crypto key pubkey-chain knownhosts

Overview This command adds a public key of the specified SSH server to the known host database on your device. The SSH client on your device uses this public key to verify the remote SSH server.

The key is retrieved from the server. Before adding a key to this database, check that the key sent to you is correct.

If the server's key changes, or if your SSH client does not have the public key of the remote SSH server, then your SSH client will inform you that the public key of the server is unknown or altered.

The **no** variant of this command deletes the public key of the specified SSH server from the known host database on your device.

Syntax `crypto key pubkey-chain knownhosts [ip|ipv6] <hostname> [ecdsa|rsa]`
`no crypto key pubkey-chain knownhosts <1-65535>`

Syntax (VRF-lite) `crypto key pubkey-chain knownhosts [vrf <vrf-name>] [ip|ipv6] <hostname> [ecdsa|rsa]`
`no crypto key pubkey-chain knownhosts [vrf <vrf-name>] <1-65535>`

Parameter	Description
<code>vrf</code>	Apply this command to the specified VRF instance.
<code><vrf-name></code>	The VRF instance name
<code>ip</code>	Keyword used prior to specifying an IPv4 address
<code>ipv6</code>	Keyword used prior to specifying an IPv6 address
<code><hostname></code>	IPv4/IPv6 address or hostname of a remote server in the format <code>a.b.c.d</code> for an IPv4 address, or in the format <code>x:x::x:x</code> for an IPv6 address.
<code>ecdsa</code>	Specify the ECDSA public key of the server to be added to the known host database.
<code>rsa</code>	Specify the RSA public key of the server to be added to the known host database.
<code><1-65535></code>	Specify a key identifier when removing a key using the no parameter.

Default If no cryptography algorithm is specified, then **rsa** is used as the default cryptography algorithm.

Mode Privilege Exec

Usage notes This command adds a public key of the specified SSH server to the known host database on the device. The key is retrieved from the server. The remote SSH server is verified by using this public key. The user is requested to check the key is correct before adding it to the database.

If the remote server's host key is changed, or if the device does not have the public key of the remote server, then SSH clients will inform the user that the public key of the server is altered or unknown.

Examples To add the RSA host key of the remote SSH host IPv4 address 192.0.2.11 to the known host database, use the command:

```
awplus# crypto key pubkey-chain knownhosts 192.0.2.11
```

To delete the second entry in the known host database, use the command:

```
awplus# no crypto key pubkey-chain knownhosts 2
```

Examples (VRF-lite) To add the RSA host key of the remote SSH host IPv4 address 192.0.2.11 in VRF 'red' to the known host database, use the command:

```
awplus# crypto key pubkey-chain knownhosts vrf red 192.0.2.11
```

To delete the second entry in the known host database in VRF 'red', use the command:

```
awplus# no crypto key pubkey-chain knownhosts vrf red 2
```

Validation Commands [show crypto key pubkey-chain knownhosts](#)

default-metric (RIP)

Overview Use this command to specify the metrics to be assigned to redistributed RIP routes. Use the **no** variant of this command to reset the RIP metric back to its default (1).

Syntax `default-metric <metric>`
`no default-metric [<metric>]`

Parameter	Description
<metric>	<1-16> Specifies the value of the default metric.

Default By default, the RIP metric value is set to 1.

Mode RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

Usage notes This command is used with the [redistribute \(RIP\)](#) command to make the routing protocol use the specified metric value for all redistributed routes, regardless of the original protocol that the route has been redistributed from.

Examples This example assigns the cost of 10 to the routes that are redistributed into RIP.

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# default-metric 10
awplus(config-router)# redistribute ospf
awplus(config-router)# redistribute connected
```

Example (VRF-lite) This example assigns the cost of 10 to the routes which are redistributed into RIP for the VRF instance blue.

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address family ipv4 vrf blue
awplus(config-router-af)# default-metric 10
awplus(config-router-af)# redistribute ospf
awplus(config-router-af)# redistribute connected
```

Related commands [redistribute \(RIP\)](#)

description (VRF)

Overview Use this command to add text that describes a specific VRF instance. Descriptions can be up to 80 characters long.

The **no** variant of this command removes the description of the selected VRF instance.

Syntax `description <descriptive-text>`
`no description`

Parameter	Description
<code><descriptive-text></code>	A string of up to 80 characters that describes the VRF instance.

Mode VRF Configuration

Example To add the description for a VRF instance named blue, use the following commands:

```
awplus# config terminal
awplus(config)# ip vrf blue
awplus(config-vrf)# description the text description of vrf
blue
```

Related commands [show ip vrf](#)

distance (RIP)

Overview This command sets the administrative distance for RIP routes. Your device uses this value to select between two or more routes to the same destination obtained from two different routing protocols. The route with the smallest administrative distance value is added to the Forwarding Information Base (FIB). For more information, see the [Route Selection Feature Overview and Configuration Guide](#).

The **no** variant of this command sets the administrative distance for the RIP route to the default of 120.

Syntax `distance <1-255> [<ip-addr/prefix-length> [<access-list>]]`
`no distance [<1-255>] [<ip-addr/prefix-length> [<access-list>]]`

Parameter	Description
<1-255>	The administrative distance value you are setting for this RIP route.
<ip-addr/prefix-length>	The network IP address and prefix-length that you are changing the administrative distance for.
<access-list>	Specifies the access-list name. This access list specifies which routes within the specified network this command applies to.

Mode RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

Examples To set the administrative distance to 8 for the RIP routes within the 10.0.0.0/8 network that match the access-list "mylist", use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# distance 8 10.0.0.0/8 mylist
```

To set the administrative distance to the default of 120 for the RIP routes within the 10.0.0.0/8 network that match the access-list "mylist", use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# no distance 8 10.0.0.0/8 mylist
```

Example (VRF-lite) This example assigns a cost of 10 to the routes for the VRF instance blue, when redistributed into RIP.

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address family ipv4 blue
awplus(config-router-af)# distance 10
```

distribute-list (RIP)

Overview Use this command to filter incoming or outgoing route updates using the access-list or the prefix-list.

When running VRF-lite, this command can be applied to a specific VRF instance.

Use the **no** variant of this command to disable this feature.

Syntax `distribute-list {<access-list> | prefix <prefix-list>} {in|out} [<interface>]`
`no distribute-list {<access-list> | prefix <prefix-list>} {in|out} [<interface>]`

Parameter	Description
<access-list>	Specifies the IPv4 access-list number or name to use.
prefix	Filter prefixes in routing updates.
<prefix-list>	Specifies the name of the IPv4 prefix-list to use.
in	Filter incoming routing updates.
out	Filter outgoing routing updates.
<interface>	The interface on which the filtering applies.

Default Disabled

Mode RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

Usage notes Filter out incoming or outgoing route updates using an access-list or a prefix-list. If you do not specify the name of the interface, the filter will be applied to all interfaces.

Examples To apply an ACL called 'myfilter' to filter incoming routing updates on VLAN2, use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# distribute-list myfilter in vlan2
```

To apply a prefix list called 'myfilter' to filter incoming routing updates on VLAN2, use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# distribute-list prefix myfilter in vlan2
```

Example (VRF-lite) This example applies the commands of the previous prefix-list example, but to a specific VRF named blue:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# distribute-list prefix myfilter in
vlan2
```

Related commands [access-list extended \(named\)](#)
[ip prefix-list](#)

export map

Overview This command associates a route map with a specific VRF instance. It provides a finer control over the routes that are exported out of a VRF instance by the **route-target** command. Note, however, that this command does not replace the need for a route-target export in the VRF configuration.

The **no** variant of this command disables the capability to export route map entries for a specified VRF instance.

Syntax `export map <route-map>`
`no export map`

Parameter	Description
<code><route-map></code>	The route-map name.

Mode VRF Configuration

Usage notes Use this command to export route-map entries in VRF configuration mode.

Example To export the route map named routemap2 for the VRF instance named blue, use the following commands:

```
awplus# config terminal
awplus(config)# ip vrf blue
awplus(config-vrf)# export map routemap2
```

Related commands [import map](#)

fullupdate (RIP)

Overview Use this command to specify which routes RIP should advertise when performing a triggered update. By default, when a triggered update is sent, RIP will only advertise those routes that have changed since the last update. When **fullupdate** is configured, the device advertises the full RIP route table in outgoing triggered updates, including routes that have not changed. This enables faster convergence times, or allows inter-operation with legacy network equipment, but at the expense of larger update messages.

Use the **no** variant of this command to disable this feature.

Syntax fullupdate
no fullupdate

Default By default this feature is disabled.

Mode RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

Usage (VRF-lite) If VRF-lite is configured, you can apply this command for either the global routing environment, or to a specific VRF instance.

Example To enable the fullupdate (RIP) function, use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# fullupdate
```

Example (VRF-lite) To enable the full update (RIP) function on the VRF instance named 'blue', use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# fullupdate
```

http client vrf

Overview Use this command to enable the use of a specific VRF for the command **copy http**.
Use the **no** variant of this command to disable the configured VRF.

Syntax `http client vrf <vrf-name>`
`no http client vrf`

Parameter	Description
<code>vrf</code> <code><vrf-name></code>	Specify the VRF to use when copying a file using HTTP.

Default Global VRF.

Mode Privileged Exec

Examples To enable the use of VRF 'MyVRF', use the commands:

```
awplus# configure terminal
awplus(config)# http client vrf MyVRF
```

To remove a specified VRF and revert to the global VRF, use the commands:

```
awplus# configure terminal
awplus(config)# no http client vrf
```

Output Figure 32-1: Example output if the specified VRF does not exist:

```
"Invalid VRF instance MyVRF"
```

Related commands [copy \(filename\)](#)
[show http client](#)

Command changes Version 5.5.2-1.1: command added

http vrf

Overview Use this command to configure an HTTP server to be run within a specified VRF. Use the **no** variant of this command to remove a VRF configuration from the HTTP server.

Syntax `http vrf <vrf-name>`
`no http vrf`

Parameter	Description
<code>vrf</code> <code><vrf-name></code>	Specify the VRF to use when running the HTTP server. The name of the VRF instance.

Default By default the HTTP server uses the global VRF.

Mode Global Configuration

Examples To configure VRF 'MyVRF', use the commands:

```
awplus# configure terminal
awplus(config)# http vrf MyVRF
```

To return the HTTP server to the global VRF, use the commands:

```
awplus# configure terminal
awplus(config)# no http vrf
```

Related commands [service http](#)
[show http](#)

Command changes Version 5.5.2-1.1: command added

import map

Overview The import map command associates a route map with a specific VRF instance. The import map command does not replace the need for a route-target import in the VRF configuration. It provides a finer control over the routes imported into a VRF instance by the **route-target** command.

The **no** variant of this command disables the capability to import route map entries for a specified VRF instance.

Syntax `import map <route-map>`
`no import map`

Parameter	Description
<code><route-map></code>	The route-map name.

Mode VRF Configuration

Usage notes Use this command to import route-map entries into the specified VRF instance.

Example To import the route map named `routemap2` for the VRF instance named `blue`, use the following commands:

```
awplus# config terminal
awplus(config)# ip vrf blue
awplus(config-vrf)# import map routemap2
```

Related commands [export map](#)

ip route static inter-vrf

Overview Applying this command enables static inter-VRF routing. Note that static inter-VRF routing must be enabled before you can use the **ip route** command to create a static inter-VRF route.

The **no** variant of this command disables static inter-VRF routing.

Syntax `ip route static inter-vrf`
`no ip route static inter-vrf`

Mode VRF Configuration

Default Static inter-VRF routing is enabled.

Example To enable static inter-VRF routing, use the following commands:

```
awplus# config terminal
awplus(config)# ip route static inter-vrf
```

Related commands [ip route](#)
[show ip route](#)

ip route vrf

Overview This command adds a static route to the Routing Information Base (RIB). If this route is the best route for the destination, then your device adds it to the Forwarding Information Base (FIB). Your device uses the FIB to advertise routes to neighbors and forward packets.

When using VRF (Virtual Routing and Forwarding), you can use this command to configure a static inter-VRF route to a destination network that is reachable by a remote gateway located in a different VRF instance. Note that to apply the command in this way, the [ip route static inter-vrf](#) command must be in enabled (its default condition). For more information about VRF, see the [VRF Feature Overview and Configuration Guide](#) and the [VRF-lite Commands](#) chapter.

The **no** variant of this command removes the static route from the RIB and FIB.

Syntax

```
ip route [vrf <vrf-name>] <subnet&mask>
{<gateway-ip>|<interface>} [<distance>] [description
<description>]

ip route [vrf <vrf-name>] <subnet&mask> fall-over bfd [disable]

ip route [vrf <vrf-name>] <subnet&mask> fall-over bfd [profile
<profile-name>]

no ip route [vrf <vrf-name>] <subnet&mask>
{<gateway-ip>|<interface>} [<distance>]

no ip route [vrf <vrf-name>] <subnet&mask> fall-over bfd
[disable]

no ip route [vrf <vrf-name>] <subnet&mask> fall-over bfd
[profile <profile-name>]
```

Parameter	Description
<subnet&mask>	The IPv4 address of the destination subnet defined using either a prefix length or a separate mask specified in one of the following formats: - The IPv4 subnet address in dotted decimal notation followed by the subnet mask, also in dotted decimal notation. - The IPv4 subnet address in dotted decimal notation, followed by a forward slash, then the prefix length.
<gateway-ip>	The IPv4 address of the gateway device.
<interface>	The interface that connects your device to the network. Enter the name of the VLAN or its VID. You can also enter 'null' as an interface. Specify a 'null' interface to add a null or blackhole route to the switch. The gateway IP address or the interface is required if VRF-lite is not configured. If VRF-lite is configured: When adding a static intra-VRF route, you must specify either the gateway IP address or the interface. When adding a static inter-VRF route, you must specify both the gateway IP address and the interface.

Parameter	Description
<code><distance></code>	The administrative distance for the static route in the range 1 to 255. Static routes by default have an administrative distance of 1, which gives them the highest priority possible.
<code>vrf</code>	Applies the command to the specified VRF instance.
<code><vrf-name></code>	The name of the VRF instance to enter IPv4 Address-Family mode for.
<code>description</code> <code><description></code>	A description to record the route's purpose. It can be up to 80 printable ASCII characters long, including spaces. The description does not affect routing or forwarding decisions made by the device. To see the description, use the command show running-configuration .
<code>fall-over bfd</code>	Enable BFD fall-over detection on the static route.
<code>disable</code>	Disable BFD fall-over detection on the static route.
<code>profile</code> <code><profile-name></code>	Apply the settings from a BFD profile when enabling BFD fall-over detection.

Mode Global Configuration

Default The default administrative distance for a static route is 1.

Usage notes You can use administrative distance to determine which routes take priority over other routes.

Specify a 'Null' interface to add a null or blackhole route to the switch. A null or blackhole route is a routing table entry that does not forward packets, so any packets sent to it are dropped.

Versions of AlliedWare Plus earlier than 5.5.1-2.1 do not support descriptions on static routes, so a start-up configuration that contains descriptions will be rejected by these older versions. If you add descriptions, be careful if you downgrade to an older AlliedWare Plus version.

The **fall-over bfd** parameter is used to enable or disable BFD fall-over detection on an IP route under the specified VRF.

Use the command:

- **ip route vrf fall-over bfd** to enable BFD fall-over detection on the specified static route.
- **no ip route vrf fall-over bfd disable** to re-enable BFD fall-over detection on the specified static route.
- **no ip route vrf fall-over bfd** to disable BFD fall-over detection on the specified static route.
- **ip route vrf fall-over bfd disable** to disable BFD fall-over detection on the specified static route, if you have used the command [bfd all-interfaces](#) and want to override it for this particular route.

You can also use the **profile** parameter with this command to apply or remove a BFD profile's settings.

Use the command:

- **ip route vrf fall-over bfd profile <name>** to enable BFD fall-over detection and apply the profile's settings to the specified static route.
- **no ip route vrf fall-over bfd profile** to revert back to using default profile settings.

Examples To create a static route from source VRF instance red, to the subnet 192.168.50.0/24 with a next hop of 192.168.20.6, use the following commands:

```
awplus# configure terminal
awplus(config)# ip route vrf red 192.168.50.0/24 192.168.20.6
```

To remove a static route from source VRF red, to the subnet 192.168.50.0/24 with a next hop of 192.168.20.6, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip route vrf red 192.168.50.0/24
192.168.20.6
```

To create a static route from source VRF red, to the subnet 192.168.50.0/24 with a next hop of 192.168.20.6 via vlan10, use the following commands:

```
awplus# configure terminal
awplus(config)# ip route vrf red 192.168.50.0/24 192.168.20.6
vlan10
```

To give a route a description of 'test' when creating it, use the commands:

```
awplus# configure terminal
awplus(config)# ip route vrf red 192.168.50.0/24 192.168.20.6
description test
```

To remove the description from a route, re-enter the route without specifying the **description** parameter:

```
awplus# configure terminal
awplus(config)# ip route vrf red 192.168.50.0/24 192.168.20.6
```

To enable BFD fall-over detection for an IP route under VRF red, use the commands:

```
awplus# configure terminal
awplus(config)# ip route vrf red 192.168.50.0/24 192.168.20.6
fall-over bfd
```

To disable BFD fall-over detection for an IP route under VRF red, use the commands:

```
awplus# configure terminal
awplus(config)# no ip route vrf red 192.168.50.0/24
192.168.20.6 fall-over bfd
```

To enable BFD fall-over detection for IP routes on all interfaces except under VRF red, use the commands:

```
awplus# configure terminal
awplus(config)# ip route bfd all-interfaces
awplus(config)# ip route vrf red 192.168.50.0/24 192.168.20.6
fall-over bfd disable
```

To re-enable BFD fall-over detection for an IP route under VRF red, use the commands:

```
awplus# configure terminal
awplus(config)# no ip route vrf red 192.168.50.0/24
192.168.20.6 fall-over bfd disable
```

To enable BFD fall-over detection and add the settings from BFD profile 'bfdProfile' to the BFD session for an IP route under VRF red, use the commands:

```
awplus# configure terminal
awplus(config)# ip route vrf red 192.168.50.0/24 192.168.20.6
fall-over bfd profile bfdProfile
```

To revert back to using default profile settings for an IP route under VRF red, use the commands:

```
awplus# configure terminal
awplus(config)# no ip route vrf red 192.168.50.0/24
192.168.20.6 fall-over bfd profile bfdProfile
```

**Command
changes**

Version 5.5.2-1.1: **fall-over bfd** and **profile** parameters added for the SBx81CFC960, SBx908 GEN2, x950, x930, and x530 series.

Version 5.5.1-2.1: **weight** and **description** parameters added.

Version 5.5.2-2.1: **weight** parameter added for 10GbE UTM firewall.

ip tftp vrf

Overview Use this command to specify a VRF to use when copying a file via TFTP.

Use the **no** variant of this command to remove the VRF from the configuration and set it back to the default VRF.

Syntax `ip tftp vrf <vrf-name>`
`no ip tftp vrf`

Parameter	Description
<code>vrf</code> <code><vrf-name></code>	Specify the VRF to use when copying a file using TFTP.

Default Global VRF

Mode Global Configuration

Example To configure a VRF called 'red' to use when copying a file via TFTP, use the commands:

```
awplus# configure terminal
awplus(config)# ip tftp vrf red
```

Related commands [copy \(filename\)](#)

Command changes Version 5.5.2-1.1: command added

ip vrf

Overview This command creates a VRF instance and specifies its unique name. You can also optionally specify a VRF ID. If you do not specify the VRF ID, a unique ID will automatically be created and assigned to the VRF instance.

The **no** variant of this command removes a selected VRF instance. All interfaces previously belonging to the removed instance are then returned to the global routing and forwarding environment.

Syntax `ip vrf <vrf-name> [<vrf-inst-id>]`
`no ip vrf <vrf-name> [<vrf-inst-id>]`

Parameter	Description
<code><vrf-name></code>	The name of the VRF instance.
<code><vrf-inst-id></code>	The ID of the VRF instance, a number in the range 1 to 600.

Mode Global Configuration

Default Static inter-VRF routing is enabled

Example To create a VRF instance named `vrf blue` and assign it the ID number 2, use the following commands:

```
awplus# config terminal
awplus(config)# ip vrf blue 2
```

Command changes Version 5.4.6-2.1: On AR Series devices: VRF-lite support added
Version 5.5.0-0.1: On SBx908 GEN2 and x950 Series devices: **vrf-inst-id** parameter range increased to 600.

ip vrf forwarding

Overview This command associates a VRF instance with an interface.
The **no** variant of this command disassociates the VRF instance from its interface.

Syntax `ip vrf forwarding <vrf-name>`
`no ip vrf <vrf-name>`

Parameter	Description
<vrf-name>	The name of the VRF instance.

Mode Interface Configuration

Default The default for an interface is the global routing table.

Examples For LAN interfaces, to associate the VRF instance named `blue` with the VLAN interface `vlan-admin`, use the following commands:

```
awplus# config terminal
awplus(config)# interface vlan-admin
awplus(config-if)# ip vrf forwarding blue
```

Related commands [show ip vrf](#)
[show ip vrf detail](#)

log host

Overview This command configures the device to send log messages to a remote syslog server via UDP port 514. The IP address of the remote server must be specified. By default no filters are defined for remote syslog servers. Filters must be defined before messages will be sent.

Use the **no** variant of this command to stop sending log messages to the remote syslog server.

Syntax `log host <ipv4-addr> [secure]`
`log host <ipv6-addr>`
`no log host <ipv4-addr>|<ipv6-addr>`

Syntax (VRF-lite) `log host <ipv4-addr>|<ipv6-addr> [vrf <vrf-name>] [secure]`
`no log host <ipv4-addr>|<ipv6-addr> [vrf <vrf-name>]`

Parameter	Description
<ipv4-addr>	Specify the source IPv4 address, in dotted decimal notation (A.B.C.D).
<ipv6-addr>	Specify the source IPv6 address, in X:X::X:X notation.
vrf <vrf-name>	The name of a VRF instance. Use this to specify the VRF that the remote syslog server (host) is accessible by. Hosts are uniquely identified by their address and VRF, so multiple hosts can have the same address as long as the VRF is different. The default is the global VRF.
secure	Optional value to create a secure log destination. This option is only valid for IPv4 hosts.

Mode Global Configuration

Usage notes Use the optional **secure** parameter to configure a secure IPv4 syslog host. For secure hosts, syslog over TLS is used to encrypt the logs. The certificate received from the remote log server must have an issuer chain that terminates with the root CA certificate for any of the trustpoints that are associated with the application.

The remote server may also request that a certificate is transmitted from the local device. In this situation the first trustpoint added to the syslog application will be transmitted to the remote server.

For detailed information about securing syslog, see the [PKI Feature Overview_and Configuration_Guide](#).

Examples To configure the device to send log messages to a remote secure syslog server with IP address 10.32.16.99, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.99 secure
```

To stop the device from sending log messages to the remote syslog server with IP address 10.32.16.99, use the following commands:

```
awplus# configure terminal
awplus(config)# no log host 10.32.16.99
```

Example (VRF-lite) To configure the device to send log messages to a remote syslog server that is accessible via VRF 'red', use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.99 vrf red
```

Command changes Version 5.5.2-1.1: **vrf** parameter added for products that support VRF

log host exclude

Overview Use this command to prevent specified log messages from being sent to the remote syslog server, when **log host** is enabled. You can exclude messages on the basis of:

- the priority/severity of the message
- the program that generated the message
- the logging facility used
- a sub-string within the message, or
- a combination of some or all of these.

Use the **no** variant of this command to stop excluding the specified messages.

Syntax `log host {<hostname>|<ipv4-addr>|<ipv6-addr>} exclude [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]`
`no log host {<hostname>|<ipv4-addr>|<ipv6-addr>} exclude [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]`

Syntax (VRF-lite) `log host {<hostname>|<ipv4-addr>|<ipv6-addr>} [vrf <vrf-name>] exclude [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]`
`no log host {<hostname>|<ipv4-addr>|<ipv6-addr>} [vrf <vrf-name>] exclude [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]`

Parameter	Description										
<hostname>	The host name of a remote syslog server.										
<ipv4-addr>	The IPv4 address of a remote syslog server, in A.B.C.D format.										
<ipv6-addr>	The IPv6 address of a remote syslog server, in X:X::X:X format.										
vrf <vrf-name>	The name of a VRF instance. Use this if the syslog server is inside a VRF. The default is the global VRF.										
level	Exclude messages of the specified severity level.										
<level>	The severity level to exclude. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity: <table><tr><td>0 emergencies</td><td>System is unusable</td></tr><tr><td>1 alerts</td><td>Action must be taken immediately</td></tr><tr><td>2 critical</td><td>Critical conditions</td></tr><tr><td>3 errors</td><td>Error conditions</td></tr><tr><td>4 warnings</td><td>Warning conditions</td></tr></table>	0 emergencies	System is unusable	1 alerts	Action must be taken immediately	2 critical	Critical conditions	3 errors	Error conditions	4 warnings	Warning conditions
0 emergencies	System is unusable										
1 alerts	Action must be taken immediately										
2 critical	Critical conditions										
3 errors	Error conditions										
4 warnings	Warning conditions										

Parameter	Description
	5 notices Normal, but significant, conditions
	6 informational Informational messages
	7 debugging Debug-level messages
program	Exclude messages from a specified program.
<program-name>	The name of a program. You can enter either one of the following predefined program names (depending on your device model), or another program name that you find in the log output. The pre-defined names are not case sensitive but other program names from the log output are.
rip	Routing Information Protocol (RIP)

facility	Exclude messages from a syslog facility.
<facility>	Specify one of the following syslog facilities to exclude messages from:
kern	Kernel messages
user	Random user-level messages
mail	Mail system

Parameter	Description
daemon	System daemons
auth	Security/authorization messages
syslog	Messages generated internally by syslogd
lpr	Line printer subsystem
news	Network news subsystem
uucp	UUCP subsystem
cron	Clock daemon
authpriv	Security/authorization messages (private)
ftp	FTP daemon
msgtext	Exclude messages containing a certain text string.
<text-string>	A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line.

Default No log messages are excluded

Mode Global configuration

Example To exclude messages that contain the string 'example of irrelevant message' being sent to the remote syslog server 10.10.10.100, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.10.10.100 exclude msgtext example
of irrelevant message
```

Example (VRF-lite) To exclude messages that contain the string 'example of irrelevant message' being sent to the remote syslog server 10.10.10.100, within VRF 'red', use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.10.10.100 vrf red exclude msgtext
example of irrelevant message
```

Command changes Version 5.2.2-1.1: **vrf** parameter added for products that support VRF

log host (filter)

Overview This command creates a filter to select messages to be sent to a remote syslog server. Selection can be based on the priority/severity of the message, the program that generated the message, the logging facility used, a substring within the message or a combination of some or all of these.

The **no** variant of this command configures the device to no longer send log messages to a remote syslog server. The IP address of the syslog server must be specified. All configuration relating to this log target will be removed.

Syntax log host <ip-addr> [level <level>] [program <program-name>]
[facility <facility>] [msgtext <text-string>]
no log host <ip-addr> [level <level>] [program <program-name>]
[facility <facility>] [msgtext <text-string>]

Syntax (VRF-lite) log host <ip-addr> [vrf <vrf-name>] [level <level>] [program
<program-name>] [facility <facility>] [msgtext <text-string>]
no log host <ip-addr> [vrf <vrf-name>] [level <level>] [program
<program-name>] [facility <facility>] [msgtext <text-string>]

Parameter	Description																
<ip-addr>	The IP address of a remote syslog server.																
vrf <vrf-name>	The name of a VRF instance. Use this if the syslog server is inside a VRF. The default is the global VRF.																
level	Filter messages by severity level.																
<level>	The minimum severity of message to send. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity: <table><tr><td>0 emergencies</td><td>System is unusable</td></tr><tr><td>1 alerts</td><td>Action must be taken immediately</td></tr><tr><td>2 critical</td><td>Critical conditions</td></tr><tr><td>3 errors</td><td>Error conditions</td></tr><tr><td>4 warnings</td><td>Warning conditions</td></tr><tr><td>5 notices</td><td>Normal, but significant, conditions</td></tr><tr><td>6 informational</td><td>Informational messages</td></tr><tr><td>7 debugging</td><td>Debug-level messages</td></tr></table>	0 emergencies	System is unusable	1 alerts	Action must be taken immediately	2 critical	Critical conditions	3 errors	Error conditions	4 warnings	Warning conditions	5 notices	Normal, but significant, conditions	6 informational	Informational messages	7 debugging	Debug-level messages
0 emergencies	System is unusable																
1 alerts	Action must be taken immediately																
2 critical	Critical conditions																
3 errors	Error conditions																
4 warnings	Warning conditions																
5 notices	Normal, but significant, conditions																
6 informational	Informational messages																
7 debugging	Debug-level messages																
program	Filter messages by program. Include messages from a specified program.																
<program-name>	The name of a program to log messages from. You can enter either one of the following predefined program names (depending on your device model), or another program name that you find in the log output. The pre-defined names are not case sensitive but other program names from the log output are. <table><tr><td>rip</td><td>Routing Information Protocol (RIP)</td></tr></table>	rip	Routing Information Protocol (RIP)														
rip	Routing Information Protocol (RIP)																

Parameter	Description

loopprot	Loop Protection
poe	Power-inline (Power over Ethernet)
dhcpsn	DHCP snooping (DHCP SN)
facility	Filter messages by syslog facility.
<facility>	Specify one of the following syslog facilities to include messages from:
kern	Kernel messages
user	Random user-level messages
mail	Mail system
daemon	System daemons
auth	Security/authorization messages
syslog	Messages generated internally by syslogd
lpr	Line printer subsystem
news	Network news subsystem
uucp	UUCP subsystem
cron	Clock daemon
authpriv	Security/authorization messages (private)

Parameter	Description
	ftp FTP daemon
msgtext	Select messages containing a certain text string.
<text-string>	A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line.

Mode Global Configuration

Examples To create a filter to send all messages generated by EPSR that have a severity of **notices** or higher to a remote syslog server with IP address 10.32.16.21, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.21 level notices program epsr
```

To create a filter to send all messages containing the text "Bridging initialization", to a remote syslog server with IP address 10.32.16.21, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.21 msgtext "Bridging
initialization"
```

To create a filter to send messages with a severity level of **informational** and above to the syslog server with IP address 10.32.16.21, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.21 level informational
```

To remove a filter that sends all messages generated by EPSR that have a severity of **notices** or higher to a remote syslog server with IP address 10.32.16.21, use the following commands:

```
awplus# configure terminal
awplus(config)# no log host 10.32.16.21 level notices program
epsr
```

To remove a filter that sends all messages containing the text "Bridging initialization", to a remote syslog server with IP address 10.32.16.21, use the following commands:

```
awplus# configure terminal
awplus(config)# no log host 10.32.16.21 msgtext "Bridging
initialization"
```

To remove a filter that sends messages with a severity level of **informational** and above to the syslog server with IP address 10.32.16.21, use the following commands:

```
awplusawpluls# configure terminal
awplus(config)# no log host 10.32.16.21 level informational
```

Example (VRF-lite) To create a filter to send messages with a severity level of **informational** and above to the syslog server with IP address 10.32.16.21, when that server is in VRF 'red', use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.21 vrf red level
informational
```

Related commands

default log host

log host

log host exclude

log host source

log host time

show log config

Command changes Version 5.5.2-1.1: **vrf** parameter added for products that support VRF

log host time

Overview This command configures the time used in messages sent to a remote syslog server. If the syslog server is in a different time zone to your device then the time offset can be configured using either the **utc-offset** parameter option keyword or the **local-offset** parameter option keyword, where **utc-offset** is the time difference from UTC (Universal Time, Coordinated) and **local-offset** is the difference from local time.

Syntax `log host {<hostname>|<ipv4-addr>|<ipv6-addr>} time {local|local-offset|utc-offset {plus|minus} <0-24>}`

Syntax (VRF-lite) `log host {<ipv4-addr>|<ipv6-addr>} [vrf <vrf-name>] time {local|local-offset|utc-offset {plus|minus} <0-24>}`

Parameter	Description
<hostname>	The host name of a remote syslog server.
<ipv4-addr>	The IPv4 address of a remote syslog server, in A.B.C.D format.
<ipv6-addr>	The IPv6 address of a remote syslog server, in X:X::X:X format.
<email-address>	The email address to send log messages to
vrf <vrf-name>	The name of a VRF instance. Use this if the syslog server is inside a VRF. The default is the global VRF.
time	Specify the time difference between the email recipient and the device you are configuring.
local	The device is in the same time zone as the email recipient
local-offset	The device is in a different time zone to the email recipient. Use the plus or minus keywords and specify the difference (offset) from local time of the device to the email recipient in hours.
utc-offset	The device is in a different time zone to the email recipient. Use the plus or minus keywords and specify the difference (offset) from UTC time of the device to the email recipient in hours.
plus	Negative offset (difference) from the device to the syslog server.
minus	Positive offset (difference) from the device to the syslog server.
<0-24>	World Time zone offset in hours

Default The default is **local** time.

Mode Global Configuration

Usage notes Use the **local** option if the remote syslog server is in the same time zone as the device. Messages will display the time as on the local device when the message was generated.

Use the **offset** option if the email recipient is in a different time zone to this device. Specify the time offset of the remote syslog server in hours. Messages will display the time they were generated on this device but converted to the time zone of the remote syslog server.

Examples To send messages to the remote syslog server with the IP address 10.32.16.21 in the same time zone as the device's local time zone, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.21 time local 0
```

To send messages to the remote syslog server with the IP address 10.32.16.12 with the time information converted to the time zone of the remote syslog server, which is 3 hours ahead of the device's local time zone, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.12 time local-offset plus 3
```

To send messages to the remote syslog server with the IP address 10.32.16.02 with the time information converted to the time zone of the email recipient, which is 3 hours behind the device's UTC time zone, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.02 time utc-offset minus 3
```

Example (VRF-lite) To send messages to the remote syslog server with the IP address 10.32.16.02 within the VRF 'red', in the same time zone as the switch's local time zone, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.02 vrf red time utc-offset minus 3
```

Command changes Version 5.5.2-1.1: **vrf** parameter added for products that support VRF

max-fib-routes (VRF)

Overview This command now enables you to control the maximum number of FIB routes configured for a VRF instance. It operates by providing parameters that enable you to configure preset maximums and warning message thresholds.

NOTE: This command applies to a user-defined VRF instance; to set the max-fib-routes for the Global VRF instance use the [max-fib-routes](#) command. For static routes use the [max-static-routes](#) command for the Global VRF instance and the [max-static-routes \(VRF\)](#) command for a user-defined VRF instance.

Use the **no** variant of this command to set the maximum number of FIB routes to the default of 4294967294 FIB routes.

Syntax max-fib-routes <1-4294967294> [<1-100>|warning-only]
no max-fib-routes

Parameter	Description
max-fib-routes	The maximum number of routes that can be stored in Forwarding Information dataBase for either the Global VRF or a VRF instance.
<1-4294967294>	The allowable configurable range for setting the maximum number of FIB-routes.
<1-100>	This parameter enables you to optionally apply a percentage value. This percentage will be based on the maximum number of FIB routes you have specified. This will cause a warning message to appear when your routes reach your specified percentage value. Routes can continue to be added until your configured maximum value is reached.
warning-only	This parameter enables you to optionally apply a warning message. If you set this option a warning message will appear if your maximum configured value configured. Routes can continue to be added until your switch reaches either the maximum capacity value of 4294967294, or a practical system limit.

Mode VRF Configuration

Default Sets the maximum number of dynamic routes to 4294967294 and no warning threshold.

Examples To set the maximum number of dynamic routes to 2000 and warning threshold of 75% on VRF instance blue, use the commands:

```
awplus# config terminal
awplus(config)# ip vrf blue
awplus(config-vrf)# max-fib-routes 2000 75
```

**Related
commands** [max-fib-routes](#)
 [show ip route](#)

max-static-routes (VRF)

Overview Use this command to set the maximum number of static routes (excluding FIB—Forwarding Information Base routes) for VRF instances. A limit of 1000 static routes can be assigned to each individual VRF instance. For example you can assign 800 static routes to the Global VRF, then also assign 600 static routes to VRF instance Blue, and a further 600 routes to VRF instance Green.

NOTE: This command applies to a user-defined VRF instance; to set the max-static-routes for the Global VRF instance use the [max-static-routes](#) command. For FIB routes use the [max-fib-routes](#) command for the Global VRF instance and the [max-fib-routes \(VRF\)](#) command for a user-defined VRF instance.

Use the **no** variant of this command to reset the maximum number of static routes to the default value of 1000.

Syntax max-static-routes <1-1000>
no max-static-routes

Default The default number of static routes is the maximum number of static routes (1000).

Mode VRF Configuration

Example To assign 200 static routes to VRF instance Blue, use the following commands:

```
awplus# configure terminal
awplus(config)# ip vrf blue
awplus(config-vrf)# max-static-routes 200
```

NOTE: Static routes are applied before adding routes to the RIB (Routing Information Base). Therefore, rejected static routes will not appear in the running config.

Related commands [max-fib-routes \(VRF\)](#)

neighbor next-hop-self

Overview Use this command to configure the BGP or BGP4+ router as the next hop for a BGP or BGP4+ speaking neighbor or peer group.

Use the **no** variant of this command to disable this feature.

Syntax `neighbor <neighborid> next-hop-self`
`no neighbor <neighborid> next-hop-self`

Parameter	Description
<neighborid>	{ <ip-address> <ipv6-addr> <peer-group> }
<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group.

Mode [BGP] Router Configuration or IPv4 Address Family Configuration

Mode [BGP4+] IPv6 Address Family Configuration

Usage notes This command allows a BGP or BGP4+ router to change the next hop information that is sent to the iBGP peer. The next hop information is set to the IP address of the interface used to communicate with the neighbor.

This command can be run for a specific VRF instance.

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72 next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router)# neighbor 10.10.0.72 next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router)# no neighbor 10.10.0.72 next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.72 remote-as 10
awplus(config-router)# neighbor 10.10.10.72 peer-group group1
awplus(config-router)# neighbor group1 next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 next-hop-self
```

Examples
[BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
next-hop-self

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
next-hop-self

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 next-hop-self

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 next-hop-self
```

**Related
commands**

[neighbor route-map](#)

**Command
changes**

Added to AlliedWare Plus prior to 5.4.6-1
Version 5.4.7-2.1: BGP support added for x510 and x550 series
Version 5.4.7-2.4: BGP support added for IE300 series

neighbor password

Overview Use this command to enable MD5 authentication on a TCP connection between BGP and BGP4+ neighbors. No authentication is applied by default. To setup authentication for the session, you must first apply authentication on each connected peer for the session.

Use the **no** variant of this command to disable this function.

Syntax [BGP] `neighbor {<ip-address>|<peer-group-name>} password <password>`
`no neighbor {<ip-address>|<peer-group-name>} password`
`[<password>]`

Syntax [BGP4+] `neighbor {<ipv6-addr>|<peer-group-name>} password <password>`
`no neighbor {<ipv6-addr>|<peer-group-name>} password`
`[<password>]`

Parameter	Description
<ip-address>	Specifies the IP address of the BGP neighbor, in A.B.C.D format.
<ipv6-addr>	Specifies the IPv6 address of the BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group-name>	Name of an existing peer-group. When this parameter is used with this command, the command applies on all peers in the specified group.
<password>	An alphanumeric string of characters to be used as password.

Default No authentication is applied by default.

Mode [BGP] Router Configuration or IPv4 Address Family Configuration

Mode [BGP4+] Router Configuration

Usage notes When using the <peer-group-name> parameter with this command (to apply this command to all peers in the group), see the related commands [neighbor peer-group \(add a neighbor\)](#) and [neighbor route-map](#) for information about how to create peer groups first.

Examples [BGP] This example specifies the encryption type and the password 'manager' for the neighbor 10.10.10.1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 password manager
```

This example removes the password set for the neighbor 10.10.10.1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 password
```

This example specifies the encryption type and the password 'manager' for the neighbor peer group named 'group1':

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 password manager
```

This example removes the password set for the neighbor peer group named group1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 password
```

**Examples
(VRF-lite)**

This example specifies the password ('manager') for the neighbor peer group named 'group1' for an IPv4 address-family VRF instance name 'red', and router bgp 10:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4 vrf red
awplus(config-router-af)# neighbor 10.10.10.1 password manager
```

This example removes the password ('manager') for the neighbor peer group named 'group1' for an IPv4 address-family, VRF instance name 'red', and router bgp 10:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4 vrf red
awplus(config-router-af)# no neighbor 10.10.10.1 password
manager
```

This example specifies the password ('manager') for the neighbor peer group named 'group1' for an IPv4 address-family, VRF instance name 'red', and router bgp 10:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# address-family ipv4 vrf red
awplus(config-router-af)# neighbor group1 password manager
```

Examples [BGP4+] This example specifies the encryption type and the password 'manager' for the neighbor 2001:0db8:010d::1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor password manager
2001:0db8:010d::1
```

This example removes the password set for the neighbor 2001:0db8:010d::1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor password 2001:0db8:010d::1
```

This example specifies the encryption type and the password 'manager' for the neighbor peer group named group1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor remote-as 102001:0db8:010d::1
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor peer-group group1
2001:0db8:010d::1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 password manager
```

This example removes the password set for the neighbor peer group named 'group1':

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 password
```

**Command
changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for x510 and x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

neighbor remote-as

Overview Use this command to configure an internal or external BGP or BGP4+ (iBGP or eBGP) peering relationship with another router.

Use the **no** variant of this command to remove a previously configured BGP or BGP4+ peering relationship.

Syntax `neighbor <neighborid> remote-as <as-number>`
`no neighbor <neighborid> remote-as <as-number>`

Syntax (VRF- lite) `neighbor <neighborid> remote-as <as-number> [global|vrf <vrf-name>]`
`no neighbor <neighborid> remote-as <as-number>`

Parameter	Description
<neighborid>	{ <ip-address> ipv6-addr <peer-group> }
	<ip-address> Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
	<ipv6-addr> Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
	<peer-group> Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group.
<as-number>	<1-4294967295> Neighbor's Autonomous System (AS) number.
global	Specify that the remote neighbor exists locally within the device, in the global routing domain
vrf	Specify that the remote neighbor exists locally within the device, in the specified VRF instance.
<vrf-name>	The name of the VRF instance.

Mode [BGP] Router Configuration or IPv4 Address Family Configuration

Mode [BGP4+] Router Configuration

Usage notes This command is used to configure iBGP and eBGP peering relationships with other BGP or BGP4+ neighbors. A peer-group support of this command is configured only after creating a specific peer-group. Use the **no** variant of this command to remove a previously configured BGP peering relationship.

The **vrf** and **global** parameters are used to create internal 'loopback' BGP connections within the device between two VRF instances. This is used to leak BGP routes between a named VRF instance and the global routing instance. This requires BGP neighbors to be configured in both the global routing instance and in the named VRF instance.

Examples [BGP] To configure a BGP peering relationship from the neighbor with the IPv4 address 10.10.0.73 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.73 remote-as 10
```

To remove a configured BGP peering relationship from the neighbor with the IPv4 address 10.10.0.73 from another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.73 remote-as 10
```

To configure a BGP peering relationship from the neighbor with the peer group named group1 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 remote-as 10
```

To remove a configured BGP peering relationship from the neighbor with the peer group named group1 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 remote-as 10
```

Examples [BGP4+] To configure a BGP4+ peering relationship with another router:

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 345
```

To remove a configured BGP4+ peering relationship from another router:

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# no neighbor 2001:0db8:010d::1 remote-as 345
```

To configure a BGP4+ peering relationship from the neighbor with the peer group named group1 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 remote-as 10
```

To remove a configured BGP4+ peering relationship from the neighbor with the peer group named group1 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 remote-as 10
```

**Command
changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for x510 and x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

network (RIP)

Overview Use this command to activate the transmission of RIP routing information on the defined network.

Use the **no** variant of this command to remove the specified network or interface as one that runs RIP.

Syntax `network {<network-address>[/<subnet-mask>]|<interface>}`
`no network {<network-address>[/<subnet-mask>]|<interface>}`

Parameter	Description
<code><network-address></code> <code>[/<subnet-mask>]</code>	Specifies the network address to run RIP. Entering a subnet mask (or prefix length) for the network address is optional. Where no mask is entered, the device will attempt to apply a mask that is appropriate to the class (A, B, or C) of the address entered, e.g. an IP address of 10.0.0.0 will have a prefix length of 8 applied to it.
<code><interface></code>	Specify an interface to run RIP.

Default Disabled

Mode RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

Usage notes Use this command to specify networks, by IP address or interface, to which routing updates will be sent and received. The connected routes corresponding to the specified network will be automatically advertised in RIP updates. RIP updates will be sent and received within the specified network.

When running VRF-lite, this command can be applied to a VRF instance.

Example Use the following commands to activate RIP routing updates on network 172.16.20.0/24:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# network 172.16.20.0/24
```

Example (VRF-lite) To activate RIP routing updates on vlan3 for VRF instance 'blue'.

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# network vlan3
```

**Related
commands** `show ip rip`
 `show running-config`
 `clear ip rip route`

offset-list (RIP)

Overview Use this command to add an offset to the **in** and **out** metrics of routes learned through RIP.

Use the **no** variant of this command to remove the offset list.

Syntax `offset-list <access-list> {in|out} <offset> [<interface>]`
`no offset-list <access-list> {in|out} <offset> [<interface>]`

Parameter	Description
<access-list>	Specifies the access-list number or names to apply. Note that you can only use standard ACLs, not extended ACLs.
in	Indicates the access list will be used for metrics of incoming advertised routes.
out	Indicates the access list will be used for metrics of outgoing advertised routes.
<offset>	<0-16> Specifies that the offset is used for metrics of networks matching the access list.
<interface>	An alphanumeric string that specifies the interface to match.

Default The default offset value is the metric value of the interface over which the updates are being exchanged.

Mode RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

Usage Use this command to specify the offset value that is added to the routing metric. When the networks match the access list the offset is applied to the metrics. No change occurs if the offset value is zero.

Examples In this example the router examines the RIP updates being sent out from interface vlan2 and adds 5 hops to the routes matching the IP addresses specified in the access list 8. To do this, use these commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# offset-list 8 in 5 vlan2
```

To apply this same command within the specific VRF instance named 'blue', use these commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# offset-list 8 in 5 vlan2
```

Related commands [access-list \(extended numbered\)](#)

passive-interface (RIP)

Overview Use this command to block RIP broadcasts on the interface.
Use the **no** variant of this command to disable this function.

Syntax `passive-interface <interface>`
`no passive-interface <interface>`

Parameter	Description
<code><interface></code>	Specifies the interface name.

Default Disabled

Mode RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

Example Use the following commands to block RIP broadcasts on vlan2:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# passive-interface vlan2
```

Example (VRF-lite) To apply the example above to a specific VRF instance named 'green', use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf green
awplus(config-router-af)# passive-interface vlan2
```

Related commands [show ip rip](#)

ping

Overview This command sends a query to another IPv4 host (send Echo Request messages).

Syntax ping [ip] <host> [broadcast] [df-bit {yes|no}] [interval <0-128>] [pattern <hex-data-pattern>] [repeat {<1-2147483647>|continuous}] [size <36-18024>] [source <ip-addr>] [timeout <1-65535>] [tos <0-255>]

Syntax (VRF-lite) ping [vrf <vrf-name>] [ip] <host> [broadcast] [df-bit {yes|no}] [interval <0-128>] [pattern <hex-data-pattern>] [repeat {<1-2147483647>|continuous}] [size <36-18024>] [source <ip-addr>] [timeout <1-65535>] [tos <0-255>]

Parameter	Description
<host>	The destination IP address or hostname.
broadcast	Allow pingging of a broadcast address.
df-bit	Enable or disable the do-not-fragment bit in the IP header.
interval <0-128>	Specify the time interval in seconds between sending ping packets. The default is 1. You can use decimal places to specify fractions of a second. For example, to ping every millisecond, set the interval to 0.001.
pattern <hex-data-pattern>	Specify the hex data pattern.
repeat	Specify the number of ping packets to send.
<1-2147483647>	Specify repeat count. The default is 5.
continuous	Continuous ping
size <36-18024>	The number of data bytes to send, excluding the 8 byte ICMP header. The default is 56 (64 ICMP data bytes).
source <ip-addr>	The IP address of a configured IP interface to use as the source in the IP header of the ping packet.
timeout <1-65535>	The time in seconds to wait for echo replies if the ARP entry is present, before reporting that no reply was received. If no ARP entry is present, it does not wait.
tos <0-255>	The value of the type of service in the IP header.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.

Mode User Exec and Privileged Exec

Example To ping the IP address 10.10.0.5 use the following command:

```
awplus# ping 10.10.0.5
```

Example (VRF-lite) To ping the IP address 10.10.0.5 from VRF instance 'red', use the following command:

```
awplus# ping vrf red 10.10.0.5
```

NOTE: Unless a cross-domain static or leaked route exists to the destination IP address, you must run this command from within the same routing domain as the address being pinged.

radius-server host

Overview Use this command to specify a remote RADIUS server host for authentication or accounting, and to set server-specific parameters. The parameters specified with this command override the corresponding global parameters for RADIUS servers. This command specifies the IP address or host name of the remote RADIUS server host and assigns authentication and accounting destination UDP port numbers.

This command adds the RADIUS server address and sets parameters to the RADIUS server. The RADIUS server is added to the running configuration after you issue this command. If parameters are not set using this command then common system settings are applied.

Use the **no** variant of this command to remove the specified server host as a RADIUS authentication and/or accounting server and set the destination port to the default RADIUS server port number (1812).

Syntax

```
radius-server host {<host-name>|<ip-address>} [acct-port <0-65535>] [auth-port <0-65535>] [key <key-string>] [retransmit <0-100>] [timeout <1-1000>]  
  
radius-server host {<host-name>|<ip-address>} [acct-port <0-65535>] [auth-port <0-65535>] [key-encrypted <encrypted-key-string>] [retransmit <0-100>] [timeout <1-1000>]  
  
no radius-server host {<host-name>|<ip-address>} [acct-port <0-65535>] [auth-port <0-65535>]
```

Syntax (VRF-lite)

```
radius-server host {<host-name>|<ip-address>} [acct-port <0-65535>] [auth-port <0-65535>] [key <key-string>] [retransmit <0-100>] [timeout <1-1000>] [vrf <vrf-name>]  
  
radius-server host {<host-name>|<ip-address>} [acct-port <0-65535>] [auth-port <0-65535>] [key-encrypted <encrypted-key-string>] [retransmit <0-100>] [timeout <1-1000>] [vrf <vrf-name>]  
  
no radius-server host {<host-name>|<ip-address>} [acct-port <0-65535>] [auth-port <0-65535>] [vrf <vrf-name>]
```

Parameter	Description
<host-name>	Server host name. The DNS name of the RADIUS server host.
<ip-address>	The IP address of the RADIUS server host.
acct-port	Accounting port. Specifies the UDP destination port for RADIUS accounting requests. If 0 is specified, the server is not used for accounting. The default UDP port for accounting is 1813.
<0-65535>	UDP port number. (Accounting port number is set to (accounting port number is set to 1813 by default) Specifies the UDP destination port for RADIUS accounting requests. If 0 is specified, the host is not used for accounting.

Parameter	Description
auth-port	Authentication port. Specifies the UDP destination port for RADIUS authentication requests. If 0 is specified, the server is not used for authentication. The default UDP port for authentication is 1812.
<0-65535>	UDP port number (authentication port number is set to 1812 by default). Specifies the UDP destination port for RADIUS authentication requests. If 0 is specified, the host is not used for authentication.
timeout	Specifies the amount of time to wait for a response from the server. If this parameter is not specified the global value configured by the radius-server timeout command is used.
<1-1000>	Time in seconds to wait for a server reply (timeout is set to 5 seconds by default). The time interval (in seconds to wait for the RADIUS server to reply before retransmitting a request or considering the server dead. This setting overrides the global value set by the radius-server timeout command. If no timeout value is specified for this server, the global value is used.
retransmit	Specifies the number of retries before skip to the next server. If this parameter is not specified the global value configured by the radius-server retransmit command is used.
<0-100>	Maximum number of retries (maximum number of retries is set to 3 by default). The maximum number of times to resend a RADIUS request to the server, if it does not respond within the timeout interval, before considering it dead and skipping to the next RADIUS server. This setting overrides the global setting of the radius-server retransmit command. If no retransmit value is specified, the global value is used.
key	Set shared secret key with RADIUS servers.
<key-string>	Shared key string applied. Specifies the shared secret authentication or encryption key for all RADIUS communications between this device and the RADIUS server. This key must match the encryption used on the RADIUS daemon. All leading spaces are ignored, but spaces within and at the end of the string are used. If spaces are used in the string, do not enclose the string in quotation marks unless the quotation marks themselves are part of the key. This setting overrides the global setting of the radius-server key command. If no key value is specified, the global value is used.
key-encrypted	Set an encrypted shared secret key. When secure mode is enabled, the running configuration contains this parameter instead of the key parameter. It indicates that the device stores keys in the running configuration in encrypted form instead of in plain text.

Parameter	Description
<code><encrypted-key -string></code>	Encrypted shared key string.
<code>vrf <vrf-name></code>	The name of a VRF instance. Use this to specify the VRF that the RADIUS server is accessible by. Servers are uniquely identified by their address and VRF, so multiple servers can have the same address or host-name as long as the VRF is different. The default is the global VRF.

Default The RADIUS client address is not configured (null) by default. No RADIUS server is configured.

Mode Global Configuration

Usage Multiple **radius-server host** commands can be used to specify multiple hosts. The software searches for hosts in the order they are specified. If no host-specific timeout, retransmit, or key values are specified, the global values apply to that host. If there are multiple RADIUS servers for this client, use this command multiple times—once to specify each server.

If you specify a host without specifying the auth port or the acct port, it will by default be configured for both authentication and accounting, using the default UDP ports. To set a host to be a RADIUS server for authentication requests only, set the **acct-port** parameter to 0; to set the host to be a RADIUS server for accounting requests only, set the **auth-port** parameter to 0.

A RADIUS server is identified by IP address, authentication port and accounting port. A single host can be configured multiple times with different authentication or accounting ports. All the RADIUS servers configured with this command are included in the predefined RADIUS server group **radius**, which may be used by AAA authentication, authorization and accounting commands. The client transmits (and retransmits, according to the **retransmit** and **timeout** parameters) RADIUS authentication or accounting requests to the servers in the order you specify them, until it gets a response.

Examples To add the RADIUS server 10.0.0.20, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host 10.0.0.20
```

To set the secret key to 'mySecret' on the RADIUS server 10.0.0.20, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host 10.0.0.20 key mySecret
```

To delete the RADIUS server 10.0.0.20, use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server host 10.0.0.20
```

To configure rad1.company.com for authentication only, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host rad1.company.com acct-port 0
```

To remove the RADIUS server rad1.company.com configured for authentication only, use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server host rad1.company.com
acct-port 0
```

To configure rad2.company.com for accounting only, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host rad2.company.com auth-port 0
```

To configure 192.168.1.1 with authentication port 1000, accounting port 1001 and retransmit count 5, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host 192.168.1.1 auth-port 1000
acct-port 1001 retransmit 5
```

Examples (VRF-lite)

To add the RADIUS server 10.0.0.20 in the VRF named 'red', use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host 10.0.0.20 vrf red
```

To set the secret key to 'mySecret' on the RADIUS server 10.0.0.20 in the VRF named 'red', use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host 10.0.0.20 key mySecret vrf
red
```

Command changes

Version 5.5.2-1.1: **vrf** parameter added for products that support VRF
Version 5.4.9-2.1: **key-encrypted** parameter added

rd (route distinguisher)

Overview This command creates a Route Distinguisher (RD). The RD forms part of the route table creation process for a VRF instance and is implemented only when using BGP routing.

Syntax `rd {<ASN:n>|<ip-address:n>}`

CAUTION: This command does not have a “no” variant. To remove the RD requires deleting the VRF instance to which it is assigned. Therefore, it is important that you carefully enter the correct value for the RD.

Parameter	Description
<ASN:n>	The RD reference number. This is based on the formal RD format structure of ASN number:Ref number. The ASN value can be any number between 1 and 4294967295, and the value n can be any number between 1 and 65535.
<ip-address:n>	The RD reference number. This is based on the formal RD format structure of IP-address:Ref number. The IP-address must be in IPv4 format. The value n can be any number between 1 and 65535.

NOTE: The above table refers to an ASN or Autonomous System Number. If you have a formal ASN number assigned to your BGP network, you should enter this value. Alternatively; because the Route Distinguisher has limited functionality in VRF-lite, you can use an unofficial value for your ASN when configuring this particular command.

Mode VRF Configuration

Usage notes For the implementation of VRF-lite installed on your switch, this command has little practical functionality. However, the switch does check certain components of the RD that you enter. For this reason, the RD syntax must comply with the structural formats defined above, and each value that you assign to a VRF instance must be unique on the switch. Good networking practice is to use common values for the RD and RT within a VRF instance.

Default No default RD is configured.

Example To create an RD 100:2 that is associated with VRF “red” use the following commands:

```
awplus# config terminal
awplus(config)# ip vrf red
awplus(config-vrf)# rd 100:2
```

Related commands [show ip vrf](#)

redistribute (into BGP or BGP4+)

Overview Use this command to inject routes from one routing process into a BGP or BGP4+ routing table.

Use the **no** variant of this command to disable this function.

Syntax `redistribute {ospf|rip|connected|static} [route-map
<route-map-entry-pointer>]`
`no redistribute {ospf|rip|connected|static} [route-map
<route-map-entry-pointer>]`

Parameter	Description
connected	Specifies the redistribution of connected routes for both BGP and BGP4+.
ospf	Specifies the redistribution of OSPF information for BGP or OSPFv3 information for BGP4+.
rip	Specifies the redistribution of RIP information for BGP or RIPng information for BGP4+.
static	Specifies the redistribution of Static routes for both BGP and BGP4+.
route-map	Route map reference for both BGP and BGP4+.
<route-map-entry-pointer>	Pointer to route-map entries.

Mode [BGP] Router Configuration or IPv4 Address Family Configuration

Mode [BGP4+] Router Configuration or IPv6 Address Family Configuration

Usage notes Redistribution is used by routing protocols to advertise routes that are learned by some other means, such as by another routing protocol or by static routes. Since all internal routes are dumped into BGP, careful filtering is applied to make sure that only routes to be advertised reach the internet, not everything. This command allows redistribution by injecting prefixes from one routing protocol into another routing protocol.

Examples [BGP/ BGP+] The following example shows the configuration of a route-map named `rmap1`, which is then applied using the **redistribute route-map** command.

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 1
awplus(config-route-map)# match origin incomplete
awplus(config-route-map)# set metric 100
awplus(config-route-map)# exit
awplus(config)# router bgp 12
awplus(config-router)# redistribute ospf route-map rmap1
```

To apply the above example to a specific VRF instance named `blue`, use the following commands:

```
awplus(config)# router bgp 12
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# redistribute ospf route-map rmap1
```

The following example shows the configuration of a route-map named `rmap2`, which is then applied using the **redistribute route-map** command.

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 3
awplus(config-route-map)# match interface vlan1
awplus(config-route-map)# set metric-type 1
awplus(config-route-map)# exit
awplus(config)# router ospf 100
awplus(config-router)# redistribute bgp route-map rmap2
```

Note that configuring a route-map and applying it with the **redistribute route-map** command allows you to filter which routes are distributed from another routing protocol (such as OSPF with BGP). A route-map can also set the metric, tag, and metric-type of the redistributed routes.

**Command
changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for x510 and x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

redistribute (OSPF)

Overview Use this command to redistribute routes from other routing protocols, static routes and connected routes into an OSPF routing table.

Use the **no** variant of this command to disable this function.

Syntax

```
redistribute {bgp|connected|rip|static} {metric  
<0-16777214>|metric-type {1|2}|route-map <name>|tag  
<0-4294967295>}  
  
no redistribute {bgp|connected|rip|static} {metric  
<0-16777214>|metric-type {1|2}|route-map <name>|tag  
<0-4294967295>}
```

Parameter	Description
bgp	Specifies that this applies to the redistribution of BGP routes.
connected	Specifies that this applies to the redistribution of connected routes.
rip	Specifies that this applies to the redistribution of RIP routes.
static	Specifies that this applies to the redistribution of static routes.
metric	Specifies the external metric.
metric-type	Specifies the external metric-type.
route-map	Specifies name of the route-map.
tag	Specifies the external route tag.

Default The default metric value for routes redistributed into OSPF is 20. The metric can also be defined using the [set metric](#) command for a route map. Note that a metric defined using the [set metric](#) command for a route map overrides a metric defined with this command.

Mode Router Configuration

Usage notes You use this command to inject routes, learned from other routing protocols, into the OSPF domain to generate AS-external-LSAs. If a route-map is configured by this command, then that route-map is used to control which routes are redistributed and can set metric and tag values on particular routes.

The metric, metric-type, and tag values specified on this command are applied to any redistributed routes that are not explicitly given a different metric, metric-type, or tag value by the route map.

See the [OSPF Feature Overview and Configuration Guide](#) for more information about metrics, and about behavior when configured in route maps.

Note that this command does not redistribute the default route. To redistribute the default route, use the [default-information originate](#) command.

Example The following example shows redistribution of BGP routes into OSPF routing table 100, with metric 12.

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# redistribute bgp metric 12
```

The following example shows the configuration of a route-map named 'rmap2', which is then applied using the **redistribute route-map** command, so routes learned via a specified interface can be redistributed as type-1 external LSAs:

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 3
awplus(config-route-map)# match interface vlan1
awplus(config-route-map)# set metric-type 1
awplus(config-route-map)# exit
awplus(config)# router ospf 100
awplus(config-router)# redistribute rip route-map rmap2
```

Note that configuring a route-map and applying it with the **redistribute route-map** command allows you to filter which routes are distributed from another routing protocol (such as RIP). A route-map can also set the metric, tag, and metric-type of the redistributed routes.

Related commands

- [distribute-list \(OSPF\)](#)
- [match interface](#)
- [route-map](#)
- [show ip ospf database external](#)

redistribute (RIP)

Overview Use this command to redistribute information from other routing protocols into RIP.

When using VRF-lite, you can apply this command to a specific VRF instance.

Use the **no** variant of this command to disable the specified redistribution. The parameters **metric** and **route-map** may be used with the **no** variant, but have no effect.

Syntax `redistribute {connected|static|ospf|bgp} [metric <0-16>]
[route-map <route-map>]`
`no redistribute {connected|static|ospf|bgp} [metric] [route-map]`

Parameter	Description
route-map	Optional. Specifies route-map that controls how routes are redistributed.
<route-map>	Optional. The name of the route map.
connected	Redistribute from connected routes.
static	Redistribute from static routes.
ospf	Redistribute from Open Shortest Path First (OSPF).
bgp	Redistribute from Border Gateway Protocol (BGP).
metric <0-16>	Optional. Sets the value of the metric that will be applied to routes redistributed into RIP from other protocols. If a value is not specified, and no value is specified using the default-metric (RIP) command, the default is one.

Default By default, the RIP metric value is set to 1.

Mode RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

Example To apply the metric value 15 to static routes being redistributed into RIP, use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# redistribute static metric 15
```

Example (VRF-lite) To apply the metric value 15 to static routes in address-family ipv4 VRF instance blue being redistributed into RIP, use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# redistribute static metric 15
```

Related commands [default-metric \(RIP\)](#)

route (RIP)

Overview Use this command to add a static RIP route.
Use the **no** variant of this command to remove a static RIP route.

Syntax `route <ip-addr/prefix-length>`
`no route <ip-addr/prefix-length>`

Parameter	Description
<code><ip-addr/prefix-length></code>	The IPv4 address and prefix length.

Default No static RIP route is added by default.

Mode RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

Usage notes Use this command to add a static RIP route. After adding the RIP route, the route can be checked in the RIP routing table.

Example To create a static RIP route to IP subnet 192.168.1.0/24, use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# route 192.168.1.0/24
```

Example (VRF-lite) To create a static RIP route to IP subnet 192.168.1.0/24, for the VRF instance red, use the following commands

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf red
awplus(config-router-af)# route 192.168.1.0/24
```

Related commands [show ip rip](#)
[clear ip rip route](#)

route-target

Overview Use this command within a specific VRF instance, to create a route-target within the BGP extended communities path attribute field. This value can then be included in a list of import and export route target extended communities for the specified VRF instance. Learned routes that carry a specific route-target extended community are then imported into all VRFs configured with that extended community as an imported route-target.

The **no** variant of this command removes a route-target extended community for the VRF instance specified.

Syntax `route-target {import|export|both} {ASN:n|ip-address:n}`
`no route-target {import|export|both} {ASN:n|ip-address:n}`

Parameter	Description
<code>route-target</code>	Specifies a BGP extended community as a route-target.
<code>import</code>	Adds the route target to its import list.
<code>export</code>	Adds the route target to its export list.
<code>both</code>	Adds the route target to both the import and export lists.
<code><ASN:n></code>	The route target reference number. This uses the same structure that is defined for the RD. This being, ASN number:Ref number. The ASN value can be any number between 1 and 65535, and the value n can be any number between 1 and 4294967295.
<code><ip-address:n></code>	The route target reference number. This uses the same structure that is defined for the RD (Route Distinguisher). This being IP-address:Ref number. In practice, the IP-address can be an entry in IPv4 format, or an integer number between 1 and 4294967295. The value n can be any number between 1 and 65535.

Mode VRF Configuration

Default No route-target community attributes are associated with a VRF instance.

Usage notes In VRF systems that use MPLS, there is an close relationship between the Route Target (RT) and the Route Distinguisher (RD) values. For VRF-lite however, this relationship is only implicit in that they share the same format structure.

Example Use the following commands to create a route-target extended community for ASN value 200, and a Reference number of 3, within the VRF instance blue:

```
awplus# config terminal
awplus(config)# ip vrf blue
awplus(config-vrf)# route-target import 200:1
```

**Related
commands** `ip vrf`
`show ip vrf`

router ospf

Overview Use this command to enter Router Configuration mode to configure an OSPF routing process. You must specify the process ID with this command for multiple OSPF routing processes on the device.

Use the **no** variant of this command to terminate an OSPF routing process.

Use the **no** parameter with the **process-id** parameter, to terminate and delete a specific OSPF routing process. If no **process-id** is specified on the **no** variant of this command, then all OSPF routing processes are terminated, and all OSPF configuration is removed.

Syntax `router ospf [<process-id>]`
`no router ospf [<process-id>]`

Syntax (VRF-lite) `router ospf [<process-id>] [<vrf-instance>]`
`no router ospf [<process-id>]`

Parameter	Description
<code><process-id></code>	A positive number from 1 to 65535, that is used to define a routing process.
<code><vrf-instance></code>	The VRF instance to be associated with the OSPF routing process.

Default No routing process is defined by default.

Mode Global Configuration

Usage notes The process ID of OSPF is an optional parameter for the **no** variant of this command only. When removing all instances of OSPF, you do not need to specify each Process ID, but when removing particular instances of OSPF you must specify each Process ID to be removed.

When using VRF-lite, this command can be used to associate a process-id with a VRF instance that has been created using the [ip vrf](#) command.

Example To enter Router Configuration mode to configure an existing OSPF routing process 100, use the commands:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)#
```

Example (VRF-lite) To enter Router Configuration mode to configure an existing OSPF routing process 100 for VRF instance `red`, use the commands:

```
awplus# configure terminal
awplus(config)# router ospf 100 red
awplus(config-router)#
```

router-id (VRF)

Overview Use this command to specify a router identifier (in IP address format). When using VRF-Lite, the router-id is configured for the specified VRF instance.

Use the **no** variant of this command to force OSPF to use the previous OSPF router-id behavior.

Syntax `router-id <ip-address>`
`no router-id`

Parameter	Description
<code><ip-address></code>	Specifies the router ID in IPv4 address format.

Mode Router Configuration

Usage notes Configure each router with a unique router-id. In an OSPF router process that has active neighbors, a new router-id is used at the next reload or when you restart OSPF manually.

Example The following example shows a fixed router ID 10.10.10.60 for the VRF instance red:

```
awplus# configure terminal
awplus(config)# ip vrf red
awplus(config-router)# router-id 10.10.10.60
```

Related commands [show ip ospf](#)
[show ip vrf](#)

router ipv6 vrf ospf

Overview Use this command to enter Router Configuration mode to configure an IPv6 OSPF routing process for a named VRF. You must specify the VRF name that this routing process is to be used on.

Use the **no** variant of this command to terminate an IPv6 OSPF routing process.

Syntax `router ipv6 vrf ospf <vrf-name>`
`no router ipv6 vrf ospf <vrf-name>`

Parameter	Description
<code><vrf-name></code>	The VRF name that the router process is to be used on. This is also the process tag for the routing process, and is used in the interface command ipv6 router ospf area to link to the router process.

Mode Global Configuration

Example To enter Router Configuration mode for VRF red, use the commands:

```
awplus# configure terminal
awplus(config)# ip vrf red
awplus(config)# router ipv6 vrf ospf red
```

Related commands [ipv6 router ospf area](#)
[router ipv6 ospf](#)

Command changes Version 5.5.3-2.1: command added

show arp

Overview Use this command to display entries in the ARP routing and forwarding table—the ARP cache contains mappings of IP addresses to physical addresses for hosts. To have a dynamic entry in the ARP cache, a host must have used the ARP protocol to access another host.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show arp`

Syntax (VRF-lite) `show arp [global|vrf <vrf-name>]`

Parameter	Description
global	When VRF-lite is configured, apply this command to the global routing and forwarding table.
vrf	Apply this command to the specified VRF instance.
<vrf-name>	The VRF instance name.

Mode User Exec and Privileged Exec

Usage notes Running this command with no additional parameters will display all entries in the ARP routing and forwarding table.

With VRF-lite configured, and no additional parameters entered, the command output displays all entries, listed by their VRF instance. By adding either a specific VRF instance or global parameter entry, you can selectively list ARP entries by their membership of a specific VRF instance.

Example To display all ARP entries in the ARP cache, use the following command:

```
awplus# show arp
```

Output Figure 32-2: Example output from the **show arp** command

awplus#show arp				
IP Address	LL Address	Interface	Port	Type
192.168.27.10	192.168.4.1	vlan1	port1.1.1	dynamic
192.168.27.100	0000.daaf.cd24	vlan1	port1.1.2	dynamic
...				

Example (VRF-lite) To display the dynamic ARP entries in the global routing instance, use the command:

```
awplus# show arp global
```

Output Figure 32-3: Example output from the **show arp global** command

awplus#show arp global					
IP Address	LL Address	Interface	Port	Type	
192.168.10.2	0015.77ad.fad8	vlan1	port1.1.1	dynamic	
192.168.20.2	0015.77ad.fa48	vlan2	port1.1.2	dynamic	
192.168.1.100	00d0.6b04.2a42	vlan2	port1.1.3	static	

Example (VRF-lite) To display the dynamic ARP entries for a VRF instance 'red', use the command:

```
awplus# show arp vrf red
```

Output Figure 32-4: Example output from the **show arp vrf red** command

awplus# show arp vrf red					
[VRF: red]					
IP Address	LL Address	Interface	Port	Type	
192.168.10.2	0015.77ad.fad8	vlan1	port1.1.1	dynamic	

Table 1: Parameters in the output of the **show arp** command

Parameter	Meaning
IP Address	IP address of the network device this entry maps to.
LL Address	Hardware address of the network device.
Interface	Interface over which the network device is accessed.
Port	Physical port that the network device is attached to.
Type	Whether the entry is a static or dynamic entry. Static entries are added using the arp command. Dynamic entries are learned from ARP request/reply message exchanges.
VRF	The name of the VRF instance. The VRF-lite components only display when VRF-lite is configured.

Related commands

- [arp](#)
- [clear arp-cache](#)
- [ip vrf](#)
- [show arp security](#)

Command changes Version 5.4.9-0.1: Link layer addresses now shown as the hardware address (MAC Address output parameter has been renamed to LL Address).

show crypto key pubkey-chain knownhosts

Overview This command displays the list of public keys maintained in the known host database on the device.

Syntax `show crypto key pubkey-chain knownhosts [<1-65535>]`

Syntax (VRF-lite) `show crypto key pubkey-chain knownhosts [vrf <vrf-name>|global] [<1-65535>]`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
<1-65535>	Key identifier for a specific key. Displays the public key of the entry if specified.

Default Display all keys.

Mode User Exec, Privileged Exec and Global Configuration

Usage When VRF-lite is configured:

- If **vrf** is specified, this command displays the known host database from the specified VRF instance.
- If **global** is specified, this command displays the known host database from the global routing environment.
- If neither **vrf** nor **global** is specified, this command displays the known host database from the global routing environment and each configured VRF.

For more information about VRF, see the [VRF Lite Feature Overview and Configuration Guide](#).

Examples To display public keys of known SSH servers, use the command:

```
awplus# show crypto key pubkey-chain knownhosts
```

To display the key data of the first entry in the known host data, use the command:

```
awplus# show crypto key pubkey-chain knownhosts 1
```

Output Figure 32-5: Example output from the **show crypto key public-chain knownhosts** command

No	Hostname	Type	Fingerprint
1	172.16.23.1	rsa	c8:33:b1:fe:6f:d3:8c:81:4e:f7:2a:aa:a5:be:df:18
2	172.16.23.10	rsa	c4:79:86:65:ee:a0:1d:a5:6a:e8:fd:1d:d3:4e:37:bd
3	5ffe:1053:ac21:ff00:0101:bcd:f:ffff:0001	rsal	af:4e:b4:a2:26:24:6d:65:20:32:d9:6f:32:06:ba:57

Table 2: Parameters in the output of the **show crypto key public-chain knownhosts** command

Parameter	Description
No	Number ID of the key.
Hostname	Host name of the known SSH server.
Type	The algorithm used to generate the key.
Fingerprint	Checksum value for the public key.

Related commands [crypto key pubkey-chain knownhosts](#)

Command changes Version 5.5.3-1.1: added to AR1050V
Version 5.4.6-2.1: VRF-lite support added for AR-Series devices

show http client

Overview Use this command to show the current HTTP client VRF.

Syntax `show http client`

Mode Privileged Exec

Usage notes If no VRF has been set, the show command shows 'None'.

Example To display the HTTP client VRF, use the commands:

```
awplus# show http client
```

Output Figure 32-6: Example output from **show http client**

```
awplus#show http client
Hyper-Text Transfer Protocol Client Configuration
-----
VRF                                     : MyVRFPoE
```

Related commands [copy \(filename\)](#)

Command changes Version 5.5.2-1.1: command added

show ip bgp cidr-only (BGP only)

Overview Use this command to display routes with non-natural network masks.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show ip bgp cidr-only`

Syntax (VRF-lite) `show ip bgp [global|vrf <vrf-name>] cidr-only`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.

Mode User Exec and Privileged Exec

Example `awplus# show ip bgp cidr-only`
`awplus# show ip bgp vrf red cidr-only`

Output Figure 32-7: Example output from the **show ip bgp cidr-only** command

```
BGP table version is 0, local router ID is 10.10.10.50

Status codes: s suppressed, d damped, h history, p stale, *

Command changes Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for x510 and x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

show ip bgp community (BGP only)

Overview Use this command to display routes that match specified communities from a BGP instance within an IPv4 environment. Use the [show bgp ipv6 community \(BGP4+ only\)](#) command within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

You may use any combination and repetition of parameters listed in the *<type>* placeholder.

Syntax `show ip bgp community [<type>] [exact-match]`

Syntax (VRF-lite) `show ip bgp [global|vrf <vrf-name>] community [<type>] [exact-match]`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<i><vrf-name></i>	The name of the VRF instance.
<i><type></i>	{[<i>AA:NN</i>] [<i>local-AS</i>] [<i>no-advertise</i>] [<i>no-export</i>] }
	<i>AA:NN</i> Specifies the Autonomous System (AS) community number, in AA:NN format.
	<i>local-AS</i> Do not send outside local Autonomous Systems (well-known community).
	<i>no-advertise</i> Do not advertise to any peer (well-known community).
	<i>no-export</i> Do not export to next AS (well-known community).
exact-match	Specifies that the exact match of the communities is displayed. This optional parameter cannot be repeated.

Mode User Exec and Privileged Exec

Examples Note that the AS numbers shown are examples only.

```
awplus# show ip bgp community 64497:64499 exact-match
awplus# show ip bgp community 64497:64499 64500:64501
exact-match

awplus# show ip bgp community 64497:64499 64500:64501
64510:64511no-advertise

awplus# show ip bgp community no-advertise
no-advertiseno-advertise exact-match

awplus# show ip bgp community no-export 64510:64511
no-advertise local-AS no-export

awplus# show ip bgp community no-export 64510:64511
no-advertise 64497:64499 64500:64501 no-export

awplus# show ip bgp community no-export 64497:64499
no-advertise local-AS no-export

awplus# show ip bgp vrf red no-export

awplus# show ip bgp global 65500:2 65500:3 exact-match
```

Version 5.4.7-2.1: BGP support added for x510 and x550 series
Version 5.4.7-2.4: BGP support added for IE300 series

show ip bgp community-list (BGP only)

Overview Use this command to display routes that match the given community-list from a BGP instance within an IPv4 environment. Use the [show bgp ipv6 community-list \(BGP4+ only\)](#) command within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show ip bgp community-list <listname> [exact-match]`

Syntax (VRF-lite) `show ip bgp [global|vrf <vrf-name>] community-list <listname> [exact-match]`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
<listname>	Specifies the community list name.
exact-match	Displays only routes that have exactly the same specified communities.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip bgp community-list mylist exact-match
awplus# show ip bgp vrf red community-list myCommunity
awplus# show ip bgp global community-list myExactCommunity exact-match
```

Related commands [show bgp ipv6 community-list \(BGP4+ only\)](#)

Command changes

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products
- Version 5.4.7-2.1: BGP support added for x510 and x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

show ip bgp dampening (BGP only)

Overview Use this command to show dampened routes from a BGP instance within an IPv4 environment. Use the [show bgp ipv6 dampening \(BGP4+ only\)](#) command within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show ip bgp dampening
{dampened-paths|flap-statistics|parameters}`

Syntax (VRF-lite) `show ip bgp [global|vrf <vrf-name>] dampening
{dampened-paths|flap-statistics|parameters}`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
dampened-paths	Display paths suppressed due to dampening.
flap-statistics	Display flap statistics of routes.
parameters	Display details of configured dampening parameters.

Mode User Exec and Privileged Exec

Usage notes Enable BGP dampening to maintain dampened-path information in memory.

Examples `awplus# show ip bgp dampening dampened-paths
awplus# show ip bgp vrf red dampening dampened-paths
awplus# show ip bgp global dampening flap-statistics`

Output Figure 32-8: Example output from the **show ip bgp dampening** command

dampening 15 750 2000 60 15	
Reachability Half-Life time	: 15 min
Reuse penalty	: 750
Suppress penalty	: 2000
Max suppress time	: 60 min
Un-reachability Half-Life time	: 15 min
Max penalty (ceil)	: 11999
Min penalty (floor)	: 375

The following example output shows that the internal route (i), has flapped 3 times and is now categorized as history (h).

Figure 32-9: Example output from the **show ip bgp dampening flap-statistics** command

```
awplus# show ip bgp dampening flap-statistics
BGP table version is 1, local router ID is 30.30.30.77
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal, S
Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
  Network          From          Flaps   Duration   Reuse    Path
  ----
hi 1.1.1.0/24      10.100.0.62      3    00:01:20      i
```

The following example output shows a dampened route in the 1.1.1.0/24 network.

Figure 32-10: Example output from the **show ip bgp dampening dampened-path** command

```
awplus# show ip bgp dampening dampened-paths
BGP table version is 1, local router ID is 30.30.30.77
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal, S
Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
  Network          From          Reuse    Path
  ----
di 1.1.1.0/24      10.100.0.62      00:35:10      i

Command changes

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products
- Version 5.4.7-2.1: BGP support added for x510 and x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

show ip bgp inconsistent-as (BGP only)

Overview Use this command to display routes with inconsistent AS Paths within an IPv4 environment. Use the [show bgp ipv6 inconsistent-as \(BGP4+ only\)](#) command to display routes with inconsistent AS paths within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show ip bgp inconsistent-as`

Syntax (VRF-lite) `show ip bgp [global|vrf <vrf-name>] inconsistent-as`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.

Mode User Exec and Privileged Exec

Example `awplus# show ip bgp inconsistent-as`
`awplus# show ip bgp global inconsistent-as`

Related commands [show bgp ipv6 inconsistent-as \(BGP4+ only\)](#)

Command changes Added to AlliedWare Plus prior to 5.4.6-1
Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products
Version 5.4.7-2.1: BGP support added for x510 and x550 series
Version 5.4.7-2.4: BGP support added for IE300 series

show ip bgp filter-list (BGP only)

Overview Use this command to display routes conforming to the filter-list within an IPv4 environment. Use the [show bgp ipv6 filter-list \(BGP4+ only\)](#) command to display routes conforming to the filter-list within an IPv6 environment

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show ip bgp filter-list <listname>`

Syntax (VRF-lite) `show ip bgp [global|vrf <vrf-name>] filter-list <listname>`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
<listname>	Specifies the regular-expression access list name.

Mode User Exec and Privileged Exec

Example
`awplus# show ip bgp filter-list mylist`
`awplus# show ip bgp vrf red filter-list mylist`

Related commands [show bgp ipv6 filter-list \(BGP4+ only\)](#)

Command changes
Added to AlliedWare Plus prior to 5.4.6-1
Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products
Version 5.4.7-2.1: BGP support added for x510 and x550 series
Version 5.4.7-2.4: BGP support added for IE300 series

show ip bgp longer-prefixes (BGP only)

Overview Use this command to display the route of the local BGP routing table for a specific prefix with a specific mask, or for any prefix having a longer mask than the one specified.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show ip bgp <ip-address/m> longer-prefixes`

Syntax (VRF-lite) `show ip bgp [global|vrf <vrf-name>] <ip-address/m> longer-prefixes`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
<ip-address/m>	Neighbor's IP address and subnet mask, entered in the form A.B.C.D/M, where M is the subnet mask length.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip bgp 10.10.0.10/24 longer-prefixes
awplus# show ip bgp vrf red 172.16.4.0/24
awplus# show ip bgp global 172.16.0.0/16 longer-prefixes
```

Command changes

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products
- Version 5.4.7-2.1: BGP support added for x510 and x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

show ip bgp prefix-list (BGP only)

Overview Use this command to display routes matching the prefix-list within an IPv4 environment. Use the [show bgp ipv6 prefix-list \(BGP4+ only\)](#) command to display routes matching the prefix-list within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show ip bgp prefix-list <list>`

Syntax (VRF-lite) `show ip bgp [global|vrf <vrf-name>] prefix-list <list>`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
<list>	Specifies the name of the IP prefix list.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ip bgp prefix-list mylist
awplus# show ip bgp vrf red prefix-list myPrefixes
```

Related commands [show bgp ipv6 prefix-list \(BGP4+ only\)](#)

Command changes

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products
- Version 5.4.7-2.1: BGP support added for x510 and x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

show ip bgp quote-regexp (BGP only)

Overview Use this command to display routes matching the AS path regular expression within an IPv4 environment. Use the [show bgp ipv6 quote-regexp \(BGP4+ only\)](#) command to display routes matching the AS path regular expression within an IPv6 environment.

Note that you must use quotes to enclose the regular expression with this command. Use the regular expressions listed below with the *<expression>* parameter:

Symbol	Character	Meaning
^	Caret	Used to match the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match.
\$	Dollar sign	Used to match the end of the input string.
.	Period	Used to match a single character (white spaces included).
*	Asterisk	Used to match none or more sequences of a pattern.
+	Plus sign	Used to match one or more sequences of a pattern.
?	Question mark	Used to match none or one occurrence of a pattern.
_	Underscore	Used to match spaces, commas, braces, parenthesis, or the beginning and end of an input string.
[]	Brackets	Specifies a range of single-characters.
-	Hyphen	Separates the end points of a range.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show ip bgp quote-regexp <expression>`

Syntax (VRF-lite) `show ip bgp [global|vrf <vrf-name>] quote-regexp <expression>`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
<expression>	Specifies a regular-expression to match the BGP AS paths.

Mode User Exec and Privileged Exec

Examples `awplus# show ip bgp quote-regexp myexpression`
 `awplus# show ip bgp global quote-regexp 65550 65555`

Related commands [show bgp ipv6 quote-regexp \(BGP4+ only\)](#)

Command changes Added to AlliedWare Plus prior to 5.4.6-1
 Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products
 Version 5.4.7-2.1: BGP support added for x510 and x550 series
 Version 5.4.7-2.4: BGP support added for IE300 series

show ip bgp regexp (BGP only)

Overview Use this command to display routes matching the AS path regular expression within an IPv4 environment. Use the [show bgp ipv6 regexp \(BGP4+ only\)](#) command to display routes matching the AS path regular expression within an IPv6 environment.

Use the regular expressions listed below with the *<expression>* parameter:

Symbol	Character	Meaning
^	Caret	Used to match the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match.
\$	Dollar sign	Used to match the end of the input string.
.	Period	Used to match a single character (white spaces included).
*	Asterisk	Used to match none or more sequences of a pattern.
+	Plus sign	Used to match one or more sequences of a pattern.
?	Question mark	Used to match none or one occurrence of a pattern.
_	Underscore	Used to match spaces, commas, braces, parenthesis, or the beginning and end of an input string.
[]	Brackets	Specifies a range of single-characters.
-	Hyphen	Separates the end points of a range.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show ip bgp regexp <expression>`

Syntax (VRF-lite) `show ip bgp [global|vrf <vrf-name>] regexp <expression>`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
<expression>	Specifies a regular-expression to match the BGP AS paths.

Mode User Exec and Privileged Exec

Examples `awplus# show ip bgp regexp myexpression`
 `awplus# show ip bgp vrf red regexp 65550 65555`

Related commands `show bgp ipv6 regexp (BGP4+ only)`

Command changes Added to AlliedWare Plus prior to 5.4.6-1
 Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products
 Version 5.4.7-2.1: BGP support added for x510 and x550 series
 Version 5.4.7-2.4: BGP support added for IE300 series

show ip bgp route-map (BGP only)

Overview Use this command to display BGP routes that match the specified route-map within an IPv4 environment. Use the [show bgp ipv6 route-map \(BGP4+ only\)](#) command to display BGP4+ routes that match the specified route-map within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show ip bgp route-map <route-map>`

Syntax (VRF-lite) `show ip bgp [global|vrf <vrf-name>] route-map <route-map>`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
<route-map>	Specifies a route-map that is matched.

Mode User Exec and Privileged Exec

Examples To show routes that match the route-map `myRouteMap` for the global routing instance, use the command:

```
awplus# show ip bgp global route-map myRouteMap
```

To show routes that match the route-map `myRouteMap`, use the command:

```
awplus# show ip bgp route-map myRouteMap
```

Related commands [show bgp ipv6 route-map \(BGP4+ only\)](#)

Command changes

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products
- Version 5.4.7-2.1: BGP support added for x510 and x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

show ip bgp summary (BGP only)

Overview Use this command to display a summary of a BGP neighbor status within an IPv4 environment. Use the [show bgp ipv6 summary \(BGP4+ only\)](#) command to display a summary of BGP4+ neighbors.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show ip bgp summary`

Syntax (VRF-lite) `show ip bgp [global|vrf <vrf-name>] summary`

Parameter	Description
global	When VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.

Mode User Exec and Privileged Exec

Examples `awplus# show ip bgp summary`
`awplus# show ip bgp vrf red summary`

Output Figure 32-11: Example output from the **show ip bgp summary** command

```
awplus>show ip bgp summary

BGP router identifier 1.0.0.1, local AS number 65541
BGP table version is 12
4 BGP AS-PATH entries
0 BGP community entries

Neighbor      V      AS      MsgRc  MsgSnt  TblVer  InOutQ  Up/Down      State/PfxRcd
192.168.3.2    4      65544    20      24      11  0/0    00:07:19      1
192.168.4.2    4      65545     0       0       0  0/0    never          Active
192.168.11.2   4      65542    34      40       0  0/0    00:00:04      Active
192.168.21.2   4      65543    29      32      11  0/0    00:07:03     13

Number of neighbors 4
```

The Up/Down column in this output is a timer that shows:

- "never" if the peer session has never been established
- The up time, if the peer session is currently up
- The down time, if the peer session is currently down.

In the example above, the session with 192.168.11.2 has been down for 4 seconds, and the session with 192.168.4.2 has never been established.

Related commands [show bgp ipv6 summary \(BGP4+ only\)](#)

Command changes

- Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products
- Version 5.4.7-2.1: BGP support added for x510 and x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

show ip interface vrf

Overview Use this command to display protocol and status information about configured interfaces and their assigned IP addresses in VRF instances.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show ip interface [vrf <vrf-name>|global]`

Parameter	Description
vrf	A VRF instance.
<vrf-name>	The name of a specific VRF instance.
global	The global routing and forwarding table.

Mode User Exec and Privileged Exec

Examples To display all interfaces and IP addresses associated with a VRF instance 'red', use the command:

```
awplus# show ip interface vrf red
```

Output Figure 32-12: Example output from **show ip interface vrf red**

[VRF: red]			
Interface	IP-Address	Status	Protocol
lo1	unassigned	admin up	running
vlan1	192.168.10.1/24	admin up	running

Example To display all interfaces and IP addresses associated with all VRF instances, use the command:

```
awplus# show ip interface
```

Output Figure 32-13: Example output from the **show ip interface** with VRF-lite configured

Interface	IP-Address	Status	Protocol
eth0	unassigned	admin up	down
lo	unassigned	admin up	running
vlan1	192.168.1.1/24	admin up	running
vlan4	172.30.4.43/24	admin up	down
[VRF: red]			
Interface	IP-Address	Status	Protocol
lo1	unassigned	admin up	running
[VRF: blue]			
Interface	IP-Address	Status	Protocol
lo2	unassigned	admin up	running

show ip rip vrf database

Overview Use this command to display information about the RIP database that is associated with a specific VRF instance.

Entering this command with the **full** option included, will display information about the full RIP database (including sub-optimal routes) associated with a specific VRF instance.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show ip rip {vrf <vrf-name>|global} database [full]`

Parameter	Description
vrf	Specific VRF instance.
<vrf-name>	The name of the VRF instance.
global	The global routing and forwarding table.
full	Specify the full RIP database including sub-optimal RIP routes.

Mode User Exec and Privileged Exec

Example To display information about the RIP database associated with a VRF instance 'blue', use the command:

```
awplus# show ip rip vrf blue database
```

Output Figure 32-14: Example output from the **show ip rip vrf blue database** command

Codes: R - RIP, Rc - RIP connected, Rs - RIP static C - Connected, S - Static, O - OSPF, B - BGP					
Network	Next Hop	Metric	From	If	Time
Rc 192.168.30.0/24		1		vlan3	
R 192.168.45.0/24	192.168.30.1	2	192.168.30.1	vlan3	02:46

Related commands [show ip rip](#)

show ip rip vrf interface

Overview Use this command to display information about the RIP interfaces that are associated with a specific VRF instance.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show ip rip {vrf <vrf-name>|global} interface [<interface-name>]`

Parameter	Description
vrf	Specific VRF instance.
<vrf-name>	The name of the VRF instance.
global	The global routing and forwarding table.
<interface-name>	The IP RIP interface (VLAN).

Mode User Exec and Privileged Exec

Example To display information about the RIP database associated with a VRF instance 'blue', use the command:

```
awplus# show ip rip vrf blue interface
```

Output Figure 32-15: Example output from **show ip rip vrf blue interface vlan3**

Codes: R - RIP, Rc - RIP connected, Rs - RIP static C - Connected, S - Static, O - OSPF, B - BGP					
Network	Next Hop	Metric	From	If	Time
Rc 192.168.30.0/24		1		vlan3	
R 192.168.45.0/24	192.168.30.1	2	192.168.30.1	vlan3	02:46

NOTE: The Time parameter operates as follows:

- RIP updates occur approximately every 30 seconds.
- Each update resets a count-down timer to 180 seconds (3 minutes).
- The Time parameter displays the count-down from the last reset.

Related commands [show ip rip](#)

show ip route

Overview Use this command to display routing entries in the FIB (Forwarding Information Base). The FIB contains the best routes to a destination, and your device uses these routes when forwarding traffic. You can display a subset of the entries in the FIB based on protocol.

To modify the lines displayed, use the | (output modifier token); to save the output to a file, use the > output redirection token.

VRF-lite If VRF-lite is configured, you can display routing entries in the FIB associated with either the global routing domain or a named VRF.

Syntax `show ip route [bgp|connected|ospf|rip|static|
<ip-addr>|<ip-addr/prefix-length>]`

Syntax (VRF-lite) `show ip route {vrf <vrf-name>|global}
[bgp|connected|ospf|rip|static]`

Parameter	Description
global	If VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
bgp	Displays only the routes learned from BGP.
connected	Displays only the routes learned from connected interfaces.
ospf	Displays only the routes learned from OSPF.
rip	Displays only the routes learned from RIP.
static	Displays only the static routes you have configured.
<ip-addr>	Displays the routes for the specified address. Enter an IPv4 address.
<ip-addr/prefix-length>	Displays the routes for the specified network. Enter an IPv4 address and prefix length.

Mode User Exec and Privileged Exec

Examples To display the static routes in the FIB, use the command:

```
awplus# show ip route static
```

To display the OSPF routes in the FIB, use the command:

```
awplus# show ip route ospf
```

Example (VRF-lite) To display all routing entries in the FIB associated with a VRF instance `red`, use the command:

```
awplus# show ip route vrf red
```

Output Each entry in the output from this command has a code preceding it, indicating the source of the routing entry. For example, O indicates OSPF as the origin of the route. The first few lines of the output list the possible codes that may be seen with the route entries.

Typically, route entries are composed of the following elements:

- code
- a second label indicating the sub-type of the route
- network or host IP address
- administrative distance and metric
- next hop IP address
- outgoing interface name
- time since route entry was added

Figure 32-16: Example output from the **show ip route** command

```
Codes: C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       * - candidate default

O      10.10.37.0/24 [110/11] via 10.10.31.16, vlan2, 00:20:54
C      3.3.3.0/24 is directly connected, vlan1
C      10.10.31.0/24 is directly connected, vlan2
C      10.70.0.0/24 is directly connected, vlan4
O E2   14.5.1.0/24 [110/20] via 10.10.31.16, vlan2, 00:18:56
C      33.33.33.33/32 is directly connected, lo
```

Connected Route An example of a connected route entry consists of:

```
C      10.10.31.0/24 is directly connected, vlan2
```

This route entry denotes:

- Route entries for network 10.10.31.0/24 are derived from the IP address of local interface vlan2.
- These routes are marked as Connected routes (C) and always preferred over routes for the same network learned from other routing protocols.

OSPF Route An example of an OSPF route entry consists of:

```
O      10.10.37.0/24 [110/11] via 10.10.31.16, vlan2, 00:20:54
```

This route entry denotes:

- This route in the network 10.10.37.0/24 was added by OSPF.
- This route has an administrative distance of 110 and metric/cost of 11.
- This route is reachable via next hop 10.10.31.16.
- The outgoing local interface for this route is vlan2.
- This route was added 20 minutes and 54 seconds ago.

OSPF External Route

An example of an OSPF external route entry consists of:

```
O E2 14.5.1.0/24 [110/20] via 10.10.31.16, vlan2, 00:18:56
```

This route entry denotes that this route is the same as the other OSPF route explained above; the main difference is that it is a Type 2 External OSPF route.

Related commands

[ip route](#)

[ip route vrf](#)

[maximum-paths](#)

[show ip route database](#)

show ip route database

Overview This command displays the routing entries in the RIB (Routing Information Base).

When multiple entries are available for the same prefix, RIB uses the routes' administrative distances to choose the best route. All best routes are entered into the FIB (Forwarding Information Base). To view the routes in the FIB, use the [show ip route](#) command.

To modify the lines displayed, use the | (output modifier token); to save the output to a file, use the > (output redirection token).

Syntax `show ip route database [bgp|connected|ospf|rip|static]`

Syntax (VRF-lite) `show ip route [vrf <vrf-name>|global] database [bgp|connected|ospf|rip|static]`

Parameter	Description
global	If VRF-lite is configured, apply the command to the global routing and forwarding table.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
bgp	Displays only the routes learned from BGP.
connected	Displays only the routes learned from connected interfaces.
ospf	Displays only the routes learned from OSPF.
rip	Displays only the routes learned from RIP.
static	Displays only the static routes you have configured.

Mode User Exec and Privileged Exec

Example To display the static routes in the RIB, use the command:

```
awplus# show ip route database static
```

Output Figure 32-17: Example output from the **show ip route database** command:

```
Codes: C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       > - selected route, * - FIB route, p - stale info

O    *> 9.9.9.9/32 [110/31] via 10.10.31.16, vlan2, 00:19:21
O    10.10.31.0/24 [110/1] is directly connected, vlan2, 00:28:20
C    *> 10.10.31.0/24 is directly connected, vlan2
S    *> 10.10.34.0/24 [1/0] via 10.10.31.16, vlan2
O    10.10.34.0/24 [110/31] via 10.10.31.16, vlan2, 00:21:19
O    *> 10.10.37.0/24 [110/11] via 10.10.31.16, vlan2, 00:21:19
C    *> 10.30.0.0/24 is directly connected, vlan6
S    *> 11.22.11.0/24 [1/0] via 10.10.31.16, vlan2
O E2 *> 14.5.1.0/24 [110/20] via 10.10.31.16,vlan2, 00:19:21
O    16.16.16.16/32 [110/11] via 10.10.31.16, vlan2, 00:21:19
S    *> 16.16.16.16/32 [1/0] via 10.10.31.16, vlan2
O    *> 17.17.17.17/32 [110/31] via 10.10.31.16, vlan2, 00:21:19
C    *> 45.45.45.45/32 is directly connected, lo
O    *> 55.55.55.55/32 [110/21] via 10.10.31.16, vlan2, 00:21:19
C    *> 127.0.0.0/8 is directly connected, lo
```

Example (VRF-lite) To display all routing entries in the RIB associated with a VRF instance `red`, use the command:

```
awplus# show ip route vrf red database
```

Output Figure 32-18: Example output from the **show ip route vrf red database** command

```
[VRF: red]
Codes: C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       > - selected route, * - FIB route, p - stale info

O    192.168.10.0/24 [110/1] is directly connected, vlan1, 06:45:51
C    *> 192.168.10.0/24 is directly connected, vlan1
B    > 192.168.33.0/24 [20/0] via 192.168.30.3, 06:45:52
O E2 *> 192.168.110.0/24 [110/20] via 192.168.10.2, vlan1, 06:45:00
O E2 *> 192.168.111.0/24 [110/20] via 192.168.10.2, vlan1, 06:45:00
```

The routes added to the FIB are marked with a *. When multiple routes are available for the same prefix, the best route is indicated with the > symbol. All unselected routes have neither the * nor the > symbol.

```
S    *> 10.10.34.0/24 [1/0] via 10.10.31.16, vlan2
O    10.10.34.0/24 [110/31] via 10.10.31.16, vlan2, 00:21:19
```

These route entries denote:

- The same prefix was learned from OSPF and from static route configuration.

- Since this static route has a lower administrative distance than the OSPF route (110), the static route (1) is selected and installed in the FIB.

If the static route becomes unavailable, then the device automatically selects the OSPF route and installs it in the FIB.

**Related
commands** [maximum-paths](#)
[show ip route](#)

show ip route summary

Overview This command displays a summary of the current RIB (Routing Information Base) entries.

To modify the lines displayed, use the | (output modifier token); to save the output to a file, use the > output redirection token.

Syntax `show ip route summary`

Syntax (VRF-lite) `show ip route summary [vrf <vrf-name>|global]`

Parameter	Description
vrf	Specific VRF instance.
<vrf-name>	The name of the VRF instance.
global	The global routing and forwarding table.

Mode User Exec and Privileged Exec

Example To display a summary of the current RIB entries, use the command:

```
awplus# show ip route summary
```

Output Figure 32-19: Example output from the **show ip route summary** command

```
IP routing table name is Default-IP-Routing-Table(0)
IP routing table maximum-paths is 4
Route Source      Networks
connected         5
ospf               2
Total             8
```

Example (VRF-lite) To display a summary of the current RIB entries associated with a VRF instance red, use the command:

```
awplus# show ip route summary vrf red
```

Output Figure 32-20: Example output from the **show ip route summary vrf red** command

```
IP routing table name is Default-IP-Routing-Table(0)
IP routing table maximum-paths is 4
Route Source      Networks
connected         1
Total             1
FIB               0

[VRF: red]
Route Source      Networks
connected         1
ospf              2
Total             3
```

Related commands [show ip route](#)
[show ip route database](#)

show ip vrf

Overview This command displays brief configurations for a specific VRF instance.

Syntax `show ip vrf <vrf-name>`

Parameter	Description
<vrf-name>	The name of the VRF instance.

Mode User Exec and Privileged Exec

Example To display brief information for the VRF instance red, use the command:

```
awplus# show ip vrf red
```

Output Figure 32-21: Example output from the show ip vrf red command

Name	Default RD	Interfaces
red	500:1	lo1, vlan1

Related commands [show ip vrf interface](#)

show ip vrf detail

Overview This command displays the detailed configuration for a specific VRF instance.

Syntax `show ip vrf detail <vrf-name>`

Parameter	Description
<vrf-name>	The name of the VRF instance.

Mode User Exec and Privileged Exec

Example To display the detailed information for all VRF instances, use the command:

```
awplus# show ip vrf detail
```

Output Figure 32-22: Example output from the **show ip detail** command, for all VRF instances

```
VRF blue; Description: VRF for customer blue
FIB ID 3; Router ID: 192.168.30.1 (automatic)
Default RD 500:3
  Interfaces:
    lo3, vlan3
  Export route-target communities
    RT: 500:3
  Import route-target communities
    RT: 500:4
  Import route-map: blue45
  No export route-map

VRF red
FIB ID 1; Router ID: 192.168.10.1 (automatic)
Default RD 500:1
  Interfaces:
    lo1, vlan1
  Export route-target communities
    RT: 500:1
  Import route-target communities
    RT: 500:1
  Import route-map: red43
  No export route-map
```

Related commands [show ip vrf](#)

show ip vrf interface

Overview This command displays protocol, operational status, and address information, for interfaces existing within either a specified VRF instance, or all VRF instances.

Syntax `show ip vrf interface <vrf-name>`

Parameter	Description
<vrf-name>	The name of the VRF instance.

Mode User Exec and Privileged Exec

Example To display all interfaces and IP addresses associated with all VRF instances, use the command:

```
awplus# show ip vrf interface
```

Output Figure 32-23: Example output from the **show ip vrf interface** command

Interface	IP-Address	Status	Protocol	Vrf
lo1	unassigned	admin up	running	red
lo2	unassigned	admin up	running	green
vlan1	192.168.10.1/24	admin up	running	red
vlan2	192.168.20.1/24	admin up	running	green

Example To display all interfaces and IP addresses associated with the VRF instance `red`, use the command:

```
awplus# show ip vrf interface red
```

Output Figure 32-24: Example output from the **show ip vrf interface red** command

Interface	IP-Address	Status	Protocol	Vrf
lo1	unassigned	admin up	running	red
vlan1	192.168.10.1/24	admin up	running	red

Related commands [show ip vrf](#)

show running-config vrf

Overview This command displays the running system VRF-related configurations for all VRF instances.

Syntax `show running-config vrf`

Mode Privileged Exec

Example To display the running system VRF-related configurations, use the command:

```
awplus# show running-config vrf
```

Output Figure 32-25: Example output from the **show running config vrf** command

```
ip vrf red
rd 500:1
route-target export 500:1
route-target export 500:4
import map red 43
!
```

Related commands [show ip vrf](#)

snmp-server host

Overview This command specifies an SNMP trap host destination to which Trap or Inform messages generated by the device are sent.

For SNMP version 1 and 2c you must specify the community name parameter. For SNMP version 3, specify the authentication/encryption parameters and the user name. If the version is not specified, the default is SNMP version 1. Inform messages can be sent instead of traps for SNMP version 2c and 3.

Use the **no** variant of this command to remove an SNMP trap host. The trap host must already exist.

The trap host is uniquely identified by:

- host IP address (IPv4 or IPv6)
- inform or trap messages
- community name (SNMPv1 or SNMP v2c) or the authentication/encryption parameters and user name (SNMP v3).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax

```
snmp-server host {<ipv4-address>|<ipv6-address>} [traps]
[version 1] <community-name>

snmp-server host {<ipv4-address>|<ipv6-address>}
[informs|traps] version 2c <community-name>

snmp-server host {<ipv4-address>|<ipv6-address>}
[informs|traps] version 3 {auth|noauth|priv} <user-name>

no snmp-server host {<ipv4-address>|<ipv6-address>} [traps]
[version 1] <community-name>

no snmp-server host {<ipv4-address>|<ipv6-address>}
[informs|traps] version 2c <community-name>

no snmp-server host {<ipv4-address>|<ipv6-address>}
[informs|traps] version 3 {auth|noauth|priv} <user-name>
```

Syntax (VRF-Lite)

```
snmp-server host {<ipv4-address>|<ipv6-address>} [vrf
<vrf-name>] [informs|traps] version {1|2c|3} {auth|noauth|priv}
{<community-name>|<user-name>}

no snmp-server host {<ipv4-address>|<ipv6-address>} [vrf
<vrf-name>] [informs|traps] version {1|2c|3} {auth|noauth|priv}
{<community-name>|<user-name>}
```

Parameter	Description
<ipv4-address>	IPv4 trap host address in the format A.B.C.D, for example, 192.0.2.2.
<ipv6-address>	IPv6 trap host address in the format x::x::x for example, 2001:db8::8a2e:7334.

Parameter	Description
<code>vrf <vrf-name></code>	Specify the VRF instance to use. If you do not specify an instance it will use the global VRF.
<code>informs</code>	Send Inform messages to this host.
<code>traps</code>	Send Trap messages to this host (default).
<code>version</code>	SNMP version to use for notification messages. Default: version 1.
<code>1</code>	Use SNMPv1 (default).
<code>2c</code>	Use SNMPv2c.
<code>3</code>	Use SNMPv3.
<code>auth</code>	Authentication.
<code>noauth</code>	No authentication.
<code>priv</code>	Encryption.
<code><community-name></code>	The SNMPv1 or SNMPv2c community name.
<code><user-name></code>	SNMPv3 user name.

Default No host is defined.

Mode Global Configuration

Usage notes You can test connectivity to the host by using the command `test snmp trap snmp`.

Examples To configure the device to send generated traps to the IPv4 host destination 192.0.2.5 with the SNMPv2c community name 'public', use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server host 192.0.2.5 version 2c public
```

To configure the device to send generated traps to the IPv6 host destination 2001:db8::8a2e:7334 with the SNMPv2c community name 'private', use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server host 2001:db8::8a2e:7334 version 2c
private
```

To remove a configured trap host of 192.0.2.5 with the SNMPv2c community name 'public', use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server host 192.0.2.5 version 2c public
```

To configure the device to send generated traps to an IPv4 host destination 192.168.1.2 with the SNMPv2c community name 'public' and on a VRF named 'red', use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server host 192.0.1.2 vrf red version 2c
public
```

changes**

Version 5.5.2-1.1: **vrf** parameter added for products that support VRF

snmp-server vrf

Overview Use this command to isolate the SNMP Agent to operate within a previously configured non-global named VRF. This means the SNMP Agent can only respond to requests from SNMP Managers operating within the same VRF.

Use the **no** variant of this command to revert the SNMP Agent to operating within the default global VRF.

Syntax `snmp-server vrf <vrf-name>`
`no snmp-server vrf`

Parameter	Description
<code>vrf</code>	The VRF instance to operate within.
<code><vrf-name></code>	The VRF instance name.

Default Global VRF

Mode Global Configuration

Examples To configure the SNMP Agent to operate within the VRF instance named 'red', use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server vrf red
```

To revert the SNMP Agent to operating within the default global VRF, use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-server vrf
```

Related commands [show snmp-server](#)
[snmp-server](#)

Command changes Version 5.5.2-2.1: command added

ssh

Overview Use this command to initiate a Secure Shell connection to a remote SSH server.

If the server requests a password to login, you need to type in the correct password at the "Password:" prompt.

An SSH client identifies the remote SSH server by its public key registered on the client device. If the server identification is changed, server verification fails. If the public key of the server has been changed, the public key of the server must be explicitly added to the known host database.

NOTE: A hostname specified with SSH cannot begin with a hyphen (-) character.

Syntax `ssh [ip|ipv6] [user <username>|port <1-65535>|version 2]
<remote-device> [<command>]`

Syntax in secure mode `ssh [cipher
{aes128-cbc|aes256-cbc|aes128-ctr|aes192-ctr|aes256-ctr}]
[hmac {hmac-sha2-256}]
[public-key {ecdsa-sha2-nistp256|ecdsa-sha2-nistp384}]
[key-exchange {ecdh-sha2-nistp256|ecdh-sha2-nistp384}]
[ip|ipv6] [user <username>|port <1-65535>|version 2]
<remote-device> [<command>]`

Syntax (VRF-lite) `ssh vrf <vrf-name> [ip|ipv6] [user <username>|port
<1-65535>|version 2] <remote-device> [<command>]`

Parameter	Description
cipher	The supported cipher name. Select either: aes128-cbc or aes256-cbc.
hmac	The supported hmac name: hmac-sha2-256
public-key	The supported public-key name. Select either: ecdsa-sha2-nistp256 or ecdsa-sha2-nistp384
key-exchange	The supported key-exchange name. Select either: ecdsa-sha2-nistp256 or ecdsa-sha2-nistp384
vrf	Apply the command to the specified VRF instance. When using VRF, specifying a VRF name means the command will apply to that VRF instance, and not specifying a VRF name means the command will apply to the global VRF.
<vrf-name>	The name of the VRF instance.
ip	Specify IPv4 SSH.
ipv6	Specify IPv6 SSH.

Parameter	Description
user	Login user. If user is specified, the username is used for login to the remote SSH server when user authentication is required. Otherwise the current user name is used. <username> User name to login on the remote server.
port	SSH server port. If port is specified, the SSH client connects to the remote SSH server with the specified TCP port. Otherwise, the client port configured by "ssh client" command or the default TCP port (22) is used. <1-65535> TCP port.
version	SSH client version. From 5.5.1-1.1 onwards, SSH only supports version 2.
<remote-device>	IPv4/IPv6 address or hostname of a remote server. The address is in the format A.B.C.D for an IPv4 address, or in the format X:X::X:X for an IPv6 address. Note that a hostname specified with SSH cannot begin with a hyphen (-) character.
<command>	A command to execute on the remote server. If a command is specified, the command is executed on the remote SSH server and the session is disconnected when the remote command finishes.

Mode User Exec and Privileged Exec

Usage notes This command contains some additional security parameters (cipher, hmac, public-key, and key exchange). To access these parameters you must enable Secure Mode on the device by using the command: **crypto secure-mode**.

```
awplus(config)# crypto secure-mode
```

Examples To login to the remote SSH server at 192.0.2.5, use the command:

```
awplus# ssh ip 192.0.2.5
```

To login to the remote SSH server at 192.0.2.5 as user 'manager', use the command:

```
awplus# ssh ip user manager 192.0.2.5
```

To login to the remote SSH server at 192.0.2.5 that is listening on TCP port 2000, use the command:

```
awplus# ssh port 2000 192.0.2.5
```

To login to the remote SSH server 'example_host' using an IPv6 session, use the command:

```
awplus# ssh ipv6 example_host
```

To run the **cmd** command on the remote SSH server at 192.0.2.5, use the command:

```
awplus# ssh ip 192.0.2.5 cmd
```

Example (VRF-lite) To login to the remote SSH server at 192.168.1.1 on VRF "red", use the command:

```
awplus# ssh vrf red 192.168.1.1
```

Command changes

- Version 5.5.3-1.1: added to AR1050V
- Version 5.5.1-1.1: support removed for SSH protocol v1
- Version 5.4.8-2.1: secure mode syntax added for x950, SBx908 GEN2.
- Version 5.4.8-1.2: secure mode syntax added for x220, x930, x550, XS900MX.
- Version 5.4.6-2.1: VRF-lite support added for AR-Series devices.

ssh client

Overview This command modifies the default configuration parameters of the Secure Shell (SSH) client. The configuration is used for any SSH client on the device to connect to remote SSH servers. Any parameters specified on SSH client explicitly override the default configuration parameters.

The change affects the current user shell only. When the user exits the login session, the configuration does not persist. This command does not affect existing SSH sessions.

The **no** variant of this command resets configuration parameters of the Secure Shell (SSH) client changed by the [ssh client](#) command, and restores the defaults.

This command does not affect the existing SSH sessions.

Syntax

```
ssh client {port <1-65535>|version 2|session-timeout <0-3600>|connect-timeout <1-600>}  
no ssh client {port|version|session-timeout|connect-timeout}
```

Syntax (VRF-lite)

```
ssh client {port <1-65535>|version 2|session-timeout <0-3600>|connect-timeout <1-600>|vrf <vrf-name>}  
no ssh client  
{port|version|session-timeout|connect-timeout|vrf}
```

Parameter	Description
port	The default TCP port of the remote SSH server. If an SSH client specifies an explicit port of the server, it overrides the default TCP port. Default: 22
	<1-65535> TCP port number.
version	The SSH version used by the client for SSH sessions. From 5.5.1-1.1 onwards, the SSH client supports only version 2
session-timeout	The global session timeout for SSH sessions. If the session timer lapses since the last time an SSH client received data from the remote server, the session is terminated. If the value is 0, then the client does not terminate the session. Instead, the connection is terminated when it reaches the TCP timeout. Default: 0 (session timer remains off)
	<0-3600> Timeout in seconds.
connect-timeout	The maximum time period that an SSH session can take to become established. The SSH client terminates the SSH session if this timeout expires and the session is still not established. Default: 30
	<1-600> Timeout in seconds.
vrf <vrf-name>	The VRF to use for SSH clients. Default: the global VRF.

Mode Privileged Exec

Examples To configure the default TCP port for SSH clients to 2200, and the session timer to 10 minutes, use the command:

```
awplus# ssh client port 2200 session-timeout 600
```

To configure the connect timeout of SSH client to 10 seconds, use the command:

```
awplus# ssh client connect-timeout 10
```

To restore the connect timeout to its default, use the command:

```
awplus# no ssh client connect-timeout
```

Example (VRF-lite) To configure SSH clients to use the VRF named 'red', use the command:

```
awplus# ssh client vrf red
```

Related commands [show ssh client](#)
[ssh](#)

Command changes Version 5.5.3-1.1: added to AR1050V
Version 5.5.2-1.1: **vrf** parameter added for products that support VRF
Version 5.5.1-1.1: support removed for the ssh-rsa algorithm in OpenSSH and for SSH protocol v1

ssh client vrf

Overview Use this command to modify the configured VRF of the SSH client. Use this configuration for any SSH client on the device to connect to remote SSH servers.

Use the **no** variant of this command to restore the configured VRF to the default VRF (global VRF).

Syntax `ssh client vrf <vrf-name>`
`no client vrf`

Parameter	Description
<code>vrf<vrf-name></code>	The name of the VRF to use for SSH clients. This overrides the default.

Default Global VRF

Mode Global Configuration

Usage notes Any VRF parameter specified on the SSH client explicitly overrides the default configuration parameters. This also affects the copy commands that utilize SSH such as **copy scp** and **copy sftp**.

This change affects all new user shell sessions. Existing sessions will not be affected.

A user may override this on a per-session basis using the executive mode variant of this command.

Examples To configure the VRF named 'management' for SSH clients, use the commands:

```
awplus# configure terminal
awplus(config)# ssh client vrf management
```

To restore to the default, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh client vrf
```

Related commands [show ssh client](#)

Command changes Version 5.5.2-2.1: command added

ssh server vrf

Overview Use this command to specify a VRF for the SSH server to operate within.
Use the **no** variant of this command to return the SSH server to the default VRF.

Syntax `ssh server vrf [<vrf-name>]`
`no ssh server vrf`

Parameter	Description
<vrf-name>	The name of the VRF instance

Default The global VRF

Mode Global Configuration

Example To configure the SSH server to operate within the VRF instance named 'red', use the command:

```
awplus# configure terminal
awplus(config)# ssh server vrf red
```

To return the SSH server to operating within the global VRF instance, use the command:

```
awplus# configure terminal
awplus(config)# no ssh server vrf
```

Command changes Version 5.5.2-1.1: command added

tacacs-server host

Overview Use this command to specify a remote TACACS+ server host for authentication, authorization and accounting, and to set the shared secret key to use with the TACACS+ server. The parameters specified with this command override the corresponding global parameters for TACACS+ servers.

Use the **no** variant of this command to remove the specified server host as a TACACS+ authentication and authorization server.

Syntax `tacacs-server host {<host-name>|<ip-address>} [key [8]
<key-string>]`
`no tacacs-server host {<host-name>|<ip-address>}`

Syntax (VRF-lite) `tacacs-server host {<host-name>|<ip-address>} [vrf <vrf-name>]
[key [8] <key-string>]`
`no tacacs-server host {<host-name>|<ip-address>} [vrf
<vrf-name>]`

Parameter	Description
<host-name>	Server host name. The DNS name of the TACACS+ server host.
<ip-address>	The IP address of the TACACS+ server host, in dotted decimal notation A.B.C.D.
vrf <vrf-name>	The name of a VRF instance. Use this to specify the VRF that the TACACS+ server is accessible by. Servers are uniquely identified by their address and VRF, so multiple servers can have the same address or host-name as long as the VRF is different. The default is the global VRF.
key	Set shared secret key with TACACS+ servers.
8	Specifies that you are entering a password as a string that has already been encrypted instead of entering a plain text password. The running config displays the new password as an encrypted string even if password encryption is turned off.
<key-string>	Shared key string applied, a value in the range 1 to 64 characters. Specifies the shared secret authentication or encryption key for all TACACS+ communications between this device and the TACACS+ server. This key must match the encryption used on the TACACS+ server. This setting overrides the global setting of the tacacs-server key command. If no key value is specified, the global value is used.

Default No TACACS+ server is configured by default.

Mode Global Configuration

Usage A TACACS+ server host cannot be configured multiple times like a RADIUS server.

As many as four TACACS+ servers can be configured and consulted for login authentication, enable password authentication and accounting. The first server configured is regarded as the primary server and if the primary server fails then the backup servers are consulted in turn. A backup server is consulted if the primary server fails, not if a login authentication attempt is rejected. The reasons a server would fail are:

- it is not network reachable
- it is not currently TACACS+ capable
- it cannot communicate with the switch properly due to the switch and the server having different secret keys

Examples To add the server tac1.company.com as the TACACS+ server host, use the following commands:

```
awplus# configure terminal
awplus(config)# tacacs-server host tac1.company.com
```

To set the secret key to 'secret' on the TACACS+ server 192.168.1.1, use the following commands:

```
awplus# configure terminal
awplus(config)# tacacs-server host 192.168.1.1 key secret
```

To remove the TACACS+ server tac1.company.com, use the following commands:

```
awplus# configure terminal
awplus(config)# no tacacs-server host tac1.company.com
```

Examples (VRF-lite) To add the server tac1.company.com as the TACACS+ server host in the VRF named 'red', use the following commands:

```
awplus# configure terminal
awplus(config)# tacacs-server host tac1.company.com vrf red
```

To remove the TACACS+ server 192.168.1.1 from the VRF named 'red', use the following commands:

```
awplus# configure terminal
awplus(config)# no tacacs-server host 192.168.1.1 vrf red
```

Command changes Version 5.5.2-1.1: **vrf** parameter added for products that support VRF

tcpdump

Overview Use this command to start a tcpdump, which gives the same output as the Unix-like **tcpdump** command to display TCP/IP traffic. Press <ctrl> + c to stop a running tcpdump.

Syntax `tcpdump <line>`

Syntax (VRF-lite) `tcpdump [vrf <vrf-name>] <line>`

Parameter	Description
<line>	Specify the dump options. For more information on the options for this placeholder see http://www.tcpdump.org/tcpdump_man.html
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.

Mode Privileged Exec

Example To start a tcpdump running to capture IP packets, enter the command:

```
awplus# tcpdump ip
```

Example (VRF-lite) To start a tcpdump on interface vlan2 associated with a VRF instance red, enter the command:

```
awplus# tcpdump vrf red vlan2
```

Output Figure 32-26: Example output from the **tcpdump** command

```
03:40:33.221337 IP 192.168.1.1 > 224.0.0.13: PIMv2, Hello,
length: 34
1 packets captured
2 packets received by filter
0 packets dropped by kernel
```

Related commands [debug ip packet interface](#)

telnet

Overview Use this command to open a telnet session to a remote device.

Syntax `telnet {<hostname>|[ip] <ipv4-addr>|[ipv6] <ipv6-addr>} [
<port>]`

Syntax (VRF-lite) `telnet [vrf <vrf-name>] {<hostname>|[ip] <ipv4-addr>|[ipv6] <ipv6-addr>} [
<port>]`

Parameter	Description
vrf	Apply this command to a VRF instance.
<vrf-name>	The name of the VRF instance.
<hostname>	The host name of the remote system.
ip	Keyword used to specify the IPv4 address or host name of a remote system.
<ipv4-addr>	An IPv4 address of the remote system.
ipv6	Keyword used to specify the IPv6 address of a remote system
<ipv6-addr>	Placeholder for an IPv6 address in the format x:x:x:x, for example, 2001:db8::8a2e:7334
<port>	Specify a TCP port number (well known ports are in the range 1-1023, registered ports are 1024-49151, and private ports are 49152-65535).

Mode User Exec and Privileged Exec

Examples To connect to TCP port 2602 on the device at 10.2.2.2, use the command:

```
awplus# telnet 10.2.2.2 2602
```

To connect to the telnet server `host.example`, use the command:

```
awplus# telnet host.example
```

To connect to the telnet server `host.example` on TCP port 100, use the command:

```
awplus# telnet host.example 100
```

Example (VRF-lite) To open a telnet session to a remote host `192.168.0.1` associated with VRF instance `red`, use the command:

```
awplus# telnet vrf red ip 192.168.0.1
```

timers (RIP)

Overview Use this command to adjust routing network timers.
Use the **no** variant of this command to restore the defaults.

Syntax `timers basic <update> <timeout> <garbage>`
`no timers basic`

Parameter	Description
<code><update></code>	<code><5-2147483647></code> Specifies the period at which RIP route update packets are transmitted. The default is 30 seconds.
<code><timeout></code>	<code><5-2147483647></code> Specifies the routing information timeout timer in seconds. The default is 180 seconds. After this interval has elapsed and no updates for a route are received, the route is declared invalid.
<code><garbage></code>	<code><5-2147483647></code> Specifies the routing garbage collection timer in seconds. The default is 120 seconds.

Default Enabled

Mode RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

Usage notes This command adjusts the RIP timing parameters.

The update timer is the time between sending out updates, that contain the complete routing table, to every neighboring router.

If an update for a given route has not been seen for the time specified by the timeout parameter, that route is no longer valid. However, it is retained in the routing table for a short time, with metric 16, so that neighbors are notified that the route has been dropped.

When the time specified by the garbage parameter expires the metric 16 route is finally removed from the routing table. Until the garbage time expires, the route is included in all updates sent by the router.

All the routers in the network must have the same timers to ensure the smooth operation of RIP throughout the network.

Examples To set the update timer to 30, the routing information timeout timer to 180, and the routing garbage collection timer to 120, use the following command:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# timers basic 30 180 120
```

To set the update timer to 30, the routing information timeout timer to 180, and the routing garbage collection timer to 120 with VRF, use the following command:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# timers basic 30 180 120
```

traceroute

Overview Use this command to trace the route to the specified IPv4 host.

Syntax `traceroute {<ip-addr>|<hostname>}`

Syntax (VRF-lite) `traceroute [vrf <vrf-name>] {<ip-addr>|<hostname>}`

Parameter	Description
<ip-addr>	The destination IPv4 address. The IPv4 address uses the format A.B.C.D.
<hostname>	The destination hostname.
vrf	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.

Mode User Exec and Privileged Exec

Example `awplus# traceroute 10.10.0.5`

Example (VRF-lite) `awplus# traceroute vrf red 192.168.0.1`

version (RIP)

Overview Use this command to specify a RIP version used globally by the router.

If VRF-lite is configured, you can specify a RIP version either globally, or for a particular VRF instance.

Use the **no** variant of this command to restore the default version.

Syntax `version {1|2}`
`no version`

Parameter	Description
1 2	Specifies the version of RIP processing.

Default Version 2

Mode RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

Usage notes RIP can be run in version 1 or version 2 mode. Version 2 has more features than version 1; in particular RIP version 2 supports authentication and classless routing. Once the RIP version is set, RIP packets of that version will be received and sent on all the RIP-enabled interfaces.

Setting the version command has no impact on receiving updates, only on sending them. The [ip rip send version](#) command overrides the value set by the [version \(RIP\)](#) command on an interface-specific basis. The [ip rip receive version](#) command allows you to configure a specific interface to accept only packets of the specified RIP version. The [ip rip receive version](#) command and the [ip rip send version](#) command override the value set by this command.

Examples To specify a RIP version, use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# version 1
```

To specify a RIP version with VRF, use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# version 1
```

Related commands [ip rip receive version](#)
[ip rip send version](#)
[show running-config](#)

vrf

Overview Use this command to add a VRF name to a DHCP server's address pool. This enables the DHCP server to become VRF-aware and allocate IP addresses which are the same as other pools.

One of the benefits of using this command is that it allows you to share DHCP leases across multiple isolated networks.

Use the **no** variant of this command to remove a VRF name from the DHCP server pool.

Syntax `vrf <vrf-name>`
`no vrf`

Parameter	Description
<vrf-name>	The name of the specific VRF instance.

Default Global VRF

Mode DHCP Configuration

Usage notes You need to enter this **vrf** command before entering the [network \(DHCP\)](#) and [range](#) address commands.
For more information, see the [DHCP Feature Overview and Configuration Guide](#).

Example To add the VRF name 'red' to the DHCP pool named 'P1', use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P1
awplus(dhcp-config)# vrf red
```

To remove a VRF name from the DHCP pool named 'P1', use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P1
awplus(dhcp-config)# no vrf
```

Related commands [network \(DHCP\)](#)

Command changes Version 5.5.1-1.1: command added

33

VXLAN Commands

Introduction

Overview This chapter provides an alphabetical reference of commands used to configure Virtual Extensible LAN (VXLAN).

VXLAN is an overlay encapsulation technology. It creates a virtual network overlaid on top of the existing physical network infrastructure. It uses the underlay IP network and builds a flexible Layer 2 overlay logical network on it.

For more information, see the [VXLAN Feature Overview and Configuration Guide](#).

- Command List**

 - [“remote-vtep”](#) on page 1929
 - [“show vxlan”](#) on page 1930
 - [“source-interface \(vxlan\)”](#) on page 1932

flood-list

Overview Use this command to create a named flood list, which contains a list of remote VTEP (VXLAN Tunnel End Point) names.

When using the **no** variant of the command, specifying a remote VTEP name will remove that remote VTEP from the flood list. Specifying only the flood list name will destroy the flood list entirely and automatically disassociate it from any map-access commands that have referenced it. Any L2VNIs affected by this will begin to be flooded to all known remote VTEPs (the standard behaviour when no flood list is specified).

Syntax `flood-list <list-name> [vteps <vtep-name>...]`
`no flood-list <list-name> [vteps <vtep-name>...]`

Parameter	Description
<list-name>	The name of the flood list, (max 20 characters).
<vtep-name>	The VTEP name or a list of remote VTEP names.

Default N/A.

Mode VXLAN Configuration

Usage notes By default, when a VLAN is mapped to an L2VNI, the local device will assume that all configured remote VTEPs are involved in the L2VNI and will flood all BUM (Broadcast, Unknown unicast, Multicast) traffic for that L2VNI to all configured remote VTEPs.

It is possible however to have an L2VNI that is only associated with a subset of the remote VTEPs on the device. This configuration scenario can be achieved by creating a flood list that specifies a set of remote VTEPs, which can then be associated with the L2VNI when it is created using the **map-access vlan vni** command.

A flood list can be created with no remote VTEPs. If such a flood list were associated with a VNI mapping, it would prevent traffic for that VNI being forwarded to any remote VTEPs.

When remote VTEPs are specified in a list, all of the remote VTEPs must exist for the command to be accepted. When the command is accepted, the newly specified remote VTEPs are added to the existing flood list. In the running configuration. The flood list may occupy multiple lines if required to display all of the remote VTEP names in the list. The order of the remote VTEPs in the list does not matter.

Example To create a new flood list named 'LectureBlockA', which includes the remote VTEPs LectureTheaterA2 and LectureTheatreA3, use the commands:

```
awplus# configure terminal
awplus(config)# nvo vxlan
awplus(config-vxlan)# flood-list LectureBlockA vteps
LectureTheaterA2 LectureTheaterA3
```

To remove LectureTheatreA3 from the 'LectureBlockA' flood list, use the commands:

```
awplus# configure terminal
awplus(config)# nvo vxlan
awplus(config-vxlan)# no flood-list LectureBlockA vteps
LectureTheaterA3
```

To destroy the 'LectureBlockA' flood list entirely, use the commands:

```
awplus# configure terminal
awplus(config)# nvo vxlan
awplus(config-vxlan)# no flood-list LectureBlockA
```

Related commands

- [source-interface \(vxlan\)](#)
- [remote-vtep](#)
- [map-access vlan vni](#)
- [nvo vxlan](#)

Command changes Version 5.5.1-0.1: command added

map-access vlan vni

Overview Use this command to map an existing VLAN ID to an L2VNI. The VLAN and L2VNI cannot already be in use in VXLAN, and a [source-interface \(vxlan\)](#) must be configured before this command will be accepted.

Use the **no** variant of this command to remove a mapping between a VLAN ID and L2VNI.

Syntax `map-access vlan <vlan-id> vni <vni-id> [flood-list <list-name>]`
`no map-access vlan <vlan-id>`

Parameter	Description
<vlan-id>	VLAN ID, in the range 1-4094
<vni-id>	Layer 2 VNI to associate with the specified VLAN ID, in the range 1-16777215
<list-name>	The name of an existing flood list.

Mode VXLAN Configuration

Usage notes You can optionally specify the name of a flood list. This is useful if an L2VNI is only operating on a sub-set of all configured remote VTEPs.

- If no flood list is specified, then the device will assume all existing configured remote VTEPs are members of this L2VNI and will flood BUM (Broadcast, Unknown unicast, Multicast traffic) traffic to them.
- If a flood list is specified, then the device will only flood BUM traffic for the L2VNI to the remote VTEPs specified in the flood list.

Example To associate VLAN 5 with VNI 10005, use the commands:

```
awplus# configure terminal
awplus(config)# nvo vxlan
awplus(config-vxlan)# map-access vlan 5 vni 10005
```

To associate VLAN 6 with VNI 10006 and a flood-list, use the commands:

```
awplus# configure terminal
awplus(config)# nvo vxlan
awplus(config-vxlan)# map-access vlan 6 vni 10006 flood-list
VNI10006
```

To remove the association between VLAN 6 and VNI 10006, use the commands:

```
awplus# configure terminal
awplus(config)# nvo vxlan
awplus(config-vxlan)# no map-access vlan 6
```

Related commands	source-interface (vxlan)
	remote-vtep
	nvo vxlan
	flood-list
Command changes	Version 5.5.1-0.1: command added

nvo vxlan

Overview Use this command to enter the **config-vxlan** mode, where all other VXLAN commands are entered.

If you want to do L3 operations (and routing) of traffic within a VXLAN tunnel, we recommend using VRF. In that case, assign VLANs mapped to the VNIs to a named VRF. The tunnel itself exists in the global VRF.

Use the **no** variant of this command to remove all VXLAN configuration under VXLAN configuration mode from the device.

Syntax nvo vxlan
no nvo vxlan

Mode Global Configuration

Example To enter the VXLAN configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# nvo vxlan
awplus(config-vxlan)#
```

Related commands [source-interface \(vxlan\)](#)
[remote-vtep](#)
[map-access vlan vni](#)
[flood-list](#)
[show vxlan](#)

Command changes Version 5.5.1-0.1: command added

platform inter-chip-header 4-word

Overview Use this command to enable extended ACL VLAN actions or to enable VXLAN platform support.

Use the **no** variant of this command to disable extended ACL VLAN actions or to disable VXLAN platform support.

Syntax `platform inter-chip-header 4-word`
`no platform inter-chip-header`

Default Not enabled.

Mode Global Configuration

Example To enable extended ACL VLAN actions or to enable VXLAN platform support, use the command:

```
awplus# platform inter-chip-header 4-word
```

To return to the default platform settings, use the command:

```
awplus# no platform inter-chip-header
```

Related commands [show platform](#)

Command changes Version 5.5.1-0.1: command added

platform l3-vxlan enable

Overview Use this command to enable VXLAN tunneling on your device.
Use the **no** variant of this command to return to the default platform settings.

Syntax platform l3-vxlan enable
no platform l3-vxlan enable

Default Not enabled.

Mode Global Configuration

Usage notes This command is required to enable VXLAN tunneling on your device.

Example To enable VXLAN tunneling, use the command:

```
awplus# platform l3-vxlan enable
```

To return the default platform settings, use the command:

```
awplus# no platform l3-vxlan enable
```

Related commands [show platform](#)

Command changes Version 5.5.1-2.1: command added

remote-vtep

Overview Use this command to create a VTEP (VXLAN Tunnel End Point) tunnel between the local device and the remote IP address specified in this command.

Use the **no** variant of this command to remove a VTEP.

Syntax `remote-vtep <vtep-name> <ip-address>`
`no remote-vtep <vtep-name>`

Parameter	Description
<code><vtep-name></code>	A unique name that identifies the remote device. The name must be 20 characters or less.
<code><ip-address></code>	The IPv4 address of the far end of the tunnel.

Default N/A.

Mode VXLAN Configuration

Example To create a VXLAN tunnel called LectureTheaterA2 with the remote IP address 192.168.4.7, use the commands:

```
awplus# configure terminal
awplus(config)# nvo vxlan
awplus(config-vxlan)# remote-vtep LectureTheaterA2 192.168.4.7
```

Related commands [source-interface \(vxlan\)](#)
[nvo vxlan](#)
[map-access vlan vni](#)
[flood-list](#)

Command changes Version 5.5.1-0.1: command added

show vxlan

Overview Use this command to see the configuration state of VXLAN in the system. As VXLAN tunnels are stateless, this command should mainly be used to check that the tunnels have been configured as intended. It can also be used to check that nexthops have been learned for the configured remote VTEPs.

Syntax `show vxlan`

Mode Privileged Exec

Usage Resource usage:

- there is a maximum limit of 127 VTEPs that can be configured, and 1000 VNIs. There is also a limit of 8192 that is the number of VTEPs * VNIs. Finally the virtual ports are used when trunked VLANs are added to ports, with each trunked VLAN added to a single port consuming 1 virtual port, so 10 trunked VLANs added onto 5 ports would consume 50 virtual ports.

Example To show the VXLAN configuration state, use the command:

```
awplus# show vxlan
```

Output Figure 33-1: Example output from **show vxlan**

```
awplus#show vxlan
Resource Usage:
-----
VTEP Usage                3/127
VNI Usage                  2/1000
VTEP multiplied by VNI usage 6/8192
Hardware Virtual Port Usage 4/16384

Remote VTEPs (3)
-----
VTEP branch-office-1 (172.16.43.1)
  VNIs (2): 10040, 10050
  Nexthops:
    IP Address      Mac Address      Interface      Port
    10.32.1.6        0000.cd38.139d    vlan5          port1.1.5
    10.32.1.9        0000.cd38.2f4c    vlan5          port1.1.5

source-interface (vxlan)

Overview Use this command to configure the device to accept the loopback interface as a termination point for VXLAN tunnels. To use this command, you must first ensure the loopback interface has an IPv4 host address configured as its primary IP address.

Use the **no** variant of this command to remove the VXLAN tunnel source interface. Note that all remote VTEPs (VXLAN Tunnel End Points) must be deconfigured first.

Syntax `source-interface <int-name>`
`no source-interface`

Parameter	Description
<code><int-name></code>	The loopback interface name 'lo'

Default Not set.

Mode VXLAN Configuration

Example To configure IP address 192.168.1.1 as the tunnel source, use the commands:

```
awplus# configure terminal
awplus(config)# interface lo
awplus(config-if)# ip address 192.168.1.1
awplus(config-if)# exit
awplus(config)# nvo vxlan
awplus(config-vxlan)# source-interface lo
```

- [“url \(linkmon-probe\)”](#) on page 1965

consecutive probe loss

Overview Use this command within a specific link performance profile to configure the allowable consecutive probe loss thresholds of probes that use that performance profile.

Use the **no** variant of this command to delete a consecutive probe loss threshold.

Syntax

```
consecutive-probe-loss bad-when <consecutive-probe-losses>
consecutive-probe-loss good-when <consecutive-probe-successes>
consecutive-probe-loss unreachable-when
<consecutive-probe-losses>
no consecutive-probe-loss bad-when
no consecutive-probe-loss good-when
no consecutive-probe-loss unreachable-when
```

Parameter	Description
bad-when <consecutive-probe-losses>	The number of probes that must be lost consecutively, at which point the associated link is considered to be bad, in a range of <1-100>.
good-when <consecutive-probe-successes>	The number of probes that must succeed consecutively, at which point the associated link is considered to be good, in a range of <1-100>.
unreachable-when <consecutive-probe-losses>	The number of probes that must be lost consecutively, at which point the associated link is considered to be unreachable, in a range of <1-100>.

Default The performance profile is disabled.

Mode Linkmon Profile Configuration

Usage notes These setting are all optional.

The **bad-when** parameter is used to set the thresholds where if the number of probe replies that have been lost consecutively is equal to or above this value, then that link is considered bad. If **bad-when** is not configured, this metric will never result in a link being considered bad.

The **unreachable-when** parameter is used to set the thresholds where if the number of probe replies that have been lost consecutively is equal to or above this value, then that link is considered unreachable or down. If **unreachable-when** is not configured, this metric will never result in a link being considered unreachable.

The **good-when** parameter is used to state the thresholds where if the number of probe replies that have been successfully received consecutively is equal to or above this value, then that link is considered good. If **good-when** is not configured, then when a link is considered bad or unreachable due to this metric, the first successful probe result will consider the link as good.

Example To configure the point at or above which consecutive probe loss is unacceptable to be 10, the point at or above which consecutive probe success is acceptable to be 5, and the point at or above which consecutive probe loss indicates the destination is unreachable to be 15 for performance profile named "profile0", use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon profile profile0
awplus(config-linkmon-profile)# consecutive-probe-loss
bad-when 10
awplus(config-linkmon-profile)# consecutive-probe-loss
good-when 5
awplus(config-linkmon-profile)# consecutive-probe-loss
unreachable-when 15
```

To delete consecutive-probe-loss thresholds in performance profile "profile0", use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon profile profile0
awplus(config-linkmon-profile)# no consecutive-probe-loss
bad-when
awplus(config-linkmon-profile)# no consecutive-probe-loss
good-when
awplus(config-linkmon-profile)# no consecutive-probe-loss
unreachable-when
```

Command changes Version 5.4.8-1.1: command added
Version 5.5.1-0.1: command added to all AlliedWare Plus switches

debug linkmon

Overview Use this command to enable Link Health Monitoring debugging.
Use the **no** variant of this command to disable Link Health Monitoring debugging.

Syntax debug linkmon [probe|ip-address|interface|trigger]
no debug linkmon [probe|ip-address|interface|trigger]
debug linkmon probe name <name>
no debug linkmon probe name <name>

Parameter	Description
probe	Link Health Monitoring probe.
ip-address	IP addresses that are of interest to Link Health Monitoring.
interface	Interfaces that are of interest to Link Health Monitoring.
trigger	This debug option will show debugging for Link Health Monitoring triggers.
<name>	The name identifying a Link Health Monitoring probe or Link Health Monitoring group.

Default No debugging is enabled.

Mode Privileged Exec

Usage notes If **probe** is specified, then debug related to all Link Health Monitoring probes is enabled.
If **probe name <name>** is specified, then debug related to the named Link Health Monitoring probe is enabled.
If **ip-address** is specified, then debug related to configuration of IP addresses that are of interest to Link Health Monitoring are enabled. These IP addresses could influence Link Health Monitoring group members being considered up/down.
If **interface** is specified, then debug related to up/down state of Link Health Monitoring is enabled.
If **trigger** is specified, then debug related to Link Health Monitoring triggers is enabled.

Example To enable debugging on the Link Health Monitoring probe 'probe1', use the following command:

```
awplus# debug linkmon probe name probe1
```

To enable debugging on all Link Health Monitoring probes, use the following command:

```
awplus# debug linkmon probe
```

To disable debugging on all Link Health Monitoring probes, use the following command:

```
awplus# no debug linkmon probe
```

Related commands

[linkmon probe](#)

Command changes

Version 5.4.8-0.2: command added

Version 5.5.1-0.1: command added to all AlliedWare Plus switches

destination (linkmon-probe)

Overview Use this command to set the destination of a Link Health Monitoring probe. This is a required configuration option for probes.

Use the **no** variant of this command to remove the destination of a probe.

Syntax `destination {<ip-address>|<fqdn>}`
`no destination`

Parameter	Description
<code><ip-address></code>	The destination of the probe, an IPv4 or IPv6 IP address.
<code><fqdn></code>	The destination of the probe, an FQDN (fully qualified domain name). The IP address of the FQDN will be automatically resolved by the DNS on the device.

Mode Linkmon ICMP Probe Configuration

Example To set the destination of a probe named 'probe1' to 192.168.2.200, use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# destination 192.168.2.200
```

To set the destination of a probe named 'probe1' to 2001:db8:a0b:12f0::1, use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# destination
2001:db8:a0b:12f0::1
```

To set the destination of a probe named 'probe1' to the FQDN of "google.com", use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# destination google.com
```

To remove the destination of a probe named 'probe1', use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# no destination
```

Related commands [linkmon probe](#)

Command changes Version 5.4.8-1.1: command added
Version 5.5.1-0.1: command added to all AlliedWare Plus switches

dscp (linkmon-probe)

Overview Use this command to set the DSCP value of packets used for Link Health Monitoring probes.

Use the **no** variant of this command to set it back to the default.

Syntax `dscp <dscp-value>`
`no dscp`

Parameter	Description
<code><dscp-value></code>	The DSCP value for the probe packet in range <code><0-63></code> .

Default The default DSCP value is 0.

Mode Linkmon ICMP Probe Configuration

Example To set the DSCP of a probe named 'probe1' to 10, use the following commands:

```
awplus(config)# linkmon probe name probe1  
awplus(config-linkmon-icmp-probe)# dscp 10
```

To set the DSCP of a probe named 'probe1' back to default, use the following commands:

```
awplus(config)# linkmon probe name probe1  
awplus(config-linkmon-icmp-probe)# no dscp
```

Related commands [linkmon probe](#)

Command changes Version 5.4.8-1.1: command added

Version 5.5.1-0.1: command added to all AlliedWare Plus switches

egress interface (linkmon-probe)

Overview Use this command to force a Link Health Monitoring probe to egress out of a specific interface.

Use the **no** variant of this command to return interface selection back to the default behavior.

Syntax `egress interface <interface>`
`no egress interface`

Parameter	Description
<code><interface></code>	The name of the egress interface for the probe. The specified egress interface needs to be locally configured and in an up and running state.

Default No egress interface is defined by default. The egress interface will be selected using standard routing behavior to reach the probe's destination.

Mode Linkmon HTTP Probe Configuration, or Linkmon ICMP Probe Configuration

Example To set the egress interface for a probe named 'probe1' to 'vlan2', use the following commands:

```
awplus(config)# linkmon probe name probe1  
awplus(config-linkmon-icmp-probe)# egress interface vlan2
```

To set the egress interface for a probe named 'probe1' back to the default, use the following commands:

```
awplus(config)# linkmon probe name probe1  
awplus(config-linkmon-icmp-probe)# no egress interface
```

Command changes Version 5.4.8-1.1: command added
Version 5.5.1-0.1: command added to all AlliedWare Plus switches

enable (linkmon-probe)

Overview Use this command to enable individual Link Health Monitoring probes. When a probe is enabled, it will begin transmitting, processing, and storing results.

Use the **no** variant of this command to disable a probe.

Syntax enable
no enable

Default Disabled

Mode Linkmon HTTP Probe Configuration, or Linkmon ICMP Probe Configuration

Example To enable a probe named 'probe1', use the following commands:

```
awplus(config)# linkmon probe name probe1  
awplus(config-linkmon-icmp-probe)# enable
```

To disable a probe named 'probe1', use the following commands:

```
awplus(config)# linkmon probe name probe1  
awplus(config-linkmon-icmp-probe)# no enable
```

Related commands [linkmon probe](#)

Command changes Version 5.4.8-1.1: command added
Version 5.5.1-0.1: command added to all AlliedWare Plus switches

interval (linkmon-probe)

Overview Use this command to set the interval between Link Health Monitoring probe packets.

Use the **no** variant of this command to set the interval back to the default.

Syntax `interval <probe-interval>`
`no interval`

Parameter	Description
<code><probe-interval></code>	The gap between probes being transmitted. For ICMP probes, this is a range of 100-10000 milliseconds. For HTTP probes, this is a range of 30000-3600000 milliseconds.

Default For ICMP probes, the default interval is 1000 milliseconds. For HTTP probes, the default interval is 60000 milliseconds.

Mode Linkmon HTTP Probe Configuration, or Linkmon ICMP Probe Configuration

Example To set the interval of a probe named 'probe1' to 100, use the following commands:

```
awplus(config)# linkmon probe name probe1  
awplus(config-linkmon-icmp-probe)# interval 100
```

To set the interval of a probe named 'probe1' back to default, use the following commands:

```
awplus(config)# linkmon probe name probe1  
awplus(config-linkmon-icmp-probe)# no interval
```

Related commands [linkmon probe](#)

Command changes Version 5.4.8-1.1: command added
Version 5.5.1-0.1: command added to all AlliedWare Plus switches

ip-version (linkmon-probe)

Overview Use this command to set the IP version for the Link Health Monitoring ICMP probe.
Use the **no** variant of this command to set it back to the default.

Syntax `ip-version {4|6}`
`no ip-version`

Parameter	Description
4	Internet Protocol (IPv4)
6	Internet Protocol version 6 (IPv6)

Default IPv4

Mode Linkmon HTTP Probe Configuration, or Linkmon ICMP Probe Configuration

Example To set the IP version as IPv6 for a probe named 'probe1', use the following commands:

```
awplus(config)# linkmon probe name probe1  
awplus(config-linkmon-icmp-probe)# ip-version 6
```

To set the IP version back to the default for a probe named 'probe1', use the following commands:

```
awplus(config)# linkmon probe name probe1  
awplus(config-linkmon-icmp-probe)# no ip-version
```

Command changes Version 5.4.8-1.1: command added
Version 5.5.1-0.1: command added to all AlliedWare Plus switches

jitter

Overview Use this command to configure the thresholds for the jitter metric. This metric is used to judge whether probes associated with this performance profile are good or bad.

Use the **no** variant of this command to remove jitter bad-above and jitter good-below ranges.

Syntax jitter bad-above <unacceptable-jitter-point>
jitter good-below <acceptable-jitter-point>
no jitter bad-above
no jitter good-below

Parameter	Description
bad-above <unacceptable-jitter-point>	The point above which jitter is unacceptable in range <1-1000> in milliseconds. When a probe associated with this profile has a jitter result greater than this value, the associated Link Health Monitoring member will be considered 'bad'.
good-below <acceptable-jitter-point>	The point at or below which jitter is acceptable in range <1-1000> in milliseconds. When a probe associated with this profile has a jitter result less than this value, the associated Link Health Monitoring member will be considered 'good'.

Mode Linkmon Profile Configuration

Usage notes If only **bad-above** is configured, then if the probe results indicate a link is above this value, then that link is considered bad. As soon as the results fall below this value, the link will be immediately considered good.

The combination of these two parameters allow for hysteresis, which may prevent link-flapping behavior. For example, with a **bad-above** value of 100, and a **good-below** value of 90, if the jitter rises to 100 the link will be marked 'bad', but it will not be marked 'good' until it reaches or falls below 90.

If only **good-below** is configured, then probe results will not cause a link to be considered bad.

Example To configure the point above which jitter is unacceptable to be 100ms and the point at or below which jitter is acceptable to be 90ms for a performance profile named 'profile1', use the following commands:

```
awplus(config)# linkmon profile profile1
awplus(config-linkmon-profile)# jitter bad-above 100
awplus(config-linkmon-profile)# jitter good-below 90
```

To delete the jitter ranges for a performance profile named 'profile1', use the following commands:

```
awplus(config)# linkmon profile profile1  
awplus(config-linkmon-profile)# no jitter bad-above  
awplus(config-linkmon-profile)# no jitter good-below
```

**Command
changes**

Version 5.4.8-0.2: command added
Version 5.5.1-0.1: command added to all AlliedWare Plus switches

latency

Overview Use this command to configure the thresholds for the latency metric. This metric is used to judge whether probes associated with this performance profile are good or bad.

Use the **no** variant of this command to remove latency bad-above and latency good-below ranges.

Syntax latency bad-above *<unacceptable-latency-point>*
latency good-below *<acceptable-latency-point>*
no latency bad-above
no latency good-below

Parameter	Description
bad-above <i><unacceptable-latency-point></i>	The point above which latency is unacceptable in range <i><1-2000></i> in milliseconds. When a probe associated with this profile has a latency result greater than this value, the associated Link Health Monitoring member will be considered 'bad'.
good-below <i><acceptable-latency-point></i>	The point at or below which latency is acceptable in range <i><1-2000></i> in milliseconds. When a probe associated with this profile has a latency result less than this value, the associated Link Health Monitoring member will be considered 'good'.

Mode Linkmon Profile Configuration

Usage notes If only **bad-above** is configured, then if the probe results indicate a link is above this value, then that link is considered bad. As soon as the results fall below this value, the link will be immediately considered good.

The combination of these two parameters allow for hysteresis, which may prevent link-flapping behavior. For example, with a **bad-above** value of 100, and a **good-below** value of 90, if the latency rises to 100 the link will be marked 'bad', but it will not be marked 'good' until it reaches or falls below 90.

If only **good-below** is configured, then probe results will not cause a link to be considered bad.

Example To configure the point above which latency is unacceptable to be 100ms and the point at or below which latency is acceptable to be 90ms for a performance profile named 'profile1', use the following commands:

```
awplus(config)# linkmon profile profile1
awplus(config-linkmon-profile)# latency bad-above 100
awplus(config-linkmon-profile)# latency good-below 90
```

To delete the latency ranges for a performance profile named 'profile1', use the following commands:

```
awplus(config)# linkmon profile profile1  
awplus(config-linkmon-profile)# no latency bad-above  
awplus(config-linkmon-profile)# no latency good-below
```

**Command
changes**

Version 5.4.8-0.2: command added
Version 5.5.1-0.1: command added to all AlliedWare Plus switches

linkmon probe

Overview Use this command to create a Link Health Monitoring probe and enter the appropriate Link Health Monitoring Probe Configuration Mode where this probe can be configured.

Use the **no** variant of this command to delete the Link Health Monitoring probe.

Syntax `linkmon probe name <probe-name> [type {icmp-ping|http-get}]`
`no linkmon probe name <probe-name>`

Parameter	Description
<probe-name>	The name of the probe.
type	The type of the probe. Indicates the packet type or protocol used by the probe, either of icmp-ping (ICMP) or http-get (HTTP). This parameter is optional. If not entered, a newly created probe's type defaults to icmp-ping.

Default The default probe type for a newly created probe is **icmp-ping**. The optional parameter **type** is only required to create a probe type other than the default. The **type** parameter is not required when editing an existing probe or deleting a probe.

Mode Global Configuration

Usage notes The optional probe **type** parameter represents the packet type or protocol used in the transmission of the probe. A probe of type **icmp-ping** will present some different configuration options to a probe of type **http-get**.

An **icmp-ping** Link Health Monitoring probe requires a destination, and must be enabled for probing to begin.

An **http-get** Link Health Monitoring probe requires a URL, and must be enabled for probing to begin.

Example To create a probe named 'probe1' using the default probe type and enter Link Health Monitoring ICMP Probe Configuration Mode to configure it, use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)#
```

To create a probe named 'probe1' using the default ICMP probe type and enter Link Health Monitoring ICMP Probe Configuration Mode to configure it, use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon probe name probe1 type icmp-ping
awplus(config-linkmon-icmp-probe)#
```

To create a probe named 'probe1' using the HTTP probe type and enter Link Health Monitoring HTTP Probe Configuration Mode to configure it, use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon probe name probe1 http-probe
awplus(config-linkmon-http-probe)#
```

To remove a probe named 'probe1', use the following commands:

```
awplus# configure terminal
awplus(config)# no linkmon probe name probe1
```

**Related
commands**

[show linkmon probe-history](#)
[size \(linkmon-probe\)](#)

**Command
changes**

Version 5.4.8-0.2: command added
Version 5.4.8-1.1: now operates as a modal command, with the new type parameter used to determine whether to enter ICMP or HTTP probe mode
Version 5.5.1-0.1: command added to all AlliedWare Plus switches

linkmon probe-history

Overview Use this command to create a collection instance that records the metrics gathered by a Link Health Monitoring probe.

Use the **no** variant of this command to remove the specified collection instance.

Syntax `linkmon probe-history [<1-65535>] probe <probe-name> interval <1-2678400> buckets <1-65535>`
`no linkmon probe-history <1-65535>`

Parameter	Description
probe-history <1-65535>	The ID of the probe history collection instance. If this is not set on creation then it will be automatically allocated.
probe <probe-name>	The name of the probe to record metrics for.
interval <1-2678400>	The interval that metrics are collated, in seconds.
buckets <1-65535>	The maximum number of metric history samples.

Mode Global Configuration

Usage notes Metrics are collated every **interval** seconds. Up to **buckets** samples of metrics are collated.

Different **interval** and **buckets** values can be used to record specific kinds of histories. For example, an **interval** value of 1 and a **buckets** value of 3600 would record per second metrics of a probe for an hour. An **interval** value of 3600 and a **buckets** value of 744 would record per hour metrics of a probe for 31 days.

Using the Web API, metric values for a sample are returned as a sum and a count. The sum can be divided by the count for an average. For example, if 10 probes have been sent during a history interval, then the metric counts would be 10 for a sample, and the sum would be the total of the metric values.

If a probe receives no reply then no metric is recorded.

Packet loss is not recorded exactly. Instead the probes sent and probe replies received is recorded.

CAUTION: This configuration option can consume a large amount of RAM on the device, particularly if you configure high numbers of buckets. The memory is reserved when the command is entered, so if the memory consumption from this command is too high, entering the command will trigger the device's low memory management procedure. The device will continue to operate when it reaches a low memory state, but if available memory decreases further into a critical zone, a warning message will be printed and the device will reboot.

Example To create a Link Health Monitoring probe history collection instance with an ID of 10 for a probe named 'probe1' that collates metrics every second while keeping up to 300 samples, use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon probe-history 10 probe probe1 interval
1 buckets 300
```

To create a Link Health Monitoring probe history collection instance with an automatically allocated ID for a probe named 'probe1' that collates metrics every 60 seconds while keeping up to 3600 samples, use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon probe-history probe probe1 interval 60
buckets 3600
```

linkmon profile

Overview Use this command to create a Link Health Monitoring performance profile and enter Linkmon Profile Configuration mode where this profile can be configured.

Use the **no** variant of this command to remove a configured performance profile.

Syntax `linkmon profile <profile-name>`
`no linkmon profile <profile-name>`

Parameter	Description
<code><profile-name></code>	The name of the performance profile.

Mode Global Configuration

Example To create a new performance profile named 'profile1', use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon profile profile1
awplus(config-linkmon-profile)#
```

To remove a performance profile named 'profile1', use the following commands:

```
awplus# configure terminal
awplus(config)# no linkmon profile profile1
```

sample-size (linkmon-probe)

Overview Use this command to set the sample size used for calculating latency and jitter metrics for a Link Health Monitoring probe.

Use the **no** variant of this command to set the sample size back to the default value.

Syntax `sample-size <1-100>`
`no sample-size`

Parameter	Description
<code><1-100></code>	The number of probe samples to use when calculating the latency and jitter metrics.

Default The default sample size is 5.

Mode Linkmon ICMP Probe Configuration

Example To set the sample size a probe named 'probe1' to 10, use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# sample-size 10
```

To set the sample size a probe named 'probe1' back to the default, use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# no sample-size
```

Related commands [linkmon probe](#)

service linkmon

Overview Use this command to enable the Link Health Monitoring service. This is required before any other link health monitoring configuration can be entered.

Use the **no** variant of this command to disable the Link Health Monitoring service.

Syntax `service linkmon`
`no service linkmon`

Default The Link Health Monitoring service is disabled.

Mode Global Configuration

Example To enable the Link Health Monitoring service, use the commands:

```
awplus# configure terminal
awplus(config)# service linkmon
```

To disable the Link Health Monitoring service, use the commands:

```
awplus# configure terminal
awplus(config)# no service linkmon

show linkmon probe

Overview Use this command to display output for one or all link monitoring probes.

Syntax show linkmon probe [<probe-name>]

Parameter	Description
<probe-name>	The name of the specific probe to display.

Mode User Exec and Privileged Exec

Example To show the output for all link monitoring probes, use the following command:

```
awplus# show linkmon probe
```

To show the output for a link monitoring probe named 'probe1', use the following command:

```
awplus# show linkmon probe probe1
```

Output Figure 34-1: Example output from **show linkmon probe**

```
awplus#show linkmon probe
Probe Name      : my_probe_1
Status          : enabled
Type            : ICMP
IP version      : IPv4
Destination     : 198.51.100.1
Egress Int      : -
Source          : -
DSCP            : -
Packet Size     : -
Interval        : -
Sample Size     : -

Last Probe Received	: 23 Mar 2018 03:36:00

Table 34-1: Parameters in the output from **show linkmon probe**

Parameter	Description
Name	The name of the probe.
Status	Whether the probe is enabled or disabled. If it is enabled, then the device will attempt to send probes if the link is up. If it is disabled, then no probes will be sent.
Type	The type of probe packet sent.
IP version	The IP version being used, IPv4 or IPv6.
Destination	The destination IP address that the probes are sent to.
Egress Interface	The interface that the probe packets should egress.
Source	The source IP address or interface.
DSCP	The DSCP value to use when sending the packet.
Packet Size	The size of a probe packet.
Interval	The number of milliseconds between sending out each probe.
Sample Size	The number of probe results to use when calculating the latency and jitter metrics.
Latency	The average latency based on the last sample size samples.
Jitter	The average jitter based on the last sample size samples.
Packet Loss	The percentage of packets lost based on the last 100 probes.

Table 34-1: Parameters in the output from **show linkmon probe** (cont.)

Parameter	Description
Probes Sent	The number of probe packets that have been sent.
Last Probe Sent	The time that the last probe packet was sent.
Last Probe Received	The time that the device last successfully received a probe packet.

Related commands [linkmon probe](#)

Version 5.5.1-0.1: command added to all AlliedWare Plus switches

show linkmon probe-history

Overview Use this command to show information about Link Health Monitoring probe metric history collection instances.

Syntax `show linkmon probe-history [<1-65535>|probe <probe-name>]`

Parameter	Description
<1-65535>	The ID of the collection instance to show history for.
<probe-name>	The name of the probe to show history for.

Mode User Exec and Privileged Exec

Example To show all Link Health Monitoring probe history collection instances, use the following command:

```
awplus# show linkmon probe-history
```

To show a Link Health Monitoring probe history collection instance with the ID of '10', use the following command:

```
awplus# show linkmon probe-history 10
```

To show all Link Health Monitoring probe history collection instances that are using a probe named 'probe1', use the following command:

```
awplus# show linkmon probe-history probe probe1
```

Output Figure 34-2: Example output from **show linkmon probe-history**

awplus#show linkmon probe-history						

ID	Interval (s)	Buckets	Latency (ms): Min	Max	Avg	
Probe			Jitter (ms): Min	Max	Avg	
			Packets: Tx	Rx	Loss (%)	

10	1	300/300	94	105	99	
PROBE1			2	11	6	
			2978	2978	0.00	
20	5	300/300	97	102	99	
PROBE1			4	9	6	
			14892	14892	0.00	
30	10	300/300	98	101	100	
PROBE1			5	8	6	
			29785	29785	0.00	

Table 34-2: Parameters in the output from **show linkmon probe-history**

Parameter	Description
ID	The ID of the Link Health Monitoring probe-history.
Probe	The name of the probe that this history is for.
Interval	The amount of time between each history sample (in seconds).
Buckets	The total number of samples that are stored.
Latency min	The minimum latency that is in the history.
Latency max	The maximum latency that is in the history.
Latency avg	The average latency of the samples stored in the history.
Jitter min	The minimum jitter that is in the history.
Jitter max	The maximum jitter that is in the history.
Jitter avg	The average jitter of the samples stored in the history.
Packets Tx	The total number of packets transmitted in this history.
Packets Rx	The total number of packets received in this history.
Packets Loss	The percentage of packets lost in the history.

show linkmon trigger

Overview Use this command to view the status of link health monitoring probe type triggers.

Syntax show linkmon trigger [<1-250>]

Parameter	Description
<1-250>	The trigger ID for a link health monitoring trigger.

Mode Privileged Exec

Example To view the status of all link health monitoring triggers, use the command:

```
awplus# show linkmon trigger
```

To view the status of link health monitoring trigger 1, use the command:

```
awplus# show linkmon trigger 1
```

Output Figure 34-3: Example output from **show linkmon trigger**

```
awplus#show linkmon trigger
Trigger 1
-----
Match State:          bad
Change Count:         5
Last Change:
  Current State:      good
  Previous State:     unknown
  Change Time:        09 Feb 2021 21:41:15
  Cause:              Rx probe 'my_probe', consecutive probe
success (3>=3)

Probe:                my_probe
Enabled:              Yes
Latest Metrics
  Latency              : 1ms
  Jitter               : 1ms
  Loss Rate             : 22.6%
  Consecutive Success  : 7

Profile:              my_profile
  latency bad above    : - ms
  latency good below   : - ms
  jitter bad above     : - ms
  jitter good below    : - ms
  Consecutive success good when : 3
  Consecutive loss bad when   : 2
  Consecutive loss unreachable when : 4
```

Table 34-3: Parameters in the output from **show linkmon trigger**

Parameter	Description
Match State	If the state of the probe is the same as the match state, the trigger will activate.
Change Count	The number of times the probe has changed state.
Current State	The current state of the probe.
Previous State	The previous state of the probe.
Change Time	The timestamp when the probe last changed state.
Cause	The reason why the probe last changed state.
Probe	The name of the probe.
Enabled	Whether the probe is enabled.
Latency	The last latency metric of the probe.
Jitter	The last jitter metric of the probe.
Loss Rate	The loss rate of the probe, up to 100 metric results calculated.
Consecutive Success	The number of probes that have consecutively succeeded.
Profile	The name of the profile the probe results are being compared to. The profile determines the acceptable jitter, latency, and probe loss.

Related commands [show linkmon probe](#)

Command changes Version 5.5.1-0.1: command added

size (linkmon-probe)

Overview Use this command to set the size of the packets used by a Link Health Monitoring probe.

Use the **no** variant of this command to set the size back to the default.

Syntax `size <64-1500>`
`no size`

Parameter	Description
<code><64-1500></code>	The size of the probe packet in bytes.

Default The default packet size is 100 bytes.

Mode Linkmon ICMP Probe Configuration

Example To set the size of a probe named 'probe1' to 1000, use the following commands:

```
awplus(config)# linkmon probe name probe1  
awplus(config-linkmon-icmp-probe)# size 1000
```

To set the size of a probe named 'probe1' back to the default, use the following commands:

```
awplus(config)# linkmon probe name probe1  
awplus(config-linkmon-icmp-probe)# no size
```

Related commands [linkmon probe](#)

Command changes Version 5.4.8-1.1: command added

Version 5.5.1-0.1: command added to all AlliedWare Plus switches

source (linkmon-probe)

Overview Use this command to set the source IP address or interface for a Link Health Monitoring probe.

Use the **no** variant of this command to return it to the default.

Syntax `source {<interface>|<ip-address>}`
`no source`

Parameter	Description
<code><interface></code>	The name of the interface that probes are sourcing from. The specified interface needs to be locally configured with at least one valid IPv4 address, and the interface is in up and running state.
<code><ip-address></code>	The source IPv4 address for this probe. The specified IP address needs to be locally configured on an interface that is in an up-and-running state.

Default No source IP address is defined by default. The source IP address will be selected using standard routing behavior to reach the probe's destination.

Mode Linkmon ICMP Probe Configuration

Example To set the source interface as 'lo' for a probe named 'probe1', use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# source lo
```

To set the source interface back to default for a probe named 'probe1', use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# no source
```

url (linkmon-probe)

Overview Use this command to set the destination URL of a Link Health Monitoring probe. This is a required configuration option for http-get probes.

Use the **no** variant of this command to remove the URL.

Syntax url <url>
no url

Parameter	Description
<url>	The destination the probe is being sent to. The URL must use ASCII characters and conform to the URL syntax in RFC 3986, with http or https protocol at the start and an optional port number on the end, such as :80, :443 or :8080.

Mode Linkmon HTTP Probe Configuration

Example To set the destination URL of a Link Health Monitoring probe named “test-probe”, use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon probe name test-probe type http
awplus(config-linkmon-http-probe)# url
http://www.alliedtelesis.co.nz/
```

Some other examples of supported URL formats:

```
awplus(config-linkmon-http-probe)# url
https://www.facebook.com/
awplus(config-linkmon-http-probe)# url
http://intranet.atlnz.lc:8080
```

To remove the URL, use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon probe name test-probe type http
awplus(config-linkmon-http-probe)# no url
```

IGMP and IGMP Snooping Commands

Introduction

Overview Devices running AlliedWare Plus use IGMP (Internet Group Management Protocol) and MLD (Multicast Listener Discovery) to track which multicast groups their clients belong to. This enables them to send the correct multimedia streams to the correct destinations. IGMP is used for IPv4 multicasting, and MLD is used for IPv6 multicasting.

This chapter describes the commands to configure IGMP Querier behaviour and selection, IGMP Snooping and IGMP Proxy.

clear ip igmp

Overview Use this command to clear all IGMP group membership records on all interfaces where it is configured .

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `clear ip igmp`

Syntax (VRF-lite) `clear ip igmp [vrf <vrf-name>]`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name

Mode Privileged Exec

Example To delete all IGMP records, use the command

```
awplus# clear ip igmp
```

Related commands

- [clear ip igmp group](#)
- [clear ip igmp interface](#)
- [show ip igmp interface](#)
- [show running-config](#)

Command changes

- Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

clear ip igmp group

Overview Use this command to clear IGMP group membership records for a specific group on either all interfaces, a single interface, or for a range of interfaces.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `clear ip igmp group *`
`clear ip igmp group <ip-address> <interface>`

Syntax (VRF-lite) `clear ip igmp [vrf <vrf-name>] group <ip-address> <interface>`

Parameter	Description
*	Clears all groups on all interfaces. This has the same effect as the clear ip igmp command.
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name
<ip-address>	Specifies the group whose membership records will be cleared from all interfaces, entered in the form A.B.C.D.
<interface>	Specifies the name of the interface; all groups learned on this interface are deleted.

Mode Privileged Exec

Usage notes This command applies to groups learned by IGMP, IGMP Snooping, or IGMP Proxy. In addition to the group, an interface can be specified. Specifying this will mean that only entries with the group learned on the interface will be deleted.

Examples To delete all group records, use the command:

```
awplus# clear ip igmp group *
```

To delete records for 224.1.1.1 on vlan1, use the command:

```
awplus# clear ip igmp group 224.1.1.1 vlan1
```

Related commands [clear ip igmp](#)

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

clear ip igmp interface

Overview Use this command to clear IGMP group membership records on a particular interface.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `clear ip igmp interface <interface>`

Syntax (VRF-lite) `clear ip igmp [vrf <vrf-name>] interface <interface>`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name
<interface>	Specifies the name of the interface. All groups learned on this interface are deleted.

Mode Privileged Exec

Usage notes This command applies to interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

Example To delete records for VRF red on vlan2, use the command:

```
awplus# clear ip igmp vrf red interface vlan2
```

Related commands

- Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

debug igmp

Overview Use this command to enable debugging of either all IGMP or a specific component of IGMP.

Use the **no** variant of this command to disable all IGMP debugging, or debugging of a specific component of IGMP.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `debug igmp {all|decode|encode|events|fsm|tib}`
`no debug igmp {all|decode|encode|events|fsm|tib}`

Syntax (VRF-lite) `debug igmp [vrf <vrf-name>] {all|decode|encode|events|fsm|tib}`
`no debug igmp [vrf <vrf-name>]`
`{all|decode|encode|events|fsm|tib}`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
all	Enable or disable all debug options for IGMP
decode	Debug of IGMP packets that have been received
encode	Debug of IGMP packets that have been sent
events	Debug IGMP events
fsm	Debug IGMP Finite State Machine (FSM)
tib	Debug IGMP Tree Information Base (TIB)

Modes Privileged Exec and Global Configuration

Example `awplus# configure terminal`
`awplus(config)# debug igmp all`

Related commands [show debugging igmp](#)
[undebug igmp](#)

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip igmp

Overview Use this command to enable IGMP on an interface. The command configures the device as an IGMP querier.

Use the **no** variant of this command to return all IGMP related configuration to the default on this interface.

Syntax `ip igmp`
`no ip igmp`

Default Disabled

Mode Interface Configuration for a VLAN interface.

Usage notes An IP address must be assigned to the interface first, before this command will work.

Example To specify an interface as an IGMP querier, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp
```

Related commands [show ip igmp interface](#)
[show running-config](#)

ip igmp access-group

Overview This command adds an access control list to a VLAN interface configured for IGMP, IGMP Snooping, or IGMP Proxy. The access control list is used to control and filter the multicast groups learned on the VLAN interface.

The **no** variant of this command disables the access control filtering on the interface.

Syntax `ip igmp access-group {<access-list-number>|<access-list-name>}`
`no ip igmp access-group`

Parameter	Description
<code><access-list-number></code>	Standard IP access-list number, in the range <1-99>.
<code><access-list-name></code>	Standard IP access-list name.

Default By default there are no access lists configured on any interface.

Mode Interface Configuration for a VLAN interface.

Usage notes This command applies to VLAN interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

Example In the following example, hosts serviced by VLAN interface vlan2 can only join the group 225.2.2.2:

```
awplus# configure terminal
awplus(config)# access-list 1 permit 225.2.2.2 0.0.0.0
awplus(config)# interface vlan2
awplus(config-if)# ip igmp access-group 1
```

ip igmp flood-group

Overview Use this command to configure a static multicast group that will flood matching packets to all ports in the VLAN and not mirror any packets matching that group to the CPU.

Use the **no** variant of this command to remove an IGMP flooding group.

Syntax `ip igmp flood-group <ip-address> [<vlan-id>]`
`no ip igmp flood-group <ip-address>`

Parameter	Description
<ip-address>	Standard IP Multicast group address, entered in the form A.B.C.D.
<vlan-id>	Layer 3 downstream interface list for Layer 3 forwarding of multicast packets.

Default Not set.

Mode Interface Configuration

Usage notes Multicast packets from an unregistered source will be mirrored to the CPU to ensure IGMP and PIM-SM knows about the group. In certain networks, it is possible for a large number of packets with a number of different sources destined for the same group address, to overwhelm a switches hardware table. This could cause packets to be stuck mirrored to the CPU forever, resulting in high CPU usage and in some cases stack failovers.

This command adds an all sources multicast entry into the switches multicast hardware table, to flood multicast packets to all ports within the VLAN without mirroring the traffic to CPU. This significantly reduces the number of hardware entries consumed.

The Layer 3 variant of this command:

```
ip igmp flood-group <ip-address> <vlan-id>
```

is only supported on one VLAN group address. Any number of the Layer 2 variants can be used.

Example To configure an IGMP flooding group to Layer 2 ports only, use the following commands. This will flood any UDP packet to group 239.255.255.250 to all ports in vlan1:

```
awplus# configure terminal
awplus(config)# int vlan1
awplus(config-if)# ip igmp flood-group 239.255.255.250
```

To configure an IGMP flooding group to Layer 2 ports and Layer 3 forwarding, use the following commands. This will flood any UDP packet to group 239.255.255.250 to all ports in vlan2 and forward any UDP packet to all ports in vlan3:

```
awplus# configure terminal
awplus(config)# int vlan2
awplus(config-if)# ip igmp flood-group 239.255.255.250 vlan3
```

To remove an IGMP flooding group from vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# int vlan2
awplus(config-if)# no ip igmp flood-group 239.255.255.250
```

IGMP Flooding Groups are integrated into the existing command: **show ip igmp groups**

Output Figure 35-1: Example output from **show ip igmp groups**

```
awplus#show ip igmp groups
IGMP Connected Group Membership
Group Address      Interface    Uptime      Expires      Last Reporter
239.255.255.250    vlan3000    01:20:59    stopped      0.0.0.0
```

Related commands [ip igmp static-group](#)

Command changes Version 5.5.0-2.3: command added

ip igmp flood specific-query

Overview Use this command if you want IGMP to flood specific queries to all VLAN member ports, instead of only sending the queries to multicast group member ports.

Use the **no** variant of this command if you want IGMP to only send the queries to multicast group member ports.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `ip igmp flood specific-query`
`no ip igmp flood specific-query`

Syntax (VRF-lite) `ip igmp [vrf <vrf-name>] flood specific-query`
`no ip igmp [vrf <vrf-name>] flood specific-query`

Parameter	Description
<code>vrf</code>	Applies the command to the specified VRF instance.
<code><vrf-name></code>	The VRF instance name.

Default By default, specific queries are flooded to all VLAN member ports.

Mode Global Configuration

Usage In an L2 switched network running IGMP, it is considered more robust to flood all specific queries. In most cases, the benefit of flooding specific queries to all VLAN member ports outweighs the disadvantages.

However, sometimes this is not the case. For example, if hosts with very low CPU capability receive specific queries for multicast groups they are not members of, their performance may degrade unacceptably. In this situation, it is desirable for IGMP to send specific queries to known member ports only. This minimizes the performance degradation of such hosts. In those circumstances, use this command to turn off flooding of specific queries.

Example To cause IGMP to flood specific queries only to multicast group member ports, use the commands:

```
awplus# configure terminal
awplus(config)# no ip igmp flood specific-query
```

Related commands [show ip igmp interface](#)

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip igmp immediate-leave

Overview In IGMP version 2, use this command to minimize the leave latency of IGMP memberships for specified multicast groups. The specified access list number or name defines the multicast groups in which the immediate leave feature is enabled.

Use the **no** variant of this command to disable this feature.

Syntax `ip igmp immediate-leave group-list
{<access-list-number>|<access-list-number-expanded>|
<access-list-name>}`
`no ip igmp immediate-leave`

Parameter	Description
<access-list-number>	Access-list number, in the range <1-99>.
<access-list-number-expanded>	Access-list number (expanded range), in the range <1300-1999>.
<access-list-name>	Standard IP access-list name.

Default Disabled by default.

Mode Interface Configuration for a VLAN interface.

Usage notes This command applies to VLAN interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

Example The following example shows how to enable the immediate-leave feature on the VLAN interface vlan2 for a specific range of multicast groups:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp immediate-leave group-list 34
awplus(config-if)# exit
awplus(config)# access-list 34 permit 225.192.20.0 0.0.0.255
```

Related commands [ip igmp last-member-query-interval](#)

ip igmp last-member-query-count

Overview Use this command to set the last-member query-count value for an interface.
Use the **no** variant of this command to return to the default on an interface.

Syntax `ip igmp last-member-query-count <2-7>`
`no ip igmp last-member-query-count`

Parameter	Description
<2-7>	Last member query count value.

Default The default last member query count value is 2.

Mode Interface Configuration for a VLAN interface.

Usage notes This command applies to VLAN interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

Example To set the last-member query-count to 3 on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp last-member-query-count 3
```

Related commands [ip igmp last-member-query-interval](#)
[ip igmp startup-query-count](#)
[show ip igmp interface](#)
[show running-config](#)

ip igmp last-member-query-interval

Overview Use this command to configure the frequency at which the router sends IGMP group specific host query messages.

Use the **no** variant of this command to set this frequency to the default.

Syntax `ip igmp last-member-query-interval <interval>`
`no ip igmp last-member-query-interval`

Parameter	Description
<interval>	The frequency in milliseconds at which IGMP group-specific host query messages are sent, in the range 1000-25500.

Default 1000 milliseconds

Mode Interface Configuration for a VLAN interface.

Usage notes This command applies to VLAN interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

Example To change the IGMP group-specific host query message interval to 2 seconds (2000 milliseconds) on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp last-member-query-interval 2000
```

Related commands [ip igmp immediate-leave](#)
[ip igmp last-member-query-count](#)
[show ip igmp interface](#)
[show running-config](#)

ip igmp limit

Overview Use this command to configure the limit on the maximum number of group membership entries for the device as a whole or for the specified interface (if in interface mode). Once the specified number of group memberships is reached, all further membership reports will be ignored.

Optionally, you can configure an access-list to stop certain addresses from being subject to the limit.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Use the **no** variant of this command to unset the limit and any specified exception access-list.

Syntax `ip igmp limit <limit-value> [except
{<access-list-number>|<access-list-number-expanded>|
<access-list-name>}]`
`no ip igmp limit`

Syntax (VRF-lite) `ip igmp [vrf <vrf-name>] limit <limit-value> [except
{<access-list-number>|<access-list-number-expanded>|
<access-list-name>}]`
`no ip igmp [vrf <vrf-name>] limit`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
<limit-value>	Maximum number of group membership entries, from 2 to 2097152.
<access-list-number>	Access-list number, in the range 1 to 99.
<access-list-number-expanded>	Access-list number (expanded range), in the range 1300 to 1999.
<access-list-name>	IP access-list name.

Default 2095152

Mode Global Configuration and Interface Configuration for a VLAN interface.

Usage notes This command applies to VLAN interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

Example To configure an IGMP limit of 100 group membership entries on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp limit 100
```

To configure an IGMP limit of 100 group membership entries across all interfaces on which IGMP is enabled, and exclude group 224.1.1.1 from this limitation, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 1 permit 224.1.1.1 0.0.0.0
awplus(config)# ip igmp limit 100 except 1
```

Command changes Version 5.4.7-1.1: VRF-lite support added to SBx8100.
Version 5.4.8-1.1: VRF-lite support added to x930, SBx908 GEN2.

ip igmp maximum-groups

Overview Use this command to set a limit, per switch port, on the number of IGMP groups clients can join. This stops a single client from using all the switch's available group-entry resources, and ensures that clients on all ports have a chance to join IGMP groups.

Use the **no** variant of this command to remove the limit.

Syntax `ip igmp maximum-groups <0-65535>`
`no ip igmp maximum-groups`

Parameter	Description
<code><0-65535></code>	The maximum number of IGMP groups clients can join on this switch port. 0 means no limit.

Default The default is 0, which means no limit

Mode Interface mode for a switch port

Usage notes We recommend using this command with IGMP snooping fast leave on the relevant VLANs. To enable fast leave, use the command:

```
awplus(config-if)# ip igmp snooping fast-leave
```

The device keeps count of the number of groups learned by each port. This counter is incremented when group joins are received via IGMP reports. It is decremented when:

- Group memberships time out
- Group leaves are received via leave messages or reports

Also, the port's group counter is cleared when:

- The port goes down
- You run the command **clear ip igmp group ***
- The port is removed from a VLAN
- The port is on a VCStack back-up member, and that member reboots or otherwise leaves the stack.

You can see the current value of the group counter by using either of the commands:

```
awplus# show ip igmp snooping statistics interface <port-list>  
awplus# show ip igmp interface <port>
```

Example To limit clients to 10 groups on port 1.1.1, which is in vlan1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# ip igmp maximum-groups 10
awplus(config-if)# exit
awplus(config)# interface vlan1
awplus(config-if)# ip igmp snooping fast-leave
```

Related commands

- [clear ip igmp group](#)
- [ip igmp snooping fast-leave](#)
- [show ip igmp interface](#)
- [show ip igmp snooping statistics](#)

ip igmp mroute-proxy

Overview Use this command to enable IGMP mroute proxy on this downstream interface and associate it with the upstream proxy service interface.

Use the **no** variant of this command to remove the association with the proxy-service interface.

Syntax `ip igmp mroute-proxy <interface>`
`no ip igmp mroute-proxy`

Parameter	Description
<interface>	The name of the interface.

Mode Interface Configuration for a VLAN interface.

Usage notes This command applies to VLAN interfaces configured for IGMP Proxy.

You must also enable the IGMP proxy service on the upstream interface, using the [ip igmp proxy-service](#) command. You can associate one or more downstream mroute proxy interfaces on the device with a single upstream proxy service interface. This downstream mroute proxy interface listens for IGMP reports, and forwards them to the upstream IGMP proxy service interface.

IGMP Proxy does not work with other multicast routing protocols, such as PIM-SM or PIM-DM.

Example To configure vlan3 as the upstream proxy-service interface for the downstream vlan2 interface, use the commands:

```
awplus# configure terminal
awplus(config)# ip multicast-routing
awplus(config)# interface vlan3
awplus(config-if)# ip igmp proxy-service
awplus(config-if)# ip igmp
awplus(config)# interface vlan2
awplus(config-if)# ip igmp mroute-proxy vlan3
awplus(config-if)# ip igmp
```

Related commands [ip igmp](#)
[ip igmp proxy-service](#)
[ip multicast-routing](#)

ip igmp proxy-service

Overview Use this command to enable an interface to be the upstream IGMP proxy-service interface for the device. All associated downstream IGMP mroute proxy interfaces on this device will have their memberships consolidated on this proxy service interface, according to IGMP host-side functionality.

Use the **no** variant of this command to remove the designation of the interface as an upstream proxy-service interface.

Syntax `ip igmp proxy-service`
`no ip igmp proxy-service`

Mode Interface Configuration for a VLAN interface.

Usage notes This command applies to VLAN interfaces configured for IGMP Proxy.

This command is used with the [ip igmp mroute-proxy](#) command to enable forwarding of IGMP reports to a proxy service interface for all forwarding entries for this interface. You must also enable the downstream IGMP mroute proxy interfaces on this device using the command [ip igmp mroute-proxy](#).

IGMP Proxy does not work with other multicast routing protocols, such as PIM-SM or PIM-DM.

From version 5.4.7-1.1 onwards, IGMP mroute proxy interfaces do not have to be configured with an IP address before they can operate. Instead, it is possible to have an addressless interface operate as an IGMP mroute proxy interface.

This feature is useful when IGMP Proxy needs to run on many downstream interfaces. For example, you may want to use it if your device has one subscriber (multicast receiver) per VLAN, and many receivers (many VLANs) connected to the device. In such a situation, assigning IP addresses to each VLAN may not be practicable.

Note that for such interface to be able to send queries to hosts directly attached to the interface, it is necessary to enable IGMP snooping querier on the interface, using the command [ip igmp snooping querier](#).

Example To configure vlan3 as the upstream proxy-service interface for the downstream vlan2 interface, use the commands:

```
awplus# configure terminal
awplus(config)# ip multicast-routing
awplus(config)# interface vlan3
awplus(config-if)# ip igmp proxy-service
awplus(config-if)# ip igmp
awplus(config)# interface vlan2
awplus(config-if)# ip igmp mroute-proxy vlan3
awplus(config-if)# ip igmp
```

**Related

`ip multicast-routing`

**Command
changes**

Version 5.4.7-1.1: Addressless interface support added.
Version 5.4.7-1.1: VRF-lite support added to SBx8100.
Version 5.4.8-1.1: VRF-lite support added to x930, SBx908 GEN2.

ip igmp querier-timeout

Overview Use this command to configure the timeout period before the device takes over as the querier for the interface after the previous querier has stopped querying.

Use the **no** variant of this command to restore the default.

Syntax `ip igmp querier-timeout <timeout>`
`no ip igmp querier-timeout`

Parameter	Description
<timeout>	IGMP querier timeout interval value in seconds, in the range 1-65535.

Default The default timeout interval is 255 seconds.

Mode Interface Configuration for a VLAN interface.

Usage notes This command applies to VLAN interfaces configured for IGMP.
The timeout value should not be less than the current active querier's general query interval.

Example To configure the device to wait 130 seconds from the time it received the last query before it takes over as the querier for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp querier-timeout 130
```

Related commands [ip igmp query-interval](#)
[show ip igmp interface](#)
[show running-config](#)

ip igmp query-holdtime

Overview This command sets the time that an IGMP Querier waits after receiving a query solicitation before it sends an IGMP Query. IGMP General Query messages will not be sent during the hold time interval.

Use the **no** variant of this command to return to the default query hold time period.

Syntax `ip igmp query-holdtime <interval>`
`no ip igmp query-holdtime`

Parameter	Description
<interval>	Query interval value in milliseconds, in the range <100-5000>.

Default By default the delay before sending IGMP General Query messages is 500 milliseconds.

Mode Interface Configuration for a VLAN interface.

Usage notes Use this command to configure a value for the IGMP query hold time in the current network. IGMP Queries can be generated after receiving Query Solicitation (QS) packets and there is a possibility of a DoS (Denial of Service) attack if a stream of Query Solicitation (QS) packets are sent to the IGMP Querier, eliciting a rapid stream of IGMP Queries. This command applies to interfaces on which the device is acting as an IGMP Querier.

Use the [ip igmp query-interval](#) command when a delay for IGMP general query messages is required and IGMP general query messages are required. The **ip igmp query-holdtime** command stops IGMP query messages during the configured holdtime interval, so the rate of IGMP Queries that can be sent out of an interface can be restricted.

See the [IGMP Feature Overview and Configuration Guide](#) for introductory information about the Query Solicitation feature.

NOTE: *This command will function on the switch in the stand-alone mode, but it is not supported when the device forms part of a VCS Stack.*

Examples To set the IGMP query holdtime to 900 ms for vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp query-holdtime 900
```

To reset the IGMP query holdtime to the default (500 ms) for vlan10, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip igmp query-holdtime
```

**Related
commands**

[ip igmp query-interval](#)
[ip igmp snooping tcn query solicit](#)
[show ip igmp interface](#)
[show running-config](#)

ip igmp query-interval

- Overview** Use this command to configure the period for sending IGMP General Query messages.
- The IGMP query interval specifies the time between IGMP General Query messages being sent.
- Use the **no** variant of this command to return to the default query interval period.
- NOTE:** *The IGMP query interval must be greater than IGMP query maximum response time.*

- Syntax** `ip igmp query-interval <interval>`
`no ip igmp query-interval`

Parameter	Description
<interval>	Query interval value in seconds, in the range <2-18000>.

- Default** The default IGMP query interval is 125 seconds.
- Mode** Interface Configuration for a VLAN interface.
- Usage notes** This command applies to interfaces configured for IGMP. Note that the IGMP query interval is automatically set to a greater value than the IGMP query max response time.
- For example, if you set the IGMP query max response time to 2 seconds using the [ip igmp query-max-response-time](#) command, and the IGMP query interval is currently less than 3 seconds, then the IGMP query interval period will be automatically reconfigured to be 3 seconds, so it is greater than the IGMP query maximum response time.
- Use the **ip igmp query-interval** command when a non-default interval for IGMP General Query messages is required.
- The [ip igmp query-holdtime](#) command can occasionally delay the sending of IGMP Queries.

- Examples** To set the period between IGMP host-query messages to 3 minutes (180 seconds) for vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp query-interval 180
```

To reset the period between sending IGMP host-query messages to the default (125 seconds) for vlan10, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip igmp query-interval
```

**Related
commands**

[ip igmp query-holdtime](#)
[ip igmp query-max-response-time](#)
[ip igmp startup-query-interval](#)
[show ip igmp interface](#)
[show running-config](#)

ip igmp query-max-response-time

Overview Use this command to configure the maximum response time advertised in IGMP Queries.

Use the **no** variant of this command to restore the default.

NOTE: The IGMP query maximum response time must be less than the IGMP query interval.

Syntax `ip igmp query-max-response-time <response-time>`
`no ip igmp query-max-response-time`

Parameter	Description
<code><response-time></code>	Response time value in seconds, in the range 1-3180.

Default The default IGMP query maximum response time is 10 seconds.

Mode Interface Configuration for a VLAN interface.

Usage notes This command applies to interfaces configured for IGMP.
Note that the IGMP query interval is automatically set to a greater value than the IGMP query maximum response time.

For example, if you set the IGMP query interval to 3 seconds using the [ip igmp query-interval](#) command, and the current IGMP query interval is less than 3 seconds, then the IGMP query maximum response time will be automatically reconfigured to be 2 seconds, so it is less than the IGMP query interval time.

To get the network to converge faster, use the **ip igmp query-max-response-time** command and set a low response time value, such as one or two seconds, so that the clients will respond immediately with a report as a response to the IGMP Queries.

Examples To set a maximum response time of 8 seconds for vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp query-max-response-time 8
```

To reset the default maximum response time to the default (10 seconds) for vlan10, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip igmp query-max-response-time
```

**Related
commands** `ip igmp query-interval`
 `show ip igmp interface`
 `show running-config`

ip igmp ra-option

Overview Use this command to enable strict Router Alert (RA) option validation. With strict RA option enabled, IGMP packets without RA options are ignored.

Use the **no** variant of this command to disable strict RA option validation.

Syntax `ip igmp ra-option`
`no ip igmp ra-option`

Default The default state of RA validation is unset.

Mode Interface Configuration for a VLAN interface.

Usage notes This command applies to interfaces configured for IGMP and IGMP Snooping.

Examples To enable strict Router Alert (RA) option validation on vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp ra-option
```

ip igmp robustness-variable

Overview Use this command to change the robustness variable value on an interface.
Use the **no** variant of this command to return to the default on an interface.

Syntax `ip igmp robustness-variable <1-7>`
`no ip igmp robustness-variable`

Parameter	Description
<1-7>	The robustness variable value.

Default The default robustness variable value is 2.

Mode Interface Configuration for a VLAN interface.

Usage notes This command applies to interfaces configured for IGMP and IGMP Snooping.

Examples To set the robustness variable to 3 on vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp robustness-variable 3
```

Related commands [show ip igmp interface](#)
[show running-config](#)

ip igmp snooping

Overview Use this command to enable IGMP Snooping. When this command is used in the Global Configuration mode, IGMP Snooping is enabled at the device level. When this command is used in Interface Configuration mode, IGMP Snooping is enabled for the specified VLANs.

Use the **no** variant of this command to either globally disable IGMP Snooping, or disable IGMP Snooping on a specified interface.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

NOTE: IGMP snooping cannot be disabled on an interface if IGMP snooping has already been disabled globally. IGMP snooping can be disabled on both an interface and globally if disabled on the interface first and then disabled globally.

Syntax `ip igmp snooping`
`no ip igmp snooping`

Syntax (VRF-lite) `ip igmp [vrf <vrf-name>] snooping`
`no ip igmp [vrf <vrf-name>] snooping`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.

Default By default, IGMP Snooping is enabled both globally and on all VLANs.

Mode Global Configuration and Interface Configuration for a VLAN interface.

Usage notes It is possible to disable IGMP snooping globally or on a per-VLAN basis, using the command **no ipv6 igmp snooping**. However, we recommend leaving IGMP snooping enabled unless an Allied Telesis support representative tells you to disable it, even if you are not actively using the device for multicast.

For IGMP snooping to operate on particular VLAN interfaces, it must be enabled both globally by using this command in Global Configuration mode, and on individual VLAN interfaces by using this command in Interface Configuration mode (both are enabled by default).

Examples To enable IGMP Snooping on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ip igmp snooping
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping
```

Related commands [ipv6 mld snooping](#)
 [show ip igmp interface](#)
 [show running-config](#)

Command changes Version 5.4.7-1.1: VRF-lite support added.

ip igmp snooping fast-leave

Overview Use this command to enable IGMP Snooping fast-leave processing. Fast-leave processing is analogous to immediate-leave processing. The IGMP group-membership entry is removed as soon as an IGMP leave group message is received, without sending out a group-specific query.

Use the **no** variant of this command to disable fast-leave processing.

Syntax `ip igmp snooping fast-leave`
`no ip igmp snooping fast-leave`

Default IGMP Snooping fast-leave processing is disabled.

Mode Interface Configuration for a VLAN interface.

Usage notes This IGMP Snooping command can only be configured on VLAN interfaces.

Example To enable fast-leave processing on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping fast-leave
```

Related commands `show ip igmp interface`
`show running-config`

ip igmp snooping mrouter

Overview Use this command to statically configure the specified port as a multicast router port for IGMP Snooping for an interface. This command applies to interfaces configured for IGMP Snooping.

Use the **no** variant of this command to remove the static configuration of the port as a multicast router port.

Syntax `ip igmp snooping mrouter interface <port>`
`no ip igmp snooping mrouter interface <port>`

Parameter	Description
<port>	The port may be a device port (e.g. port1.1.2), a static channel group (e.g. sa3), or a dynamic (LACP) channel group (e.g. po4).

Mode Interface Configuration for a VLAN interface.

Example To configure port1.1.2 statically as a multicast router interface for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping mrouter interface port1.1.2
```

Related commands [show ip igmp snooping mrouter](#)

ip igmp snooping querier

Overview Use this command to enable IGMP querier operation when no multicast routing protocol is configured. When enabled, the IGMP Snooping querier sends out periodic IGMP queries for all interfaces. This command applies to interfaces configured for IGMP Snooping.

Use the **no** variant of this command to disable IGMP querier configuration.

Syntax `ip igmp snooping querier`
`no ip igmp snooping querier`

Mode Interface Configuration for a VLAN interface.

Usage notes The IGMP Snooping querier uses the 0.0.0.0 Source IP address because it only masquerades as a proxy IGMP querier for faster network convergence.

It does not start, or automatically cease, the IGMP Querier operation if it detects query message(s) from a multicast router.

If an IP address is assigned to a VLAN, which has IGMP querier enabled on it, then the IGMP Snooping querier uses the VLAN's IP address as the Source IP Address in IGMP queries.

The IGMP Snooping Querier will not stop sending IGMP Queries if there is another IGMP Snooping Querier in the network with a lower Source IP Address.

NOTE: Do not enable the IGMP Snooping Querier feature on a Layer 2 device when there is an operational IGMP Querier in the network.

Example To configure vlan2 as a Snooping querier, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping querier
```

Related commands [show ip igmp interface](#)
[show running-config](#)

ip igmp snooping report-suppression

Overview Use this command to enable report suppression for IGMP versions 1 and 2. This command applies to interfaces configured for IGMP Snooping.

Report suppression stops reports being sent to an upstream multicast router port when there are already downstream ports for this group on this interface.

Use the **no** variant of this command to disable report suppression.

Syntax `ip igmp snooping report-suppression`
`no ip igmp snooping report-suppression`

Default Report suppression does not apply to IGMPv3, and is turned on by default for IGMPv1 and IGMPv2 reports.

Mode Interface Configuration for a VLAN interface.

Example To enable report suppression for IGMPv2 reports for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp version 2
awplus(config-if)# ip igmp snooping report-suppression
```

Related commands [show ip igmp interface](#)
[show running-config](#)

ip igmp snooping routermode

Overview Use this command to set the destination IP addresses as router multicast addresses.

Use the **no** variant of this command to set it to the default. You can also remove a specified IP address from a custom list of multicast addresses.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax

```
ip igmp snooping routermode  
{all|default|ip|multicastrouter|address <ip-address>}  
no ip igmp snooping routermode [address <ip-address>]
```

Syntax (VRF-lite)

```
ip igmp [vrf <vrf-name>] snooping routermode  
{all|default|ip|multicastrouter|address <ip-address>}  
no ip igmp [vrf <vrf-name>] snooping routermode [address  
<ip-address>]
```

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name
all	All reserved multicast addresses (224.0.0.x). Packets from all possible addresses in range 224.0.0.x are treated as coming from routers.
default	Default set of reserved multicast addresses. Packets from 224.0.0.1, 224.0.0.2, 224.0.0.4, 224.0.0.5, 224.0.0.6, 224.0.0.9, 224.0.0.13, 224.0.0.15 and 224.0.0.24 are treated as coming from routers.
ip	Custom reserved multicast addresses. Packets from custom IP address in the 224.0.0.x range are treated as coming from routers.
multicastrouter	Packets from DVMRP (224.0.0.4) and PIM (224.0.0.13) multicast addresses are treated as coming from routers.
address <ip-address>	Packets from the specified multicast address are treated as coming from routers. The address must be in the 224.0.0.x range.

Default The default routermode is **default** (not **all**) and shows the following reserved multicast addresses:

```
Router mode.....Def
```

```
Reserved multicast address
```

```
224.0.0.1  
224.0.0.2  
224.0.0.4  
224.0.0.5  
224.0.0.6  
224.0.0.9  
224.0.0.13  
224.0.0.15  
224.0.0.24
```

Mode Global Configuration

Examples To set **ip igmp snooping routermode** for all default reserved addresses enter:

```
awplus(config)# ip igmp snooping routermode default
```

To remove the multicast address 224.0.0.5 from the custom list of multicast addresses enter:

```
awplus(config)# no ip igmp snooping routermode address  
224.0.0.5
```

Related commands [ip igmp trusted](#)
[show ip igmp snooping routermode](#)

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip igmp snooping source-timeout

Overview Use this command to set the global IGMP Snooping source time-out value (in seconds) on the switch.

Use the **no** variant of this command to set the source time-out value to be the same as the group membership timeout.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

If the platform supports multicast for VRFs, then specifying a VRF name will configure the command on that VRF. If you do not specify a VRF, the command will configure the global VRF. The VRF option is only available for the global command and not the interface command.

Syntax `ip igmp snooping source-timeout <timeout>`
`no ip igmp snooping source-timeout <timeout>`

Syntax (VRF-lite) `ip igmp [vrf <vrf-name>] snooping source-timeout <timeout>`
`no ip igmp [vrf <vrf-name>] snooping source-timeout <timeout>`

Parameter	Description
<code>vrf</code>	Applies the command to the specified VRF instance.
<code><vrf-name></code>	The VRF instance name
<code><timeout></code>	Time-out value in seconds <0-86400>

Default Global IGMP Snooping source-timeout is disabled by default, and unregistered multicast will be timed-out like normal entries.

Interface IGMP Snooping source timeout is disabled by default, and unregistered multicast will be timed-out like normal entries, unless VRF global settings override.

Mode Interface/Global Configuration

Usage notes The timeout determines how long unregistered multicast entries will be kept for. If the value '0' is specified, then effectively all unregistered multicast entries will never be timed out, and can only be cleared by using the command **clear ip igmp group**. The interface settings will always take precedence over the global setting.

Example To configure IGMP Snooping source timeout on 'vlan1', use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip igmp snooping source-timeout 200
```

Example To configure IGMP Snooping source timeout globally on a switch, use the commands:

```
awplus# configure terminal
awplus(config)# ip igmp snooping source-timeout 200
```

Related commands [show ip igmp snooping source-timeout](#)

Command changes Version 5.4.7-1.1: command added

ip igmp snooping tcn query solicit

Overview Use this command to enable IGMP (Internet Group Management Protocol) Snooping TCN (Topology Change Notification) Query Solicitation feature. When this command is used in the Global Configuration mode, Query Solicitation is enabled.

Use the **no** variant of this command to disable IGMP Snooping TCN Query Solicitation. When the **no** variant of this command is used in Interface Configuration mode, this overrides the Global Configuration mode setting and Query Solicitation is disabled.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `ip igmp snooping tcn query solicit`
`no ip igmp snooping tcn query solicit`

Syntax (VRF-lite) `ip igmp [vrf <vrf-name>] snooping tcn query solicit`
`no ip igmp [vrf <vrf-name>] snooping tcn query solicit`

Parameter	Description
<code>vrf</code>	Applies the command to the specified VRF instance.
<code><vrf-name></code>	The VRF instance name.

Default IGMP Snooping TCN Query Solicitation is disabled by default on the device, unless the device is the Master Node in an EPSR ring, or is the Root Bridge in a Spanning Tree.

When the device is the Master Node in an EPSR ring, or the device is the Root Bridge in a Spanning Tree, then IGMP Snooping TCN Query Solicitation is enabled by default and cannot be disabled using the Global Configuration mode command. However, Query Solicitation can be disabled for specified interfaces using the **no** variant of this command from the Interface Configuration mode.

Mode Global Configuration, and Interface Configuration for a VLAN interface.

Usage notes Once enabled, if the device is not an IGMP Querier, on detecting a topology change, the device generates IGMP Query Solicit messages that are sent to all the ports of the vlan configured for IGMP Snooping on the device.

On a device that is not the Master Node in an EPSR ring or the Root Bridge in a Spanning Tree, Query Solicitation can be disabled using the **no** variant of this command after being enabled.

If the device that detects a topology change is an IGMP Querier then the device will generate an IGMP Query message.

Note that the **no** variant of this command when issued in Global Configuration mode has no effect on a device that is the Master Node in an EPSR ring or on a device that is a Root Bridge in a Spanning Tree. Query Solicitation is not disabled for the device these instances. However, Query Solicitation can be disabled on a per-vlan basis from the Interface Configuration mode.

See the following state table that shows when Query Solicit messages are sent in these instances:

Command issued from Global Configuration	Command issued from Interface Configuration	Device is STP Root Bridge or the EPSR Master Node	IGMP Query Solicit message sent on VLAN
No	Yes	Yes	Yes
Yes	No	Yes	No
Yes	Yes	Yes	Yes

See the [IGMP Feature Overview and Configuration Guide](#) for introductory information about the Query Solicitation feature.

NOTE: This command will function on the switch in the stand-alone mode, but it is not supported when the device forms part of a VCS Stack.

Examples To enable Query Solicitation on a device, use the commands:

```
awplus# configure terminal
awplus(config)# ip igmp snooping tcn query solicit
```

To disable Query Solicitation on a device, use the commands:

```
awplus# configure terminal
awplus(config)# no ip igmp snooping tcn query solicit
```

To enable Query Solicitation for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping tcn query solicit
```

To disable Query Solicitation for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip igmp snooping tcn query solicit
```

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.
 Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip igmp source-address-check

Overview This command enables the checking of the Source Address for an IGMP Report, rejecting any IGMP Reports originating on devices outside of the local subnet.

Use the **no** variant of this command to disable the checking of the Source Address for an IGMP Report, which allows IGMP Reports from devices outside of the local subnet.

Syntax `ip igmp source-address-check`
`no ip igmp source-address-check`

Default Source address checking for IGMP Reports is enabled by default.

Mode Interface Configuration for a VLAN interface.

Usage notes This is a security feature, and should be enabled unless IGMP Reports from outside the local subnet are expected, for example, if Multicast VLAN Registration is active in the network.

The no variant of this command is required to disable the IGMP Report source address checking feature in networks that use Multicast VLAN Registration to allow IGMP Reports from devices outside of the local subnet.

Examples To deny IGMP Reports from outside the current subnet for vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp source-address-check
```

To allow IGMP Reports from outside the current subnet for vlan10, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip igmp source-address-check
```

Related commands [show ip igmp interface](#)
[show running-config](#)

ip igmp ssm

Overview Use this command to define a non-default Source Specific Multicast (SSM) range of IP multicast addresses in IGMP. Incoming IGMPv1 and IGMPv2 join requests are ignored if the multicast IP address is in the SSM range and no SSM mapping is configured for these addresses. By default, the SSM range is 232/8. To define the SSM range to be other than the default, use one of the access-list parameter options.

Use the **no** variant of this command to change the SSM range in IGMP back to the default.

Syntax `ip igmp ssm range {<access-list-number>|<access-list-name>}`
`no ip igmp ssm`

Parameter	Description
<access-list-number>	Access-list number, in the range 1 to 99.
<access-list-name>	Standard IP access-list name.

Default By default the SSM range is 232/8.

Mode Global Configuration

Examples To configure a non-default SSM range to be used in IGMP enter the commands:

```
awplus# configure terminal
awplus(config)# access-list 10 permit 224.1.1.0 0.0.0.255
awplus(config)# ip igmp ssm range 10
```

To return to the default configuration enter the commands:

```
awplus# configure terminal
awplus(config)# no ip igmp ssm
```

Related commands [access-list \(standard numbered\)](#)
[ip pim ssm](#)

ip igmp ssm-map enable

Overview Use this command to enable Source Specific Multicast (SSM) mapping on the device.

Use the **no** variant of this command to disable SSM mapping.

Syntax `ip igmp ssm-map enable`
`no ip igmp ssm-map enable`

Mode Global Configuration

Usage notes This command applies to VLAN interfaces configured for IGMP.

Example To enable SSM on the device enter the commands:

```
awplus# configure terminal
awplus(config)# ip igmp ssm-map enable
```

Related commands [ip igmp ssm-map static](#)

ip igmp ssm-map static

Overview Use this command to specify the static mode of defining Source Specific Multicast (SSM) mapping. SSM statically assigns sources to IGMPv1 and IGMPv2 groups to translate such (*,G) groups' memberships to (S,G) memberships for use with PIM-SSM.

Use the **no** variant of this command to remove the SSM map association.

Syntax

```
ip igmp ssm-map static  
{<access-list-number>|<access-list-number-extended>|  
<access-list-name>} <ip-address>  
  
no ip igmp ssm-map static  
{<access-list-number>|<access-list-number-extended>|  
<access-list-name>} <ip-address>
```

Parameter	Description
<access-list-number>	Access-list number, in the range 1 to 99.
<access-list-number-extended>	Access-list number (expanded range), in the range 1300 to 1999.
<access-list-name>	Standard IP access-list name.
<ip-address>	Source address to use for static map group, entered in the form A.B.C.D.

Mode Global Configuration

Usage notes This command applies to VLAN interfaces configured for IGMP. You can use Standard numbered and Standard named ACLs plus Expanded Numbered ACLs.

Examples This example shows how to configure an SSM static mapping for group-address 224.1.1.1, using a standard numbered ACL shown as 10:

```
awplus# configure terminal  
awplus(config)# access-list 10 permit 224.1.1.1 0.0.0.0  
awplus(config)# ip igmp ssm-map static 10 1.2.3.4
```

This example shows how to configure an SSM static mapping for group-address 224.1.1.1, using an expanded numbered ACL shown as 1301:

```
awplus# configure terminal  
awplus(config)# access-list 1301 permit 224.1.1.1 0.0.0.0  
awplus(config)# ip igmp ssm-map static 1301 1.2.3.4
```

This example shows how to configure an SSM static mapping for group-address 224.1.1.1, using a standard named ACL shown as sales:

```
awplus# configure terminal
awplus(config)# access-list sales permit 224.1.1.1 0.0.0.0
awplus(config)# ip igmp ssm-map static sales 1.2.3.4
```

Related commands [ip igmp ssm-map enable](#)

ip igmp static-group

Overview Use this command to statically configure multicast group membership entries on a VLAN interface, or to statically forward a multicast channel out a particular port or port range.

To statically add only a group membership, do not specify any parameters.

To statically add a (*,g) entry to forward a channel out of a port, specify only the multicast group address and the switch port range.

To statically add an (s,g) entry to forward a channel out of a port, specify the multicast group address, the source IP address, and the switch port range.

To use Source Specific Multicast mapping to determine the source IP address of the multicast server use the **ssm-map** parameter instead of specifying the source IP address.

Use the **no** variant of this command to delete static group membership entries.

Syntax

```
ip igmp static-group <ip-address> [source  
{<ip-source-addr>|ssm-map}] [interface <port>]  
  
no ip igmp static-group <ip-address> [source  
{<ip-source-addr>|ssm-map}] [interface <port>]
```

Parameter	Description
<ip-address>	Standard IP Multicast group address, entered in the form A.B.C.D, to be configured as a static group member.
source	Optional.
<ip-source-addr>	Standard IP source address, entered in the form A.B.C.D, to be configured as a static source from where multicast packets originate.
ssm-map	This parameter uses Source Specific Multicast (SSM) Mapping to determine the source IP address associated with the specified IP Multicast group address. SSM mappings are configured using the ip igmp ssm-map static command.
interface	Use this parameter to specify a specific switch port or switch port range to statically forward the multicast group out of. If not used, static configuration is applied on all ports in the VLAN.
<port>	The port or port range to statically forward the group out of. The port may be a device port (e.g. port 1.1.4), a static channel group (e.g. sa3), or a dynamic (LACP) channel group (e.g. po4).

Mode Interface Configuration for a VLAN interface.

Usage notes This command applies to IGMP operation, or to IGMP Snooping on a VLAN interface.

Example The following example show how to statically add group and source records for IGMP on vlan3:

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# ip igmp
awplus(config-if)# ip igmp static-group 226.1.2.4 source
10.2.3.4
```

ip igmp startup-query-count

Overview Use this command to configure the IGMP startup query count for an interface. The IGMP startup query count is the number of IGMP General Query messages sent by a querier at startup. The default IGMP startup query count is 2.

Use the **no** variant of this command to return an interface's configured IGMP startup query count to the default.

Syntax `ip igmp startup-query-count <startup-query-count>`
`no ip igmp startup-query-count`

Parameter	Description
<code><startup-query-count></code>	Specify the IGMP startup query count, in the range 2-10.

Default The default IGMP startup query count is 2.

Mode Interface Configuration for a VLAN interface.

Example To set the IGMP startup query count to 4 on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp startup-query-count 4
```

Related commands [ip igmp last-member-query-count](#)
[ip igmp startup-query-interval](#)

ip igmp startup-query-interval

Overview Use this command to configure the IGMP startup query interval for an interface. The IGMP startup query interval is the amount of time in seconds between successive IGMP General Query messages sent by a querier during startup. The default IGMP startup query interval is one quarter of the IGMP query interval value.

Use the **no** variant of this command to return an interface's configured IGMP startup query interval to the default.

Syntax `ip igmp startup-query-interval <startup-query-interval>`
`no ip igmp startup-query-interval`

Parameter	Description
<code><startup-query-interval></code>	Specify the IGMP startup query interval, in the range of 2-1800 seconds. The value must be one quarter of the IGMP query interval value.

Default The default IGMP startup query interval is one quarter of the IGMP query interval value.

NOTE: *The IGMP startup query interval must be one quarter of the IGMP query interval.*

Mode Interface Configuration for a VLAN interface.

Example To set the IGMP startup query interval to 15 seconds for vlan2, which is one quarter of the IGMP query interval of 60 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp query-interval 60
awplus(config-if)# ip igmp startup-query-interval 15
```

Related commands [ip igmp last-member-query-interval](#)
[ip igmp query-interval](#)
[ip igmp startup-query-count](#)

ip igmp trusted

Overview Use this command to allow IGMP to process packets received on certain trusted ports only.

Use the **no** variant of this command to stop IGMP from processing specified packets if the packets are received on the specified ports or aggregator.

Syntax `ip igmp trusted {all|query|report|routermode}`
`no ip igmp trusted {all|query|report|routermode}`

Parameter	Description
all	Specifies whether or not the interface is allowed to receive all IGMP and other routermode packets
query	Specifies whether or not the interface is allowed to receive IGMP queries
report	Specifies whether or not the interface is allowed to receive IGMP membership reports
routermode	Specifies whether or not the interface is allowed to receive routermode packets

Default By default, all ports and aggregators are trusted interfaces, so IGMP is allowed to process all IGMP query, report, and router mode packets arriving on all interfaces.

Mode Interface mode for one or more switch ports or aggregators

Usage Because all ports are trusted by default, use this command in its **no** variant to stop IGMP processing packets on ports you do not trust.

For example, you can use this command to make sure that only ports attached to approved IGMP routers are treated as router ports.

Example To stop ports port1.1.3-port1.1.6 from being treated as router ports by IGMP, use the commands:

```
awplus(config)# interface port1.1.3-port1.1.6  
awplus(config-if)# no ip igmp trusted routermode
```

Related commands [ip igmp snooping routermode](#)

ip igmp version

Overview Use this command to set the current IGMP version (IGMP version 1, 2 or 3) on an interface.

Use the **no** variant of this command to return to the default version.

Syntax `ip igmp version <1-3>`
`no ip igmp version`

Parameter	Description
<code>version <1-3></code>	IGMP protocol version number

Default The default IGMP version is 3.

Mode Interface Configuration for a VLAN interface.

Example To set the IGMP version to 2 for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp version 2
```

Related commands [show ip igmp interface](#)

show debugging igmp

Overview Use this command to see what debugging is turned on for IGMP.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `show debugging igmp`

Syntax (VRF-lite) `show debugging igmp [vrf <vrf-name>]`

Parameter	Description
<code>vrf</code>	Applies the command to the specified VRF instance.
<code><vrf-name></code>	The VRF instance name.

Mode User Exec and Privileged Exec

Example To display the IGMP debugging options set, enter the command:

```
awplus# show debugging igmp
```

Output Figure 35-2: Example output from the **show debugging igmp** command

```
IGMP Debugging status:
IGMP Decoder debugging is on
IGMP Encoder debugging is on
IGMP Events debugging is on
IGMP FSM debugging is on
IGMP Tree-Info-Base (TIB) debugging is on
```

Related commands [debug igmp](#)

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

show ip igmp groups

Overview Use this command to display the multicast groups with receivers directly connected to the router, and learned through IGMP.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax

```
show ip igmp groups [brief]
show ip igmp groups <ip-address> [detail]
show ip igmp groups <interface> [<ip-address>] [detail]
```

Syntax (VRF-lite)

```
show ip igmp [vrf <vrf-name>|global] groups [brief]
show ip igmp [vrf <vrf-name>|global] groups <ip-address>
[detail]
show ip igmp [vrf <vrf-name>|global] groups <interface>
[<ip-address>] [detail]
```

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name
global	The global routing and forwarding table
<ip-address>	Address of the multicast group, entered in the form A.B.C.D.
<interface>	Interface name for which to display local information.
brief	Brief display of all interfaces.
detail	Detailed display of the interface.

Mode User Exec and Privileged Exec

Example The following command displays local-membership information for all ports in all interfaces:

```
awplus# show ip igmp groups
```

Output Figure 35-3: Example output from **show ip igmp groups**

IGMP Connected Group Membership				
Group Address	Interface	Uptime	Expires	Last Reporter
224.0.1.1	port1.1.1	00:00:09	00:04:17	10.10.0.82
224.0.1.24	port1.1.2	00:00:06	00:04:14	10.10.0.84
...				

Table 35-1: Parameters in the output of **show ip igmp groups**

Parameter	Description
Group Address	Address of the multicast group.
Interface	Port through which the group is reachable.
Uptime	The time in weeks, days, hours, minutes, and seconds that this multicast group has been known to the device.
Expires	Time (in hours, minutes, and seconds) until the entry expires.
Last Reporter	Last host to report being a member of the multicast group.

**Command
changes**

Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

Version 5.4.8-2.3: **brief** parameter added.

show ip igmp interface

Overview Use this command to display the state of IGMP, IGMP Proxy service, and IGMP Snooping for a specified VLAN, or all VLANs. IGMP is shown as Active or Disabled in the show output. You can also display the number of groups a switch port belongs to.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show ip igmp interface [<interface>]`

Syntax (VRF-lite) `show ip igmp [vrf <vrf-name>|global] interface [<interface>]`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name
global	The global routing and forwarding table
<interface>	The name of the interface. If you specify a switch port number, the output displays the number of groups the port belongs to, and the port’s group membership limit, if a limit has been set (with the command ip igmp maximum-groups).

Mode User Exec and Privileged Exec

Output The following output shows IGMP interface status for vlan2 with IGMP Snooping enabled:

```
awplus#show ip igmp interface vlan2
Interface vlan2 (Index 202)
  IGMP Disabled, Inactive, Version 3 (default)
  IGMP interface has 0 group-record states
  IGMP activity: 0 joins, 0 leaves
  IGMP robustness variable is 2
  IGMP last member query count is 2
  IGMP query interval is 125 seconds
```

```
IGMP query holdtime is 500 milliseconds
IGMP querier timeout is 255 seconds
IGMP max query response time is 10 seconds
Last member query response interval is 1000 milliseconds
Group Membership interval is 260 seconds
Strict IGMPv3 ToS checking is disabled on this interface
Source Address checking is enabled
IGMP Snooping is globally enabled
IGMP Snooping query solicitation is globally disabled
  Num. query-solicit packets: 57 sent, 0 recvd
IGMP Snooping is enabled on this interface
IGMP Snooping fast-leave is not enabled
IGMP Snooping querier is not enabled
IGMP Snooping report suppression is enabled
```

The following output shows IGMP interface status for vlan2 with IGMP Snooping disabled:

```
awplus#show ip igmp interface vlan2
Interface vlan2 (Index 202)
  IGMP Disabled, Inactive, Version 3 (default)
  IGMP interface has 0 group-record states
  IGMP activity: 0 joins, 0 leaves
  IGMP robustness variable is 2
  IGMP last member query count is 2
  IGMP query interval is 125 seconds
  IGMP query holdtime is 500 milliseconds
  IGMP querier timeout is 255 seconds
  IGMP max query response time is 10 seconds
  Last member query response interval is 1000 milliseconds
  Group Membership interval is 260 seconds
  Strict IGMPv3 ToS checking is disabled on this interface
  Source Address checking is enabled
  IGMP Snooping is globally enabled
  IGMP Snooping query solicitation is globally disabled
    Num. query-solicit packets: 57 sent, 0 recvd
  IGMP Snooping is not enabled on this interface
  IGMP Snooping fast-leave is not enabled
  IGMP Snooping querier is not enabled
  IGMP Snooping report suppression is enabled
```

The following output displays membership information for port1.1.1:

```
awplus#show ip igmp interface port1.1.1
IGMP information for port1.1.1
  Maximum groups limit set: 10
  Number of groups port belongs to: 0
```

Command changes

Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

show ip igmp proxy

Overview Use this command to display the state of IGMP Proxy services for a specified interface or for all interfaces.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `show ip igmp proxy`

Syntax (VRF-lite) `show ip igmp [vrf <vrf-name>|global] proxy`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
global	The global routing and forwarding table

Mode User Exec and Privileged Exec

Example To display the state of IGMP Proxy services for all interfaces, enter the command:

```
awplus# show ip igmp proxy
```

Output Figure 35-4: Example output from **show ip igmp proxy**

```
awplus#show ip igmp proxy
Interface vlan40 (Index 340)
Administrative status: enabled
Operational status: up
Upstream interface is vlan30
Number of multicast groups: 1
```

Related commands [ip igmp proxy-service](#)

Command changes Version 5.4.7-1.1: VRF-lite support added.

show ip igmp proxy groups

Overview Use this command to display multicast groups with receivers directly connected to the router, learned through IGMP, which use a proxy service. You can also use a filter to specify a multicast group IP address and /or interface.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax

```
show ip igmp proxy groups [detail]
show ip igmp proxy groups <multicast-group> [detail]
show ip igmp proxy groups <vlan> [detail]
show ip igmp proxy groups <vlan> <multicast-group> [detail]
```

Syntax (VRF-lite)

```
show ip igmp [vrf <vrf-name>|global] proxy groups [detail]
show ip igmp [vrf <vrf-name>|global] proxy groups <multicast-group> [detail]
show ip igmp [vrf <vrf-name>|global] proxy groups <vlan> [detail]
show ip igmp [vrf <vrf-name>|global] proxy groups <vlan> <multicast-group> [detail]
```

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
global	The global routing and forwarding table
groups	Specify IGMP proxy group membership information.
detail	Specify detailed IGMPv3 source information.
<vlan>	Specify the name of a single VLAN interface, for example vlan1 .
<multicast-group>	Specify the IPv4 address in of the multicast group, in the format A.B.C.D.

Mode User Exec

Example To display local membership information for IGMP proxy service interfaces, use the command:

```
awplus# show ip igmp proxy groups
```

Output Figure 35-5: Example output from **show ip igmp proxy groups**

```
awplus#show ip igmp proxy groups
IGMP Connected Proxy Group Membership
Group Address      Interface          Member state
224.9.10.11        vlan10             Delay
```

Example To display local membership information for IGMP proxy service interfaces, use the command:

```
awplus# show ip igmp proxy groups detail
```

Output Figure 35-6: Example output from **show ip igmp proxy groups detail**

```
awplus#show ip igmp proxy groups detail
Interface:          vlan10
Group:              224.9.10.11
Group mode:         Exclude
Member state:       Delay
Source list is empty

Summary :
IGMP Connected Proxy Group Membership

Source list is empty
```

Table 35-2: Parameters in the output of **show ip igmp proxy groups**

Parameter	Description
Interface	The interface that received the IGMP report.
Group	The multicast group address that has been requested by the IGMP report.
Group mode	Include mode indicates that the multicast receiver has sent an IGMPv3 report for a group with a list of addresses that it wants to receive traffic from. Exclude mode indicates that the multicast receiver has sent an IGMPv3 report for a group with a list of addresses that it does not want to receive traffic from.
Member state	Delay indicates that no group or source query timers are running for the specified group, otherwise the member state is shown as Idle .

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.
 Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

show ip igmp snooping mrouter

Overview Use this command to display the multicast router ports, both static and dynamic, in a VLAN.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `show ip igmp snooping mrouter [interface <interface>]`

Syntax (VRF-lite) `show ip igmp [vrf <vrf-name>|global] snooping mrouter [interface <interface>]`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
global	The global routing and forwarding table
interface	A specific interface.
<interface>	The name of the VLAN interface.

Mode User Exec and Privileged Exec

Example To show all multicast router interfaces, use the command:

```
awplus# show ip igmp snooping mrouter
```

To show the multicast router interfaces in `vlan1`, use the command:

```
awplus# show ip igmp snooping mrouter interface vlan1
```

Output Figure 35-7: Example output from **show ip igmp snooping mrouter**

VLAN	Interface	Static/Dynamic
1	port1.1.1	Statically configured
200	port1.1.2	Statically configured

Figure 35-8: Example output from **show ip igmp snooping mrouter interface vlan1**

VLAN	Interface	Static/Dynamic
1	port1.1.1	Statically configured

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.
 Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

show ip igmp snooping routermode

Overview Use this command to display the current router mode and the list of IP addresses set as router multicast addresses from the [ip igmp snooping routermode](#) command.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `show ip igmp snooping routermode`

Syntax (VRF-lite) `show ip igmp [vrf <vrf-name>|global] snooping routermode`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name
global	The global routing and forwarding table

Mode User Exec and Privileged Exec

Example To show the router mode and the list of router multicast addresses, use the command:

```
awplus# show ip igmp snooping routermode
```

Output Figure 35-9: Example output from **show ip igmp snooping routermode**

```
awplus#show ip igmp snooping routermode
Router mode.....Def
Reserved multicast address

      224.0.0.1
      224.0.0.2
      224.0.0.4
      224.0.0.5
      224.0.0.6
      224.0.0.9
      224.0.0.13
      224.0.0.15
      224.0.0.24
```

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

show ip igmp snooping source-timeout

Overview Use this command to display the configured IGMP snooping source timeouts for a specified VLAN or VLAN range.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Specifying a VRF name will show the IGMP source timeouts for that VRF or use global for the global VRF. Not specifying a VRF will display the information for all VRFs.

Syntax `show ip igmp snooping source-timeout [interface|<interface-range>]`

Syntax (VRF-lite) `show ip igmp [vrf <vrf-name>|global] snooping source-timeout [interface|<interface-range>]`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name
global	The global routing and forwarding table
<interface-range>	The name of the VLAN interface or VLAN range

Mode Privileged Exec

Example To display the configured IGMP snooping source timeouts for all VLANs, use the command:

```
awplus# show ip igmp snooping source-timeout
```

Output Figure 35-10: Example output from **show ip igmp snooping source-timeout**

```
awplus#show ip igmp snooping source-timeout
Global IGMP snooping source-timeout is enabled (60 secs)

vlan1          enabled (300 secs)
vlan2          inherits global setting
vlan1000       inherits global settingawplus#show ip igmp
snooping source-timeout int vlan1
Global IGMP snooping source-timeout is enabled (60 secs)vlan1
enabled (300 secs)
```

Example To display the configured IGMP snooping source timeouts for VLAN1, use the command:

```
awplus# show ip igmp snooping source-timeout int vlan1
```

Output Figure 35-11: Example output from **show ip igmp snooping source-timeout int vlan1**

```
awplus#show ip igmp snooping source-timeout int vlan1
Global IGMP snooping source-timeout is enabled (60 secs)vlan1
enabled (300 secs)
```

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

show ip igmp snooping statistics

Overview Use this command to display IGMP Snooping statistics data.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `show ip igmp snooping statistics interface <interface-range> [group [<ip-address>]]`

Syntax (VRF-lite) `show ip igmp [vrf <vrf-name>|global] snooping statistics interface <interface-range> [group [<ip-address>]]`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name
global	The global routing and forwarding table
<ip-address>	Optionally specify the address of the multicast group, entered in the form A.B.C.D.
<interface>	Specify the name of the interface or interface range. If you specify a port number, the output displays the number of groups the port belongs to, and the port's group membership limit, if a limit has been set (with the command ip igmp maximum-groups)

Mode Privileged Exec

Example To display IGMP statistical information for **vlan1** and **vlan2**, use the command:

```
awplus# show ip igmp snooping statistics interface vlan1-vlan2
```

Output Figure 35-12: Example output from the **show ip igmp snooping statistics** command for VLANs

```
awplus#show ip igmp interface vlan1-vlan2
IGMP Snooping statistics for vlan1
Interface:      port1.1.1
Group:          224.1.1.1
Uptime:         00:00:09
Group mode:     Exclude (Expires: 00:04:10)
Last reporter:  10.4.4.5
Source list is empty
IGMP Snooping statistics for vlan2
Interface:      port1.1.2
Group:          224.1.1.2
Uptime:         00:00:19
Group mode:     Exclude (Expires: 00:05:10)
Last reporter:  10.4.4.6
Source list is empty
```

Figure 35-13: Example output from the **show ip igmp snooping statistics** command for a switch port

```
awplus#show ip igmp interface port1.1.1
IGMP information for port1.1.1
    Maximum groups limit set: 10
    Number of groups port belongs to: 0
```

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

undebbug igmp

Overview This command applies the functionality of the no [debug igmp](#) command.

36

MLD and MLD Snooping Commands

Introduction

Overview This chapter provides an alphabetical reference of configuration, clear, and show commands related to MLD and MLD Snooping.

The Multicast Listener Discovery (MLD) module includes the MLD Proxy service and MLD Snooping functionality. Some of the following commands may have commonalities and restrictions; these are described under the Usage section for each command.

MLD and MLD Snooping commands only apply to switch ports, not Ethernet interfaces.

Before using PIM-SMv6:

- IPv6 must be enabled on an interface ([ipv6 enable](#)),
- IPv6 forwarding must be enabled globally for routing IPv6 ([ipv6 forwarding](#)), and
- IPv6 multicasting must be enabled globally ([ipv6 multicast-routing](#)).

- Command List**
- [“clear ipv6 mld”](#) on page 2040

clear ipv6 mld

Overview Use this command to clear all MLD local memberships on all interfaces.

Syntax `clear ipv6 mld`

Mode Privileged Exec

Usage This command applies to interfaces configured for MLD Layer 3 multicast protocols and learned by MLD Snooping.

Example To clear all MLD local memberships on all interfaces, use the command:

```
awplus# clear ipv6 mld
```

Related commands [clear ipv6 mld group](#)
[clear ipv6 mld interface](#)

clear ipv6 mld group

Overview Use this command to clear MLD specific local-membership(s) on all interfaces, for all groups or a particular group.

Syntax `clear ipv6 mld group {*|<ipv6-address>}`

Parameter	Description
*	Clears all groups on all interfaces. This is an alias to the clear ipv6 mld command.
<ipv6-address>	Specify the group address for which MLD local-memberships are to be cleared from all interfaces. Specify the IPv6 multicast group address in the format in the format X:X::X:X.

Mode Privileged Exec

Usage This command applies to interfaces configured for MLD Layer 3 multicast protocols and learned by MLD Snooping.

Example To clear all groups on all interfaces, use the command:

```
awplus# clear ipv6 mld group *
```

Related commands [clear ipv6 mld](#)
[clear ipv6 mld interface](#)

clear ipv6 mld interface

Overview Use this command to clear MLD interface entries.

Syntax `clear ipv6 mld interface <interface>`

Parameter	Description
<interface>	Specifies name of the interface; all groups learned from this interface are deleted.

Mode Privileged Exec

Usage This command applies to interfaces configured for MLD Layer 3 multicast protocols and learned by MLD Snooping.

Example To clear the entries from vlan2, use the command:

```
awplus# clear ipv6 mld interface vlan2
```

Related commands [clear ipv6 mld](#)
[clear ipv6 mld group](#)

debug mld

Overview Use this command to enable all MLD debugging modes, or a specific MLD debugging mode.

Use the **no** variant of this command to disable all MLD debugging modes, or a specific MLD debugging mode.

Syntax `debug mld {all|decode|encode|events|fsm|tib}`
`no debug mld {all|decode|encode|events|fsm|tib}`

Parameter	Description
all	Debug all MLD.
decode	Debug MLD decoding.
encode	Debug MLD encoding.
events	Debug MLD events.
fsm	Debug MLD Finite State Machine (FSM).
tib	Debug MLD Tree Information Base (TIB).

Mode Privileged Exec and Global Configuration

Usage notes This command applies to interfaces configured for MLD Layer 3 multicast protocols and learned by MLD Snooping.

Examples

```
awplus# configure terminal
awplus(config)# debug mld all
awplus# configure terminal
awplus(config)# debug mld decode
awplus# configure terminal
awplus(config)# debug mld encode
awplus# configure terminal
awplus(config)# debug mld events
```

Related commands [show debugging mld](#)

ipv6 mld

Overview Use this command to enable the MLD protocol operation on an interface. This command enables MLD protocol operation in stand-alone mode, and can be used to learn local-membership information prior to enabling a multicast routing protocol on the interface.

Use the **no** variant of this command to return all MLD related configuration to the default (including MLD Snooping).

NOTE: *There is a 100 MLD interface limit when applying MLD commands to multiple VLANs. Only the first 100 VLANs have the required multicast structures added to the interfaces that allow multicast routing.*

Syntax `ipv6 mld`
`no ipv6 mld`

Default MLD is disabled by default.

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage notes MLD requires memory for storing data structures, as well as the hardware tables to implement hardware routing. As the number of ports, VLANs, static and dynamic groups increases then more memory is consumed. You can track the memory used for MLD with the command:

```
awplus# show memory pools nsm | grep MLD
```

Static and dynamic groups (LACP), ports and VLANs are not limited for MLD. For VLANs, this allows you to configure MLD across more VLANs with fewer ports per VLAN, or fewer VLANs with more ports per VLAN. For LACPs, you can configure MLD across more LACP groups with fewer ports per LACP, or fewer LACP groups with more ports per LACP.

Example To enable MLD on vlan1, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan1
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld
```

Related commands [show ipv6 mld interface](#)

ipv6 mld access-group

Overview Use this command to control the multicast local-membership groups learned on an interface.

Use the **no** variant of this command to disable this access control.

Syntax `ipv6 mld access-group <IPv6-access-list-name>`
`no ipv6 mld access-group`

Parameter	Description
<code><IPv6-access-list-name></code>	Specify a Standard or an Extended software IPv6 access-list name. See IPv6 Software Access Control List (ACL) Commands for supported IPv6 ACLs.

Default No access list is configured by default.

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Examples In the following example, the VLAN interface `vlan2` will only accept MLD joins for groups in the range `ff1e:0db8:0001::/64`:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 access-list standard group1 permit
ff1e:0db8:0001::/64
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld access-group group1
```

In the following example, the VLAN interfaces `vlan2-vlan4` will only accept MLD joins for groups in the range `ff1e:0db8:0001::/64`:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 access-list standard group1 permit
ff1e:0db8:0001::/64
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld access-group group1
```

ipv6 mld immediate-leave

Overview Use this command to minimize the leave latency of MLD memberships.
Use the **no** variant of this command to disable this feature.

Syntax `ipv6 mld immediate-leave group-list <IPv6-access-list-name>`
`no ipv6 mld immediate-leave`

Parameter	Description
<code><IPv6-access-list-name></code>	Specify a Standard or an Extended software IPv6 access-list name that defines multicast groups in which the immediate leave feature is enabled. See IPv6 Software Access Control List (ACL) Commands for supported IPv6 ACLs.

Default Disabled

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Example The following example shows how to enable the immediate-leave feature on an interface for a specific range of multicast groups. In this example, the router assumes that the group access-list consists of groups that have only one node membership at a time per interface:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld immediate-leave v6grp
awplus(config-if)# exit
```

Related commands [ipv6 mld last-member-query-interval](#)

ipv6 mld last-member-query-count

Overview Use this command to set the last-member query-count value.
Use the **no** variant of this command to return to the default on an interface.

Syntax `ipv6 mld last-member-query-count <value>`
`no ipv6 mld last-member-query-count`

Parameter	Description
<value>	Count value. Valid values are from 2 to 7.

Default The default last-member query-count value is 2.

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Example To set the last-member query-count to 3 on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld last-member-query-count 3
```

ipv6 mld last-member-query-interval

Overview Use this command to configure the interval at which the router sends MLD group-specific host query messages.

Use the **no** variant of this command to set this frequency to the default.

Syntax `ipv6 mld last-member-query-interval <milliseconds>`
`no ipv6 mld last-member-query-interval`

Parameter	Description
<code><milliseconds></code>	The time delay between successive query messages (in milliseconds). Valid values are from 1000 to 25500 milliseconds.

Default 1000 milliseconds

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Example The following example changes the MLD group-specific host query message interval to 2 seconds:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld last-member-query-interval 2000
```

Related commands [ipv6 mld immediate-leave](#)

ipv6 mld limit

Overview Use this command to configure a limit on the maximum number of group memberships that may be learned. The limit may be set for the device as a whole, or for a specific interface.

Once the specified group membership limit is reached, all further local-memberships will be ignored.

Optionally, an exception access-list can be configured to specify the group-address(es) that are exempted from being subject to the limit.

Use the **no** variant of this command to unset the limit and any specified exception access-list.

Syntax `ipv6 mld limit <limitvalue> [except <IPv6-access-list-name>]`
`no ipv6 mld limit`

Parameter	Description
<limitvalue>	<2-512> Maximum number of group membership states.
<IPv6-access-list-name>	Specify a Standard or an Extended software IPv6 access-list name that defines multicast groups, which are exempted from being subject to the configured limit. See IPv6 Software Access Control List (ACL) Commands for supported IPv6 ACLs.

Default The default limit, which is reset by the **no** variant of this command, is the same as maximum number of group membership entries that can be learned with the **ipv6 mld limit** command.

The default limit of group membership entries that can be learned is 512 entries.

Mode Global Configuration and Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage notes This command applies to interfaces configured for MLD Layer-3 multicast protocols and learned by MLD Snooping.

Examples The following example configures an MLD limit of 100 group-memberships across all VLAN interfaces on which MLD is enabled, and excludes groups in the range `ff1e:0db8:0001::/64` from this limitation:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 access-list standard v6grp permit
ff1e:0db8:0001::/64
awplus(config)# ipv6 mld limit 100 except v6grp
```

The following example configures an MLD limit of 100 group-membership states on the VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld limit 100
```

The following example configures an MLD limit of 100 group-membership states on the VLAN interfaces `vlan2-vlan4`:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld limit 100
```

Related commands [ipv6 mld immediate-leave](#)
 [show ipv6 mld groups](#)

ipv6 mld querier-timeout

Overview Use this command to configure the timeout period before the router takes over as the querier for the interface after the previous querier has stopped querying.

Use the **no** variant of this command to restore the default.

Syntax `ipv6 mld querier-timeout <seconds>`
`no ipv6 mld querier-timeout`

Parameter	Description
<seconds>	Number of seconds that the router waits after the previous querier has stopped querying before it takes over as the querier. Valid values are from 2 to 65535 seconds.

Default 255 seconds

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage notes This command applies to interfaces configured for MLD Layer 3 multicast protocols.

Example The following example configures the router to wait 120 seconds from the time it received the last query before it takes over as the querier for the interface:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld querier-timeout 120
```

Related commands [ipv6 mld query-interval](#)

ipv6 mld query-interval

Overview Use this command to configure the frequency of sending MLD host query messages.

Use the **no** variant of this command to return to the default frequency.

Syntax `ipv6 mld query-interval <seconds>`
`no ipv6 mld query-interval`

Parameter	Description
<code><seconds></code>	Variable that specifies the time delay between successive MLD host query messages (in seconds). Valid values are from 1 to 18000 seconds.

Default The default query interval is 125 seconds.

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage This command applies to interfaces configured for MLD Layer 3 multicast protocols.

Example The following example changes the frequency of sending MLD host-query messages to 2 minutes:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld query-interval 120
```

Related commands [ipv6 mld querier-timeout](#)

ipv6 mld query-max-response-time

Overview Use this command to configure the maximum response time advertised in MLD queries.

Use the **no** variant of with this command to restore the default.

Syntax `ipv6 mld query-max-response-time <seconds>`
`no ipv6 mld query-max-response-time`

Parameter	Description
<seconds>	Maximum response time (in seconds) advertised in MLD queries. Valid values are from 1 to 240 seconds.

Default 10 seconds

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage This command applies to interfaces configured for MLD Layer 3 multicast protocols.

Example The following example configures a maximum response time of 8 seconds:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld query-max-response-time 8
```

ipv6 mld robustness-variable

Overview Use this command to change the robustness variable value on an interface.
Use the **no** variant of this command to return to the default on an interface.

Syntax `ipv6 mld robustness-variable <value>`
`no ipv6 mld robustness-variable`

Parameter	Description
<value>	Valid values are from 1 to 7.

Default The default robustness variable value is 2.

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage This command applies to interfaces configured for MLD Layer 3 multicast protocols.

Example The following example changes the robustness variable value to 3:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld robustness-variable 3
```

ipv6 mld snooping

Overview Use this command to enable MLD Snooping. When this command is issued in the Global Configuration mode, MLD Snooping is enabled globally for the device. When this command is issued in Interface mode for a VLAN then MLD Snooping is enabled for the specified VLAN. Note that MLD Snooping is enabled on the VLAN only if it is enabled globally and on the VLAN.

Use the **no** variant of this command to globally disable MLD Snooping in Global Configuration mode, or for the specified VLAN interface in Interface mode.

NOTE: *There is a 100 MLD interface limit when applying MLD commands to multiple VLANs. Only the first 100 VLANs have the required multicast structures added to the interfaces that allow multicast routing.*

Syntax `ipv6 mld snooping`
`no ipv6 mld snooping`

Default By default, MLD Snooping is enabled both globally and on all VLANs.

Mode Global Configuration and Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage notes It is possible to disable MLD snooping globally or on a per-VLAN basis, using the command **no ipv6 mld snooping**. However, we recommend leaving MLD snooping enabled unless an Allied Telesis support representative tells you to disable it, even if you are not actively using the device for multicast.

For MLD Snooping to operate on particular VLAN interfaces, it must be enabled both globally by using this command in Global Configuration mode, and on individual VLAN interfaces by using this command in Interface Configuration mode (both are enabled by default).

MLD requires memory for storing data structures, as well as the hardware tables to implement hardware routing. As the number of ports, VLANs, static and dynamic groups increases then more memory is consumed. You can track the memory used for MLD with the command:

```
awplus# show memory pools nsm | grep MLD
```

Static and dynamic groups (LACP), ports and VLANs are not limited for MLD. For VLANs, this allows you to configure MLD across more VLANs with fewer ports per VLAN, or fewer VLANs with more ports per VLAN. For LACPs, you can configure MLD across more LACP groups with fewer ports per LACP, or fewer LACP groups with more ports per LACP.

Examples To configure MLD Snooping on the VLAN interfaces vlan2-vlan4, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 mld snooping
```

To disable MLD Snooping for the VLAN interfaces vlan2-vlan4, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config)# no ipv6 mld snooping
```

To configure MLD Snooping globally for the device, enter the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 mld snooping
```

To disable MLD Snooping globally for the device, enter the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 mld snooping
```

ipv6 mld snooping fast-leave

Overview Use this command to enable MLD Snooping fast-leave processing. Fast-leave processing is analogous to immediate-leave processing; the MLD group-membership is removed as soon as an MLD leave group message is received, without sending out a group-specific query.

Use the **no** variant of this command to disable fast-leave processing.

Syntax `ipv6 mld snooping fast-leave`
`no ipv6 mld snooping fast-leave`

Default MLD Snooping fast-leave processing is disabled.

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage notes This MLD Snooping command can only be configured on VLAN interfaces.

Examples This example shows how to enable fast-leave processing on the VLAN interface `vlan2`.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping fast-leave
```

This example shows how to enable fast-leave processing on the VLAN interface `vlan2-vlan4`.

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 mld snooping fast-leave
```

ipv6 mld snooping mrouter

Overview Use this command to statically configure the specified port as a Multicast Router interface for MLD Snooping within the specified VLAN.

See detailed usage notes below to configure static multicast router ports when using static IPv6 multicast routes with EPSR, and the destination VLAN is an EPSR data VLAN.

Use the **no** variant of this command to remove the static configuration of the interface as a Multicast Router interface.

Syntax `ipv6 mld snooping mrouter interface <port>`
`no ipv6 mld snooping mrouter interface <port>`

Parameter	Description
<port>	Specify the name of the port.

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage notes This MLD Snooping command statically configures a switch port as a Multicast Router interface.

Note that if static IPv6 multicast routing is being used with EPSR and the destination VLAN is an EPSR data VLAN, then multicast router (mrouter) ports must be statically configured. This minimizes disruption for multicast traffic in the event of ring failure or restoration.

When configuring the EPSR data VLAN, statically configure mrouter ports so that the multicast router can be reached in either direction around the EPSR ring.

For example, if port1.1.1 and port1.1.14 are ports on an EPSR data VLAN vlan101, which is the destination for a static IPv6 multicast route, then configure both ports as multicast router (mrouter) ports as shown in the example commands listed below:

Figure 36-1: Example **ipv6 mld snooping mrouter** commands when static IPv6 multicast routing is being used and the destination VLAN is an EPSR data VLAN:

```
awplus>enable
awplus#configure terminal
awplus(config)#interface vlan101
awplus(config-if)#ipv6 mld snooping mrouter interface port1.1.1
awplus(config-if)#ipv6 mld snooping mrouter interface port1.1.14
```

Examples This example shows how to specify the next-hop interface to the multicast router for VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping mrouter interface
port1.1.5
```

This example shows how to specify the next-hop interface to the multicast router for VLAN interfaces `vlan2-vlan4`:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 mld snooping mrouter interface
port1.1.5
```

Related commands [ipv6 multicast route](#)

ipv6 mld snooping querier

Overview Use this command to enable MLD querier operation on a subnet (VLAN) when no multicast routing protocol is configured in the subnet (VLAN). When enabled, the MLD Snooping querier sends out periodic MLD queries for all interfaces on that VLAN.

Use the **no** variant of this command to disable MLD querier configuration.

Syntax `ipv6 mld snooping querier`
`no ipv6 mld snooping querier`

Mode Interface Configuration for a specified VLAN interface.

Usage This command can only be configured on a single VLAN interface - not on multiple VLANs.

The MLD Snooping querier uses the 0.0.0.0 Source IP address because it only masquerades as an MLD querier for faster network convergence.

The MLD Snooping querier does not start, or automatically cease, the MLD Querier operation if it detects query message(s) from a multicast router. It restarts as an MLD Snooping querier if no queries are seen within the other querier interval.

Do not enable MLD Snooping querier if you have already enabled MLD on your device.

Do not enable MLD Snooping querier on your device and then enable MLD afterwards.

Example `awplus# configure terminal`
`awplus(config)# interface vlan2`
`awplus(config-if)# ipv6 mld snooping querier`

ipv6 mld snooping report-suppression

Overview Use this command to enable report suppression from hosts for Multicast Listener Discovery version 1 (MLDv1) on a VLAN in Interface Configuration mode.

Use the **no** variant of this command to disable report suppression on a VLAN in Interface Configuration mode.

Syntax `ipv6 mld snooping report-suppression`
`no ipv6 mld snooping report-suppression`

Default Report suppression does not apply to MLDv2, and is turned on by default for MLDv1 reports.

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage This MLD Snooping command can only be configured on VLAN interfaces.

MLDv1 Snooping maybe configured to suppress reports from hosts. When a querier sends a query, only the first report for particular set of group(s) from a host will be forwarded to the querier by the MLD Snooping device. Similar reports (to the same set of groups) from other hosts, which would not change group memberships in the querier, will be suppressed by the MLD Snooping device to prevent 'flooding' of query responses.

Examples This example shows how to enable report suppression for MLD reports on VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping report-suppression
```

This example shows how to disable report suppression for MLD reports on VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 mld snooping report-suppression
```

This example shows how to enable report suppression for MLD reports on VLAN interfaces `vlan2-vlan4`:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 mld snooping report-suppression
```

This example shows how to disable report suppression for MLD reports on VLAN interfaces `vlan2-vlan4`:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# no ipv6 mld snooping report-suppression
```

ipv6 mld ssm-map enable

Overview Use this command to enable the Source Specific Multicast (SSM) mapping feature on the device.

Use the **no** variant of this command to disable the SSM mapping feature on the device.

Syntax `ipv6 mld ssm-map enable`
`no ipv6 mld ssm-map enable`

Mode Global Configuration

Usage notes This command enables the SSM mapping feature for group members in the defined SSM range. Configure the group member and the SSM range using the [ipv6 mld ssm-map static](#) command.

Example This example shows how to enable the MLD SSM mapping feature on the device.

```
awplus# configure terminal
awplus(config)# ipv6 mld ssm-map enable
```

Related commands [ipv6 mld ssm-map static](#)

ipv6 mld ssm-map static

Overview Use this command to statically define a Source Specific Multicast (SSM) mapping. The SSM mapping statically assigns sources to MLDv1 groups to translate such (*,G) groups' memberships to (S,G) memberships for use with PIM-SSM.

Use the **no** variant of this command to remove the SSM map association.

Syntax `ipv6 mld ssm-map static <access-list-name> X:X::X:X`
`no ipv6 mld ssm-map static <access-list-name> X:X::X:X`

Parameter	Description
<access-list-name>	IPv6 named standard access-list.
X:X::X:X	IPv6 source address that is associated with the above access-list. The IPv6 address uses the format X:X::X:X.

Mode Global Configuration

Usage notes Use this command to configure SSM mappings after enabling SSM mapping with the [ipv6 mld ssm-map enable](#) command.

Example This example shows how to configure an SSM static mapping for the group-address ff0e::1/128.

```
awplus# configure terminal
awplus(config)# ipv6 mld ssm-map enable
awplus(config)# ipv6 access-list standard v6grp permit ff0e::1/128
awplus(config)# ipv6 mld ssm-map static v6grp 2006::3
```

Related commands [ipv6 mld ssm-map enable](#)

ipv6 mld static-group

Overview Use this command to statically configure IPv6 group membership entries on an interface. To statically add only a group membership, do not specify any parameters.

Use the **no** variant of this command to delete static group membership entries.

Syntax `ipv6 mld static-group <ipv6-group-address> [source <ipv6-source-address>|ssm-map] [interface <port>]`
`no ipv6 mld static-group <ipv6-group-address> [source <ipv6-source-address>|ssm-map] [interface <port>]`

Parameter	Description
<ipv6-group-address>	Specify a standard IPv6 Multicast group address to be configured as a static group member. The IPv6 address uses the format X:X::X:X.
<ipv6-source-address>	Optional. Specify a standard IPv6 source address to be configured as a static source from where multicast packets originate. The IPv6 address uses the format X:X::X:X.
ssm-map	Mode of defining SSM mapping. SSM mapping statically assigns sources to MLDv1 groups to translate these (*,G) groups' memberships to (S,G) memberships for use with PIM-SSM.
<port>	Optional. Physical interface. This parameter specifies a physical port. If this parameter is used, the static configuration is applied to just that physical interface. If this parameter is not used, the static configuration is applied on all interfaces in the group.

Mode Interface Configuration for a specified VLAN interface.

Usage notes This command applies to MLD Snooping on a VLAN interface to statically add groups and/or source records.

Examples To add a static group record, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ff1e::10
```

To add a static group and source record, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ff1e::10 source
fe80::2fd:6cff:fe1c:b
```

To add a static group record on a specific port on vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ff1e::10 interface
port1.1.8
```

To add an SSM mapping record on a specific port on vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ff1e::10 source
ssm-map interface port1.1.8
```

ipv6 mld version

Overview Use this command to set the current MLD protocol version on an interface.
Use the **no** variant of this command to return to the default version on an interface.

Syntax `ipv6 mld version <version>`
`no ipv6 mld version`

Parameter	Description
<version>	MLD protocol version number. Valid version numbers are 1 and 2

Default The default MLD protocol version number is 2.

Mode Interface Configuration for a specified VLAN interface.

Usage notes This command applies to interfaces configured for MLD Layer 3 multicast protocols and MLD Snooping.

Note this command is intended for use where there is another querier (when there is another device with MLD enabled) on the same link that can only operate with MLD version 1. Otherwise, the default MLD version 2 is recommended for performance.

Example To set the MLD protocol version to 1, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld version 1
```

show debugging mld

Overview Use this command to see what debugging is turned on for MLD. MLD debugging modes are enabled with the [debug mld](#) command.

For information on filtering and saving command output, see the [“Getting_Started with AlliedWare Plus” Feature Overview and Configuration_Guide](#).

Syntax `show debugging mld`

Mode Privileged Exec

Example `awplus# show debugging mld`

Output

```
show debugging mld
MLD Debugging status:
  MLD Decoder debugging is on
  MLD Encoder debugging is on
  MLD Events debugging is on
  MLD FSM debugging is on
  MLD Tree-Info-Base (TIB) debugging is on
```

Related commands [debug mld](#)

show ipv6 mld groups

Overview Use this command to display the multicast groups that have receivers directly connected to the router and learned through MLD.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `show ipv6 mld groups [<ipv6-address>|<interface>] [detail]`

Syntax (VRF-lite) `show ipv6 mld [vrf <vrf-name>|global] groups [<ipv6-address>|<interface>] [detail]`

Parameter	Description
<ipv6-address>	Optional. Specify the address of the multicast group in format X:X::X:X.
<interface>	Optional. The interface to display information about.
detail	Display more detailed information.
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
global	The global routing and forwarding table.

Mode User Exec and Privileged Exec

Examples The following command displays local-membership information for all interfaces:

```
awplus# show ipv6 mld groups
```

The following command displays detailed local-membership information for all interfaces:

```
awplus# show ipv6 mld groups detail
```

Output Figure 36-2: Example output for **show ipv6 mld groups**

awplus#show ipv6 mld groups					
MLD Connected Group Membership					
Group Address	Interface	Uptime	Expires	Last Reporter	
ff03::1	eth3	00:00:37	00:03:43	fe80::214:1ff:fe00:1	
ff03::2	eth3	00:00:37	00:03:43	fe80::214:1ff:fe00:1	

Figure 36-3: Example output for **show ipv6 mld groups detail**

```
awplus# show ipv6 mld groups detail
MLD Connected Group Membership Details for port1.0.1
Interface:      port1.0.1
Group:          ff08::1
Uptime:         00:00:13
Group mode:     Include ()
Last reporter:  fe80::eecd:6dff:fe6b:4783
Group source list: (R - Remote, M - SSM Mapping, S - Static )
  Source Address      Uptime      v2 Exp      Fwd  Flags
  2001:db8::1         00:00:13    00:04:07    Yes  R
  2002:db8::3         00:00:13    00:04:07    Yes  R
```

Command changes Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

show ipv6 mld interface

Overview Use this command to display the state of MLD and MLD Snooping for a specified interface, or all interfaces.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `show ipv6 mld interface [<interface>]`

Syntax (VRF-lite) `show ipv6 mld [vrf <vrf-name>|global] interface [<interface>]`

Parameter	Description
<interface>	Optionally, an interface to display information about.
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
global	The global routing and forwarding table.

Mode User Exec and Privileged Exec

Example The following command displays MLD interface status on all interfaces enabled for MLD:

```
awplus# show ipv6 mld interface
```

Output Figure 36-4: Example output for **show ipv6 mld interface**

```
awplus#show ipv6 mld interface

Interface vlan1 (Index 301)
  MLD Enabled, Active, Querier, Version 2 (default)
  Internet address is fe80::215:77ff:fec9:7468
  MLD interface has 0 group-record states
  MLD activity: 0 joins, 0 leaves
  MLD robustness variable is 2
  MLD last member query count is 2
  MLD query interval is 125 seconds
  MLD querier timeout is 255 seconds
  MLD max query response time is 10 seconds
  Last member query response interval is 1000 milliseconds
  Group Membership interval is 260 seconds
  MLD Snooping is globally enabled
  MLD Snooping is enabled on this interface
  MLD Snooping fast-leave is not enabled
  MLD Snooping querier is enabled
  MLD Snooping report suppression is enabled
```

Command changes Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

show ipv6 mld snooping mrrouter

Overview Use this command to display the multicast router interfaces, both configured and learned, in a VLAN. If you do not specify a VLAN interface then all the VLAN interfaces are displayed.

For information on filtering and saving command output, see the [“Getting_Started with AlliedWare Plus” Feature Overview and Configuration_Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `show ipv6 mld snooping mrrouter [<interface>]`

Syntax (VRF-lite) `show ipv6 mld [vrf <vrf-name>|global] snooping mrrouter [<interface>]`

Parameter	Description
<interface>	Optionally, an interface to display information about.
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
global	The global routing and forwarding table.

Mode User Exec and Privileged Exec

Example To display the multicast router interfaces in vlan2, use the command:

```
awplus# show ipv6 mld snooping mrrouter vlan2
```

To display the multicast router interfaces for all VLAN interfaces, use the command:

```
awplus# show ipv6 mld snooping mrrouter
```

Output Figure 36-5: Example output for **show ipv6 mld snooping mrrouter vlan2**

```
awplus#show ipv6 mld snooping mrrouter vlan2
VLAN    Interface    Static/Dynamic
2       port1.1.2    Dynamically Learned
2       port1.1.3    Dynamically Learned
```

Figure 36-6: Example output for **show ipv6 mld snooping mrrouter**

```
awplus#show ipv6 mld snooping mrrouter
VLAN    Interface    Static/Dynamic
2       port1.1.2    Dynamically Learned
2       port1.1.3    Dynamically Learned
3       port1.1.4    Statically Assigned
3       port1.1.5    Statically Assigned
```

Command changes Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

show ipv6 mld snooping statistics

Overview Use this command to display MLD Snooping statistics data.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus”_Feature Overview and Configuration Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `show ipv6 mld snooping statistics interface <interface>`

Syntax (VRF-lite) `show ipv6 mld [vrf <vrf-name>|global] snooping statistics interface <interface>`

Parameter	Description
<interface>	The interface to display information about.
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
global	The global routing and forwarding table.

Mode User Exec and Privileged Exec

Example To display MLDv2 statistical information for an interface, use the command:

```
awplus# show ipv6 mld snooping statistics interface vlan1
```

Output Figure 36-7: Example output for **show ipv6 mld snooping statistics interface vlan1**

```
awplus#show ipv6 mld snooping statistics interface vlan1
MLD Snooping statistics for vlan1
Interface:      port1.1.1
Group:          ff08::1
Uptime:         00:02:18
Group mode:     Include ()
Last reporter:  fe80::eecd:6dff:fe6b:4783
Group source list: (R - Remote, M - SSM Mapping, S - Static )
  Source Address      Uptime    v2 Exp    Fwd  Flags
  2001:db8::1         00:02:18  00:02:02  Yes  R
  2001:db8::3         00:02:18  00:02:02  Yes  R
```

Command changes Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

Multicast Commands

Introduction

Overview This chapter provides an alphabetical reference of multicast commands for configuring:

- IPv4 and IPv6 multicast forwarding
- IPv4 and IPv6 static multicast routes
- mroutes (routes back to a multicast source)

For commands for other multicast protocols, see:

- [IGMP and IGMP Snooping Commands](#)
- [MLD and MLD Snooping Commands](#)
- [PIM-SM Commands](#)
- [PIM-SMv6 Commands](#)
- [PIM-DM Commands](#)

NOTE: Before using PIM-SMv6 commands, IPv6 must be enabled on an interface with the [ipv6 enable](#) command, IPv6 forwarding must be enabled globally for routing IPv6 with the [ipv6 forwarding](#) command, and IPv6 multicasting must be enabled globally with the [ipv6 multicast-routing](#) command.

Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the [clear ipv6 mroute](#) command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.

The IPv6 Multicast addresses shown can be derived from IPv6 unicast prefixes as per RFC 3306. The IPv6 unicast prefix reserved for documentation is 2001:0db8::/32 as per RFC 3849. Using the base /32 prefix the IPv6 multicast prefix for 2001:0db8::/32 is ff3x:20:2001:0db8::/64. Where an RP address is 2001:0db8::1 the embedded RP multicast prefix is ff7x:120:2001:0db8::/96.

The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical

networks (other than for testing purposes) nor should they appear on any public network.

- Command List**
- “clear ip mroute” on page 2078
 - “clear ip mroute statistics” on page 2080
 - “clear ip multicast route” on page 2081
 - “clear ipv6 mroute” on page 2082
 - “clear ipv6 mroute statistics” on page 2083
 - “ipv6 multicast forward-slow-path-packet” on page 2084
 - “debug nsm” on page 2085
 - “debug nsm mcast” on page 2086
 - “debug nsm mcast6” on page 2087
 - “ip mroute” on page 2088
 - “ip multicast allow-register-fragments” on page 2090
 - “ip multicast forward-first-packet” on page 2091
 - “ip multicast handle-igmp-immediately” on page 2092
 - “ip multicast route” on page 2093
 - “ip multicast route-limit” on page 2095
 - “ip multicast wrong-vif-suppression” on page 2096
 - “ip multicast-routing” on page 2097
 - “ip multicast-routing ssm-only-hw” on page 2098
 - “ipv6 mroute” on page 2099
 - “ipv6 multicast route” on page 2101
 - “ipv6 multicast route-limit” on page 2104
 - “ipv6 multicast-routing” on page 2105
 - “multicast” on page 2106
 - “platform l2mc-overlap” on page 2107
 - “platform multicast-ratelimit” on page 2108
 - “platform stop-unreg-mc-flooding” on page 2109
 - “show debugging nsm mcast” on page 2111
 - “show ip mroute” on page 2112
 - “show ip mvif” on page 2115
 - “show ip rpf” on page 2116
 - “show ipv6 mif” on page 2117
 - “show ipv6 mroute” on page 2118
 - “show ipv6 multicast forwarding” on page 2120

clear ip mroute

Overview Use this command to delete one or more dynamically-added route entries from the IPv4 multicast routing table.

You need to do this if, for example, you want to create a static route instead of an existing dynamic route.

NOTE: If you use this command, you should also use the [clear ip igmp group](#) command to clear IGMP group membership records.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `clear ip mroute {*|<ipv4-group-address>
[<ipv4-source-address>]} [pim sparse-mode]`

Syntax (VRF-lite) `clear ip mroute [vrf <vrf-name>] {*|<ipv4-group-address>
[<ipv4-source-address>]} [pim sparse-mode]`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
*	Deletes all dynamically-learned IPv4 multicast routes.
<ipv4-group-address>	Group IPv4 address, in dotted decimal notation in the format A.B.C.D.
<ipv4-source-address>	Source IPv4 address, in dotted decimal notation in the format A.B.C.D.
pim sparse-mode	Clear specified IPv4 multicast route(s) for PIM Sparse Mode only.

Mode Privileged Exec

Usage notes When this command is used, the Multicast Routing Information Base (MRIB) clears the specified dynamic IPv4 multicast route entries in its IPv4 multicast route table, and deletes the entries from the multicast forwarder. The MRIB also sends a “clear” message to the relevant multicast protocols.

This command does not delete static routes from the routing table or the configuration. To delete static routes, use the **no** parameter of the command [ip multicast route](#), or the command [clear ip multicast route](#).

Examples To delete a specific dynamic route (from 192.168.3.3 for the group 225.1.1.1), use the command:

```
awplus# clear ip mroute 225.1.1.1 192.168.3.3
```

To delete all dynamic multicast routes, use the command:

```
awplus# clear ip mroute *
```

Related commands [clear ip multicast route](#)
[ip multicast route](#)
[show ip mroute](#)

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

clear ip mroute statistics

Overview Use this command to delete multicast route statistics entries from the IP multicast routing table.

Syntax `clear ip mroute statistics {*|<ipv4-group-addr> [<ipv4-source-addr>]}`

Syntax (VRF-lite) `clear ip mroute [vrf <vrf-name>] statistics {*|<ipv4-group-address> [<ipv4-source-address>]}`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
*	Deletes all dynamically-learned IPv4 multicast routes.
<ipv4-group-address>	Group IPv4 address, in dotted decimal notation in the format A.B.C.D.
<ipv4-source-address>	Source IPv4 address, in dotted decimal notation in the format A.B.C.D.

Mode Privileged Exec

Example `awplus# clear ip mroute statistics 225.1.1.2 192.168.4.4`
`awplus# clear ip mroute statistics *`

clear ip multicast route

Overview Use this command to delete all user-added static IPv4 multicast routes.

Syntax `clear ip multicast route *`

Parameter	Description
*	Deletes all static IPv4 multicast routes.

Mode Privileged Exec

Usage notes This command deletes all static IPv4 multicast routes from the routing table. To delete a single static route, use the **no** parameter of the command [ip multicast route](#). To delete dynamic routes, use the command [clear ip mroute](#).

Example To delete all static IPv4 multicast route entries, use the command:

```
awplus# clear ip multicast route *
```

Related commands

- [clear ip mroute](#)
- [ip multicast route](#)
- [show ip mroute](#)

clear ipv6 mroute

Overview Use this command to delete one or more dynamically-added route entries from the IPv6 multicast routing table.

You need to do this if, for example, you want to create a static route instead of an existing dynamic route.

NOTE: If you use this command, you should also use the [clear ipv6 mld group](#) command to clear MLD group membership records.

Syntax `clear ipv6 mroute {*|<ipv6-group-address>
[<ipv6-source-address>]} [pim sparse-mode]`

Parameter	Description
*	Deletes all dynamically-learned IPv6 multicast routes.
<ipv6-group-address>	Group IPv6 address, in hexadecimal notation in the format X.X::X.X.
<ipv6-source-address>	Source IPv6 address, in hexadecimal notation in the format X.X::X.X.
pim sparse-mode	Clear specified IPv6 multicast route(s) for PIM Sparse Mode only.

Mode Privileged Exec

Usage notes When this command is used, the Multicast Routing Information Base (MRIB) clears the specified dynamic IPv6 multicast route entries in its IPv6 multicast route table, and deletes the entries from the multicast forwarder. The MRIB also sends a “clear” message to the relevant multicast protocols.

This command does not delete static routes from the routing table or the configuration. To delete static routes, use the **no** parameter of the command [ipv6 multicast route](#).

Examples To delete a specific dynamic route (from ff08::1 for the group 2001::2), use the command:

```
awplus# clear ipv6 mroute 2001::2 ff08::1
```

To delete all dynamic multicast routes, use the command:

```
awplus# clear ipv6 mroute *
```

Related commands [ipv6 multicast route](#)
[show ipv6 mroute](#)

clear ipv6 mroute statistics

Overview Use this command to delete multicast route statistics entries from the IPv6 multicast routing table.

Syntax `clear ipv6 mroute statistics {*|<ipv6-group-address>
[<ipv6-source-address>]}`

Parameter	Description
*	All multicast route entries.
<ipv6-group-addr>	Group IPv6 address, in hexadecimal notation in the format X.X::X.X.
<ipv6-source-addr>	Source IPv6 address, in hexadecimal notation in the format X.X::X.X.

Mode Privileged Exec

Examples `awplus# clear ipv6 mroute statistics 2001::2 ff08::1`
`awplus# clear ipv6 mroute statistics *`

ipv6 multicast forward-slow-path-packet

Overview Use this command to enable multicast packets to be forwarded to the CPU. Enabling this command will ensure that the Layer 3 MTU is set correctly for each IP multicast group and will apply the value of the smallest MTU among the outgoing interfaces for the multicast group.

It will also ensure that a received packet that is larger than the MTU value will result in the generation of an ICMP Too Big message.

Use the **no** variant of this command to disable the above functionality.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `ipv6 multicast forward-slow-path-packet`
`no ipv6 multicast forward-slow-path-packet`

Syntax (VRF-lite) `ipv6 multicast [vrf <vrf-name>] forward-slow-path-packet`
`no ipv6 multicast [vrf <vrf-name>] forward-slow-path-packet`

Parameter	Description
<code>vrf</code>	Applies the command to the specified VRF instance.
<code><vrf-name></code>	The VRF instance name

Default Disabled.

Mode Privileged Exec

Example To enable the ipv6 multicast forward-slow-path-packet function, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast forward-slow-path-packet
```

Related commands [show ipv6 forwarding](#)

Command changes Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

debug nsm

Overview This command specifies a set of debug options for use by Allied Telesis authorized service personnel only.

Use the **no** variant of this command to remove debug options.

Syntax `debug nsm [all|events|ha|kernel]`
`no debug nsm [all|events|ha|kernel]`

Parameter	Description
all	Enables all the nsm debugging options
events	Enables the nsm events debugging options
ha	Enables the nsm high availability debugging options
kernel	Enables the nsm kernel debugging options

Mode Global Configuration, Privileged Exec

Usage notes This command is intended for use by Allied Telesis authorized service personnel for diagnostic purposes.

Related commands [show debugging nsm mcast](#)

Command changes Version 5.4.7-2.1 command added.

debug nsm mcast

Overview Use this command to debug IPv4 events in the Multicast Routing Information Base (MRIB).

This command is intended for use by Allied Telesis authorized service personnel for diagnostic purposes.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `debug nsm mcast`
`{all|fib-msg|mrt|mtrace|mtrace-detail|register|stats|vif}`

Syntax (VRF-lite) `debug nsm mcast [vrf <vrf-name>]`
`{all|fib-msg|mrt|mtrace|mtrace-detail|register|stats|vif}`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
all	All IPv4 multicast debugging.
fib-msg	Forwarding Information Base (FIB) messages.
mrt	Multicast routes.
mtrace	Multicast traceroute.
mtrace-detail	Multicast traceroute detailed debugging.
register	Multicast PIM register messages.
stats	Multicast statistics.
vif	Multicast interface.

Mode Privileged Exec and Global Configuration

Examples To enable debugging of all multicast route events, use the commands:

```
awplus# configure terminal
awplus(config)# debug nsm mcast all
```

To enable debugging of PIM register entries, use the commands:

```
awplus# configure terminal
awplus(config)# debug nsm mcast register
```

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

debug nsm mcast6

Overview Use this command to debug IPv6 events in the Multicast Routing Information Base (MRIB).

This command is intended for use by Allied Telesis authorized service personnel for diagnostic purposes.

Syntax `debug nsm mcast6 {all|fib-msg|mrt|register|stats|vif}`
`no debug nsm mcast6 {all|fib-msg|mrt|register|stats|vif}`

Parameter	Description
all	All IPv6 multicast route debugging.
fib-msg	Forwarding Information Base (FIB) messages.
mrt	Multicast routes.
register	Multicast PIM register messages.
stats	Multicast statistics.
vif	Multicast interfaces.

Mode Privileged Exec and Global Configuration

Examples To enable debugging of all multicast route events, use the commands:

```
awplus# configure terminal
awplus(config)# debug nsm mcast6 all
```

To enable debugging of PIM register entries, use the commands:

```
awplus# configure terminal
awplus(config)# debug nsm mcast6 register
```

ip mroute

Overview Use this command to inform multicast of the RPF (Reverse Path Forwarding) route to a given IPv4 multicast source.

Use the **no** variant of this command to delete a route to an IPv4 multicast source.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `ip mroute <ipv4-source-address/mask-length>
[bgp|ospf|rip|static] <rpf-address> [<admin-distance>]`
`no ip mroute <ipv4-source-address/mask-length>
[bgp|ospf|rip|static]`

Syntax (VRF-lite) `ip mroute [vrf <vrf-name>] <ipv4-source-address/mask-length>
[bgp|ospf|rip|static] <rpf-address> [<admin-distance>]`
`no ip mroute [vrf <vrf-name>] <ipv4-source-address/mask-length>
[bgp|ospf|rip|static]`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
<ipv4-source-address/ mask-length>	A multicast source IPv4 address and mask length, in dotted decimal notation in the format A.B.C.D/M.
bgp	BGP unicast routing protocol.
ospf	OSPF unicast routing protocol.
rip	RIP unicast routing protocol.
static	Specifies a static route.
<rpf-address>	A.B.C.D The closest known address on the multicast route back to the specified source. This host IPv4 address can be within a directly connected subnet or within a remote subnet. In the case that the address is in a remote subnet, a lookup is done from the unicast route table to find the next hop address on the path to this host.
<admin-distance>	The administrative distance. Use this to determine whether the RPF lookup selects the unicast or multicast route. Lower distances have preference. If the multicast static route has the same distance as the other RPF sources, the multicast static route takes precedence. The default is 0 and the range available is 0-255.

Mode Global Configuration

Usage notes Typically, when a Layer 3 multicast routing protocol is determining the RPF (Reverse Path Forwarding) interface for the path to an IPv4 multicast source, it uses the unicast route table to find the best path to the source. However, in some networks a deliberate choice is made to send multicast via different paths to those used for unicast. In this case, the interface via which a multicast stream from a given source enters a router may not be the same as the interface that connects to the best unicast route to that source.

This command enables the user to statically configure the device with “multicast routes” back to given sources. When performing the RPF check on a stream from a given IPv4 source, the multicast routing protocol will look at these static entries as well as looking into the unicast routing table. The route with the lowest administrative distance - whether a static “multicast route” or a route from the unicast route table - will be chosen as the RPF route to the source.

Note that in this context the term “multicast route” does not imply a route via which the current router will forward multicast; instead it refers to the route the multicast will have traversed in order to arrive at the current router.

Examples The following example creates a static multicast IPv4 route back to the sources in the 10.10.3.0/24 subnet. The multicast route is via the host 192.168.2.3, and has an administrative distance of 2:

```
awplus# configure terminal
awplus(config)# ip mroute 10.10.3.0/24 static 2 192.168.2.3 2
```

The following example creates a static multicast IPv4 route back to the sources in the 192.168.3.0/24 subnet. The multicast route is via the host 10.10.10.50. The administrative distance on this route has the default value of 0:

```
awplus# configure terminal
awplus(config)# ip mroute 192.168.3.0/24 10.10.10.50
```

**Validation
Commands** [clear ip mroute](#)
[show ip mroute](#)
[show ip rpf](#)

**Command
changes** Version 5.4.6-2.1: VRF-lite support added.

ip multicast allow-register-fragments

Overview Use this command to allow PIM to register fragmented packets. It is disabled by default.

Use the **no** variant of this command to stop PIM from registering fragmented packets.

Syntax `ip multicast allow-register-fragments`
`no ip multicast allow-register-fragments`

Default This command is disabled by default

Mode Global Configuration

Usage notes Most multicast streams are not fragmented, and therefore this command is unnecessary. By default, when IP multicast packets are fragmented, the switch attempts to reassemble them before registering the packets. This is necessary for tasks such as network address translation, or a firewall.

However, reassembly may be difficult for switches where the CPU cannot handle a large amount of traffic. In that situation, with the CPU failing to reassemble the fragmented packets, there can be a delay in forwarding multicast streams.

We do not recommend enabling this feature if a firewall or network address translation is being used. This feature should only be enabled if multicast data is fragmented and the data rate is too high for the CPU to manage reassembly.

Example To allow PIM to register fragmented packets, use the commands:

```
awplus# configure terminal
awplus(config)# ip multicast allow-register-fragments
```

ip multicast forward-first-packet

Overview Use this command to enable multicast to forward the first multicast packets coming to the device.

Use the **no** variant of this command to disable this feature.

Syntax `ip multicast forward-first-packet`
`no ip multicast forward-first-packet`

Default By default, this feature is disabled.

Mode Global Configuration

Usage notes If this command is enabled, the device will forward the first packets in a multicast stream that create the multicast route, possibly causing degradation in the quality of the multicast stream, such as the pixelation of video and audio data.

NOTE: *If you use this command, ensure that the [ip igmp snooping](#) command is enabled, the default setting, otherwise the device will not process the first packets of the multicast stream correctly.*

The device will forward the first multicast packets to all interfaces which are on the same VLAN as those which asked for this multicast group.

Examples To enable the forwarding of the first multicast packets, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast forward-first-packet
```

To disable the forwarding of the first multicast packets, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip multicast forward-first-packet
```

ip multicast handle-igmp-immediately

Overview Use this command to allow traffic to be switched as soon as an IGMP report is received.

Use the **no** variant of this command to revert to the default setting.

Syntax `ip multicast handle-igmp-immediately`
`no ip multicast handle-igmp-immediately`

Default Turned off. This means that traffic will be switched after either a 1 second delay or if the IGMP buffer fills with 250 packets.

Mode Global Configuration

Example To turn on this feature, use the commands:

```
awplus# configure terminal
awplus(config)# ip multicast handle-igmp-immediately
```

Related commands [show running-config](#)

Command changes Supported since software version 5.4.9-2.0

ip multicast route

Overview Use this command to add an IPv4 static multicast route for a specific multicast source and group IPv4 address to the multicast Routing Information Base (RIB). This IPv4 multicast route is used to forward multicast traffic from a specific source and group ingressing on an upstream interface to a single or range of downstream interfaces.

Use the **no** variant of this command to either remove an IPv4 static multicast route set with this command or to remove a specific downstream interface from an IPv4 static multicast route for a specific multicast source and group IPv4 address.

Syntax

```
ip multicast route <ipv4-source-addr> <ipv4-group-addr>
<upstream-interface> [<downstream-interface>]

no ip multicast route <ipv4-source-addr> <ipv4-group-addr>
[<upstream-interface> <downstream-interface>]
```

Parameter	Description
<ipv4-source-addr>	Source IPv4 address, in dotted decimal notation in the format A.B.C.D.
<ipv4-group-addr>	Group IPv4 address, in dotted decimal notation in the format A.B.C.D.
<upstream-interface>	Upstream interface on which the multicast packets ingress.
<downstream-interface>	Downstream interface or range of interfaces to which the multicast packets are sent.

Default By default, this feature is disabled.

Mode Global Configuration

Usage notes Only one multicast route entry per IPv4 address and multicast group can be specified. Therefore, if one entry for a static multicast route is configured, PIM will not be able to update this multicast route in any way.

If a dynamic multicast route exists you cannot create a static multicast route with the same source IPv4 address, group IPv4 address, upstream interface and downstream interfaces. An error message is displayed and logged. To add a new static multicast route, either wait for the dynamic multicast route to timeout or clear the dynamic multicast route with the [clear ip mroute](#) command.

To update an existing static multicast route entry with more or a new set of downstream interfaces, you must first remove the existing static multicast route and then add the new static multicast route with all downstream interfaces specified. If you attempt to update an existing static multicast route entry with an additional interface or interfaces, an error message is displayed and logged.

To create a blackhole or null route where packets from a specified source and group address coming from an upstream interface are dropped rather than

forwarded, do not specify the optional *<downstream-interface>* parameter when entering this command.

To remove a specific downstream interface from an existing static multicast route entry, specify the interface you want to remove with the *<downstream-interface>* parameter when entering the **no** variant of this command.

Examples To create a static multicast route for the multicast source IPv4 address 2.2.2.2 and group IPv4 address 224.9.10.11, specifying the upstream VLAN interface as vlan10 and the downstream VLAN interface as vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast route 2.2.2.2 224.9.10.11 vlan10
vlan20
```

To create a blackhole route for the multicast source IPv4 address 2.2.2.2 and group IPv4 address 224.9.10.11, specifying the upstream VLAN interface as vlan10, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast route 2.2.2.2 224.9.10.11 vlan10
```

To create an IPv4 static multicast route for the multicast source IPv4 address 2.2.2.2 and group IP address 224.9.10.11, specifying the upstream VLAN interface as vlan10 and the downstream VLAN range as vlan20-25, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast route 2.2.2.2 224.9.10.11 vlan10
vlan20-25
```

To remove the downstream VLAN 23 from the IPv4 static multicast route created with the above command, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip multicast route 2.2.2.2 224.9.10.11
vlan10 vlan23
```

To delete an IPv4 static multicast route for the multicast source IP address 2.2.2.2 and group IP address 224.9.10.11, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip multicast route 2.2.2.2 224.9.10.11
```

Related commands

- [clear ip mroute](#)
- [clear ip multicast route](#)
- [show ip mroute](#)

ip multicast route-limit

Overview Use this command to limit the number of multicast routes that can be added to an IPv4 multicast routing table.

Use the **no** variant of this command to return the IPv4 route limit to the default.

Syntax `ip multicast route-limit <limit> [<threshold>]`
`no ip multicast route-limit`

Syntax (VRF-lite) `ip multicast [vrf <vrf-name>] route-limit <limit> [<threshold>]`
`no ip multicast [vrf <vrf-name>] route-limit`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
<limit>	<1-2147483647> Number of routes.
<threshold>	<1-2147483647> Threshold above which to generate a warning message. The mroute warning threshold must not exceed the mroute limit.

Default The default limit and threshold value is 2147483647.

Mode Global Configuration

Usage notes This command limits the number of multicast IPv4 routes (mroutes) that can be added to a router, and generates an error message when the limit is exceeded. If the threshold parameter is set, a threshold warning message is generated when this threshold is exceeded, and the message continues to occur until the number of mroutes reaches the limit set by the limit argument.

When VRF-lite is configured you can apply this command to a specific VRF instance. If you don't specify a specific VRF instance the command is applied to the global VRF. Note there is a hardware limit for all VRFs combined and it is possible for one VRF to consume all these routes and therefore other VRFs will not be able to create additional routes. To prevent this situation from occurring, consider the multicast route limit per VRF carefully.

Examples `awplus# configure terminal`
`awplus(config)# ip multicast route-limit 34 24`
`awplus# configure terminal`
`awplus(config)# no ip multicast route-limit`

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip multicast wrong-vif-suppression

Overview Use this command to prevent unwanted multicast packets received on an unexpected interface being trapped to the CPU.

Use the no variant of this command to disable wrong VIF suppression.

Syntax `ip ip multicast wrong-vif-suppression`
`no ip multicast wrong-vif-suppression`

Default By default, this feature is disabled.

Mode Global Configuration

Usage notes Use this command if there is excessive CPU load and multicast traffic is enabled. To confirm that VIF messages are being sent to the CPU use the [debug nsm mcast6](#) command.

Examples To enable the suppression of wrong VIF packets, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast wrong-vif-suppression
```

To disable the suppression of wrong VIF packets, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip multicast wrong-vif-suppression
```

ip multicast-routing

Overview Use this command to turn on/off IPv4 multicast routing on the router; when turned off the device does not perform multicast functions.

Use the **no** variant of this command to disable IPv4 multicast routing after enabling it. Note the default stated below.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `ip multicast-routing`
`no ip multicast-routing`

Syntax (VRF-lite) `ip multicast-routing [vrf <vrf-name>]`
`no ip multicast-routing [vrf <vrf-name>]`

Parameter	Description
<code>vrf</code>	Applies the command to the specified VRF instance.
<code><vrf-name></code>	The VRF instance name

Default By default, IPv4 multicast routing is off.

Mode Global Configuration

Usage notes When the **no** variant of this command is used, the Multicast Routing Information Base (MRIB) cleans up Multicast Routing Tables (MRT), stops IGMP operation, and stops relaying multicast forwarder events to multicast protocols.

When multicast routing is enabled, the MRIB starts processing any MRT addition/deletion requests, and any multicast forwarding events.

You must enable multicast routing before issuing other multicast commands.

Example `awplus# configure terminal`
`awplus(config)# ip multicast-routing`

Validation Commands `show running-config`

Command changes Version 5.4.7-1.1: VRF-lite support added for SBx8100.
Version 5.4.8-1.1: VRF-lite support added for x930, SBx908 GEN2.

ip multicast-routing ssm-only-hw

Overview Use this command to suppress the creation of (*,G) entries in hardware, but not suppress (S,G) entries. This command prevents a large number of (*,G) entries from being created in hardware, which improves the performance when there are many multicast groups with many downstream interfaces. (*,G) entries will still be created as needed in the CPU.

However, using this command may cause multicast data to be briefly flooded on the incoming interface, if it comes from interfaces other than the “correct” incoming interface. The “correct” incoming interface is determined by Unicast Reverse Path Forwarding (uRPF).

Use the **no** variant of this command to return to creating both (*,G) and (S,G) entries in hardware.

Syntax `ip multicast-routing ssm-only-hw`
`no ip multicast-routing ssm-only-hw`

Syntax (VRF-lite) `ip multicast-routing [vrf <vrf-name>] ssm-only-hw`
`no ip multicast-routing [vrf <vrf-name>] ssm-only-hw`

Parameter	Description
<code>vrf</code>	Applies the command to the specified VRF instance.
<code><vrf-name></code>	The VRF instance name

Default Disabled

Mode Global Configuration

Example To suppress the creation of (*,G) entries in hardware, use the commands:

```
awplus# configure terminal
awplus(config)# ip multicast-routing ssm-only-hw
```

Related commands [ip multicast-routing](#)

Command changes Version 5.4.8-1.1: command added

ipv6 mroute

Overview Use this command to inform multicast of the RPF (Reverse Path Forwarding) route to a given IPv6 multicast source.

Use the **no** variant of this command to delete a route to an IPv6 multicast source.

Syntax

```
ipv6 mroute <ipv6-source-address/mask-length>
[<rpf-interface>] [<rpf-address>] [rip|static]
[<admin-distance>]

no ipv6 mroute <ipv6-source-address/mask-length> [rip|static]
```

Parameter	Description
<ipv6-source-address/mask-length>	A multicast source IPv6 address and mask length, in hexadecimal notation in the format X.X::X.X/M.
rip	RIPng IPv6 unicast routing protocol.
static	Specifies a static route.
<rpf-interface>	The RPF interface or the pseudo-interface null .
<rpf-address>	X.X::X:X The closest known address on the IPv6 multicast route back to the specified source. This host IPv6 address can be within a directly connected subnet or within a remote subnet. In the case that the address is in a remote subnet, a lookup is done from the unicast route table to find the nexthop address on the path to this host.
<admin-distance>	The administrative distance. Use this to determine whether the RPF lookup selects the unicast or multicast route. Lower distances have preference. If the multicast static route has the same distance as the other RPF sources, the multicast static route takes precedence. The default is 0 and the range available is 0-255.

Mode Global Configuration

Usage notes Typically, when a Layer 3 multicast routing protocol is determining the RPF (Reverse Path Forwarding) interface for the path to a multicast source, it uses the unicast IPv6 route table to find the best path to the source. However, in some networks a deliberate choice is made to send multicast via different paths to those used for unicast. In this case, the interface via which a multicast stream from a given source enters a router may not be the same as the interface that connects to the best unicast route to that source.

This command enables the user to statically configure the switch with "multicast routes" back to given sources. When performing the RPF check on a stream from a given IPv6 source, the multicast routing protocol will look at these static entries as well as looking into the unicast routing table. The route with the lowest

administrative distance - whether a static “multicast route” or a route from the unicast route table - will be chosen as the RPF route to the source.

Note that in this context the term “multicast route” does not imply a route via which the current router will forward multicast; instead it refers to the route the multicast will have traversed in order to arrive at the current router.

Examples The following example creates a static multicast route back to the sources in the 2001::1/64 subnet. The multicast route is via the host 2002::2, and has an administrative distance of 2:

```
awplus# configure terminal
awplus(config)# ipv6 mroute 2001::1/64 static 2 2002::2
```

The following example creates a static multicast route back to the sources in the 2002::2/64 subnet. The multicast route is via the host 2001::1. The administrative distance on this route has the default value of 0:

```
awplus# configure terminal
awplus(config)# ipv6 mroute 2002::2/64 2001::1
```

**Validation
Commands**

- clear ipv6 mroute
- show ipv6 mroute
- show ipv6 mroute

ipv6 multicast route

Overview Use this command to add an IPv6 static multicast route for a specific multicast source and group IPv6 address to the multicast Routing Information Base (RIB). This IPv6 multicast route is used to forward IPv6 multicast traffic from a specific source and group ingressing on an upstream interface to a single or range of downstream interfaces.

See detailed usage notes below to configure static multicast router ports when using static IPv6 multicast routes with EPSR, and the destination VLAN is an EPSR data VLAN.

Use the **no** variant of this command to either remove an IPv6 static multicast route set with this command or to remove a specific downstream interface from an IPv6 static multicast route for a specific IPv6 multicast source and group address.

Syntax `ipv6 multicast route <ipv6-source-addr> <ipv6-group-addr>
<upstream-interface> [<downstream-interface>]`
`no ipv6 multicast route <ipv6-source-addr> <ipv6-group-addr>
[<upstream-interface> <downstream-interface>]`

Parameter	Description
<code><ipv6-source-addr></code>	Source IPv6 address, in dotted decimal notation in the format X.X::X.X.
<code><ipv6-group-addr></code>	Group IP address, in dotted decimal notation in the format X.X::X.X.
<code><upstream-interface></code>	Upstream interface on which the multicast packets ingress.
<code><downstream-interface></code>	Downstream interface or range of interfaces to which the multicast packets are sent.

Default By default, no static routes exist.

Mode Global Configuration

Usage notes Only one multicast route entry per IPv6 address and multicast group can be specified. Therefore, if one entry for an IPv6 static multicast route is configured, PIM will not be able to update this multicast route in any way.

If a dynamic multicast route exists, you cannot create a static multicast route with the same source IPv6 address and group IPv6 address. An error message is displayed and logged. To add a new static multicast route, either wait for the dynamic multicast route to time out or clear the dynamic multicast route with the [clear ipv6 mroute](#) command.

To update an existing IPv6 static multicast route entry with new or additional downstream interfaces, you must first remove the existing static multicast route and then add the new static multicast route with all downstream interfaces

specified. If you attempt to update an existing static multicast route entry with an additional interface or interfaces an error message is displayed and logged.

To create a blackhole or null route where packets from a specified source and group address coming from an upstream interface are dropped rather than forwarded, do not specify the optional *<downstream-interface>* parameter when entering this command.

To remove a specific downstream interface from an existing static multicast route entry, specify the interface you want to remove with the *<downstream-interface>* parameter when entering the **no** variant of this command.

Note that if static IPv6 multicast routing is being used with EPSR and the destination VLAN is an EPSR data VLAN, then multicast router (mrouter) ports must be statically configured. This minimizes disruption for multicast traffic in the event of ring failure or restoration.

When configuring the EPSR data VLAN, statically configure mrouter ports so that the multicast router can be reached in either direction around the EPSR ring.

For example, if port1.1.1 and port1.1.8 are ports on an EPSR data VLAN vlan101, which is the destination for a static IPv6 multicast route, then configure both ports as multicast router (mrouter) ports as shown in the example commands listed below:

Table 37-1: Example ipv6 mld snooping mrouter commands when static IPv6 multicast routing is being used and the destination VLAN is an EPSR data VLAN:

```
awplus>enable
awplus#configure terminal
awplus(config)#interface vlan101
awplus(config-if)#ipv6 mld snooping mrouter interface port1.1.1
awplus(config-if)#ipv6 mld snooping mrouter interface port1.1.8
```

See [ipv6 mld snooping mrouter](#) for a command description and command examples.

Examples To create an IPv6 static multicast route for the multicast source IPv6 address 2001::1 and group IPv6 address ff08::1, specifying the upstream VLAN interface as vlan10 and the downstream VLAN interface as vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 multicast route 2001::1 ff08::1 vlan10
vlan20
```

To create a blackhole route for the IPv6 multicast source IP address 2001::1 and group IP address ff08::1, specifying the upstream VLAN interface as vlan10, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 multicast route 2001::1 ff08::1 vlan10
```

To create an IPv6 static multicast route for the multicast source IPv6 address 2001::1 and group IPv6 address ff08::1, specifying the upstream VLAN interface as vlan10 and the downstream VLAN range as vlan20-25, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 multicast route 2001::1 ff08::1 vlan10
vlan20-25
```

To remove the downstream VLAN 23 from the IPv6 static multicast route created with the above command, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 multicast route 2001::1 ff08::1 vlan10
vlan23
```

To delete an IPv6 static multicast route for the multicast source IPv6 address 2001::1 and group IPv6 address ff08::1, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 multicast route 2001::1 ff08::1
```

[ipv6 mld snooping mrouter](#)

ipv6 multicast route-limit

Overview Use this command to limit the number of multicast routes that can be added to an IPv6 multicast routing table.

Use the **no** variant of this command to return the IPv6 route limit to the default.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `ipv6 multicast route-limit <limit> [<threshold>]`
`no ipv6 multicast route-limit`

Syntax (VRF-lite) `ipv6 multicast [vrf <vrf-name>] route-limit <limit> [<threshold>]`
`no ipv6 multicast [vrf <vrf-name>] route-limit`

Parameter	Description
<limit>	<1-2147483647> Number of routes.
<threshold>	<1-2147483647> Threshold above which to generate a warning message. The mroute warning threshold must not exceed the mroute limit.
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name

Default The default limit and threshold value is 2147483647.

Mode Global Configuration

Usage notes This command limits the number of multicast IPv6 routes (mroutes) that can be added to a router, and generates an error message when the limit is exceeded. If the threshold parameter is set, a threshold warning message is generated when this threshold is exceeded, and the message continues to occur until the number of mroutes reaches the limit set by the limit argument.

Examples To change the limit to 34 routes and the warning threshold to 24 routes, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 multicast route-limit 34 24
```

To return to the default limits, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 multicast route-limit
```

Command changes Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

ipv6 multicast-routing

Overview Use this command to turn on/off IPv6 multicast routing on the router; when turned off the device does not perform multicast functions.

Use the **no** variant of this command to disable IPv6 multicast routing after enabling it. Note the default stated below.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `ipv6 multicast-routing`
`no ipv6 multicast-routing`

Syntax (VRF-lite) `ipv6 multicast-routing [vrf <vrf-name>]`
`no ipv6 multicast-routing [vrf <vrf-name>]`

Parameter	Description
<code>vrf</code>	Applies the command to the specified VRF instance.
<code><vrf-name></code>	The VRF instance name

Default Off

Mode Global Configuration

Usage When the **no** variant of this command is used, the Multicast Routing Information Base (MRIB) cleans up Multicast Routing Tables (MRT), and stops relaying multicast forwarder events to multicast protocols.

When multicast routing is enabled, the MRIB starts processing any MRT addition/deletion requests, and any multicast forwarding events.

You must enable multicast routing before issuing other multicast commands.

Examples To enable multicast routing, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 multicast-routing
```

To disable multicast routing again, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 multicast-routing
```

Validation Commands `show running-config`

Command changes Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

multicast

Overview Use this command to enable a device port to route multicast packets that ingress the port.

Use the **no** variant of this command to stop the device port from routing multicast packets that ingress the port. Note that this does not affect Layer 2 forwarding of multicast packets. If you enter **no multicast** on a port, multicast packets received on that port will not be forwarded to other VLANs, but ports in the same VLANs as the receiving port will still receive the multicast packets.

CAUTION: *We do not recommend disabling multicast routing in a live network. Some non-multicast protocols use multicast packets and will not function correctly if you disable it.*

Syntax multicast
no multicast

Default By default, all device ports route multicast packets.

Mode Interface Configuration

Examples To disable routing of multicast packets on a port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# no multicast
```

To re-enable routing of multicast packets on a port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# multicast
```

**Validation
Commands** [show running-config](#)

platform l2mc-overlap

Overview Use this command to enable checking for overlapping (shared) multicast entries, so that shared entries are not deleted if they are still in use.

An overlap exists if the resulting MAC address is the same for two different multicast groups. For example, 224.1.1.1 and 239.1.1.1 will result in a multicast overlap—packets destined for 239.1.1.1 will also be sent to 224.1.1.1.

Use the **no** version of this command to disable checking for overlapping entries before deletion.

Syntax `platform l2mc-overlap`
`no platform l2mc-overlap`

Mode Global Configuration

Default Disabled

Usage notes When overlap handling is on, group entries will not be deleted if a multicast overlap exists. However, this may have the unexpected behavior of flooding multicast packets to ports which have not joined the group. If this is an issue, either turn off the command or redesign the network to ensure no multicast groups overlap.

This command is disabled by default. We recommend you enable it if you have multicast packets with a TTL of 1.

Example To prevent the deletion of overlapping (shared) Layer 2 multicast entries, use the command:

```
awplus# configure terminal
awplus(config)# platform l2mc-overlap
```

Related commands [show platform](#)

Command changes Version 5.5.1-0.1: Default changed to enabled

Version 5.5.1-1.2: Command added to SBx908 GEN2 and x950 Series. Note that it is disabled by default on these switches.

platform multicast-ratelimit

Overview Use this command to set the maximum number of multicast packets to be forwarded to the CPU (in packets per second). Setting the value to zero disables rate limiting.

This command should be used with care. Increasing or removing the limit could make the device less responsive under heavy multicast load.

Use the **no** variant of this command to return the limit to its default.

Syntax `platform multicast-ratelimit <0-1000>`
`no platform multicast-ratelimit`

Default 100 packets per second (pps)

Mode Global Configuration

Usage notes If you find that the CPU load on your device from multicast traffic is higher than desired, reducing this rate may reduce the CPU load.

Example To set the rate to 30pps, use the commands:

```
awplus# configure terminal
awplus(config)# platform multicast-ratelimit 30
```

Command changes Version 5.4.8-1.1: default changed to 100pps on SBx908 GEN2, SBx8100, and x930 Series switches.

platform stop-unreg-mc-flooding

Overview If a multicast stream is arriving at a network device, and that network device has received no IGMP reports that request the receipt of the stream, then that stream is referred to as "unregistered". IGMP snooping actively prevents the flooding of unregistered streams to all ports in the VLAN on which the stream is received. However, there are brief moments at which this prevention is not in operation, and an unregistered stream may be briefly flooded. This command stops this flooding during even those brief periods when IGMP snooping is not explicitly preventing the flooding.

Use the **no** variant of this command to revert to default behavior and disable this feature.

NOTE: *This command should not be used within any IPv6 networks. IPv6 neighbor discovery operation is inhibited by this feature.*

This command does not affect the flooding of Local Network Control Block IPv4 multicast packets in the address range 224.0.0.1 to 224.0.0.255 (224.0.0/24). Such packets will continue to be uninterruptedly flooded, as they need to be.

Syntax `platform stop-unreg-mc-flooding`
`no platform stop-unreg-mc-flooding`

Default This feature is disabled by default.

Mode Global Configuration

Usage notes This command stops the periodic flooding of unknown or unregistered multicast packets when the Group Membership interval timer expires and there are no subscribers to a multicast group. If there is multicast traffic in a VLAN without subscribers, multicast traffic temporarily floods out of the VLAN when the Group Membership interval timer expires, which happens when the switch does not get replies from Group Membership queries.

This command also stops the initial flood of multicast packets that happens when a new multicast source starts to send traffic. This flooding lasts until snooping realises that this the multicast group is arriving at the switch, and puts an entry into hardware to prevent it from being flooded.

This command is useful in networks where low-performance devices are attached. The operation of such devices can be impaired by them receiving unnecessary streams of traffic. For example, in sites where IP cameras are in use, the flooding of video streams to a whole VLAN can send enough traffic to the cameras to cause interruption of their video streaming.

Do not use this command in IPv6 networks. The following console message is displayed after entering this command to warn you of this:

```
% WARNING: IPv6 will not work with this setting enabled
% Please consult the documentation for more information
```

Examples To enable this feature and stop multicast packet flooding, use the following commands:

```
awplus# configure terminal
awplus(config)# platform stop-unreg-mc-flooding
```

To disable this feature and allow multicast packet flooding, use the following commands:

```
awplus# configure terminal
awplus(config)# no platform stop-unreg-mc-flooding
```

Related commands [show platform](#)
[show running-config](#)

show debugging nsm mcast

Overview Use this command to show the status of the NSM multicast debugging.

Syntax show debugging nsm mcast

Syntax (VRF-lite) show debugging nsm mcast [*<vrf-name>*]

Parameter	Description
<i><vrf-name></i>	VRF instance name

Mode Privileged Exec

Usage notes This command is intended for use by Allied Telesis authorized service personnel for diagnostic purposes.

Example To show debugging for NSM multicast, use the following command:

```
awplus# show debug nsm mcast
```

Output Figure 37-1: Example output from **show debug nsm mcast**

```
awplus# show debugging nsm mcast
Debugging status:
  NSM multicast vif debugging is on
  NSM multicast route debugging is on
  NSM multicast route statistics debugging is on
  NSM multicast FIB message debugging is on
  NSM multicast PIM Register message debugging is on
  NSM multicast traceroute debugging is on
  NSM multicast traceroute detailed debugging is on
```

Related commands [debug nsm mcast](#)

Command changes Version 5.4.7-2.1: command added
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2

show ip mroute

Overview Use this command to display the contents of the IPv4 multicast routing (mroute) table.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `show ip mroute [<ipv4-group-addr>] [<ipv4-source-addr>]
[dense|sparse|static] [count|summary]`

Syntax (VRF-lite) `show ip mroute [vrf <vrf-name>|global] [<ipv4-group-addr>]
[<ipv4-source-addr>] [dense|sparse|static] [count|summary]`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
global	The global routing and forwarding table
<ipv4-group-addr>	Group IPv4 address, in dotted decimal notation in the format A.B.C.D.
<ipv4-source-addr>	Source IPv4 address, in dotted decimal notation in the format A.B.C.D.
dense	Display dense IPv4 multicast routes.
sparse	Display sparse IPv4 multicast routes.
static	Display static IPv4 multicast routes.
count	Display the route and packet count from the IPv4 multicast routing (mroute) table.
summary	Display the contents of the IPv4 multicast routing (mroute) table in an abbreviated form.

Mode User Exec and Privileged Exec

Examples `awplus# show ip mroute 10.10.3.34 224.1.4.3`
`awplus# show ip mroute 10.10.5.24 225.2.2.2 count`
`awplus# show ip mroute 10.10.1.34 summary`

Output The following is a sample output of this command displaying the IPv4 multicast routing table, with and without specifying the group and source IPv4 address:

Figure 37-2: Example output from the **show ip mroute** command

```
awplus# show ip mroute
IP Multicast Routing Table
Flags: I - Immediate Stat, T - Timed Stat, F - Forwarder
installed
Timers: Uptime/Stat Expiry
Interface State: Interface (TTL)

(10.10.1.52, 224.0.1.3), uptime 00:00:31, stat expires 00:02:59
Owner PIM-SM, Flags: TF
  Incoming interface: vlan2
  Outgoing interface list:
    vlan3 (1)
```

Figure 37-3: Example output from the **show ip mroute** command with the source and group IPv4 address specified

```
awplus# show ip mroute 10.10.1.52 224.0.1.3

IP Multicast Routing Table
Flags: I - Immediate Stat, T - Timed Stat, F - Forwarder
installed
Timers: Uptime/Stat Expiry
Interface State: Interface (TTL)

(10.10.1.52, 224.0.1.3), uptime 00:03:24, stat expires 00:01:28
Owner PIM-SM, Flags: TF
  Incoming interface: vlan2
  Outgoing interface list:
    vlan3 (1)
```

The following is a sample output of this command displaying the packet count from the IPv4 multicast routing table:

Figure 37-4: Example output from the **show ip mroute count** command

```
awplus# show ip mroute count
IP Multicast Statistics
Total 1 routes using 132 bytes memory
Route limit/Route threshold: 2147483647/2147483647
Total NOCACHE/WRONGVIF/WHOLEPKT rcv from fwd: 1/0/0
Total NOCACHE/WRONGVIF/WHOLEPKT sent to clients: 1/0/0
Immediate/Timed stat updates sent to clients: 0/0

Client msg counts: WRONGVIF/WHOLEPKT/Imm Stat/Timed Stat sent
Reg pkt counts: Reg ACK rcv/Reg NACK rcv/Reg pkt sent

(10.10.1.52, 224.0.1.3), Forwarding: 2/19456, Other: 0
  Fwd msg: 0/0, Client msg: 0/0/0/0, Reg: 0/0/0
```

The following is a sample output for this command displaying the IPv4 multicast routing table in an abbreviated form:

Figure 37-5: Example output from the **show ip mroute summary** command

```
awplus# show ip mroute summary

IP Multicast Routing Table
Flags: I - Immediate Stat, T - Timed Stat, F - Forwarder
installed
Timers: Uptime/Stat Expiry
Interface State: Interface (TTL)

(10.10.1.52, 224.0.1.3), 00:01:32/00:03:20, PIM-SM, Flags: TF
```

**Command
changes**

Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

show ip mvif

Overview Use this command to display the contents of the IPv4 Multicast Routing Information Base (MRIB) VIF table.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `show ip mvif <interface>`

Syntax (VRF-lite) `show ip mvif [vrf <vrf-name>|global] <interface>`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
global	The global routing and forwarding table
<interface>	The interface to display information about.

Mode User Exec and Privileged Exec

Example `awplus# show ip mvif vlan2`

Output Figure 37-6: Example output from the **show ip mvif** command

Interface	Vif Idx	Owner Module	TTL	Local Address	Remote Address	Uptime
vlan2	0	PIM-SM	1	192.168.1.53	0.0.0.0	00:04:26
Register	1		1	192.168.1.53	0.0.0.0	00:04:26
vlan3	2	PIM-SM	1	192.168.10.53	0.0.0.0	00:04:25

Command changes Version 5.4.7-1.1: VRF-lite support added for SBx8100.

Version 5.4.8-1.1: VRF-lite support added for x930, SBx908 GEN2.

show ip rpf

Overview Use this command to display Reverse Path Forwarding (RPF) information for the specified IPv4 source address.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `show ip rpf <source-addr>`

Syntax (VRF-lite) `show ip rpf [vrf <vrf-name>|global] <source-addr>`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
global	The global routing and forwarding table
<source-addr>	Source IPv4 address, in dotted decimal notation in the format A.B.C.D.

Mode User Exec and Privileged Exec

Example `awplus# show ip rpf 10.10.10.50`

Command changes Version 5.4.7-1.1: VRF-lite support added for SBx8100.
Version 5.4.8-1.1: VRF-lite support added for x930, SBx908 GEN2.

show ipv6 mif

Overview Use this command to display the contents of the IPv6 Multicast Routing Information Base (MRIB) MIF table.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `show ipv6 mif [<interface>]`

Syntax (VRF-lite) `show ipv6 mif [vrf <vrf-name>|global] [<interface>]`

Parameter	Description
<interface>	An interface to display information about.
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
global	The global routing and forwarding table.

Mode User Exec and Privileged Exec

Example To display the contents of the MIF table for all interfaces, use the following command:

```
awplus# show ipv6 mif
```

To display the contents of the MIF table for a specific interface, use the following command:

```
awplus# show ipv6 mif vlan2
```

Output Figure 37-7: Example output from the **show ipv6 mif** command

```
awplus#show ipv6 mif
```

Interface	Mif	Owner	Uptime
	Idx	Module	
vlan3	0	MLD/MLD Proxy-Service	03:28:48
vlan2	1	MLD/MLD Proxy-Service	03:28:48
vlan1	2	MLD/MLD Proxy-Service	03:28:48

Figure 37-8: Example output from the **show ipv6 mif** command with the interface parameter specified

Interface	Mif	Owner	TTL	Remote	Uptime
	Idx	Module		Address	
vlan2	0	MLD/MLD Proxy-Service	1	0.0.0.0	00:05:17

Command changes Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

show ipv6 mroute

Overview Use this command to display the contents of the IPv6 multicast routing (mroute) table.

Syntax `show ipv6 mroute [<ipv6-group-addr>] [<ipv6-source-addr>]
[{count|summary}]`

Parameter	Description
<code><ipv6-group-addr></code>	Group IPv6 address, in hexadecimal notation in the format X.X::X.X.
<code><ipv6-source-addr></code>	Source IPv6 address, in hexadecimal notation in the format X.X::X.X.
<code>count</code>	Display the route and packet count from the IPv6 multicast routing (mroute) table.
<code>summary</code>	Display the contents of the IPv6 multicast routing (mroute) table in an abbreviated form.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ipv6 mroute
awplus# show ipv6 mroute count
awplus# show ipv6 mroute summary
awplus# show ipv6 mroute 2001::2 ff08::1 count
awplus# show ipv6 mroute 2001::2 ff08::1
awplus# show ipv6 mroute 2001::2 summary
```

Output The following is a sample output of this command displaying the IPv6 multicast routing table for a single static IPv6 Multicast route:

Figure 37-9: Example output from the **show ipv6 mroute** command

```
awplus#show ipv6 mroute
IPv6 Multicast Routing Table
Flags: I - Immediate Stat, T - Timed Stat, F - Forwarder
installed
Timers: Uptime/Stat Expiry
Interface State: Interface
(2001::2, ff08::1), uptime 03:18:38
Owner IMI, Flags: F
  Incoming interface: vlan2
  Outgoing interface list:
    vlan3
```

The following is a sample output of this command displaying the IPv6 multicast routing count table for a single static IPv6 Multicast route:

Figure 37-10: Example output from the **show ipv6 mroute count** command

```
awplus#show ipv6 mroute count

IPv6 Multicast Statistics
Total 1 routes using 152 bytes memory
Route limit/Route threshold: 1024/1024
Total NOCACHE/WRONGmif/WHOLEPKT rcv from fwd: 6/0/0
Total NOCACHE/WRONGmif/WHOLEPKT sent to clients: 6/0/0
Immediate/Timed stat updates sent to clients: 0/0
Reg ACK rcv/Reg NACK rcv/Reg pkt sent: 0/0/0
Next stats poll: 00:01:14

Forwarding Counts: Pkt count/Byte count, Other Counts: Wrong If
pkts
Fwd msg counts: WRONGmif/WHOLEPKT rcv
Client msg counts: WRONGmif/WHOLEPKT/Imm Stat/Timed Stat sent

(2001::2, ff08::1), Forwarding: 0/0, Other: 0
  Fwd msg: 0/0, Client msg: 0/0/0/0, Reg: 0/0/0
```

The following is a sample output of this command displaying the IPv6 multicast routing summary table for a single static IPv6 Multicast route:

Figure 37-11: Example output from the **show ipv6 mroute summary** command

```
awplus#show ipv6 mroute summary

IPv6 Multicast Routing Table
Flags: I - Immediate Stat, T - Timed Stat, F - Forwarder
installed
Timers: Uptime/Stat Expiry
Interface State: Interface

(2001::2, ff08::1), 03:20:28/-, IMI, Flags: F
```

show ipv6 multicast forwarding

Overview Use this command to view the status of multicast forwarding.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `show ipv6 multicast forwarding`

Syntax (VRF-lite) `show ipv6 multicast forwarding [vrf <vrf-name>|global]`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name
global	The Global routing/forwarding table

Mode Privileged Exec

Example To show the status of the multicast forwarding, use the following command:

```
awplus# show ipv6 multicast forwarding
```

Output Figure 37-12: Example output from the **show ipv6 multicast forwarding** command:

```
ipv6 multicast forwarding is disabled
```

clear ip pim sparse-mode bsr rp-set *

Overview Use this command to clear all Rendezvous Point (RP) sets learned through the PIMv2 Bootstrap Router (BSR).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `clear ip pim sparse-mode bsr rp-set *`

Syntax (VRF-lite) `clear ip pim [vrf <vrf-name>] sparse-mode bsr rp-set *`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
*	Clears all RP sets.

Mode Privileged Exec

Usage notes For multicast clients, note that one router will be automatically or statically designated as the RP, and all routers must explicitly join through the RP. A Designated Router (DR) sends periodic Join/Prune messages toward a group-specific RP for each group that it has active members.

For multicast sources, note that the Designated Router (DR) unicasts Register messages to the RP encapsulating the data packets from the multicast source. The RP forwards decapsulated data packets toward group members.

Example `awplus# clear ip pim sparse-mode bsr rp-set *`

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

clear ip pim sparse-mode packet statistics

Overview Use this command to clear the PIM sparse mode packet statistics counter.

If the platform supports multicast for VRFs, then specifying a VRF name will clear the counters for that VRF. If you do not specify a VRF, then the counters will be cleared for the global VRF.

Syntax `clear ip pim sparse-mode packet statistics`

Syntax (VRF-lite) `clear ip pim [<vrf-name>|global] sparse-mode packet statistics`

Parameter	Description
<vrf-name>	The VRF instance name
global	The global routing and forwarding table

Mode Privileged Exec

Example The following command clears the current packet receive counts for PIM sparse-mode:

```
awplus# configure terminal
awplus(config)# clear ip pim sparse-mode statistics
```

Output Figure 38-1: Example output from **clear ip pim sparse-mode statistics**

```
awplus(config)#clear ip pim sparse-mode statistics
PIM-SM Receive Packet Statistics :
All PIM-SM      :   Total : 0   Valid : 0
Hello           :   Total : 0   Valid : 0
Register        :   Total : 0   Valid : 0
Register Stop   :   Total : 0   Valid : 0
Join/Prune      :   Total : 0   Valid : 0
Bootstrap       :   Total : 0   Valid : 0
Assert          :   Total : 0   Valid : 0
Candidate-RP    :   Total : 0   Valid : 0
```

Related commands [show ip pim sparse-mode packet statistics](#)

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

clear ip mroute pim sparse-mode

Overview Use this command to clear all multicast route table entries learned through PIM-SM for a specified multicast group address, and optionally a specified multicast source address.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `clear ip mroute <Group-IP-address> pim sparse-mode`
`clear ip mroute <Group-IP-address> <Source-IP-address> pim sparse-mode`

Syntax (VRF-lite) `clear ip mroute [vrf <vrf-name>] <Group-IP-address> pim sparse-mode`
`clear ip mroute [vrf <vrf-name>] <Group-IP-address> <Source-IP-address> pim sparse-mode`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
<Group-IP-address>	Specify a multicast group IPv6 address, entered in the form A.B.C.D.
<Source-IP-address>	Specify a source group IP address, entered in the form A.B.C.D.

Mode Privileged Exec

Example `awplus# clear ip mroute pim sparse-mode 224.0.0.0`
`awplus# clear ip mroute 192.168.7.1 pim sparse-mode 224.0.0.0`

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

debug pim sparse-mode

Overview Use this command to turn on some or all PIM-SM debugging.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Use the **no** variant of this command to turn off some or all PIM-SM debugging.

Syntax `debug pim sparse-mode [all] [events] [mfc] [mib] [nexthop] [nsm] [packet] [state] [mtrace]`

`no debug pim sparse-mode [all] [events] [mfc] [mib] [nexthop] [nsm] [packet] [state] [mtrace]`

Syntax (VRF-lite) `debug pim [vrf <vrf-name>] sparse-mode [all] [events] [mfc] [mib] [nexthop] [nsm] [packet] [state] [mtrace]`
`no debug pim [vrf <vrf-name>] sparse-mode [all] [events] [mfc] [mib] [nexthop] [nsm] [packet] [state] [mtrace]`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
all	Activates/deactivates all PIM-SM debugging.
events	Activates debug printing of events.
mfc	Activates debug printing of MFC (Multicast Forwarding Cache in kernel) add/delete/updates.
mib	Activates debug printing of PIM-SM MIBs.
nexthop	Activates debug printing of PIM-SM next hop communications.
nsm	Activates debugging of PIM-SM Network Services Module communications.
packet	Activates debug printing of incoming and/or outgoing packets.
state	Activates debug printing of state transition on all PIM-SM FSMs.
mtrace	Activates debug printing of multicast traceroute.

Mode Privileged Exec and Global Configuration

Example `awplus# configure terminal`
`awplus(config)# debug pim sparse-mode all`

Related commands [show debugging pim sparse-mode](#)

**Command
changes**

Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

debug pim sparse-mode timer

Overview Use this command to enable debugging for the specified PIM-SM timers.

Use the **no** variants of this command to disable debugging for the specified PIM-SM timers.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax

```
debug pim sparse-mode timer assert [at]
no debug pim sparse-mode timer assert [at]
debug pim sparse-mode timer bsr [bst|crp]
no debug pim sparse-mode timer bsr [bst|crp]
debug pim sparse-mode timer hello [ht|nlt|tht]
no debug pim sparse-mode timer hello [ht|nlt|tht]
debug pim sparse-mode timer joinprune [jt|et|ppt|kat|ot]
no debug pim sparse-mode timer joinprune [jt|et|ppt|kat|ot]
debug pim sparse-mode timer register [rst]
no debug pim sparse-mode timer register [rst]
```

Syntax (VRF-lite)

```
debug pim [vrf <vrf-name>] sparse-mode timer assert [at]
no debug pim [vrf <vrf-name>] sparse-mode timer assert [at]
debug pim [vrf <vrf-name>] sparse-mode timer bsr [bst|crp]
no debug pim [vrf <vrf-name>] sparse-mode timer bsr [bst|crp]
debug pim [vrf <vrf-name>] sparse-mode timer hello [ht|nlt|tht]
no debug pim [vrf <vrf-name>] sparse-mode timer hello
[ht|nlt|tht]
debug pim [vrf <vrf-name>] sparse-mode timer joinprune
[jt|et|ppt|kat|ot]
no debug pim [vrf <vrf-name>] sparse-mode timer joinprune
[jt|et|ppt|kat|ot]
debug pim [vrf <vrf-name>] sparse-mode timer register [rst]
no debug pim [vrf <vrf-name>] sparse-mode timer register [rst]
```

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
assert	Enable or disable debugging for the Assert timers.
at	Enable or disable debugging for the Assert Timer.

Parameter	Description
bsr	Enable or disable debugging for the specified Bootstrap Router timer, or all Bootstrap Router timers.
bst	Enable or disable debugging for the Bootstrap Router: Bootstrap Timer.
crp	Enable or disable debugging for the Bootstrap Router: Candidate-RP Timer.
hello	Enable or disable debugging for the specified Hello timer, or all Hello timers.
ht	Enable or disable debugging for the Hello timer: Hello Timer.
nlt	Enable or disable debugging for the Hello timer: Neighbor Liveness Timer.
tht	Enable or disable debugging for the Hello timer: Triggered Hello Timer.
joinprune	Enable or disable debugging for the specified JoinPrune timer, or all JoinPrune timers.
jt	Enable or disable debugging for the JoinPrune timer: upstream Join Timer.
et	Enable or disable debugging for the JoinPrune timer: Expiry Timer.
ppt	Enable or disable debugging for the JoinPrune timer: PrunePending Timer.
kat	Enable or disable debugging for the JoinPrune timer: KeepAlive Timer.
ot	Enable or disable debugging for the JoinPrune timer: Upstream Override Timer.
register	Enable or disable debugging for the Register timers.
rst	Enable or disable debugging for the Register timer: Register Stop Timer.

Default By default, all debugging is disabled.

Mode Privileged Exec and Global Configuration

Examples To enable debugging for the PIM-SM Bootstrap Router bootstrap timer, use the commands:

```
awplus(config)# debug pim sparse-mode timer bsr bst
```

To enable debugging for the PIM-SM Hello: neighbor liveness timer, use the command:

```
awplus(config)# debug pim sparse-mode timer hello ht
```

To enable debugging for the PIM-SM Joinprune expiry timer, use the command:

```
awplus# debug pim sparse-mode timer joinprune et
```

To disable debugging for the PIM-SM Register timer, use the command:

```
awplus# no debug pim sparse-mode timer register
```

Related commands [show debugging pim sparse-mode](#)

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip multicast allow-register-fragments

Overview Use this command to allow PIM to register fragmented packets. It is disabled by default.

Use the **no** variant of this command to stop PIM from registering fragmented packets.

Syntax `ip multicast allow-register-fragments`
`no ip multicast allow-register-fragments`

Default This command is disabled by default

Mode Global Configuration

Usage notes Most multicast streams are not fragmented, and therefore this command is unnecessary. By default, when IP multicast packets are fragmented, the switch attempts to reassemble them before registering the packets. This is necessary for tasks such as network address translation, or a firewall.

However, reassembly may be difficult for switches where the CPU cannot handle a large amount of traffic. In that situation, with the CPU failing to reassemble the fragmented packets, there can be a delay in forwarding multicast streams.

We do not recommend enabling this feature if a firewall or network address translation is being used. This feature should only be enabled if multicast data is fragmented and the data rate is too high for the CPU to manage reassembly.

Example To allow PIM to register fragmented packets, use the commands:

```
awplus# configure terminal
awplus(config)# ip multicast allow-register-fragments
```

ip pim accept-register list

Overview Use this command to configure the ability to filter out multicast sources specified by the given access-list at the Rendezvous Point (RP), so that the RP will accept/refuse to perform the register mechanism for the packets sent by the specified sources.

Use the **no** variant of this command to revert to default.

Syntax `ip pim accept-register list {<100-199>|<2000-2699>|<name>}`
`no ip pim accept-register`

Parameter	Description
<100-199>	IP extended access-list, identified by number.
<2000-2699>	IP extended access list, identified by number (expanded range).
<name>	IP access list, identified by name.

Default By default, the RP accepts register packets from all multicast sources.

Mode Global Configuration

Example To create an ACL that denies packets from 100.1.1.1 to any destination, and use that ACL to filter at the RP point, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 121
awplus(config-ip-ext-acl)# deny ip 100.1.1.1 0.0.0.0 any
awplus(config-ip-ext-acl)# exit
awplus(config)# ip pim accept-register list 121
```

ip pim anycast-rp

Overview Use this command to configure Anycast RP (Rendezvous Point) in a RP set.

Use the **no** variant of this command to remove the configuration.

Syntax `ip pim anycast-rp <anycast-rp-address> <member-rp-address>`
`no ip pim anycast-rp <anycast-rp-address> [<member-rp-address>]`

Parameter	Description
<code><anycast-rp-address></code>	<A.B.C.D> Specify an anycast IP address to configure an Anycast RP (Rendezvous Point) in a RP set.
<code><member-rp-address></code>	<A.B.C.D> Specify an Anycast RP (Rendezvous Point) address to configure an Anycast RP in a RP set.

Mode Global Configuration

Usage notes Anycast is a network addressing and routing scheme where data is routed to the nearest or best destination as viewed by the routing topology. Compared to unicast with a one-to-one association between network address and network endpoint, and multicast with a one-to-many association between network address and network endpoint; anycast has a one-to-many association between network address and network endpoint. For anycast, each destination address identifies a set of receiver endpoints, from which only one receiver endpoint is chosen.

Anycast is often implemented using BGP to simultaneously advertise the same destination IP address range from many sources, resulting in packets address to destination addresses in this range being routed to the nearest source announcing the given destination IP address.

Use this command to specify the Anycast RP configuration in the Anycast RP set. Use the **no** variant of this command to remove the Anycast RP configuration. Note that the member RP address is optional when using the **no** parameter to remove the Anycast RP configuration. removing the anycast RP address also removes the member RP address.

Examples The following example shows how to configure the Anycast RP address with **ip pim anycast-rp**:

```
awplus# configure terminal
awplus(config)# ip pim anycast-rp 1.1.1.1 10.10.10.10
```

The following example shows how to remove the Anycast RP in the RP set specifying only the anycast RP address with **no ip pim anycast-rp**, but not specifying the member RP address:

```
awplus# configure terminal
awplus(config)# no ip pim anycast-rp 1.1.1.1
```

ip pim bsr-border

Overview Use the **ip pim bsr-border** command to prevent Bootstrap Router (BSR) messages from being sent or received through an interface. The BSR border is the border of the PIM domain.

Use the **no** variant of this command to disable the configuration set with **ip pim bsr-border**.

Syntax `ip pim bsr-border`
`no ip pim bsr-border`

Mode Interface Configuration for a VLAN interface.

Usage notes When this command is configured on an interface, no PIM version 2 BSR messages will be sent or received through the interface. Configure an interface bordering another PIM domain with this command to avoid BSR messages from being exchanged between the two PIM domains.

BSR messages should not be exchanged between different domains, because devices in one domain may elect Rendezvous Points (RPs) in the other domain, resulting in loss of isolation between the two PIM domains that would stop the PIM protocol from working as intended.

Examples The following example configures the VLAN interface vlan2 to be the PIM domain border:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim bsr-border
```

The following example removes the VLAN interface vlan2 from the PIM domain border:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim bsr-border
```

ip pim bsr-candidate

Overview Use this command to give the device the candidate BSR (Bootstrap Router) status using the specified IP address mask of the interface.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Use the **no** variant of this command to withdraw the address of the interface from being offered as a BSR candidate.

Syntax `ip pim bsr-candidate <interface> [<hash>] [<priority>]`
`no ip pim bsr-candidate [<interface>]`

Syntax (VRF-lite) `ip pim [vrf <vrf-name>] bsr-candidate <interface> [<hash>] [<priority>]`
`no ip pim [vrf <vrf-name>] bsr-candidate [<interface>]`

Parameter	Description
<code>vrf</code>	Applies the command to the specified VRF instance.
<code><vrf-name></code>	The VRF instance name.
<code><interface></code>	The interface.
<code><hash></code>	<0-32> configure hash mask length for RP selection. The default hash value if you do not configure this parameter is 10.
<code><priority></code>	<0-255> configure priority for a BSR candidate. Note that you must also specify the <code><hash></code> (mask length) when specifying the <code><priority></code> . The default priority if you do not configure this parameter is 64.

Mode Global Configuration

Default The default hash parameter value is 10 and the default priority parameter value is 64.

Examples To set the BSR candidate to the VLAN interface vlan2, with the optional mask length and BSR priority parameters, enter the commands shown below:

```
awplus# configure terminal
awplus(config)# ip pim bsr-candidate vlan2 20 30
```

To withdraw the address of vlan2 from being offered as a BSR candidate, enter:

```
awplus# configure terminal
awplus(config)# no ip pim bsr-candidate vlan2
```

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip pim cisco-register-checksum

Overview Use this command to configure the option to calculate the Register checksum over the whole packet. This command is used to inter-operate with older Cisco IOS versions.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Use the **no** variant of this command to disable this option.

Syntax `ip pim cisco-register-checksum`
`no ip pim cisco-register-checksum`

Syntax (VRF-lite) `ip pim [vrf <vrf-name>] cisco-register-checksum`
`no ip pim [vrf <vrf-name>] cisco-register-checksum`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.

Default This command is disabled by default. By default, Register Checksum is calculated only over the header.

Mode Global Configuration

Example `awplus# configure terminal`
`awplus(config)# ip pim cisco-register-checksum`

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip pim cisco-register-checksum group-list

Overview Use this command to configure the option to calculate the Register checksum over the whole packet on multicast groups specified by the access-list. This command is used to inter-operate with older Cisco IOS versions.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Use the **no** variant of this command to revert to default settings.

Syntax `ip pim cisco-register-checksum group-list <acl>`
`no ip pim cisco-register-checksum group-list <acl>`

Syntax (VRF-lite) `ip pim [vrf <vrf-name>] cisco-register-checksum group-list <acl>`
`no ip pim [vrf <vrf-name>] cisco-register-checksum group-list <acl>`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name
<acl>	The standard, expanded or named ACL to use.

Mode Global Configuration

Example `awplus# configure terminal`
`awplus(config)# ip pim cisco-register-checksum group-list 34`
`awplus(config)# access-list 34 permit 224.0.1.3`

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip pim crp-cisco-prefix

Overview Use this command to interoperate with Cisco devices that conform to an earlier draft standard. Some Cisco devices might not accept candidate RPs with a group prefix number of zero. Note that the latest BSR specification prohibits sending RP advertisements with prefix 0. RP advertisements for the default IPv4 multicast group range 224/4 are sent with a prefix of 1.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Use the **no** variant of this command to revert to the default settings.

Syntax `ip pim crp-cisco-prefix`
`no ip pim crp-cisco-prefix`

Syntax (VRF-lite) `ip pim [vrf <vrf-name>] crp-cisco-prefix`
`no ip pim [vrf <vrf-name>] crp-cisco-prefix`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.

Mode Global Configuration

Example `awplus# configure terminal`
`awplus(config)# ip pim crp-cisco-prefix`
`awplus# configure terminal`
`awplus(config)# no ip pim crp-cisco-prefix`

Related commands [ip pim rp-candidate](#)

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip pim dr-priority

Overview Use this command to set the Designated Router priority value.
Use the **no** variant of this command to disable this function.

Syntax `ip pim dr-priority <priority>`
`no ip pim dr-priority [<priority>]`

Parameter	Description
<priority>	Specify the Designated Router priority value, in the range 0 to 4294967294. Note that a higher value has a higher preference or higher priority.

Default The default is 1. The negated form of this command restores the value to the default.

Mode Interface Configuration for a VLAN interface.

Examples To set the Designated Router priority value to 11234 for the VLAN interface vlan2, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim dr-priority 11234
```

To disable the Designated Router priority value for the VLAN interface vlan2, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim dr-priority
```

Related commands [ip pim ignore-rp-set-priority](#)

ip pim exclude-genid

Overview Use this command to exclude the GenID option from Hello packets sent out by the PIM module on a particular interface. This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to revert to default settings.

Syntax `ip pim exclude-genid`
`no ip pim exclude-genid`

Default By default, this command is disabled; the GenID option is included.

Mode Interface Configuration for a VLAN interface.

Example To exclude the GenID option on interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim exclude-genid
```

ip pim ext-srcs-directly-connected

Overview Use this command to configure PIM to treat all source traffic arriving on the interface as though it was sent from a host directly connected to the interface.

Use the **no** variant of this command to configure PIM to treat only directly connected sources as directly connected.

Syntax `ip pim ext-srcs-directly-connected`
`no ip pim ext-srcs-directly-connected`

Default The **no** variant of this command is the default behavior.

Mode Interface Configuration for a VLAN interface.

Example To configure PIM to treat all sources as directly connected for VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim ext-srcs-directly-connected
```

To configure PIM to treat only directly connected sources as directly connected for VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim ext-srcs-directly-connected
```

ip pim hello-holdtime (PIM-SM)

Overview This command configures a hello-holdtime value. You cannot configure a hello-holdtime value that is less than the current hello-interval.

Use the **no** variant of this command to return it to its default of 3.5 * the current hello-interval.

Syntax `ip pim hello-holdtime <holdtime>`
`no ip pim hello-holdtime`

Parameter	Description
<holdtime>	<1-65535> The holdtime value in seconds (no fractional seconds are accepted).

Default The default hello-holdtime value is 3.5 * the current hello-interval.

Mode Interface Configuration for a VLAN interface.

Usage Each time the hello-interval is updated, the hello-holdtime is also updated, according to the following rules:

If the hello-holdtime is not configured; or if the hello-holdtime is configured and less than the current hello-interval value, it is modified to the (3.5 * hello-interval). Otherwise, it retains the configured value.

Example To set the hello-hold time value on interface vlan2 use the commands

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim hello-holdtime 123
```

ip pim hello-interval (PIM-SM)

Overview This command configures a hello-interval value.
Use the **no** variant of this command to reset the hello-interval to the default.

Syntax `ip pim hello-interval <interval>`
`no ip pim hello-interval`

Parameter	Description
<interval>	<1-65535> The value in seconds (no fractional seconds accepted).

Default The default hello-interval value is 30 seconds.

Mode Interface Configuration for a VLAN interface.

Usage When the hello-interval is configured, and the hello-holdtime is not configured, or when the configured hello-holdtime value is less than the new hello-interval value; the holdtime value is modified to the (3.5 * hello-interval). Otherwise, the hello-holdtime value is the configured value.

Example To set the hello-interval value on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim hello-interval 123
```

ip pim ignore-rp-set-priority

Overview Use this command to ignore the RP-SET priority value, and use only the hashing mechanism for RP selection.

This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to disable this setting.

Syntax `ip pim ignore-rp-set-priority`
`no ip pim ignore-rp-set-priority`

Mode Global Configuration

Example `awplus# configure terminal`
`awplus(config)# ip pim ignore-rp-set-priority`

ip pim jp-timer

Overview Use this command to set the PIM-SM join/prune timer. Note that the value the device puts into the holdtime field of the join/prune packets it sends to its neighbors is 3.5 times the join/prune timer value set using this command.

Use the **no** variant of this command to return the PIM-SM join/prune timer to its default value of 60 seconds, which corresponds to a join/prune packet holdtime of 210 seconds.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `ip pim jp-timer <1-65535>`
`no ip pim jp-timer [<1-65535>]`

Syntax (VRF-lite) `ip pim [vrf <vrf-name>] jp-timer <1-65535>`
`no ip pim [vrf <vrf-name>] jp-timer [<1-65535>]`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name
<1-65535>	Specifies the join/prune timer value. The default value is 60 seconds.

Default The default join/prune timer value is 60 seconds.

Mode Global Configuration

Example To set the join/prune timer value to 300 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip pim jp-timer 300
```

To return the join/prune timer to its default value of 60 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# no ip pim jp-timer
```

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip pim neighbor-filter (PIM-SM)

Overview This command enables filtering of neighbors on the VLAN interface. When configuring a neighbor filter, PIM-SM will either not establish adjacency with the neighbor, or terminate adjacency with the existing neighbors if denied by the filtering access list.

Use the **no** variant of this command to disable this function.

Syntax `ip pim neighbor-filter {<number>|<accesslist>}`
`no ip pim neighbor-filter {<number>|<accesslist>}`

Parameter	Description
<number>	<1-99> Standard IP access-list number.
<accesslist>	IP access list name.

Default By default, there is no filtering.

Mode Interface Configuration for a VLAN interface.

Example `awplus# configure terminal`
`awplus(config)# interface vlan2`
`awplus(config-if)# ip pim neighbor-filter 14`

ip pim register-rate-limit

Overview Use this command to configure the rate of register packets sent by this DR, in units of packets per second.

Use the **no** variant of this command to remove the limit.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `ip pim register-rate-limit <1-65535>`
`no ip pim register-rate-limit`

Syntax (VRF-lite) `ip pim [vrf <vrf-name>] register-rate-limit <1-65535>`
`no ip pim [vrf <vrf-name>] register-rate-limit`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name
<1-65535>	Specifies the maximum number of packets that can be sent per second.

Mode Global Configuration

Example `awplus# configure terminal`
`awplus(config)# ip pim register-rate-limit 3444`

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip pim register-rp-reachability

Overview Use this command to enable the RP reachability check for PIM Register processing at the DR. The default setting is no checking for RP-reachability.

Use the **no** variant of this command to disable this processing.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `ip pim register-rp-reachability`
`no ip pim register-rp-reachability`

Syntax (VRF-lite) `ip pim [vrf <vrf-name>] register-rp-reachability`
`no ip pim [vrf <vrf-name>] register-rp-reachability`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.

Default This command is disabled; by default, there is no checking for RP-reachability.

Mode Global Configuration

Example `awplus# configure terminal`
`awplus(config)# ip pim register-rp-reachability`

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip pim register-source

Overview Use this command to configure the source address of register packets sent by this DR, overriding the default source address, which is the address of the RPF interface toward the source host.

Use the **no** variant of this command to un-configure the source address of Register packets sent by this DR, reverting back to use the default source address that is the address of the RPF interface toward the source host.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `ip pim register-source [<source-address>|<interface>]`
`no ip pim register-source`

Syntax (VRF-lite) `ip pim [vrf <vrf-name>] register-source`
`[<source-address>|<interface>]`
`no ip pim [vrf <vrf-name>] register-source`

Parameter	Description
<code>vrf</code>	Applies the command to the specified VRF instance.
<code><vrf-name></code>	The VRF instance name
<code><source-address></code>	The IP address, entered in the form A.B.C.D, to be used as the source of the register packets.
<code><interface></code>	The name of the interface to be used as the source of the register packets.

Usage notes The configured address must be a reachable address to be used by the RP to send corresponding Register-Stop messages in response. It is normally the local loopback interface address, but can also be a physical address. This address must be advertised by unicast routing protocols on the DR. The configured interface does not have to be PIM enabled.

Mode Global Configuration

Example `awplus# configure terminal`
`awplus(config)# ip pim register-source 10.10.1.3`

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip pim register-suppression

Overview Use this command to configure the register-suppression time, in seconds, overriding the default of 60 seconds. Configuring this value modifies register-suppression time at the DR. Configuring this value at the RP modifies the RP-keepalive-period value if the [ip pim rp-register-kat](#) command is not used.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Use the **no** variant of this command to reset the value to its default of 60 seconds.

Syntax `ip pim register-suppression <1-65535>`
`no ip pim register-suppression`

Syntax (VRF-lite) `ip pim [vrf <vrf-name>] register-suppression <1-65535>`
`no ip pim [vrf <vrf-name>] register-suppression`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
<1-65535>	Register suppression time in seconds.

Mode Global Configuration

Example `awplus# configure terminal`
`awplus(config)# ip pim register-suppression 192`

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip pim rp-address

Overview Use this command to statically configure the RP (Rendezvous Point) address for multicast groups.

Use the **no** variant of this command to remove a statically configured RP address for multicast groups.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `ip pim rp-address <ip-address> group-list <group-prefix> [override]`
`no ip pim rp-address <ip-address> group-list <group-prefix> [override]`

Syntax (VRF-lite) `ip pim [vrf <vrf-name>] rp-address <ip-address> group-list <group-prefix> [override]`
`no ip pim [vrf <vrf-name>] rp-address <ip-address> group-list <group-prefix> [override]`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name
<ip-address>	IP address of RP, entered in the form A.B.C.D.
<group-prefix>	Multicast group IP prefix address of RP, entered in the form A.B.C.D/M
override	Enables statically defined RPs to override dynamically learned RPs.

Mode Global Configuration

Usage notes The AlliedWare Plus PIM-SM implementation supports multiple static RPs. It also supports usage of static RP and the BSR (Bootstrap Router) mechanism simultaneously. The **ip pim rp-address** command is used to statically configure the RP address for multicast groups.

You need to understand the following information before using this command.

If the RP address configured by the BSR, and the statically configured RP address are both available for a group range, then the RP address configured through the BSR is chosen over the statically configured RP address, unless the 'override' parameter is specified, in which case, the static RP will be chosen.

After configuration, the RP address is inserted into a static RP group tree based on the configured group ranges. For each group range, multiple static RPs are maintained in a linked list. This list is sorted in a descending order of IP addresses.

When selecting static RPs for a group range, the first element (which is the static RP with highest IP address) is chosen.

RP address deletion is handled by removing the static RP from all the existing group ranges and recalculating the RPs for existing TIB states if required.

NOTE: A unique RP address may only be specified once as a static RP.

Example `awplus# configure terminal`
`awplus(config)# ip pim rp-address 192.0.2.10 group-list`
`233.252.0.0/24 override`

Figure 38-2: Output from the **show ip pim sparse-mode rp mapping** command

```
awplus#show ip pim sp rp mapping
PIM Group-to-RP Mappings
Group(s): 233.252.0.0/24, Static
RP: 192.0.2.10
Uptime: 00:00:17
```

Related commands `ip pim rp-candidate`
 `ip pim rp-register-kat`
 `show ip pim sparse-mode rp mapping`

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.
 Version 5.4.8-0.5: Replaced <acl> parameter with <group-list> parameter.
 Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip pim rp-candidate

Overview Use this command to make the router an RP (Rendezvous Point) candidate, using the IP address of the specified interface.

Use the **no** variant of this command to remove the RP status set using the **ip pim rp-candidate** command.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `ip pim rp-candidate <interface> [priority <priority>] [interval <interval>] [grouplist <acl>]`
`no ip pim rp-candidate [<interface>]`

Syntax (VRF-lite) `ip pim [vrf <vrf-name>] rp-candidate <interface> [priority <priority>] [interval <interval>] [grouplist <acl>]`
`no ip pim [vrf <vrf-name>] rp-candidate [<interface>]`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
<interface>	Interface name.
priority <priority>	The RP candidate priority for this interface on this device, from 0 to 255. The lower the priority value, the more likely this candidate is to become the RP.
interval <interval>	The advertisement interval, from 1 to 16383 seconds.
grouplist <acl>	The standard, expanded or named ACL to use.

Default The priority value for a candidate RP is 192 by default until specified using the **priority** parameter.

Mode Global Configuration

Usage notes Entering the command **ip pim rp-candidate <interface>** without one of the optional **priority**, **interval**, or **grouplist** parameters will configure the candidate RP with a priority value of 192.

Examples To specify a priority of 3, use the commands:

```
awplus# configure terminal
awplus(config)# ip pim rp-candidate vlan2 priority 3
```

To use the ACL numbered 3 to specify the group prefixes that are advertised in association with the RP address, use the commands:

```
awplus# configure terminal
awplus(config)# ip pim rp-candidate vlan2 group-list 3
```

To stop the device from being an RP candidate on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# no ip pim rp-candidate vlan2
```

ip pim rp-register-kat

Overview Use this command to configure the Keep Alive Time (KAT) for (S,G) states at the RP (Rendezvous Point) to monitor PIM-SM Register packets.

Use the **no** variant of this command to return the PIM-SM KAT timer to its default value of 210 seconds.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `ip pim rp-register-kat <1-65535>`
`no ip pim rp-register-kat`

Syntax (VRF-lite) `ip pim [vrf <vrf-name>] rp-register-kat <1-65535>`
`no ip pim [vrf <vrf-name>] rp-register-kat`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name
<1-65535>	Specify the KAT timer in seconds. The default value is 210 seconds.

Mode Global Configuration

Default The default PIM-SM KAT timer value is 210 seconds.

Examples `awplus# configure terminal`
`awplus(config)# ip pim rp-register-kat 3454`
`awplus# configure terminal`
`awplus(config)# no ip pim rp-register-kat`

Related commands [ip pim rp-address](#)

ip pim sparse-mode

Overview Use this command to enable PIM-SM on an interface.
Use the **no** variant of this command to disable PIM-SM on an interface.

Syntax `ip pim sparse-mode`
`no ip pim sparse-mode`

Mode Interface Configuration for a VLAN interface.

Examples To enable PIM-SM on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim sparse-mode
```

To disable PIM-SM on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim sparse-mode
```

ip pim sparse-mode join-prune-batching

Overview Use this command to enable batching of Join and Prune messages in PIM-SM. This functionality reduces the number of PIM packets that must be sent to maintain a large number of groups

When using VRF-lite, you can use this command to enable Join and Prune batching in PIM-SM for a named VRF instance.

Use the **no** variant of this command to disable batching of Join and Prune messages in PIM-SM.

Syntax `ip pim sparse-mode join-prune-batching`
`no ip pim sparse-mode join-prune-batching`

Syntax (VRF-lite) `ip pim [vrf <vrf-name>]sparse-mode join-prune-batching`
`no ip pim [vrf <vrf-name>]sparse-mode join-prune-batching`

Parameter	Description
vrf	Apply this command to a VRF instance.
<vrf-name>	The name of the VRF instance.

Default Disabled.

Mode Global Configuration

Examples To enable Join/Prune batching for PIM-SM, use the commands:

```
awplus# configure terminal
awplus(config)# ip pim sparse-mode join-prune-batching
```

To disable Join/Prune batching for PIM-SM, use the commands:

```
awplus# configure terminal
awplus(config)# no ip pim sparse-mode join-prune-batching
```

Example (VRF-lite) To enable Join/Prune batching for the VRF instance 'red', use the commands:

```
awplus# configure terminal
awplus(config)# ip pim vrf red sparse-mode join-prune-batching
```

To disable Join/Prune batching for the VRF instance 'red', use the commands:

```
awplus# configure terminal
awplus(config)# no ip pim vrf red sparse-mode
join-prune-batching
```

Related commands [ip pim sparse-mode wrong-vif-suppression](#)

Command changes Version 5.4.8-2.3: command added.

ip pim sparse-mode passive

Overview Use this command to enable and disable passive mode operation for local members on an interface.

Use the **no** variant of this command to disable passive mode operation for local members on an interface.

Syntax `ip pim sparse-mode passive`
`no ip pim sparse-mode passive`

Mode Interface Configuration for a VLAN interface.

Usage Passive mode essentially stops PIM transactions on the interface, allowing only IGMP mechanism to be active. To turn off passive mode, use the **no ip pim sparse-mode passive** or the `ip pim sparse-mode` command. To turn off PIM activities on an interface, use the **no ip pim sparse-mode** command.

Examples To enable passive mode on vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim sparse-mode passive
```

To disable passive mode on vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim sparse-mode passive
```

ip pim sparse-mode wrong-vif-suppression

Overview Use this command to permit or block multicast packets that arrive on the wrong interface.

When using VRF-lite, you can use this command to enable wrong VIF suppression for a named VRF instance.

Use the **no** variant of this command to disable wrong VIF suppression.

Syntax `ip pim sparse-mode wrong-vif-suppression`
`no ip pim sparse-mode wrong-vif-suppression`

Syntax (VRF-lite) `ip pim [vrf <vrf-name>] sparse-mode wrong-vif-suppression`
`no ip pim [vrf <vrf-name>] sparse-mode wrong-vif-suppression`

Parameter	Description
vrf	Apply this command to a VRF instance.
<vrf-name>	The name of the VRF instance.

Default Disabled.

Mode Global Configuration

Usage notes This command enables wrong VIF suppression for PIM sparse-mode. Wrong VIF suppression prevents multicast packets received on the wrong upstream interface from being copied to the CPU.

Examples To enable wrong VIF suppression, use the commands:

```
awplus# configure terminal
awplus(config)# ip pim sparse-mode wrong-vif-suppression
```

To disable wrong VIF suppression, use the commands:

```
awplus# configure terminal
awplus(config)# no ip pim sparse-mode wrong-vif-suppression
```

Example (VRF-lite) To enable wrong VIF suppression for the VRF instance 'green', use the commands:

```
awplus# configure terminal
awplus(config)# ip pim vrf green sparse-mode
wrong-vif-suppression
```

To disable wrong VIF suppression for the VRF instance 'green', use the commands:

```
awplus# configure terminal
awplus(config)# no ip pim vrf green sparse-mode
wrong-vif-suppression
```

Related commands [ip pim sparse-mode join-prune-batching](#)

Command changes Version 5.4.8-2.3: command added.

ip pim spt-threshold

Overview This command turns on the ability for the last-hop PIM router to switch to SPT (shortest-path tree).

The **no** variant of this command turns off the ability for the last-hop PIM router to switch to SPT.

NOTE: *The switching to SPT happens either at the receiving of the first data packet, or not at all; it is not rate-based.*

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `ip pim spt-threshold`
`no ip pim spt-threshold`

Syntax (VRF-lite) `ip pim [vrf <vrf-name>] spt-threshold`
`no ip pim [vrf <vrf-name>] spt-threshold`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.

Mode Global Configuration

Examples To enable the last-hop PIM-SM router to switch to SPT, use the following commands:

```
awplus# configure terminal
awplus(config)# ip pim spt-threshold
```

To stop the last-hop PIM-SM router from being able to switch to SPT, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip pim spt-threshold
```

Related commands [ip pim spt-threshold group-list](#)

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip pim spt-threshold group-list

Overview Use this command to turn on the ability for the last-hop PIM router to switch to SPT (shortest-path tree) for multicast group addresses specified by the given access-list.

The switching to SPT happens either at the receiving of the first data packet, or not at all; it is not rate-based.

Use the **no** variant of this command to turn off switching to the SPT.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `ip pim spt-threshold group-list <acl>`
`no ip pim spt-threshold group-list [<acl>]`

Syntax (VRF-lite) `ip pim [vrf <vrf-name>] spt-threshold group-list <acl>`
`no ip pim [vrf <vrf-name>] spt-threshold group-list [<acl>]`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name
<acl>	The standard, expanded or named ACL to use.

Mode Global Configuration

Usage notes Turn on/off the ability for the last-hop PIM router to switch to SPT for multicast group addresses specified by the given access-list.

Example `awplus# configure terminal`
`awplus(config)# ip pim spt-threshold group-list 1`
`awplus(config)# access-list 1 permit 224.0.1.3`

Related commands [ip pim spt-threshold](#)

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip pim ssm

Overview Use this command to define the Source Specific Multicast (SSM) range of IP multicast addresses. The default keyword defines the SSM range as 232/8.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

To define the SSM range to be other than the default, use the **access-list** parameter option.

Use the **no** variant of this command to disable the SSM range.

Syntax

```
ip pim ssm default
ip pim ssm range {<access-list>|<named-access-list>}
no ip pim ssm
```

Syntax (VRF-lite)

```
ip pim [vrf <vrf-name>] ssm default
ip pim [vrf <vrf-name>] ssm range
{<access-list>|<named-access-list>}
no ip pim [vrf <vrf-name>] ssm
```

Parameter	Description
default	Use 232/8 as the range for SSM.
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
<access-list>	<1-99> Simple access-list.
<named-access-list>	Named Standard Access List.

Default By default, the command is disabled.

Mode Global Configuration

Usage When an SSM range of IP multicast addresses is defined by this command, the no (*,G) or (S,G,rpt) state will be initiated for groups in the SSM range.

The messages corresponding to these states will not be accepted or originated in the SSM range.

Examples To configure the SSM service for the IP address range defined by access list 10, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 10 permit 225.1.1.1
awplus(config)# ip pim ssm range 10
```

To use the default address range for PIM-SSM, use the commands:

```
awplus# configure terminal  
awplus(config)# ip pim ssm default
```

To disable PIM-SSM, use the commands:

```
awplus# configure terminal  
awplus(config)# no ip pim ssm
```

**Command
changes**

Version 5.5.3-1.1: VRF-lite support added.

service pim

Overview Use this command to enable PIM sparse mode services.
Use the **no** version of the command to disable unused PIM sparse mode services.

Syntax service pim
no service pim

Default Enabled

Mode Global Configuration

Usage notes Sometimes it may be desirable to disable unused services, in order to reduce memory use.
Disabling the PIM services will only take effect after you save the configuration and restart the device.

Example To disable the PIM sparse mode service, use the commands:

```
awplus# configure terminal  
awplus(config)# no service pim
```

Output Figure 38-3: Example output from **no service pim**

```
awplus(config)#no service pim  
% Save the config and restart the device for this change to take  
effect
```

Command changes Version 5.5.0-0.1: command added

show debugging pim sparse-mode

Overview This command displays the status of the debugging of the system.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `show debugging pim sparse-mode`

Syntax (VRF-lite) `show debugging pim [vrf <vrf-name>|global] sparse-mode`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
global	The global routing and forwarding table

Mode User Exec and Privileged Exec

Example To display PIM-SM debugging settings, use the command:

```
awplus# show debugging pim sparse-mode
```

Figure 38-4: Output from **show debugging pim sparse-mode**

```
Debugging status:
  PIM event debugging is on
  PIM Hello THT timer debugging is on
  PIM event debugging is on
  PIM MFC debugging is on
  PIM state debugging is on
  PIM packet debugging is on
  PIM incoming packet debugging is on
  PIM outgoing packet debugging is on
```

Related commands [debug pim sparse-mode](#)

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

show ip pim sparse-mode bsr-router

Overview Use this command to show the Bootstrap Router (BSR) (v2) address.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `show ip pim sparse-mode bsr-router`

Syntax (VRF-lite) `show ip pim [vrf <vrf-name>|global] sparse-mode bsr-router`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
global	The global routing and forwarding table

Mode User Exec and Privileged Exec

Output Figure 38-5: Output from the **show ip pim sparse-mode bsr-router** command

```
PIMv2 Bootstrap information
BSR address: 10.10.11.35 (?)
Uptime:      00:00:38, BSR Priority: 0, Hash mask length: 10
Expires:     00:01:32
Role: Non-candidate BSR
State: Accept Preferred
```

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

show ip pim sparse-mode interface

Overview Use this command to show PIM-SM interface information.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#)

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `show ip pim sparse-mode interface`

Syntax (VRF-lite) `show ip pim [vrf <vrf-name>|global] sparse-mode interface`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
global	The global routing and forwarding table

Mode User Exec and Privileged Exec

Example To display information about PIM-SM interfaces, use the command:

```
awplus# show ip pim sparse-mode interface
```

Output Figure 38-6: Example output from **show ip pim sparse-mode interface**

Total configured interfaces: 100 Maximum allowed: 100						
Total active interfaces: 100						
Address	Interface	VIFindex	Ver/ Mode	Nbr Count	DR Prior	DR
10.1.100.4	vlan100	4	v2/S	2	1	10.1.100.6
10.2.101.10	vlan1001	5	v2/S	0	1	10.2.101.10
10.2.102.10	vlan1002	6	v2/S	0	1	10.2.102.10
10.2.103.10	vlan1003	7	v2/S	0	1	10.2.103.10
10.2.104.10	vlan1004	8	v2/S	0	1	10.2.104.10
10.2.105.10	vlan1005	9	v2/S	0	1	10.2.105.10
10.2.106.10	vlan1006	10	v2/S	0	1	10.2.106.10
10.2.107.10	vlan1007	11	v2/S	0	1	10.2.107.10
...						

Table 1: Parameters in the output from the **show ip pim sparse-mode interface** command

Parameters	Description
Total configured interfaces	The number of configured PIM Sparse Mode interfaces.
Maximum allowed	The maximum number of PIM Sparse Mode interfaces that can be configured.
Total active interfaces	The number of active PIM Sparse Mode interfaces.
Address	Primary PIM-SM address.
Interface	Name of the PIM-SM interface.
VIF Index	The Virtual Interface index of the interface.
Ver/Mode	PIM version/Sparse mode.
Nbr Count	Neighbor count of the PIM-SM interface.
DR Priority	Designated Router priority.
DR	The IP address of the Designated Router.

show ip pim sparse-mode interface detail

Overview Use this command to show detailed information on a PIM-SM interface.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `show ip pim sparse-mode interface detail`

Syntax (VRF-lite) `show ip pim [vrf <vrf-name>|global] sparse-mode interface detail`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
global	The global routing and forwarding table

Mode User Exec and Privileged Exec

Output Figure 38-7: Example output from the **show ip pim sparse-mode interface detail** command

```
vlan3 (vif 3):
  Address 192.168.1.149, DR 192.168.1.149
  Hello period 30 seconds, Next Hello in 15 seconds
  Triggered Hello period 5 seconds
  Neighbors:
    192.168.1.22

vlan2 (vif 0):
  Address 10.10.11.149, DR 10.10.11.149
  Hello period 30 seconds, Next Hello in 18 seconds
  Triggered Hello period 5 seconds
  Neighbors:
    10.10.11.4
```

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

show ip pim sparse-mode local-members

Overview Use this command to show detailed local member information on an interface configured for PIM-SM. If you do not specify an interface then detailed local member information is shown for all interfaces configured for PIM-SM.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show ip pim sparse-mode local-members [<interface>]`

Syntax (VRF-lite) `show ip pim [vrf <vrf-name>|global] sparse-mode local-members [<interface>]`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
global	The global routing and forwarding table
<interface>	Optional. Specify the interface.

Mode User Exec and Privileged Exec

Example To show detailed PIM-SM information for all PIM-SM configured interfaces, use the command:

```
awplus# show ip pim sparse-mode local-members
```

To show detailed PIM-SM information for the PIM-SM configured interface vlan1, use the command:

```
awplus# show ip pim sparse-mode local-members vlan1
```

Output Figure 38-8: Example output from the **show ip pim sparse-mode local-members** command

```
awplus#show ip pim sparse-mode local-members
PIM Local membership information

vlan1:
    (*, 224.0.0.4) : Include

vlan203:
    (*, 223.0.0.3) : Include
```

Output Figure 38-9: Example output from the **show ip pim sparse-mode local-members** command on a specific interface.

```
awplus#show ip pim sparse-mode local-members vlan1
PIM Local membership information

vlan1:
  (*, 224.0.0.4) : Include
```

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

show ip pim sparse-mode mroute

Overview Use this command to display the IP multicast routing table or the IP multicast routing table based on a specific address or addresses.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

If the platform supports multicast for VRFs then specifying a VRF name will show the multicast routing table for that VRF or use global for the global VRF. Not specifying a VRF will display the information for all VRFs.

Syntax

```
show ip pim sparse-mode mroute brief
show ip pim sparse-mode mroute
show ip pim sparse-mode mroute <group-address>
show ip pim sparse-mode mroute <source-address>
show ip pim sparse-mode mroute <source-address> <group-address>
```

Syntax (VRF-lite)

```
show ip pim [vrf <vrf-name>|global] sparse-mode mroute brief
show ip pim [vrf <vrf-name>|global] sparse-mode mroute
show ip pim [vrf <vrf-name>|global] sparse-mode mroute
<group-address>
show ip pim [vrf <vrf-name>|global] sparse-mode mroute
<source-address>
show ip pim [vrf <vrf-name>|global] sparse-mode mroute
<source-address> <group-address>
```

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
global	The global routing and forwarding table
brief	Shows only a summary of the number of each type of multicast entry and the cache.
<group-address>	Group IP address, entered in the form A.B.C.D. Output is all multicast entries belonging to that group.
<source-address>	Source IP address, entered in the form A.B.C.D. Output is all multicast entries belonging to that source.

Mode Privileged Exec

Usage notes Note that when a feature license is enabled, the output for the **show ip pim sparse-mode mroute** command will only show 32 interfaces because of the terminal display width limit. Use the **show ip pim sparse-mode mroute detail** command to display detailed entries of the IP multicast routing table.

Example To display the IP multicast routing table for the address 40.40.40.11, enter the command:

```
awplus# show ip pim sparse-mode mroute 40.40.40.11
```

Output Figure 38-10: Example output from **show ip pim sparse-mode mroute brief**

```
awplus#show ip pim sparse-mode mroute brief
IP Multicast Routing Table

(*,*,RP) Entries: 0
(*,G) Entries: 0
(S,G) Entries: 99
(S,G,rpt) Entries: 99

```

Related commands [show ip pim sparse-mode mroute detail](#)

**Command
changes**

Version 5.4.7-1.1: VRF-lite support added to SBx8100.

Version 5.4.8-1.1: VRF-lite support added to x930, SBx908 GEN2.

Version 5.4.8-2.1: **brief** parameter added.

show ip pim sparse-mode mroute detail

Overview Use this command to display detailed entries of the IP multicast routing table, or detailed entries of the IP multicast routing table based on the specified address or addresses.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

If the platform supports multicast for VRFs then specifying a VRF name will show the PIM-SM RP mappings for that VRF or use global for the global VRF. Not specifying a VRF will display the information for all VRFs.

Syntax

```
show ip pim sparse-mode mroute [<group-address>] detail
show ip pim sparse-mode mroute [<source-address>] detail
show ip pim sparse-mode mroute [<group-address>
<source-address>] detail
show ip pim sparse-mode mroute [<source-address>
<group-address>] detail
```

Syntax (VRF-lite)

```
show ip pim [vrf <vrf-name>|global] sparse-mode mroute
[<group-address>] detail
show ip pim [vrf <vrf-name>|global] sparse-mode mroute
[<source-address>] detail
show ip pim [vrf <vrf-name>|global] sparse-mode mroute
[<group-address> <source-address>] detail
show ip pim [vrf <vrf-name>|global] sparse-mode mroute
[<source-address> <group-address>] detail
```

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
global	The global routing and forwarding table.
<group-address>	Group IP address, entered in the form A.B.C.D. Output is all multicast entries belonging to that group.
<source-address>	Source IP address, entered in the form A.B.C.D. Output is all multicast entries belonging to that source.
detail	Show detailed information.

Usage notes Based on the group and source address, the output is the selected route if present in the multicast route tree.

Mode User Exec and Privileged Exec

Examples The following example commands show detailed entries for IP multicast routing tables:

```
awplus# show ip pim sparse-mode mroute detail
awplus# show ip pim sparse-mode mroute 40.40.40.11 detail
awplus# show ip pim sparse-mode mroute 224.1.1.1 detail
awplus# show ip pim sparse-mode mroute 224.1.1.1 40.40.40.11
detail
```

Output Figure 38-12: Example output from **show ip pim sparse-mode mroute detail**

```
IP Multicast Routing Table

```

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

show ip pim sparse-mode neighbor

Overview Use this command to show the PIM-SM neighbor information.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `show ip pim sparse-mode neighbor [<interface>] [<ip-address>]
[detail]`

Syntax (VRF-lite) `show ip pim [vrf <vrf-name>|global] sparse-mode neighbor
[<interface>] [<ip-address>] [detail]`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
global	The global routing and forwarding table
<interface>	Interface name. Show neighbors on an interface.
<ip-address>	Show neighbors with a particular address on an interface. The IP address entered in the form A.B.C.D.
detail	Show detailed information.

Mode Privileged Exec

Examples To show the neighbor information for all interfaces, use the command:

```
awplus# show ip pim sparse-mode neighbor
```

To show the neighbor information for vlan5, use the command:

```
awplus# show ip pim sparse-mode neighbor vlan5 detail
```

Output Figure 38-13: Example output from the **show ip pim sparse-mode neighbor** command

Neighbor Address Mode	Interface	Uptime/Expires	Ver	DR Priority/
10.10.0.9	vlan2	00:55:33/00:01:44	v2	1 /
10.10.0.136	vlan2	00:55:20/00:01:25	v2	1 /
10.10.0.172	vlan2	00:55:33/00:01:32	v2	1 / DR
192.168.0.100	vlan3	00:55:30/00:01:20	v2	N / DR

Figure 38-14: Example output from the **show ip pim sparse-mode neighbor interface detail** command

```
Nbr 10.10.3.180 (vlan5), DR
  Expires in 55 seconds, uptime 00:00:15
  Holdtime: 70 secs, T-bit: off, Lan delay: 1, Override interval: 3
  DR priority: 100, Gen ID: 625159467,
  Secondary addresses:
    192.168.30.1
```

**Command
changes**

Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

show ip pim sparse-mode nexthop

Overview Use this command to see the next hop information as used by PIM-SM.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#)

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `show ip pim sparse-mode nexthop`

Syntax (VRF-lite) `show ip pim [vrf <vrf-name>|global]sparse-mode nexthop`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
global	The global routing and forwarding table

Mode User Exec and Privileged Exec

Example `awplus# show ip pim sparse-mode nexthop`

Figure 38-15: Example output from the **show ip pim sparse-mode nexthop** command

Flags: N = New, R = RP, S = Source, U = Unreachable									
Destination	Type	Nexthop Num	Nexthop Addr	Nexthop	Nexthop Ifindex	Metric	Pref	Refcnt	
10.10.0.9	.RS.	1	0.0.0.0	4	0	0	1		

Table 2: Parameters in output of the **show ip pim sparse-mode nexthop** command

Parameter	Description
Destination	The destination address for which PIM-SM requires next hop information.
Type	The type of destination, as indicated by the Flags description. N = New, R= RP, S = Source, U = Unreachable.
Nexthop Num	The number of next hops to the destination. PIM-SM always uses only 1 next hop.
Nexthop Addr	The address of the primary next hop gateway.

Table 2: Parameters in output of the **show ip pim sparse-mode nexthop** command (cont.)

Parameter	Description
Nexthop IfIndex	The interface on which the next hop gateway can be reached.
Nexthop Name	The name of next hop interface.
Metric	The metric of the route towards the destination.
Preference	The preference of the route towards destination.
Refcnt	Only used for debugging.

**Command
changes**

Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

show ip pim sparse-mode packet statistics

Overview Use this command to display the current packet receive counts for PIM sparse-mode.

If the device supports multicast for VRFs, then specifying a VRF name will show the PIM sparse-mode packet statistics for that VRF or use global for the global VRF. Not specifying a VRF will display the information for all VRFs.

Syntax `show ip pim sparse-mode packet statistics`

Syntax (VRF-lite) `show ip pim [vrf <vrf-name>|global] sparse-mode packet statistics`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
global	The global routing and forwarding table

Mode Privileged Exec

Example The following command displays the current packet receive counts for PIM sparse-mode:

```
awplus# configure terminal
awplus(config)# show ip pim sparse-mode statistics
```

Output Figure 38-16: Example output from **show ip pim sparse-mode statistics**

```
awplus(config)#show ip pim sparse-mode statistics
PIM-SM Receive Packet Statistics :
All PIM-SM      :   Total : 25   Valid : 25
Hello           :   Total : 14   Valid : 14
Register        :   Total : 5    Valid : 5
Register Stop   :   Total : 0    Valid : 0
Join/Prune      :   Total : 0    Valid : 0
Bootstrap       :   Total : 6    Valid : 6
Assert          :   Total : 0    Valid : 0
Candidate-RP    :   Total : 0    Valid : 0
```

Example The following command displays the current packet receive counts for PIM sparse-mode on VRF Red:

```
awplus# configure terminal
awplus(config)# show ip pim vrf red sparse-mode statistics
```

Output Figure 38-17: Example output from **show ip pim vrf red sparse-mode statistics**

```
awplus(config)#show ip pim vrf red sparse-mode statistics
[VRF: red]
PIM-SM Receive Packet Statistics :
All PIM-SM      :   Total : 32   Valid : 32
Hello           :   Total : 19   Valid : 19
Register        :   Total : 5    Valid : 5
Register Stop   :   Total : 0    Valid : 0
Join/Prune      :   Total : 0    Valid : 0
Bootstrap       :   Total : 8    Valid : 8
Assert          :   Total : 0    Valid : 0
Candidate-RP    :   Total : 0    Valid : 0
```

Related commands [clear ip pim sparse-mode packet statistics](#)

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

show ip pim sparse-mode rp-hash

Overview Use this command to display the Rendezvous Point (RP) to be chosen based on the group selected.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `show ip pim sparse-mode rp-hash <group-addr>`

Syntax (VRF-lite) `show ip pim [vrf <vrf-name>|global] sparse-mode rp-hash <group-addr>`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
global	The global routing and forwarding table.
<group-addr>	The group address for which to find the RP, entered in the form A.B.C.D.

Mode User Exec and Privileged Exec

Example `awplus# show ip pim sparse-mode rp-hash 224.0.1.3`

Figure 38-18: Output from the **show ip pim sparse-mode rp-hash** command

```
RP: 10.10.11.35
Info source: 10.10.11.35, via bootstrap
```

Related commands [show ip pim sparse-mode rp mapping](#)

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

show ip pim sparse-mode rp mapping

Overview Use this command to show group-to-RP (Rendezvous Point) mappings, and the RP set.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

If the platform supports multicast for VRFs then specifying a VRF name will show the PIM-SM RP mappings for that VRF or use global for the global VRF. Not specifying a VRF will display the information for all VRFs.

Syntax `show ip pim sparse-mode rp mapping`

Syntax (VRF-lite) `show ip pim [vrf <vrf-name>|global] sparse-mode rp mapping`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
global	The global routing and forwarding table.

Mode Privileged Exec

Example `awplus# show ip pim sparse-mode rp mapping`

Output Figure 38-19: Example output from **show ip pim sparse-mode rp mapping**

```
PIM Group-to-RP Mappings
Group(s): 224.0.0.0/4
RP: 10.10.0.9
  Info source: 10.10.0.9, via bootstrap, priority 192
  Uptime: 16:52:39, expires: 00:02:50
```

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

undebbug all pim sparse-mode

Overview Use this command to disable all PIM-SM debugging.
Use this command if the device supports multicast for VRFs. This command will disable all PIM-SM debugging for all VRFs.

Syntax `undebbug all pim sparse-mode`

Mode Privileged Exec

Example `awplus# undebbug all pim sparse-mode`

Related commands [debug pim sparse-mode](#)

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

Introduction

Overview This chapter provides an alphabetical reference of PIM-SMv6 commands. For IPv6 Multicast commands, see [Multicast Commands](#). For an overview of PIM-SMv6, see the [PIM-SMv6 Feature Overview and Configuration Guide](#).

IPv6 must be enabled on an interface with the [ipv6 enable](#) command, IPv6 forwarding must be enabled globally for routing IPv6 with the [ipv6 forwarding](#) command, and IPv6 multicasting must be enabled globally with the [ipv6 multicast-routing](#) command before using PIM-SMv6 commands.

Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the [clear ipv6 mroute](#) command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous IPv6 static multicast routes.

NOTE: The IPv6 Multicast addresses shown can be derived from IPv6 unicast prefixes as per RFC 3306. The IPv6 unicast prefix reserved for documentation is 2001:0db8::/32 as per RFC 3849. Using the base /32 prefix the IPv6 multicast prefix for 2001:0db8::/32 is ff3x:20:2001:0db8::/64. Where an RP address is 2001:0db8::1 the embedded RP multicast prefix is ff7x:120:2001:0db8::/96. For ASM (Any-Source Multicast) the IPv6 multicast addresses allocated for documentation purposes are ff0x::0db8:0:0/96 as per RFC 6676. This is a /96 prefix so that it can be used with group IDs as per RFC 3307. These addresses should not be used for practical networks (other than for testing purposes), nor should they appear in any public network.

The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical networks (other than for testing purposes) nor should they appear on any public network.

clear ipv6 mroute pim

Overview Use this command to clear all Multicast Forwarding Cache (MFC) entries in PIM-SMv6.

NOTE: Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the *clear ipv6 mroute* command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.

Syntax `clear ipv6 mroute [*] pim sparse-mode`

Parameter	Description
*	Clears all PIM-SMv6 multicast routes. Using this command without this optional operator only deletes the multicast router table entries.

Mode Privileged Exec

Example `awplus# clear ipv6 mroute pim sparse-mode`
`awplus# clear ipv6 mroute * pim sparse-mode`

clear ipv6 mroute pim sparse-mode

Overview Use this command to clear all multicast route table entries learned through PIM-SMv6 for a specified multicast group address, and optionally a specified multicast source address.

NOTE: Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the *clear ipv6 mroute* command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.

Syntax `clear ipv6 mroute <Group-IPv6-add> pim sparse-mode`
`clear ipv6 mroute <Group-IPv6-add> <Source-IPv6-add> pim sparse-mode`

Parameter	Description
<Group-IPv6-add>	Specify a multicast group IPv6 address, entered in the form X:X::X:X.
<Source-IPv6-add>	Specify a source group IPv6 address, entered in the form X:X::X:X.

Mode Privileged Exec

Example `awplus# clear ipv6 mroute 2001:db8:: pim sparse-mode`
`awplus# clear ipv6 mroute 2001:db8:: 2002:db8:: pim sparse-mode`

clear ipv6 pim sparse-mode bsr rp-set *

Overview Use this command to clear all Rendezvous Point (RP) sets learned through the PIM-SMv6 Bootstrap Router (BSR).

NOTE: Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the [clear ipv6 mroute](#) command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.

Syntax `clear ipv6 pim sparse-mode bsr rp-set *`

Parameter	Description
*	Clears all RP sets.

Mode Privileged Exec

Usage For multicast clients, note that one router will be automatically or statically designated as the RP, and all routers must explicitly join through the RP. A Designated Router (DR) sends periodic Join/Prune messages toward a group-specific RP for each group that it has active members.

For multicast sources, note that the Designated Router (DR) unicasts Register messages to the RP encapsulating the data packets from the multicast source. The RP forwards decapsulated data packets toward group members.

Example `awplus# clear ipv6 pim sparse-mode bsr rp-set *`

debug ipv6 pim sparse-mode

Overview Use this command to activate PIM-SMv6 debugging.

Use the **no** variant of this command to deactivate PIMv6 debugging.

Note that the **undebg ipv6 pim sparse-mode** command is an alias of the **no** variant of this command.

Syntax `debug ipv6 pim sparse-mode [all] [events] [mfc] [mib] [nexthop]
[nsm] [state] [timer]`
`no debug ipv6 pim sparse-mode [all] [events] [mfc] [mib]
[nexthop] [nsm] [state] [timer]`

Parameter	Description
all	Activates/deactivates all PIM-SMv6 debugging.
events	Activates debug printing of PIM-SMv6 events.
mfc	Activates debug printing of MFC (Multicast Forwarding Cache).
mib	Activates debug printing of PIM-SMv6 MIBs.
nexthop	Activates debug printing of PIM-SMv6 next hop communications.
nsm	Activates debugging of PIM-SMv6 NSM (Network Services Module) communications.
state	Activates debug printing of state transition on all PIM-SMv6 FSMs.
timer	Activates debug printing of PIM-SMv6 timers.

Mode Privileged Exec and Global Configuration

Example `awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# debug ipv6 pim sparse-mode all
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# debug ipv6 pim sparse-mode events
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# debug ipv6 pim sparse-mode nexthop`

**Validation
output**

Figure 39-1: Example output from the **show debugging ipv6 pim sparse-mode** command after issuing **multiple debug ipv6 pim sparse-mode** commands

```
awplus#debug ipv6 pim sparse-mode state
awplus#debug ipv6 pim sparse-mode events
awplus#debug ipv6 pim sparse-mode packet
awplus#show debugging ipv6 pim sparse-mode
PIM-SMv6 debugging status:
  PIM event debugging is on
  PIM MFC debugging is off
  PIM state debugging is on
  PIM packet debugging is on
  PIM Hello HT timer debugging is off
  PIM Hello NLT timer debugging is off
  PIM Hello THT timer debugging is off
  PIM Join/Prune JT timer debugging is off
  PIM Join/Prune ET timer debugging is off
  PIM Join/Prune PPT timer debugging is off
  PIM Join/Prune KAT timer debugging is off
  PIM Join/Prune OT timer debugging is off
  PIM Assert AT timer debugging is off
  PIM Register RST timer debugging is off
  PIM Bootstrap BST timer debugging is off
  PIM Bootstrap CRP timer debugging is off
  PIM mib debugging is off
  PIM nsm debugging is off
  PIM nexthop debugging is off
```

[undebug all ipv6 pim sparse-mode](#)
[undebug ipv6 pim sparse-mode](#)

debug ipv6 pim sparse-mode packet

Overview Use this command to activate PIM-SMv6 packet debugging.
Use the no variant of this command to deactivate PIMv6 packet debugging.

Syntax debug ipv6 pim sparse-mode packet {in|out}
no debug ipv6 pim sparse-mode packet {in|out}

Parameter	Description
packet	Activates debug printing of incoming and/or outgoing IPv6 packets.
in	Specify incoming packet debugging.
out	Specify outgoing packet debugging.

Mode Privileged Exec and Global Configuration

Example

```
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# debug ipv6 pim sparse-mode packet in
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# debug ipv6 pim sparse-mode packet out
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# no debug ipv6 pim sparse-mode packet in
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# no debug ipv6 pim sparse-mode packet out
```

Related commands [show debugging ipv6 pim sparse-mode](#)

debug ipv6 pim sparse-mode timer

Overview Use this command to enable debugging for the specified PIM-SMv6 timers.

Use the **no** variants of this command to disable debugging for the specified PIM-SMv6 timers.

Syntax

```
debug ipv6 pim sparse-mode timer assert [at]
no debug ipv6 pim sparse-mode timer assert [at]
debug pim ipv6 sparse-mode timer bsr [bst|crp]
no debug pim ipv6 sparse-mode timer bsr [bst|crp]
debug pim ipv6 sparse-mode timer hello [ht|nlt|tht]
no debug pim ipv6 sparse-mode timer hello [ht|nlt|tht]
debug pim ipv6 sparse-mode timer joinprune [jt|et|ppt|kat|ot]
no debug pim ipv6 sparse-mode timer joinprune
[jt|et|ppt|kat|ot]
debug pim ipv6 sparse-mode timer register [rst]
no debug pim ipv6 sparse-mode timer register [rst]
```

Parameter	Description
assert	Enable or disable debugging for the Assert timers.
at	Enable or disable debugging for the Assert Timer.
bsr	Enable or disable debugging for the specified Bootstrap Router timer, or all Bootstrap Router timers.
bst	Enable or disable debugging for the Bootstrap Router: Bootstrap Timer.
crp	Enable or disable debugging for the Bootstrap Router: Candidate-RP Timer.
hello	Enable or disable debugging for the specified Hello timer, or all Hello timers.
ht	Enable or disable debugging for the Hello timer: Hello Timer.
nlt	Enable or disable debugging for the Hello timer: Neighbor Liveness Timer.
tht	Enable or disable debugging for the Hello timer: Triggered Hello Timer.
joinprune	Enable or disable debugging for the specified JoinPrune timer, or all JoinPrune timers.
jt	Enable or disable debugging for the JoinPrune timer: upstream Join Timer.
et	Enable or disable debugging for the JoinPrune timer: Expiry Timer.
ppt	Enable or disable debugging for the JoinPrune timer: PrunePending Timer.

Parameter	Description
kat	Enable or disable debugging for the JoinPrune timer: KeepAlive Timer.
ot	Enable or disable debugging for the JoinPrune timer: Upstream Override Timer.
register	Enable or disable debugging for the Register timers.
rst	Enable or disable debugging for the Register timer: Register Stop Timer.

Default By default, all debugging is disabled.

Mode Privileged Exec and Global Configuration

Examples To enable debugging for the PIM-SMv6 Bootstrap Router bootstrap timer, use the commands:

```
awplus(config)# debug ipv6 pim sparse-mode timer bsr bst
```

To enable debugging for the PIM-SMv6 Hello: neighbor liveness timer, use the command:

```
awplus(config)# debug ipv6 pim sparse-mode timer hello ht
```

To enable debugging for the PIM-SMv6 Joinprune expiry timer, use the command:

```
awplus# debug ipv6 pim sparse-mode timer joinprune et
```

To disable debugging for the PIM-SMv6 Register timer, use the command:

```
awplus# no debug ipv6 pim sparse-mode timer register
```

Related commands [show debugging ipv6 pim sparse-mode](#)

ipv6 pim accept-register

Overview Use this command to configure the ability to filter out multicast sources specified by the given software IPv6 access-list at the Rendezvous Point (RP), so that the RP will accept/refuse to perform the register mechanism for the packets sent by the specified sources. By default, the RP accepts register packets from all multicast sources.

Use the **no** variant of this command to revert to default.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `ipv6 pim accept-register list <access-list>`
`no ipv6 pim accept-register`

Syntax (VRF-lite) `ipv6 pim [vrf <vrf-name>] accept-register list <access-list>`
`no ipv6 pim [vrf <vrf-name>] accept-register`

Parameter	Description
<access-list>	Specify a Standard or an Extended software IPv6 Access list. See IPv6 Software Access Control List (ACL) Commands for supported IPv6 ACLs.
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name

Mode Global Configuration

Example To use the ACL named G2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 access-list standard G2 permit
2001:db8::/128
awplus(config)# ipv6 pim accept-register list G2
```

To remove the configuration, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim accept-register
```

Command changes Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

ipv6 pim anycast-rp

Overview Use this command to configure Anycast RP (Rendezvous Point) in an RP set.

Use the **no** variant of this command to remove the configuration.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `ipv6 pim anycast-rp <anycast-rp-address> <member-rp-address>`
`no ipv6 pim anycast-rp <anycast-rp-address>`
`[<member-rp-address>]`

Syntax (VRF-lite) `ipv6 pim [vrf <vrf-name>] anycast-rp <anycast-rp-address>`
`<member-rp-address>`
`no ipv6 pim [vrf <vrf-name>] anycast-rp <anycast-rp-address>`
`[<member-rp-address>]`

Parameter	Description
<code><anycast-rp-address></code>	<code><X:X::X:X></code> Specify an Anycast IPv6 address to configure an Anycast RP (Rendezvous Point) in a RP set.
<code><member-rp-address></code>	<code><A:B::C:D></code> Specify an Anycast RP (Rendezvous Point) IPv6 address to configure an Anycast RP in a RP set.
<code>vrf</code>	Applies the command to the specified VRF instance.
<code><vrf-name></code>	The VRF instance name.

Mode Global Configuration

Usage notes Anycast is a network addressing and routing scheme where data is routed to the nearest or best destination as viewed by the routing topology. Compared to unicast with a one-to-one association between network address and network endpoint, and multicast with a one-to-many association between network address and network endpoint; anycast has a one-to-many association between network address and network endpoint. For anycast, each destination address identifies a set of receiver endpoints, from which only one receiver endpoint is chosen.

Anycast is often implemented using BGP to simultaneously advertise the same destination IPv6 address range from many sources, resulting in packets addressed to destination addresses in this range being routed to the nearest source announcing the given destination IPv6 address.

Use this command to specify the Anycast RP configuration in the Anycast RP set. Use the **no** variant of this command to remove the Anycast RP configuration. Note that the member RP address is optional when using the **no** parameter to remove the Anycast RP configuration. Removing the Anycast RP address also removes the member RP address.

Examples The following example shows how to configure the Anycast RP address with **ipv6 pim anycast-rp**:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim anycast-rp 2:2::2:2 20:20::20:20
```

The following example shows how to remove the Anycast RP in the RP set specifying only the Anycast RP address with **no ipv6 pim anycast-rp**, but not specifying the member RP address:

```
awplus# configure terminal
awplus(config)# no ipv6 pim anycast-rp 2:2::2:2 20:20::20:20
```

Command changes Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

ipv6 pim bsr-border

Overview Use the **ipv6 pim bsr-border** command to prevent Bootstrap Router (BSR) messages from being sent or received through an interface. The BSR border is the border of the PIM-SMv6 domain.

Use the **no** variant of this command to disable the configuration set with **ipv6 pim bsr-border**.

Syntax `ipv6 pim bsr-border`
`no ipv6 pim bsr-border`

Mode Interface Configuration for a VLAN interface.

Usage When this command is configured on an interface, no PIM-SMv6 BSR messages will be sent or received through the interface. Configure an interface bordering another PIM-SMv6 domain with this command to avoid BSR messages from being exchanged between the two PIM-SMv6 domains.

BSR messages should not be exchanged between different domains, because devices in one domain may elect Rendezvous Points (RPs) in the other domain, resulting in loss of isolation between the two PIM domains that would stop the PIM-SMv6 protocol from working as intended.

Examples The following example configures the VLAN interface vlan2 to be the PIM-SMv6 domain border:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim bsr-border
```

The following example removes the VLAN interface vlan2 from the PIM-SMv6 domain border:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim bsr-border
```

ipv6 pim bsr-candidate

Overview Use this command to give the device the candidate BSR (Bootstrap Router) status using the specified IPv6 address mask of the interface.

Use the **no** variant of this command to withdraw the address of the interface from being offered as a BSR candidate.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `ipv6 pim bsr-candidate <interface> [<hash>] [<priority>]`
`no ipv6 pim bsr-candidate [<interface>]`

Syntax (VRF-lite) `ipv6 pim [vrf <vrf-name>] bsr-candidate <interface> [<hash>] [<priority>]`
`no ipv6 pim [vrf <vrf-name>] bsr-candidate [<interface>]`

Parameter	Description
<interface>	Specify the interface.
<hash>	<0-128> configure the hash mask length used for RP selection. The default hash value if you do not configure this parameter is 126.
<priority>	<0-255> configure priority for a BSR candidate. Note that you must also specify the <hash> (mask length) when specifying the <priority>. The default priority if you do not configure this parameter is 64.
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name

Mode Global Configuration

Default The default hash parameter value is 126 and the default priority parameter value is 64.

Examples To set the BSR candidate to the VLAN interface vlan2, with the optional mask length and BSR priority parameters, enter the commands shown below:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim bsr-candidate vlan2 20 30
```

To withdraw the address of vlan2 from being offered as a BSR candidate, enter:

```
awplus# configure terminal
awplus(config)# no ipv6 pim bsr-candidate vlan2
```

Command changes Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

ipv6 pim cisco-register-checksum

Overview Use this command to configure the option to calculate the Register Checksum over the whole packet. This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to disable this option.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `ipv6 pim cisco-register-checksum`
`no ipv6 pim cisco-register-checksum`

Syntax (VRF-lite) `ipv6 pim [vrf <vrf-name>] cisco-register-checksum`
`no ipv6 pim [vrf <vrf-name>] cisco-register-checksum`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name

Default This command is disabled by default. By default, Register Checksum is calculated only over the header.

Mode Global Configuration

Example To calculate the Register Checksum over the whole packet, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim cisco-register-checksum
```

To return to calculating the Register Checksum over the header, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim cisco-register-checksum
```

Command changes Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

ipv6 pim cisco-register-checksum group-list

Overview Use this command to configure the option to calculate the Register Checksum over the whole packet on multicast groups as specified by the software IPv6 access-list. This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to revert to default settings.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `ipv6 pim cisco-register-checksum group-list <IPv6-access-list>`
`no ipv6 pim cisco-register-checksum group-list`
`<IPv6-access-list>`

Syntax (VRF-lite) `ipv6 pim [vrf <vrf-name>] cisco-register-checksum group-list`
`<IPv6-access-list>`
`no ipv6 pim [vrf <vrf-name>] cisco-register-checksum group-list`
`<IPv6-access-list>`

Parameter	Description
<code><IPv6-access-list></code>	Optional. Specify a Standard or Extended software IPv6 access list. See IPv6 Software Access Control List (ACL) Commands for supported IPv6 ACLs. Use this parameter to configure the option to calculate the Register Checksum over the whole packet on multicast groups as specified by an IPv6 access list entered after this command.
<code>vrf</code>	Applies the command to the specified VRF instance.
<code><vrf-name></code>	The VRF instance name

Mode Global Configuration

Default This command is disabled by default. By default, Register Checksum is calculated only over the header.

Example To calculate the Register Checksum over the whole packet on the multicast groups ff0x::db8:0:0/96, as specified by the ACL named G1, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 access-list standard G1 permit
ff0x::db8:0:0/96
awplus(config)# ipv6 pim cisco-register-checksum group-list G1
```

Command changes Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

ipv6 pim crp-cisco-prefix

Overview Use this command to interoperate with Cisco devices that conform to an earlier draft standard. Some Cisco devices might not accept candidate RPs with a group prefix number of zero. Note that the latest BSR specification prohibits sending RP advertisements with prefix 0.

Use the **no** variant of this command to revert to the default settings.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `ipv6 pim crp-cisco-prefix`
`no ipv6 pim crp-cisco-prefix`

Syntax (VRF-lite) `ipv6 pim [vrf <vrf-name>] crp-cisco-prefix`
`no ipv6 pim [vrf <vrf-name>] crp-cisco-prefix`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name

Mode Global Configuration

Example To enable this option, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim crp-cisco-prefix
```

To disable this option again, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim crp-cisco-prefix
```

Related commands [ipv6 pim rp-candidate](#)

Command changes Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

ipv6 pim dr-priority

Overview Use this command to set the Designated Router priority value.
Use the **no** variant of this command to disable this function.

Syntax `ipv6 pim dr-priority <priority>`
`no ipv6 pim dr-priority [<priority>]`

Parameter	Description
<priority>	Specify the Designated Router priority value, in the range 0 to 4294967294. Note that a higher value has a higher preference or higher priority.

Default The default value is 1. The negated form of this command restores the value to the default.

Mode Interface Configuration for a VLAN interface.

Examples To set the Designated Router priority value to 11234 for the VLAN interface vlan2, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim dr-priority 11234
```

To disable the Designated Router priority value for the VLAN interface vlan2, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim dr-priority
```

Related commands [ipv6 pim ignore-rp-set-priority](#)

ipv6 pim exclude-genid

Overview Use this command to exclude the GenID option from Hello packets sent out by the PIM-SMv6 module on a particular interface. This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to revert to default settings.

Syntax `ipv6 pim exclude-genid`
`no ipv6 pim exclude-genid`

Default By default, this command is disabled; the GenID option is included.

Mode Interface Configuration for a VLAN interface.

Examples To exclude the GenID option in Hello packets on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim exclude-genid
```

To include the GenID option in Hello packets, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim exclude-genid
```

ipv6 pim ext-srcs-directly-connected

Overview Use this command to configure PIM-SMv6 to treat all source traffic arriving on the interface as though it was sent from a host directly connected to the interface.

Use the **no** variant of this command to configure PIM-SMv6 to treat only directly connected sources as directly connected.

Syntax `ipv6 pim ext-srcs-directly-connected`
`no ipv6 pim ext-srcs-directly-connected`

Default The **no** variant of this command is the default behavior.

Mode Interface Configuration for a VLAN interface.

Example To configure PIM-SMv6 to treat all sources as directly connected for VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim ext-srcs-directly-connected
```

To configure PIM-SMv6 to treat only directly connected sources as directly connected for VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim ext-srcs-directly-connected
```

ipv6 pim hello-holdtime

Overview This command configures a hello-holdtime value. You cannot configure a hello-holdtime value that is less than the current hello-interval.

Use the **no** variant of this command to return it to its default of 3.5 * the current hello-interval.

Syntax `ipv6 pim hello-holdtime <holdtime>`
`no ipv6 pim hello-holdtime`

Parameter	Description
<holdtime>	<1-65535> The holdtime value in seconds (no fractional seconds are accepted).

Default The default hello-holdtime value is 3.5 * the current hello-interval. The default hello-holdtime is restored using the negated form of this command.

Mode Interface Configuration for a VLAN interface.

Usage Each time the hello-interval is updated, the hello-holdtime is also updated, according to the following rules:

If the hello-holdtime is not configured; or if the hello-holdtime is configured and less than the current hello-interval value, it is modified to the (3.5 * hello-interval). Otherwise, it retains the configured value.

Examples To configure a hello-holdtime of 123 seconds on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim hello-holdtime 123
```

To reset the hello-holdtime to default, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim hello-holdtime
```

ipv6 pim hello-interval

Overview This command configures a hello-interval value for PIM-SMv6.

Use the **no** variant of this command to reset the hello-interval for PIM-SMv6 to the default.

Syntax `ipv6 pim hello-interval <interval>`
`no ipv6 pim hello-interval`

Parameter	Description
<interval>	<1-65535> The value in seconds (no fractional seconds accepted).

Default The default hello-interval value is 30 seconds. The default is restored using the negated form of this command.

Mode Interface Configuration for a VLAN interface.

Usage When the hello-interval is configured, and the hello-holdtime is not configured, or when the configured hello-holdtime value is less than the new hello-interval value; the holdtime value is modified to the (3.5 * hello-interval). Otherwise, the hello-holdtime value is the configured value.

Example To set the hello-interval to 123 seconds on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim hello-interval 123
```

To set the hello-interval to the default on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim hello-interval
```

ipv6 pim ignore-rp-set-priority

Overview Use this command to ignore the RP-SET priority value, and use only the hashing mechanism for RP selection.

Use the **no** variant of this command to disable this setting.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `ipv6 pim ignore-rp-set-priority`
`no ipv6 pim ignore-rp-set-priority`

Syntax (VRF-lite) `ipv6 pim [vrf <vrf-name>] ignore-rp-set-priority`
`no ipv6 pim [vrf <vrf-name>] ignore-rp-set-priority`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name

Mode Global Configuration

Usage This command is used to inter-operate with older Cisco IOS versions.

Example To enable this option, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim ignore-rp-set-priority
```

To disable this option again, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim ignore-rp-set-priority
```

Command changes Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

ipv6 pim jp-timer

Overview Use this command to set the PIM-SMv6 join/prune timer. Note that the value set by the join/prune timer is the value that the device puts into the holdtime field of the join/prune packets it sends to its neighbors.

Use the **no** variant of this command to return the PIM-SMv6 join/prune timer to its default value of 210 seconds.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `ipv6 pim jp-timer <1-65535>`
`no ipv6 pim jp-timer [<1-65535>]`

Syntax (VRF-lite) `ipv6 pim [vrf <vrf-name>] jp-timer <1-65535>`
`no ipv6 pim [vrf <vrf-name>] jp-timer [<1-65535>]`

Parameter	Description
<1-65535>	Specifies the Join/Prune timer value. The default value is 210 seconds.
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name

Default The default PIM-SMv6 join/prune timer value is 210 seconds.

Mode Global Configuration

Example To change the join/prune timer to 300 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim jp-timer 300
```

To return the join/prune timer to its default value, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim jp-timer
```

Command changes Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

ipv6 pim neighbor-filter

Overview This command enables filtering of neighbors on the VLAN interface. When configuring a neighbor filter, PIM-SMv6 will either not establish adjacency with the neighbor, or terminate adjacency with the existing neighbors if denied by the filtering IPv6 access list.

Use the **no** variant of this command to disable this function.

Syntax `ipv6 pim neighbor-filter <IPv6-accesslist>`
`no ipv6 pim neighbor-filter <IPv6-accesslist>`

Parameter	Description
<code><IPv6-access list></code>	Specify a Standard or an Extended software IPv6 access list name for the PIM-SMv6 neighbor filter. See the IPv6 Software Access Control List (ACL) Commands chapter for supported IPv6 ACLs.

Default By default, there is no neighbor filtering applied to an interface.

Mode Interface Configuration for a VLAN interface.

Example To enable filtering on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 access-list standard filter1 deny
fe80:20e:cff:fe01:facc
awplus(config-if)# ipv6 access-list standard filter1 permit any
awplus(config-if)# ipv6 pim neighbor-filter filter1
```

ipv6 pim register-rate-limit

Overview Use this command to configure the rate of register packets sent by this DR, in units of packets per second. The configured rate is per (S, G) state, and is not a system wide rate.

Use the **no** variant of this command to remove the limit.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `ipv6 pim register-rate-limit <1-65535>`
`no ipv6 pim register-rate-limit`

Syntax (VRF-lite) `ipv6 pim [vrf <vrf-name>] register-rate-limit <1-65535>`
`no ipv6 pim [vrf <vrf-name>] register-rate-limit`

Parameter	Description
<1-65535>	Specifies the maximum number of packets that can be sent per second.
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name

Mode Global Configuration

Default The default is 0, which means no rate limit.

Examples To set the rate limit to 3444 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-rate-limit 3444
```

To remove the rate limit, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim register-rate-limit
```

Command changes Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

ipv6 pim register-rp-reachability

Overview Use this command to enable the RP reachability check for PIMv6 Register processing at the DR. The default setting is no checking for RP-reachability.

Use the **no** variant of this command to disable this processing.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `ipv6 pim register-rp-reachability`
`no ipv6 pim register-rp-reachability`

Syntax (VRF-lite) `ipv6 pim [vrf <vrf-name>] register-rp-reachability`
`no ipv6 pim [vrf <vrf-name>] register-rp-reachability`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name

Default This command is disabled; by default, there is no checking for RP-reachability.

Mode Global Configuration

Examples To check for RP reachability, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-rp-reachability
```

To stop checking for RP reachability, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim register-rp-reachability
```

Command changes Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

ipv6 pim register-source

Overview Use this command to configure the source IPv6 address of register packets sent by this DR, overriding the default source IPv6 address, which is the IPv6 address of the RPF interface toward the source host.

Use the **no** variant of this command to remove the IPv6 source address of Register packets sent by this DR, reverting back to use the default IPv6 source address that is the address of the RPF interface toward the source host.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `ipv6 pim register-source [<source-IPv6-address>|<interface>]`
`no ipv6 pim register-source`

Syntax (VRF-lite) `ipv6 pim [vrf <vrf-name>] register-source`
`[<source-IPv6-address>|<interface>]`
`no ipv6 pim [vrf <vrf-name>] register-source`

Parameter	Description
<source-IPv6-address>	The IPv6 address, entered in the form X:X::X:X, to be used as the source of the register packets.
<interface>	The name of the interface to be used as the source of the register packets.
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name

Mode Global Configuration

Usage The configured address must be a reachable address to be used by the RP to send corresponding Register-Stop messages in response. It is normally the local loopback IPv6 interface address, but can also be a physical IPv6 address. This IPv6 address must be advertised by unicast routing protocols on the DR. The configured interface does not have to be PIM-SMv6 enabled.

Mode Global Configuration

Examples To configure the register source as 3ffe::24:2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-source 3ffe::24:2
```

To configure the register source as vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-source vlan2
```

To change back to the default, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# no ipv6 pim register-source
```

Command changes Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

ipv6 pim register-suppression

Overview Use this command to configure the register-suppression time, in seconds, overriding the default of 60 seconds.

Use the **no** variant of this command to reset the value to its default of 60 seconds.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `ipv6 pim register-suppression <1-65535>`
`no ipv6 pim register-suppression`

Syntax (VRF-lite) `ipv6 pim [vrf <vrf-name>] register-suppression <1-65535>`
`no ipv6 pim [vrf <vrf-name>] register-suppression`

Parameter	Description
<1-65535>	Register suppression on time in seconds.
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name

Mode Global Configuration

Default 60 seconds

Usage Configuring this value modifies register-suppression time at the DR. Configuring this value at the RP modifies the RP-keepalive-period value if the [ipv6 pim rp-register-kat](#) command is not used.

Examples To change the register-suppression time to 192 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-suppression 192
```

To return to the default register-suppression time of 60 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim register-suppression
```

Command changes Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

ipv6 pim rp-address

Overview Use this command to statically configure RP (Rendezvous Point) address for IPv6 multicast groups.

Use the **no** variant of this command to remove a statically configured RP (Rendezvous Point) address for IPv6 multicast groups.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `ipv6 pimv6 rp-address <IPv6-address> [<IPv6-access-list>]
[override]`
`no ipv6 pim rp-address <IPv6-address> [<IPv6-access-list>]
[override]`

Syntax (VRF-lite) `ipv6 pim [vrf <vrf-name>] rp-address <IPv6-address>
[<IPv6-access-list>] [override]`
`no ipv6 pim [vrf <vrf-name>] rp-address <IPv6-address>
[<IPv6-access-list>] [override]`

Parameter	Description
<IPv6-address>	Specify the IPv6 address of the Rendezvous Point, entered in the form X:X::X:X.
<IPv6-access-list>	Specify a Standard or an Extended software IPv6 access-list name. See IPv6 Software Access Control List (ACL) Commands for supported IPv6 ACLs.
override	Specify this optional parameter keyword to enable any statically defined RPs to override dynamically learned RPs.
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name

Mode Global Configuration

Usage notes The AlliedWare Plus™ PIM-SMv6 implementation supports multiple static RPs. It also supports usage of static RPs and the BSR mechanism simultaneously. This command is used to statically configure the RP address for IPv6 multicast groups.

You need to understand the following information before using this command:

If the RP address that is configured by the BSR, and the RP-address that is configured statically, are both available for a group range, then the RP address configured through BSR is chosen over the statically configured RP address.

A single static RP can be configured for multiple group ranges using software IPv6 access- lists (ACLs). However, configuring multiple static RPs with the same RP address is not allowed. The static RP can either be configured for the whole

multicast group range ff00::/8 (without using IPv6 ACLs) or for specific group ranges (using IPv6 ACLs). For example:

- **ipv6 pim rp-address 3ffe:10:10:5::153** will configure static RP 3ffe:10:10:5::153 for the default group range ff00::/8.
- **ipv6 pim rp-address 3fee:20:20:5::153 grp-list** will configure static RP 3fee:20:20:5::153 for all the group ranges represented by permit filters in the defined named **grp-list** ACL.

If multiple static RPs are available for a group range, then one with the highest IPv6 address is chosen.

Only **permit** filters in IPv6 ACLs are considered as valid group ranges. The default **permit** filter ::/0 is converted to the default multicast filter ff00::/8.

After configuration, the RP address is inserted into a static RP group tree based on the configured group ranges. For each group range, multiple static RPs are maintained in a list. This list is sorted in a descending order of IPv6 addresses. When selecting static RPs for a group range, the first element (which is the static RP with highest IPv6 address) is chosen.

RP address deletion is handled by removing the static RP from all the existing group ranges and recalculating the RPs for existing TIB states if required.

Group mode and RP address mappings learned through BSR take precedence over mappings statistically defined by this command. Commands with the **override** parameter take precedence over dynamically learned mappings.

Examples To configure static-RP 3ffe:30:30:5::153 for the group range 2001:db8::/128 (specified in the permit filter in the ACL named G2), use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 access-list standard G2 permit
2001:db8::/128
awplus(config)# ipv6 pim rp-address 3ffe:30:30:5::153 G2
```

To undo that configuration, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim rp-address 3ffe:30:30:5::153 G2
```

Related commands [ipv6 pim rp-candidate](#)

Command changes Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

ipv6 pim rp-candidate

Overview Use this command to make the device an RP (Rendezvous Point) candidate, using the IPv6 address of the specified interface.

Use the **no** variant of this command to stop the device from being an RP candidate.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `ipv6 pim rp-candidate <interface> [priority <priority>|interval <interval>|grouplist <accesslist>]`
`no ipv6 pim rp-candidate [<interface>]`

Syntax (VRF-lite) `ipv6 pim [vrf <vrf-name>] rp-candidate <interface> [priority <priority>|interval <interval>|grouplist <accesslist>]`
`no ipv6 pim [vrf <vrf-name>] rp-candidate [<interface>]`

Parameter	Description
<interface>	The interface name.
priority <priority>	The RP candidate priority for this interface on this device, from 0 to 255. The lower the priority value, the more likely this candidate is to become the RP.
interval <interval>	The advertisement interval, from 1 to 16383 seconds.
grouplist <accesslist>	A Standard or an Extended software IPv6 access list name. See the IPv6 Software Access Control List (ACL) Commands chapter for supported IPv6 ACLs.
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name

Default The priority value for a candidate RP is 192 by default until specified using the **priority** parameter.

Mode Global Configuration

Usage notes Note that issuing the command **ipv6 pim rp-candidate <interface>** without optional **priority**, **interval**, or **grouplist** parameters will configure the candidate RP with a priority value of 192.

Examples To specify a priority of 3, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim rp-candidate vlan2 priority 3
```

To stop the device from being an RP candidate on vlan2 , use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim rp-candidate vlan2
```

To use the ACL named G2 to specify the group prefixes that are advertised in association with the RP address, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 access-list standard G2 permit
2001:db8::/128
awplus(config)# ipv6 pim rp-candidate vlan2 group-list G2
```

Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

ipv6 pim rp embedded

Overview Use this command to configure and enable embedded RP (Rendezvous Point) in PIM-SMv6.

This command only applies to the embedded RP group range **ff7x::/12** and **fffx::/12**.

Use the **no** variant of this command to disable embedded RP support. Since embedded RP support is enabled by default, use the **no** variant of this command to disable the default.

Syntax `ipv6 pim rp embedded`
`no ipv6 pim rp embedded`

Syntax (VRF-lite) `ipv6 pim [vrf <vrf-name>] rp embedded`
`no ipv6 pim [vrf <vrf-name>] rp embedded`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name

Mode Global Configuration

Default Enabled

Examples The following example re-enables embedded RP support, the default state in PIM-SMv6:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim rp embedded
```

The following example disables embedded RP support, which is enabled by default in PIM-SMv6:

```
awplus# configure terminal
awplus(config)# no ipv6 pim rp embedded
```

Command changes Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

ipv6 pim rp-register-kat

Overview Use this command to configure the Keep Alive Time (KAT) for (S,G) states at the RP (Rendezvous Point) to monitor PIM-SMv6 Register packets.

Use the **no** variant of this command to return the PIM-SMv6 KAT timer to its default value of 210 seconds.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `ipv6 pim rp-register-kat <1-65535>`
`no ipv6 pim rp-register-kat`

Syntax (VRF-lite) `ipv6 pim [vrf <vrf-name>] rp-register-kat <1-65535>`
`no ipv6 pim [vrf <vrf-name>] rp-register-kat`

Parameter	Description
<1-65536>	Specify the KAT timer in seconds. The default value is 210 seconds.
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name

Mode Global Configuration

Default The default PIM-SMv6 KAT timer value is 210 seconds.

Examples To change the KAT timer to 3454 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim rp-register-kat 3454
```

To return the KAT timer to its default setting, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim rp-register-kat
```

Related commands [ipv6 pim rp-address](#)
[ipv6 pim rp-candidate](#)

Command changes Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

ipv6 pim sparse-mode

Overview Use this command to enable PIM-SMv6 on an interface.
Use the **no** variant of this command to disable PIM-SMv6 on an interface.

Syntax `ipv6 pim sparse-mode`
`no ipv6 pim sparse-mode`

Mode Interface Configuration for a VLAN interface.

Examples To enable PIM-SMv6 on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim sparse-mode
```

To disable PIM-SMv6 on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim sparse-mode
```

ipv6 pim sparse-mode passive

Overview Use this command to enable and disable PIM-SMv6 passive mode operation for local members on an interface.

Use the **no** variant of this command to disable PIM-SMv6 passive mode operation for local members on an interface.

Syntax `ipv6 pim sparse-mode passive`
`no ipv6 pim sparse-mode passive`

Mode Interface Configuration for a VLAN interface.

Usage Passive mode essentially stops PIM-SMv6 transactions on the interface, allowing only the MLD mechanism to be active.

Examples To enable passive mode on vlan2, use the commands

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim sparse-mode passive
```

To disable passive mode on vlan2, use the commands

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim sparse-mode passive
```

ipv6 pim spt-threshold

Overview This command turns on the ability for the last-hop PIM-SMv6 router to switch to SPT (shortest-path tree).

The **no** variant of this command turns off the ability for the last-hop PIM-SMv6 router to switch to SPT.

NOTE: The switching to SPT happens either at the receiving of the first data packet, or not at all; it is not rate-based.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `ipv6 pim spt-threshold`
`no ipv6 pim spt-threshold`

Syntax (VRF-lite) `ipv6 pim [vrf <vrf-name>] spt-threshold`
`no ipv6 pim [vrf <vrf-name>] spt-threshold`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name

Mode Global Configuration

Examples To enable the last-hop PIM-SMv6 router to switch to SPT, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim spt-threshold
```

To stop the last-hop PIM-SMv6 router from being able to switch to SPT, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim spt-threshold
```

Related commands [ipv6 pim spt-threshold group-list](#)

Command changes Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

ipv6 pim spt-threshold group-list

Overview Use this command to turn on/off the ability for the last-hop PIM-SMv6 router to switch to SPT (shortest-path tree) for multicast group addresses as specified by the given software IPv6 access-list.

Use the **no** variant of this command to turn off switching to the SPT.

NOTE: The switching to SPT happens either at the receiving of the first data packet, or not at all; it is not rate-based.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `ipv6 pim spt-threshold group-list <IPv6-access-list>`
`no ipv6 pim spt-threshold group-list <IPv6-access-list>`

Syntax (VRF-lite) `ipv6 pim [vrf <vrf-name>] spt-threshold group-list <IPv6-access-list>`
`no ipv6 pim [vrf <vrf-name>] spt-threshold group-list <IPv6-access-list>`

Parameter	Description
<IPv6-access-list>	Specify a Standard or an Extended software IPv6 access-list name. See the IPv6 Software Access Control List (ACL) Commands chapter for supported IPv6 ACLs.
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name

Mode Global Configuration

Examples To enable the last-hop PIM-SMv6 router to switch to SPT for groups specified by the ACL named G1, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim spt-threshold group-list G1
awplus(config)# ipv6 access-list standard G1 permit
2001:db8::/128
```

To stop the last-hop PIM-SMv6 router from being able to switch to SPT for groups specified by the ACL named G1, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim spt-threshold group-list G1
```

Related commands [ipv6 pim spt-threshold](#)

Command changes Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

ipv6 pim ssm

Overview Use this command to define the Source Specific Multicast (SSM) range of IPv6 multicast addresses. PIM-SMv6 routers will only install (S,G) entries for multicast groups (addresses) residing in the SSM range.

Use the **no** variant of this command to disable the SSM range.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax

```
ipv6 pim ssm range <named-access-list>
ipv6 pim ssm default
no ipv6 pim ssm
```

Syntax (VRF-lite)

```
ipv6 pim [vrf <vrf-name>] ssm range <named-access-list>
ipv6 pim [vrf <vrf-name>] ssm default
no ipv6 pim [vrf <vrf-name>] ssm
```

Parameter	Description
default	Use FF3x::/32 as the range for SSM.
range	Specify an ACL for group range to be used for SSM.
<named-access-list>	Specify a named standard access list.
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name

Default Disabled

Mode Global Configuration

Usage Any (*,G) or (S,G,rpt) joins received for multicast groups (addresses) within the range are not installed in PIM-SMv6 mroute table.

Examples To configure the SSM service for the IPv6 address range defined by IPv6 access list 'IPv6-PIM-SSM-RANGE', use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list standard IPv6-PIM-SSM-RANGE
permit ff3e::/32
awplus(config)# ipv6 pim ssm range IPv6-PIM-SSM-RANGE
```

To use the default address range for PIM-SSM, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 pim ssm default
```

To disable PIM-SSM, use the commands:

```
awplus# configure terminal  
awplus(config)# no ipv6 pim ssm
```

Command changes Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

ipv6 pim unicast-bsm

Overview Use this command to enable support for the sending and receiving of unicast Bootstrap Messages (BSM) on an interface.

Use the **no** variant of this command to disable the sending and receiving of unicast BSM on an interface.

Syntax `ipv6 pim unicast-bsm`
`no ipv6 pim unicast-bsm`

Mode Interface Configuration for a VLAN interface.

Default Unicast BSM is disabled by default on an interface.

Usage This command provides backward compatibility with older versions of the Bootstrap Router (BSR) specification, which directs unicast BSM to refresh the state of new or restarting neighbors. The current BSR specification defines a No Forward BSM to achieve the same result.

Examples To enable BSM messages on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim unicast-bsm
```

To disable BSM messages on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim unicast-bsm
```

service pim6

Overview Use this command to enable IPv6 PIM sparse mode services.

Use the **no** version of the command to disable unused IPv6 PIM sparse mode services.

Syntax `service pim6`
`no service pim6`

Default Enabled

Mode Global Configuration

Usage notes Sometimes it may be desirable to disable unused services, in order to reduce memory use.

Disabling the PIM services will only take effect after you save the configuration and restart the device.

Example To disable the IPv6 PIM sparse mode service, use the commands:

```
awplus# configure terminal
awplus(config)# no service pim6
```

Output Figure 39-2: Example output from **no service pim6**

```
awplus(config)#no service pim6
% Save the config and restart the device for this change to take
effect
```

Command changes Version 5.5.0-0.1: command added

show debugging ipv6 pim sparse-mode

Overview Use this command to see what debugging is turned on for PIM-SMv6.

For information on filtering and saving command output, see the [“Getting_Started with AlliedWare Plus” Feature Overview and Configuration_Guide](#).

Syntax `show debugging ipv6 pim sparse-mode`

Mode User Exec and Privileged Exec

Example To display PIM-SMv6 debugging settings, use the command:

```
awplus# show debugging ipv6 pim sparse-mode
```

Figure 39-3: Example output from the **show debugging ipv6 pim sparse-mode** command

```
awplus#show debugging ipv6 pim sparse-mode
Debugging status:
  PIM event debugging is on
  PIM MFC debugging is on

show ipv6 pim sparse-mode bsr-router

Overview Use this command to show the PIM-SMv6 Bootstrap Router (BSR) IPv6 address.

For information on filtering and saving command output, see the [“Getting_Started with AlliedWare Plus” Feature Overview and Configuration_Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `show ipv6 pim sparse-mode bsr-router`

Syntax (VRF-lite) `show ipv6 pim [vrf <vrf-name>|global] sparse-mode bsr-router`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
global	The global routing and forwarding table.

Mode User Exec and Privileged Exec

Example To display the BSR IPv6 address, use the command:

```
awplus# show ipv6 pim sparse-mode bsr-router
```

Output Figure 39-4: Example output from the **show ipv6 pim sparse-mode bsr-router** command

```
awplus#show ipv6 pim sparse-mode bsr-router
PIM6v2 Bootstrap information
  BSR address: 2001:203::213 (?)
  Uptime:      00:36:25, BSR Priority: 64, Hash mask length: 126
  Expires:     00:01:46
  Role: Candidate BSR
  State: Candidate BSR

  Candidate RP: 2001:5::211(vlan5)
    Advertisement interval 60 seconds
    Next C-RP advertisement in 00:00:43
```

Command changes Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

show ipv6 pim sparse-mode interface

Overview Use this command to show PIM-SMv6 interface information.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `show ipv6 pim sparse-mode interface [detail]`

Syntax (VRF-lite) `show ipv6 pim [vrf <vrf-name>|global] sparse-mode interface [detail]`

Parameter	Description
detail	Show detailed information.
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
global	The global routing and forwarding table.

Mode User Exec and Privileged Exec

Examples To display information about all PIM-SMv6 interfaces, use the command:

```
awplus# show ipv6 pim sparse-mode interface
```

Output Figure 39-5: Example output from the **show ipv6 pim sparse-mode interface** command

```
awplus#show ipv6 pim sparse-mode interface
Interface VIFindex Ver/   Nbr   DR
              Mode   Count Priority

  Global Address: 3ffe:192:168:10::53
  DR           : this system
```

Table 1: Parameters in the output from the **show ipv6 pim sparse-mode interface** command

Parameters	Description
Address	Primary PIM-SMv6 address.
Interface	Name of the PIM-SMv6 interface.
VIF Index	The Virtual Interface index of the interface.
Ver/Mode	PIMv6 version/Sparse mode.
Nbr Count	Neighbor count of the PIM-SMv6 interface.
DR Priority	Designated Router priority.
DR	The IPv6 address of the Designated Router.

show ipv6 pim sparse-mode local-members

Overview Use this command to show detailed local member information on an interface configured for PIM-SMv6. If you do not specify an interface then detailed local member information is shown for all interfaces configured for PIM-SMv6.

For information on filtering and saving command output, see the [“Getting_Started with AlliedWare Plus” Feature Overview and Configuration_Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `show ipv6 pim sparse-mode local-members [<interface>]`

Syntax (VRF-lite) `show ipv6 pim [vrf <vrf-name>|global] sparse-mode local-members [<interface>]`

Parameter	Description
<interface>	An interface to display information about.
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
global	The global routing and forwarding table.

Mode User Exec and Privileged Exec

Example To show detailed PIM-SMv6 information for all PIM-SMv6 configured interfaces, use the command:

```
awplus# show ipv6 pim sparse-mode local-members
```

Output Figure 39-7: Example output from the **show ipv6 pim sparse-mode local-members** command

```
awplus#show ipv6 pim sparse-mode local-members
PIM Local membership information

vlan1:

  (*, ff02::1:ff6b:4783) : Include

vlan203:

  (*, ff0e:1::4) : Include
```

Output Figure 39-8: Example output from the **show ipv6 pim sparse-mode local-members vlan1** command

```
awplus#show ipv6 pim sparse-mode local-members vlan1
PIM Local membership information

```

Command changes Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

show ipv6 pim sparse-mode mroute

Overview Use this command to display the IPv6 multicast routing table, or the IPv6 multicast routing table based on the specified IPv6 address or addresses.

Two group IPv6 addresses cannot be entered simultaneously; two source IPv6 addresses cannot be entered simultaneously.

For information on filtering and saving command output, see the [“Getting_Started with AlliedWare Plus” Feature Overview and Configuration_Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax

```
show ipv6 pim sparse-mode mroute
show ipv6 pim sparse-mode mroute <group-IPv6-address>
show ipv6 pim sparse-mode mroute <source-IPv6-address>
show ipv6 pim sparse-mode mroute <group-IPv6-address>
<source-IPv6-address>
show ipv6 pim sparse-mode mroute <source-IPv6-address>
<group-IPv6-address>
show ipv6 pim sparse-mode mroute brief
```

Syntax (VRF-lite)

```
show ipv6 pim [vrf <vrf-name>|global] sparse-mode mroute
show ipv6 pim [vrf <vrf-name>|global] sparse-mode mroute
<group-IPv6-address>
show ipv6 pim [vrf <vrf-name>|global] sparse-mode mroute
<source-IPv6-address>
show ipv6 pim [vrf <vrf-name>|global] sparse-mode mroute
<group-IPv6-address> <source-IPv6-address>
show ipv6 pim [vrf <vrf-name>|global] sparse-mode mroute
<source-IPv6-address> <group-IPv6-address>
show ipv6 pim [vrf <vrf-name>|global] sparse-mode mroute brief
```

Parameter	Description
<group-IPv6-address>	Group IPv6 address, entered in the form X:X::X:X. Based on the group and source IPv6 address, the output is the selected route if present in the multicast route tree.
<source-IPv6-address>	Source IPv6 address, entered in the form X:X::X:X. Based on the source and group IPv6 address, the output is the selected route if present in the multicast route tree.
brief	Brief display.
vrf	Applies the command to the specified VRF instance.

Parameter	Description
<vrf-name>	The VRF instance name.
global	The global routing and forwarding table.

Mode User Exec and Privileged Exec

Usage notes Note that when a feature license is enabled, the output for the `show ipv6 pim sparse-mode mroute` command will only show 100 interfaces because of the terminal display width limit. Use the `show ipv6 pim sparse-mode mroute detail` command to display detailed entries of the IPv6 multicast routing table.

Examples

```
awplus# show ipv6 pim sparse-mode mroute
awplus# show ipv6 pim sparse-mode mroute 2001:db8::
awplus# show ipv6 pim sparse-mode mroute 2001:db8:: 2002:db8::
awplus# show ipv6 pim sparse-mode mroute brief
```

Output Figure 39-9: Example output from the `show ipv6 pim sparse-mode mroute` command

```
awplus#show ipv6 pim sparse-mode mroute

Command changes Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

show ipv6 pim sparse-mode mroute detail

Overview Use this command to display detailed entries of the IPv6 multicast routing table, or detailed entries of the IPv6 multicast routing table based on the specified IPv6 address or addresses.

Two group IPv6 addresses cannot be used simultaneously; two IPv6 source addresses cannot be used simultaneously.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration_Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax

```
show ipv6 pim sparse-mode mroute  
[<group-IPv6-address>|<source-IPv6-address>] detail  
  
show ipv6 pim sparse-mode mroute [<group-IPv6-address>  
<source-IPv6-address>] detail  
  
show ipv6 pim sparse-mode mroute [<source-IPv6-address>  
<group-IPv6-address>] detail
```

Syntax (VRF-lite)

```
show ipv6 pim [vrf <vrf-name>|global] sparse-mode mroute  
[<group-IPv6-address>|<source-IPv6-address>] detail  
  
show ipv6 pim [vrf <vrf-name>|global] sparse-mode mroute  
[<group-IPv6-address> <source-IPv6-address>] detail  
  
show ipv6 pim [vrf <vrf-name>|global] sparse-mode mroute  
[<source-IPv6-address> <group-IPv6-address>] detail
```

Parameter	Description
<group-IPv6-address>	Group IPv6 address, entered in the form X:X::X:X. Output is all multicast entries belonging to that group.
<source-IPv6-address>	Source IPv6 address, entered in the form X:X::X:X. Output is all multicast entries belonging to that source.
detail	Show detailed information.
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
global	The global routing and forwarding table.

Mode User Exec and Privileged Exec

Usage notes Based on the group and source IPv6 address, the output is the selected route if present in the multicast route tree.

Examples awplus# show ipv6 pim sparse-mode mroute detail
 awplus# show ipv6 pim sparse-mode mroute 2001:db8:: detail
 awplus# show ipv6 pim sparse-mode mroute 2001:db8:: 2002:db8::

show ipv6 pim sparse-mode neighbor

Overview Use this command to show the PIM-SMv6 neighbor information.

For information on filtering and saving command output, see the [“Getting_Started with AlliedWare Plus” Feature Overview and Configuration_Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `show ipv6 pim sparse-mode neighbor [<interface>]
[<IPv6-address>] [detail]`

Syntax (VRF-lite) `show ipv6 pim [vrf <vrf-name>|global] sparse-mode neighbor
[<interface>] [<IPv6-address>] [detail]`

Parameter	Description
<interface>	Interface name. Show neighbors on an interface.
<IPv6-address>	Show neighbors with a particular address on an interface. The IPv6 address entered in the form X:X::X:X.
detail	Show detailed information.
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
global	The global routing and forwarding table.

Mode User Exec and Privileged Exec

Examples `awplus# show ipv6 pim sparse-mode neighbor`
`awplus# show ipv6 pim sparse-mode neighbor vlan5 detail`

Output Figure 39-12: Example output from the **show ipv6 pim sparse-mode neighbor** command

awplus#show ipv6 pim sparse-mode neighbor			
Neighbor Address	Interface	Uptime/Expires	DR
			Pri/Mode
fe80::202:b3ff:fed4:69fe	vlan2	05:33:52/00:01:41	1 /

```

Command changes Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

show ipv6 pim sparse-mode nexthop

Overview Use this command to see the next hop information as used by PIM-SMv6.

For information on filtering and saving command output, see the [“Getting_Started with AlliedWare Plus” Feature Overview and Configuration_Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `show ipv6 pim sparse-mode nexthop`

Syntax (VRF-lite) `show ipv6 pim [vrf <vrf-name>|global] sparse-mode nexthop`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
global	The global routing and forwarding table.

Mode User Exec and Privileged Exec

Example `awplus# show ipv6 pim sparse-mode nexthop`

Output Figure 39-14: Example output from the **show ipv6 pim sparse-mode nexthop** command

awplus#show ipv6 pim sparse-mode nexthop								
Flags: N = New, R = RP, S = Source, U = Unreachable								
Destination	Type	Nexthop Num	Nexthop Addr	Nexthop Ifindex	Nexthop Name	Metric	Pref	Refcnt
3ffe:10:10:5::153	.RS.	1	fe80::20e:cff:fe01:facc			2 30	110	1

Table 2: Parameters in output of the **show ipv6 pim sparse-mode nexthop** command

Parameter	Description
Destination	The destination address for which PIM-SMv6 requires next hop information.
Type	The type of destination, as indicated by the Flags description. N = New, R= RP, S = Source, U = Unreachable.
Nexthop Num	The number of next hops to the destination. PIM-SMv6 always uses only 1 next hop.

Table 2: Parameters in output of the **show ipv6 pim sparse-mode nexthop** command (cont.)

Parameter	Description
Nexthop Addr	The address of the primary next hop gateway.
Nexthop IfIndex	The interface on which the next hop gateway can be reached.
Nexthop Name	The name of next hop interface.
Metric	The metric of the route towards the destination.
Preference	The preference of the route towards destination.
Refcnt	Only used for debugging.

Command changes Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

show ipv6 pim sparse-mode rp-hash

Overview Use this command to display the Rendezvous Point (RP) to be chosen based on the IPv6 group address selected.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `show ipv6 pim sparse-mode rp-hash <IPv6-group-addr>`

Syntax (VRF-lite) `show ipv6 pim [vrf <vrf-name>|global] sparse-mode rp-hash <IPv6-group-addr>`

Parameter	Description
<IPv6-group-addr>	The IPv6 group address used to find the RP, entered in the form X:X::X:X.
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
global	The global routing and forwarding table.

Mode User Exec and Privileged Exec

Example `awplus# show ipv6 pim sparse-mode rp-hash ff04:10`

Output Figure 39-15: Output from the **show ipv6 pim sparse-mode rp-hash** command:

```
awplus#show ipv6 pim sparse-mode rp-hash ff04::10
RP: 3ffe:10:10:5::153
Info source: 3ffe:10:10:5::153, via bootstrap
```

Related commands [show ipv6 pim sparse-mode rp mapping](#)

Command changes Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

show ipv6 pim sparse-mode rp mapping

Overview Use this command to show group-to-RP (Rendezvous Point) mappings, and the RP set.

For information on filtering and saving command output, see the [“Getting_Started with AlliedWare Plus” Feature Overview and Configuration_Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `show ipv6 pim sparse-mode rp mapping`

Syntax (VRF-lite) `show ipv6 pim [vrf <vrf-name>|global] sparse-mode rp mapping`

Parameter	Description
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
global	The global routing and forwarding table.

Mode User Exec and Privileged Exec

Example `awplus# show ipv6 pim sparse-mode rp mapping`

Output Figure 39-16: Output from the **show ipv6 pim sparse-mode rp mapping** command

```
awplus#show ipv6 pim sparse-mode rp mapping
PIM Group-to-RP Mappings
Group(s): ff00::/8
  RP: 3ffe:10:10:5::153
    Info source: 3ffe:10:10:5::153, via bootstrap, priority 192
    Uptime: 05:36:40
```

Related commands [show ipv6 pim sparse-mode rp-hash](#)

Command changes Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

show ipv6 pim sparse-mode rp nexthop

Overview Use this command to display the RP (Rendezvous Point) next hop information used by PIM-SMv6.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax `show ipv6 pim sparse-mode rp nexthop <RP-group-addr>`

Syntax (VRF-lite) `show ipv6 pim [vrf <vrf-name>|global] sparse-mode rp nexthop <RP-group-addr>`

Parameter	Description
<RP-group-addr>	Specify the RP group address used to display next hop RP information, entered in the form X:X::X:X.
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
global	The global routing and forwarding table.

Mode User Exec and Privileged Exec

Example `awplus# show ipv6 pim sparse-mode rp nexthop 3ffe:10:10:5::153`

Output Figure 39-17: Example output from the **show ipv6 pim sparse-mode rp nexthop** command

awplus#show ipv6 pim sparse-mode rp nexthop 3ffe:10:10:5::153								
Flags: N = New, R = RP, S = Source, U = Unreachable								
Destination	Type	Nexthop Num	Nexthop Addr	Nexthop Ifindex	Nexthop Name	Metric	Pref	Refcnt
3ffe:10:10:5::153	.RS.	1	fe80::20e:cff:fe01:facc	2	30	110	1	

Table 3: Parameters in output of the **show ipv6 pim sparse-mode rp nexthop** command

Parameter	Description
Destination	The destination address for which PIM-SMv6 requires next hop information.
Type	The type of destination, as indicated by the Flags description. N = New, R= RP, S = Source, U = Unreachable.
Nexthop Num	The number of next hops to the destination. PIM-SMv6 always uses only 1 next hop.
Nexthop Addr	The address of the primary next hop gateway.
Nexthop IfIndex	The interface on which the next hop gateway can be reached.
Nexthop Name	The name of next hop interface.
Metric	The metric of the route towards the destination.
Preference	The preference of the route towards destination.
Refcnt	Only used for debugging.

Command changes Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

undebug all ipv6 pim sparse-mode

Overview Use this command to disable all PIM-SMv6 debugging.

Syntax `undebug all ipv6 pim sparse-mode`

Mode Privileged Exec

Example `awplus# undebug all ipv6 pim sparse-mode`

Related commands [debug ipv6 pim sparse-mode](#)

undebg ipv6 pim sparse-mode

Overview Use this command to deactivate PIM-SMv6 debugging. Note that this command is an alias of the no variant of the [debug ipv6 pim sparse-mode](#) command.

Syntax `undebg ipv6 pim sparse-mode [all] [events] [mfc] [mib]
[nexthop] [nsm] [state] [timer]`

Parameter	Description
all	Deactivates all PIM-SMv6 debugging.
events	Deactivates debug printing of PIM-SMv6 events.
mfc	Deactivates debug printing of MFC (Multicast Forwarding Cache).
mib	Deactivates debug printing of PIM-SMv6 MIBs.
nexthop	Deactivates debug printing of PIM-SMv6 next hop communications.
nsm	Deactivates debugging of PIM-SMv6 NSM (Network Services Module) communications.
state	Deactivates debug printing of state transition on all PIM-SMv6 FSMs.
timer	Deactivates debug printing of PIM-SMv6 timers.

Mode Privileged Exec and Global Configuration

Example

```
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# undebg ipv6 pim sparse-mode all
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# undebg ipv6 pim sparse-mode events
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# undebg ipv6 pim sparse-mode nexthop
```

**Validation
Output**

Figure 39-18: Example output from the **show debugging ipv6 pim sparse-mode** command after issuing the **undebg ipv6 pim sparse-mode all** command

```
awplus#undebg ipv6 pim sparse-mode all
awplus#show debugging ipv6 pim sparse-mode
PIM-SMv6 debugging status:
  PIM event debugging is off
  PIM MFC debugging is off

debug pim dense-mode all

Overview This command enables PIM-DM debugging.
The **no** variant of this command disables PIM-DM debugging.

Syntax `debug pim dense-mode all`
`no debug pim dense-mode all`

Mode Privileged Exec and Global Configuration

Example `awplus# configure terminal`
`awplus(config)# debug pim dense-mode all`

Output Figure 40-1: Example output from the **debug pim dense-mode all** command

```
PIM event debugging is on
PIM MFC debugging is on
PIM state debugging is on
PIM packet debugging is on
PIM incoming packet debugging is on
PIM outgoing packet debugging is on
```

Validation Commands `show debugging pim dense-mode`

Related commands `debug pim dense-mode context`
`debug pim dense-mode decode`
`debug pim dense-mode encode`
`debug pim dense-mode fsm`
`debug pim dense-mode mrt`
`debug pim dense-mode nexthop`
`debug pim dense-mode nsm`
`debug pim dense-mode vif`

debug pim dense-mode context

Overview This command enables debugging of general configuration context.

The **no** variant of this command disables debugging of general configuration context.

This command also enables debugging of general configuration and Virtual Routing (VR), and Virtual Routing and Forwarding (VRF) context.

The **no** variant of this command also disables debugging of general configuration and Virtual Routing (VR), and Virtual Routing and Forwarding (VRF) context.

Syntax `debug pim dense-mode context`
`no debug pim dense-mode context`

Mode Privileged Exec and Global Configuration

Example `awplus# configure terminal`
`awplus(config)# debug pim dense-mode context`

Related commands

- `debug pim dense-mode all`
- `debug pim dense-mode decode`
- `debug pim dense-mode encode`
- `debug pim dense-mode fsm`
- `debug pim dense-mode mrt`
- `debug pim dense-mode nexthop`
- `debug pim dense-mode nsm`
- `debug pim dense-mode vif`

debug pim dense-mode decode

Overview This command enables debugging of the PIM-DM message decoder.
The **no** variant of this command disables debugging of the PIM-DM message decoder.

Syntax `debug pim dense-mode decode`
`no debug pim dense-mode decode`

Mode Privileged Exec and Global Configuration

Example `awplus# configure terminal`
`awplus(config)# debug pim dense-mode decoder`

Related commands `debug pim dense-mode all`
`debug pim dense-mode context`
`debug pim dense-mode encode`
`debug pim dense-mode fsm`
`debug pim dense-mode mrt`
`debug pim dense-mode nexthop`
`debug pim dense-mode nsm`
`debug pim dense-mode vif`

debug pim dense-mode encode

Overview This command enables debugging of the PIM-DM message encoder.
The **no** variant of this command disables debugging of the PIM-DM message encoder.

Syntax `debug pim dense-mode encode`
`no debug pim dense-mode encode`

Mode Privileged Exec and Global Configuration

Example `awplus# configure terminal`
`awplus(config)# debug pim dense-mode encoder`

Related commands

- `debug pim dense-mode all`
- `debug pim dense-mode context`
- `debug pim dense-mode decode`
- `debug pim dense-mode fsm`
- `debug pim dense-mode mrt`
- `debug pim dense-mode nexthop`
- `debug pim dense-mode nsm`
- `debug pim dense-mode vif`

debug pim dense-mode fsm

Overview This command enables debugging of Finite-State Machine (FSM) specific information of all Multicast Routing Table (MRT) and MRT Virtual Multicast Interface (MRT-VIF) entries.

The **no** variant of this command disables debugging of Finite-State Machine (FSM) specific information of all Multicast Routing Table (MRT) and MRT Virtual Multicast Interface (MRT-VIF) entries.

Syntax `debug pim dense-mode fsm`
`no debug pim dense-mode fsm`

Mode Privileged Exec and Global Configuration

Example `awplus# configure terminal`
`awplus(config)# debug pim dense-mode fsm`

Related commands `debug pim dense-mode all`
`debug pim dense-mode context`
`debug pim dense-mode decode`
`debug pim dense-mode encode`
`debug pim dense-mode mrt`
`debug pim dense-mode nexthop`
`debug pim dense-mode nsm`
`debug pim dense-mode vif`

debug pim dense-mode mrt

Overview This command enables debugging of MRT and MRT-VIF entry handling (for example, creation and deletion of).

The **no** variant of this command disables debugging of MRT and MRT-VIF entry handling.

Syntax `debug pim dense-mode mrt`
`no debug pim dense-mode mrt`

Mode Privileged Exec and Global Configuration

Example `awplus# configure terminal`
`awplus(config)# debug pim dense-mode mrt`

Related commands `debug pim dense-mode all`
`debug pim dense-mode context`
`debug pim dense-mode decode`
`debug pim dense-mode encode`
`debug pim dense-mode fsm`
`debug pim dense-mode nexthop`
`debug pim dense-mode nsm`
`debug pim dense-mode vif`

debug pim dense-mode nexthop

Overview This command enables debugging of Reverse Path Forwarding (RPF) neighbor next hop cache handling.

The **no** variant of this command disables debugging of Reverse Path Forwarding (RPF) neighbor next hop cache handling.

Syntax `debug pim dense-mode nexthop`
`no debug pim dense-mode nexthop`

Mode Privileged Exec and Global Configuration

Example `awplus# configure terminal`
`awplus(config)# debug pim dense-mode nexthop`

Related commands `debug pim dense-mode all`
`debug pim dense-mode context`
`debug pim dense-mode decode`
`debug pim dense-mode encode`
`debug pim dense-mode fsm`
`debug pim dense-mode mrt`
`debug pim dense-mode nsm`
`debug pim dense-mode vif`

debug pim dense-mode nsm

Overview This command enables debugging of PIM-DM interface with NSM.
The **no** variant of this command disables debugging of PIM-DM interface with NSM.

Syntax `debug pim dense-mode nsm`
`no debug pim dense-mode nsm`

Mode Privileged Exec and Global Configuration

Example `awplus# configure terminal`
`awplus(config)# debug pim dense-mode nsm`

Related commands `debug pim dense-mode all`
`debug pim dense-mode context`
`debug pim dense-mode decode`
`debug pim dense-mode encode`
`debug pim dense-mode fsm`
`debug pim dense-mode mrt`
`debug pim dense-mode nexthop`
`debug pim dense-mode vif`

debug pim dense-mode vif

Overview This command enables debugging of VIF handling.
The **no** variant of this command disables debugging of VIF handling.

Syntax `debug pim dense-mode vif`
`no debug pim dense-mode vif`

Mode Privileged Exec and Global Configuration

Example `awplus# configure terminal`
`awplus(config)# debug pim dense-mode vif`

Related commands `debug pim dense-mode all`
`debug pim dense-mode context`
`debug pim dense-mode decode`
`debug pim dense-mode encode`
`debug pim dense-mode fsm`
`debug pim dense-mode mrt`
`debug pim dense-mode nexthop`
`debug pim dense-mode nsm`

ip pim dense-mode

Overview This command enables or disables PIM-DM operation from Interface mode on the current VLAN interface. This command also disables passive mode on the VLAN interface if passive mode has been enabled using an [ip pim dense-mode passive](#) command.

The **no** variant of this command disables all PIM-DM activities on the interface.

Syntax `ip pim dense-mode`
`no ip pim dense-mode`

Mode Interface Configuration for a VLAN interface.

Example `awplus# configure terminal`
`awplus(config)# interface vlan2`
`awplus(config-if)# ip pim dense-mode`

ip pim dense-mode passive

Overview This command enables PIM-DM passive mode operation from Interface mode on the current VLAN interface.

The **no** variant of this command disables passive mode.

Syntax `ip pim dense-mode passive`
`no ip pim dense-mode passive`

Mode Interface Configuration for a VLAN interface.

Usage Configuring a VLAN interface as a passive PIM-DM interface indicates that the VLAN interface is connected to a stub network (i.e. a network that does not contain any PIM Routers). So, multicast streams that arrive on other PIM-DM interfaces can be routed to hosts on the passive PIM-DM interface, but no PIM neighbor relationships will be formed on the passive PIM-DM interface.

Example `awplus# configure terminal`
`awplus(config)# interface vlan2`
`awplus(config-if)# ip pim dense-mode passive`

ip pim dense-mode wrong-vif-suppression

Overview Use this command to permit or block packets that arrive on the wrong VLAN Interface (VIF) for PIM dense-mode.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Use the **no** variant of this command to disable dense-mode wrong VIF suppression

Syntax `ip pim dense-mode wrong-vif-suppression`
`no ip pim dense-mode wrong-vif-suppression`

Syntax (VRF-lite) `ip pim [vrf <vrf-name>]dense-mode wrong-vif-suppression`
`no ip pim [vrf <vrf-name>]dense-mode wrong-vif-suppression`

Parameter	Description
vrf	Apply this command to a VRF instance.
<vrf-name>	The name of the VRF instance.

Default Disabled.

Mode Global Configuration

Usage notes This command enables wrong VIF suppression for PIM dense-mode. Wrong VIF suppression prevents multicast packets received on the wrong upstream interface from being copied to the CPU.

Examples To enable wrong VIF suppression, use the commands:

```
awplus# configure terminal
awplus(config)# ip pim dense-mode wrong-vif-suppression
```

To disable wrong VIF suppression, use the commands:

```
awplus# configure terminal
awplus(config)# no ip pim dense-mode wrong-vif-suppression
```

Example (VRF-lite) To enable wrong VIF suppression for the VRF instance 'blue', use the commands:

```
awplus# configure terminal
awplus(config)# ip pim vrf blue sparse-mode
wrong-vif-suppression
```

To disable wrong VIF suppression for the VRF instance 'blue', use the commands:

```
awplus# configure terminal
awplus(config)# no ip pim vrf blue sparse-mode
wrong-vif-suppression
```

Command changes Version 5.4.8-2.3: command added.

ip pim ext-srcs-directly-connected

Overview Use this command to configure PIM to treat all source traffic arriving on the interface as though it was sent from a host directly connected to the interface.

Use the **no** variant of this command to configure PIM to treat only directly connected sources as directly connected.

Syntax `ip pim ext-srcs-directly-connected`
`no ip pim ext-srcs-directly-connected`

Default The **no** variant of this command is the default behavior.

Mode Interface Configuration for a VLAN interface.

Example To configure PIM to treat all sources as directly connected for VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim ext-srcs-directly-connected
```

To configure PIM to treat only directly connected sources as directly connected for VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim ext-srcs-directly-connected
```

ip pim hello-holdtime (PIM-DM)

Overview This command configures a **hello-holdtime**. The PIM **hello-holdtime** on a VLAN interface is the period which the router will wait to receive a hello from neighbors on that interface. If the router does not receive a hello from a given neighbor within that period, then it will decide that the neighbor is no longer an active PIM Router, and will terminate the neighbor relationship.

You cannot configure a **hello-holdtime** value that is less than the current **hello-interval**. Each time the **hello-interval** is updated, the **hello-holdtime** is also updated, according to the following rules:

- If the **hello-holdtime** is not configured; or if the hello holdtime is configured and less than the current **hello-interval** value, it is modified to 3.5 times the **hello-interval** value.
- Otherwise, it retains the configured value.

Use the **no** variant of this command to return the hello-holdtime value to its default of 3.5 times the current hello-interval value.

Syntax `ip pim hello-holdtime <holdtime>`
`no ip pim hello-holdtime`

Parameter	Description
<code><holdtime></code>	<code><1-65535></code> The holdtime value in seconds (no fractional seconds are accepted).

Mode Interface Configuration for a VLAN interface.

Example `awplus# configure terminal`
`awplus(config)# interface vlan2`
`awplus(config-if)# ip pim hello-holdtime 123`

ip pim hello-interval (PIM-DM)

Overview This command configures a PIM **hello-interval** value. The PIM **hello-interval** on a VLAN interface is the period at which the router will transmit PIM hello messages on that interface.

When the **hello-interval** is configured, and the **hello-holdtime** is not configured, or when the configured **hello-holdtime** value is less than the new **hello-interval** value; the **hello-holdtime** value is modified to 3.5 times the **hello-interval** value. Otherwise, the **hello-holdtime** value is the configured value. The default is 30 seconds.

Use the **no** variant of this command to reset the **hello-interval** to the default.

Syntax `ip pim hello-interval <interval>`
`no ip pim hello-interval`

Parameter	Description
<interval>	<1-65535> The value in seconds (no fractional seconds accepted).

Mode Interface Configuration for a VLAN interface.

Example `awplus# configure terminal`
`awplus(config)# interface vlan2`
`awplus(config-if)# ip pim hello-interval 123`

ip pim max-graft-retries

Overview This command configures PIM-DM to send a limited number of Graft message retries, after which time the device will remove all information regarding the particular (Source, Group), or until the device receives an acknowledgment, whichever occurs first.

The **no** variant of this command configures PIM-DM to send Graft message retries until the device receives an acknowledgment, which is the default behavior.

Syntax `ip pim max-graft-retries <1-65535>`
`no pim max-graft-retries`

Parameter	Description
no	Negate a command or set its defaults.
ip	Internet Protocol (IP).
pim	PIM Interface commands.
max-graft-retries	PIM Graft message retries.
<1-65535>	Graft message retries before ceasing Graft message retries.

Default By default, Graft retries are sent by PIM-DM until the device receives an acknowledgment.

Mode Interface Configuration for a VLAN interface.

Usage Graft messages are used to reduce the join latency when a previously pruned branch of the source tree must be grafted back, when a member joins the group after the PIM-DM device has sent a Prune message to prune unwanted traffic. Graft messages are the only PIM-DM messages that receive an acknowledgment.

If Graft messages were not used, then the member waiting for pruned off traffic would have to wait up to 3 minutes for the periodic re-flooding to occur to begin receiving multicast traffic again. By using Grafts, the Prune can be reversed much faster than waiting for periodic re-flooding to begin receiving multicast traffic again.

Examples To configure PIM-DM on the VLAN interface vlan2 to send a maximum of 10 Graft message retries, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim max-graft-retries 10
```

To configure PIM-DM on the VLAN interface vlan2 to send Graft message retries forever, which is the default behavior, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim max-graft-retries
```

**Validation
Commands**

```
show ip mroute
show ip pim dense-mode mroute
show running-config
```

ip pim neighbor-filter (PIM-DM)

Overview Enables filtering of neighbors on the VLAN interface. When configuring a neighbor filter, PIM-DM will either not establish adjacency with the neighbor, or terminate adjacency with the existing neighbors if denied by the filtering access list.

Use the **no** variant of this command to disable this function.

Syntax `ip pim neighbor-filter [<number>|<accesslist>]`
`no ip pim neighbor-filter [<number>|<accesslist>]`

Parameter	Description
<number>	<1-99> Standard IP access list number.
<accesslist>	IP access list name.

Default By default, there is no filtering.

Mode Interface Configuration for a VLAN interface.

Example `awplus# configure terminal`
`awplus(config)# interface vlan2`
`awplus(config-if)# ip pim neighbor-filter 14`

ip pim propagation-delay

Overview This command configures the PIM **propagation-delay** value. The PIM **propagation-delay** is the expected delay in the transfer of PIM messages across the VLAN interface that it is attached to.

Use the **no** variant of this command to return the **propagation-delay** to the default (1000 milliseconds).

Syntax `ip pim propagation-delay <delay>`
`no ip pim propagation-delay`

Parameter	Description
<delay>	<1000-5000> The value in milliseconds. The default is 1000 milliseconds.

Default The propagation-delay is set to 1000 milliseconds by default.

Mode Interface Configuration for a VLAN interface.

Examples

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim propagation-delay 2000
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim propagation-delay
```

ip pim state-refresh origination-interval

Overview This command configures a PIM **state-refresh origination-interval** value. The origination interval is the number of seconds between PIM state refresh control messages. The default is 60 seconds.

Use the **no** variant of this command to return the origination interval to the default.

Syntax `ip pim state-refresh origination-interval <interval>`
`no ip pim state-refresh origination-interval`

Parameter	Description
<interval>	<1-100> The integer value in seconds (no fractional seconds accepted). The default state-refresh origination-interval value is 60.

Default The state-refresh origination-interval is set to 60 seconds by default, and is reset using negation.

Mode Interface Configuration for a VLAN interface.

Example `awplus# configure terminal`
`awplus(config)# interface vlan2`
`awplus(config-if)# ip pim state-refresh origination-interval 65`

service pdm

Overview Use this command to enable PIM dense mode services.
Use the **no** version of the command to disable unused PIM dense mode services.

Syntax service pdm
no service pdm

Default Enabled

Mode Global Configuration

Usage notes Sometimes it may be desirable to disable unused services, in order to reduce memory use.
Disabling the PIM services will only take effect after you save the configuration and restart the device.

Example To disable the PIM dense mode service, use the commands:

```
awplus# configure terminal  
awplus(config)# no service pdm
```

Output Figure 40-2: Example output from **no service pdm**

```
awplus(config)#no service pdm  
% Save the config and restart the device for this change to take  
effect
```

Command changes Version 5.5.0-0.1: command added

show debugging pim dense-mode

Overview This command displays the status of the debugging of the system.
For information on filtering and saving command output, see the [“Getting_Started with AlliedWare Plus” Feature Overview and Configuration_Guide](#).

Syntax `show debugging pim dense-mode`

Mode User Exec and Privileged Exec

Output Figure 40-3: Example output from the show debugging pim dense-mode command

```
PIM-DM Debugging status:

PIM-DM VR-VRF Context debugging is off
PIM-DM Decoder debugging is off
PIM-DM Encoder debugging is off
PIM-DM FSM debugging is off
PIM-DM MRT debugging is off
PIM-DM NHOP debugging is off
PIM-DM NSM debugging is off
PIM-DM VIF debugging is off
```

Related commands [debug pim dense-mode all](#)

show ip pim dense-mode interface

Overview This command displays the PIM-DM interface information.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show ip pim dense-mode interface`

Mode User Exec and Privileged Exec

Example To display information about the PIM-DM interfaces, use the command:

```
awplus# show ip pim dense-mode interface
```

Output

Table 1: Example output from the **show ip pim dense-mode interface** command

Total configured interfaces: 100 Maximum allowed: 100				
Total active interfaces: 100				
Address	Interface	VIFIndex	Ver/ Mode	Nbr Count
10.1.100.4	vlan100	4	v2/D	0
10.2.101.10	vlan1001	5	v2/D	0
10.2.102.10	vlan1002	6	v2/D	0
10.2.103.10	vlan1003	7	v2/D	0
10.2.104.10	vlan1004	8	v2/D	0
10.2.105.10	vlan1005	9	v2/D	0
10.2.106.10	vlan1006	10	v2/D	0
10.2.107.10	vlan1007	11	v2/D	0
... Note that this screen has been edited to remove any additional interfaces.				

Table 2: Parameters in the output of the **show ip pim dense-mode interface** command

Parameter	Description
Total configured interfaces	The number of configured PIM Dense Mode interfaces.
Maximum allowed	The maximum number of PIM Dense Mode interfaces that can be configured.
Total active interfaces	The number of active PIM Dense Mode interfaces.
Address	Primary PIM-DM address.

Table 2: Parameters in the output of the **show ip pim dense-mode interface** command (cont.)

Parameter	Description
Interface	Name of the PIM-DM interface.
VIF Index	The Virtual Interface index of the VLAN.
Ver/Mode	PIM version/Dense mode.
Nbr Count	Neighbor count of the PIM-DM interface.

Related commands [ip pim dense-mode](#)
[show ip pim dense-mode neighbor](#)

show ip pim dense-mode interface detail

Overview This command displays detailed information on a PIM-DM interface.
For information on filtering and saving command output, see the [“Getting_Started with AlliedWare Plus” Feature Overview and Configuration_Guide](#).

Syntax `show ip pim dense-mode interface detail`

Mode User Exec and Privileged Exec

Example `awplus# show ip pim dense-mode interface detail`

Output Figure 40-4: Example output from the **show ip pim dense-mode interface detail** command

```
vlan2 (vif-id: 0):  
  
Address 192.168.1.53/24  
Hello period 30 seconds, Next Hello in 30 seconds  
  
Neighbors:  
  192.168.1.152/32  
  192.168.1.149/32  
vlan3 (vif-id: 2):  
Address 192.168.10.53/24  
Hello period 30 seconds, Next Hello in 8 seconds  
Neighbors: none
```

show ip pim dense-mode mroute

- Overview** Use this command to display the IP PIM-DM multicast routing table.
- For information on filtering and saving command output, see the [“Getting_Started with AlliedWare Plus” Feature Overview and Configuration_Guide](#).
- Syntax** `show ip pim dense-mode mroute`
- Mode** User Exec and Privileged Exec
- Example** `awplus# show ip pim dense-mode mroute`
- Output** Figure 40-5: Example output from the **show ip pim dense-mode mroute** command

```
PIM-DM Multicast Routing Table

(192.168.10.52, 224.1.1.1)
Source directly connected on vlan3
State-Refresh Originator State: Originator
Upstream IF: vlan3, State: Forwarding
Downstream IF List:
vlan2, in 'olist':
Downstream State: NoInfo
Assert State: NoInfo
```

show ip pim dense-mode neighbor

Overview This command displays PIM-DM neighbor information.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show ip pim dense-mode neighbor`

Mode User Exec and Privileged Exec

Usage notes The total number of PIM-DM neighbors is restricted to 500 PIM-DM neighbors.

When the 500 PIM-DM neighbor limit is reached, as a result of receiving hello packets from new PIM-DM neighbors, a log entry will be issued to the log file in the below format:

```
<date> <time> <facility>.<severity> <program[<pid>]>: <message>
-----
2008 Dec 10 00:58:39 user.err x908 PIM-DM[1150]: [VIF] Nbr
Create: Cannot create more than 500 neighbours - ignoring
neighbour 100.0.1.247/32 on vlan100
```

Example `awplus# show ip pim dense-mode neighbor`

Output Figure 40-6: Example output from the **show ip pim dense-mode neighbor** command

```
Total number of neighbors: 500
Neighbor-Address  Interface      Uptime/Expires  Ver
192.168.1.152     vlan2          17:15:42/00:01:28 v2
192.168.1.149     vlan2          17:15:34/00:01:34 v2
```

show ip pim dense-mode neighbor detail

- Overview** This command displays detailed PIM-DM neighbor information.
For information on filtering and saving command output, see the [“Getting_Started with AlliedWare Plus” Feature Overview and Configuration_Guide](#).
- Syntax** `show ip pim dense-mode neighbor detail`
- Mode** User Exec and Privileged Exec
- Example** `awplus# show ip pim dense-mode neighbor detail`
- Output** Figure 40-7: Example output from the **show ip pim dense-mode neighbor detail** command

```
Neighbor 192.168.1.152 (vlan2)
Up since 17:16:20, Expires in 00:01:20
Neighbor 192.168.1.149 (vlan2)
Up since 17:16:12, Expires in 00:01:26
```

show ip pim dense-mode nexthop

Overview This command displays the next hop information as used by PIM-DM. In the context of PIM-DM, the term '**next hop**' refers to the next hop router on the path back to the source address of a multicast stream.

For information on filtering and saving command output, see the ["Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide](#).

Syntax `show ip pim dense-mode nexthop`

Mode User Exec and Privileged Exec

Example `awplus# show ip pim dense-mode nexthop`

Output Figure 40-8: Example output from the **show ip pim dense-mode neighbor nexthop** command

Destination	Nexthop Num	Nexthop Addr	Nexthop Interface	Metric	Pref
192.168.10.52	1	0.0.0.0	vlan2	3	1

Table 3: Parameters in the output of the **show ip pim dense-mode neighbor nexthop** command

Parameter	Description
Destination	Destination address for which PIM-DM requires next hop information.
Nexthop Num	Number of next hops to the destination. PIM can only use one next hop.
Nexthop Addr	Address of the current next hop gateway.
Nexthop Interface	Name of the next hop interface.
Metric	Metric of the route towards the destination.
Preference	Preference of the route towards the destination.

undebug all pim dense-mode

Overview Use this command from the Global Configuration mode to disable all PIM-DM debugging.

Syntax `undebug all pim dense-mode`

Mode Global Configuration

Example `awplus# configure terminal`
`awplus(config)# undebug all pim dense-mode`

Related commands

- `debug pim dense-mode all`
- `debug pim dense-mode context`
- `debug pim dense-mode decode`
- `debug pim dense-mode encode`

- [“show ip msdp peer”](#) on page 2328
- [“show ip msdp sa-cache”](#) on page 2332

clear ip msdp sa-cache

Overview Use this command to clear all the source-active (SA) messages in the SA-cache. The SA-cache contains multicast SA messages that are being sent to or received from MSDP peers.

Syntax `clear ip msdp sa-cache`

Mode Privileged Exec

Example To remove all entries in the SA-cache, use the commands:

```
awplus# clear ip msdp sa-cache
```

Related commands [show ip msdp sa-cache](#)

Command changes Version 5.5.1-0.1: command added

debug msdp

Overview Use this command to enable debugging for MSDP.
Use the **no** variant of this command to disable debugging for MSDP.

Syntax

```
debug msdp all
debug msdp state
debug msdp packet [in|out]
no debug msdp all
no debug msdp state
no debug msdp packet [in|out]
```

Parameter	Description
all	Enable all MSDP debugging options.
state	Enable debugging for the MSDP peer state.
packet	Enable debugging for MSDP packets.
in	Enable debugging for incoming MSDP packets.
out	Enable debugging for outgoing MSDP packets.

Default Debugging is disabled.

Mode Global Configuration or Privileged Exec

Example To enable debugging for the MSDP peer state, use the command:

```
awplus# debug msdp state
```

To enable debugging for incoming MSDP packets, use the command:

```
awplus# debug msdp packet in
```

To disable all MSDP debugging, use the command:

```
awplus# no debug msdp all
```

Related commands

- [debug msdp timer](#)
- [show debugging msdp](#)

Command changes Version 5.5.1-0.1: command added

debug msdp timer

Overview Use this command to enable debugging for the specified MSDP timers.
Use the **no** variant of this command to disable debugging for MSDP timers.

Syntax `debug msdp timer [connect|hold|keep-alive|sa-advert|sa-state]`
`no debug msdp timer`
`[connect|hold|keep-alive|sa-advert|sa-state]`

Parameter	Description
connect	Debugging for the connect retry timer.
hold	Debugging for the peer hold-time timer.
keep-alive	Debugging for the keep-alive timer.
sa-advert	Debugging for the SA-advertisement timer.
sa-state	Debugging for the SA-cache timer.

Default Debugging is disabled.

Mode Privileged Exec

Example To enable debugging for all timers, use the command:

```
awplus# debug msdp timer
```

To enable debugging for the connect retry timer, use the command:

```
awplus# debug msdp timer connect
```

To disable debugging for the peer hold-time timer, use the command:

```
awplus# no debug msdp timer hold
```

Related commands [debug msdp](#)
[show debugging msdp](#)

Command changes Version 5.5.1-0.1: command added

ip msdp hold-time

Overview Use this command to configure the global MSDP hold-time timeout.

The hold-time timeout defines how long a peer will wait between MSDP messages before dropping the connection. It is important that the hold-time timeout is greater than the keep-alive timeout configured on each peer. The global hold-time will be overridden if a specific hold-time timeout is configured for an individual peer.

Use the **no** variant of this command to reset the hold-time timeout to the default (75 seconds).

Syntax `ip msdp hold-time <15-75>`
`no ip msdp hold-time`

Parameter	Description
<15-75>	The hold-time timeout (in seconds).

Default 75 seconds.

Mode Global Configuration

Example To configure the hold-time timeout to 60 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip msdp hold-time 60
```

To reset the hold-time timeout to the default of 75 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp hold-time
```

- [ip msdp peer keep-alive](#)
- [ip msdp sa-cache-timeout](#)

Command changes Version 5.5.1-0.1: command added

ip msdp keep-alive

Overview Use this command to configure the global MSDP keep-alive timeout.

The keep-alive timeout defines the period between keep-alive messages being sent to each peer. It is important that the keep-alive timeout is less than the hold-time timeout configured on each peer device. The global keep-alive will be overridden if a specific keep-alive timeout is configured for an individual peer.

Use the **no** variant of this command to reset the keep-alive timeout to the default (60 seconds).

Syntax `ip msdp keep-alive <10-60>`
`no ip msdp keep-alive`

Parameter	Description
<10-60>	The keep-alive timeout (in seconds).

Default 60 seconds.

Mode Global Configuration

Example To configure the keep-alive timeout to 45 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip msdp keep-alive 45
```

To reset the keep-alive timeout to the default of 60 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp keep-alive
```

Command changes Version 5.5.1-0.1: command added

ip msdp mesh-group

Overview Use this command to create an MSDP mesh-group with an associated local source address.

Use the **no** variant of this command to delete an MSDP mesh-group.

Syntax `ip msdp mesh-group <group-name> local-address <ip-address>`
`no ip msdp mesh-group <group-name>`

Parameter	Description
<group-name>	The name of the MSDP mesh-group.
<ip-address>	The IPv4 local address.

Default No mesh-groups are configured.

Mode Global Configuration

Example To create an MSDP mesh-group named 'group' with a local address of 192.168.1.5, use the commands:

```
awplus# configure terminal
awplus(config)# ip msdp mesh-group group local-address
192.168.1.5
```

To delete an MSDP mesh-group named 'group', use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp mesh-group group
```

Command changes Version 5.5.1-0.1: command added

ip msdp mesh-group member

Overview Use this command to include an MSDP peer as a member of an MSDP mesh-group. The mesh-group needs to be configured with the [ip msdp mesh-group](#) command before members can be added.

Use the **no** variant of this command to remove an MSDP peer from an MSDP mesh-group.

Syntax `ip msdp mesh-group <group-name> member <ip-address>`
`no ip msdp mesh-group <group-name> member <ip-address>`

Parameter	Description
<code><group-name></code>	The name of the MSDP mesh-group.
<code><ip-address></code>	The IPv4 address of the peer.

Default Peers are not included in a mesh-group.

Mode Global Configuration

Example To add the peer at 192.168.1.3 to an MSDP mesh-group named 'group', use the commands:

```
awplus# configure terminal
awplus(config)# ip msdp mesh-group group member 192.168.1.3
```

To remove the peer at 192.168.1.3 from an MSDP mesh-group named 'group', use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp mesh-group group member 192.168.1.3
```

`show ip msdp mesh-group`

Command changes Version 5.5.1-0.1: command added

ip msdp mesh-group member hold-time

Overview Use this command to configure the MSDP hold-time timeout for an MSDP mesh-group member.

The hold-time timeout defines how long a peer will wait between MSDP messages before dropping the connection. It is important that the hold-time timeout is greater than the keep-alive timeout configured on each peer. The global hold-time will be overridden if a specific hold-time timeout is configured for an individual peer.

Use the **no** variant of this command to delete the mesh-group member-specific hold-time timeout.

Syntax `ip msdp mesh-group <group-name> member <ip-address> hold-time <15-75>`

`no ip msdp mesh-group <group-name> member <ip-address> hold-time`

Parameter	Description
<group-name>	The name of a mesh-group.
<ip-address>	The IPv4 address of the mesh-group member.
<15-75>	The hold-time timeout (in seconds).

Default MSDP mesh-group members use the global hold-time timeout (75 seconds by default).

Mode Global Configuration

Example To configure the hold-time timeout for a member of mesh-group 'group' at 192.168.1.5 to 45 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip msdp mesh-group group 192.168.1.5 hold-time 45
```

To delete the specific hold-time timeout configured for the member at 192.168.1.5, use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp mesh-group group 192.168.1.5 hold-time
```

ip msdp mesh-group member keep-alive

ip msdp peer

ip msdp peer hold-time

ip msdp peer keep-alive

ip msdp sa-cache-timeout

Command changes Version 5.5.1-0.1: command added

ip msdp mesh-group member keep-alive

Overview Use this command to configure the MSDP keep-alive timeout for an MSDP mesh-group member.

The keep-alive timeout defines the period between keep-alive messages being sent to each peer. It is important that the keep-alive timeout is less than the hold-time timeout configured on each peer device. The global keep-alive will be overridden if a specific keep-alive timeout is configured for an individual peer.

Use the **no** variant of this command to delete the mesh-group member-specific keep-alive timeout.

Syntax

```
ip msdp mesh-group <group-name> member <ip-address> keep-alive <10-60>
```

```
no ip msdp mesh-group <group-name> member <ip-address> keep-alive
```

Parameter	Description
<group-name>	The name of a mesh-group.
<ip-address>	The IPv4 address of the mesh-group member.
<10-60>	The keep-alive timeout (in seconds).

Default MSDP mesh-group members use the global keep-alive timeout (60 seconds by default).

Mode Global Configuration

Example To configure the keep-alive timeout for a member of mesh-group 'group' at 192.168.1.5 to 45 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip msdp mesh-group group 192.168.1.5 keep-alive 45
```

To delete the specific keep-alive timeout configured for the member at 192.168.1.5, use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp mesh-group group 192.168.1.5 keep-alive
```

Command Version 5.5.1-0.1: command added
changes

ip msdp peer

Overview Use this command to configure a new MSDP peer.
Use the **no** variant of this command to remove an MSDP peer.

Syntax `ip msdp peer <ip-address> local-address <local-address>`
`no ip msdp peer <ip-address> [local-address <local-address>]`

Parameter	Description
<ip-address>	The IPv4 address of the peer.
<local-address>	The local IPv4 address to listen and send from.

Default No MSDP peers are configured.

Mode Global Configuration

Example To configure an MSDP peer at 192.168.1.3 with a local address of 192.168.1.5, use the commands:

```
awplus# configure terminal
awplus(config)# ip msdp peer 192.168.1.3 local-address
192.168.1.5
```

ip msdp peer hold-time

Overview Use this command to configure the MSDP hold-time timeout for an MSDP peer.

The hold-time timeout defines how long a peer will wait between MSDP messages before dropping the connection. It is important that the hold-time timeout is greater than the keep-alive timeout configured on each peer. The global hold-time will be overridden if a specific hold-time timeout is configured for an individual peer.

Use the **no** variant of this command to delete the peer-specific hold-time timeout.

Syntax

```
ip msdp peer <ip-address> hold-time <15-75>
no ip msdp peer <ip-address> hold-time
```

Parameter	Description
<ip-address>	The IPv4 address of the peer.
<15-75>	The hold-time timeout (in seconds).

Default MSDP peers use the global hold-time timeout (75 seconds by default).

Mode Global Configuration

Example To configure the hold-time timeout for the peer at 192.168.1.5 to 45 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip msdp peer 192.168.1.5 hold-time 45
```

To delete the specific hold-time timeout configured for the peer at 192.168.1.5, use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp peer 192.168.1.5 hold-time
```

Command changes Version 5.5.1-0.1: command added

ip msdp peer keep-alive

Overview Use this command to configure the MSDP keep-alive timeout for an MSDP peer.

The keep-alive timeout defines the period between keep-alive messages being sent to each peer. It is important that the keep-alive timeout is less than the hold-time timeout configured on each peer device. The global keep-alive will be overridden if a specific keep-alive timeout is configured for an individual peer.

Use the **no** variant of this command to delete the peer-specific keep-alive timeout.

Syntax `ip msdp peer <ip-address> keep-alive <10-60>`
`no ip msdp peer <ip-address> keep-alive`

Parameter	Description
<ip-address>	The IPv4 address of the peer.
<10-60>	The keep-alive timeout (in seconds).

Default MSDP peers use the global keep-alive timeout (60 seconds by default).

Mode Global Configuration

Example To configure the keep-alive timeout for the peer at 192.168.1.5 to 45 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip msdp peer 192.168.1.5 keep-alive 45
```

To delete the specific keep-alive timeout configured for the peer at 192.168.1.5, use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp peer 192.168.1.5 keep-alive
```

ip msdp peer rp-filter

Overview Use this command to configure filters for incoming and outgoing SA messages for a peer based on the RP address. You can configure filters for a peer to permit or deny SA messages based on the RP addresses. The filters use an access list where the source must match the SA RP address; the destination address is unused.

Use the **no** variant of this command to remove the filters.

Syntax

```
ip msdp peer <ip-address> rp-filter in  
{<100-199>|<2000-2699>|<access-list>}  
  
ip msdp peer <ip-address> rp-filter out  
{<100-199>|<2000-2699>|<access-list>}  
  
no ip msdp peer <ip-address> rp-filter [in|out]
```

Parameter	Description
<ip-address>	The IPv4 address of the peer.
in	The incoming filter.
out	The outgoing filter.
<100-199>	IP extended access list.
<2000-2699>	IP extended access list (expanded range).
<access-list>	Access list name.

Default No RP filters are configured.

Mode Global Configuration

Example To configure an incoming RP filter for 192.168.1.5 using IP extended access list 100, use the commands:

```
awplus# configure terminal  
awplus(config)# access-list 100 permit ip 172.16.48.133/32  
1.1.1.1/32  
awplus(config)# ip msdp peer 192.168.1.5 rp-filter in 100
```

To configure an outgoing RP filter for 192.168.1.5 using an access list named 'list1', use the commands:

```
awplus# configure terminal  
awplus(config)# ip msdp peer 192.168.1.5 rp-filter out list1
```

To remove an incoming RP filter for 192.168.1.5, use the commands:

```
awplus# configure terminal  
awplus(config)# no ip msdp peer 192.168.1.5 rp-filter in
```

To remove all RP filters for 192.168.1.5, use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp peer 192.168.1.5 rp-filter
```

Version 5.5.1-0.1: command added

ip msdp peer sg-filter

Overview Use this command to configure filters for a peer to permit or deny SA messages based on the source and group addresses. The filters use an access list where the source must match the SA source address, and the destination must match the SA group address.

Use the **no** variant of this command to remove the filters.

Syntax

```
ip msdp peer <ip-address> sg-filter in  
{<100-199>|<2000-2699>|<access-list>}  
  
ip msdp peer <ip-address> sg-filter out  
{<100-199>|<2000-2699>|<access-list>}  
  
no ip msdp peer <ip-address> sg-filter [in|out]
```

Parameter	Description
<ip-address>	The IPv4 address of the peer.
in	The incoming filter.
out	The outgoing filter.
<100-199>	IP extended access list.
<2000-2699>	IP extended access list (expanded range).
<access-list>	Access list name.

Default No SG filters are configured.

Mode Global Configuration

Example To configure an incoming SG filter for 192.168.1.5 using IP extended access list 100, use the commands:

```
awplus# configure terminal  
awplus(config)# access-list 100 permit ip 172.16.48.133/32  
1.1.1.1/32  
awplus(config)# ip msdp peer 192.168.1.5 sg-filter in 100
```

To configure an outgoing SG filter for 192.168.1.5 using an access list named 'list1', use the commands:

```
awplus# configure terminal  
awplus(config)# ip msdp peer 192.168.1.5 sg-filter out list1
```

To remove an incoming SG filter for 192.168.1.5, use the commands:

```
awplus# configure terminal  
awplus(config)# no ip msdp peer 192.168.1.5 sg-filter in
```

To remove all SG filters for 192.168.1.5, use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp peer 192.168.1.5 sg-filter
```

changes**

Version 5.5.1-0.1: command added

ip msdp sa-cache-timeout

Overview Use this command to configure the MSDP Source-Active cache expiry timeout. The MSDP Source-Active cache timeout determines how long entries can exist in the cache before they expire.

Use the **no** variant of this command to reset the timeout to the default (75 seconds).

Syntax `ip msdp sa-cache-timeout <75-300>`
`no ip msdp sa-cache-timeout`

Parameter	Description
<75-300>	How long cache entries exist before they expire (in seconds).

Default 75 seconds

Mode Global Configuration

Example To configure the MSDP Source-Active cache timeout to 255 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip msdp sa-cache-timeout 255
```

To reset the MSDP Source-Active cache timeout to the default of 75 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp sa-cache-timeout
```

Command changes Version 5.5.1-0.1: command added

msdp default peer

Overview Use this command to configure an MSDP peer as a default peer. SA messages from the default peer will be accepted without Peer Reverse Path Forwarding (Peer-RPF) checks for the peer address against the advertised RP. It is possible to configure multiple default peers, however only one of the active peers that are configured as default will be recognized as the default.

Use the **no** variant of this command to remove an MSDP peer as a default peer.

Syntax `ip msdp peer <ip-address> default-peer`
`no ip msdp peer <ip-address> default-peer`

Parameter	Description
<code><ip-address></code>	The IPv4 address of the peer.

Default No default peer is configured.

Mode Global Configuration

Example To configure existing MSDP peer 192.168.1.5 as the default peer, use the commands:

```
awplus# configure terminal
awplus(config)# ip msdp peer 192.168.1.5 default-peer
```

To remove MSDP peer 192.168.1.5 as the default peer, use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp peer 192.168.1.5 default-peer
```

Command changes Version 5.5.1-0.1: command added

show debugging msdp

Overview Use this command to display which MSDP debugging options are currently enabled. Debugging is either on or off for each option.

Syntax show debugging msdp

Mode Privileged Exec

Example To display which MSDP debugging options are enabled, use the command:

```
awplus# show debugging msdp
```

Output Figure 41-1: Example output from **show debugging msdp**

```
awplus# show debugging msdp
MSDP debugging status:
  MSDP state debugging is on
  MSDP incoming packet debugging is on
  MSDP outgoing packet debugging is off
  MSDP peer hold timer debugging is off
  MSDP peer connect timer debugging is off
  MSDP peer keep-alive timer debugging is off
  MSDP source-active state timer debugging is on
  MSDP source-active advertisement timer debugging is off
```

Table 41-1: Parameters in the output from **show debugging msdp**

Parameter	Description
MSDP state	If enabled, shows when a peer has a change of state.
MSDP incoming packet	If enabled, shows when MSDP packets are received by the device.
MSDP outgoing packet	If enabled, shows when MSDP packets are transmitted by the device.
MSDP peer hold timer	If enabled, shows activity related to the peer hold timer, for example, when the timer starts, expires, or is reset.
MSDP peer connect timer	If enabled, shows activity related to the peer hold timer, for example, when the timer starts or expires.
MSDP peer keep-alive timer	If enabled, shows activity related to the peer keep-alive timer, for example, when the timer starts, expires, or is reset.

Table 41-1: Parameters in the output from **show debugging msdp** (cont.)

Parameter	Description
MSDP source-active state timer	If enabled, shows activity related to the source-active state timer, for example, when the timer starts, expires, or is reset.
MSDP source-active advertisement timer	If enabled, shows activity related to the source-active advertisement timer, for example, when the timer starts, expires, or is reset.

Version 5.5.1-0.1: command added

show ip msdp mesh-group

Overview Use this command to show information about the MSDP mesh-groups and the members within them.

Syntax

```
show ip msdp mesh-group [detail]
show ip msdp mesh-group <group-name> [detail]
show ip msdp mesh-group <group-name> member <ip-address>
[detail]
```

Parameter	Description
detail	Show detailed information about the mesh groups.
<group-name>	The name of a mesh-group.
<ip-address>	The IPv4 address of a member of the mesh-group.

Mode Privileged Exec

Example To show brief information about every mesh-group and the members within, use the command:

```
awplus# show ip msdp mesh-group
```

To show information about mesh-group 'group2' and all of its members, use the command:

```
awplus# show ip msdp mesh-group group2
```

To show information about member 172.16.48.133 inside mesh-group 'group2', use the commands:

```
awplus# show ip msdp mesh-group group2 member 172.16.48.133
```

To show detailed information about member 172.16.48.133 inside mesh-group 'group2', use the commands:

```
awplus# show ip msdp mesh-group group2 member 172.16.48.133
detail
```

Output Figure 41-2: Example output from **show ip msdp mesh-group**

```
awplus# show ip msdp mesh-group

In Deny	: 0

Table 41-2: Parameters in the output from **show ip msdp mesh-group**

Parameter	Description
Default peer	Yes, if the peer is a default peer, and No if not.
Mesh-group	If the peer is a member of a mesh-group then the name of the mesh-group will be displayed, otherwise "--".
Keep Alive receive	The number of keep alive messages the peer has received.
Keep Alive transmit	The number of keep alive messages the peer has transmitted.
Keep Alive receive error	The number of keep alive messages that have been received that contained errors.
Source active receive	The number of source active messages the peer has received.
Source active transmit	The number of source active messages the peer has transmitted.
Source active receive error	The number of source active messages that have been received that contained errors.
Unknown TLV receive	The number of messages received by the peer that were not keep alive or source active messages.
Peer Hold	The seconds remaining until the peer hold timer expires, at which point the peer connection ends.
Keep Alive	The seconds remaining until the keep alive timer expires, at which point the peer will send out a keep alive message.
Connect Retry	The seconds remaining till the connect retry timer expires, at which point another attempt is made to connect to the peer.

Table 41-2: Parameters in the output from **show ip msdp mesh-group** (cont.)

Parameter	Description
SG filter out	The name of the filter based on the source and group address of outgoing source active messages.
SG filter in	The name of the filter based on the source and group address of incoming source active messages.
RP filter out	The name of the filter based on the RP address of outgoing source active messages.
RP filter in	The name of the filter based on the RP address of incoming source active messages.
Out permit	The number of SA messages that have been permitted to send.
Out deny	The number of SA messages that have been denied from being sent.
In permit	The number of SA messages that have been permitted to be received.
In deny	The number of SA messages that have been denied to be received.

show ip msdp peer

Overview Use this command to display MSDP peers, their addresses, and their current status. Use the **detail** parameter to display additional information on timers, filters, and counters.

Syntax `show ip msdp peer [<ip-address>] [detail]`

Parameter	Description
<ip-address>	The IPv4 address of the peer.
detail	Display additional information on timers, filters, and counters.

Mode Privileged Exec

Example To show the results for all MSDP peers, use the command:

```
awplus# show ip msdp peer
```

To show the results for MSDP peer 192.168.1.3, use the command:

```
awplus# show ip msdp peer 192.168.1.3
```

To show detailed results for MSDP peer 192.168.1.3, use the command:

```
awplus# show ip msdp peer 192.168.1.3 detail
```

Output Figure 41-6: Example output from **show ip msdp peer**

Command changes Version 5.5.1-0.1: command added

show ip msdp sa-cache

Overview Use this command to display information about the MSDP Source Address Cache (SA-cache) entries.

Entries that are Local (Yes) are learned from the local multicast route table. They will expire when they are removed from the local multicast route table, and the MSDP expiry is always set to 0. Local entries will be advertised to MSDP peers.

Entries that are Local (No) have been received via an MSDP SA-message from an MSDP peer. They will expire when the expiry timer reaches 0, unless they are refreshed from the peer. SA-cache entries that are not local are advertised to PIM.

Syntax `show ip msdp sa-cache`

Mode Privileged Exec

Example To show information about the MSDP SA-cache entries, use the command:

```
awplus# show ip msdp sa-cache
```

Output Figure 41-9: Example output from **show ip msdp sa-cache**

```
awplus# show ip msdp sa-cache

MSDP Source-Active cache:

Source-Active advertisement expiry (secs): 51

RP Address      Source Address  Group Address  Local  Expiry (secs)
-----
172.16.48.133  10.36.20.1     232.0.0.8     Yes    0
172.16.48.133  10.36.20.1     239.254.1.1   Yes    0
172.16.48.133  10.36.20.1     239.254.1.2   Yes    0
172.16.48.133  10.36.20.1     239.254.1.3   Yes    0
172.16.48.133  10.36.20.1     239.254.1.4   Yes    0
172.16.48.133  10.36.20.1     239.254.1.7   Yes    0
172.16.48.133  10.36.20.1     239.254.1.8   Yes    0
172.16.48.133  10.36.20.1     239.254.1.9   Yes    0
```

Table 41-4: Parameters in the output from **show ip msdp sa-cache**

Parameter	Description
Source-Active advertisement expiry (secs)	The number of seconds until the RP will advertise its sources by sending out SA messages.
RP Address	The RP address of the cache entry.
Source Address	The source address of the cache entry.
Group Address	The group address of the cache entry.

Table 41-4: Parameters in the output from **show ip msdp sa-cache** (cont.)

Parameter	Description
Local	Whether the entry is local, Yes or No.
Expiry (secs)	The number of seconds until the entry expires.

IPv4 Hardware Access Control List (ACL) Commands

Introduction

Overview This chapter provides an alphabetical reference of IPv4 Hardware Access Control List (ACL) commands. It contains detailed command information and command examples about IPv4 hardware ACLs, which you can apply directly to interfaces using the [access-group](#) command.

To apply ACLs to an LACP channel group, apply it to all the individual switch ports in the channel group. To apply ACLs to a static channel group, apply it to the static channel group itself.

Most ACL command titles include information in parentheses:

- When the command title ends with words in parentheses, these words indicate usage instead of keywords to enter into the CLI. For example, the title **access-list (numbered hardware ACL for ICMP)** indicates that the command is used to create an ACL with the syntax:

```
access-list <3000-3699> <action> icmp <source-ip> <dest-ip>  
[icmp-type <number>] [vlan <1-4094>]
```

- When the command title is completely surrounded by parentheses, the title indicates the type of ACL filter instead of keywords to enter into the CLI. For example, the title **(named hardware ACL: ICMP entry)** represents a command with the syntax:

```
[<sequence-number>] <action> icmp <source-ip> <dest-ip>  
[icmp-type <number>] [vlan <1-4094>]
```

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

Sub-modes Many of the ACL commands operate from sub-modes that are specific to particular ACL types. The following table shows the CLI prompts at which ACL commands are entered.

Table 42-1: IPv4 Hardware Access List Commands and Prompts

Command Name	Command Mode	Prompt
show interface access-group	Privileged Exec	awplus#
show access-list (IPv4 Hardware ACLs)	Privileged Exec	awplus#
show acl-group ip address	Privileged Exec	awplus#
show acl-group ip port	Privileged Exec	awplus#
show interface access-group	Privileged Exec	awplus#

access-group

Overview This command adds or removes a hardware-based access-list to or from a switch port interface or interfaces. The number of hardware numbered and named access-lists that can be added to a switch port interface is determined by the available memory in hardware-based packet classification tables.

This command works in Interface Configuration mode to apply hardware access-lists to selected switch port interfaces.

The **no** variant of this command removes the selected access-list from an interface.

Syntax

```
access-group  
[<3000-3699>|<4000-4699>|<hardware-access-list-name>]  
  
no access-group  
[<3000-3699>|<4000-4699>|<hardware-access-list-name>]
```

Parameter	Description
<3000-3699>	Hardware IP access-list.
<4000-4699>	Hardware MAC access-list.
<hardware-access-list-name>	The hardware access-list name.

Mode Interface Configuration for a switch port interface or interfaces

Default Any traffic on an interface controlled by a hardware ACL that does not explicitly match a filter is permitted.

Usage notes First create an IP access-list that applies the appropriate permit/deny requirements with the [access-list \(numbered hardware ACL for IP packets\)](#) command, the [access-list \(numbered hardware ACL for MAC addresses\)](#) command or the [access-list hardware \(named hardware ACL\)](#) command. Then use this command to apply this hardware access- list to a specific port or port range. Note that this command will apply the access-list only to incoming data packets.

To apply ACLs to an LACP aggregated link, apply it to all the individual switch ports in the aggregated group. To apply ACLs to a static channel group, apply it to the static channel group itself. An ACL can even be applied to a static aggregated link that spans more than one switch instance ([Link Aggregation Commands](#)).

Note that you cannot apply software numbered ACLs to switch port interfaces with the access-group command. This command will only apply hardware ACLs.

NOTE: Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

Examples To add the numbered hardware access-list 3005 to switch port interface port1.1.1, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# access-group 3005
```

To add the named hardware access-list "hw-acl" to switch port interface port1.1.2, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# access-group hw-acl
```

To apply an ACL to static channel group 2 containing switch port1.1.3 and port1.1.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.3-port1.1.4
awplus(config-if)# static-channel-group 2
awplus(config)# interface sa2
awplus(config-if)# access-group 3000
```

[show interface access-group](#)

access-list (numbered hardware ACL for ICMP)

Overview This command creates an access-list for use with hardware classification. The access-list will match on ICMP packets that have the specified source and destination IP addresses and, optionally, ICMP type. You can use the value **any** instead of source or destination address if an address does not matter.

Once you have configured the ACL, you can use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map.

The optional **vlan** parameter can be used to match tagged (802.1q) packets.

The **no** variant of this command removes the previously specified access-list.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

CAUTION: Specifying a “send” action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.

Syntax `access-list <3000-3699> <action> icmp <source-ip> <dest-ip>
[icmp-type <number>] [vlan <1-4094>] [log]
no access-list <3000-3699>`

The following actions are available for hardware ACLs:

Values for the <action> parameter	
deny	Reject packets that match the source and destination filtering specified with this command.
permit	Permit packets that match the source and destination filtering specified with this command.
copy-to-cpu	Send a copy of matching packets to the CPU.
copy-to-mirror [interface port-number]	Send a copy of matching packets to a mirror port. Use the mirror interface command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.
send-to-mirror [interface port-number]	Send matching packets to the mirror port. Use the mirror interface command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.
send-to-vlan-port vlan <vid> port <port-number>	Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.

Values for the <action> parameter	
send-to-cpu	Send matching packets to the CPU.
deny-and-not-cpu	Drop the packet and make sure that it isn't sent to the switch's CPU. Use this action if you want to drop packets that AlliedWare Plus would normally send to the switch's CPU.

Parameter	Description
<3000-3699>	An ID number for this hardware IP access-list.
<action>	The action that the switch will take on matching packets. See the table above for valid values.
icmp	Match against ICMP packets
<source-ip>	The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:
	any Match any source IP address.
	host <ip-addr> Match a single source host with the IP address given by <ip-addr> in dotted decimal notation.
	<ip-addr>/<prefix> Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.
	<ip-addr> <reverse-mask> Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.
<dest-ip>	The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:
	any Match any destination IP address.
	host <ip-addr> Match a single destination host with the IP address given by <ip-addr> in dotted decimal notation.
	<ip-addr>/<prefix> Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.

Parameter	Description																										
	<i><ip-addr></i> <i><reverse-mask></i> Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.																										
icmp-type <i><number></i>	The type of ICMP message to match against, as defined in RFC792 and RFC950. Values include: <table> <tr><td>0</td><td>Echo replies.</td></tr> <tr><td>3</td><td>Destination unreachable messages.</td></tr> <tr><td>4</td><td>Source quench messages.</td></tr> <tr><td>5</td><td>Redirect (change route) messages.</td></tr> <tr><td>8</td><td>Echo requests.</td></tr> <tr><td>11</td><td>Time exceeded messages.</td></tr> <tr><td>12</td><td>Parameter problem messages.</td></tr> <tr><td>13</td><td>Timestamp requests.</td></tr> <tr><td>14</td><td>Timestamp replies.</td></tr> <tr><td>15</td><td>Information requests.</td></tr> <tr><td>16</td><td>Information replies.</td></tr> <tr><td>17</td><td>Address mask requests.</td></tr> <tr><td>18</td><td>Address mask replies.</td></tr> </table>	0	Echo replies.	3	Destination unreachable messages.	4	Source quench messages.	5	Redirect (change route) messages.	8	Echo requests.	11	Time exceeded messages.	12	Parameter problem messages.	13	Timestamp requests.	14	Timestamp replies.	15	Information requests.	16	Information replies.	17	Address mask requests.	18	Address mask replies.
0	Echo replies.																										
3	Destination unreachable messages.																										
4	Source quench messages.																										
5	Redirect (change route) messages.																										
8	Echo requests.																										
11	Time exceeded messages.																										
12	Parameter problem messages.																										
13	Timestamp requests.																										
14	Timestamp replies.																										
15	Information requests.																										
16	Information replies.																										
17	Address mask requests.																										
18	Address mask replies.																										
vlan <i><1-4094></i>	The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.																										
log	Log packets that are denied by this ACL. You must also enable the logging, using the command access-list hardware-deny-log .																										

Mode Global Configuration

Default On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

Usage notes This command creates an ACL for use with hardware classification. Once you have configured the ACL, use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map.

ACLs numbered in the range 3000-3699 match on packets that have the specified source and destination IP addresses.

ICMP ACLs will match any ICMP packet that has the specified source and destination IP addresses and ICMP type. The ICMP type is an optional parameter.

Examples To create an access-list that will permit ICMP packets with a source address of 192.168.1.0/24 with any destination address and an ICMP type of 5 enter the following commands:

```
awplus# configure terminal
awplus(config)# access-list 3000 permit icmp 192.168.1.0/24 any
icmp-type 5
```

To destroy the access-list with an access-list identity of 3000 enter the following commands:

```
awplus# configure terminal
awplus(config)# no access-list 3000
```

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

access-list (numbered hardware ACL for IP packets)

Overview This command creates an access-list for use with hardware classification. The access-list will match on packets that have the specified source and destination IP addresses. You can use the value **any** instead of source or destination address if an address does not matter.

Once you have configured the ACL, you can use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map.

The optional **vlan** parameter can be used to match tagged (802.1q) packets.

The **no** variant of this command removes the previously specified IP hardware access-list.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

CAUTION: Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.

Syntax `access-list <3000-3699> <action> ip <source-ip> <dest-ip> [vlan <1-4094>] [log]`
`no access-list <3000-3699>`

The following actions are available for hardware ACLs:

Values for the <action> parameter	
deny	Reject packets that match the source and destination filtering specified with this command.
permit	Permit packets that match the source and destination filtering specified with this command.
copy-to-cpu	Send a copy of matching packets to the CPU.
copy-to-mirror [interface port-number]	Send a copy of matching packets to a mirror port. Use the mirror interface command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.
send-to-mirror [interface port-number]	Send matching packets to the mirror port. Use the mirror interface command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.
send-to-vlan-port vlan <vid> port <port-number>	Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.

Values for the <action> parameter	
send-to-cpu	Send matching packets to the CPU.
deny-and-not-cpu	Drop the packet and make sure that it isn't sent to the switch's CPU. Use this action if you want to drop packets that AlliedWare Plus would normally send to the switch's CPU.

Table 42-2: IP and ICMP parameters in **access-list (hardware IP numbered)**

Parameter	Description
<3000-3699>	An ID number for this hardware IP access-list.
<action>	The action that the switch will take on matching packets. See the table above for valid values.
ip	Match against IP packets
<source-ip>	The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:
any	Match any source IP address.
host <ip-addr>	Match a single source host with the IP address given by <ip-addr> in dotted decimal notation.
<ip-addr>/<prefix>	Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.
<ip-addr> <reverse-mask>	Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.
<dest-ip>	The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:
any	Match any destination IP address.
host <ip-addr>	Match a single destination host with the IP address given by <ip-addr> in dotted decimal notation.
<ip-addr>/<prefix>	Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.

Table 42-2: IP and ICMP parameters in **access-list (hardware IP numbered)**

Parameter	Description
<i><ip-addr></i> <i><reverse-mask></i>	Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.
vlan <i><1-4094></i>	The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.
log	Log packets that are denied by this ACL. You must also enable the logging, using the command access-list hardware-deny-log .

Mode Global Configuration

Default On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

Usage notes This command creates an ACL for use with hardware classification. Once you have configured the ACL, use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map.

ACLs numbered in the range 3000-3699 match on packets that have the specified source and destination IP addresses.

Examples To create an access-list that will permit IP packets with a source address of 192.168.1.1 and any destination address, enter the commands:

```
awplus# configure terminal
awplus(config)# access-list 3000 permit ip 192.168.1.1/32 any
```

To destroy the access-list with an access-list identity of 3000 enter the following commands:

```
awplus# configure terminal
awplus(config)# no access-list 3000
```

access-list (numbered hardware ACL for IP protocols)

Overview This command creates an access-list for use with hardware classification. The access-list will match on packets that have the specified source and destination IP addresses and IP protocol number. You can use the value **any** instead of source or destination address if an address does not matter.

Once you have configured the ACL, you can use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map.

The optional **vlan** parameter can be used to match tagged (802.1q) packets.

The **no** variant of this command removes the previously specified IP hardware access-list.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

CAUTION: Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.

Syntax `access-list <3000-3699> <action> proto <1-255> <source-ip> <dest-ip> [vlan <1-4094>] [log]`
`no access-list <3000-3699>`

The following actions are available for hardware ACLs:

Values for the <action> parameter	
deny	Reject packets that match the source and destination filtering specified with this command.
permit	Permit packets that match the source and destination filtering specified with this command.
copy-to-cpu	Send a copy of matching packets to the CPU.
copy-to-mirror [interface port-number]	Send a copy of matching packets to a mirror port. Use the mirror interface command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.
send-to-mirror [interface port-number]	Send matching packets to the mirror port. Use the mirror interface command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.
send-to-vlan-port vlan <vid> port <port-number>	Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.

Values for the <action> parameter	
send-to-cpu	Send matching packets to the CPU.
deny-and-not-cpu	Drop the packet and make sure that it isn't sent to the switch's CPU. Use this action if you want to drop packets that AlliedWare Plus would normally send to the switch's CPU.

Table 42-3: Parameters in **access-list (hardware IP numbered)**

Parameter	Description
<3000-3699>	An ID number for this hardware IP access-list.
<action>	The action that the switch will take on matching packets. See the table above for valid values.
proto <1-255>	The IP protocol number to match against, as defined by IANA (Internet Assigned Numbers Authority www.iana.org/assignments/protocol-numbers) See below for a list of IP protocol numbers and their descriptions.
<source-ip>	The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:
	any Match any source IP address.
	host <ip-addr> Match a single source host with the IP address given by <ip-addr> in dotted decimal notation.
	<ip-addr>/<prefix> Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.
	<ip-addr> <reverse-mask> Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.
<dest-ip>	The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:
	any Match any destination IP address.
	host <ip-addr> Match a single destination host with the IP address given by <ip-addr> in dotted decimal notation.

Table 42-3: Parameters in **access-list (hardware IP numbered)** (cont.)

Parameter	Description
<i><ip-addr>/<prefix></i>	Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.
<i><ip-addr></i> <i><reverse-mask></i>	Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.
vlan <i><1-4094></i>	The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.
log	Log packets that are denied by this ACL. You must also enable the logging, using the command access-list hardware-deny-log .

138	MANET Protocols / RFC-ietf-manet-iana-07.txt
139-252	Unassigned / IANA
253	Use for experimentation and testing / RFC3692
254	Use for experimentation and testing / RFC3692
255	Reserved / IANA

Mode Global Configuration

Default On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

Usage notes This command creates an ACL for use with hardware classification. Once you have configured the ACL, use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map.

ACLs numbered in the range 3000-3699 match on packets that have the specified source and destination IP addresses.

Examples To create an access-list that will deny all IGMP packets (IP protocol 2) from the 192.168.0.0 network, enter the commands:

```
awplus# configure terminal
awplus(config)# access-list 3000 deny proto 2 192.168.0.0/16
any
```

To destroy the access-list with an access-list identity of 3000 enter the following commands:

```
awplus# configure terminal
awplus(config)# no access-list 3000
```

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

access-list (numbered hardware ACL for MAC addresses)

Overview This command creates an access-list for use with hardware classification. The access-list will match on packets that have the specified source and destination MAC addresses. You can use the value **any** instead of source or destination address if an address does not matter.

Once you have configured the ACL, you can use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map.

The **no** variant of this command removes the specified MAC hardware filter access-list.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

CAUTION: Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.

Syntax

```
access-list <4000-4699> <action> {<source-mac>|any}  
{<dest-mac>|any} [vlan <1-4094>] [inner-vlan  
<1-4094>]  
  
no access-list <4000-4699>
```

The following actions are available for hardware ACLs:

Values for the <action> parameter	
deny	Reject packets that match the source and destination filtering specified with this command.
permit	Permit packets that match the source and destination filtering specified with this command.
copy-to-cpu	Send a copy of matching packets to the CPU.
copy-to-mirror [interface port-number]	Send a copy of matching packets to a mirror port. Use the mirror interface command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.
send-to-mirror [interface port-number]	Send matching packets to the mirror port. Use the mirror interface command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.
send-to-vlan-port vlan <vid> port <port-number>	Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.

Values for the <action> parameter	
send-to-cpu	Send matching packets to the CPU.
deny-and-not-cpu	Drop the packet and make sure that it isn't sent to the switch's CPU. Use this action if you want to drop packets that AlliedWare Plus would normally send to the switch's CPU.

Parameter	Description
<4000-4699>	An ID number for this hardware IP access-list.
<action>	The action that the switch will take on matching packets. See the table above for valid values.
<source-mac>	The source MAC address to match against, followed by the mask. Enter the address in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number. Enter the mask in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number. For a mask, each value is either 0 or F, where FF = Ignore, and 00 = Match.
any	Match against any source MAC address.
<dest-mac>	The destination MAC address to match against, followed by the mask. Enter the address in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number. Enter the mask in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number. For a mask, each value is either 0 or F, where FF = Ignore, and 00 = Match.
any	Match against any destination MAC address.
vlan <1-4094>	Match against the specified ID in the packet's VLAN tag.
inner-vlan <1-4094>	Match against the inner VLAN tag (VID). This parameter is used within double-tagged VLANs. It is sometimes referred to as the C-TAG (Customer VLAN TAG), where the vlan VID tag is referred to as the S-TAG (Service VLAN TAG).

Mode Global Configuration

Default On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

Usage notes This command creates an ACL for use with hardware classification. Once you have configured the ACL, use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map.

ACLs numbered in the range 4000-4699 match on packets that have the specified source and destination MAC addresses.

Examples To create an access-list that will permit packets with a source MAC address of 0000.00ab.1234 and any destination address, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 4000 permit 0000.00ab.1234
0000.0000.0000 any
```

To create an access-list that will permit packets if their source MAC address starts with 0000.00ab, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 4001 permit 0000.00ab.1234
0000.0000.FFFF any
```

To create an access-list that will send a copy of packets to the mirror port if their source MAC address starts with 0000.00ab, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 4001 copy-to-mirror 0000.00ab.1234
0000.0000.FFFF any
```

You also need to configure the mirror port with the [mirror interface](#) command.

To destroy the access-list with an access-list identity of 4000 enter the commands:

```
awplus# configure terminal
awplus(config)# no access-list 4000
```

**Related

access-list (numbered hardware ACL for TCP or UDP)

Overview This command creates an access-list for use with hardware classification. The access-list will match on TCP or UDP packets that have the specified source and destination IP addresses and optionally, port values. You can use the value **any** instead of source or destination IP address if an address does not matter.

Once you have configured the ACL, you can use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map.

You can use the optional **vlan** parameter to match tagged (802.1q) packets.

The **no** variant of this command removes the specified IP hardware access-list.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

CAUTION: Specifying a “send” action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.

Syntax `access-list <3000-3699> <action> {tcp|udp} <source-ip>
[<source-ports>] <dest-ip> [<dest-ports>] [vlan <1-4094>] [log]
no access-list <3000-3699>`

The following actions are available for hardware ACLs:

Values for the <action> parameter	
deny	Reject packets that match the source and destination filtering specified with this command.
permit	Permit packets that match the source and destination filtering specified with this command.
copy-to-cpu	Send a copy of matching packets to the CPU.
copy-to-mirror [interface port-number]	Send a copy of matching packets to a mirror port. Use the mirror interface command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.
send-to-mirror [interface port-number]	Send matching packets to the mirror port. Use the mirror interface command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.
send-to-vlan-port vlan <vid> port <port-number>	Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.

Values for the <action> parameter	
send-to-cpu	Send matching packets to the CPU.
deny-and-not-cpu	Drop the packet and make sure that it isn't sent to the switch's CPU. Use this action if you want to drop packets that AlliedWare Plus would normally send to the switch's CPU.

Parameter	Description
<3000-3699>	An ID number for this hardware IP access-list.
<action>	The action that the switch will take on matching packets. See the table above for valid values.
tcp	Match against TCP packets.
udp	Match against UDP packets.
<source-ip>	The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:
	any Match any source IP address.
	host <ip-addr> Match a single source host with the IP address given by <ip-addr> in dotted decimal notation.
	<ip-addr>/<prefix> Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.
	<ip-addr> <reverse-mask> Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.
<source-ports>	Match source TCP or UDP port numbers. Port numbers are specified as integers between 0 and 65535. You can specify one or more port numbers as follows:
	eq <0-65535> Match a single port number.
	lt <0-65535> Match all port numbers that are less than the specified port number.
	gt <0-65535> Match all port numbers that are greater than the specified port number.
	ne <0-65535> Match all port numbers except the specified port number.

Parameter	Description
	range <start-port> <end-port> Match a range of port numbers.
<dest-ip>	The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:
	any Match any destination IP address.
	host <ip-addr> Match a single destination host with the IP address given by <ip-addr> in dotted decimal notation.
	<ip-addr>/<prefix> Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.
	<ip-addr> <reverse-mask> Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.
<dest-ports>	Match destination TCP or UDP port numbers. Port numbers are specified as integers between 0 and 65535. You can specify one or more port numbers as follows:
	eq <0-65535> Match a single port number.
	lt <0-65535> Match all port numbers that are less than the specified port number.
	gt <0-65535> Match all port numbers that are greater than the specified port number.
	ne <0-65535> Match all port numbers except the specified port number.
	range <start-port> <end-port> Match a range of port numbers.
vlan <1-4094>	The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.
log	Log packets that are denied by this ACL. You must also enable the logging, using the command access-list hardware-deny-log .

Mode Global Configuration

Default On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

Usage notes This command creates an ACL for use with hardware classification. Once you have configured the ACL, use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map.

ACLs numbered in the range 3000-3699 match on packets that have the specified source and destination IP addresses.

Examples To create an access-list that will permit TCP packets with a destination address of 192.168.1.1, a destination port of 80, and any source address and source port, enter the commands:

```
awplus# configure terminal
awplus(config)# access-list 3000 permit tcp any 192.168.1.1/32
eq 80
```

To create an access-list that will copy TCP packets to the mirror port, if they have a destination address of 192.168.1.1, a destination port of 80, and any source address and source port, enter the commands:

```
awplus# configure terminal
awplus(config)# access-list 3000 copy-to-mirror tcp any
192.168.1.1/32 eq 80
```

You also need to configure the mirror port with the [mirror interface](#) command.

access-list hardware (named hardware ACL)

Overview This command creates a named hardware access-list and puts you into IPv4 Hardware ACL Configuration mode, where you can add filter entries to the ACL.

Once you have configured the ACL, you can use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map.

The **no** variant of this command removes the specified named hardware ACL.

Syntax `access-list hardware <name>`
`no access-list hardware <name>`

Parameter	Description
<name>	Specify a name for the hardware ACL.

Mode Global Configuration

Default Any traffic on an interface controlled by a hardware ACL that does not explicitly match a filter is permitted.

Usage notes Use this command to name a hardware ACL and enter the IPv4 Hardware ACL Configuration mode. If the named hardware ACL does not exist, it will be created after entry. If the named hardware ACL already exists, then this command puts you into IPv4 Hardware ACL Configuration mode for that existing ACL.

Entering this command moves you to the IPv4 Hardware ACL Configuration mode (config-ip-hw-acl prompt), so you can enter ACL filters with sequence numbers. From this prompt, configure the filters for the ACL. See the [ACL Feature Overview and Configuration Guide](#) for complete examples of configured sequenced numbered ACLs.

NOTE: Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

Examples To create the hardware access-list named "ACL-1" and enter the IPv4 Hardware ACL Configuration mode to specify the ACL filter entry, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware ACL-1
awplus(config-ip-hw-acl)#
```

To remove the hardware access-list named "ACL-1", use the commands:

```
awplus# configure terminal
awplus(config)# no access-list hardware ACL-1
```

Related commands

 - (named hardware ACL entry for ICMP)
 - (named hardware ACL entry for IP protocols)
 - (named hardware ACL entry for TCP or UDP)
 - (access-list standard named filter)
- `show interface access-group`
- `show access-list` (IPv4 Hardware ACLs)

access-list hardware-deny-log

Overview Use this command to enable logging of packets that are denied by hardware IP ACLs. Hardware IP ACLs are ACLs with an ID number from 3000 to 3699. If you turn on logging, the switch will produce a log message when it drops denied packets.

CAUTION: *If you enable this logging, do not use an action of **copy-to-cpu** or **send-to-cpu** in any of the switch's ACLs. If you do, packets that match those ACLs will also be dropped.*

Use the **no** variant of this command to disable logging of packets that are denied by hardware IP ACLs.

Syntax `access-list hardware-deny-log [info|warn] [rate <1-1000>]
[burst <1-1000>] [timeout <1-3600>]
no access-list hardware-deny-log`

Parameter	Description
info	Give the log messages a severity level of 'info'. This is the default severity level.
warn	Give the log messages a severity level of 'warn'. If you want the messages to go to the buffered, permanent, and external log as well as the terminal, specify this parameter.
rate <1-1000>	This limits the number of log messages produced per hour. The switch will stop creating log messages if packets are denied at a higher rate than this specified rate. The default is 12 packets per hour. This means, for example, that if there are 60 denied packets in the first hour, then at most the first 12 of these packets will be logged. After that, logging will stop unless the rate drops below 12 an hour. (The actual number of packets logged depends on the number of flows the dropped packets come from; see the burst parameter).
burst <1-1000>	This is the maximum initial number of packets to log for a given flow. A flow is a set of packets with the same source IP address, destination IP address, source port, and destination port. The default is 5. The burst number reduces by 1 each time a packet in the flow is logged. Then it increases by 1 again every time the rate drops below the limit set by the rate parameter, up to the burst number.
timeout <1-3600>	This is the length of time it takes for a flow record to expire, in seconds. The switch considers that a flow has expired if it hasn't received any packets that match that flow for the timeout number of seconds. The default is 3600 seconds (1 hour). When a flow expires, its burst value is reset and logging may restart (depending on the current rate of denied packets).

Default Disabled

Mode Global Configuration

Usage notes To enable logging for a particular ACL, enter:

- this command (**access-list hardware-deny-log**)
- the command [terminal monitor](#), and
- a **log** parameter at the end of the desired ACL.

The switch will send the log messages to:

- The terminal monitor, by default, as long as you enter the command [terminal monitor](#), and
- If you change the severity of the messages to **warn**, to the buffered log, permanent log, and external log as well. The external log defines what logs will be sent to external syslog servers.

The log message format is:

```
DENY> IN=<interface-name> OUT=<blank>
MAC=<dest-mac-addr:src-mac-addr:eth-type> SRC=<source-ip-address>
DST=<dest-ip-address> LEN=<packet-length> TOS=<type-of-service>
PREC=<precedence> TTL=<time-to-live> ID=<packet-ID>
PROTO=<L4-protocol> SPT=<L4-source-port> DPT=<L4-dest-port>
LEN=<L4-packet-length> MARK=<internal-packet-marking>
```

An example of a permanent log message is:

```
2023 March 03 07:04:37 local5.warning awplus ulogd[931]: DENY>
IN=vlan100 OUT= MAC=e0:1a:ea:50:51:fc:00:00:11:11:22:22:08:00
SRC=192.168.1.100 DST=192.170.1.1 LEN=42 TOS=00 PREC=0x00 TTL=64
ID=0 PROTO=UDP SPT=63 DPT=63 LEN=22 MARK=0x20000000
```

Example To log packets denied by ACL 3000, which denies all Echo requests, use the commands:

```
awplus# terminal monitor
awplus# configure terminal
awplus(config)# access-list hardware-deny-log
awplus(config)# access-list 3000 deny icmp any any icmp-type 8
```

acl-group ip address

- Overview** Use this command to create a new named IPv4 ACL group that contains one or more IPv4 host or subnets.
- This command creates a named IPv4 ACL group and enters the ACL Host Group config mode. IPv4 hosts or subnets can be added to or removed from this group. This host group can be used as a source or destination match for any hardware ACL to simplify large ACL configs with lots of IPv4 hosts.
- Use the **no** variant of this command to delete an IPv4 ACL group.

- Syntax** `acl-group ip address <group>`
`no acl-group ip address <group>`

Parameter	Description
<group>	The name of the IPv4 ACL group.

- Default** No ACL groups exist by default.

- Mode** Global Configuration

- Example** To create an IPv4 ACL group named IPV4_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ip address IPV4_GROUP1
awplus(config-ip-host-group)#
```

To delete an IPv4 ACL group named IPV4_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# no acl-group ip address IPV4_GROUP1
```

- Related commands** [ip \(ip-host-group\)](#)
[show acl-group ip address](#)

- Command changes** Version 5.5.0-1.1: command added

acl-group ip port

Overview Use this command to create a new named port ACL group that contains one or more port rules for an ACL.

This command creates a named port ACL group and enters the ACL Port Group config mode. Port matching rules can be added to or removed from this group. This host group can be used to match on source or destination ports when used with an ACL.

Use the **no** variant of this command to delete a port ACL group.

Syntax `acl-group ip port <group>`
`no acl-group ip port <group>`

Parameter	Description
<group>	The name of the port ACL group.

Default No ACL groups exist by default.

Mode Global Configuration

Example To create a port ACL group named PORT_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ip port PORT_GROUP1
awplus(config-ip-port-group)#
```

To delete a port ACL group named PORT_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# no acl-group ip port PORT_GROUP1
```

Related commands [\(acl-group ip port range\)](#)
[show acl-group ip port](#)

Command changes Version 5.5.0-1.1: command added

(acl-group ip port range)

Overview Use this command to add one or more protocol port rules on a port ACL group. These port matching rules are used to simplify large ACL configs where many ACLs block or permit on the same service ports.

Use the **no** variant of this command to remove a rule match on protocol ports.

Syntax

```
eq <0-65535>
lt <0-65535>
gt <0-65535>
ne <0-65535>
range <0-65535> <0-65535>
no eq <0-65535>
no lt <0-65535>
no gt <0-65535>
no ne <0-65535>
no range <0-65535> <0-65535>
```

Parameter	Description
eq	The protocol port matches if equal to this number.
lt	The protocol port matches if less than this number.
gt	The protocol port matches if greater than this number.
ne	The protocol port matches if not equal to this number.
range	The protocol port matches if it is in this range.
<0-65535>	The port number.

Default The port ACL group will match on all ports by default.

Mode IP ACL Port Group Configuration

Example To add the rule match on protocol ports equal to 20 on a port ACL group, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ip port PORT_GROUP1
awplus(config-ip-port-group)# eq 20
```

To add the rule match on protocol ports between 20 and 50 on a port ACL group, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ip port PORT_GROUP1
awplus(config-ip-port-group)# range 20 50
```

To add the rule match on protocol ports greater than 20 except 30 on a port ACL group, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ip port PORT_GROUP1
awplus(config-ip-port-group)# gt 20
awplus(config-ip-port-group)# ne 30
```

To remove the rule match on protocol ports between 20 and 50 on a port ACL group, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ip port PORT_GROUP1
awplus(config-ip-port-group)# no range 20 50
```

changes**

Version 5.5.0-1.1: command added

clear access-list counters

Overview Use this command to reset the hardware access-list counters to zero. The access-list counters show the number of packets that match your hardware ACLs. Every time a hardware ACL allows or drops a packet, its counter increments.

Syntax `clear access-list counters [<acl>]`

Parameter	Description
<acl>	Clear the counters for only the specified ACL. You can enter the ACL name or number.

Mode Privileged Exec

Usage notes To view the counter values, use the command [show access-list counters](#).

Example To clear the counters for the ACL named ACL-1, use the command:

```
awplus# clear access-list counters ACL-1
```

Related commands [show access-list counters](#)

Command changes Version 5.5.2-2.1: command added

commit (IPv4)

Overview Use this command to commit the IPv4 ACL filter configuration entered at the console to the hardware immediately without exiting the IPv4 Hardware ACL Configuration mode.

This command forces the associated hardware and software IPv4 ACLs to synchronize.

Syntax `commit`

Mode IPv4 Hardware ACL Configuration

Usage notes Normally, when an IPv4 hardware ACL is edited, the new configuration state of the IPv4 ACL is not written to hardware until you exit IPv4 Hardware ACL Configuration mode. By entering this command you can ensure that the current state of a hardware access-list that is being edited is written to hardware immediately.

Scripts typically do not include the [exit](#) command to exit configuration modes, potentially leading to IPv4 ACL filters in hardware not being correctly updated. Using this **commit** command in a configuration script after specifying an IPv4 hardware ACL filter ensures that it is updated in the hardware immediately.

Example To update the hardware with the IPv4 ACL filter configuration, use the command:

```
awplus# configure terminal
awplus(config)# access-list hardware my-hw-list
awplus(config-ip-hw-acl)# commit
```

Related commands [access-list hardware \(named hardware ACL\)](#)

ip (ip-host-group)

Overview Use this command to add an IPv4 host or subnet to an IPv4 ACL group. Adding IPv4 hosts and subnets to an ACL group allows you to simplify ACL config when the same IP addresses are required for many ACLs.

Use the **no** variant of this command to remove an IPv4 host or subnet from an IPv4 ACL group.

Syntax `ip {any|<match-ip>}`
`no ip {any|<match-ip>}`

Parameter	Description
any	Match any IP address.
<match-ip>	The addresses to match against. You can specify a single host or a subnet. The following are the valid formats for specifying the addresses:
<ip-addr>	Match a single host with the IP address given by <ip-addr> in dotted decimal notation.
<ip-addr>/<prefix>	Match any IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.
<ip-addr> <reverse-mask>	Match any IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.

Default No hosts or subnets are in an IPv4 ACL group by default.

Mode IP ACL Host Group Configuration

Example To add the subnet 192.168.1.0/24 to an IPv4 ACL group IPV4_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ip address IPV4_GROUP1
awplus(config-ip-host-group)# ip 192.168.1.0/24
```

To remove the subnet 192.168.1.0/24 from an IPv4 ACL group IPV4_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ip address IPV4_GROUP1
awplus(config-ip-host-group)# no ip 192.168.1.0/24
```

Version 5.5.0-1.1: command added

(named hardware ACL entry for ICMP)

Overview Use this command to add a new ICMP filter entry to the current hardware access-list. The filter will match on any ICMP packet that has the specified source and destination IP addresses and (optionally) ICMP type. You can specify the value **any** if source or destination address does not matter.

If you specify a sequence number, the switch inserts the new filter at the specified location. Otherwise, the switch adds the new filter to the end of the access-list.

The **no** variant of this command removes an ICMP filter entry from the current hardware access-list. You can specify the ICMP filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its ICMP filter profile without specifying its sequence number (e.g. **no permit icmp 192.168.1.0/24 any icmp-type 11**).

You can find the sequence number by running the [show access-list \(IPv4 Hardware ACLs\)](#) command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

CAUTION: Specifying a “send” action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.

Syntax [`<sequence-number>`] `<action>` icmp `<source-ip>` `<dest-ip>`
[icmp-type `<number>`] [vlan `<1-4094>`] [log]

no `<sequence-number>`

no `<action>` icmp `<source-ip>` `<dest-ip>` [icmp-type `<number>`]
[vlan `<1-4094>`] [log]

The following actions are available for hardware ACLs:

Values for the <code><action></code> parameter	
deny	Reject packets that match the source and destination filtering specified with this command.
permit	Permit packets that match the source and destination filtering specified with this command.
copy-to-cpu	Send a copy of matching packets to the CPU.
copy-to-mirror [interface <i>port-number</i>]	Send a copy of matching packets to a mirror port. Use the mirror interface command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.
send-to-mirror [interface <i>port-number</i>]	Send matching packets to the mirror port. Use the mirror interface command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.

Values for the <action> parameter	
send-to-vlan-port vlan <vid> port <port-number>	Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.
send-to-cpu	Send matching packets to the CPU.
deny-and-not-cpu	Drop the packet and make sure that it isn't sent to the switch's CPU. Use this action if you want to drop packets that AlliedWare Plus would normally send to the switch's CPU.

Parameter	Description
<sequence-number>	The sequence number for the filter entry of the selected access control list, in the range 1-65535. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.
<action>	The action that the switch will take on matching packets. See the table above for valid values.
icmp	Match against ICMP packets
<source-ip>	The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:
	any Match any source IP address.
	host <ip-addr> Match a single source host with the IP address given by <ip-addr> in dotted decimal notation.
	<ip-addr>/<prefix> Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.
	<ip-addr> <reverse-mask> Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.
<dest-ip>	The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:
	any Match any destination IP address.

Parameter	Description
	host <i><ip-addr></i> Match a single destination host with the IP address given by <i><ip-addr></i> in dotted decimal notation.
	<i><ip-addr>/<prefix></i> Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.
	<i><ip-addr></i> <i><reverse-mask></i> Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.
icmp-type <i><number></i>	The type of ICMP message to match against, as defined in RFC792 and RFC950. Values include:
	0 Echo replies.
	3 Destination unreachable messages.
	4 Source quench messages.
	5 Redirect (change route) messages.
	8 Echo requests.
	11 Time exceeded messages.
	12 Parameter problem messages.
	13 Timestamp requests.
	14 Timestamp replies.
	15 Information requests.
	16 Information replies.
	17 Address mask requests.
	18 Address mask replies.
vlan <i><1-4094></i>	The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.
log	Log packets that are denied by this ACL. You must also enable the logging, using the command access-list hardware-deny-log .

Mode IPv4 Hardware ACL Configuration (accessed by running the command [access-list hardware](#) (named hardware ACL))

Default On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

Usage notes To use this command, first run the command [access-list hardware \(named hardware ACL\)](#) and enter the desired access-list name. This changes the prompt to:

```
awplus(config-ip-hw-acl)#
```

Then use this command (and the other “named hardware ACL: entry” commands) to add filter entries. You can add multiple filter entries to an ACL. You can insert a new filter entry into the middle of an existing list by specifying the appropriate sequence number. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Then use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

Examples To add an access-list filter entry with a sequence number of 100 to the access-list named “my-list” that will permit ICMP packets with a source address of 192.168.1.0/24, any destination address and an ICMP type of 5, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# 100 permit icmp 192.168.1.0/24 any
icmp-type 5
```

To remove an access-list filter entry with a sequence number of 100 from the access-list named “my-list”, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# no 100
```

Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

(named hardware ACL entry for IP packets)

Overview Use this command to add an IP packet filter entry to the current hardware access-list. The filter will match on IP packets that have the specified IP and/or MAC addresses. You can use the value **any** instead of source or destination IP or MAC address if an address does not matter.

If you specify a sequence number, the switch inserts the new filter at the specified location. Otherwise, the switch adds the new filter to the end of the access-list.

The **no** variant of this command removes a filter entry from the current hardware access-list. You can specify the filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its filter profile without specifying its sequence number (e.g. **no deny ip 192.168.0.0/16 any**).

You can find the sequence number by running the [show access-list \(IPv4 Hardware ACLs\)](#) command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

CAUTION: Specifying a “send” action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.

Syntax [`<sequence-number>`] `<action>` ip `<source-ip>` `<dest-ip>`
[`<source-mac>` `<dest-mac>`] [`vlan <1-4094>`] [`log`]

`no <sequence-number>`

`no <action>` ip `<source-ip>` `<dest-ip>` [`<source-mac>` `<dest-mac>`]
[`vlan <1-4094>`] [`log`]

The following actions are available for hardware ACLs:

Values for the <code><action></code> parameter	
deny	Reject packets that match the source and destination filtering specified with this command.
permit	Permit packets that match the source and destination filtering specified with this command.
copy-to-cpu	Send a copy of matching packets to the CPU.
copy-to-mirror [interface <i>port-number</i>]	Send a copy of matching packets to a mirror port. Use the mirror interface command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.
send-to-mirror [interface <i>port-number</i>]	Send matching packets to the mirror port. Use the mirror interface command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.

Values for the <action> parameter	
send-to-vlan-port vlan <vid> port <port-number>	Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.
send-to-cpu	Send matching packets to the CPU.
deny-and-not-cpu	Drop the packet and make sure that it isn't sent to the switch's CPU. Use this action if you want to drop packets that AlliedWare Plus would normally send to the switch's CPU.

Parameter	Description
<sequence-number>	The sequence number for the filter entry of the selected access control list, in the range 1-65535. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.
<action>	The action that the switch will take on matching packets. See the table above for valid values.
ip	Match against IP packets
<source-ip>	The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:
any	Match any source IP address.
dhcp snooping	Match the source address learned from the DHCP Snooping binding database.
host <ip-addr>	Match a single source host with the IP address given by <ip-addr> in dotted decimal notation.
<ip-addr>/<prefix>	Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.
<ip-addr> <reverse-mask>	Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.
<dest-ip>	The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:
any	Match any destination IP address.

Parameter	Description
host <ip-addr>	Match a single destination host with the IP address given by <ip-addr> in dotted decimal notation.
<ip-addr>/<prefix>	Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.
<ip-addr> <reverse-mask>	Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.
<source-mac>	The source MAC address to match against. You can specify a single MAC address, a range (through a mask), the address learned from DHCP snooping, or any:
any	Match against any source MAC address.
<source-mac>	The source MAC address to match against, followed by the mask. Enter the address in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number. Enter the mask in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number. For a mask, each value is either 0 or F, where FF = Ignore, and 00 = Match.
dhcpsnooping	Match the source address learned from the DHCP Snooping binding database.
<dest-mac>	The destination MAC address to match against. You can specify a single MAC address, a range (through a mask), or any:
any	Match against any destination MAC address.
<dest-mac>	The destination MAC address to match against, followed by the mask. Enter the address in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number. Enter the mask in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number. For a mask, each value is either 0 or F, where FF = Ignore, and 00 = Match.

Parameter	Description
vlan <1-4094>	The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.
log	Log packets that are denied by this ACL. You must also enable the logging, using the command access-list hardware-deny-log .

Mode IPv4 Hardware ACL Configuration (accessed by running the command [access-list hardware](#) (named hardware ACL))

Default On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

Usage notes To use this command, first run the command [access-list hardware](#) (named hardware ACL) and enter the desired access-list name. This changes the prompt to:

```
awplus(config-ip-hw-acl)#
```

Then use this command (and the other “named hardware ACL: entry” commands) to add filter entries. You can add multiple filter entries to an ACL. You can insert a new filter entry into the middle of an existing list by specifying the appropriate sequence number. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Then use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

Examples To add a filter entry to the access-list named “my-list” that will permit any IP packet with a source address of 192.168.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# permit ip 192.168.1.1/32 any
```

To add a filter entry to the access-list named “my-list” that will permit any IP packet with a source address of 192.168.1.1 and a MAC source address of ffee.ddcc.bbbaa, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# permit ip 192.168.1.1/32 any mac
ffee.ddcc.bbbaa 0000.0000.0000 any
```

To add a filter entry to the access-list named “my-list” that will deny all IP packets on vlan 2, use the commands:

```
awplus# enable
awplus(config)# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# deny ip any any vlan 2
```

changes**

Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

(named hardware ACL entry for IP protocols)

Overview Use this command to add an IP protocol type filter entry to the current hardware access-list. The filter will match on IP packets that have the specified IP protocol number, and the specified IP and/or MAC addresses. You can use the value **any** instead of source or destination IP or MAC address if an address does not matter.

If you specify a sequence number, the switch inserts the new filter at the specified location. Otherwise, the switch adds the new filter to the end of the access-list.

The **no** variant of this command removes a filter entry from the current hardware access-list. You can specify the filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its filter profile without specifying its sequence number (e.g. **no deny proto 2 192.168.0.0/16 any**).

You can find the sequence number by running the [show access-list \(IPv4 Hardware ACLs\)](#) command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

CAUTION: Specifying a “send” action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.

Syntax [`<sequence-number>`] `<action>` proto `<1-255>` `<source-ip>`
`<dest-ip>` [`<source-mac>` `<dest-mac>`] [`vlan <1-4094>`] [`log`]

`no <sequence-number>`

`no <action>` proto `<1-255>` `<source-ip>` `<dest-ip>` [`<source-mac>`
`<dest-mac>`] [`vlan <1-4094>`] [`log`]

The following actions are available for hardware ACLs:

Values for the <code><action></code> parameter	
deny	Reject packets that match the source and destination filtering specified with this command.
permit	Permit packets that match the source and destination filtering specified with this command.
copy-to-cpu	Send a copy of matching packets to the CPU.
copy-to-mirror [interface port-number]	Send a copy of matching packets to a mirror port. Use the mirror interface command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.
send-to-mirror [interface port-number]	Send matching packets to the mirror port. Use the mirror interface command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.

Values for the <action> parameter	
send-to-vlan-port vlan <vid> port <port-number>	Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.
send-to-cpu	Send matching packets to the CPU.
deny-and-not-cpu	Drop the packet and make sure that it isn't sent to the switch's CPU. Use this action if you want to drop packets that AlliedWare Plus would normally send to the switch's CPU.

Table 42-5: Parameters in IP protocol ACL entries

Parameter	Description
<sequence-number>	The sequence number for the filter entry of the selected access control list, in the range 1-65535. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.
<action>	The action that the switch will take on matching packets. See the table above for valid values.
proto <1-255>	The IP protocol number to match against, as defined by IANA (Internet Assigned Numbers Authority www.iana.org/assignments/protocol-numbers) See below for a list of IP protocol numbers and their descriptions.
<source-ip>	The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:
	any Match any source IP address.
	dhcpsnooping Match the source address learned from the DHCP Snooping binding database.
	host <ip-addr> Match a single source host with the IP address given by <ip-addr> in dotted decimal notation.
	<ip-addr>/<prefix> Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.
	<ip-addr> <reverse-mask> Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.

Table 42-5: Parameters in IP protocol ACL entries (cont.)

Parameter	Description
<code><dest-ip></code>	The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:
<code>any</code>	Match any destination IP address.
<code>host <ip-addr></code>	Match a single destination host with the IP address given by <code><ip-addr></code> in dotted decimal notation.
<code><ip-addr>/<prefix></code>	Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.
<code><ip-addr></code> <code><reverse-mask></code>	Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.
<code><source-mac></code>	The source MAC address to match against. You can specify a single MAC address, a range (through a mask), the address learned from DHCP snooping, or any:
<code>any</code>	Match against any source MAC address.
<code><source-mac></code>	The source MAC address to match against, followed by the mask. Enter the address in the format <code><HHHH.HHHH.HHHH></code> , where each <i>H</i> is a hexadecimal number. Enter the mask in the format <code><HHHH.HHHH.HHHH></code> , where each <i>H</i> is a hexadecimal number. For a mask, each value is either 0 or F, where FF = Ignore, and 00 = Match.
<code>dhcpsnooping</code>	Match the source address learned from the DHCP Snooping binding database.
<code><dest-mac></code>	The destination MAC address to match against. You can specify a single MAC address, a range (through a mask), or any:
<code>any</code>	Match against any destination MAC address.

Table 42-5: Parameters in IP protocol ACL entries (cont.)

Parameter	Description
<code><dest-mac></code>	The destination MAC address to match against, followed by the mask. Enter the address in the format <code><HHHH.HHHH.HHHH></code> , where each <i>H</i> is a hexadecimal number. Enter the mask in the format <code><HHHH.HHHH.HHHH></code> , where each <i>H</i> is a hexadecimal number. For a mask, each value is either 0 or F, where FF = Ignore, and 00 = Match.
<code>vlan <1-4094></code>	The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.
<code>log</code>	Log packets that are denied by this ACL. You must also enable the logging, using the command access-list hardware-deny-log .

Mode IPv4 Hardware ACL Configuration (accessed by running the command [access-list hardware \(named hardware ACL\)](#))

Default On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

Usage notes To use this command, run the command [access-list hardware \(named hardware ACL\)](#) and enter the desired access-list name. This changes the prompt to:

```
awplus(config-ip-hw-acl) #
```

Then use this command (and the other “named hardware ACL: entry” commands) to add filter entries. You can add multiple filter entries to an ACL. You can insert a new filter entry into the middle of an existing list by specifying the appropriate sequence number. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Then use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

Examples To add a filter entry to the access-list named “my-list” that will deny all IGMP packets (protocol 2) from the 192.168.0.0 subnet, and give it a sequence number of 50, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# 50 deny proto 2 192.168.0.0/16 any
```

Command changes Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

(named hardware ACL entry for MAC addresses)

Overview Use this command to add a MAC address filter entry to the current hardware access-list. The access-list will match on packets that have the specified source and destination MAC addresses. You can use the value **any** instead of source or destination MAC address if an address does not matter.

If you specify a sequence number, the switch inserts the new filter at the specified location. Otherwise, the switch adds the new filter to the end of the access-list.

The **no** variant of this command removes a filter entry from the current hardware access-list. You can specify the filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its filter profile without specifying its sequence number (e.g. **no permit mac aaaa.bbbb.cccc 0000.0000.0000 any**).

You can find the sequence number by running the [show access-list \(IPv4 Hardware ACLs\)](#) command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

CAUTION: Specifying a “send” action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.

Syntax [`<sequence-number>`] `<action>` mac {`<source-mac>`|any} {`<dest-mac>`|any} [vlan `<1-4094>`] [inner-vlan `<1-4094>`]

no `<sequence-number>`

no `<action>` mac {`<source-mac>`|any} {`<dest-mac>`|any} [vlan `<1-4094>`] [inner-vlan `<1-4094>`]

The following actions are available for hardware ACLs:

Values for the <code><action></code> parameter	
deny	Reject packets that match the source and destination filtering specified with this command.
permit	Permit packets that match the source and destination filtering specified with this command.
copy-to-cpu	Send a copy of matching packets to the CPU.
copy-to-mirror [interface <i>port-number</i>]	Send a copy of matching packets to a mirror port. Use the mirror interface command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.

Values for the <action> parameter	
send-to-mirror [interface port-number]	Send matching packets to the mirror port. Use the mirror interface command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.
send-to-vlan-port vlan <vid> port <port-number>	Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.
send-to-cpu	Send matching packets to the CPU.
deny-and-not-cpu	Drop the packet and make sure that it isn't sent to the switch's CPU. Use this action if you want to drop packets that AlliedWare Plus would normally send to the switch's CPU.

Parameter	Description
<sequence-number>	The sequence number for the filter entry of the selected access control list, in the range 1-65535. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.
<action>	The action that the switch will take on matching packets. See the table above for valid values.
mac	Match against MAC address
<source-mac>	The source MAC address to match against, followed by the mask. Enter the address in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number. Enter the mask in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number. For a mask, each value is either 0 or F, where FF = Ignore, and 00 = Match.
any	Match against any source MAC address.
<dest-mac>	The destination MAC address to match against, followed by the mask. Enter the address in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number. Enter the mask in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number. For a mask, each value is either 0 or F, where FF = Ignore, and 00 = Match.
any	Match against any destination MAC address.
vlan <1-4094>	Match against the specified ID in the packet's VLAN tag.
inner-vlan <1-4094>	Match against the inner VLAN tag (VID). This parameter is used within double-tagged VLANs. It is sometimes referred to as the C-TAG (Customer VLAN TAG), and the vlan VID tag is referred to as the S-TAG (Service VLAN TAG).

- Mode** IPv4 Hardware ACL Configuration (accessed by running the command [access-list hardware \(named hardware ACL\)](#))
- Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.
- Usage notes** To use this command, first run the command [access-list hardware \(named hardware ACL\)](#) and enter the desired access-list name. This changes the prompt to:
- ```
awplus(config-ip-hw-acl)#
```
- Then use this command (and the other “named hardware ACL: entry” commands) to add filter entries. You can add multiple filter entries to an ACL. You can insert a new filter entry into the middle of an existing list by specifying the appropriate sequence number. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.
- Then use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.
- Examples** To add a filter entry to the access-list named “my-list” that will permit packets with a source MAC address of 0000.00ab.1234 and any destination MAC address, use the commands:
- ```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# permit mac 0000.00ab.1234
0000.0000.0000 any
```
- To remove a filter entry that permit packets with a source MAC address of 0000.00ab.1234 and any destination MAC address, use the commands:
- ```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# no permit mac 0000.00ab.1234
0000.0000.0000 any
```

# (named hardware ACL entry for TCP or UDP)

**Overview** Use this command to add a TCP or UDP filter entry to the current hardware access-list. The access-list will match on TCP or UDP packets that have the specified source and destination IP addresses and optionally, port values. You can use the value **any** instead of source or destination IP address if an address does not matter.

If you specify a sequence number, the switch inserts the new filter at the specified location. Otherwise, the switch adds the new filter to the end of the access-list.

The **no** variant of this command removes a filter entry from the current hardware access-list. You can specify the filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its filter profile without specifying its sequence number (e.g. **no permit udp 192.168.0.0/16 any**).

You can find the sequence number by running the [show access-list \(IPv4 Hardware ACLs\)](#) command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:** Specifying a “send” action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.

**Syntax** [`<sequence-number>`] `<action>` {tcp|udp} `<source-ip>`  
[`<source-ports>`] `<dest-ip>` [`<dest-ports>`] [`vlan <1-4094>`] [`log`]  
  
`no <sequence-number>`  
  
`no <action>` {tcp|udp} `<source-ip>` [`<source-ports>`] `<dest-ip>`  
[`<dest-ports>`] [`vlan <1-4094>`] [`log`]

The following actions are available for hardware ACLs:

| Values for the <action> parameter            |                                                                                                                                                                                                                                                              |
|----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| deny                                         | Reject packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| permit                                       | Permit packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| copy-to-cpu                                  | Send a copy of matching packets to the CPU.                                                                                                                                                                                                                  |
| copy-to-mirror<br>[interface<br>port-number] | Send a copy of matching packets to a mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |
| send-to-mirror<br>[interface<br>port-number] | Send matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.         |

| Values for the <action> parameter                     |                                                                                                                                                                                 |
|-------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| send-to-vlan-port<br>vlan <vid> port<br><port-number> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.                                              |
| send-to-cpu                                           | Send matching packets to the CPU.                                                                                                                                               |
| deny-and-not-cpu                                      | Drop the packet and make sure that it isn't sent to the switch's CPU. Use this action if you want to drop packets that AlliedWare Plus would normally send to the switch's CPU. |

| Parameter         | Description                                                                                                                                                                                                                                                          |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <sequence-number> | The sequence number for the filter entry of the selected access control list, in the range 1-65535. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number. |
| <action>          | The action that the switch will take on matching packets. See the table above for valid values.                                                                                                                                                                      |
| tcp               | Match against TCP packets.                                                                                                                                                                                                                                           |
| udp               | Match against UDP packets.                                                                                                                                                                                                                                           |
| <source-ip>       | The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:                                                                                              |
|                   | any Match any source IP address.                                                                                                                                                                                                                                     |
|                   | host <ip-addr> Match a single source host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                                                         |
|                   | <ip-addr>/<prefix> Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                                                           |
|                   | <ip-addr><br><reverse-mask> Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.                   |
| <source-ports>    | Match source TCP or UDP port numbers. Port numbers are specified as integers between 0 and 65535. You can specify one or more port numbers as follows:                                                                                                               |
|                   | eq <0-65535> Match a single port number.                                                                                                                                                                                                                             |
|                   | lt <0-65535> Match all port numbers that are less than the specified port number.                                                                                                                                                                                    |

| Parameter                        | Description                                                                                                                                                                                                                 |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| gt <0-65535>                     | Match all port numbers that are greater than the specified port number.                                                                                                                                                     |
| ne <0-65535>                     | Match all port numbers except the specified port number.                                                                                                                                                                    |
| range <start-port><br><end-port> | Match a range of port numbers.                                                                                                                                                                                              |
| <dest-ip>                        | The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:                                      |
| any                              | Match any destination IP address.                                                                                                                                                                                           |
| host <ip-addr>                   | Match a single destination host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                          |
| <ip-addr>/<prefix>               | Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                                |
| <ip-addr><br><reverse-mask>      | Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24. |
| <dest-ports>                     | Match destination TCP or UDP port numbers. Port numbers are specified as integers between 0 and 65535. You can specify one or more port numbers as follows:                                                                 |
| eq <0-65535>                     | Match a single port number.                                                                                                                                                                                                 |
| lt <0-65535>                     | Match all port numbers that are less than the specified port number.                                                                                                                                                        |
| gt <0-65535>                     | Match all port numbers that are greater than the specified port number.                                                                                                                                                     |
| ne <0-65535>                     | Match all port numbers except the specified port number.                                                                                                                                                                    |
| range <start-port><br><end-port> | Match a range of port numbers.                                                                                                                                                                                              |
| vlan <1-4094>                    | The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.                                                                                                                            |
| log                              | Log packets that are denied by this ACL. You must also enable the logging, using the command <a href="#">access-list hardware-deny-log</a> .                                                                                |

- Mode** IPv4 Hardware ACL Configuration (accessed by running the command [access-list hardware \(named hardware ACL\)](#))
- Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.
- Usage notes** To use this command, first run the command [access-list hardware \(named hardware ACL\)](#) and enter the desired access-list name. This changes the prompt to:
- ```
awplus(config-ip-hw-acl)#
```
- Then use this command (and the other “named hardware ACL: entry” commands) to add filter entries. You can add multiple filter entries to an ACL. You can insert a new filter entry into the middle of an existing list by specifying the appropriate sequence number. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.
- Then use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.
- Example** To add a filter entry to access-list named “my-list” that will permit TCP packets with a destination address of 192.168.1.1, a destination port of 80, from any source, use the commands:
- ```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# permit tcp any 192.168.1.1/32 eq 80
```

- Command changes**
- Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches
- Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches
- Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches
- Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

# show access-list (IPv4 Hardware ACLs)

**Overview** Use this command to display the specified access-list, or all access-lists if none have been specified. Note that only defined access-lists are displayed. An error message is displayed for an undefined access-list.

**Syntax** `show access-list`  
`[<1-99>|<100-199>|<1300-1999>|<2000-2699>|<3000-3699>|`  
`<4000-4499>|<access-list-name>]`

| Parameter          | Description                                          |
|--------------------|------------------------------------------------------|
| <1-99>             | IP standard access-list.                             |
| <100-199>          | IP extended access-list.                             |
| <1300-1999>        | IP standard access-list (standard - expanded range). |
| <2000-2699>        | IP extended access-list (extended - expanded range). |
| <3000-3699>        | Hardware IP access-list.                             |
| <4000-4499>        | Hardware MAC access-list.                            |
| <access-list-name> | IP named access-list.                                |

**Mode** User Exec and Privileged Exec

**Examples** To show all access-lists configured on the switch:

```
awplus# show access-list
```

```
Standard IP access list 1
 deny 172.16.2.0, wildcard bits 0.0.0.255
Standard IP access list 20
 deny 192.168.10.0, wildcard bits 0.0.0.255
 deny 192.168.12.0, wildcard bits 0.0.0.255
Hardware IP access list 3001
 permit ip 192.168.20.0 255.255.255.0 any
Hardware IP access list 3020
 permit tcp any 192.0.2.0/24
```

To show the access-list with an ID of 20:

```
awplus# show access-list 20
```

```
Standard IP access-list 20
 deny 192.168.10.0, wildcard bits 0.0.0.255
 deny 192.168.12.0, wildcard bits 0.0.0.255
```

ACLs that are added dynamically during port authentication will be displayed with the label 'dynamic':

```
awplus# show access-list
```

```
Hardware IP access list 3000
 4 permit ip any any
Hardware IP access list 3001
 4 deny ip 192.168.0.0/24 any
Hardware IP access list dacl-port1.0.49-eccd.6dc9.c0d2 (dynamic)
 4 permit ip 192.168.1.0/24 192.168.2.0/24
 8 deny ip 192.168.1.0/24 any
```

The following error message is displayed if you try to show an undefined access-list.

```
awplus# show access-list 2
```

```
% Can't find access-list 2
```

**Related  
commands**

[access-list extended \(named\)](#)

[access-list \(numbered hardware ACL for MAC addresses\)](#)

[access-list hardware \(named hardware ACL\)](#)

# show access-list counters

**Overview** Use this command to show the number of packets that match one or all of your hardware ACLs. Every time a hardware ACL allows or drops a packet, its counter increments. This lets you check your ACL configuration.

**Syntax** `show access-list counters [<acl>]`

| Parameter | Description                                                                                            |
|-----------|--------------------------------------------------------------------------------------------------------|
| <acl>     | Display the number of packets that match only the specified ACL. You can enter the ACL name or number. |

**Mode** User Exec and Privileged Exec

**Usage notes** This command displays the counter values since the last time they were cleared. To clear the counter values, enter the command [clear access-list counters](#).

To accurately measure the number of packet hits per ACL, you need to read the counters for all ACLs frequently.

**Example** To show the number of packets that match all hardware ACLs, use the following command:

```
awplus# show access-list counters
```

**Output** Figure 42-1: Example output from **show access-list counters**

```
awplus#show access-list counters
Hardware ACL Packet Counters

ACL-1
Packet Hits: 17
ACL-2
Packet Hits: 0
ACL-3
Packet Hits: 1
```

**Output** Figure 42-2: Example output from **show access-list counters ACL-1**

```
awplus#show access-list counters ACL-1
Hardware ACL Packet Counters

ACL-1
Packet Hits: 17
```

Table 42-7: Parameters in the output from **show access-list counters**

| Parameter   | Description                                                                                    |
|-------------|------------------------------------------------------------------------------------------------|
| Packet Hits | The number of packets that match the ACL. The count includes both dropped and allowed packets. |

**Related commands**    [clear access-list counters](#)  
                          [show interface access-group](#)

**Command changes**    Version 5.5.2-2.1: reading the counters no longer clears them  
                          Version 5.5.1-2.1: command added

# show acl-group ip address

**Overview** Use this command to show the hosts and subnets in a named IPv4 ACL group.

**Syntax** `show acl-group ip address <group>`

| Parameter                  | Description                     |
|----------------------------|---------------------------------|
| <code>&lt;group&gt;</code> | The name of the IPv4 ACL group. |

**Mode** Privileged Exec

**Example** To show all hosts and subnets in an IPv4 ACL group IPV4\_GROUP1, use the command:

```
awplus# show acl-group ip address IPV4_GROUP1
```

**Output** Figure 42-3: Example output from **show acl-group ip address IPV4\_GROUP1**

```
awplus#show acl-group ip address IPV4_GROUP1
Host Group: IPV4_GROUP1

192.168.1.2/32
192.168.2.5/32
10.0.0.0/8
```

**Related commands** [acl-group ip address](#)  
[ip \(ip-host-group\)](#)

**Command changes** Version 5.5.0-1.1: command added

# show acl-group ip port

**Overview** Use this command to show the port rules in a named port ACL group.

**Syntax** `show acl-group ip port <group>`

| Parameter                  | Description                     |
|----------------------------|---------------------------------|
| <code>&lt;group&gt;</code> | The name of the port ACL group. |

**Mode** Privileged Exec

**Example** To show all port rules in a port ACL group PORT\_GROUP1, use the command:

```
awplus# show acl-group ip port PORT_GROUP1
```

**Output** Figure 42-4: Example output from **show acl-group ip port PORT\_GROUP1**

```
awplus#show acl-group ip port PORT_GROUP1
Port Group: PORT_GROUP1

eq 11
gt 20
lt 503
ne 500
```

**Related commands** [\(acl-group ip port range\)](#)  
[acl-group ip port](#)

**Command changes** Version 5.5.0-1.1: command added

# show interface access-group

**Overview** Use this command to display the access groups attached to a port. If an access group is specified, then the output only includes the ports that the specified access group is attached to. If no access group is specified then this command displays all access groups that are attached to the ports that are specified with <port-list>.

Note that **access group** is the term given for an access-list when it is applied to an interface.

**NOTE:** This command will function on the switch in stand-alone mode, but is not supported when the switch forms part of a VCStack.

**Syntax**

```
show interface <port-list> access-group
[<3000-3699>|<4000-4699>|<access-list-name>]
```

```
show interface <port-list> access-group
[<3000-3699>|<4000-4699>]
```

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <port-list>        | Specify the ports to display information. A port-list can be either: <ul style="list-style-type: none"><li>a switch port (e.g. port1.1.12) a static channel group (e.g. sa3) or a dynamic (LACP) channel group (e.g. po3)</li><li>a continuous range of ports separated by a hyphen, e.g. port1.1.1-1.1.24 or port1.1.1-port1.1.24 or po1-po4</li><li>a comma-separated list of ports and port ranges, e.g. port1.1.1,port1.1.3-1.1.24. Do not mix switch ports, static channel groups, and LACP channel groups in the same list.</li></ul> |
| access group       | Select the access group whose details you want to show.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <3000-3699>        | Specifies the Hardware IP access-list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <4000-4699>        | Specifies the Hardware MAC access-list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <access-list-name> | Specify the Hardware IPv4 access-list name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**Mode** User Exec and Privileged Exec

**Example** To show all access-lists attached to port1.1.1, use the command:

```
awplus# show interface port1.1.1 access-group
```

**Output** Figure 42-5: Example output from the **show interface access-group** command

```
Interface port1.1.1
 access-group 3000
 access-group 3002
 access-group 3001
```

**Related  
commands** [access-group](#)

# IPv4 Software Access Control List (ACL) Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for the IPv4 Software Access Control List (ACL) commands, and contains detailed command information and command examples about IPv4 software ACLs as applied to Routing and Multicasting, which are not applied to interfaces.

For information about ACLs, see the [ACL Feature Overview and Configuration Guide](#).

To apply ACLs to an LACP channel group, apply it to all the individual switch ports in the channel group. To apply ACLs to a static channel group, apply it to the static channel group itself. For more information on link aggregation see the following references:

- the [Link Aggregation Feature Overview\\_and\\_Configuration\\_Guide](#).
- [Link Aggregation Commands](#)

**NOTE:** Text in parenthesis in command names indicates usage not keyword entry. For example, **access-list hardware (named)** indicates named IPv4 hardware ACLs entered as `access-list hardware <name>` where <name> is a placeholder not a keyword.

Parenthesis surrounding ACL filters indicates the type of ACL filter not the keyword entry in the CLI, such as **(access-list standard numbered filter)** represents command entry in the format shown in the syntax:

```
[<sequence-number>] {deny|permit} {<source-address>|host
<host-address>|any}
```

**NOTE:** Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Sub-modes** Many of the ACL commands operate from sub-modes that are specific to particular ACL types. The following table shows the CLI prompts at which ACL commands are entered.

Table 43-1: IPv4 Software Access List Commands and Prompts

| Command Name                              | Command Mode                    | Prompt                       |
|-------------------------------------------|---------------------------------|------------------------------|
| clear ip prefix-list                      | Privileged Exec                 | awplus#                      |
| show ip access-list                       | Privileged Exec                 | awplus#                      |
| show ip prefix-list                       | Privileged Exec                 | awplus#                      |
| access-group                              | Global Configuration            | awplus (config) #            |
| access-list (extended named)              | Global Configuration            | awplus (config) #            |
| access-list (extended numbered)           | Global Configuration            | awplus (config) #            |
| access-list (standard named)              | Global Configuration            | awplus (config) #            |
| access-list (standard numbered)           | Global Configuration            | awplus (config) #            |
| ip prefix-list                            | Global Configuration            | awplus (config) #            |
| maximum-access-list                       | Global Configuration            | awplus (config) #            |
| (access-list extended ICMP filter)        | IPv4 Extended ACL Configuration | awplus (config-ip-ext-acl) # |
| (access-list extended IP filter)          | IPv4 Extended ACL Configuration | awplus (config-ip-ext-acl) # |
| (access-list extended IP protocol filter) | IPv4 Extended ACL Configuration | awplus (config-ip-ext-acl) # |
| (access-list extended TCP UDP filter)     | IPv4 Extended ACL Configuration | awplus (config-ip-ext-acl) # |
| (access-list standard named filter)       | IPv4 Standard ACL Configuration | awplus (config-ip-std-acl) # |
| (access-list standard numbered filter)    | IPv4 Standard ACL Configuration | awplus (config-ip-std-acl) # |

## access-list extended (named)

**Overview** This command configures an extended named access-list that permits or denies packets from specific source and destination IP addresses. You can:

- use this command to enter a new or existing ACL name and enter the IPv4 Extended ACL Configuration mode. Once in that mode, you can create an ACL filter entry. This approach lets you give the entry a sequence number.
- or, use this command to create an ACL and an ACL filter entry at the same time. With this approach, you cannot give the entry a sequence number, so the entry will go after any existing entries.

The **no** variant of this command removes a specified extended named access-list.

**Syntax [to enter the sub-mode]**

```
access-list extended <list-name>
no access-list extended <list-name>
```

| Parameter   | Description                             |
|-------------|-----------------------------------------|
| <list-name> | A user-defined name for the access-list |

**Syntax [icmp]**

```
access-list extended <list-name> {deny|permit} icmp <source>
<destination> [icmp-type <type-number>] [log]
no access-list extended <list-name> {deny|permit} icmp <source>
<destination> [icmp-type <type-number>] [log]
```

Table 43-2: Parameters in the access-list extended (named) command - icmp

| Parameter   | Description                                                                                                         |
|-------------|---------------------------------------------------------------------------------------------------------------------|
| <list-name> | A user-defined name for the access-list.                                                                            |
| deny        | The access-list rejects packets that match the type, source, and destination filtering specified with this command. |
| permit      | The access-list permits packets that match the type, source, and destination filtering specified with this command. |
| icmp        | The access-list matches only ICMP packets.                                                                          |
| icmp-type   | Matches only a specified type of ICMP messages. This is valid only when the filtering is set to match ICMP packets. |

Table 43-2: Parameters in the access-list extended (named) command - icmp

| Parameter                                             | Description                                                                                                                                                                         |
|-------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;source&gt;</code>                           | The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:                          |
| <code>any</code>                                      | Matches any source IP address.                                                                                                                                                      |
| <code>host &lt;ip-addr&gt;</code>                     | Matches a single source host with the IP address given by <code>&lt;ip-addr&gt;</code> in dotted decimal notation.                                                                  |
| <code>&lt;ip-addr&gt;/<br/>&lt;prefix&gt;</code>      | An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.                                               |
| <code>&lt;ip-addr&gt;<br/>&lt;reverse-mask&gt;</code> | Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering <code>192.168.1.10.0.0.255</code> is the same as entering <code>192.168.1.1/24</code> . |
| <code>&lt;destination&gt;</code>                      | The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:           |
| <code>any</code>                                      | Matches any destination IP address.                                                                                                                                                 |
| <code>host &lt;ip-addr&gt;</code>                     | Matches a single destination host with the IP address given by <code>&lt;ip-addr&gt;</code> in dotted decimal notation.                                                             |
| <code>&lt;ip-addr&gt;/<br/>&lt;prefix&gt;</code>      | An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.                                          |
| <code>&lt;ip-addr&gt;<br/>&lt;reverse-mask&gt;</code> | Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering <code>192.168.1.10.0.0.255</code> is the same as entering <code>192.168.1.1/24</code> . |

Table 43-2: Parameters in the access-list extended (named) command - icmp

| Parameter     | Description                                                                                                                         |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <type-number> | The ICMP type, as defined in RFC792 and RFC950. Specify one of the following integers to create a filter for the ICMP message type: |
| 0             | Echo replies.                                                                                                                       |
| 3             | Destination unreachable messages.                                                                                                   |
| 4             | Source quench messages.                                                                                                             |
| 5             | Redirect (change route) messages.                                                                                                   |
| 8             | Echo requests.                                                                                                                      |
| 11            | Time exceeded messages.                                                                                                             |
| 12            | Parameter problem messages.                                                                                                         |
| 13            | Timestamp requests.                                                                                                                 |
| 14            | Timestamp replies.                                                                                                                  |
| 15            | Information requests.                                                                                                               |
| 16            | Information replies.                                                                                                                |
| 17            | Address mask requests.                                                                                                              |
| 18            | Address mask replies.                                                                                                               |
| log           | Logs the results.                                                                                                                   |

### Syntax [tcp|udp]

```
access-list extended <list-name> {deny|permit} {tcp|udp}
<source> [eq <sourceport>|lt <sourceport>|gt <sourceport>|ne
<sourceport>] <destination> [eq <destport>|lt <destport>|gt
<destport>|ne <destport>] [log]
```

```
no access-list extended <list-name> {deny|permit} {tcp|udp}
<source> [eq <sourceport>|lt <sourceport>|gt <sourceport>|ne
<sourceport>] <destination> [eq <destport> |lt <destport>|gt
<destport>|ne <destport>] [log]
```

Table 43-3: Parameters in the access-list extended (named) command - tcp|udp

| Parameter   | Description                                                                                                         |
|-------------|---------------------------------------------------------------------------------------------------------------------|
| <list-name> | A user-defined name for the access-list.                                                                            |
| deny        | The access-list rejects packets that match the type, source, and destination filtering specified with this command. |
| permit      | The access-list permits packets that match the type, source, and destination filtering specified with this command. |
| tcp         | The access-list matches only TCP packets.                                                                           |
| udp         | The access-list matches only UDP packets.                                                                           |

Table 43-3: Parameters in the access-list extended (named) command - tcp|udp

| Parameter                                             | Description                                                                                                                                                                           |
|-------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;source&gt;</code>                           | The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:                            |
| <code>any</code>                                      | Matches any source IP address.                                                                                                                                                        |
| <code>host &lt;ip-addr&gt;</code>                     | Matches a single source host with the IP address given by <code>&lt;ip-addr&gt;</code> in dotted decimal notation.                                                                    |
| <code>&lt;ip-addr&gt;/<br/>&lt;prefix&gt;</code>      | An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.                                                 |
| <code>&lt;ip-addr&gt;<br/>&lt;reverse-mask&gt;</code> | Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering <code>192.168.1.10.0.0.0.255</code> is the same as entering <code>192.168.1.1/24</code> . |
| <code>&lt;destination&gt;</code>                      | The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:             |
| <code>any</code>                                      | Matches any destination IP address.                                                                                                                                                   |
| <code>host &lt;ip-addr&gt;</code>                     | Matches a single destination host with the IP address given by <code>&lt;ip-addr&gt;</code> in dotted decimal notation.                                                               |
| <code>&lt;ip-addr&gt;/<br/>&lt;prefix&gt;</code>      | An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.                                            |
| <code>&lt;ip-addr&gt;<br/>&lt;reverse-mask&gt;</code> | Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering <code>192.168.1.10.0.0.0.255</code> is the same as entering <code>192.168.1.1/24</code> . |
| <code>&lt;sourceport&gt;</code>                       | The source port number, specified as an integer between 0 and 65535.                                                                                                                  |
| <code>&lt;destport&gt;</code>                         | The destination port number, specified as an integer between 0 and 65535.                                                                                                             |
| <code>eq</code>                                       | Matches port numbers equal to the port number specified immediately after this parameter.                                                                                             |
| <code>lt</code>                                       | Matches port numbers less than the port number specified immediately after this parameter.                                                                                            |
| <code>gt</code>                                       | Matches port numbers greater than the port number specified immediately after this parameter.                                                                                         |

Table 43-3: Parameters in the access-list extended (named) command - tcp|udp

| Parameter | Description                                                                                   |
|-----------|-----------------------------------------------------------------------------------------------|
| ne        | Matches port numbers not equal to the port number specified immediately after this parameter. |
| log       | Log the results.                                                                              |

**Syntax**  
**[proto|any|ip]**

```
access-list extended <list-name> {deny|permit} {proto
<ip-protocol>|any|ip} {<source>} {<destination>} [log]
no access-list extended <list-name>{deny|permit} {proto
<ip-protocol>|any|ip}{<source>}{<destination>} [log]
```

Table 43-4: Parameters in the access-list extended (named) command -  
proto|ip|any

| Parameter   | Description                                                                                                                                                                       |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <list-name> | A user-defined name for the access-list.                                                                                                                                          |
| deny        | The access-list rejects packets that match the type, source, and destination filtering specified with this command.                                                               |
| permit      | The access-list permits packets that match the type, source, and destination filtering specified with this command.                                                               |
| proto       | Matches only a specified type of IP Protocol.                                                                                                                                     |
| any         | The access-list matches any type of IP packet.                                                                                                                                    |
| ip          | The access-list matches only IP packets.                                                                                                                                          |
| <source>    | The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:                        |
|             | any Matches any source IP address.                                                                                                                                                |
|             | host <ip-addr> Matches a single source host with the IP address given by <ip-addr> in dotted decimal notation.                                                                    |
|             | <ip-addr>/<prefix> An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.                          |
|             | <ip-addr><reverse-mask> Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering 192.168.1.1 0.0.0.255 is the same as entering 192.168.1.1/24. |

Table 43-4: Parameters in the access-list extended (named) command -  
proto|ip|any (cont.)

| Parameter                                             | Description                                                                                                                                                                                                                                                         |
|-------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;destination&gt;</code>                      | The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:                                                                                           |
| <code>any</code>                                      | Matches any destination IP address.                                                                                                                                                                                                                                 |
| <code>host &lt;ip-addr&gt;</code>                     | Matches a single destination host with the IP address given by <code>&lt;ip-addr&gt;</code> in dotted decimal notation.                                                                                                                                             |
| <code>&lt;ip-addr&gt;/<br/>&lt;prefix&gt;</code>      | An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.                                                                                                                          |
| <code>&lt;ip-addr&gt;<br/>&lt;reverse-mask&gt;</code> | Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering <code>192.168.1.1 0.0.0.255</code> is the same as entering <code>192.168.1.1/24</code> .                                                                                |
| <code>log</code>                                      | Logs the results.                                                                                                                                                                                                                                                   |
| <code>&lt;ip-protocol&gt;</code>                      | The IP protocol number, as defined by IANA (Internet Assigned Numbers Authority)<br><a href="http://www.iana.org/assignments/protocol-numbers">www.iana.org/assignments/protocol-numbers</a><br>See below for a list of IP protocol numbers and their descriptions. |

Table 43-5: IP protocol number and description

| Protocol Number | Protocol Description [RFC]                             |
|-----------------|--------------------------------------------------------|
| 1               | Internet Control Message [RFC792]                      |
| 2               | Internet Group Management [RFC1112]                    |
| 3               | Gateway-to-Gateway [RFC823]                            |
| 4               | IP in IP [RFC2003]                                     |
| 5               | Stream [RFC1190] [RFC1819]                             |
| 6               | TCP (Transmission Control Protocol) [RFC793]           |
| 8               | EGP (Exterior Gateway Protocol) [RFC888]               |
| 9               | IGP (Interior Gateway Protocol) [IANA]                 |
| 11              | Network Voice Protocol [RFC741]                        |
| 17              | UDP (User Datagram Protocol) [RFC768]                  |
| 20              | Host monitoring [RFC869]                               |
| 27              | RDP (Reliable Data Protocol) [RFC908]                  |
| 28              | IRTP (Internet Reliable Transaction Protocol) [RFC938] |

Table 43-5: IP protocol number and description (cont.)

| Protocol Number | Protocol Description [RFC]                            |
|-----------------|-------------------------------------------------------|
| 29              | ISO-TP4 (ISO Transport Protocol Class 4) [RFC905]     |
| 30              | Bulk Data Transfer Protocol [RFC969]                  |
| 33              | DCCP (Datagram Congestion Control Protocol) [RFC4340] |
| 48              | DSR (Dynamic Source Routing Protocol) [RFC4728]       |
| 50              | ESP (Encap Security Payload) [RFC2406]                |

**Mode** Global Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage** Use this command when configuring access-lists for filtering IP software packets. You can either create access-lists from within this command, or you can enter **access-list extended** followed by only the name. Entering only the name moves you to the IPv4 Extended ACL Configuration mode for the selected access-list.

From there you can configure your access-lists by using the commands ([access-list extended ICMP filter](#)), ([access-list extended IP filter](#)), and ([access-list extended IP protocol filter](#)).

Note that packets must match both the source and the destination details.

**NOTE:** Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Examples** You can enter the extended named ACL in the Global Configuration mode together with the ACL filter entry on the same line, as shown below:

```
awplus# configure terminal
awplus(config)# access-list extended TK deny tcp 2.2.2.3/24 eq
14 3.3.3.4/24 eq 12 log
```

Alternatively, you can enter the extended named ACL in Global Configuration mode before specifying the ACL filter entry in the IPv4 Extended ACL Configuration mode, as shown below:

```
awplus# configure terminal
awplus(config)# access-list extended TK
awplus(config-ip-ext-acl)# deny tcp 2.2.2.3/24 eq 14 3.3.3.4/24
eq 12 log
```

## access-list (extended numbered)

**Overview** This command configures an extended numbered access-list that permits or denies packets from specific source and destination IP addresses. You can:

- use this command to enter a new or existing ACL number and enter the IPv4 Extended ACL Configuration mode. Once in that mode, you can create an ACL filter entry. This approach lets you give the entry a sequence number.
- or, use this command to create an ACL and an ACL filter entry at the same time. With this approach, you cannot give the entry a sequence number, so the entry will go after any existing entries.

The **no** variant of this command removes a specified extended named access-list.

**Syntax [to enter the sub-mode]**

```
access-list {<100-199>|<2000-2699>}
no access-list {<100-199>|<2000-2699>}
```

**Syntax [to create an ACL entry]**

```
access-list {<100-199>|<2000-2699>} {deny|permit} ip <source>
<destination>
no access-list {<100-199>|<2000-2699>} {deny|permit} ip
<source> <destination>
```

| Parameter                   | Description                                                                                                                                                                                                               |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <100-199>                   | IP extended access-list.                                                                                                                                                                                                  |
| <2000-2699>                 | IP extended access-list (expanded range).                                                                                                                                                                                 |
| deny                        | Access-list rejects packets that match the source and destination filtering specified with this command.                                                                                                                  |
| permit                      | Access-list permits packets that match the source and destination filtering specified with this command.                                                                                                                  |
| <source>                    | The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:                                                                |
| any                         | Matches any source IP address.                                                                                                                                                                                            |
| host <ip-addr>              | Matches a single source host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                           |
| <ip-addr><br><reverse-mask> | An IPv4 address, followed by a reverse mask in dotted decimal format. For example, entering 192.168.1.1 0.0.0.255 is the same as entering 192.168.1.1/24. This matches any source IP address within the specified subnet. |
| <destination>               | The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:                                                 |

| Parameter                   | Description                                                                                                                                                                                                                    |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| any                         | Matches any destination IP address.                                                                                                                                                                                            |
| host <ip-addr>              | Matches a single destination host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                           |
| <ip-addr><br><reverse-mask> | An IPv4 address, followed by a reverse mask in dotted decimal format. For example, entering 192.168.1.1 0.0.0.255 is the same as entering 192.168.1.1/24. This matches any destination IP address within the specified subnet. |

**Mode** Global Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage notes** Use this command when configuring access-list for filtering IP software packets.

You can either create access-lists from within this command, or you can enter **access-list** followed by only the number. Entering only the number moves you to the IPv4 Extended ACL Configuration mode for the selected access-list. From there you can configure your access-lists by using the commands ([access-list extended ICMP filter](#)), ([access-list extended IP filter](#)), and ([access-list extended IP protocol filter](#)).

Note that packets must match both the source and the destination details.

**NOTE:** Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Examples** You can enter the extended ACL in the Global Configuration mode together with the ACL filter entry on the same line, as shown below:

```
awplus# configure terminal
awplus(config)# access-list 101 deny ip 172.16.10.0 0.0.0.255
any
```

Alternatively, you can enter the extended ACL in Global Configuration mode before specifying the ACL filter entry in the IPv4 Extended ACL Configuration mode, as shown below:

```
awplus# configure terminal
awplus(config)# access-list 101
awplus(config-ip-ext-acl)# deny ip 172.16.10.0 0.0.0.255 any
```

**Related commands** (access-list extended ICMP filter)

(access-list extended TCP UDP filter)  
show interface access-group  
show ip access-list  
show running-config

## (access-list extended ICMP filter)

**Overview** Use this ACL filter to add a new ICMP filter entry to the current extended access-list. If the sequence number is specified, the new filter is inserted at the specified location. Otherwise, the new filter is added at the end of the access-list.

The **no** variant of this command removes an ICMP filter entry from the current extended access-list. You can specify the ICMP filter entry for removal by entering either its sequence number (e.g. **no 10**), or by entering its ICMP filter profile without specifying its sequence number.

Note that the sequence number can be found by running the [show access-list \(IPv4 Software ACLs\)](#) command.

**Syntax [icmp]** [*<sequence-number>*] {deny|permit} icmp *<source>* *<destination>*  
[icmp-type *<icmp-value>*] [log]

no {deny|permit} icmp *<source>* *<destination>*[icmp-type  
*<icmp-value>*] [log]

no *<sequence-number>*

| Parameter                      | Description                                                                                                                                                                         |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;sequence-number&gt;</i> | <i>&lt;1-65535&gt;</i><br>The sequence number for the filter entry of the selected access control list.                                                                             |
| deny                           | Access-list rejects packets that match the source and destination filtering specified with this command.                                                                            |
| permit                         | Access-list permits packets that match the source and destination filtering specified with this command.                                                                            |
| icmp                           | ICMP packet type.                                                                                                                                                                   |
| <i>&lt;source&gt;</i>          | The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:                          |
|                                | <i>&lt;ip-addr&gt;/&lt;prefix&gt;</i><br>An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.      |
|                                | any<br>Matches any source IP address.                                                                                                                                               |
| <i>&lt;destination&gt;</i>     | The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:           |
|                                | <i>&lt;ip-addr&gt;/&lt;prefix&gt;</i><br>An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet. |
|                                | any<br>Matches any destination IP address.                                                                                                                                          |

| Parameter    | Description                 |
|--------------|-----------------------------|
| icmp-type    | The ICMP type.              |
| <icmp-value> | The value of the ICMP type. |
| log          | Log the results.            |

**Mode** IPv4 Extended ACL Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage notes** An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 4 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

**NOTE:** The access control list being configured is selected by running the [access-list \(extended numbered\)](#) command or the [access-list extended \(named\)](#) command, with the required access control list number, or name - but with no further parameters selected.

Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Examples** To add a new entry in access-list called 'my-list' that will reject ICMP packets from 10.0.0.1 to 192.168.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# access-list extended my-list
awplus(config-ip-ext-acl)# deny icmp 10.0.0.1/32 192.168.1.1/32
```

Use the following commands to add a new filter at sequence number 5 position of the access-list called 'my-list'. The filter will accept the ICMP type 8 packets from 10.1.1.0/24 network, to 192.168.1.0 network:

```
awplus# configure terminal
awplus(config)# access-list extended my-list
awplus(config-ip-ext-acl)# 5 permit icmp 10.1.1.0/24
192.168.1.0/24 icmp-type 8
```

**Related commands**

- [access-group](#)
- [show interface access-group](#)
- [show running-config](#)
- [show ip access-list](#)

## (access-list extended IP filter)

**Overview** Use this ACL filter to add a new IP filter entry to the current extended access-list. If the sequence number is specified, the new filter is inserted at the specified location. Otherwise, the new filter is added at the end of the access-list.

The **no** variant of this command removes an IP filter entry from the current extended access-list. You can specify the IP filter entry for removal by entering either its sequence number (e.g. **no 10**), or by entering its IP filter profile without specifying its sequence number.

Note that the sequence number can be found by running the [show access-list \(IPv4 Software ACLs\)](#) command.

**Syntax [ip]** [*<sequence-number>*] {deny|permit} ip *<source>* *<destination>*  
no {deny|permit} ip *<source>* *<destination>*  
no *<sequence-number>*

| Parameter                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |     |                                |                             |                                                                                                              |                                                       |                                                                                                                                     |

| <i>&lt;sequence-number&gt;</i>                        | <i>&lt;1-65535&gt;</i><br>The sequence number for the filter entry of the selected access control list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |     |                                |                             |                                                                                                              |                                                       |                                                                                                                                     |
| deny                                                  | Access-list rejects packets that match the source and destination filtering specified with this command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |     |                                |                             |                                                                                                              |                                                       |                                                                                                                                     |
| permit                                                | Access-list permits packets that match the source and destination filtering specified with this command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |     |                                |                             |                                                                                                              |                                                       |                                                                                                                                     |
| <i>&lt;source&gt;</i>                                 | The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source: <table><tr><td>any</td><td>Matches any source IP address.</td></tr><tr><td>host <i>&lt;ip-addr&gt;</i></td><td>Matches a single source host with the IP address given by <i>&lt;ip-addr&gt;</i> in dotted decimal notation.</td></tr><tr><td><i>&lt;ip-addr&gt;</i><br/><i>&lt;reverse-mask&gt;</i></td><td>Alternatively, enter an IPv4 address followed by a reverse mask in dotted decimal format. For example, enter 192.168.1.1 0.0.0.255.</td></tr></table> | any | Matches any source IP address. | host <i>&lt;ip-addr&gt;</i> | Matches a single source host with the IP address given by <i>&lt;ip-addr&gt;</i> in dotted decimal notation. | <i>&lt;ip-addr&gt;</i><br><i>&lt;reverse-mask&gt;</i> | Alternatively, enter an IPv4 address followed by a reverse mask in dotted decimal format. For example, enter 192.168.1.1 0.0.0.255. |
| any                                                   | Matches any source IP address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |     |                                |                             |                                                                                                              |                                                       |                                                                                                                                     |
| host <i>&lt;ip-addr&gt;</i>                           | Matches a single source host with the IP address given by <i>&lt;ip-addr&gt;</i> in dotted decimal notation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |     |                                |                             |                                                                                                              |                                                       |                                                                                                                                     |
| <i>&lt;ip-addr&gt;</i><br><i>&lt;reverse-mask&gt;</i> | Alternatively, enter an IPv4 address followed by a reverse mask in dotted decimal format. For example, enter 192.168.1.1 0.0.0.255.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |     |                                |                             |                                                                                                              |                                                       |                                                                                                                                     |

| Parameter                   | Description                                                                                                                                                               |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <destination>               | The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination: |
| any                         | Matches any destination IP address.                                                                                                                                       |
| host <ip-addr>              | Matches a single destination host with the IP address given by <ip-addr> in dotted decimal notation.                                                                      |
| <ip-addr><br><reverse-mask> | Alternatively, enter an IPv4 address followed by a reverse mask in dotted decimal format. For example, enter 192.168.1.1 0.0.0.255.                                       |

**Mode** Extended ACL Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage notes** An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 4 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

**NOTE:** The access control list being configured is selected by running the *access-list (extended numbered)* command or the *access-list extended (named)* command, with the required access control list number, or name - but with no further parameters selected.

Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Example 1 [list-number]** First use the following commands to enter the IPv4 Extended ACL Configuration mode and define a numbered extended access-list 101:

```
awplus# configure terminal
awplus(config)# access-list 101
awplus(config-ip-ext-acl)#
```

Then use the following commands to add a new entry to the numbered extended access-list 101 that will reject packets from 10.0.0.1 to 192.168.1.1:

```
awplus(config-ip-ext-acl)# deny ip host 10.0.0.1 host
192.168.1.1
awplus(config-ip-ext-acl)# 20 permit ip any any
```

**Example 2 [list-name]** First use the following commands to enter the IPv4 Extended ACL Configuration mode and define a named access-list called 'my-acl':

```
awplus# configure terminal
awplus(config)# access-list extended my-acl
awplus(config-ip-ext-acl)#
```

Then use the following commands to add a new entry to the named access-list 'my-acl' that will reject packets from 10.0.0.1 to 192.168.1.1:

```
awplus(config-ip-ext-acl)# deny ip host 10.0.0.1 host
192.168.1.1
```

```
awplus(config-ip-ext-acl)# 20 permit ip any any
```

**Example 3** Use the following commands to remove the access-list filter entry with sequence  
**[list-number]** number 20 from extended numbered access-list 101.

```
awplus# configure terminal
awplus(config)# access-list 101
awplus(config-ip-ext-acl)# no 20
```

**Example 4** Use the following commands to remove the access-list filter entry with sequence  
**[list-name]** number 20 from extended named access-list my-acl:

```
awplus# configure terminal
awplus(config)# access-list extended my-acl
awplus(config-ip-ext-acl)# no 20
```

**Related commands**

- [access-list \(extended numbered\)](#)
- [show interface access-group](#)
- [show ip access-list](#)
- [show running-config](#)

## (access-list extended IP protocol filter)

**Overview** Use this ACL filter to add a new IP protocol type filter entry to the current extended access-list. If the sequence number is specified, the new filter is inserted at the specified location. Otherwise, the new filter is added at the end of the access-list.

The **no** variant of this command removes an IP protocol filter entry from the current extended access-list. You can specify the IP filter entry for removal by entering either its sequence number (e.g. **no 10**), or by entering its IP filter profile without specifying its sequence number.

Note that the sequence number can be found by running the [show access-list \(IPv4 Software ACLs\)](#) command.

**Syntax [proto]** [*<sequence-number>*] {deny|permit} proto *<ip-protocol>* *<source>* *<destination>* [log]  
  
no {deny|permit} proto *<ip-protocol>* *<source>* *<destination>* [log]  
  
no *<sequence-number>*

**Mode** IPv4 Extended ACL Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage notes** An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 4 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

**NOTE:** The access control list being configured is selected by running the [access-list \(extended numbered\)](#) command or the [access-list extended \(named\)](#) command, with the required access control list number, or name - but with no further parameters selected.

Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Example 1 [creating a list]** Use the following commands to add a new access-list filter entry to the access-list named 'my-list' that will reject IP packets from source address 10.10.1.1/32 to destination address 192.68.1.1/32:

```
awplus# configure terminal
awplus(config)# access-list extended my-list
awplus(config-ip-ext-acl)# deny ip 10.10.1.1/32 192.168.1.1/32
```

**Example 2** Use the following commands to add a new access-list filter entry at sequence  
**[adding to a list]** position 5 in the access-list named 'my-list' that will accept packets from source  
address 10.10.1.1/24 to destination address 192.68.1.1/24:

```
awplus# configure terminal
awplus(config)# access-list extended my-list
awplus(config-ip-ext-acl)# 5 permit ip 10.10.1.1/24
192.168.1.1/24
```

## (access-list extended TCP UDP filter)

**Overview** Use this ACL filter to add a new TCP or UDP filter entry to the current extended access-list. If the sequence number is specified, the new filter is inserted at the specified location. Otherwise, the new filter is added at the end of the access-list.

The **no** variant of this command removes a TCP or UDP filter entry from the current extended access-list. You can specify the TCP or UDP filter entry for removal by entering either its sequence number (e.g. **no 10**), or by entering its TCP or UDP filter profile without specifying its sequence number.

Note that the sequence number can be found by running the [show access-list \(IPv4 Software ACLs\)](#) command.

**Syntax [tcp|udp]** [*<sequence-number>*] {deny|permit} {tcp|udp} *<source>* {eq *<sourceport>* |lt *<sourceport>*|gt *<sourceport>*|ne *<sourceport>*} *<destination>* [eq *<destport>*|lt *<destport>*|gt *<destport>*|ne *<destport>*] [log]

no [*<sequence-number>*] {deny|permit} {tcp|udp} *<source>* {eq *<sourceport>* |lt *<sourceport>*|gt *<sourceport>*|ne *<sourceport>*} *<destination>* [eq *<destport>*|lt *<destport>*|gt *<destport>*|ne *<destport>*] [log]

no *<sequence-number>*

| Parameter                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                       |                                                                                                                                       |     |                                |

| <i>&lt;source&gt;</i>                 | The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source: <table><tr><td><i>&lt;ip-addr&gt;/&lt;prefix&gt;</i></td><td>An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.</td></tr><tr><td>any</td><td>Matches any source IP address.</td></tr></table> | <i>&lt;ip-addr&gt;/&lt;prefix&gt;</i> | An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet. | any | Matches any source IP address. |
| <i>&lt;ip-addr&gt;/&lt;prefix&gt;</i> | An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.                                                                                                                                                                                                                                                                                                       |                                       |                                                                                                                                       |     |                                |
| any                                   | Matches any source IP address.                                                                                                                                                                                                                                                                                                                                                                                                              |                                       |                                                                                                                                       |     |                                |
| <i>&lt;sourceport&gt;</i>             | The source port number, specified as an integer between 0 and 65535.                                                                                                                                                                                                                                                                                                                                                                        |                                       |                                                                                                                                       |     |                                |

| Parameter              | Description                                                                                                                                                               |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <destination>          | The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination: |
| <ip-addr>/<br><prefix> | An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.                                |
| any                    | Matches any destination IP address.                                                                                                                                       |
| <destport>             | The destination port number, specified as an integer between 0 and 65535.                                                                                                 |
| eq                     | Matches port numbers equal to the port number specified immediately after this parameter.                                                                                 |
| lt                     | Matches port numbers less than the port number specified immediately after this parameter.                                                                                |
| gt                     | Matches port numbers greater than the port number specified immediately after this parameter.                                                                             |
| ne                     | Matches port numbers not equal to the port number specified immediately after this parameter.                                                                             |
| log                    | Log the results.                                                                                                                                                          |

**Mode** IPv4 Extended ACL Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage** An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 4 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

**NOTE:** The access control list being configured is selected by running the [access-list \(extended numbered\)](#) command or the [access-list extended \(named\)](#) command, with the required access control list number, or name - but with no further parameters selected.

Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Example 1 [creating a list]** To add a new entry to the access-list named 'my-list' that will reject TCP packets from 10.0.0.1 on TCP port 10 to 192.168.1.1 on TCP port 20, use the commands:

```
awplus# configure terminal
awplus(config)# access-list extended my-list
awplus(config-ip-ext-acl)# deny tcp 10.0.0.1/32 eq 10
192.168.1.1/32 eq 20
```

**Example 2** To insert a new entry with sequence number 5 into the access-list named 'my-list'  
**[adding to a list]** that will accept UDP packets from 10.1.1.0/24 network to 192.168.1.0/24 network on UDP port 80, use the commands:

```
awplus# configure terminal
awplus(config)# access-list extended my-list
awplus(config-ip-ext-acl)# 5 permit udp 10.1.1.0/24
192.168.1.0/24 eq 80
```

## access-list standard (named)

- Overview** This command configures a standard named access-list that permits or denies packets from a specific source IP address. You can:
- use this command to enter a new or existing ACL name and enter the IPv4 Standard ACL Configuration mode. Once in that mode, you can create an ACL filter entry using the command ([access-list standard named filter](#)). This approach lets you give the entry a sequence number.
  - or, use this command to create an ACL and an ACL filter entry at the same time. With this approach, you cannot give the entry a sequence number, so the entry will go after any existing entries.

The **no** variant of this command removes a specified standard named access-list.

**Syntax [to enter the sub-mode]**

```
access-list standard <standard-acl-name>
no access-list standard <standard-acl-name>
```

**Syntax [to create an ACL entry]**

```
access-list standard <standard-acl-name> {deny|permit}
{any|<ip-addr>/<prefix>}
no access-list standard <standard-acl-name> {deny|permit}
{any|<ip-addr>/<prefix>}
```

| Parameter           | Description                                                                                                                                                                                                          |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <standard-acl-name> | Specify a name for the standard access-list.                                                                                                                                                                         |
| deny                | The access-list rejects packets that match the source filtering specified with this command.                                                                                                                         |
| permit              | The access-list permits packets that match the source filtering specified with this command.                                                                                                                         |
| any                 | Match any source IP address.                                                                                                                                                                                         |
| <ip-addr>/<prefix>  | Match the source address of the packets. Specify an IPv4 address in dotted decimal format, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet. |

**Mode** Global Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage notes** Use this command when configuring a standard named access-list for filtering IP software packets.

You can either create access-lists from within this command, or you can enter **access-list standard** followed by only the name. Entering only the name moves you to the IPv4 Standard ACL Configuration mode for the selected access-list. From

there you can configure your access-lists by using the command [\(access-list standard named filter\)](#).

**NOTE:** Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Examples** To define a standard access-list named 'my-list' and deny any packets from any source, use the commands:

```
awplus# configure terminal
awplus(config)# access-list standard my-list deny any
```

Alternatively, to define a standard access-list named 'my-list' and enter the IPv4 Standard ACL Configuration mode, and then create ACL entry 5 to deny any packets from any source, use the commands:

```
awplus# configure terminal
awplus(config)# access-list standard my-list
awplus(config-ip-std-acl)# 5 deny any
```

**Related commands** [\(access-list standard named filter\)](#)  
[show interface access-group](#)  
[show ip access-list](#)  
[show running-config](#)

# access-list (standard numbered)

**Overview** This command configures a standard numbered access-list that permits or denies packets from a specific source IP address. You can:

- use this command to enter a new or existing ACL number and enter the IPv4 Standard ACL Configuration mode. Once in that mode, you can create an ACL filter entry using the command ([access-list standard numbered filter](#)). This approach lets you give the entry a sequence number.
- or, use this command to create an ACL and an ACL filter entry at the same time. With this approach, you cannot give the entry a sequence number, so the entry will go after any existing entries.

The **no** variant of this command removes a specified standard numbered access-list.

**Syntax [to enter the sub-mode]**

```
access-list {<1-99>|<1300-1999>}
no access-list {<1-99>|<1300-1999>}
```

**Syntax [to create an ACL entry]**

```
access-list {<1-99>|<1300-1999>} {deny|permit} <source>
no access-list {<1-99>|<1300-1999>} {deny|permit} <source>
```

| Parameter                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                             |                                                                                                                                                                    |           |                                                                                             |                |                                                                                             |     |                     |

| <1-99>                      | IP standard access-list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                             |                                                                                                                                                                    |           |                                                                                             |                |                                                                                             |     |                     |
| <1300-1999>                 | IP standard access-list (expanded range).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                             |                                                                                                                                                                    |           |                                                                                             |                |                                                                                             |     |                     |
| deny                        | Access-list rejects packets from the specified source.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                             |                                                                                                                                                                    |           |                                                                                             |                |                                                                                             |     |                     |
| permit                      | Access-list accepts packets from the specified source.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                             |                                                                                                                                                                    |           |                                                                                             |                |                                                                                             |     |                     |
| <source>                    | The source address of the packets. The following are the valid formats for specifying the source: <table><tr><td>&lt;ip-addr&gt;<br/>&lt;reverse-mask&gt;</td><td>A source subnet, specified by entering the address and a reverse mask in dotted decimal format. For example, 192.168.1.0 0.0.0.255 (equivalent to 192.168.1.0/24).</td></tr><tr><td>&lt;ip-addr&gt;</td><td>A single source address to match. The source address is specified in dotted decimal format.</td></tr><tr><td>host &lt;ip-addr&gt;</td><td>A single source address to match. The source address is specified in dotted decimal format.</td></tr><tr><td>any</td><td>Any source address.</td></tr></table> | <ip-addr><br><reverse-mask> | A source subnet, specified by entering the address and a reverse mask in dotted decimal format. For example, 192.168.1.0 0.0.0.255 (equivalent to 192.168.1.0/24). | <ip-addr> | A single source address to match. The source address is specified in dotted decimal format. | host <ip-addr> | A single source address to match. The source address is specified in dotted decimal format. | any | Any source address. |
| <ip-addr><br><reverse-mask> | A source subnet, specified by entering the address and a reverse mask in dotted decimal format. For example, 192.168.1.0 0.0.0.255 (equivalent to 192.168.1.0/24).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                             |                                                                                                                                                                    |           |                                                                                             |                |                                                                                             |     |                     |
| <ip-addr>                   | A single source address to match. The source address is specified in dotted decimal format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                             |                                                                                                                                                                    |           |                                                                                             |                |                                                                                             |     |                     |
| host <ip-addr>              | A single source address to match. The source address is specified in dotted decimal format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                             |                                                                                                                                                                    |           |                                                                                             |                |                                                                                             |     |                     |
| any                         | Any source address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                             |                                                                                                                                                                    |           |                                                                                             |                |                                                                                             |     |                     |

**Mode** Global Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage notes** Use this command when configuring a standard numbered access-list for filtering IP software packets.

You can either create access-lists from within this command, or you can enter **access-list** followed by only the number. Entering only the number moves you to the IPv4 Standard ACL Configuration mode for the selected access-list. From there you can configure your access-lists by using the command ([access-list standard numbered filter](#)).

**NOTE:** Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Examples** To create ACL number 67 that will deny packets from subnet 172.16.10.0, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 67 deny 172.16.10.0 0.0.0.255
```

Alternatively, to define ACL number 67 and enter the IPv4 Standard ACL Configuration mode, and then create ACL entry 5 to deny any packets from subnet 172.16.10.0, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 67
awplus(config-ip-std-acl)# 5 deny 172.16.10.0 0.0.0.255
```

## (access-list standard named filter)

**Overview** This ACL filter adds a source IP address filter entry to a current named standard access-list. If the sequence number is specified, the new filter entry is inserted at the specified location. Otherwise, the new entry is added at the end of the access-list.

The **no** variant of this command removes a source IP address filter entry from the current named standard access-list. You can specify the source IP address filter entry for removal by entering either its sequence number (e.g. **no 10**), or by entering its source IP address filter profile without specifying its sequence number (e.g. **no deny any**).

Note that you can find the sequence number by running the [show access-list \(IPv4 Software ACLs\)](#) command.

**Syntax** [*<sequence-number>*] {deny|permit} {any|*<ip-addr>/<prefix>*  
[exact-match] }  
  
no *<sequence-number>*  
  
no {deny|permit} {any|*<ip-addr>/<prefix>* [exact-match] }

| Parameter                             | Description                                                                                                                                                                                                          |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;sequence-number&gt;</i>        | <1-65535><br>The sequence number for the filter entry of the selected access control list.                                                                                                                           |
| deny                                  | Access-list rejects packets of the source filtering specified.                                                                                                                                                       |
| permit                                | Access-list allows packets of the source filtering specified                                                                                                                                                         |
| any                                   | Match any source IP address.                                                                                                                                                                                         |
| <i>&lt;ip-addr&gt;/&lt;prefix&gt;</i> | Match the source address of the packets. Specify an IPv4 address in dotted decimal format, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet. |
| exact-match                           | Specify an exact IP prefix to match on.                                                                                                                                                                              |

**Mode** IPv4 Standard ACL Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage notes** An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 4 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

**NOTE:** The access control list being configured is selected by running the [access-list standard \(named\)](#) command with the required access control list name, but with no further parameters selected.

Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Examples** Use the following commands to add a new filter entry to access-list 'my-list' that will reject IP address 10.1.1.1:

```
awplus# configure terminal
awplus(config)# access-list standard my-list
awplus(config-ip-std-acl)# deny 10.1.1.1/32
```

Use the following commands to insert a new filter entry into access-list 'my-list' at sequence position number 15 that will accept IP network 10.1.2.0:

```
awplus# configure terminal
awplus(config)# access-list standard my-list
awplus(config-ip-std-acl)# 15 permit 10.1.2.0/24
```

## (access-list standard numbered filter)

**Overview** This ACL filter adds a source IP address filter entry to a current standard numbered access-list. If a sequence number is specified, the new filter entry is inserted at the specified location. Otherwise, the new filter entry is added at the end of the access-list.

The **no** variant of this command removes a source IP address filter entry from the current standard numbered access-list. You can specify the source IP address filter entry for removal by entering either its sequence number (e.g. **no 10**), or by entering its source IP address filter profile without specifying its sequence number.

Note that the sequence number can be found by running the [show access-list \(IPv4 Software ACLs\)](#) command.

**Syntax** [*<sequence-number>*] {deny|permit} *<source>*  
no {deny|permit} *<source>*  
no *<sequence-number>*

| Parameter                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                       |                                                                                                                                                                    |                        |                                                                                             |                             |                                                                                             |     |                     |

The source address is specified in dotted decimal format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                       |                                                                                                                                                                    |                        |                                                                                             |                             |                                                                                             |     |                     |
| host <i>&lt;ip-addr&gt;</i>                           | A single source address to match. The source address is specified in dotted decimal format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                       |                                                                                                                                                                    |                        |                                                                                             |                             |                                                                                             |     |                     |
| any                                                   | Any source address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                       |                                                                                                                                                                    |                        |                                                                                             |                             |                                                                                             |     |                     |

**Mode** IPv4 Standard ACL Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage notes** An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 4 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

**NOTE:** The access control list being configured is selected by running the [access-list \(standard numbered\)](#) command with the required access control list number but with no further parameters selected.

Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Example** To add a new entry accepting the IP network 10.1.1.0/24 at the sequence number 15 position, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 99
awplus(config-ip-std-acl)# 15 permit 10.1.2.0 0.0.0.255
```

**Related commands**

- [access-list \(standard numbered\)](#)
- [show interface access-group](#)
- [show ip access-list](#)
- [show running-config](#)

# clear ip prefix-list

**Overview** Use this command to reset the hit count to zero in the prefix-list entries.

**Syntax** `clear ip prefix-list [<list-name>] [<ip-address>/<mask>]`

| Parameter           | Description                  |
|---------------------|------------------------------|
| <list-name>         | The name of the prefix-list. |
| <ip-address>/<mask> | The IP prefix and length.    |

**Mode** Privileged Exec

**Example** To clear a prefix-list named List1:

```
awplus# clear ip prefix-list List1
```

# dos

**Overview** Use this command to configure Denial-of-Service (DoS) protection features for a port. Six different DoS attacks can be detected: IP Options, Land, Ping-of-Death, Smurf, Synflood and Teardrop.

When the attack is detected, three different actions are available:

- Shutdown the port for one minute
- Cause an SNMP trap.
- Send traffic to the mirror port

**Syntax** `dos {ipoptions|land|ping-of-death|smurf broadcast  
<ip-address>|synflood|teardrop} action {shutdown|trap|mirror}`

| Parameter     | Description                  |
|---------------|------------------------------|
| dos           | Denial-Of-Service.           |
| ipoptions     | IP Options attack.           |
| land          | Land attack.                 |
| ping-of-death | Large ping attack.           |
| smurf         | Ping to broadcast address.   |
| broadcast     | Broadcast.                   |
| <ip-address>  | Local IP Broadcast Address.  |
| synflood      | SYN flood attack.            |
| teardrop      | IP fragmentation attack.     |
| action        | Action.                      |
| shutdown      | Shutdown port.               |
| trap          | Trap to SNMP.                |
| mirror        | Send packets to mirror port. |

**Mode** Interface Configuration for a switch port interface.

**Default** DoS attack detection is not configured by default on any switch port interface.

**Usage notes** See the below table for more information about the DoS attacks recognized by this command:

| Type of DoS attack | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ipoptions          | This type of attack occurs when an attacker sends packets containing bad IP options to a victim node. There are many different types of IP options attacks and this software does not try to distinguish between them. Rather, if this defense is activated, the number of ingress IP packets containing IP options is counted. If the number exceeds 20 packets per second, the switch considers this a possible IP options attack. This defense does not require the CPU to monitor packets, so does not put extra load on the switch's CPU.                                                                                                                                                   |
| land               | This type of attack occurs when the Source IP and Destination IP address are the same. This can cause a target host to be confused. Since packets with the same source and destination addresses should never occur, these packets are dropped when this attack is enabled.<br>This defense does not require the CPU to monitor packets, so does not put extra load on the switch's CPU.                                                                                                                                                                                                                                                                                                         |
| ping-of-death      | This type of attack results from a fragmented packet which, when reassembled, would exceed the maximum size of a valid IP datagram. To detect this attack, the final fragment of ICMP packets has to be sent to the CPU for inspection. This defense can therefore load the CPU.<br>Note that the extra CPU load will not affect normal traffic switching between ports, but other protocols such as IGMP and STP may be affected. This defense is not recommended where a large number of fragmented packets are expected.                                                                                                                                                                      |
| smurf              | This type of attack is an ICMP ping packet to a broadcast address. Although routers should not forward packets to local broadcast addresses anymore (see RFC2644), the Smurf attack can still be explicitly discarded with this command. In order for the Smurf attack to work, the broadcast IP address is required. Any ICMP Ping packet with this destination address is considered an attack.<br>This defense does not require the CPU to monitor packets, so does not put extra load on the switch's CPU.                                                                                                                                                                                   |
| synflood           | In this type of attack, an attacker, seeking to overwhelm a victim with TCP connection requests, sends a large number of TCP SYN packets with bogus source addresses to the victim. The victim responds with SYN ACK packets, but since the original source addresses are bogus, the victim node does not receive any replies. If the attacker sends enough requests in a short enough period, the victim may freeze operations once the requests exceed the capacity of its connections queue.<br>To defend against this form of attack, a switch port monitors the number of ingress TCP-SYN packets it receives. An attack is recorded if a port receives more 60 TCP-SYN packets per second. |
| teardrop           | In this DoS attack, an attacker sends a packet in several fragments with a bogus offset value, used to reconstruct the packet, in one of the fragments to a victim. This results in the victim being unable to reassemble the packet, possibly causing it to freeze operations.                                                                                                                                                                                                                                                                                                                                                                                                                  |

**Examples** To configure **smurf** DoS detection on port1.1.1, and shutdown the interface if an attack is detected, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# dos smurf broadcast 192.168.1.0 action
shutdown
```

To configure **land** DoS detection on port1.1.1, and shutdown the interface if an attack is detected, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# dos land action shutdown
```

To configure **ipoptions** DoS detection on port1.1.1, and shutdown the interface if an attack is detected, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# dos ipoptions action shutdown
```

To configure **ping-of-death** DoS detection on port1.1.1, and shutdown the interface if an attack is detected, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# dos ping-of-death action shutdown
```

To configure **synflood** DoS detection on port1.1.1, and shutdown the interface if an attack is detected, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# dos synflood action shutdown
```

To configure **teardrop** DoS detection on port1.1.1, and shutdown the interface if an attack is detected, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# dos teardrop action shutdown
```

**Related commands** [show dos interface](#)

# ip prefix-list

**Overview** Use this command to create an entry for an IPv4 prefix list.

Use the **no** variant of this command to delete the IPv4 prefix-list entry.

**Syntax**

```
ip prefix-list <list-name> [seq <1-429496725>] {deny|permit}
{any|<ip-prefix>} [ge <0-32>] [le <0-32>]

ip prefix-list <list-name> description <text>

ip prefix-list sequence-number

no ip prefix-list <list-name> [seq <1-429496725>]

no ip prefix-list <list-name> [description <text>]

no ip prefix-list sequence-number
```

| Parameter         | Description                                                                                          |
|-------------------|------------------------------------------------------------------------------------------------------|
| <list-name>       | Specifies the name of a prefix list.                                                                 |
| seq <1-429496725> | Sequence number of the prefix list entry.                                                            |
| deny              | Specifies that the prefixes are excluded from the list.                                              |
| permit            | Specifies that the prefixes are included in the list.                                                |
| <ip-prefix>       | Specifies the IPv4 address and length of the network mask in dotted decimal in the format A.B.C.D/M. |
| any               | Any prefix match. Same as <b>0.0.0.0/0 le 32</b> .                                                   |
| ge<0-32>          | Specifies the minimum prefix length to be matched.                                                   |
| le<0-32>          | Specifies the maximum prefix length to be matched.                                                   |
| <text>            | Text description of the prefix list.                                                                 |
| sequence-number   | Specify sequence numbers included or excluded in prefix list.                                        |

**Mode** Global Configuration

**Usage notes** When the device processes a prefix list, it starts to match prefixes from the top of the prefix list, and stops whenever a permit or deny occurs. To promote efficiency, use the **seq** parameter and place common permits or denials towards the top of the list. If you do not use the **seq** parameter, the sequence values are generated in a sequence of 5.

The parameters **ge** and **le** specify the range of the prefix lengths to be matched. When setting these parameters, set the **le** value to be less than 32, and the **ge** value to be less than or equal to the **le** value and greater than the ip-prefix mask length.

Prefix lists implicitly exclude prefixes that are not explicitly permitted in the prefix list. This means if a prefix that is being checked against the prefix list reaches the end of the prefix list without matching a permit or deny, this prefix will be denied.

**Example** In the following sample configuration, the last **ip prefix-list** command in the below list matches all, and the first **ip prefix-list** command denies the IP network 76.2.2.0:

```
awplus(config)# router bgp 100
awplus(config-router)# network 172.1.1.0
awplus(config-router)# network 172.1.2.0
awplus(config-router)# neighbor 10.6.5.3 remote-as 300
awplus(config-router)# neighbor 10.6.5.3 prefix-list mylist out
awplus(config-router)# exit
awplus(config)# ip prefix-list mylist seq 5 deny 76.2.2.0/24
awplus(config)# ip prefix-list mylist seq 100 permit any
```

To deny the IP addresses between 10.0.0.0/14 (10.0.0.0 255.252.0.0) and 10.0.0.0/22 (10.0.0.0 255.255.252.0) within the 10.0.0.0/8 (10.0.0.0 255.0.0.0) addressing range, enter the following commands:

```
awplus# configure terminal
awplus(config)# ip prefix-list mylist seq 12345 deny 10.0.0.0/8
ge 14 le 22
```

- [show ip prefix-list](#)

# maximum-access-list (deleted)

**Overview** This command has been removed from version 5.5.1-01 onwards. There is no alternative command.

# show access-list (IPv4 Software ACLs)

**Overview** Use this command to display the specified access-list, or all access-lists if none have been specified. Note that only defined access-lists are displayed. An error message is displayed for an undefined access-list

**Syntax** `show access-list`  
`[<1-99>|<100-199>|<1300-1999>|<2000-2699>|<3000-3699>|`  
`<4000-4499>|<access-list-name>]`

| Parameter          | Description                                          |
|--------------------|------------------------------------------------------|
| <1-99>             | IP standard access-list.                             |
| <100-199>          | IP extended access-list.                             |
| <1300-1999>        | IP standard access-list (standard - expanded range). |
| <2000-2699>        | IP extended access-list (extended - expanded range). |
| <3000-3699>        | Hardware IP access-list.                             |
| <4000-4499>        | Hardware MAC access-list.                            |
| <access-list-name> | IP named access-list.                                |

**Mode** User Exec and Privileged Exec

**Examples** To show all access-lists configured on the switch:

```
awplus# show access-list
```

```
Standard IP access list 1
 deny 172.16.2.0, wildcard bits 0.0.0.255
Standard IP access list 20
 deny 192.168.10.0, wildcard bits 0.0.0.255
 deny 192.168.12.0, wildcard bits 0.0.0.255
Hardware IP access list 3001
 permit ip 192.168.20.0 255.255.255.0 any
Hardware IP access list 3020
 permit tcp any 192.0.2.0/24
awplus#show access-list 20
```

To show the access-list with an ID of 20:

```
awplus# show access-list 20
```

```
Standard IP access-list 20
 deny 192.168.10.0, wildcard bits 0.0.0.255
 deny 192.168.12.0, wildcard bits 0.0.0.255
```

Note the following error message is displayed if you attempt to show an undefined access-list:

```
awplus# show access-list 2
```

```
% Can't find access-list 2
```

[access-list \(extended numbered\)](#)

# show dos interface

**Overview** Use this command to display the Denial-of-Service (DoS) features configured on a switch port interface from the [dos](#) command. See the [dos](#) command for descriptions of DoS attack types.

**Syntax** `show dos interface {<port-list>}`

| Parameter                      | Description                                                                                                         |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------|
| <code>&lt;port-list&gt;</code> | Specify the switch port or port list to display DoS configuration options set with the <a href="#">dos</a> command. |

**Mode** Privileged Exec

**Output** Figure 43-1: Example output from the **show dos interface** command prior to a DoS attack

```
awplus#configure terminal
Enter configuration commands, one per line. End with CTNLT/Z.
awplus(config)#interface port1.1.1
awplus(config-if)#dos synflood action shutdown
awplus(config-if)#exit
awplus(config)#exit
awplus#show dos interface port1.1.1

DoS settings for interface port1.1.1

Port status : Enabled
ipoptions : Disabled
land : Disabled
ping-of-death : Disabled
smurf : Disabled
synflood : Enabled
 Action : Shutdown port
 Attacks detected : 0
teardrop : Disabled
awplus#
```

Figure 43-2: Example output from the **show dos interface** command after a **synflood** DoS attack

```
awplus#show dos interface port1.1.1

DoS settings for interface port1.1.1

Port status : Enabled
ipoptions : Disabled
land : Disabled
ping-of-death : Disabled
smurf : Disabled
synflood : Enabled
 Action : Shutdown port
 Attacks detected : 1
teardrop : Disabled
awplus#
```

**Table 44:** Parameters in the **show dos interface** command output:

| Type of DoS attack | Description                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port status        | Displays <b>Enabled</b> when the port is configured as being administratively up after issuing the <b>no shutdown</b> command. Displays <b>Disabled</b> when the port is configured as being administratively down with the <b>shutdown</b> command.                                                                                                                                                                    |
| ipoptions          | Displays <b>Enabled</b> when the <b>ipoptions</b> parameter is configured with the <b>dos</b> command, plus the action ( <b>Shutdown port</b> , <b>Mirror port</b> , or <b>Trap port</b> ) and the number of instances of any <b>ipoptions</b> DoS attacks that have occurred on the interface. Displays <b>Disabled</b> when the <b>ipoptions</b> parameter is not configured with the <b>dos</b> command.             |
| land               | Displays <b>Enabled</b> when the <b>land</b> parameter is configured with the <b>dos</b> command, plus the action ( <b>Shutdown port</b> , <b>Mirror port</b> , or <b>Trap port</b> ) and the number of instances of any <b>land</b> DoS attacks that have occurred on the interface. Displays <b>Disabled</b> when the <b>land</b> parameter is not configured with the <b>dos</b> command.                            |
| ping-of-death      | Displays <b>Enabled</b> when the <b>ping-of-death</b> parameter is configured with the <b>dos</b> command, plus the action ( <b>Shutdown port</b> , <b>Mirror port</b> , or <b>Trap port</b> ) and the number of instances of any <b>ping-of-death</b> DoS attacks that have occurred on the interface. Displays <b>Disabled</b> when the <b>ping-of-death</b> parameter is not configured with the <b>dos</b> command. |

**Table 44:** Parameters in the **show dos interface** command output: (cont.)

| Type of DoS attack | Description                                                                                                                                                                                                                                                                                                                                                       |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| smurf              | Displays Enabled when the <b>smurf</b> parameter is configured with the <b>dos</b> command, plus the action (Shutdown port, Mirror port, or Trap port) and the number of instances of any <b>smurf</b> DoS attacks that have occurred on the interface. Displays Disabled when the <b>smurf</b> parameter is not configured with the <b>dos</b> command.          |
| synflood           | Displays Enabled when the <b>synflood</b> parameter is configured with the <b>dos</b> command, plus the action (Shutdown port, Mirror port, or Trap port) and the number of instances of any <b>synflood</b> DoS attacks that have occurred on the interface. Displays Disabled when the <b>synflood</b> parameter is not configured with the <b>dos</b> command. |
| teardrop           | Displays Enabled when the <b>teardrop</b> parameter is configured with the <b>dos</b> command, plus the action (Shutdown port, Mirror port, or Trap port) and the number of instances of any <b>teardrop</b> DoS attacks that have occurred on the interface. Displays Disabled when the <b>teardrop</b> parameter is not configured with the <b>dos</b> command. |

# show ip access-list

**Overview** Use this command to display IP access-lists.

**Syntax** `show ip access-list`  
`[<1-99>|<100-199>|<1300-1999>|<2000-2699>|<access-list-name>]`

| Parameter          | Description                               |
|--------------------|-------------------------------------------|
| <1-99>             | IP standard access-list.                  |
| <100-199>          | IP extended access-list.                  |
| <1300-1999>        | IP standard access-list (expanded range). |
| <2000-2699>        | IP extended access-list (expanded range). |
| <access-list-name> | IP named access-list.                     |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip access-list`

**Output** Figure 43-3: Example output from the **show ip access-list** command

```
Standard IP access-list 1
 permit 172.168.6.0, wildcard bits 0.0.0.255
 permit 192.168.6.0, wildcard bits 0.0.0.255
```

# show ip prefix-list

**Overview** Use this command to display the IPv4 prefix-list entries.  
Note that this command is valid for RIP and BGP routing protocols only.

**Syntax** `show ip prefix-list [<name>|detail|summary]`

| Parameter | Description                                                               |
|-----------|---------------------------------------------------------------------------|
| <name>    | Specify the name of a prefix list in this placeholder.                    |
| detail    | Specify this parameter to show detailed output for all IPv4 prefix lists. |
| summary   | Specify this parameter to show summary output for all IPv4 prefix lists.  |

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show ip prefix-list
awplus# show ip prefix-list 10.10.0.98/8
awplus# show ip prefix-list detail
```

**Related commands** [ip prefix-list](#)

## vty access-class (numbered)

**Overview** For IPv4, use this command to set a standard numbered software access list to be the management ACL. This is then applied to all available VTY lines for controlling remote access by Telnet and SSH. This command allows or denies packets containing the IP addresses included in the ACL to create a connection to your device.

ACLs that are attached using this command have an implicit deny-all filter as the final entry in the ACL. So a typical configuration would be to permit a specific address, or range of addresses, and rely on the deny-all filter to block all other access.

Use the **no** variant of this command to remove the access list.

**Syntax** `vty access-class {<1-99>|<1300-1999>}`  
`no vty access-class [<1-99>|<1300-1999>]`

| Parameter   | Description                                       |
|-------------|---------------------------------------------------|
| <1-99>      | IPv4 standard access-list number                  |
| <1300-1999> | IPv4 standard access-list number (expanded range) |

**Mode** Global Configuration

**Examples** To set access-list 4 to be the management ACL, use the following commands:

```
awplus# configure terminal
awplus(config)# vty access-class 4
```

To remove access-list 4 from the management ACL, use the following commands:

```
awplus# configure terminal
awplus(config)# no vty access-class 4
```

**Output** Figure 43-4: Example output from the **show running-config** command

```
awplus#show running-config|grep access-class
vty access-class 4
```

**Related commands** [show running-config](#)

## IPv6 Hardware Access Control List (ACL) Commands

### Introduction

**Overview** This chapter provides an alphabetical reference for the IPv6 Hardware Access Control List (ACL) commands, and contains detailed command information and command examples about IPv6 hardware ACLs, which are applied directly to interfaces using the [ipv6 traffic-filter](#) command.

For information about ACLs, see the [ACL Feature Overview and Configuration Guide](#).

To apply ACLs to an LACP channel group, apply it to all the individual switch ports in the channel group. To apply ACLs to a static channel group, apply it to the static channel group itself. For more information on link aggregation see the following references:

- [Link Aggregation Feature Overview\\_and\\_Configuration\\_Guide](#).
- [Link Aggregation Commands](#)

Most ACL command titles include usage information in parentheses. When the command title is completely surrounded by parentheses, the title indicates the type of ACL filter instead of keywords to enter into the CLI. For example, the title **(named IPv6 hardware ACL: IP protocol entry)** represents a command with the syntax:

```
[<sequence-number>] <action> proto <1-255> <source-addr>
<dest-addr> [vlan <1-4094>]
```

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**Sub-modes** Many of the ACL commands operate from sub-modes that are specific to particular ACL types. The following table shows the CLI prompts at which ACL commands are entered.

Table 44-1: IPv6 Hardware Access List Commands and Prompts

| Command Name                                 | Command Mode                      | Prompt                          |
|----------------------------------------------|-----------------------------------|---------------------------------|
| show acl-group ipv6 address                  | Privileged Exec                   | awplus#                         |
| show ipv6 access-list (IPv6 Hardware ACLs)   | Privileged Exec                   | awplus#                         |
| access-list hardware-deny-log                | Global Configuration              | awplus(config)#                 |
| acl-group ipv6 address                       | Global Configuration              | awplus(config)#                 |
| ipv6 access-list (named IPv6 hardware ACL)   | Global Configuration              | awplus(config)#                 |

# access-list hardware-deny-log

**Overview** Use this command to enable logging of packets that are denied by hardware IP ACLs. Hardware IP ACLs are ACLs with an ID number from 3000 to 3699. If you turn on logging, the switch will produce a log message when it drops denied packets.

**CAUTION:** *If you enable this logging, do not use an action of **copy-to-cpu** or **send-to-cpu** in any of the switch's ACLs. If you do, packets that match those ACLs will also be dropped.*

Use the **no** variant of this command to disable logging of packets that are denied by hardware IP ACLs.

**Syntax** `access-list hardware-deny-log [info|warn] [rate <1-1000>]  
[burst <1-1000>] [timeout <1-3600>]  
no access-list hardware-deny-log`

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| info             | Give the log messages a severity level of 'info'. This is the default severity level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| warn             | Give the log messages a severity level of 'warn'. If you want the messages to go to the buffered, permanent, and external log as well as the terminal, specify this parameter.                                                                                                                                                                                                                                                                                                                                                                                 |
| rate <1-1000>    | This limits the number of log messages produced per hour. The switch will stop creating log messages if packets are denied at a higher rate than this specified rate. The default is 12 packets per hour. This means, for example, that if there are 60 denied packets in the first hour, then at most the first 12 of these packets will be logged. After that, logging will stop unless the rate drops below 12 an hour. (The actual number of packets logged depends on the number of flows the dropped packets come from; see the <b>burst</b> parameter). |
| burst <1-1000>   | This is the maximum initial number of packets to log for a given flow. A flow is a set of packets with the same source IP address, destination IP address, source port, and destination port. The default is 5. The burst number reduces by 1 each time a packet in the flow is logged. Then it increases by 1 again every time the rate drops below the limit set by the <b>rate</b> parameter, up to the burst number.                                                                                                                                       |
| timeout <1-3600> | This is the length of time it takes for a flow record to expire, in seconds. The switch considers that a flow has expired if it hasn't received any packets that match that flow for the timeout number of seconds. The default is 3600 seconds (1 hour). When a flow expires, its burst value is reset and logging may restart (depending on the current rate of denied packets).                                                                                                                                                                             |

**Default** Disabled

**Mode** Global Configuration

**Usage notes** To enable logging for a particular ACL, enter:

- this command (**access-list hardware-deny-log**)
- the command **terminal monitor**, and
- a **log** parameter at the end of the desired ACL.

The switch will send the log messages to:

- The terminal monitor, by default, as long as you enter the command **terminal monitor**, and
- If you change the severity of the messages to **warn**, to the buffered log, permanent log, and external log as well. The external log defines what logs will be sent to external syslog servers.

The log message format is:

```
DENY> IN=<interface-name> OUT=<blank>
MAC=<dest-mac-addr:src-mac-addr:eth-type> SRC=<source-ip-address>
DST=<dest-ip-address> LEN=<packet-length> TOS=<type-of-service>
PREC=<precedence> TTL=<time-to-live> ID=<packet-ID>
PROTO=<L4-protocol> SPT=<L4-source-port> DPT=<L4-dest-port>
LEN=<L4-packet-length> MARK=<internal-packet-marking>
```

An example of a permanent log message is:

```
2023 March 03 07:04:37 local5.warning awplus ulogd[931]: DENY>
IN=vlan100 OUT= MAC=e0:1a:ea:50:51:fc:00:00:11:11:22:22:08:00
SRC=192.168.1.100 DST=192.170.1.1 LEN=42 TOS=00 PREC=0x00 TTL=64
ID=0 PROTO=UDP SPT=63 DPT=63 LEN=22 MARK=0x20000000
```

**Example** To log packets denied by ACL 3000, which denies all Echo requests, use the commands:

```
awplus# terminal monitor
awplus# configure terminal
awplus(config)# access-list hardware-deny-log
awplus(config)# access-list 3000 deny icmp any any icmp-type 8
```

**Command changes**    Version 5.5.3-0.1: command added

# acl-group ipv6 address

- Overview** Use this command to create a new named IPv6 ACL group that contains one or more IPv6 host or subnets.
- This command creates a named IPv6 ACL group and enters the ACL Host Group config mode. IPv6 hosts or subnets can be added to or removed from this group. This host group can be used as a source or destination match for any hardware ACL to simplify large ACL configs with lots of IPv6 hosts.
- Use the **no** variant of this command to delete an IPv6 ACL group.

**Syntax** `acl-group ipv6 address <group>`  
`no acl-group ipv6 address <group>`

| Parameter | Description                     |
|-----------|---------------------------------|
| <group>   | The name of the IPv6 ACL group. |

**Default** No ACL groups exist by default.

**Mode** Global Configuration

**Example** To create an IPv6 ACL group named IPV6\_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ipv6 address IPV6_GROUP1
awplus(config-ip-host-group)#
```

To delete an IPv6 ACL group named IPV6\_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# no acl-group ipv6 address IPV6_GROUP1
```

**Command changes** Version 5.5.0-1.1: command added

# clear access-list counters

**Overview** Use this command to reset the hardware access-list counters to zero. The access-list counters show the number of packets that match your hardware ACLs. Every time a hardware ACL allows or drops a packet, its counter increments.

**Syntax** `clear access-list counters [<acl>]`

| Parameter | Description                                                                          |
|-----------|--------------------------------------------------------------------------------------|
| <acl>     | Clear the counters for only the specified ACL. You can enter the ACL name or number. |

**Mode** Privileged Exec

**Usage notes** To view the counter values, use the command [show access-list counters](#).

**Example** To clear the counters for the ACL named ACL-1, use the command:

```
awplus# clear access-list counters ACL-1
```

**Related commands** [show access-list counters](#)

**Command changes** Version 5.5.2-2.1: command added

## commit (IPv6)

**Overview** Use this command to commit the IPv6 ACL filter configuration entered at the console to the hardware immediately without exiting the IPv6 Hardware ACL Configuration mode.

This command forces the associated hardware and software IPv6 ACLs to synchronize.

**Syntax** `commit`

**Mode** IPv6 Hardware ACL Configuration

**Usage notes** Normally, when an IPv6 hardware ACL is edited, the new configuration state of the IPv6 ACL is not written to hardware until you exit IPv6 Hardware ACL Configuration mode. By entering this command you can ensure that the current state of a hardware access-list that is being edited is written to hardware immediately.

Scripts typically do not include the [exit](#) command to exit configuration modes, potentially leading to IPv6 ACL filters in hardware not being correctly updated. Using this **commit** command in a configuration script after specifying an IPv6 hardware ACL filter ensures that it is updated in the hardware.

**Example** To update the hardware with the IPv6 ACL filter configuration, use the command:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-ipv6-acl
awplus(config-ipv6-hw-acl)# commit
```

**Related commands** [ipv6 access-list \(named IPv6 hardware ACL\)](#)

# ipv6 (ipv6-host-group)

**Overview** Use this command to add an IPv6 host or subnet to an IPv6 ACL group. Adding IPv6 hosts and subnets to an ACL group allows you to simplify ACL config when the same IP addresses are required for many ACLs.

Use the **no** variant of this command to remove an IPv6 host or subnet from an IPv6 ACL group.

**Syntax** `ipv6 {any|<match-ip>}`  
`no ipv6 {any|<match-ip>}`

| Parameter                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |             |                                                                             |                      |                                                                                                                                                                               |                               |                                                     |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------|-----------------------------------------------------------------------------|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------|-----------------------------------------------------|
| any                           | Match any IP address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |             |                                                                             |                      |                                                                                                                                                                               |                               |                                                     |
| <match-ip>                    | The addresses to match against. You can specify a single host or a subnet. The following are the valid formats for specifying the addresses: <table><tr><td>&lt;ipv6-addr&gt;</td><td>Specifies a single host address. The IPv6 address uses the format X:X::X:X.</td></tr><tr><td>&lt;ipv6-addr&gt;/&lt;prefix&gt;</td><td>Specifies an address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64, or has the value 128.</td></tr><tr><td>&lt;ipv6-addr&gt;<br/>&lt;reverse-mask&gt;</td><td>An IPv6 host and a reverse mask in format X:X::X:X.</td></tr></table> | <ipv6-addr> | Specifies a single host address. The IPv6 address uses the format X:X::X:X. | <ipv6-addr>/<prefix> | Specifies an address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64, or has the value 128. | <ipv6-addr><br><reverse-mask> | An IPv6 host and a reverse mask in format X:X::X:X. |
| <ipv6-addr>                   | Specifies a single host address. The IPv6 address uses the format X:X::X:X.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |             |                                                                             |                      |                                                                                                                                                                               |                               |                                                     |
| <ipv6-addr>/<prefix>          | Specifies an address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64, or has the value 128.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |             |                                                                             |                      |                                                                                                                                                                               |                               |                                                     |
| <ipv6-addr><br><reverse-mask> | An IPv6 host and a reverse mask in format X:X::X:X.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |             |                                                                             |                      |                                                                                                                                                                               |                               |                                                     |

**Default** No hosts or subnets are in an IPv6 ACL group by default.

**Mode** IPv6 ACL Host Group Configuration

**Example** To add the subnet 2001:DB8::/32 to an IPv6 ACL group IPV6\_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ipv6 address IPV6_GROUP1
awplus(config-ipv6-host-group)# ipv6 2001:DB8::/32
```

To remove the subnet 2001:DB8::/32 from an IPv6 ACL group IPV6\_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ipv6 address IPV6_GROUP1
awplus(config-ipv6-host-group)# no ipv6 2001:DB8::/32
```

**Command changes**   Version 5.5.0-1.1: command added

# ipv6 access-list (named IPv6 hardware ACL)

**Overview** Use this command to either create a new IPv6 hardware access-list, or to select an existing IPv6 hardware access-list in order to apply a filter entry to it.

Use the **no** variant of this command to delete an existing IPv6 hardware access-list.

**NOTE:** Before you can delete an access-list, you must first remove it from any interface it is assigned to.

**Syntax** `ipv6 access-list <ipv6-access-list-name>`  
`no ipv6 access-list <ipv6-access-list-name>`

| Parameter                                  | Description                       |
|--------------------------------------------|-----------------------------------|
| <code>&lt;ipv6-access-list-name&gt;</code> | Specify an IPv6 access-list name. |

**Mode** Global Configuration

**Default** Any traffic on an interface controlled by a hardware ACL that does not explicitly match a filter is permitted.

**Usage notes** Use IPv6 hardware named access-lists to control the transmission of IPv6 packets on an interface, and restrict the content of routing updates. The switch stops checking the IPv6 hardware named access-list when a match is encountered.

This command moves you to the (config-ipv6-hw-acl) prompt for the selected IPv6 hardware named access-list number. From there you can configure the filters for this selected IPv6 hardware named access-list.

Once you have configured the ACL, use the [ipv6 traffic-filter](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**Examples** To create an IPv6 access-list named "my-ipv6-acl", use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-ipv6-acl
awplus(config-ipv6-hw-acl)#
```

To delete the IPv6 access-list named "my-ipv6-acl", use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 access-list my-ipv6-acl
```

ipv6 traffic-filter

match access-group

show ipv6 access-list (IPv6 Hardware ACLs)

# ipv6 traffic-filter

**Overview** This command adds an IPv6 hardware-based access-list to an interface. The number of access-lists that can be added is determined by the amount of available space in the hardware-based packet classification tables.

Use the **no** variant of this command to remove an IPv6 hardware-based access-list from an interface.

**Syntax** `ipv6 traffic-filter <ipv6-access-list-name>`  
`no ipv6 traffic-filter <ipv6-access-list-name>`

| Parameter                                  | Description                     |
|--------------------------------------------|---------------------------------|
| <code>&lt;ipv6-access-list-name&gt;</code> | Hardware IPv6 access-list name. |

**Mode** Interface Configuration (to apply an IPv6 hardware ACL to a specific switch port).

**Usage notes** This command adds an IPv6 hardware-based access-list to an interface. The number of access-lists that can be added is determined by the amount of available space in the hardware-based packet classification tables.

**Examples** To add access-list "acl1" as a traffic-filter to interface port1.1.1, enter the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# ipv6 traffic-filter acl1
```

To remove access-list "acl1" as a traffic-filter from interface port1.1.1, enter the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# no ipv6 traffic-filter acl1
```

## (named IPv6 hardware ACL: ICMP entry)

**Overview** Use this command to add a new ICMP filter entry to the current IPv6 hardware access-list. The filter will match on any ICMP packet that has the specified IPv6 source and destination IP addresses and (optionally) ICMP type. You can specify the value **any** if source or destination address does not matter.

The **no** variant of this command removes a filter entry from the current IPv6 hardware access-list. You can specify the filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its filter profile without specifying its sequence number (e.g. **no deny icmp 2001:0db8::0/64 any**).

You can find the sequence number by running the [show ipv6 access-list \(IPv6 Hardware ACLs\)](#) command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:** Specifying a “send” action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.

**Syntax** [`<sequence-number>`] `<action>` icmp `<source-addr>` `<dest-addr>`  
[icmp-type `<number>`] [vlan `<1-4094>`] [log]  
  
`no <sequence-number>`  
  
`no <action>` icmp `<source-addr>` `<dest-addr>` [icmp-type `<number>`]  
[vlan `<1-4094>`] [log]

The following actions are available for hardware ACLs:

| Values for the <code>&lt;action&gt;</code> parameter                                        |                                                                                                                                                                                                                                                              |
|---------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| deny                                                                                        | Reject packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| permit                                                                                      | Permit packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| copy-to-cpu                                                                                 | Send a copy of matching packets to the CPU.                                                                                                                                                                                                                  |
| copy-to-mirror<br>[interface<br><i>port-number</i> ]                                        | Send a copy of matching packets to a mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |
| send-to-mirror<br>[interface<br><i>port-number</i> ]                                        | Send matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.         |
| send-to-vlan-port<br>vlan <code>&lt;vid&gt;</code> port<br><code>&lt;port-number&gt;</code> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.                                                                                                                           |

| Values for the <action> parameter |                                                                                                                                                                                 |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| send-to-cpu                       | Send matching packets to the CPU.                                                                                                                                               |
| deny-and-not-cpu                  | Drop the packet and make sure that it isn't sent to the switch's CPU. Use this action if you want to drop packets that AlliedWare Plus would normally send to the switch's CPU. |

| Parameter         | Description                                                                                                                                                                                                                                  |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <sequence-number> | The sequence number for the filter entry of the selected access control list, in the range 1-65535.                                                                                                                                          |
| <action>          | The action that the switch will take on matching packets. See the table above for valid values.                                                                                                                                              |
| icmp              | Match against ICMP packets.                                                                                                                                                                                                                  |
| <source-addr>     | The source addresses to match against. You can specify a single host, a range, or all source addresses. The following are the valid formats for specifying the source:                                                                       |
|                   | any Match any source host.                                                                                                                                                                                                                   |
|                   | <ipv6-src-address/prefix-length> Match the specified source address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.                                       |
|                   | <ipv6-src-address><br><ipv6-src-wildcard> Match the specified IPv6 source address, masked using wildcard bits. The IPv6 address uses the format X:X::X:X. In the wildcard bits, 1 represents bits to ignore, and 0 represents bits to match. |
|                   | host<br><ipv6-source-host> Match a single source host address. The IPv6 address uses the format X:X::X:X.                                                                                                                                    |
| <dest-addr>       | The destination addresses to match against. You can specify a single host, a range, or all destination addresses. The following are the valid formats for specifying the destination:                                                        |
|                   | any Match any destination host.                                                                                                                                                                                                              |
|                   | <ipv6-dest-address/prefix-length> Match the specified destination address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.                                 |

The ACL will match against the specified ID in the packet's VLAN tag.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |   |               |   |                                   |   |                         |   |                                   |   |                |    |                         |    |                             |    |                     |    |                    |    |                       |    |                      |    |                        |    |                       |
| <code>log</code>                                                                  | <p>Log packets that are denied by this ACL. You must also enable the logging, using the command <a href="#">access-list hardware-deny-log</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |   |               |   |                                   |   |                         |   |                                   |   |                |    |                         |    |                             |    |                     |    |                    |    |                       |    |                      |    |                        |    |                       |

**Mode** IPv6 Hardware ACL Configuration (accessed by running the command [ipv6 access-list \(named IPv6 hardware ACL\)](#))

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** To use this command, first run the command [ipv6 access-list \(named IPv6 hardware ACL\)](#) and enter the desired access-list name. This changes the prompt to:

```
awplus(config-ipv6-hw-acl) #
```

Then use this command (and the other “named IPv6 hardware ACL: entry” commands) to add filter entries. You can add multiple filter entries to an ACL.

If you specify a sequence number, the new entry is inserted at the specified location. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Once you have configured the ACL, use the [ipv6 traffic-filter](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

**Examples** To add a filter entry to the ACL named “my-acl”, to block ICMP packets sent from network 2001:0db8::0/64 , use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# deny icmp 2001:0db8::0/64 any
```

To remove a filter entry from the ACL named “my-acl” that blocks all ICMP packets sent from network 2001:0db8::0/ 64 , use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# no deny icmp 2001:0db8::0/64 any
```

To specify an ACL named “my-acl1” and add a filter entry that blocks all ICMP6 echo requests, enter the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl1
awplus(config-ipv6-hw-acl)# deny icmp any any icmp-type 128
```

To specify an ACL named “my-acl2” and add a filter entry that blocks all ICMP6 echo requests on the default VLAN (vlan1), enter the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl2
awplus(config-ipv6-hw-acl)# deny icmp any any icmp-type 128
vlan 1
```

To remove a filter entry that blocks all ICMP6 echo requests from the ACL named “my-acl1”, enter the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl1
awplus(config-ipv6-hw-acl)# no deny icmp any any icmp-type 128
```

**Related  
commands**

**Command  
changes**

Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

# (named IPv6 hardware ACL: IPv6 packet entry)

**Overview** Use this command to add an IPv6 packet filter entry to the current hardware access-list. The filter will match on IPv6 packets that have the specified source and destination IPv6 address and (optionally) prefix. You can use the value **any** instead of source or destination IPv6 address if an address does not matter.

The **no** variant of this command removes a filter entry from the current hardware access-list. You can specify the filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its filter profile without specifying its sequence number (e.g. **no deny ipv6 2001:0db8::0/64 any**).

You can find the sequence number by running the [show ipv6 access-list \(IPv6 Hardware ACLs\)](#) command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:** Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.

**Syntax** [`<sequence-number>`] `<action>` ipv6 `<source-addr>` `<dest-addr>`  
[vlan `<1-4094>`] [log]  
  
no `<sequence-number>`  
  
no `<action>` ipv6 `<source-addr>` `<dest-addr>` [vlan `<1-4094>`]  
[log]

The following actions are available for hardware ACLs:

| Values for the <code>&lt;action&gt;</code> parameter |                                                                                                                                                                                                                                                              |
|------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| deny                                                 | Reject packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| permit                                               | Permit packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| copy-to-cpu                                          | Send a copy of matching packets to the CPU.                                                                                                                                                                                                                  |
| copy-to-mirror<br>[interface<br><i>port-number</i> ] | Send a copy of matching packets to a mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |
| send-to-mirror<br>[interface<br><i>port-number</i> ] | Send matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.         |

| Values for the <action> parameter                     |                                                                                                                                                                                 |
|-------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| send-to-vlan-port<br>vlan <vid> port<br><port-number> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.                                              |
| send-to-cpu                                           | Send matching packets to the CPU.                                                                                                                                               |
| deny-and-not-cpu                                      | Drop the packet and make sure that it isn't sent to the switch's CPU. Use this action if you want to drop packets that AlliedWare Plus would normally send to the switch's CPU. |

| Parameter         | Description                                                                                                                                                                                                                                  |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <sequence-number> | The sequence number for the filter entry of the selected access control list, in the range 1-65535.                                                                                                                                          |
| <action>          | The action that the switch will take on matching packets. See the table above for valid values.                                                                                                                                              |
| ipv6              | Match against IPv6 packets                                                                                                                                                                                                                   |
| <source-addr>     | The source addresses to match against. You can specify a single host, a range, or all source addresses. The following are the valid formats for specifying the source:                                                                       |
|                   | any Match any source host.                                                                                                                                                                                                                   |
|                   | <ipv6-src-address/<br>prefix-length> Match the specified source address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.                                   |
|                   | <ipv6-src-address><br><ipv6-src-wildcard> Match the specified IPv6 source address, masked using wildcard bits. The IPv6 address uses the format X:X::X:X. In the wildcard bits, 1 represents bits to ignore, and 0 represents bits to match. |
|                   | host<br><ipv6-source-host> Match a single source host address. The IPv6 address uses the format X:X::X:X.                                                                                                                                    |
| <dest-addr>       | The destination addresses to match against. You can specify a single host, a range, or all destination addresses. The following are the valid formats for specifying the destination:                                                        |
|                   | any Match any destination host.                                                                                                                                                                                                              |

| Parameter                                                       | Description                                                                                                                                                                                        |
|-----------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;ipv6-dest-address/<br/>prefix-length&gt;</i>             | Match the specified destination address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.                         |
| <i>&lt;ipv6-dest-address&gt;<br/>&lt;ipv6-dest-wildcard&gt;</i> | Match the specified destination address, masked using wildcard bits. The IPv6 address uses the format X:X::X:X. In the wildcard bits, 1 represents bits to ignore, and 0 represents bits to match. |
| host<br><i>&lt;ipv6-dest-host&gt;</i>                           | Match a single destination host address. The IPv6 address uses the format X:X::X:X.                                                                                                                |
| vlan <i>&lt;1-4094&gt;</i>                                      | The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.                                                                                                   |
| log                                                             | Log packets that are denied by this ACL. You must also enable the logging, using the command <a href="#">access-list hardware-deny-log</a> .                                                       |

**Mode** IPv6 Hardware ACL Configuration (accessed by running the command [ipv6 access-list \(named IPv6 hardware ACL\)](#))

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** To use this command, first run the command [ipv6 access-list \(named IPv6 hardware ACL\)](#) and enter the desired access-list name. This changes the prompt to:

```
awplus(config-ipv6-hw-acl) #
```

Then use this command (and the other "named IPv6 hardware ACL: entry" commands) to add filter entries. You can add multiple filter entries to an ACL.

If you specify a sequence number, the new entry is inserted at the specified location. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Once you have configured the ACL, use the [ipv6 traffic-filter](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

**Examples** To add a filter entry to the ACL named "my-acl" to block IPv6 traffic sent from network 2001:0db8::0/64, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# deny ipv6 2001:0db8::0/64 any
```

To remove a filter entry from the ACL named "my-acl" that blocks all IPv6 traffic sent from network 2001:0db8::0/64, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# no deny ipv6 2001:0db8::0/64 any
```

**Related  
commands**

[access-list hardware-deny-log](#)

[ipv6 traffic-filter](#)  
[match access-group](#)  
[show ipv6 access-list \(IPv6 Hardware ACLs\)](#)

**Command  
changes**

Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

# (named IPv6 hardware ACL: IP protocol entry)

**Overview** Use this command to add an IP protocol type filter entry to the current IPv6 hardware access-list. The filter will match on IPv6 packets that have the specified IP protocol number, and the specified IPv6 addresses. You can use the value **any** instead of source or destination IPv6 address if an address does not matter.

The **no** variant of this command removes a filter entry from the current hardware access-list. You can specify the filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its filter profile without specifying its sequence number (e.g. **no deny proto 2 2001:0db8::0/64 any**).

You can find the sequence number by running the [show ipv6 access-list \(IPv6 Hardware ACLs\)](#) command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:** Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.

**Syntax** [`<sequence-number>`] `<action>` proto `<1-255>` `<source-addr>`  
`<dest-addr>` [`vlan <1-4094>`] [`log`]  
  
`no <sequence-number>`  
  
`no <action>` proto `<1-255>` `<source-addr>` `<dest-addr>` [`vlan <1-4094>`] [`log`]

The following actions are available for hardware ACLs:

| Values for the <code>&lt;action&gt;</code> parameter |                                                                                                                                                                                                                                                              |
|------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| deny                                                 | Reject packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| permit                                               | Permit packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| copy-to-cpu                                          | Send a copy of matching packets to the CPU.                                                                                                                                                                                                                  |
| copy-to-mirror<br>[interface<br>port-number]         | Send a copy of matching packets to a mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |
| send-to-mirror<br>[interface<br>port-number]         | Send matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.         |

| Values for the <action> parameter                     |                                                                                                                                                                                 |
|-------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| send-to-vlan-port<br>vlan <vid> port<br><port-number> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.                                              |
| send-to-cpu                                           | Send matching packets to the CPU.                                                                                                                                               |
| deny-and-not-cpu                                      | Drop the packet and make sure that it isn't sent to the switch's CPU. Use this action if you want to drop packets that AlliedWare Plus would normally send to the switch's CPU. |

Table 44-2: Parameters in IP protocol ACL entries

| Parameter         | Description                                                                                                                                                                                                                                                                        |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <sequence-number> | The sequence number for the filter entry of the selected access control list, in the range 1-65535.                                                                                                                                                                                |
| <action>          | The action that the switch will take on matching packets. See the table above for valid values.                                                                                                                                                                                    |
| proto <1-255>     | The IP protocol number to match against, as defined by IANA (Internet Assigned Numbers Authority <a href="http://www.iana.org/assignments/protocol-numbers">www.iana.org/assignments/protocol-numbers</a> )<br>See below for a list of IP protocol numbers and their descriptions. |
| <source-addr>     | The source addresses to match against. You can specify a single host, a range, or all source addresses. The following are the valid formats for specifying the source:                                                                                                             |
|                   | any Match any source host.                                                                                                                                                                                                                                                         |
|                   | <ipv6-src-address/<br>prefix-length> Match the specified source address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.                                                                         |
|                   | <ipv6-src-address><br><ipv6-src-wildcard> Match the specified IPv6 source address, masked using wildcard bits. The IPv6 address uses the format X:X::X:X. In the wildcard bits, 1 represents bits to ignore, and 0 represents bits to match.                                       |
|                   | host<br><ipv6-source-host> Match a single source host address. The IPv6 address uses the format X:X::X:X.                                                                                                                                                                          |
| <dest-addr>       | The destination addresses to match against. You can specify a single host, a range, or all destination addresses. The following are the valid formats for specifying the destination:                                                                                              |

Table 44-2: Parameters in IP protocol ACL entries (cont.)

| Parameter                                                             | Description                                                                                                                                                                                        |
|-----------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| any                                                                   | Match any destination host.                                                                                                                                                                        |
| <code>&lt;ipv6-dest-address/<br/>prefix-length&gt;</code>             | Match the specified destination address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.                         |
| <code>&lt;ipv6-dest-address&gt;<br/>&lt;ipv6-dest-wildcard&gt;</code> | Match the specified destination address, masked using wildcard bits. The IPv6 address uses the format X:X::X:X. In the wildcard bits, 1 represents bits to ignore, and 0 represents bits to match. |
| host<br><code>&lt;ipv6-dest-host&gt;</code>                           | Match a single destination host address. The IPv6 address uses the format X:X::X:X.                                                                                                                |
| vlan <code>&lt;1-4094&gt;</code>                                      | The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.                                                                                                   |
| log                                                                   | Log packets that are denied by this ACL. You must also enable the logging, using the command <a href="#">access-list hardware-deny-log</a> .                                                       |

Table 44-3: IP protocol number and description

| Protocol Number | Protocol Description [RFC]                             |

**Mode** IPv6 Hardware ACL Configuration (accessed by running the command `ipv6 access-list (named IPv6 hardware ACL)`)

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** To use this command, first run the command `ipv6 access-list (named IPv6 hardware ACL)` and enter the desired access-list name. This changes the prompt to:

```
awplus(config-ipv6-hw-acl) #
```

Then use this command (and the other “named IPv6 hardware ACL: entry” commands) to add filter entries. You can add multiple filter entries to an ACL.

If you specify a sequence number, the new entry is inserted at the specified location. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Once you have configured the ACL, use the [ipv6 traffic-filter](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

**Examples** To add a filter entry to the ACL named “my-acl” to deny IGMP packets from 2001:0db8::0/64 , use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# deny proto 2 2001:0db8::0/64 any
```

To remove a filter entry that blocks IGMP packets from network 2001:0db8::0/64 from the ACL named “my-acl”, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# no deny proto 2 2001:0db8::0/64 any
```

**Command changes**

Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

# (named IPv6 hardware ACL: TCP or UDP entry)

**Overview** Use this command to add a TCP or UDP filter entry to the current IPv6 hardware access-list. The access-list will match on TCP or UDP packets that have the specified source and destination IP addresses and optionally, port values. You can use the value **any** instead of source or destination IP address if an address does not matter.

The **no** variant of this command removes a filter entry from the current hardware access-list. You can specify the filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its filter profile without specifying its sequence number (e.g. **no deny tcp 2001:0db8::0/64 any**).

You can find the sequence number by running the [show ipv6 access-list \(IPv6 Hardware ACLs\)](#) command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:** Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.

**Syntax** [`<sequence-number>`] `<action>` {tcp|udp} `<source-addr>`  
[`<source-ports>`] `<dest-addr>` [`<dest-ports>`] [vlan `<1-4094>`]  
[log]  
  
no `<sequence-number>`  
  
no `<action>` {tcp|udp} `<source-addr>` [`<source-ports>`]  
`<dest-addr>` [`<dest-ports>`] [vlan `<1-4094>`] [log]

The following actions are available for hardware ACLs:

| Values for the <code>&lt;action&gt;</code> parameter |                                                                                                                                                                                                                                                              |
|------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| deny                                                 | Reject packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| permit                                               | Permit packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| copy-to-cpu                                          | Send a copy of matching packets to the CPU.                                                                                                                                                                                                                  |
| copy-to-mirror<br>[interface<br><i>port-number</i> ] | Send a copy of matching packets to a mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |
| send-to-mirror<br>[interface<br><i>port-number</i> ] | Send matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.         |

| Values for the <action> parameter                     |                                                                                                                                                                                 |
|-------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| send-to-vlan-port<br>vlan <vid> port<br><port-number> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.                                              |
| send-to-cpu                                           | Send matching packets to the CPU.                                                                                                                                               |
| deny-and-not-cpu                                      | Drop the packet and make sure that it isn't sent to the switch's CPU. Use this action if you want to drop packets that AlliedWare Plus would normally send to the switch's CPU. |

| Parameter                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |              |                              |                |                                                                                               |                        |                                                                                                                                                         |                             |                                                                                                                                                                                                                        |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------|------------------------------|----------------|-----------------------------------------------------------------------------------------------|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <sequence-number>           | The sequence number for the filter entry of the selected access control list, in the range 1-65535. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |              |                              |                |                                                                                               |                        |                                                                                                                                                         |                             |                                                                                                                                                                                                                        |
| <action>                    | The action that the switch will take on matching packets. See the table above for valid values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |              |                              |                |                                                                                               |                        |                                                                                                                                                         |                             |                                                                                                                                                                                                                        |
| tcp                         | Match against TCP packets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |              |                              |                |                                                                                               |                        |                                                                                                                                                         |                             |                                                                                                                                                                                                                        |

| <source-addr>               | The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source: <table border="1"> <tr> <td>any</td><td>Match any source IP address.</td></tr> <tr> <td>host &lt;ip-addr&gt;</td><td>Match a single source host with the IP address given by &lt;ip-addr&gt; in dotted decimal notation.</td></tr> <tr> <td>&lt;ip-addr&gt;/<br/>&lt;prefix&gt;</td><td>Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.</td></tr> <tr> <td>&lt;ip-addr&gt;<br/>&lt;reverse-mask&gt;</td><td>Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.</td></tr> </table> | any          | Match any source IP address. | host <ip-addr> | Match a single source host with the IP address given by <ip-addr> in dotted decimal notation. | <ip-addr>/<br><prefix> | Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length. | <ip-addr><br><reverse-mask> | Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24. |
| any                         | Match any source IP address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |              |                              |                |                                                                                               |                        |                                                                                                                                                         |                             |                                                                                                                                                                                                                        |
| host <ip-addr>              | Match a single source host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |              |                              |                |                                                                                               |                        |                                                                                                                                                         |                             |                                                                                                                                                                                                                        |
| <ip-addr>/<br><prefix>      | Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |              |                              |                |                                                                                               |                        |                                                                                                                                                         |                             |                                                                                                                                                                                                                        |
| <ip-addr><br><reverse-mask> | Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |              |                              |                |                                                                                               |                        |                                                                                                                                                         |                             |                                                                                                                                                                                                                        |
| <source-ports>              | Match source TCP or UDP port numbers. Port numbers are specified as integers between 0 and 65535. You can specify one or more port numbers as follows: <table border="1"> <tr> <td>eq &lt;0-65535&gt;</td><td>Match a single port number.</td></tr> <tr> <td>lt &lt;0-65535&gt;</td><td>Match all port numbers that are less than the specified port number.</td></tr> </table>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | eq <0-65535> | Match a single port number.  | lt <0-65535>   | Match all port numbers that are less than the specified port number.                          |                        |                                                                                                                                                         |                             |                                                                                                                                                                                                                        |
| eq <0-65535>                | Match a single port number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |              |                              |                |                                                                                               |                        |                                                                                                                                                         |                             |                                                                                                                                                                                                                        |
| lt <0-65535>                | Match all port numbers that are less than the specified port number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |              |                              |                |                                                                                               |                        |                                                                                                                                                         |                             |                                                                                                                                                                                                                        |

| Parameter                        | Description                                                                                                                                                                                                                 |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| gt <0-65535>                     | Match all port numbers that are greater than the specified port number.                                                                                                                                                     |
| ne <0-65535>                     | Match all port numbers except the specified port number.                                                                                                                                                                    |
| range <start-port><br><end-port> | Match a range of port numbers.                                                                                                                                                                                              |
| <dest-addr>                      | The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:                                      |
| any                              | Match any destination IP address.                                                                                                                                                                                           |
| host <ip-addr>                   | Match a single destination host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                          |
| <ip-addr>/<br><prefix>           | Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                                |
| <ip-addr><br><reverse-mask>      | Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24. |
| <dest-ports>                     | Match destination TCP or UDP port numbers. Port numbers are specified as integers between 0 and 65535. You can specify one or more port numbers as follows:                                                                 |
| eq <0-65535>                     | Match a single port number.                                                                                                                                                                                                 |
| lt <0-65535>                     | Match all port numbers that are less than the specified port number.                                                                                                                                                        |
| gt <0-65535>                     | Match all port numbers that are greater than the specified port number.                                                                                                                                                     |
| ne <0-65535>                     | Match all port numbers except the specified port number.                                                                                                                                                                    |
| range <start-port><br><end-port> | Match a range of port numbers.                                                                                                                                                                                              |
| vlan <1-4094>                    | The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.                                                                                                                            |
| log                              | Log packets that are denied by this ACL. You must also enable the logging, using the command <a href="#">access-list hardware-deny-log</a> .                                                                                |

**Mode** IPv6 Hardware ACL Configuration (accessed by running the command [ipv6 access-list \(named IPv6 hardware ACL\)](#))

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** To use this command, first run the command [ipv6 access-list \(named IPv6 hardware ACL\)](#) and enter the desired access-list name. This changes the prompt to:

```
awplus(config-ipv6-hw-acl)#
```

Then use this command (and the other “named IPv6 hardware ACL: entry” commands) to add filter entries. You can add multiple filter entries to an ACL.

If you specify a sequence number, the new entry is inserted at the specified location. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Once you have configured the ACL, use the [ipv6 traffic-filter](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

**Examples** To add a filter entry that blocks all SSH traffic from network 2001:0db8::0/64 to the hardware IPv6 access-list named “my-acl”, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# deny tcp 2001:0db8::0/64 any eq 22
```

To add a filter entry that blocks all SSH traffic from network 2001:0db8::0/64 on the default VLAN (vlan1) to the hardware IPv6 access-list named “my-acl”, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# deny tcp 2001:0db8::0/64 any eq 22
vlan 1
```

To remove an ACL filter entry that blocks all SSH traffic from network 2001:0db8::0/64 from the hardware IPv6 access-list named “my-acl”, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# no deny tcp 2001:0db8::0/64 any eq 22
```

- Command changes** Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches
- Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches
- Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches
- Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

# platform hwfilter-size

**Overview** You can use this command to control the configuration of hardware Access Control Lists (ACLs), which determines the total available number and functionality of hardware ACLs.

For this command to take effect, you need to reboot the affected service.

You cannot attach an IPv6 ACL to a port if the ACL contains a specified source or destination IPv6 address or both and the **hw-filter size** setting is **ipv4-limited-ipv6**. If you do so, a diagnostic message will be generated.

**Syntax** `platform hwfilter-size {ipv4-limited-ipv6|ipv4-full-ipv6}`

| Parameter         | Description                                                                                                                                                                                                                                  |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| hwfilter-size     | Configure hardware ACLs command.                                                                                                                                                                                                             |
| ipv4-full-ipv6    | Configure hardware ACLs to filter IPv4 traffic, MAC addresses and IPv6 traffic, including filtering on source or destination IPv6 addresses, or both; however, this will reduce the total number of filters available in the hardware table. |
| ipv4-limited-ipv6 | Configure hardware ACLs to filter IPv4 traffic, MAC addresses and IPv6 traffic. Source or destination IPv6 addresses or both are not filtered.                                                                                               |

**Default** The default mode is **ipv4-limited-ipv6**.

**Mode** Global Configuration

**Example** To configure hardware ACLs to filter IPv4 and IPv6 traffic, use the following commands:

```
awplus# configure terminal
awplus(config)# platform hwfilter-size ipv4-full-ipv6
```

**Related commands** [show platform](#)  
[ipv6 access-list \(named IPv6 hardware ACL\)](#)

# show access-list counters

**Overview** Use this command to show the number of packets that match one or all of your hardware ACLs. Every time a hardware ACL allows or drops a packet, its counter increments. This lets you check your ACL configuration.

**Syntax** `show access-list counters [<acl>]`

| Parameter | Description                                                                                            |
|-----------|--------------------------------------------------------------------------------------------------------|
| <acl>     | Display the number of packets that match only the specified ACL. You can enter the ACL name or number. |

**Mode** User Exec and Privileged Exec

**Usage notes** This command displays the counter values since the last time they were cleared. To clear the counter values, enter the command [clear access-list counters](#).

To accurately measure the number of packet hits per ACL, you need to read the counters for all ACLs frequently.

**Example** To show the number of packets that match all hardware ACLs, use the following command:

```
awplus# show access-list counters
```

**Output** Figure 44-1: Example output from **show access-list counters**

```
awplus#show access-list counters
Hardware ACL Packet Counters

ACL-1
Packet Hits: 17
ACL-2
Packet Hits: 0
ACL-3
Packet Hits: 1
```

**Output** Figure 44-2: Example output from **show access-list counters ACL-1**

```
awplus#show access-list counters ACL-1
Hardware ACL Packet Counters

ACL-1
Packet Hits: 17
```

Table 44-4: Parameters in the output from **show access-list counters**

| Parameter   | Description                                                                                    |
|-------------|------------------------------------------------------------------------------------------------|
| Packet Hits | The number of packets that match the ACL. The count includes both dropped and allowed packets. |

**Related commands**    [clear access-list counters](#)  
                              [show interface access-group](#)

**Command changes**    Version 5.5.2-2.1: reading the counters no longer clears them  
                              Version 5.5.1-2.1: command added

# show acl-group ipv6 address

**Overview** Use this command to show the hosts and subnets in a named IPv6 ACL group.

**Syntax** `show acl-group ipv6 address <group>`

| Parameter                  | Description                     |
|----------------------------|---------------------------------|
| <code>&lt;group&gt;</code> | The name of the IPv6 ACL group. |

**Mode** Privileged Exec

**Example** To show all hosts and subnets in an IPv6 ACL group IPV6\_GROUP1, use the command:

```
awplus# show acl-group ipv6 address IPV6_GROUP1
```

**Output** Figure 44-3: Example output from **show acl-group ipv6 address IPV6\_GROUP1**

```
awplus#show acl-group ipv6 address IPV6_GROUP1
Host Group: IPV6_GROUP1

2001:DB8::/32
2001:DB9::1/128
```

**Related commands** [acl-group ipv6 address](#)  
[ipv6 \(ipv6-host-group\)](#)

**Command changes** Version 5.5.0-1.1: command added

# show ipv6 access-list (IPv6 Hardware ACLs)

**Overview** Use this command to display all configured hardware IPv6 access-lists or the IPv6 access-list specified by name. Omitting the optional name parameter will display all IPv6 ACLs.

**Syntax** `show ipv6 access-list [<name>]`

| Parameter | Description                     |
|-----------|---------------------------------|
| <name>    | Hardware IPv6 access-list name. |

**Mode** User Exec and Privileged Exec

**Example** To show all configured IPv6 access-lists use the command:

```
awplus# show ipv6 access-list
```

**Output** Figure 44-4: Example output from the **show ipv6 access-list** command

```
IPv6 access-list deny_ssh
deny tcp abcd::0/64 any eq 22
```

ACLs that are added dynamically during port authentication will be displayed with the label 'dynamic':

```
awplus# show ipv6 access-list
```

```
Named Standard IPv6 access list red
10 deny any

Named Extended IPv6 access list blue
10 deny ip any any

Hardware IPv6 access list dacl-port1.0.45-2477.03fe.ded4-ipv6 (dynamic)
4 deny ipv6 any any
```

# IPv6 Software Access Control List (ACL) Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for the IPv6 Software Access Control List (ACL) commands, and contains detailed command information and command examples about IPv6 software ACLs as applied to Routing and Multicasting, which are not applied to interfaces.

For information about ACLs, see the [ACL Feature Overview and Configuration Guide](#).

To apply ACLs to an LACP channel group, apply it to all the individual switch ports in the channel group. To apply ACLs to a static channel group, apply it to the static channel group itself. For more information on link aggregation see the following references:

- the [Link Aggregation Feature Overview\\_and\\_Configuration\\_Guide](#).
- [Link Aggregation Commands](#)

Note that text in parenthesis in command names indicates usage not keyword entry. For example, **ipv6-access-list (named)** indicates named IPv6 ACLs entered as:

```
ipv6-access-list<name>
```

where <name> is a placeholder not a keyword.

Note also that parenthesis surrounding ACL filters indicates the type of ACL filter not the keyword entry in the CLI. For example, **(ipv6 access-list standard IPv6 filter)** represents command entry in the format shown in the syntax:

```
[<sequence-number>] {deny|permit}
{<source-ipv6-address/prefix-length>|any}
```

**NOTE:** Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Sub-modes** Many of the ACL commands operate from sub-modes that are specific to particular ACL types. The following table shows the CLI prompts at which ACL commands are entered.

Table 45-1: IPv6 Software Access List Commands and Prompts

| Command Name                                   | Command Mode                    | Prompt                         |
|------------------------------------------------|---------------------------------|--------------------------------|
| show ipv6 access-list (IPv6 Software ACLs)     | Privileged Exec                 | awplus#                        |
| ipv6 access-list extended (named)              | Global Configuration            | awplus (config) #              |
| ipv6 access-list standard (named)              | Global Configuration            | awplus (config) #              |
| (ipv6 access-list extended IP protocol filter) | IPv6 Extended ACL Configuration | awplus (config-ipv6-ext-acl) # |
| (ipv6 access-list extended TCP UDP filter)     | IPv6 Extended ACL Configuration | awplus (config-ipv6-ext-acl) # |
| (ipv6 access-list standard filter)             | IPv6 Standard ACL Configuration | awplus (config-ipv6-std-acl) # |

# ipv6 access-list extended (named)

**Overview** Use this command when configuring an IPv6 extended access-list for filtering frames that permit or deny IP, ICMP, TCP, UDP packets or ICMP packets with a specific value based on the source or destination.

The **no** variant of this command removes a specified IPv6 extended access-list.

**Syntax**  
**[list-name]** `ipv6 access-list extended <list-name>`  
`no ipv6 access-list extended <list-name>`

| Parameter                      | Description                                                     |
|--------------------------------|-----------------------------------------------------------------|
| <code>&lt;list-name&gt;</code> | A user-defined name for the IPv6 software extended access-list. |

**Syntax**  
**[any|icmp|ip]** `ipv6 access-list extended <list-name> {deny|permit} {any|icmp|ip} {<ipv6-source-address/prefix-length>|any} {<ipv6-destination-address/prefix-length>|any} [<icmp-type>|<icmp-type>] [log]`

`no ipv6 access-list extended <list-name> {deny|permit} {any|icmp|ip} {<ipv6-source-address/prefix-length>|any} {<ipv6-destination-address/prefix-length>|any} [<icmp-type>|<icmp-type>] [log]`

**Syntax [tcp|udp]** `ipv6 access-list extended <list-name> {deny|permit} {tcp|udp} {<ipv6-source-address/prefix-length>|any} {eq <sourceport>|lt <sourceport>|gt <sourceport>|ne <sourceport>} {<ipv6-destination-address/prefix-length>|any} {eq <destport>|lt <destport>|gt <destport>|ne <destport>} [log]`

`no ipv6 access-list extended <list-name> {deny|permit} {tcp|udp} {<ipv6-source-address/prefix-length>|any} {eq <sourceport>|lt <sourceport>|gt <sourceport>|ne <sourceport>} {<ipv6-destination-addr/prefix-length>|any} {eq <destport>|lt <destport>|gt <destport>|ne <destport>} [log]`

| Parameter                      | Description                                                                                                                                |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;list-name&gt;</code> | A user-defined name for the IPv6 software extended access-list.                                                                            |
| <code>deny</code>              | The IPv6 software extended access-list rejects packets that match the type, source, and destination filtering specified with this command. |
| <code>permit</code>            | The IPv6 software extended access-list permits packets that match the type, source, and destination filtering specified with this command. |

| Parameter                                | Description                                                                                                                                                    |
|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| any                                      | For ICMP IP<br>The IPv6 software extended access-list matches any type of packet.                                                                              |
| ip                                       | For ICMP IP<br>The IPv6 software extended access-list matches only IP packets.                                                                                 |
| icmp                                     | For ICMP IP<br>The IPv6 software extended access-list matches only ICMP packets.                                                                               |
| tcp                                      | For TCP/UDP<br>The IPv6 software extended access-list matches only TCP packets.                                                                                |
| udp                                      | For TCP/UDP<br>The IPv6 software extended access-list matches only UDP packets.                                                                                |
| <ipv6-source-address/prefix-length>      | Specifies a source address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.  |
| <ipv6-destination-address/prefix-length> | Specifies a destination address and prefix length. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64. |
| any                                      | Matches any IPv6 address.                                                                                                                                      |
| <sourceport>                             | For TCP/UDP<br>The source port number, specified as an integer between 0 and 65535.                                                                            |
| <destport>                               | For TCP/UDP<br>The destination port number, specified as an integer between 0 and 65535.                                                                       |
| icmp-type                                | For ICMP IP<br>Matches only a specified type of ICMP messages. This is valid only when the filtering is set to match ICMP packets.                             |
| eq                                       | For TCP/UDP<br>Matches port numbers equal to the port number specified immediately after this parameter.                                                       |
| lt                                       | For TCP/UDP<br>Matches port numbers less than the port number specified immediately after this parameter.                                                      |
| gt                                       | For TCP/UDP<br>Matches port numbers greater than the port number specified immediately after this parameter.                                                   |
| ne                                       | For TCP/UDP<br>Matches port numbers not equal to the port number specified immediately after this parameter.                                                   |

| Parameter                      | Description                                                                                                                                        |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;icmp-type&gt;</code> | For ICMP IP<br>The ICMP type, as defined in RFC792 and RFC950. Specify one of the following integers to create a filter for the ICMP message type: |
| 0                              | Echo replies.                                                                                                                                      |
| 3                              | Destination unreachable messages.                                                                                                                  |
| 4                              | Source quench messages.                                                                                                                            |
| 5                              | Redirect (change route) messages.                                                                                                                  |
| 8                              | Echo requests.                                                                                                                                     |
| 11                             | Time exceeded messages.                                                                                                                            |
| 12                             | Parameter problem messages.                                                                                                                        |
| 13                             | Timestamp requests.                                                                                                                                |

**Mode** Global Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage notes** Use IPv6 extended access-lists to control the transmission of IPv6 packets on an interface, and restrict the content of routing updates. The switch stops checking the IPv6 extended access-list when a match is encountered.

For backwards compatibility you can either create IPv6 extended access-lists from within this command, or you can enter `ipv6 access-list extended` followed by only the IPv6 extended access-list name. This latter (and preferred) method moves you to the `(config-ipv6-ext-acl)` prompt for the selected IPv6 extended access-list number, and from here you can configure the filters for this selected access-list.

**NOTE:** Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Example 1 [creating a list]** To add a new filter to the access-list named `my-list` that will reject incoming ICMP packets from 2001:0db8::0/64 to 2001:0db8::f/64, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# icmp 2001:0db8::0/64
2001:0db8::f/64
```

**Example 2 [adding to a list]** To insert a new filter at sequence number 5 of the access-list named `my-list` that will accept ICMP type 8 packets from the 2001:0db8::0/64 network to the 2001:0db8::f/64 network, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# 5 icmp 2001:0db8::0/64
2001:0db8::f/64
```

**Example 3 [list with filter]** To create the access-list named TK to deny TCP protocols, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended TK deny tcp any eq 14
any lt 12 log
```

**Command changes**

Version 5.5.1-0.1: Support for the **no** variant added

# ipv6 access-list extended proto

**Overview** Use this command when configuring an IPv6 extended access-list for filtering frames that permit or deny packets with a specific value based on the IP protocol number specified.

The **no** variant of this command removes a specified IPv6 extended access-list with an IP protocol number.

**Syntax**

```
ipv6 access-list extended <list-name> {deny|permit} proto
<ip-protocol> {<ipv6-source-address/prefix>|any}
{<ipv6-destination-address/prefix>|any} [log]

no ipv6 access-list extended <list-name> {deny|permit} proto
<ip-protocol>{<ipv6-source-address/prefix>|any}
{<ipv6-destination-address/prefix>|any} [log]
```

| Parameter                         | Description                                                                                                                                                |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <list-name>                       | A user-defined name for the IPv6 software extended access- list.                                                                                           |
| deny                              | Specifies the packets to reject.                                                                                                                           |
| permit                            | Specifies the packets to accept.                                                                                                                           |
| proto                             | The IP Protocol type specified by its protocol number in the range 1 to 255.                                                                               |
| <ipv6-source-address/prefix>      | IPv6 source address, or local address.<br>The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.      |
| any                               | Any source address or local address.                                                                                                                       |
| <ipv6-destination-address/prefix> | IPv6 destination address, or local address.<br>The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64. |
| any                               | Any destination address or remote address.                                                                                                                 |
| log                               | Log the results.                                                                                                                                           |

**Mode** Global Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage notes** Use IPv6 extended access-lists to control the transmission of IPv6 packets on an interface, and restrict the content of routing updates. The switch stops checking the IPv6 extended access-list when a match is encountered.

The filter entry will match on any IP protocol type packet that has the specified source and destination IPv6 addresses and the specified IP protocol type. The parameter *any* may be specified if an address does not matter.

**NOTE:** Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Examples** To create the IPv6 access-list named ACL-1 to deny IP protocol 9 packets from 2001:0db8:1::1/128 to 2001:0db8:f::1/128, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended ACL-1 deny proto 9
2001:0db8:1::1/128 2001:0db8:f::1/128
```

To remove the IPv6 access-list named ACL-1 to deny IP protocol 9 packets from 2001:0db8:1::1/128 to 2001:0db8:f::1/128, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 access-list extended ACL-1 deny proto
10 2001:0db8:1::1/128 2001:0db8:f::1/128
```

## (ipv6 access-list extended IP protocol filter)

**Overview** Use this ACL filter to add a filter entry for an IPv6 source and destination address and prefix, with or without an IP protocol specified, to the current extended IPv6 access-list. If a sequence is specified, the new entry is inserted at the specified location. Otherwise, the new entry is added at the end of the access-list.

The **no** variant of this command removes a filter entry for an IPv6 source and destination address and prefix, with or without an IP protocol filter entry, from the current extended IPv6 access-list. You can specify the ACL filter entry by entering either its sequence number, or its filter entry profile.

**Syntax [ip|proto]** [*<sequence-number>*] {deny|permit} {ip|any|proto *<ip-protocol>*} {*<ipv6-source-address/prefix>*|any} {*<ipv6-destination-address/prefix>*|any} [log]  
  
no {deny|permit} {ip|any|proto *<ip-protocol>*} {*<ipv6-source-address/prefix>*|any} {*<ipv6-destination-address/prefix>*|any} [log]  
  
no [*<sequence-number>*]

**Mode** IPv6 Extended ACL Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage notes** The filter entry will match on any IP protocol type packet that has the specified source and destination IPv6 addresses and the specified IP protocol type. The parameter *any* may be specified if an address does not matter.

**NOTE:** Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Examples** To add a new ACL filter entry to the extended IPv6 access-list named *my-list* with sequence number 5 rejecting the IPv6 packet from *2001:db8:1:1:1* to *2001:db8:f:1:1*, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# 5 deny ip 2001:db8:1::1/128
2001:db8:f::1/128
```

To remove the ACL filter entry to the extended IPv6 access-list named *my-list* with sequence number 5, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# no 5
```

**Related commands** [ipv6 access-list extended \(named\)](#)

## (ipv6 access-list extended TCP UDP filter)

**Overview** Use this ACL filter to add a filter entry for an IPv6 source and destination address and prefix, with a TCP (Transmission Control Protocol) or UDP (User Datagram Protocol) source and destination port specified, to the current extended IPv6 access-list. If a sequence number is specified, the new entry is inserted at the specified location. Otherwise, the new entry is added at the end of the access-list.

The **no** variant of this command removes a filter entry for an IPv6 source and destination address and prefix, with a TCP or UDP source and destination port specified, from the current extended IPv6 access-list. You can specify the filter entry for removal by entering either its sequence number, or its filter entry profile.

**Syntax [tcp|udp]** [*<sequence-number>*] {deny|permit} {tcp|udp} {<ipv6-source-address/prefix>|any} {eq <sourceport>|lt <sourceport>|gt <sourceport>|ne <sourceport>} {<IPv6-destination-address/prefix>|any} {eq <destport>|lt <destport>|gt <destport>|ne <destport>} [log]

no {deny|permit} {tcp|udp} {<ipv6-source-address/prefix>|any} {eq <sourceport>|lt <sourceport>|gt <sourceport>|ne <sourceport>}} {<IPv6-destination-address/prefix>|any} {eq <destport>|lt <destport>|gt <destport>|ne <destport>} [log]

no <sequence-number>

| Parameter                    | Description                                                                                                                                           |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <sequence-number>            | <1-65535><br>The sequence number for the filter entry of the selected access control list.                                                            |
| deny                         | Specifies the packets to reject.                                                                                                                      |
| permit                       | Specifies the packets to accept.                                                                                                                      |
| tcp                          | TCP packet.                                                                                                                                           |
| udp                          | UDP packet.                                                                                                                                           |
| <ipv6-source-address/prefix> | IPv6 source address, or local address.<br>The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64. |
| any                          | Any source address or local address.                                                                                                                  |
| eq                           | Equal to.                                                                                                                                             |
| lt                           | Less than.                                                                                                                                            |
| gt                           | Greater than.                                                                                                                                         |
| ne                           | Not equal to.                                                                                                                                         |
| <sourceport>                 | The source port number, specified as an integer between 0 and 65535.                                                                                  |

| Parameter                         | Description                                                                                                                                           |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ipv6-destination-address/prefix> | IPv6 destination address, or local address. The IPv6 address uses the format X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64. |
| <destport>                        | The destination port number, specified as an integer between 0 and 65535.                                                                             |
| log                               | Log the results.                                                                                                                                      |

**Mode** IPv6 Extended ACL Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage notes** The filter entry will match on any packet that has the specified source and destination IPv6 addresses and the specified TCP or UDP source and destination port. The parameter *any* may be specified if an address does not matter.

**NOTE:** Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Examples** To add a new filter entry with sequence number 5 to the access-list named *my-list* to reject TCP packets from 2001:0db8::0/64 port 10 to 2001:0db8::f/64 port 20, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# 5 deny tcp 2001:0db8::0/64 eq 10
2001:0db8::f/64 eq 20
```

To add a new filter entry with sequence number 5 to the extended IPv6 access-list named *my-list* to reject UDP packets from 2001:0db8::0/64 port 10 to 2001:0db8::f/64 port 20, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# 5 deny udp 2001:0db8::0/64 eq 10
2001:0db8::f/64 eq 20
```

To remove the filter entry with sequence number 5 to the extended IPv6 access-list named *my-list*, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# no 5
```

## ipv6 access-list standard (named)

**Overview** This command configures an IPv6 standard access-list for filtering frames that permit or deny IPv6 packets from a specific source IPv6 address.

The **no** variant of this command removes a specified IPv6 standard access-list.

**Syntax**  
**[list-name]** `ipv6 access-list standard <ipv6-acl-list-name>`  
`no ipv6 access-list standard <ipv6-acl-list-name>`

| Parameter                               | Description                                                     |
|-----------------------------------------|-----------------------------------------------------------------|
| <code>&lt;ipv6-acl-list-name&gt;</code> | A user-defined name for the IPv6 software standard access-list. |

**Syntax [deny|permit]** `ipv6 access-list standard <ipv6-acl-list-name> [{deny|permit} {<ipv6-source-address/prefix-length>|any} [exact-match]]`  
`no ipv6 access-list standard <ipv6-acl-list-name> [{deny|permit} {<ipv6-source-address/prefix-length>|any} [exact-match]]`

| Parameter                                              | Description                                                                                                                                                   |
|--------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ipv6-acl-list-name&gt;</code>                | A user-defined name for the IPv6 software standard access-list.                                                                                               |
| <code>deny</code>                                      | The IPv6 software standard access-list rejects packets that match the type, source, and destination filtering specified with this command.                    |
| <code>permit</code>                                    | The IPv6 software standard access-list permits packets that match the type, source, and destination filtering specified with this command.                    |
| <code>&lt;ipv6-source-address/prefix-length&gt;</code> | Specifies a source address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64. |
| <code>any</code>                                       | Matches any source IPv6 address.                                                                                                                              |
| <code>exact-match</code>                               | Exact match of the prefixes.                                                                                                                                  |

**Mode** Global Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage notes** Use IPv6 standard access-lists to control the transmission of IPv6 packets on an interface, and restrict the content of routing updates. The switch stops checking the IPv6 standard access-list when a match is encountered.

For backwards compatibility you can either create IPv6 standard access-lists from within this command, or you can enter `ipv6 access-list standard` followed by only the IPv6 standard access-list name. This latter (and preferred) method moves you to the `(config-ipv6-std-acl)` prompt for the selected IPv6 standard access-list, and from here you can configure the filters for this selected IPv6 standard access-list.

**NOTE:** Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Example** To enter the IPv6 Standard ACL Configuration mode for the access-list named `my-list`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list standard my-list
awplus(config-ipv6-std-acl)#
```

**Related commands** [\(ipv6 access-list standard filter\)](#)  
[show ipv6 access-list \(IPv6 Software ACLs\)](#)  
[show running-config](#)

## (ipv6 access-list standard filter)

**Overview** Use this ACL filter to add a filter entry for an IPv6 source address and prefix length to the current standard IPv6 access-list. If a sequence number is specified, the new entry is inserted at the specified location. Otherwise, the new entry is added at the end of the access-list.

The **no** variant of this command removes a filter entry for an IPv6 source address and prefix from the current standard IPv6 access-list. You can specify the filter entry for removal by entering either its sequence number, or its filter entry profile.

**Syntax [icmp]** [`<sequence-number>`] {deny|permit}  
{`<ipv6-source-address/prefix-length>`|any}  
no {deny|permit} {`<ipv6-source-address/prefix-length>`|any}  
no `<sequence-number>`

| Parameter                                              | Description                                                                                                   |
|--------------------------------------------------------|---------------------------------------------------------------------------------------------------------------|
| <code>&lt;sequence-number&gt;</code>                   | <code>&lt;1-65535&gt;</code><br>The sequence number for the filter entry of the selected access control list. |
| deny                                                   | Specifies the packets to reject.                                                                              |
| permit                                                 | Specifies the packets to accept.                                                                              |
| <code>&lt;ipv6-source-address/prefix-length&gt;</code> | IPv6 source address and prefix-length in the form X:X::X:X/P.                                                 |
| any                                                    | Any IPv6 source host address.                                                                                 |

**Mode** IPv6 Standard ACL Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage** The filter entry will match on any IPv6 packet that has the specified IPv6 source address and prefix length. The parameter `any` may be specified if an address does not matter.

**NOTE:** Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Examples** To add an ACL filter entry with sequence number 5 that will deny any IPv6 packets to the standard IPv6 access-list named `my-list`, enter the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list standard my-list
awplus(config-ipv6-std-acl)# 5 deny any
```

To remove the ACL filter entry that will deny any IPv6 packets from the standard IPv6 access-list named `my-list`, enter the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list standard my-list
awplus(config-ipv6-std-acl)# no deny any
```

Alternately, to remove the ACL filter entry with sequence number 5 to the standard IPv6 access-list named `my-list`, enter the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list standard my-list
awplus(config-ipv6-std-acl)# no 5
```

**Related  
commands**

# ipv6 prefix-list

**Overview** Use this command to create an IPv6 prefix list or an entry in an existing prefix list.

Use the **no** variant of this command to delete a whole prefix list, a prefix list entry, or a description.

**Syntax**

```
ipv6 prefix-list <list-name> [seq <1-429496725>] {deny|permit}
{any|<ipv6-prefix>} [ge <0-128>] [le <0-128>]

ipv6 prefix-list <list-name> description <text>

no ipv6 prefix-list <list-name> [seq <1-429496725>]

no ipv6 prefix-list <list-name> [description <text>]
```

| Parameter         | Description                                                                          |
|-------------------|--------------------------------------------------------------------------------------|
| <list-name>       | Specifies the name of a prefix list.                                                 |
| seq <1-429496725> | Sequence number of the prefix list entry.                                            |
| deny              | Specifies that the prefixes are excluded from the list.                              |
| permit            | Specifies that the prefixes are included in the list.                                |
| <ipv6-prefix>     | Specifies the IPv6 prefix and prefix length in hexadecimal in the format X:X::X:X/M. |
| any               | Any prefix match. Same as ::0/0 le 128.                                              |
| ge <0-128>        | Specifies the minimum prefix length to be matched.                                   |
| le <0-128>        | Specifies the maximum prefix length to be matched.                                   |
| description       | Prefix list specific description.                                                    |
| <text>            | Up to 80 characters of text description of the prefix list.                          |

**Mode** Global Configuration

**Usage notes** When the device processes a prefix list, it starts to match prefixes from the top of the prefix list, and stops whenever a permit or deny occurs. To promote efficiency, use the **seq** parameter and place common permits or denials towards the top of the list. If you do not use the **seq** parameter, the sequence values are generated in a sequence of 5.

The parameters **ge** and **le** specify the range of the prefix lengths to be matched. The parameters **ge** and **le** are only used if an ip-prefix is stated. When setting these parameters, set the **le** value to be less than 128, and the **ge** value to be less than or equal to the **le** value and greater than the ip-prefix mask length.

Prefix lists implicitly exclude prefixes that are not explicitly permitted in the prefix list. This means if a prefix that is being checked against the prefix list reaches the end of the prefix list without matching a permit or deny, this prefix will be denied.

**Example** To check the first 32 bits of the prefix 2001:db8:: and that the subnet mask must be greater than or equal to 34 and less than or equal to 40, enter the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 prefix-list mylist seq 12345 permit
2001:db8::/32 ge 34 le 40
```

**Related commands**

- match ipv6 address
- show ipv6 prefix-list
- show running-config ipv6 prefix-list

# show ipv6 access-list (IPv6 Software ACLs)

**Overview** Use this command to display all configured IPv6 access-lists or the IPv6 access-list specified by name.

**Syntax** `show ipv6 access-list [<access-list-name>]`  
`show ipv6 access-list standard [<access-list-name>]`  
`show ipv6 access-list extended [<access-list-name>]`

| Parameter          | Description                                                                 |
|--------------------|-----------------------------------------------------------------------------|
| <access-list-name> | Only display information about an IPv6 access-list with the specified name. |
| standard           | Only display information about standard access-lists.                       |
| extended           | Only display information about extended access-lists.                       |

**Mode** User Exec and Privileged Exec

**Example** To show all configured IPv6 access-lists, use the following command:

```
awplus# show ipv6 access-list
```

**Output** Figure 45-1: Example output from **show ipv6 access-list**

```
IPv6 access-list deny_icmp
deny icmp any any vlan 1

IPv6 access-list deny_ssh
deny tcp abcd::0/64 any eq 22
```

**Example** To show the IPv6 access-list named **deny\_icmp**, use the following command:

```
awplus# show ipv6 access-list deny_icmp
```

**Output** Figure 45-2: Example output from **show ipv6 access-list** for a named ACL

```
IPv6 access-list deny_icmp
deny icmp any any vlan 1
```

**Related commands**

- [\(ipv6 access-list extended IP protocol filter\)](#)
- [ipv6 access-list standard \(named\)](#)
- [\(ipv6 access-list extended TCP UDP filter\)](#)
- [\(ipv6 access-list standard filter\)](#)

# show ipv6 prefix-list

**Overview** Use this command to display the prefix-list entries.  
Note that this command is valid for RIPng and BGP4+ routing protocols only.

**Syntax** `show ipv6 prefix-list [<name>|detail|summary]`

| Parameter | Description                                                               |
|-----------|---------------------------------------------------------------------------|
| <name>    | Specify the name of an individual IPv6 prefix list.                       |
| detail    | Specify this parameter to show detailed output for all IPv6 prefix lists. |
| summary   | Specify this parameter to show summary output for all IPv6 prefix lists.  |

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show ipv6 prefix-list
awplus# show ipv6 prefix-list 10.10.0.98/8
awplus# show ipv6 prefix-list detail
```

**Related commands** [ipv6 prefix-list](#)

## vty ipv6 access-class (named)

**Overview** For IPv6, use this command to set a standard named software access list to be the management ACL. This is then applied to all available VTY lines for controlling remote access by Telnet and SSH. This command allows or denies packets containing the IPv6 addresses included in the ACL to create a connection to your device.

ACLs that are attached using this command have an implicit 'deny-all' filter as the final entry in the ACL. A typical configuration is to permit a specific address, or range of addresses, and rely on the 'deny-all' filter to block all other access.

Use the **no** variant of this command to remove the access list.

**Syntax** `vty ipv6 access-class <access-name>`  
`no vty ipv6 access-class [<access-name>]`

| Parameter                        | Description                                        |
|----------------------------------|----------------------------------------------------|
| <code>&lt;access-name&gt;</code> | Specify an IPv6 standard software access-list name |

**Mode** Global Configuration

**Examples** To set the named standard access-list named **access-ctrl** to be the IPv6 management ACL, use the following commands:

```
awplus# configure terminal
awplus(config)# vty ipv6 access-class access-ctrl
```

To remove **access-ctrl** from the management ACL, use the following commands:

```
awplus# configure terminal
awplus(config)# no vty ipv6 access-class access-ctrl
```

**Output** Figure 45-3: Example output from the **show running-config** command

```
awplus#show running-config|grep access-class
vty ipv6 access-class access-ctrl
```

**Related commands** [show running-config](#)

# QoS and Policy-based Routing Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for Quality of Service commands.

QoS uses ACLs. For more information about ACLs, see the [ACL Feature Overview and Configuration Guide](#).

For more information about PBR, see the [Policy-Based Routing Feature Overview and Configuration Guide](#).

# class

**Overview** Use this command to associate an existing class-map to a policy or policy-map (traffic classification), and to enter Policy Map Class Configuration mode to configure the class-map.

Use the **no** variant of this command to delete an existing class-map.

If your class-map does not exist, you can create it by using the [class-map](#) command.

**Syntax** `class {<name>|default}`  
`no class <name>`

| Parameter | Description                               |
|-----------|-------------------------------------------|
| <name>    | Name of the (already existing) class-map. |
| default   | Specify the default class-map.            |

**Mode** Policy Map Configuration

**Example** The following example creates the policy-map `pmap1` (using the `policy-map` command), then associates this to an already existing class-map named `cmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)#
```

**Related commands** [class-map](#)  
[policy-map](#)

# class-map

**Overview** Use this command to create a class-map.  
Use the **no** variant of this command to delete the named class-map.

**Syntax** `class-map <name>`  
`no class-map <name>`

| Parameter | Description                          |
|-----------|--------------------------------------|
| <name>    | Name of the class-map to be created. |

**Mode** Global Configuration

**Example** This example creates a class-map called `cmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)#
```

# clear mls qos interface policer-counters

**Overview** Resets an interface's policer counters to zero. You can either clear a specific class-map, or you can clear all class-maps by not specifying a class map.

**Syntax** `clear mls qos interface <port> policer-counters [class-map <class-map>]`

| Parameter   | Description                                                                                                                      |
|-------------|----------------------------------------------------------------------------------------------------------------------------------|
| <port>      | The port may be a switch port (e.g. port1.1.4), a static channel group (e.g. sa3), or a dynamic (LACP) channel group (e.g. po4). |
| class-map   | Select a class-map.                                                                                                              |
| <class-map> | Class-map name.                                                                                                                  |

**Mode** Privileged Exec

**Example** To reset the policy counters to zero for all class-maps for port1.1.4, use the command:

```
awplus# clear mls qos interface port1.1.4 policer-counters
```

**Related commands** [show mls qos interface policer-counters](#)

# clear mls qos interface queue-counters

**Overview** Use this command to clear the QoS queue counters for an interface.

**Syntax** `clear mls qos interface <interface> queue-counters`

| Parameter   | Description                                                                                                                   |
|-------------|-------------------------------------------------------------------------------------------------------------------------------|
| <interface> | The interface to clear the counters for. This can be a switchport, a static channel group, or a dynamic (LACP) channel group. |

**Mode** Privileged Exec

**Example** To clear the egress queue counters on interface port1.1.1, use the command:

```
awplus# clear mls qos interface port1.1.1 queue-counters
```

To clear the egress queue counters on the static aggregator sa1, use the command:

```
awplus# clear mls qos interface sa1 queue-counters
```

**Related commands** [show mls qos interface queue-counters](#)

**Command changes** Version 5.5.2-2.1: command added

# default-action

**Overview** Use this command to set the action for the default class-map belonging to a particular policy-map. The action for a non-default class-map depends on the action of any ACL that is applied to the policy-map.

You can think of the default action as the action that the switch will apply to any data that does not meet the criteria specified by the applied matching commands.

Use the **no** variant of this command to reset to the default action of 'permit'.

**Syntax** `default-action <action>`  
`no default-action`

| Parameter                                                                           | Description                                                                                                                                                                                                                                                               |
|-------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;action&gt;</code> <code>permit</code>                                     | Permit packets                                                                                                                                                                                                                                                            |
| <code>deny</code>                                                                   | Deny packets.                                                                                                                                                                                                                                                             |
| <code>send-to-cpu</code>                                                            | Send packets to the CPU.                                                                                                                                                                                                                                                  |
| <code>copy-to-cpu</code>                                                            | Copy packets to the CPU as well as forwarding them.                                                                                                                                                                                                                       |
| <code>copy-to-mirror</code><br><code>[interface</code><br><code>port-number]</code> | Copy packets to the mirror port as well as forwarding them.<br>Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |
| <code>send-to-mirror</code><br><code>[interface</code><br><code>port-number]</code> | Send packets to the mirror port instead of forwarding them.<br>Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |

**Default** The default is **permit**.

**Mode** Policy Map Configuration

**Examples** To set the action for the default class-map to 'deny' for the policy map named 'map1', use the commands:

```
awplus# configure terminal
awplus(config)# mls qos enable
awplus(config)# policy-map map1
awplus(config-pmap)# default-action deny
```

To set the action for the default class-map to 'copy-to-mirror' for use with the [mirror interface](#) command, for the policy map named 'map1', use the commands:

```
awplus# configure terminal
awplus(config)# mls qos enable
awplus(config)# policy-map map1
awplus(config-pmap)# default-action copy-to-mirror
```

**Related  
commands**   [mirror interface](#)

## description (QoS policy-map)

**Overview** Adds a textual description of the policy-map. This can be up to 80 characters long. Use the **no** variant of this command to remove the current description from the policy-map.

**Syntax** `description <line>`  
`no description`

| Parameter                 | Description                               |
|---------------------------|-------------------------------------------|
| <code>&lt;line&gt;</code> | Up to 80 character long line description. |

**Mode** Policy Map Configuration

**Example** To add the description, VOIP traffic, use the command:  
`awplus(config-pmap)# description VOIP traffic`

# egress-rate-limit

**Overview** Use this command to limit the amount of traffic that can be transmitted per second from this port.

Use the **no** variant of this command to disable the limiting of traffic egressing on the interface.

**Syntax** `egress-rate-limit <rate-limit>`  
`no egress-rate-limit`

| Parameter                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;rate-limit&gt;</code> | Bandwidth <1-10000000 units per second> (usable units: k, m, g). The minimum bandwidth depends on the type of card the port is on.<br>The egress rate limit can be configured in multiples of 64kbps. If you configure a value that is not an exact multiple of 64kbps, then the value will be rounded up to the nearest higher exact multiple of 64kbps. The minimum is 64 Kb.<br>The default unit is Kb ( <b>k</b> ), but Mb ( <b>m</b> ) or Gb ( <b>g</b> ) can also be specified. The command syntax is not case sensitive, so a value such as 20m or 20M will be interpreted as 20 megabits. |

**Mode** Interface Configuration

**Examples** To enable egress rate limiting on a port, with a limit of approximately 500Mbps, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# egress-rate-limit 500m
```

To disable egress rate limiting on a port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# no egress-rate-limit
```

**Related commands** [egress-rate-limit overhead](#)

# egress-rate-limit overhead

**Overview** Use this command to allow for the size of packet preamble and inter-packet gap (the “overhead”) in egress queue rate limiting on switch ports.

Doing this keeps the rate limit at the same percentage of line rate for all packet sizes. Otherwise, the percentage of line rate changes with packet size, because of the size of the overhead relative to smaller packets. This means smaller packets take up a larger percentage of the line rate.

Use the **no** variant of this command to turn off the overhead allowance.

**Syntax** `egress-rate-limit overhead <bytes>`  
`no egress-rate-limit overhead`

| Parameter                  | Description                                                                                                                                                 |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;bytes&gt;</code> | The number of bytes to allow for overhead. For standard ethernet packets, use a value of 20 bytes (8 bytes of preamble and a inter-packet gap of 12 bytes). |

**Default** No overhead allowance

**Mode** Interface Configuration

**Example** To configure an overhead allowance of 20 bytes (8 bytes of preamble and a inter-packet gap of 12 bytes) on port1.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# egress-rate-limit overhead 20
```

To return port1.1.1 to the default of no overhead allowance, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# no egress-rate-limit overhead
```

**Related commands** [egress-rate-limit](#)

**Command changes** Version 5.4.9-2.1: command added

# match access-group

**Overview** Use this command to apply an ACL to a class-map or VLAN.

Use the **no** variant of this command to remove the match.

**Syntax** `match access-group {<hw-IP-ACL>|<hw-MAC-ACL>|<hw-named-ACL>}`  
`no match access-group`  
`{<hw-IP-ACL>|<hw-MAC-ACL>|<hw-named-ACL>}`

| Parameter      | Description                                                     |
|----------------|-----------------------------------------------------------------|
| <hw-IP-ACL>    | Specify a hardware IP ACL number in the range <3000-3699>.      |
| <hw-MAC-ACL>   | Specify a hardware MAC ACL number in the range <4000-4699>.     |
| <hw-named-ACL> | Specify a hardware named ACL (IP, IPv6 or MAC address entries). |

**Mode** Class Map or VLAN Access-Map

**Usage notes** First create an access-list that applies the appropriate action to matching packets. Then use the **match access-group** command to apply this access-list as desired. Note that this command will apply the access-list matching only to *incoming* data packets.

**Examples** To configure a class-map named "cmap1", which matches traffic against access-list 3001, which allows IP traffic from any source to any destination, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 3001 permit ip any any
awplus(config)# class-map cmap1
awplus(config-cmap)# match access-group 3001
```

To configure a class-map named "cmap2", which matches traffic against access-list 4001, which allows MAC traffic from any source to any destination, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 4001 permit any any
awplus(config)# class-map cmap2
awplus(config-cmap)# match access-group 4001
```

To configure a class-map named "cmap3", which matches traffic against access-list "hw\_acl", which allows IP traffic from any source to any destination, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware hw_acl
awplus(config-ip-hw-acl)# permit ip any any
awplus(config)# class-map cmap3
awplus(config-cmap)# match access-group hw_acl
```

To apply ACL 3001 to VLAN 48, where the ACL drops IP traffic from any source to any destination, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 3001 deny ip any any
awplus(config)# vlan access-map deny_all
awplus(config-vlan-access-map)# match access-group 3001
awplus(config-vlan-access-map)# exit
awplus(config)# vlan filter deny_all vlan-list 48 input
```

**Command  
changes**

Version 5.4.6-2.1: support for VLAN access-maps added

# match cos

**Overview** Use this command to define a COS to match against incoming packets.  
Use the **no** variant of this command to remove CoS.

**Syntax** `match cos <0-7>`  
`no match cos`

| Parameter | Description            |
|-----------|------------------------|
| <0-7>     | Specify the CoS value. |

**Mode** Class Map Configuration

**Examples** To set the class-map's CoS to 4, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match cos 4
```

To remove CoS from a class-map, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match cos
```

# match dscp

**Overview** Use this command to define the DSCP to match against incoming packets.  
Use the **no** variant of this command to remove a previously defined DSCP.

**Syntax** `match dscp <0-63>`  
`no match dscp`

| Parameter | Description                                           |
|-----------|-------------------------------------------------------|
| <0-63>    | Specify DSCP value (only one value can be specified). |

**Mode** Class Map Configuration

**Usage** Use the **match dscp** command to define the match criterion after creating a class-map.

**Examples** To configure a class-map named `cmap1` with criterion that matches DSCP 56, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match dscp 56
```

To remove a previously defined DSCP from a class-map named `cmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match dscp
```

**Related commands** [class-map](#)

# match eth-format protocol

**Overview** This command sets the Ethernet format and the protocol for a class-map to match on.

Select one Layer 2 format and one Layer 3 protocol when you issue this command.

Use the **no** variant of this command to remove the configured Ethernet format and protocol from a class-map.

**Syntax** `match eth-format <layer-two-format> protocol  
<layer-three-protocol>  
no match eth-format protocol`

The following eth-formats and protocols are available (note that not all options are available on all AlliedWare Plus switch models):

| Parameter               | Description                                                                                                              |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------|
| <layer-two-formats>     |                                                                                                                          |
| 802dot2-tagged          | 802.2 Tagged Packets (enter the parameter name).                                                                         |
| 802dot2-untagged        | 802.2 Untagged Packets (enter the parameter name).                                                                       |
| ethii-tagged            | EthII Tagged Packets (enter the parameter name).                                                                         |
| ethii-untagged          | EthII Untagged Packets (enter the parameter name).                                                                       |
| ethii-any               | EthII Tagged or Untagged Packets (enter the parameter name).                                                             |
| netwareraw-tagged       | Netware Raw Tagged Packets (enter the parameter name).                                                                   |
| netwareraw-untagged     | Netware Raw Untagged Packets (enter the parameter name).                                                                 |
| snap-tagged             | SNAP Tagged Packets (enter the parameter name).                                                                          |
| snap-untagged           | SNAP Untagged Packets (enter the parameter name).                                                                        |
| <layer-three-protocols> |                                                                                                                          |
| <word>                  | A Valid Protocol Number in hexadecimal.                                                                                  |
| any                     | Note that the parameter "any" is only valid when used with the netwarerawtagged and netwarerawuntagged protocol options. |
| sna-path-control        | Protocol Number 04 (enter the parameter name or its number).                                                             |
| proway-lan              | Protocol Number 0E (enter the parameter name or its number).                                                             |
| eia-rs Protocol         | Number 4E (enter the parameter name or its number).                                                                      |
| proway Protocol         | Number 8E (enter the parameter name or its number).                                                                      |

| Parameter         | Description                                                    |
|-------------------|----------------------------------------------------------------|
| ipx-802dot2       | Protocol Number E0 (enter the parameter name or its number).   |
| netbeui           | Protocol Number F0 (enter the parameter name or its number).   |
| iso-clns-is       | Protocol Number FE (enter the parameter name or its number).   |
| xdot75-internet   | Protocol Number 0801 (enter the parameter name or its number). |
| nbs-internet      | Protocol Number 0802 (enter the parameter name or its number). |

| ipx              | Protocol Number 8137 (enter the parameter name or its number). |
| ipv6             | Protocol Number 86DD (enter the parameter name or its number). |

### Mode Class Map Configuration

**Examples** To set the eth-format to ethii-tagged and the protocol to 0800 (IP) for class-map cmap1, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match eth-format ethii-tagged protocol
0800
awplus(config-cmap)# match eth-format ethii-tagged protocol ip
```

To remove the eth-format and the protocol from the class-map cmap1, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match eth-format protocol
```

# match inner-cos

**Overview** Sets the Inner CoS for a class-map to match on.  
Use the **no** variant of this command to remove CoS.

**Syntax** `match inner-cos <0-7>`  
`no match inner-cos`

| Parameter | Description                  |
|-----------|------------------------------|
| <0-7>     | Specify the Inner CoS value. |

**Mode** Class Map Configuration

**Examples** To set the class-map's inner-cos to 4, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match inner-cos 4
```

To remove CoS from the class-map, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match inner-cos
```

# match inner-vlan

**Overview** Use this command to define the inner VLAN ID as match criteria.  
Use the **no** variant of this command to disable the VLAN ID used as match criteria.

**Syntax** `match inner-vlan <1-4094>`  
`no match inner-vlan`

| Parameter                   | Description      |
|-----------------------------|------------------|
| <code>&lt;1-4094&gt;</code> | The VLAN number. |

**Mode** Class Map Configuration

**Usage notes** This command is used in double-tagged networks to match on a VLAN ID belonging to the client network. For more information on VLAN double-tagged networks, see the [VLAN\\_Feature Overview and Configuration Guide](#).

**Examples** To configure a class-map named `cmap1` to match traffic from inner VLAN 3, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match inner-vlan 3
```

To disable the configured VLAN ID as a match criteria for the class-map named `cmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match inner-vlan
```

# match ip-precedence

**Overview** Use this command to identify IP precedence values as match criteria.

Use the **no** variant of this command to remove IP precedence values from a class-map.

**Syntax** `match ip-precedence <0-7>`  
`no match ip-precedence`

| Parameter | Description                         |
|-----------|-------------------------------------|
| <0-7>     | The precedence value to be matched. |

**Mode** Class Map Configuration

**Example** To configure a class-map named `cmap1` to match all IPv4 packets with a precedence value of 5, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match ip-precedence 5
```

# match mac-type

**Overview** Use this command to set the MAC type for a class-map to match on.  
Use **no** variant of this command to remove the MAC type match entry.

**Syntax** `match mac-type {l2broadcast|l2multicast|l2unicast}`  
`no match mac-type`

| Parameter   | Description                |
|-------------|----------------------------|
| l2broadcast | Layer 2 Broadcast traffic. |
| l2multicast | Layer 2 Multicast traffic. |
| l2unicast   | Layer 2 Unicast traffic.   |

**Mode** Class Map Configuration

**Examples** To set the class-map's MAC type to Layer 2 multicast, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match mac-type l2multicast
```

To remove the class-map's MAC type entry, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match mac-type
```

# match tcp-flags

**Overview** Sets one or more TCP flags (control bits) for a class-map to match on.

Use the **no** variant of this command to remove one or more TCP flags for a class-map to match on.

**Syntax** `match tcp-flags [ack] [fin] [psh] [rst] [syn] [urg]`  
`no match tcp-flags [ack] [fin] [psh] [rst] [syn] [urg]`

| Parameter | Description  |
|-----------|--------------|
| ack       | Acknowledge. |
| fin       | Finish.      |
| psh       | Push.        |
| rst       | Reset.       |
| syn       | Synchronize. |
| urg       | Urgent.      |

**Mode** Class Map Configuration

**Examples** To set the class-map's TCP flags to **ack** and **syn**, use the commands:

```
awplus# configure terminal
awplus(config)# class-map
awplus(config-cmap)# match tcp-flags ack syn
```

To remove the TCP flags **ack** and **rst**, use the commands:

```
awplus# configure terminal
awplus(config)# class-map
awplus(config-cmap)# no match tcp-flags ack rst
```

# match vlan

- Overview** Use this command to define the VLAN ID as match criteria.
- Use the **no** variant of this command to disable the VLAN ID used as match criteria.

**Syntax** `match vlan <1-4094>`  
`no match vlan`

| Parameter                   | Description      |
|-----------------------------|------------------|
| <code>&lt;1-4094&gt;</code> | The VLAN number. |

**Mode** Class Map Configuration

**Examples** To configure a class-map named `cmap1` to include traffic from VLAN 3, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match vlan 3
```

To disable the configured VLAN ID as a match criteria for the class-map named `cmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match vlan
```

# mls qos cos

**Overview** This command assigns a CoS (Class of Service) user-priority value to untagged frames entering a specified interface. By default, all untagged frames are assigned a CoS value of 0.

Use the **no** variant of this command to return the interface to the default CoS setting for untagged frames entering the interface.

**Syntax** `mls qos cos <0-7>`  
`no mls qos cos`

| Parameter | Description                                |
|-----------|--------------------------------------------|
| <0-7>     | The Class of Service, user-priority value. |

**Default** By default, all untagged frames are assigned a CoS value of 0. Note that for tagged frames, the default behavior is not to alter the CoS value.

**Mode** Interface Configuration

**Example** To assign a CoS user priority value of 2 to all untagged packets entering port1.1.1 to port1.1.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1-port1.1.4
awplus(config-if)# mls qos cos 2
```

# mls qos enable

**Overview** Use this command to enable QoS.

Use the **no** variant of this command to globally disable QoS and remove all QoS configuration. The **no** variant of this command removes all class-maps, policy-maps, and policers that have been created. Running the **no mls qos** command will therefore remove all pre-existing QoS configurations on the switch.

**Mode** Global Configuration

**Syntax** mls qos enable  
no mls qos

**Example** To enable QoS on the switch, use the commands:

```
awplus# configure terminal
awplus(config)# mls qos enable
```

# mls qos map cos-queue

**Overview** Use this command to set the default CoS to egress queue mapping. This is the default queue mapping for packets that do not get assigned an egress queue via any other QoS functionality.

Use the **no** variant of this command to reset the cos-queue map back to its default setting. The default mappings for this command are:

|                |   |   |   |   |   |   |   |   |
|----------------|---|---|---|---|---|---|---|---|
| CoS Priority : | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
| -----          |   |   |   |   |   |   |   |   |
| CoS QUEUE:     | 2 | 0 | 1 | 3 | 4 | 5 | 6 | 7 |

**Syntax** mls qos map cos-queue <cos-priority> to <queue-number>  
no mls qos map cos-queue

| Parameter      | Description                                           |
|----------------|-------------------------------------------------------|
| <cos-priority> | CoS priority value. Can take a value between 0 and 7. |
| <queue-number> | Queue number. Can take a value between 0 and 7.       |

**Mode** Global Configuration

**Examples** To map CoS 2 to queue 0, use the command:

```
awplus# configure terminal
awplus(config)# mls qos map cos-queue 2 to 0
```

To set the cos-queue map back to its defaults, use the command:

```
awplus# configure terminal
awplus(config)# no mls qos map cos-queue
```

**Related commands** [show mls qos interface](#)

# mls qos map premark-dscp

**Overview** This command configures the premark-dscp map. It is used when traffic is classified by a class-map that has [trust dscp](#) configured. Based on a lookup DSCP, the map determines new QoS settings for the traffic.

The **no** variant of this command resets the premark-dscp map to its defaults. If no DSCP is specified then all DSCP entries will be reset to their defaults.

**Syntax** `mls qos map premark-dscp <0-63> to  
{[new-dscp <0-63>] [new-cos <0-7>]  
[new-bandwidth-class {green|yellow|red}]}`  
`no mls qos map premark-dscp [<0-63>]`

| Parameter           | Description                                                                                                           |
|---------------------|-----------------------------------------------------------------------------------------------------------------------|
| premark-dscp <0-63> | The DSCP value on ingress.                                                                                            |
| new-dscp <0-63>     | The DSCP value that the packet will have on egress.<br>If unspecified, this value will remain the DSCP ingress value. |
| new-cos <0-7>       | The CoS value that the packet will have on egress.<br>If unspecified, this value will retain its value on ingress.    |
| new-bandwidth-class | Modify Egress Bandwidth-class.<br>If unspecified, this value will be set to green.                                    |
| green               | Egress Bandwidth-class green (marked down Bandwidth-class).                                                           |
| yellow              | Egress Bandwidth-class yellow (marked down Bandwidth-class).                                                          |
| red                 | Egress Bandwidth-class red (marked down Bandwidth-class).                                                             |

**Mode** Global Configuration

**Usage notes** With the [trust dscp](#) command set, this command (**mls qos map premark-dscp**) enables you to remap the DSCP, CoS, output queue, or bandwidth class values.

However, note that you cannot simultaneously change the DSCP and CoS, because they use the same byte in the IP header.

**Example** To set the entry for DSCP 1 to use a new DSCP of 2, use the command:

```
awplus# configure terminal
awplus(config)# mls qos map premark-dscp 1 to new-dscp 2
```

**Example** To set the entry for DSCP 1 to use a new CoS of 3, and a new bandwidth class of yellow, use the command:

```
awplus# configure terminal
awplus(config)# mls qos map premark-dscp 1 to new-cos 3
new-bandwidth-class yellow
```

**Example** To reset the entry for DSCP 1 use the command:

```
awplus# configure terminal
awplus(config)# no mls qos map premark-dscp 1
```

**Related commands** [show mls qos maps premark-dscp](#)  
[trust dscp](#)

# mls qos queue name

**Overview** Use this command to give a name and optional description to a specific egress queue.

Use the **no** variant of this command to remove the name and description from an egress queue.

**Syntax** `mls qos queue <0-7> name <name> [description <description>]`  
`no mls qos queue <0-7> name`

| Parameter     | Description                                                                                                                                    |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <0-7>         | The number of the egress queue to name.                                                                                                        |
| <name>        | The name you want to give the egress queue. The name can contain any printable ASCII character (ASCII 33-126), except for spaces.              |
| <description> | The description you want to give the egress queue. The description can contain any printable ASCII character (ASCII 32-126), including spaces. |

**Default** Queues have no name or description

**Mode** Global Configuration

**Example** To give queue 6 the name 'Video' and the description 'Real-time interactive, broadcast video', use the commands:

```
awplus# configure terminal
awplus(config)# mls qos queue 6 name Video description Real-time
interactive, broadcast video
```

To remove the name and description from queue 6, use the commands:

```
awplus# configure terminal
awplus(config)# no mls qos queue 6 name
```

**Command changes** Version 5.5.2-2.1: command added

# no police

**Overview** Use this command to disable any policer previously configured on the class-map.

**Syntax** no police

**Mode** Policy Map Class Configuration

**Usage notes** This command disables any policer previously configured on the class-map.

**Example** To disable policing on a class-map, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map name
awplus(config-pmap)# class classname
awplus(config-pmap-c)# no police
```

**Related commands** [police single-rate action](#)  
[police twin-rate action](#)

# police single-rate action

**Overview** Configures a single-rate policer for a class-map.

**Syntax** `police single-rate <cir> <cbs> <ebs> action  
{drop-red|remark-transmit}`

| Parameter       | Description                                                                                                                            |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <cir>           | Specify the Committed Information Rate (CIR) (1-100000000 kbps).                                                                       |
| <cbs>           | Specify the Committed Burst Size (CBS) (0-16777216 bytes).                                                                             |
| <ebs>           | Specify a Excess Burst Size (EBS) (0-16777216 bytes).                                                                                  |
| action          | Specify the action if the rate is exceeded.                                                                                            |
| drop-red        | Drop the red packets.                                                                                                                  |
| remark-transmit | Modify the packets using the remark map, then transmit. You can configure the remark map using the <a href="#">remark-map</a> command. |

**Mode** Policy Map Class Configuration

**Usage notes** You can use a policer to meter the traffic classified by the class-map and assign it to one of three bandwidth classes.

The bandwidth classes are green (conforming), yellow (partially-conforming), and red (non-conforming). A single-rate policer is based on three values. These are the average rate, minimum burst and maximum burst.

| Color  | Definition                                                           |
|--------|----------------------------------------------------------------------|
| green  | The traffic rate is less than the average rate and minimum burst.    |
| yellow | The traffic rate is between the minimum burst and the maximum burst. |
| red    | The traffic rate exceeds the average rate and the maximum burst.     |

Using an action of drop-red means that any packets classed as red are discarded.

**NOTE:** This command will not take effect when applied to a class-map that attaches to a channel group whose ports span processor instances.

Note that the [remark-map](#) does not only apply to red traffic. If a remark-map is configured on the same class-map as the policer, then the remark-map will apply to green- colored and yellow-colored traffic irrespective of the value configured on the **action** parameter of the policer. So, even if **action** is configured to **drop-red**, the remark-map will be applied to green and yellow traffic. So, the **action** parameter only applies to red- colored traffic. If **action** is set to **drop-red**, then red

traffic is dropped; if **action** is set to **remark-transmit**, then the red traffic has the action of the remark map applied to it, and is then transmitted.

**Example** To configure a single rate meter measuring traffic of 100 Mbps that drops a sustained burst of traffic over this rate, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map name
awplus(config-pmap)# class classname
awplus(config-pmap-c)# police single-rate 100000 1875000
1875000 action drop-red
```

**Related commands**

- [no police](#)
- [police twin-rate action](#)
- [remark-map](#)

# police twin-rate action

**Overview** Configures a twin-rate policer for a class-map.

**Syntax** `police twin-rate <cir> <pir> <cbs> <pbs> action  
{drop-red|remark-transmit}`

| Parameter       | Description                                                                                                                            |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <cir>           | Specify the Committed Information Rate (CIR) (1-100000000 kbps).                                                                       |
| <pir>           | Specify the Peak Information Rate (PIR) (1-100000000 kbps).                                                                            |
| <cbs>           | Specify the Committed Burst Size (CBS) (0-16777216 bytes).                                                                             |
| <pbs>           | Specify the Peak Burst Size (PBS) (0-16777216 bytes).                                                                                  |
| action          | Specify the action if rate is exceeded.                                                                                                |
| drop-red        | Drop the red packets.                                                                                                                  |
| remark-transmit | Modify the packets using the remark map, then transmit. You can configure the remark map using the <a href="#">remark-map</a> command. |

**Mode** Policy Map Class Configuration

**Usage notes** A policer can be used to meter the traffic classified by the class-map and as a result will be given one of three bandwidth classes. These are green (conforming), yellow (partially-conforming), and red (non-conforming).

A twin-rate policer is based on four values. These are the minimum rate (CIR), minimum burst size (CBS), maximum rate (PIR), and maximum burst size (PBS). The following table shows how these values define the bandwidth classes.

| Bandwidth Class | Definition                                                                                                                                                             |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| green           | The sum of the number of existing (buffered) bytes plus those arriving at the port per unit time results in a value that is less than that set for the CBS.            |
| yellow          | The sum of the number of existing (buffered) bytes plus those arriving at the port per unit time results in a value that is between those set for the CBS and the PBS. |
| red             | The sum of the number of existing (buffered) bytes plus those arriving at the port per unit time results in a value that exceeds that set for the PBS.                 |

Using an action of drop-red means that any packets classed as red will be discarded.

Using an action of remark-transmit means that the packet will be remarked with the values configured in the policed-dscp map. The index into this map is determined by the DSCP in the packet.

Note that the [remark-map](#) does not only apply to red traffic. If a remark-map is configured on the same class-map as the policer, then the remark-map will apply to green-colored and yellow-colored traffic irrespective of the value configured on the **action** parameter of the policer. So, even if **action** is configured to **drop-red**, the remark-map will be applied to green and yellow traffic. So, the **action** parameter only applies to red-colored traffic. If **action** is set to **drop-red**, then red traffic is dropped; if **action** is set to **remark-transmit**, then the red traffic has the action of the remark map applied to it, and is then transmitted.

**Example** To configure a twin rate meter measuring a minimum rate of 10 Mbps and a maximum rate of 20 Mbps, and drop red packets, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map name
awplus(config-pmap)# class classname
awplus(config-pmap-c)# police twin-rate 10000 20000 1875000
3750000 action drop-red
```

To configure a twin rate meter measuring a minimum rate of 10 Mbps and a maximum rate of 20 Mbps that uses the remark map to remark any non-conforming traffic, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map name
awplus(config-pmap)# class classname
awplus(config-pmap-c)# police twin-rate 10000 20000 1875000
3750000 action remark-transmit
```

**Related commands** [no police](#)  
[police single-rate action](#)

# policy-map

**Overview** Use this command to create a policy-map and to enter Policy Map Configuration mode to configure the specified policy-map.

Use the **no** variant of this command to delete an existing policy-map.

**Syntax** `policy-map <name>`  
`no policy-map <name>`

| Parameter | Description             |
|-----------|-------------------------|
| <name>    | Name of the policy-map. |

**Mode** Global Configuration

**Example** To create a policy-map called pmap1, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)#
```

**Related commands** [class-map](#)

# priority-queue

**Overview** This command configures strict priority-based scheduling on the specified egress queues. You must specify at least one queue.

**Syntax** `priority-queue [0] [1] [2] [3] [4] [5] [6] [7]`

| Parameter                      | Description                                                                                                                                                                                                            |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>[0] [1] . . . [7]</code> | Specify the queues that will use strict priority scheduling. With strict priority scheduling, the switch will completely empty the highest numbered queue first, then start processing the next lowest numbered queue. |

**Mode** Interface Configuration.

**Usage notes** By default, the queues on all ports are set for priority queuing. You can change the queue emptying sequence to weighted round robin, by using the [wrr-queue weight queues](#) command. You can then use the [priority-queue](#) command to reset the selected queues to priority queuing.

Note that the emptying sequence for priority queuing is always highest queue number to lowest queue number.

**Example** To apply priority-based scheduling to egress queues 1 and 2, use the commands:

```
awplus#configure terminal
awplus(config)#interface port1.1.1
awplus(config-if)#priority-queue 1 2
```

**Related commands** [show mls qos interface](#)  
[show mls qos interface queue-counters](#)  
[wrr-queue weight queues](#)

# remark-map

**Overview** Use this command to configure the remark map. If a re-mark map is applied to a class, and a policer is also applied to the same class, then:

- green and yellow traffic will all be acted upon by the remark-map, and
- red traffic will be either dropped or acted upon by the remark-map, depending on whether the policer **action** is set to **drop-red** or **remark-transmit**.

The **no** variant of this command resets the remark map to its defaults. Specifying the bandwidth class is optional. If no bandwidth class is specified, then all bandwidth classes are reset to their defaults.

**Syntax** `remark-map [bandwidth-class {green|yellow|red}] to {[new-dscp <0-63>] [new-bandwidth-class {green|yellow|red}]}`

`no remark-map [bandwidth-class {green|yellow|red}] to {[new-dscp <0-63>] [new-bandwidth-class {green|yellow|red}]}`

| Parameter           | Description                                       |
|---------------------|---------------------------------------------------|
| bandwidth-class     | Specify the bandwidth class of packets to remark. |
| green               | Remark green packets.                             |
| yellow              | Remark yellow packets.                            |
| red                 | Remark red packets.                               |
| new-dscp            | Specify the new DSCP value.                       |
| <0-63>              | The DSCP value.                                   |
| new-bandwidth-class | Specify the new bandwidth class.                  |
| green               | Remark the packet green.                          |
| yellow              | Remark the packet yellow.                         |
| red                 | Remark the packet red.                            |

**Mode** Policy Map Class Configuration

**Examples** To remark the policed green traffic to a new DSCP of 2 and a new bandwidth class of yellow, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# remark-map bandwidth-class green to
new-dscp 2 new-bandwidth-class yellow
```

To remark the policed green traffic to a new DSCP of 2, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# remark-map bandwidth-class green to
new-dscp 2
```

To reset the DSCP for all bandwidth classes, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# no remark-map to new-dscp
```

**Related commands**   [police single-rate action](#)  
[police twin-rate action](#)

# remark new-cos

- Overview** This command enables you to configure and remark either or both of:
- the CoS flag in the data packet
  - the input into the CoS to queue map, thus changing the destination egress queue.

**Syntax** `remark new-cos <0-7> [internal|external|both]`  
`no remark new-cos [internal|external|both]`

| Parameter | Description                                                                                          |
|-----------|------------------------------------------------------------------------------------------------------|
| <0-7>     | The new value for the CoS flag and/or the input into the CoS to queue map.                           |
| external  | Remarks the CoS flag in the packet.                                                                  |
| internal  | Remarks the new-CoS input into the CoS to queue map.                                                 |
| both      | Remarks (with the same value) both the CoS flag in the packet and the input to the CoS to queue map. |

**Mode** Policy Map Class Configuration

**Usage notes** The default CoS to Queue mappings are shown in the following table:

|                 |   |   |   |   |   |   |   |   |
|-----------------|---|---|---|---|---|---|---|---|
| CoS Value       | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
| Egress Queue No | 2 | 0 | 1 | 3 | 4 | 5 | 6 | 7 |

The relationship between this command and the CoS to queue map is shown in the following figure.

Figure 46-1: Remarking and the CoS to Q map

Table 46-1: CoS to egress queue remarking function

| Input                                                                            | Command                         | Output                                         |
|----------------------------------------------------------------------------------|---------------------------------|------------------------------------------------|
| CoS field = 1                                                                    | Remark new-cos (not configured) | CoS value = 1<br>Packet sent to egress queue 0 |
| CoS field = 1                                                                    | Remark new-cos 2 external       | CoS value = 2<br>Packet sent to egress queue 0 |
| CoS set to 1                                                                     | Remark new-cos 2 internal       | CoS value = 1<br>Packet sent to egress queue 1 |
| CoS set to 1                                                                     | Remark new-cos 2 both           | CoS value = 2<br>Packet sent to egress queue 1 |
| Note: This table assumes that the CoS to Queue map is set to its default values. |                                 |                                                |

**Example** For policy-map “pmap3” and class-map “cmap1”, set the CoS value to 2 and also set the input to the CoS to queue map so that the traffic is assigned to egress queue 1:

```
awplus# configure terminal
awplus(config)# policy-map pmap3
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# remark new-cos 2 both
```

**Related commands** [mls qos map cos-queue](#)  
[show mls qos maps cos-queue](#)

# service-policy input

**Overview** Use this command to apply a policy-map to the input of an interface.

Use the **no** variant of this command to remove a policy-map and interface association.

**Syntax** `service-policy input <policy-map>`  
`no service-policy input <policy-map>`

| Parameter                       | Description                                        |
|---------------------------------|----------------------------------------------------|
| <code>&lt;policy-map&gt;</code> | Policy map name that will be applied to the input. |

**Mode** Interface Configuration

**Usage notes** This command can be applied to switch ports or static channel groups, but not to dynamic (LACP) channel groups.

**Example** To apply a policy-map named `pmap1` to interface `port1.1.2`, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
wplus(config-if)# service-policy input pmap1
```

# set ip next-hop (PBR)

**Overview** Use this command to configure policy-based routing. When this command is set, all packets that match a selected class-map will be forwarded to the specified next hop.

The **no** variant of this command removes the next-hop address (in the context of its policy-map and class-map) from the configuration.

**Syntax** `set ip next-hop <ip-addr>`  
`no set ip next-hop`

| Parameter | Description                                 |
|-----------|---------------------------------------------|
| <ip-addr> | The IP address of the next hop destination. |

**Mode** Policy Map Class Configuration

**Usage notes** **Combining conventional and policy-based routing**

In typical deployments of policy-based routing, some traffic types require conventional routing (i.e. via the routes in the IP routing table) while other traffic types require policy-based routing.

Where the traffic to be policy-routed is a subset of the traffic that is to be conventionally routed, then the configuration is reasonably simple. To configure this, make a policy-map that contains one or more class-maps that match the traffic to be policy routed. Then configure their next-hop with this command (**set ip next-hop**). The remaining traffic will be conventionally routed according to the rules set for the default class-map, providing that this is not subject to the **set ip next-hop**.

The situation becomes more complex if the traffic requiring conventional routing is a subset of the traffic to be policy-routed. To configure this, make a policy-map that contains one, or more, class-maps that match the requirement for conventional routing. Do not configure these class-maps with a **set ip next-hop** command. Then identify the remaining class-maps that require policy-based routing and apply the **set ip next-hop** command to them. Note that this remaining traffic could be just the default class-map, if all other traffic types were to be policy-routed.

Also note that the order in which the class-maps are configured in the policy-map is important, because traffic is matched against the class-maps in the order that they were assigned to the policy-map.

For more information about PBR, see the [Policy-Based Routing Feature Overview and Configuration Guide](#).

**Example** To forward packets to 192.168.1.1 if they match the class-map called cmap1, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# set ip next-hop 192.168.1.1
```

**Related commands** [class-map](#)

# show class-map

**Overview** Use this command to display the QoS class-maps' criteria for classifying traffic.

**Syntax** `show class-map [<class-map-name>]`

| Parameter        | Description            |
|------------------|------------------------|
| <class-map-name> | Name of the class-map. |

**Mode** User Exec and Privileged Exec

**Example** To display a QoS class-map's match criteria for classifying traffic, use the command:

```
awplus# show class-map cmap1
```

**Output** Figure 46-2: Example output from the **show class-map** command

```
awplus#show class-map

CLASS-MAP-NAME: myClass
Match Mac Type: 2 12mcast

CLASS-MAP-NAME: default
```

**Related commands** [class-map](#)

# show mls qos

**Overview** Use this command to display whether QoS is enabled or disabled on the switch.

**Syntax** `show mls qos`

**Mode** User Exec and Privileged Exec

**Example** To display whether QoS is enabled or disabled, use the command:

```
awplus# show mls qos
```

**Output** Figure 46-3: Example output from the **show mls qos** command

```
awplus#show mls qos
Enable
```

**Related commands** [mls qos enable](#)

# show mls qos interface

**Overview** Displays the current settings for the interface. This includes its default CoS and queue, scheduling used for each queue, and any policies/maps that are attached.

**Syntax** `show mls qos interface [<port>]`

| Parameter | Description  |
|-----------|--------------|
| <port>    | Switch port. |

**Mode** User Exec and Privileged Exec

**Example** To display current CoS and queue settings for interface port1.1.1, use the command:

```
awplus# show mls qos interface port1.1.1
```

**Output** Figure 46-4: Example output from the **show mls qos interface** command for port1.1.1

Table 46-2: Parameters in the output of the show mls qos interface command

| Parameter               | Description                                                                            |
|-------------------------|----------------------------------------------------------------------------------------|
| Number of egress queues | The total number of egress queues available on this interface.                         |
| Egress Queue            | Number of this egress queue.                                                           |
| Status                  | Queue can either be enabled or disabled.                                               |
| Scheduler               | The scheduling mode being used for servicing the transmission of packets on this port. |

Table 46-2: Parameters in the output of the show mls qos interface command

| Parameter                       | Description                                                                                                                                                                                                            |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Queue Limit                     | The percentage of the port's buffers that have been allocated to this queue.                                                                                                                                           |
| Egress Rate Limit               | The amount of traffic that can be transmitted via this queue per second. 0 Kb means there is currently no rate-limiting enabled.                                                                                       |
| Egress Traffic Shaping Overhead | The number of bytes specified to allow for the size of packet preamble and inter-packet gap (the "overhead") in egress queue rate limiting. Use the <a href="#">egress-rate-limit overhead</a> command to change this. |

**Command  
changes**

Version 5.5.1-0.1: DSCP queue mapping removed from output

# show mls qos interface policer-counters

**Overview** This command displays an interface's policer counters. This can either be for a specific class-map or for all class-maps attached to the interface. If no class-map is specified then all class-map policer counters attached to the interface are displayed.

**Syntax** `show mls qos interface <port> policer-counters [class-map <class-map>]`

| Parameter   | Description         |
|-------------|---------------------|
| <port>      | Switch port.        |
| class-map   | Select a class-map. |
| <class-map> | Class-map name.     |

**Mode** User Exec and Privileged Exec

**Usage** Note that:

- The hardware does not record distinct counters for the number of Green or Yellow bytes, so the field marked Green/Yellow is the summation of bytes that have been marked Green or Yellow by the meter.
- The counters are based on metering performed on the specified class-map. Therefore, the 'Dropped Bytes' counter is the number of bytes dropped due to metering. This is different from packets dropped via a 'deny' action in the ACL. If a policer is configured to perform re-marking, bytes can be marked Red but are not dropped, and is shown with a value of 0 for the Dropped field and a non-0 value for the 'Red Bytes' field.

**Example** To show the counters for all class-maps attached to port1.1.1, use the command:

```
awplus# show mls qos interface port1.1.1 policer-counters
```

**Output** Figure 46-5: Example output from **show mls qos interface policer-counters** on a port

```
awplus#show mls qos interface port1.1.1 policer-counters
Interface: port1.1.1
 Class-map: default
 Green/Yellow Bytes: 0
 Red Bytes: 0
 Dropped Bytes: 0
 Non-dropped Bytes: 0
 Class-map: cmap1
 Green/Yellow Bytes: 1290
 Red Bytes: 0
 Dropped Bytes: 0
 Non-dropped Bytes: 1290
```

# show mls qos interface queue-counters

**Overview** This command displays an interface's egress queue counters. This can either be for a specific queue or for all queues on the interface. If no queue is specified all queue counters on the interface will be displayed.

The counters show the number of frames currently in the queue and the maximum number of frames allowed in the queue, for individual egress queues and the port's queue (which will be a sum of all egress queues).

**Syntax** `show mls qos interface <port> queue-counters [queue <0-7>]`

| Parameter   | Description                                      |
|-------------|--------------------------------------------------|
| <port>      | The switch port to display counters for.         |
| queue <0-7> | The number of the queue to display counters for. |

**Mode** User Exec and Privileged Exec

**Example** To show the counters for all queues on port1.1.1, use the command:

```
awplus# show mls qos interface port1.1.1 queue-counters
```

**Output** Figure 46-6: Example output from **show mls qos interface queue-counters**

|                                      |               |              |          |         |
|--------------------------------------|---------------|--------------|----------|---------|
| Interface port1.1.1 Queue Counters:  |               |              |          |         |
| Port queue length                    |               | 1169         |          |         |
| Egress Queue length:                 |               |              |          |         |
| Queue 0                              | 0             |              |          |         |
| Queue 1                              | 0             |              |          |         |
| Queue 2                              | 1169          |              |          |         |
| Queue 3                              | 0             |              |          |         |
| Queue 4                              | 0             |              |          |         |
| Queue 5                              | 0             |              |          |         |
| Queue 6                              | 0             |              |          |         |
| Queue 7                              | 0             |              |          |         |
| Egress queue drop/transmit counters: |               |              |          |         |
|                                      | Dropped Bytes | Dropped Pkts | Tx Bytes | Tx Pkts |
| Queue 0                              | 0             | 0            | 0        | 0       |
| Queue 1                              | 0             | 0            | 0        | 0       |
| Queue 2                              | 0             | 0            | 0        | 0       |
| Queue 3                              | 0             | 0            | 0        | 0       |
| Queue 4                              | 0             | 0            | 576      | 9       |
| Queue 5                              | 0             | 0            | 0        | 0       |
| Queue 6                              | 0             | 0            | 10489664 | 63901   |
| Queue 7                              | 0             | 0            | 0        | 0       |

Table 46-3: Parameters in the output from **show mls qos interface queue-counters**

| Parameter                           | Description                                                                                  |
|-------------------------------------|----------------------------------------------------------------------------------------------|
| Interface                           | Port we are showing the counters for.                                                        |
| Port queue length                   | Number of frames in the port's queue. This will be the sum of all egress queues on the port. |
| Egress Queue length                 | Number of frames in a specific egress queue.                                                 |
| Egress queue drop/transmit counters | The number of bytes and packets dropped and transmitted on each egress queue.                |

**Related commands** [clear mls qos interface queue-counters](#)

# show mls qos interface storm-status

**Overview** Show the current configuration and status of the QoS Storm Protection (QSP) on the given port.

**Syntax** `show mls qos interface <port> storm-status`

| Parameter | Description  |
|-----------|--------------|
| <port>    | Switch port. |

**Mode** User Exec and Privileged Exec

**Example** To see the QSP status on port1.1.1, use the command:

```
awplus# show mls qos interface port1.1.1 storm-status
```

**Output** Figure 46-7: Example output from **show mls qos interface storm-status**

|                      |             |
|----------------------|-------------|
| Interface:           | port1.1.1   |
| Storm-Protection:    | Enabled     |

# show mls qos maps cos-queue

**Overview** Show the current configuration of the cos-queue map.

**Syntax** `show mls qos maps cos-queue`

**Mode** User Exec and Privileged Exec

**Example** To display the current configuration of the cos-queue map, use the command:

```
awplus# show mls qos maps cos-queue
```

**Output** Figure 46-8: Example output from **show mls qos maps cos-queue**

|                   |   |   |   |   |   |   |   |   |
|-------------------|---|---|---|---|---|---|---|---|
| COS-TO-QUEUE-MAP: |   |   |   |   |   |   |   |   |
| COS :             | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
| -----             |   |   |   |   |   |   |   |   |
| QUEUE:            | 2 | 0 | 1 | 3 | 4 | 5 | 6 | 7 |

**Related commands** [mls qos map cos-queue](#)

# show mls qos maps premark-dscp

**Overview** This command displays the premark-dscp map. This map is used to replace the DSCP, CoS and/or bandwidth class of a packet matching the class-map, based on a lookup DSCP value.

**Syntax** `show mls qos maps premark-dscp [<0-63>]`

| Parameter | Description       |
|-----------|-------------------|
| <0-63>    | DSCP table entry. |

**Mode** User Exec and Privileged Exec

**Example** To display the premark-dscp map for DSCP 1, use the command:

```
awplus# show mls qos maps premark-dscp 1
```

**Output** Figure 46-9: Example output from the **show mls qos maps premark-dscp** command

```
PREMARK-DSCP-MAP:

DSCP 1
Bandwidth Class

New DSCP 2
New CoS 0
New Bandwidth Class green
```

**Related commands** [mls qos map premark-dscp](#)  
[trust dscp](#)

# show platform classifier statistics utilization brief

**Overview** This command displays the number of used entries available for various platform functions, and the percentage that number of entries represents of the total available.

**Syntax** `show platform classifier statistics utilization brief`

**Mode** Privileged Exec

**Example** To display the platform classifier utilization statistics, use the following command:  
`awplus# show platform classifier statistics utilization brief`

**Output** Figure 46-10: Output from **show platform classifier statistics utilization brief**

```
awplus#show platform classifier statistics utilization brief

[Instance 4]
Capacity: 8183
Number of Entries:
Policy Type Group ID Used / Allocated

ACL 1476395010 0 / 2039 (0%)
 Interface 0
 VACL 0
DoS Inactive 0 / 0 (0%)
VLAN Counter
 Group-Octet Inactive 0 / 0 (0%)
 Group-Packet Inactive 0 / 0 (0%)

Qos Inactive 0 / 0 (0%)

Rule Limit Reached (clear on read): 0
Total Rule Limit Reached from startup: 0

Space will be allocated to ACL and QOS as required.
```

**Output parameters** Depending on your switch, you will see some of the following parameters in the output from **show platform classifier statistics utilization brief**

| Parameter      | Description                                                                                                                                                                                                                                                                                                                   |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IPv6 Multicast | Reserved hardware space for use by IPv6 multicast, when the <a href="#">ipv6 multicast-routing</a> command is used.                                                                                                                                                                                                           |
| System         | Fixed system entries. For example, resiliency links make use of system ACLs.                                                                                                                                                                                                                                                  |
| MLD Snooping   | Entries to send various packets that MLD Snooping is interested in to the CPU.                                                                                                                                                                                                                                                |
| DHCP Snooping  | Entries used to send DHCP and ARP packets to the CPU. User-added DHCP Snooping filters under ACLs are counted under the ACL or QoS categories.                                                                                                                                                                                |
| Loop Detection | Entries uses to send the special loop detection frame to the CPU.                                                                                                                                                                                                                                                             |
| EPSR           | Entries used to send EPSR control traffic to the CPU.                                                                                                                                                                                                                                                                         |
| CFM            | Entries used by Connectivity Fault Management.                                                                                                                                                                                                                                                                                |
| G8032          | Entries used to send G.8032 control traffic to the CPU.                                                                                                                                                                                                                                                                       |
| Global ACLs    | Entries for ACLs appear here if the ACLs are applied globally instead of per switchport.                                                                                                                                                                                                                                      |
| ACL            | Entries for ACL filters that have been applied directly to ports using the <a href="#">access-group</a> command.                                                                                                                                                                                                              |
| VACL           | Entries for VLAN-based ACLs (ACLs that are applied to VLANs instead of ports).                                                                                                                                                                                                                                                |
| DOS            | Entries used for Denial of Service protection.                                                                                                                                                                                                                                                                                |
| UFO            | Entries used by Upward Forwarding Only (UFO).                                                                                                                                                                                                                                                                                 |
| QoS            | Entries for ACL filters and other class-map configurations, such as policers, applied through policy maps using the <b>service input</b> command.                                                                                                                                                                             |
| RA Guard       | Entries used to block IPv6 router advertisements, configured with the <b>ipv6 nd raguard</b> command.                                                                                                                                                                                                                         |
| AMFAPPS        | Entries used by AMF Application Proxy. These entries enable the SES Controller to block infected ports.                                                                                                                                                                                                                       |
| Pre-Ingress    | Entries used for VLAN ID Translation (and also for subnet-based and MAC-based VLAN entries on SBx81XLEM cards).                                                                                                                                                                                                               |
| Egress         | Entries used for VLAN ID Translation.                                                                                                                                                                                                                                                                                         |
| UDB            | User Defined Bytes (UDB), which are a limited resource of bytes that can be used to implement additional arbitrary matching on packet bytes on some switches. The software manages the use and allocation of these bytes automatically. The output of this table is intended for use by Allied Telesis Customer Support only. |

**Related commands** [show platform](#)  
[ipv6 access-list \(named IPv6 hardware ACL\)](#)

# show policy-map

**Overview** Displays the policy-maps configured on the switch. The output also shows whether or not they are connected to a port (attached / detached) and shows their associated class-maps.

**Syntax** `show policy-map [<name>]`

| Parameter | Description                        |
|-----------|------------------------------------|
| <name>    | The name of a specific policy-map. |

**Mode** User Exec and Privileged Exec

**Example** To display a listing of the policy-maps configured on the switch, use the command:

```
awplus# show policy-map
```

**Output** Figure 46-11: Example output from the **show policy-map** command

```
POLICY-MAP-NAME: example
 Interfaces:
 Default class-map action: permit

 CLASS-MAP-NAME: default
 Policer counters enabled
```

**Related commands** [no police](#)  
[service-policy input](#)

# storm-action

**Overview** Sets the action to be taken when triggered by QoS Storm Protection (QSP). There are three available options:

- **portdisable** will disable the port in software.
- **vlandisable** will disable the port from the VLAN matched by the class-map in class-map. This option requires the match vlan class-map to be present in the class-map
- **linkdown** will physically bring the port down. .

The **no** variant of this command will negate the action set by the **storm-action** command.

**Syntax** storm-action {portdisable|vlandisable|linkdown}  
no storm-action

| Parameter   | Description                   |
|-------------|-------------------------------|
| portdisable | Disable the port in software. |
| vlandisable | Disable the VLAN.             |
| linkdown    | Shutdown the port physically. |

**Mode** Policy Map Class Configuration

**Examples** To apply the storm protection of **vlandisable** to the policy-map named "pmap2" and the class-map named "cmap1", use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap1
awplus(config-pmap-c# storm-action vlandisable
```

To negate the storm protection set on the policy-map named "pmap2" and the class-map named "cmap1", use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap1
awplus(config-pmap-c# no storm-action
```

**Related commands** [storm-downtime](#)  
[storm-protection](#)  
[storm-rate](#)  
[storm-window](#)

# storm-downtime

**Overview** Sets the time to re-enable a port that has been disabled by QoS Storm Protection (QSP). The time is given in seconds, from a minimum of one second to maximum of 86400 seconds (i.e. one day).

The **no** variant of this command resets the time to the default value of 10 seconds.

**Syntax** `storm-downtime <1-86400>`  
`no storm-downtime`

| Parameter | Description |
|-----------|-------------|
| <1-86400> | Seconds.    |

**Default** 10 seconds

**Mode** Policy Map Class Configuration

**Examples** To re-enable the port in 1 minute, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# storm-downtime 60
```

To re-set the port to the default (10 seconds), use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# no storm-downtime
```

**Related commands** [storm-action](#)  
[storm-protection](#)  
[storm-rate](#)  
[storm-window](#)

# storm-protection

**Overview** Use this command to enable policy-based Storm Protection (such as QSP - QoS Storm Protection). Storm protection is activated as soon as a port is enabled. However, it will only be functional after [storm-rate](#) and [storm-window](#) have been set.

The **no** variant of this command disables policy-based Storm Protection.

**Syntax** `storm-protection`  
`no storm-protection`

**Default** By default, storm protection is disabled.

**Mode** Policy Map Class Configuration

**Examples** To enable QSP on cmap2 in pmap2, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# storm-protection
```

To disable QSP on cmap2 in pmap2, use the following commands:

```
awplus# policy-map pmap2
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# no storm-protection
```

**Related commands** [show mls qos interface storm-status](#)  
[storm-action](#)  
[storm-downtime](#)  
[storm-rate](#)  
[storm-window](#)

# storm-rate

**Overview** Sets the data rate that triggers the storm-action. The rate is in kbps and the range is from 1kbps to 40Gbps.

Note that this setting is made in conjunction with the [storm-window](#) command.

Use the **no** variant of this command to negate the **storm-rate** command.

**Syntax** `storm-rate <1-40000000>`  
`no storm-rate`

| Parameter                       | Description                  |
|---------------------------------|------------------------------|
| <code>&lt;1-40000000&gt;</code> | The range of the storm-rate. |

**Default** No default

**Mode** Policy Map Class Configuration

**Usage** This setting is made in conjunction with the [storm-window](#) command.

**Examples** To limit the data rate to 100Mbps, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# storm-rate 100000
```

To negate the limit set previously, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# no storm-rate
```

**Related commands** [storm-action](#)  
[storm-downtime](#)  
[storm-protection](#)  
[storm-window](#)

# storm-window

**Overview** Sets the window size of QoS Storm Protection (QSP). This sets the time to poll the data-rate every given milliseconds. Minimum window size is 100 ms and the maximum size is 60 sec.

Use the **no** variant of this command to negate the **storm-window** command.

**Syntax** `storm-window <100-60000>`  
`no storm-window`

| Parameter                      | Description                                |
|--------------------------------|--------------------------------------------|
| <code>&lt;100-60000&gt;</code> | The window size, measured in milliseconds. |

**Default** No default

**Mode** Policy Map Class Configuration

**Usage** This command should be set in conjunction with the [storm-rate](#) command.

**Examples** To set the QSP window size to 5000 ms, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# storm-window 5000
```

To negate the QSP window size set previously, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# no storm-window
```

**Related commands** [storm-action](#)  
[storm-downtime](#)  
[storm-protection](#)  
[storm-rate](#)

# strict-priority-queue egress-rate-limit queues

**Overview** Sets a limit on the amount of traffic that can be transmitted per second from these queues. The default unit is in Kb, but Mb or Gb can also be specified. The minimum is 651 Kb.

This limit applies to WRR queues too. Setting the limit with this command is the same as setting it with [wrr-queue egress-rate-limit queues](#).

**Syntax** `strict-priority-queue egress-rate-limit <bandwidth> queues  
[0] [1] [2] [3] [4] [5] [6] [7]`  
`no strict-priority-queue egress-rate-limit <bandwidth> queues  
[0] [1] [2] [3] [4] [5] [6] [7]`

| Parameter         | Description                                            |
|-------------------|--------------------------------------------------------|
| <bandwidth>       | Bandwidth <1-100000000 kbits> (usable units: k, m, g). |
| [0] [2] . . . [7] | Selects one or more queues numbered 0 to 7.            |

**Mode** Interface Configuration

**Example** To limit the egress rate of queues 0, 1 and 2 on port1.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# strict-priority-queue egress-rate-limit
500M queues 0 1 2
```

**Related commands** [show mls qos interface](#)  
[wrr-queue egress-rate-limit queues](#)

# trust dscp

**Overview** This command enables the premark-dscp map to replace the DSCP, bandwidth-class and/or CoS of classified traffic based on a lookup DSCP value.

With the **no** variant of this command, no premark-dscp mapping function will be applied for the selected class-map. QoS components of the packet existing either at ingress, or applied by the class-map, will pass unchanged.

**Syntax** `trust dscp`  
`no trust`

**Mode** Policy-Map Configuration

**Examples** To enable the premark-dscp map lookup for policy-map pmap1, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# trust dscp
```

To disable the premark-dscp map lookup for policy-map pmap1, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# no trust
```

**Related commands** [mls qos map premark-dscp](#)

# wrr-queue disable queues

**Overview** Use this command to disable an egress queue from transmitting traffic.  
The **no** variant of this command enables an egress queue to transmit traffic.

**Syntax** `wrr-queue disable queues [0] [1] [2] [3] [4] [5] [6] [7]`  
`no wrr-queue disable queues [0] [1] [2] [3] [4] [5] [6] [7]`

| Parameter       | Description                                 |
|-----------------|---------------------------------------------|
| [0] [2] ... [7] | Selects one or more queues numbered 0 to 7. |

**Mode** Interface Configuration

**Examples** To disable queue 1 on port1.1.1 from transmitting traffic, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# wrr-queue disable queues 1
```

To enable queue 1 on port1.1.1 to transmit traffic, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# no wrr-queue disable queues 1
```

**Related commands** [show mls qos interface](#)

# wrr-queue egress-rate-limit queues

**Overview** Sets a limit on the amount of traffic that can be transmitted per second from these queues. The default unit is in Kb, but Mb or Gb can also be specified. The minimum is 651 Kb.

This limit applies to strict priority queues too. Setting the limit with this command is the same as setting it with [strict-priority-queue egress-rate-limit queues](#).

**Syntax** `wrr-queue egress-rate-limit <bandwidth> queues  
[0] [1] [2] [3] [4] [5] [6] [7]`  
`no wrr-queue egress-rate-limit <bandwidth> queues  
[0] [1] [2] [3] [4] [5] [6] [7]`

| Parameter         | Description                                            |
|-------------------|--------------------------------------------------------|
| <bandwidth>       | Bandwidth <1-100000000 kbits> (usable units: k, m, g). |
| [0] [2] . . . [7] | Selects one or more queues numbered 0 to 7.            |

**Mode** Interface Configuration

**Example** To limit the egress rate of queues 0, 1 and 2 on port1.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# wrr-queue egress-rate-limit 500M queues 0 1
2
```

**Related commands** [show mls qos interface](#)  
[strict-priority-queue egress-rate-limit queues](#)

# wrr-queue weight queues

**Overview** This command configures weighted round-robin based scheduling on the specified egress queues on switch port interfaces only. The weights are specified as ratios relative to each other.

Use the **no wrr-queue** command to remove weighted round-robin based scheduling from the specified egress queue. The queue then reverts to its normal priority-based scheduling.

**Syntax** `wrr-queue weight <1-15> queues [0] [1] [2] [3] [4] [5] [6] [7]`  
`no wrr-queue <queue-number>`

| Parameter         | Description                                                             |
|-------------------|-------------------------------------------------------------------------|
| <1-15>            | Weight (the higher the number the greater will be the queue servicing). |
| [0] [2] . . . [7] | Selects one or more queues numbered 0 to 7.                             |
| <queue-number>    | Egress queue to revert to priority-based scheduling.                    |

**Mode** Interface Configuration for switch port interfaces only (not for static aggregated interfaces).

**Usage notes** You cannot apply weighted round-robin based scheduling to static aggregated interfaces (for example, sa2).

**NOTE:** The commands **wrr-queue weight** and **no wrr-queue** interrupt traffic flow. The interruption lasts for less than a second and resolves automatically. When you enter either of these commands, the switch displays a message to warn you about the interruption and gives you an opportunity to abort.

**Example** To apply a WRR weight of 6 to queues 0 and 1 on port1.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# wrr-queue weight 6 queues 0 1
```

To remove weighted round-robin scheduling from egress queue 2 on port1.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# no wrr-queue 2
```

**Related commands** [priority-queue](#)  
[show mls qos interface](#)

## Introduction

**Overview** 802.1X is an IEEE standard providing a mechanism for authenticating devices attached to a LAN port or wireless device. Devices wishing to access services behind a port must authenticate themselves before any Ethernet packets are allowed to pass through. The protocol is referred to as 802.1X because it was initially defined in the IEEE standard 802.1X, published in 2001 and revised in 2004 and again as the current 802.1X 2010 standard.

This chapter provides an alphabetical reference of commands used to configure 802.1X port access control. For more information, see the [AAA and Port Authentication\\_Feature Overview and Configuration Guide](#).

# dot1x accounting

**Overview** This command overrides the **default** RADIUS accounting method for IEEE 802.1X-based authentication on an interface by allowing you to apply a user-defined named method list.

Use the **no** variant of this command to remove the named list from the interface and apply the **default** method list.

**Syntax** `dot1x accounting {default|<list-name>}`  
`no dot1x accounting`

| Parameter   | Description                              |
|-------------|------------------------------------------|
| default     | Apply the default accounting method list |
| <list-name> | Apply the user-defined named list        |

**Default** The **default** method list is applied to an interface by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Example** To apply the named list 'vlan10\_acct' on the vlan10 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# dot1x accounting vlan10_acct
```

To remove the named list from the vlan10 interface and set the authentication method back to **default**, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no dot1x accounting
```

**Related commands** [aaa accounting dot1x](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# dot1x authentication

**Overview** This command overrides the **default** 802.1X-based authentication method on an interface by allowing you to apply a user-defined named list.

Use the **no** variant of this command to remove the named list from the interface and apply the **default** method.

**Syntax** `dot1x authentication {default|<list-name>}`  
`no dot1x authentication`

| Parameter                | Description                                  |
|--------------------------|----------------------------------------------|
| <i>default</i>           | Apply the default authentication method list |
| <i>&lt;list-name&gt;</i> | Apply the user-defined named list            |

**Default** The **default** method list is applied to an interface by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Example** To apply the named list 'vlan10\_auth' on the vlan10 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# dot1x authentication vlan10_auth
```

To remove the named list from the vlan10 interface and set the authentication method back to **default**, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no dot1x authentication
```

**Related commands** [aaa authentication dot1x](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# debug dot1x

**Overview** Use this command to enable 802.1X IEEE Port-Based Network Access Control troubleshooting functions.

Use the **no** variant of this command to disable this function.

**Syntax** `debug dot1x [all|auth-web|event|nsm|packet|timer]`  
`no debug all dot1x`  
`no debug dot1x [all|auth-web|event|nsm|packet|timer]`

| Parameter | Description                                                                                      |
|-----------|--------------------------------------------------------------------------------------------------|
| all       | Used with the <b>no</b> variant of this command exclusively; turns off all debugging for 802.1X. |
| auth-web  | Specifies debugging for 802.1X auth-web information.                                             |
| events    | Specifies debugging for 802.1X events.                                                           |
| nsm       | Specifies debugging for NSM messages.                                                            |
| packet    | Specifies debugging for 802.1X packets.                                                          |
| timer     | Specifies debugging for 802.1X timers.                                                           |

**Mode** Privileged Exec and Global Configuration

**Usage notes** This command turns on a mode where trace-level information is output during authentication conversations. Be aware that this is a very verbose output. It is mostly useful to capture this as part of escalating an issue to ATI support.

**Examples** Use this command without any parameters to turn on normal 802.1X debug information.

```
awplus# debug dot1x
awplus# show debugging dot1x
```

```
802.1X debugging status:
 802.1X events debugging is
 802.1X timer debugging is on
 802.1X packets debugging is on
 802.1X NSM debugging is on
```

**Related commands** [show debugging dot1x](#)  
[undebug dot1x](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# dot1x control-direction

- Overview** This command sets the direction of the filter for the unauthorized interface.
- If the optional **in** parameter is specified with this command then packets entering the specified port are discarded. The **in** parameter discards the ingress packets received from the supplicant.
- If the optional **both** parameter is specified with this command then packets entering (ingress) and leaving (egress) the specified port are discarded. The **both** parameter discards the packets received from the supplicant and sent to the supplicant.
- The **no** variant of this command sets the direction of the filter to **both**. The port will then discard both ingress and egress traffic.

**Syntax** dot1x control-direction {in|both}  
no dot1x control-direction

| Parameter | Description                                                                                                                |
|-----------|----------------------------------------------------------------------------------------------------------------------------|
| in        | Discard received packets from the supplicant (ingress packets).                                                            |
| both      | Discard received packets from the supplicant (ingress packets) and transmitted packets to the supplicant (egress packets). |

- Default** The authentication port direction is set to **both** by default.
- Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To set the port direction to the default (**both**) for port1.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no dot1x control-direction
```

To set the port direction to **in** for port1.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# dot1x control-direction in
```

To set the port direction to **in** for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x control-direction in
```

**Related commands**

- auth profile (global)
- show dot1x
- show dot1x interface
- show auth interface

**Command changes**    Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# dot1x eap

**Overview** This command selects the transmit mode for the EAP packet. If the authentication feature is not enabled then EAP transmit mode is not enabled. The default setting discards EAP packets.

**Syntax** `dot1x eap {discard|forward|forward-untagged-vlan|forward-vlan}`

| Parameter             | Description                                   |
|-----------------------|-----------------------------------------------|
| discard               | Discard.                                      |
| forward               | Forward to all ports on the switch.           |
| forward-untagged-vlan | Forward to ports with the same untagged VLAN. |
| forward-vlan          | Forward to ports with the same VLAN.          |

**Default** The transmit mode is set to `discard` EAP packets by default.

**Mode** Global Configuration

**Examples** To set the transmit mode of EAP packet to **forward**, to forward EAP packets to all ports on the switch, use the commands:

```
awplus# configure terminal
awplus(config)# dot1x eap forward
```

To set the transmit mode of EAP packet to **discard**, to discard EAP packets, use the commands:

```
awplus# configure terminal
awplus(config)# dot1x eap discard
```

To set the transmit mode of EAP packet to **forward-untagged-vlan**, to forward EAP packets to ports with the same untagged VLAN, use the commands:

```
awplus# configure terminal
awplus(config)# dot1x eap forward-untagged-vlan
```

To set the transmit mode of EAP packet to **forward-vlan**, to forward EAP packets to ports with the same VLAN, use the commands:

```
awplus# configure terminal
awplus(config)# dot1x eap forward-vlan
```

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# dot1x eapol-version

**Overview** This command sets the EAPOL protocol version for EAP packets when 802.1X port authentication is applied.

Use the **no** variant of this command to set the EAPOL protocol version to 1.

The default EAPOL protocol version is version 1.

**Syntax** dot1x eapol-version {1|2}  
no dot1x eapol-version

| Parameter | Description                    |
|-----------|--------------------------------|
| 1   2     | EAPOL protocol version 1 or 2. |

**Default** The EAP version for 802.1X authentication is set to 1 by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To set the EAPOL protocol version to 2 for port1.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# dot1x eapol-version 2
```

To set the EAPOL protocol version to the default version (1) for interface port1.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no dot1x eapol-version
```

To set the EAPOL protocol version to 2 for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x eapol-version 2
```

**Validation Commands** auth profile (global)  
show dot1x  
show dot1x interface

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# dot1x initialize interface

**Overview** This command removes authorization for a specified connected interface. The connection will attempt to re-authorize when the specified port attempts to make use of the network connection.

**NOTE:** Reauthentication could be a long time after the use of this command because the reauthorization attempt is not triggered by this command. The attempt is triggered by the first packet from the interface trying to access the network resources.

**Syntax** `dot1x initialize interface <interface-list>`

| Parameter                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;interface-list&gt;</code> | The interfaces or ports to configure. An interface-list can be: <ul style="list-style-type: none"><li>• a VLAN (e.g. vlan2)</li><li>• a switchport (e.g. port1.1.4)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li><li>• a continuous range of interfaces separated by a hyphen (e.g. port1.1.1-port1.1.3)</li><li>• a comma-separated list (e.g. port1.1.1, port1.1.3-port1.1.4). Do not mix interface types in a list.</li></ul> The specified interfaces must exist. |

**Mode** Privileged Exec

**Examples** To initialize 802.1X port authentication on the interface port1.1.2, use the command:

```
awplus# dot1x initialize interface port1.1.2
```

To unauthorize switch port1.1.2 and attempt reauthentication on switch port1.1.2, use the command:

```
awplus# dot1x initialize interface port1.1.2
```

To unauthorize all switch ports for a 18-port device and attempt reauthentication, use the command:

```
awplus# dot1x initialize interface port1.1.1-port1.1.18
```

**Related commands** [dot1x initialize supplicant](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# dot1x initialize supplicant

**Overview** This command removes authorization for a connected supplicant with the specified MAC address or username. The connection will attempt to re-authorize when the specified supplicant attempts to make use of the network connection.

**NOTE:** *Reauthentication could be a long time after the use of this command because the reauthorization attempt is not triggered by this command. The attempt is triggered by the first packet from the supplicant trying to access the network resources.*

**Syntax** dot1x initialize supplicant {<macadd>|username}

| Parameter  | Description                                      |
|------------|--------------------------------------------------|
| dot1x      | IEEE 802.1X Port-Based Access Control.           |
| initialize | Initialize the port to attempt reauthentication. |
| supplicant | Specify the supplicant to initialize.            |
| <macadd>   | MAC (hardware address of the supplicant.         |
| username   | The name of the supplicant entry.                |

**Mode** Privileged Exec

**Example** To initialize the supplicant authentication, use the commands

```
awplus# configure terminal
awplus(config)# dot1x initialize supplicant 0090.99ab.a020
awplus(config)# dot1x initialize supplicant guest
```

**Related commands** [dot1x initialize interface](#)  
[show dot1x](#)  
[show dot1x supplicant](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# dot1x keytransmit

**Overview** Use this command to enable key transmission on the interface specified previously in Interface mode.

This command enables key transmission over an Extensible Authentication Protocol (EAP) packet between the authenticator and supplicant.

The **no** variant of this command disables key transmission on the interface specified.

**Syntax** dot1x keytransmit  
no dot1x keytransmit

**Default** Key transmission for port authentication is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To enable the key transmit feature on interface port1.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# dot1x keytransmit
```

To disable the key transmit feature on interface port1.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no dot1x keytransmit
```

**Related commands** [show dot1x](#)  
[show dot1x interface](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# dot1x max-auth-fail

**Overview** Use this command to configure the maximum number of login attempts for a supplicant (client device) using the **auth-fail vlan** feature, when using 802.1X port authentication on an interface.

The **no** variant of this command resets the maximum login attempts for a supplicant (client device) using the auth-fail vlan feature, to the default configuration of 3 login attempts.

**Syntax** dot1x max-auth-fail <0-10>  
no dot1x max-auth-fail

| Parameter | Description                                                                                                    |
|-----------|----------------------------------------------------------------------------------------------------------------|
| <0-10>    | Specify the maximum number of login attempts for supplicants on an interface using 802.1X port authentication. |

**Default** The default maximum number of login attempts for a supplicant on an interface using 802.1X port authentication is 3 login attempts.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** This command sets the maximum number of login attempts for supplicants on an interface. The supplicant is moved to the auth-fail VLAN from the Guest VLAN after the number of failed login attempts using 802.1X authentication is equal to the number set with this command.

See the [AAA and Port Authentication Feature Overview and Configuration Guide](#) for information about:

- the auth-fail VLAN feature, and
- restrictions regarding combinations of authentication enhancements working together

**Examples** To configure the maximum number of login attempts for a supplicant on interface port1.1.2 to a single login attempt, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# dot1x max-auth-fail 1
```

To configure the maximum number of login attempts for a supplicant on interface port1.1.2 to the default number of 3 login attempts, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no dot1x max-auth-fail
```

To configure the maximum number of login attempts for a supplicant on authentication profile 'student' to a single login attempt, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x max-auth-fail 1
```

**Command  
changes**

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# dot1x max-reauth-req

**Overview** Use this command to set the number of reauthentication attempts before an interface is unauthorized.

The **no** variant of this command resets the reauthentication delay to the default.

**Syntax** `dot1x max-reauth-req <1-10>`  
`no dot1x max-reauth-req`

| Parameter | Description                                                                                                               |
|-----------|---------------------------------------------------------------------------------------------------------------------------|
| <1-10>    | Specify the maximum number of reauthentication attempts for supplicants on an interface using 802.1X port authentication. |

**Default** The default maximum reauthentication attempts for interfaces using 802.1X port authentication is two (2) reauthentication attempts, before an interface is unauthorized.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** Use this command to set the maximum reauthentication attempts after failure.

**Examples** To configure the maximum number of reauthentication attempts for interface port1.1.2 to a single (1) reauthentication request, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# dot1x max-reauth-req 1
```

To configure the maximum number of reauthentication attempts for interface port1.1.2 to the default maximum number of two (2) reauthentication attempts, use the commands:

```
awplus(config)# interface port1.1.2
awplus(config-if)# no dot1x max-reauth-req
```

To configure the maximum number of reauthentication attempts for authentication profile 'student' to a single (1) reauthentication request, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x max-reauth-req 1
```

show dot1x interface

**Command  
changes**

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

## dot1x max-req

**Overview** Use this command to change the number of times the device resends an EAP Request packet if that packet is lost between the authenticating device and the supplicant. If the supplicant does not respond to an EAP Request after this number of retries, the supplicant fails the authentication process.

Use the **no** variant of this command to return to the default number of retries.

**Syntax** `dot1x max-req <1-10>`  
`no dot1x max-req`

| Parameter | Description                                                                                                                                                 |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <1-10>    | The number of retries. Note that this does not include the initial attempt, so the total number of attempts is one higher than the number you specify here. |

**Default** The default value is 2.

Note: This means the authenticator sends the original attempt and 2 more attempts, which is 3 attempts in total.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** You can set this on a per-supplicant basis by using the **max-req** parameter in the commands:

- `auth supplicant-ip`
- `auth supplicant-mac`

**Example** To change the number of retries to 5 for port1.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# dot1x max-req 5
```

To return the number of retries to the default setting of 2 for port1.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no dot1x max-req
```

To set the number of retries to 1 for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x max-req 1
```

**Command  
changes**

Version 5.5.3-1.1: command added

# dot1x port-control

**Overview** This command enables 802.1X port authentication on the interface specified, and sets the control of the authentication port.

The **no** variant of this command disables the port authentication on the interface specified.

**Syntax** `dot1x port-control {force-unauthorized|force-authorized|auto}`  
`no dot1x port-control`

| Parameter          | Description                                                                                               |
|--------------------|-----------------------------------------------------------------------------------------------------------|
| force-unauthorized | Force the port state to unauthorized. Specify this to force a port to always be in an unauthorized state. |
| force-authorized   | Force the port state to authorized. Specify this to force a port to always be in an authorized state.     |
| auto               | Allow the port client to negotiate authentication. Specify this to enable authentication on the port.     |

**Default** 802.1X port control is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** Use this command to force a port state.

When **port-control** is set to **auto**, the 802.1X authentication feature is executed on the interface, but only if the **aaa authentication dot1x** command has been issued.

If you attempt to change the authentication configuration on an interface that has threat protection quarantine configured, you will see the following error message:

```
% portx.x.x: Application Proxy quarantine configuration must be removed before port authentication is changed
```

Before changing the interface's authentication configuration you must either:

- remove the interface's threat protection configuration, or
- shut down the interface.

**Examples** To enable port authentication on the interface port1.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# dot1x port-control auto
```

To enable port authentication force authorized on the interface port1.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# dot1x port-control force-authorized
```

To disable port authentication on the interface port1.1.2 use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no dot1x port-control
```

To enable port authentication on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x port-control auto
```

**Command  
changes**

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# dot1x timeout tx-period

**Overview** This command sets the transmit timeout for the authentication request on the specified interface.

The **no** variant of this command resets the transmit timeout period to the default (30 seconds).

**Syntax** `dot1x timeout tx-period <1-65535>`  
`no dot1x timeout tx-period`

| Parameter | Description |
|-----------|-------------|
| <1-65535> | Seconds.    |

**Default** The default transmit period for port authentication is 30 seconds.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** Use this command to set the interval between successive attempts to request an ID.

**Examples** To set the transmit timeout period to 5 seconds on interface port1.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# dot1x timeout tx-period 5
```

To reset transmit timeout period to the default (30 seconds) on interface port1.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no dot1x timeout tx-period
```

To set the transmit timeout period to 5 seconds on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x timeout tx-period 5
```

# show debugging dot1x

**Overview** Use this command to see what debugging is turned on for 802.1X.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show debugging dot1x`

**Mode** User Exec and Privileged Exec

**Example** To enable 802.1X debugging and display the debugging option set, use the following commands:

```
awplus# debug dot1x
awplus# show debugging dot1x
```

```
802.1X debugging status:
 802.1X events debugging is on
 802.1X timer debugging is on
 802.1X packets debugging is on
 802.1X NSM debugging is on
```

**Related commands** [debug dot1x](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# show dot1x

**Overview** Use this command to show authentication information for 802.1X port authentication.

If you specify the optional **all** parameter then this command also displays all authentication information for each port available on the switch.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare\\_Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show dot1x [all]`

| Parameter | Description                                                                    |
|-----------|--------------------------------------------------------------------------------|
| all       | Displays all authentication information for each port available on the switch. |

**Mode** Privileged Exec

**Example** `awplus# show dot1x all`

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# show dot1x sessionstatistics

**Overview** This command shows authentication session statistics for the specified interface, which may be a static channel (or static aggregator) or a dynamic (or LACP) channel group or a switch port.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show dot1x sessionstatistics [interface <interface-list>]`

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| interface        | Specify a port to show.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <interface-list> | The interfaces to display information about. An interface-list can be: <ul style="list-style-type: none"><li>• a VLAN (e.g. vlan2)</li><li>• a switchport (e.g. port1.1.4)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li><li>• a continuous range of interfaces separated by a hyphen (e.g. port1.1.1-port1.1.3)</li><li>• a comma-separated list (e.g. port1.1.1,port1.1.3-port1.1.4). Do not mix interface types in a list.</li></ul> |

**Mode** Privileged Exec

**Example** See sample output below showing 802.1X authentication session statistics for port1.1.2:

```
awplus# show dot1x sessionstatistics interface port1.1.2
```

```
Authentication session statistics for interface port1.1.2
 session user name: manager
 session authentication method: Remote server
 session time: 19440 secs
 session terminat cause: Not terminated yet
```

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# show dot1x statistics interface

**Overview** Use this command to show the authentication statistics for the specified interface. For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

The output from this command is the same as the output from the [show auth statistics interface](#) command.

**Syntax** `show dot1x statistics interface <interface-list>`

| Parameter                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;interface-list&gt;</code> | The interfaces to display information about. An interface-list can be: <ul style="list-style-type: none"><li>• a VLAN (e.g. vlan2)</li><li>• a switchport (e.g. port1.1.4)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li><li>• a continuous range of interfaces separated by a hyphen (e.g. port1.1.1-port1.1.3)</li><li>• a comma-separated list (e.g. port1.1.1, port1.1.3-port1.1.4). Do not mix interface types in a list.</li></ul> |

**Mode** Privileged Exec

**Example** To display 802.1X authentication statistics for port1.1.2, use the command:

```
awplus# show dot1x statistics interface port1.1.2
```

**Output** Figure 47-2: Example output from **show dot1x statistics interface** for a port

```

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# show dot1x supplicant

**Overview** This command shows the supplicant state of the authentication mode set for the switch.

This command shows a summary when the optional **brief** parameter is used.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare\\_Plus” Feature Overview and Configuration Guide](#).

**Syntax** show dot1x supplicant [<macadd>] [brief]

| Parameter | Description                               |
|-----------|-------------------------------------------|
| <macadd>  | MAC (hardware) address of the Supplicant. |
| brief     | Brief summary of the Supplicant state.    |

**Mode** Privileged Exec

**Example** See sample output below showing the 802.1X authenticated supplicant on the switch:

```
awplus# show dot1x supplicant
```

```
authenticationMethod: dot1x
totalSupplicantNum: 1
authorizedSupplicantNum: 1
macBasedAuthenticationSupplicantNum: 0
dot1xAuthenticationSupplicantNum: 1
webBasedAuthenticationSupplicantNum: 0
Supplicant name: manager
Supplicant address: 00d0.59ab.7037
 authenticationMethod: dot1x
 Two-Step Authentication:
 firstAuthentication: Pass - Method: mac
 secondAuthentication: Pass - Method: dot1x
portStatus: Authorized - currentId: 4
abort:F fail:F start:F timeout:F success:T
PAE: state: Authenticated - portMode: Auto
PAE: reAuthCount: 0 - rxRespId: 0
PAE: quietPeriod: 60 - maxReauthReq: 2 - txPeriod: 30
BE: state: Idle - reqCount: 0 - idFromServer: 3
BE: suppTimeout: 30 - serverTimeout: 30
CD: adminControlledDirections: in - operControlledDirections: in
CD: bridgeDetected: false
KR: rxKey: false
KT: keyAvailable: false - keyTxEnabled: false
RADIUS server group (auth): radius
RADIUS server (auth): 192.168.1.40
```

See sample output below showing the supplicant on the switch using the **brief** parameter:

```
awplus# show dot1x supplicant 00d0.59ab.7037 brief
```

```
Interface port1.1.2
authenticationMethod: dot1x
totalSupplicantNum: 1
authorizedSupplicantNum: 1
 macBasedAuthenticationSupplicantNum: 0
 dot1xAuthenticationSupplicantNum: 1
 webBasedAuthenticationSupplicantNum: 0
```

| Interface | VID | Mode | MAC Address    | Status        | IP Address    | Username |
|-----------|-----|------|----------------|---------------|---------------|----------|
| =====     | === | ===  | =====          | =====         | =====         | =====    |
| port1.1.2 | 2   | D    | 00d0.59ab.7037 | Authenticated | 192.168.2.201 | manager  |

See sample output below showing the supplicant on the switch using the **brief** parameter:

```
awplus# show dot1x supplicant brief
```

For example, if two-step authentication is configured with 802.1X authentication as the first method and web authentication as the second method then the output is as follows:

```
Interface port1.1.2 authenticationMethod: dot1x/web
Two-Step Authentication
 firstMethod: dot1x
 secondMethod: web
totalSupplicantNum: 1
authorizedSupplicantNum: 1
 macBasedAuthenticationSupplicantNum: 0
 dot1xAuthenticationSupplicantNum: 0
 webBasedAuthenticationSupplicantNum: 1
 otherAuthenticationSupplicantNum: 0
```

| Interface | VID   | Mode  | MAC Address    | Status        | IP Address    | Username |
|-----------|-------|-------|----------------|---------------|---------------|----------|
| =====     | ===== | ===== | =====          | =====         | =====         | =====    |
| port1.1.2 | 5     | W     | 0008.0d5e.c216 | Authenticated | 192.168.1.200 | web      |

**Related commands** [show dot1x supplicant interface](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# show dot1x supplicant interface

**Overview** Use this command to show the supplicant state of the authentication mode set for the interface.

This command shows a summary when the optional **brief** parameter is used.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare\\_Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show dot1x supplicant interface <interface-list> [brief]`

| Parameter                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;interface-list&gt;</code> | The interfaces to display information about. # Authentication Commands

## Introduction

**Overview** Port authentication commands enable you to specify three different types of device authentication: 802.1X authentication, web authentication, and MAC authentication.

- 802.1X is an IEEE standard providing a mechanism for authenticating devices attached to a LAN port or wireless device.
- Web authentication is applicable to devices that have a human user who opens the web browser and types in a user name and password when requested.
- MAC authentication is used to authenticate devices that have neither a human user nor implement 802.1X supplicant when making a network connection request.

This chapter provides an alphabetical reference for MAC and web authentication commands. For a list of 802.1X commands see the [802.1X Commands](#) chapter.

For more information on configuring and using port authentication, see the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

## auth auth-fail vlan

**Overview** Use this command to enable the **auth-fail vlan** feature on the specified vlan interface. This feature assigns supplicants (client devices) to the specified VLAN if they fail port authentication.

Use the **no** variant of this command to disable the auth-fail vlan feature for a specified VLAN interface.

**Syntax** `auth auth-fail vlan <1-4094>`  
`no auth auth-fail vlan`

| Parameter | Description                                                                  |
|-----------|------------------------------------------------------------------------------|
| <1-4094>  | Assigns the VLAN ID to any supplicants that have failed port authentication. |

**Default** The auth-fail vlan feature is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** Use the auth-fail vlan feature when using web authentication instead of the Guest VLAN feature, when you need to separate networks where one supplicant (client device) requires authentication and another supplicant does not require authentication from the same interface.

This is because the DHCP lease time using the Web-Authentication feature is shorter, and the auth-fail vlan feature enables assignment to a different VLAN if a supplicant fails authentication.

To enable the auth-fail vlan feature with web authentication, you need to set the web authentication server virtual IP address by using the [auth-web-server ipaddress](#) command or the [auth-web-server dhcp ipaddress](#) command.

When using 802.1X port authentication, use a [dot1x max-auth-fail](#) command to set the maximum number of login attempts. Three login attempts are allowed by default for 802.1X port authentication before supplicants trying to authenticate are moved from the Guest VLAN to the auth-fail VLAN. See the [dot1x max-auth-fail](#) on page 2593 for command information.

See the [AAA and Port Authentication Feature Overview and Configuration Guide](#) for information about:

- the auth-fail VLAN feature, which allows the Network Administrator to separate the supplicants who attempted authentication, but failed, from the supplicants who did not attempt authentication, and
- restrictions regarding combinations of authentication enhancements working together

Use appropriate ACLs (Access Control Lists) on interfaces for extra security if a supplicant allocated to the designated auth-fail vlan can access the same network

as a supplicant on the Guest VLAN. For more information about ACL concepts, and configuring ACLs see the [ACL Feature Overview and Configuration Guide](#). For more information about ACL commands see:

- [IPv4 Hardware Access Control List \(ACL\) Commands](#)
- [IPv4 Software Access Control List \(ACL\) Commands](#)
- [IPv6 Hardware Access Control List \(ACL\) Commands](#)
- [IPv6 Software Access Control List \(ACL\) Commands](#)

**Examples** To enable the auth-fail vlan feature for port1.1.2 and assign VLAN 100, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# auth auth-fail vlan 100
```

To disable the auth-fail vlan feature for port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth auth-fail vlan
```

**Related commands** [auth profile \(global\)](#)

[show running-config](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# auth critical

**Overview** Use this command to enable the critical port feature on the interface. When the critical port feature is enabled on an interface, and all the RADIUS servers are unavailable, then the interface becomes authorized.

The **no** variant of this command disables the critical port feature on the interface.

**Syntax** `auth critical`  
`no auth critical`

**Default** The critical port of port authentication is disabled.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To enable the critical port feature on interface port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# auth critical
```

To disable the critical port feature on interface port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth critical
```

To enable the critical port feature on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth critical
```

**Related commands** [auth profile \(global\)](#)

[show dot1x interface](#)  
[show running-config](#)

# auth dhcp-framed-ip-lease

**Overview** Use this command to enable DHCP Framed IP Lease on an interface.

When the DHCP Framed IP Lease feature is enabled on an interface, supplicants authenticated using 802.1x or MAC authentication will be assigned a specific IP address, and other network settings, gathered from the RADIUS server during the authentication process.

Use the **no** variant of this command to disable DHCP Framed IP Lease.

**Syntax** `auth dhcp-framed-ip-lease`  
`no auth dhcp-framed-ip-lease`

**Default** DHCP Framed IP Lease is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** You need to complete the following steps to configure the DHCP Framed IP Lease feature on your network.

**On the RADIUS server:**

- Configure the RADIUS server with the username and password for 802.1x or MAC authentication
- Configure the following 'framed' RADIUS attributes on the RADIUS server for the that user:
  - Framed-IP-Address (8): the IPv4 address for the supplicant
  - Framed-IP-Netmask (9): the netmask for the supplicant
  - Framed-Route (22): the default gateway IPv4 address for the supplicant
  - Session-Timeout (27): IP address lease time for the supplicant

**NOTE:** *The Frame-IP-Address (8) attribute must be configured for this feature to work. All other attributes are optional.*

**On the DHCP server:**

- Configure the RADIUS client
- Enable 802.1x or MAC authentication on the required interface/s
- Enable DHCP Framed IP Lease feature on the required interface/s
- Setup a DHCP pool with the network range for the IP address/es registered on the RADIUS server
- Enable DHCP server

For more information, see the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

**Example** To enable DHCP Framed IP Lease on port1.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# auth dhcp-framed-ip-lease
```

To disable DHCP Framed IP Lease on port1.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# no auth dhcp-framed-ip-lease
```

**Related commands** [show dot1x supplicant](#)  
[show ip dhcp pool](#)

**Command changes** Version 5.4.8-2.1: command added

# auth dynamic-acl enable

**Overview** Use this command to enable Dynamic Access Control Lists (ACLs). This lets you configure port authentication to dynamically apply ACLs when a supplicant is authorized. These ACLs are automatically removed when the supplicant disconnects.

Use the **no** variant of this command to disable Dynamic ACLs.

**Syntax** `auth dynamic-acl enable`  
`no auth dynamic-acl enable`

**Default** Disabled.

**Mode** Interface configuration for switch port or static aggregator.

**Usage notes** Dynamic ACLs are created and attached to a switchport in the following way:

- A RADIUS server holds the ACL rules for a supplicant, along with that supplicants user name and password.
- These ACL rules can be either:
  - a complete IPv4 or IPv6 hardware rule (stored as a RADIUS NAS-Filter-Rule attribute), or
  - name or number reference to an existing ACL rule (stored as a RADIUS Filter-Id attribute)
- When the first packet from a supplicant arrives on a switchport the authenticator starts the authentication process with the RADIUS server.
- The RADIUS server returns Access-Accept packet to the authenticator with the configured ACL rules.
- The authenticator creates and installs these ACLs dynamically on the switchport and authorizes the supplicant.
- These Dynamic ACLs are named IPv4 and IPv6 hardware access-lists. They are internally maintained and cannot be removed or modified from the CLI.
- All traffic on the switchport is filtered using these ACLs.
- When the supplicant is unauthorized, dynamically installed ACLs are removed and detached from the switchport.

For more information, see the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

**Examples** This example uses the local RADIUS server to define two ACL rules that are applied to MAC authenticated supplicants on port1.1.2.

Define the local RADIUS server as the RADIUS server to use:

```
awplus# configure terminal
awplus(config)# radius-server host 127.0.0.1 key
awplus-local-radius-server
```

Define the authentication method list:

```
awplus(config)# aaa authentication auth-mac default group
radius
```

Enable MAC authentication and dynamic ACLs on port1.1.2:

```
awplus(config)# interface port1.1.2
awplus(config-if)# auth-mac enable
awplus(config-if)# auth dynamic-acl enable
awplus(config-if)# exit
```

Configure the local RADIUS server with the required ACL rules:

```
awplus(config)# radius-server local
awplus(config-radsrv)# group dacl-rule
awplus(config-radsrv-group)# attribute repeated
NAS-Filter-Rule "ip:permit ip 192.168.1.0/24 192.168.2.0/24"
awplus(config-radsrv-group)# attribute repeated
NAS-Filter-Rule "ip:deny ip 192.168.1.0/24 any"
awplus(config-radsrv-group)# exit
```

Add a user with the Dynamic ACL rules and enable the local RADIUS server:

```
awplus(config-radsrv)# user xx-xx-xx-xx-xx-xx password
xx-xx-xx-xx-xx-x group dacl-rule
awplus(config-radsrv)# server enable
awplus(config-radsrv)# exit
```

These ACL rules will reject IP traffic from 192.168.1.x to any destination except 192.168.2.x for supplicants on port1.1.2.

**Command  
changes**

Version 5.5.0-1.1: command added

# auth dynamic-vlan-creation

**Overview** Use this command to enable and disable the Dynamic VLAN assignment feature.

The Dynamic VLAN assignment feature allows a supplicant (client device) to be placed into a specific VLAN based on information returned from the RADIUS server during authentication, on a given interface.

Use the **no** variant of this command to disable the Dynamic VLAN assignment feature.

**Syntax**

```
auth dynamic-vlan-creation [rule {deny|permit}] [type {multi|single}]
no auth dynamic-vlan-creation
```

| Parameter | Description                                                                                                                                                                                |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rule      | VLAN assignment rule.                                                                                                                                                                      |
| deny      | Deny a differently assigned VLAN ID. This is the default rule.                                                                                                                             |
| permit    | Permit a differently assigned VLAN ID.                                                                                                                                                     |
| type      | Specifies whether multiple different VLANs can be assigned to supplicants (client devices) attached to the port, or whether only a single VLAN can be assigned to supplicants on the port. |
| multi     | Multiple Dynamic VLAN.                                                                                                                                                                     |
| single    | Single Dynamic VLAN.                                                                                                                                                                       |

**Default** By default, the Dynamic VLAN assignment feature is disabled.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** If the Dynamic VLAN assignment feature is enabled, VLAN assignment is dynamic. If the Dynamic VLAN assignment feature is disabled then RADIUS attributes are ignored and configured VLANs are assigned to ports. Dynamic VLANs may be associated with authenticated MAC addresses if the **type** parameter is applied with the **rule** parameter.

The **rule** parameter deals with the case where there are multiple supplicants attached to a port, and the type parameter has been set to **single-vlan**. The parameter specifies how the switch should act if different VLAN IDs end up being assigned to different supplicants. The keyword value **deny** means that once a given VID has been assigned to the first supplicant, then if any subsequent supplicant is assigned a different VID, that supplicant is rejected. The keyword value **permit** means that once a given VID has been assigned to the first supplicant, then if any subsequent supplicant is assigned a different VID, that supplicant is accepted, but it is actually assigned the same VID as the first supplicant.

If you issue an **auth dynamic-vlan-creation** command without a **rule** parameter then a second supplicant with a different VLAN ID is rejected. It is not assigned to the first supplicant's VLAN. Issuing an **auth dynamic-vlan-creation** command without a **rule** parameter has the same effect as issuing an **auth dynamic-vlan-creation rule deny** command rejecting supplicants with differing VLANs.

The **type** parameter specifies whether multiple different VLANs can be assigned to supplicants attached to the port, or whether only a single VLAN can be assigned to supplicants on the port. The **type** parameter can select the port base VLAN or the MAC base VLAN from the RADIUS VLAN ID. This can be used when the host-mode is set to multi-supplicant. For **single**-host ports, the VLAN ID will be assigned to the port. It is not supported with the Guest VLAN feature. Display the ID assigned using a **show vlan** command. For **multi**-host ports, the VLAN ID will be assigned to the MAC address of the authenticated supplicant. The VLAN ID assigned for the MAC Base VLAN is displayed using the **show platform table vlan** command.

To configure Dynamic VLAN with Web Authentication, you need to set the Web Authentication Server virtual IP address by using the [auth-web-server ipaddress](#) command or the [auth-web-server dhcp ipaddress](#) command. You also need to create a hardware access-list that can be applied to the switch port interface.

You need to configure an IPv4 address for the VLAN interface on which Web Authentication is running.

**Examples** To enable the Dynamic VLAN assignment feature on interface port1.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# switchport access vlan 10
awplus(config-if)# auth-web enable
awplus(config-if)# auth dynamic-vlan-creation
awplus(config-if)# interface vlan10
awplus(config-if)# ip address 10.1.1.1/24
```

To enable the Dynamic VLAN assignment feature with Web Authentication on interface port1.1.2 when Web Authentication is needed, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ipaddress 1.2.3.4
awplus(config)# access-list hardware acl-web send-to-cpu ip any 1.2.3.4
awplus(config)# interface port1.1.2
awplus(config-if)# auth-web enable
awplus(config-if)# auth dynamic-vlan-creation
awplus(config-if)# access-group acl-web
awplus(config-if)# interface vlan1
awplus(config-if)# ip address 10.1.1.1/24
```

To disable the Dynamic VLAN assignment feature on interface port1.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth dynamic-vlan-creation
```

To enable the Dynamic VLAN assignment feature on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth dynamic-vlan-creation
```

**Command  
changes**

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# auth guest-vlan

**Overview** Use this command to enable and configure the Guest VLAN feature on the interface specified by associating a Guest VLAN with an interface. This command does not start authentication. The supplicant's (client device's) traffic is associated with the native VLAN of the interface unless it is already associated with another VLAN. The **routing** option enables routing from the Guest VLAN to another VLAN, so the switch can lease DHCP addresses and accept access to a limited network.

The **no** variant of this command disables the guest VLAN feature on the interface specified.

**Syntax** `auth guest-vlan <1-4094> [routing]`  
`no auth guest-vlan [routing]`

| Parameter | Description                                         |
|-----------|-----------------------------------------------------|
| <1-4094>  | VLAN ID (VID).                                      |
| routing   | Enables routing from the Guest VLAN to other VLANs. |

**Default** The Guest VLAN authentication feature is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** The Guest VLAN feature may be used by supplicants (client devices) that have not attempted authentication, or have failed the authentication process. Note that if a port is in multi-supplicant mode with per-port dynamic VLAN configuration, after the first successful authentication, subsequent hosts cannot use the guest VLAN due to the change in VLAN ID. This may be avoided by using per-user dynamic VLAN assignment.

When using the Guest VLAN feature with the multi-host mode, a number of supplicants can communicate via a guest VLAN before authentication. A supplicant's traffic is associated with the native VLAN of the specified switch port. The supplicant must belong to a VLAN before traffic from the supplicant can be associated.

Note that you must enable 802.1X on the port and define a VLAN using the [vlan](#) command before you can configure it as a guest VLAN.

Roaming Authentication cannot be enabled if DHCP snooping is enabled ([service dhcp-snooping](#) command), and vice versa.

Note that Guest VLAN can use only untagged ports.

See the [AAA and Port Authentication Feature Overview and Configuration Guide](#) for information about:

- Guest VLAN, and

- restrictions regarding combinations of authentication enhancements working together

**Examples** To define vlan100 and assign the guest VLAN feature to vlan100 on interface port1.1.2, and enable routing from the guest VLAN to other VLANs, use the following commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 100
awplus(config-vlan)# exit
awplus(config)# interface port1.1.2
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth guest-vlan 100 routing
```

To disable the guest VLAN feature on port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth guest-vlan
```

To define vlan100 and assign the guest VLAN feature to vlan100 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 100
awplus(config-vlan)# exit
awplus(config)# auth profile student
awplus(config-auth-profile)# auth guest-vlan 100
```

**Related commands**

- [show dot1x interface](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# auth guest-vlan forward

**Overview** Use this command to enable packet forwarding from the guest VLAN to a destination IP address or subnet. If this command is configured, the device can lease DHCP addresses and accept access to a limited part of your network. Also, when using NAP authentication, the supplicant can log on to a domain controller to gain certification.

Use the **no** variant of this command to disable packet forwarding from the Guest VLAN to a destination IP address or subnet.

**Syntax** `auth guest-vlan forward {<ip-address>|<ip-address/mask>}  
[dns|tcp <1-65535>|udp <1-65535>]`  
`no auth guest-vlan forward {<ip-address>|<ip-address/mask>}  
[dns|tcp <1-65535>|udp <1-65535>]`

| Parameter                             | Description                                                                                      |
|---------------------------------------|--------------------------------------------------------------------------------------------------|
| <ip-address><br><ip-address/<br>mask> | The IP address or subnet to which the guest VLAN can forward packets, in dotted decimal notation |
| dns                                   | Enable forwarding of DNS packets                                                                 |
| tcp <1-65535>                         | Enable forwarding of packets for the specified TCP port number                                   |
| udp <1-65535>                         | Enable forwarding of packets for the specified UDP port number                                   |

**Default** Forwarding is disabled by default.

**Mode** Interface Configuration mode for a specified switch port, or Authentication Profile mode

**Usage** Before using this command, you must configure the guest VLAN with the [auth guest-vlan](#) command.

**Example** To enable packet forwarding from the guest VLAN to the destination IP address on interface port1.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# auth guest-vlan forward 10.0.0.1
```

To enable forwarding of DNS packets from the guest VLAN to the destination IP address on interface port1.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface
awplus(config-if)# auth guest-vlan forward 10.0.0.1 dns
```

To disable forwarding of DNS packets from the guest VLAN to the destination IP address on port1.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth guest-vlan forward 10.0.0.1 dns
```

To enable the TCP forwarding port 137 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth guest-vlan forward 10.0.0.1
tcp 137
```

**Command  
changes**

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# auth guest-vlan hw-forwarding

**Overview** Use this command to enable hardware forwarding on the guest VLAN. By default, hardware forwarding is disabled and all traffic on the VLAN is forwarded by the CPU.

Use the **no** variant of this command to disable hardware forwarding on the guest VLAN.

**Syntax** `auth guest-vlan hw-forwarding`  
`no auth guest-vlan hw-forwarding`

**Default** Disabled.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Example** To enable guest VLAN hardware forwarding on interface port1.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# auth guest-vlan hw-forwarding
```

To disable guest VLAN hardware forwarding on port1.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth guest-vlan hw-forwarding
```

To enable guest VLAN hardware forwarding authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth guest-vlan hw-forwarding
```

**Related commands** [auth profile \(global\)](#)  
[auth guest-vlan](#)  
[auth guest-vlan forward](#)

**Command changes** Version 5.5.0-1.1: command added to x230, GS970M, IE210 series switches.  
Version 5.5.1-0.1: command added to all other AlliedWare Plus switches.

# auth host-mode

**Overview** Use this command to select the host mode on the specified interface.

Use the **no** variant of this command to set host mode to the default setting (single host).

**Syntax**

```
auth host-mode
{host-plus-voice|single-host|multi-host|multi-supPLICANT}

no auth host-mode
```

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| host-plus-voice  | In this mode, only one voice device (IP phone) and one host device can join the network. You use the RADIUS attribute 'Cisco-AVPair device-traffic-class=voice' to identify the IP phone. For more information and a step-by-step configuration example, see the "Limit the number of supplicants when connecting via an IP phone" section of the <a href="#">AAA and Port Authentication Feature Overview and Configuration Guide</a> . |
| single-host      | In this mode, only one supplicant is allowed per port. This is the default mode.                                                                                                                                                                                                                                                                                                                                                         |
| multi-host       | In this mode, once the first host on a port is authenticated, all other downstream hosts are allowed without being authenticated (piggy-back mode).                                                                                                                                                                                                                                                                                      |
| multi-supPLICANT | In this mode, multiple separate supplicants are individually authenticated on one port.                                                                                                                                                                                                                                                                                                                                                  |

**Default** The default host mode for port authentication is for a single host.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** **Single-host mode**

With this mode, only one supplicant may be authenticated on the port. Once that host has been authenticated, no other supplicants may be authenticated until the first supplicant's session has closed. This means, of course, that none of the other hosts downstream of the port will be able to send or receive traffic on that port.

This option is recommended when you know that there should only be one host connected to a port. By limiting the port to a single authenticated host, you guard against the consequences of someone accidentally or maliciously connecting a downstream switch to the port.

**Multi-host mode**

With this mode, once the first host has been authenticated on the port, all other downstream hosts are allowed without being authenticated. This is sometimes known as piggy-back mode. It is useful when the downstream switch attached to

the authenticating port is an intelligent switch that can act as an authentication supplicant.

If you trust that malicious users cannot be connected to that switch but you do not know the identity of those users, then you can simply authenticate the switch and then allow its attached users to have network access. If the valid switch is disconnected and an invalid one is connected which is not configured with the correct authentication credentials, then the devices connected to the invalid switch will be blocked from accessing the network.

**Examples** To set the host mode to multi-supplicant on interface port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# auth host-mode multi-supplicant
```

To set the host mode to the default (single host) on interface port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth host-mode
```

To set the host mode to multi-supplicant on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth host-mode multi-supplicant
```

To set the host mode to the default (single host) on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth host-mode
```

**Command changes** Version 5.5.2-1.1: **host-plus-voice** parameter added

# auth log

**Overview** Use this command to configure the types of authentication feature log messages that are output to the log file.

Use the **no** variant of this command to remove either specified types or all types of authentication feature log messages that are output to the log file.

**Syntax**

```
auth log {dot1x|auth-mac|auth-web}
{success|failure|logoff|all}

no auth log {dot1x|auth-mac|auth-web}
{success|failure|logoff|all}
```

| Parameter | Description                                                                                                                                                 |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dot1x     | Specify only 802.1X-Authentication log messages are output to the log file.                                                                                 |
| auth-mac  | Specify only MAC-Authentication log messages are output to the log file.                                                                                    |
| auth-web  | Specify only Web-Authentication log messages are output to the log file.                                                                                    |
| success   | Specify only successful authentication log messages are output to the log file.                                                                             |
| failure   | Specify only authentication failure log messages are output to the log file.                                                                                |
| logoff    | Specify only authentication log-off messages are output to the log file. Note that link down, age out and expired ping polling messages will be included.   |
| all       | Specify all types of authentication log messages are output to the log file. Note that this is the default behavior for the authentication logging feature. |

**Default** All types of authentication log messages are output to the log file by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To configure the logging of MAC authentication failures to the log file for supplicants (client devices) connected to interface port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# auth log auth-mac failure
```

To disable the logging of all types of authentication log messages to the log file for auth-mac supplicants (client devices) connected to interface port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth log auth-mac all
```

To configure the logging of web authentication failures to the log file for supplicants (client devices) connected to authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth log auth-web failure
```

To disable the logging of all types of authentication log messages to the log file for auth-mac supplicants (client devices) connected to authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth log auth-mac all
```

**Related  
commands**    [auth profile \(global\)](#)  
              [show running-config](#)

# auth max-suppliant

**Overview** Use this command to set the maximum number of supplicants (client devices) that can be authenticated on the selected port. Once this value is exceeded, further supplicants will not be authenticated.

The **no** variant of this command resets the maximum supplicant number to the default.

**Syntax** `auth max-suppliant <2-1024>`  
`no auth max-suppliant`

| Parameter | Description   |
|-----------|---------------|
| <2-1024>  | Limit number. |

**Default** 1024

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To set the maximum number of supplicants to 10 on interface port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# auth max-suppliant 10
```

To reset the maximum number of supplicants to the default value on interface port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth max-suppliant
```

To set the maximum number of supplicants to 10 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth max-suppliant 10
```

To reset the maximum number of supplicants to the default value on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth max-suppliant
```

**Related commands**

- `auth max-supPLICANT untagged-vlan`
- `auth profile (global)`
- `show dot1x`
- `show dot1x interface`
- `show running-config`

# auth max-suppliant tagged-vlan

**Overview** Use this command to set the maximum number of supplicants (client devices) that can be authenticated on the selected port on tagged VLANs. Once this value is exceeded, further supplicants will not be authenticated on tagged VLANs on that port.

This command is useful for preventing unwanted supplicants from connecting to the network when a host (e.g. a PC) connects to an AlliedWare Plus NAS via an IP phone. For more information and a step-by-step configuration example, see the ["Limit the number of supplicants when connecting via an IP phone" section of the AAA and Port Authentication Feature Overview and Configuration Guide](#).

Use the **no** variant of this command to reset the maximum number of supplicants on tagged VLANs to the default.

**Syntax** `auth max-suppliant tagged-vlan <0-1024>`  
`no auth max-suppliant tagged-vlan <0-1024>`

**Default** 1024

**Mode** Interface Configuration for a switch port; or Authentication Profile mode.

**Examples** To set the maximum number of supplicants on tagged VLANs on interface port1.1.2 to 1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# auth max-suppliant tagged-vlan 1
```

To reset the maximum number of supplicants on tagged VLANs on interface port1.1.2 to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth max-suppliant tagged-vlan
```

To set the maximum number of supplicants on tagged VLANs on authentication profile 'accounts' to 1, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile accounts
awplus(config-auth-profile)# auth max-suppliant tagged-vlan 1
```

To reset the maximum number of supplicants on tagged VLANs on authentication profile 'accounts' to the default value, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile accounts
awplus(config-auth-profile)# no auth max-suppliant tagged-vlan
```

**Related commands**    [auth max-suppliant](#)  
                              [auth max-suppliant untagged-vlan](#)

**Command changes**    Version 5.5.2-1.1: command added

# auth max-suppliant untagged-vlan

**Overview** Use this command to set the maximum number of supplicants (client devices) that can be authenticated on the selected port on untagged VLANs. Once this value is exceeded, further supplicants will not be authenticated on untagged VLANs on that port.

This command is useful for preventing unwanted supplicants from connecting to the network when a host (e.g. a PC) connects to an AlliedWare Plus NAS via an IP phone. For more information and a step-by-step configuration example, see the [“Limit the number of supplicants when connecting via an IP phone”](#) section of the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

Use the **no** variant of this command to reset the maximum number of supplicants on untagged VLANs to the default.

**Syntax** `auth max-suppliant untagged-vlan <0-1024>`  
`no auth max-suppliant untagged-vlan <0-1024>`

**Default** 1024

**Mode** Interface Configuration for a switch port; or Authentication Profile mode.

**Examples** To set the maximum number of supplicants on untagged VLANs on interface port1.1.2 to 1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# auth max-suppliant untagged-vlan 1
```

To reset the maximum number of supplicants on untagged VLANs on interface port1.1.2 to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth max-suppliant untagged-vlan
```

To set the maximum number of supplicants on untagged VLANs on authentication profile 'accounts' to 1, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile accounts
awplus(config-auth-profile)# auth max-suppliant untagged-vlan 1
```

To reset the maximum number of supplicants on untagged VLANs on authentication profile 'accounts' to the default value, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile accounts
awplus(config-auth-profile)# no auth max-suppliant untagged-vlan
```

- Command changes** Version 5.5.2-1.1: command added

# auth multi-vlan-session

**Overview** Use this command to enable packet forwarding on multiple VLANs for an authenticated supplicant attached to a trunked (tagged VLAN) port.

By default, AlliedWare Plus only allows packet forwarding on the VLAN that a device was authenticated on. This command enables packet forwarding to the attached device on any VLAN configured on the switchport. After the device authenticates it will have access to all VLANs configured on the switchport.

Use the **no** variant of this command to disable packet forwarding on multiple VLANs for an authenticated supplicant.

**Syntax** `auth multi-vlan-session`  
`no auth multi-vlan-session`

**Default** By default, **multi-vlan-session** is disabled.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Example** To allow a client attached to port1.1.2 to access all VLANs configured on the AlliedWare Plus device, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# switchport mode trunk
awplus(config-if)# switchport trunk allowed vlan all
awplus(config-if)# auth host-mode multi-supplicant
awplus(config-if)# auth multi-vlan-session
```

To disable **multi-vlan-session** on interface port1.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth multi-vlan-session
```

**Command changes**

- Version 5.4.8-1.1: command added
- Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# auth priority

**Overview** Use this command to enable authentication priority on an interface. This sets the tri-authentication order of priority for MAC, 802.1X, and web-based authentication. If tri-authentication is not configured on the interface then this command has no effect.

You specify the authentication methods in order of priority. The first method in the list has the highest priority, the second method has the second highest priority, and the third method has the lowest priority. Any methods not specified will have the lowest priority.

Use the **no** variant of this command to disable authentication priority.

**Syntax** `auth priority {[auth-mac] [dot1x] [auth-web]}`  
`no auth priority`

| Parameter | Description                            |
|-----------|----------------------------------------|
| auth-mac  | Set MAC authentication priority.       |
| dot1x     | Set 802.1X authentication priority.    |
| auth-web  | Set web-based authentication priority. |

**Default** Authentication priority is not set.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** Before using this command you must correctly configure tri-authentication on the interface. Tri-authentication is when multiple authentication methods (MAC, 802.1X, and/or web-based) are configured on the same interface. With tri-authentication, a supplicant is authorized to use the network as soon as they are successfully authenticated by any of the configured authentication methods.

When authentication priority is not set, once a supplicant is authenticated any future attempts to authenticate are ignored. When, however, authentication priority is set, and a higher priority authentication attempt is made by the supplicant, a new authentication process starts. The supplicant will then be authorized, or unauthorized, based on the result of this new authentication attempt.

**Example** To configure 802.1X authentication to have a higher priority than MAC authentication on interface port1.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# switchport mode access
awplus(config-if)# auth-mac enable
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth priority dot1x auth-mac
```

To disable authentication priority on interface port1.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth priority
```

To configure 802.1X authentication to have a higher priority than MAC authentication on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-if)# switchport mode access
awplus(config-if)# auth-mac enable
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth priority dot1x auth-mac
```

**Related commands**

- [auth profile \(interface\)](#)
- [auth-mac enable](#)

**Command changes** Version 5.5.0-2.1: command added

# auth profile (global)

**Overview** Use this command to enter port authentication profile mode and configure a port authentication profile.

If the specified profile does not exist a new authentication profile is created with the name provided.

Use the **no** variant of this command to delete the specified port authentication profile.

**Syntax** `auth profile <profile-name>`  
`no auth profile <profile-name>`

| Parameter                         | Description                                 |
|-----------------------------------|---------------------------------------------|
| <code>&lt;profile-name&gt;</code> | Name of the profile to create or configure. |

**Default** No port authentication profiles are created by default.

**Mode** Global Configuration

**Usage** A port authentication profile is a configuration object that aggregates multiple port authentication commands. These profiles are attached or detached from an interface using the [auth profile \(interface\)](#) command.

**Example** To create a new authentication profile 'student', use the following commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)#
```

To delete an authentication profile 'student', use the following commands:

```
awplus# configure terminal
awplus(config)# no auth profile student
```

**Related commands** [auth profile \(interface\)](#)  
[description \(auth-profile\)](#)

# auth profile (interface)

**Overview** Use this command to attach a port authentication profile to the current interface.

Use the **no** variant of this command to detach a port authentication profile from the current interface.

**Syntax** `auth profile <profile-name>`  
`no auth profile <profile-name>`

| Parameter                         | Description                                                 |
|-----------------------------------|-------------------------------------------------------------|
| <code>&lt;profile-name&gt;</code> | The name of the profile to attach to the current interface. |

**Default** No profile is attached by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage** This command attaches an authentication profile, that was created using the [auth profile \(global\)](#) command, to a static channel, a dynamic (LACP) channel group, or a switch port.

You can only attach one profile to an interface at a time. Use the **no** variant of the command to detach a profile before attempting to attach another one.

**Example** To attach the authentication profile 'student' to port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# auth profile student
```

To detach the authentication profile 'student' from port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth profile student
```

**Related commands** [auth profile \(global\)](#)

# auth reauthentication

**Overview** Use this command to enable re-authentication on the interface specified in the Interface mode, which may be a static channel group (or static aggregator) or a dynamic (or LACP) channel group or a switch port.

Use the **no** variant of this command to disable reauthentication on the interface.

**Syntax** `auth reauthentication`  
`no auth reauthentication`

**Default** Reauthentication of port authentication is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To enable reauthentication on interface port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# auth reauthentication
```

To disable reauthentication on interface port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth reauthentication
```

To enable reauthentication on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth reauthentication
```

**Related commands** [auth profile \(global\)](#)  
[show dot1x](#)  
[show dot1x interface](#)  
[show running-config](#)

# auth roaming disconnected

**Overview** This command allows a supplicant to move to another authenticating interface without reauthentication, even if the link is down for the interface that the supplicant is currently connected to.

You must enter the [auth roaming enable](#) command on both interfaces before using this command.

The **no** variant of this command disables roaming authentication on interfaces that are link-down, and forces a supplicant to be reauthenticated when moving between interfaces.

See the [AAA and Port Authentication Feature Overview and Configuration Guide](#) for further information about this feature.

**Syntax** `auth roaming disconnected`  
`no auth roaming disconnected`

**Default** By default, the authentication status for a roaming supplicant is deleted when an interface goes down, so supplicants must reauthenticate.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** Note that 802.1X port authentication, MAC-authentication, or Web-authentication must be configured before using this feature. The port that the supplicant is moving to must have the same authentication configuration as the port the supplicant is moving from.

Roaming Authentication cannot be enabled if DHCP snooping is enabled ([service dhcp-snooping](#) command), and vice versa.

**Examples** To allow supplicants to move from port1.1.2 without reauthentication even when the link is down, when using 802.1X authentication, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth roaming enable
awplus(config-if)# auth roaming disconnected
```

To require supplicants to reauthenticate when moving from port1.1.2 if the link is down, when using 802.1X authentication, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth roaming disconnected
```

To allow supplicants using authentication profile 'student' to move between ports without reauthentication even when the link is down, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth roaming disconnected
```

To require supplicants using authentication profile 'student' to reauthenticate when moving between ports if the link is down, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth roaming disconnected
```

# auth roaming enable

**Overview** Use this command to allow a supplicant to move to another authenticating interface without reauthentication, providing the link is up for the interface that the supplicant is currently connected to.

The **no** variant of this command disables roaming authentication on an interface, and forces a supplicant to be reauthenticated when moving between interfaces.

See the [AAA and Port Authentication Feature Overview and Configuration Guide](#) for further information about this feature.

**Syntax** `auth roaming enable`  
`no auth roaming enable`

**Default** Roaming authentication is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** Note that 802.1X port authentication, MAC authentication, or web-based authentication must be configured before using this feature. The port that the supplicant is moving to must have the same authentication configuration as the port the supplicant is moving from.

This command only enables roaming authentication for links that are up. If you want roaming authentication on links that are down, you must also use the command [auth roaming disconnected](#).

Roaming Authentication cannot be enabled if DHCP snooping is enabled ([service dhcp-snooping](#) command), and vice versa.

**Examples** To enable roaming authentication for port1.1.4, when using auth-mac authentication, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.4
awplus(config-if)# auth-mac enable
awplus(config-if)# auth roaming enable
```

To disable roaming authentication for port1.1.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.4
awplus(config-if)# no auth roaming enable
```

To enable roaming authentication for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth roaming enable
```

# auth supplicant-ip

**Overview** Use this command to add a supplicant (client device) IP address on a given interface.

Use the **no** variant of this command to delete the supplicant IP address and reset other parameters to their default values. The IP address can be determined before authentication for auth-web clients only.

**Syntax** `auth supplicant-ip <ip-addr> [max-reauth-req <1-10>] [max-req <1-10>] [port-control {auto|force-authorized|force-unauthorized|skip-second-auth}] [quiet-period <1-65535>] [reauthentication] [reauth-period <1-4294967295>] [supp-timeout <1-65535>] [server-timeout <1-65535>]`  
`no auth supplicant-ip <ip-addr> [reauthentication]`

| Parameter                    | Description                                                                                                                                                                                                                                                                                                                                |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ip-addr>                    | IP address of the supplicant entry in A.B.C.D/P format.                                                                                                                                                                                                                                                                                    |
| max-reauth-req <1-10>        | Number of reauthentication attempts before becoming unauthorized (default 2).                                                                                                                                                                                                                                                              |
| max-req <1-10>               | Number of times the device resends an EAP Request packet if that packet is lost between the authenticating device and the specified supplicant (default 2, which is 3 transmission attempts in total). If the supplicant does not respond to an EAP Request after this number of retries, the supplicant fails the authentication process. |
| port-control                 | Port control options:<br><b>auto</b> : Allow port client to negotiate authentication<br><b>force-authorized</b> : Force port state to authorized<br><b>force-unauthorized</b> : Force port state to unauthorized<br><b>skip-second-auth</b> : Skip second authentication step.                                                             |
| quiet-period <1-65535>       | Quiet period in the HELD state in seconds (default 60 seconds).                                                                                                                                                                                                                                                                            |
| reauthentication             | Enable reauthentication on a port.                                                                                                                                                                                                                                                                                                         |
| reauth-period <1-4294967295> | Seconds between reauthorization attempts (default 3600 seconds).                                                                                                                                                                                                                                                                           |
| supp-timeout <1-65535>       | Supplicant response timeout in seconds (default 30 seconds).                                                                                                                                                                                                                                                                               |
| server-timeout <1-65535>     | Authentication server response timeout in seconds (default 30 seconds).                                                                                                                                                                                                                                                                    |

**Default** No supplicant IP address for port authentication exists by default until first created with the **auth supplicant-ip** command. The parameter defaults are shown in the table above.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To add the supplicant IP address 192.168.10.0/24 to force authorized port control for interface port1.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# auth supplicant-ip 192.168.10.0/24
port-control force-authorized
```

To delete the supplicant IP address 192.168.10.0/24 for interface port1.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth supplicant-ip 192.168.10.0/24
```

To disable reauthentication for the supplicant(s) IP address 192.168.10.0/24 for interface port1.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth supplicant-ip 192.168.10.0/24
reauthentication
```

To add the supplicant IP address 192.168.10.0/24 to force authorized port control for auth profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth supplicant-ip
192.168.10.0/24 port-control force-authorized
```

**Command changes** Version 5.5.3-1.1: **max-req** parameter added

# auth supplicant-mac

**Overview** This command adds a supplicant (client device) MAC address or MAC mask on a given interface with the parameters as specified in the table below.

Use the **no** variant of this command to delete the supplicant MAC address and reset other parameters to their default values.

**Syntax**

```
auth supplicant-mac <mac-addr> [mask <mac-addr-mask>]
[max-reauth-req <1-10>] [max-req <1-10>] [port-control
{auto|force-authorized|force-unauthorized|skip-second-auth}]
[quiet-period <1-65535>] [reauthentication] [reauth-period
<1-4294967295>] [supp-timeout <1-65535>] [server-timeout
<1-65535>]

no auth supplicant-mac <mac-addr> [reauthentication]
```

| Parameter                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <mac-addr>                | MAC (hardware) address of the supplicant entry in HHHH.HHHH.HHHH MAC address hexadecimal format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| mask<br><mac-addr-mask>   | A mask applied to MAC addresses in order to select only those addresses containing a specific string. The mask comprises a string of three (period separated) bytes, where each byte comprises four hexadecimal characters that will generally be either 1 or 0. When the mask is applied to a specific MAC address, a match is only required for characters that correspond to a 1 in the mask. Characters that correspond to a 0 in the mask are effectively ignored. In the examples section below, the mask ffff.ff00.0000 is applied for the MAC address 0000.5E00.0000. The applied mask will then match only those MAC addresses that begin with 0000.5E (in this case the OUI component). The remaining portion of the addresses (in this case the NIC component) will be ignored. |
| max-reauth-req<br><1-10>  | Number of reauthentication attempts before becoming unauthorized (default 2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| max-req <1-10>            | Number of times the device resends an EAP Request packet if that packet is lost between the authenticating device and the specified supplicant (default 2, which is 3 transmission attempts in total). If the supplicant does not respond to an EAP Request after this number of retries, the supplicant fails the authentication process.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| port-control              | Port control options:<br><b>auto</b> : Allow port client to negotiate authentication<br><b>force-authorized</b> : Force port state to authorized<br><b>force-unauthorized</b> : Force port state to unauthorized<br><b>skip-second-auth</b> : Skip second authentication step.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| quiet-period<br><1-65535> | Quiet period in the HELD state in seconds (default 60 seconds).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Parameter                       | Description                                                             |
|---------------------------------|-------------------------------------------------------------------------|
| reauthentication                | Enable reauthentication on a port.                                      |
| reauth-period<br><1-4294967295> | Seconds between reauthorization attempts (default 3600 seconds).        |
| supp-timeout<br><1-65535>       | Supplicant response timeout in seconds (default 30 seconds).            |
| server-timeout<br><1-65535>     | Authentication server response timeout in seconds (default 30 seconds). |

**Default** No supplicant MAC address for port authentication exists by default until first created with the **auth supplicant-mac** command. The defaults for parameters are shown in the table above.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To add the supplicant MAC address 0000.5E00.5343 to force authorized port control for interface port1.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# auth supplicant-mac 0000.5E00.5343
port-control force-authorized
```

To apply the mask ffff.ff00.0000 in order to add any supplicant MAC addresses whose MAC address begins with 0000.5E, and then to force authorized port control for interface port1.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# auth supplicant-mac 0000.5E00.0000 mask
ffff.ff00.0000 port-control force-authorized
```

To delete the supplicant MAC address 0000.5E00.5343 for interface port1.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth supplicant-mac 0000.5E00.5343
```

To disable reauthentication for the supplicant MAC address 0000.5E00.5343 for interface port1.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth supplicant-mac 0000.5E00.5343
reauthentication
```

To add the supplicant MAC address 0000.5E00.5343 to force authorized port control for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth supplicant-mac
0000.5E00.5343 port-control force-authorized
```

To delete the supplicant MAC address 0000.5E00.5343 for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth supplicant-mac
0000.5E00.5343
```

**Command  
changes**

Version 5.5.3-1.1: **max-req** parameter added

# auth timeout connect-timeout

**Overview** Use this command to set the connect-timeout period for the interface.

Use the **no** variant of this command to reset the connect-timeout period to the default.

**Syntax** `auth timeout connect-timeout <1-65535>`  
`no auth timeout connect-timeout`

| Parameter | Description                                        |
|-----------|----------------------------------------------------|
| <1-65535> | Specifies the connect-timeout period (in seconds). |

**Default** The connect-timeout default is 30 seconds.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** This command is used for MAC and web authentication. If the connect-timeout has lapsed and the supplicant has the state **connecting**, then the supplicant is deleted. When [auth-web-server session-keep](#) or [auth two-step enable](#) is enabled, we recommend you configure a longer connect-timeout period.

**Examples** To set the connect-timeout period to 3600 seconds for port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# auth timeout connect-timeout 3600
```

To reset the connect-timeout period to the default (30 seconds) for port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth timeout connect-timeout
```

To set the connect-timeout period to 3600 seconds for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth timeout connect-timeout 3600
```

**Related commands** [auth profile \(global\)](#)

[show dot1x interface](#)

# auth timeout quiet-period

**Overview** Use this command to set a time period for which another authentication request is not accepted on a given interface, after an authentication request has failed.

Use the **no** variant of this command to reset the quiet period to the default.

**Syntax** `auth timeout quiet-period <1-65535>`  
`no auth timeout quiet-period`

| Parameter | Description                              |
|-----------|------------------------------------------|
| <1-65535> | Specifies the quiet period (in seconds). |

**Default** The quiet period for port authentication is 60 seconds.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To set the quiet period to 10 seconds for interface port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# auth timeout quiet-period 10
```

To reset the quiet period to the default (60 seconds) for interface port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth timeout quiet-period
```

To set the quiet period to 10 seconds for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth timeout quiet-period 10
```

**Related commands** [auth profile \(global\)](#)

# auth timeout reauth-period

**Overview** Use this command to set the timer for reauthentication on a given interface. The re-authentication for the supplicant (client device) is executed at this timeout. The timeout is only applied if the **auth reauthentication** command is applied.

Use the **no** variant of this command to reset the **reauth-period** parameter to the default (3600 seconds).

**Syntax** `auth timeout reauth-period <1-4294967295>`  
`no auth timeout reauth-period`

| Parameter      | Description                                       |
|----------------|---------------------------------------------------|
| <1-4294967295> | The reauthentication timeout period (in seconds). |

**Default** The default reauthentication period for port authentication is 3600 seconds, when reauthentication is enabled on the port.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To set the reauthentication period to 1 day for interface port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# auth timeout reauth-period 86400
```

To reset the reauthentication period to the default (3600 seconds) for interface port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth timeout reauth-period
```

To set the reauthentication period to 1 day for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth timeout reauth-period 86400
```

To reset the reauthentication period to the default (3600 seconds) for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth timeout reauth-period
```

# auth timeout server-timeout

**Overview** Use this command to set the timeout for the waiting response from the RADIUS server on a given interface.

Use the **no** variant of this command to reset the server-timeout to the default (30 seconds).

**Syntax** `auth timeout server-timeout <1-65535>`  
`no auth timeout server-timeout`

| Parameter | Description                         |
|-----------|-------------------------------------|
| <1-65535> | Server timeout period (in seconds). |

**Default** The server timeout for port authentication is 30 seconds.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To set the server timeout to 120 seconds for interface port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# auth timeout server-timeout 120
```

To set the server timeout to the default (30 seconds) for interface port1.1.2 use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth timeout server-timeout
```

To set the server timeout to 120 seconds for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth timeout server-timeout 120
```

To set the server timeout to the default (30 seconds) for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth timeout server-timeout
```

**Related commands** [auth profile \(global\)](#)

`show dot1x`  
`show dot1x interface`  
`show running-config`

# auth timeout supp-timeout

**Overview** This command sets the timeout of the waiting response from the supplicant (client device) on a given interface.

The **no** variant of this command resets the supplicant timeout to the default (30 seconds).

**Syntax** `auth timeout supp-timeout <1-65535>`  
`no auth timeout supp-timeout`

| Parameter | Description                                 |
|-----------|---------------------------------------------|
| <1-65535> | The supplicant timeout period (in seconds). |

**Default** The supplicant timeout for port authentication is 30 seconds.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To set the supplicant timeout to 2 seconds for interface port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# auth timeout supp-timeout 2
```

To reset the supplicant timeout to the default (30 seconds) for interface port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth timeout supp-timeout
```

To set the supplicant timeout to 2 seconds for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth timeout supp-timeout 2
```

# auth vlan-restriction

**Overview** Use this command to restrict port authenticated supplicants on an interface to one per VLAN. This is useful, for example, if you have configured multiple supplicants on an interface but you want to restrict network access to a single IP phone and a single authorized workstation.

Use the **no** variant of this command to remove the single supplicant per VLAN restriction.

**Syntax** `auth vlan-restriction`  
`no auth vlan-restriction`

**Default** Not configured

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** This is a port authentication command, so you should first configure 802.1X, MAC, or web authentication. In addition, configure multi-supplicants on the interface using the **auth host-mode multi-supplicant** command.

This command works with both dynamic VLANs and static voice VLAN configurations.

**Examples** To restrict supplicants to a one per VLAN on interface port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# auth vlan-restriction
```

To remove the one per VLAN supplicant restriction on interface port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth vlan-restriction
```

**Command changes** Version 5.5.1-2.1: command added

# auth two-step enable

**Overview** Use this command to enable a two-step authentication feature on an interface. When this feature is enabled, the supplicant is authorized in a two-step process. If authentication succeeds, the supplicant becomes authenticated.

Use this command to apply the two-step authentication method based on 802.1X, MAC or web authentication.

Use the **no** variant of this command to disable the two-step authentication feature.

**Syntax** `auth two-step enable`  
`no auth two-step enable`

**Default** Two step authentication is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage** The single step authentication methods (either user or device authentication) have a potential security risk:

- an unauthorized user can access the network with an authorized device, or
- an authorized user can access the network with an unauthorized device.

Two-step authentication solves this problem by authenticating both the user and the device. The supplicant will only become authenticated if both these steps are successful. If the first authentication step fails, then the second step is not started.

**Examples** To enable the two step authentication feature, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# auth two-step enable
```

To disable the two step authentication feature, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth two-step enable
```

To enable MAC authentication followed by 802.1X authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# switchport mode access
awplus(config-if)# auth-mac enable
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth dynamic-vlan-creation
awplus(config-if)# auth two-step enable
```

To enable MAC authentication followed by web authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# switchport mode access
awplus(config-if)# auth-mac enable
awplus(config-if)# auth-web enable
awplus(config-if)# auth dynamic-vlan-creation
awplus(config-if)# auth two-step enable
```

To enable 802.1X authentication followed by web authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# switchport mode access
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth-web enable
awplus(config-if)# auth dynamic-vlan-creation
awplus(config-if)# auth two-step enable
```

To enable the two step authentication feature for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth two-step enable
```

**Command  
changes**

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# auth two-step order

**Overview** Use this command to configure the order for two-step authentication. Two-step authentication and the relevant authentication methods must be enabled on the interface.

Use the **no** variant of this command to reset the authentication order to the default.

**Syntax**

```
auth two-step order auth-mac {dot1x|auth-web}
auth two-step order dot1x {auth-mac|auth-web}
no auth two-step order
```

| Parameter | Description           |
|-----------|-----------------------|
| auth-mac  | MAC authentication    |
| dot1x     | 802.1X authentication |
| auth-web  | Web authentication    |

**Default** Order is determined by the authentication methods configured on the interface (see **Usage notes**).

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** The default authentication order depends on the combination of the authentication methods configured on the interface:

- If auth-mac is configured then auth-mac will be the first method.
- If auth-mac is **not** configured then dot1x will become the first method.
- If only two methods are configured then the remaining method becomes the second method.
- If all three methods are configured then the second method is chosen based on the packet type received (dot1x for an EAPOL packet and auth-web for an HTTP packet).

**Examples** To set the two-step authentication order on port1.1.1 for 802.1X authentication and then MAC authentication, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# switchport mode access
awplus(config-if)# auth-mac enable
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth two-step enable
awplus(config-if)# auth two-step order dot1x auth-mac
```

To reset the two-step authentication order back to the default, which would be MAC authentication then 802.1X authentication if configured as above, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# no auth two-step order
```

- [show auth supplicant](#)

**Command changes** Version 5.5.0-0.3: command added

# auth-mac accounting

**Overview** Use this command to override the **default** RADIUS accounting method for MAC-based authentication on an interface by allowing you to apply a user-defined named list.

Use the **no** variant of this command to remove the named list from the interface and apply the **default** method.

**Syntax** `auth-mac accounting {default|<list-name>}`  
`no auth-mac accounting`

| Parameter   | Description                              |
|-------------|------------------------------------------|
| default     | Apply the default accounting method list |
| <list-name> | Apply the user-defined named list        |

**Default** The **default** method list is applied to an interface by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Example** To apply the named list 'vlan10\_acct' on the vlan10 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# auth-mac accounting vlan10_acct
```

To remove the named list from the vlan10 interface and set the accounting method back to **default**, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no auth-mac accounting
```

**Related commands** [aaa accounting auth-mac](#)

**Command changes** Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# auth-mac authentication

**Overview** This command overrides the **default** MAC authentication method on an interface by allowing you to apply a user-defined named list.

Use the **no** variant of this command to remove the named list from the interface and apply the **default** method.

**Syntax** `auth-mac authentication {default|<list-name>}`  
`no auth-mac authentication`

| Parameter   | Description                                  |
|-------------|----------------------------------------------|
| default     | Apply the default authentication method list |
| <list-name> | Apply a user-defined named list              |

**Default** The **default** method list is applied to an interface by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Example** To apply the named list 'vlan10\_auth' on the vlan10 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# auth-mac authentication vlan10_auth
```

To remove the named list from the vlan10 interface and set the authentication method back to **default**, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no auth-mac authentication
```

**Related commands** [aaa authentication auth-mac](#)

**Command changes** Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# auth-mac enable

**Overview** This command enables MAC authentication on the interface specified in the Interface command mode.

Use the **no** variant of this command to disable MAC authentication on an interface.

**Syntax** `auth-mac enable`  
`no auth-mac enable`

**Default** MAC-Authentication is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** Enabling **spanning-tree edgeport** on ports after enabling MAC authentication avoids unnecessary re-authentication when the port state changes, which does not happen when spanning tree edgeport is enabled. Note that re-authentication is correct behavior without **spanning-tree edgeport** enabled.

Applying **switchport mode access** on ports is also good practice to set the ports to access mode with ingress filtering turned on, whenever ports for MAC authentication are in a VLAN.

If you attempt to change the authentication configuration on an interface that has threat protection quarantine configured, you will see the following error message:

```
% portx.x.x: Application Proxy quarantine configuration must be removed before port authentication is changed
```

Before changing the interface's authentication configuration you must either:

- remove the interface's threat protection configuration, or
- shut down the interface.

**Examples** To enable MAC authentication on interface port1.1.2 and enable spanning tree edgeport to avoid unnecessary re-authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# auth-mac enable
awplus(config-if)# spanning-tree edgeport
awplus(config-if)# switchport mode access
```

To disable MAC authentication on interface port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth-mac enable
```

To enable MAC authentication on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-mac enable
```

changes**

Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# auth-mac method

**Overview** This command sets the type of authentication method for MAC authentication that is used with RADIUS on the interface specified in the interface command mode.

The **no** variant of this command resets the authentication method used to the default method (PAP) as the RADIUS authentication method used by the MAC authentication.

**Syntax** `auth-mac method [eap-md5|pap]`  
`no auth-mac method`

| Parameter | Description                                  |
|-----------|----------------------------------------------|
| eap-md5   | Enable EAP-MD5 as the authentication method. |
| pap       | Enable PAP as the authentication method.     |

**Default** The MAC authentication method is PAP.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To set the MAC authentication method to PAP on interface port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# auth-mac method pap
```

To set the MAC authentication method to the default on interface port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth-mac method
```

To set the MAC authentication method to EAP-MD5 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-mac method eap-md5
```

**Command  
changes**

Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# auth-mac password

**Overview** This command changes the password for MAC-based authentication.  
Use the **no** variant of this command to return the password to its default.

**Syntax** `auth-mac [encrypted] password <password>`  
`no auth-mac password`

| Parameter                     | Description                                                                                                                                                                                                       |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>auth-mac</code>         | MAC-based authentication                                                                                                                                                                                          |
| <code>encrypted</code>        | Specify an encrypted password                                                                                                                                                                                     |
| <code>password</code>         | Configure the password                                                                                                                                                                                            |
| <code>&lt;password&gt;</code> | The new password. Passwords can be up to 64 characters in length and can contain any printable characters except: <ul style="list-style-type: none"><li>• ?</li><li>• " (double quotes)</li><li>• space</li></ul> |

**Default** By default, the password is the MAC address of the supplicant.

**Mode** Global Configuration

**Usage notes** Changing the password increases the security of MAC-based authentication, because the default password is easy for an attacker to discover. This is particularly important if:

- some MAC-based supplicants on the network are intelligent devices, such as computers, and/or
- you are using two-step authentication (see the “Ensuring Authentication Methods Require Different Usernames and Passwords” section of the [AAA and Port Authentication Feature\\_Overview\\_and\\_Configuration\\_Guide](#)).

**Examples** To change the password to verySecurePassword, use the commands:

```
awplus# configure terminal
awplus(config)# auth-mac password verySecurePassword
```

**Related commands** [auth two-step enable](#)  
[show auth](#)

**Command changes** Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# auth-mac reauth-relearning

**Overview** This command sets the MAC address learning of the supplicant (client device) to re-learning for re-authentication on the interface specified in the interface command mode.

Use the **no** variant of this command to disable the auth-mac re-learning option.

**Syntax** `auth-mac reauth-relearning`  
`no auth-mac reauth-relearning`

**Default** Re-learning for port authentication is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To enable the re-authentication re-learning feature on interface port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# auth-mac reauth-relearning
```

To disable the re-authentication re-learning feature on interface port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth-mac reauth-relearning
```

To enable the re-authentication re-learning feature on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-mac reauth-relearning
```

**Command changes** Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# auth-mac static

**Overview** This command configures MAC authentication to use static entries in the FDB. Static entries persist in the FDB, even if there is no traffic flow from the supplicant.

When static FDB entries are configured, the [auth roaming disconnected](#) command is supported for MAC authentication. This command allows a supplicant to move to another authenticating interface without re-authentication.

Use the **no** variant of this command to revert to dynamic FDB entries.

**Syntax** `auth-mac static`  
`no auth-mac static`

**Default** By default MAC authentication supplicants are added to the FDB dynamically.

**Mode** Global Configuration

**Example** To configure MAC authentication to use static FDB entries, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-mac static
```

To configure MAC authentication to use dynamic FDB entries, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-mac static
```

**Related commands** [auth roaming disconnected](#)

Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# auth-mac username

**Overview** Use this command to specify the format of the MAC address in the username and password field when a request for MAC-based authorization is sent to a RADIUS server.

**Syntax** `auth-mac username {ietf|unformatted} {lower-case|upper-case}`

| Parameter   | Description                                                                          |
|-------------|--------------------------------------------------------------------------------------|
| ietf        | The MAC address includes a hyphen between each 2 bytes. (Example: xx-xx-xx-xx-xx-xx) |
| unformatted | The MAC address does not include hyphens. (Example: xxxxxxxxxxxx)                    |
| lower-case  | The MAC address uses lower-case characters (a-f)                                     |
| upper-case  | The MAC address uses upper-case characters (A-F)                                     |

**Default** `auth-mac username ietf lower-case`

**Mode** Global Configuration

**Usage** This command is provided to allow other vendors', AlliedWare, and AlliedWare Plus switches to share the same format on the RADIUS server.

**Example** To configure the format of the MAC address in the username and password field to be changed to IETF and upper-case, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-mac username ietf upper-case
```

**Related commands** [auth-mac username](#)  
[show running-config](#)

**Command changes** Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# auth-web accounting

**Overview** This command overrides the default RADIUS accounting method for web-based authentication on an interface by allowing you to apply a user-defined named list.

Use the **no** variant of this command to remove the named list from the interface and apply the default method.

**Syntax** `auth-web accounting {default|<list-name>}`  
`no auth-web accounting`

| Parameter   | Description                              |
|-------------|------------------------------------------|
| default     | Apply the default accounting method list |
| <list-name> | Apply a named accounting method list     |

**Default** The **default** method list is applied to an interface by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Example** To apply the named list 'vlan10\_acct' on the vlan10 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# auth-web accounting vlan10_acct
```

To remove the named list from the vlan10 interface and set the accounting method back to default, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no auth-web accounting
```

**Related commands** [aaa accounting auth-web](#)

# auth-web authentication

**Overview** Use this command to override the default web-based authentication method on an interface by allowing you to apply a user-defined named list.

Use the **no** variant of this command to remove the named list from the interface and apply the default method.

**Syntax** `auth-web authentication {default|<list-name>}`  
`no auth-web authentication`

| Parameter   | Description                                  |
|-------------|----------------------------------------------|
| default     | Apply the default authentication method list |
| <list-name> | Apply the user-defined named list            |

**Default** The **default** method list is applied to an interface by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Example** To apply the named list 'vlan10\_auth' on the vlan10 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# auth-web authentication vlan10_auth
```

To remove the named list from the vlan10 interface and set the authentication method back to default, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no auth-web authentication
```

**Related commands** [aaa authentication auth-web](#)

# auth-web enable

**Overview** Use this command to enable web-based authentication in Interface mode on the interface specified.

Use the **no** variant of this command to apply its default.

**Syntax** `auth-web enable`  
`no auth-web enable`

**Default** Web authentication is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** Web-based authentication cannot be enabled if DHCP snooping is enabled by using the [service dhcp-snooping](#) command, and vice versa. You need to configure an IPv4 address for the VLAN interface on which web authentication is running.

If you attempt to change the authentication configuration on an interface that has threat protection quarantine configured, you will see the following error message:

```
% portx.x.x: Application Proxy quarantine configuration must be removed before port authentication is changed
```

Before changing the interface's authentication configuration you must either:

- remove the interface's threat protection configuration, or
- shut down the interface.

**Examples** To enable web authentication on static-channel-group 2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# static-channel-group 2
awplus(config-if)# exit
awplus(config)# interface sa2
awplus(config-if)# auth-web enable
```

To disable web authentication on static-channel-group 2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface sa2
awplus(config-if)# no auth-web enable
```

To enable web authentication on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-web enable
```

To disable web authentication on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth-web enable
```

**Related  
commands**

[show auth](#)

[show auth interface](#)

[show running-config](#)

# auth-web forward

**Overview** Use this command to enable the web authentication packet forwarding feature on the interface specified. This command also enables ARP forwarding, and adds forwarded packets to the **tcp** or **udp** port number specified.

Use the **no** variant of this command to disable the specified packet forwarding feature on the interface.

**Syntax** `auth-web forward [<ip-address>|<ip-address/prefix-length>]  
{dns|tcp <1-65535>|udp <1-65535>}`

or

`auth-web forward {arp|dhcp|dns|tcp <1-65535>|udp <1-65535>}`

The **no** variants of this command are:

`no auth-web forward [<ip-address>|<ip-address/prefix-length>]  
{dns|tcp <1-65535>|udp <1-65535>}`

or

`no auth-web forward {arp|dhcp|dns|tcp <1-65535>|udp <1-65535>}`

| Parameter                                      | Description                                                                |
|------------------------------------------------|----------------------------------------------------------------------------|
| <ip-address><br><ip-address/<br>prefix-length> | The IP address or subnet on which the web authentication is to be enabled. |
| arp                                            | Enable forwarding of ARP.                                                  |
| dhcp                                           | Enable forwarding of DHCP (67/udp).                                        |
| dns                                            | Enable forwarding of DNS (53/udp).                                         |
| tcp                                            | Enable forwarding of TCP specified port number.                            |
| <1-65535>                                      | TCP Port number.                                                           |
| udp                                            | Enable forwarding of UDP specified port number.                            |
| <1-65535>                                      | UDP Port number.                                                           |

**Default** Packet forwarding for port authentication is enabled by default for "arp", "dhcp" and "dns".

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** For more information about the <ip-address> parameter, and an example, see the "auth-web forward" section in the [Alliedware Plus Technical Tips and Tricks](#).

**Examples** To enable the ARP forwarding feature on interface port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# auth-web forward arp
```

To add TCP forwarding port 137 on interface port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# auth-web forward tcp 137
```

To add the DNS Server IP address 192.168.1.10 on interface port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# switchport mode access
awplus(config-if)# auth-web enable
awplus(config-if)# auth dynamic-vlan-creation
awplus(config-if)# auth-web forward 192.168.1.10 dns
```

To disable the ARP forwarding feature on interface port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth-web forward arp
```

To delete TCP forwarding port 137 on interface port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth-web forward tcp 137
```

To delete all TCP forwarding on interface port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth-web forward tcp
```

To enable the ARP forwarding feature on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-web forward arp
```

To add TCP forwarding port 137 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-web forward tcp 137
```

To disable the ARP forwarding feature on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth-web forward arp
```

To delete TCP forwarding port 137 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth-web forward tcp 137
```

To delete all TCP forwarding on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth-web forward tcp
```

# auth-web idle-timeout enable

**Overview** Use this command to enable the idle-timeout for client of web authentication on the interface.

The **no** variant of this command to disable the idle-timeout for client of web authentication on the interface.

**Syntax** `auth-web idle-timeout enable`  
`no auth-web idle-timeout enable`

**Default** The idle-timeout is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Example** To enable the idle-timeout on an interface, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config)# auth-web enable
awplus(config-if)# auth-web idle-timeout enable
```

To disable the idle-timeout on an interface, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth-web idle-timeout enable
```

**Related commands** [auth-web enable](#)  
[auth-web idle-timeout timeout](#)

# auth-web idle-timeout timeout

**Overview** Use this command to set the timeout value for web authentication client in seconds. The client will be unauthorized when it does not have any activity for a period that exceeds the timeout value.

The **no** variant of this command sets the timeout value to the default setting, 3600 seconds.

**Syntax** `auth-web idle-timeout timeout <420-86400>`  
`no auth-web idle-timeout timeout`

| Parameter   | Description      |
|-------------|------------------|
| <420-86400> | Time in seconds. |

**Default** The timeout is 3600 seconds by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Example** To set 30 minutes as the idle-timeout, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth-web idle-timeout timeout 1800
```

To return the idle-timeout to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth-web idle-timeout timeout
```

**Related commands** [auth-web enable](#)  
[auth-web idle-timeout enable](#)

# auth-web max-auth-fail

**Overview** Use this command to set the number of authentication failures allowed before rejecting further authentication requests. When the supplicant (client device) fails more than the specified number of times, then login requests are refused during the quiet period.

Use the **no** variant of this command to reset the maximum number of authentication failures to the default.

**Syntax** `auth-web max-auth-fail <0-10>`  
`no auth-web max-auth-fail`

| Parameter | Description                                                                              |
|-----------|------------------------------------------------------------------------------------------|
| <0-10>    | The maximum number of authentication failures allowed before login requests are refused. |

**Default** The maximum number of authentication failures is set to 3.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To set the lock count to 5 on interface port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# auth-web max-auth-fail 5
```

To set the lock count to the default on interface port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth-web max-auth-fail
```

To set the lock count to 5 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-web max-auth-fail 5
```

To set the lock count to the default on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth-web max-auth-fail
```

**Related  
commands**

- auth profile (global)
- auth timeout quiet-period
- show auth
- show auth interface
- show running-config

# auth-web method

**Overview** Use this command to set the web authentication access method that is used with RADIUS on the interface specified.

Use the **no** variant of this command to set the authentication method to PAP for the interface specified when web authentication is also used with the RADIUS authentication method.

**Syntax** `auth-web method {eap-md5|pap}`  
`no auth-web method`

| Parameter | Description                                  |
|-----------|----------------------------------------------|
| eap-md5   | Enable EAP-MD5 as the authentication method. |
| pap       | Enable PAP as the authentication method.     |

**Default** The web authentication method is set to PAP by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Example** To set the web authentication method to EAP-MD5 on interface port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# auth-web method eap-md5
```

To set the web authentication method to EAP-MD5 for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-web method eap-md5
```

**Related commands** [auth profile \(global\)](#)  
[show auth](#)  
[show auth interface](#)  
[show running-config](#)

# auth-web-server blocking-mode

**Overview** Use this command to enable blocking mode for the Web-Authentication server. The blocking mode displays an authentication success or failure screen immediately from the response result from a RADIUS server.

Use the **no** variant of this command to disable blocking mode for the Web-Authentication server.

**Syntax** `auth-web-server blocking-mode`  
`no auth-web-server blocking-mode`

**Default** By default, blocking mode is disabled for the Web-Authentication server.

**Mode** Global Configuration

**Example** To enable blocking mode for the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server blocking-mode
```

To disable blocking mode for the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server blocking-mode
```

**Related commands** [auth-web-server redirect-delay-time](#)  
[show auth-web-server](#)  
[show running-config](#)

# auth-web-server dhcp ipaddress

**Overview** Use this command to assign an IP address and enable the DHCP service on the Web-Authentication server for supplicants (client devices).

Use the **no** variant of this command to remove an IP address and disable the DHCP service on the Web-Authentication server for supplicants.

**Syntax** `auth-web-server dhcp ipaddress <ip-address/prefix-length>`  
`no auth-web-server dhcp ipaddress`

| Parameter                                     | Description                                                                                                        |
|-----------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ip-address/prefix-length&gt;</code> | The IPv4 address and prefix length assigned for the DHCP service on the Web-Authentication server for supplicants. |

**Default** No IP address for the Web-Authentication server is set by default.

**Mode** Global Configuration

**Usage notes** See the [AAA and Port Authentication Feature Overview and Configuration Guide](#) for information about:

- using DHCP with web authentication, and
- restrictions regarding combinations of authentication enhancements working together

You cannot use the IPv4 address assigned to the device's interface as the Web-Authentication server address.

Note that this Web Authentication virtual DHCP server is a limited implementation of the DHCP protocol. Separation of IP addresses depends on allocating addresses incrementally and a short lease time. In a situation where a supplicant remains permanently connected but does not authenticate, there is a risk of re-allocation of the same IP address once the server has rolled through the entire address range.

**Examples** To assign the IP address 10.0.0.1 to the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server dhcp ipaddress 10.0.0.1/8
```

To remove an IP address on the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server dhcp ipaddress
```

**Related commands**    `auth-web-server dhcp lease`  
                          `show auth-web-server`  
                          `show running-config`

# auth-web-server dhcp lease

**Overview** Use this command to set the DHCP lease time for supplicants (client devices) using the DHCP service on the Web-Authentication server.

Use the **no** variant of this command to reset to the default DHCP lease time for supplicants using the DHCP service on the Web-Authentication server.

**Syntax** `auth-web-server dhcp lease <20-60>`  
`no auth-web-server dhcp lease`

| Parameter | Description                                                                                         |
|-----------|-----------------------------------------------------------------------------------------------------|
| <20-60>   | DHCP lease time for supplicants using the DHCP service on the Web-Authentication server in seconds. |

**Default** The default DHCP lease time for supplicants using the DHCP service on the Web-Authentication server is set to 30 seconds.

**Mode** Global Configuration

**Usage notes** See the [AAA and Port Authentication Feature Overview and Configuration Guide](#) for information about:

- using DHCP with web authentication, and
- restrictions regarding combinations of authentication enhancements working together

**Examples** To set the DHCP lease time to 1 minute for supplicants using the DHCP service on the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server dhcp lease 60
```

To reset the DHCP lease time to the default setting (30 seconds) for supplicants using the DHCP service on the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server dhcp lease
```

**Validation Commands** `show running-config`

**Related commands** `show auth-web-server`  
`auth-web-server dhcp ipaddress`

# auth-web-server dhcp-wpad-option

**Overview** This command sets the DHCP WPAD (Web Proxy Auto-Discovery) option for the Web-Authentication temporary DHCP service.

For more information and examples, see the “Web Auth Proxy” section in the [Alliedware Plus Technical Tips and Tricks](#).

Use the **no** variant of this command to disable the DHCP WPAD function.

**Syntax** `auth-web-server dhcp wpad-option <url>`  
`no auth-web-server dhcp wpad-option`

| Parameter | Description                               |
|-----------|-------------------------------------------|
| <url>     | URL to the server which gets a .pac file. |

**Default** The Web-Authentication server DHCP WPAD option is not set.

**Mode** Global Configuration

**Usage notes** If the supplicant is configured to use WPAD, the supplicant’s web browser will use TCP port 80 as usual. Therefore, the packet can be intercepted by Web-Authentication as normal, and the Web-Authentication Login page can be sent. However, after authentication, the browser does not know where to get the WPAD file and so cannot access external web pages. The WPAD file is usually named proxy.pac file and tells the browser what web proxy to use.

Use this command to tell the supplicant where it can get this file from. The switch itself can be specified as the source for this file, and it can deliver it to the supplicant on request.

**Example** To specify that the proxy.pac file is found on the server at 192.168.1.100, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server dhcp wpad-option
http://192.168.1.100/proxy/proxy.pac
```

**Related commands** [show auth-web-server](#)

# auth-web-server host-name

**Overview** This command assigns a hostname to the web authentication server.

Use the **no** variant of this command to remove the hostname from the web authentication server.

**Syntax** `auth-web-server host-name <hostname>`  
`no auth-web-server host-name`

| Parameter                     | Description                |
|-------------------------------|----------------------------|
| <code>&lt;hostname&gt;</code> | URL string of the hostname |

**Default** The web authentication server has no hostname.

**Mode** Global Configuration

**Usage notes** When the web authentication server uses HTTPS protocol, the web browser will validate the certificate. If the certificate is invalid, the web page gives a warning message before displaying server content. However, the web page will not give warning message if the server has a hostname same as the one stored in the installed certificate.

**Examples** To set the auth.example.com as the hostname of the web authentication server, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server host-name auth.example.com
```

To remove hostname auth.example.com from the web authentication server, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server host-name
```

**Related commands** [aaa authentication auth-web](#)  
[auth-web enable](#)

# auth-web-server intercept-port

**Overview** This command specifies any additional TCP port numbers that the Web-Authentication server is to intercept.

Use the **no** variant of this command to stop intercepting the TCP port numbers.

**Syntax** `auth-web-server intercept-port {<1-65535>|any}`  
`no auth-web-server intercept-port {<1-65535>|any}`

| Parameter | Description               |
|-----------|---------------------------|
| <1-65535> | TCP port number.          |
| any       | Intercept all TCP packets |

**Default** No additional TCP port numbers are intercepted by default.

**Mode** Global Configuration

**Usage notes** If this command is not specified, AlliedWare Plus Web-Authentication intercepts the supplicant's initial TCP port 80 connection to a web page and sends it the Web-Authentication Login page. However, if the supplicant is configured to use a web proxy, then it will usually be using TCP port 8080 (or another user configured port number). In this case Web-Authentication cannot intercept the connection.

To overcome this limitation you can use this command to tell the switch which additional port it should intercept, and then send the Web-Authentication Login page to the supplicant.

When the web authentication switch is in a guest network, the switch does not know the proxy server's port number in the supplicant's proxy setting. To overcome this limitation, you can use the **any** option in this command to intercept all TCP packets.

When you use this command in conjunction with a proxy server configured in the web browser, you must add the proxy server's network as a 'No Proxy' network. You can specify 'No Proxy' networks in the proxy settings in your web browser. For more information, see the "Web Auth Proxy" section in the [Alliedware Plus Technical Tips and Tricks](#).

**Example** To additionally intercept port number 3128, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server intercept-port 3128
```

**Related commands** [show auth-web-server](#)

# auth-web-server ip-conflict-prefer-newer-suplicant

**Overview** Use this command to alter the behavior of a Network Access Server (NAS) when it detects a supplicant with a duplicate IP address.

The default behavior is for the NAS to not authorize the newer supplicant. This command allows it to authorize the newer supplicant and unauthorize the original supplicant.

This command applies to Web-based authentication supplicants only.

Use the **no** variant of this command to set the behavior back to default.

**Syntax** `auth-web-server ip-conflict-prefer-newer-suplicant`  
`no auth-web-server ip-conflict-prefer-newer-suplicant`

**Default** The default behavior is to not authorize the newer supplicant if the NAS detects a duplicate IP address.

**Mode** Global Configuration

**Usage notes** Allied Telesis recommends you investigate and resolve the root cause of the conflicting IP addresses.

**Example** To configure a NAS to authorize the newer supplicant, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server
ip-conflict-prefer-newer-suplicant
```

**Related commands** [auth-web enable](#)  
[show auth](#)

**Command changes** Version 5.5.2-0.1: command added

# auth-web-server ipaddress

**Overview** This command sets the IP address for the Web-Authentication server.

Use the **no** variant of this command to delete the IP address for the Web-Authentication server.

You cannot use the IPv4 address assigned to the device's interface as the Web-Authentication server address.

**Syntax** `auth-web-server ipaddress <ip-address>`  
`no auth-web-server ipaddress`

| Parameter                       | Description                                                            |
|---------------------------------|------------------------------------------------------------------------|
| <code>&lt;ip-address&gt;</code> | Web-Authentication server dotted decimal IP address in A.B.C.D format. |

**Default** The Web-Authentication server address on the system is not set by default.

**Mode** Global Configuration

**Examples** To set the IP address 10.0.0.1 to the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ipaddress 10.0.0.1
```

To delete the IP address from the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ipaddress
```

**Validation Commands** `show auth`  
`show auth-web-server`  
`show running-config`

# auth-web-server page language

**Overview** Use this command to set the presentation language of Web authentication pages. Titles and subtitles of Web authentication pages will be set accordingly. Note that presently only English or Japanese are offered.

Use the **no** variant of this command to set the presentation language of Web authentication pages to its default (English).

**Syntax** `auth-web-server page language {english|japanese}`  
`no auth-web-server page language`

| Parameter | Description                                         |
|-----------|-----------------------------------------------------|
| english   | Web authentication pages are presented in English.  |
| japanese  | Web authentication pages are presented in Japanese. |

**Default** Web authentication pages are presented in English by default.

**Mode** Global Configuration

**Examples** To set Japanese as the presentation language of Web authentication pages, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page language japanese
```

To set English as the presentation language of Web authentication pages, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page language english
```

To unset the presentation language of Web authentication pages and use English as the default presentation language, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page language
```

**Related commands** [auth-web-server page title](#)  
[auth-web-server page sub-title](#)  
[show auth-web-server page](#)

# auth-web-server login-url

**Overview** This command sets the web-authentication login page URL. This lets you replace the login page with your own page. See “Customising the Login Page” in the [AAA and Port Authentication Feature Overview and Configuration Guide](#) for details.

Use the **no** variant of this command to delete the URL.

**Syntax** `auth-web-server login-url <URL>`  
`no auth-web-server login-url`

| Parameter | Description        |
|-----------|--------------------|
| <URL>     | Set login page URL |

**Default** The built-in login page is set by default.

**Mode** Global Configuration

**Examples** To set `http://example.com/login.html` as the login page, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server login-url
http://example.com/login.html
```

To unset the login page URL, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server login-url
```

**Related commands** [show running-config](#)

# auth-web-server page logo

**Overview** This command sets the type of logo that will be displayed on the web authentication page.

Use the **no** variant of this command to set the logo type to **auto**.

Note that if you need to customize the login page extensively, you can instead replace it with your own page. See “Customising the Login Page” in the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

**Syntax** `auth-web-server page logo {auto|default|hidden}`  
`no auth-web-server page logo`

| Parameter | Description                                                              |
|-----------|--------------------------------------------------------------------------|
| auto      | Display the custom logo if installed; otherwise display the default logo |
| default   | Display the default logo                                                 |
| hidden    | Hide the logo                                                            |

**Default** Logo type is **auto** by default.

**Mode** Global Configuration

**Examples** To display the default logo with ignoring installed custom logo, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page logo default
```

To set back to the default logo type **auto**, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page logo
```

**Validation Commands** `show auth-web-server page`

# auth-web-server page sub-title

**Overview** This command sets the custom sub-title on the web authentication page.

Use the **no** variant of this command to reset the sub-title to its default.

Note that if you need to customize the login page extensively, you can instead replace it with your own page. See “Customising the Login Page” in the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

**Syntax** `auth-web-server page sub-title {hidden|text <sub-title>}`  
`no auth-web-server page sub-title`

| Parameter   | Description                  |
|-------------|------------------------------|
| hidden      | Hide the sub-title           |
| <sub-title> | Text string of the sub-title |

**Default** “Allied-Telesis” is displayed by default.

**Mode** Global Configuration

**Examples** To set the custom sub-title, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page sub-title text Web
Authentication
```

To hide the sub-title, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page sub-title hidden
```

To change back to the default title, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page sub-title
```

**Validation  
Commands** `show auth-web-server page`

# auth-web-server page success-message

**Overview** This command sets the success message on the web-authentication page.

Use the **no** variant of this command to remove the success message.

Note that if you need to customize the login page extensively, you can instead replace it with your own page. See “Customising the Login Page” in the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

**Syntax** `auth-web-server page success-message text <success-message>`  
`no auth-web-server page success-message`

| Parameter                            | Description                        |
|--------------------------------------|------------------------------------|
| <code>&lt;success-message&gt;</code> | Text string of the success message |

**Default** No success message is set by default.

**Mode** Global Configuration

**Examples** To set the success message on the web-authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page success-message text Your
success message
```

To unset the success message on the web-authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page success-message
```

**Validation  
Commands** [show auth-web-server page](#)

# auth-web-server page title

**Overview** This command sets the custom title on the web authentication page.

Use the **no** variant of this command to remove the custom title.

Note that if you need to customize the login page extensively, you can instead replace it with your own page. See “Customising the Login Page” in the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

**Syntax** `auth-web-server page title {hidden|text <title>}`  
`no auth-web-server page title`

| Parameter | Description              |
|-----------|--------------------------|
| hidden    | Hide the title           |
| <title>   | Text string of the title |

**Default** “Web Access Authentication Gateway” is displayed by default.

**Mode** Global Configuration

**Examples** To set the custom title on the web authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page title text Login
```

To hide the title on the web authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page title hidden
```

To unset the custom title on the web authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page title
```

**Validation Commands** [show auth-web-server page](#)

# auth-web-server page welcome-message

**Overview** This command sets the welcome message on the web-authentication login page.

Use the **no** variant of this command to remove the welcome message.

Note that if you need to customize the login page extensively, you can instead replace it with your own page. See “Customising the Login Page” in the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

**Syntax** `auth-web-server page welcome-message text <welcome-message>`  
`no auth-web-server page welcome-message`

| Parameter                            | Description                        |
|--------------------------------------|------------------------------------|
| <code>&lt;welcome-message&gt;</code> | Text string of the welcome message |

**Default** No welcome message is set by default.

**Mode** Global Configuration

**Examples** To set the welcome message on the web-authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page welcome-message text Your
welcome message
```

To remove the welcome message on the web-authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page welcome-message
```

**Validation  
Commands** [show auth-web-server page](#)

# auth-web-server ping-poll enable

**Overview** This command enables the ping polling to the supplicant (client device) that is authenticated by Web-Authentication.

The **no** variant of this command disables the ping polling to the supplicant that is authenticated by Web-Authentication.

**Syntax** `auth-web-server ping-poll enable`  
`no auth-web-server ping-poll enable`

**Default** The ping polling feature for Web-Authentication is disabled by default.

**Mode** Global Configuration

**Examples** To enable the ping polling feature for Web-Authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll enable
```

To disable the ping polling feature for Web-Authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll enable
```

**Validation  
Commands** `show auth`  
`show auth-web-server`  
`show running-config`

# auth-web-server ping-poll failcount

**Overview** This command sets a fail count for the ping polling feature when used with Web-Authentication. The **failcount** parameter specifies the number of unanswered pings. A supplicant (client device) is logged off when the number of unanswered pings are greater than the failcount set with this command.

Use the **no** variant of this command to resets the fail count for the ping polling feature to the default (5 pings).

**Syntax** `auth-web-server ping-poll failcount <1-100>`  
`no auth-web-server ping-poll failcount`

| Parameter | Description |
|-----------|-------------|
| <1-100>   | Count.      |

**Default** The default failcount for ping polling is 5 pings.

**Mode** Global Configuration

**Examples** To set the failcount of ping polling to 10 pings, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll failcount 10
```

To set the failcount of ping polling to default, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll failcount
```

**Validation  
Commands** `show auth`  
`show auth-web-server`  
`show running-config`

# auth-web-server ping-poll interval

**Overview** This command is used to change the ping poll interval. The interval specifies the time period between pings when the supplicant (client device) is reachable.

Use the **no** variant of this command to reset to the default period for ping polling (30 seconds).

**Syntax** `auth-web-server ping-poll interval <1-65535>`  
`no auth-web-server ping-poll interval`

| Parameter | Description |
|-----------|-------------|
| <1-65535> | Seconds.    |

**Default** The interval for ping polling is 30 seconds by default.

**Mode** Global Configuration

**Examples** To set the interval of ping polling to 60 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll interval 60
```

To set the interval of ping polling to the default (30 seconds), use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll interval
```

**Validation Commands** `show auth`  
`show auth-web-server`  
`show running-config`

# auth-web-server ping-poll reauth-timer-refresh

**Overview** This command modifies the **reauth-timer-refresh** parameter for the Web-Authentication feature. The **reauth-timer-refresh** parameter specifies whether a re-authentication timer is reset and when the response from a supplicant (a client device) is received.

Use the **no** variant of this command to reset the **reauth-timer-refresh** parameter to the default setting (disabled).

**Syntax** `auth-web-server ping-poll reauth-timer-refresh`  
`no auth-web-server ping-poll reauth-timer-refresh`

**Default** The `reauth-timer-refresh` parameter is disabled by default.

**Mode** Global Configuration

**Examples** To enable the `reauth-timer-refresh` timer, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll reauth-timer-refresh
```

To disable the `reauth-timer-refresh` timer, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll
reauth-timer-refresh
```

**Validation  
Commands** `show auth`  
`show auth-web-server`  
`show running-config`

# auth-web-server ping-poll timeout

**Overview** This command modifies the ping poll **timeout** parameter for the Web-Authentication feature. The **timeout** parameter specifies the time in seconds to wait for a response to a ping packet.

Use the **no** variant of this command to reset the timeout of ping polling to the default (1 second).

**Syntax** `auth-web-server ping-poll timeout <1-30>`  
`no auth-web-server ping-poll timeout`

| Parameter | Description |
|-----------|-------------|
| <1-30>    | Seconds.    |

**Default** The default timeout for ping polling is 1 second.

**Mode** Global Configuration

**Examples** To set the timeout of ping polling to 2 seconds, use the command:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll timeout 2
```

To set the timeout of ping polling to the default (1 second), use the command:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll timeout
```

**Validation  
Commands** `show auth`  
`show auth-web-server`  
`show running-config`

# auth-web-server ping-poll type

**Overview** Use this command to set the type of polling used to check that a web authenticated supplicant is still connected. The polling can be done using either ICMP (ping), or ARP messages.

If there is a firewall between an authenticating server and a supplicant, it may block ICMP traffic. If this occurs try changing to ARP polling.

Polling only starts when ping-polling is enabled and the supplicant has been authorized.

Use the **no** variant of this command to set the default polling type of ICMP (ping).

**Syntax** `auth-web-server ping-poll type {arp|ping}`  
`no auth-web-server ping-poll type`

| Parameter       | Description                                      |
|-----------------|--------------------------------------------------|
| auth-web-server | Web authentication server configuration commands |
| arp             | Enable polling via ARP                           |
| ping            | Enable polling via ICMP (ping)                   |

**Default** ICMP

**Mode** Global Configuration

**Examples** To set the polling type to ARP, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll enable
awplus(config)# auth-web-server ping-poll type arp
```

To set the polling type to ICMP, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll enable
awplus(config)# auth-web-server ping-poll type ping
```

To set the polling type to the default, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll type
```

**Related commands** [auth-web-server ping-poll enable](#)

**Command changes** Version 5.5.1-1.1: command added

# auth-web-server port

**Overview** This command sets the HTTP port number for the Web-Authentication server.  
Use the **no** variant of this command to reset the HTTP port number to the default (80).

**Syntax** `auth-web-server port <port-number>`  
`no auth-web-server port`

| Parameter                        | Description                                                                               |
|----------------------------------|-------------------------------------------------------------------------------------------|
| <code>&lt;port-number&gt;</code> | Set the local Web-Authentication server port within the TCP port number range 1 to 65535. |

**Default** The Web-Authentication server HTTP port number is set to 80 by default.

**Mode** Global Configuration

**Examples** To set the HTTP port number 8080 for the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server port 8080
```

To reset to the default HTTP port number 80 for the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server port
```

**Validation Commands** `show auth`  
`show auth-web-server`  
`show running-config`

# auth-web-server redirect-delay-time

**Overview** Use this command to set the delay time in seconds before redirecting the supplicant to a specified URL when the supplicant is authorized.

Use the variant **no** to reset the delay time set previously.

**Syntax** `auth-web-server redirect-delay-time <5-60>`  
`no auth-web-server redirect-delay-time`

| Parameter                        | Description                                                                              |
|----------------------------------|------------------------------------------------------------------------------------------|
| <code>redirect-delay-time</code> | Set the delay time before jumping to a specified URL after the supplicant is authorized. |
| <code>&lt;5-60&gt;</code>        | The time in seconds.                                                                     |

**Default** The default redirect delay time is 5 seconds.

**Mode** Global Configuration

**Examples** To set the delay time to 60 seconds for the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server redirect-delay-time 60
```

To reset the delay time, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server redirect-delay-time
```

**Related commands**

- [auth-web-server blocking-mode](#)
- [auth-web-server redirect-url](#)
- [show auth-web-server](#)
- [show running-config](#)

# auth-web-server redirect-url

**Overview** This command sets a URL for supplicant (client device) authentication. When a supplicant is authorized it will be automatically redirected to the specified URL. Note that if the http redirect feature is used then this command is ignored.

Use the **no** variant of this command to delete the URL string set previously.

**Syntax** `auth-web-server redirect-url <url>`  
`no auth-web-server redirect-url`

| Parameter                | Description                           |
|--------------------------|---------------------------------------|
| <code>&lt;url&gt;</code> | URL (hostname or dotted IP notation). |

**Default** The redirect URL for the Web-Authentication server feature is not set by default (null).

**Mode** Global Configuration

**Examples** To enable and set redirect a URL string `www.alliedtelesis.com` for the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server redirect-url
http://www.alliedtelesis.com
```

To delete a redirect URL string, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server redirect-url
```

**Related commands** [auth-web-server redirect-delay-time](#)  
[show auth](#)  
[show auth-web-server](#)  
[show running-config](#)

# auth-web-server session-keep

**Overview** This command enables the session-keep feature to jump to the original URL after being authorized by Web-Authentication.

Use the **no** variant of this command to disable the session keep feature.

**Syntax** `auth-web-server session-keep`  
`no auth-web-server session-keep`

**Default** The session-keep feature is disabled by default.

**Mode** Global Configuration

**Usage notes** This function doesn't ensure to keep session information in all cases. Authenticated supplicant may be redirected to unexpected page when session-keep is enabled. This issue occurred by supplicant sending HTTP packets automatically after authentication page is displayed and the URL is written.

**Examples** To enable the session-keep feature, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server session-keep
```

To disable the session-keep feature, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server session-keep
```

**Validation Commands** `show auth`  
`show auth-web-server`  
`show running-config`

# auth-web-server ssl

**Overview** This command enables HTTPS functionality for the Web-Authentication server feature.

Use the **no** variant of this command to disable HTTPS functionality for the Web-Authentication server.

**Syntax** `auth-web-server ssl`  
`no auth-web-server ssl`

**Default** HTTPS functionality for the Web-Authentication server feature is disabled by default.

**Mode** Global Configuration

**Examples** To enable HTTPS functionality for the Web-Authentication server feature, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ssl
```

To disable HTTPS functionality for the Web-Authentication server feature, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ssl
```

**Validation  
Commands** `show auth`  
`show auth-web-server`  
`show running-config`

# auth-web-server ssl intercept-port

**Overview** Use this command to register HTTPS intercept port numbers when the HTTPS server uses custom port number (not TCP port number 443).

Note that you need to use the **auth-web-server intercept-port** command to register HTTP intercept port numbers.

Use the **no** variant of this command to delete registered port number.

**Syntax** `auth-web-server ssl intercept-port <1-65535>`  
`no auth-web-server ssl intercept-port <1-65535>`

| Parameter | Description                                       |
|-----------|---------------------------------------------------|
| <1-65535> | TCP port number in the range from 1 through 65535 |

**Default** 443/TCP is registered by default.

**Mode** Global Configuration

**Examples** To register HTTPS port number 3128, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ssl intercept-port 3128
```

To delete HTTPS port number 3128, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ssl intercept-port 3128
```

**Validation Commands** `show auth-web-server`

**Related commands** `auth-web-server intercept-port`

# auth-web-server trustpoint

**Overview** Use this command to set the PKI trustpoint to use for secure web authentication communication to an AlliedWare Plus device.

Use the **no** variant of this command to revert to using the default trustpoint 'default-selfsigned'.

**Syntax** `auth-web-server trustpoint <trustpoint-name>`  
`no auth-web-server trustpoint`

| Parameter         | Description        |
|-------------------|--------------------|
| <trustpoint-name> | Name of trustpoint |

**Default** By default, web authentication uses the 'default-selfsigned' trustpoint.

**Mode** Global Configuration

**Usage notes** Before using the **auth-web-server trustpoint** command you will need to establish a trustpoint. For example, you can create a local self-signed trustpoint using the procedure outlined below.

Create a self-signed trustpoint called 'web-trust' with keypair 'web\_key':

```
awplus# configure terminal
awplus(config)# crypto pki trustpoint web-trust
awplus(ca-trustpoint)# enrollment selfsigned
awplus(ca-trustpoint)# rsakeypair web_key
awplus(ca-trustpoint)# exit
awplus(config)# exit
```

Create the root and server certificates for this trustpoint:

```
awplus# crypto pki authenticate web-trust
awplus# crypto pki enroll web-trust
```

For more information about the AlliedWare Plus implementation of Public Key Infrastructure (PKI), see the [Public Key Infrastructure \(PKI\) Feature Overview and Configuration Guide](#)

**Example** To configure web authentication to use the trustpoint 'web-trust', use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server trustpoint web-trust
```

To configure web authentication to use the default trustpoint 'default-selfsigned', use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server trustpoint
```

Version 5.5.1-2.1: command added

# copy proxy-autoconfig-file

**Overview** Use this command to download the proxy auto configuration (PAC) file to your switch. The Web-Authentication supplicant can get the downloaded file from the system web server.

**Syntax** `copy <filename> proxy-autoconfig-file`

| Parameter  | Description              |
|------------|--------------------------|
| <filename> | The URL of the PAC file. |

**Mode** Privileged Exec

**Example** To download the PAC file to this device, use the command:

```
awplus# copy tftp://server/proxy.pac proxy-autoconfig-file
```

**Related commands** [show proxy-autoconfig-file](#)  
[erase proxy-autoconfig-file](#)

# copy web-auth-https-file

**Overview** Use this command to download the SSL server certificate for web-based authentication. The file must be in PEM (Privacy Enhanced Mail) format, and contain the private key and the server certificate.

**Syntax** `copy <filename> web-auth-https-file`

| Parameter  | Description                             |
|------------|-----------------------------------------|
| <filename> | The URL of the server certificate file. |

**Mode** Privileged Exec

**Example** To download the server certificate file `verisign_cert.pem` from the TFTP server directory `server`, use the command:

```
awplus# copy tftp://server/verisign_cert.pem
web-auth-https-file
```

**Related commands**

- [auth-web-server ssl](#)
- [erase web-auth-https-file](#)
- [show auth-web-server](#)

## description (auth-profile)

**Overview** Use this command to add a description to an authentication profile in Authentication Profile mode.

Use the **no** variant of this command to remove the current description.

**Syntax** `description <description>`

| Parameter                        | Description                                          |
|----------------------------------|------------------------------------------------------|
| <code>&lt;description&gt;</code> | Text describing the selected authentication profile. |

**Default** No description configured by default.

**Mode** Authentication Profile

**Example** To add a description to the authentication profile 'student', use the following commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# description student room setting
```

To remove a description from the authentication profile 'student', use the following commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no description
```

**Related commands** [auth profile \(global\)](#)

# erase proxy-autoconfig-file

**Overview** Use this command to remove the proxy auto configuration file.

**Syntax** `erase proxy-autoconfig-file`

**Mode** Privileged Exec

**Example** To remove the proxy auto configuration file, use the command:

```
awplus# erase proxy-autoconfig-file
```

**Related commands** [show proxy-autoconfig-file](#)  
[copy proxy-autoconfig-file](#)

# erase web-auth-https-file

**Overview** Use this command to remove the SSL server certificate for web-based authentication.

**Syntax** `erase web-auth-https-file`

**Mode** Privileged Exec

**Example** To remove the SSL server certificate file for web-based authentication use the command:

```
awplus# erase web-auth-https-file
```

**Related commands**

- [auth-web-server ssl](#)
- [copy web-auth-https-file](#)
- [show auth-web-server](#)

# platform l3-hashing-algorithm

**Overview** This command enables you to change the L3 VLAN hash-key-generating algorithm.

The **no** variant of this command returns the hash-key algorithm to the default of `crc32l`.

**Syntax** `platform l3-hashing-algorithm {crc16l|crc16u|crc32l|crc32u}`  
`no platform l3-hashing-algorithm`

| Parameter           | Description                                               |
|---------------------|-----------------------------------------------------------|
| <code>crc16l</code> | The algorithm that will apply to the lower bits of CRC-16 |
| <code>crc16u</code> | The algorithm that will apply to the upper bits of CRC-16 |
| <code>crc32l</code> | The algorithm that will apply to the lower bits of CRC-32 |
| <code>crc32u</code> | The algorithm that will apply to the upper bits of CRC-32 |

**Default** The hash-key algorithm is `crc32l` by default.

**Mode** Global configuration

**Usage notes** Occasionally, when using the Multiple Dynamic VLAN feature, a supplicant cannot be authenticated because a collision occurs within the VLAN L3 table. This can happen when more than four different IP addresses produce the same hash-key.

When this situation occurs, collisions can sometimes be avoided by changing the hashing algorithm from its default of `crc32l`. Several different algorithms may need to be tried to rectify the problem.

You must restart the switch for this command to take effect.

Note that this command is intended for technical support staff, or advanced end users.

**Example** To change the hash-key generating algorithm applying to the lower bits of CRC-16, use the command:

```
awplus# configure terminal
awplus(config)# platform l3-hashing-algorithm crc16l
```

**Related commands** [platform mac-vlan-hashing-algorithm](#)  
[show platform](#)

# platform mac-vlan-hashing-algorithm

**Overview** This command enables you to change the MAC VLAN hash-key-generating algorithm.

The **no** variant of this command returns the hash-key algorithm to the default of `crc32l`

**Syntax** `platform mac-vlan-hashing-algorithm`  
`{crc16l|crc16u|crc32l|crc32u}`  
`no platform mac-vlan-hashing-algorithm`

| Parameter           | Description                                               |
|---------------------|-----------------------------------------------------------|
| <code>crc16l</code> | The algorithm that will apply to the lower bits of CRC-16 |
| <code>crc16u</code> | The algorithm that will apply to the upper bits of CRC-16 |
| <code>crc32l</code> | The algorithm that will apply to the lower bits of CRC-32 |
| <code>crc32u</code> | The algorithm that will apply to the upper bits of CRC-32 |

**Default** The hash-key algorithm is `crc32l` by default.

**Mode** Global configuration

**Usage notes** Occasionally, when using the Multiple Dynamic VLAN feature, a supplicant cannot be authenticated because a collision occurs within the VLAN MAC table. This can happen when more than four different MAC addresses produce the same hash-key.

When this situation occurs, collisions can sometimes be avoided by changing the hashing algorithm from its default of `crc32l`. Several different algorithms may need to be tried to rectify the problem.

You must restart the switch for this command to take effect.

Note that this command is intended for technical support staff, or advanced end users.

**Example** To change the hash-key generating algorithm applying to the lower bits of CRC-16, use the command:

```
awplus# configure terminal
awplus(config)# platform mac-vlan-hashing-algorithm crc16l
```

**Related commands** [show platform](#)

# show auth

**Overview** This command shows the configuration state of authentication.

**Syntax** show auth [all]

| Parameter | Description                                                                                                                                                                           |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| all       | Display all authentication information for each authenticated interface. This can be a static channel (or static aggregator), or a dynamic (or LACP) channel group, or a switch port. |

**Mode** Privileged Exec

**Example** To display all authentication information, enter the command:

```
awplus# show auth all
```

**Output** Figure 48-1: Example output from the **show auth** command

```
awplus# show auth all

# show auth sessionstatistics

**Overview** This command shows authentication session statistics for the specified interface, which may be a static channel (or static aggregator) or a dynamic (or LACP) channel group or a switch port.

**Syntax** `show auth sessionstatistics [interface <interface-list>]`

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

# show auth supplicant

**Overview** Use this command to show the supplicant (client device) state when authentication is configured for the switch. Use the optional **brief** parameter to show a summary of the supplicant state.

**Syntax** show auth supplicant [<macadd>] [brief]

| Parameter | Description                                                                                |
|-----------|--------------------------------------------------------------------------------------------|
| <macadd>  | Mac (hardware) address of the supplicant.<br>Entry format is HHHH.HHHH.HHHH (hexadecimal). |
| brief     | Brief summary of the supplicant state.                                                     |

**Mode** Privileged Exec

**Examples** To display a summary of authenticated supplicant information on the device, enter the command:

```
awplus# show auth supplicant brief
```

To display authenticated supplicant information on the device, enter the command:

```
awplus# show auth supplicant
```

To display authenticated supplicant information for the device with MAC address 0000.5E00.5301, enter the command:

```
awplus# show auth supplicant 0000.5E00.5301
```

**Output** Figure 48-5: Example output from **show auth supplicant brief**

# show auth supplicant interface

**Overview** This command shows the supplicant (client device) state for the authentication mode set for the interface. Use the optional **brief** parameter to show a summary of the supplicant state.

**Syntax** `show auth-web supplicant interface <interface-list> [brief]`

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

**Mode** Privileged Exec

**Examples** To display the authenticated supplicant on the interface `port1.1.2`, enter the command:

```
awplus# show auth supplicant interface port1.1.2
```

To display brief summary output for the authenticated supplicant on the interface `port1.1.2`, enter the command:

```
awplus# show auth supplicant interface port1.1.2 brief
```

# show auth two-step supplicant brief

**Overview** This command displays the supplicant state of the two-step authentication feature on the interface.

**Syntax** show auth two-step supplicant [interface <interface-list>]  
brief

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| interface        | The interface selected for display.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <interface-list> | The interfaces to display information about. An interface-list can be: <ul style="list-style-type: none"><li>• a VLAN (e.g. vlan2)</li><li>• a switchport (e.g. port1.1.4)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li><li>• a continuous range of interfaces separated by a hyphen (e.g. port1.1.1-port1.1.3)</li><li>• a comma-separated list (e.g. port1.1.1, port1.1.3-port1.1.4). Do not mix interface types in a list.</li></ul> |

**Mode** Privileged Exec

**Usage notes** Do not mix interface types in a list. The specified interfaces must exist.

**Example** To display the supplicant state of the two-step authentication feature, enter the command:

```
awplus# show two-step supplicant interface port1.1.2 brief
```

**Output** Figure 48-8: Example output from **show auth two-step supplicant brief**

# AAA Commands

## Introduction

**Overview** AAA is the collective title for the three related functions of Authentication, Authorization and Accounting. These functions can be applied in a variety of methods with a variety of servers.

The purpose of the AAA commands is to map instances of the AAA functions to sets of servers. The Authentication function can be performed in multiple contexts, such as authentication of users logging in at a console, or 802.1X-Authentication of devices connecting to Ethernet ports.

For each of these contexts, you may want to use different sets of servers for examining the proffered authentication credentials and deciding if they are valid. AAA Authentication commands enable you to specify which servers will be used for different types of authentication.

This chapter provides an alphabetical reference for AAA commands for Authentication, Authorization and Accounting. For more information, see the [AAA and Port\\_Authentication Feature Overview and Configuration Guide](#).

## aaa accounting auth-mac

**Overview** This command configures an accounting method list for MAC-based authentication. An accounting method list specifies what type of accounting messages are sent and which RADIUS servers the accounting messages are sent to. Use this command to configure either the default method list, which is automatically applied to interfaces with MAC-based authentication enabled, or a named method list, which can be applied to an interface with the [auth-mac accounting](#) command.

Use the **no** variant of this command to disable either the default or a named accounting method list for MAC-based authentication. Once all method lists are disabled, AAA accounting for MAC-based authentication is disabled globally.

**Syntax** `aaa accounting auth-mac {default|<list-name>}  
{start-stop|stop-only|none} group {<group-name>|radius}  
no aaa accounting auth-mac {default|<list-name>}`

| Parameter    | Description                                                                                                               |
|--------------|---------------------------------------------------------------------------------------------------------------------------|
| default      | Configure the default accounting method list                                                                              |
| <list-name>  | Configure a named accounting method list                                                                                  |
| start-stop   | Sends a start accounting message at the beginning of the session and a stop accounting message at the end of the session. |
| stop-only    | Only sends a stop accounting message at the end of the session.                                                           |
| none         | No accounting record sent.                                                                                                |
| group        | Use a server group                                                                                                        |
| <group-name> | Server group name.                                                                                                        |
| radius       | Use all RADIUS servers.                                                                                                   |

**Default** RADIUS accounting for MAC-based Authentication is disabled by default

**Mode** Global Configuration

**Usage notes** This command can be used to configure either the default accounting method list or a named accounting method list:

- **default:** the default accounting method list which is automatically applied to all interfaces with MAC-based authentication enabled.
- **<list-name>:** a user named list which can be applied to an interface using the [auth-mac accounting](#) command.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius:** use all RADIUS servers configured by [radius-server host](#) command

- **group** <group-name>: use the specified RADIUS server group configured with the [aaa group server](#) command

The accounting event to send to the RADIUS server is configured with the following options:

- **start-stop**: sends a **start** accounting message at the beginning of a session and a **stop** accounting message at the end of the session.
- **stop-only**: sends a **stop** accounting message at the end of a session.
- **none**: disables accounting.

**Examples** To enable the default RADIUS accounting for MAC-based authentication, and use all available RADIUS servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting auth-mac default start-stop
group radius
```

To disable RADIUS accounting for MAC-based Authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting auth-mac default
```

To enable a named RADIUS accounting method list 'vlan10\_acct' for MAC-based authentication, with the RADIUS server group 'rad\_group\_vlan10', use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting auth-mac vlan10_acct start-stop
group rad_group_vlan10
```

To disable a named RADIUS accounting method list 'vlan10\_acct' for MAC-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting auth-mac vlan10_acct
```

**Related commands**

- [aaa group server](#)
- [auth-mac accounting](#)
- [auth-mac enable](#)
- [radius-server host](#)
- [show aaa server group](#)

# aaa accounting auth-web

**Overview** This command configures an accounting method list for Web-based authentication. An accounting method list specifies what type of accounting messages are sent and which RADIUS servers the accounting messages are sent to. Use this command to configure either the default method list, which is automatically applied to interfaces with Web-based authentication enabled, or a named method list, which can be applied to an interface with the [auth-web accounting](#) command.

Use the **no** variant of this command to disable either the default or a named accounting method list for Web-based authentication. Once all method lists are disabled, AAA accounting for Web-based authentication is disabled globally.

**Syntax**

```
aaa accounting auth-web {default|<list-name>}
{start-stop|stop-only|none} group {<group-name>|radius}

no aaa accounting auth-web {default|<list-name>}
```

| Parameter    | Description                                                                                                               |
|--------------|---------------------------------------------------------------------------------------------------------------------------|
| default      | Configure the default accounting method list                                                                              |
| <list-name>  | Configure a named accounting method list                                                                                  |
| start-stop   | Sends a start accounting message at the beginning of the session and a stop accounting message at the end of the session. |
| stop-only    | Only sends a stop accounting message at the end of the session.                                                           |
| none         | No accounting record sent.                                                                                                |
| group        | Use a server group                                                                                                        |
| <group-name> | Server group name.                                                                                                        |
| radius       | Use all RADIUS servers.                                                                                                   |

**Default** RADIUS accounting for Web-based authentication is disabled by default.

**Mode** Global Configuration

**Usage notes** This command can be used to configure either the default accounting method list or a named accounting method list:

- **default:** the default accounting method list which is automatically applied to all interfaces with Web-based authentication enabled.
- **<list-name>:** a user named list which can be applied to an interface using the [auth-web accounting](#) command.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius:** use all RADIUS servers configured by [radius-server host](#) command

- **group <group-name>**: use the specified RADIUS server group configured with the [aaa group server](#) command

Configure the accounting event to be sent to the RADIUS server with the following options:

- **start-stop**: sends a start accounting message at the beginning of a session and a stop accounting message at the end of the session.
- **stop-only**: sends a stop accounting message at the end of a session.
- **none**: disables accounting.

**Examples** To enable the default RADIUS accounting method for Web-based authentication, and use all available RADIUS servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting auth-web default start-stop
group radius
```

To disable the default RADIUS accounting method for Web-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting auth-web default
```

To enable a named RADIUS accounting method list 'vlan10\_acct' for Web-based authentication, with the RADIUS server group 'rad\_group\_vlan10', use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting auth-web vlan10_acct start-stop
group rad_group_vlan10
```

To disable a named RADIUS accounting method list 'vlan10\_acct' for Web-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting auth-web vlan10_acct
```

# aaa accounting commands

**Overview** This command configures and enables TACACS+ accounting on commands entered at a specified privilege level. Once enabled for a privilege level, accounting messages for commands entered at that privilege level will be sent to a TACACS+ server.

In order to account for all commands entered on a device, configure command accounting for each privilege level separately.

The command accounting message includes, the command as entered, the date and time the command finished executing, and the user-name of the user who executed the command.

Use the **no** variant of this command to disable command accounting for a specified privilege level.

TACACS+ is not available in Secure Mode (see the [crypto secure-mode](#) command).

**Syntax** `aaa accounting commands <1-15> default stop-only group tacacs+`  
`no aaa accounting commands <1-15> default`

| Parameter | Description                                                                                                        |
|-----------|--------------------------------------------------------------------------------------------------------------------|
| <1-15>    | The privilege level being configured, in the range 1 to 15.                                                        |
| default   | Use the default method list, this means the command is applied globally to all user exec sessions.                 |
| stop-only | Send accounting message when the commands have stopped executing.                                                  |
| group     | Specify the server group where accounting messages are sent. Only the tacacs+ group is available for this command. |
| tacacs+   | Use all TACACS+ servers configured by the <a href="#">tacacs-server host</a> command.                              |

**Default** TACACS+ command accounting is disabled by default.

**Mode** Global Configuration

**Usage notes** This command only supports a **default** method list, this means that it is applied to every console and VTY line.

The **stop-only** parameter indicates that the command accounting messages are sent to the TACACS+ server when the commands have stopped executing.

The **group tacacs+** parameters signifies that the command accounting messages are sent to the TACACS+ servers configured by the [tacacs-server host](#) command.

Note that up to four TACACS+ servers can be configured for accounting. The servers are checked for reachability in the order they are configured with only the

first reachable server being used. If no server is found, the accounting message is dropped.

Command accounting cannot coexist with triggers. An error message is displayed if you attempt to enable command accounting while a trigger is configured. Likewise, an error message is displayed if you attempt to configure a trigger while command accounting is configured.

**Examples** To configure command accounting for privilege levels 1, 7, and 15, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting commands 1 default stop-only
group tacacs+
awplus(config)# aaa accounting commands 7 default stop-only
group tacacs+
awplus(config)# aaa accounting commands 15 default stop-only
group tacacs+
```

To disable command accounting for privilege levels 1, 7, and 15, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting commands 1 default
awplus(config)# no aaa accounting commands 7 default
awplus(config)# no aaa accounting commands 15 default
```

# aaa accounting dot1x

**Overview** Use this command to configure an accounting method list for IEEE 802.1X-based authentication. An accounting method list specifies what type of accounting messages are sent and which RADIUS servers the accounting messages are sent to. Use this command to configure either the default method list, which is automatically applied to interfaces with IEEE 802.1X-based authentication enabled, or a named method list, which can be applied to an interface with the [dot1x accounting](#) command.

Use the **no** variant of this command to disable either the default or a named accounting method list for 802.1X-based authentication. Once all method lists are disabled, AAA accounting for 802.1x-based authentication is disabled globally.

**Syntax** `aaa accounting dot1x {default|<list-name>}  
{start-stop|stop-only|none} group {<group-name>|radius}  
no aaa accounting dot1x {default|<list-name>}`

| Parameter    | Description                                                                                                               |
|--------------|---------------------------------------------------------------------------------------------------------------------------|
| default      | Configure the default accounting method list                                                                              |
| <list-name>  | Configure a named accounting method list                                                                                  |
| start-stop   | Sends a start accounting message at the beginning of the session and a stop accounting message at the end of the session. |
| stop-only    | Only sends a stop accounting message at the end of the session.                                                           |
| none         | No accounting record sent.                                                                                                |
| group        | Use a server group                                                                                                        |
| <group-name> | Server group name.                                                                                                        |
| radius       | Use all RADIUS servers.                                                                                                   |

**Default** RADIUS accounting for 802.1X-based authentication is disabled by default (there is no default server set by default).

**Mode** Global Configuration

**Usage notes** This command can be used to configure either the default accounting method list or a named accounting method list:

- **default:** the default accounting method list which is automatically applied to all interfaces with 802.1X-based authentication enabled.
- **<list-name>:** a user named list which can be applied to an interface using the [dot1x accounting](#) command.

There are two ways to define servers where RADIUS accounting messages will be sent:

- **group radius:** use all RADIUS servers configured by [radius-server host](#) command.
- **group <group-name>:** use the specified RADIUS server group configured with the [aaa group server](#) command.

The accounting event to send to the RADIUS server is configured by the following options:

- **start-stop:** sends a **start** accounting message at the beginning of a session and a **stop** accounting message at the end of the session.
- **stop-only:** sends a **stop** accounting message at the end of a session.
- **none:** disables accounting.

**Examples** To enable RADIUS accounting for 802.1X-based authentication, and use all available RADIUS Servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting dot1x default start-stop group
radius
```

To disable RADIUS accounting for 802.1X-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting dot1x default
```

To enable a named RADIUS accounting method list 'vlan10\_acct' for 802.1X-based authentication, with the RADIUS server group 'rad\_group\_vlan10', use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting dot1x vlan10_acct start-stop
group rad_group_vlan10
```

To disable a named RADIUS accounting method list 'vlan10\_acct' for 802.1X-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting dot1x vlan10_acct
```

**Command  
changes**

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# aaa accounting login

**Overview** This command configures RADIUS and TACACS+ accounting for login shell sessions. The specified method list name can be used by the **accounting login** command in the Line Configuration mode. If the **default** parameter is specified, then this creates a default method list that is applied to every console and VTY line, unless another accounting method list is applied on that line.

Note that unlimited RADIUS servers and up to four TACACS+ servers can be configured and consulted for accounting. The first server configured is regarded as the primary server and if the primary server fails then the backup servers are consulted in turn. A backup server is consulted if the primary server fails, i.e. is unreachable.

TACACS+ is not available in Secure Mode (see the [crypto secure-mode](#) command).

Use the **no** variant of this command to remove an accounting method list for login shell sessions configured by an **aaa accounting login** command. If the method list being deleted is already applied to a console or VTY line, accounting on that line will be disabled. If the default method list name is removed by this command, it will disable accounting on every line that has the default accounting configuration.

**Syntax**

```
aaa accounting login
{default|<list-name>} {start-stop|stop-only|none} {group
{radius|tacacs+|<group-name>}}

no aaa accounting login {default|<list-name>}
```

| Parameter    | Description                                                                                           |
|--------------|-------------------------------------------------------------------------------------------------------|
| default      | Default accounting method list.                                                                       |
| <list-name>  | Named accounting method list.                                                                         |
| start-stop   | Start and stop records to be sent.                                                                    |
| stop-only    | Stop records to be sent.                                                                              |
| none         | No accounting record to be sent.                                                                      |
| group        | Specify the servers or server group where accounting packets are sent.                                |
| radius       | Use all RADIUS servers configured by the <a href="#">radius-server host</a> command.                  |
| tacacs+      | Use all TACACS+ servers configured by the <a href="#">tacacs-server host</a> command.                 |
| <group-name> | Use the specified RADIUS server group, as configured by the <a href="#">aaa group server</a> command. |

**Default** Accounting for login shell sessions is disabled by default.

**Mode** Global Configuration

**Usage notes** This command enables you to define a named accounting method list. The items that you define in the accounting options are:

- the types of accounting packets that will be sent
- the set of servers to which the accounting packets will be sent

You can define a default method list with the name **default** and any number of other named method lists. The name of any method list that you define can then be used as the *<list-name>* parameter in the [accounting login](#) command.

If the method list name already exists, the command will replace the existing configuration with the new one.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius** : use all RADIUS servers configured by [radius-server host](#) command
- **group <group-name>** : use the specified RADIUS server group configured with the [aaa group server](#) command

There is one way to define servers where TACACS+ accounting messages are sent:

- **group tacacs+** : use all TACACS+ servers configured by [tacacs-server host](#) command

The accounting event to send to the RADIUS or TACACS+ server is configured with the following options:

- **start-stop** : sends a **start** accounting message at the beginning of a session and a **stop** accounting message at the end of the session.
- **stop-only** : sends a **stop** accounting message at the end of a session.
- **none** : disables accounting.

**Examples** To configure RADIUS accounting for login shell sessions, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting login default start-stop group
radius
```

To configure TACACS+ accounting for login shell sessions, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting login default start-stop group
tacacs+
```

To reset the configuration of the default accounting list, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting login default
```

**Related  
commands**

- [tacacs-server host](#)

# aaa accounting update

**Overview** This command enables periodic accounting reporting to either the RADIUS or TACACS+ accounting server(s) wherever login accounting has been configured.

Note that unlimited RADIUS servers and up to four TACACS+ servers can be configured and consulted for accounting. The first server configured is regarded as the primary server and if the primary server fails then the backup servers are consulted in turn. A backup server is consulted if the primary server fails, i.e. is unreachable.

Use the **no** variant of this command to disable periodic accounting reporting to the accounting server(s).

**Syntax** `aaa accounting update [periodic <1-65535>]`  
`no aaa accounting update`

| Parameter                    | Description                                                                      |
|------------------------------|----------------------------------------------------------------------------------|
| <code>periodic</code>        | Send accounting records periodically.                                            |
| <code>&lt;1-65535&gt;</code> | The interval to send accounting updates (in minutes). The default is 30 minutes. |

**Default** Disabled

**Mode** Global Configuration

**Usage notes** Use this command to enable the device to send periodic AAA login accounting reports to the accounting server. When periodic accounting reporting is enabled, interim accounting records are sent at the interval specified by the **periodic** parameter. The accounting updates are start messages.

If the **no** variant of this command is used to disable periodic accounting reporting, any interval specified by the **periodic** parameter is reset to the default of 30 minutes when accounting reporting is re-enabled, unless this interval is specified.

**Examples** To configure the switch to send period accounting updates every 30 minutes, the default period, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting update
```

To configure the switch to send period accounting updates every 10 minutes, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting update periodic 10
```

To disable periodic accounting updates wherever accounting has been configured, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# no aaa accounting update
```

[radius-server host](#)

# aaa authentication auth-mac

**Overview** This command enables MAC-based authentication globally and allows you to enable either the default authentication method list (in this case, a list of RADIUS servers), which is automatically applied to every interface running MAC-based authentication, or a user named authentication method list, which is applied to an interface with the [auth-mac authentication](#) command.

Use the **no** variant of this command to disable either the default or a named method list for MAC-based authentication. Once all method lists are disabled MAC-based authentication is disabled globally.

**Syntax** `aaa authentication auth-mac {default|<list-name>} group {<group-name>|radius}`  
`no aaa authentication auth-mac {default|<list-name>}`

| Parameter    | Description                                      |
|--------------|--------------------------------------------------|
| default      | Configure the default authentication method list |
| <list-name>  | Configure a named authentication method list     |
| group        | Use a server group                               |
| <group-name> | Server group name.                               |
| radius       | Use all RADIUS servers.                          |

**Default** MAC-based Port Authentication is disabled by default.

**Mode** Global Configuration

**Usage notes** This command can be used to configure either the default authentication method list or a named authentication method list:

- **default:** the default authentication method list which is automatically applied to all interfaces with Web-based authentication enabled.
- **<list-name>:** a user named list which can be applied to an interface using the [auth-web authentication](#) command.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius:** use all RADIUS servers configured by [radius-server host](#) command
- **group <group-name>:** use the specified RADIUS server group configured with the [aaa group server](#) command

All configured RADIUS Servers are automatically members of the server group **radius**. If a server is added to a named group **<group-name>**, it also remains a member of the group **radius**.

**Examples** To enable MAC-based authentication globally for all RADIUS servers, and use all available RADIUS servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authentication auth-mac default group
radius
```

To disable MAC-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication auth-mac default
```

To enable MAC-based authentication for named list 'vlan10\_auth', with RADIUS server group 'rad\_group\_vlan10, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authentication auth-mac vlan10_auth group
rad_group_vlan10
```

To disable MAC-based authentication for named list 'vlan10\_auth', use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication auth-mac vlan10_acct
```

# aaa authentication auth-web

**Overview** This command enables Web-based authentication globally and allows you to enable either the default authentication method list (in this case, a list of RADIUS servers), which is automatically applied to every interface running Web-based authentication, or a user named authentication method list, which is applied to an interface with the [auth-web authentication](#) command.

Use the **no** variant of this command to disable either the default or a named method list for Web-based authentication. Once all method lists are disabled Web-based authentication is disabled globally.

**Syntax** `aaa authentication auth-web {default|<list-name>} group {<group-name>|radius}`  
`no aaa authentication auth-web {default|<list-name>}`

| Parameter    | Description                                      |
|--------------|--------------------------------------------------|
| default      | Configure the default authentication method list |
| <list-name>  | Configure a named authentication method list     |
| group        | Use a server group                               |
| <group-name> | Server group name.                               |
| radius       | Use all RADIUS servers.                          |

**Default** Web-based authentication is disabled by default.

**Mode** Global Configuration

**Usage notes** This command can be used to configure either the default authentication method list or a named authentication method list:

- **default:** the default authentication method list which is automatically applied to all interfaces with Web-based authentication enabled.
- **<list-name>:** a user named list which can be applied to an interface using the [auth-web authentication](#) command.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius:** use all RADIUS servers configured by [radius-server host](#) command
- **group <group-name>:** use the specified RADIUS server group configured with the [aaa group server](#) command

Note that you need to configure an IPv4 address for the VLAN interface on which Web authentication is running.

**Examples** To enable Web-based authentication globally for all RADIUS servers, and use all available RADIUS servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authentication auth-web default group
radius
```

To disable Web-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication auth-web default
```

To enable Web-based authentication for named list 'vlan10\_auth', with RADIUS server group 'rad\_group\_vlan10, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authentication auth-web vlan10_auth group
rad_group_vlan10
```

To disable Web-based authentication for named list 'vlan10\_auth', use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication vlan10_auth
```

# aaa authentication dot1x

**Overview** Use this command to enable IEEE 802.1X-based authentication globally and to allow you to enable either the default authentication method list (in this case, a list of RADIUS servers), which is automatically applied to every interface running IEEE 802.1X-based authentication, or a user named authentication method list, which is applied to an interface with the [dot1x authentication](#) command.

Use the **no** variant of this command to disable either the default or a named method list for 802.1X-based authentication. Once all method lists are disabled 802.1x-based authentication is disabled globally.

**Syntax**

```
aaa authentication dot1x {default|<list-name>} group
{<group-name>|radius}

no aaa authentication dot1x {default|<list-name>}
```

| Parameter    | Description                                      |
|--------------|--------------------------------------------------|
| default      | Configure the default authentication method list |
| <list-name>  | Configure a named authentication method list     |
| group        | Use a server group                               |
| <group-name> | Server group name.                               |
| radius       | Use all RADIUS servers.                          |

**Default** 802.1X-based Port Authentication is disabled by default.

**Mode** Global Configuration

**Usage notes** This command can be used to configure either the default authentication method list or a named authentication method list:

- **default:** the default authentication method list which is automatically applied to all interfaces with 802.1X-based authentication enabled.
- **<list-name>:** a user named list which can be applied to an interface using the [aaa authentication dot1x](#) command.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius:** use all RADIUS servers configured by [radius-server host](#) command
- **group <group-name>:** use the specified RADIUS server group configured with the [aaa group server](#) command

**Examples** To enable 802.1X-based authentication globally with all RADIUS servers, and use all available RADIUS servers, use the command:

```
awplus# configure terminal
awplus(config)# aaa authentication dot1x default group radius
```

To disable 802.1X-based authentication, use the command:

```
awplus# configure terminal
awplus(config)# no aaa authentication dot1x default
```

To enable 802.1X-based authentication for named list 'vlan10\_auth', with RADIUS server group 'rad\_group\_vlan10', use the commands:

```
awplus# configure terminal
awplus(config)# aaa authentication dot1x vlan10_auth group
rad_group_vlan10
```

To disable 802.1X-based authentication for named list 'vlan10\_auth' use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication dot1x vlan10_acct
```

**Command  
changes**

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# aaa authentication enable default group tacacs+

**Overview** This command enables privilege level authentication against a TACACS+ server. Use the **no** variant of this command to disable privilege level authentication. TACACS+ is not available in Secure Mode (see the [crypto secure-mode](#) command).

**Syntax** `aaa authentication enable default group tacacs+ [local] [none]`  
`no aaa authentication enable default`

| Parameter | Description                                                                                      |
|-----------|--------------------------------------------------------------------------------------------------|
| local     | Use the locally configured enable password ( <b>enable password</b> command) for authentication. |
| none      | No authentication.                                                                               |

**Default** Local privilege level authentication is enabled by default ([aaa authentication enable default local](#) command).

**Mode** Global Configuration

**Usage notes** A user is configured on a TACACS+ server with a maximum privilege level. When they enter the [enable \(Privileged Exec mode\)](#) command they are prompted for an enable password which is authenticated against the TACACS+ server. If the password is correct and the specified privilege level is equal to or less than the users maximum privilege level, then they are granted access to that level. If the user attempts to access a privilege level that is higher than their maximum configured privilege level, then the authentication session will fail and they will remain at their current privilege level.

**NOTE:** If both **local** and **none** are specified, you must always specify **local** first.

If the TACACS+ server goes offline, or is not reachable during enable password authentication, and command level authentication is configured as:

- **aaa authentication enable default group tacacs+**  
then the user is never granted access to Privileged Exec mode.
- **aaa authentication enable default group tacacs+ local**  
then the user is authenticated using the locally configured enable password, which if entered correctly grants the user access to Privileged Exec mode. If no enable password is locally configured (**enable password** command), then the enable authentication will fail until the TACACS+ server becomes available again.

- **aaa authentication enable default group tacacs+ none**  
then the user is granted access to Privileged Exec mode with no authentication. This is true even if a locally configured enable password is configured.
- **aaa authentication enable default group tacacs+ local none**  
then the user is authenticated using the locally configured enable password. If no enable password is locally configured, then the enable authentication will grant access to Privileged Exec mode with no authentication.

If the password for the user is not successfully authenticated by the server, then the user is again prompted for an enable password when they enter **enable** via the CLI.

**Examples** To enable a privilege level authentication method that will not allow the user to access Privileged Exec mode if the TACACS+ server goes offline, or is not reachable during enable password authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication enable default group tacacs+
```

To enable a privilege level authentication method that will allow the user to access Privileged Exec mode if the TACACS+ server goes offline, or is not reachable during enable password authentication, and a locally configured enable password is configured, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication enable default group tacacs+
local
```

To disable privilege level authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication enable default
```

**Related commands**

- [aaa authentication login](#)

# aaa authentication enable default local

**Overview** This command enables local privilege level authentication.  
Use the **no** variant of this command to disable local privilege level authentication.

**Syntax** `aaa authentication enable default local`  
`no aaa authentication enable default`

**Default** Local privilege level authentication is enabled by default.

**Mode** Global Configuration

**Usage notes** The privilege level configured for a particular user in the local user database is the privilege threshold above which the user is prompted for an [enable \(Privileged Exec mode\)](#) command.

**Examples** To enable local privilege level authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication enable default local
```

To disable local privilege level authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication enable default
```

**Related commands** [aaa authentication login](#)  
[enable \(Privileged Exec mode\)](#)  
[enable password](#)  
[enable secret \(deprecated\)](#)

# aaa authentication login

**Overview** Use this command to create an ordered list of methods for authenticating user logins. It can also be used to replace an existing method list with a list of the same name. Specify one or more of the options **local** or **group**, in the order you want them to be applied. If the **default** method list name is specified, it is applied to every console and VTY line immediately unless another method list is applied to that line by the [login authentication](#) command. To apply a non-default method list, you must also use the [login authentication](#) command.

TACACS+ is not available in Secure Mode (see the [crypto secure-mode](#) command).

Use the **no** variant of this command to remove a method list from user login authentication. The specified method list name is deleted from the configuration. If the method list name has been applied to any console or VTY line, user login authentication on that line will fail.

Note that the **no aaa authentication login default** command does not remove the default method list. This will return the default method list to its default state (**local** is the default).

**Syntax** `aaa authentication login {default|<list-name>} {[local] [group  
{radius|ldap|tacacs+|<group-name>}]}`  
`no aaa authentication login {default|<list-name>}`

| Parameter    | Description                                                                           |
|--------------|---------------------------------------------------------------------------------------|
| default      | Set the default authentication server for user login.                                 |
| <list-name>  | Name of authentication server.                                                        |
| local        | Use the local username database.                                                      |
| group        | Use server group.                                                                     |
| radius       | Use all RADIUS servers configured by the <a href="#">radius-server host</a> command.  |
| ldap         | Use all LDAP servers configured by the <a href="#">ldap-server</a> command.           |
| tacacs+      | Use all TACACS+ servers configured by the <a href="#">tacacs-server host</a> command. |
| <group-name> | Use the specified RADIUS or LDAP server group.                                        |

**Default** If the default server is not configured using this command, user login authentication uses the local user database only.

If the **default** method list name is specified, it is applied to every console and VTY line immediately unless a named method list server is applied to that line by the **login authentication** command.

**local** is the default state for the default method list unless a named method list is applied to that line by the **login authentication** command. You can reset it to the default method list using the **no aaa authentication login default** command.

**Mode** Global Configuration

**Usage notes** When a user attempts to log in, the switch sends an authentication request to the first authentication server in the method list. If the first server in the list is reachable and it contains a username and password matching the authentication request, the user is authenticated and the login succeeds. If the authentication server denies the authentication request because of an incorrect username or password, the user login fails. If the first server in the method list is unreachable, the switch sends the request to the next server in the list, and so on.

For example, if the method list specifies **group tacacs+ local**, and a user attempts to log in with a password that does not match a user entry in the first TACACS+ server, if this TACACS+ server denies the authentication request, then the switch does not try any other TACACS+ servers nor the local user database; the user login fails.

**Examples** To configure the default authentication method list for user login to first use all available RADIUS servers for user login authentication, and then use the local user database, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication login default group radius
local
```

To configure the default authentication method list for user login to first use all available LDAP servers for user login authentication, and then use the local user database, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication login default group ldap
local
```

To configure a user login authentication method list called 'USERS' to first use the RADIUS server group 'RAD\_GROUP1' for user login authentication, and then use the local user database, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication login USERS group RAD_GROUP1
local
```

To configure a user login authentication method list called 'USERS' to first use the TACACS+ servers for user login authentication, and then use the local user database, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication login USERS group tacacs+
local
```

To return to the default method list (**local** is the default server), use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication login default
```

To delete an existing authentication method list 'USERS' created for user login authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication login USERS
```

changes**

Version 5.5.2-1.1: **ldap** parameter added

# aaa authorization commands

**Overview** This command configures a method list for commands authorization that can be applied to console or VTY lines. When command authorization is enabled for a privilege level, only authorized users can executed commands in that privilege level.

Use the **no** variant of this command to remove a named method list or disable the default method list for a privilege level.

**Syntax**

```
aaa authorization commands <privilege-level>
{default|<list-name>} group tacacs+ [none]

no aaa authorization commands <privilege-level>
{default|<list-name>}
```

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| tacacs+           | Use all TACACS+ servers configured by the <code>tacacs-server host</code> command.                                                                                                                                                                                                                                                                                                                                                                                                              |
| default           | Configure the default authorization commands method list.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <list-name>       | Configure a named authorization commands method list                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| none              | If specified, this provides a local fallback to command authorization so that if authorization servers become unavailable then the device will accept all commands normally allowed for the privilege level of the user.                                                                                                                                                                                                                                                                        |

**Mode** Global Configuration

**Usage notes** TACACS+ command authorization provides centralized control of the commands available to a user of an AlliedWare Plus device. Once enabled:

- The command string and username are encrypted and sent to the first available configured TACACS+ server (the first server configured) for authorization.

- The TACACS+ server decides if the user is authorized to execute the command and returns the decision to the AlliedWare Plus device.
- Depending on this decision the device will then either execute the command or notify the user that authorization has failed.

If multiple TACACS+ servers are configured, and the first server is unreachable or does not respond, the other servers will be queried, in turn, for an authorization decision. If all servers are unreachable and a local fallback has been configured, with the **none** parameter, then commands are authorized based on the user's privilege level; the same behavior as if command authorization had not been configured. If, however, the local fallback is not configured and all servers become unreachable then all commands except **logout**, **exit**, and **quit** will be denied.

The **default** method list is defined with a local fallback unless configured differently using this command.

**Example** To configure a commands authorization method list, named TAC15, using all TACACS+ servers to authorize commands for privilege level 15, with a local fallback, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authorization commands 15 TAC15 group
tacacs+ none
```

To configure the default method list to authorize commands for privilege level 7, with no local fallback, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authorization commands 7 default group
tacacs+
```

To remove the authorization method list TAC15, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authorization commands 15 TAC15
```

**Command changes** Version 5.4.6-2.1: command added

# aaa authorization config-commands

**Overview** Use this command to enable command authorization on configuration mode commands. By default, command authorization applies to commands in exec mode only.

Use the **no** variant of this command to disable command authorization on configuration mode commands.

**Syntax** `aaa authorization config-commands`  
`no aaa authorization config-commands`

**Default** By default, command authorization is disabled on configuration mode commands.

**Mode** Global Configuration

**Usage notes** If authorization of configuration mode commands is not enabled then all configuration commands are accepted by default, including command authorization commands.

**NOTE:** *Authorization of configuration commands is required for a secure TACACS+ command authorization configuration as it prevents the feature from being disabled to gain access to unauthorized exec mode commands.*

**Example** To enable command authorization for configuration mode commands, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authorization config-commands
```

To disable command authorization for configuration mode commands, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authorization config-commands
```

**Related commands** [aaa authorization commands](#)

**Command changes** Version 5.4.6-2.1: command added

# aaa group server

**Overview** Use this command to create an AAA group of RADIUS or LDAP servers, and to enter Server Group Configuration mode.

A server group is used to specify a subset of RADIUS or LDAP servers in AAA commands. Once in Server Group Configuration mode you can add servers to the group.

Use the **no** variant of this command to remove an existing server group.

**Syntax** `aaa group server {radius|ldap} <group-name>`  
`no aaa group server {radius|ldap} <group-name>`

| Parameter    | Description                                |
|--------------|--------------------------------------------|
| radius       | Create or configure a RADIUS server group. |
| ldap         | Create or configure an LDAP server group.  |
| <group-name> | Server group name.                         |

**Mode** Global Configuration

**Usage notes** To add servers to a RADIUS or LDAP server group, use the **server** command. Each RADIUS server in a server group must be configured using the [radius-server host](#) command. Similarly, each LDAP server in a server group must be configured using the [ldap-server](#) command.

Server groups named 'radius' and 'ldap' are predefined and include all RADIUS and LDAP servers configured using the [radius-server host](#) or [ldap-server](#) commands.

**Examples** To create a RADIUS server group named 'GROUP1' with hosts 192.168.1.1, 192.168.2.1 and 192.168.3.1, use the commands:

```
awplus(config)# aaa group server radius GROUP1
awplus(config-sg)# server 192.168.1.1 auth-port 1812 acct-port 1813
awplus(config-sg)# server 192.168.2.1 auth-port 1812 acct-port 1813
awplus(config-sg)# server 192.168.3.1 auth-port 1812 acct-port 1813
```

To remove a RADIUS server group named 'GROUP1' from the configuration, use the command:

```
awplus(config)# no aaa group server radius GROUP1
```

To create an LDAP server group named 'GROUP2' with servers named 'SERVER1', 'SERVER2' and 'SERVER3', use the commands:

```
awplus(config)# aaa group server ldap GROUP2
awplus(config-ldap-group)# server SERVER1
awplus(config-ldap-group)# server SERVER2
awplus(config-ldap-group)# server SERVER3
```

To remove an LDAP server group named 'GROUP2' from the configuration, use the command:

```
awplus(config)# no aaa group server ldap GROUP2
```

# aaa local authentication attempts lockout-time

**Overview** This command configures the duration of the user lockout period.

Use the **no** variant of this command to restore the duration of the user lockout period to its default of 300 seconds (5 minutes).

**Syntax** `aaa local authentication attempts lockout-time <lockout-time>`  
`no aaa local authentication attempts lockout-time`

| Parameter                         | Description                                                         |
|-----------------------------------|---------------------------------------------------------------------|
| <code>&lt;lockout-time&gt;</code> | <code>&lt;0-10000&gt;</code> . Time in seconds to lockout the user. |

**Mode** Global Configuration

**Default** The default for the lockout-time is 300 seconds (5 minutes).

**Usage notes** While locked out all attempts to login with the locked account will fail. The lockout can be manually cleared by another privileged account using the [clear aaa local user lockout](#) command.

**Examples** To configure the lockout period to 10 minutes (600 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# aaa local authentication attempts lockout-time
600
```

To restore the default lockout period of 5 minutes (300 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# no aaa local authentication attempts
lockout-time
```

**Related commands** [aaa local authentication attempts max-fail](#)  
[aaa local authentication attempts max-fail remote-login-only](#)  
[clear aaa local user lockout](#)

# aaa local authentication attempts max-fail

**Overview** This command configures the maximum number of failed login attempts before a user account is locked out. Every time a login attempt fails the failed login counter is incremented.

Use the **no** variant of this command to restore the maximum number of failed login attempts to the default setting (five failed login attempts).

**Syntax** `aaa local authentication attempts max-fail <failed-logins>`  
`no aaa local authentication attempts max-fail`

| Parameter                          | Description                                                                             |
|------------------------------------|-----------------------------------------------------------------------------------------|
| <code>&lt;failed-logins&gt;</code> | <code>&lt;1-32&gt;</code> . Number of login failures allowed before locking out a user. |

**Mode** Global Configuration

**Default** The default for the maximum number of failed login attempts is five failed login attempts.

**Usage** When the failed login counter reaches the limit configured by this command that user account is locked out for a specified duration configured by the [aaa local authentication attempts lockout-time](#) command.

When a successful login occurs the failed login counter is reset to 0. When a user account is locked out all attempts to login using that user account will fail.

**Examples** To configure the number of login failures that will lock out a user account to two login attempts, use the commands:

```
awplus# configure terminal
awplus(config)# aaa local authentication attempts max-fail 2
```

To restore the number of login failures that will lock out a user account to the default number of login attempts (five login attempts), use the commands:

```
awplus# configure terminal
awplus(config)# no aaa local authentication attempts max-fail
```

**Related commands** [aaa local authentication attempts lockout-time](#)  
[aaa local authentication attempts max-fail remote-login-only](#)  
[clear aaa local user lockout](#)

# aaa local authentication attempts max-fail remote-login-only

**Overview** Use this command to configure account lockout to remote logins only. This means that console logins are not subject to lock out when this feature is configured.

This command allow users to login via the physical console port even when the account is locked due to reaching the maximum number of failed login attempts.

Use the **no** variant of this command to prevent users from logging in via the console port when the maximum number of failed login attempts is reached.

**Syntax** `aaa local authentication attempts max-fail remote-login-only`  
`no aaa local authentication attempts max-fail remote-login-only`

**Default** Not set. Max-fail lockout applies to all logins.

**Mode** Global Configuration

**Example** To configure account lock-out to remote login only, use the commands:

```
awplus# configure terminal
awplus(config)# aaa local authentication attempts max-fail
remote-login-only
```

To configure account lock-out to apply to all logins, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa local authentication attempts max-fail
remote-login-only
```

**Related commands** [aaa local authentication attempts max-fail](#)  
[aaa local authentication attempts lockout-time](#)  
[clear aaa local user lockout](#)

**Command changes** Version 5.5.4-1.2: command added

# aaa login fail-delay

**Overview** Use this command to configure the minimum time period between failed login attempts. This setting applies to login attempts via the console, SSH and Telnet. Use the **no** variant of this command to reset the minimum time period to its default value.

**Syntax** `aaa login fail-delay <1-10>`  
`no aaa login fail-delay`

| Parameter | Description                                                   |
|-----------|---------------------------------------------------------------|
| <1-10>    | The minimum number of seconds required between login attempts |

**Default** 1 second

**Mode** Global configuration

**Example** To apply a delay of at least 5 seconds between login attempts, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa login fail-delay 5
```

**Related commands** [aaa authentication login](#)  
[aaa local authentication attempts logout-time](#)  
[clear aaa local user logout](#)

# accounting login

**Overview** This command applies a login accounting method list to console or VTY lines for user login. When login accounting is enabled using this command, logging events generate an accounting record to the accounting server.

The accounting method list must be configured first using this command. If an accounting method list is specified that has not been created by this command then accounting will be disabled on the specified lines.

The **no** variant of this command resets AAA Accounting applied to console or VTY lines for local or remote login. **default** login accounting is applied after issuing the **no accounting login** command. Accounting is disabled with **default**.

**Syntax** `accounting login {default|<list-name>}`  
`no accounting login`

| Parameter   | Description                     |
|-------------|---------------------------------|
| default     | Default accounting method list. |
| <list-name> | Named accounting method list.   |

**Default** By default login accounting is disabled in the **default** accounting server. No accounting will be performed until accounting is enabled using this command.

**Mode** Line Configuration

**Examples** To apply the accounting server `USERS` to all VTY lines, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 32
awplus(config-line)# accounting login USERS
```

To reset accounting for login sessions on the console, use the following commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# no accounting login
```

**Related commands** [aaa accounting commands](#)  
[aaa accounting login](#)

# authorization commands

**Overview** This command applies a command authorization method list, defined using the [aaa authorization commands](#) command, to console and VTY lines.

Use the **no** variant of this command to reset the command authorization configuration on the console and VTY lines.

**Syntax** `authorization commands <privilege-level> {default|<list-name>}`  
`no authorization commands <privilege-level>`

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <privilege-level> | The privilege level of the set of commands the method list will be applied to.<br>AlliedWare Plus defines three sets of commands, that are indexed by a level value:<br><b>Level = 1:</b> All commands that can be accessed by a user with privilege level between 1 and 6 inclusive<br><b>Level = 7:</b> All commands that can be accessed by a user with privilege level between 7 and 14 inclusive<br><b>Level = 15:</b> All commands that can be accessed by a user with privilege level 15 |
| default           | Configure the default authorization commands method list.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <list-name>       | Configure a named authorization commands method list                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Default** The **default** method list is applied to each console and VTY line by default.

**Mode** Line Configuration

**Usage notes** If the specified method list does not exist users will not be enable to execute any commands in the specified method list on the specified VTY lines.

**Example** To apply the TAC15 command authorization method list with privilege level 15 to VTY lines 0 to 5, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 5
awplus(config-line)# authorization commands 15 TAC15
```

To reset the command authorization configuration with privilege level 15 on VTY lines 0 to 5, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 5
awplus(config-line)# no authorization commands 15
```

Version 5.4.6-2.1: command added

# clear aaa local user lockout

**Overview** Use this command to clear the lockout on a specific user account or all user accounts.

**Syntax** `clear aaa local user lockout {username <username>|all}`

| Parameter  | Description                           |
|------------|---------------------------------------|
| username   | Clear lockout for the specified user. |
| <username> | Specifies the user account.           |
| all        | Clear lockout for all user accounts.  |

**Mode** Privileged Exec

**Examples** To unlock the user account 'bob' use the following command:

```
awplus# clear aaa local user lockout username bob
```

To unlock all user accounts use the following command:

```
awplus# clear aaa local user lockout all
```

**Related commands** [aaa local authentication attempts lockout-time](#)

# debug aaa

**Overview** This command enables AAA debugging.  
Use the **no** variant of this command to disable AAA debugging.

**Syntax** debug aaa [accounting|all|authentication|authorization]  
no debug aaa [accounting|all|authentication|authorization]

| Parameter      | Description                        |
|----------------|------------------------------------|
| accounting     | Accounting debugging.              |
| all            | All debugging options are enabled. |
| authentication | Authentication debugging.          |
| authorization  | Authorization debugging.           |

**Default** AAA debugging is disabled by default.

**Mode** Privileged Exec

**Examples** To enable authentication debugging for AAA, use the command:

```
awplus# debug aaa authentication
```

To disable authentication debugging for AAA, use the command:

```
awplus# no debug aaa authentication
```

**Related commands** [show debugging aaa](#)  
[undebug aaa](#)

# login authentication

**Overview** Use this command to apply an AAA server for authenticating user login attempts from a console or remote logins on these console or VTY lines. The authentication method list must be specified by the **aaa authentication login** command. If the method list has not been configured by the **aaa authentication login** command, login authentication will fail on these lines.

Use the **no** variant of this command to reset AAA Authentication configuration to use the default method list for login authentication on these console or VTY lines.

**Command Syntax** login authentication {default|<list-name>}  
no login authentication

| Parameter   | Description                                                                                                                                                                                                        |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| default     | The default authentication method list. If the default method list has not been configured by the <a href="#">aaa authentication login</a> command, the local user database is used for user login authentication. |
| <list-name> | Named authentication server.                                                                                                                                                                                       |

**Default** The default login authentication method list, as specified by the [aaa authentication login](#) command, is used to authenticate user login. If this has not been specified, the default is to use the local user database.

**Mode** Line Configuration

**Examples** To apply the authentication method list called `CONSOLE` to the console port terminal line (asyn 0), use the following commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# login authentication CONSOLE
```

To reset user authentication configuration on all VTY lines, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 32
awplus(config-line)# no login authentication
```

**Related commands** [aaa authentication login](#)  
[line](#)

# proxy-port

**Overview** Use this command to change the local UDP port used for communication between local RADIUS client applications and the RadSecProxy AAA application. Any unused UDP port may be selected. The default port is 1645.

Use the **no** variant of this command to change the UDP port back to the default of 1645.

**Syntax** `proxy-port <port>`  
`no proxy-port`

| Parameter                 | Description               |
|---------------------------|---------------------------|
| <code>&lt;port&gt;</code> | UDP Port Number, 1-65536. |

**Default** The default port is 1645.

**Mode** RadSecProxy AAA Configuration Mode

**Usage notes** It is not necessary to change the value from the default unless UDP port 1645 is required for another purpose. RADIUS requests received on this port from external devices will be ignored. The port is only used for local (intra-device) communication.

**Example** To configure change the UDP port to 7001, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy aaa
awplus(config-radsecproxy-aaa)# proxy-port 7001
```

**Related commands** [radius-secure-proxy aaa](#)  
[server \(radsecproxy-aaa\)](#)  
[server name-check](#)  
[server trustpoint](#)

# radius-secure-proxy aaa

**Overview** Use this command to enter the RadSecProxy AAA (authentication, authorization, and accounting) application configuration mode. This application allows local RADIUS-based clients on system to communicate with remote RadSec servers via a secure (TLS) proxy.

**Syntax** `radius-secure-proxy aaa`

**Mode** Global Configuration Mode

**Example** To change mode from User Exec mode to the RadSecProxy AAA configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy aaa
awplus(config-radsecproxy-aaa)#
```

**Related commands**

- [proxy-port](#)
- [server \(radsecproxy-aaa\)](#)
- [server name-check](#)
- [server trustpoint](#)

## server (radsecproxy-aaa)

**Overview** Use this command to add a server to the RadSecProxy AAA application. Local RADIUS client applications will attempt, via the proxy, to communicate with any RadSec servers that are operational (in addition to any non-TLS RADIUS servers that are configured).

Use the **no** variant of this command to delete a previously-configured server from the RadSecProxy AAA application.

**Syntax** `server {<hostname>|<ip-addr>} [timeout <1-1000>] [name-check {on|off}]`  
`no server {<hostname>|<ip-addr>}`

| Parameter  | Description                                                                                                                                                                     |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <hostname> | Hostname of RadSec server                                                                                                                                                       |
| <ip-addr>  | Specify the client IPv4 address, in dotted decimal notation (A.B.C.D).                                                                                                          |
| timeout    | Specify the amount of time that the RadSecProxy AAA application should wait for replies from this server. RADIUS server timeout (which defaults to 5 seconds).                  |
| <1-1000>   | Time in seconds to wait for a server reply.                                                                                                                                     |
| name-check | Specify whether or not to enforce certificate name checking for this client. If the parameter is not specified then the global behavior, which defaults to <b>on</b> , is used. |
| on         | Enable name checking for this client.                                                                                                                                           |
| off        | Disable name checking for this client.                                                                                                                                          |

**Mode** RadSecProxy AAA Configuration Mode

**Usage notes** The server may be specified by its domain name or by its IPv4 address. If a domain name is used, it must be resolvable using a configured DNS name server.

Each server may be configured with a timeout; if not specified, the global timeout value for RADIUS servers will be used. The global timeout may be changed using the **radius-server timeout** command. The default global timeout is 5 seconds.

Each server may be configured to use certificate name-checking; if not specified, the global behavior defined by **server name-check** or **no server name-check** will be used. If name checking is enabled, the Common Name portion of the subject field of the server's X.509 certificate must match the domain name or IP address specified in this command.

**Example** To add a server 'mynas.local' with a timeout of 3 seconds, and name checking off, use the commands:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy aaa
awplus(config-radsecproxy-aaa)# server mynas.local name-check
off
```

**Related  
commands**

- [proxy-port](#)
- [radius-secure-proxy aaa](#)
- [server name-check](#)
- [server trustpoint](#)

# server mutual-authentication

**Overview** This command enables or disables mutual certificate authentication for all RadSecProxy servers. When enabled, the RadSecProxy AAA application will send a local X.509 certificate to the server when establishing a TLS connection.

Use the **no** variant of this command to disable mutual certificate validation causing the RadSecProxy AAA application to not transmit a certificate to the server.

**NOTE:** *If mutual authentication is disabled on the client (AAA) application but enabled on the server, a connection will not be established.*

**Syntax** `server mutual-authentication`  
`no server mutual-authentication`

**Default** Mutual authentication is enabled by default.

**Mode** RadSecProxy AAA Configuration Mode

**Example** Disable mutual certificate validation with the following command:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy aaa
awplus(config-radsecproxy-aaa)# no server
mutual-authentication
```

**Related commands** [radius-secure-proxy aaa](#)  
[server name-check](#)  
[server \(radsecproxy-aaa\)](#)

**Command changes** Version 5.4.6-2.1: command added

# server name-check

**Overview** This command sets the global behavior for certificate name-checking for the RadSecProxy AAA application to **on**. This behavior will be used for all servers associated with the application that do not specify a behavior on a per-server basis. If name-checking is enabled, the Common Name portion of the subject field of the client's X.509 certificate must match the domain name or IP address specified in the **server (radsecproxy-aaa)** command.

Use the **no** variant of this command to set the global behavior for certificate name checking to **off**

**Syntax** `server name-check`  
`no server name-check`

**Default** Certificate name checking is on by default.

**Mode** RadSecProxy AAA Configuration Mode

**Example** Disable certificate name checking globally with the following command:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy aaa
awplus(config-radsecproxy-aaa)# no server name-check
```

**Related commands** [proxy-port](#)  
[radius-secure-proxy aaa](#)  
[server \(radsecproxy-aaa\)](#)  
[server trustpoint](#)

# server trustpoint

**Overview** This command adds one or more trustpoints to be used with the RadSecProxy AAA application. Multiple trustpoints may be specified, or the command may be executed more than once, to add multiple trustpoints to the application.

The **no** version of this command removes one or more trustpoints from the list of trustpoints associated with the application.

**Syntax** `server trustpoint [<trustpoint-list>]`  
`no server trustpoint [<trustpoint-list>]`

| Parameter         | Description                                             |
|-------------------|---------------------------------------------------------|
| <trustpoint-list> | Specify one or more trustpoints to be added or deleted. |

**Default** By default, no trustpoints are associated with the application.

**Mode** RadSecProxy AAA Configuration Mode

**Usage notes** The device certificate associated with first trustpoint added to the application will be transmitted to remote servers. The certificate received from the remote server must have an issuer chain that terminates with the root CA certificate for any of the trustpoints that are associated with the application.

If no trustpoints are specified in the command, the trustpoint list will be unchanged.

If **no server trustpoint** is issued without specifying any trustpoints, then all trustpoints will be disassociated from the application.

**Example** You can add multiple trustpoints to the RadSecProxy AAA application by executing the command multiple times:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy aaa
awplus(config-radsecproxy-aaa)# server trustpoint example_1
awplus(config-radsecproxy-aaa)# server trustpoint example_2
```

Alternatively, add multiple trustpoints with a single command:

```
awplus(config-radsecproxy-aaa)# server trustpoint example_3
example_4
```

Disassociate all trustpoints from the RadSecProxy AAA application using the command:

```
awplus(config-radsecproxy-aaa)# no server trustpoint
```

**Related commands** [proxy-port](#)

server (radsecproxy-aaa)  
server name-check

# show aaa local user locked

**Overview** This command displays the failed attempts against each user account attempting to login into the device, along with the failure times and locations.

Use this command's output to see if a user is currently locked out or not. You can check:

- the number of login attempts that have a 'V' in the 'Valid' column, and
- if the last attempt happened within the lockout time. If the number of 'V' attempts exceeds the maximum allowed number of attempts, and the last attempt is within the lockout time, then the user is locked out.

The maximum number of attempts is 5 by default. You can change it using the command **aaa local authentication attempts max-fail**. The lockout time is 5 minutes by default. You can change it using the command **aaa local authentication attempts lockout-time**.

Once a user's lockout status is cleared, this command will no longer display any failed attempts for that user. The status gets cleared by:

- being manually cleared by another privileged user, using the [clear aaa local user lockout](#) command, or
- the locked out user successfully logs into the system after waiting for the lockout time to pass.

In the Valid column:

- 'V' means this login attempt counts towards the maximum allowed number of attempts
- 'I' means this login attempt does not count towards the maximum allowed number of attempts, because it was more than 15 minutes ago.

**Syntax** `show aaa local user locked`

**Mode** User Exec and Privileged Exec

**Example** To display the current failed attempts for local users, use the command:

```
awplus# show aaa local user locked
```

**Output** Figure 49-1: Example output from the **show aaa local user locked** command

```
awplus#show aaa local user locked
```

| manager:            |       |             |       |
|---------------------|-------|-------------|-------|
| When                | Type  | Source      | Valid |
| 2023-02-09 11:48:15 | RHOST | 192.168.5.1 | V     |
| 2023-02-09 11:48:21 | RHOST | 192.168.5.1 | V     |
| user1:              |       |             |       |

| 2023-02-09 11:47:28 | RHOST | 192.168.5.1 | V     |
| 2023-02-09 11:47:31 | TTY   | /dev/ttyS0  | V     |
| 2023-02-09 11:47:35 | TTY   | /dev/ttyS0  | V     |
| 2023-02-09 11:47:38 | RHOST | 192.168.5.1 | V     |
| 2023-02-09 11:47:49 | RHOST | 192.168.5.1 | V     |
| 2023-02-09 11:20:50 | TTY   | /dev/ttyS0  | I     |
| 2023-02-09 11:20:54 | RHOST | 192.168.5.1 | I     |
| 2023-02-09 11:47:19 | RHOST | 192.168.5.1 | V     |
| 2023-02-09 11:47:23 | TTY   | /dev/ttyS0  | V     |
| user2:              |       |             |       |
| When                | Type  | Source      | Valid |
| 2023-02-09 11:47:52 | TTY   | /dev/ttyS0  | V     |
| 2023-02-09 11:47:55 | RHOST | 192.168.5.1 | V     |
| 2023-02-09 11:47:58 | TTY   | /dev/ttyS0  | V     |
| 2023-02-09 11:48:05 | RHOST | 192.168.5.1 | V     |
| 2023-02-09 11:22:51 | RHOST | 192.168.5.1 | I     |
| 2023-02-09 11:22:54 | TTY   | /dev/ttyS0  | I     |
| user3:              |       |             |       |
| When                | Type  | Source      | Valid |
| 2023-02-09 11:38:58 | TTY   | /dev/ttyS0  | V     |
| 2023-02-09 11:39:04 | RHOST | 192.168.5.1 | V     |
| 2023-02-09 11:39:06 | TTY   | /dev/ttyS0  | V     |
| 2023-02-09 11:39:22 | RHOST | 192.168.5.1 | V     |
| 2023-02-09 11:39:26 | TTY   | /dev/ttyS0  | V     |

This output example was run at 11:49. The lockout-time and max-fail settings are set to their defaults:

- manager: is not locked out because they only have 2 valid attempts.
- user1: is locked out because they have 7 valid attempts and the most recent was within the lockout time.
- user2: is not locked out because only 4 attempts are valid.
- user3: is not locked out. Even though they have 5 valid attempts, the most recent attempt is older than the lockout time of 5 minutes.

# show debugging aaa

**Overview** Use this command to see what debugging is turned on for AAA (Authentication, Authorization, Accounting).

**Syntax** `show debugging aaa`

**Mode** User Exec and Privileged Exec

**Example** To display the current debugging status of AAA, use the command:

```
awplus# show debug aaa
```

**Output** Figure 49-3: Example output from the **show debug aaa** command

```
AAA debugging status:
Authentication debugging is on
Accounting debugging is off
```

# show radius server group

**Overview** Use this command to show the RADIUS server group configuration.

**Syntax** `show radius server group [<group-name>]`

| Parameter                       | Description               |
|---------------------------------|---------------------------|
| <code>&lt;group-name&gt;</code> | RADIUS server group name. |

**Default** Command name is set to something by default.

**Mode** Privileged Exec

**Usage** Use this command with the `<group-name>` parameter to display information for a specific RADIUS server group, or without the parameter to display information for all RADIUS server groups.

**Example** To display information for all RADIUS server groups, use the command:

```
awplus# show radius server group
```

To display a information for a RADIUS server group named 'rad\_group\_list1', use the command:

```
awplus# show radius server group rad_group_list1
```

**Output** Figure 49-4: Example output from **show radius server group**

```
awplus#show radius server group
RADIUS Group Configuration
 Group Name : radius?
 Server Host/ Auth Acct Auth Acct
 IP Address Port Port Status Status

 192.168.1.101 1812 1813 Active Active

# Lightweight Directory Access Protocol (LDAP) Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure Lightweight Directory Access Protocol (LDAP).

LDAP is an authentication protocol that facilitates user access to various IT resources e.g. applications, servers, networking equipment, and file servers.

It can be used to connect to internal networks over OpenVPN. Although both LDAP and RADIUS are interchangeable on AlliedWare Plus devices as an authentication protocol, LDAP is added because of its ability to interact with directory services such as Microsoft's Active Directory (AD).

For more information, see the [LDAP Feature Overview and Configuration Guide](#).

# authentication (ldap-server)

**Overview** Use this command to set the authentication method used to authenticate users against the Lightweight Directory Access Protocol (LDAP) server.

Use the **no** variant of this command to reset the authentication method to **search**.

**Syntax** authentication {search|bind-only}  
no authentication

| Parameter | Description                                                                                                                                                                                                                                                                                                               |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| search    | The <b>search</b> method initially binds to the LDAP server, then searches for the user, then binds to the user using the DN found with the search. The initial bind is either anonymous, or using the user specified with the <a href="#">bind authenticate root-dn</a> command.                                         |
| bind-only | The <b>bind-only</b> method attempts to bind to the LDAP server using a predicted DN based on the username, the user attribute (set with the login-attribute command) and the base DN (set with the <a href="#">base-dn</a> command). The format of this user DN is as follows: '<username>=<login-attribute>,<base-dn>'. |

**Default** Search

**Mode** LDAP Server Configuration

**Example** To set the authentication method to bind-only for the LDAP server called 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# authentication bind-only
```

To reset the authentication method to the default (search) for 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no authentication
```

**Related commands** [base-dn](#)  
[bind authenticate root-dn](#)  
[ldap-server](#)  
[login-attribute](#)  
[search-filter](#)

**Command changes** Version 5.5.2-1.1: command added

# base-dn

- Overview** Use this command to set the base DN (Distinguished Name) of the LDAP server.
- When using 'search' authentication, the base DN is the LDAP server's starting point to search for the user within the directory.
- If 'bind-only' authentication is enabled, then the base DN is the suffix of the DN that is used to bind to the user.
- Use the **no** variant of this command to remove the configured base DN.

**Syntax** base-dn <base-dn>  
no base-dn

| Parameter | Description                     |
|-----------|---------------------------------|
| <base-dn> | The base DN of the LDAP server. |

**Default** Not set

**Mode** LDAP Server Configuration

**Example** To set the base DN for the LDAP server called 'Server1' to 'dc=example, dc=com', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# base-dn dc=example,dc=com
```

To clear the base DN for Server1, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no base-dn
```

**Command changes** Version 5.5.2-1.1: command added

# bind authenticate root-dn

**Overview** Use this command to set the authenticated user to bind to when searching for a user on an LDAP server. Do not set this option if you wish to use anonymous binding with the 'search' method.

This option is ignored with the 'bind-only' authentication method.

Use the **no** variant of this command to unset the authenticated user.

**Syntax** `bind authenticate root-dn <user-dn> password <password>`  
`no bind authenticate root-dn`

| Parameter                     | Description                                  |
|-------------------------------|----------------------------------------------|
| <code>&lt;user-dn&gt;</code>  | The DN of the authenticated user to bind to. |
| <code>&lt;password&gt;</code> | The password of the authenticated user.      |

**Default** Not set

**Mode** LDAP Server Configuration

**Example** To set the authenticated user to 'cn=admin,dc=example,dc=com' with the password '12345678' for the LDAP server called 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# bind authenticate root-dn
cn=admin,dc=example,dc=com password 12345678
```

**Command changes** Version 5.5.2-1.1: command added

# deadtime (ldap-server)

**Overview** Use this command to configure the deadtime for an LDAP server. The configured deadtime is how long in seconds before an unresponsive LDAP server is considered dead.

Use the **no** variant of this command to remove the deadtime configured on an LDAP server. When you remove the deadtime, the server will never be considered dead.

**Syntax** `deadtime <0-1440>`  
`no deadtime`

| Parameter                   | Description                                                                                 |
|-----------------------------|---------------------------------------------------------------------------------------------|
| <code>&lt;0-1440&gt;</code> | The number of seconds that the server can be unresponsive for before it is considered dead. |

**Default** 0 seconds (the LDAP server is never considered dead)

**Mode** LDAP Server Configuration

**Example** To set the deadtime to 20 seconds for the LDAP server called 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# deadtime 20
```

To reset the deadtime to the default for 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no deadtime
```

[timeout \(ldap-server\)](#)

**Command changes** Version 5.5.2-1.1: command added

# debug ldap client

**Overview** Use this command to enable LDAP debugging.

Use the **no** variant of this command to disable all LDAP debugging.

**Syntax** debug ldap client all

debug ldap client {[acl] [args] [ber] [config] [conns] [filter]  
[packets] [parse] [shell] [stats] [stats2] [sync] [trace]}

no debug ldap client

| Parameter | Enable or disable debugging for ...                       |
|-----------|-----------------------------------------------------------|
| all       | All LDAP debugging options                                |
| acl       | Access Control List processing                            |
| args      | Heavy trace debugging (args, arguments)                   |
| ber       | Print out packets sent and received (ber, Bit Error Rate) |
| config    | Configuration processing                                  |
| conns     | Connection management                                     |
| filter    | Search filter processing                                  |
| packets   | Debug packet handling                                     |
| parse     | Parsing processing                                        |
| shell     | Print communication with shell backends                   |
| stats     | Stats from connections, operations and results            |
| stats2    | Stats from log entries sent                               |
| sync      | Syncrepl consumer processing (LDAP Sync replication)      |
| trace     | Trace function calls                                      |

**Default** By default, all LDAP debugging is disabled.

**Mode** Global Configuration

**Example** To turn on all LDAP debugging, use the command:

```
awplus# debug ldap client all
```

To turn on filter and packet LDAP debugging, use the command:

```
awplus# debug ldap client filter packets
```

To disable all LDAP debugging, use the command:

```
awplus# no debug ldap client
```

                          [aaa group server](#)  
                          [ldap-server](#)

**Command changes**    Version 5.5.2-1.1: command added

# group-attribute

**Overview** Use this command to configure the name of the attribute that group members are stored in.

It is only necessary to set this option if [group-dn](#) is used and you don't want to use the default attribute, which is 'uniquemember'.

Use the **no** variant of this command to revert to the default group attribute.

**Syntax** `group-attribute <attribute>`  
`no group-attribute`

| Parameter                      | Description                                     |
|--------------------------------|-------------------------------------------------|
| <code>&lt;attribute&gt;</code> | The attribute that group members are stored in. |

**Default** The default group attribute is 'uniquemember'.

**Mode** LDAP Server Configuration

**Example** To set the group attribute for the LDAP server called 'Server1' to 'member', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# group-attribute member
```

To reset the group attribute to default for 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no group-attribute
```

**Related commands** [base-dn](#)

**Command changes** Version 5.5.2-1.1: command added

# group-dn

**Overview** Use this command to configure the group DN (Distinguished Name) of the group that users should be a member of.

By default the device will determine this by checking the 'uniquemember' attribute of the group to see if it contains the user's DN string. This can be changed with the [group-attribute](#) command.

Use the **no** variant of this command to remove the configured group DN.

**Syntax** `group-dn <group-dn>`  
`no group-dn`

| Parameter                     | Description                                           |
|-------------------------------|-------------------------------------------------------|
| <code>&lt;group-dn&gt;</code> | The DN of the group that users should be a member of. |

**Default** Not set

**Mode** LDAP Server Configuration

**Example** To set the group DN for the LDAP server called 'Server1' to 'cn=Users,dc=example,dc=com', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# group-dn cn=Users,dc=example,dc=com
```

To clear the group DN for 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no group-dn
```

**Related commands** [base-dn](#)

[search-filter](#)

**Command changes** Version 5.5.2-1.1: command added

# host (ldap-server)

**Overview** Use this command to configure the address of the remote LDAP server you want to connect to.

Use the **no** variant of this command to remove the remote LDAP server.

**Syntax** `host {<host-name>|<ip-address>|<ipv6-address>}`  
`no host`

| Parameter                         | Description                                                    |
|-----------------------------------|----------------------------------------------------------------|
| <code>&lt;hostname&gt;</code>     | The hostname of the LDAP server.                               |
| <code>&lt;ip-address&gt;</code>   | The IPv4 address of the LDAP server. Uses the format A.B.C.D.  |
| <code>&lt;ipv6-address&gt;</code> | The IPv6 address of the LDAP server. Uses the format x:x::x:x. |

**Default** Not set

**Mode** LDAP Server Configuration

**Example** To set the host for the LDAP server called 'Server1' to the IP address 10.0.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# host 10.0.0.1
```

To set the host for Server1 to the IPv6 address 2001:0db8::a2, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# host 2001:db8::a2
```

To set the host for Server1 to the hostname www.ldapserver.com, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# host www.ldapserver.com
```

To unset the host for Server1, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no host
```

secure trustpoint (ldap-server)  
timeout (ldap-server)

**Command changes** Version 5.5.2-1.1: command added

# ldap-server

**Overview** Use this command to configure an LDAP server and enter LDAP server configuration mode.

Use the **no** variant of this command to remove the specified server.

**Syntax** `ldap-server <server-name>`  
`no ldap-server <server-name>`

| Parameter                        | Description                  |
|----------------------------------|------------------------------|
| <code>&lt;server-name&gt;</code> | The name of the LDAP server. |

**Default** Not set

**Mode** Global Configuration

**Example** To create and configure an LDAP server called 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)#
```

To configure the LDAP server called 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)#
```

To remove an LDAP server called 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# no ldap-server Server1
```

**Related commands**

**Command changes** Version 5.5.2-1.1: command added

# login-attribute

**Overview** Use this command to set the name of the attribute user names are stored in. The device will search this attribute for the user's DN (Distinguished Name).

It is only necessary to set this option if you don't want to use the default attribute, which is 'uid'.

If the authentication method is 'bind-only', then this attribute is used as the first component of the user DN, with the base DN added to complete the user DN.

Use the **no** variant of this command to reset the login attribute to the default of 'uid'.

**Syntax** login-attribute <attribute>  
no login-attribute

| Parameter   | Description                                                     |
|-------------|-----------------------------------------------------------------|
| <attribute> | The LDAP attribute to use for the username of connecting users. |

**Default** uid

**Mode** LDAP Server Configuration

**Example** To set the login attribute for the LDAP server called 'Server1' to 'sAMAccountName', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# login-attribute sAMAccountName
```

To reset the login attribute for 'Server1' to the default, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no login-attribute
```

**Related command** [authentication \(ldap-server\)](#)  
[base-dn](#)

**Command changes** Version 5.5.2-1.1: command added

# port (ldap-server)

**Overview** Use this command to configure the port you are using to connect to the remote LDAP server.

Note that if secure ciphers are enabled, then the secure port is used instead. Secure ciphers are configured with the [secure mode \(ldap-server\)](#) command.

Use the **no** variant of this command to reset the port number to the default (389).

**Syntax** `port <1-65535>`  
`no port`

| Parameter                    | Description                       |
|------------------------------|-----------------------------------|
| <code>&lt;1-65535&gt;</code> | Port number from 1 through 65535. |

**Default** 389

**Mode** LDAP Server Configuration

**Example** To set the port for the LDAP server called 'Server1' to 1579, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# port 1579
```

To reset the port for 'Server1' to the default of 389, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no port
```

**Related commands**

- [timeout \(ldap-server\)](#)

**Command changes** Version 5.5.2-1.1: command added

# retransmit (ldap-server)

**Overview** Use this command to configure the number of times a device will attempt to reconnect to the LDAP server before aborting.

Use the **no** variant of this command to reset the reconnect attempts to the default value of 3.

**Syntax** `retransmit <0-100>`  
`no retransmit`

| Parameter                  | Description                                                                  |
|----------------------------|------------------------------------------------------------------------------|
| <code>&lt;0-100&gt;</code> | The number of times the device will attempt to reconnect to the LDAP server. |

**Default** 3 times

**Mode** LDAP Server Configuration

**Example** To set the number of reconnect attempts for the LDAP server called 'Server1' to 5 attempts, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# retransmit 5
```

To reset the number of reconnect attempts for 'Server1' to 3 attempts, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no retransmit
```

**Related commands** [deadtime \(ldap-server\)](#)  
[host \(ldap-server\)](#)  
[ldap-server](#)  
[port \(ldap-server\)](#)  
[timeout \(ldap-server\)](#)

**Command changes** Version 5.5.2-1.1: command added

# search-filter

**Overview** Use this command to add a filter to use when searching for a user on the LDAP server.

The filter should be a form similar to 'attribute=value' or '&(attribute1=value1)(attribute2=value2)

Use the **no** variant of this command to remove the search filter.

**Syntax** search-filter <filter>  
no search-filter

| Parameter | Description                                  |
|-----------|----------------------------------------------|
| <filter>  | The filter to use when searching for a user. |

**Default** Not set

**Mode** LDAP Server Configuration

**Usage notes** If the 'bind-only' authentication method is used, then this value is unused.  
For the search authentication method, a search operation is used to search the LDAP server. The client specifies the starting point (base DN) of the search, the search scope (either the object, its children, or the subtree rooted at the object), and a search filter.

**Example** To set a search filter on the LDAP server called 'Server1' to 'building=block1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# search-filter building=block1
```

To unset the search filter of 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no search-filter
```

**Related commands** [authentication \(ldap-server\)](#)  
[base-dn](#)  
[bind authenticate root-dn](#)  
[group-attribute](#)  
[group-dn](#)  
[ldap-server](#)

## login-attribute

**Command changes** Version 5.5.2-1.1: command added

# secure cipher (ldap-server)

**Overview** Use this command to configure the OpenSSL ciphers used in LDAP secure mode. You can choose groups of ciphers from a number of Mozilla TLS configs, or specify multiple individual ciphers in OpenSSL format.

Use the **no** variant of this command to remove the configured ciphers on a server.

**Syntax** `secure cipher {old|intermediate|modern}`  
`secure cipher <cipher-list>`  
`no secure cipher`

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| old           | Ciphers in Mozilla's old TLS config. Alongside the modern and intermediate ciphers, this includes the following ciphers:<br>DHE-RSA-CHACHA20-POLY1305,ECDHE-ECDSA-AES128SHA256,<br>ECDHE-RSA-AES128-SHA256,ECDHE-ECDSA-AES128-SHA,<br>ECDHE-RSA-AES128-SHA,ECDHE-ECDSA-AES256-SHA384,<br>ECDHE-RSA-AES256-SHA384, ECDHE-ECDSA-AES256-SHA,<br>ECDHE-RSA-AES256-SHA,DHE-RSA-AES128-SHA256, DHE-RSA-AES256-SHA256,<br>AES128-GCM-SHA256, AES256-GCM-SHA384,AES128-SHA256, AES256-SHA256,<br>AES128-SHA, AES256-SHA, DES-CBC3-SHA |
| intermediate  | Ciphers in Mozilla's intermediate TLS config. Alongside the modern ciphers, this includes the following ciphers:<br>ECDHE-ECDSA-AES128-GCM-SHA256,ECDHE-RSA-AES128-CM-SHA256,<br>ECDHE-ECDSA-AES256-GCM-SHA384,ECDHE-RSA-AES256-CM-SHA384,<br>ECDHE-ECDSA-CHACHA20-POLY1305,ECDHE-RSA-CHACHA20-POLY1305,<br>DHE-RSA-AES128-GCM-SHA256,DHE-RSA-AES256-GCM-SHA384                                                                                                                                                               |
| modern        | Ciphers in Mozilla's modern TLS config. Includes the following ciphers:<br>TLS_AES_128_GCM_SHA256,TLS_AES_256_GCM_SHA384,<br>TLS_CHACHA20_POLY1305_SHA256                                                                                                                                                                                                                                                                                                                                                                     |
| <cipher-list> | The name (or names) of a cipher in OpenSSL format. This is a <b>space</b> separated list of cipher names, for example:<br>DHE-DSS-AES256-GCM-SHA384 TLS_AES_256_GCM_SHA384                                                                                                                                                                                                                                                                                                                                                    |

**Default** Not set

**Mode** LDAP Server Configuration

**Example** To use the Intermediate Mozilla cipher suite on the LDAP server called Server1, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# secure cipher intermediate
```

To remove the configured ciphers on 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no secure cipher
```

To use the ciphers DHE-DSS-AES256-GCM-SHA384 and TLS\_AES\_256\_GCM\_SHA384 on 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# secure cipher
DHE-DSS-AES256-GCM-SHA384 TLS_AES_256_GCM_SHA384
```

commands**

[host \(ldap-server\)](#)  
[ldap-server](#)  
[port \(ldap-server\)](#)  
[secure mode \(ldap-server\)](#)  
[secure trustpoint \(ldap-server\)](#)

**Command  
changes**

Version 5.5.2-1.1: command added

## secure mode (ldap-server)

**Overview** Use this command to configure the LDAP server to use secure mode. Secure mode encrypts communications with the LDAP server using TLS (Transport Layer Security). If you don't specify a port number, the default port (636) is used.

For secure mode, you should also set the CA certificate using the [secure trustpoint \(ldap-server\)](#) command.

Use **no secure mode** to disable secure mode for communicating with this LDAP server.

Use **no secure mode secure-port** to reset the secure mode port to the default.

**Syntax** secure mode [secure-port <port>]  
no secure mode  
no secure mode secure-port

| Parameter | Description                                            |
|-----------|--------------------------------------------------------|
| <port>    | The secure port for communicating with the LDAP server |

**Default** Secure mode is disabled, and the default port is 636

**Mode** LDAP Server Configuration

**Example** To enable secure mode for communicating with the LDAP server called 'Server1', with the default port, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# secure mode
```

To disable secure mode for communicating with 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no secure mode
```

To enable secure mode with the port 1234 for communicating with 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# secure mode secure-port 1234
```

To reset the secure mode port to the default on 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no secure mode secure-port
```

**Related  
commands**

[ldap-server](#)  
[port \(ldap-server\)](#)  
[secure cipher \(ldap-server\)](#)  
[secure trustpoint \(ldap-server\)](#)

**Command  
changes**

Version 5.5.2-1.1: command added

# secure trustpoint (ldap-server)

**Overview** Use this command to link a preconfigured trustpoint to the LDAP server configuration. The trustpoint must be the LDAP server certificate and is required to successfully connect to the LDAP server when secure mode is enabled.

Use the **no** variant of this command to remove a trustpoint from an LDAP server.

**Syntax** `secure trustpoint <trustpoint>`  
`no secure trustpoint`

| Parameter                       | Description                                          |
|---------------------------------|------------------------------------------------------|
| <code>&lt;trustpoint&gt;</code> | The name of the trustpoint used for LDAP secure mode |

**Default** Not set

**Mode** LDAP Server Configuration

**Example** To set the trustpoint to Trustpoint1 for the LDAP server called 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap server Server1
awplus(config-ldap-server)# secure trustpoint Trustpoint1
```

To remove the trustpoint from 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap server Server1
awplus(config-ldap-server)# no secure trustpoint
```

**Related commands** [host \(ldap-server\)](#)  
[ldap-server](#)  
[port \(ldap-server\)](#)  
[secure cipher \(ldap-server\)](#)  
[secure mode \(ldap-server\)](#)

**Command changes** Version 5.5.2-1.1: command added

# server (ldap-group)

**Overview** Use this command to add an LDAP server to an LDAP server group.

The server is identified by the name of the server, which is created using the [ldap-server](#) command.

Use the **no** variant of this command to remove an LDAP server from an LDAP server group.

**Syntax** `server <server-name>`  
`no server <server-name>`

| Parameter                        | Description                                                                 |
|----------------------------------|-----------------------------------------------------------------------------|
| <code>&lt;server-name&gt;</code> | The name of the LDAP server group, specified when creating the LDAP server. |

**Default** By default, LDAP servers are only added to the default 'ldap' server group.

**Mode** LDAP Server Group Configuration

**Usage notes** The server is appended to the server list of the group, and the order of configuration determines the precedence of servers.

**Example** To add the LDAP server called 'Server1' to the LDAP server group called 'Group1', use the commands:

```
awplus# configure terminal
awplus(config)# aaa group server ldap Group1
awplus(config-ldap-group)# server Server1
```

To remove 'Server1' from 'Group1', use the commands:

```
awplus# configure terminal
awplus(config)# aaa group server ldap Group1
awplus(config-ldap-group)# no server Server1
```

**Related commands** [aaa authentication login](#)  
[aaa group server](#)  
[ldap-server](#)  
[show ldap server group](#)

**Command changes** Version 5.5.2-1.1: command added

# show ldap server group

**Overview** Use this command to display information about LDAP server groups, their servers and the status of those servers.

**Syntax** `show ldap server group [<group-name>]`

| Parameter                       | Description                        |
|---------------------------------|------------------------------------|
| <code>&lt;group-name&gt;</code> | The name of the LDAP server group. |

**Mode** Global Configuration

**Usage notes** If you specify a single group name, you will only see information relating to that specific server group. Otherwise, all LDAP server groups are shown, including the 'ldap' group that contains every LDAP server.

**Example** To show all server groups, use the command:

```
awplus# show ldap server group
```

To show the default LDAP group that includes all the LDAP servers, use the command:

```
awplus# show ldap server group ldap
```

To show a server group named 'CustomGroup1', use the command:

```
awplus# show ldap server group CustomGroup1
```

**Output** Figure 50-1: Example output from **show ldap server group**

LDAP Group Configuration

Group Name : ldap

| LDAP server name | Server Host/IP Address | Port | Status        |
|------------------|------------------------|------|---------------|
| server_one       | 10.1.1.1               | N/A  | Alive         |
| server_two       | 10.2.1.1               | N/A  | Dead (1 hour) |

Group Name : CustomGroup1

| LDAP server name | Server Host/IP Address | Port | Status |
|------------------|------------------------|------|--------|
| server_one       | 10.1.1.1               | N/A  | Alive  |

Group Name : CustomGroup2

| LDAP server name                  | Server Host/IP Address | Port | Status |
|-----------------------------------|------------------------|------|--------|
| No LDAP servers currently defined |                        |      |        |

server (ldap-group)

**Command changes** Version 5.5.2-1.1: command added

# timeout (ldap-server)

**Overview** Use this command to set the time to wait for a connection before reattempting to connect to the LDAP server.

Use the **no** variant of this command to reset the timeout back to the default value.

**Syntax** `timeout <1-1000>`  
`no timeout`

| Parameter                   | Description                                                                                       |
|-----------------------------|---------------------------------------------------------------------------------------------------|
| <code>&lt;1-1000&gt;</code> | The number of seconds to wait for a connection before reattempting to connect to the LDAP server. |

**Default** 5 seconds

**Mode** LDAP Server Configuration

**Example** To set the server timeout for the LDAP server called 'Server1' to 10 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# timeout 10
```

To set the server timeout for 'Server1' to the default, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no timeout
```

# auth-mac-promiscuous

**Overview** Use this command to enable promiscuous mode for MAC address authentication on a local RADIUS server.

Use the **no** variant of this command to disable MAC authentication promiscuous mode on a local RADIUS server.

**Syntax** `auth-mac-promiscuous`  
`no auth-mac-promiscuous`

**Default** Disabled.

**Mode** RADIUS Server Configuration

**Usage notes** In promiscuous mode, the RADIUS server will respond with an Access-Accept for any Access-Request with a Radius Service-Type attribute of 'Call-Check', when the supplicants credentials are NOT in the user database.

If the credentials do appear in the database, the behavior of the server is unchanged.

**Example** To disable MAC authentication promiscuous mode on a local RADIUS server, use the commands:

```
awplus# radius-server local
awplus(config-radsrv)# no auth-mac-promiscuous
```

**Related commands** [show radius local-server auth-mac-promiscuous](#)

**Command changes** Version 5.5.3-2.1: command added

# auth radius send nas-identifier

**Overview** Use this command to enable the device to include the NAS-Identifier(32) attribute in RADIUS authentication requests.

Use the **no** variant of this command to stop including the NAS-Identifier attribute.

**Syntax** `auth radius send nas-identifier {<name>|vlan-id}`  
`no auth radius send nas-identifier`

| Parameter | Description                                                                                                                                  |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <name>    | Send this user-defined text as the NAS-Identifier. You can specify up to 253 characters.                                                     |
| vlan-id   | Send the VLAN ID of the authentication port as the NAS-Identifier. This is the configured VLAN ID, not the dynamic VLAN ID or guest VLAN ID. |

**Mode** Global Configuration

**Example** To use a user-defined identifier of NASID100 as the NAS-Identifier attribute, use the commands:

```
awplus# configure terminal
awplus(config)# auth radius send nas-identifier NASID100
```

To use the VLAN ID as the NAS-Identifier attribute, use the commands:

```
awplus# configure terminal
awplus(config)# auth radius send nas-identifier vlan-id
```

To stop sending the NAS-Identifier attribute, use the commands:

```
awplus# configure terminal
awplus(config)# no auth radius send nas-identifier
```

**Related commands** [auth radius send service-type](#)

# auth radius send service-type

**Overview** Use this command to enable the device to include the Service-Type(6) attribute in RADIUS authentication requests. The Service-Type attribute has a value of:

- Framed(2) for 802.1x
- Call-Check(10) for MAC authentication
- Unbound(5) for Web authentication.

Use the **no** variant of this command to stop including the Service-Type attribute.

**Syntax** `auth radius send service-type`  
`no auth radius send service-type`

**Mode** Global Configuration

**Example** To send the Service-Type attribute, use the commands:

```
awplus# configure terminal
awplus(config)# auth radius send service-type
```

**Related commands** [auth radius send nas-identifier](#)

# clear radius dynamic-authorization counters

**Overview** Use this command to set the Dynamic Authorization message counters to zero.

**Syntax** `clear radius dynamic-authorization counters`

**Mode** Privileged Exec

**Example** To set the Dynamic Authorization message counters to zero, use the command:

```
awplus# clear radius dynamic-authorization counters
```

**Related commands** [radius dynamic-authorization-client](#)  
[show radius dynamic-authorization counters](#)

**Command changes** Version 5.5.1-1.1: command added

# deadtime (RADIUS server group)

**Overview** Use this command to configure the **deadtime** parameter for the RADIUS server group. This command overrides the global dead-time configured by the [radius-server deadtime](#) command. The configured deadtime is the time period in minutes to skip a RADIUS server for authentication or accounting requests if the server is 'dead'. Note that a RADIUS server is considered 'dead' if there is no response from the server within a defined time period.

Use the **no** variant of this command to reset the deadtime configured for the RADIUS server group. If the global deadtime for RADIUS server is configured the value will be used for the servers in the group. The global deadtime for the RADIUS server is set to 0 minutes by default.

**Syntax** `deadtime <0-1440>`  
`no deadtime`

| Parameter                   | Description                |
|-----------------------------|----------------------------|
| <code>&lt;0-1440&gt;</code> | Amount of time in minutes. |

**Default** The deadtime is set to 0 minutes by default.

**Mode** RADIUS Server Group Configuration

**Usage** If the RADIUS server does not respond to a request packet, the packet is retransmitted the number of times configured for the **retransmit** parameter (after waiting for a **timeout** period to expire). The server is then marked 'dead', and the time is recorded. The **deadtime** parameter configures the amount of time to skip a dead server; if a server is dead, no request message is sent to the server for the **deadtime** period.

**Examples** To configure the deadtime for 5 minutes for the RADIUS server group 'GROUP1', use the commands:

```
awplus(config)# aaa group server radius GROUP1
awplus(config-sg)# server 192.168.1.1
awplus(config-sg)# deadtime 5
```

To remove the deadtime configured for the RADIUS server group 'GROUP1', use the commands:

```
awplus(config)# aaa group server radius GROUP1
awplus(config-sg)# no deadtime
```

**Related commands** [aaa group server](#)  
[radius-server deadtime](#)

# debug radius

**Overview** This command enables RADIUS debugging. If no option is specified, all debugging options are enabled.

Use the **no** variant of this command to disable RADIUS debugging. If no option is specified, all debugging options are disabled.

**Syntax** debug radius [packet|event|all]  
no debug radius [packet|event|all]

| Parameter | Description                                          |
|-----------|------------------------------------------------------|
| packet    | Debugging for RADIUS packets is enabled or disabled. |
| event     | Debugging for RADIUS events is enabled or disabled.  |
| all       | Enable or disable all debugging options.             |

**Default** RADIUS debugging is disabled by default.

**Mode** Privileged Exec

**Examples** To enable debugging for RADIUS packets, use the command:

```
awplus# debug radius packet
```

To enable debugging for RADIUS events, use the command:

```
awplus# debug radius event
```

To disable debugging for RADIUS packets, use the command:

```
awplus# no debug radius packet
```

To disable debugging for RADIUS events, use the command:

```
awplus# no debug radius event
```

**Related commands** [show debugging radius](#)  
[undebug radius](#)

# group (radproxy)

**Overview** Use this command create a RADIUS proxy server group. This command also takes you to the RADIUS proxy server group configuration mode.

Use the **no** variant of this command to delete a RADIUS proxy server group.

**Syntax** `group <groupname>`  
`no group <groupname>`

| Parameter                      | Description                                          |
|--------------------------------|------------------------------------------------------|
| <code>&lt;groupname&gt;</code> | The name of the group to either create or configure. |

**Mode** RADIUS Proxy Server Configuration

**Example** To create a RADIUS proxy server group named 'group1', use the commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config-radproxy)# group group1
awplus(config-radproxy-group)#
```

To remove a RADIUS proxy server group named 'group1', use the commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config-radproxy)# no group group1
```

**Related commands** [proxy enable](#)  
[radius-server proxy-server](#)  
[rule attribute \(radproxy\)](#)  
[rule realm \(radproxy\)](#)  
[show radius proxy-server group](#)

**Command changes** Version 5.4.8-0.2: command added  
Version 5.4.9-0.1: added to x530 Series products

# help radius-attribute

**Overview** Use this command to display a list of standard and vendor specific valid RADIUS attributes that are supported by the local RADIUS server.

**Syntax** `help radius-attribute [<attribute-name>|<attribute-ID>]`

| Parameter                           | Description                                                        |
|-------------------------------------|--------------------------------------------------------------------|
| <code>&lt;attribute-name&gt;</code> | List the details and predefined values for the named attribute.    |
| <code>&lt;attribute-ID&gt;</code>   | List the details and predefined values for the given attribute ID. |

**Mode** Privileged Exec

**Usage notes** When used without a parameter, this command lists all of the available RADIUS attributes.

When used with an attribute name or ID, this command displays the attribute name, value type, and any predefined values.

**Example** To list all available RADIUS attributes, use the following command:

```
awplus# help radius-attribute
```

```
awplus#help radius-attribute
Standard Attributes:
 1 User-Name
 2 User-Password
 3 CHAP-Password

# ip radius require-message-authenticator

**Overview** Use this command to configure the RADIUS client to reject unverified RADIUS packets. This means it will discard any received RADIUS Access-Accept, Access-Challenge, and Access-Reject packets that do not have a valid Message-Authenticator attribute.

Use the **no** variant of this command to allow the client to accept unverified RADIUS packets.

**Syntax** `ip radius require-message-authenticator`  
`no ip radius require-message-authenticator`

**Default** Disabled

**Mode** Global Configuration

**Example** To require Message-Authenticator attributes in responses from RADIUS servers, use the commands:

```
awplus# configure terminal
awplus(config)# ip radius require-message-authenticator
```

**Related commands** [nas message-authenticator \(radsvr\)](#)

**Command changes** Version 5.5.4-2.3: command added

# ip radius source-interface

**Overview** This command configures the source IP address of every outgoing RADIUS packet to use a specific IP address or the IP address of a specific interface. If the specified interface is down or there is no IP address on the interface, then the source IP address of outgoing RADIUS packets depends on the interface the packets leave.

Use the **no** variant of this command to remove the source interface configuration. The source IP address in outgoing RADIUS packets will be the IP address of the interface from which the packets are sent.

**Syntax** `ip radius source-interface {<interface>|<ip-address>}`  
`no ip radius source-interface`

| Parameter                       | Description                                      |
|---------------------------------|--------------------------------------------------|
| <code>&lt;interface&gt;</code>  | Interface name.                                  |
| <code>&lt;ip-address&gt;</code> | IP address in the dotted decimal format A.B.C.D. |

**Default** Source IP address of outgoing RADIUS packets depends on the interface the packets leave.

**Mode** Global Configuration

**Examples** To configure all outgoing RADIUS packets to use the IP address of the interface "vlan1" for the source IP address, use the following commands:

```
awplus# configure terminal
awplus(config)# ip radius source-interface vlan1
```

To configure the source IP address of all outgoing RADIUS packets to use 192.168.1.10, use the following commands:

```
awplus# configure terminal
awplus(config)# ip radius source-interface 192.168.1.10
```

To reset the source interface configuration for all outgoing RADIUS packets, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip radius source-interface
```

## nas (radproxy)

**Overview** Use this command to add a NAS (Network Access Server) client to the list of devices able to send authentication requests to a RADIUS proxy server.

The NAS is identified by its IP address. In addition, a shared secret (also referred to as a shared key) must be defined. The NAS will use this key to establish its identity.

Use the **no** variant of this command to remove a NAS client from the list of devices that are allowed to send authentication requests to the RADIUS proxy server.

**Syntax** `nas <ip-address> key <nas-keystring>`  
`no nas <ip-address>`

| Parameter                          | Description           |
|------------------------------------|-----------------------|
| <code>&lt;ip-address&gt;</code>    | NAS IP address        |
| <code>key</code>                   | Specify a shared key  |
| <code>&lt;nas-keystring&gt;</code> | NAS shared key string |

**Mode** RADIUS Proxy Server Configuration

**Example** To add a NAS with IP address '192.168.1.2' and the shared key 'nas\_password', use the following commands.

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config-radproxy)# nas 192.168.1.2 key nas_password
```

To remove the NAS with IP address '192.168.1.2', use the following commands.

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config-radproxy)# no nas 192.168.1.2
```

# proxy (radproxy)

**Overview** Use this command to set the UDP port numbers the RADIUS proxy service will implement for authentication and accounting. This only needs to be done if you do not want to use the default authentication (1812) and/or accounting (1813) ports.

Use the **no** variant of this command to set the UDP port numbers back to the default.

**Syntax** `proxy [auth-port <port-number>] [acct-port <port-number>]`  
`no proxy [auth-port] [acct-port]`

| Parameter     | Description                                                                                                                                                       |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| auth-port     | Set the UDP port the RADIUS proxy server uses to listen for authentication requests. This only needs to be set if you don't wish to use the standard port (1812). |
| <port-number> | 1-65535:<br>Authentication port number.                                                                                                                           |
| acct-port     | Set the UDP port the RADIUS proxy server uses to listen for accounting requests. This only needs to be set if you don't wish to use the standard port (1813).     |
| <port-number> | 1-65535:<br>Accounting port number.                                                                                                                               |

**Default** By default UDP port 1812 is used for authentication and port 1813 is used for accounting.

**Mode** RADIUS Proxy Server Configuration

**Example** To configure a RADIUS proxy server to listen on UDP ports '2044' for authentication and '2055' for accounting, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config-radproxy)# proxy auth-port 2044 acct-port 2055
```

To reset the RADIUS proxy server's accounting port to default, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config-radproxy)# no proxy acct-port
```

# proxy enable

**Overview** Use this command to enable the RADIUS proxy server.  
Use the **no** variant of this command to disable the RADIUS proxy server

**Syntax** proxy enable  
no proxy enable

**Default** RADIUS proxy is disabled by default.

**Usage notes** You configure a RADIUS proxy server so that remote RADIUS servers hold the RADIUS user database and validate NAS RADIUS requests.

- The NAS sends a RADIUS request to the RADIUS proxy server.
- The proxy server forwards the request to the first available RADIUS server.
- The RADIUS server processes the request and sends the response back to the proxy server.
- The proxy server then forwards the response to the NAS with an accept or reject.

There are a variety of situations where a RADIUS proxy is useful. For example, multiple RADIUS servers could be configured to each hold a different user database for a specific purpose e.g. one for authenticating switch management sessions, one for authenticating VPN connections, and one for authenticating 802.1X sessions. In this situation it is convenient to use a single IP address on all the NASs to point to the RADIUS proxy server. This server then forwards the request to the correct RADIUS server holding the relevant user database.

For more information on configuring RADIUS proxy server, see the [RADIUS Feature Overview and Configuration Guide..](#)

**Mode** RADIUS Proxy Server Configuration

**Example** To enable RADIUS proxy server, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config-radproxy)# proxy enable
```

To disable RADIUS proxy server, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config-radproxy)# no proxy enable
```

changes**

Version 5.4.8-0.2: command added

Version 5.4.9-0.1: added to x530 Series products

# radius dynamic-authorization-client

**Overview** Use this command to add a Dynamic Authorization Client (DAC). A Network Access Server (NAS) will only accept Dynamic Authorization (DA) messages from DACs that have been authorized using this command.

Use the **no** variant of this command to remove a DAC from the list of authorized clients.

**Syntax** `radius dynamic-authorization-client <ip-address> key <key-string>`

`no radius dynamic-authorization-client <ip-address>`

When in secure mode (see the [crypto secure-mode](#) command), the syntax in config files will be:

`radius dynamic-authorization-client <ip-address> key-encrypted <encrypted-key-string>`

| Parameter     | Description                                                                                                                                                                                                                                                        |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ip-address>  | IP address of the DAC, entered in the form A.B.C.D                                                                                                                                                                                                                 |
| key           | Sets the shared-key of the client.                                                                                                                                                                                                                                 |
| key-encrypted | Set an encrypted shared secret key. When secure mode is enabled, the running configuration contains this parameter instead of the key parameter. It indicates that the device stores keys in the running configuration in encrypted form instead of in plain text. |

**Mode** Global Configuration

**Usage notes** The RADIUS protocol does not support unsolicited messages sent from the RADIUS server to the NAS. This means that the network access configuration a supplicant receives from a RADIUS server cannot be updated until the supplicant re-authenticates with the RADIUS server.

In some situations it is desirable to either update a supplicant's configuration, or even disconnect their session.

This command allows a Dynamic Authentication Client to send a message that will either update or terminate a supplicant's session.

**Example** To add a DAC with IP address 10.0.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# radius dynamic-authorization-client 10.0.0.1
key secret-key
```

To remove the configuration for a DAC with IP address 10.0.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# no radius dynamic-authorization-client 10.0.0.1
```

**Related commands**   [clear radius dynamic-authorization counters](#)  
                              [show radius dynamic-authorization counters](#)

**Command changes**   Version 5.5.1-1.1: command added

# radius-server deadtime

**Overview** Use this command to specify the global **deadtime** for all RADIUS servers. If a RADIUS server is considered dead, it is skipped for the specified deadtime. This command specifies for how many minutes a RADIUS server that is not responding to authentication requests is passed over by requests for RADIUS authentication.

Use the **no** variant of this command to reset the global deadtime to the default of 0 seconds, so that RADIUS servers are not skipped even if they are dead.

**Syntax** `radius-server deadtime <minutes>`  
`no radius-server deadtime`

| Parameter | Description                                                          |
|-----------|----------------------------------------------------------------------|
| <minutes> | RADIUS server deadtime in minutes in the range 0 to 1440 (24 hours). |

**Default** The default RADIUS deadtime configured on the system is 0 seconds.

**Mode** Global Configuration

**Usage** The RADIUS client considers a RADIUS server to be dead if it fails to respond to a request after it has been retransmitted as often as specified globally by the [radius-server retransmit](#) command or for the server by the [radius-server host](#) command. To improve RADIUS response times when some servers may be unavailable, set a **deadtime** to skip dead servers.

**Examples** To set the dead time of the RADIUS server to 60 minutes, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server deadtime 60
```

To disable the dead time of the RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server deadtime
```

**Related commands** [deadtime \(RADIUS server group\)](#)  
[radius-server host](#)  
[radius-server retransmit](#)  
[show radius statistics](#)

# radius-server host

**Overview** Use this command to specify a remote RADIUS server host for authentication or accounting, and to set server-specific parameters. The parameters specified with this command override the corresponding global parameters for RADIUS servers. This command specifies the IP address or host name of the remote RADIUS server host and assigns authentication and accounting destination UDP port numbers.

This command adds the RADIUS server address and sets parameters to the RADIUS server. The RADIUS server is added to the running configuration after you issue this command. If parameters are not set using this command then common system settings are applied.

Use the **no** variant of this command to remove the specified server host as a RADIUS authentication and/or accounting server and set the destination port to the default RADIUS server port number (1812).

**Syntax**

```
radius-server host {<host-name>|<ip-address>} [acct-port <0-65535>] [auth-port <0-65535>] [key <key-string>] [retransmit <0-100>] [timeout <1-1000>]

radius-server host {<host-name>|<ip-address>} [acct-port <0-65535>] [auth-port <0-65535>] [key-encrypted <encrypted-key-string>] [retransmit <0-100>] [timeout <1-1000>]

no radius-server host {<host-name>|<ip-address>} [acct-port <0-65535>] [auth-port <0-65535>]
```

**Syntax (VRF-lite)**

```
radius-server host {<host-name>|<ip-address>} [acct-port <0-65535>] [auth-port <0-65535>] [key <key-string>] [retransmit <0-100>] [timeout <1-1000>] [vrf <vrf-name>]

radius-server host {<host-name>|<ip-address>} [acct-port <0-65535>] [auth-port <0-65535>] [key-encrypted <encrypted-key-string>] [retransmit <0-100>] [timeout <1-1000>] [vrf <vrf-name>]

no radius-server host {<host-name>|<ip-address>} [acct-port <0-65535>] [auth-port <0-65535>] [vrf <vrf-name>]
```

| Parameter    | Description                                                                                                                                                                                                                      |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <host-name>  | Server host name. The DNS name of the RADIUS server host.                                                                                                                                                                        |
| <ip-address> | The IP address of the RADIUS server host.                                                                                                                                                                                        |
| acct-port    | Accounting port. Specifies the UDP destination port for RADIUS accounting requests. If 0 is specified, the server is not used for accounting. The default UDP port for accounting is 1813.                                       |
| <0-65535>    | UDP port number. (Accounting port number is set to (accounting port number is set to 1813 by default) Specifies the UDP destination port for RADIUS accounting requests. If 0 is specified, the host is not used for accounting. |

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| auth-port     | Authentication port. Specifies the UDP destination port for RADIUS authentication requests. If 0 is specified, the server is not used for authentication. The default UDP port for authentication is 1812.                                                                                                                                                                                                                                                                                                                                                                                                          |
| <0-65535>     | UDP port number (authentication port number is set to 1812 by default). Specifies the UDP destination port for RADIUS authentication requests. If 0 is specified, the host is not used for authentication.                                                                                                                                                                                                                                                                                                                                                                                                          |
| timeout       | Specifies the amount of time to wait for a response from the server. If this parameter is not specified the global value configured by the <b>radius-server timeout</b> command is used.                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <1-1000>      | Time in seconds to wait for a server reply (timeout is set to 5 seconds by default). The time interval (in seconds to wait for the RADIUS server to reply before retransmitting a request or considering the server dead. This setting overrides the global value set by the <b>radius-server timeout</b> command. If no timeout value is specified for this server, the global value is used.                                                                                                                                                                                                                      |
| retransmit    | Specifies the number of retries before skip to the next server. If this parameter is not specified the global value configured by the <b>radius-server retransmit</b> command is used.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <0-100>       | Maximum number of retries (maximum number of retries is set to 3 by default). The maximum number of times to resend a RADIUS request to the server, if it does not respond within the timeout interval, before considering it dead and skipping to the next RADIUS server. This setting overrides the global setting of the <b>radius-server retransmit</b> command. If no retransmit value is specified, the global value is used.                                                                                                                                                                                 |
| key           | Set shared secret key with RADIUS servers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <key-string>  | Shared key string applied. Specifies the shared secret authentication or encryption key for all RADIUS communications between this device and the RADIUS server. This key must match the encryption used on the RADIUS daemon. All leading spaces are ignored, but spaces within and at the end of the string are used.<br><br>If spaces are used in the string, do not enclose the string in quotation marks unless the quotation marks themselves are part of the key. This setting overrides the global setting of the <b>radius-server key</b> command. If no key value is specified, the global value is used. |
| key-encrypted | Set an encrypted shared secret key. When secure mode is enabled, the running configuration contains this parameter instead of the key parameter. It indicates that the device stores keys in the running configuration in encrypted form instead of in plain text.                                                                                                                                                                                                                                                                                                                                                  |

| Parameter                                      | Description                                                                                                                                                                                                                                                                           |
|------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;encrypted-key<br/>-string&gt;</code> | Encrypted shared key string.                                                                                                                                                                                                                                                          |
| <code>vrf &lt;vrf-name&gt;</code>              | The name of a VRF instance. Use this to specify the VRF that the RADIUS server is accessible by. Servers are uniquely identified by their address and VRF, so multiple servers can have the same address or host-name as long as the VRF is different. The default is the global VRF. |

**Default** The RADIUS client address is not configured (null) by default. No RADIUS server is configured.

**Mode** Global Configuration

**Usage** Multiple **radius-server host** commands can be used to specify multiple hosts. The software searches for hosts in the order they are specified. If no host-specific timeout, retransmit, or key values are specified, the global values apply to that host. If there are multiple RADIUS servers for this client, use this command multiple times—once to specify each server.

If you specify a host without specifying the auth port or the acct port, it will by default be configured for both authentication and accounting, using the default UDP ports. To set a host to be a RADIUS server for authentication requests only, set the **acct-port** parameter to 0; to set the host to be a RADIUS server for accounting requests only, set the **auth-port** parameter to 0.

A RADIUS server is identified by IP address, authentication port and accounting port. A single host can be configured multiple times with different authentication or accounting ports. All the RADIUS servers configured with this command are included in the predefined RADIUS server group **radius**, which may be used by AAA authentication, authorization and accounting commands. The client transmits (and retransmits, according to the **retransmit** and **timeout** parameters) RADIUS authentication or accounting requests to the servers in the order you specify them, until it gets a response.

**Examples** To add the RADIUS server 10.0.0.20, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host 10.0.0.20
```

To set the secret key to 'mySecret' on the RADIUS server 10.0.0.20, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host 10.0.0.20 key mySecret
```

To delete the RADIUS server 10.0.0.20, use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server host 10.0.0.20
```

To configure rad1.company.com for authentication only, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host rad1.company.com acct-port 0
```

To remove the RADIUS server rad1.company.com configured for authentication only, use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server host rad1.company.com
acct-port 0
```

To configure rad2.company.com for accounting only, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host rad2.company.com auth-port 0
```

To configure 192.168.1.1 with authentication port 1000, accounting port 1001 and retransmit count 5, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host 192.168.1.1 auth-port 1000
acct-port 1001 retransmit 5
```

#### Examples (VRF-lite)

To add the RADIUS server 10.0.0.20 in the VRF named 'red', use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host 10.0.0.20 vrf red
```

To set the secret key to 'mySecret' on the RADIUS server 10.0.0.20 in the VRF named 'red', use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host 10.0.0.20 key mySecret vrf
red
```

#### Command changes

Version 5.5.2-1.1: **vrf** parameter added for products that support VRF  
Version 5.4.9-2.1: **key-encrypted** parameter added

# radius-server key

**Overview** This command sets a global secret key for RADIUS authentication on the device. The shared secret text string is used for RADIUS authentication between the device and a RADIUS server.

Note that if no secret key is explicitly specified for a RADIUS server, the global secret key will be used for the shared secret for the server.

Use the **no** variant of this command to reset the secret key to the default (null).

**Syntax** `radius-server key <key-string>`  
`no radius-server key`

When in secure mode, the syntax in config files will be:

`radius-server key-encrypted <encrypted-key-string>`

| Parameter                                               | Description                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>key &lt;key-string&gt;</code>                     | Shared secret among RADIUS server and 802.1X client.                                                                                                                                                                                                                                                                                                                  |
| <code>key-encrypted &lt;encrypted-key-string&gt;</code> | This parameter indicates that the key is in its encrypted form. You would not normally enter this command. Instead, if you enter key and secure mode is enabled, the running config contains this parameter instead of the key parameter. This indicates that in secure mode the device stores keys in the running config in encrypted form instead of in plain text. |

**Default** The RADIUS server secret key on the system is not set by default (null).

**Mode** Global Configuration

**Usage** Use this command to set the global secret key shared between this client and its RADIUS servers. If no secret key is specified for a particular RADIUS server using the **radius-server host** command, this global key is used.

After enabling AAA authentication with the **aaa authentication login** command, set the authentication and encryption key using the **radius-server key** command so the key entered matches the key used on the RADIUS server.

**Examples** To set the global secret key to **allied** for RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server key allied
```

To set the global secret key to **secret** for RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server key secret
```

To delete the global secret key for RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server key
```

# radius-server proxy-server

**Overview** Use this command to enter RADIUS proxy server configuration mode.

**Syntax** `radius-server proxy-server`

**Mode** Global Configuration

**Usage notes** You configure a RADIUS proxy server so that remote RADIUS servers hold the RADIUS user database and validate NAS RADIUS requests.

- The NAS sends a RADIUS request to the RADIUS proxy server.
- The proxy server forwards the request to the first available RADIUS server.
- The RADIUS server processes the request and sends the response back to the proxy server.
- The proxy server then forwards the response to the NAS with an accept or reject.

There are a variety of situations where a RADIUS proxy is useful. For example, multiple RADIUS servers could be configured to each hold a different user database for a specific purpose e.g. one for authenticating switch management sessions, one for authenticating VPN connections, and one for authenticating 802.1X sessions. In this situation it is convenient to use a single IP address on all the NASs to point to the RADIUS proxy server. This server then forwards the request to the correct RADIUS server holding the relevant user database.

For more information on configuring RADIUS proxy server, see the [RADIUS Feature Overview and Configuration Guide](#)..

**Example** To enter RADIUS proxy server configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config-radproxy)#
```

**Command changes** Version 5.4.8-0.2: command added  
Version 5.4.9-0.1: added to x530 Series products

# radius-server retransmit

**Overview** This command sets the retransmit counter to use RADIUS authentication on the device. This command specifies how many times the device transmits each RADIUS request to the RADIUS server before giving up.

This command configures the **retransmit** parameter for RADIUS servers globally. If the **retransmit** parameter is not specified for a RADIUS server by the **radius-server host** command then the global configuration set by this command is used for the server instead.

Use the **no** variant of this command to reset the re-transmit counter to the default (3).

**Syntax** `radius-server retransmit <retries>`  
`no radius-server retransmit`

| Parameter | Description                                                                                                                                                                                                                                                                                                                                 |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <retries> | RADIUS server retries in the range <0-100>. The number of times a request is resent to a RADIUS server that does not respond, before the server is considered dead and the next server is tried. If no retransmit value is specified for a particular RADIUS server using the <b>radius-server host</b> command, this global value is used. |

**Default** The default RADIUS retransmit count on the device is 3.

**Mode** Global Configuration

**Examples** To set the RADIUS **retransmit** count to 1, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server retransmit 1
```

To set the RADIUS **retransmit** count to the default (3), use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server retransmit
```

To configure the RADIUS **retransmit** count globally with 5, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server retransmit 5
```

To disable retransmission of requests to a RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server retransmit 0
```

**Related  
commands**

- radius-server deadtime
- radius-server host
- show radius statistics

# radius-server timeout

**Overview** Use this command to specify the RADIUS global timeout value. This is how long the device waits for a reply to a RADIUS request before retransmitting the request, or considering the server to be dead. If no timeout is specified for the particular RADIUS server by the **radius-server host** command, it uses this global timeout value.

Note that this command configures the **timeout** parameter for RADIUS servers globally.

The **no** variant of this command resets the transmit timeout to the default (5 seconds).

**Syntax** `radius-server timeout <seconds>`  
`no radius-server timeout`

| Parameter                    | Description                                                                                                                                                                                                                                                               |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;seconds&gt;</code> | RADIUS server timeout in seconds in the range 1 to 1000. The global time in seconds to wait for a RADIUS server to reply to a request before retransmitting the request, or considering the server to be dead (depending on the <b>radius-server retransmit</b> command). |

**Default** The default RADIUS transmit timeout on the system is 5 seconds.

**Mode** Global Configuration

**Examples** To globally set the device to wait 20 seconds before retransmitting a RADIUS request to unresponsive RADIUS servers, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server timeout 20
```

To set the RADIUS **timeout** parameter to 1 second, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server timeout 1
```

To set the RADIUS **timeout** parameter to the default (5 seconds), use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server timeout
```

To configure the RADIUS server **timeout** period globally with 3 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server timeout 3
```

To reset the global **timeout** period for RADIUS servers to the default, use the following command:

```
awplus# configure terminal
awplus(config)# no radius-server timeout
```

# rule attribute (radproxy)

**Overview** Use this command to configure a rule to match a RADIUS request based on a RADIUS packet attribute. If a match is found then the request will be sent to the server or group defined in the rule.

Use the **no** variant of this command to remove a rule.

**Syntax**

```
rule <rule-id> attribute <attribute-name> <match-pattern>
server <ip-address> [auth-port <port-number>] [acct-port
<port-number>]

rule <rule-id> attribute <attribute-name> <match-pattern> group
<group-name>

no rule <rule-id>
```

| Parameter        | Description                                                                                                                                                         |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <rule-id>        | Unique rule id.                                                                                                                                                     |
| <attribute-name> | Attribute name to match. Commonly used names are:                                                                                                                   |
|                  | called-station-id Match for called-station-id: the phone number that the user called, uses Dialed Number Identification (DNIS) or similar technology.               |
|                  | calling-station-id Match for calling-station-id: the phone number that the call came from, uses Automatic Number Identification (ANI) or similar technology.        |
|                  | nas-identifier Match for NAS-Identifier: this attribute contains a string identifying the NAS originating the Access-Request                                        |
|                  | nas-ip-address NAS IP address to match for.                                                                                                                         |
|                  | user-name Match for user-name: the name of the user to be authenticated.                                                                                            |
|                  | Use the <a href="#">help radius-attribute</a> command to get a list of all RADIUS attributes.                                                                       |
| <match-pattern>  | Attribute pattern to match. See the Usage section below for more information.                                                                                       |
| server           | Specify the upstream server to send the request to.                                                                                                                 |
| <ip-address>     | IP address of the upstream RADIUS server.                                                                                                                           |
| auth-port        | Set the authentication port used by the upstream server. This only needs to be set if the upstream server is not using the standard port (1812) for authentication. |

| Parameter     | Description                                                                                                                                                 |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <port-number> | 1-65535:<br>Authentication port number.                                                                                                                     |
| acct-port     | Set the accounting port used by the upstream server. This only needs to be set if the upstream server is not using the standard port (1813) for accounting. |
| <port-number> | 1-65535:<br>Accounting port number.                                                                                                                         |
| group         | Specify a group of RADIUS servers to send the request to.                                                                                                   |
| <group-name>  | Name of the RADIUS server group.                                                                                                                            |

**Default** By default a RADIUS request is sent to the first available server.

**Mode** RADIUS Proxy Server Configuration

**Usage notes** An asterisk acts as a wildcard character in the **match-pattern**. It matches any string of characters. For example using 'test\*' as a match pattern for the user-name attribute will match all user-names beginning with 'test'.

If you wish to include an asterisk in the match pattern then escape it with the backslash character. For example using 'SSID: AP\\\*\\\*X' as a match pattern for the Called-Station-Id attribute will match the call station with SSID 'SSID:AP\*\*X'.

**Example** To configure a rule with id 20, that uses the RADIUS attribute user-name to send all requests from user 'myuser' to the upstream server 192.168.2.2, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config-radproxy)# rule 20 attribute user-name myuser
server 192.168.2.2
```

To configure a rule with id 30, that uses the RADIUS attribute user-name to send all traffic from user-names that start with 'test' to the group of upstream servers 'group1', use the commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config-radproxy)# rule 30 attribute user-name test*
group group1
```

To remove a rule with id 20, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config-radproxy)# no rule 20
```

## rule realm (radproxy)

**Overview** Use this command to configure a rule to match a RADIUS request based on a realm. If a match is found then the request will be sent to the server or group defined in the rule.

A realm can be any of the following formats:

- username@domain.com
- username%domain.com
- domain/username
- domain\username

Use the **no** variant of this command to remove a rule.

**Syntax**

```
rule <rule-id> realm <match-pattern> [nostrip] server
<ip-address> [auth-port <port-number>] [acct-port
<port-number>]

rule <rule-id> realm <match-pattern> [nostrip] group
<group-name>

no rule <rule-id>
```

| Parameter       | Description                                                                                                                                                         |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <rule-id>       | Unique rule id.                                                                                                                                                     |
| <match-pattern> | Attribute pattern to match. See the Usage section below for more information.                                                                                       |
| server          | Specify the upstream server to send the request to.                                                                                                                 |
| nostrip         | Do not strip the realm name when the request is sent to the upstream server. By default the realm name is stripped from the request.                                |
| <ip-address>    | IP address of the upstream RADIUS server.                                                                                                                           |
| auth-port       | Set the authentication port used by the upstream server. This only needs to be set if the upstream server is not using the standard port (1812) for authentication. |
| <port-number>   | 1-65535:<br>Authentication port number.                                                                                                                             |
| acct-port       | Set the accounting port used by the upstream server. This only needs to be set if the upstream server is not using the standard port (1813) for accounting.         |
| <port-number>   | 1-65535:<br>Accounting port number.                                                                                                                                 |
| group           | Specify a group of RADIUS servers to send the request to.                                                                                                           |
| <group-name>    | Name of the RADIUS server group.                                                                                                                                    |

**Default** By default a RADIUS request is sent to the first available server.

**Mode** RADIUS Proxy Server Configuration

**Usage notes** An asterisk acts as a wildcard character in the **match-pattern**. It matches any string of characters. For example using 'myuser@\*' as a match pattern will match the realms myuser@abcd.com, myuser@xyz.com, myuser@xyz.ac.nz, etc.

If you wish to include an asterisk in the match pattern then escape it with the backslash character.

**Example** To configure a rule with id 10, that matches a realm myuser@abcd.com, myuser@xyz.com, myuser@xyz.ac.nz to use the upstream server 192.168.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config-radproxy)# rule 10 realm myuser@* server
192.168.1.1
```

To configure the same rule as in the previous example, where the upstream server is listening on ports 2044 and 2055, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config-radproxy)# rule 10 realm myuser@* server
192.168.1.1 auth-port 2044 acct-port 2055
```

To remove a rule with id 10, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config-radproxy)# no rule 10
```

## server (radproxy-group)

**Overview** Use this command to add and configure an upstream RADIUS proxy server in a RADIUS proxy group.

Use the **no** variant of this command to remove an upstream RADIUS proxy server from a group.

**Syntax** `server <ip-address> [auth-port <port-number>] [acct-port <port-number>]`  
`no server <ip-address> [auth-port <port-number>] [acct-port <port-number>]`

| Parameter     | Description                                                                                                                                                         |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ip-address>  | IP address of the upstream RADIUS server.                                                                                                                           |
| auth-port     | Set the authentication port used by the upstream server. This only needs to be set if the upstream server is not using the standard port (1812) for authentication. |
| <port-number> | 1-65535:<br>Authentication port number.                                                                                                                             |
| acct-port     | Set the accounting port used by the upstream server. This only needs to be set if the upstream server is not using the standard port (1813) for accounting.         |
| <port-number> | 1-65535:<br>Accounting port number.                                                                                                                                 |

**Mode** RADIUS Proxy Group Configuration

**Usage notes** You can configure more than one RADIUS server on the same IP address as long as each server has unique authentication and accounting ports.

**Example** To configure an upstream RADIUS server, '192.168.1.1', with authentication port '4050' and accounting port '4051', for the group 'group1', use the commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config-radproxy)# group group1
awplus(config-radproxy-group)# server 192.168.1.1 auth-port
4050 acct-port 4051
```

To remove the RADIUS server, '192.168.1.1', with authentication port '4050' and accounting port '4051', from the group 'group1', use the commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config-radproxy)# group group1
awplus(config-radproxy-group)# no server 192.168.1.1 auth-port
4050 acct-port 4051
```

If the RADIUS server uses the default authentication and accounting ports then to configure an upstream RADIUS server, '192.168.1.1' for the group 'group1', use the commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config-radproxy)# group group1
awplus(config-radproxy-group)# server 192.168.1.1
```

If the RADIUS server uses the default authentication and accounting ports then to remove an upstream RADIUS server, '192.168.1.1' from the group 'group1', use the commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config-radproxy)# group group1
awplus(config-radproxy-group)# no server 192.168.1.1
```

# server (radproxy)

**Overview** Use this command to add and configure a RADIUS proxy upstream server.

Use the **no** variant of this command to remove a RADIUS proxy upstream server.

**Syntax** `server <ip-address> [auth-port <port-number>] [acct-port <port-number>] key <key-string> [status-check]`

`no server <ip-address> [auth-port <port-number>] [acct-port <port-number>]`

| Parameter     | Description                                                                                                                                                         |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ip-address>  | IP address of the upstream RADIUS server.                                                                                                                           |
| auth-port     | Set the authentication port used by the upstream server. This only needs to be set if the upstream server is not using the standard port (1812) for authentication. |
| <port-number> | 1-65535:<br>Authentication port number.                                                                                                                             |
| acct-port     | Set the accounting port used by the upstream server. This only needs to be set if the upstream server is not using the standard port (1813) for accounting.         |
| <port-number> | 1-65535:<br>Accounting port number.                                                                                                                                 |
| key           | Set the secret key for the upstream RADIUS server.                                                                                                                  |
| <key-string>  | Secret key string.                                                                                                                                                  |
| status-check  | Send a status check to a dead upstream server.                                                                                                                      |

**Mode** RADIUS Proxy Server Configuration

**Usage notes** You can configure more than one upstream server. RADIUS requests will be sent to the first available server. If the first one is not available, the request will be sent to the second one.

The authentication and accounting port parameters only need to be used if the upstream RADIUS server is not using the default authentication (1812) and/or accounting (1813) ports.

The status-check parameter is only valid if the upstream server supports status check.

- If status check is set then a dead server's status will change to 'Alive' if it responds favorably to a status check.
- If status check is not set, a dead server's status changes to 'Alive' after the specified deadtime, irrespective of the actual state of the server.

**Example** To configure an upstream RADIUS server, '192.168.2.1', with authentication port '4050', accounting port '4051', and secret key 'secret', use the commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config-radproxy)# server 192.168.2.1 auth-port 4050
acct-port 4051 key secret
```

To remove an upstream RADIUS server, '192.168.2.1', with authentication port '4050' and accounting port '4051', use the commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config-radproxy)# no server 192.168.2.1 auth-port 4050
acct-port 4051
```

# server deadtime (radproxy)

**Overview** Use this command to configure RADIUS proxy upstream server deadtime. An upstream RADIUS server is considered "dead" if it does not respond to a RADIUS request within a specified timeout period.

The deadtime period is the amount of time a server is considered "dead" before:

- its status is changed to "alive" if status-check is disabled or
- a check status is initiated if status-check is enabled.

Use the **no** variant of this command to reset the deadtime period.

**Syntax** `server deadtime <seconds>`  
`no server deadtime`

| Parameter | Description                                                                                                |
|-----------|------------------------------------------------------------------------------------------------------------|
| deadtime  | Specify the amount of time to consider an unavailable RADIUS server 'dead'.                                |
| <seconds> | The time, in seconds, before a 'dead' RADIUS server is considered 'alive', or a check status is initiated. |

**Default** The deadtime is set to 300 seconds by default.

**Mode** RADIUS Proxy Server Configuration

**Example** To configure the RADIUS server deadtime to 100 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config)# server deadtime 100
```

To reset to the default deadtime, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config)# no server deadtime
```

**Command changes** Version 5.4.8-0.2: command added  
Version 5.4.9-0.1: added to x530 Series products

## server (RADIUS server group)

**Overview** This command adds a RADIUS server to a server group in RADIUS Server Group Configuration mode. The RADIUS server should be configured by the [radius-server host](#) command.

The device adds each server to the end of the group's list of servers, so add the servers in order of priority. If you add a server and it is already in the list, it will be removed and then re-added to the end of the list.

The server is identified by IP address and authentication and accounting UDP port numbers. So a RADIUS server can have multiple entries in a group with different authentication and/or accounting UDP ports. The **auth-port** specifies the UDP destination port for authentication requests to the server. To disable authentication for the server, set **auth-port** to 0. If the authentication port is missing, the default port number is 1812. The **acct-port** specifies the UDP destination port for accounting requests to the server. To disable accounting for the server, set **acct-port** to 0. If the accounting port is missing, the default port number is 1813.

Use the **no** variant of this command to remove a RADIUS server from the server group.

**Syntax**

```
server {<hostname>|<ip-address>} [auth-port <0-65535>]
[acct-port <0-65535>]

no server {<hostname>|<ip-address>} [auth-port <0-65535>]
[acct-port <0-65535>]
```

| Parameter    | Description                                                                                                                                                                                                                                                            |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <hostname>   | Server host name                                                                                                                                                                                                                                                       |
| <ip-address> | Server IP address<br>The server is identified by IP address, authentication and accounting UDP port numbers. So a RADIUS server can have multiple entries in a group with different authentication and/or accounting UDP ports.                                        |
| auth-port    | Authentication port<br>The <b>auth-port</b> specifies the UDP destination port for authentication requests to the server. To disable authentication for the server, set <b>auth-port</b> to 0. If the authentication port is missing, the default port number is 1812. |
| <0-65535>    | UDP port number (default: 1812)                                                                                                                                                                                                                                        |
| acct-port    | Accounting port<br>The <b>acct-port</b> specifies the UDP destination port for accounting requests to the server. To disable accounting for the server, set <b>acct-port</b> to 0. If the accounting port is missing, the default port number is 1813.                 |
| <0-65535>    | UDP port number (default: 1813)                                                                                                                                                                                                                                        |

**Default** The default Authentication port number is 1812 and the default Accounting port number is 1813.

**Mode** RADIUS Server Group Configuration

**Usage notes** The RADIUS server to be added must be configured by the **radius-server host** command. In order to add or remove a server, the **auth-port** and **acct-port** parameters in this command must be the same as the corresponding parameters in the **radius-server host** command.

**Examples** To create a RADIUS server group 'RAD\_AUTH1' for authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa group server radius RAD_AUTH1
awplus(config-sg)# server 192.168.1.1 acct-port 0
awplus(config-sg)# server 192.168.2.1 auth-port 1000 acct-port 0
```

To create a RADIUS server group 'RAD\_ACCT1' for accounting, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa group server radius RAD_ACCT1
awplus(config-sg)# server 192.168.2.1 auth-port 0 acct-port 1001
awplus(config-sg)# server 192.168.3.1 auth-port 0
```

To remove server 192.168.3.1 from the existing server group 'GROUP1', use the following commands:

```
awplus# configure terminal
awplus(config)# aaa group server radius GROUP1
awplus(config-sg)# no server 192.168.3.1
```

# server timeout (radproxy)

**Overview** Use this command to configure RADIUS proxy upstream server timeout. An upstream RADIUS server is considered “dead” if it does not respond to a RADIUS request within a specified timeout period.

Use the **no** variant of this command to reset the timeout period.

**Syntax** `server timeout <seconds>`  
`no server timeout`

| Parameter                    | Description                                                                  |
|------------------------------|------------------------------------------------------------------------------|
| <code>timeout</code>         | Specify the time to wait for an upstream RADIUS server to respond.           |
| <code>&lt;seconds&gt;</code> | The time, in seconds, to wait for the server to respond to a RADIUS request. |

**Default** The timeout is set to 30 seconds by default.

**Mode** RADIUS Proxy Server Configuration

**Example** To configure the RADIUS server timeout to 10 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config)# server timeout 10
```

To reset to the default timeout, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config)# no server timeout
```

**Related commands** [radius-server proxy-server](#)

# show debugging radius

**Overview** This command displays the current debugging status for the RADIUS servers.

**Syntax** `show debugging radius`

**Mode** User Exec and Privileged Exec

**Example** To display the current debugging status of RADIUS servers, use the command:

```
awplus# show debugging radius
```

**Output** Figure 51-1: Example output from the **show debugging radius** command

```
RADIUS debugging status:
RADIUS event debugging is off
RADIUS packet debugging is off
```

# show radius

**Overview** This command displays the current RADIUS server configuration and status.

**Syntax** show radius

**Mode** User Exec and Privileged Exec

**Example** To display the current status of RADIUS servers, use the command:

```
awplus# show radius
```

**Output** Figure 51-2: Example output from the **show radius** command showing RADIUS servers

```

| Output Parameter    | Meaning                                                                                            |
|---------------------|----------------------------------------------------------------------------------------------------|
| Source Interface    | The interface name or IP address to be used for the source address of all outgoing RADIUS packets. |
| Secret Key          | A shared secret key to a radius server.                                                            |
| Timeout             | A time interval in seconds.                                                                        |
| Retransmit Count    | The number of retry count if a RADIUS server does not response.                                    |
| Deadtime            | A time interval in minutes to mark a RADIUS server as "dead".                                      |
| Interim-Update      | A time interval in minutes to send Interim-Update Accounting report.                               |
| Group Deadtime      | The deadtime configured for RADIUS servers within a server group.                                  |
| Server Host         | The RADIUS server hostname or IP address.                                                          |
| Authentication Port | The destination UDP port for RADIUS authentication requests.                                       |
| Accounting Port     | The destination UDP port for RADIUS accounting requests.                                           |

| Output Parameter | Meaning                                                                                                                                                                            |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Auth Status      | The status of the authentication port.<br>The status ("dead", "error", or "alive") of the RADIUS authentication server and, if dead, how long it has been dead for.                |
|                  | Alive      The server is alive.                                                                                                                                                    |
|                  | Error      The server is not responding.                                                                                                                                           |
|                  | Dead      The server is detected as dead and it will not be used for deadtime period. The time displayed in the output shows the server is in dead status for that amount of time. |
|                  | Unknown   The server is never used or the status is unknown.                                                                                                                       |
| Acct Status      | The status of the accounting port.<br>The status ("dead", "error", or "alive") of the RADIUS accounting server and, if dead, how long it has been dead for.                        |

# show radius dynamic-authorization counters

**Overview** Use this command to display the Dynamic Authorization message counters. It shows the count of sent and received messages, as well as a count of any error messages.

**Syntax** `show radius dynamic-authorization counters`

**Mode** Privileged Exec

**Example** To display the Dynamic Authorization message counters, use the following command:

```
awplus# show radius dynamic-authorization counters
```

**Output** Figure 51-4: Example output from **show radius dynamic-authorization counters**

```
awplus#show radius dynamic-authorization counters

RADIUS Dynamic Authorization packet counters

Received:

# show radius local-server auth-mac-promiscuous

**Overview** Use this command to show the status of the **auth-mac-promiscuous** command.

**Syntax** `show radius local-server auth-mac-promiscuous`

**Mode** User Exec

**Usage notes** In promiscuous mode, the RADIUS server will respond with an Access-Accept for any Access-Request with a Radius Service-Type attribute of 'Call-Check', when the supplicants credentials are NOT in the user database.

If the credentials do appear in the database, the behavior of the server is unchanged.

**Example** To display the status of the **auth-mac-promiscuous** command, use the command:

```
awplus# show radius local-server auth-mac-promiscuous
```

**Output** Figure 51-5: Example output from **show radius local-server  
auth-mac-promiscuous**

```
awplus#show radius local-server auth-mac-promiscuous
Auth-mac promiscuous mode: Disabled
...
```

**Related commands** [auth-mac-promiscuous](#)

**Command changes** Version 5.5.3-2.1: command added

# show radius proxy-server

**Overview** Use this command to see the status of the upstream RADIUS servers.

**Syntax** `show radius proxy-server`

**Mode** Privileged Exec

**Example** To see the status of the upstream RADIUS servers, use the following command:

```
awplus# show radius proxy-server
```

**Output** Figure 51-6: Example output from **show radius proxy-server**

```
awplus#show radius proxy-server
```

| Server Host/IP Address | Auth Port | Acct Port | Auth Status | Acct Status |
|------------------------|-----------|-----------|-------------|-------------|
| 192.168.1.1            | 1812      | 1813      | Alive       | Unknown     |
| 192.168.2.1            | 1812      | 1813      | Unknown     | Unknown     |
| 192.168.1.2            | 1812      | 1813      | Unknown     | Unknown     |
| 192.168.10.1           | 1812      | 1813      | Unknown     | Unknown     |
| 192.168.11.1           | 1812      | 1813      | Unknown     | Unknown     |
| 192.168.12.1           | 1812      | 1813      | Unknown     | Unknown     |

Each upstream RADIUS server will be in one of the following states:

- Unknown - each server starts out as 'unknown' until an attempt is made to contact it.
- Alive - the server responded to a RADIUS request.
- Unreachable - the server did not respond to a RADIUS request.

# show radius proxy-server statistics

**Overview** Use this command to show RADIUS proxy server statistics for the upstream servers.

**Syntax** show radius proxy-server statistics

**Mode** Privileged Exec

**Example** Use the following command to see the status of the upstream RADIUS servers.

```
awplus# show radius proxy-server statistics
```

**Output** Figure 51-8: Example output from **show radius proxy-server statistics**

```
awplus#show radius proxy-server statistics
RADIUS Proxy Statistics for Server 192.168.1.1:1812,1813:
```

|                   | Auth | Acct |

Table 51-1: Parameters in the output from **show radius proxy-server statistics**

| Parameter         | Description                                                               |
|-------------------|---------------------------------------------------------------------------|
| Requests          | Number of request packets sent to the server.                             |
| Responses         | Number of response packets received from the server.                      |
| Accepts           | (auth-only): Number of Access-Accept packets received from the server.    |
| Rejects           | (auth-only): Number of Access-Reject packets received from the server.    |
| Challenges        | (auth-only): Number of Access-Challenge packets received from the server. |
| Dup               | Duplicated requests.                                                      |
| Invalid           | Invalid requests (e.g. requests from an unknown NAS).                     |
| Malformed         | Malformed requests (e.g. requests packets with an invalid length).        |
| Bad_Authenticator | Bad authenticators (wrong secret key).                                    |
| Dropped           | Packets dropped for other reasons.                                        |
| Unknown_Types     | Packets types not allowed on this proxy.                                  |
| Timeouts          | No response from the server.                                              |
| Last_Packet       | Last time a packet was sent to the server.                                |

# show radius statistics

**Overview** This command shows the RADIUS client statistics for the device.

**Syntax** `show radius statistics`

**Mode** User Exec and Privileged Exec

**Example** See the sample output below showing RADIUS client statistics and RADIUS configuration:

```
awplus# show radius statistics
```

**Output** Figure 51-9: Example output from the **show radius statistics** command:

```
RADIUS statistics for Server: 150.87.18.89
Access-Request Tx : 5 - Retransmit : 0
Access-Accept Rx : 1 - Access-Reject Rx : 2
Access-Challenge Rx : 2
Unknown Type : 0 - Bad Authenticator : 0
Malformed Access-Resp : 0 - Wrong Identifier : 0
Bad Attribute : 0 - Packet Dropped : 0
TimeOut : 0 - Dead count : 0
Pending Request : 0
```

# source-interface (radproxy)

**Overview** Use this command to configure the source IP address of each outgoing RADIUS packet. The RADIUS packets will use the specified IP address or the IP address of the specified interface. If the interface is down, or there is no IP address on the interface, then the source IP address will be the IP address of the interface the packets leave on.

Use the **no** variant of this command to remove the source interface configuration. The source IP address in outgoing proxy RADIUS packets will then be the IP address of the interface from which the packets are sent.

**Syntax** `source-interface [<ip-address>|<interface-name>]`  
`no source-interface`

| Parameter                           | Description                                                                        |
|-------------------------------------|------------------------------------------------------------------------------------|
| <code>&lt;ip-address&gt;</code>     | The IP address to be used as the source IP address.                                |
| <code>&lt;interface-name&gt;</code> | The name of the interface whose IP address is to be used as the source IP address. |

**Default** The source IP in outgoing proxy RADIUS packets is the IP address of the interface from which the packets are sent.

**Mode** RADIUS Proxy Server Configuration

**Example** To set the source IP address to '192.168.1.1' for all outgoing RADIUS packets from the proxy server, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config-radproxy)# source-interface 192.168.1.1
```

To remove the source interface configuration., use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config-radproxy)# no source-interface
```

# Local RADIUS Server Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure the local RADIUS server on the device. For more information, see the [Local RADIUS Server Feature Overview and Configuration Guide](#).

The local RADIUS server is not available in Secure Mode (see the [crypto secure-mode](#) command).

- Command List**

# attribute (radsrv-grp)

**Overview** Use this command to define a RADIUS attribute for the local RADIUS server user group.

For a complete list of defined RADIUS attributes and values, see the [Local RADIUS Server Feature Overview and Configuration Guide](#).

When used with the **value** parameter the **attribute** command configures RADIUS attributes to the user group. If the specified attribute is already defined then it is replaced with the new value.

Use the **no** variant of this command to delete an attribute from the local RADIUS server user group.

**Syntax** `attribute [repeated] {<attribute-name>|<attribute-id>} <value>`  
`no attribute {<attribute-name>|<attribute-id>}`

| Parameter        | Description                                                                                                                                                                                  |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| repeated         | This optional parameter allows you to set multiple instances of the same attribute name or attribute ID.                                                                                     |
| <attribute-name> | RADIUS attribute name for standard attributes or Vendor-Specific attributes (see the <a href="#">Local RADIUS Server Feature Overview and Configuration Guide</a> for tables of attributes). |
| <attribute-id>   | RADIUS attribute numeric identifier for standard attributes.                                                                                                                                 |
| <value>          | RADIUS attribute value.                                                                                                                                                                      |

**Default** By default, no attributes are configured.

**Mode** Local RADIUS Server User Group Configuration

**Usage notes** For the Standard attributes, the attribute may be specified using either the attribute name, or its numeric identifier. For example, the command:

```
awplus(config-radsrv-group)# attribute acct-terminate-cause 1
```

will produce the same results as the command:

```
awplus(config-radsrv-group)# attribute 49 1
```

In the same way, where the specific attribute has a pre-defined value, the parameter <value> may be substituted with the Value Name or with its numeric value, for example the command:

```
awplus(config-radsrv-group)# attribute acct-terminate-cause
user-request
```

will produce the same results as the command:

```
awplus(config-radsrv-group)# attribute 49 1
```

or the command:

```
awplus(config-radsrv-group)# attribute acct-terminate-cause 1
```

You can define more than one instance of an attribute name (or id) by using the **repeated** parameter. For example:

```
awplus(config-radsrv-group)# attribute repeated
Nas-filter-Rule "deny in tcp from any to 0.0.0.0/0 23"

awplus(config-radsrv-group)# attribute repeated
Nas-filter-Rule "deny in tcp from any to fe80::b1 23"
```

**Examples** To define the attribute name 'Service-Type' with Administrative User (6) to the RADIUS User Group 'Admin', use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group Admin
awplus(config-radsrv-group)# attribute Service-Type 6
```

To delete the attribute 'Service-Type' from the RADIUS User Group 'Admin', use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group Admin
awplus(config-radsrv-group)# no attribute Service-Type
```

To define multiple values for attribute 'NAS-Filter-Rule', use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group dynamicAcl
awplus(config-radsrv-group)# attribute repeated
NAS-Filter-Rule "deny in tcp from any to 0.0.0.0/0 23"

awplus(config-radsrv-group)# attribute repeated
NAS-Filter-Rule "deny in tcp from any to fe80::b1 23"
```

To delete a specific value from the attribute 'NAS-Filter-Rule', use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group dynamicAcl
awplus(config-radsrv-group)# no attribute NAS-Filter-Rule "deny
in tcp from any to 0.0.0.0/0 23"
```

**Related  
commands** [egress-vlan-id \(radsrv-grp\)](#)  
[egress-vlan-name \(radsrv-grp\)](#)  
[help radius-attribute](#)

**Command  
changes** Version 5.5.0-1.1: **repeated** parameter added

# authentication

**Overview** Use this command to enable the specified authentication methods on the local RADIUS server.

Use the **no** variant of this command to disable specified authentication methods on the local RADIUS server.

**Syntax** `authentication {mac|eapmd5|eaptls|peap}`  
`no authentication {mac|eapmd5|eaptls|peap}`

| Parameter | Description                            |
|-----------|----------------------------------------|
| mac       | Enable MAC authentication method.      |
| eapmd5    | Enable EAP-MD5 authentication method.  |
| eaptls    | Enable EAP-TLS authentication method.  |
| peap      | Enable EAP-PEAP authentication method. |

**Default** All authentication methods are enabled by default.

**Mode** RADIUS Server Configuration

**Examples** The following commands enable EAP-MD5 authentication methods on the local RADIUS server.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# authentication eapmd5
```

The following commands disable EAP-MD5 authentication methods on Local RADIUS server.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no authentication eapmd5
```

**Related commands** [server enable](#)  
[show radius local-server statistics](#)

# client (radsecproxy-srv)

**Overview** Use this command to add a RadSec client (for example, a NAS device) to the RadSecProxy local-server application. The application will accept RADIUS requests from all configured clients.

Use the **no** variant of this command to delete a previously-configured client from the RadSecProxy local-server application.

**Syntax** `client {<hostname>|<ip-addr>} [name-check {on|off}]`  
`no client {<hostname>|<ip-addr>}`

| Parameter  | Description                                                                                                                                                                     |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <hostname> | Hostname of client.                                                                                                                                                             |
| <ip-addr>  | Specify the client IPv4 address, in dotted decimal notation (A.B.C.D).                                                                                                          |
| name-check | Specify whether or not to enforce certificate name checking for this client. If the parameter is not specified then the global behavior, which defaults to <b>on</b> , is used. |
| on         | Enable name checking for this client.                                                                                                                                           |
| off        | Disable name checking for this client.                                                                                                                                          |

**Mode** RadSecProxy Local Server Configuration

**Usage notes** The client may be specified by its domain name or by its IPv4 address. If a domain name is used, it must be resolvable using a configured DNS name server.

Each client may be configured to use certificate name-checking; if not specified, the global behavior defined by **client name-check** or **no client name-check** will be used. If name checking is enabled, the Common Name portion of the subject field of the client's X.509 certificate must match the domain name or IP address specified in this command.

**NOTE:** If mutual authentication is disabled then this parameter has no effect, see the [client mutual-authentication](#) command.

**Example** To add a client called 'mynas.local' with certificate name checking **off**, use the commands:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy local-server
awplus(config-radsecproxy-srv)# client mynas.local name-check
off
```

**Related commands** [client mutual-authentication](#)  
[client name-check](#)

client trustpoint  
radius-secure-proxy local-server

# client mutual-authentication

**Overview** This command enables or disables mutual certificate authentication for all RadSecProxy clients. When enabled, the RadSecProxy local-server application will request and validate an X.509 certificate from the client when establishing a connection.

The **no** variant of this command disables mutual certificate validation. The local-server application will still transmit the local server certificate to the client, but will not expect or validate a certificate from the client.

**Syntax** `client mutual-authentication`  
`no client mutual-authentication`

**Default** Mutual authentication is enabled by default.

**Mode** RadSecProxy Local Server Configuration

**Example** Disable mutual certificate validation with the following command:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy local-server
awplus(config-radius-secure-proxy)# no client
mutual-authentication
```

**Related commands** [client \(radsecproxy-srv\)](#)  
[client name-check](#)  
[radius-secure-proxy local-server](#)

**Command changes** Version 5.4.6-2.1: command added

# client name-check

**Overview** This command sets the global behavior for certificate name-checking for the RadSecProxy localserver application to **on**. This behavior will be used for all clients associated with the application that do not specify a behavior on a per-client basis. If name-checking is enabled, the Common Name portion of the subject field of the client's X.509 certificate must match the domain name or IP address specified in the **client (radsecproxy-aaa)** command.

Use the **no** variant of this command to set the global behavior for certificate name checking to **off**

**Syntax** `client name-check`  
`no client name-check`

**Default** Certificate name checking is on by default.

**Mode** RadSecProxy Local Server Configuration

**Example** Disable certificate name checking globally with the following command:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy local-server
awplus(config-radsecproxy-srv)# no client name-check
```

**Related commands** [client \(radsecproxy-srv\)](#)  
[client trustpoint](#)  
[radius-secure-proxy local-server](#)

# client trustpoint

**Overview** This command adds one or more trustpoints to be used with the RadSecProxy local-server application. Multiple trustpoints may be specified, or the command may be executed more than once, to add multiple trustpoints to the application.

The **no** version of this command removes one or more trustpoints from the list of trustpoints associated with the application.

**Syntax** `client trustpoint [<trustpoint-list>]`  
`no client trustpoint [<trustpoint-list>]`

| Parameter         | Description                                             |
|-------------------|---------------------------------------------------------|
| <trustpoint-list> | Specify one or more trustpoints to be added or deleted. |

**Mode** RadSecProxy Local Server Configuration

**Usage notes** The device certificate associated with the first trustpoint added to the application will be transmitted to remote servers. The certificate received from the remote server must have an issuer chain that terminates with the root CA certificate for any of the trustpoints that are associated with the application.

If you enter **client trustpoint** without specifying a trustpoint, the trustpoint list will be unchanged.

If you enter **no client trustpoint** without specifying a trustpoint, all trustpoints will be disassociated from the application.

**Example** You can add multiple trustpoints to the RadSecProxy local-server by executing the command multiple times:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy local-server
awplus(config-radsecproxy-srv)# client trustpoint example_1
awplus(config-radsecproxy-srv)# client trustpoint example_2
```

Alternatively, add multiple trustpoints with a single command:

```
awplus(config-radsecproxy-srv)# client trustpoint example_3
example_4
```

Disassociate all trustpoints from the RadSecProxy local-server application using the command:

```
awplus(config-radsecproxy-srv)# no client trustpoint
```

**Related commands** [client \(radsecproxy-srv\)](#)  
[client name-check](#)  
[radius-secure-proxy local-server](#)

# clear radius local-server statistics

**Overview** Use this command to clear the statistics stored on the device for the local RADIUS server.

Use this command without any parameters to clear all types of local RADIUS server statistics.

**Syntax** `clear radius local-server statistics [nas|server|user]`

| Parameter | Description                                                                                                                                  |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------|
| nas       | Clear the NAS (Network Access Server) statistics on the device. For example, clearing statistics stored for NAS server invalid passwords.    |
| server    | Clear the Local RADIUS Server statistics on the device. For example, clearing Local RADIUS Servers statistics for all failed login attempts. |
| user      | Clear the Local RADIUS Server user statistics. For example, clearing statistics stored for the number of successful user logins.             |

**Mode** Privileged Exec

**Usage** Refer to the sample output for the [show radius local-server statistics](#) for further information about the type of statistics each parameter option for this command clears. Both the **nas** and **server** parameters clear unknown username and invalid passwords statistics, while the **user** parameter clears the number of successful and failed logins for each local RADIUS server user.

**Examples** To clear the NAS (Network Access Server) statistics stored on the device, use the command:

```
awplus# clear radius local-server statistics nas
```

To clear the local RADIUS server statistics stored on the device, use the command:

```
awplus# clear radius local-server statistics server
```

To clear the local RADIUS server user statistics stored on the device, use the command:

```
awplus# clear radius local-server statistics user
```

**Related commands** [show radius local-server statistics](#)

## copy fdb-radius-users (to file)

**Overview** Use this command to create a set of local RADIUS server users from MAC addresses in the local FDB. A local RADIUS server user created using this command can be used for MAC authentication.

**Syntax** `copy fdb-radius-users  
{local-radius-user-db|nvs|flash|usb|debug|tftp|scp|  
fserver|<url>} [interface <port>] [vlan <vid>] [group <name>]  
[export-vlan [<radius-group-name>]]`

| Parameter            | Description                                                                                                                                                                                                                                                                               |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| local-radius-user-db | Copy the local RADIUS server users created to the local RADIUS server.                                                                                                                                                                                                                    |
| nvs                  | Copy the local RADIUS server users created to NVS memory.                                                                                                                                                                                                                                 |
| flash                | Copy the local RADIUS server users created to Flash memory.                                                                                                                                                                                                                               |
| usb                  | Copy the local RADIUS server users created to USB storage device.                                                                                                                                                                                                                         |
| debug                | Copy the local RADIUS server users created to debug.                                                                                                                                                                                                                                      |
| tftp                 | Copy the local RADIUS server users created to the TFTP destination.                                                                                                                                                                                                                       |
| scp                  | Copy the local RADIUS server users created to the SCP destination.                                                                                                                                                                                                                        |
| fserver              | Copy the local RADIUS server users created to the remote file server.                                                                                                                                                                                                                     |
| <url>                | Copy the local RADIUS server users created to the specified URL.                                                                                                                                                                                                                          |
| interface <port>     | Copy only MAC addresses learned on a specified device port. Wildcards may be used when specifying an interface name. For example, if you specify interface port2.* in a stacked environment, then this command generates RADIUS server users for MAC addresses learned on stack member 2. |
| vlan <vid>           | Copy only MAC addresses learned on a specified VLAN.                                                                                                                                                                                                                                      |
| group <name>         | Assign a group name to the local RADIUS server users created.                                                                                                                                                                                                                             |
| export-vlan          | Export VLAN ID assigned to exported FDB entry.                                                                                                                                                                                                                                            |
| <radius-group-name>  | Prefix for Radius group name storing VLAN ID                                                                                                                                                                                                                                              |

**Mode** Privileged Exec

**Usage notes** The local RADIUS server users created are written to a specified destination file in local RADIUS user CSV (Comma Separated Values) format. The local RADIUS server

users can then be imported to a local RADIUS server using the [copy local-radius-user-db \(from file\)](#) command.

The name and password of the local RADIUS server users created use a MAC address, which can be used for MAC authentication.

This command does not copy a MAC address learned by the CPU or the management port.

This command can filter FDB entries by the interface name and the VLAN ID. When the interface name and the VLAN ID are specified, this command generates local RADIUS server users from only the MAC address learned on the specified interface and on the specified VLAN.

**Examples** To register the local RADIUS server users from the local FDB directly to the local RADIUS server, use the command:

```
awplus# copy fdb-radius-users local-radius-user-db
```

To register the local RADIUS server users from the interface port1.1.1 to the local RADIUS server, use the command:

```
awplus# copy fdb-radius-users local-radius-user-db interface
port1.1.1
```

To copy output generated as local RADIUS server user data from MAC addresses learned on vlan10 on interface port1.1.1 to the file radius-user.csv, use the command:

```
awplus# copy fdb-radius-users radius-user.csv interface
port1.1.1 vlan10
```

To copy output generated as local RADIUS server user data from MAC addresses learned on vlan10 on interface port1.1.1 to a file on the remote file server, use the command:

```
awplus# copy fdb-radius-users fserver interface port1.1.1
vlan10
```

**Related commands** [copy local-radius-user-db \(to file\)](#)  
[copy local-radius-user-db \(from file\)](#)

# copy local-radius-user-db (from file)

**Overview** Use this command to copy the Local RADIUS server user data from a file. The file, including the RADIUS user data in the file, must be in the CSV (Comma Separated Values) format.

You can select **add** or **replace** as the copy method. The **add** parameter option copies the contents of specified file to the local RADIUS server user database. If the same user exists then the old user is removed before adding a new user. The **replace** parameter option deletes all contents of the local RADIUS server user database before copying the contents of specified file.

**Syntax** `copy <source-url> local-radius-user-db [add|replace]`

| Parameter    | Description                                                           |
|--------------|-----------------------------------------------------------------------|
| <source-url> | URL of the source file.                                               |
| add          | Add file contents to local RADIUS server user database.               |
| replace      | Replace current local RADIUS server user database with file contents. |

**Default** When no copy method is specified with this command the **replace** option is applied.

**Mode** Privileged Exec

**Examples** To replace the current local RADIUS server user data to the contents of `http://datahost/ user.csv`, use the following command:

```
awplus# copy http://datahost/user.csv local-radius-user-db
```

To add the contents of `http://datahost/user.csv` to the current local RADIUS server user database, use the following command:

```
awplus# copy http://datahost/user.csv local-radius-user-db add
```

**Related commands** [copy fdb-radius-users \(to file\)](#)  
[copy local-radius-user-db \(to file\)](#)

## copy local-radius-user-db (to file)

**Overview** Use this command to copy the local RADIUS server user data to a file. The output file produced is CSV (Comma Separated Values) format.

**Syntax** `copy local-radius-user-db  
{nvs|flash|usb|tftp|scp|<destination-url>}`

| Parameter         | Description                  |
|-------------------|------------------------------|
| nvs               | Copy to NVS memory.          |
| flash             | Copy to Flash memory.        |
| usb               | Copy to USB storage device.  |
| tftp              | Copy to TFTP destination.    |
| scp               | Copy to SCP destination.     |
| <destination-url> | URL of the Destination file. |

**Mode** Privileged Exec

**Example** Copy the current local RADIUS server user data to `http://datahost/user.csv`.

```
awplus# copy local-radius-user-db http://datahost/user.csv
```

**Related commands** [copy fdb-radius-users \(to file\)](#)

crypto pki trustpoint <trustpoint>
```

Note that “local” is a valid name for a trustpoint, so you do not need to modify existing configurations or scripts.

# debug crypto pki (deleted)

**Overview** This command is no longer available.

# domain-style

**Overview** Use this command to enable a specified domain style on the local RADIUS server. The local RADIUS server decodes the domain portion of a username login string when this command is enabled.

Use the **no** variant of this command to disable the specified domain style on the local RADIUS server.

**Syntax** domain-style {suffix-at-sign|ntdomain}  
no domain-style {suffix-at-sign|ntdomain}

| Parameter      | Description                                                    |
|----------------|----------------------------------------------------------------|
| suffix-at-sign | Enable at sign "@" delimited suffix style, i.e. "user@domain". |
| ntdomain       | Enable NT domain style, i.e. "domain\user".                    |

**Default** This feature is disabled by default.

**Mode** RADIUS Server Configuration

**Usage notes** When both domain styles are enabled, the first domain style configured has the highest priority. A username login string is matched against the first domain style enabled. Then, if the username login string is not decoded, it is matched against the second domain style enabled.

**Examples** To enable NT domain style on the local RADIUS server, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# domain-style ntdomain
```

To disable NT domain style on the local RADIUS server, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no domain-style ntdomain
```

**Related commands** [server enable](#)

## egress-vlan-id (radsrv-grp)

**Overview** Use this command to configure the standard RADIUS attribute 'Egress-VLANID (56)' for the local RADIUS Server user group.

Use the **no** variant of this command to remove the Egress-VLANID attribute from the local RADIUS server user group.

**Syntax** `egress-vlan-id <vid> [tagged|untagged]`  
`no egress-vlan-id`

| Parameter | Description                                                                                                                       |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------|
| <vid>     | The VLAN identifier to be used for the Egress VLANID attribute, in the range 1 to 4094.                                           |
| tagged    | Set frames on the VLAN as tagged. This sets the tag indication field to indicate that all frames on this VLAN are tagged.         |
| untagged  | Set all frames on the VLAN as untagged. This sets the tag indication field to indicate that all frames on this VLAN are untagged. |

**Default** By default, no Egress-VLANID attributes are configured.

**Mode** Local RADIUS Server User Group Configuration

**Usage** When a Voice VLAN is configured for dynamic VLAN allocation ([switchport voice vlan](#) command), the RADIUS server must be configured to send the VLAN information when an IP phone is successfully authenticated. Use either the [egress-vlan-id \(radsrv-grp\)](#) command or the [egress-vlan-name \(radsrv-grp\)](#) command, and specify the **tagged** parameter.

**Examples** To set the 'Egress-VLANID' attribute for the 'NormalUsers' local RADIUS server user group to VLAN identifier 200, with tagged frames, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# egress-vlan-id 200 tagged
```

To remove the 'Egress-VLANID' attribute for the 'NormalUsers' local RADIUS server user group, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# no egress-vlan-id
```

**Related commands**    `attribute (radsrv-grp)`  
                          `egress-vlan-name (radsrv-grp)`  
                          `switchport voice vlan`

## egress-vlan-name (radsrv-grp)

**Overview** Use this command to configure the standard RADIUS attribute 'Egress-VLAN-Name (58)' for the local RADIUS server user group.

Use the **no** variant of this command to remove the Egress-VLAN-Name attribute from the local RADIUS server user group.

**Syntax** `egress-vlan-name <vlan-name> [tagged|untagged]`  
`no egress-vlan-name`

| Parameter   | Description                                                                                                                       |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <vlan-name> | The VLAN name to be configured as the Egress-VLAN-Name attribute.                                                                 |
| tagged      | Set frames on the VLAN as tagged. This sets the tag indication field to indicate that all frames on this VLAN are tagged.         |
| untagged    | Set all frames on the VLAN as untagged. This sets the tag indication field to indicate that all frames on this VLAN are untagged. |

**Default** By default, no Egress-VLAN-Name attributes are configured.

**Mode** Local RADIUS Server User Group Configuration

**Usage** When a Voice VLAN is configured for dynamic VLAN allocation ([switchport voice vlan](#) command), the RADIUS server must be configured to send the VLAN information when an IP phone is successfully authenticated. Use either the [egress-vlan-id \(radsrv-grp\)](#) command or the [egress-vlan-name \(radsrv-grp\)](#) command, and specify the **tagged** parameter.

**Examples** To configure the 'Egress-VLAN-Name' attribute for the RADIUS server user group 'NormalUsers' with the VLAN name vlan2 and all frames on this VLAN tagged, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# egress-vlan-name vlan2 tagged
```

To delete the 'Egress-VLAN-Name' attribute for the 'NormalUsers' group, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# no egress-vlan-name
```

**Related  
commands**    `attribute (radsrv-grp)`  
                  `egress-vlan-id (radsrv-grp)`  
                  `switchport voice vlan`

# group (radsrv)

**Overview** Use this command to create a local RADIUS server user group, and enter local RADIUS Server User Group Configuration mode.

Use the **no** variant of this command to delete the local RADIUS server user group.

**Syntax** `group <user-group-name>`  
`no group <user-group-name>`

| Parameter                            | Description             |
|--------------------------------------|-------------------------|
| <code>&lt;user-group-name&gt;</code> | User group name string. |

**Mode** RADIUS Server Configuration

**Examples** The following command creates the user group NormalUsers.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
```

The following command deletes the user group NormalUsers.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no group NormalUsers
```

**Related commands** [user \(radsrv\)](#)  
[show radius local-server user](#)  
[vlan \(radsrv-grp\)](#)

# help radius-attribute

**Overview** Use this command to display a list of standard and vendor specific valid RADIUS attributes that are supported by the local RADIUS server.

**Syntax** `help radius-attribute [<attribute-name>|<attribute-ID>]`

| Parameter                           | Description                                                        |
|-------------------------------------|--------------------------------------------------------------------|
| <code>&lt;attribute-name&gt;</code> | List the details and predefined values for the named attribute.    |
| <code>&lt;attribute-ID&gt;</code>   | List the details and predefined values for the given attribute ID. |

**Mode** Privileged Exec

**Usage notes** When used without a parameter, this command lists all of the available RADIUS attributes.

When used with an attribute name or ID, this command displays the attribute name, value type, and any predefined values.

**Example** To list all available RADIUS attributes, use the following command:

```
awplus# help radius-attribute
```

```
awplus#help radius-attribute
Standard Attributes:
 1 User-Name
 2 User-Password
 3 CHAP-Password
 4 NAS-IP-Address
 5 NAS-Port
 6 Service-Type
...
```

To display the details for the RADIUS attribute Frag-Status, use the following command:

```
awplus# help radius-attribute frag-status
```

```
awplus#help radius-attribute frag-status
Frag-Status : integer (Integer number)

Pre-defined values :
 Fragmentation-Supported (1)
 More-Data-Pending (2)
 More-Data-Request (3)
 Reserved (0)
```

**Related commands**   [attribute \(radsrv-grp\)](#)

[rule attribute \(radproxy\)](#)

**Command changes**   Version 5.4.8-0.2: command added  
Version 5.4.9-0.1: added to x530 Series products

# nas

**Overview** This command adds a client device (the Network Access Server or the NAS) to the list of devices that are able to send authentication requests to the local RADIUS server. The NAS is identified by its IP address and a shared secret (also referred to as a shared key) must be defined that the NAS will use to establish its identity.

Use the **no** variant of this command to remove a NAS client from the list of devices that are allowed to send authentication requests to the local RADIUS server.

**Syntax** `nas <ip-address> key <nas-keystring>`  
`no nas <ip-address>`

| Parameter                          | Description            |
|------------------------------------|------------------------|
| <code>&lt;ip-address&gt;</code>    | RADIUS NAS IP address. |
| <code>&lt;nas-keystring&gt;</code> | NAS shared keystring.  |

**Mode** RADIUS Server Configuration

**Examples** The following commands add the NAS with an IP address of 192.168.1.2 to the list of clients that may send authentication requests to the local RADIUS server. Note the shared key that this NAS will use to establish its identity is NAS\_PASSWORD.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# nas 192.168.1.2 key NAS_PASSWORD
```

The following commands remove the NAS with an IP address of 192.168.1.2 from the list of clients that are allowed to send authentication requests to the local RADIUS server:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no nas 192.168.1.2
```

**Related commands** [nas message-authenticator \(radsrv\)](#)  
[show radius local-server nas](#)

## nas message-authenticator (radsvr)

**Overview** Use this command to decide whether or not to require verification of RADIUS packets for a specific NAS. Verification prevents RADIUS protocol forgery attacks. It is achieved by putting a Message-Authenticator attribute in Access-Requests from the NAS.

Use the **no** variant of this command to return the setting to the default.

**Syntax** `nas <ip-address> message-authenticator  
{required|optional|auto}`  
`no nas <ip-address> message-authenticator`

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                       |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ip-address> | The IP address of the NAS.                                                                                                                                                                                                                                                                                                                        |
| required     | Discard Access-Requests that have no Message-Authenticator attribute, or that have an invalid Message-Authenticator attribute.                                                                                                                                                                                                                    |
| optional     | Allow Access-Requests that have no Message-Authenticator attribute, and discard Access-Requests that have an invalid Message-Authenticator attribute.                                                                                                                                                                                             |
| auto         | Determine the mode based on the content of the first Access-Request received. On the basis of this, the device will produce a log message to tell you which mode you should configure. Only use <b>auto</b> temporarily while you are transitioning an existing network or adding new NAS devices with unknown support for Message-Authenticator. |

**Default** auto

**Mode** RADIUS Server Configuration

**Usage notes** If you use both MAC authentication and web authentication to authenticate the same TQ Series access point, make sure you set this to **optional**. Otherwise, web authentication may fail.

This is because if the first packet that the server receives from the client contains a valid Message-Authenticator attribute, then by default all subsequent packets from that client must also contain the same Message-Authenticator attribute. If packets don't contain the attribute, the server drops them. This can cause an issue on TQ series APs, because on these APs, MAC authentication's initial packet contains the attribute, and web authentication's initial packet doesn't. This means that web authentication will fail if MAC authentication has already happened.

Setting this to **optional** allows the server to accept packets from a client when the packets don't have a Message-Authenticator attribute, even if the server has already received a packet from that client that contained a Message-Authenticator attribute. This means both web authentication and MAC authentication will succeed, no matter which happens first.

**Examples** To require Message-Authenticator attributes in messages from a registered NAS whose IP address is 192.168.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsvr)# nas 192.168.1.2 message-authenticator
required
```

To make Message-Authenticator attributes optional in messages from a registered NAS whose IP address is 192.168.1.9, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsvr)# nas 192.168.1.9 message-authenticator
optional
```

To return to the default behavior of **auto** for the NAS whose IP address is 192.168.1.9, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsvr)# no nas 192.168.1.9 message-authenticator
```

**Command changes** Version 5.5.4-2.3: command added

# radius-secure-proxy local-server

**Overview** Use this command to enter the RadSecProxy local-server application configuration mode. This application allows remote RadSec clients to communicate with the local RADIUS server process via a secure (TLS) proxy.

**Syntax** `radius-secure-proxy local-server`

**Mode** Global Configuration Mode

**Example** To change mode from User Exec mode to the RadSecProxy local-server configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy local-server
awplus(config-radsecproxy-srv)#
```

**Related commands**

- `client (radsecproxy-srv)`
- `client name-check`
- `client trustpoint`

# radius-server local

**Overview** Use this command to navigate to the Local RADIUS server configuration mode (`config-radsrv`) from the Global Configuration mode (`config`).

**Syntax** `radius-server local`

**Mode** Global Configuration

**Example** Local RADIUS Server commands are available from `config-radsrv` configuration mode. To change mode from User Exec mode to the Local RADIUS Server mode (`config-radsrv`), use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)#
```

## Output

```
awplus(config)#radius-server local
Creating Local CA repository.....OK
Enrolling Local System to local trustpoint..OK
awplus(config-radsrv)#
```

**Related commands**

# server auth-port

**Overview** Use this command to change the UDP port number for local RADIUS server authentication.

Use the **no** variant of this command to reset the RADIUS server authentication port back to the default.

**Syntax** `server auth-port <1-65535>`  
`no server auth-port`

| Parameter                    | Description      |
|------------------------------|------------------|
| <code>&lt;1-65535&gt;</code> | UDP port number. |

**Default** The default local RADIUS server UDP authentication port number is 1812.

**Mode** RADIUS Server Configuration

**Examples** The following commands set the RADIUS server authentication port to 10000.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# server auth-port 10000
```

The following commands reset the RADIUS server authentication port back to the default UDP port of 1812.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no server auth-port
```

**Related commands** [server enable](#)  
[show radius local-server statistics](#)

# server enable

**Overview** This command enables the local RADIUS server. The local RADIUS server feature is started immediately when this command is issued.

The **no** variant of this command disables local RADIUS server. When this command is issued, the local RADIUS server stops operating.

**Syntax** `server enable`  
`no server enable`

**Default** The local RADIUS server is disabled by default and must be enabled for use with this command.

**Mode** RADIUS Server Configuration

**Examples** To enable the local RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# server enable
```

To disable the local RADIUS server, use the command:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no server enable
```

**Related commands** [server auth-port](#)  
[show radius local-server statistics](#)

# server trustpoint (radsrv)

**Overview** Use this command to add one or more trustpoints to the local RADIUS server. You can specify multiple trustpoints on one line, or execute the command more than once to add multiple trustpoints to the local RADIUS server.

Use the **no** variant to remove one or more trustpoints from the local RADIUS server.

**Syntax** `server trustpoint [<trustpoint-list>]`  
`no server trustpoint [<trustpoint-list>]`

| Parameter         | Description                                            |
|-------------------|--------------------------------------------------------|
| <trustpoint-list> | Specify one or more trustpoints to be added or deleted |

**Default** By default, the local trustpoint is associated with the local RADIUS server.

**Mode** RADIUS Server Configuration

**Usage Notes** If you do not specify any trustpoints, the command displays a list of trustpoints but leaves the list unchanged.

If you use the **no server trustpoint** command without specifying any trustpoints, then all trustpoints will be removed from the local RADIUS server.

**Example** To configure a trustpoint called 'my\_trustpoint' on the local RADIUS server, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# server trustpoint my_trustpoint
```

You can add multiple trustpoints to the local RADIUS server by executing the **server trustpoint** command multiple times:

```
awplus(config-radsrv)# server trustpoint my_trustpoint1
my_trustpoint2
```

To remove the trustpoint called 'my\_trustpoint' from the local RADIUS server, use the command:

```
awplus(config-radsrv)# no server trustpoint my_trustpoint
```

To remove all trustpoints from the local RADIUS server, use the command:

```
awplus(config-radsrv)# no server trustpoint
```

**Related commands** [show radius local-server trustpoint](#)  
[server enable](#)  
[client trustpoint](#)  
[server trustpoint](#)

**Command changes** Version 5.4.1-1.1: command added.

# show radius local-server group

**Overview** Use this command to display information about the local RADIUS server user group.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show radius local-server group [<user-group-name>]`

| Parameter                            | Description             |
|--------------------------------------|-------------------------|
| <code>&lt;user-group-name&gt;</code> | User group name string. |

**Mode** User Exec and Privileged Exec

**Example** The following command displays Local RADIUS server user group information.

```
awplus# show radius local-server group
```

## Output

**Table 1:** Example output from the **show radius local-server group** command

|                  |               |
|------------------|---------------|
| Group-Name       | Vlan          |
| -----            |               |
| NetworkOperators | ManagementNet |
| NormalUsers      | CommonNet     |

**Table 2:** Parameters in the output of the **show radius local-server group** command

| Parameter  | Description                      |
|------------|----------------------------------|
| Group-Name | Group name.                      |
| Vlan       | VLAN name assigned to the group. |

**Related commands** [group \(radsrv\)](#)

# show radius local-server nas

**Overview** Use this command to display information about NAS (Network Access Servers) registered to the local RADIUS server.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show radius local-server nas [<ip-address>]`

| Parameter    | Description                             |
|--------------|-----------------------------------------|
| <ip-address> | Specify NAS IP address for show output. |

**Mode** User Exec and Privileged Exec

**Example** The following command displays NAS information.

```
awplus# show radius local-server nas
```

## Output

**Table 3:** Example output from the **show radius local-server nas** command

| NAS-Address | Shared-Key (encrypted) | Message Authenticator |
|-------------|------------------------|-----------------------|
| 127.0.0.1   | dbSQ8ED....            | optional              |

**Table 4:** Parameters in the output of the **show radius local-server nas** command

| Parameter             | Description                            |
|-----------------------|----------------------------------------|
| NAS-Address           | IP address of NAS.                     |
| Shared-Key            | Shared key used for RADIUS connection. |
| Message Authenticator | The message-authenticator mode.        |

**Related commands** [nas](#)
