awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 capability orf
prefix-list both
```

Examples [BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router)# neighbor 2001:0db8:010d::1 capability
orf prefix-list both
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router)# no neighbor 2001:0db8:010d::1
capability orf prefix-list both
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as
10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 peer-group
group1
awplus(config-router-af)# neighbor group1 capability orf
prefix-list both
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 capability orf
prefix-list both
```

Related Commands

neighbor capability orf prefix-list (BGP and BGP4+)
neighbor peer-group (add a neighbor) (BGP and BGP+)
neighbor route-map (BGP and BGP4+)

neighbor capability route-refresh (BGP and BGP4+)

Use this command to advertise route-refresh capability to the specified BGP and BGP4+ neighbors.

Use the **no** variant of this command to disable this function

Syntax [BGP/BGP4+]

```
neighbor <neighborid> capability route-refresh
no neighbor <neighborid> capability route-refresh
```

Parameter	Description	
<neighborid>	{*<ip-address>*|*ipv6-addr>*|*<peer-group>*}	
	<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
	<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
	<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the **neighbor peer-group (add a neighbor) (BGP and BGP+)** command on page 45.145, and **neighbor route-map (BGP and BGP4+)** command on page 45.160. When this parameter is used with this command, the command applies on all peers in the specified group.

Mode [BGP/BGP4+]

Router Configuration

Default [BGP/BGP4+]

Enabled

Usage [BGP/BGP4+]

Use this command to advertise to peer about route refresh capability support. If route refresh capability is supported, then router can dynamically request that the peer readvertises its Adj-RIB-Out.

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 capability route-
refresh

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 capability
route-refresh

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.1.1 remote-as 10
awplus(config-router)# neighbor 10.10.1.1 peer-group group1
awplus(config-router)# neighbor group1 capability route-refresh

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 capability route-
refresh
```

Examples [BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 capability
route-refresh

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1 capability
route-refresh

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as
10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 peer-group
group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 capability
route-refresh

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 capability
route-refresh
```

Related Commands

neighbor peer-group (add a neighbor) (BGP and BGP+)
neighbor route-map (BGP and BGP4+)

neighbor collide-established (BGP and BGP4+)

Use this command to specify including a BGP or BGP4+ neighbor, already in an 'established' state, for conflict resolution when a TCP connection collision is detected.

Use the **no** variant of this command to remove a BGP or BGP4+ neighbor, already in an 'established' state, for conflict resolution when a TCP connection collision is detected.

Syntax [BGP/BGP4+]

```
neighbor <neighborid> collide-established
no neighbor <neighborid> collide-established
```

Parameter	Description	
<neighborid>	{*<ip-address>*|*<ipv6-addr>*|*<peer-group>*}	
	<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
	<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
	<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the **neighbor peer-group (add a neighbor) (BGP and BGP+)** command on page 45.145, and **neighbor route-map (BGP and BGP4+)** command on page 45.160. When this parameter is used with this command, the command applies on all peers in the specified group.

Mode [BGP/BGP4+]

Router Configuration

Usage [BGP/BGP4+]

This command must be used only when specially required. It is not required in most network deployments.

The associated functionality of including an 'established' neighbor into TCP connection collision conflict resolution is automatically enabled when neighbor is configured for BGP graceful-restart.

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 collide-established

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1
collide-established
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 collide-established

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 collide-established
```

Examples [BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1
collide-established

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1
collide-established

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1
remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 collide-established

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 collide-established
```

Related Commands

neighbor peer-group (add a neighbor) (BGP and BGP+)
neighbor route-map (BGP and BGP4+)

neighbor default-originate (BGP and BGP4+)

Use this command to allow a BGP or BGP4+ local router to send the default route to a neighbor.

Use the **no** variant of this command to send no route as a default route.

Syntax [BGP/BGP4+]

```
neighbor {<neighborid>} default-originate [route-map <routemap-name>]

no neighbor {<neighborid>} default-originate [route-map <routemap-
    name>]
```

Parameter	Description	
<neighborid>	{*<ip-address>*|*<ipv6-addr>*|*<peer-group>*}	
	<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
	<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
	<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the **neighbor peer-group (add a neighbor) (BGP and BGP+)** command on page 45.145, and **neighbor route-map (BGP and BGP4+)** command on page 45.160. When this parameter is used with this command, the command applies on all peers in the specified group.
`route-map`	If a route-map is specified, then the route table must contain at least one route that matches the permit criteria of the route map before the default route will be advertised to the specified neighbor.	
<routemap-name>	Enter the route-map name.	

Mode [BGP] Router Configuration or IPv4 Address Family Configuration for a VRF instance

Mode [BGP4+] IPv6 Address Family Configuration

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 default-originate
route-map myroute
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1
default-originate route-map myroute
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.10.1
default-originate route-map
myroute
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.10.1
default-originate route-map myroute
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 default-originate
route-map myroute
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 default-originate
route-map myroute
```

Examples [BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
default-originate route-map myroute

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
default-originate route-map myroute

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as
10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 default-originate
route-map myroute

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 default-originate
route-map myroute
```

Related Commands **neighbor peer-group (add a neighbor) (BGP and BGP+)**
neighbor route-map (BGP and BGP4+)

neighbor description (BGP and BGP4+)

Use this command to associate a description with a BGP or a BGP4+ neighbor. We recommend adding descriptions to defined neighbors, so any network administrators or network engineers can see a description of connected BGP or BGP4+ peers on the switch.

Use the **no** variant of this command to remove the description from a BGP or a BGP4+ neighbor.

Syntax

```
neighbor <neighborid> description <description>
no neighbor <neighborid> description [<description>]
```

Parameter	Description	
<neighborid>	{*<ip-address>*|*<ipv6-addr>*|*<peer-group>*}	
	<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
	<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
	<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the **neighbor peer-group (add a neighbor) (BGP and BGP+)** command on page 45.145, and **neighbor route-map (BGP and BGP4+)** command on page 45.160. When this parameter is used with this command, the command applies on all peers in the specified group.
<description>	Enter up to 80 characters of text describing the neighbor.	

Mode [BGP] Router Configuration or IPv4 Address Family Configuration for a VRF instance

Mode [BGP4+] Router Configuration

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 description Backup
router for sales

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 description
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 description Backup
router for sales
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 description Backup

router for sales
```

Related Commands neighbor peer-group (add a neighbor) (BGP and BGP+)
neighbor route-map (BGP and BGP4+)

neighbor disallow-infinite-holdtime (BGP and BGP4+)

Use this command to disallow the configuration of infinite holdtime for BGP and BGP4+.

Use the **no** variant of this command to allow the configuration of infinite holdtime for BGP or BGP4+.

Syntax [BGP]

```
neighbor {<ip-address>} disallow-infinite-holdtime
no neighbor {<ip-address>} disallow-infinite-holdtime
```

Syntax [BGP4+]

```
neighbor {<ipv6-addr>} disallow-infinite-holdtime
no neighbor {<ipv6-addr>} disallow-infinite-holdtime
```

Parameter	Description
<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.

Mode [BGP/BGP4+] Router Configuration

Usage [BGP/BGP4+] This command enables the local BGP or BGP4+ speaker to reject holdtime "0" seconds from the peer during exchange of open messages or the user during configuration.

The **no** variant of this command allows the BGP speaker to accept "0" holdtime from the peer or during configuration.

Examples [BGP] To enable the **disallow-infinite-holdtime** feature on the BGP speaker with the IP address of `10.10.10.1`, enter the command:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 disallow-infinite-
holdtime
```

To disable the **disallow-infinite-holdtime** feature on the BGP speaker with the IP address of `10.10.10.10`, enter the command:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1
                       disallow-infinite-holdtime
```

Examples [BGP4+] To enable the **disallow-infinite-holdtime** feature on the BGP4+ speaker with the IPv6 address of `2001:0db8:010d::1`, enter the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1
                       disallow-infinite-holdtime
```

To disable the **disallow-infinite-holdtime** feature on the BGP4+ speaker with the IPv6 address of `2001:0db8:010d::1`, enter the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1
                       disallow-infinite-holdtime
```

Related Commands **neighbor timers (BGP and BGP4+)**

neighbor distribute-list (BGP and BGP4+)

This command filters route updates from a particular BGP or BGP4+ neighbor using an access control list.

You can add one incoming and one outgoing distribute-list for each BGP or BGP4+ neighbor.

The **no** variant of this command removes a previously configured BGP or BGP4+ distribute-list.

Syntax [BGP/BGP4+]

```
neighbor <neighborid> distribute-list <access-list> {in|out}
no neighbor <neighborid> distribute-list <access-list> {in|out}
```

Parameter	Description	
<neighborid>	Specify an identification method for the BGP or BGP4+ peer. Use one of the following formats:	
	<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation *A.B.C.D.*
	<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
	<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the **neighbor peer-group (add a neighbor) (BGP and BGP+)** and **neighbor route-map (BGP and BGP4+)** commands. When this parameter is used with this command, the command applies on all peers in the specified group.
<access-list>	The specific access-list used to filter routes. Specify one of the following types of access-lists:	
	<WORD>	The name of IP access-list.
	<1-199>	The ID number of a standard IP access-list.
	<1300-2699>	The ID number of an extended IP access-list.
in	Indicates that incoming advertised routes will be filtered.	
out	Indicates that outgoing advertised routes will be filtered.	

Mode [BGP] Router Configuration or IPv4 Address Family Configuration for a VRF instance

Mode [BGP4+] IPv6 Address Family Configuration

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 distribute-list
mylist out
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 distribute-list
mylist out
```

```
awplus# configure terminal
awplus(config)# router bgp 10

awplus(config-router-af)# neighbor 10.10.10.1 distribute-list
mylist out
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.10.1 distribute-
list mylist out
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor 10.10.10.1 distribute-list
mylist out
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 distribute-list
mylist out
```

Examples [BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
distribute-list mylist out
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
distribute-list mylist out
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as
10
awplus(config-router# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 peer-group
group1
awplus(config-router-af)# neighbor 2001:0db8:010d::1
distribute-list mylist out
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
distribute-list mylist out
```

Related Commands **neighbor peer-group (add a neighbor) (BGP and BGP+)**
neighbor route-map (BGP and BGP4+)

neighbor dont-capability-negotiate (BGP and BGP4+)

Use this command to disable capability negotiation for BGP and BGP4+.

The capability negotiation is performed by default. This command is used to allow compatibility with older BGP versions that have no capability parameters used in open messages between peers.

Use the **no** variant of this command to enable capability negotiation.

Syntax [BGP/BGP4+]

```
neighbor <neighborid> dont-capability-negotiate
no neighbor <neighborid> dont-capability-negotiate
```

Parameter	Description	
<neighborid>	{*<ip-address>*|*<ipv6-addr>*|*<peer-group>*}	
	<ip-address>	Specify the IPv4 address of the BGP neighbor in dotted decimal, in the format *A.B.C.D*.
	<ipv6-addr>	Specify the IPv6 address of the BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
	<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the **neighbor peer-group (add a neighbor) (BGP and BGP+)** and **neighbor route-map (BGP and BGP4+)** commands. When this parameter is used with this command, the command applies on all peers in the specified group.

Mode [BGP/BGP4+]

Router Configuration

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.34
dont-capability-negotiate

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.34
dont-capability-negotiate
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.34 remote-as 100
awplus(config-router)# neighbor 10.10.10.34 peer-group group1
awplus(config-router)# neighbor group1
dont-capability-negotiate
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1
dont-capability-negotiate
```

Examples [BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 dont-
capability-negotiate
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1
dont-capability-negotiate
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as
100
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 peer-group
group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1
dont-capability-negotiate
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1
                       dont-capability-negotiate
```

Related Commands **neighbor peer-group (add a neighbor) (BGP and BGP4+)**
neighbor route-map (BGP and BGP4+)

neighbor ebgp-multihop (BGP and BGP4+)

Use this command to accept and attempt BGP or BGP4+ connections to external peers on indirectly connected networks.

Effectively, this command sets the TTL value in the BGP or BGP4+ packets that the router sends to the neighbor, so that the packets may traverse the network route to the neighbor.

The switch will not establish a connection to a multihop neighbor, if the only route to the multihop peer is a default route.

Use the **no** variant of this command to return to the default.

Syntax [BGP/BGP4+]

```
neighbor <neighborid> ebgp-multihop [<count>]
no neighbor <neighborid> ebgp-multihop [<count>]
```

Parameter	Description	
<neighborid>	{*<ip-address>*|*ipv6-addr*|*<peer-group>*}	
	<ip-addr>	Specify the address of an IPv4 BGP neighbor, entered in dotted decimal notation A.B.C.D.
	<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
	<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the **neighbor peer-group (add a neighbor) (BGP and BGP+)** command on page 45.145, and **neighbor route-map (BGP and BGP4+)** command on page 45.160. When this parameter is used with this command, the command applies on all peers in the specified group.
<count>	*<1-255>* The Maximum hop count, that is set in the TTL field of the BGP packets. If this optional parameter is not specified with the command, then the Maximum hop count is set to 255.	

Mode [BGP] Router Configuration or IPv4 Address Family Configuration for a VRF instance

Mode [BGP4+] Router Configuration

Examples [BGP]

```
                awplus# configure terminal
       awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.34 remote-as 10
awplus(config-router)# neighbor 10.10.10.34 ebgp-multihop 5

                awplus# configure terminal
       awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.34 ebgp-multihop 5

                awplus# configure terminal
       awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.34 remote-as 10
awplus(config-router)# neighbor 10.10.10.34 peer-group group1
awplus(config-router)# neighbor group1 ebgp-multihop 5

                awplus# configure terminal
       awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 ebgp-multihop 5
```

Examples [BGP4+]

```
                awplus# configure terminal
       awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# neighbor 2001:0db8:010d::1
                       ebgp-multihop 5

                awplus# configure terminal
       awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1
                       ebgp-multihop 5
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as
10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 ebgp-multihop 5
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 ebgp-multihop 5
```

Related Commands

neighbor ebgp-multihop (BGP and BGP4+)
neighbor peer-group (add a neighbor) (BGP and BGP+)
neighbor route-map (BGP and BGP4+)

neighbor enforce-multihop (BGP and BGP4+)

Use this command to enforce the requirement that BGP and BGP4+ neighbors form multihop connections.

Use the **no** variant of this command to turn off this feature.

Syntax [BGP/BGP4+]

```
neighbor <neighborid> enforce-multihop
no neighbor <neighborid> enforce-multihop
```

Parameter	Description	
<neighborid>	{*<ip-address>*|*<ipv6-addr>*|*<peer-group>*}	
	<ip-address>	The address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
	<ipv6-addr>	The address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
	<peer-group>	Name of an existing peer-group. For information on how to create peer groups, refer to the **neighbor peer-group (add a neighbor) (BGP and BGP+)** command on page 45.145, and **neighbor route-map (BGP and BGP4+)** command on page 45.160. When this parameter is used with this command, the command applies on all peers in the specified group.

Mode [BGP] Router Configuration or IPv4 Address Family Configuration for a VRF instance

Mode [BGP4+] Router Configuration

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.34 remote-as 10
awplus(config-router)# neighbor 10.10.0.34 enforce-multihop

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.34 enforce-multihop
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.34 remote-as 10
awplus(config-router)# neighbor 10.10.10.34 peer-group group1
awplus(config-router)# neighbor group1 enforce-multihop
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 enforce-multihop
```

Examples [BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as
10
awplus(config-router)# neighbor 2001:0db8:010d::1
enforce-multihop
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1
enforce-multihop
```

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as
10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 peer-group
group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 enforce-multihop
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 enforce-multihop
```

Related Commands **neighbor peer-group (add a neighbor) (BGP and BGP+)**
neighbor route-map (BGP and BGP4+)

neighbor filter-list (BGP and BGP4+)

This command creates a BGP or BGP4+ filter using an AS (Autonomous System) path list. This command specifies an AS path list, which it then applies to filter updates to and from a BGP or a BGP4+ neighbor

The **no** variant of this command removes the previously specified BGP or BGP4+ filter using access control lists.

Syntax [BGP/BGP4+]

```
neighbor <neighborid> filter-list <listname> {in|out}
no neighbor <neighborid> filter-list <listname> {in|out}
```

Parameter	Description	
<neighborid>	Specify the identification method for the BGP or BGP4+ peer. Use one of the following formats:	
	<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
	<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
	<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the **neighbor peer-group (add a neighbor) (BGP and BGP+)** command on page 45.145, and **neighbor route-map (BGP and BGP4+)** command on page 45.160. When this parameter is used with this command, the command applies on all peers in the specified group.
<listname>	Specify the name of an AS (Autonomous System) path list.	
in	Indicates that incoming advertised routes will be filtered.	
out	Indicates that outgoing advertised routes will be filtered.	

Mode [BGP] Router Configuration or IPv4 Address Family Configuration for a VRF instance

Mode [BGP4+] IPv6 Address Family Configuration

Usage [BGP/BGP4+] This command specifies a filter for updates based on a BGP AS (Autonomous System) path list.

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.34 filter-list list1
out
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.34 filter-list list1
out
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.0.34 filter-list list1
out
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.0.34 filter-list
list1 out
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.34 remote-as 10
awplus(config-router)# neighbor 10.10.10.34 peer-group group1
awplus(config-router)# neighbor group1 filter-list list1 out
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 filter-list list1 out
```

Examples [BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
filter-list list1 out
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
filter-list list1 out
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as
10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 filter-list list1 out
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 filter-list list1
out
```

Related Commands **neighbor peer-group (add a neighbor) (BGP and BGP+)**
neighbor route-map (BGP and BGP4+)

neighbor interface (BGP and BGP4+)

Use this command to configure the interface name of a BGP4+ speaking neighbor.

Use the **no** variant of this command to disable this function.

Syntax [BGP4+]

```
neighbor {<ipv6-addr>|<ipaddress>} interface <interface>
no neighbor {<ipv6-addr>|<ipaddress>} interface <interface>
```

Parameter	Description
<ipaddress>	Specifies the IPv4 address of the BGP neighbor - entered in dotted decimal notation in the format A.B.C.D.
<ipv6-addr>	Specifies the IPv6 address of the BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<interface>	Specifies the interface name of BGP neighbor, e.g. `vlan2`.

Mode [BGP4+] Router Configuration

Usage [BGP4+] This command is for use with BGP4+ peering. Use this command for BGP peering with IPv6 link local addresses.

Examples [BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 interface vlan2

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72 interface vlan2

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 interface
vlan2

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1
interface vlan2
```

neighbor local-as (BGP and BGP4+)

Use this command to configure a local AS number for the specified BGP or BGP4+ neighbor. This overrides the local AS number specified by the **router bgp (BGP and BGP4+)** command on page 45.201.

Use the **no** variant of this command to remove the local AS number for the specified BGP or BGP4+ neighbor.

Syntax [BGP/BGP4+]

```
neighbor <neighborid> local-as <as-number>
no neighbor <neighborid> local-as <as-number>
```

Parameter	Description	
<neighborid>	{*<ip-address>*|*<ipv6-addr>*|*<peer-group>*}	
	<ip-address>	The address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
	<ipv6-addr>	The address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
	<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the **neighbor peer-group (add a neighbor) (BGP and BGP+)** and **neighbor route-map (BGP and BGP4+)** commands. When this parameter is used with this command, the command applies on all peers in the specified group.
<as-number>	*<1-4294967295>* Neighbor's Autonomous System (AS) number.	

Mode [BGP] Router Configuration or IPv4 Address Family Configuration for a VRF instance

Mode [BGP4+] Router Configuration

When VRF-Lite is configured, this command allows internal BGP loopback connections between named VRFs and the default global routing instance to be configured to act as eBGP connections, instead of only iBGP.

Usage [BGP4+]

When BGP4+ is configured, this command prepends the ASN as defined by the **router bgp (BGP and BGP4+)** command, and adds the ASN as defined by the **neighbor local-as (BGP and BGP4+)** command in front of the actual ASN as defined by the **router bgp (BGP and BGP4+)** command. This makes the peer believe it is peering with the ASN as defined by the **neighbor local-as (BGP and BGP4+)** command.

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.34 local-as 1

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.34 local-as 1

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.34 remote-as 10
awplus(config-router)# neighbor 10.10.10.34 peer-group group1
awplus(config-router)# neighbor group1 local-as 1

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 local-as 1
```

Examples [BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 local-as 1

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1 local-as 1
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 peer-group
group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 local-as 1
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 local-as 1
```

Related Commands

neighbor peer-group (add a neighbor) (BGP and BGP4+)
neighbor route-map (BGP and BGP4+)
router bgp (BGP and BGP4+)

neighbor maximum-prefix (BGP and BGP4+)

Use this command to control the number of prefixes that can be received from a BGP or a BGP4+ neighbor.

Use the **no** variant of this command to disable this function. Do not specify threshold to apply the default threshold of 75% for the maximum number of prefixes before this is applied.

Syntax [BGP/BGP4+]

```
neighbor <neighborid> maximum-prefix <maximum>
no neighbor <neighborid> maximum-prefix [<maximum>]
```

Parameter	Description	
<neighborid>	{*<ip-address>*|*<ipv6-addr>*|*<peer-group>*}	
	<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
	<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
	<peer-group>	Name of an existing peer-group. For information on how to create peer groups, refer to the **neighbor peer-group (add a neighbor) (BGP and BGP+)** command on page 45.145, and **neighbor route-map (BGP and BGP4+)** command on page 45.160. When this parameter is used with this command, the command applies on all peers in the specified group.

Parameter	Description
<maximum>	*<maxprefix>* [*<threshold>*] [warning-only]
<maxprefix>	*<1-4294967295>* Specifies the maximum number of prefixes permitted.
<threshold>	*<1-100>* Specifies the threshold value, 1 to 100 percent. 75% by default.
warning-only	Only gives a warning message when the limit is exceeded.

Default [BGP/BGP4+] The default threshold value is 75%. If the threshold value is not specified this default is applied.

Mode [BGP] Router Configuration or IPv4 Address Family Configuration for a VRF instance

Mode [BGP4+] IPv6 Address Family Configuration

Usage [BGP/BGP4+] The **neighbor maximum-prefix** command allows the configuration of a specified number of prefixes that a BGP or a BGP4+ router is allowed to receive from a neighbor. When the `warning-only` option is not used, if any extra prefixes are received, the router ends the peering. A terminated peer, stays down until the **clear ip bgp** command is used.

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 maximum-prefix 1244
warning-only

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72 maximum-prefix
1244 warning-only

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.72 remote-as 10
awplus(config-router)# neighbor 10.10.10.72 peer-group group1
awplus(config-router)# neighbor group1 maximum-prefix 1244
warning-only

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 maximum-prefix 1244
warning-only
```

Examples [BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
maximum-prefix 1244 warning-only

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
maximum-prefix 1244 warning-only

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 maximum-prefix 1244
warning-only

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 maximum-prefix
1244 warning-only
```

Related Commands **neighbor peer-group (add a neighbor) (BGP and BGP+)**
neighbor route-map (BGP and BGP4+)

neighbor next-hop-self (BGP and BGP4+)

Use this command to configure the BGP or BGP4+ router as the next hop for a BGP or BGP4+ speaking neighbor or peer group.

Use the **no** variant of this command to disable this feature.

Syntax [BGP/BGP4+]

```
neighbor <neighborid> next-hop-self
no neighbor <neighborid> next-hop-self
```

Parameter	Description	
<neighborid>	{*<ip-address>*|*<ipv6-addr>*|*<peer-group>*}	
	<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
	<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
	<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the **neighbor peer-group (add a neighbor) (BGP and BGP+)** command on page 45.145, and **neighbor route-map (BGP and BGP4+)** command on page 45.160. When this parameter is used with this command, the command applies on all peers in the specified group.

Mode [BGP] Router Configuration or IPv4 Address Family Configuration for a VRF instance

Mode [BGP4+] IPv6 Address Family Configuration

Usage [BGP/BGP4+] This command allows a BGP or BGP4+ router to change the nexthop information that is sent to the iBGP peer. The nexthop information is set to the IP address of the interface used to communicate with the neighbor.

This command can be run for a specific VRF instance.

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 next-hop-self

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72 next-hop-self
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router)# neighbor 10.10.0.72 next-hop-self

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router)# no neighbor 10.10.0.72 next-hop-self

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.72 remote-as 10
awplus(config-router)# neighbor 10.10.10.72 peer-group group1
awplus(config-router)# neighbor group1 next-hop-self

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 next-hop-self
```

Examples [BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
                          next-hop-self

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
                          next-hop-self
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as
10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 peer-group
group1
awplus(config-router-af)# neighbor group1 next-hop-self
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 next-hop-self
```

Related Commands **neighbor peer-group (add a neighbor) (BGP and BGP+)**
neighbor route-map (BGP and BGP4+)

neighbor override-capability (BGP and BGP4+)

Use this command to override a capability negotiation result for BGP and BGP4+.

Use the **no** variant of with this command to disable this function.

Syntax [BGP/BGP4+]

```
neighbor <neighborid> override-capability
no neighbor <neighborid> override-capability
```

Parameter	Description	
<neighborid>	{*<ip-address>*|*<ipv6-addr>*|*<peer-group>*}	
	<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
	<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
	<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the **neighbor peer-group (add a neighbor) (BGP and BGP+)** command on page 45.145, and **neighbor route-map (BGP and BGP4+)** command on page 45.160. When this parameter is used with this command, the command applies on all peers in the specified group.

Mode [BGP/BGP4+] Router Configuration

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 override-capability
```

```

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# neighbor 2001:0db8:010d::1
override-capability
```

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# no neighbor 2001:0db8:010d::1
override-capability
```

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as
10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 override-capability
```

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# no neighbor group1 override-capability
```

Related Commands

neighbor peer-group (add a neighbor) (BGP and BGP+)
neighbor route-map (BGP and BGP4+)

neighbor passive (BGP and BGP4+)

Use this command to configure the local BGP or BGP4+ router to be passive with regard to the specified BGP or BGP4+ neighbor. This has the effect that the BGP or BGP4+ router will not attempt to initiate connections to this BGP or BGP4+ neighbor, but will accept incoming connection attempts from the BGP or BGP4+ neighbor.

Use the **no** variant of this command to disable this function.

Syntax [BGP/BGP4+]

```
neighbor <neighborid> passive
no neighbor <neighborid> passive
```

Parameter	Description	
<neighborid>	{*<ip-address>*|*<ipv6-addr>*|*<peer-group>*}	
	<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
	<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
	<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the **neighbor peer-group (add a neighbor) (BGP and BGP+)** command on page 45.145, and **neighbor route-map (BGP and BGP4+)** command on page 45.160. When this parameter is used with this command, the command applies on all peers in the specified group.

Mode [BGP] Router Configuration or IPv4 Address Family Configuration for a VRF instance

Mode [BGP4+] Router Configuration

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 passive

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72 passive
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.72 remote-as 10
awplus(config-router)# neighbor 10.10.10.72 peer-group group1
awplus(config-router)# neighbor group1 passive

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 passive
```

Examples [BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 passive

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1 passive

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as
10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 peer-group
group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 passive

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 passive
```

Related Commands **neighbor peer-group (add a neighbor) (BGP and BGP+)**
neighbor route-map (BGP and BGP4+)

neighbor password (BGP and BGP4+)

Use this command to enable MD5 authentication on a TCP connection between BGP and BGP4+ neighbors. No authentication is applied by default. To setup authentication for the session, you must first apply authentication on each connected peer for the session.

Use the **no** variant of this command to disable this function.

Syntax [BGP]

```
neighbor {<ip-address>|<peer-group-name>} password <password>
no neighbor {<ip-address>|<peer-group-name>} password [<password>]
```

Syntax [BGP4+]

```
neighbor {<ipv6-addr>|<peer-group-name>} password <password>
no neighbor {<ipv6-addr>|<peer-group-name>} password [<password>]
```

Parameter	Description
<ip-address>	Specifies the IP address of the BGP neighbor, in A.B.C.D format.
<ipv6-addr>	Specifies the IPv6 address of the BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group-name>	Name of an existing peer-group. When this parameter is used with this command, the command applies on all peers in the specified group.
<password>	An alphanumeric string of characters to be used as password.

Default No authentication is applied by default.

Mode [BGP] Router Configuration or IPv4 Address Family Configuration for a VRF instance

Mode [BGP4+] Router Configuration

Usage [BGP/BGP4+] When using the *<peer-group-name>* parameter with this command (to apply this command to all peers in the group), see the related commands **neighbor peer-group (add a neighbor) (BGP and BGP+)** and **neighbor route-map (BGP and BGP4+)** for information about how to create peer groups first.

Examples [BGP] This example specifies the encryption type and the password (`manager`) for the neighbor `10.10.10.1`:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 password manager
```

This example removes the password set for the neighbor `10.10.10.1`:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 password
```

This example specifies the encryption type and the password (`manager`) for the neighbor peer group named `group1`:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 password manager
```

This example removes the password set for the neighbor peer group named `group1`:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 password
```

Example (VRF Lite) This example specifies the password (`manager`) for the neighbor peer group named `group1` for an IPv4 address-family, VRF name `red`, and `router bgp 10`:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4 vrf red
awplus(config-router-af)# neighbor 10.10.10.1 password manager
```

Example (VRF Lite) This example removes the password (`manager`) for the neighbor peer group named `group1` for an IPv4 address-family, VRF name `red`, and `router bgp 10`:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4 vrf red
awplus(config-router-af)# no neighbor 10.10.10.1 password
manager
```

This example specifies the password (`manager`) for the neighbor peer group named `group1` for an IPv4 address-family, VRF name `red`, and `router bgp 10`:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group
group1
awplus(config-router)# address-family ipv4 vrf red
awplus(config-router-af)# neighbor group1 password manager
```

Examples [BGP4+] This example specifies the encryption type and the password (`manager`) for the neighbor `2001:0db8:010d::1`:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 password
manager
```

This example removes the password set for the neighbor `2001:0db8:010d::1`:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1 password
```

This example specifies the encryption type and the password (`manager`) for the neighbor peer group named `group1`:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as
10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 peer-group
group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 password manager
```

This example removes the password set for the neighbor peer group named `group1`:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 password
```

Related Commands **neighbor peer-group (add a neighbor) (BGP and BGP+)**
neighbor route-map (BGP and BGP4+)

neighbor peer-group (add a neighbor) (BGP and BGP+)

Use this command to add a BGP or a BGP4+ neighbor to an existing peer-group.

Use the **no** variant of this command to disable this function.

Syntax [BGP]

```
neighbor <ip-address> peer-group <peer-group>
no neighbor <ip-address> peer-group <peer-group>
```

Syntax [BGP4+]

```
neighbor <ipv6-addr> peer-group <peer-group>
no neighbor <ipv6-addr> peer-group <peer-group>
```

Parameter	Description
<ip-address>	Specify the IPv4 address of the BGP neighbor, entered in the format A.B.C.D.
<ipv6-addr>	Specify the IPv6 address of the BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group>	Enter the name of the peer-group. When this parameter is used with this command, the command applies on all peers in the specified group.

Mode [BGP] Router Configuration or IPv4 Address Family Configuration for a VRF instance

Mode [BGP4+] IPv6 Address Family Configuration

Usage [BGP/BGP4+] Use this command to add neighbors with the same update policies to a peer group. This facilitates the updates of various policies, such as, distribute and filter lists. The peer-group is then configured easily with many of the neighbor commands. Any changes made to the peer group affect all members.

To create a peer-group use the **neighbor port (BGP and BGP4+)** command on page 45.148 and then use this command to add neighbors to the group.

Examples [BGP] This example shows a new peer-group `group1` and the addition of a neighbor `10.10.0.63` to the group.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.0.63 peer-group group1
```

This example shows a new peer-group `group1` and the removal of a neighbor `10.10.0.63` to the group.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# no neighbor 10.10.0.63 peer-group group1
```

Examples [BGP4+] This example shows a new peer-group `group1` and the addition of a neighbor `2001:0db8:010d::1` to the group.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
```

This example shows a new peer-group `group1` and the removal of a neighbor `2001:0db8:010d::1` to the group.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
peer-group group1
```

Related Commands **neighbor peer-group (create a peer-group) (BGP and BGP4+)**
neighbor port (BGP and BGP4+)

neighbor peer-group (create a peer-group) (BGP and BGP4+)

Use this command to create a peer-group for BGP and BGP4+.

Use the **no** variant of this command to disable this function.

Syntax [BGP/BGP4+]

```
neighbor <peer-group> peer-group
no neighbor <peer-group> peer-group
```

Parameter	Description
<peer-group>	Enter the name of the peer-group.

Mode [BGP] Router Configuration or IPv4 Address Family Configuration for a VRF instance

Mode [BGP4+] Router Configuration

Usage [BGP/BGP4+] Neighbors with the same update policies are grouped into peer groups. This facilitates the updates of various policies, such as, distribute and filter lists.

The peer-group is then configured easily with many of the neighbor commands. Any changes made to the peer group affect all members.

Use this command to create a peer-group, then use the **neighbor peer-group (add a neighbor) (BGP and BGP+)** command on page 45.145 to add neighbors to the group.

Examples [BGP/BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 peer-group
```

Related Commands **neighbor peer-group (add a neighbor) (BGP and BGP+)**

neighbor port (BGP and BGP4+)

Use this command to specify the TCP port to which packets are sent to on a BGP or a BGP4+ neighbor. TCP port 179 is the default port used to connect BGP and BGP4+ peers. You can specify a different destination port for the TCP session with this command.

Use the **no** variant of this command to reset the port number back to the default value (TCP port 179).

Syntax [BGP]

```
neighbor <neighborid> port <portnum>
no neighbor <neighborid> port [<portnum>]
```

Parameter	Description	
<neighborid>	{*<ip-address>*|*ipv6-addr>*|*<peer-group>*}	
	<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
	<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
	<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the **neighbor peer-group (add a neighbor) (BGP and BGP+)** command on page 45.145, and **neighbor route-map (BGP and BGP4+)** command on page 45.160. When this parameter is used with this command, the command applies on all peers in the specified group.
<portnum>	*<0-65535>* Specifies the TCP port number.	

Default TCP port 179 is the default port used to connect BGP and BGP4+ peers.

Mode [BGP] Router Configuration or IPv4 Address Family Configuration for a VRF instance

Mode [BGP4+] Router Configuration

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# neighbor 10.10.10.10 port 643

awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# no neighbor 10.10.10.10 port 643
```

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 port 643

awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# no neighbor group1 port 643
```

Examples [BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# neighbor 2001:0db8:010d::1 port 643

awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# no neighbor 2001:0db8:010d::1 port 643

awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as
10
awplus(awplus-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 peer-group
group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 port 643

awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# no neighbor group1 port 643
```

Related Commands **neighbor peer-group (add a neighbor) (BGP and BGP+)**
neighbor route-map (BGP and BGP4+)

neighbor prefix-list (BGP and BGP4+)

Use this command to distribute BGP and BGP4+ neighbor information as specified in a prefix list.

Use the **no** variant of this command to remove an entry.

Syntax [BGP/BGP4+]

```
neighbor <neighborid> prefix-list <listname> {in|out}
no neighbor <neighborid> prefix-list <listname> {in|out}
```

Parameter	Description	
<neighborid>	{*<ip-address>*|*<ipv6-addr>*|*<peer-group>*}	
	<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
	<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
	<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the **neighbor peer-group (add a neighbor) (BGP and BGP+)** command on page 45.145, and **neighbor route-map (BGP and BGP4+)** command on page 45.160. When this parameter is used with this command, the command applies on all peers in the specified group.
<listname>	The name of an IP prefix list.	
in	Specifies that the IP prefix list applies to incoming advertisements.	
out	Specifies that the IP prefix list applies to outgoing advertisements.	

Mode [BGP] Router Configuration or IPv4 Address Family Configuration for a VRF instance

Mode [BGP4+] IPv6 Address Family Configuration

Usage [BGP/BGP4+] Use this command to specify a prefix list for filtering BGP or BGP4+ advertisements. Filtering by prefix list matches the prefixes of routes with those listed in the prefix list. If there is a match, the route is used. An empty prefix list permits all prefixes. If a given prefix does not match any entries of a prefix list, the route is denied access.

The router begins the search at the top of the prefix list, with the sequence number 1. Once a match or deny occurs, the router does not need to go through the rest of the prefix list. For efficiency the most common matches or denies are listed at the top.

The **neighbor distribute-list** command is an alternative to the **neighbor prefix-list** command and only one of them can be used for filtering to the same neighbor in any direction.

Examples [BGP]

```
awplus# configure terminal
awplus(config)# ip prefix-list list1 deny 30.0.0.0/24
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 prefix-list list1 in

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 prefix-list list1
in

awplus# configure terminal
awplus(config)# ip prefix-list list1 deny 30.0.0.0/24
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.10.1 prefix-list list1
in

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.10.1 prefix-list
list1 in

awplus# configure terminal
awplus(config)# ip prefix-list list1 deny 30.0.0.0/24
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 prefix-list list1 in

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 prefix-list list1 in
```

Examples [BGP4+]

```
awplus# configure terminal
awplus(config)# ipv6 prefix-list list1 deny
2001:0db8:010d::1/128
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:: prefix-list
list1 in

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:: prefix-list
list1 in

awplus# configure terminal
awplus(config)# ip prefix-list list1 deny
2001:0db8:010d::1/128
awplus(config)# router bgp 10

awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as
10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 peer-group
group1
awplus(config-router-af)# neighbor group1 prefix-list list1 in

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 prefix-list list1
in
```

Related Commands

ip prefix-list (IPv4 Prefix List)
neighbor peer-group (add a neighbor) (BGP and BGP+)
neighbor route-map (BGP and BGP4+)

neighbor remote-as (BGP and BGP4+)

Use this command to configure an internal or external BGP or BGP4+ (iBGP or eBGP) peering relationship with another router.

Use the **no** variant of this command to remove a previously configured BGP or BGP4+ peering relationship.

Syntax [BGP/BGP4+]

```
neighbor <neighborid> remote-as <as-number>
no neighbor <neighborid> remote-as <as-number>
```

Syntax (VRF Lite)

```
neighbor <neighborid> remote-as <as-number> [global|vrf <vrf-name>]
no neighbor <neighborid> remote-as <as-number>
```

Parameter	Description	
<neighborid>	{*<ip-address>*|*ipv6-addr>*|*<peer-group>*}	
	<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
	<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
	<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the **neighbor peer-group (add a neighbor) (BGP and BGP+)** command on page 45.145, and **neighbor route-map (BGP and BGP4+)** command on page 45.160. When this parameter is used with this command, the command applies on all peers in the specified group.
<as-number>	*<1-4294967295>* Neighbor's Autonomous System (AS) number.	
global	Specify that the remote neighbor exists locally within the device, in the global routing domain	
vrf	Specify that the remote neighbor exists locally within the device, in the specified VRF instance.	
<vrf-name>	The name of the VRF instance.	

Mode [BGP] Router Configuration or IPv4 Address Family Configuration for a VRF instance

Mode [BGP4+] Router Configuration

Usage [BGP/BGP4+]

This command is used to configure iBGP and eBGP peering relationships with other BGP or BGP4+ neighbors. A peer-group support of this command is configured only after creating a specific peer-group. Use the **no** variant of this command to remove a previously configured BGP peering relationship.

The **vrf** and **global** parameters are used to create internal 'loopback' BGP connections within the device between two VRF instances. This is used to leak BGP routes between a named VRF instance and the global routing instance. This requires BGP neighbors to be configured in both the global routing instance and in the named VRF instance.

Examples [BGP]

To configure a BGP peering relationship from the neighbor with the IPv4 address `10.10.0.73` with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.73 remote-as 10
```

To remove a configured BGP peering relationship from the neighbor with the IPv4 address `10.10.0.73` from another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.73 remote-as 10
```

To configure a BGP peering relationship from the neighbor with the peer group named `group1` with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 remote-as 10
```

To remove a configured BGP peering relationship from the neighbor with the peer group named `group1` with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 remote-as 10
```

Examples [BGP4+] To configure a BGP4+ peering relationship with another router:

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-
as 345
```

To remove a configured BGP4+ peering relationship from another router:

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# no neighbor 2001:0db8:010d::1
remote-as 345
```

To configure a BGP4+ peering relationship from the neighbor with the peer group named `group1` with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as
10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 peer-group
group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 remote-as 10
```

To remove a configured BGP4+ peering relationship from the neighbor with the peer group named `group1` with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 remote-as 10
```

neighbor remove-private-AS (BGP)

Use this command to remove the private Autonomous System (AS) number from external outbound updates. Use the **no** variant of this command to revert to the default (disabled).

Syntax

```
neighbor <neighborid> remove-private-AS
no neighbor <neighborid> remove-private-AS
```

Parameter	Description	
<neighborid>	{*<ip-address>*|*<tag>*}	
	<ip-address>	The address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
	<tag>	Name of an existing peer-group. For information on how to create peer groups, refer to the **neighbor peer-group (add a neighbor) (BGP and BGP+)** command on page 45.145, and **neighbor remote-as (BGP and BGP4+)** command on page 45.153. When this parameter is used with a command, the command applies on all peers in the specified group.

Default This command is disabled by default.

Mode BGP Router Configuration or BGP Router Address Family Configuration for a VRF instance

Usage The private AS numbers range from <64512-65535>. Private AS numbers are not advertised to the Internet. This command is used with external BGP peers only. The router removes the AS numbers only if the update includes private AS numbers. If the update includes both private and public AS numbers, the system treats it as an error.

This command removes private AS numbers for BGP in Router Configuration mode. This command is not supported for BGP4+ in IPv6 Address Family Configuration mode. This command removes a private AS number and makes an update packet with a public AS number as the AS path attribute. So only public AS numbers are entered in Internet BGP routing tables, and private AS numbers are not entered in Internet BGP tables.

For the filtering to apply, both peering devices must be set to use either 2-byte or extended 4- byte ASN (with the same ASN type set on both peers). For example, if a device (which defaults to use a 4-byte ASN), is peered with a device that defaults to a 2-byte ASN, then the device using a 2-byte ASN device also needs to be configured with the command **bgp extended-asn-cap** for the filtering to apply.

See the **How to remove private AS numbers for BGP** section in the **BGP and BGP4+ Introduction** chapter for further information about removing private AS numbers.

Examples

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.63 remove-private-AS
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.63 remove-private-AS
```

Related Commands **show ip bgp (BGP)**

neighbor restart-time (BGP and BGP4+)

Use this command to set a different restart-time other than the global restart-time configured using the **bgp graceful-restart** command for BGP and BGP4+.

Use the **no** variant of this command to restore the device to its default state (see the default value of the **bgp graceful-restart** command).

Syntax [BGP/BGP4+]

```
neighbor <neighborid> restart-time <delay-value>
no neighbor <neighborid> restart-time <delay-value>
```

Parameter	Description	
<neighborid>	{*<ip-address>*|*<ipv6-addr>*|*<peer-group>*}	
	<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
	<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
	<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the **neighbor peer-group (add a neighbor) (BGP and BGP+)** command on page 45.145, and **neighbor route-map (BGP and BGP4+)** command on page 45.160. When this parameter is used with this command, the command applies on all peers in the specified group.
<delay-value>	*<1-3600>*	Delay value in seconds.

Mode [BGP] Router Configuration or IPv4 Address Family Configuration for a VRF instance

Mode [BGP4+] Router Configuration

Usage [BGP/BGP4+] This command takes precedence over the restart-time value specified using the **bgp graceful-restart** command.

The restart-time value is the maximum time that a graceful-restart neighbor waits to come back up after a restart. The default is 120 seconds.

Make sure that the restart time specified using this command does not exceed the stalepath-time specified in the Router Configuration mode.

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 restart-time 45

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 restart-time 45

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 restart-time 45

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 restart-time 45
```

Examples [BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1
restart-time 45
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1
restart-time 45
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as
10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 peer-group
group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 restart-time 45
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 restart-time 45
```

Related Commands

bgp graceful-restart (BGP and BGP4+)
neighbor peer-group (add a neighbor) (BGP and BGP+)
neighbor route-map (BGP and BGP4+)

neighbor route-map (BGP and BGP4+)

Use this command to apply a route map to incoming or outgoing routes for BGP or BGP4+.

Use the **no** variant of this command to remove a route map from a BGP or BGP4+ route.

Syntax [BGP/BGP4+]

```
neighbor <neighborid> route-map <mapname> {in|out}
no neighbor <neighborid> route-map <mapname> {in|out}
```

Parameter	Description	
<neighborid>	{*<ip-address>*|*ipv6-addr>*|*<peer-group>*}	
	<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
	<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
	<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the **neighbor peer-group (add a neighbor) (BGP and BGP+)** command on page 45.145, and **neighbor route-map (BGP and BGP4+)** command on page 45.160. When this parameter is used with this command, the command applies on all peers in the specified group.
<mapname>	Specifies name of the route-map.	
in	Specifies that the access list applies to incoming advertisements.	
out	Specifies that the access list applies to outgoing advertisements.	

Mode [BGP] Router Configuration or IPv4 Address Family Configuration for a VRF instance

Mode [BGP4+] IPv6 Address Family Configuration

Usage [BGP/BGP4+] Use the **neighbor route-map** command to filter updates and modify attributes. A route map is applied to inbound or outbound updates. Only the routes that pass the route map are sent or accepted in updates.

Examples [BGP] The following example shows the configuration of the route-map name **rmap2** and then the use of this map name in the **neighbor route-map** command for the neighbor with the IPv4 address `10.10.10.1` in the Router Configuration mode.

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 6
awplus(config-route-map)# match origin incomplete
awplus(config-route-map)# set metric 100
awplus(config-route-map)# exit
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 route-map rmap2
in
```

The following example shows the removal of the route-map name **rmap2** in the **neighbor route-map** command for the neighbor with the IPv4 address `10.10.10.1` in the Router Configuration mode.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 route-map
rmap2 in
```

The following example shows the configuration of the route-map name **rmap2** and then the use of this map name in the **neighbor route-map** command for the neighbor with the IPv4 address `10.10.10.1` in the IPv4 Address Family Configuration mode.

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 6
awplus(config-route-map)# match origin incomplete
awplus(config-route-map)# set metric 100
awplus(config-route-map)# exit
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.10.1 route-map rmap2
in
```

The following example shows the removal of the route-map name **rmap2** in the **neighbor route-map** command for the neighbor with the IPv4 address `10.10.10.1` in the IPv4 Address Family Configuration mode.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.10.1 route-map
rmap2 in
```

The following example shows the configuration of the route-map name **rmap2** and then the use of this map name in the **neighbor route-map** command for the neighbor with the peer group named `group1` in the Router Configuration mode.

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 6
awplus(config-route-map)# match origin incomplete
awplus(config-route-map)# set metric 100
awplus(config-route-map)# exit
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 route-map rmap2 in
```

The following example shows the removal the route-map name **rmap2** in the **neighbor route-map** command for the neighbor with the peer group named `group1` in the Router Configuration mode.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 route-map rmap2 in
```

Examples [BGP4+] The following example shows the configuration of the route-map name **rmap2** and then the use of this map name in the **neighbor route-map** command for the neighbor with the IPv6 address `2001:0db8:010d::1` in the IPv6 Address Family Configuration mode.

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 6
awplus(config-route-map)# match origin incomplete
awplus(config-route-map)# set metric 100
awplus(config-route-map)# exit
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 route-map
rmap2 in
```

The following example shows the removal of the route-map name **rmap2** in the **neighbor route-map** command for the neighbor with the IPv6 address `2001:0db8:010d::1` in the IPv6 Address Family Configuration mode.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1 route-
map rmap2 in
```

The following example shows the configuration of the route-map name **rmap2** and then the use of this map name in the **neighbor route-map** command for the neighbor with the peer group named `group1` in the Router Configuration mode.

```
                awplus# configure terminal
          awplus(config)# route-map rmap2 permit 6
awplus(config-route-map)# match origin incomplete
awplus(config-route-map)# set metric 100
awplus(config-route-map)# exit
          awplus(config)# router bgp 10
   awplus(config-router)# neighbor group1 peer-group
   awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as
                         10
   awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 peer-group
                         group1
awplus(config-router-af)# neighbor group1 route-map rmap2 in
```

The following example shows the removal the route-map name **rmap2** in the **neighbor route-map** command for the neighbor with the peer group named `group1` in the Router Configuration mode.

```
                awplus# configure terminal
          awplus(config)# router bgp 10
   awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 route-map rmap2 in
```

Related Commands

address-family (BGP and BGP4+)
neighbor peer-group (add a neighbor) (BGP and BGP+)
route-map (Route Map)

neighbor route-reflector-client (BGP)

Use this command to configure the router as a BGP route reflector and configure the specified neighbor as its client.

Use the **no** variant of this command to indicate that the neighbor is not a client.

Syntax

```
neighbor <neighborid> route-reflector-client
no neighbor <neighborid> route-reflector-client
```

Parameter	Description	
<neighborid>	{*<ip-address>*|*<peer-group>*}	
	<ip-address>	The address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
	<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the **neighbor peer-group (add a neighbor) (BGP and BGP+)** command on page 45.145, and **neighbor route-map (BGP and BGP4+)** command on page 45.160. When this parameter is used with this command, the command applies on all peers in the specified group.

Mode Router Configuration or IPv4 Address Family Configuration for a VRF instance

Usage Route reflectors are a solution for the explosion of iBGP peering within an autonomous system. By route reflection the number of iBGP peers within an AS is reduced. Use the **neighbor route-reflector-client** command to configure the local router as the route reflector and specify neighbors as its client.

An AS can have more than one route reflector. One route reflector treats the other route reflector as another iBGP speaker.

In the following configuration, Router1 is the route reflector for clients `3.3.3.3` and `2.2.2.2`; it also has a non-client peer `6.6.6.6`:

```
Router1#
router bgp 200
neighbor 3.3.3.3 remote-as 200
neighbor 3.3.3.3 route-reflector-client
neighbor 2.2.2.2 remote-as 200
neighbor 2.2.2.2 route-reflector-client
neighbor 6.6.6.6 remote-as 200
```

Examples

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72
                       route-reflector-client
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72
route-reflector-client
```

neighbor route-server-client (BGP)

Use this command to specify the peer as route server client.

Use the **no** variant of this command to disable this function.

Syntax

```
neighbor <neighborid> route-server-client
no neighbor <neighborid> route-server-client
```

Parameter	Description	
<neighborid>	{*<ip-address>*|*<peer-group>*}	
	<ip-address>	The address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
	<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the **neighbor peer-group (add a neighbor) (BGP and BGP+)** command on page 45.145, and **neighbor route-map (BGP and BGP4+)** command on page 45.160. When this parameter is used with this command, the command applies on all peers in the specified group.

Mode Router Configuration

Examples

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 route-server-client
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72
route-server-client
```

neighbor send-community (BGP and BGP4+)

Use this command to specify that a community attribute should be sent to a BGP or BGP4+ neighbor.

Use the **no** variant of this command to remove the entry for the community attribute.

Syntax [BGP/BGP4+]

```
neighbor <neighborid> send-community {both|extended|standard}
no neighbor <neighborid> send-community {both|extended|standard}
```

Parameter	Description	
<neighborid>	{*<ip-address>*|*<ipv6-addr>*|*<peer-group>*}	
	<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
	<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
	<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the **neighbor peer-group (add a neighbor) (BGP and BGP+)** command on page 45.145, and **neighbor route-map (BGP and BGP4+)** command on page 45.160. When this parameter is used with this command, the command applies on all peers in the specified group.
`both`	Sends Standard and Extended Community attributes. Specifying this parameter with the **no** variant of this command results in no `standard` or `extended` community attributes being sent.	
`extended`	Sends Extended Community attributes. Specifying this parameter with the **no** variant of this command results in no `extended` community attributes being sent.	
`standard`	Sends Standard Community attributes. Specifying this parameter with the **no** variant of this command results in no `standard` community attributes being sent.	

Default [BGP/BGP4+] Both **standard** and **extended** community attributes are sent to a neighbor.

Mode [BGP] Router Configuration or IPv4 Address Family Configuration for a VRF instance

Mode [BGP4+] Router Configuration and IPv6 Address Family Configuration

Usage [BGP/BGP4+] This command is used to specify a community attribute to be sent to a neighbor. The community attribute groups destinations in a certain community and applies routing decisions according to those communities. On receiving community attributes the router reannounces them to the neighbor. Only when the **no** parameter is used with this command the community attributes are not reannounced to the neighbor.

By default, both **standard** and **extended** community attributes are sent to a neighbor.

Examples [BGP]

```
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 send-community
extended

awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72 send-community
extended

awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.0.72 send-community
extended

awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.0.72 send-community
extended

awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 send-community extended
```

Examples [BGP4+]

```
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1
send-community extended

awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1
send-community extended

awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
send-community extended

awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
send-community extended
```

```
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as
10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 peer-group
group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 send-community
extended
```

```
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 send-community
extended
```

Related Commands

bgp config-type (BGP and BGP4+)
neighbor peer-group (add a neighbor) (BGP and BGP+)
neighbor route-map (BGP and BGP4+)

neighbor shutdown (BGP and BGP4+)

Use this command to disable a peering relationship with a BGP or BGP4+ neighbor.

Use the **no** variant of this command to re-enable the BGP or BGP4+ neighbor.

Syntax [BGP/BGP4+]

```
neighbor <neighborid> shutdown
no neighbor <neighborid> shutdown
```

Parameter	Description	
<neighborid>	{*<ip-address>*|*<peer-group>*}	
	<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
	<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
	<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the **neighbor peer-group (add a neighbor) (BGP and BGP+)** command on page 45.145, and **neighbor route-map (BGP and BGP4+)** command on page 45.160. When this parameter is used with this command, the command applies on all peers in the specified group.

Mode [BGP] Router Configuration or IPv4 Address Family Configuration for a VRF instance

Mode [BGP4+] Router Configuration

Usage [BGP/BGP4+] This command shuts down any active session for the specified BGP or BGP4+ neighbor and clears all related routing data.

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 shutdown
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72 shutdown
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 shutdown
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 shutdown
```

Examples [BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 shutdown
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1
shutdown
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 shutdown
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 shutdown
```

Related Commands **neighbor peer-group (add a neighbor) (BGP and BGP+)**
neighbor route-map (BGP and BGP4+)

neighbor soft-reconfiguration inbound (BGP and BGP4+)

Use this command to configure the switch to start storing all updates from the BGP or BGP4+ neighbor, without any consideration of any inward route filtering policy that might be applied to the connection with this BGP or BGP4+ neighbor. This is so that the full set of the neighbor's updates are available locally to be used in a soft-reconfiguration event.

You may need to apply this older method of clearing routes if the peer does not support route refresh.

Use the **no** variant of this command to disable this function for a BGP or BGP4+ neighbor.

Syntax [BGP/BGP4+]

```
neighbor <neighborid> soft-reconfiguration inbound
no neighbor <neighborid> soft-reconfiguration inbound
```

Parameter	Description	
<neighborid>	{*<ip-address>*|*<ipv6-addr>*|*<peer-group>*}	
	<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
	<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
	<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the **neighbor peer-group (add a neighbor) (BGP and BGP+)** command on page 45.145, and **neighbor route-map (BGP and BGP4+)** command on page 45.160. When this parameter is used with this command, the command applies on all peers in the specified group.

Mode [BGP] Router Configuration or IPv4 Address Family Configuration for a VRF instance

Mode [BGP4+] IPv6 Address Family Configuration

Usage [BGP/BGP4+] Use this command to store updates for inbound soft reconfiguration. Soft-reconfiguration may be used in lieu of BGP route refresh capability. Using this command enables local storage of all the received routes and their attributes. This requires additional memory. When a soft reset (inbound) is done on this neighbor, the locally stored routes are re-processed according to the inbound policy. The BGP neighbor connection is not affected.

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# neighbor 10.10.10.10
soft-reconfiguration inbound
```

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# no neighbor 10.10.10.10
soft-reconfiguration inbound
```

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.10.10
soft-reconfiguration inbound
```

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.10.10
soft-reconfiguration inbound
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 soft-reconfiguration
inbound
```

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# no neighbor group1 soft-reconfiguration
inbound
```

Examples [BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
soft-reconfiguration inbound

awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
soft-reconfiguration inbound

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as
10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 peer-group
group1
awplus(config-router-af)# neighbor group1 soft-reconfiguration
inbound

awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1
soft-reconfiguration inbound
```

Related Commands **neighbor peer-group (add a neighbor) (BGP and BGP+)**
neighbor route-map (BGP and BGP4+)

neighbor timers (BGP and BGP4+)

Use this command to set the keepalive, holdtime, and connect timers for a specific BGP or BGP4+ neighbor.

Use the **no** variant of this command to clear the timers for a specific BGP or BGP4+ neighbor.

Syntax [BGP/BGP4+]

```
neighbor <neighborid> timers
    {<keepalive> <holdtime>|connect <connect>}

no neighbor <neighborid> timers [connect]
```

Parameter	Description	
<neighborid>	*{<ip-address>|<ipv6-addr>|<peer-group>}*	
	<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
	<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
	<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the **neighbor peer-group (add a neighbor) (BGP and BGP+)** command on page 45.145, and **neighbor route-map (BGP and BGP4+)** command on page 45.160. When this parameter is used with this command, the command applies on all peers in the specified group.
<keepalive>	*<0-65535>* Frequency (in seconds) at which a router sends keepalive messages to its neighbor.	
<holdtime>	*<0-65535>* Interval (in seconds) after which, on not receiving a keepalive message, the router declares a neighbor dead.	
<connect>	`connect` *<1-65535>* Specifies the connect timer in seconds. The default connect timer value is 120 seconds as per RFC 4271. Modify this value as needed for interoperability.	

Default The keepalive timer default is 60 seconds, the holdtime timer default is 90 seconds, and the connect timer default is 120 seconds as per RFC 4271. Holdtime is keepalive * 3.

Mode [BGP] Router Configuration or IPv4 Address Family Configuration for a VRF instance

Mode [BGP4+] Router Configuration

Usage [BGP/BGP4+] Keepalive messages are sent by a router to inform another router that the BGP connection between the two is still active. The keepalive interval is the period of time between each keepalive message sent by the router. The holdtime interval is the time the router waits to receive a keepalive message and if it does not receive a message for this period it declares the neighbor dead. The holdtime value must be 3 times the value of the keepalive value.

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 timers 60 120

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 timers

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 timers 60 120

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 timers
```

Examples [BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 timers 60
120

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1 timers

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as
10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 peer-group
group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 timers 60 120

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 timers
```

neighbor transparent-as (BGP and BGP4+)

Use this command to specify not to append your AS path number even if the BGP or BGP4+ peer is an eBGP peer.

Note this command has the same effect as invoking **neighbor attribute-unchanged (BGP and BGP4+)** and specifying the optional **as-path** parameter.

Syntax [BGP/BGP4+]

```
neighbor <neighborid> transparent-as
```

Parameter	Description	
<neighborid>	{*<ip-address>*|*<ipv6-addr>*|*<peer-group>*}	
	<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
	<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
	<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the **neighbor peer-group (add a neighbor) (BGP and BGP+)** command on page 45.145, and **neighbor route-map (BGP and BGP4+)** command on page 45.160. When this parameter is used with this command, the command applies on all peers in the specified group.

Mode [BGP/BGP4+] Router Configuration

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 transparent-as

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 transparent-as
```

Examples [BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1
transparent-as
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as
10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 peer-group
group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 transparent-as
```

Related Commands

neighbor peer-group (add a neighbor) (BGP and BGP+)
neighbor route-map (BGP and BGP4+)
neighbor transparent-nexthop (BGP and BGP4+)

neighbor transparent-nexthop (BGP and BGP4+)

Use this command to keep the nexthop value of the route even if the BGP or BGP4+ peer is an eBGP peer.

Note this command has the same effect as invoking **neighbor attribute-unchanged (BGP and BGP4+)** and specifying the optional **next-hop** parameter.

Syntax [BGP/BGP4+]

```
neighbor <neighborid> transparent-nexthop
```

Parameter	Description	
<neighborid>	{*<ip-address>*|*<ipv6-addr>*|*<peer-group>*}	
	<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
	<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
	<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the **neighbor peer-group (add a neighbor) (BGP and BGP+)** command on page 45.145, and **neighbor route-map (BGP and BGP4+)** command on page 45.160. When this parameter is used with this command, the command applies on all peers in the specified group.

Mode [BGP/BGP4+] Router Configuration

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 transparent-nexthop
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 transparent-nexthop
```

Examples [BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1
transparent-nexthop
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as
10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 peer-group
group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 transparent-nexthop
```

Related Commands

neighbor attribute-unchanged (BGP and BGP4+)
neighbor peer-group (add a neighbor) (BGP and BGP+)
neighbor route-map (BGP and BGP4+)
neighbor transparent-as (BGP and BGP4+)

neighbor unsuppress-map (BGP and BGP4+)

Use this command to selectively leak more specific routes to a particular BGP or BGP4+ neighbor.

Use the **no** variant of this command to remove selectively leaked specific routes to a particular BGP or BGP4+ neighbor.

Syntax [BGP/BGP4+]

```
neighbor <neighborid> unsuppress-map <route-map-name>
no neighbor <neighborid> unsuppress-map <route-map-name>
```

Parameter	Description	
<neighborid>	{*<ip-address>*|*<ipv6-addr>*|*<peer-group>*}	
	<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
	<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
	<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the **neighbor peer-group (add a neighbor) (BGP and BGP+)** command on page 45.145, and **neighbor route-map (BGP and BGP4+)** command on page 45.160. When this parameter is used with this command, the command applies on all peers in the specified group.
<route-map-name>	The name of the route-map used to select routes to be unsuppressed.	

Mode [BGP] Router Configuration or Address-Family Configuration for IPv4 unicast or for a VRF instance

Mode [BGP4+] IPv6 Address Family Configuration

Usage [BGP/BGP4+] When the **aggregate-address (BGP and BGP4+)** command is used with the **summary-only** option, the more-specific routes of the aggregate are suppressed to all neighbors. Use this command instead to selectively leak more-specific routes to a particular neighbor.

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.73 unsuppress-map
mymap

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4 unicast
awplus(config-router-af)# neighbor 10.10.0.70 unsuppress-map
mymap

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.73 unsuppress-map
mymap

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4 unicast
awplus(config-router-af)# no neighbor 10.10.0.70 unsuppress-map
mymap

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 unsuppress-map mymap

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 unsuppress-map
mymap
```

Examples [BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6 unicast
awplus(config-router-af)# neighbor 2001:0db8:010d::1
unsuppress-map mymap
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6 unicast
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
unsuppress-map mymap
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as
10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 peer-group
group1
awplus(config-router-af)# neighbor group1 unsuppress-map mymap
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 unsuppress-map
mymap
```

Related Commands

aggregate-address (BGP and BGP4+)
neighbor peer-group (add a neighbor) (BGP and BGP+)
neighbor route-map (BGP and BGP4+)

neighbor update-source (BGP and BGP4+)

Use this command to specify the source IPv4 or IPv6 address of BGP or BGP4+ packets, which are sent to the neighbor for routing updates, as the IPv4 or IPv6 address configured on the specified interface. The specified interface is usually the local loopback (`lo`) interface to allow internal BGP or BGP4+ connections to stay up regardless of which interface is used to reach a neighbor.

Use the **no** variant of this command to remove the IPv4 or IPv6 address from the interface as the source IPv4 or IPv6 address of BGP or BGP4+ packets sent to the neighbor, and restores the interface assignment to the closest interface, which is also called the best local address.

Syntax [BGP/BGP4+]

```
neighbor <neighborid> update-source <interface>
no neighbor <neighborid> update-source
```

Parameter	Description	
<neighborid>	{*<ip-address>*|*<ipv6-addr>*|*<peer-group>*}	
	<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
	<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
	<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the **neighbor peer-group (add a neighbor) (BGP and BGP+)** command on page 45.145, and **neighbor route-map (BGP and BGP4+)** command on page 45.160. When this parameter is used with this command, the command applies on all peers in the specified group.
<interface>	Specifies the local loopback interface (`lo`).	

Default [BGP/BGP4+] Use of this command sets a default value of 2 for the maximum hop count.

Mode [BGP] Router Configuration or IPv4 Address Family Configuration for a VRF instance

Mode [BGP4+] Router Configuration

Usage [BGP/BGP4+] Use this command in conjunction with any specified interface on the router. The local loopback interface is the interface that is most commonly used with this command. The use of local loopback interface eliminates a dependency and BGP or BGP4+ does not have to rely on the availability of a particular interface for making BGP or BGP4+ peer relationships.

Examples [BGP] To source BGP connections for neighbor `10.10.0.72` with the IP address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# interface lo
awplus(config-if)# ip address 10.10.0.73/24
awplus(config-if)# exit
awplus(config)# router bgp 100
awplus(config-router)# network 10.10.0.0
awplus(config-router)# neighbor 10.10.0.72 remote-as 110
awplus(config-router)# neighbor 10.10.0.72 update-source lo
```

To remove BGP connections for neighbor `10.10.0.72` with the IP address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# router bgp 100
awplus(config-router)# no neighbor 10.10.0.72 update-source
```

To source BGP connections for neighbor `group1` with the IP address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# interface lo
awplus(config-if)# ip address 10.10.0.73/24
awplus(config-if)# exit
awplus(config)# router bgp 100
awplus(config-router)# network 10.10.0.0
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.0.72 remote-as 100
awplus(config-router)# neighbor 10.10.0.72 peer-group group1
awplus(config-router)# neighbor group1 update-source lo
```

To remove BGP connections for neighbor `group1` with the IP address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# router bgp 100
awplus(config-router)# neighbor group1 update-source lo
```

Examples [BGP4+]

To source BGP connections for neighbor `2001:0db8:010d::1` with the IPv6 address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# interface lo
awplus(config-if)# ipv6 address 2001:0db8:010d::1/128
awplus(config-if)# exit
awplus(config)# router bgp 100
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as
110
awplus(config-router)# neighbor 2001:0db8:010d::1
update-source lo
```

To remove BGP connections for neighbor `2001:0db8:010d::1` with the IPv6 address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# router bgp 100
awplus(config-router)# no neighbor 2001:0db8:010d::1
update-source
```

To source BGP connections for neighbor `group1` with the IPv6 address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# interface lo
awplus(config-if)# ipv6 address 2001:0db8:010d::1/128
awplus(config-if)# exit
awplus(config)# router bgp 100
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as
100
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 peer-group
group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 update-source lo
```

To remove BGP connections for neighbor `group1` with the IPv6 address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# router bgp 100
awplus(config-router)# neighbor group1 update-source lo
```

Related Commands

neighbor peer-group (add a neighbor) (BGP and BGP+)
neighbor route-map (BGP and BGP4+)

neighbor version (BGP)

Use this command to configure the switch to accept only a particular BGP version.

Use the **no** variant of this command to use the default BGP version (version 4).

Syntax

```
neighbor <neighborid> version <version>
no neighbor <neighborid> version
```

Parameter	Description	
<neighborid>	{*<ip-address>*|*<peer-group>*}	
	<ip-address>	The address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
	<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the **neighbor peer-group (add a neighbor) (BGP and BGP+)** command on page 45.145, and **neighbor route-map (BGP and BGP4+)** command on page 45.160. When this parameter is used with this command, the command applies on all peers in the specified group.
<version>	{4} Specifies the BGP version number.	

Mode Router Configuration or IPv4 Address Family Configuration for a VRF instance

Usage By default, the system uses BGP version 4 and on request dynamically negotiates down to version 2. Using this command disables the router's version-negotiation capability and forces the router to use only a specified version with the neighbor.

Examples

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 version 4

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 version 4
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 version

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 version
```

Related Commands

neighbor peer-group (add a neighbor) (BGP and BGP+)
neighbor route-map (BGP and BGP4+)

neighbor weight (BGP and BGP4+)

Use this command to set default weights for routes from this BGP or BGP4+ neighbor.

Use the **no** variant of this command to remove a weight assignment.

Syntax [BGP/BGP4+]

```
neighbor <neighborid> weight <weight>
no neighbor <neighborid> weight [<weight>]
```

Parameter	Description	
<neighborid>	{*<ip-address>*|*<ipv6-addr>*|*<peer-group>*}	
	<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
	<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
	<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the **neighbor peer-group (add a neighbor) (BGP and BGP+)** command on page 45.145, and **neighbor route-map (BGP and BGP4+)** command on page 45.160. When this parameter is used with this command, the command applies on all peers in the specified group.
<weight>	*<0-65535>* Specifies the weight this command assigns to the route.	

Mode [BGP] Router Configuration or IPv4 Address Family Configuration for a VRF instance

Mode [BGP4+] IPv6 Address Family Configuration

Usage [BGP/BGP4+] Use this command to specify a weight value to all routes learned from a BGP or BGP4+ neighbor. The route with the highest weight gets preference when there are other routes on the network.

Unlike the local-preference attribute, the weight attribute is relevant only to the local router.

The weights assigned using the **set weight** command overrides the weights assigned using this command.

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 weight 60

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 weight

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.10.1 weight 60

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.10.1 weight

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 weight 60

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 weight
```

Examples [BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 weight 60

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1 weight

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as
10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 peer-
group group1
awplus(config-router-af)# neighbor group1 weight 60

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 weight
```

neighbor route-map (BGP and BGP4+)

network (BGP and BGP4+)

Use this command to specify particular routes to be advertised into the BGP or BGP4+ routing process. A unicast network address without a mask is accepted if it falls into the natural boundary of its class. A class-boundary mask is derived if the address matches its natural class-boundary.

Note that you can specify a prefix length for the prefix being added, and you can also specify a classful network without a prefix length and an appropriate prefix length is added. Note that specifying a non-classful prefix without a prefix length results in a /32 prefix length on an IPv4 route.

Use the **no** variant of this command to remove a network route entry.

Syntax [BGP]

```
network {<ip-prefix/length>|<ip-network-addr>} [mask <network-mask>]
    [route-map <route-map-name>] [backdoor]

no network {<ip-prefix/length>|<ip-network-addr>}
    [mask <network-mask>][route-map <route-map-name>] [backdoor]
```

Syntax [BGP4+]

```
network {<ipv6-prefix/length>|<ipv6-network-addr>}
    [route-map <route-map-name>]

no network {<ipv6-prefix/length>|<ipv6-network-addr>}
    [route-map <route-map-name>]
```

Parameter	Description
<ip-prefix/length>	IP network prefix and prefix length entered in dotted decimal format for the IP network prefix, then slash notation for the prefix length in the format A.B.C.D/M, e.g. 192.168.1.224/27
<ip-network-addr>	IP network prefix entered in dotted decimal format A.B.C.D, e.g. 192.168.1.224
<network-mask>	Specify a network mask in the format A.B.C.D, e.g. 255.255.255.224.
<ipv6-prefix/length>	IPv6 network prefix and prefix length entered in dotted decimal format for the IPv6 network prefix, then slash notation for the IPv6 prefix length in the format X:X::X:X/M, e.g. 2001:db8::/64
<ipv6-network-addr>	IP network prefix entered in dotted decimal format A.B.C.D, e.g. 192.168.1.224
<route-map-name>	Specify the name of the route map.
`backdoor`	Specify a BGP backdoor route that is not advertised.

Mode [BGP] Router Configuration and IPv4 Address Family `[ipv4 unicast]` mode

Mode [BGP4+] IPv6 Address Family Configuration

Usage [BGP/BGP4+] It does not matter how the route is arranged in the IP or IPv6 routing table. The route can arrive in the IP routing table by a static route, or the route can be learnt from OSPF or OSPFv3 or RIP or RIPng routing.

If you configure a route-map, then that route-map will be used in filtering the network, or the route-map will be used to modify the attributes that are advertised with the route.

Example [BGP] The following example illustrates a Class-A address configured as a network route. The natural Class-A network prefix mask length of 8 will be internally derived, that is, 2.0.0.0/8.

```
awplus(config)# router bgp 100
awplus(config-router)# network 2.0.0.0
```

Output [BGP] **Figure 45-1: Example output from the show running-config command after entering network 2.0.0.0**

```
awplus#show running-config
!
router bgp 100
 network 2.0.0.0/8
!
```

Example [BGP] The following example illustrates a network address which does not fall into its natural class boundary, and hence, is perceived as a host route, that is, 192.0.2.224/27.

```
awplus(config)# router bgp 100
awplus(config-router)# network 192.0.2.224 mask 255.255.255.224
```

Output [BGP] **Figure 45-2: Example output from the show running-config command after entering network 192.0.2.224 mask 255.255.255.224**

```
awplus#show running-config
!
router bgp 100
 network 192.0.2.224/27
!
```

Example [BGP] The following example is the same as the previous example for host route 192.0.2.224/27, but is entered in prefix/length format using slash notation (instead of prefix plus mask in dotted decimal format using the **mask** keyword before the network mask in dotted decimal format):

```
awplus(config)# router bgp 100
awplus(config-router)# network 192.0.2.224/27
```

Output [BGP] **Figure 45-3: Example output from the show running-config command after entering network 192.0.2.224/27**

```
awplus#show running-config
!
router bgp 100
 network 192.0.2.224/27
!
```

Example [BGP4+] The following example is the same as the previous example for host route 2001:db8::/32,:

```
awplus(config)# router bgp 100
awplus(config-router)# address-family ipv6
awplus(config-router-af)# network 2001:db8::/32
```

Output [BGP4+] **Figure 45-4: Example output from the show running-config command after entering network 2001:db8::/32**

```
awplus#show running-config
!
router bgp 100
 network 2001:db8::/32
!
```

network synchronization (BGP and BGP4+)

Use this command to ensure the exact same static network prefix, specified through any of the **network** commands, is local or has IGP reachability before introduction to BGP or BGP4+.

Use the **no** variant of this command to disable this function.

Syntax [BGP/BGP4+]

```
network synchronization
no network synchronization
```

Default [BGP/BGP4+] Network synchronization is disabled by default.

Mode [BGP] Router Configuration and IPv4 Address Family [ipv4 unicast] Configuration

Mode [BGP4+] IPv6 Address Family [ipv6 unicast] Configuration

Examples [BGP] The following example enables IGP synchronization of BGP static network routes in the Router Configuration mode.

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# network synchronization
```

The following example enables IGP synchronization of BGP static network routes in the IPv4-Unicast address family.

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# address-family ipv4 unicast
awplus(config-router-af)# network synchronization
```

Example [BGP4+] The following example enables IGP synchronization of BGP4+ static network routes in the IPv6-Unicast address family.

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# address-family ipv6 unicast
awplus(config-router-af)# network synchronization
```

redistribute (into BGP or BGP4+) (BGP and BGP4+)

Use this command to inject routes from one routing process into a BGP or BGP4+ routing table.

Use the **no** variant of this command to disable this function.

Syntax [BGP/BGP4+]

```
redistribute {ospf|rip|connected|static} [route-map <route-map-entry-pointer>]
```

```
no redistribute {ospf|rip|connected|static} [route-map <route-map-entry-pointer>]
```

Parameter	Description
`connected`	Specifies the redistribution of connected routes for both BGP and BGP4+.
`ospf`	Specifies the redistribution of OSPF information for BGP or OSPFv3 information for BGP4+.
`rip`	Specifies the redistribution of RIP information for BGP or RIPng information for BGP4+.
`static`	Specifies the redistribution of Static routes for both BGP and BGP4+.
`route-map`	Route map reference for both BGP and BGP4+.
`<route-map-entry-pointer>`	Pointer to route-map entries.

Mode [BGP] Router Configuration or IPv4 Address Family Configuration for a VRF instance

Mode [BGP4+] Router Configuration or IPv6 Address Family Configuration

Usage [BGP/BGP4+] Redistribution is used by routing protocols to advertise routes that are learned by some other means, such as by another routing protocol or by static routes. Since all internal routes are dumped into BGP, careful filtering is applied to make sure that only routes to be advertised reach the internet, not everything. This command allows redistribution by injecting prefixes from one routing protocol into another routing protocol.

Examples [BGP/BGP+]

The following example shows the configuration of a route-map named `rmap1`, which is then applied using the **redistribute route-map** command.

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 1
awplus(config-route-map)# match origin incomplete
awplus(config-route-map)# set metric 100
awplus(config-route-map)# exit
awplus(config)# router bgp 12
awplus(config-router)# redistribute ospf route-map rmap1
```

To apply the above example to a specific VRF instance named `blue`, use the following commands:

```
awplus(config)# router bgp 12
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# redistribute ospf route-map rmap1
```

The following example shows the configuration of a route-map named `rmap2`, which is then applied using the **redistribute route-map** command.

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 3
awplus(config-route-map)# match interface vlan1
awplus(config-route-map)# set metric-type 1
awplus(config-route-map)# exit
awplus(config)# router ospf 100
awplus(config-router)# redistribute bgp route-map rmap2
```

Note that configuring a route-map and applying it with the redistribute route-map command allows you to filter which router are distributed from another routing protocol (such as OSPF with BGP). A route-map can also set the metric, tag, and metric-type of the redistributed routes.

restart bgp graceful (BGP)

Use this command to force the switch to perform a graceful BGP restart.

Syntax

```
restart bgp graceful
```

Mode

Privileged Exec

Usage

Before using this command, BGP graceful-restart capabilities must be enabled within the router BGP (**bgp graceful-restart (BGP and BGP4+)** command on page 45.32), and each neighbor configured on the device should be set to advertise its graceful-restart capability (**bgp graceful-restart graceful-reset (BGP and BGP4+)** command on page 45.33). The neighbor devices also need to have BGP graceful-restart capabilities enabled (**bgp graceful-restart (BGP and BGP4+)** command on page 45.32).

This command stops the whole BGP process and makes the switch retain the BGP routes and mark them as stale. Receiving BGP speakers, retain and mark as stale all BGP routes received from the restarting speaker for all the address families received in the Graceful Restart Capability exchange.

When a **restart bgp graceful** command is issued, the BGP configuration is reloaded from the last saved configuration. Ensure you first issue a **copy running-config startup-config**.

Example

```
awplus# restart bgp graceful
```

Related Commands

bgp graceful-restart (BGP and BGP4+)
bgp graceful-restart graceful-reset (BGP and BGP4+)

router bgp (BGP and BGP4+)

Use this command to configure a BGP routing process, specifying the 32-bit Autonomous System (AS) number.

Use the **no** variant of this command to disable a BGP routing process, specifying the 32-bit AS number.

Syntax

```
router bgp <asn>
no router bgp <asn>
```

Parameter	Description
<asn>	*<1-4294967295>* Specifies the 32-bit Autonomous System (AS) number.

Mode Global Configuration

Usage The **router bgp** command enables a BGP routing process:

```
router bgp 1
    neighbor 10.0.0.1 remote-as 1
    neighbor 10.0.0.2 remote-as 1
     !
  router bgp 2
    neighbor 10.0.0.3 remote-as 2
    neighbor 10.0.0.4 remote-as 2
```

Examples

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)#

awplus# configure terminal
awplus(config)# no router bgp 12
awplus(config)#
```

route-map (Route Map)

Use this command to configure a route map entry, and to specify whether the device will process or discard matching routes and BGP update messages.

The switch uses a name to identify the route map, and a sequence number to identify each entry in the route map.

The **route-map** command puts you into route-map configuration mode. In this mode, you can use the following:

- one or more of the **match** commands to create match clauses. These specify what routes or update messages match the entry.
- one or more of the **set** commands to create set clauses. These change the attributes of matching routes or update messages.

Use the **no** variant of this command to delete a route map or to delete an entry from a route map.

Syntax

```
route-map <mapname> {deny|permit} <seq>
no route-map <mapname>
no route-map <mapname> {deny|permit} <seq>
```

Parameter	Description
<mapname>	A name to identify the route map.
`deny`	The route map causes a routing process to discard matching routes or BGP update messages.
`permit`	The route map causes a routing process to use matching routes or BGP update messages.
<seq>	`<1-65535>` The sequence number of the entry. You can use this parameter to control the order of entries in this route map.

Mode Global Configuration

Usage Route maps allow you to control and modify routing information by filtering routes and setting route attributes. You can apply route maps when the device:

- processes BGP update messages that it has received from a peer
- prepares BGP update messages to send to peers
- redistributes routes from one routing protocol into another
- redistributes static routes into routing protocols
- uses BGP route flap dampening

When a routing protocol passes a route or update message through a route map, it checks the entries in order of their sequence numbers, starting with the lowest numbered entry.

If it finds a match on a route map with an action of permit, then it applies any set clauses and accepts the route. Having found a match, the route is not compared against any further entries of the route map.

If it finds a match on a route map with an action of deny, it will discard the matching route.

If it does not find a match, it discards the route or update message. This means that route maps end with an implicit deny entry. To permit all non-matching routes or update messages, end your route map with an entry that has an action of **permit** and no match clause.

Examples To enter route-map mode for entry 1 of the route map called `route1`, and then add a match and set clause to it, use the commands:

```
awplus# configure terminal
awplus(config)# route-map route1 permit 1
awplus(config-route-map)# match as-path 60
awplus(config-route-map)# set weight 70
```

To enter route-map mode for entry 2 of the route map called `route1`, and then add a match and set clause to it, use the commands:

```
awplus# configure terminal
awplus(config)# route-map route1 permit 2
awplus(config-route-map)# match interface vlan2
awplus(config-route-map)# set metric 20
```

Note how the prompt changes when you go into route map configuration mode.

To make the device process non-matching routes instead of discarding them, add a command like the following one:

```
awplus(config)# route-map route1 permit 100
```

network (BGP and BGP4+)
redistribute (into BGP or BGP4+) (BGP and BGP4+)
show ip bgp route-map (BGP)
show route-map (Route Map)

set as-path (Route Map)

Use this command to add an AS path set clause to a route map entry.

When a BGP update message matches the route map entry, the device prepends the specified Autonomous System Number (ASN) or ASNs to the update's AS path attribute.

The AS path attribute is a list of the autonomous systems through which the announcement for the prefix has passed. As prefixes pass between autonomous systems, each autonomous system adds its ASN to the beginning of the list. This means that the AS path attribute can be used to make routing decisions.

Use the **no** variant of this command to remove the set clause.

Syntax

```
set as-path prepend <1-65535> [<1-65535>]...
no set as-path prepend [<1-65535> [<1-65535>]...]
```

Parameter	Description
`prepend`	Prepends the autonomous system path.
<1-65535>	The number to prepend to the AS path. If you specify multiple ASNs, separate them with spaces.

Mode Route-map mode

Usage Use the **set as-path** command to specify an autonomous system path. By specifying the length of the AS-Path, the device influences the best path selection by a neighbor. Use the `prepend` parameter with this command to prepend an AS path string to routes increasing the AS path length.

This command is valid for BGP update messages only.

Example To use entry `3` of the route map called `myroute` to prepend ASN `8` and `24` to the AS path of matching update messages, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# set as-path prepend 8 24
```

Related Commands

match as-path (Route Map)
route-map (Route Map)
show route-map (Route Map)

set community (Route Map)

Use this command to add a community set clause to a route map entry.

When a BGP update message matches the route map entry, the device takes one of the following actions:

- changes the update's community attribute to the specified value or values, or
- adds the specified community value or values to the update's community attribute, if you specify the **additive** parameter after specifying another parameter. or
- removes the community attribute from the update, if you specify the **none** parameter

Use the **no** variant of this command to remove the set clause.

Syntax

```
set community {[<1-65535>][AA:NN] [internet] [local-AS]
    [no-advertise] [no-export] [additive]}

no set community {[AA:NN] [internet] [local-AS] [no-advertise]
    [no-export] [additive]}

set community none

no set community none
```

Parameter	Description
<1-65535>	The AS number of the community as an integer not in AA:NN format.
AA:NN	The Autonomous System (AS) number of the community, in AA:NN format. AS numbers are assigned to the regional registries by the IANA (**www.iana.org**) and can be obtained from the registry in your region. AA and NN are both integers from 1 to 65535. AA is the AS number; NN is a value chosen by the ASN administrator.
`local-AS`	The community of routes that must not be advertised to external BGP peers (this includes peers in other members' Autonomous Systems inside a BGP confederation).
`internet`	The community of routes that can be advertised to all BGP peers.
`no-advertise`	The community of routes that must not be advertised to other BGP peers.
`no-export`	The community of routes that must not be advertised outside a BGP confederation boundary (a standalone Autonomous System that is not part of a confederation should be considered a confederation itself).
`none`	The device removes the community attribute from matching update messages.
`additive`	The device adds the specified community value to the update message's community attribute, instead of replacing the existing attribute. By default this parameter is not included, so the device replaces the existing attribute.

Mode Route-map Configuration

Usage This command is valid for BGP update messages only.

Examples To use entry `3` of the route map called `rmap1` to put matching routes into the no-advertise community, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set community no-advertise
```

To use entry `3` of the route map called `rmap1` to put matching routes into several communities, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set community 10:01 23:34 12:14
no-export
```

To use entry `3` of the route map called `rmap1` to put matching routes into a single AS community numbered `16384`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set community 16384 no-export
```

Related Commands **match community (Route Map)**
route-map (Route Map)

show bgp ipv6 (BGP4+)

Use this command to display BGP4+ network information for a specified IPv6 address.

For information on output options, see **"Controlling "show" Command Output" on page 45.6**.

Syntax `show bgp ipv6 <ipv6-addr>`

Parameter	Description
<ipv6-addr>	Specifies the IPv6 address, entered in hexadecimal in the format X:X::X:X.

Mode User Exec and Privileged Exec

Example

```
awplus# show bgp ipv6 2001:0db8:010d::1
```

Related Commands **show bgp ipv6 longer-prefixes (BGP4+)**

show bgp ipv6 community (BGP4+)

Use this command to display routes that match specified communities within an IPv6 environment. Use the **show ip bgp community (BGP)** command within an IPv4 environment.

For information on output options, see **"Controlling "show" Command Output" on page 45.6**.

You may use any combination and repetition of parameters listed in the *<type>* placeholder.

Syntax `show bgp ipv6 community [<type>] [exact-match]`

Parameter		Description
<type>	{[*AA:NN*][local-AS][no-advertise][no-export]}	
	AA:NN	Specifies the Autonomous System (AS) community number, in AA:NN format.
	local-AS	Do not send outside local Autonomous Systems (well-known community).
	no-advertise	Do not advertise to any peer (well-known community).
	no-export	Do not export to next AS (well-known community).
exact-match	Specifies that the exact match of the communities is displayed. This optional parameter cannot be repeated.	

Mode User Exec and Privileged Exec

Examples Note that the AS numbers shown are examples only.

```
awplus# show bgp ipv6 community 64497:64499 exact-match

awplus# show bgp ipv6 community 64497:64499 64500:64501
        exact-match

awplus# show bgp ipv6 community 64497:64499 64500:64501
        no-advertise 64510:64511

awplus# show bgp ipv6 community no-advertise no-advertise
        no-advertise exact-match

awplus# show bgp ipv6 community no-export 64510:64511
        no-advertise local-AS no-export

awplus# show bgp ipv6 community no-export 64510:64511
        no-advertise 64497:64499 64500:64501 no-export

awplus# show bgp ipv6 community no-export 64497:64499
        no-advertise local-AS no-export
```

Related Commands **show ip bgp community (BGP)**

show bgp ipv6 community-list (BGP4+)

Use this command to display routes that match the given community-list within an IPv6 environment. Use the **show ip bgp community-list (BGP)** command within an IPv4 environment.

For information on output options, see **"Controlling "show" Command Output" on page 45.6**.

Syntax

```
show bgp ipv6 community-list <listname> [exact-match]
```

Parameter	Description
<listname>	Specifies the community list name.
`exact-match`	Displays only routes that have exactly the same specified communities.

Mode User Exec and Privileged Exec

Example

```
awplus# show bgp ipv6 community-list mylist exact-match
```

Related Commands **show ip bgp community-list (BGP)**

show bgp ipv6 dampening (BGP4+)

Use this command to show dampened routes from a BGP4+ instance within an IPv6 environment. Use the **show ip bgp dampening (BGP)** command to show dampened routes from a BGP instance within an IPv4 environment.

For information on output options, see **"Controlling "show" Command Output" on page 45.6**.

Syntax

```
show bgp ipv6 dampening {dampened-paths|flap-statistics|parameters}
```

Parameter	Description
`dampened-paths`	Display paths suppressed due to dampening.
`flap-statistics`	Display flap statistics of routes.
`parameters`	Display details of configured dampening parameters.

Mode User Exec and Privileged Exec

Usage Enable BGP4+ dampening to maintain dampened-path information in memory.

Examples

```
awplus# show bgp ipv6 dampening dampened-path
```

```
awplus# show bgp ipv6 dampening flap-statistics
```

```
awplus# show bgp ipv6 dampening parameter
```

Related Commands **show ip bgp dampening (BGP)**

show bgp ipv6 filter-list (BGP4+)

Use this command to display routes conforming to the filter-list within an IPv6 environment. Use the **show ip bgp filter-list (BGP)** command to display routes conforming to the filter-list within an IPv4 environment.

For information on output options, see **"Controlling "show" Command Output" on page 45.6**.

Syntax `show bgp ipv6 filter-list <listname>`

Parameter	Description
<listname>	Specifies the regular-expression access list name.

Mode User Exec and Privileged Exec

Example

```
awplus# show bgp ipv6 filter-list mylist
```

Related Commands **show ip bgp filter-list (BGP)**

show bgp ipv6 inconsistent-as (BGP4+)

Use this command to display routes with inconsistent AS Paths within an IPv6 environment. Use the **show ip bgp inconsistent-as (BGP)** command to display routes with inconsistent AS paths within an IPv4 environment.

For information on output options, see **"Controlling "show" Command Output" on page 45.6**.

Syntax `show bgp ipv6 inconsistent-as`

Mode User Exec and Privileged Exec

Example

```
awplus# show bgp ipv6 inconsistent-as
```

Related Commands **show ip bgp inconsistent-as (BGP)**

show bgp ipv6 longer-prefixes (BGP4+)

Use this command to display the route of the local BGP4+ routing table for a specific prefix with a specific mask or for any prefix having a longer mask than the one specified.

For information on output options, see **"Controlling "show" Command Output" on page 45.6**.

Syntax

```
show bgp ipv6 <ipv6-addr/prefix-length> longer-prefixes
```

Parameter	Description
<ipv6-addr/prefix-length>	Specifies the IPv6 address with prefix length. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.

Mode User Exec and Privileged Exec

Example

```
awplus# show bgp ipv6 2001:0db8::/64 longer-prefixes
```

Related Commands **show bgp ipv6 (BGP4+)**

show bgp ipv6 neighbors (BGP4+)

Use this command to display detailed information on peering connections to all BGP4+ neighbors within an IPv6 environment. Use the **show ip bgp neighbors (BGP)** to display detailed information on peering connections to all BGP neighbors within an IPv4 environment. See the **Usage** section about what you can verify using this command.

For information on output options, see **"Controlling "show" Command Output" on page 45.6**.

Syntax

```
show bgp ipv6 neighbors [<ipv6-addr> [advertised-routes|received
   prefix-filter|received-routes|routes]]
```

Parameter	Description
<ipv6-addr>	Specifies the IPv6 address, entered in hexadecimal in the format X:X::X:X.
`advertised-routes`	Displays the routes advertised to a BGP4+ neighbor.
`received prefix-filter`	Displays received prefix-list filters.
`received-routes`	Displays the received routes from the neighbor. To display all the received routes from the neighbor, configure the BGP4+ soft reconfigure first.
`routes`	Displays all accepted routes learned from neighbors.

Mode User Exec and Privileged Exec

Usage You can verify many of the BGP4+ settings using this command:

- **show bgp ipv6 neighbors session information:**
- **show bgp ipv6 neighbors IPv6 unicast address family information:**
- **show bgp ipv6 neighbors connection information:**

show bgp ipv6 neighbors session information:

- Neighbor address, ASN information and if the link is external or internal
- BGP version and status
- Neighbor capabilities for the BGP session
- Number of messages transmitted and received

show bgp ipv6 neighbors IPv6 unicast address family information:

- BGP4+ table version
- IPv6 Address Family dependant capabilities
- IPv6 Communities
- IPv6 Route filters for ingress and egress updates
- Number of announced and accepted IPv6 prefixes

show bgp ipv6 neighbors connection information:

- Connection counters
- Graceful restart timer
- Hop count to the peer
- Next hop information
- Local and external port numbers

Examples [BGP4+]

```
awplus# show bgp ipv6 neighbors 2001:0db8:010d::1
        advertised-routes

awplus# show bgp ipv6 neighbors 2001:0db8:010d::1 received
        prefix-filter

awplus# show bgp ipv6 neighbors 2001:0db8:010d::1
        received-routes

awplus# show bgp ipv6 neighbors 2001:0db8:010d::1 routes
```

Output **Figure 45-5: Example output from the show bgp ipv6 neighbors 2001:db8:b::1 command**

```
awplus#show bgp ipv6 neighbors 2001:db8:b::1
BGP neighbor is 2001:db8:b::1, remote AS 200, local AS 100, external link
  BGP version 4, remote router ID 2.2.2.1
  BGP state = Established, up for 01:03:26
  Last read 01:03:26, hold time is 90, keepalive interval is 30 seconds
  Neighbor capabilities:
    Route refresh: advertised and received (old and new)
    4-Octet ASN Capability: advertised and received
    Address family IPv4 Unicast: advertised and received
    Address family IPv6 Unicast: advertised and received
  Received 157 messages, 0 notifications, 0 in queue
  Sent 228 messages, 0 notifications, 0 in queue
  Route refresh request: received 0, sent 0
  Minimum time between advertisement runs is 30 seconds
  Update source is lo
For address family: IPv4 Unicast
  BGP table version 1, neighbor version 1
  Index 2, Offset 0, Mask 0x4
  Community attribute sent to this neighbor (both)
  0 accepted prefixes
  0 announced prefixes

For address family: IPv6 Unicast
  BGP table version 66, neighbor version 66
  Index 2, Offset 0, Mask 0x4
  AF-dependant capabilities:
    Graceful restart: advertised, received

  Community attribute sent to this neighbor (both)
  Default information originate, default sent
  Inbound path policy configured
  Incoming update prefix filter list is *BGP_FILTER_LIST
  Route map for incoming advertisements is *BGP_LOCAL_PREF_MAP
  8 accepted prefixes
  8 announced prefixes

Connections established 1; dropped 0
Graceful-restart Status:
  Remote restart-time is 90 sec

  External BGP neighbor may be up to 2 hops away.
Local host: 2001:db8:a::1, Local port: 179
Foreign host: 2001:db8:b::1, Foreign port: 50672
Nexthop: 1.1.1.1
Nexthop global: 2001:db8:a::1
Nexthop local: ::
BGP connection: non shared network
```

Related Commands **show ip bgp neighbors (BGP)**

show bgp ipv6 paths (BGP4+)

Use this command to display BGP4+ path information within an IPv6 environment. Use the **show ip bgp paths (BGP)** command to display BGP path information within an IPv4 environment.

For information on output options, see **"Controlling "show" Command Output" on page 45.6**.

Syntax `show bgp ipv6 paths`

Mode User Exec and Privileged Exec

Example

```
awplus# show bgp ipv6 paths
```

Related Commands **show ip bgp paths (BGP)**

show bgp ipv6 prefix-list (BGP4+)

Use this command to display routes matching the prefix-list within an IPv6 environment. Use the **show ip bgp prefix-list (BGP)** command to display routes matching the prefix-list within an IPv4 environment.

For information on output options, see **"Controlling "show" Command Output" on page 45.6**.

Syntax `show bgp ipv6 prefix-list <list>`

Parameter	Description
<list>	Specifies the name of the IPv6 prefix list.

Mode User Exec and Privileged Exec

Example

```
awplus# show bgp ipv6 prefix-list mylist
```

Related Commands **show ip bgp prefix-list (BGP)**

show bgp ipv6 quote-regexp (BGP4+)

Use this command to display routes matching the AS path regular expression within an IPv6 environment. Use the **show ip bgp quote-regexp (BGP)** command to display routes matching the AS path regular expression within an IPv4 environment.

Note that you must use quotes to enclose the regular expression with this command. Use the regular expressions listed below with the *<expression>* parameter:

Symbol	Character	Meaning
^	Caret	Used to match the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match.
$	Dollar sign	Used to match the end of the input string.
.	Period	Used to match a single character (white spaces included).
*	Asterisk	Used to match none or more sequences of a pattern.
+	Plus sign	Used to match one or more sequences of a pattern.
?	Question mark	Used to match none or one occurrence of a pattern.
_	Underscore	Used to match spaces, commas, braces, parenthesis, or the beginning and end of an input string.
[]	Brackets	Specifies a range of single-characters.
-	Hyphen	Separates the end points of a range.

For information on output options, see **"Controlling "show" Command Output" on page 45.6**.

Syntax

```
show bgp ipv6 quote-regexp <expression>
```

Mode User Exec and Privileged Exec

Example

```
awplus# show bgp ipv6 quote-regexp myexpression
```

Related Commands **show ip bgp quote-regexp (BGP)**

show bgp ipv6 regexp (BGP4+)

Use this command to display routes matching the AS path regular expression within an IPv6 environment. Use the **show ip bgp regexp (BGP)** command to display routes matching the AS path regular expression within an IPv4 environment.

Use the regular expressions listed below with the <*expression*> parameter:

Symbol	Character	Meaning
^	Caret	Used to match the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match.
$	Dollar sign	Used to match the end of the input string.
.	Period	Used to match a single character (white spaces included).
*	Asterisk	Used to match none or more sequences of a pattern.
+	Plus sign	Used to match one or more sequences of a pattern.
?	Question mark	Used to match none or one occurrence of a pattern.
_	Underscore	Used to match spaces, commas, braces, parenthesis, or the beginning and end of an input string.
[ ]	Brackets	Specifies a range of single-characters.
-	Hyphen	Separates the end points of a range.

For information on output options, see **"Controlling "show" Command Output" on page 45.6**.

Syntax

```
show bgp ipv6 regexp <expression>
```

Parameter	Description
<*expression*>	Specifies a regular-expression to match the BGP4+ AS paths.

Mode User Exec and Privileged Exec

Example

```
awplus# show bgp ipv6 regexp myexpression
```

Related Commands **show ip bgp regexp (BGP)**

show bgp ipv6 route-map (BGP4+)

Use this command to display BGP4+ routes that match the specified route-map within an IPv6 environment. Use the **show ip bgp route-map (BGP)** command to display BGP routes that match the specified route-map within an IPv4 environment.

For information on output options, see **"Controlling "show" Command Output" on page 45.6**.

Syntax `show bgp ipv6 route-map <route-map>`

Parameter	Description
<route-map>	Specifies a route-map that is matched.

Mode User Exec and Privileged Exec

Example To show routes that match the route-map `myRouteMap`, use the command:

```
awplus# show bgp ipv6 route-map myRouteMap
```

Related Commands **show ip bgp route-map (BGP)**

show bgp ipv6 summary (BGP4+)

Use this command to display a summary of a BGP4+ neighbor status within an IPv6 environment. Use the **show ip bgp summary (BGP)** command to display a summary of a BGP neighbor status within an IPv4 environment.

For information on output options, see **"Controlling "show" Command Output" on page 45.6**.

Syntax `show bgp ipv6 summary`

Mode User Exec and Privileged Exec

Example

```
awplus# show bgp ipv6 summary
```

Related Commands **show ip bgp summary (BGP)**

show bgp nexthop-tracking (BGP)

Use this command to display BGP nexthop-tracking status.

Syntax `show bgp nexthop-tracking`

Mode User Exec and Privileged Exec

Example To display BGP nexthop-tracking status, use the command:

```
awplus# show bgp nexthop-tracking
```

Related Commands **bgp nexthop-trigger-count (BGP and BGP4+)**
show bgp nexthop-tree-details (BGP)

show bgp nexthop-tree-details (BGP)

Use this command to display BGP nexthop-tree-details.

Syntax `show bgp nexthop-tree-details`

Mode User Exec and Privileged Exec

Example To display BGP nexthop-tree-details, use the command:

```
awplus# show bgp nexthop-tree-details
```

Related Commands **show bgp nexthop-tracking (BGP)**

show bgp memory maxallocation (BGP)

This command displays the maximum percentage of total memory that is allocated to BGP processes.

For information on output options, see **"Controlling "show" Command Output" on page 45.6**.

Syntax `show bgp memory maxallocation`

Mode User Exec and Privileged Exec

Example To display the maximum amount of memory allocated for BGP processes, use the command:

```
awplus# show bgp memory maxallocation
```

Output **Figure 45-6: Example output from the show bgp memory maxallocation command**

```
BGP maximum RAM allocation is 100%
```

show debugging bgp (BGP)

Use this command to display the BGP debugging option set.

For information on output options, see **"Controlling "show" Command Output" on page 45.6**.

Syntax

```
show debugging bgp
```

Mode

User Exec and Privileged Exec

Example

```
awplus# show debugging bgp
```

Output

Figure 45-7: Example output from the show debugging bgp command

```
BGP debugging status:
  BGP debugging is on
  BGP events debugging is on
  BGP updates debugging is on
  BGP fsm debugging is on
```

Related Commands

debug bgp (BGP)

show ip bgp (BGP)

Use this command to display BGP network information.

For information on output options, see **"Controlling "show" Command Output" on page 45.6**.

Syntax `show ip bgp [<ip-addr>|<ip-addr/m>]`

Parameter	Description
<ip-addr> *<ip-addr/m>*	Specifies the IPv4 address and the optional prefix mask length.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip bgp 10.10.1.34/24
```

Output **Figure 45-8: Example output from the show ip bgp command**

```
BGP table version is 7, local router ID is 80.80.80.80

Related Commands **neighbor remove-private-AS (BGP)**

show ip bgp attribute-info (BGP)

Use this command to show internal attribute hash information.

For information on output options, see **"Controlling "show" Command Output" on page 45.6**.

Syntax

```
show ip bgp attribute-info
```

Mode

User Exec and Privileged Exec

Example

```
awplus# show ip bgp attribute-info
```

Output

Figure 45-9: Example output from the show ip bgp attribute-info command

show ip bgp cidr-only (BGP)

Use this command to display routes with non-natural network masks.

For information on output options, see **"Controlling "show" Command Output" on page 45.6**.

Syntax `show ip bgp cidr-only`

Syntax [VRF] `show ip bgp [global|vrf <vrf-name>] cidr-only`

Parameter	Description
`global`	When VRF-Lite is configured, apply the command to the global routing and forwarding table.
`vrf`	Apply the command to the specified VRF instance.
`<vrf-name>`	The name of the VRF instance.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip bgp cidr-only
awplus# show ip bgp vrf red cidr-only
```

Output **Figure 45-10: Example output from the show ip bgp cidr-only command**

```

```

show ip bgp community (BGP)

Use this command to display routes that match specified communities from a BGP instance within an IPv4 environment. Use the **show bgp ipv6 community (BGP4+)** command within an IPv6 environment.

For information on output options, see **"Controlling "show" Command Output" on page 45.6**.

You may use any combination and repetition of parameters listed in the *<type>* placeholder.

Syntax `show ip bgp community [<type>] [exact-match]`

Syntax [VRF] `show ip bgp [global|vrf <vrf-name>] community [<type>] [exact-match]`

Parameter	Description	
`global`	When VRF-Lite is configured, apply the command to the global routing and forwarding table.	
`vrf`	Apply the command to the specified VRF instance.	
<vrf-name>	The name of the VRF instance.	
<type>	{[*AA:NN*][local-AS][no-advertise][no-export]}	
	AA:NN	Specifies the Autonomous System (AS) community number, in AA:NN format.
	`local-AS`	Do not send outside local Autonomous Systems (well-known community).
	`no-advertise`	Do not advertise to any peer (well-known community).
	`no-export`	Do not export to next AS (well-known community).
`exact-match`	Specifies that the exact match of the communities is displayed. This optional parameter cannot be repeated.	

Mode User Exec and Privileged Exec

Examples Note that the AS numbers shown are examples only.

```
awplus# show ip bgp community 64497:64499 exact-match

awplus# show ip bgp community 64497:64499 64500:64501
       exact-match

awplus# show ip bgp community 64497:64499 64500:64501
       no-advertise 64510:64511

awplus# show ip bgp community no-advertise no-advertise
       no-advertise exact-match

awplus# show ip bgp community no-export 64510:64511
       no-advertise local-AS no-export
```

```
awplus# show ip bgp community no-export 64510:64511
        no-advertise 64497:64499 64500:64501 no-export

awplus# show ip bgp community no-export 64497:64499
        no-advertise local-AS no-export

awplus# show ip bgp vrf red no-export

awplus# show ip bgp global 65500:2 65500:3 exact-match
```

Related Commands **set community (Route Map)**
show bgp ipv6 community (BGP4+)

show ip bgp community-info (BGP)

Use this command to list all BGP community information.

For information on output options, see **"Controlling "show" Command Output" on page 45.6**.

Syntax

```
show ip bgp community-info
```

Mode User Exec and Privileged Exec

Example

```
awplus# show ip bgp community-info
```

show ip bgp community-list (BGP)

Use this command to display routes that match the given community-list from a BGP instance within an IPv4 environment. Use the **show bgp ipv6 community-list (BGP4+)** command within an IPv6 environment.

For information on output options, see **"Controlling "show" Command Output" on page 45.6**.

Syntax

```
show ip bgp community-list <listname> [exact-match]
```

Syntax [VRF]

```
show ip bgp [global|vrf <vrf-name>] community-list <listname>
   [exact-match]
```

Parameter	Description
`global`	When VRF-Lite is configured, apply the command to the global routing and forwarding table.
`vrf`	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
<listname>	Specifies the community list name.
`exact-match`	Displays only routes that have exactly the same specified communities.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip bgp community-list mylist exact-match
awplus# show ip bgp vrf red community-list myCommunity
awplus# show ip bgp global community-list myExactCommunity
        exact-match
```

Related Commands **show bgp ipv6 community-list (BGP4+)**

show ip bgp dampening (BGP)

Use this command to show dampened routes from a BGP instance within an IPv4 environment. Use the **show bgp ipv6 dampening (BGP4+)** command within an IPv6 environment.

For information on output options, see **"Controlling "show" Command Output" on page 45.6**.

Syntax

```
show ip bgp dampening {dampened-paths|flap-statistics|parameters}
```

Syntax [VRF]

```
show ip bgp [unicast] dampening {dampened-paths|flap-statistics|
   parameters}

show ip bgp [global|vrf <vrf-name>] dampening {dampened-paths|
   flap-statistics|parameters}
```

Parameter	Description
`global`	When VRF-Lite is configured, apply the command to the global routing and forwarding table.
`vrf`	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
`dampened-paths`	Display paths suppressed due to dampening.
`flap-statistics`	Display flap statistics of routes.
`parameters`	Display details of configured dampening parameters.

Mode User Exec and Privileged Exec

Usage Enable BGP dampening to maintain dampened-path information in memory.

Examples

```
awplus# show ip bgp dampening dampened-paths

awplus# show ip bgp vrf red dampening dampened-paths

awplus# show ip bgp global dampening flap-statistics
```

Output **Figure 45-11: Example output from the show ip bgp dampening command**

```
dampening 15 750 2000 60 15
 Reachability Half-Life time    : 15 min
 Reuse penalty                  : 750
 Suppress penalty               : 2000
 Max suppress time              : 60 min
 Un-reachability Half-Life time : 15 min
 Max penalty (ceil)             : 11999
 Min penalty (floor)            : 375
```

The following example output shows that the internal route (`i`), has flapped 3 times and is now categorized as history (`h`).

Figure 45-12: Example output from the show ip bgp dampening flap-statistics command

```
awplus# show ip bgp dampening flap-statistics
BGP table version is 1, local router ID is 30.30.30.77
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,S
Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
   Network          From            Flaps  Duration  Reuse    Path

Total number of prefixes 1
```

Related Commands **show bgp ipv6 dampening (BGP4+)**

show ip bgp filter-list (BGP)

Use this command to display routes conforming to the filter-list within an IPv4 environment. Use the **show bgp ipv6 filter-list (BGP4+)** command to display routes conforming to the filter-list within an IPv6 environment

For information on output options, see **"Controlling "show" Command Output" on page 45.6**.

Syntax `show ip bgp filter-list <listname>`

Syntax [VRF] `show ip bgp [global|vrf <vrf-name>] filter-list <listname>`

Parameter	Description
`global`	When VRF-Lite is configured, apply the command to the global routing and forwarding table.
`vrf`	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
<listname>	Specifies the regular-expression access list name.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip bgp filter-list mylist
awplus# show ip bgp vrf red filter-list mylist
```

Related Commands **show bgp ipv6 filter-list (BGP4+)**

show ip bgp inconsistent-as (BGP)

Use this command to display routes with inconsistent AS Paths within an IPv4 environment. Use the **show bgp ipv6 inconsistent-as (BGP4+)** command to display routes with inconsistent AS paths within an IPv6 environment.

For information on output options, see **"Controlling "show" Command Output" on page 45.6**.

Syntax

```
show ip bgp inconsistent-as
```

Syntax [VRF]

```
show ip bgp [global|vrf <vrf-name>] inconsistent-as
```

Parameter	Description
`global`	When VRF-Lite is configured, apply the command to the global routing and forwarding table.
`vrf`	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip bgp inconsistent-as
awplus# show ip bgp global inconsistent-as
```

Related Commands **show bgp ipv6 inconsistent-as (BGP4+)**

show ip bgp longer-prefixes (BGP)

Use this command to display the route of the local BGP routing table for a specific prefix with a specific mask, or for any prefix having a longer mask than the one specified.

For information on output options, see **"Controlling "show" Command Output" on page 45.6**.

Syntax `show ip bgp <ip-address/m> longer-prefixes`

Syntax [VRF] `show ip bgp [global|vrf <vrf-name>] <ip-address/m> longer-prefixes`

Parameter	Description
`global`	When VRF-Lite is configured, apply the command to the global routing and forwarding table.
`vrf`	Apply the command to the specified VRF instance.
`<vrf-name>`	The name of the VRF instance.
`<ip-address/m>`	Neighbor's IP address and subnet mask, entered in the form A.B.C.D/M. Where M is the subnet mask length.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip bgp 10.10.0.10/24 longer-prefixes
awplus# show ip bgp vrf red 172.16.4.0/24
awplus# show ip bgp global 172.16.0.0/16 longer-prefixes
```

show ip bgp neighbors (BGP)

Use this command to display detailed information on peering connections to all BGP neighbors within an IPv4 environment. Use the **show bgp ipv6 neighbors (BGP4+)** to display detailed information on peering connections to all BGP4+ neighbors within an IPv6 environment. See the **Usage** section about what you can verify using this command.

For information on output options, see **"Controlling "show" Command Output" on page 45.6**.

Syntax [BGP]

```
show ip bgp neighbors [<ipv4-addr> [advertised-routes|
   received prefix-filter|received-routes|routes]]
```

Syntax [VRF]

```
show ip bgp [global|vrf <vrf-name>] neighbors [<ipv4-addr> routes]
```

Parameter	Description
<ipv4-addr>	The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
`advertised-routes`	Displays the routes advertised to a BGP neighbor.
`received prefix-filter`	Displays the received prefix-list filters.
`received-routes`	Displays the received routes from the neighbor. To display all the received routes from the neighbor, configure the BGP soft reconfigure first.
`routes`	Displays all accepted routes learned from neighbors.
`global`	When VRF-Lite is configured, apply the command to the global routing and forwarding table.
`vrf`	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.

Mode [BGP] User Exec and Privileged Exec

Usage [BGP] You can verify many of the BGP settings using this command:

- **show bgp ip neighbors session information:**
- **show bgp ip neighbors IPv4 unicast address family Information:**
- **show bgp ip neighbors connection information:**

show bgp ip neighbors session information:

- Neighbor address, ASN information and if the link is external or internal
- BGP version and status
- Neighbor capabilities for the BGP session
- Number of messages transmitted and received

show bgp ip neighbors IPv4 unicast address family Information:

- BGP table version
- IPv4 Address Family dependant capabilities
- IPv4 Communities
- IPv4 Route filters for ingress and egress updates
- Number of announced and accepted IPv4 prefixes

show bgp ip neighbors connection information:

- Connection counters
- Graceful restart timer
- Hop count to the peer
- Next hop information
- Local and external port numbers

Examples [BGP]

```
awplus# show ip bgp neighbors 10.10.10.72 advertised-routes

awplus# show ip bgp neighbors 10.10.10.72 received
        prefix-filter

awplus# show ip bgp neighbors 10.10.10.72 received-routes

awplus# show ip bgp neighbors 10.10.10.72 routes
```

Output **Figure 45-14: Example output from the show ip bgp neighbors 10.10.10.72 command**

```
awplus#show ip bgp neighbors 10.10.10.72
BGP neighbor is 10.10.10.72, remote AS 100, local AS 100, internal
 link
 Member of peer-group group1 for session parameters
  BGP version 4, remote router ID 0.0.0.0
  BGP state = Active
  Last read          , hold time is 90, keepalive interval is 30 seconds
  Received 0 messages, 0 notifications, 0 in queue
  Sent 0 messages, 0 notifications, 0 in queue
  Route refresh request: received 0, sent 0
  Minimum time between advertisement runs is 5 seconds
 For address family: IPv4 Unicast
  BGP table version 1, neighbor version 0
  Index 1, Offset 0, Mask 0x2
  group1 peer-group member
  NEXT_HOP is always this router
  0 accepted prefixes
  0 announced prefixes

 Connections established 0; dropped 0
Next connect timer due in 33 seconds
```

Related Commands **show bgp ipv6 neighbors (BGP4+)**

show ip bgp neighbors connection-retrytime (BGP)

Use this command to display the configured connection-retrytime value of the peer at the session establishment time with the neighbor.

For information on output options, see **"Controlling "show" Command Output" on page 45.6**.

Syntax

```
show ip bgp neighbors <ipv4-addr>
   connection-retrytime
```

Parameter	Description
<ipv4-addr>	The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip bgp neighbors 10.11.4.26 connection-retrytime
```

show ip bgp neighbors hold-time (BGP)

Use this command to display the configured holdtime value of the peer at the session establishment time with the neighbor.

For information on output options, see **"Controlling "show" Command Output" on page 45.6**.

Syntax

```
show ip bgp neighbors <ipv4-addr> hold-time
```

Parameter	Description
<ipv4-addr>	The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.

Default The holdtime timer default is 90 seconds as per RFC 4271. Holdtime is keepalive * 3.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ip bgp neighbors 10.11.4.26 hold-time
```

Related Commands

neighbor timers (BGP and BGP4+)
show ip bgp neighbors keepalive-interval (BGP)
timers (BGP and BGP4+)

show ip bgp neighbors keepalive (BGP)

Use this command to display the number of keepalive messages sent to the neighbor from the peer throughout the session.

For information on output options, see **"Controlling "show" Command Output" on page 45.6**.

Syntax

```
show ip bgp neighbors <ipv4-addr> keepalive
```

Parameter	Description
<ipv4-addr>	The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ip bgp neighbors 10.11.4.26 keepalive
```

Related Commands **show ip bgp neighbors keepalive-interval (BGP)**

show ip bgp neighbors keepalive-interval (BGP)

Use this command to display the configured keepalive-interval value of the peer at the session establishment time with the neighbor.

For information on output options, see **"Controlling "show" Command Output" on page 45.6**.

Syntax

```
show ip bgp neighbors <ipv4-addr> keepalive-interval
```

Parameter	Description
<ipv4-addr>	The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.

Default The keepalive timer default is 60 seconds as per RFC 4271. Keepalive is holdtime / 3.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ip bgp neighbors 10.11.4.26 keepalive-interval
```

Related Commands **neighbor timers (BGP and BGP4+)**
show ip bgp neighbors hold-time (BGP)
timers (BGP and BGP4+)

show ip bgp neighbors notification (BGP)

Use this command to display the number of notification messages sent to the neighbor from the peer throughout the session.

For information on output options, see **"Controlling "show" Command Output" on page 45.6**.

Syntax `show ip bgp neighbors <ipv4-addr> notification`

Parameter	Description
<ipv4-addr>	The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip bgp neighbors 10.11.4.26 notification
```

show ip bgp neighbors open (BGP)

Use this command to display the number of open messages sent to the neighbor from the peer throughout the session.

For information on output options, see **"Controlling "show" Command Output" on page 45.6**.

Syntax `show ip bgp neighbors <ipv4-addr> open`

Parameter	Description
<ipv4-addr>	The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip bgp neighbors 10.11.4.26 open
```

show ip bgp neighbors rcvd-msgs (BGP)

Use this command to display the number of messages received by the neighbor from the peer throughout the session.

For information on output options, see **"Controlling "show" Command Output" on page 45.6**.

Syntax `show ip bgp neighbors <ipv4-addr> rcvd-msgs`

Parameter	Description
<ipv4-addr>	The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip bgp neighbors 10.11.4.26 rcvd-msgs
```

show ip bgp neighbors sent-msgs (BGP)

Use this command to display the number of messages sent to the neighbor from the peer throughout the session.

For information on output options, see **"Controlling "show" Command Output" on page 45.6**.

Syntax `show ip bgp neighbors <ipv4-addr> sent-msgs`

Parameter	Description
<ipv4-addr>	The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip bgp neighbors 10.11.4.26 sent-msgs
```

show ip bgp neighbors update (BGP)

Use this command to display the number of update messages sent to the neighbor from the peer throughout the session.

For information on output options, see **"Controlling "show" Command Output" on page 45.6**.

Syntax `show ip bgp neighbors <ipv4-addr> update`

Parameter	Description
<ipv4-addr>	The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip bgp neighbors 10.11.4.26 update
```

show ip bgp paths (BGP)

Use this command to display BGP4 path information within an IPv4 environment. Use the **show bgp ipv6 paths (BGP4+)** command to display BGP4+ path information within an IPv4 environment.

For information on output options, see **"Controlling "show" Command Output" on page 45.6**.

Syntax `show ip bgp paths`

Mode User Exec and Privileged Exec

Example

```
awplus# show ip bgp paths
```

Related Commands **show bgp ipv6 paths (BGP4+)**

show ip bgp prefix-list (BGP)

Use this command to display routes matching the prefix-list within an IPv4 environment. Use the **show bgp ipv6 prefix-list (BGP4+)** command to display routes matching the prefix-list within an IPv6 environment.

For information on output options, see **"Controlling "show" Command Output" on page 45.6**.

Syntax

```
show ip bgp prefix-list <list>
```

Syntax [VRF]

```
show ip bgp [global|vrf <vrf-name>] prefix-list <list>
```

Parameter	Description
`global`	When VRF-Lite is configured, apply the command to the global routing and forwarding table.
`vrf`	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
<list>	Specifies the name of the IP prefix list.

Mode

User Exec and Privileged Exec

Examples

```
awplus# show ip bgp prefix-list mylist
awplus# show ip bgp vrf red prefix-list myPrefixes
```

Related Commands

show bgp ipv6 prefix-list (BGP4+)

show ip bgp quote-regexp (BGP)

Use this command to display routes matching the AS path regular expression within an IPv4 environment. Use the **show bgp ipv6 quote-regexp (BGP4+)** command to display routes matching the AS path regular expression within an IPv6 environment.

Note that you must use quotes to enclose the regular expression with this command. Use the regular expressions listed below with the *<expression>* parameter:

Symbol	Character	Meaning
^	Caret	Used to match the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match.
$	Dollar sign	Used to match the end of the input string.
.	Period	Used to match a single character (white spaces included).
*	Asterisk	Used to match none or more sequences of a pattern.
+	Plus sign	Used to match one or more sequences of a pattern.
?	Question mark	Used to match none or one occurrence of a pattern.
_	Underscore	Used to match spaces, commas, braces, parenthesis, or the beginning and end of an input string.
[]	Brackets	Specifies a range of single-characters.
-	Hyphen	Separates the end points of a range.

For information on output options, see **"Controlling "show" Command Output" on page 45.6**.

Syntax

```
show ip bgp quote-regexp <expression>
```

Syntax [VRF]

```
show ip bgp [global|vrf <vrf-name>] quote-regexp <expression>
```

Parameter	Description
`global`	When VRF-Lite is configured, apply the command to the global routing and forwarding table.
`vrf`	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
<expression>	Specifies a regular-expression to match the BGP AS paths.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ip bgp quote-regexp myexpression
awplus# show ip bgp global quote-regexp 65550 65555
```

Related Commands **show bgp ipv6 quote-regexp (BGP4+)**

show ip bgp regexp (BGP)

Use this command to display routes matching the AS path regular expression within an IPv4 environment. Use the **show bgp ipv6 regexp (BGP4+)** command to display routes matching the AS path regular expression within an IPv6 environment.

Use the regular expressions listed below with the *<expression>* parameter

Use the regular expressions listed below with the *<expression>* parameter:

Symbol	Character	Meaning
^	Caret	Used to match the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match.
$	Dollar sign	Used to match the end of the input string.
.	Period	Used to match a single character (white spaces included).
*	Asterisk	Used to match none or more sequences of a pattern.
+	Plus sign	Used to match one or more sequences of a pattern.
?	Question mark	Used to match none or one occurrence of a pattern.
_	Underscore	Used to match spaces, commas, braces, parenthesis, or the beginning and end of an input string.
[]	Brackets	Specifies a range of single-characters.
-	Hyphen	Separates the end points of a range.

For information on output options, see **"Controlling "show" Command Output" on page 45.6**.

Syntax

```
show ip bgp regexp <expression>
```

Syntax [VRF]

```
show ip bgp [global|vrf <vrf-name>] regexp <expression>
```

Parameter	Description
`global`	When VRF-Lite is configured, apply the command to the global routing and forwarding table.
`vrf`	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
<expression>	Specifies a regular-expression to match the BGP AS paths.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ip bgp regexp myexpression
awplus# show ip bgp vrf red regexp 65550 65555
```

Related Commands **show bgp ipv6 regexp (BGP4+)**

show ip bgp route-map (BGP)

Use this command to display BGP routes that match the specified route-map within an IPv4 environment. Use the **show bgp ipv6 route-map (BGP4+)** command to display BGP4+ routes that match the specified route-map within an IPv6 environment.

For information on output options, see **"Controlling "show" Command Output" on page 45.6**.

Syntax `show ip bgp route-map <route-map>`

Syntax [VRF] `show ip bgp [global|vrf <vrf-name>] route-map <route-map>`

Parameter	Description
`global`	When VRF-Lite is configured, apply the command to the global routing and forwarding table.
`vrf`	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
<route-map>	Specifies a route-map that is matched.

Mode User Exec and Privileged Exec

Examples To show routes that match the route-map `myRouteMap` for the global routing instance, use the command:

```
awplus# show ip bgp global route-map myRouteMap
```

To show routes that match the route-map `myRouteMap`, use the command:

```
awplus# show ip bgp route-map myRouteMap
```

Related Commands **show bgp ipv6 route-map (BGP4+)**

show ip bgp scan (BGP)

Use this command to display BGP scan status.

For information on output options, see **"Controlling "show" Command Output" on page 45.6**.

Syntax `show ip bgp scan`

Mode User Exec and Privileged Exec

Example

```
awplus# show ip bgp scan
```

Output **Figure 45-15: Example output from the show ip bgp scan command**

```
BGP scan is running
BGP scan interval is 60
BGP instance : AS is 11,DEFAULT
Current BGP nexthop cache:
BGP connected route:
 10.10.10.0/24
 10.10.11.0/24
```

show ip bgp summary (BGP)

Use this command to display a summary of a BGP neighbor status within an IPv4 environment. Use the **show bgp ipv6 summary (BGP4+)** command to display a summary of BGP4+ neighbors.

For information on output options, see **"Controlling "show" Command Output" on page 45.6**.

Syntax `show ip bgp summary`

Syntax [VRF] `show ip bgp [global|vrf <vrf-name>] summary`

Parameter	Description
`global`	When VRF-Lite is configured, apply the command to the global routing and forwarding table.
`vrf`	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ip bgp summary
awplus# show ip bgp vrf red summary
```

Output **Figure 45-16: Example output from the show ip bgp summary command**

```
awplus>show ip bgp summary
BGP router identifier 0.0.0.0, local AS number 100
BGP table version is 10
BGP AS-PATH entries 0
BGP community entries
Neighbor          V         AS   MsgRc  MsgSnt TblVer InOutQ Up/Down State/PfxRcd
10.10.10.72       4        100       0       0      0 0/0    never   Active
2001:0db8:010d::1 4          1       0       0      0 0/0    never   Active
Number of neighbors 2
```

Related Commands **show bgp ipv6 summary (BGP4+)**

show ip community-list (BGP and BGP4+)

Use this command to display routes that match a specified community-list name or number.

For information on output options, see **"Controlling "show" Command Output" on page 45.6**.

Syntax

```
show ip community-list [<listnumber>|<listname>]
```

Parameter	Description
<listnumber>	Specifies the community list number in the range <1-199> as specified by a previously issued **ip community-list** command.
<listname>	Specifies the community list name as specified by a previously issued **ip community-list (BGP and BGP4+)** command.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ip community-list mylist
awplus# show ip community-list 99
```

Related Commands

ip community-list (BGP and BGP4+)
ip community-list expanded (BGP and BGP4+)
ip community-list standard (BGP and BGP4+)

show ip extcommunity-list (BGP and BGP4+)

Use this command to display a configured extcommunity-list.

For information on output options, see **"Controlling "show" Command Output" on page 45.6**.

Syntax

```
show ip extcommunity-list [<1-199>|<extcommunity-listname>]
```

Parameter	Description
<1-199>	Extcommunity-list number
<extcommunity-listname>	Extcommunity-list name

Mode User Exec and Privileged Exec

Example

```
awplus# show ip extcommunity-list 33
```

Related Commands

ip extcommunity-list expanded (BGP and BGP4+)
ip extcommunity-list standard (BGP and BGP4+)

show ip prefix-list (IPv4 Prefix List)

Use this command to display the IPv4 prefix-list entries. Note that this command is valid for RIP and BGP routing protocols only.

Syntax `show ip prefix-list [<name>|detail|summary]`

Parameter	Description
<name>	Specify the name of a prefix list in this placeholder.
`detail`	Specify this parameter to show detailed output for all IPv4 prefix lists.
`summary`	Specify this parameter to show summary output for all IPv4 prefix lists.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip prefix-list
awplus# show ip prefix-list 10.10.0.98/8
awplus# show ip prefix-list detail
```

Related Commands ip prefix-list (IPv4 Prefix List)

show ipv6 prefix-list (IPv6 Prefix List)

Use this command to display the prefix-list entries. Note that this command is valid for RIPng and BGP4+ routing protocols only.

Syntax `show ipv6 prefix-list [<name>|detail|summary]`

Parameter	Description
<name>	Specify the name of an individual IPv6 prefix list.
`detail`	Specify this parameter to show detailed output for all IPv6 prefix lists.
`summary`	Specify this parameter to show summary output for all IPv6 prefix lists.

Mode User Exec and Privileged Exec

Example

```
awplus# show ipv6 prefix-list
awplus# show ipv6 prefix-list 10.10.0.98/8
awplus# show ipv6 prefix-list detail
```

Related Commands ipv6 prefix-list (IPv6 Prefix List)

show ip protocols bgp (BGP)

Use this command to display BGP process parameters and statistics.

For information on output options, see **"Controlling "show" Command Output" on page 45.6**.

Syntax `show ip protocols bgp`

Mode User Exec and Privileged Exec

Example To display BGP process parameters and statistics, use the command:

```
awplus# show ip protocols bgp
```

Output

```
Routing Protocol is "bgp 100"
  IGP synchronization is disabled
  Automatic route summarization is disabled
  Default local-preference applied to incoming route is 100
  Redistributing:
  Neighbor(s):
  Address AddressFamily FiltIn FiltOut DistIn DistOut RouteMapIn RouteMapOut
Weight
10.10.10.1              unicast
```

show route-map (Route Map)

Use this command to display information about one or all route maps.

Syntax `show route-map <map-name>`

Parameter	Description
<map-name>	A name to identify the route map.

Mode User Exec and Privileged Exec

Example To display information about the route-map named `example-map`, use the command:

```
awplus# show route-map example-map
```

Output **Figure 45-17: Example output from the show route-map command**

```
route-map example-map, permit, sequence 1
  Match clauses:
    ip address prefix-list example-pref
  Set clauses:
    metric 100
route-map example-map, permit, sequence 200
  Match clauses:
  Set clauses:
```

Related Commands route-map (Route Map)

synchronization (BGP and BGP4+)

Use this command in Router Configuration mode or in Address Family Configuration mode to ensure BGP does not advertise router learned from iBGP peers until they are learned locally, or are propagated throughout the AS via an IGP.

Use the **no** variant of this command to disable this function.

Syntax

```
synchronization
no synchronization
```

Default Disabled.

Mode Router Configuration and Address Family Configuration mode

Usage Synchronization is used when a BGP router should not advertise routes learned from iBGP neighbors, unless those routes are also present in an IGP (for example, OSPF). These routes must be in the RIB (Routing Information Base) learned locally or via an IGP.

Synchronization may be enabled when all the routers in an autonomous system do not speak BGP, and the autonomous system is a transit for other autonomous systems.

Use the **no synchronization** command when BGP router can advertise routes learned from iBGP neighbors, without waiting for IGP reachability, when routes are in the RIB.

Example The following example enables IGP synchronization of iBGP routes in Router Configuration mode:

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# synchronization
```

The following example enables IGP synchronization of iBGP routes in IPv4 unicast Address Family Configuration mode:

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config)# address-family ipv4 unicast
awplus(config-af)# synchronization
```

The following example enables IGP synchronization of iBGP routes in the IPv6 unicast Address Family Configuration mode:

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config)# address-family ipv6 unicast
awplus(config-af)# synchronization
```

timers (BGP and BGP4+)

Use this command sets the BGP keepalive timer and holdtime timer values.

Use the **no** variant of this command to reset timers to the default.

Syntax

```
timers bgp <keepalive> <holdtime>
no timers bgp [<keepalive> <holdtime>]
```

Parameter	Description
<keepalive>	*<0-65535>* The frequency with which the keepalive messages are sent to the neighbors. The default is 30 seconds as per RFC 4271. Cisco IOS uses a 60 second keepalive timer default value. Adjust keepalive timers for interoperability as required. Maintain the keepalive value at the holdtime value / 3.
<holdtime>	*<0-65535>* The interval after which the neighbor is considered dead if keepalive messages are not received. The default holdtime value is 90 seconds as per RFC 4271. Cisco IOS uses a 180 second holdtime timer default value. Adjust holdtime timers for interoperability as required. Maintain the holdtime value at the keepalive value * 3.

Default The keepalive timer default is 60 seconds, the holdtime timer default is 90 seconds, and the connect timer default is 120 seconds as per RFC 4271. Holdtime is keepalive * 3.

Mode Router Configuration

Usage This command is used globally to set or unset the keepalive and holdtime values for all the neighbors.

Examples

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# timers bgp 40 120
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no timers bgp 30 90
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no timers bgp
```

Related Commands

neighbor timers (BGP and BGP4+)
show ip bgp neighbors hold-time (BGP)
show ip bgp neighbors keepalive-interval (BGP)

undebug bgp (BGP)

Use this command to disable BGP debugging functions.

Syntax

```
undebug bgp [all|dampening|events|filters|fsm|keepalives|nht|nsm|
    updates]

undebug all bgp
```

Parameter	Description
`all`	Disable all debugging for BGP.
`dampening`	Disable debugging for BGP dampening.
`events`	Disable debugging for BGP events.
`filters`	Disable debugging for BGP filters.
`fsm`	Disable debugging for BGP Finite State Machine (FSM).
`keepalives`	Disable debugging for BGP keepalives.
`nht`	Disable debugging for BGP NHT (Next Hop Tracking) messages.
`nsm`	Disable debugging for NSM messages.
`updates`	Disable debugging for BGP updates.

Mode Privileged Exec and Global Configuration

Example

```
awplus# undebug bgp events
awplus# undebug bgp nht
awplus# undebug bgp updates
```

Configuring route maps for filtering and modifying OSPF routes 46.5
Configuring a match clause 46.5
Configuring a set clause 46.6
Applying route maps in OSPF 46.7

Introduction

This chapter introduces route maps for filtering in BGP and OSPF. For details about the commands used in these examples, or the outputs from validation commands, see **Chapter 47, Route Map Commands**.

Route maps offer a complex combination of match criteria and actions. They can be used to filter BGP and OSPF routes and also to alter the attributes in BGP update messages.

Structure of a route map

There are various levels of structure within a route map:

- A route map is an entity with a name
- Each route map consists of multiple entries, identified by sequence numbers
- Each entry can consist of multiple clauses

In effect, an entry defines an individual filter. It can have a **match** clause that defines what it will match on, and it can have multiple **set** clauses that can specify actions to be taken.

A BGP update packet or a route is matched against each entry in turn. Once an entry is found that matches the packet or route, the action(s) associated with that entry is (are) performed, and no further entries are considered.

For example, if you create an entry that will permit an update packet, followed by an entry that would deny that packet, the packet is permitted. As another example, if you create two conflicting set clauses, the first change is applied, not the second.

There is an implicit "match all" filter at the end of the route map. The action on that implicit entry is **deny**. By default, any update packet or route that does not explicitly match any particular entry in the route map will be dropped.

You can change this by ending the route map with a "permit all" clause, such as the following:

```
awplus(config)#  route-map <map-name> permit 65535
```

Clauses

There are two types of clauses that can be present in a route map entry:

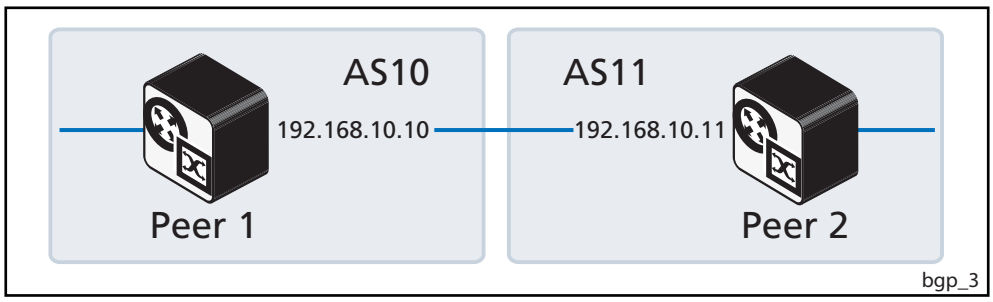
- match clauses, which specify attributes or prefixes to match on
- set clauses, which specify the changes to be made to attribute values

A given route map entry can never have more than one match clause, but it can have multiple set clauses.

Route-Map example for filtering BGP

This section contains a simple example of use of a route map. For detailed information and examples, see **How To Use Route Maps and Other Filters to Filter and Alter BGP and OSPF Routes**. This How To Note is available from the **documentation library at alliedtelesis.com**.

Use route-maps to filter incoming updates from a BGP peer. In this example, a prefix-list `list1` on Peer 1 is configured to deny entry of any routes with the IP address `1.1.1.0/M (M = 26,27,28)`. To test the filter, Peer 2 is configured to generate network addresses `1.1.1.0/27` and `1.1.2.0/24`. To verify, use the **show ip bgp (BGP)** command on page 45.221 on Peer 1; it displays Peer 1 receiving updates from only `1.1.2.0/24`.



Peer 1

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`ip prefix-list prefixlist1 seq 5 deny 1.1.1.0/24 ge 26 le 28`	Create the prefix-list named `prefixlist1` as shown opposite. `prefixlist1` contains two entries. The first entry with a deny action is to not match any routes in the `1.1.1.0/24` range that have prefix lengths from `26` to `28` (inclusive). The second entry allows all other routes.
`awplus(config)#`	
`ip prefix-list prefixlist1 seq 10 permit any`	Also note the sequence number (`seq 5 seq 10`) in the prefix-list specifies the sequence for each entry.
`awplus(config)#`	
`route-map routemap1 permit 1`	Enter the route-map mode to set the match operation.
`awplus(config-route-map)#`	
`match ip address prefix-list prefixlist1`	Set the match criteria. This match criterion on this route-map entry is to match the incoming route updates against the prefix-list prefixlist1. If a route matches the permit criteria of the prefix-list prefixlist1, then packets are permitted by the route-map, since this route-map entry has a permit action. Because this is the only entry route-map, all routes that are not permitted by this entry route-map will be dropped.

Peer 1(cont.)

`awplus(config-route-map)#`	
`exit`	Exit the Route-map mode and return to Global Configuration mode.
`awplus(config)#`	
`router bgp 10`	Define the routing process. The number 10 specifies the AS number of R1.
`awplus(config-router)#`	
`neighbor 192.168.10.11 remote-as 11`	Define BGP neighbors. 192.168.10.11 is the IP address of the neighbor (Peer 2) and 11 is the neighbor's AS number.
`awplus(config-router)#`	
`neighbor 192.168.10.11 route-map routemap1 in`	The route-map is now applied as the filter for route updates that are received from the neighbor 192.168.10.11. Routes are accepted from the neighbor 192.168.10.11 if they match the permit criteria of route-map routemap1.

Peer 2

`awplus(config)#`	
`router bgp 11`	Define the routing process. The number 11 specifies the AS number of Peer 2.
`awplus(config-router)#`	
`neighbor 192.168.10.10 remote-as 10`	Define BGP neighbors. 192.168.10.10 is the IP address of the neighbor (Peer 1) and 10 is the neighbor's AS number.
`awplus(config-router)#`	
`network 1.1.1.0/27`	Specify a route to be advertised by the BGP routing process.
`awplus(config-router)#`	
`network 1.1.2.0/24`	Specify a route to be advertised by the BGP routing process.

Names of Commands Used

ip prefix-list
neighbor remote-as (BGP and BGP4+)
route-map
match ip address
network (BGP and BGP4+)

Validation Commands

show ip bgp (BGP)

Configuring route maps for filtering and modifying OSPF routes

Route maps can be applied to OSPF routes as well as BGP routes. Of course, the route maps that can be used with OSPF are rather limited in comparison with those that are used with BGP, as OSPF route updates do not carry attributes in the way that BGP route updates do.

OSPF route maps can be applied to importing:

- OSPF-learnt routes into the main IP route table, or
- static, BGP or RIP routes into OSPF

Filtering **cannot**:

- remove an entry from the LSA database once the entry has been added
- prevent the switch from advertising an entry to interfaces in the same area that the entry is relevant to
- prevent updates that OSPF learns from being put into the LSA database
- change the properties of an entry in the LSA database

This is because OSPF shares LSAs between all the routers in an area. The protocol assumes that all the routers in the area have shared all the advertisements among each other, and that all agree on the state of the complete link state database for the area. If some routers in the area are learning, but not advertising, that breaks the OSPF model.

Configuring a match clause

A match clause can match on the following clauses.

When configuring a match clause, make sure you are in route map mode. The prompt should look like:

```
awplus(config-route-map)#
```

Metric

The entry will match all routes whose metric is equal to that specified in the clause.

To match a metric value, use the command:

```
match metric <value>
```

Interface

The entry will match all routes learnt via the specified VLAN.

To match a VLAN, use the command:

```
match interface <vlan>
```

External route type

The entry will match all routes of either Type 1 External or Type 2 External.

To match a route type, use the command:

```
match external {type-1|type-2}
```

A prefix, by using a prefix list

The entry will match one or more route prefixes.

Once you have made the prefix list, apply it to the match clause of a route map entry by using the command:

```
match ip address prefix-list <list-name>
```

A prefix, by using an ACL

An ACL is an alternative to a prefix list for matching route prefixes.

Once you have made the ACL, apply it to the match clause of a route map entry by using the command:

```
match ip address <acl-number-or-name>
```

A next hop address

The entry will match the route's next hop.

You can use either a prefix list or an ACL to specify a next hop address. Once you have made the prefix list or ACL, apply it to the match clause of a route map entry by using one of the commands:

```
match ip next-hop prefix-list <list-name>
```

```
match ip next-hop <acl-number-or-name>
```

Configuring a set clause

If a route matches the **match** clause, then the action of the route map entry will be applied to that route. The action might simply be to permit or deny the route, or it might be to update its parameters by applying one or more **set** clauses.

When configuring a set clause, make sure you are in route map mode for the same route map name sequence number as you used for the match clause. The prompt should look like:

```
awplus(config-route-map)#
```

A set clause can alter the following parameters on a route.

Metric This changes the route metric. You can:

- Set the metric, by using the command:

```
set metric <0-4294967295>
```

- Increase or decrease the metric by a specified amount, by using one of the commands:

```
set metric +<amount>
```

```
set metric -<amount>
```

For example, to increase the metric by 2, use the command:

```
set metric +2
```

Note defining the OSPF metric in a route map supersedes the metric defined using a **redistribute (OSPF)** or a **redistribute (IPv6 OSPF)** command.

See the section **OSPF Metrics** in the **OSPF Introduction and Configuration** chapter for more information about OSPF metrics.

See the section **OSPFv3 Metrics** in the **OSPFv3 for IPv6 Introduction and Configuration** chapter for more information about OSPFv3 metrics.

Next hop This specifies the next hop for matching routes.

Use the command:

```
set ip next-hop <ipadd>
```

Type This sets the route type to either Type 1 External or Type 2 External.

Use the command:

```
set metric-type {type-1|type-2}
```

Applying route maps in OSPF

To specify a route map to be applied to static, BGP, RIP or connected routes as they are imported to OSPF, use the commands:

```
router ospf
redistribute {bgp|rip|connected|static} route-map <map-name>
```

Note that if you want to filter OSPF routes as they are imported into the main IP route table, you need to use a distribute filter instead of a route map.

Use commands like the following:

```
router ospf 88
distribute-list list1 in
```

Chapter 47: Route Map Commands

Command List 47.2
match as-path 47.2
match community 47.4
match interface 47.6
match ip address 47.7
match ip next-hop 47.9
match ipv6 address 47.11
match ipv6 next-hop 47.12
match metric 47.13
match origin 47.14
match route-type 47.15
match tag 47.16
route-map 47.17
set aggregator 47.19
set as-path 47.20
set atomic-aggregate 47.21
set comm-list delete 47.22
set community 47.23
set dampening 47.25
set extcommunity 47.27
set ip next-hop (route map) 47.29
set ipv6 next-hop 47.30
set local-preference 47.31
set metric 47.32
set metric-type 47.34
set origin 47.35
set originator-id 47.36
set tag 47.37
set weight 47.38
show route-map 47.39

Command List

This chapter provides an alphabetical reference for route map commands. These commands can be divided into the following categories:

- **route-map** command, used to create a route map and/or route map entry, and to put you into route map mode
- **match** commands, used to determine which routes or BGP update messages the route map applies to
- **set** commands, used to modify matching routes or BGP update messages

match as-path

Use this command to add an autonomous system (AS) path match clause to a route map entry. Specify the AS path attribute value or values to match by specifying the name of an AS path access list. To create the AS path access list, enter Global Configuration mode and use the **ip as-path access-list** command.

A BGP update message matches the route map if its attributes include AS path values that match the AS path access list.

Each entry of a route map can only match against one AS path access list in one AS path match clause. If the route map entry already has an AS path match clause, entering this command replaces that match clause with the new clause.

Note that AS path access lists and route map entries both specify an action of deny or permit. The action in the AS path access list determines whether the route map checks update messages for a given AS path value. The route map action and its **set** clauses determine what the route map does with update messages that contain that AS path value.

Use the **no** variant of this command to remove the AS path match clause from a route map entry.

Syntax

```
match as-path <as-path-listname>
no match as-path [<as-path-listname>]
```

Parameter	Description
<as-path-listname>	Specifies an AS path access list name.

Mode Route-map Configuration

Usage This command is valid for BGP update messages only.

Example To add entry `34` to the route map called `myroute`, which will discard update messages if they contain the AS path values that are included in `myaccesslist`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute deny 34
awplus(config-route-map)# match as-path myaccesslist
```

Related Commands

ip as-path access-list (BGP and BGP4+)
route-map
set as-path
show route-map

match community

Use this command to add a community match clause to a route map entry. Specify the community value or values to match by specifying a community list. To create the community list, enter Global Configuration mode and use the **ip community-list (BGP and BGP4+)** command.

A BGP update message matches the route map if its attributes include community values that match the community list.

Each entry of a route map can only match against one community list in one community match clause. If the route map entry already has a community match clause, entering this command replaces that match clause with the new clause.

Note that community lists and route map entries both specify an action of deny or permit. The action in the community list determines whether the route map checks update messages for a given community value. The route map action and its **set** clauses determine what the route map does with update messages that contain that community value.

Use the **no** variant of this command to remove the community match clause from a route map.

Syntax

```
match community {<community-listname>|<1-99>|<100-199>}[exact-match]
no match community [<community-listname>|<1-99>|<100-199>|exact-
    match]
```

Parameter	Description
<community-listname>	The community list name or number.
<1-99>	Community list number (standard range).
<100-199>	Community list number (expanded range).
exact-match	Exact matching of communities.

Mode Route-map Configuration

Usage This command is valid for BGP update messages only.

Communities are used to group and filter routes. They are designed to provide the ability to apply policies to large numbers of routes by using match and set commands. Community lists are used to identify and filter routes by their common attributes.

Example To add entry `3` to the route map called `myroute`, which will process update messages if they contain the community values that are included in `mylist`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# match community mylist
```

Related Commands

ip community-list (BGP and BGP4+)
route-map
set comm-list delete
set community
show route-map

match interface

Use this command to add an interface match clause to a route map entry. Specify the interface name to match.

A route matches the route map if its interface matches the interface name.

Each entry of a route map can only match against one interface in one interface match clause. If the route map entry already has an interface match clause, entering this command replaces that match clause with the new clause.

Use the **no** variant of this command to remove the interface match clause from the route map entry. Use the **no** variant of this command without a specified interface to remove all interfaces.

Syntax

```
match interface <interface>
no match interface [<interface>]
```

Parameter	Description
<interface>	The VLAN to match, e.g. `vlan2`.

Mode Route-map Configuration

Usage This command is valid for RIP and OSPF routes only.

Example To add entry `10` to the route map called `mymap1`, which will process routes if they use the interface `vlan1`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map mymap1 permit 10
awplus(config-route-map)# match interface vlan1
```

To remove all interfaces from the route map called `mymap1`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map mymap1 permit 10
awplus(config-route-map)# no match interface
```

Related Commands

match ip address
match ip next-hop
match route-type
match tag
route-map
show route-map

match ip address

Use this command to add an IP address prefix match clause to a route map entry. You can specify the prefix or prefixes to match by either:

- specifying the name of an access list. To create the access list, enter Global Configuration mode and use the **access-list** command.
- specifying the name of a prefix list. To create the prefix list, enter Global Configuration mode and use the **ip prefix-list** command.

A route matches the route map entry if the route's prefix matches the access list or prefix list.

Each entry of a route map can have at most one access list-based IP address match clause and one prefix list-based IP address match clause. If the route map entry already has one of these match clauses, entering this command replaces that match clause with the new clause.

Note that access lists, prefix lists and route map entries all specify an action of deny or permit. The action in the access list or prefix list determines whether the route map checks update messages and routes for a given prefix. The route map action and its **set** clauses determine what the route map does with routes that contain that prefix.

Use the **no** variant of this command to remove the IP address match clause from a route map entry. To remove a prefix list-based match clause you must also specify the **prefix-list** parameter.

Syntax

```
match ip address {<accesslistID>|prefix-list <prefix-listname>}
no match ip address [<accesslistID>]
no match ip address prefix-list <prefix-listname>
```

Parameter	Description
<accesslistID>	{*<access-list-name>*|<1-199>|<1300-2699>} The IP access list name or number.
<access-list-name>	The IP access list name.
<1-199>	The IP access list number.
<1300-2699>	The IP access list number (expanded range).
prefix-list	Use an IP prefix list to specify which prefixes to match.
<prefix-listname>	The prefix list name.

Mode Route-map Configuration

Usage The `match ip address` command specifies the IP address to be matched. If there is a match for the specified IP address, and `permit` is specified, the route is redistributed or controlled, as specified by the set action. If the match criteria are met, and `deny` is specified then the route is `not` redistributed or controlled. If the match criteria are `not` met, the route is neither accepted nor forwarded, irrespective of `permit` or `deny` specifications.

This command is valid for routes in BGP update messages, and for OSPF and RIP routes.

Examples

To add entry `3` to the route map called `myroute`, which will process routes that match the ACL called `List1`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# match ip address List1
```

To add entry `3` to the route map called `rmap1`, which will process routes that match the prefix list called `mylist`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# match ip address prefix-list mylist
```

Related Commands

access-list (extended numbered)
access-list (standard numbered)
ip prefix-list
route-map
show ip access-list
show route-map

match ip next-hop

Use this command to add a next-hop match clause to a route map entry. You can specify the next hop to match by either:

- specifying the name of an access list. To create the access list, enter Global Configuration mode and use the **access-list** command.
- specifying the name of a prefix list. To create the prefix list, enter Global Configuration mode and use the **ip prefix-list** command.

A route matches the route map if the route's next hop matches the access list or prefix list.

Each entry of a route map can have at most one access list-based next-hop match clause and one prefix list-based next-hop match clause. If the route map entry already has one of these match clauses, entering this command replaces that match clause with the new clause.

Note that access lists, prefix lists and route map entries all specify an action of deny or permit. The action in the access list or prefix list determines whether the route map checks update messages and routes for a given next-hop value. The route map action and its **set** clauses determine what the route map does with update messages and routes that contain that next hop.

Use the **no** variant of this command to remove the next-hop match clause from a route map entry. To remove a prefix list-based match clause you must also specify the prefix-list parameter.

Syntax

```
match ip next-hop {<accesslistID>|prefix-list <prefix-listname>}
no match ip next-hop [<accesslistID>]
no match ip next-hop prefix-list [<prefix-listname>]
```

Parameter	Description
<accesslistID>	{*<access-list-name>*|<1-199>|<1300-2699>} The IP access list name or number.
<access-list-name>	The IP access list name.
<1-199>	The IP access list number.
<1300-2699>	The IP access list number (expanded range).
prefix-list	Use an IP prefix list to specify which next hop to match.
<prefix-listname>	The prefix list name.

Mode Route-map Configuration

Usage This command is valid for BGP update messages and OSPF and RIP routes.

Examples

To add entry `3` to the route map called `rmap1`, which will process routes whose next hop matches the ACL called `mylist`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# match ip next-hop mylist
```

To add entry `3` to the route map called `mymap`, which will process routes whose next hop matches the prefix list called `list1`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map mymap permit 3
awplus(config-route-map)# match ip next-hop prefix-list list1
```

Related Commands

access-list (extended numbered)
access-list (standard numbered)
ip prefix-list
route-map
show ip access-list
show ip prefix-list
show route-map

match ipv6 address

Use this command to specify the match address of route.

Use the **no** variant of this command to remove the `match ipv6 address` entry.

Syntax

```
match ipv6 address {<access-list-name>|prefix-list <prefix-listname>}
no match ipv6 address [<access-list-name>|prefix-list <prefix-
    listname>]
```

Parameter	Description
<access-list-name>	The name of the IPv6 access list that specifies criteria for the addresses to match. Valid only with BGP and RIPng.
<prefix-listname>	The name of the IPv6 prefix list that specifies criteria for the addresses to be matched. Valid only with BGP and RIPng.

Mode Route-map Configuration

Usage The **match ipv6 address <access-list>** command specifies the IPv6 address to be matched. If there is a match for the specified IPv6 address, and `permit` is specified, the route is redistributed or controlled as specified by the set action. If the match criteria are met, and `deny` is specified, the route is not redistributed or controlled. If the match criteria are not met, the route is neither accepted nor forwarded, irrespective of `permit` or `deny` specifications.

The **match ipv6 address prefix-list** command specifies the entries of prefix-lists to be matched. If there is a match for the specified prefix-list entries, and `permit` is specified, the route is redistributed or controlled as specified by the set action. If the match criteria are met, and `deny` is specified, the route is not redistributed or controlled. If the match criteria are not met, the route is neither accepted nor forwarded, irrespective of `permit` or `deny` specifications.

Examples

```
awplus# configure terminal
awplus(config)# route-map rmap1 deny 1
awplus(config-route-map)# match ipv6 address rmap1

awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# match ipv6 address prefix-list mylist
```

match ipv6 next-hop

Use this command to specify a next-hop address to be matched by the route-map.

Use the **no** variant of this command to disable this function.

Syntax

```
match ipv6 next-hop {<access-list-name>|<ipv6-addr>|prefix-list
    <prefix-listname>}
```

```
no match ipv6 next-hop [<access-list-name>|<ipv6-addr>|prefix-list
    [<prefix-listname>]]
```

Parameter	Description
<access-list-name>	The name of the IPv6 access list that specifies criteria for the addresses to match.
<ipv6-addr>	The IPv6 address of the next hop. The IPv6 address uses the format X:X::X:X.
<prefix-listname>	The name of the IPv6 prefix list that specifies criteria for the addresses to be matched.

Mode Route-map Configuration

Usage The `match ipv6 next-hop` command specifies the next-hop address to be matched. If there is a match for the specified next-hop address, and `permit` is specified, the route is redistributed or controlled as specified by the set action. If the match criteria are met, and `deny` is specified, the route is not redistributed or controlled. If the match criteria are not met, the route is neither accepted nor forwarded, irrespective of `permit` or `deny` specifications.

Note This command is valid only for BGP.

Example

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# match ipv6 next-hop 2001:0db8::/32
```

match metric

Use this command to add a metric match clause to a route map entry. Specify the metric value to match.

A route matches the route map if its metric matches the route map's metric. A BGP update message matches the route map if its MED attribute value matches the route map's metric.

Each entry of a route map can only match against one metric value in one metric match clause. If the route map entry already has a metric match clause, entering this command replaces that match clause with the new clause.

Use the **no** variant of this command to remove the metric match clause from the route map entry.

Syntax

```
match metric <metric>
no match metric [<metric>]
```

Parameter	Description
<metric>	*<0-4294967295>* Specifies the metric value.

Mode Route-map Configuration

Usage This command is valid for BGP update messages and OSPF and RIP routes.

Example To stop entry `3` of the route map called `myroute` from processing routes with a metric of `888999`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# no match metric 888999
```

Related Commands

route-map
set metric
show route-map

match origin

Use this command to add an origin match clause to a route map entry. Specify the origin attribute value to match.

A BGP update message matches the route map if its origin attribute value matches the route map's origin value.

Each entry of a route map can only match against one origin in one origin match clause. If the route map entry already has an origin match clause, entering this command replaces that match clause with the new clause.

Use the **no** variant of this command to remove the origin match clause from the route map entry.

Syntax

```
match origin {egp|igp|incomplete}
no match origin [egp|igp|incomplete]
```

Parameter	Description
`egp`	Learned from an exterior gateway protocol.
`igp`	Learned from a local interior gateway protocol.
`incomplete`	Of unknown heritage, for example a static route.

Mode Route-map Configuration

Usage The origin attribute defines the origin of the path information. The **egp** parameter is indicated as an **e** in the routing table, and it indicates that the origin of the information is learned via Exterior Gateway Protocol. The **igp** parameter is indicated as an **i** in the routing table, and it indicates the origin of the path information is interior to the originating AS. The **incomplete** parameter is indicated as a **?** in the routing table, and indicates that the origin of the path information is unknown or learned through other means. If a static route is redistributed into BGP, the origin of the route is incomplete.

The **match origin** command specifies the origin to be matched. If there is a match for the specified origin, and **permit** is specified, the route is redistributed or controlled as specified by the set action. If the match criteria are met, and `deny` is specified, the route is not redistributed or controlled. If the match criteria are not met, the route is neither accepted nor forwarded, irrespective of **permit** or **deny** specifications.

This command is valid for BGP update messages only.

Example To add entry 34 to the route map called "rmap1", which will drop externally-originated routes, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute deny 34
awplus(config-route-map)# match origin egp
```

Related Commands
route-map
set origin
show route-map

match route-type

Use this command to add an external route-type match clause to a route map entry. Specify whether to match OSPF type-1 external routes or OSPF type-2 external routes.

An OSPF route matches the route map if its route type matches the route map's route type.

Each entry of a route map can only match against one route type in one match clause. If the route map entry already has a route type match clause, entering this command replaces that match clause with the new clause.

Use the **no** variant of this command to remove the route type match clause from the route map entry.

Syntax

```
match route-type external {type-1|type-2}
no match route-type external [type-1|type-2]
```

Parameter	Description
`type-1`	OSPF type-1 external routes.
`type-2`	OSPF type-2 external routes.

Mode Route-map Configuration

Usage Use the **match route-type external** command to match specific external route types. AS-external LSA is either Type-1 or Type-2. **external type-1** matches only Type 1 external routes, and **external type-2** matches only Type 2 external routes.

This command is valid for OSPF routes only.

Example To add entry `10` to the route map called `mymap1`, which will process type-1 external routes, use the commands:

```
awplus# configure terminal
awplus(config)# route-map mymap1 permit 10
awplus(config-route-map)# match route-type external type-1
```

Related Commands

match interface
match ip address
match ip next-hop
match tag
route-map
set metric-type
show route-map

match tag

Use this command to add a tag match clause to a route map entry. Specify the route tag value to match.

An OSPF route matches the route map if it has been tagged with the route map's tag value. Routes can be tagged through OSPF commands or through another route map's set clause.

Each entry of a route map can only match against one tag in one match clause. If the route map entry already has a tag match clause, entering this command replaces that match clause with the new clause.

Use the **no** variant of this command to remove the tag match clause from the route map entry.

Syntax

```
match tag <0-4294967295>
no match tag [<0-4294967295>]
```

Mode Route-map Configuration

Usage This command is valid for OSPF routes only.

Example To add entry 10 to the route map called `mymap1`, which will process routes that are tagged `100`, use the following commands:

```
awplus# configure terminal
awplus(config)# route-map mymap1 permit 10
awplus(config-route-map)# match tag 100
```

Related Commands

match interface
match ip address
match ip next-hop
match route-type
route-map
set tag
show route-map

route-map

Use this command to configure a route map entry, and to specify whether the device will process or discard matching routes and BGP update messages.

The switch uses a name to identify the route map, and a sequence number to identify each entry in the route map.

The **route-map** command puts you into route-map configuration mode. In this mode, you can use the following:

- one or more of the **match** commands to create match clauses. These specify what routes or update messages match the entry.
- one or more of the **set** commands to create set clauses. These change the attributes of matching routes or update messages.

Use the **no** variant of this command to delete a route map or to delete an entry from a route map.

Syntax

```
route-map <mapname> {deny|permit} <seq>
no route-map <mapname>
no route-map <mapname> {deny|permit} <seq>
```

Parameter	Description
<mapname>	A name to identify the route map.
`deny`	The route map causes a routing process to discard matching routes or BGP update messages.
`permit`	The route map causes a routing process to use matching routes or BGP update messages.
<seq>	`<1-65535>` The sequence number of the entry. You can use this parameter to control the order of entries in this route map.

Mode Global Configuration

Usage Route maps allow you to control and modify routing information by filtering routes and setting route attributes. You can apply route maps when the device:

- processes BGP update messages that it has received from a peer
- prepares BGP update messages to send to peers
- redistributes routes from one routing protocol into another
- redistributes static routes into routing protocols
- uses BGP route flap dampening

When a routing protocol passes a route or update message through a route map, it checks the entries in order of their sequence numbers, starting with the lowest numbered entry.

If it finds a match on a route map with an action of permit, then it applies any set clauses and accepts the route. Having found a match, the route is not compared against any further entries of the route map.

If it finds a match on a route map with an action of deny, it will discard the matching route.

If it does not find a match, it discards the route or update message. This means that route maps end with an implicit deny entry. To permit all non-matching routes or update messages, end your route map with an entry that has an action of **permit** and no match clause.

Examples To enter route-map mode for entry 1 of the route map called `route1`, and then add a match and set clause to it, use the commands:

```
awplus# configure terminal
awplus(config)# route-map route1 permit 1
awplus(config-route-map)# match as-path 60
awplus(config-route-map)# set weight 70
```

To enter route-map mode for entry 2 of the route map called `route1`, and then add a match and set clause to it, use the commands:

```
awplus# configure terminal
awplus(config)# route-map route1 permit 2
awplus(config-route-map)# match interface vlan2
awplus(config-route-map)# set metric 20
```

Note how the prompt changes when you go into route map configuration mode.

To make the device process non-matching routes instead of discarding them, add a command like the following one:

```
awplus(config)# route-map route1 permit 100
```

Related Commands **show route-map**

For BGP:
bgp dampening (BGP and BGP4+)
neighbor default-originate (BGP and BGP4+)
neighbor route-map (BGP and BGP4+)
neighbor unsuppress-map (BGP and BGP4+)
network (BGP and BGP4+)
redistribute (into BGP or BGP4+) (BGP and BGP4+)
show ip bgp route-map (BGP)

For OSPF:
distribute-list (OSPF)
default-information originate (OSPF)
redistribute (OSPF)

For RIP:
redistribute (RIP)

set aggregator

Use this command to add an aggregator set clause to a route map entry.

When a BGP update message matches the route map entry, the device sets the update's aggregator attribute. The aggregator attribute specifies the AS and IP address of the device that performed the aggregation.

Use the **no** variant of this command to remove the set clause.

Syntax

```
set aggregator as <asnum> <ip-address>
no set aggregator as
```

Parameter	Description
<asnum>	The AS number of the aggregator.
<ip-address>	The IP address of the aggregator.

Mode Route-map Configuration

Usage An Autonomous System (AS) is a collection of networks under a common administration sharing a common routing strategy. It is subdivided by areas, and is assigned a unique 16-bit number. Use the **set aggregator** command to assign an AS number for the aggregator.

This command is valid for BGP update messages only.

Example To use entry `3` of the route map called `myroute` to set the aggregator attribute to `43 10.10.0.3` in matching update messages, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# set aggregator as 43 10.10.0.3
```

To remove all aggregator attributes for entry `3` of the route map called `myroute`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# no set aggregator as
```

Related Commands **route-map**
show route-map

set as-path

Use this command to add an AS path set clause to a route map entry.

When a BGP update message matches the route map entry, the device prepends the specified Autonomous System Number (ASN) or ASNs to the update's AS path attribute.

The AS path attribute is a list of the autonomous systems through which the announcement for the prefix has passed. As prefixes pass between autonomous systems, each autonomous system adds its ASN to the beginning of the list. This means that the AS path attribute can be used to make routing decisions.

Use the **no** variant of this command to remove the set clause.

Syntax

```
set as-path prepend <1-65535> [<1-65535>]...
no set as-path prepend [<1-65535> [<1-65535>]...]
```

Parameter	Description
`prepend`	Prepends the autonomous system path.
<1-65535>	The number to prepend to the AS path. If you specify multiple ASNs, separate them with spaces.

Mode Route-map mode

Usage Use the **set as-path** command to specify an autonomous system path. By specifying the length of the AS-Path, the device influences the best path selection by a neighbor. Use the `prepend` parameter with this command to prepend an AS path string to routes increasing the AS path length.

This command is valid for BGP update messages only.

Example To use entry `3` of the route map called `myroute` to prepend ASN `8` and `24` to the AS path of matching update messages, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# set as-path prepend 8 24
```

Related Commands **match as-path**
route-map
show route-map

set atomic-aggregate

Use this command to add an atomic aggregate set clause to a route map entry.

When a BGP update message matches the route map entry, the device adds the atomic aggregate attribute to the update.

Use the **no** variant of this command to remove the set clause.

Syntax

```
set atomic-aggregate
no set atomic-aggregate
```

Mode Route-map Configuration

Usage This command is valid for BGP update messages only.

Example To use entry `3` of the route map called `rmap1` to add the atomic aggregator attribute to matching update messages, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set atomic-aggregate
```

Related Commands **route-map**
show route-map

set comm-list delete

Use this command to delete one or more communities from the community attribute of a BGP update message. Specify the communities to delete by specifying a community list. To create the community list, enter Global Configuration mode and use the **ip community-list (BGP and BGP4+)** command.

When a BGP update message matches the route map entry, the device deletes the specified communities from the update's comm.unity attribute.

Use the **no** variant of this command to stop deleting the communities.

Syntax

```
set comm-list {<1-199>|<100-199>|<word>} delete
no set comm-list {<1-199>|<100-199>|<word>} delete
```

Parameter	Description
<1-99>	Standard community-list number.
<100-199>	Expanded community-list number.
<word>	Name of the Community-list.

Mode Route-map Configuration

Usage This command is valid for BGP update messages only.

Example To use entry `3` of the route map called `myroute` to delete the communities in community list `34` from matching update messages, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# set comm-list 34 delete
```

Related Commands
ip community-list (BGP and BGP4+)
match community
route-map
set community
show route-map

set community

Use this command to add a community set clause to a route map entry.

When a BGP update message matches the route map entry, the device takes one of the following actions:

- changes the update's community attribute to the specified value or values, or
- adds the specified community value or values to the update's community attribute, if you specify the **additive** parameter after specifying another parameter. or
- removes the community attribute from the update, if you specify the **none** parameter

Use the **no** variant of this command to remove the set clause.

Syntax

```
set community {[<1-65535>][AA:NN] [internet] [local-AS]
    [no-advertise] [no-export] [additive]}

no set community {[AA:NN] [internet] [local-AS] [no-advertise]
    [no-export] [additive]}

set community none

no set community none
```

Parameter	Description
<1-65535>	The AS number of the community as an integer not in AA:NN format.
AA:NN	The Autonomous System (AS) number of the community, in AA:NN format. AS numbers are assigned to the regional registries by the IANA (**www.iana.org**) and can be obtained from the registry in your region. AA and NN are both integers from 1 to 65535. AA is the AS number; NN is a value chosen by the ASN administrator.
`local-AS`	The community of routes that must not be advertised to external BGP peers (this includes peers in other members' Autonomous Systems inside a BGP confederation).
`internet`	The community of routes that can be advertised to all BGP peers.
`no-advertise`	The community of routes that must not be advertised to other BGP peers.
`no-export`	The community of routes that must not be advertised outside a BGP confederation boundary (a standalone Autonomous System that is not part of a confederation should be considered a confederation itself).
`none`	The device removes the community attribute from matching update messages.
`additive`	The device adds the specified community value to the update message's community attribute, instead of replacing the existing attribute. By default this parameter is not included, so the device replaces the existing attribute.

Mode Route-map Configuration

Usage This command is valid for BGP update messages only.

Examples To use entry `3` of the route map called `rmap1` to put matching routes into the no-advertise community, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set community no-advertise
```

To use entry `3` of the route map called `rmap1` to put matching routes into several communities, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set community 10:01 23:34 12:14 no-
export
```

To use entry `3` of the route map called `rmap1` to put matching routes into a single AS community numbered `16384`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set community 16384 no-export
```

Related Commands
match community
route-map
set aggregator
set comm-list delete
set extcommunity
show route-map

set dampening

Use this command to add a route flap dampening set clause to a route map entry.

Also use the route map by specifying it in the command **bgp dampening (BGP and BGP4+) route-map**.

When a route matches the route map entry, the device enables route flap dampening for that route. If the set clause includes dampening parameter values, the device uses those values when dampening the matching route.

Use the **no** variant of this command to remove the set clause. This disables dampening on matching routes.

Syntax

```
set dampening

set dampening [<reachtime>]

set dampening <reachtime> [<reuse> <suppress> <maxsuppress>]
    [<unreachtime>]

no set dampening

no set dampening [<reachtime>]

no set dampening <reachtime> [<reuse> <suppress> <maxsuppress>]
    [<unreachtime>]
```

Parameter	Description
<reachtime>	*<1-45>* The time it takes, in minutes, for the route's instability penalty to halve if the route remains stable. The instability penalty is called the Figure of Merit (FoM). For example, if reachtime is 15, the FoM of a stable route halves over a 15 minute period, quarters over a 30 minute period, and so on. The default is 15 minutes.
<reuse>	*<1-20000>* The value that the instability penalty (FoM) must reach for the device to use a suppressed route again. Once a route is suppressed, it remains suppressed until its FoM falls below this threshold. Reuse must not exceed suppress. The default is 750.
<suppress>	*<1-20000>* The instability penalty (FoM) at which the route is suppressed. Suppress must be greater than or equal to reuse. If suppress is less than 1000, a route is suppressed when it becomes unreachable for the first time. The default is 2000.
<maxsuppress>	*<1-255>* A number that is multiplied by reachtime to give the maximum time in minutes for which a suppressed route must remain stable in order to become unsuppressed. The lowest maxsuppress value of 1 gives a maximum suppression time of 1 x reachtime, and the highest maxsuppress value of 255 gives a maximum suppression time of 255 x reachtime. For example, if reachtime is 15 and maxsuppress is 4, the route is unsuppressed after 60 minutes of stability even if its FoM still exceeds reuse. The default is 4.

Parameter(cont.)	Description(cont.)
<unreachtime>	*<1-45>* The time it takes, in minutes, for the route's instability penalty to halve if the route remains unstable. The default is 15 minutes.

Mode Route-map Configuration

Usage The **suppress** value must be greater than or equal to the **reuse** value.

Set the unreachability half-life time to be equal to, or greater than, reachability half-life time. The suppress-limit value must be greater than or equal to the reuse limit value.

This command is valid for BGP routes only.

Example To use entry 24 of the route map called `R1` to enable dampening of matching routes and set the dampening parameters, use the commands:

```
awplus# configure terminal
awplus(config)# route-map R1 permit 24
awplus(config-route-map)# set dampening 20 333 534 30
```

Related Commands
bgp dampening (BGP and BGP4+)
route-map
show route-map

set extcommunity

Use this command to add an extended community set clause to a route map entry. A route map entry can have a route target extended community set clause, a site-of-origin extended community set clause, or both.

When a BGP update message matches the route map entry, the device sets the update's extended community attribute to the specified value or values.

Use the **no** variant of this command to remove the set clause.

Syntax

```
set extcommunity {rt|soo} <extcomm-number>
no set extcommunity {rt|soo} [<extcomm-number>]
```

Parameter	Description
`rt`	Configure a route target extended community. This consists of routers that will receive matching routes.
`soo`	Configure a site-of-origin extended community. This consists of routers that will inject matching routes into BGP.
<extcomm-number>	The extended community number, in the format AA:NN or IPADD:N.

Mode Route-map Configuration

Usage This command is valid for BGP update messages only.

Examples To use entry `3` of the route map called `rmap1` to set the route target extended community attribute to 06:01, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set extcommunity rt 06:01
```

To instead specify the extended community number in dotted decimal notation, use the command:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set extcommunity rt 0.0.0.6:01
```

To use entry `3` of the route map called `rmap1` to set the site-of-origin extended community attribute to 06:01, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set extcommunity soo 06:01
```

To instead specify the extended community number in dotted decimal notation, use the command:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set extcommunity soo 0.0.0.6:01
```

Related Commands

match community
route-map
set comm-list delete
set community
show route-map

set ip next-hop (route map)

Use this command to add a next-hop set clause to a route map entry.

When a route or BGP update message matches the route map entry, the device sets the route's next hop to the specified IP address.

Use the **no** variant of this command to remove the set clause.

Syntax

```
set ip next-hop <ip-address>
no set ip next-hop [<ip-address>]
```

Parameter	Description
<ip-address>	The IP address of the next hop, entered in the form A.B.C.D.

Mode Route-map Configuration

Usage Use this command to set the next-hop IP address to the routes.

This command is valid for BGP update messages, and OSPF and RIP routes.

Example To use entry 3 of the route map called `mymap` to give matching routes a next hop of 10.10.0.67, use the commands:

```
awplus# configure terminal
awplus(config)# route-map mymap permit 3
awplus(config-route-map)# set ip next-hop 10.10.0.67
```

Related Commands
match ip next-hop
route-map
show route-map

set ipv6 next-hop

Use this command to set a next hop-address.

Use the **no** variant of this command to delete an entry.

Syntax

```
set ipv6 next-hop {<ipv6-addr-global>|local <ipv6-addr>}
no set ipv6 next-hop [<ipv6-addr-global>|local [<ipv6-addr>]]
```

Parameter	Description
<ipv6-addr-global>	The IPv6 global address of next hop. The IPv6 address uses the format X:X::X:X.
`local`	Specifies that the address is local.
<ipv6-addr>	The IPv6 local address of next hop. The IPv6 address uses the format X:X::X:X.

Mode Route-map Configuration

Usage Use this command to set the next-hop IPv6 address to the routes.

This command is valid only for BGP.

Examples

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set ipv6 next-hop local
fe80::203:47ff:fe97:66dc
awplus(config-route-map)# no set ipv6 next-hop
```

set local-preference

This command changes the default local preference value.

The local preference indicates the BGP local preference path attribute when there are multiple paths to the same destination. The path with the higher preference is chosen.

Use this command to define the preference of a particular path. The preference is sent to all routers and access servers in the local autonomous system.

The **no** variant of this command reverts to the default setting.

Syntax

```
set local-preference <pref-value>
no set local-preference [<pref-value>]
```

Parameter	Description
<pref-value>	<0-4294967295> Configure local preference value. The default local preference value is 100.

Mode Route-map Configuration

Examples

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set local-preference 2345555
```

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-route-map)# no set local-preference
```

Related Commands For related Route Map commands:
route-map
show route-map

For related BGP commands:
bgp default local-preference (BGP)
neighbor route-map (BGP and BGP4+)

set metric

Use this command to add a metric set clause to a route map entry.

When a route or BGP update message matches the route map entry, the device takes one of the following actions:

- changes the metric (or for BGP, the MED attribute value) to the specified value, or
- adds or subtracts the specified value from the metric or MED attribute, if you specify **+** or **-** before the value (for example, to increase the metric by 2, enter +2)

Use the **no** variant of this command to remove the set clause.

Syntax

```
set metric {+<metric-value>|-<metric-value>|<metric-value>}
no set metric [+<metric-value>|-<metric-value> |<metric-value>]
```

Parameter	Description
+	Increase the metric or MED attribute by the specified amount.
–	Decrease the metric or MED attribute by the specified amount.
<metric-value>	<0-4294967295> The new metric or MED attribute value, or the amount by which to increase or decrease the existing value.

Default The default metric value for routes redistributed into OSPF and OSPFv3 is 20.

Mode Route-map Configuration

Usage For BGP, if you want the device to compare MED values in update messages from peers in different ASes, also enter the command **bgp always-compare-med (BGP and BGP4+)**. The device always compares MED values in update messages from peers in the same AS.

This command is valid for BGP update messages, and OSPF and RIP routes.

Note that defining the OSPF metric in a route map supersedes the metric defined using a **redistribute (OSPF)** or a **redistribute (IPv6 OSPF)** command.

See the section **OSPF Metrics** in the **OSPF Introduction and Configuration** chapter for more information about OSPF metrics, and see the section **OSPFv3 Metrics** in the **OSPFv3 for IPv6 Introduction and Configuration** chapter for more information about OSPFv3 metrics.

Examples To use entry `3` of the route map called `rmap1` to give matching routes a metric of `600`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set metric 600
```

To use entry 3 of the route map called rmap1 to increase the metric of matching routes by 2, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set metric +2
```

Related Commands

match metric
route-map
show route-maps

set metric-type

Use this command to add a metric-type set clause to a route map entry.

When a route matches the route map entry, the device sets its route type to the specified value.

Use the **no** variant of this command to remove the set clause.

Syntax

```
set metric-type {type-1|type-2}
no set metric-type [type-1|type-2]
```

Parameter	Description
`type-1`	Redistribute matching routes into OSPF as type-1 external routes.
`type-2`	Redistribute matching routes into OSPF as type-2 external routes.

Mode Route-map Configuration

Usage This command is valid for OSPF routes only.

Example To use entry `3` of the route map called `rmap1` to redistribute matching routes into OSPF as type-1 external routes, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set metric-type 1
```

Related Commands

default-information originate (OSPF)
redistribute (OSPF)
match route-type
route-map
show route-map

set origin

Use this command to add an origin set clause to a route map entry.

When a BGP update message matches the route map entry, the device sets its origin attribute to the specified value.

Use the **no** variant of this command to remove the set clause.

Syntax

```
set origin {egp|igp|incomplete}
no set origin [egp|igp|incomplete]
```

Parameter	Description
`egp`	Learned from an exterior gateway protocol.
`igp`	Learned from a local interior gateway protocol.
`incomplete`	Of unknown heritage, for example a static route.

Mode Route-map Configuration

Usage This command is valid for BGP update messages only.

Example To use entry `3` of the route map called `rmap1` to give matching update messages an origin of `egp`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set origin egp
```

Related Commands

match origin
route-map
show route-map

set originator-id

Use this command to add an originator ID set clause to a route map entry.

The originator ID is the router ID of the IBGP peer that first learned this route, either via an EBGP peer or by some other means such as importing it.

When a BGP update message matches the route map entry, the device sets its originator ID attribute to the specified value.

Use the **no** variant of this command to remove the set clause.

Syntax

```
set originator-id <ip-address>
no set originator-id [<ip-address>]
```

Parameter	Description
<ip-address>	The IP address of the originator, entered in the form A.B.C.D.

Mode Route-map Configuration

Usage This command is valid for BGP update messages only.

Example To use entry `3` of the route map called `rmap1` to give matching update messages an originator ID of `1.1.1.1`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set originator-id 1.1.1.1
```

Related Commands route-map
show route-map

set tag

Use this command to add a tag set clause to a route map entry.

When a route matches the route map entry, the device sets its tag to the specified value when it redistributes the route into OSPF.

Use the **no** variant of this command to remove the set clause.

Syntax

```
set tag <tag-value>
no set tag [<tag-value>]
```

Parameter	Description
<tag-value>	*<0-4294967295>* Value to tag matching routes with.

Mode Route-map Configuration

Usage This command is valid only when redistributing routes into OSPF.

Example To use entry 3 of the route map called `rmap1` to tag matching routes with the number 6, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set tag 6
```

Related Commands

default-information originate (OSPF)
redistribute (OSPF)
match tag
route-map
show route-map

set weight

Use this command to add a weight set clause to a route map entry.

The weight value assists in best path selection of BGP routes. It is stored with the route in the BGP routing table, but is not advertised to peers. When there are multiple routes with a common destination, the device uses the route with the highest weight value.

When a route matches the route map entry, the device sets its weight to the specified value.

Use the **no** variant of this command to remove the set clause.

Syntax

```
set weight <weight>
no set weight [<weight>]
```

Parameter	Description
<weight>	*<0-4294967295>* The weight value.

Mode Route-map Configuration

Usage This command is valid for BGP routes only.

Example To use entry `3` of the route map called `rmap1` to give matching routes a weight of `60`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set weight 60
```

Related Commands

route-map
show route-map

show route-map

Use this command to display information about one or all route maps.

Syntax `show route-map <map-name>`

Parameter	Description
<map-name>	A name to identify the route map.

Mode User Exec and Privileged Exec

Example To display information about the route-map named `example-map`, use the command:

```
awplus# show route-map example-map
```

Output **Figure 47-1: Example output from the show route-map command**

```
route-map example-map, permit, sequence 1

Static Inter-VRF Routing 48.14
Dynamic VRF Routing 48.15
Utilities Available within VRF-Lite 48.15
Utilities Unavailable within VRF-Lite 48.16

Introduction to VRF Lite

This chapter describes Virtual Routing and Forwarding Lite (VRF-Lite) on the switch. For detailed descriptions of the commands used to configure VRF-Lite, see **Chapter 49, VRF-Lite Commands**.

VRF Software Feature Licensing

To operate the VRF-Lite feature requires a special software license. A VRF-Lite feature license key is distributed in the Advanced Layer 3 License Bundle, which enables up to 8 VRF-Lite instances to be configured.

The number of configurable VRF-Lite instances can be increased via a an additional VRF-Lite-63 license. The advanced Layer 3 License Bundle containing the VRF-Lite feature that provides for the additional VRF-Lite instances is available though the AW+ licensing web portal (**http://licensing.alliedtelesis.com/**).

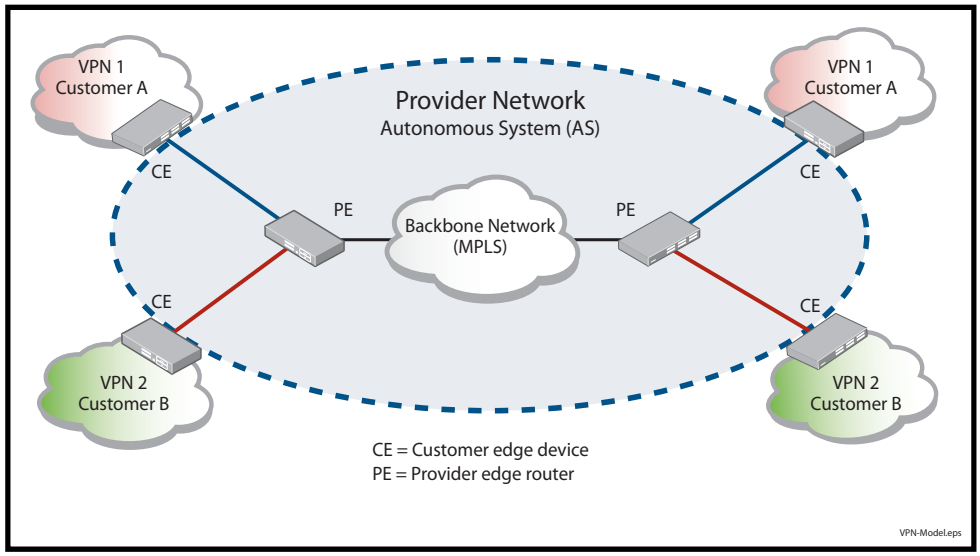
A VRF-Lite-63 license requires an Advanced Layer 3 License Bundle in order to operate.

Note Enabling multiple VRFs means that there will be more routing entries on the device system-wide. This may affect the number or routes used by BGP or OSPF specified by the license key on the device.

VRF-Lite

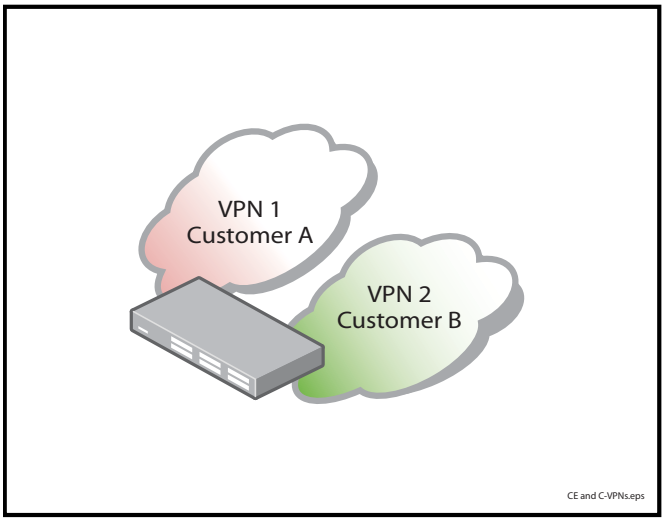
Virtual Routing and Forwarding Lite (VRF-Lite) provides a cut back (lightweight) version of the full VRF capability that is used to create large-scale Virtual Private Networks (VPNs). **Figure 48-1** shows a conceptual diagram of a VRF network that utilizes a Multiprotocol Label Switching (MPLS) network to transport the backbone traffic.

Figure 48-1: VRF network - conceptual diagram



In functional terms, VRF-Lite provides multiple customer VPNs within a single device. VRF-Lite can be considered to be VRF without the backbone network component. This concept is illustrated in **Figure 48-2** below:

Figure 48-2: VRF-Lite network - conceptual diagram

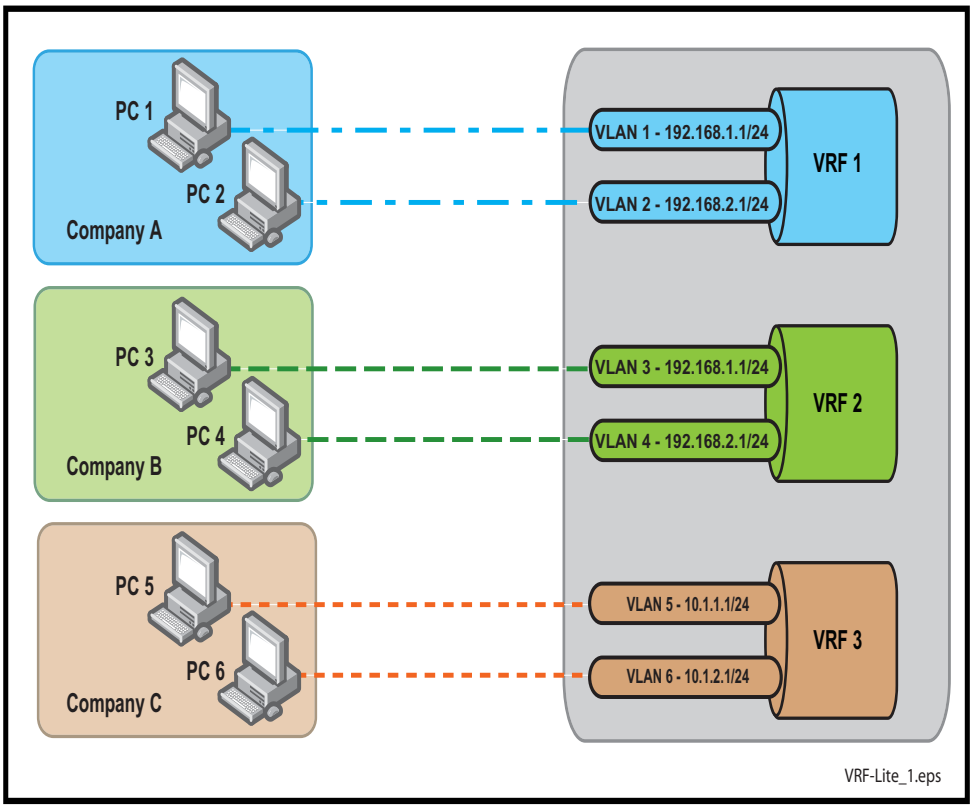


Within a single device, VRF-Lite provides the capability to operate up to 64 routing environments - called VRF instances. These are made up of 63 configurable VRF instances, plus the default Global VRF instance.

Figure 48-3 shows a device that is supporting three separate and independently operating private networks, each allocated to a particular company. Because each company's traffic is completely separate, their address ranges could overlap. For example, Company A and Company B could both use the same private address range such as 192.168.x.x.

Each interface on the device is assigned to one specific VRF instance. This enables traffic flow within VRF instances (routing domains), but prevents its flow between domains - unless specifically configured using techniques such as static routing or route leaking. Also notice that each VLAN is associated to one specific VRF instance. This association between VLANs and VRF instances is essential to the association of interfaces (and their connected devices, PCs etc) to VRF instances.

Figure 48-3: VRF-Lite switch with three company-allocated VRF instances



Conventionally, VRF uses BGP (Border Gateway Protocol) and its recently extended BGP route distinguishing features, together with MPLS. This combination enables the creation of completely separate individual networks to operate over a common physical network (VPN).

Extended VRF-Lite Support Environments

VRF-Lite also supports the following network environments:

- VRF-Lite is supported with VCStack (Virtual Chassis Stacking)
- Support for route limits
- User-configurable static and dynamic routing resource limits can be applied on a per-VRF basis using the commands:

  max-static-routes command on page 10.26

  max-fib-routes command on page 10.25

DNS and DHCP Relay Functionality

For more information on DNS and DHCP relay commands see

Supplementary Information

For more information on the above topics, refer to: **How to Configure VRF-Lite** at **http://www.alliedtelesis.com/support/documentation**.

Configuring VRF-Lite

This section provides an introduction to configuring VRF-Lite by showing simple examples of how VRF-Lite might be used. For a more in-depth explanation of VRF-Lite and more complex network configurations, refer to: **How to Configure VRF-Lite** at, **http://www.alliedtelesis.com/support/documentation**.

Creating and Partitioning VRF Instances

VRF-Lite enables your switch to maintain up to eight independent IP routing tables, plus a global routing and forwarding table, within which all IP routes are initially stored.

In VRF-Lite, an interface (a VLAN) can only be a member of either a single VRF instance, or of the global routing domain. Adding an interface to a VRF instance will automatically remove it from the Global VRF domain. Here are some short examples showing how to create VRF instances.

It is worth noting that although the VRF-Lite command-set contains commands to configure the Route Distinguisher and Address Families features, these entities are not mapped to components across the wide area network. Also, although within VRF-Lite these commands provide only a subset of their functionality for full VPN networking, they do still need to be configured in order to run VRF-Lite correctly.

Example A switch is located in a leisure complex and connects computer equipment in a cinema and a restaurant. Because the cinema and the restaurant are owned by different companies, their networks must be kept separate.

Use the following commands to create the VRF instance named **cinema**:

```
awplus# config terminal
awplus(config)# ip vrf cinema
```

Once you have created a VRF instance, you can assign one or more VLANs to it.

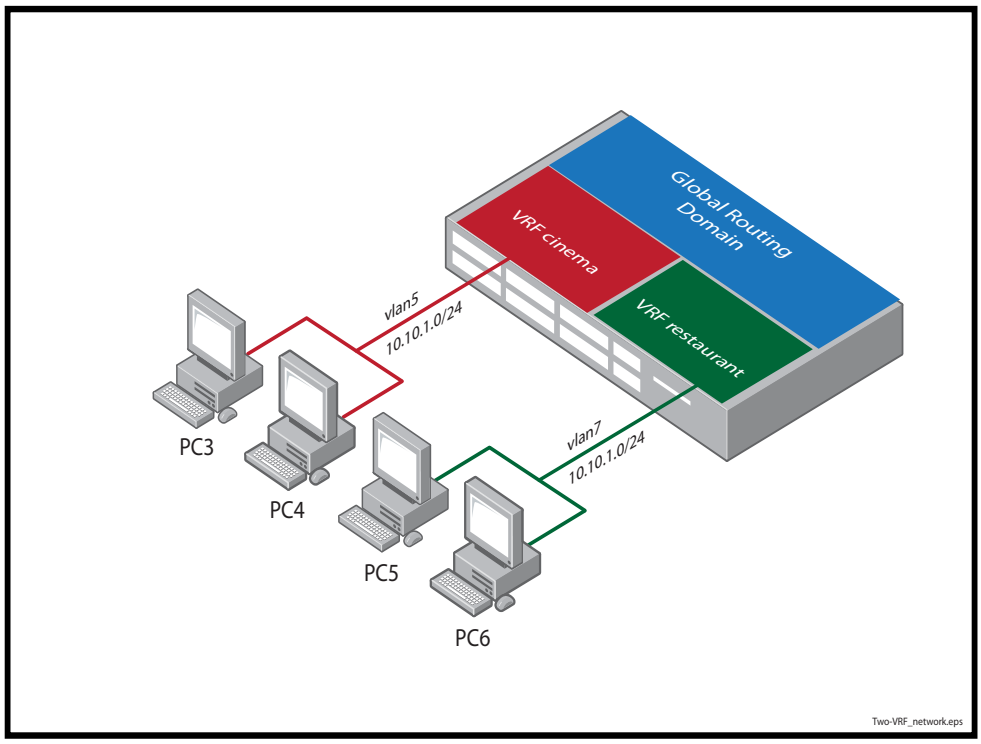
In the following example, VLAN 5 is added to the VRF instance **cinema**.

```
awplus# config terminal
awplus(config)# interface vlan5
awplus(config)# ip vrf forwarding cinema
```

Configuring a second VRF, named **restaurant** and associating this with **vlan7**, will result in the switch being configured to support the network shown in **Figure 48-4 on page 48.7**. In this configuration no inter domain routing exists. Each of the two VRF instances (cinema and restaurant) and the Global routing domain operate as completely separate and isolated routing environments.

Because of the isolation that exists between the routing instances, VRF instance **cinema** and VRF instance **restaurant** are both able to operate with the same IP subnet address ranges, 10.10.1.0/24.

Figure 48-4: Two VRF instance configuration



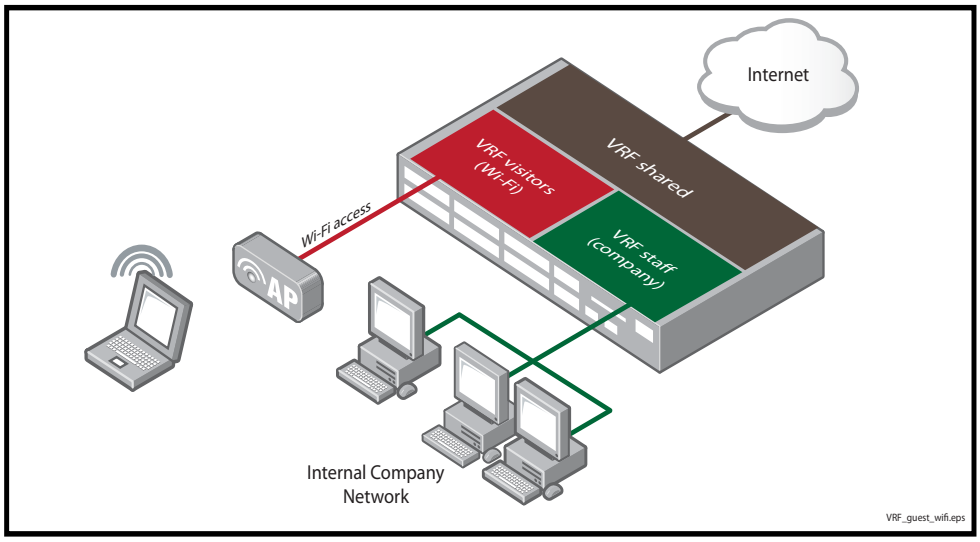
Sharing Connectivity Between VRF Instances

Occasionally you may want VRF instances to share a common connection. Here are two examples that show VRF-Lite being used to partition connectivity, whilst also permitting a degree of inter-domain connectivity.

Using VRF-Lite to share Internet connectivity

This first example is one where two VRF instances share a single Internet connection. In **Figure 48-5** a company's staff and its visitors share a common Internet connection. Company employees access the Internet using their own PCs via the corporate LAN, while company visitors gain access via a Wi-Fi connection on their laptops.

Figure 48-5: Using VRF-Lite to share Internet connectivity



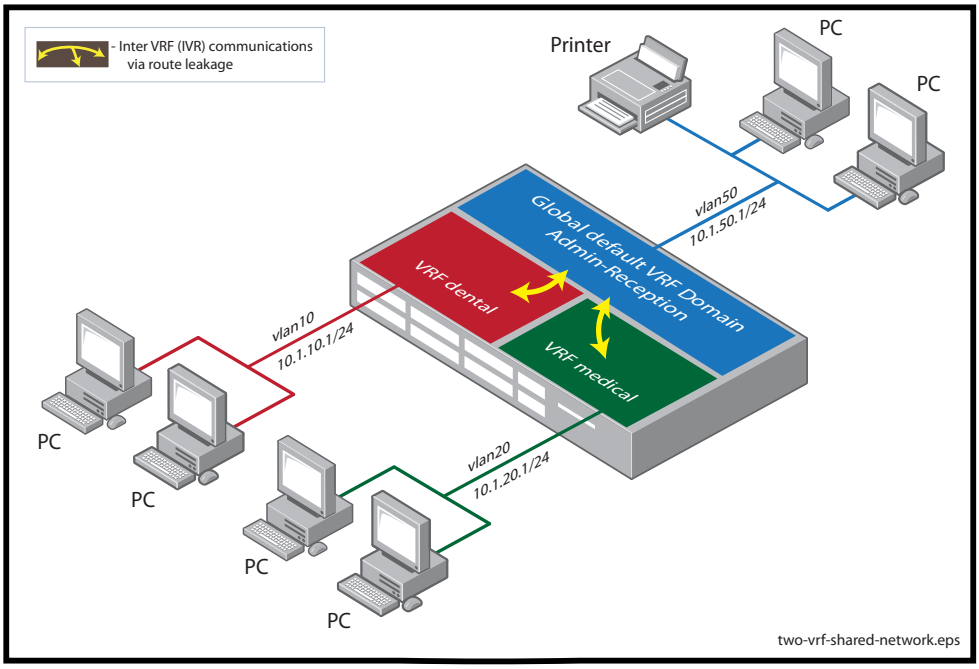
For security reasons the staff and visitor traffic must always be kept separate. The staff are able to access the network over physical (wired) connections and are collectively allocated the VRF instance name, **staff**. Company visitors are provided with wireless Wi-Fi access and are collectively allocated the VRF instance name, **visitors**. A third VRF instance named **shared** allows both staff and visitors to share the single internet connection.

Where duplicated addresses exist, the switch would be unable to determine the session originator of traffic returning from Internet-based sites. Therefore overlapping host addresses do not work in this configuration.

Using VRF-Lite to partially share a partitioned network

In the example, shown in **Figure 48-6**, a device running VRF-Lite is located in a medical centre that contains three areas, a dental clinic, a general practitioners surgery, and a central administration and reception area. For privacy reasons, patient records databases are held separately by the doctors and the dentists, each utilizing totally separate networks. The central admin area carries out functions such as appointments and billing for both clinical areas, and therefore requires some network sharing to specific devices such as an e-mail server and central printer etc. However, there is to be no direct connectivity between the networks belonging to the two clinical areas.

Figure 48-6: Practical network utilizing VRF-Lite domain partitioning



The following VRF instances, VLANs, and IP addresses are allocated.

- Central-Admin area
  - « Global Routing Domain
  - « VLAN 50 name, central-admin
  - « IP subnet 10.1.50.0/24
- Dental Clinic
  - « VRF instance, dental
  - « VLAN 10 name dental
  - « IP subnet 10.1.10.0/24
- Medical Surgery
  - « VRF instance, medical
  - « VLAN 20 name medical
  - « IP subnet 10.1.20.0/24

Here is how such a network could be configured:

Table 48-1: Configure the VRFs, VLANs, and IP Addresses on the switch

Description	Prompt	Command
Step 1. Configure the Global VRF Domain, its VLANs and IP addresses		
Note that you do not need to create the Global VRF domain, because this is always present.		
Create VLAN50 and name it "central-admin"		
Enter VLAN database mode.	`(config)#`	`vlan database`
Create VLAN 50, name it "**central-admin**" and enable it.	`(config-vlan)#`	`vlan 50 name central-admin state enable`
Return to Global Configuration mode.	`(config-vlan)#`	`exit`
Assign IP address 10.1.50.1/24		
Enter the Interface mode for VLAN50.	`(config)#`	`interface vlan50`
Assign an IP address to VLAN50	`(config-if)#`	`ip address 10.1.50.1/24`
Return to the Global Config mode	`(config-if)#`	`exit`
Return to the Privileged Exec mode	`(config)#`	`exit`
Step 2. Configure the dental VRF instance, its VLANs and IP addresses		
Create the VRF called dental.		
Enter Global Configuration mode.	`#`	`configure terminal`
Create the VRF instance called "**dental**".	`(config)#`	`ip vrf dental`
Create VLAN10 and name it "dental"		
Enter VLAN database mode.	`(config)#`	`vlan database`
Create VLAN 10 name it **"dental"** and enable it.	`(config-vlan)#`	`vlan 10 name dental state enable`
Return to Global Configuration mode.		`exit`
Assign VLAN 10 to VRF dental and IP address 10.1.10.1/24		
Enter the Interface mode for VLAN10.	`(config)#`	`interface vlan10`
Associate vlan10 with VRF instance dental.	`(config-if)#`	`ip vrf forwarding dental`

Table 48-1: Configure the VRFs, VLANs, and IP Addresses on the switch(cont.)

Description(cont.)	Prompt(cont.)	Command(cont.)
Assign an IP address to vlan10	`(config-if)#`	`ip address 10.1.10.1/24`
Return to the Global Config mode	`(config-if)#`	`exit`
Return to the Privileged Exec mode	`(config)#`	`exit`
Inspect the show output for correct configuration	`#`	`show ip vrf`

Step 3. Configure the medical VRF instance, its VLANs and IP addresses		
Create the VRF called medical.		
Enter Global Config Mode	`#`	`configure terminal`
Create the VRF instance called "**medical**".	`(config)#`	`ip vrf medical`
Create VLAN20 and name it "medical"		
Enter VLAN database mode.	`(config)#`	`vlan database`
Create VLAN 20 name it medical and enable it.	`(config-vlan)#`	`vlan 20 name medical state enable`
Return to Global Configuration mode.		`exit`
Assign VLAN 20 to VRF medical and IP address 10.1.20.1/24		
Enter the Interface mode for VLAN20.	`(config)#`	`interface vlan20`
Associate vlan20 with VRF instance medical.	`(config-if)#`	`ip vrf forwarding medical`
Assign an IP address to VLAN20		`ip address 10.1.20.1/24`
Return to the Global Config mode		`exit`
Return to the Privileged Exec mode	`(config)#`	`exit`
Inspect the show output for correct configuration	`#`	`show ip vrf`

Table 48-2: Configure static and default routes

Description	Prompt	Command
Step 1. Create the control and data VLANS on the Master Node		
For more information on creating static routes see the section **"Inter-VRF Routing" on page 48.13**.		
Enter the Global Configuration mode	#	`configure terminal`
Create a default route from the dental VRF domain to the central-admin global routing domain.		
Create a default route for the dental VRF	(config)#	`ip route vrf dental 0.0.0.0/0 vlan50`
Create a default route from the medical VRF domain to the central-admin global routing domain		
Create a default route for the medical VRF	(config)#	`ip route vrf medical 0.0.0.0/0 vlan50`
Create a default route to send 10.1.10.0/24 traffic from the central-admin network, to the dental network		
Create a default route for the VRF	(config)#	`ip route 10.1.10.0/24 vlan10`
Create a default route to send 10.1.20.0/24 traffic from the central-admin network to the medical network		
Create a default route for the VRF	(config)#	`ip route 10.1.20.0/24 vlan20`

Note The static routes set up in the above table only permit traffic flow between the central-admin area and each practice area. Traffic between the dental and medical areas remains blocked.

Intra-VRF Routing

Each VRF instance operates as a separate router, and therefore intra-VRF routing occurs in the same way as it does in a standard router.

For each VRF instance, the switch maintains a table of the current best routes to destinations - the routes that the switch uses for intra-VRF routing - which is called a Forwarding Information Base. Any static or connected routes you configure are automatically added to the instance's FIB.

If you configure routing protocols for a VRF instance, the switch also maintains Routing Information Bases (RIBs) for that instance. RIBs contain the routes from the routing protocols and are a source of routes for populating the instance's FIB.

A router creates and populates a RIB when you configure a routing protocol. Similarly, VRF lite creates and populates a RIB when you configure a routing protocol and associate it with a VRF instance.

Inter-VRF Routing

In some circumstances you may want to allow traffic between two interfaces that are located in different VRF instances. A common reason is to utilize shared network equipment or resources, such as an Internet connection or - as in the medical centre example - for separate organizations to share resources with a central admin area.

Inter-VRF routing can be achieved by either statically, or dynamically, taking a route entry and its next-hop interface from one VRF, and adding it into the routing table of another. A dynamic inter-VRF route can be added by using the BGP route import/export feature. A static inter-VRF route can be added by a user command. For more information on static routing, see **"Static Inter-VRF Routing" on page 48.14**.

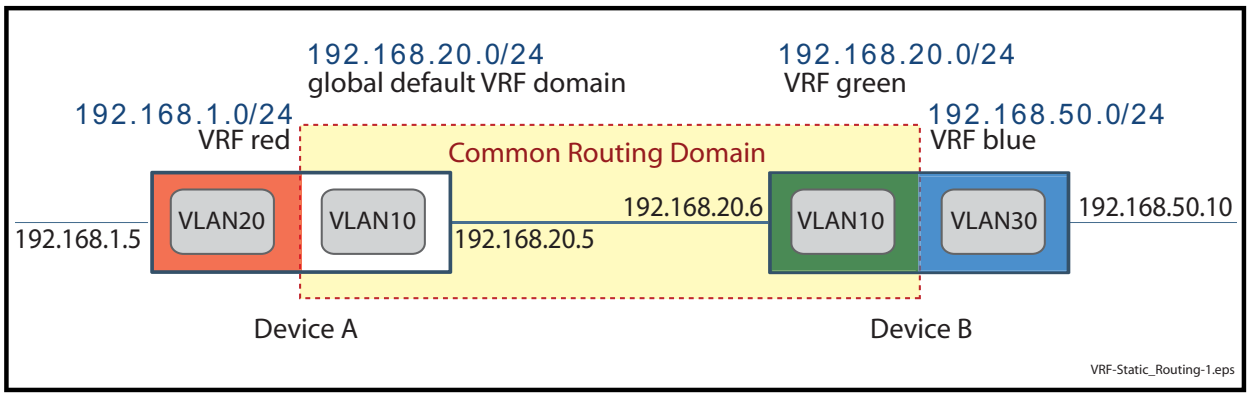
Static and dynamic inter-VRF communication can be applied simultaneously or separately. Dynamic inter-VRF communication is achieved using BGP. Routing protocols such as OSPF, and RIP cannot be used to achieve inter-VRF communication.

Note the difference between Inter-VRF routing (described above) and Intra-VRF routing. Inter-VRF routing is the process of transferring routes between different VRF instances within the switch (or router); whereas Intra VRF routing is the process of transferring routes between a specific VRF instance on the switch and other routers that share the same routing instance (or routing domain).

Static Inter-VRF Routing

Static inter-VRF routing (using VRF-Lite) involves creating static routes between VRF instances on the same device. **Figure 48-7** illustrates how static routing can be applied to achieve inter-VRF communication. Note that although each of the following steps creates a valid static route, creating too many inter-domain static routes may begin to defeat the purpose of using isolated VRF instances.

Figure 48-7: Inter-VRF communication using static routes



Configuring inter-VRF static routes with VRF-Lite

Static routes on Switch A	Static routes on Switch B
ip route vrf red 192.168.20.0/24 vlan10 This creates an inter-domain static route from the source vrf red, to the IP subnet 192.168.20.0/24 via vlan10, which is in the global VRF domain. See Footnote 1.	**ip route vrf blue 192.168.20.0/24 vlan10** This creates an inter-domain static route from the source vrf blue, to the IP subnet 192.168.20.0/24 via vlan10. See Footnote 1.
ip route 192.168.1.0/24 vlan20 This creates an inter-domain static route from the source global VRF domain, to the subnet 192.168.1.0/24 via vlan20. See Footnote 1.	**ip route vrf green 192.168.50.0/24 vlan30** This creates an inter-domain static route from the source vrf green, to the subnet 192.168.50.0/24 via vlan30. See Footnote 1.
ip route vrf red 192.168.50.0/24 192.168.20.6 vlan10 This creates an inter-domain static route from the source vrf red, to 192.168.50.0/24 with a next hop of 192.168.20.6 (egressing) via vlan10. See Footnote 1.	**ip route vrf blue 192.168.1.0/24 192.168.20.5 vlan10** This creates an inter-domain static route from the source vrf blue, to 192.168.1.0/24 with a next hop of 192.168.20.5 (egressing) via vlan10. See Footnote 1.
ip route 192.168.50.0/24 192.168.20.6 This creates a static route from the global VRF domain, to IP subnet 192.168.50.0/24 (VRF blue via switch B) with a next hop of 192.168.20.6. See Footnote 2.	**ip route vrf green 192.168.1.0/24 192.168.20.5** This creates a static route from the source vrf green, to 192.168.1.0/24 with a next hop of 192.168.20.5. See Footnote 2.

Footnotes

1. **Stating the target (egressing) VLAN is required when configuring static routes between VRF instances (inter-domain routing).**
2. **Stating the egressing VLAN is NOT required when configuring static routes within the same VRF instance (intra-domain routing).**

Dynamic VRF Routing

Another alternative to static inter VRF routes is to use dynamic routes managed by BGP. This entails further BGP configuration within the VRF instances using BGP Address Families and Route Targets (RTs). This advanced topic is beyond the scope of this introductory chapter. For more information see: **How to Configure VRF-Lite** at, **http://www.alliedtelesis.com/support/documentation**.

Utilities Available within VRF-Lite

A number of network utility and management features are now supported within a VRF-Lite environment. These include:

- Ping
- Trace Route
- Telnet Client
- SSH Client
- TCP Dump

Note that unless specifically configured with either static or leaked routes, these commands will not operate across routing domains. This is shown in the following examples:

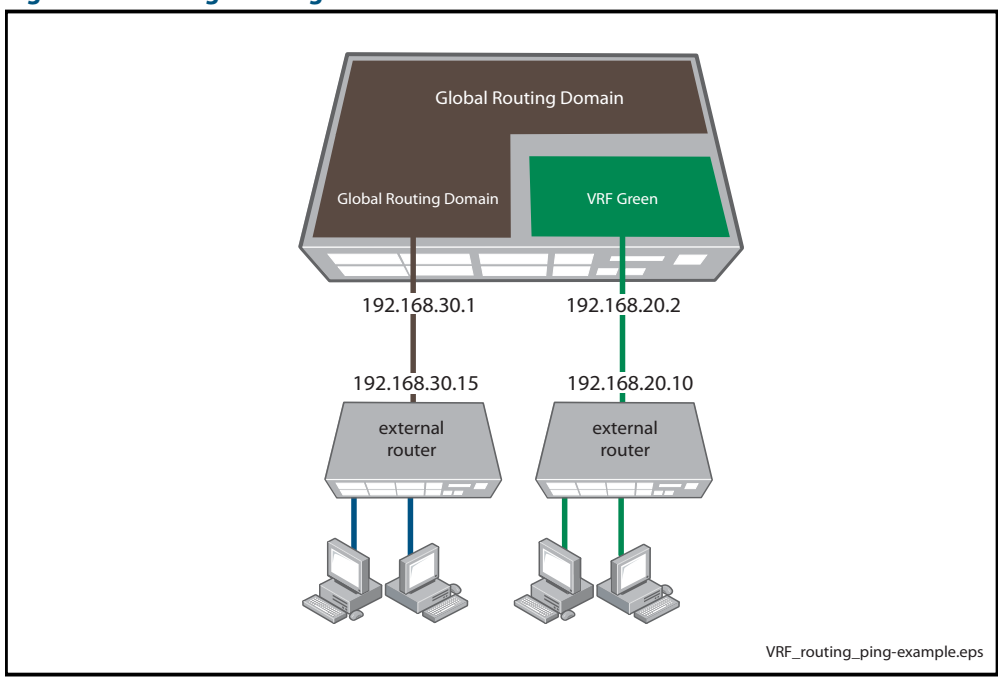
Example 1 In the example shown in **Figure 48-8**, use the following command to ping the IP address 192.168.30.15 from the global routing domain, to a destination that resides within the same domain:

```
awplus# ping 192.168.30.15
```

Example 2 In the example shown in **Figure 48-8**, use the following command to ping from within VRF green to destination the 192.168.20.10 that resides within the same routing domain

```
awplus# ping vrf green 192.168.20.10
```

Figure 48-8: Using the Ping command with VRF-Lite



Note Running the ping command across VRF instances, or from the Global Routing Domain to a target located within a VRF instance, will **not** work unless either static or leaked routes exist on both the source and target devices. See "Static Inter-VRF Routing" on page 14.

Utilities Unavailable within VRF-Lite

In this VRF-lite implementation, the following applications and Layer 4+ services are not supported on a per-VRF basis:

- Telnet Server
- SSH Server
- File Copy
- System Log
- SNMP Server
- DHCP server
- DHCP relay
- NTP Server

Although not supported within VRF instances, these services are supported in the global VRF domain context, which is equivalent to a non-VRF environment.

Chapter 49: VRF-Lite Commands

Introduction 49.3

Introduction

This chapter provides an alphabetical reference of commands used to configure Virtual Routing and Forwarding Lite (VRF-Lite). For more information about VRF-Lite, see **Chapter 48, VRF-Lite Introduction and Configuration**.

Command List

address-family (BGP and BGP4+)

This command enters the IPv4 address-family command mode for BGP. In this mode you can configure address-family specific parameters. When using VRF-Lite you can configure an address-family for a specific VRF instance.

Syntax

```
address-family ipv4 [unicast|vrf <vrf-name>]
no address-family ipv4 [unicast|vrf <vrf-name>]
```

This is an alias entry and provides a brief description to the main the **address-family (BGP and BGP4+)** command on page 45.8.

address-family ipv4 (RIP)

This command enters the IPv4 address-family command mode for RIP.

Syntax

```
address-family ipv4 vrf <vrf-name>
no address-family ipv4 vrf <vrf-name>
```

This is an alias entry and provides a brief description to the main the **address-family ipv4 (RIP)** command on page 36.4.

arp (IP address MAC)

This command adds a static ARP entry to the ARP cache. You can add ARP entries to either the global cache or for a specific VRF instance.

Syntax

```
arp [vrf <vrf-name>] <ip-addr> <mac-address> [<port-number>]
   [alias]
no arp [vrf <vrf-name>] <ip-addr>
```

This is an alias entry and provides a brief description to the main the **arp (IP address MAC)** command on page 27.6.

arp opportunistic-nd

This command enables and disables opportunistic neighbor discovery for a VRF instance when a VRF instance name is specified. If no VRF instance is specified then this command enables or disables opportunistic neighbor discovery for the global ARP cache.

Syntax

```
arp opportunistic-nd [vrf <vrf-name>]
no arp opportunistic-nd
```

This is an alias entry and provides a brief description to the main the **arp opportunistic-nd** command on page 27.11.

clear arp-cache

This command deletes the dynamic ARP entries either from the general ARP cache, or from the ARP cache of a specific VRF instance.

Syntax

```
clear arp-cache [<ip-address>]]
```

This is an alias entry and provides a brief description to the main the **clear arp-cache** command on page 27.13.

clear ip bgp * (BGP)

Use this command to reset all BGP connections within a specified VRF instance, either by fully resetting sessions, or by performing soft resets.

Syntax

```
clear ip bgp * [vrf <vrf-name>]
clear ip bgp * [vrf <vrf-name>] in
clear ip bgp * [vrf <vrf-name>] out
clear ip bgp * [vrf <vrf-name>] soft [in|out]
```

This is an alias entry and provides a brief description to the main the **clear ip bgp * (BGP)** command on page 45.50.

clear ip bgp (IPv4) (BGP)

Use this command to reset the IPv4 BGP connection to the peer specified by the IP address. When running VRF, you can apply this command per VRF Instance.

Syntax

```
clear ip bgp <ipv4-address> [vrf <vrf-name>] [in|out|soft [in|
   out]]
```

This is an alias entry and provides a brief description to the main the **clear ip bgp (IPv4) (BGP)** command on page 45.52.

clear ip rip route

Use this command to clear specific data from the RIP routing table, optionally for a specified VRF instance.

Syntax

```
clear ip rip [vrf <vrf-name>] route {<ip-dest-network/prefix-
   length> |static|connected|rip|ospf|bgp|all}
```

This is an alias entry and provides a brief description to the main the **clear ip rip route** command on page 36.6.

crypto key pubkey-chain knownhosts

This command adds a public key of the specified SSH server to the known host database on your switch. This command can be applied to specific VRF instances.

Syntax

```
crypto key pubkey-chain knownhosts [vrf <vrf-name>] [ip|ipv6]
   <hostname> [rsa|dsa|rsa1]

no crypto key pubkey-chain knownhosts [vrf <vrf-name>] <1-
   65535>
```

This is an alias entry and provides a brief description to the main the **crypto key pubkey-chain knownhosts** command on page 81.8.

default-metric (RIP)

Use this command to specify the metrics to be assigned to redistributed routes.

Syntax

```
default-metric <metric>

no default-metric [<metric>]
```

This is an alias entry and provides a brief description to the main the **default-metric (RIP)** command on page 36.9.

description (VRF)

Use this command to add text that describes a specific VRF instance. Descriptions can be up to 80 characters long.

The **no** variant of this command removes the description of the selected VRF instance.

Syntax

```
description <descriptive-text>
no description
```

Parameter	Description
<descriptive-text>	A string of up to 80 characters that describes the VRF instance.

Mode VRF Configuration

Example To add the description for a VRF instance named blue, use the following commands:

```
awplus# config terminal
awplus(config)# ip vrf blue
awplus(config-vrf)# description the text description of vrf
blue
```

Related Commands **show ip vrf**

distance (RIP)

This command sets the administrative distance for RIP routes. Your device uses this value to select between two or more routes to the same destination from two different routing protocols. When running VRF this command can be applied to specific VRF instances.

Syntax

```
distance <1-255> [<ip-addr/prefix-length> [<access-list>]]
no distance [<1-255>] [<ip-addr/prefix-length> [<access-
   list>]]
```

For more information on this command, see the **distance (RIP)** command on page 36.10.

distribute-list (RIP)

Use this command to filter incoming or outgoing route updates using the access-list or the prefix-list. When running VRF this command can be applied to specific VRF instances.

Syntax

```
distribute-list {<access-list> | prefix <prefix-list>} {in|
   out} [<interface>]
```

```
no distribute-list {<access-list> | prefix <prefix-list>} {in|
   out} [<interface>]
```

For more information on this command, see the **distribute-list (RIP)** command on page 36.11.

export map

This command associates a route map with a specific VRF instance. It provides a finer control over the routes that are exported out of a VRF instance by the **route-target** command. Note, however, that this command does not replace the need for a route-target export in the VRF configuration.

The **no** variant of this command disables the capability to export route map entries for a specified VRF instance.

Syntax

```
export map <route-map>
```

```
no export map
```

Parameter	Description
<route-map>	The route-map name.

Mode VRF Configuration

Usage Use this command to export route-map entries in VRF configuration mode.

Example To export the route map named routemap2 for the VRF instance named blue, use the following commands:

```
awplus# config terminal
awplus(config)# ip vrf blue
awplus(config-vrf)# export map routemap2
```

Related Commands **import map**

fullupdate (RIP)

Use this command to specify which routes RIP should advertise when performing a triggered update. By default, when a triggered update is sent, RIP will only advertise those routes that have changed since the last update. You can apply this command to either the global routing environment, or to specific VRF instances.

Syntax

```
fullupdate
no fullupdate
```

For more information on this command, see the **fullupdate (RIP)** command on page 36.13.

import map

The import map command associates a route map with a specific VRF instance. The import map command does not replace the need for a route-target import in the VRF configuration. It provides a finer control over the routes imported into a VRF instance by the **route-target** command.

The **no** variant of this command disables the capability to import route map entries for a specified VRF instance.

Syntax

```
import map <route-map>
no import map
```

Parameter	Description
<route-map>	The route-map name.

Mode VRF Configuration

Usage Use this command to import route-map entries into the specified VRF instance.

Example To import the route map named `routemap2` for the VRF instance named `blue`, use the following commands:

```
awplus# config terminal
awplus(config)# ip vrf blue
awplus(config-vrf)# import map routemap2
```

Related Commands **export map**

ip route static inter-vrf

Applying this command enables static inter-VRF routing. Note that static inter-VRF routing must be enabled before you can use the **ip route** command on page 49.9 to create a static inter-VRF route.

The **no** variant of this command disables static inter-vrf routing.

Syntax

```
ip route static inter-vrf
```

```
no ip route static inter-vrf
```

Mode VRF Configuration

Default Static inter-vrf routing is enabled.

Example To enable static inter-VRF routing, use the following commands:

```
awplus# config terminal
awplus(config)# ip route static inter-vrf
```

Related Commands **show ip route**

ip route

This command adds a static route to the Routing Information Base (RIB). If this route is the best route for the destination, then your device adds it to the Forwarding Information Base (FIB). Your device uses the FIB to advertise routes to neighbors and forward packets.

When using VRF (Virtual Routing and Forwarding), you can use this command to configure a static inter-VRF route to a destination network that is reachable by a remote gateway located in a different VRF instance. Note that to apply the command in this way, the **ip route static inter-vrf** command must be enabled (its default condition).

Syntax

```
ip route [vrf <vrf-name>] <subnet&mask> [<gateway-ip>]
   [<interface>] [<distance>]
```

```
no ip route [vrf <vrf-name>] <subnet&mask> [<gateway-ip>]
[<interface>] [<distance>]
```

This is an alias entry and provides a brief description to the main the **ip route** command on page 34.2.

ip vrf

This command creates a VRF instance and specifies its unique name. You can also optionally specify a VRF ID. If you do not specify the VRF ID, a unique ID will automatically be created and assigned to the VRF instance.

The **no** variant of this command removes a selected VRF instance. All interfaces previously belonging to the removed instance are then returned to the global routing and forwarding environment.

Syntax

```
ip vrf <vrf-name> [<vrf-inst-id>]
no ip vrf <vrf-name> [<vrf-inst-id>]
```

Parameter	Description
<vrf-name>	The name of the VRF instance.
<vrf-inst-id>	The ID of the VRF instance, a number in the range 1 to 8.

Mode Global Configuration

Default Static inter-vrf routing is enabled.

Example To create a VRF instance named `vrf blue` and assign it the ID number `2`, use the following commands:

```
awplus# config terminal
awplus(config)# ip vrf blue 2
```

ip vrf forwarding

This command associates a VRF instance with an interface.

The **no** variant of this command disassociates the VRF instance from its interface.

Syntax

```
ip vrf forwarding <vrf-name>
no ip vrf <vrf-name>
```

Parameter	Description
<vrf-name>	The name of the VRF instance.

Mode Interface Configuration

Default The default for an interface is the global routing table.

Examples For LAN interfaces, to associate the VRF instance named `blue` with the VLAN interface `vlan-admin`, use the following commands:

```
awplus# config terminal
awplus(config)# interface vlan-admin
awplus(config-if)# ip vrf forwarding blue
```

Related Commands show ip vrf
show ip vrf detail

max-fib-routes (VRF)

This command now enables you to control the maximum number of FIB routes configured for a VRF Instance. It operates by providing parameters that enable you to configure preset maximums and warning message thresholds.

Note

To set the max-fib-routes for the Global VRF, use the **max-fib-routes** command on page 10.25
To set static routes, for the Global VRF, use the **max-static-routes** command on page 10.26.
To set static routes, for a VRF Instance use the **max-static-routes** command on page 49.13.

Syntax

```
max-fib-routes <1-4294967294> [<1-100>|warning-only]

no max-fib-routes
```

Parameter	Description
`max-fib-routes`	The maximum number of routes that can be stored in Forwarding Information dataBase for either the Global VRF or a VRF instance.
`<1-4294967294>`	The allowable configurable range for setting maximum the number of FIB-routes.
`<1-100>`	This parameter enables you to optionally apply a percentage value. This percentage will be based on the maximum number of FIB routes you have specified. This will cause a warning message to appear when your routes reach your specified percentage value. Routes can continue to be added until your configured maximum value is reached.
`warning-only`	This parameter enables you to optionally apply a warning message. If you set this option a warning message will appear if your maximum configured value configured. Routes can continue to be added until your switch reaches either the maximum capacity value of 4294967294, or a practical system limit.

Mode VRF-Mode

Default Sets the maximum number of dynamic routes to `4294967294` and no warning threshold.

Examples To set the maximum number of dynamic routes to 2000 and warning threshold of 75%, on VRF instance blue, use the following commands:

```
awplus# config terminal
awplus(config)# ip vrf blue
awplus(config-vrf)# max-fib-routes 2000 75
```

Related Commands **max-fib-routes**
show ip route

max-static-routes

Use this command to set the maximum number of static routes (excluding FIB - Forwarding Information Base routes) for VRF Instances. A limit of 1000 static routes can be assigned to each individual VRF instance. For example you can assign 800 static routes to the Global VRF, then also assign 600 static routes to VRF instance Blue, and a further 600 routes to VRF instance Green.

Note
To set the max-static-routes for a the Global VRF Instance, use the **max-static-routes** command on page 10.26.
To set dynamic FIB routes, use the **max-fib-routes (VRF)** command on page 49.12.

Use the **no** variant of this command to reset the maximum number of static routes to the default value of 1000.

Syntax
```
max-static-routes <1-1000>
no max-static-routes
```

Default The default number of static routes is the maximum number of static routes (1000).

Mode VRF-Mode

Example To assign 200 static routes to VRF instance Blue, use the following commands:

```
awplus# configure terminal
awplus(config)# ip vrf blue
awplus(condig-vrf)# max-static-routes 200
```

Note
Static routes are applied before adding routes to the RIB (Routing Information Base). Therefore, rejected static routes will not appear in the running config.

Related Commands **max-fib-routes (VRF)**

neighbor next-hop-self (BGP and BGP4+)

Use this command to configure the router as the next hop for a BGP-speaking neighbor or peer group. This command can be run for a specific VRF instance.

Syntax
```
neighbor <neighborid> next-hop-self
```

This is an alias entry and provides a brief description to the main the **neighbor next-hop-self (BGP and BGP4+)** command on page 45.135.

neighbor password (BGP and BGP4+)

Use this command to enable MD5 authentication on a TCP connection between BGP neighbors.

Syntax

```
neighbor {<ip-address>|<peer-group-name>} password <password>
no neighbor {<ip-address>|<peer-group-name>} password
   [<password>]
neighbor {<ipv6-addr>|<peer-group-name>} password <password>
no neighbor {<ipv6-addr>|<peer-group-name>} password
   [<password>]
```

This is an alias entry and provides a brief description to the main the **neighbor password (BGP and BGP4+)** command on page 45.142.

neighbor remote-as (BGP and BGP4+)

Use this command to configure an internal or external BGP (iBGP or eBGP) peering relationship with another router. This command can be run for a specific VRF instance.

Syntax

```
neighbor <neighborid> remote-as <as-number> [global|vrf
   <vrf-name>]
no neighbor <neighborid> remote-as <as-number>
```

This is an alias entry and provides a brief description to the main the **neighbor remote-as (BGP and BGP4+)** command on page 45.153.

network (RIP)

This command specifies that a network or VLAN within a VRF instance will run OSPF.

Syntax

```
network {<network-address>[/<subnet-prefix-length>]|<vlan-
   name>}
no network {<network-address>[/<subnet-mask>]|<vlan-name>}
```

This is an alias entry and provides a brief description to the main the **network (RIP)** command on page 36.35.

offset-list (RIP)

Use this command to add an offset to the **in** and **out** metrics of routes learned through RIP, optionally for specific VRF instances.

Syntax

```
offset-list <access-list> {in|out} <offset> [<interface>]
no offset-list <access-list> {in|out} <offset> [<interface>]
```

This is an alias entry and provides a brief description to the main the **offset-list (RIP)** command on page 36.37

passive-interface (RIP)

Use this command to block RIP broadcasts on the VLAN interface.

Syntax

```
passive-interface <interface>

no passive-interface <interface>
```

This is an alias entry and provides a brief description to the main the **passive-interface (RIP)** command on page 36.38

ping

This command sends a query to another IPv4 host (send Echo Request messages).

You can run this command for a specific virtual routing instance.

Syntax

```
ping [vrf <vrf-name>] [ip] <host> [broadcast] [df-bit {yes|
   no}] [interval <0-128>] [pattern <hex-data-pattern>]
   [repeat {<1-2147483647>|continuous}] [size <36-18024>]
   [source <ip-addr>] [timeout <1-65535>] [tos <0-255>]
```

This is an alias entry and provides a brief description to the main the **ping** command on page 27.55.

rd (route distinguisher)

This command creates a Route Distinguisher (RD). The RD forms part of the route table creation process for a VRF instance and is implemented only when using BGP routing.

Syntax `rd {<ASN:n>|<ip-address:n>}`

Caution **This command does not contain a "no" variant. To remove the rd requires deleting the VRF instance to which it is assigned. Therefore, it is important that you carefully enter the correct value for the rd.**

Parameter	Description
<ASN:n>	The RD reference number. This is based on the formal RD format structure of, ASN number:Ref number. The ASN value can be any number between 1 and 65535, and the value n can be any number between 1 and 4294967295.
<ip-address:n>	The RD reference number. This is based on the formal RD format structure of, IP-address:Ref number. The IP-address must be in IPv4 format. The value `n` can be any number between 1 and 65535.

Note The above table refers to an ASN or Autonomous System Number. If you have a formal ASN number assigned to your BGP network, you should enter this value. Alternatively; because the Route Distinguisher has limited functionality in VRF Lite, you can use an unofficial value for your ASN when configuring "this particular" command.

Mode VRF Configuration

Usage For the implementation of VRF-lite installed on your switch, this command has little practical functionality. However, the switch does check certain components of the RD that you enter. For this reason, the RD syntax must comply with the structural formats defined below, and each value that you assign to a VRF instance must be unique on the switch. Good networking practice is to use common values for the RD and RT within a VRF instance.

Default No default RD is configured.

Example To create an RD `100:2` that is associated with `vrf red` use the following commands:

```
awplus# config terminal
awplus(config)# ip vrf red
awplus(config-vrf)# rd 100:2
```

Related Commands **show ip vrf**

redistribute (into BGP or BGP4+) (BGP and BGP4+)

Use this command to inject routes from one routing process into another.

Syntax

```
redistribute {ospf|rip|connected|static} [route-map <route-map-entry-pointer>]
no redistribute {ospf|rip|connected|static} [route-map <route-map-entry-pointer>]
```

This is an alias entry and provides a brief description to the main the **redistribute (into BGP or BGP4+) (BGP and BGP4+)** command on page 45.198.

redistribute (OSPF)

Use this command to redistribute routes from other routing protocols, static routes and connected routes into an OSPF routing table. Although this command has no specific VRF components, this command fragment is included for completeness with the other redistribute commands shown in this chapter.

Syntax

```
redistribute {bgp|connected|rip|static} {metric|metric-type|route-map|tag}
no redistribute {bgp|connected|rip|static} {metric|metric-type|route-map|tag}
```

This is an alias entry and provides a brief description to the main the **redistribute (OSPF)** command on page 40.61.

redistribute (RIP)

Use this command to redistribute information from other routing protocols into RIP. When using VRF-Lite, you can apply this command to a specific VRF instance.

Syntax

```
redistribute {connected|static|ospf|bgp} [metric <0-16>] [routemap <routemap>]
no redistribute {connected|static|ospf|bgp} [metric] [routemap]
```

This is an alias entry and provides a brief description to the main the **redistribute (RIP)** command on page 36.40.

route (RIP)

Use this command to configure static RIP routes within either the Global routing domain, or within a specific VRF instance.

Syntax

```
route <ip-addr/prefix-length>
no route <ip-addr/prefix-length>
```

This is an alias entry and provides a brief description to the main the **route (RIP)** command on page 36.43.

route-target

Use this command within a specific VRF instance, to create a route-target within the BGP extended communities path attribute field. This value can then be included in a list of import and export route target extended communities for the specified VRF instance. Learned routes that carry a specific route-target extended community are then imported into all VRFs configured with that extended community as an imported route-target.

The **no** variant of this command removes a route-target extended community for the VRF instance specified.

Syntax

```
route-target {import|export|both} {ASN:n|ip-address:n}
no route-target {import|export|both} {ASN:n|ip-address:n}
```

Parameter	Description
`route-target`	Specifies a BGP extended community as a route-target.
`import`	Adds the route target to its import list.
`export`	Adds the route target to its export list.
`both`	Adds the route target to both the import and export lists.
<ASN:n>	The route target reference number. This uses the same structure that is defined for the RD. This being, ASN number:Ref number. The ASN value can be any number between 1 and 65535, and the value n can be any number between 1 and 4294967295.
<ip-address:n>	The route target reference number. This uses the same structure that is defined for the RD (Route Distinguisher). This being, IP-address:Ref number. In practice, the IP-address can be an entry in IPv4 format, or an integer number between 1 and 4294967295. The value n can be any number between 1 and 65535.

Mode VRF Configuration

Default No route-target community attributes are associated with a VRF instance.

Usage In VRF systems that use MPLS, there is an close relationship between the Route Target (RT) and the Route Distinguisher (RD) values. For VRF-Lite however, this relationship is only implicit in that they share the same format structure.

Example Use the following commands to create a route-target extended community for ASN value 200, and a Reference number of 3, within the VRF instance blue:

```
awplus# config terminal
awplus(config)# ip vrf blue
awplus(config-vrf)# route-target import 200:1
```

Related Commands **ip vrf**
show ip vrf

router ospf

Use this command to enter Router Configuration mode to configure an OSPF routing process. You must specify the process ID with this command for multiple OSPF routing processes on the switch.

Syntax

```
router ospf [<process-id>] [<vrf-instance>]
no router ospf [<process-id>]
```

This is an alias entry and provides a brief description to the main the **router ospf** command on page 40.64.

router-id (VRF)

Use this command to specify a router identifier (in IP address format). When using VRF-Lite, the router-id is configured for the specified VRF instance.

Use the **no** variant of this command to force OSPF to use the previous OSPF router-id behavior.

Syntax

```
router-id <ip-address>
no router-id
```

Parameter	Description
<ip-address>	Specifies the router ID in IPv4 address format.

Mode Router Configuration

Usage Configure each router with a unique router-id. In an OSPF router process that has active neighbors, a new router-id is used at the next reload or when you restart OSPF manually.

Example The following example shows a fixed router ID `10.10.10.60` for the VRF instance `red`:

```
awplus# configure terminal
awplus(config)# ip vrf red
awplus(config-router)# router-id 10.10.10.60
```

Related Commands
show ip ospf
show ip vrf

show arp

Use this command to display entries in the ARP routing and forwarding table for either the global routing and forwarding database or for a specific VRF instance. The ARP cache contains mappings of IP addresses to physical addresses for hosts. To have a dynamic entry in the ARP cache, a host must have used the ARP protocol to access another host.

Syntax `show arp [global|security|vrf <vrf-name>]`

This is an alias entry and provides a brief description to the main the **show arp** command on page 27.57.

show crypto key pubkey-chain knownhosts

Use this command to display information about the known host database from the specified VRF.

Syntax `show crypto key pubkey-chain knownhosts [vrf <vrf-name>|global] [<1-65535>]`

This is an alias entry and provides a brief description to the main the **show crypto key pubkey-chain knownhosts** command on page 81.17.

show ip bgp cidr-only (BGP)

Use this command to display routes with non-natural network masks.

Syntax `show ip bgp [global|vrf <vrf-name>] cidr-only`

This is an alias entry and provides a brief description to the main the **show ip bgp cidr-only (BGP)** command on page 45.223.

show ip bgp community (BGP)

Use this command to display routes that match specified communities from a BGP instance, either the global routing domain or a named VRF.

Syntax `show ip bgp [global|vrf <vrf-name>] community [<type>] [exact-match]`

This is an alias entry and provides a brief description to the main the **show ip bgp community (BGP)** command on page 45.224.

show ip bgp community-list (BGP)

Use this command to show routes that match the given community-list from a BGP instance, either the global routing domain or a named VRF.

Syntax `show ip bgp [global|vrf <vrf-name>] community [<type>] [exact-match]`

This is an alias entry and provides a brief description to the main the **show ip bgp community-list (BGP)** command on page 45.226.

show ip bgp dampening (BGP)

Use this command to show dampened routes from a BGP instance, in either the global routing domain or a named VRF.

Syntax `show ip bgp [global|vrf <vrf-name>] dampening {dampened-paths|flap-statistics|parameters}`

This is an alias entry and provides a brief description to the main the **show ip bgp dampening (BGP)** command on page 45.227.

show ip bgp filter-list (BGP)

Use this command to display routes conforming to the filter-list.

Syntax `show ip bgp [global|vrf <vrf-name>] filter-list <listname>`

This is an alias entry and provides a brief description to the main the **show ip bgp filter-list (BGP)** command on page 45.229.

show ip bgp inconsistent-as (BGP)

Use this command to display routes with inconsistent AS Paths.

Syntax `show ip bgp [global|vrf <vrf-name>] inconsistent-as`

This is an alias entry and provides a brief description to the main the **show ip bgp inconsistent-as (BGP)** command on page 45.230.

show ip bgp longer-prefixes (BGP)

Use this command to display the route of the local BGP routing table for a specific prefix with a specific mask or for any prefix having a longer mask than the one specified.

Syntax `show ip bgp [global|vrf <vrf-name>] <ip-address/m> longer-prefixes`

This is an alias entry and provides a brief description to the main the **show ip bgp longer-prefixes (BGP)** command on page 49.21.

show ip bgp prefix-list (BGP)

Use this command to display routes matching the prefix-list.

Syntax `show ip bgp [global|vrf <vrf-name>] prefix-list <list>`

This is an alias entry and provides a brief description to the main the **show ip bgp prefix-list (BGP)** command on page 45.240.

show ip bgp quote-regexp (BGP)

Use this command to display routes matching the AS path regular expression in quotes.

Syntax `show ip bgp [global|vrf <vrf-name>] quote-regexp <expression>`

This is an alias entry and provides a brief description to the main the **show ip bgp quote-regexp (BGP)** command on page 45.241.

show ip bgp regexp (BGP)

Use this command to display routes matching the AS path regular expression.

Syntax `show ip bgp [global|vrf <vrf-name>] regexp <expression>`

This is an alias entry and provides a brief description to the main the **show ip bgp regexp (BGP)** command on page 45.242.

show ip bgp route-map (BGP)

Use this command to display routes that match the specified route-map.

Syntax `show ip bgp [global|vrf <vrf-name>] route-map <route-map>`

This is an alias entry and provides a brief description to the main the **show ip bgp route-map (BGP)** command on page 45.243.

show ip bgp summary (BGP)

Use this command to display a summary of BGP neighbor status.

Syntax `show ip bgp [global|vrf <vrf-name>] summary`

This is an alias entry and provides a brief description to the main the **show ip bgp summary (BGP)** command on page 45.245.

show ip interface vrf

Use this command to display protocol and status information about configured interfaces and their assigned IP addresses.

Syntax `show ip interface [vrf <vrf-name>|global]`

This is an alias entry and provides a brief description to the main the **show ip interface vrf** command on page 27.70.

show ip rip vrf database

Use this command to display information about the RIP database that is associated with a specific VRF instance.

Syntax `show ip rip {vrf <vrf-name>|global} database [full]`

This is an alias entry and provides a brief description to the main the **show ip rip vrf database** command on page 36.50.

show ip rip vrf interface

Use this command to display information about the RIP interfaces that are associated with a specific VRF instance.

Syntax `show ip rip {vrf <vrf-name>|global} interface [<interface-name>]`

This is an alias entry and provides a brief description to the main the **show ip rip vrf interface** command on page 36.51.

show ip route

Use this command to display the current state of the routing table.

Syntax `show ip route {vrf <vrf-name>|global} [bgp|connected|ospf|rip|static]`

This is an alias entry and provides a brief description to the main the **show ip route** command on page 34.6.

show ip route database

Use this command to display all routing entries for a protocol in the RIB associated with either the global routing and forwarding database, or for a selected VRF instance.

Syntax `show ip route [vrf <vrf-name>|global] database [bgp|connected|ospf|rip|static]`

This is an alias entry and provides a brief description to the main the **show ip route database** command on page 34.9.

show ip route summary

This command displays a summary of the current RIB entries for either the global routing and forwarding database, or for a selected VRF instance.

Syntax `show ip route summary [vrf <vrf-name>|global]`

This is an alias entry and provides a brief description to the main the **show ip route summary** command on page 34.12.

show ip vrf

This command displays brief configurations for a specific VRF instance.

Syntax `show ip vrf <vrf-name>`

Parameter	Description
<vrf-name>	The name of the VRF instance.

Mode User Exec and Privileged Exec

Example To display brief information for the VRF instance red, use the command:

```
awplus# show ip vrf red
```

Output **Figure 49-1: Example output from the show ip vrf red command**

```
Name                    Default RD          Interfaces
red                     500:1               lo1, vlan1
```

Related Commands **show ip vrf interface**

show ip vrf detail

This command displays the detailed configuration for a specific VRF instance.

Syntax `show ip vrf detail <vrf-name>`

Parameter	Description
<vrf-name>	The name of the VRF instance.

Mode User Exec and Privileged Exec

Example To display the detailed information for all VRF instances, use the command:

```
awplus# show ip vrf detail
```

Output **Figure 49-2: Example output from the show ip detail command, for all VRF instances**

```
VRF blue; Description: VRF for customer blue
FIB ID 3; Router ID: 192.168.30.1 (automatic)
Default RD 500:3
  Interfaces:
    lo3, vlan3
  Export route-target communities
    RT: 500:3
  Import route-target communities
    RT: 500:4
  Import route-map: blue45
  No export route-map

VRF red
FIB ID 1; Router ID: 192.168.10.1 (automatic)
Default RD 500:1
  Interfaces:
    lo1, vlan1
  Export route-target communities
    RT: 500:1
  Import route-target communities
    RT: 500:1
  Import route-map: red43
  No export route-map
```

Related Commands **show ip vrf**

show ip vrf interface

This command displays protocol, operational status, and address information, for interfaces existing within either a specified VRF instance, or all VRF instances.

Syntax `show ip vrf interface <vrf-name>`

Parameter	Description
<vrf-name>	The name of the VRF instance.

Mode User Exec and Privileged Exec

Example To display all interfaces and IP addresses associated with all VRF instances, use the command:

```
awplus# show ip vrf interface
```

Output **Figure 49-3: Example output from the show ip vrf interface command**

```
Interface              IP-Address          Status          Protocol   Vrf
lo1                    unassigned          admin up        running    red
lo2                    unassigned          admin up        running    green
vlan1                  192.168.10.1/24     admin up        running    red
vlan2                  192.168.20.1/24     admin up        running    green
```

Example To display all interfaces and IP addresses associated with the VRF instance `red`, use the command:

```
awplus# show ip vrf interface red
```

Output **Figure 49-4: Example output from the show ip vrf interface red command**

```
Interface              IP-Address          Status          Protocol   Vrf
lo1                    unassigned          admin up        running    red
vlan1                  192.168.10.1/24     admin up        running    red
```

Related Commands show ip vrf

show running-config vrf

This command displays the running system VRF related configurations for all VRF instances.

Syntax `show running-config vrf`

Mode Privileged Exec

Example To display the running system VRF related configurations, use the command:

```
awplus# show running-config vrf
```

Output **Figure 49-5: Example output from the show running config vrf command**

```
ip vrf red
rd 500:1
route-target export 500:1
route-target export 500:4
import map red 43
!
```

Related Commands **show ip vrf**

ssh

Use this command to initiate a Secure Shell connection to a remote SSH server in the context of a specific VRF instance.

Syntax `ssh [vrf <vrf-name>] [ip|ipv6][{[user <username>]|[port <1-65535>]|[version {1|2]}}] <hostname> [<line>]`

This is an alias entry and provides a brief description to the main the **ssh** command on page 81.27.

tcpdump

Use this command to start a tcpdump associated with a specific VRF instance.

Syntax `tcpdump [vrf <vrf-name>] <line>`

This is an alias entry and provides a brief description to the main the **tcpdump** command on page 27.83.

telnet

Use this command to open a telnet session to a remote device in the context of a specific VRF instance.

Syntax `telnet [vrf <vrf-name>] {<hostname>|[ip] <ipv4-addr>| [ipv6] <ipv6-addr>} [<port>]`

This is an alias entry and provides a brief description to the main the **telnet** command on page 5.34.

timers (RIP)

Use this command to adjust routing network timers for a VRF instance.

Syntax `timers basic <update> <timeout> <garbage>`

`no timers basic`

This is an alias entry and provides a brief description to the main the **timers (RIP)** command on page 36.52.

traceroute

Use this command to trace the VRF route packets take in the context of a specific VRF instance when travelling to their destination address.

Syntax `traceroute [vrf <vrf-name>] {<ip-addr>|<hostname>}`

This is an alias entry and provides a brief description to the main the **traceroute** command on page 27.84.

version

Use this command to specify a RIP version used by the device for a VRF instance.

Syntax `version {1|2}`

`no version`

This is an alias entry and provides a brief description to the main the **version** command on page 36.54.

Multicast Introduction

Multicasting is a technique developed to send packets from one location in a network to many other locations without any unnecessary packet duplication. In multicasting, one packet is sent from a source and is replicated as needed in the network to reach as many end-users as necessary.

Multicasting is different from broadcasting; while broadcast packets are sent to every possible receiver, multicast packets need only be forwarded to receivers that want them. The benefit of this technique is bandwidth conservation - it is the most economical technique for sending a packet stream to many locations simultaneously.

The IPv4 and IPv6 addressing for multicast packets works differently from unicast and broadcast packets. A multicast stream sends packets out with a destination IPv4 or IPv6 address that identifies a specific multicast group. It does not at all specify an end host, like unicast; or a whole subnet, like broadcast.

This makes multicasting a connectionless process. The server simply sends out its multicast UDP packets, with no idea who will receive them, or whether they are successfully received. In an IPv4 network, IGMP allows hosts to tell the network that they wish to receive a multicast stream, using the Internet Group Management Protocol (IGMP). This is a Layer 3 protocol; however Layer 2 switches can also conserve bandwidth within their LAN by using IGMP snooping to track which hosts require the data stream. For more information about IGMP and IGMP snooping, see **Chapter 51, IGMP and IGMP Snooping Introduction**.

Similar to IGMP for IPv4, Multicast Listener Discovery (MLD) for IPv6 is used to exchange membership status information between IPv6 routers that support multicasting and members of multicast groups on a network segment. Host membership in a multicast group is reported by individual member hosts, and membership status is periodically polled by multicast routers. For an overview of MLD and MLD command descriptions, see **Chapter 59, MLD and MLD Snooping Introduction and Commands**.

Note

IPv6 must be enabled on an interface with the **ipv6 enable** command, IPv6 forwarding must be enabled globally for routing IPv6 with the **ipv6 forwarding** command, and IPv6 multicasting must be enabled globally with the **ipv6 multicast-routing** command before using PIM-SMv6 commands.

Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the **clear ipv6 mroute** command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.

Note

The IPv6 Multicast addresses shown can be derived from IPv6 unicast prefixes as per RFC 3306.The IPv6 unicast prefix reserved for documentation is 2001:0db8::/32 as per RFC 3849. Using the base /32 prefix the IPv6 multicast prefix for 2001:0db8::/32 is ff3x:20:2001:0db8::/64. Where an RP address is 2001:0db8::1 the embedded RP multicast prefix is ff7x:120:2001:0db8::/96. For ASM (Any-Source Multicast) the IPV6 multicast addresses allocated for documentation purposes are ff0x::0db8:0:0/96 as per RFC 6676. This is a /96 prefix so that it can be used with group IDs as per RFC 3307. These addresses should not be used for practical networks (other than for testing purposes), nor should they appear in any public network.

Note

The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical networks (other than for testing purposes) nor should they appear on any public network.

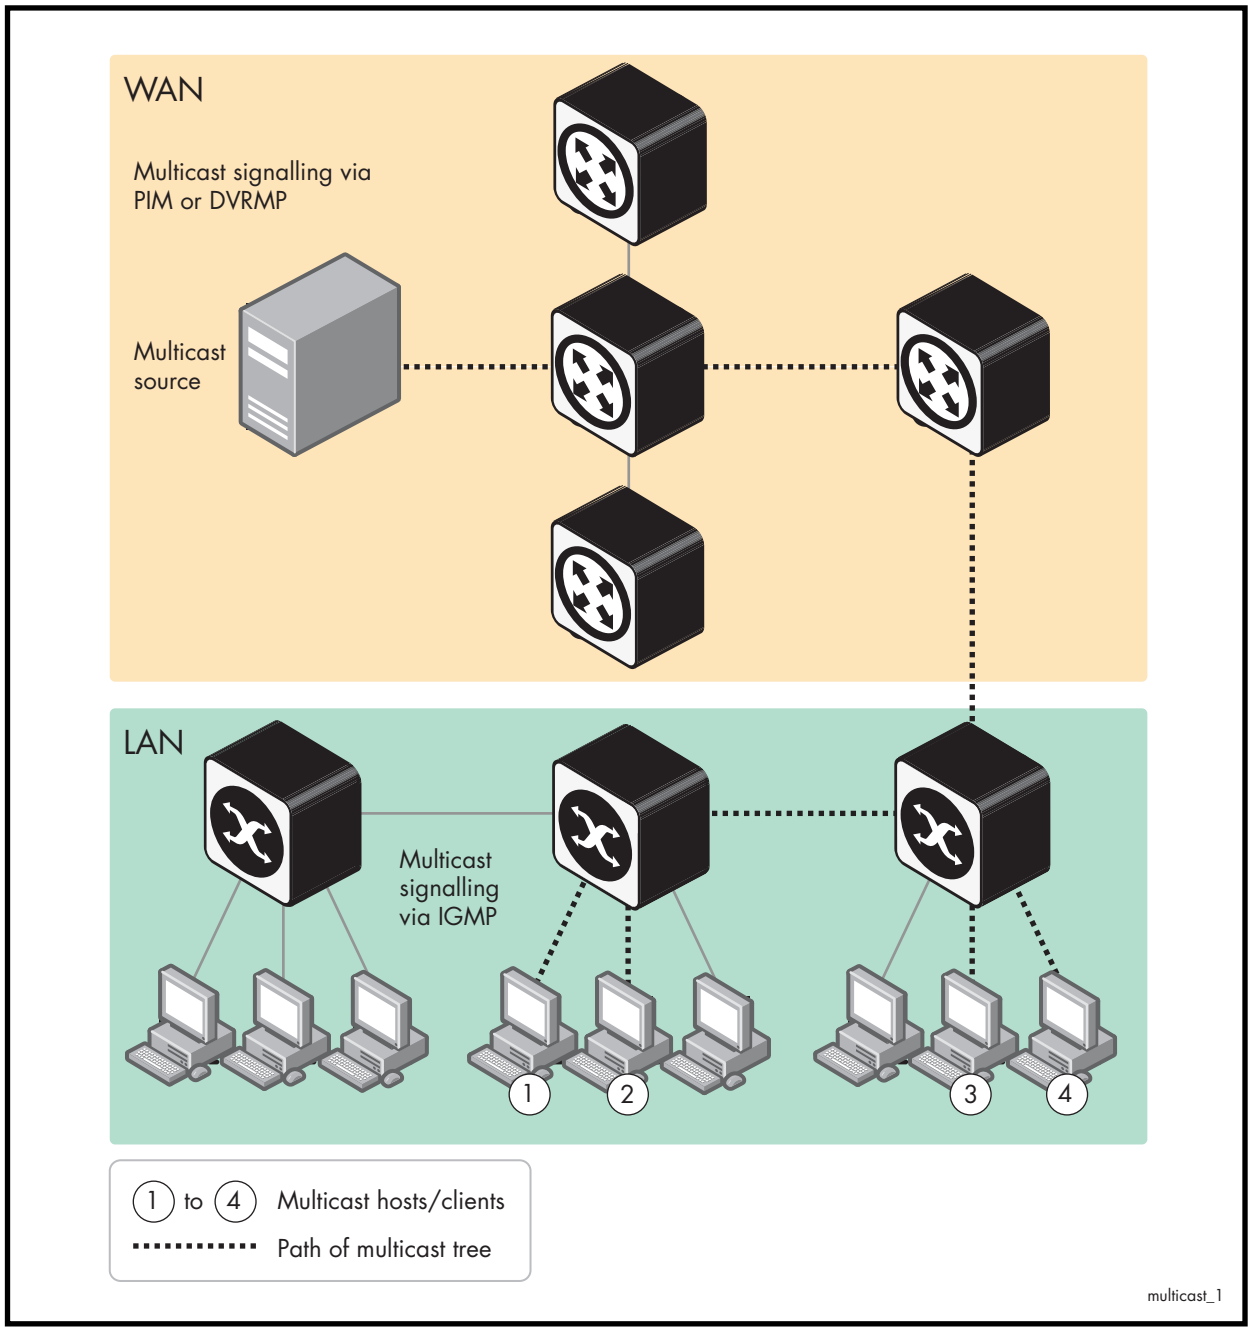
Multicast groups

The concept of a group is crucial to multicasting. A group is the set of hosts that wish to receive a particular multicast stream, and is identified by a multicast IP address at Layer 3 and matching multicast MAC address at Layer 2. The multicast sender transmits the stream to the group address, and only members of the group can receive the multicast data.

Components in a multicast network

There are several protocols and roles required in a multicast network, as shown in **Figure 50-1 on page 50.3**. This section describes the end-to-end process of transporting multicast data through a network.

Figure 50-1: Components in a multicast network



At the two ends of a multicast data transmission are:

- **the source**
  This is typically a server or video encoder. It sends the stream of multicast data out through its network interface. It is unaware of where the recipients of the stream are, or if there are any recipients.
- **the recipients**
  These are storage or display devices, such as PCs, set-top boxes, or security video archivers. The recipients signal their desire to receive a particular multicast stream by sending out IGMP messages requesting the stream.

The role of the network in-between is to deliver the multicast stream to the recipients as efficiently as possible. The devices achieve this by exchanging signalling information between themselves in order to establish a forwarding path along which the multicast stream will flow. Each node informs the next node up the chain that it needs to receive the multicast stream. Once this series of requests reaches the router nearest the multicast source, then that router will start to forward the stream. All the nodes between the source and the recipients are ready to forward the stream, due to their having received the signalled requests. In this way, the stream is efficiently forwarded right through to the recipients.

The type of signalling that the network uses falls into two categories:

- in the local area network where the recipients are located, the signalling consists of the exchange of IGMP or MLD packets.
- as soon as the signalling needs to leave the VLAN containing the recipients and cross into other VLANs and subnets, then a Layer 3 multicasting protocol like PIM is used between the routers in the Layer 3 network.

In every Layer 2 multicast network, there needs to be a device that is sending IGMP or MLD queries into the network. This is essential to maintain multicast flows once they have been established (see **"Staying in the multicast group (Query message)" on page 51.4** for more information). Typically, the device that is configured to send the queries is the router that is the gateway from the local network into a Layer 3 network.

Command List

This chapter provides an alphabetical reference of multicast commands common to PIM Sparse Mode and PIM Dense Mode. See also **Chapter 59, MLD and MLD Snooping Introduction and Commands**, **Chapter 58, PIM-DM Commands**, **Chapter 54, PIM-SM Commands** and **Chapter 52, IGMP and IGMP Snooping Commands**.

Note

IPv6 must be enabled on an interface with the **ipv6 enable** command, IPv6 forwarding must be enabled globally for routing IPv6 with the **ipv6 forwarding** command, and IPv6 multicasting must be enabled globally with the **ipv6 multicast-routing** command before using PIM-SMv6 commands.

Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the **clear ipv6 mroute** command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.

Note

The IPv6 Multicast addresses shown can be derived from IPv6 unicast prefixes as per RFC 3306.The IPv6 unicast prefix reserved for documentation is 2001:0db8::/32 as per RFC 3849. Using the base /32 prefix the IPv6 multicast prefix for 2001:0db8::/32 is ff3x:20:2001:0db8::/64. Where an RP address is 2001:0db8::1 the embedded RP multicast prefix is ff7x:120:2001:0db8::/96. For ASM (Any-Source Multicast) the IPV6 multicast addresses allocated for documentation purposes are ff0x::0db8:0:0/96 as per RFC 6676. This is a /96 prefix so that it can be used with group IDs as per RFC 3307. These addresses should not be used for practical networks (other than for testing purposes), nor should they appear in any public network.

Note

The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical networks (other than for testing purposes) nor should they appear on any public network.

clear ip mroute

Use this command to delete entries from the IPv4 multicast routing table.

Note If you use this command, you should also use the clear ip igmp group command to clear IGMP group membership records.

Syntax

```
clear ip mroute {*|<ipv4-group-address> [<ipv4-source-address>]}
   [pim sparse-mode]
```

Parameter	Description
*	Deletes all multicast routes.
<ipv4-group-address>	Group IPv4 address, in dotted decimal notation in the format A.B.C.D.
<ipv4-source-address>	Source IPv4 address, in dotted decimal notation in the format A.B.C.D.
pim sparse-mode	Clear specified IPv4 multicast route(s) for PIM Sparse Mode only.

Mode Privileged Exec

Usage When this command is used, the Multicast Routing Information Base (MRIB) clears the IPv4 multicast route entries in its IPv4 multicast route table, and removes the entries from the multicast forwarder. The MRIB sends a “clear” message to the multicast protocols. Each multicast protocol has its own “clear” multicast route command. The protocol-specific “clear” command clears multicast routes from PIM Sparse Mode, and also clears the routes from the MRIB.

Examples

```
awplus# clear ip mroute 225.1.1.1 192.168.3.3
```

```
awplus# clear ip mroute *
```

Related Commands ip multicast route
show ip mroute

clear ip mroute statistics

Use this command to delete multicast route statistics entries from the IP multicast routing table.

Syntax `clear ip mroute statistics {*|<ipv4-group-addr> [<ipv4-source-addr>]}`

Parameter	Description
*	All multicast route entries.
<ipv4-group-addr>	Group IPv4 address, in dotted decimal notation in the format `A.B.C.D`.
<ipv4-source-addr>	Source IPv4 address, in dotted decimal notation in the format `A.B.C.D`.

Mode Privileged Exec

Example

```
awplus# clear ip mroute statistics 225.1.1.2 192.168.4.4

awplus# clear ip mroute statistics *
```

clear ipv6 mroute

Use this command to delete one or more dynamically-added route entries from the IPv6 multicast routing table. You need to do this, for example, if you want to create a static route instead of an existing dynamic route.

Syntax `clear ipv6 mroute {*|<ipv6-group-address> [<ipv6-source-address>]}`

Parameter	Description
*	Deletes all dynamically-learnt IPv6 multicast routes.
<ipv6-group-address>	Group IPv6 address, in hexadecimal notation in the format `X.X::X.X`.
<ipv6-source-address>	Source IPv6 address, in hexadecimal notation in the format `X.X::X.X`.

Mode Privileged Exec

Usage When this command is used, the Multicast Routing Information Base (MRIB) clears the relevant IPv6 multicast route entries in its IPv6 multicast route table, and removes the entries from the multicast forwarder. The MRIB sends a “clear” message to the multicast protocols. Each multicast protocol has its own “clear” multicast route command.

This command does not remove static routes from the routing table or the configuration. To remove static routes, use the `no` parameter of the command **ipv6 multicast route**.

Example

```
awplus# clear ipv6 mroute 2001::2 ff08::1
```

Related Commands **ipv6 multicast route**
show ipv6 mroute

clear ipv6 mroute statistics

Use this command to delete multicast route statistics entries from the IPv6 multicast routing table.

Note Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the **clear ipv6 mroute** command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.

Syntax

```
clear ipv6 mroute statistics {*|<ipv6-group-address>
   [<ipv6-source-address>]}
```

Parameter	Description
*	All multicast route entries.
<ipv6-group-addr>	Group IPv6 address, in hexadecimal notation in the format `X.X::X.X`.
<ipv6-source-addr>	Source IPv6 address, in hexadecimal notation in the format `X.X::X.X`.

Mode Privileged Exec

Examples

```
awplus# clear ipv6 mroute statistics 2001::2 ff08::1
```

```
awplus# clear ipv6 mroute statistics *
```

debug nsm mcast

Use this command to debug IPv4 events in the Multicast Routing Information Base (MRIB).

Syntax

```
debug nsm mcast
   {all|fib-msg|mrt|mtrace|mtrace-detail|register|stats|vif}
```

Parameter	Description
`all`	All IPv4 multicast debugging.
`fib-msg`	Forwarding Information Base (FIB) messages.
`mrt`	Multicast routes.
`mtrace`	Multicast traceroute.
`mtrace-detail`	Multicast traceroute detailed debugging.
`register`	Multicast PIM register messages.
`stats`	Multicast statistics.
`vif`	Multicast interface.

Mode Privileged Exec and Global Configuration

Examples

```
awplus# configure terminal
awplus(config)# debug nsm mcast all

awplus# configure terminal
awplus(config)# debug nsm mcast fib-msg

awplus# configure terminal
awplus(config)# debug nsm mcast mrt

awplus# configure terminal
awplus(config)# debug nsm mcast mtrace

awplus# configure terminal
awplus(config)# debug nsm mcast mtrace-detail

awplus# configure terminal
awplus(config)# debug nsm mcast register

awplus# configure terminal
awplus(config)# debug nsm mcast stat
```

```
awplus# configure terminal
awplus(config)# debug nsm mcast vif
```

debug nsm mcast6

Use this command to debug IPv6 events in the Multicast Routing Information Base (MRIB).

Syntax

```
debug nsm mcast6
   {all|fib-msg|mrt|mtrace|mtrace-detail|register|stats|vif}
```

Parameter	Description
`all`	All IPv4 multicast debugging.
`fib-msg`	Forwarding Information Base (FIB) messages.
`mif`	Multicast interfaces.
`mrt`	Multicast routes.
`register`	Multicast PIM register messages.
`stats`	Multicast statistics.

Mode Privileged Exec and Global Configuration

Examples

```
awplus# configure terminal
awplus(config)# debug nsm mcast6 all

awplus# configure terminal
awplus(config)# debug nsm mcast6 fib-msg

awplus# configure terminal
awplus(config)# debug nsm mcast6 mif

awplus# configure terminal
awplus(config)# debug nsm mcast6 mrt

awplus# configure terminal
awplus(config)# debug nsm mcast6 register

awplus# configure terminal
awplus(config)# debug nsm mcast6 stats
```

ip mroute

Use this command to inform multicast of the RPF (Reverse Path Forwarding) route to a given IPv4 multicast source.

Use the **no** variant of this command to delete a route to an IPv4 multicast source.

Syntax

```
ip mroute [vrf <vrf-name>] <ipv4-source-address/mask-length>
    [bgp|ospf|rip|static] <rpf-address> [<admin-distance>]

no ip mroute [vrf <vrf-name>] <ipv4-source-address/mask-length>
    [bgp|ospf|rip|static]
```

Syntax (VRF Lite)

```
ip mroute [vrf <vrf-name>] <ipv4-source-address/mask-length>
    [bgp|ospf|rip|static] <rpf-address> [<admin-distance>]

no ip mroute [vrf <vrf-name>] <ipv4-source-address/mask-length>
    [bgp|ospf|rip|static]
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
<ipv4-source-address/mask-length>	A multicast source IPv4 address and mask length, in dotted decimal notation in the format `A.B.C.D/M`.
`bgp`	BGP unicast routing protocol.
`ospf`	OSPF unicast routing protocol.
`rip`	RIP unicast routing protocol.
`static`	Specifies a static route.
<rpf-address>	`A.B.C.D` The closest known address on the multicast route back to the specified source. This host IPv4 address can be within a directly connected subnet or within a remote subnet. In the case that the address is in a remote subnet, a lookup is done from the unicast route table to find the nexthop address on the path to this host.
<admin-distance>	The administrative distance. Use this to determine whether the RPF lookup selects the unicast or multicast route. Lower distances have preference. If the multicast static route has the same distance as the other RPF sources, the multicast static route takes precedence. The default is `0` and the range available is `0-255`.

Mode Global Configuration

Usage

Typically, when a Layer 3 multicast routing protocol is determining the RPF (Reverse Path Forwarding) interface for the path to an IPv4 multicast source, it uses the unicast route table to find the best path to the source. However, in some networks a deliberate choice is made to send multicast via different paths to those used for unicast. In this case, the interface via which a multicast stream from a given source enters a router may not be the same as the interface that connects to the best unicast route to that source.

This command enables the user to statically configure the switch with "multicast routes" back to given sources. When performing the RPF check on a stream from a given IPv4 source, the multicast routing protocol will look at these static entries as well as looking into the unicast routing table. The route with the lowest administrative distance - whether a static "multicast route" or a route from the unicast route table - will be chosen as the RPF route to the source.

Note that in this context the term "multicast route" does not imply a route via which the current router will forward multicast; instead it refers to the route the multicast will have traversed in order to arrive at the current router.

Examples

The following example creates a static multicast IPv4 route back to the sources in the `10.10.3.0/24` subnet. The multicast route is via the host `192.168.2.3`, and has an administrative distance of `2`:

```
awplus# configure terminal
awplus(config)# ip mroute 10.10.3.0/24 static 2 192.168.2.3 2
```

The following example creates a static multicast IPv4 route back to the sources in the `192.168.3.0/24` subnet. The multicast route is via the host `10.10.10.50`. The administrative distance on this route has the default value of `0`:

```
awplus# configure terminal
awplus(config)# ip mroute 192.168.3.0/24 10.10.10.50
```

Validation Commands

show ip rpf

ip multicast forward-first-packet

Use this command to enable multicast to forward the first multicast packets coming to the device.

Use the **no** variant of this command to disable this feature.

Syntax

```
ip multicast forward-first-packet
no ip multicast forward-first-packet
```

Default By default, this feature is disabled.

Mode Global Configuration

Usage If this command is enabled, the device will forward the first packets in a multicast stream that create the multicast route, possibly causing degradation in the quality of the multicast stream, such as the pixilation of video and audio data.

Note If you use this command, ensure that the ip igmp snooping command is enabled, the default setting, otherwise the device will not process the first packets of the multicast stream correctly.

Examples To enable the forwarding of the first multicast packets, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast forward-first-packet
```

To disable the forwarding of the first multicast packets, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip multicast forward-first-packet
```

ip multicast route

Use this command to add an IPv4 static multicast route for a specific multicast source and group IPv4 address to the multicast Routing Information Base (RIB). This IPv4 multicast route is used to forward multicast traffic from a specific source and group ingressing on an upstream VLAN to a single or range of downstream VLANs.

Use the **no** variant of this command to either remove an IPv4 static multicast route set with this command or to remove a specific downstream VLAN interface from an IPv4 static multicast route for a specific multicast source and group IPv4 address.

Syntax

```
ip multicast route <ipv4-source-addr> <ipv4-group-addr>
   <upstream-vlan-id> [<downstream-vlan-id>]

no ip multicast route <ipv4-source-addr> <ipv4-group-addr>
   [<upstream-vlan-id> <downstream-vlan-id>]
```

Parameter	Description
<ipv4-source-addr>	Source IPv4 address, in dotted decimal notation in the format `A.B.C.D`.
<ipv4-group-addr>	Group IPv4 address, in dotted decimal notation in the format `A.B.C.D`.
<upstream-vlan-id>	Upstream VLAN interface on which the multicast packets ingress.
<downstream-vlan-id>	Downstream VLAN interface or range of VLAN interfaces to which the multicast packets are sent.

Default By default, this feature is disabled.

Mode Global Configuration

Usage Only one multicast route entry per IPv4 address and multicast group can be specified. Therefore, if one entry for a static multicast route is configured, PIM will not be able to update this multicast route in any way.

If a dynamic multicast route exists you cannot create a static multicast route with same source IPv4 address, group IPv4 address, upstream VLAN and downstream VLANs. An error message is displayed and logged. To add a new static multicast route, either wait for the dynamic multicast route to timeout or clear the dynamic multicast route with the **clear ip mroute** command.

To update an existing static multicast route entry with more or a new set of downstream VLANs, you must firstly remove the existing static multicast route and then add the new static multicast route with all downstream VLANs specified. If you attempt to update an existing static multicast route entry with an additional VLAN or VLANs an error message is displayed and logged.

To create a blackhole or null route where packets from a specified source and group address coming from an upstream VLAN are dropped rather than forwarded, do not specify the optional *<downstream-vlan-id>* parameter when entering this command.

To remove a specific downstream VLAN from an existing static multicast route entry, specify the VLAN you want to remove with the <*downstream-vlan-id*> parameter when entering the **no** variant of this command.

Examples To create a static multicast route for the multicast source IPv4 address `2.2.2.2` and group IPv4 address `224.9.10.11`, specifying the upstream VLAN interface as `vlan10` and the downstream VLAN interface as `vlan20`, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast route 2.2.2.2 224.9.10.11 vlan10
vlan20
```

To create a blackhole route for the multicast source IPv4 address `2.2.2.2` and group IPv4 address `224.9.10.11`, specifying the upstream VLAN interface as `vlan10`, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast route 2.2.2.2 224.9.10.11 vlan10
```

To create an IPv4 static multicast route for the multicast source IPv4 address `2.2.2.2` and group IP address `224.9.10.11`, specifying the upstream VLAN interface as `vlan10` and the downstream VLAN range as `vlan20-25`, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast route 2.2.2.2 224.9.10.11 vlan10
vlan20-25
```

To remove the downstream VLAN `23` from the IPv4 static multicast route created with the above command, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip multicast route 2.2.2.2 224.9.10.11
vlan10 vlan23
```

To delete an IPv4 static multicast route for the multicast source IP address `2.2.2.2` and group IP address `224.9.10.11`, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip multicast route 2.2.2.2 224.9.10.11
```

Related Commands **clear ip mroute**
show ip mroute

ip multicast route-limit

Use this command to limit the number of multicast routes that can be added to an IPv4 multicast routing table.

Use the **no** variant of this command to return the IPv4 route limit to the default.

Syntax

```
ip multicast route-limit <limit> [<threshold>]
no ip multicast route-limit
```

Parameter	Description
<limit>	*<1-2147483647>* Number of routes.
<threshold>	*<1-2147483647>* Threshold above which to generate a warning message. The mroute warning threshold must not exceed the mroute limit.

Default The default limit and threshold value is 2147483647.

Mode Global Configuration

Usage This command limits the number of multicast IPv4 routes (mroutes) that can be added to a router, and generates an error message when the limit is exceeded. If the threshold parameter is set, a threshold warning message is generated when this threshold is exceeded, and the message continues to occur until the number of mroutes reaches the limit set by the limit argument.

Examples

```
awplus# configure terminal
awplus(config)# ip multicast route-limit 34 24

awplus# configure terminal
awplus(config)# no ip multicast route-limit
```

ip multicast wrong-vif-suppression

Use this command to prevent unwanted multicast packets received on an unexpected VLAN being trapped to the CPU.

Use the **no** variant of this command to disable wrong VIF suppression.

Syntax

```
ip ip multicast wrong-vif-suppression
no ip multicast wrong-vif-suppression
```

Default By default, this feature is disabled.

Mode Global Configuration

Usage Use this command if there is excessive CPU load and multicast traffic is enabled. To confirm that VIF messages are being sent to the CPU use the **debug nsm mcast6** command.

Examples To enable the suppression of wrong VIF packets, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast wrong-vif-suppression
```

To disable the suppression of wrong VIF packets, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip multicast wrong-vif-suppression
```

ip multicast-routing

Use this command to turn on/off IPv4 multicast routing on the router; when turned off the device does not perform multicast functions.

Use the **no** variant of this command to disable IPv4 multicast routing after enabling it. Note the default stated below.

Syntax

```
ip multicast-routing
```

```
no ip multicast-routing
```

Default By default, IPv4 multicast routing is off.

Mode Global Configuration

Usage When the **no** variant of this command is used, the Multicast Routing Information Base (MRIB) cleans up Multicast Routing Tables (MRT), stops IGMP operation, and stops relaying multicast forwarder events to multicast protocols.

When multicast routing is enabled, the MRIB starts processing any MRT addition/deletion requests, and any multicast forwarding events.

You must enable multicast routing before issuing other multicast commands.

Example

```
awplus# configure terminal
awplus(config)# ip multicast-routing
```

Validation Commands **show running-config**

ipv6 multicast route

Use this command to add an IPv6 static multicast route for a specific multicast source and group IPv6 address to the multicast Routing Information Base (RIB). This IPv6 multicast route is used to forward IPv6 multicast traffic from a specific source and group ingressing on an upstream VLAN to a single or range of downstream VLANs.

See detailed usage notes below to configure static multicast router ports when using static IPv6 multicast routes with EPSR, and the destination VLAN is an EPSR data VLAN.

Use the **no** variant of this command to either remove an IPv6 static multicast route set with this command or to remove a specific downstream VLAN interface from an IPv6 static multicast route for a specific IPv6 multicast source and group address.

Syntax

```
ipv6 multicast route <ipv6-source-addr> <ipv6-group-addr>
    <upstream-vlan-id> [<downstream-vlan-id>]

no ipv6 multicast route <ipv6-source-addr> <ipv6-group-addr>
    [<upstream-vlan-id> <downstream-vlan-id>]
```

Parameter	Description
<ipv6-source-addr>	Source IPv6 address, in dotted decimal notation in the format `X.X::X.X`.
<ipv6-group-addr>	Group IP address, in dotted decimal notation in the format `X.X::X.X`.
<upstream-vlan-id>	Upstream VLAN interface on which the multicast packets ingress.
<downstream-vlan-id>	Downstream VLAN interface or range of VLAN interfaces to which the multicast packets are sent.

Default By default, no static routes exist.

Mode Global Configuration

Usage Only one multicast route entry per IPv6 address and multicast group can be specified. Therefore, if one entry for an IPv6 static multicast route is configured, PIM will not be able to update this multicast route in any way.

If a dynamic multicast route exists, you cannot create a static multicast route with the same source IPv6 address and group IPv6 address. An error message is displayed and logged. To add a new static multicast route, either wait for the dynamic multicast route to time out or clear the dynamic multicast route with the **clear ipv6 mroute** command.

To update an existing IPv6 static multicast route entry with new or additional downstream VLANs, you must firstly remove the existing static multicast route and then add the new static multicast route with all downstream VLANs specified. If you attempt to update an existing static multicast route entry with an additional VLAN or VLANs an error message is displayed and logged.

To create a blackhole or null route where packets from a specified source and group address coming from an upstream VLAN are dropped rather than forwarded, do not specify the optional *<downstream-vlan-id>* parameter when entering this command.

To remove a specific downstream VLAN from an existing static multicast route entry, specify the VLAN you want to remove with the <*downstream-vlan-id*> parameter when entering the **no** variant of this command.

Note that if static IPv6 multicast routing is being used with EPSR and the destination VLAN is an EPSR data VLAN, then multicast router (mrouter) ports must be statically configured. This minimizes disruption for multicast traffic in the event of ring failure or restoration.

When configuring the EPSR data VLAN, statically configure mrouter ports so that the multicast router can be reached in either direction around the EPSR ring.

For example, if `port1.0.1` and `port1.0.14` are ports on an EPSR data VLAN `vlan101`, which is the destination for a static IPv6 multicast route, then configure both ports as multicast router (mrouter) ports as shown in the example commands listed below:

Output **Figure 50-2: Example ipv6 mld snooping mrouter commands when static IPv6 multicast routing is being used and the destination VLAN is an ESPR data VLAN:**

```
awplus>enable
awplus#configure terminal
awplus(config)#interface vlan101
awplus(config-if)#ipv6 mld snooping mrouter interface port1.0.1
awplus(config-if)#ipv6 mld snooping mrouter interface port1.0.14
```

See **ipv6 mld snooping mrouter** for a command description and command examples.

Examples To create an IPv6 static multicast route for the multicast source IPv6 address `2001::1` and group IPv6 address `ff08::1`, specifying the upstream VLAN interface as `vlan10` and the downstream VLAN interface as `vlan20`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 multicast route 2001::1 ff08::1 vlan10
vlan20
```

To create a blackhole route for the IPv6 multicast source IP address `2001::1` and group IP address `ff08::1`, specifying the upstream VLAN interface as `vlan10`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 multicast route 2001::1 ff08::1 vlan10
```

To create an IPv6 static multicast route for the multicast source IPv6 address `2001::1` and group IPv6 address `ff08::1`, specifying the upstream VLAN interface as `vlan10` and the downstream VLAN range as `vlan20-25`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 multicast route 2001::1 ff08::1 vlan10
vlan20-25
```

To remove the downstream VLAN `23` from the IPv6 static multicast route created with the above command, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 multicast route 2001::1 ff08::1 vlan10
vlan23
```

To delete an IPv6 static multicast route for the multicast source IPv6 address `2001::1` and group IPv6 address `ff08::1`, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 multicast route 2001::1 ff08::1
```

Related Commands

clear ipv6 mroute
ipv6 mld snooping mrouter
show ipv6 mroute

ipv6 multicast route-limit

Use this command to limit the number of multicast routes that can be added to an IPv6 multicast routing table.

Use the **no** variant of this command to return the IPv6 route limit to the default.

Syntax

```
ipv6 multicast route-limit <limit> [<threshold>]
no ipv6 multicast route-limit
```

Parameter	Description
<limit>	*<1-2147483647>* Number of routes.
<threshold>	*<1-2147483647>* Threshold above which to generate a warning message. The mroute warning threshold must not exceed the mroute limit.

Default The default limit and threshold value is 2147483647.

Mode Global Configuration

Usage This command limits the number of multicast IPv6 routes (mroutes) that can be added to a router, and generates an error message when the limit is exceeded. If the threshold parameter is set, a threshold warning message is generated when this threshold is exceeded, and the message continues to occur until the number of mroutes reaches the limit set by the limit argument.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 multicast route-limit 34 24

awplus# configure terminal
awplus(config)# no ipv6 multicast route-limit
```

ipv6 multicast-routing

Use this command to turn on/off IPv6 multicast routing on the router; when turned off the device does not perform multicast functions.

Use the **no** variant of this command to disable IPv6 multicast routing after enabling it. Note the default stated below.

Syntax

```
ipv6 multicast-routing
no ipv6 multicast-routing
```

Default By default, IPv6 multicast routing is off.

Mode Global Configuration

Usage When the **no** variant of this command is used, the Multicast Routing Information Base (MRIB) cleans up Multicast Routing Tables (MRT, and stops relaying multicast forwarder events to multicast protocols.

When multicast routing is enabled, the MRIB starts processing any MRT addition/deletion requests, and any multicast forwarding events.

You must enable multicast routing before issuing other multicast commands.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 multicast-routing

awplus# configure terminal
awplus(config)# no ipv6 multicast-routing
```

Validation Commands show running-config

multicast

Use this command to enable a switch port to route multicast packets that ingress the port.

Use the **no** variant of this command to stop the switch port from routing multicast packets that ingress the port. Note that this does not affect Layer 2 forwarding of multicast packets. If you enter **no multicast** on a port, multicast packets received on that port will not be forwarded to other VLANs, but ports in the same VLANs as the receiving port will still receive the multicast packets.

Syntax

```
multicast
no multicast
```

Default By default, all switch ports route multicast packets.

Mode Interface Configuration

Examples

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# multicast
```

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no multicast
```

Validation Commands **show running-config**

show ip mroute

Use this command to display the contents of the IPv4 multicast routing (mroute) table.

Syntax

```
show ip mroute [<ipv4-group-addr>] [<ipv4-source-addr>] [{dense|
   sparse}] [{count|summary}]
```

Parameter	Description
<ipv4-group-addr>	Group IPv4 address, in dotted decimal notation in the format `A.B.C.D`.
<ipv4-source-addr>	Source IPv4 address, in dotted decimal notation in the format `A.B.C.D`.
`dense`	Display dense IPv4 multicast routes.
`sparse`	Display sparse IPv4 multicast routes.
`count`	Display the route and packet count from the IPv4 multicast routing (mroute) table.
`summary`	Display the contents of the IPv4 multicast routing (mroute) table in an abbreviated form.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ip mroute 10.10.3.34 224.1.4.3
```

```
awplus# show ip mroute 10.10.5.24 225.2.2.2 count
```

```
awplus# show ip mroute 10.10.1.34 summary
```

Output The following is a sample output of this command displaying the IPv4 multicast routing table, with and without specifying the group and source IPv4 address:

Figure 50-3: Example output from the show ip mroute command

```
awplus# show ip mroute
IP Multicast Routing Table

```

show ip rpf

Use this command to display Reverse Path Forwarding (RPF) information for the specified IPv4 source address.

Syntax `show ip rpf <source-addr>`

Parameter	Description
<ipv4-source-addr>	Source IPv4 address, in dotted decimal notation in the format `A.B.C.D`.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip rpf 10.10.10.50
```

show ipv6 mroute

Use this command to display the contents of the IPv6 multicast routing (mroute) table.

Syntax

```
show ipv6 mroute [<ipv6-group-addr>] [<ipv6-source-addr>]
    [{count|summary}]
```

Parameter	Description
<ipv6-group-addr>	Group IPv6 address, in hexadecimal notation in the format X.X::X.X.
<ipv6-source-addr>	Source IPv6 address, in hexadecimal notation in the format X.X::X.X.
count	Display the route and packet count from the IPv6 multicast routing (mroute) table.
summary	Display the contents of the IPv6 multicast routing (mroute) table in an abbreviated form.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ipv6 mroute

awplus# show ipv6 mroute count

awplus# show ipv6 mroute summary

awplus# show ipv6 mroute 2001::2 ff08::1 count

awplus# show ipv6 mroute 2001::2 ff08::1

awplus# show ipv6 mroute 2001::2 summary
```

Output The following is a sample output of this command displaying the IPv6 multicast routing table for a single static IPv6 Multicast route:

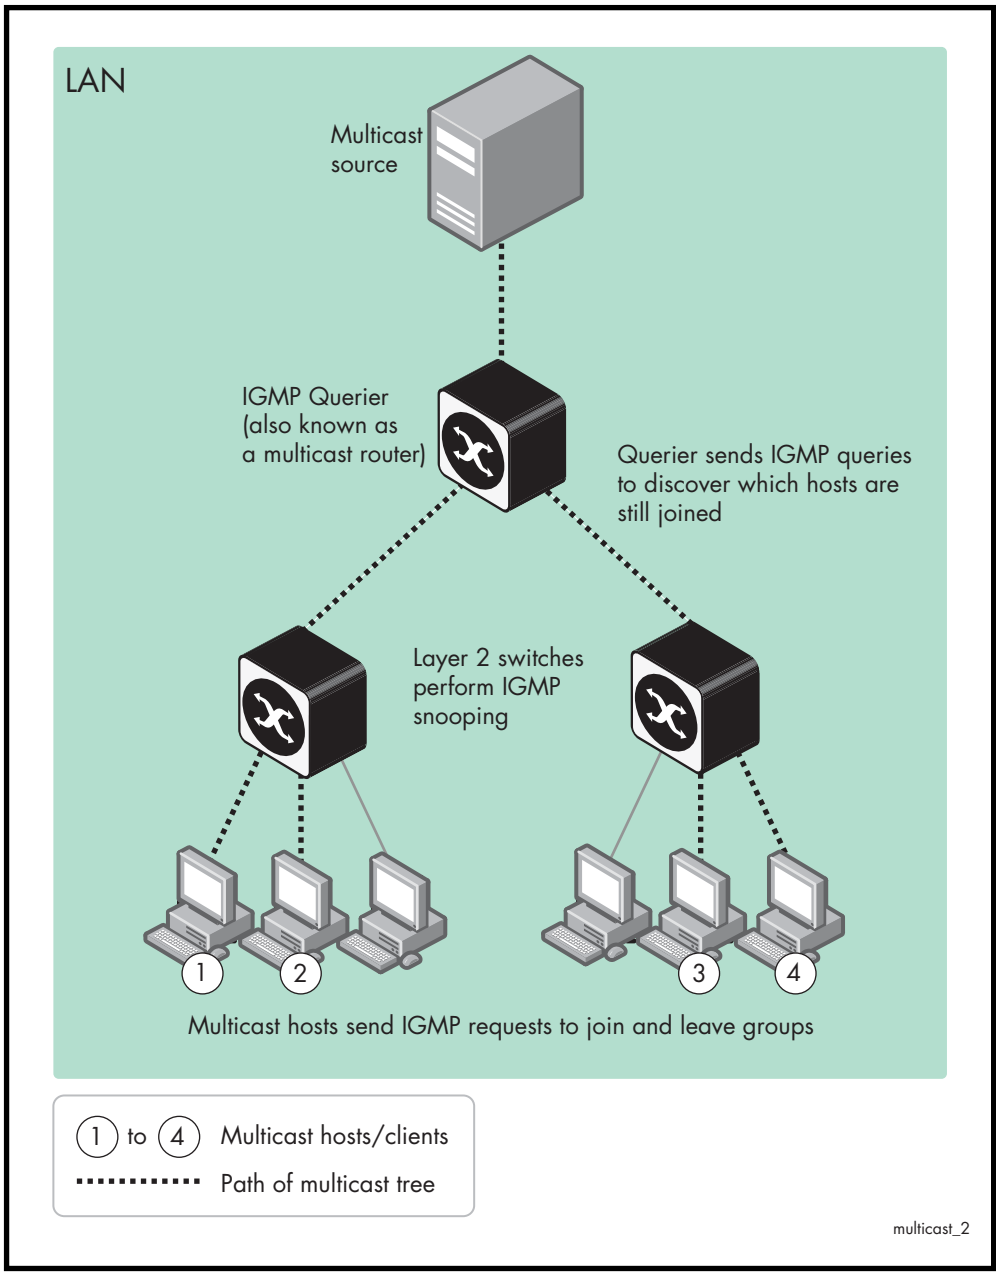
Introduction

This chapter provides information about Internet Group Management Protocol (IGMP), IGMP Snooping, and an introduction to the Query Solicitation feature when used with IGMP Snooping. To see details on the commands used in this example, or to see the outputs of the validation commands, refer to **Chapter 52, IGMP and IGMP Snooping Commands**. For a general overview of multicasting, see **Chapter 50, Multicast Introduction and Commands**.

IGMP

Internet Group Management Protocol (IGMP) is the protocol that hosts use to indicate that they are interested in receiving a particular multicast stream. An example of a multicast system within a single Layer 2 LAN is shown in **Figure 51-1**.

Figure 51-1: Multicast system within a single LAN



Joining a multicast group (Membership report)

When a host wants to receive a stream, referred to as "joining a group", it sends out an IGMP packet containing the address of the group it wants to join. This packet is called an IGMP Membership report, often referred to as a "join packet". This packet is forwarded through the LAN to the local IGMP querier, which is typically a router. Once the querier has received an IGMP join message, it knows to forward the multicast stream to the host. If it is not already receiving the stream, it must tell the devices between itself and the multicast source, which may be some hops away from the querier, that it wishes to receive the stream. This might involve a process of using Layer 3 multicast protocols to signal across a WAN, or it might be as simple as receiving a stream from a locally connected multicast server.

Staying in the multicast group (Query message)

The Query message is used by a querier to determine whether hosts are still interested in an IGMP group. At certain time intervals (the default is 125 seconds), the querier sends an IGMP query message onto the local LAN. The destination address of the query message is a special “all multicast groups” address. The purpose of this query is to ask “Are there any hosts on the LAN that wish to remain members of multicast groups?” After receiving an IGMP query, any host that wants to remain in a multicast group must send a new join packet for that group. If a host is a member of more than one group, then it sends a join message for each group it wants to remain a member of. The querier looks at the responses it receives to its query, and compares these to the list of multicast streams that it is currently registered to forward. If there are any items in that list for which it has not received query responses, it will stop forwarding those streams. Additionally, if it is receiving those streams through a Layer 3 network, it will send a Layer 3 routing protocol message upstream, asking to no longer receive that stream.

Leaving the multicast group (Leave message)

How a host leaves a group depends on the IGMP version that it is using. Under IGMP version 1, when a host has finished with a data stream, the local querier continues to send the stream to the host until it sends out the next query message and receives no reply back from the host. IGMP version 2 introduced the Leave message. This allows a host to explicitly inform its querier that it wants to leave a particular multicast group. When the querier receives the Leave message, it sends out a group specific query asking whether any hosts still want to remain members of that specific group. If no hosts respond with join messages for that group, then the querier knows that there are no hosts on its LAN that are still members of that group. This means that for that specific group, it can ask to be pruned from the multicast tree. IGMP version 3 removed the Leave message. Instead a host leaves a group by sending a join message with no source specified.

IGMP Snooping

IGMP Snooping is a way for Layer 2 switches to reduce the amount of multicast traffic on a LAN. The AlliedWare Plus implementation of IGMP Snooping is compatible with networks running all IGMP versions.

Without IGMP Snooping, Layer 2 switches handle IP multicast traffic in the same manner as broadcast traffic and forward multicast frames received on one port to all other ports in the same VLAN. IGMP Snooping allows switches to monitor network traffic, and determine hosts to receive multicast traffic, by looking into IGMP packets to learn which attached hosts need to receive which multicast groups. This allows the switch to forward multicast traffic only out the appropriate ports. If it sees multiple reports sent for one group, it will forward only one of them.

How IGMP Snooping operates

IGMP Snooping operates similarly to the multicast protocols. When a switch hears an IGMP report from a host for a given multicast group, the switch adds the host's port number to the list of ports that are listening to the multicast group. When the switch hears an IGMP leave, it removes the host's port from the list, after the completion of the leave process as described in **"Leaving the multicast group (Leave message)" on page 51.4**. When there are no hosts listening to a group, the switch informs the local querier to stop sending that group's multicast stream.

IGMP Snooping allows query messages to be forwarded to all ports. The hosts that still require the stream respond to the queries by sending reports. The switch intercepts these. Depending on configuration settings, the switch may just forward the reports directly on to the querier, or it may proxy report on behalf of the group, only forwarding on one consolidated report for each group.

By default, IGMP Snooping is enabled both globally and on all VLANs.

Note

IGMP Snooping cannot be disabled on an interface if IGMP Snooping has already been disabled globally. IGMP Snooping can be disabled on both an interface and globally if disabled on the interface first and then disabled globally.

To disable IGMP Snooping either		
1.	`awplus#`	
	`configure terminal`	Enter Global Configuration mode.
2.	`awplus(config)#`	
	`no ip igmp snooping`	Disable IGMP Snooping globally.
or		
1.	`awplus#`	
	`configure terminal`	Enter Global Configuration mode.
2.	`awplus(config)#`	
	`interface <vlan-name>`	Enter Interface Configuration mode for a specific VLAN.
3.	`awplus(config-if)#`	
	`no ip igmp snooping`	Disable IGMP Snooping for a specific VLAN.

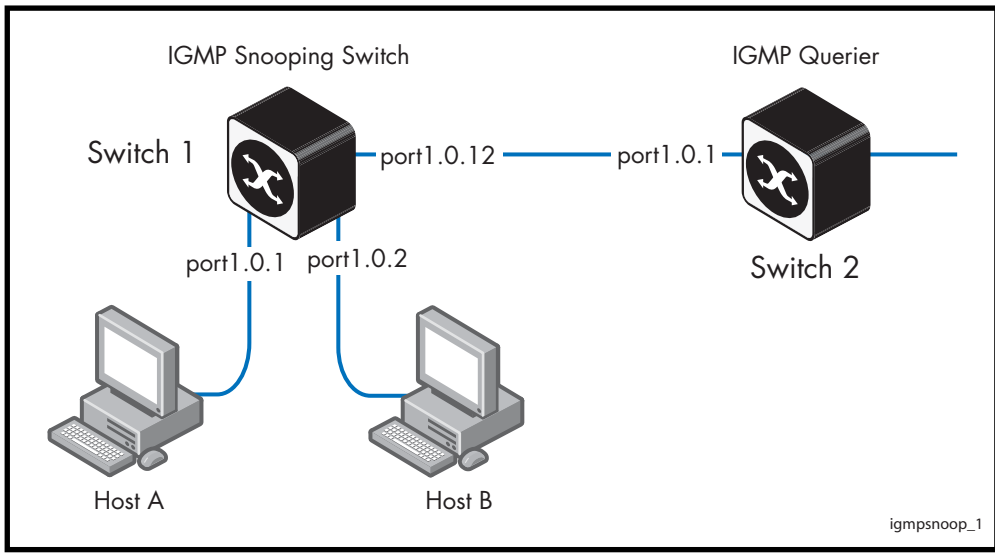
IGMP Snooping and Querier configuration example

This example describes the configuration of IGMP Snooping on an Allied Telesis managed Layer 3 switch (Switch 1) and the configuration of IGMP Querier (Switch 2). The interface port1.0.12 is configured as a multicast router port. Host A and Host B are both members of the same multicast group.

To enable IGMP Snooping on an interface:

- Enable IGMP Snooping globally, if necessary. IGMP Snooping is enabled by default.
- Enable IGMP Snooping on the desired interfaces, if necessary. IGMP Snooping is enabled on all interfaces by default.
- Statically configure ports that are connected to routers if necessary.

Figure 51-2: IGMP Snooping configuration example



As a result of this configuration:

- Membership reports are generated by hosts. The IGMP Snooping switch will forward the membership reports to its router port. Queries received by the IGMP Snooping switch from the IGMP Querier on port1.0.12 are forwarded by the IGMP Snooping switch.
- Because Host A and Host B are members of the same multicast group, the switch does not notify the IP IGMP routing device (IGMP Querier) when Host A leaves the group, because the group still has another member Host B remaining. When Host B also leaves the group, the switch forwards the leave message to the IP IGMP Querier.
- The addition of a static mrouter port is only required when there is no upstream IGMP querier or an upstream router does not send topology discovery or maintenance messages (like IGMP General Queries or OSPF Hello packets).
- In this example, the configuration of a static mrouter port on port1.0.12 is provided to illustrate the **ip igmp snooping mrouter** command. However, this command would probably not be necessary, since the switch should dynamically set port1.0.12 to be an mrouter port as it receives IGMP Queries arriving from the IGMP Querier attached to port1.0.12.

- In this example, it is not necessary to explicitly configure the switch to work with IGMPv2 or IGMPv3. When the IGMP version is not configured then the switch will work with both versions of IGMP.

Table 51-1: Configuring IGMP Snooping on Switch 1 and IGMP Querier on Switch 2

Configure IGMP Snooping (Switch 1)		
1.	`awplus#` `configure terminal`	Enter Global Configuration mode.
2.	`awplus(config)#` `ip igmp snooping`	Enable IGMP Snooping globally. Snooping is enabled by default. Use this command only if you have previously disabled it.
3.	`awplus(config)#` `ip igmp snooping`	Enter Interface Configuration mode for VLAN 1.
4.	`awplus(config-if)#` `ip igmp snooping mrouter interface port1.0.12`	Configure port1.0.12 as a multicast router port to the IGMP Querier.
5.	`awplus(config-if)#` `exit`	Return to Global Configuration mode.
Validate the configuration		
6.	`awplus#` `exit`	Return to Privileged Exec mode.
7.	`awplus#` `show ip igmp interface vlan1`	Display the state of IGMP Snooping for VLAN 1.
8.	`awplus#` `show ip igmp groups`	Display the multicast groups with receivers directly connected to the router.
9.	`awplus#` `show ip igmp snooping mrouter interface vlan1`	Display the multicast router ports, both static and dynamic, in VLAN 1.
Configure IGMP Querier (Switch 2)		
1.	`awplus#` `configure terminal`	Enter Global Configuration mode.
2.	`awplus(config)#` `interface vlan1`	Enter Interface Configuration mode for VLAN 1.
3.	`awplus(config-if)#` `ip igmp`	Enable IGMP on VLAN 1 and configure the switch as an IGMP Querier.
Validate the configuration		
4.	`awplus#` `exit`	Return to Privileged Exec mode.
5.	`awplus#` `show ip igmp interface vlan1`	Display the state of IGMP Querier for VLAN 1.

Table 51-1: Configuring IGMP Snooping on Switch 1 and IGMP Querier on Switch 2

6.	`awplus#`	
	`show running-config`	Display the current dynamic configuration of Switch 2.

Query Solicitation

Query Solicitation minimizes the loss of multicast data after a topology change on networks that use EPSR or spanning tree (STP, RSTP, or MSTP) for loop protection. Without Query Solicitation, when the underlying link layer topology changes, multicast data flow can stop for up to several minutes, depending on which port goes down and how much of the IGMP query interval remained at the time of the topology change. Query Solicitation greatly reduces this disruption.

Query Solicitation operates without configuration in AlliedWare Plus™ switches running STP, RSTP, MSTP or EPSR. However, you may find it useful to manually enable Query Solicitation in loop-free networks running IGMP (see **Speeding up IGMP convergence in a non-looped topology**) and networks where not all switches support Query Solicitation (see **Enabling Query Solicitation on multiple switches in a looped topology**).

How Query Solicitation Works

Query Solicitation monitors STP, RSTP, MSTP and EPSR messages for topology changes. When it detects a change, it generates a special IGMP Leave message called a Query Solicit. The switch floods the Query Solicit message to all ports in every VLAN that Query Solicitation is enabled on. When the Querier receives the Query Solicit message, it sends out a General Query and waits for clients to respond with Membership Reports. These Reports update the snooping information throughout the network.

Query Solicit messages have a group address of 0.0.0.0.

Query Solicitation works by default (without you enabling it) on all VLANs on the root bridge in an STP instance and on all data VLANs on the master node in an EPSR instance. By default, the root bridge or master node always sends a Query Solicit message when any of the following events occur:

- an STP BPDU packet with the Topology Change (TC) flag arrives at the root bridge
- an STP port on a switch goes from a Discarding to Forwarding state
- the FDB gets flushed by EPSR

If necessary, you can make clients respond more quickly to the General Query by tuning the IGMP timers, especially the maximum response time advertised in IGMP queries using the **ip igmp query-max-response-time** command.

Query Solicitation Operation

When IGMP Snooping is enabled and EPSR or Spanning Tree changes the underlying link layer topology, this can interrupt multicast data flow for a significant length of time. This is because there is no way for switches in a network with interested clients to know where the traffic is available, due to the change in network topology. This change in network topology may take up to two IGMP Query intervals from the IGMP Querier, until the switches will know where to forward membership reports received by client hosts. During this time, those hosts will not receive multicast traffic.

Query solicitation prevents this by monitoring for any topology changes. When it detects a change, it generates a special IGMP Leave message known as a Query Solicit, and floods the Query Solicit message to all ports in every VLAN that query solicitation is enabled on. When the IGMP Querier receives the message, it responds by sending a General Query, which all IGMP listeners respond to. This refreshes snooped group membership information in the network.

Query solicitation reduces downtime to a negligible amount by triggering on topology

changes. The generation of query solicitation messages in the network causes the IGMP Querier to send an IGMP Query immediately following a topology change. This enables the switches to know where to look for the traffic and thus to send reports to the correct switch upstream. This allows the multicast data traffic to be recovered instantly.

Query solicitation functions by default (without you enabling it) on all VLANs on the root bridge in an STP instance and on all data VLANs on the master node in an EPSR instance. By default, the root bridge or master node always sends a Query Solicit message when the topology changes.

If you have multiple STP or EPSR instances, query solicitation only sends Query Solicit messages on VLANs in the instance that experienced a topology change.

In switches other than the STP root bridge or EPSR master node, query solicitation is disabled by default, but you can enable it by using the **ip igmp snooping tcn query solicit** command.

If you enable query solicitation on a switch other than the STP root bridge or EPSR master node, both that switch and the root or master send a Query Solicit message.

Once the Querier receives the Query Solicit message, it sends out a General Query and waits for responses, which update the snooping information throughout the network.

The **ip igmp query-holdtime** command can be configured on the IGMP Querier. This command introduces a brief delay between when the IGMP Querier receives the query solicit, and when it sends out the general query. Although this slightly reduces the speed with which the network recovers from the topology change, its does guard against a DoS (Denial of Service) attack. Without this delay, a malign host sending a stream of query solicits could cause the IGMP Querier to flood the network with IGMP Queries.

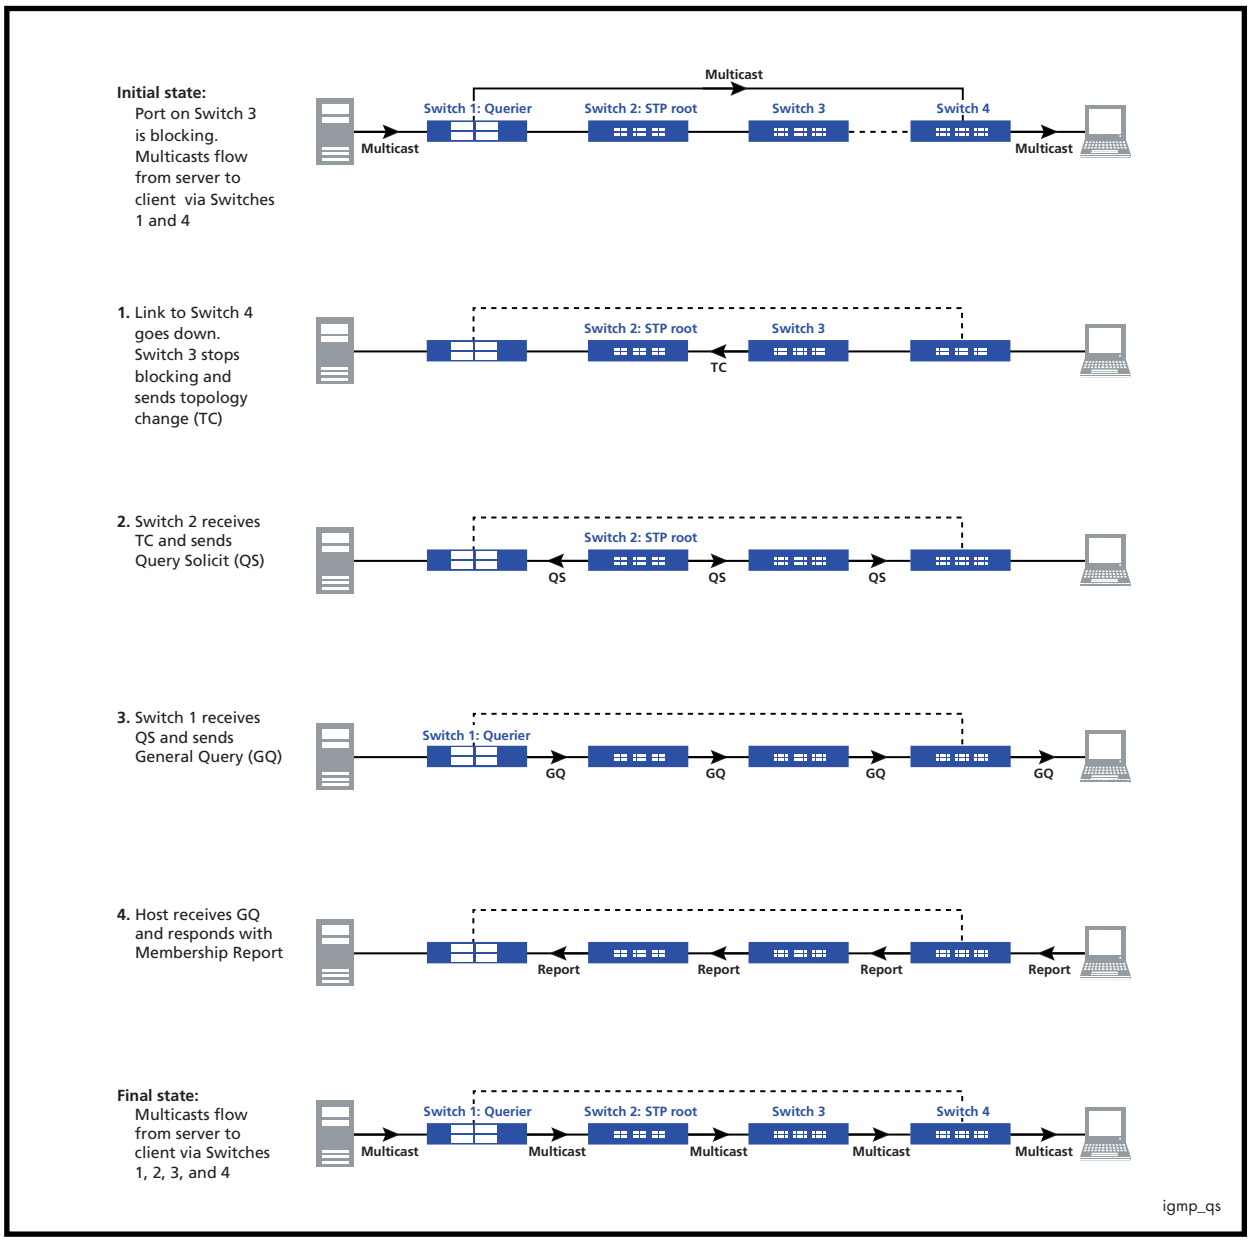
To get the network to converge faster, use the **ip igmp query-max-response-time** command and set a low response time value, such as one or two seconds, so that the clients will respond immediately with a report as a response to the IGMP Queries

On switches other than the STP root bridge or the EPSR master node, you can disable query solicitation by using the no variant of the **ip igmp snooping tcn query solicit** command. In addition, on all switches, you can disable query solicitation on a per-vlan basis using the no variant of the **ip igmp snooping tcn query solicit** command in Interface Configuration mode, after specifying a VLAN first in Interface Configuration mode.

To see whether query solicitation is on or off, check the Query Solicitation field in output of the **show ip igmp interface** command. You can view running and startup configurations with **show running-config** and **show startup-config** commands to see if Query Solicitation is enabled.

The following figure shows how Query Solicitation works when a port goes down.

Figure 51-3: Query Solicitation when a port goes down



Speeding up IGMP convergence in a non-looped topology

For loop-free networks running IGMP, where it may take up to two minutes for multicasting to recover in a non-looped topology after a port comes back up, you can speed up convergence by enabling RSTP using the **spanning-tree mode** and **spanning-tree enable** commands.

RSTP enables the network to use Query Solicitation by default, and means that multicasting should resume within seconds, not minutes, of the link coming up.

Enabling Query Solicitation on multiple switches in a looped topology

On networks that use spanning tree or EPSR, Query Solicitation is not normally required on switches other than the STP root bridge or EPSR master node. Therefore, it is only enabled by default on the root bridge and the master node.

However, in some networks you may need to turn on Query Solicitation on all switches - for example, if the network includes other switches that do not support Query Solicitation and therefore the STP root bridge may be a switch that does not send Query Solicit messages. To enable Query Solicitation, use the **ip igmp snooping tcn query solicit** command.

Every switch that has Query Solicitation enabled sends a Query Solicit message when it detects a topology change. Enabling it on multiple switches means you get multiple messages, but has no other disadvantage.

The following figure shows the packet flow for a four-switch network with Query Solicitation enabled on all the switches.

Figure 51-4: Packet flow for a four switch network with Query Solicitation enabled

Introduction

The Internet Group Management Protocol (IGMP) module includes the IGMP Proxy service and IGMP Snooping functionality. Some of the following commands may have commonalities and restrictions. These are described under the Usage section for each command.

Command List

This chapter provides an alphabetical reference of configure, clear, and show commands related to Internet Group Management Protocol (IGMP).

clear ip igmp

Use this command to clear all IGMP group membership records on all VLAN interfaces.

Syntax `clear ip igmp`

Mode Privileged Exec

Usage This command applies to VLAN interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

Example

```
awplus# clear ip igmp
```

Validation Commands **show ip igmp interface**
show running-config

Related Commands **clear ip igmp group**
clear ip igmp interface

clear ip igmp group

Use this command to clear IGMP group membership records for a specific group on either all VLAN interfaces, a single VLAN interface, or for a range of VLAN interfaces.

Syntax

```
clear ip igmp group *
clear ip igmp group <ip-address> <interface>
```

Parameter	Description
*	Clears all groups on all VLAN interfaces. This is an alias to the **clear ip igmp** command.
<ip-address>	Specifies the group whose membership records will be cleared from all VLAN interfaces, entered in the form A.B.C.D.
<interface>	Specifies the name of the VLAN interface; all groups learned on this VLAN interface are deleted.

Mode Privileged Exec

Usage This command applies to groups learned by IGMP, IGMP Snooping, or IGMP Proxy.

In addition to the group a VLAN interface can be specified. Specifying this will mean that only entries with the group learnt on the interface will be deleted.

Examples

```
awplus# clear ip igmp group *
awplus# clear ip igmp group 224.1.1.1 vlan1
```

Validation Commands **show ip igmp interface**
show running-config

Related Commands **clear ip igmp**
clear ip igmp interface

clear ip igmp interface

Use this command to clear IGMP group membership records on a particular VLAN interface.

Syntax `clear ip igmp interface <interface>`

Parameter	Description
<interface>	Specifies the name of the VLAN interface. All groups learned on this VLAN interface are deleted.

Mode Privileged Exec

Usage This command applies to interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

Example

```
awplus# clear ip igmp interface vlan1
```

Validation Commands **show ip igmp interface**
show running-config

Related Commands **clear ip igmp**
clear ip igmp group

debug igmp

Use this command to enable debugging of either all IGMP or a specific component of IGMP.

Use the **no** variant of this command to disable all IGMP debugging, or debugging of a specific component of IGMP.

Syntax

```
debug igmp {all|decode|encode|events|fsm|tib}
no debug igmp {all|decode|encode|events|fsm|tib}
```

Parameter	Description
`all`	Enable or disable all debug options for IGMP
`decode`	Debug of IGMP packets that have been received
`encode`	Debug of IGMP packets that have been sent
`events`	Debug IGMP events
`fsm`	Debug IGMP Finite State Machine (FSM)
`tib`	Debug IGMP Tree Information Base (TIB)

Modes

Privileged Exec and Global Configuration

Usage

This command applies to interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

Example

```
awplus# configure terminal
awplus(config)# debug igmp all
```

Related Commands

show debugging igmp
undebug igmp

ip igmp

Use this command to enable IGMP on an interface. The command configures the device as an IGMP querier.

Use the **no** variant of this command to return all IGMP related configuration to the default on this interface.

Syntax

```
ip igmp
no ip igmp
```

Default Disabled

Mode Interface Configuration for a VLAN interface.

Usage This command can only be configured on VLAN interfaces, and will have no effect on IGMP Proxy or IGMP Snooping configuration.

Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Note An IP address must be assigned to the VLAN first, before this command will work.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp
```

Validation Commands **show ip igmp interface**
show running-config

ip igmp access-group

This command adds an access control list to a VLAN interface configured for IGMP, IGMP Snooping, or IGMP Proxy. The access control list is used to control and filter the multicast groups learnt on the VLAN interface.

The **no** variant of this command disables the access control filtering on the interface.

Syntax

```
ip igmp access-group {<access-list-number>|<access-list-name>}
no ip igmp access-group
```

Parameter	Description
<access-list-number>	Standard IP access-list number, in the range <1-99>.
<access-list-name>	Standard IP access-list name.

Default By default there are no access lists configured on any interface.

Mode Interface Configuration for a VLAN interface.

Usage This command applies to VLAN interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

This command applies to VLAN interfaces configured for IGMP or IGMP Snooping.

Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Example In the following example, hosts serviced by VLAN interface `vlan2` can only join the group `225.2.2.2`:

```
awplus# configure terminal
awplus(config)# access-list 1 permit 225.2.2.2 0.0.0.0
awplus(config)# interface vlan2
awplus(config-if)# ip igmp access-group 1
```

ip igmp immediate-leave

In IGMP version 2, use this command to minimize the leave latency of IGMP memberships for specified multicast groups. The specified access list number or name defines the multicast groups in which the immediate leave feature is enabled.

Use the **no** variant of this command to disable this feature.

Syntax

```
ip igmp immediate-leave group-list {<access-list-number>|<access-
    list-number-expanded>|<access-list-name>}

no ip igmp immediate-leave
```

Parameter	Description
<access-list-number>	Access-list number, in the range <1-99>.
<access-list-number-expanded>	Access-list number (expanded range), in the range <1300-1999>.
<access-list-name>	Standard IP access-list name.

Default Disabled by default.

Mode Interface Configuration for a VLAN interface.

Usage This command applies to interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Example The following example shows how to enable the immediate-leave feature on the VLAN interface `vlan2` for a specific range of multicast groups

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp immediate-leave group-list 34
awplus(config-if)# exit
awplus(config)# access-list 34 permit 225.192.20.0 0.0.0.255
```

Related Commands **ip igmp last-member-query-interval**

ip igmp last-member-query-count

Use this command to set the last-member query-count value for an interface.

Use the **no** variant of this command to return to the default on an interface.

Syntax

```
ip igmp last-member-query-count <2-7>
no ip igmp last-member-query-count
```

Parameter	Description
<2-7>	Last member query count value.

Default The default last member query count value is 2.

Mode Interface Configuration for a VLAN interface.

Usage This command applies to interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp last-member-query-count 3
```

Validation Commands **show ip igmp interface**
show running-config

Related Commands **ip igmp last-member-query-interval**
ip igmp startup-query-count

ip igmp last-member-query-interval

Use this command to configure the frequency at which the router sends IGMP group specific host query messages.

Use the **no** variant of this command to set this frequency to the default.

Syntax

```
ip igmp last-member-query-interval <interval>
no ip igmp last-member-query-interval
```

Parameter	Description
<interval>	The frequency in milliseconds, in the range <1000-25500>, at which IGMP group-specific host query messages are sent.

Default 1000 milliseconds

Mode Interface Configuration for a VLAN interface.

Usage This command applies to interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Example The following example changes the IGMP group-specific host query message interval to 2 seconds (`2000` milliseconds) for VLAN interface `vlan1`:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip igmp last-member-query-interval 2000
```

Validation Commands **show ip igmp interface**
show running-config

Related Commands **ip igmp immediate-leave**
ip igmp last-member-query-count

ip igmp limit

Use this command to configure the limit on the maximum number of group membership entries for the device as a whole or for the specified interface (if in interface mode). Once the specified number of group memberships is reached, all further membership reports will be ignored. Optionally, you can configure an access-list to stop certain address(es) from being subject to the limit.

The limit is dependent on the MTU (Maximum Transmission Unit) of the interface, which is the size in bytes of the largest packet that a network protocol can transmit. Typically for an ethernet channel with an MTU of 1500 the igmp group membership limit will be 183 groups, because each igmp group membership is 8 bytes.

Use the **no** variant of this command to unset the limit and any specified exception access-list.

Syntax

```
ip igmp limit <limitvalue> [except {<access-list-number>|<access-
    list-number-expanded>|<access-list-name>}]

no ip igmp limit
```

Parameter	Description
<limitvalue>	<2-2097152> Maximum number of group membership entries.
<limitvalue>	<2-512> Maximum number of group membership entries.
<access-list-number>	Access-list number, in the range <1-99>.
<access-list-number-expanded>	Access-list number (expanded range), in the range <1300-1999>.
<access-list-name>	Standard IP access-list name.

Default The default limit, which is reset by the **no** variant of this command, is the same as maximum number of group membership entries that can be learned with the **ip igmp limit** command.

The default limit of group membership entries that can be learned is 2095152 entries.

Usage This command applies to interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Examples The following example configures an IGMP limit of `100` group membership entries across all interfaces on which IGMP is enabled, and excludes group `224.1.1.1` from this limitation:

```
awplus# configure terminal
awplus(config)# access-list 1 permit 224.1.1.1 0.0.0.0
awplus(config)# ip igmp limit 100 except 1
```

The following example configures an IGMP limit of 100 group membership entries on VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp limit 100
```

ip igmp mroute-proxy

Use this command to enable IGMP mroute proxy on this downstream interface and associate it with the upstream proxy service interface.

Use the **no** variant of this command to remove the association with the proxy-service interface.

Syntax

```
ip igmp mroute-proxy <interface>
no ip igmp mroute-proxy
```

Parameter	Description
<interface>	The name of the VLAN interface.

Mode Interface Configuration for a VLAN interface.

Usage You must also enable the IGMP proxy service on the upstream interface, using the **ip igmp proxy-service** command. You can associate one or more downstream mroute proxy interfaces on the device with a single upstream proxy service interface. This downstream mroute proxy interface listens for IGMP reports, and forwards them to the upstream IGMP proxy service interface.

IGMP Proxy does not work with other multicast routing protocols, such as PIM-SM or PIM-DM. This command applies to interfaces configured for IGMP Proxy.

Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Example The following example configures the VLAN interface `vlan2` interface as the upstream proxy-service interface for the downstream interface, VLAN interface `vlan3`.

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# ip igmp mroute-proxy vlan2
```

Related Commands **ip igmp proxy-service**

ip igmp proxy-service

Use this command to enable the VLAN interface to be the upstream IGMP proxy-service interface for the device. All associated downstream IGMP mroute proxy interfaces on this device will have their memberships consolidated on this proxy service interface, according to IGMP host-side functionality.

Use the **no** variant of this command to remove the designation of the VLAN interface as an upstream proxy-service interface.

Syntax

```
ip igmp proxy-service
no ip igmp proxy-service
```

Mode Interface Configuration for a VLAN interface.

Usage This command is used with the **ip igmp mroute-proxy** command to enable forwarding of IGMP reports to a proxy service interface for all forwarding entries for this interface. You must also enable the downstream IGMP mroute proxy interfaces on this device using the command **ip igmp mroute-proxy**.

IGMP Proxy does not work with other multicast routing protocols, such as PIM-SM or PIM-DM.

Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Example The following example designates the VLAN interface `vlan2` interface as the upstream proxy-service interface.

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip igmp proxy-service
```

Related Commands **ip igmp mroute-proxy**

ip igmp querier-timeout

Use this command to configure the timeout period before the device takes over as the querier for the VLAN interface after the previous querier has stopped querying.

Use the **no** variant of this command to restore the default.

Syntax

```
ip igmp querier-timeout <timeout>
no ip igmp querier-timeout
```

Parameter	Description
<timeout>	IGMP querier timeout interval value in seconds, in the range <1-65535>.

Default The default timeout interval is 255 seconds.

Mode Interface Configuration for a VLAN interface.

Usage This command applies to VLAN interfaces configured for IGMP. The timeout value should not be less than the current active querier's general query interval.

Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Example The following example configures the device to wait `130` seconds from the time it received the last query before it takes over as the querier for the VLAN interface `vlan20`:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp querier-timeout 130
```

Validation Commands **show ip igmp interface**
show running-config

Related Commands **ip igmp query-interval**

ip igmp query-holdtime

This command sets the time that an IGMP Querier waits after receiving a query solicitation before it sends an IGMP Query. IGMP General Query messages will not be sent during the hold time interval.

Use the **no** variant of this command to return to the default query hold time period.

Syntax

```
ip igmp query-holdtime <interval>
no ip igmp query-holdtime
```

Parameter	Description
<interval>	Query interval value in milliseconds, in the range <100-5000>.

Default By default the delay before sending IGMP General Query messages is 500 milliseconds.

Mode Interface Configuration for a VLAN interface.

Usage Use this command to configure a value for the IGMP query hold time in the current network. IGMP Queries can be generated after receiving Query Solicitation (QS) packets and there is a possibility of a DoS (Denial of Service) attack if a stream of Query Solicitation (QS) packets are sent to the IGMP Querier, eliciting a rapid stream of IGMP Queries. This command applies to interfaces on which the switch is acting as an IGMP Querier.

Use the **ip igmp query-interval** command when a delay for IGMP general query messages is required and IGMP general query messages are required. The **ip igmp query-holdtime** command stops IGMP query messages during the configured holdtime interval, so the rate of IGMP Queries that can be sent out of an interface can be restricted.

See **"Query Solicitation" on page 51.9** for introductory information about the Query Solicitation feature.

Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Examples To set the IGMP query holdtime to `900` ms for `vlan20`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp query-holdtime 900
```

To reset the IGMP query holdtime to the default (500 ms) for `vlan10`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip igmp query-holdtime
```

Validation Commands
show ip igmp interface
show running-config

Related Commands
ip igmp query-interval
ip igmp snooping tcn query solicit

ip igmp query-interval

Use this command to configure the period for sending IGMP General Query messages. The IGMP query interval specifies the time between IGMP General Query messages being sent.

Use the **no** variant of this command to return to the default query interval period.

Note The IGMP query interval must be greater than IGMP query maximum response time.

Syntax

```
ip igmp query-interval <interval>
no ip igmp query-interval
```

Parameter	Description
<interval>	Query interval value in seconds, in the range <2-18000>.

Default The default IGMP query interval is 125 seconds.

Mode Interface Configuration for a VLAN interface.

Usage This command applies to interfaces configured for IGMP. Note that the IGMP query interval is automatically set to a greater value than the IGMP query max response time.

For example, if you set the IGMP query max response time to 2 seconds using the **ip igmp query-max-response-time** command, and the IGMP query interval is currently less than 3 seconds, then the IGMP query interval period will be automatically reconfigured to be 3 seconds, so it is greater than the IGMP query maximum response time.

Use the **ip igmp query-interval** command when a non-default interval for IGMP General Query messages is required.

The **ip igmp query-holdtime** command can occasionally delay the sending of IGMP Queries.

Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Examples The following example changes the period between IGMP host-query messages to 3 minutes (180 seconds) for VLAN interface vlan20:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp query-interval 180
```

The following example resets the period between sending IGMP host-query messages to the default (125 seconds) for VLAN interface vlan20:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# no ip igmp query-interval
```

Validation Commands
show ip igmp interface
show running-config

Related Commands
ip igmp query-holdtime
ip igmp query-max-response-time
ip igmp startup-query-interval

ip igmp query-max-response-time

Use this command to configure the maximum response time advertised in IGMP Queries.

Use the **no** variant of this command to restore the default.

Note The IGMP query maximum response time must be less than the IGMP query interval.

Syntax

```
ip igmp query-max-response-time <response-time>
no ip igmp query-max-response-time
```

Parameter	Description
<response-time>	Response time value in seconds, in the range <1-3180>.

Default The default IGMP query maximum response time is 10 seconds.

Mode Interface Configuration for a VLAN interface.

Usage This command applies to interfaces configured for IGMP. Note that the IGMP query interval is automatically set to a greater value than the IGMP query maximum response time.

For example, if you set the IGMP query interval to 3 seconds using the **ip igmp query-interval** command, and the current IGMP query interval is less than 3 seconds, then the IGMP query maximum response time will be automatically reconfigured to be 2 seconds, so it is less than the IGMP query interval time.

To get the network to converge faster, use the **ip igmp query-max-response-time** command and set a low response time value, such as one or two seconds, so that the clients will respond immediately with a report as a response to the IGMP Queries.

Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Examples The following example configures a maximum response time of `8` seconds for VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp query-max-response-time 8
```

The following example restores the default maximum response time of `10` seconds for VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip igmp query-max-response-time
```

Validation Commands **show ip igmp interface**
show running-config

Related Commands **ip igmp query-interval**

ip igmp ra-option (Router Alert)

Use this command to enable strict Router Alert (RA) option validation. With strict RA option enabled, IGMP packets without RA options are ignored.

Syntax

```
ip igmp ra-option
no ip igmp ra-option
```

Default The default state of RA validation is unset.

Mode Interface Configuration for a VLAN interface.

Usage This command applies to interfaces configured for IGMP and IGMP Snooping.

Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Example

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp ra-option
```

ip igmp robustness-variable

Use this command to change the robustness variable value on a VLAN interface.

Use the **no** variant of this command to return to the default on an interface.

Syntax

```
ip igmp robustness-variable <1-7>
no ip igmp robustness-variable
```

Parameter	Description
<1-7>	The robustness variable value.

Default The default robustness variable value is 2.

Mode Interface Configuration for a VLAN interface.

Usage This command applies to interfaces configured for IGMP and IGMP Snooping.

Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Examples

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp robustness-variable 3

awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# no ip igmp robustness-variable 3
```

Validation Commands **show ip igmp interface**
show running-config

ip igmp snooping

Use this command to enable IGMP Snooping. When this command is used in the Global Configuration mode, IGMP Snooping is enabled at the switch level. When this command is used in Interface Configuration mode, IGMP Snooping is enabled for the specified VLANs.

Use the **no** variant of this command to either globally disable IGMP Snooping, or disable IGMP Snooping on a specified interface.

IGMP snooping cannot be disabled on an interface if IGMP snooping has already been disabled globally. IGMP snooping can be disabled on both an interface and globally if disabled on the interface first and then disabled globally.

Syntax

```
ip igmp snooping
no ip igmp snooping
```

Default By default, IGMP Snooping is enabled both globally and on all VLANs.

Mode Global Configuration and Interface Configuration for a VLAN interface.

Usage For IGMP snooping to operate on particular VLAN interfaces, it must be enabled both globally by using this command in Global Configuration mode, and on individual VLAN interfaces by using this command in Interface Configuration mode (both are enabled by default.)

Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Examples

```
awplus# configure terminal
awplus(config)# ip igmp snooping

awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping
```

Related Commands **show ip igmp interface**
show running-config

ip igmp snooping fast-leave

Use this command to enable IGMP Snooping fast-leave processing. Fast-leave processing is analogous to immediate-leave processing. The IGMP group-membership entry is removed as soon as an IGMP leave group message is received, without sending out a group-specific query.

Use the **no** variant of this command to disable fast-leave processing.

Syntax

```
ip igmp snooping fast-leave
no ip igmp snooping fast-leave
```

Default IGMP Snooping fast-leave processing is disabled.

Mode Interface Configuration for a VLAN interface.

Usage This IGMP Snooping command can only be configured on VLAN interfaces.

Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Example This example shows how to enable fast-leave processing on the VLAN interface vlan2:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping fast-leave
```

Validation Commands **show ip igmp interface**
show running-config

ip igmp snooping mrouter

Use this command to statically configure the specified port as a multicast router port for IGMP Snooping for an interface. This command applies to interfaces configured for IGMP Snooping.

Use the **no** variant of this command to remove the static configuration of the port as a multicast router port.

Syntax

```
ip igmp snooping mrouter interface <port>
no ip igmp snooping mrouter interface <port>
```

Parameter	Description
<port>	The port may be a switch port (e.g. `port1.0.4`), a static channel group (e.g. `sa3`), or a dynamic (LACP) channel group (e.g. `po4`).

Mode Interface Configuration for a VLAN interface.

Usage Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Example This example shows the switch port interface `port1.0.2` statically configured to be a multicast router interface for the VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping mrouter interface port1.0.2
```

Related Commands **show ip igmp snooping mrouter**

ip igmp snooping querier

Use this command to enable IGMP querier operation when no multicast routing protocol is configured. When enabled, the IGMP Snooping querier sends out periodic IGMP queries for all interfaces. This command applies to interfaces configured for IGMP Snooping.

Use the **no** variant of this command to disable IGMP querier configuration.

Syntax

```
ip igmp snooping querier
no ip igmp snooping querier
```

Mode Interface Configuration for a VLAN interface.

Usage The IGMP Snooping querier uses the `0.0.0.0` Source IP address because it only masquerades as a proxy IGMP querier for faster network convergence.

It does not start, or automatically cease, the IGMP Querier operation if it detects query message(s) from a multicast router.

If an IP address is assigned to a VLAN, which has IGMP querier enabled on it, then the IGMP Snooping querier uses the VLAN's IP address as the Source IP Address in IGMP queries.

The IGMP Snooping Querier will not stop sending IGMP Queries if there is another IGMP Snooping Querier in the network with a lower Source IP Address.

Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Note Do not enable the IGMP Snooping Querier feature on a Layer 2 switch when there is an operational IGMP Querier in the network.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping querier
```

Validation Commands **show ip igmp interface**
show running-config

ip igmp snooping report-suppression

Use this command to enable report suppression for IGMP versions 1 and 2. This command applies to interfaces configured for IGMP Snooping.

Report suppression stops reports being sent to an upstream multicast router port when there are already downstream ports for this group on this interface.

Use the **no** variant of this command to disable report suppression.

Syntax

```
ip igmp snooping report-suppression
no ip igmp snooping report-suppression
```

Default Report suppression does not apply to IGMPv3, and is turned on by default for IGMPv1 and IGMPv2 reports.

Mode Interface Configuration for a VLAN interface.

Usage Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Example This example shows how to enable report suppression for IGMPv2 reports for the VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp version 2
awplus(config-if)# ip igmp snooping report-suppression
```

Validation Commands **show ip igmp interface**
show running-config

ip igmp snooping routermode

Use this command to set the destination IP addresses as a router multicast address, according to the routermode (all multicast addresses, default multicast addresses, specified multicast addresses).

Use the **no** variant of this command to the default. You can also remove a specified IP address from a custom list of multicast addresses.

Syntax

```
ip igmp snooping routermode {all|default|ip|multicastrouter|address
   <ip-address>}
```

```
no ip igmp snooping routermode [address <ip-address>]
```

Parameter	Description
`all`	All reserved multicast addresses (224.0.0.x). Packets from all possible addresses in range 224.0.0.x are set as routers.
`default`	Default set of reserved multicast addresses. Packets from 224.0.0.1, 224.0.0.2, 224.0.0.4, 224.0.0.5, 224.0.0.6, 224.0.0.9, 224.0.0.13, 224.0.0.15 and 224.0.0.24 are set as routers.
`ip`	Custom reserved multicast addresses. Custom IP address in the 224.0.0.x range are set as router multicast addresses using the **ip igmp snooping routermode address** command.
`multicastrouter`	DVMRP (224.0.0.4) and PIM (224.0.0.13) multicast addresses are set as routers.
`address`	Specify the multicast address in the 224.0.0.x range for use after issuing an **ip igmp snooping routermode ip** command
`<ip-address>`	IPv4 multicast address (224.0.0.x)

Default The default routermode is **default** not **all** and shows the below reserved multicast addresses:

```
Router mode.............Def
Reserved multicast address
          224.0.0.1
          224.0.0.2
          224.0.0.4
          224.0.0.5
          224.0.0.6
          224.0.0.9
          224.0.0.13
          224.0.0.15
          224.0.0.24
```

Mode Global Configuration

Examples To set **ip igmp snooping routermode** for all default reserved addresses enter:.

```
awplus(config)# ip igmp snooping routermode default
```

To remove the multicast address 224.0.0.5 from the custom list of multicast addresses enter:.

```
awplus(config)# no ip igmp snooping routermode address
                224.0.0.5
```

Related commands **show ip igmp snooping routermode**

ip igmp snooping tcn query solicit

Use this command to enable IGMP (Internet Group Management Protocol) Snooping TCN (Topology Change Notification) Query Solicitation feature. When this command is used in the Global Configuration mode, Query Solicitation is enabled.

Use the **no** variant of this command to disable IGMP Snooping TCN Query Solicitation. When the no variant of this command is used in Interface Configuration mode, this overrides the Global Configuration mode setting and Query Solicitation is disabled.

Syntax

```
ip igmp snooping tcn query solicit

no ip igmp snooping tcn query solicit
```

Default IGMP Snooping TCN Query Solicitation is disabled by default on the switch, unless the switch is the Master Node in an EPSR ring, or is the Root Bridge in a Spanning Tree.

When the switch is the Master Node in an EPSR ring, or the switch is the Root Bridge in a Spanning Tree, then IGMP Snooping TCN Query Solicitation is enabled by default and cannot be disabled using the Global Configuration mode command. However, Query Solicitation can be disabled for specified VLANs using this command from the Interface Configuration mode. Select the VLAN you want to disable in Interface Configuration mode then issue the no variant of this command to disable the specified VLAN without disabling this feature for other VLANs.

Mode Global Configuration and Interface Configuration for a VLAN interface.

Usage Once enabled, if the switch is not an IGMP Querier, on detecting a topology change, the switch generates IGMP Query Solicit messages that are sent to all the ports of the vlan configured for IGMP Snooping on the switch.

On a switch that is not the Master Node in an EPSR ring or the Root Bridge in a Spanning Tree, Query Solicitation can be disabled using the **no** variant of this command after being enabled.

If the switch that detects a topology change is an IGMP Querier then the switch will generate an IGMP Query message.

Note that the **no** variant of this command when issued in Global Configuration mode has no effect on a switch that is the Master Node in an EPSR ring or on a switch that is a Root Bridge in a Spanning Tree. Query Solicitation is not disabled for the switch these instances. However, Query Solicitation can be disabled on a per-vlan basis from the Interface Configuration mode.

See the below state table that shows when Query Solicit messages are sent in these instances:

Command issued from Global Configuration	Switch is STP Root Bridge or the EPSR Master Node	Command issued from Interface Configuration	IGMP Query Solicit message sent on VLAN
No	Yes	Yes	Yes
Yes	Yes	No	No
Yes	Yes	Yes	Yes

See **"Query Solicitation" on page 51.9** for introductory information about the Query Solicitation feature.

Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Examples

This example shows how to enable IGMP Snooping TCN Query Solicitation on a switch:

```
awplus# configure terminal
awplus(config)# ip igmp snooping tcn query solicit
```

This example shows how to disable IGMP Snooping TCN Query Solicitation on a switch:

```
awplus# configure terminal
awplus(config)# no ip igmp snooping tcn query solicit
```

This example shows how to enable IGMP Snooping TCN Query Solicitation for the VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping tcn query solicit
```

This example shows how to disable IGMP Snooping TCN Query Solicitation for the VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip igmp snooping tcn query solicit
```

Validation Commands

show ip igmp interface
show running-config

Related Commands

ip igmp query-holdtime

ip igmp source-address-check

This command enables the checking of the Source Address for an IGMP Report, rejecting any IGMP Reports originating on devices outside of the local subnet.

Use the **no** variant of this command to disable the checking of the Source Address for an IGMP Report, which allows IGMP Reports from devices outside of the local subnet.

Syntax

```
ip igmp source-address-check
no ip igmp source-address-check
```

Default Source address checking for IGMP Reports is enabled by default.

Mode Interface Configuration for a VLAN interface.

Usage This is a security feature, and should be enabled unless IGMP Reports from outside the local subnet are expected, for example, if Multicast VLAN Registration is active in the network.

The **no** variant of this command is required to disable the IGMP Report source address checking feature in networks that use Multicast VLAN Registration to allow IGMP Reports from devices outside of the local subnet.

Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Examples To deny IGMP Reports from outside the current subnet for the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp source-address-check
```

To allow IGMP Reports from outside the current subnet for the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip igmp source-address-check
```

Validation Commands **show ip igmp interface**
show running-config

ip igmp ssm

Use this command to define a non-default Source Specific Multicast (SSM) range of IP multicast addresses in IGMP. Incoming IGMPv1 and IGMPv2 join requests are ignored if the multicast IP address is in the SSM range and no SSM mapping is configured for these addresses. By default, the SSM range is 232/8. To define the SSM range to be other than the default, use one of the access-list parameter options.

Use the **no** variant of this command to change the SSM range in IGMP back to the default.

Syntax

```
ip igmp ssm range {<access-list-number>|<access-list-name>}
no ip igmp ssm
```

Parameter	Description
<access-list-number>	Access-list number, in the range <1-99>.
<access-list-name>	Standard IP access-list name.

Default By default the SSM range is 232/8.

Mode Global Configuration

Examples To configure a non-default SSM range to be used in IGMP enter the commands:

```
awplus# configure terminal
awplus(config)# access-list 10 permit 224.1.1.0 0.0.0.255
awplus(config)# ip igmp ssm range 10
```

To return to the default configuration enter the commands:

```
awplus# configure terminal
awplus(config)# no ip igmp ssm
```

Related Commands **access-list (standard numbered)**

ip pim ssm

ip igmp ssm-map enable

Use this command to enable Source Specific Multicast (SSM) mapping on the device.

Use the **no** variant of this command to disable SSM mapping.

Syntax

```
ip igmp ssm-map enable
no ip igmp ssm-map enable
```

Mode Global Configuration

Usage This command applies to VLAN interfaces configured for IGMP.

Example To enable SSM on the switch enter the commands:

```
awplus# configure terminal
awplus(config)# ip igmp ssm-map enable
```

Related Commands ip igmp ssm-map static

ip igmp ssm-map static

Use this command to specify the static mode of defining Source Specific Multicast (SSM) mapping. SSM statically assigns sources to IGMPv1 and IGMPv2 groups to translate such (*,G) groups' memberships to (S,G) memberships for use with PIM-SSM.

Use the **no** variant of this command to remove the SSM map association.

Syntax

```
ip igmp ssm-map static {<access-list-number>|<access-list-number-expanded>|<access-list-name>} <ip-address>
no ip igmp ssm-map static {<access-list-number>|<access-list-number-expanded>|<access-list-name>} <ip-address>
```

Parameter	Description
<access-list-number>	Access-list number, in the range <1-99>.
<access-list-number-expanded>	Access-list number (expanded range), in the range <1300-1999>.
<access-list-name>	Standard IP access-list name.
<ip-address>	Source address to use for static map group, entered in the form A.B.C.D.

Mode Global Configuration

Usage This command applies to VLAN interfaces configured for IGMP. You can use Standard numbered and Standard named ACLs plus Expanded Numbered ACLs.

Examples This example shows how to configure an SSM static mapping for group-address `224.1.1.1`, using a standard numbered ACL shown as `10`:

```
awplus# configure terminal
awplus(config)# access-list 10 permit 224.1.1.1 0.0.0.0
awplus(config)# ip igmp ssm-map static 10 1.2.3.4
```

This example shows how to configure an SSM static mapping for group-address `224.1.1.1`, using an expanded numbered ACL shown as `1301`:

```
awplus# configure terminal
awplus(config)# access-list 1301 permit 224.1.1.1 0.0.0.0
awplus(config)# ip igmp ssm-map static 1301 1.2.3.4
```

This example shows how to configure an SSM static mapping for group-address `224.1.1.1`, using a standard named ACL shown as `sales`:

```
awplus# configure terminal
awplus(config)# access-list sales permit 224.1.1.1 0.0.0.0
awplus(config)# ip igmp ssm-map static sales 1.2.3.4
```

Related Commands **ip igmp ssm-map enable**

ip igmp static-group

Use this command to statically configure multicast group membership entries on a VLAN interface, or to statically forward a multicast channel out a particular port or port range.

To statically add only a group membership, do not specify any parameters.

To statically add a (*,g) entry to forward a channel out of a port, specify only the multicast group address and the switch port range.

To statically add an (s,g) entry to forward a channel out of a port, specify the multicast group address, the source IP address, and the switch port range.

To use Source Specific Multicast mapping to determine the source IP address of the multicast server use the **ssm-map** parameter instead of specifying the source IP address.

Use the **no** variant of this command to delete static group membership entries.

Syntax

```
ip igmp static-group <ip-address> [source {<ip-source-addr>|ssm-map}]
    [interface <port>]

no ip igmp static-group <ip-address> [source {<ip-source-addr>|
    ssm-map}] [interface <port>]
```

Parameter	Description
<ip-address>	Standard IP Multicast group address, entered in the form A.B.C.D, to be configured as a static group member.
`source`	Optional.
<ip-source-addr>	Standard IP source address, entered in the form A.B.C.D, to be configured as a static source from where multicast packets originate.
`ssm-map`	This parameter uses Source Specific Multicast (SSM) Mapping to determine the source IP address associated with the specified IP Multicast group address. SSM mappings are configured using the **ip igmp ssm-map static** command.
`interface`	Use this parameter to specify a specific switch port or switch port range to statically forward the multicast group out of. If not used, static configuration is applied on all ports in the VLAN.
<port>	The port or port range to statically forward the group out of. The port may be a switch port (e.g. `port1.0.4`), a static channel group (e.g. `sa3`), or a dynamic (LACP) channel group (e.g. `po4`).

Mode Interface Configuration for a VLAN interface.

Usage This command applies to IGMP operation on a specific interface to statically add group and/or source records, or to IGMP Snooping on a VLAN interface to statically add group and/or source records.

Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Example The following example shows how to statically add group and source records for IGMP on the VLAN interface `vlan3`:

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# ip igmp static-group 226.1.2.4 source 10.2.3.4
```

ip igmp startup-query-count

Use this command to configure the IGMP startup query count for an interface. The IGMP startup query count is the number of IGMP General Query messages sent by a querier at startup. The default IGMP startup query count is 2.

Use the **no** variant of this command to return an interface's configured IGMP startup query count to the default.

Syntax

```
ip igmp startup-query-count <startup-query-count>
no ip igmp startup-query-count
```

Parameter	Description
<startup-query-count>	Specify the IGMP startup query count for a VLAN interface in the range <2-10> where 2 is the default IGMP query count.

Default The default IGMP startup query count is 2.

Mode Interface Configuration for a VLAN interface.

Usage Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Examples The following example shows how to configure the IGMP startup query count to 4 for the VLAN interface vlan3:

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# ip igmp startup-query-count 4
```

The following example shows how to remove the IGMP startup query count for the VLAN interface vlan3:

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# no ip igmp startup-query-count
```

Related Commands

ip igmp last-member-query-count
ip igmp startup-query-interval

ip igmp startup-query-interval

Use this command to configure the IGMP startup query interval for an interface. The IGMP startup query interval is the amount of time in seconds between successive IGMP General Query messages sent by a querier during startup. The default IGMP startup query interval is one quarter of the IGMP query interval value.

Use the **no** variant of this command to return an interface's configured IGMP startup query interval to the default.

Syntax

```
ip igmp startup-query-interval <startup-query-interval>
no ip igmp startup-query-interval
```

Parameter	Description
<startup-query-interval>	Specify the IGMP startup query interval for a VLAN interface in Interface Configuration mode in the range of <2-1800> seconds to be one quarter of the IGMP query interval value.

Default The default IGMP startup query interval is one quarter of the IGMP query interval value.

Note The IGMP startup query interval must be one quarter of the IGMP query interval.

Mode Interface Configuration for a VLAN interface.

Usage Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Examples The following example shows how to configure the IGMP startup query interval to `15` seconds for the VLAN interface `vlan2` to be one quarter of the IGMP query interval value of 60 seconds:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp startup-query-interval 15
awplus(config-if)# ip igmp query-interval 60
```

The following example shows how to remove the IGMP startup query interval for the VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip igmp startup-query-interval
```

Related Commands
ip igmp last-member-query-interval
ip igmp query-interval
ip igmp startup-query-count

ip igmp version

Use this command to set the current IGMP version (IGMP version 1, 2 or 3) on an interface.

Use the **no** variant of this command to return to the default version.

Syntax

```
ip igmp version <1-3>
no ip igmp version
```

Parameter	Description
<1-3>	IGMP protocol version number

Default The default IGMP protocol version number is 3.

Mode Interface Configuration for a VLAN interface.

Usage This command applies to VLAN interfaces configured for IGMP.

Ensure your VLAN is configured first, see **Chapter 18, Configuring VLANs**.

Example

```
awplus# configure terminal
awplus(config)# interface vlan5
awplus(config-if)# ip igmp version 2
```

Validation Commands **show ip igmp interface**

show debugging igmp

Use this command to display the IGMP debugging options set.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show debugging igmp`

Mode User Exec and Privileged Exec

Example To display the IGMP debugging options set, enter the command:

```
awplus# show debugging igmp
```

Output **Figure 52-1: Example output from the show debugging igmp command**

```
IGMP Debugging status:
  IGMP Decoder debugging is on
  IGMP Encoder debugging is on
  IGMP Events debugging is on
  IGMP FSM debugging is on
  IGMP Tree-Info-Base (TIB) debugging is on
```

Related Commands **debug igmp**

show ip igmp groups

Use this command to display the multicast groups with receivers directly connected to the router, and learned through IGMP.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show ip igmp groups [<ip-address>|<interface> detail]`

Parameter	Description
<ip-address>	Address of the multicast group, entered in the form A.B.C.D.
<interface>	Interface name for which to display local information.

Mode User Exec and Privileged Exec

Example The following command displays local-membership information for all ports in all interfaces:

```
awplus# show ip igmp groups
```

Output **Figure 52-2: Example output from the show ip igmp groups command**

```
IGMP Connected Group Membership
Group Address    Interface       Uptime    Expires   Last

Table 52-1: Parameters in the output of the show ip igmp groups command

Parameter	Description
`Group Address`	Address of the multicast group.
`Interface`	Port through which the group is reachable.
`Uptime`	The time in weeks, days, hours, minutes, and seconds that this multicast group has been known to the device.
`Expires`	Time (in hours, minutes, and seconds) until the entry expires.
`Last Reporter`	Last host to report being a member of the multicast group.

show ip igmp interface

Use this command to display the state of IGMP, IGMP Proxy service, and IGMP Snooping for a specified VLAN, or all VLANs. IGMP is shown as Active or Disabled in the show output.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show ip igmp interface [<interface>]`

Parameter	Description
<interface>	The name of the VLAN interface.

Mode User Exec and Privileged Exec

Examples The following output shows IGMP interface status for **vlan2** (with IGMP Snooping enabled):

```
awplus#configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
awplus(config)#interface vlan2
awplus(config-if)#ip igmp snooping
awplus(config-if)#exit
awplus(config)#exit
awplus#show ip igmp interface vlan2
Interface vlan2 (Index 202)
 IGMP Disabled, Inactive, Version 3 (default)
 IGMP interface has 0 group-record states
 IGMP activity: 0 joins, 0 leaves
 IGMP robustness variable is 2
 IGMP last member query count is 2
 IGMP query interval is 125 seconds
 IGMP query holdtime is 500 milliseconds
 IGMP querier timeout is 255 seconds
 IGMP max query response time is 10 seconds
 Last member query response interval is 1000 milliseconds
 Group Membership interval is 260 seconds
 Strict IGMPv3 ToS checking is disabled on this interface
 Source Address checking is enabled
 IGMP Snooping is globally enabled
 IGMP Snooping query solicitation is globally disabled
  Num. query-solicit packets: 57 sent, 0 recvd
 IGMP Snooping is enabled on this interface
 IGMP Snooping fast-leave is not enabled
 IGMP Snooping querier is not enabled
 IGMP Snooping report suppression is enabled
awplus#
```

The following output shows IGMP interface status for **vlan2** (with IGMP Snooping disabled):

```
awplus#configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
awplus(config)#interface vlan2
awplus(config-if)#no ip igmp snooping
awplus(config-if)#exit
awplus(config)#exit
awplus#show ip igmp interface vlan2
Interface vlan2 (Index 202)
 IGMP Disabled, Inactive, Version 3 (default)
 IGMP interface has 0 group-record states
 IGMP activity: 0 joins, 0 leaves
 IGMP robustness variable is 2
 IGMP last member query count is 2
 IGMP query interval is 125 seconds
 IGMP query holdtime is 500 milliseconds
 IGMP querier timeout is 255 seconds
 IGMP max query response time is 10 seconds
 Last member query response interval is 1000 milliseconds
 Group Membership interval is 260 seconds
 Strict IGMPv3 ToS checking is disabled on this interface
 Source Address checking is enabled
 IGMP Snooping is globally enabled
 IGMP Snooping query solicitation is globally disabled
  Num. query-solicit packets: 57 sent, 0 recvd
 IGMP Snooping is not enabled on this interface
 IGMP Snooping fast-leave is not enabled
 IGMP Snooping querier is not enabled
 IGMP Snooping report suppression is enabled
awplus#
```

The following command displays the IGMP interface status and Query Solicitation for **vlan3**:

```
awplus#show ip igmp interface vlan3
Interface vlan3 (Index 203)
 IGMP Enabled, Active, Querier, Version 3 (default)
 Internet address is 192.168.9.1
 IGMP interface has 256 group-record states
 IGMP activity: 51840 joins, 0 leaves
 IGMP robustness variable is 2
 IGMP last member query count is 2
 IGMP query interval is 125 seconds
 IGMP query holdtime is 500 milliseconds
 IGMP querier timeout is 250 seconds
 IGMP max query response time is 1 seconds
 Last member query response interval is 1000 milliseconds
 Group Membership interval is 251 seconds
 Strict IGMPv3 ToS checking is disabled on this interface
 IGMP Snooping is globally enabled
 IGMP Snooping query solicitation is globally enabled
  Num. query-solicit packets: 1 sent, 10 recvd
 IGMP Snooping is enabled on this interface
 IGMP Snooping fast-leave is not enabled
 IGMP Snooping querier is not enabled
 IGMP Snooping report suppression is enabled
awplus#
```

Note

Query Solicitation status information is highlighted in **bold** in the above output.

Use the **show ip igmp interface** command to validate that Query Solicitation is enabled and to show the number of query-solicit message packets sent and received on a VLAN.

show ip igmp proxy

Use this command to display the state of IGMP Proxy services for a specified interface or for all interfaces.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show ip igmp proxy
show ip igmp proxy groups [detail]
show ip igmp proxy groups <multicast-group> [detail]
show ip igmp proxy groups <vlan> [detail]
show ip igmp proxy groups <vlan> <multicast-group> [detail]
```

Parameter	Description
`groups`	Specify IGMP proxy group membership information.
`detail`	Specify detailed IGMPv3 source information.
<vlan>	Specify the name of a single VLAN interface, for example **vlan1**.
<multicast-group>	Specify the IPv4 address in of the multicast group, in the format A.B.C.D.

Mode User Exec and Privileged Exec

Example To display the state of IGMP Proxy services for all interfaces, enter the command:

```
awplus# show ip igmp proxy
```

To display the state of IGMP Proxy services for VLAN interface **vlan1**, enter the command:

```
awplus# show ip igmp proxy groups vlan1
```

To display the detailed state of IGMP Proxy services for VLAN interface **vlan1**, enter the command:

```
awplus# show ip igmp proxy groups vlan1 detail
```

Related Commands **ip igmp proxy-service**

show ip igmp snooping mrouter

Use this command to display the multicast router ports, both static and dynamic, in a VLAN.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show ip igmp snooping mrouter [interface <interface>]`

Parameter	Description
`interface`	A specific interface.
`<interface>`	The name of the VLAN interface.

Mode User Exec and Privileged Exec

Example To show all multicast router interfaces, use the command:

```
awplus# show ip igmp snooping mrouter
```

To show the multicast router interfaces in `vlan1`, use the command:

```
awplus# show ip igmp snooping mrouter interface vlan1
```

Output **Figure 52-3: Example output from the show ip igmp snooping mrouter command**

```
VLAN    Interface   Static/Dynamic
1       port1.0.5   Statically configured
200     port1.0.2   Statically configured
```

Figure 52-4: Example output from the show ip igmp snooping mrouter interface vlan1 command

```
VLAN    Interface   Static/Dynamic
1       port1.0.5   Statically configured
```

Related Commands **ip igmp snooping mrouter**

show ip igmp snooping routermode

Use this command to display the current routermode and the list of IP addresses set as router multicast addresses from the **ip igmp snooping routermode** command.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show ip igmp snooping routermode`

Mode User Exec and Privileged Exec

Example To show the routermode and the list of router multicast addresses, use the command:

```
awplus# show ip igmp snooping routermode
```

Output **Figure 52-5: Example output from the show ip igmp snooping routermode command**

```
Router mode.............Def
Reserved multicast address
         224.0.0.1
         224.0.0.2
         224.0.0.4
         224.0.0.5
         224.0.0.6
         224.0.0.9
         224.0.0.13

         224.0.0.24
```

Related Commands **ip igmp snooping routermode**

show ip igmp snooping statistics

Use this command to display IGMP Snooping statistics data.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show ip igmp snooping statistics interface <interface-range>
   [group [<ip-address>]]
```

Parameter	Description
<ip-address>	Optionally specify the address of the multicast group, entered in the form A.B.C.D.
<interface>	Specify the name of the VLAN interface or interface range.

Mode User Exec and Privileged Exec

Example To display IGMP statistical information for **vlan1** and **vlan2**, use the command:

```
awplus# show ip igmp snooping statistics interface
       vlan1-vlan2
```

Output **Figure 52-6: Example output from the show ip igmp snooping statistics command**

```
IGMP Snooping statistics for vlan1
Interface:      port1.0.3
Group:          224.1.1.1
Uptime:         00:00:09
Group mode:     Exclude (Expires: 00:04:10)
Last reporter:  10.4.4.5
Source list is empty
IGMP Snooping statistics for vlan2
Interface:      port1.0.4
Group:          224.1.1.2
Uptime:         00:00:19
Group mode:     Exclude (Expires: 00:05:10)
Last reporter:  10.4.4.6
Source list is empty
```

undebug igmp

This command applies the functionality of the no **debug igmp** command on page 52.5.

Introduction

This chapter provides information about Protocol Independent Multicast - Sparse Mode (PIM-SM) and Protocol Independent Multicast - Source Specific Multicast (PIM-SSM).

PIM-SM

Protocol Independent Multicast - Sparse Mode (PIM-SM) provides efficient communication between members of sparsely distributed groups - the type of groups that are most common in wide-area internetworks.

For details of the commands used to configure PIM-SM, see **Chapter 54, PIM-SM Commands**. For a general overview of multicasting, see **Chapter 50, Multicast Introduction and Commands**.

Characteristics of PIM-SM

PIM Sparse Mode (PIM-SM) is designed on the principle that several hosts wishing to participate in a multicast conference does not justify flooding the entire internetwork with periodic multicast traffic. PIM-SM is designed to limit multicast traffic so that only those switches interested in receiving traffic for a particular group receive the traffic.

Switches with directly attached or downstream members are required to join a Sparse Mode distribution tree by transmitting explicit join messages. If a switch does not become part of the predefined distribution tree, it does not receive multicast traffic addressed to the group. In contrast, dense mode multicast routing protocols assume downstream group membership and continue to forward multicast traffic on downstream links until explicit prune messages are received. The default forwarding action of a sparse mode multicast routing protocol is to block traffic unless it is explicitly requested, while the default action of the dense mode multicast routing protocols is to forward traffic.

PIM-SM employs the concept of a Rendezvous Point (RP) where receivers “meet” sources. The initiator of each multicast group selects a primary RP and a small ordered set of alternative RPs, known as the RP-list. For each multicast group, there is only a single active RP. Each receiver wishing to join a multicast group contacts its directly attached switch, which in turn joins the multicast distribution tree by sending an explicit join message to the group’s primary RP. A source uses the RP to announce its presence and to find a path to members that have joined the group. This model requires Sparse Mode switches to maintain some state information (the RP-list) prior to the arrival of data packets. In contrast, Dense Mode multicast routing protocols are data driven, since they do not define any state for a multicast group until the first data packet arrives.

Roles in PIM-SM

A multicast sender does not need to know the addresses of the members of the group in order to send to them, and the members of the group need not know the address of the sender. Group membership can change at any time. When PIM is enabled on the switch, and before the switch can route multicast traffic, it must establish which of the PIM routers in the network are performing some key roles:

- Designated Router.
- Rendezvous Point.
- Bootstrap Router.

Designated Router

There must be one PIM Designated Router (DR) in the subnetwork to which the IP hosts are connected. Any PIM-SM interfaces on the subnetwork elect the DR with the highest DR priority. If there is more than one router with the same priority, or no priority, they choose the interface with the highest IP address number. The DR performs all the PIM functionality for the subnetwork. If the current DR becomes unavailable, the remaining switches elect a new DR on the interface by DR priority or IP address.

Rendezvous Point

Each multicast group must have a Rendezvous Point (RP). The RP forms the root of the group's distribution tree. The DR for a multicast sender sends multicast packets towards the RP. DRs with group members connected to them send join messages towards the group's RP. The RP candidate with the lowest priority is elected from all the RP candidates for a group. If the RP becomes unavailable, the remaining RP candidates elect a new RP.

Bootstrap Router

Each PIM-SM network must have at least one Bootstrap Router (BSR) candidate, unless all switches in the domain are configured statically with information about all RPs in the domain. Every switch that is a BSR candidate periodically sends a Bootstrap Candidate Advertisement message to advertise that it is available as a BSR candidate. The BSR candidates in the network elect the switches with the highest preference value to be the BSR. The elected BSR listens to PIM Candidate RP Advertisement messages specifying RP candidates for multicast groups. It maintains a list of RP candidates and sends a bootstrap message every BSM interval, specifying all the multicast groups in the PIM network, and their RP candidates. Each switch uses this information and a standardized hash mechanism to determine the RP for each group.

In summary:

- Each multicast group must have at least one RP candidate
- Each PIM-SM domain must have at least one BSR candidate, unless all routers in the domain are configured statically with information about all RPs in the domain
- Each subnetwork must have at least one DR candidate.

PIM hello messages

When PIM is enabled on a switch, it sends out a PIM Hello message on all its PIM enabled interfaces, and listens for Hello messages from its PIM neighbors. When a switch receives a Hello message, it records the interface, IP address, priority for becoming a DR, and the timeout for the neighbor's information. The switch sends Hello messages regularly at the Hello Time interval.

Operation of PIM-SM

Once roles are established, multicast routing follows specific phases:

1. **Rendezvous Point Tree**
2. **Register stop**
3. **Shortest Path Tree**

While multicast routing always begins with phase 1, the Designated Router (DR) for a receiver determines whether and when to move on to phases 2 and 3, depending on the amount of traffic from the source.

Rendezvous Point Tree

Phase 1 establishes and uses a shared tree rooted at the Rendezvous Point (RP) to forward all multicast data to group members.

When an IP host sends an IGMP join message to the local PIM DR, which is not the RP for the group, the DR sends a PIM join message towards the RP for the group ("upstream"). The DR determines which switch is the RP for the group from the most recent bootstrap message. Every switch the join message passes through records that there is a group member on the incoming interface. Eventually, the join message reaches either the RP, or another switch that already knows that it has a group member downstream. If the group has many members, the join messages converge on the RP to form a Rendezvous Point Tree (RPT). This is called a shared tree because multicast data that is sent to the group by any sender shares the tree. The multicast receiver's DR sends join messages periodically according to the upstream join timer as long as the IP host is a member of the group. When the last receiver on a subnetwork leaves the group, the join messages stop, and their entries timeout on routers that are closer to the RP.

The sender's DR encapsulates the multicast data in a unicast packet in a process called **registering**, and sends these register packets to the group's RP. When the RP receives the data, it decapsulates them, and forwards them onto the shared tree.

Register stop

Phase 2 improves efficiency and performance by using register stop. In this phase the RP joins the shortest path tree between the source and receiver. This allows the original (unencapsulated) packets to be forwarded from the sender, instead of encapsulated packets. It also allows shorter paths to receivers that are close to the sender, making it more efficient in some circumstances.

When the RP for a group receives the first encapsulated data packet from a source, it joins the shortest path tree towards the sender. Once data is able to flow along the shortest path from the sender to the RP, packets do not need to be registered. The RP sends a register stop message in reply to the next encapsulated message. When the sender's DR receives the register stop message, it stops registering. The DR sends a null register message to the RP to find whether the RP still does not need to receive registered packets. If it receives another register stop message, the DR continues to forward only the native data packets. If the DR does not receive another register stop message within the register probe time, it resumes registering the data packets and sending them to the RP.

When the RP starts receiving native data packets from the source, it starts to discard the encapsulated packets, and starts forwarding native packets on the shared tree to all the group members. If the path from the source to the RP intersects the shared RP tree for the group, then the packets also take a short-cut onto the shared tree for delivery to the group members down its branches.

Shortest Path Tree

This phase further optimizes routing by using Shortest Path Trees (SPT). In phase 3 the receiver joins the shortest path tree between the source and receiver. This allows a multicast group member to receive multicast data by the shortest path from the sender, instead of from the shared RP tree. When the receiver's DR receives multicast data from a particular sender, it sends a join message towards the sender. When this message reaches the sender's DR, the DR starts forwarding the multicast data directly towards the receiver. As several receivers all initiate shortest paths to the sender, these paths converge, creating a SPT.

When the multicast packets start arriving from the SPT at the receiver's DR or an upstream router common to the SPT and the RPT, it starts discarding the packets from the RPT, and sends a prune message towards the RP. The prune message travels up the RPT until it reaches the RP or a switch that still needs to forward multicast packets from this sender to other receivers. Every time a switch receives a prune message, it waits a short time so that other switches on the LAN have the opportunity to override the prune message.

Multi-Access LANs

If the PIM-SM network includes multi-access LAN links for transit, as well as point-to-point links, then a mechanism is needed to prevent multiple trees forwarding the same data to the same group member. Two or more switches on a LAN may have different information about how to reach the RP or the multicast sender. They could each send a join message to two different switches closer to the RP for an RPT or the sender for an SPT. This could potentially cause two copies of all the multicast traffic towards the receiver.

When PIM switches notice duplicate data packets on the LAN, they elect a single switch to forward the data packets, by each sending PIM Assert messages. If one of the upstream switches is on an SPT and the other is on an RPT, the switch on the SPT has the shortest path to the sender, and wins the Assert election. If both switches are on RPTs the switch with the shortest path to the RP (the lowest sum of metrics to the RP) wins the Assert. If both switches are on an SPT, then the switch with the shortest path to the sender (the lowest sum of metrics to the sender's DR) wins the Assert.

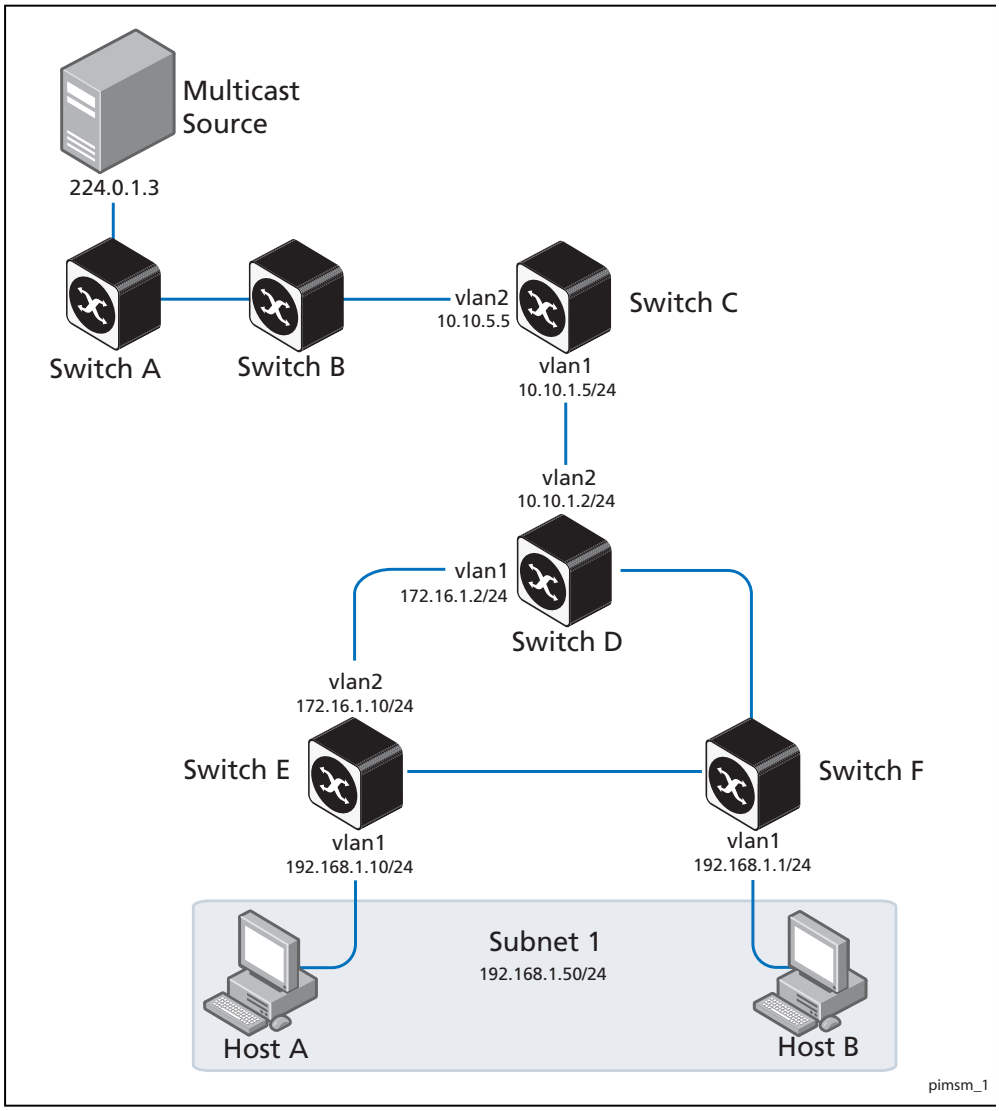
The switch that won the Assert election forwards these data packets, and acts as the local Designated Router for any IGMP members on the LAN. The downstream switches on the LAN also receive the Assert messages, and send all their join messages to the Assert winner. The result of an Assert election will timeout after the Assert Time. As long as the situation causing the duplication remains unchanged, the Assert winner sends an Assert message at a the Assert time interval, before the previous Assert messages time out. When the last downstream switch leaves the SPT, the Assert winner sends an Assert Cancel message saying that it is about to stop forwarding data on the SPT. Any RPT downstream switches then switch back to the RP tree.

PIM-SM Configuration

This section provides three PIM-SM configuration examples:

- **Static Rendezvous Point configuration**
- **Dynamic Rendezvous Point configuration**
- **Bootstrap Router configuration**

Both Rendezvous Point (RP) configuration examples refer to the network topology in the following graphic and use Allied Telesis managed Layer 3 Switches as the PIM routers. For details on the commands used in the following examples, refer to **Chapter 54, PIM-SM Commands**.



Static Rendezvous Point configuration

In this example using the above network topology, Switch C is the Rendezvous Point (RP) and all switches are statically configured with RP information. Host A and Host B join group `224.0.1.3` for all the sources. They send the IGMP membership report to Subnet 1. Two switches are attached to Subnet 1, Switch E and Switch F. Both of these switches have default Designated Router (DR) priority on `vlan1`. Because Switch E has a higher IP address on `vlan1`, Switch E becomes the DR and is responsible for sending Join messages to the RP (Switch C).

While configuring the RP, ensure that:

- Every switch includes the **ip pim rp-address 10.10.1.5** statement, even if it does not have any source or group member attached to it.
- There is only one RP address for the whole multicast group.
- All interfaces running PIM-SM must have sparse-mode enabled. In the configuration sample output below, both **vlan1** and **vlan2** are pim sparse-mode enabled.

See the following configuration output for **Switch D**:

```
hostname Switch D
!!
interface vlan1
 ip pim sparse-mode
!
interface vlan2
 ip pim sparse-mode
!
interface lo
!
!
ip multicast-routing
ip pim rp-address 10.10.1.5
!
```

Configure all the switches with the same **ip pim rp-address 10.10.1.5** statement as shown above.

Verifying configuration

Use the following commands to verify the RP configuration, interface details, and the multicast routing table.

RP details

For **Switch D**, the **show ip pim sparse-mode rp mapping** command shows that `10.10.1.5` is the RP for all multicast groups `224.0.0.0/4`, and is statically configured. All other switches will have a similar output.

```
awplus#show ip pim sparse-mode rp mapping
PIM Group-to-RP Mappings
Group(s): 224.0.0.0/4, Static
    RP: 10.10.1.5
         Uptime: 5d02h15m
```

For **Switch D**, the **show ip pim sparse-mode rp-hash** command displays the selected RP for the specified group, in this example `224.0.1.3`.

```
awplus#show ip pim sparse-mode rp-hash 224.0.1.3
    RP: 10.10.1.5
```

Interface details

For **Switch E**, the **show ip pim sparse-mode interface** command displays the interface details and shows that Switch E is the DR on Subnet 1.

```
awplus#show ip pim sparse-mode interface
Total configured interfaces: 16   Maximum allowed: 31
Total active interfaces:     12

Address      Interface VIFindex Ver/   Nbr      DR    DR
                                       Mode    Count  Prior
192.168.1.10    vlan2  0       v2/S    1          1   192.168.1.10
172.16.1.10     vlan3  2       v2/S    1          1   172.16.1.10
```

IP multicast routing table

Note that the multicast routing table displayed for an RP switch is different to that displayed for other switches. For **Switch C**, because this switch is the RP and the root of this multicast tree, the **show ip pim sparse-mode mroute** command shows **RPF nbr** (next-hop to reach RP) as **0.0.0.0** and **RPF idx** (incoming interface for this (*, G) state) as **None**.

```
awplus#show ip pim sparse-mode mroute
IP Multicast Routing Table

(*,*,RP) Entries: 0
(*,G) Entries: 1
(S,G) Entries: 0
(S,G,rpt) Entries: 0
(*, 224.0.1.3)
RP: 10.10.1.5
RPF nbr: 0.0.0.0
RPF idx: None
Upstream State: JOINED
 Local      ..............................
 Joined     j..............................
 Asserted   ..............................
 Outgoing   o..............................
```

For **Switch E**, the **show ip pim sparse-mode mroute** command displays the IP multicast routing table.

```
awplus#show ip pim sparse-mode mroute
IP Multicast Routing Table

(*,*,RP) Entries: 0
(*,G) Entries: 1
(S,G) Entries: 0
(S,G,rpt) Entries: 0
(*, 224.0.1.3)
RP: 10.10.1.5
RPF nbr: 172.16.1.2
RPF idx: port1.0.2
Upstream State: JOINED
 Local      ..............................
 Joined     j..............................
 Asserted   ..............................
 Outgoing   o..............................
```

On Switch E, `port1.0.2` is the incoming interface of the (*, G) entry, and `port1.0.1` is on the outgoing interface list of the (*, G) entry. This means that there is a group member through `port1.0.1`, and RP is reachable through `port1.0.2`.

Dynamic Rendezvous Point configuration

A static RP configuration works for a small, stable PIM domain. However, it is not practical for a large and not so stable internetwork. In such a network, if the RP fails, the network administrator may have to change the static configurations on all PIM switches. An additional reason for choosing dynamic configuration high routing traffic leading to a change in the RP.

The Bootstrap Router (BSR) mechanism is used to dynamically maintain the RP information. To configure the RP dynamically in the above network topology, Switch C on `port1.0.1` and Switch D on `vlan1` are configured as RP candidates using the **ip pim rp-candidate** command. Switch D on `vlan1` is also configured as the BSR candidate. Since no other device has been configured as a BSR candidate, Switch D becomes the BSR router and is responsible for sending group-to-RP mapping information to all other PIM switches in this PIM domain.

The following output displays the complete configuration at **Switch C**.

```
awplus#show run
!
interface vlan1
 ip pim sparse-mode
!
interface vlan2
 ip pim sparse-mode
!
interface lo
!
ip multicast-routing
ip pim rp-candidate vlan1
```

The following output displays the complete configuration at **Switch D**.

```
awplus#show run
!
interface vlan1
 ip pim sparse-mode
!
interface vlan2
 ip pim sparse-mode
!
interface lo
!
ip multicast-routing
ip pim bsr-candidate vlan1
ip pim rp-candidate vlan1 priority 2
!
```

The highest priority switch is chosen as the RP. If two or more switches have the same priority, a hash function in the BSR mechanism is used to choose the RP to make sure that all devices in the PIM domain have the same RP for the same multicast group.

Use the `<interface> [priority <priority>]` parameters of the **ip pim rp-candidate** command to change the default priority of any RP candidate.

PIM group-to-RP mappings

The **show ip pim sparse-mode rp mapping** command displays the group-to-RP mapping details. The output shows information about RP candidates. There are two RP candidates for the group range `224.0.0.0/4`. RP candidate `10.10.1.5` has a default priority of `192`, whereas RP candidate `172.16.1.2` has been configured to have a priority of `2`. Since RP candidate `172.16.1.2` has a higher priority, it is selected as the RP for the multicast group `224.0.0.0/4`.

See the following configuration output for **Switch D**.

```
awplus#show ip pim sparse-mode rp mapping
This system is the Bootstrap Router (v2)
Group(s): 224.0.0.0/4
  RP: 10.10.1.5
    Info source: 172.16.1.2, via bootstrap, priority 192
         Uptime: 00:00:13, expires: 00:02:29
  RP: 172.16.1.2
    Info source: 172.16.1.2, via bootstrap, priority 2
         Uptime: 00:34:42, expires: 00:01:49
```

RP details

The **show ip pim sparse-mode rp-hash** command displays information about the RP router for a particular group. See the following configuration output for **Switch D**. This output shows that `172.16.1.2` has been chosen as the RP for the multicast group `224.0.1.3`.

```
awplus#show ip pim sparse-mode rp-hash 224.0.1.3
Group(s): 224.0.0.0/4
    RP: 172.16.1.2
    Info source: 172.16.1.2, via bootstrap
```

After RP information reaches all PIM switches in the domain, various state machines maintain all routing states as the result of Join/Prune messages from members of the multicast group.

Bootstrap Router configuration

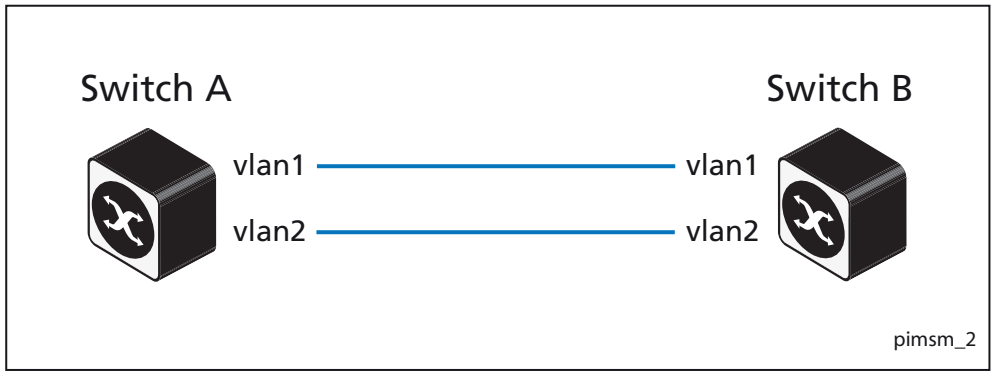
Every PIM multicast group needs to be associated with the IP address of a Rendezvous Point (RP). This address is used as the root of a group-specific distribution tree, whose branches extend to all nodes in the domain that want to receive traffic sent to the group. For all senders to reach all receivers, all devices in the domain use the same mappings of group addresses to RP addresses. In order to determine the RP for a multicast group, a PIM device maintains a collection of group-to-RP mappings, called the RP-Set.

The Bootstrap Router (BSR) mechanism for the class of multicast routing protocols in the PIM domain uses the concept of an RP as a means for receivers to discover the sources that send to a particular multicast group. The BSR mechanism is one way that a multicast router can learn the set of group-to-RP mappings required in order to function.

Some of the PIM devices within a PIM domain are configured as RP candidates. A subset of the RP candidates will eventually be used as the actual RPs for the domain. An RP configured with a lower value in the priority field has higher a priority.

Some of the PIM devices in the domain are configured to be BSR candidates. One of these BSR candidates is elected to be the BSR for the domain, and all PIM devices in the domain learn the result of this election through Bootstrap messages (BSM). The BSR candidate with highest value in the priority field is the elected BSR.

The RP candidates then report their candidacy to the elected BSR, which chooses a subset of the RP candidates, and distributes corresponding group-to-RP mappings to all the devices in the domain through Bootstrap messages.



Switch A Enter the following commands to configure `vlan1` on Switch A as the BSR candidate. The default priority is 64.

```
awplus# configure terminal
awplus(config)# ip pim bsr-candidate vlan1
awplus(config)# exit
```

Switch B Enter the following commands to configure `vlan1` on Switch B as the BSR candidate with a hash mask length of 10 and a priority of 25 and to configure `vlan1` as the RP candidate with a priority of 0.

```
awplus# configure terminal
awplus(config)# ip pim bsr-candidate vlan1 10 25
awplus(config)# ip pim rp-candidate vlan1 priority 0
awplus(config)# exit
```

Validation Commands

Use the **show ip pim sparse-mode bsr-router** command to verify the BSR candidate state on **Switch A**.

```
awplus#show ip pim sparse-mode bsr-router
PIMv2 Bootstrap information
This system is the Bootstrap Router (BSR)
  BSR address: 20.0.1.21
  Uptime:      00:37:12, BSR Priority: 64, Hash mask length: 10
  Expires:     00:01:32
  Role: Candidate BSR
  State: Elected BSR
```

Use the **show ip pim sparse-mode bsr-router** command to verify the BSR candidate state on **Switch B**. The initial state of the BSR candidate is pending before transitioning to BSR candidate.

```
awplus#show ip pim sparse-mode bsr-router
PIMv2 Bootstrap information
  BSR address: 20.0.1.21
  Uptime:      00:02:39, BSR Priority: 64, Hash mask length: 10
  Expires:     00:00:03
  Role: Candidate BSR
  State: Pending BSR

awplus#show ip pim sparse-mode bsr-router
PIMv2 Bootstrap information
 BSR address: 20.0.1.21
 Uptime:      00:40:20, BSR Priority: 64, Hash mask length: 10
 Expires:     00:02:07
 Role: Candidate BSR
 State: Candidate BSR
```

Use the **show ip pim sparse-mode rp mapping** command to verify RP-set information on **Switch A**.

```
awplus#show ip pim sparse-mode rp mapping
PIM Group-to-RP Mappings
This system is the Bootstrap Router (v2)
Group(s): 224.0.0.0/4
 RP: 20.0.1.11
 Info source: 20.0.1.11, via bootstrap, priority 0
 Uptime: 00:00:30, expires: 00:02:04
```

Use the **show ip pim sparse-mode rp mapping** command to verify RP-set information on **Switch B**.

```
awplus#show ip pim sparse-mode rp mapping
PIM Group-to-RP Mappings
Group(s): 224.0.0.0/4
 RP: 20.0.1.11
 Info source: 20.0.1.21, via bootstrap, priority 0
 Uptime: 00:00:12, expires: 00:02:18
```

PIM-SSM

Protocol Independent Multicast - Source Specific Multicast (PIM-SSM) is derived from Protocol Independent Multicast - Sparse Mode (PIM-SM) and is a simplified version of PIM-SM.

For details of the commands used to configure PIM-SSM, see **Chapter 54, PIM-SM Commands** and **Chapter 52, IGMP and IGMP Snooping Commands**.

Characteristics of PIM-SSM

While PIM-SM supports both a “many-to-many” and a “one-to-many” model, PIM-SSM only supports the “one-to-many” model, also known as a “broadcast application”. It is possible for devices in a network to support both PIM-SM and PIM-SSM at the same time, even on the same interfaces.

Instead of multicast groups being initially sent to a Rendezvous Point (RP), PIM-SSM builds shortest path trees (SPT) that are directly rooted at the source. This is because PIM-SSM relies on the multicast client informing the closest multicast router of the source IP address of the multicast server, as well as the multicast group IP address for the group it wants to join.

This approach removes some of the complexity in the multicast routing process and also improves security. Because a multicast client sends a join that includes the specific source IP address of the server it is no longer possible for an attacker to broadcast to the same group IP address from a different source IP address and cause a Denial of Service (DoS) attack. With PIM-SSM the attacker's traffic is discarded at the edge of the PIM domain.

PIM-SSM IP Address Range

The Internet Assigned Numbers Authority (IANA) has reserved the address range 232.0.0.0 through 232.255.255.255 for SSM applications. Although PIM-SSM can technically be configured to use the entire 224/4 multicast address range, PIM-SSM operation is guaranteed only in the 232/8 range (232.0.0/24 is reserved).

IGMPv3 and SSM-Mapping

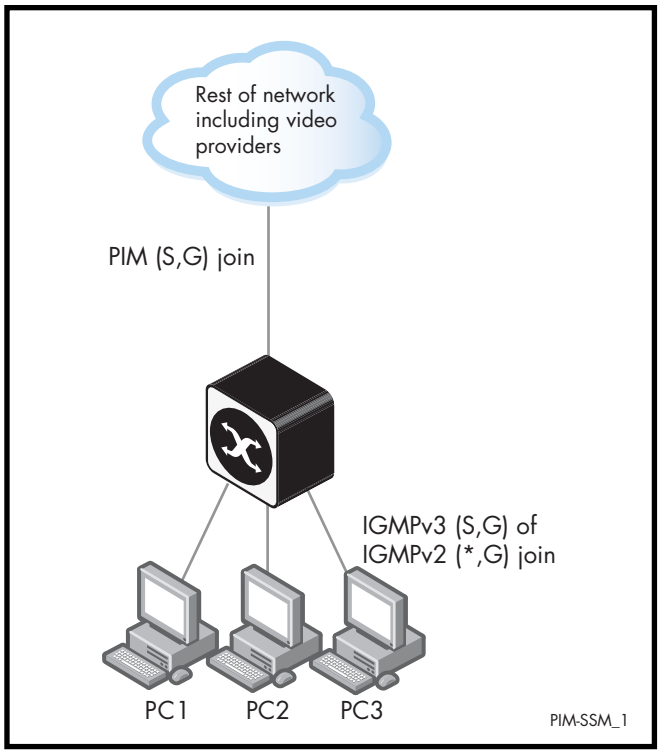
A restriction of PIM-SSM is that it requires a “Source, Group” (S,G) join and only IGMPv3 supports this. Source Specific Multicast Mapping is required to use PIM-SSM when you have older multicast client devices that do not support IGMPv3. This additional feature allows you to statically map IGMPv1/v2 (*,G) joins into PIM (S,G) joins, which in turn allows the device to talk to an upstream PIM-SSM network.

Note that IGMPv3 (*,G) joins cannot be mapped by SSM-Mapping.

How PIM-SSM Works

To join multicast group `232.1.1.1` each PC must send an IGMPv3 join with the source IP address specified. The join will be a (S,G) join, for example (`85.1.1.1,232.1.1.1`). The router will receive the IGMP join and check if the group address is in the SSM range. Then:

- If the group address is in the SSM range, the router will verify that a specific source or sources have been included in the IGMP join.
- If a specific source or sources has been included in the IGMP join, then the router will forward a PIM (S,G) join towards the source IP address.
- If the source IP address is not specified, then the router will discard the IGMP join and the PC will not join the group.
- If an IGMPv2 join is received for the SSM range then by default the join is discarded because no source IP address is specified. IGMP joins for group addresses that are not in the SSM range do not need to specify a specific source IP address.



How IGMP SSM-Mapping Works

In the example above (**"How PIM-SSM Works"**), if an IGMPv2 join is sent it is discarded because IGMPv2 only supports (*,G) joins. To resolve this issue, IGMP SSM-Mapping allows the router to be statically configured with source IP addresses for each group address or range of group addresses. This allows the router to receive a (*,G) join, match the group address via a software ACL, and based on this, insert the matching source IP address. The router then treats the join as a normal (S,G) join. If no match is found then the (*,G) is used. If the group address is in the SSM range then the join is discarded.

Configure PIM-SSM

Table 53-1: General configuration procedure for PIM-SSM

To enable SSM on the device	
`awplus#`	
`configure terminal`	Enter Global Configuration mode.
`awplus(config)#`	
`ip igmp ssm-map enable`	This command applies to VLAN interfaces configured for IGMP.
To specify the static mode of defining SSM	
`awplus#`	
`configure terminal`	Enter Global Configuration mode.
`awplus(config)#`	

`access-list {<1-99>|<1300-1999>} permit <source>`
OR
`access-list standard <standard-access-list-name> permit <source>`
	Configure either a Standard Numbered ACL, Expanded Numbered ACL, or Standard Named ACL. Specify a multicast group address range and wildcard mask with the *source* parameter.

`awplus(config)#`	
`ip igmp ssm-map static {<access-list-number>|<access-list-number-expanded>|<access-list-name>} <ip-address>`	This command applies to VLAN interfaces configured for IGMP. SSM statically assigns sources to IGMPv1 and IGMPv2 groups to translate such (*,G) groups' memberships to (S,G) memberships for use with PIM-SSM.
To define a non-default SSM range of IP multicast addresses in IGMP	
`awplus#`	
`configure terminal`	Enter Global Configuration mode.
`awplus(config)#`	

`access-list {<1-99>} permit <source>`
OR
`access-list standard <standard-access-list-name> permit <source>`
	Configure either a Standard Numbered ACL or Standard Named ACL.

Table 53-1: General configuration procedure for PIM-SSM(cont.)

`awplus(config)#`	
`ip igmp ssm range {<access-list-number>|<access-list-name>}`	Incoming IGMPv1 and IGMPv2 join requests are ignored if the multicast IP address is in the SSM range and no SSM mapping is configured for these addresses. By default, the SSM range is 232/8. To define the SSM range to be other than the default, specify either an access-list name or and access-list number.
To define the Source Specific Multicast (SSM) range of IP multicast addresses	
`awplus#`	
	Enter Global Configuration mode.
`awplus(config)#`	
`ip pim ssm default`	The default keyword defines the SSM range as 232/8. OR
`awplus(config)#`	
`ip pim ssm range {<access-list>|<named-access-list>}`	To define the SSM range to be other than the default, use the access-list parameter option.

Chapter 54: PIM-SM Commands

Command List 54.2
clear ip pim sparse-mode bsr rp-set * 54.2
clear ip mroute pim sparse-mode 54.3

show ip pim sparse-mode rp mapping 54.48
undebug all pim sparse-mode 54.49

Command List

This chapter provides an alphabetical reference of PIM-SM commands. For commands common to PIM-SM and PIM-DM, see **Chapter 50, Multicast Introduction and Commands**.

clear ip pim sparse-mode bsr rp-set *

Use this command to clear all Rendezvous Point (RP) sets learned through the PIMv2 Bootstrap Router (BSR).

Syntax

```
clear ip pim sparse-mode bsr rp-set *
```

Parameter	Description
*	Clears all RP sets.

Mode Privileged Exec

Usage For multicast clients, note that one router will be automatically or statically designated as the RP, and all routers must explicitly join through the RP. A Designated Router (DR) sends periodic Join/Prune messages toward a group-specific RP for each group that it has active members.

For multicast sources, note that the Designated Router (DR) unicasts Register messages to the RP encapsulating the data packets from the multicast source. The RP forwards decapsulated data packets toward group members.

Example

```
awplus# clear ip pim sparse-mode bsr rp-set *
```

clear ip mroute pim sparse-mode

Use this command to clear all multicast route table entries learned through PIM-SM for a specified multicast group address, and optionally a specified multicast source address.

Syntax

```
clear ip mroute <Group-IP-address> pim sparse-mode
clear ip mroute <Group-IP-address> <Source-IP-address> pim sparse-mode
```

Parameter	Description
<Group-IP-address>	Specify a multicast group IPv6 address, entered in the form `A.B.C.D`.
<Source-IP-address>	Specify a source group IP address, entered in the form `A.B.C.D`.

Mode Privileged Exec

Example

```
awplus# clear ip mroute 224.0.0.0 pim sparse-mode
awplus# clear ip mroute 224.0.0.0 192.168.7.1 pim sparse-mode
```

debug pim sparse-mode

Use this command to activate/de-activate all PIM-SM debugging.

Syntax

```
debug pim sparse-mode [all] [events] [mfc] [mib] [nexthop] [nsm]
    [packet] [state] [mtrace]

no debug pim sparse-mode [all] [events] [mfc] [mib] [nexthop] [nsm]
    [packet] [state] [mtrace]
```

Parameter	Description
`all`	Activates/deactivates all PIM-SM debugging.
`events`	Activates debug printing of events.
`mfc`	Activates debug printing of MFC (Multicast Forwarding Cache in kernel) add/delete/updates.
`mib`	Activates debug printing of PIM-SM MIBs.
`nexthop`	Activates debug printing of PIM-SM nexthop communications.
`nsm`	Activates debugging of PIM-SM Network Services Module communications.
`packet`	Activates debug printing of incoming and/or outgoing packets.
`state`	Activates debug printing of state transition on all PIM-SM FSMs.
`mtrace`	Activates debug printing of multicast traceroute.

Mode Privileged Exec and Global Configuration

Example

```
awplus# configure terminal
awplus(config)# debug pim sparse-mode all
```

Related Commands **show debugging pim sparse-mode**
undebug all pim sparse-mode

debug pim sparse-mode timer

Use this command to enable debugging for the specified PIM-SM timers.

Use the **no** variants of this command to disable debugging for the specified PIM-SM timers.

Syntax

```
debug pim sparse-mode timer assert [at]
no debug pim sparse-mode timer assert [at]
debug pim sparse-mode timer bsr [bst|crp]
no debug pim sparse-mode timer bsr [bst|crp]
debug pim sparse-mode timer hello [ht|nlt|tht]
no debug pim sparse-mode timer hello [ht|nlt|tht]
debug pim sparse-mode timer joinprune [jt|et|ppt|kat|ot]
no debug pim sparse-mode timer joinprune [jt|et|ppt|kat|ot]
debug pim sparse-mode timer register [rst]
no debug pim sparse-mode timer register [rst]
```

Parameter	Description
`assert`	Enable or disable debugging for the Assert timers.
`at`	Enable or disable debugging for the Assert Timer.
`bsr`	Enable or disable debugging for the specified Bootstrap Router timer, or all Bootstrap Router timers.
`bst`	Enable or disable debugging for the Bootstrap Router: Bootstrap Timer.
`crp`	Enable or disable debugging for the Bootstrap Router: Candidate-RP Timer.
`hello`	Enable or disable debugging for the specified Hello timer, or all Hello timers.
`ht`	Enable or disable debugging for the Hello timer: Hello Timer.
`nlt`	Enable or disable debugging for the Hello timer: Neighbor Liveness Timer.
`tht`	Enable or disable debugging for the Hello timer: Triggered Hello Timer.
`joinprune`	Enable or disable debugging for the specified JoinPrune timer, or all JoinPrune timers.
`jt`	Enable or disable debugging for the JoinPrune timer: upstream Join Timer.
`et`	Enable or disable debugging for the JoinPrune timer: Expiry Timer.
`ppt`	Enable or disable debugging for the JoinPrune timer: PrunePending Timer.
`kat`	Enable or disable debugging for the JoinPrune timer: KeepAlive Timer.

Parameter	Description
`ot`	Enable or disable debugging for the JoinPrune timer: Upstream Override Timer.
`register`	Enable or disable debugging for the Register timers.
`rst`	Enable or disable debugging for the Register timer: Register Stop Timer.

Default By default, all debugging is disabled.

Mode Privileged Exec and Global Configuration

Examples To enable debugging for the PIM-SM Bootstrap Router bootstrap timer, use the commands:

```
awplus(config)# debug pim sparse-mode timer bsr bst
```

To enable debugging for the PIM-SM Hello: neighbor liveness timer, use the command:

```
awplus(config)# debug pim sparse-mode timer hello ht
```

To enable debugging for the PIM-SM Joinprune expiry timer, use the command:

```
awplus# debug pim sparse-mode timer joinprune et
```

To disable debugging for the PIM-SM Register timer, use the command:

```
awplus# no debug pim sparse-mode timer register
```

Related Commands **show debugging pim sparse-mode**

ip pim accept-register list

Use this command to configure the ability to filter out multicast sources specified by the given access-list at the Rendezvous Point (RP), so that the RP will accept/refuse to perform the register mechanism for the packets sent by the specified sources. By default, the RP accepts register packets from all multicast sources.

Use the **no** variant of this command to revert to default.

Syntax

```
ip pim accept-register list{<simplerange>|<exprange>|<access-list>}
no ip pim accept-register
```

Parameter	Description
<simplerange>	<100-199> IP extended access-list.
<exprange>	<2000-2699> IP extended access list (expanded range).
<access-list>	IP Named Standard Access list.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# ip pim accept-register list 121
awplus(config)# access-list 121 permit ip 100.1.1.1 0.0.0.0 any
```

ip pim anycast-rp

Use this command to configure Anycast RP (Rendezvous Point) in a RP set.

Use the **no** variant of this command to remove the configuration.

Syntax

```
ip pim anycast-rp <anycast-rp-address> <member-rp-address>
no ip pim anycast-rp <anycast-rp-address> [<member-rp-address>]
```

Parameter	Description
<anycast-rp-address>	<A.B.C.D> Specify an anycast IP address to configure an Anycast RP (Rendezvous Point) in a RP set.
<member-rp-address>	<A.B.C.D> Specify an Anycast RP (Rendezvous Point) address to configure an Anycast RP in a RP set.

Mode Global Configuration

Usage Anycast is a network addressing and routing scheme where data is routed to the nearest or best destination as viewed by the routing topology. Compared to unicast with a one-to-one association between network address and network endpoint, and multicast with a one-to-many association between network address and network endpoint; anycast has a one-to-many association between network address and network endpoint. For anycast, each destination address identifies a set of receiver endpoints, from which only one receiver endpoint is chosen.

Anycast is often implemented using BGP to simultaneously advertise the same destination IP address range from many sources, resulting in packets address to destination addresses in this range being routed to the nearest source announcing the given destination IP address.

Use this command to specify the Anycast RP configuration in the Anycast RP set. Use the **no** variant of this command to remove the Anycast RP configuration. Note that the member RP address is optional when using the **no** parameter to remove the Anycast RP configuration. removing the anycast RP address also removes the member RP address.

Examples The following example shows how to configure the Anycast RP address with **ip pim anycast-rp**:

```
awplus# configure terminal
awplus(config)# ip pim anycast-rp 1.1.1.1 10.10.10.10
```

The following example shows how to remove the Anycast RP in the RP set specifying only the anycast RP address with **no ip pim anycast-rp**, but not specifying the member RP address:

```
awplus# configure terminal
awplus(config)# no ip pim anycast-rp 1.1.1.1
```

ip pim bsr-border

Use the **ip pim bsr-border** command to prevent Bootstrap Router (BSR) messages from being sent or received through a VLAN interface. The BSR border is the border of the PIM domain.

Use the **no** variant of this command to disable the configuration set with **ip pim bsr-border**.

Syntax

```
ip pim bsr-border
no ip pim bsr-border
```

Mode Interface Configuration for a VLAN interface.

Usage When this command is configured on a VLAN interface, no PIM version 2 BSR messages will be sent or received through the interface. Configure an interface bordering another PIM domain with this command to avoid BSR messages from being exchanged between the two PIM domains.

BSR messages should not be exchanged between different domains, because devices in one domain may elect Rendezvous Points (RPs) in the other domain, resulting in loss of isolation between the two PIM domains that would stop the PIM protocol from working as intended.

Examples The following example configures the VLAN interface `vlan2` to be the PIM domain border:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim bsr-border
```

The following example removes the VLAN interface `vlan2` from the PIM domain border:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim bsr-border
```

ip pim bsr-candidate

Use this command to give the device the candidate BSR (Bootstrap Router) status using the specified IP address mask of the interface.

Use the **no** variant of this command to withdraw the address of the interface from being offered as a BSR candidate.

Syntax

```
ip pim bsr-candidate <interface> [<hash>] [<priority>]
no ip pim bsr-candidate [<interface>]
```

Parameter	Description
<interface>	The interface. For instance, `vlan2`.
<hash>	`<0-32>` configure hash mask length for RP selection. The default hash value if you do not configure this parameter is 10.
<priority>	`<0-255>` configure priority for a BSR candidate. Note that you must also specify the *<hash>* (mask length) when specifying the *<priority>*. The default priority if you do not configure this parameter is 64.

Mode Global Configuration

Default The default hash parameter value is 10 and the default priority parameter value is 64.

Examples To set the BSR candidate to the VLAN interface `vlan2`, with the optional mask length and BSR priority parameters, enter the commands shown below:

```
awplus# configure terminal
awplus(config)# ip pim bsr-candidate vlan2 20 30
```

To withdraw the address of `vlan2` from being offered as a BSR candidate, enter:

```
awplus# configure terminal
awplus(config)# no ip pim bsr-candidate vlan2
```

ip pim cisco-register-checksum

Use this command to configure the option to calculate the Register checksum over the whole packet. This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to disable this option.

Syntax

```
ip pim cisco-register-checksum
no ip pim cisco-register-checksum
```

Default This command is disabled by default. By default, Register Checksum is calculated only over the header.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# ip pim cisco-register-checksum
```

ip pim cisco-register-checksum group-list

Use this command to configure the option to calculate the Register checksum over the whole packet on multicast groups specified by the access-list. This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to revert to default settings.

Syntax

```
ip pim cisco-register-checksum group-list
   [<simplerange>|<exprange>|<access-list>]

no ip pim cisco-register-checksum group-list
   [<simplerange>|<exprange>|<access-list>]
```

Parameter	Description
<simplerange>	<1-99> Simple access-list.
<exprange>	<1300-1999> Simple access-list (expanded range).
<access-list>	IP Named Standard Access list.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# ip pim cisco-register-checksum group-list 34
awplus(config)# access-list 34 permit 224.0.1.3
```

ip pim crp-cisco-prefix

Use this command to interoperate with Cisco devices that conform to an earlier draft standard. Some Cisco devices might not accept candidate RPs with a group prefix number of zero. Note that the latest BSR specification prohibits sending RP advertisements with prefix 0. RP advertisements for the default IPv4 multicast group range 224/4 are sent with a prefix of 1.

Use the **no** variant of this command to revert to the default settings.

Syntax

```
ip pim crp-cisco-prefix
no ip pim crp-cisco-prefix
```

Mode Global Configuration

Usage Cisco's BSR code does not conform to the latest BSR draft, it does not accept candidate RPs with a group prefix number of zero. To make the candidate RP work with a Cisco BSR, use the **ip pim crp-cisco-prefix** command when interoperating with older versions of Cisco IOS.

Example

```
awplus# configure terminal
awplus(config)# ip pim crp-cisco-prefix

awplus# configure terminal
awplus(config)# no ip pim crp-cisco-prefix
```

Related Commands ip pim rp-candidate

ip pim dr-priority

Use this command to set the Designated Router priority value.

Use the **no** variant of this command to disable this function.

Syntax

```
ip pim dr-priority  <priority>
no ip pim dr-priority [<priority>]
```

Parameter	Description
<priority>	<0-4294967294> The Designated Router priority value. A higher value has a higher preference.

Default The default is 1. The negated form of this command restores the value to the default.

Mode Interface Configuration for a VLAN interface.

Examples To set the Designated Router priority value to `11234` for the VLAN interface `vlan2`, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim dr-priority 11234
```

To disable the Designated Router priority value for the VLAN interface `vlan2`, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim dr-priority
```

Related Commands **ip pim ignore-rp-set-priority**

ip pim exclude-genid

Use this command to exclude the GenID option from Hello packets sent out by the PIM module on a particular interface.This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to revert to default settings.

Syntax

```
ip pim exclude-genid
no ip pim exclude-genid
```

Default By default, this command is disabled; the GenID option is included.

Mode Interface Configuration for a VLAN interface.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim exclude-genid
```

ip pim ext-srcs-directly-connected (PIM-SM)

Use this command to configure PIM to treat all source traffic arriving on the interface as though it was sent from a host directly connected to the interface.

Use the **no** variant of this command to configure PIM to treat only directly connected sources as directly connected.

Syntax

```
ip pim ext-srcs-directly-connected
no ip pim ext-srcs-directly-connected
```

Default The **no** variant of this command is the default behavior.

Mode Interface Configuration for a VLAN interface.

Example To configure PIM to treat all sources as directly connected for VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim ext-srcs-directly-connected
```

To configure PIM to treat only directly connected sources as directly connected for VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim ext-srcs-directly-connected
```

ip pim hello-holdtime (PIM-SM)

This command configures a hello-holdtime value. You cannot configure a hello-holdtime value that is less than the current hello-interval.

Use the **no** variant of this command to return it to its default of 3.5 * the current hello-interval.

Syntax

```
ip pim hello-holdtime <holdtime>
no ip pim hello-holdtime
```

Parameter	Description
<holdtime>	<1-65535> The holdtime value in seconds (no fractional seconds are accepted).

Default The default hello-holdtime value is 3.5 * the current hello-interval. The default hello-holdtime is restored using the negated form of this command.

Mode Interface Configuration for a VLAN interface.

Usage Each time the hello interval is updated, the hello holdtime is also updated, according to the following rules:

If the hello holdtime is not configured; or if the hello holdtime is configured and less than the current hello-interval value, it is modified to the (3.5 * hello interval). Otherwise, it retains the configured value.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim hello-holdtime 123
```

ip pim hello-interval (PIM-SM)

This command configures a hello-interval value.

Use the **no** variant of this command to reset the hello-interval to the default.

Syntax

```
ip pim hello-interval <interval>
no ip pim hello-interval
```

Parameter	Description
<interval>	<1-65535> The value in seconds (no fractional seconds accepted).

Default The default hello-interval value is 30 seconds. The default is restored using the negated form of this command.

Mode Interface Configuration for a VLAN interface.

Usage When the hello interval is configured, and the hello holdtime is not configured, or when the configured hello-holdtime value is less than the new hello-interval value; the holdtime value is modified to the (3.5 * hello interval). Otherwise, the hello-holdtime value is the configured value.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim hello-interval 123
```

ip pim ignore-rp-set-priority

Use this command to ignore the RP-SET priority value, and use only the hashing mechanism for RP selection.

This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to disable this setting.

Syntax

```
ip pim ignore-rp-set-priority
no ip pim ignore-rp-set-priority
```

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# ip pim ignore-rp-set-priority
```

ip pim jp-timer

Use this command to set the PIM-SM join/prune timer. Note that the value set by the join/prune timer is the value that the switch puts into the holdtime field of the join/prune packets it sends to its neighbors.

Use the **no** variant of this command to return the PIM-SM join/prune timer to its default value of 210 seconds.

Syntax

```
ip pim jp-timer <1-65535>
no ip pim jp-timer [<1-65535>]
```

Parameter	Description
<1-65535>	Specifies the join/prune timer value. The default value is 210 seconds.

Default The default join/prune timer value is 210 seconds.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# ip pim jp-timer 300

awplus# configure terminal
awplus(config)# no ip pim jp-timer
```

ip pim neighbor-filter (PIM-SM)

This command enables filtering of neighbors on the VLAN interface. When configuring a neighbor filter, PIM-SM will either not establish adjacency with the neighbor, or terminate adjacency with the existing neighbors if denied by the filtering access list.

Use the **no** variant of this command to disable this function.

Syntax

```
ip pim neighbor-filter {<number>|<accesslist>}
no ip pim neighbor-filter {<number>|<accesslist>}
```

Parameter	Description
<number>	<1-99> Standard IP access-list number.
<accesslist>	IP access list name.

Default By default, there is no filtering.

Mode Interface Configuration for a VLAN interface.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim neighbor-filter 14
```

ip pim register-rate-limit

Use this command to configure the rate of register packets sent by this DR, in units of packets per second.

Use the **no** variant of this command to remove the limit.

Syntax

```
ip pim register-rate-limit <1-65535>
no ip pim register-rate-limit
```

Parameter	Description
<1-65535>	Specifies the maximum number of packets that can be sent per second.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# ip pim register-rate-limit 3444
```

ip pim register-rp-reachability

Use this command to enable the RP reachability check for PIM Register processing at the DR. The default setting is no checking for RP-reachability.

Use the **no** variant of this command to disable this processing.

Syntax

```
ip pim register-rp-reachability
no ip pim register-rp-reachability
```

Default This command is disabled; by default, there is no checking for RP-reachability.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# ip pim register-rp-reachability
```

ip pim register-source

Use this command to configure the source address of register packets sent by this DR, overriding the default source address, which is the address of the RPF interface toward the source host.

Use the **no** variant of this command to un-configure the source address of Register packets sent by this DR, reverting back to use the default source address that is the address of the RPF interface toward the source host.

Syntax

```
ip pim register-source [<sourceaddress>|<interface>]
no ip pim register-source
```

Parameter	Description
<sourceaddress>	The IP address, entered in the form `A.B.C.D`, to be used as the source of the register packets.
<interface>	The name of the interface to be used as the source of the register packets.

Usage The configured address must be a reachable address to be used by the RP to send corresponding Register-Stop messages in response. It is normally the local loopback interface address, but can also be a physical address. This address must be advertised by unicast routing protocols on the DR. The configured interface does not have to be PIM enabled.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# ip pim register-source 10.10.1.3
```

ip pim register-suppression

Use this command to configure the register-suppression time, in seconds, overriding the default of 60 seconds. Configuring this value modifies register-suppression time at the DR. Configuring this value at the RP modifies the RP-keepalive-period value if the **ip pim rp-register-kat** command on page 54.29 is not used.

Use the **no** variant of this command to reset the value to its default of 60 seconds.

Syntax

```
ip pim register-suppression <1-65535>
no ip pim register-suppression
```

Parameter	Description
<1-65535>	Register suppression on time in seconds.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# ip pim register-suppression 192
```

ip pim rp-address

Use this command to statically configure RP (Rendezvous Point) address for multicast groups.

Use the **no** variant of this command to remove a statically configured RP (Rendezvous Point) address for multicast groups.

Syntax

```
ip pim rp-address <ip-address>
    [<simplerange>|<expandedrange> |<accesslist>] [<override>]

no ip pim rp-address <ip-address>
    [<simplerange>|<expandedrange>| <accesslist>] [override>]
```

Parameter	Description
<ip-address>	IP address of Rendezvous Point, entered in the form `A.B.C.D`.
<simplerange>	`<1-99>` IP Standard Access-list.
<expandedrange>	`<1300-1999>` IP Standard Access-list (expanded range).
<accesslist>	IP extended Access-list name.
<override>	Enables statically defined RPs to override dynamically learned RPs.

Mode Global Configuration

Usage The AlliedWare Plus™ PIM-SM implementation supports multiple static RPs. It also supports usage of static-RP and BSR mechanism simultaneously. The **ip pim rp-address** command is used to statically configure the RP address for multicast groups.

You need to understand the following information before using this command.

If the RP-address that is configured by the BSR, and the RP-address that is configured statically, are both available for a group range, then the RP-address configured through BSR is chosen over the statically configured RP-address.

A single static-RP can be configured for multiple group ranges using Access Lists. However, configuring multiple static RPs (using **ip pim rp-address** command) with the same RP address is not allowed. The static-RP can either be configured for the whole multicast group range `224.0.0.0/4` (without ACL) or for specific group ranges (using ACL).

For example, configuring **ip pim rp-address 192.168.3.4** will configure static-RP 192.168.3.4 for the default group range 224.0.0.0/4. Configuring i**p pim rp-address 192.168.7.8 grp-list** will configure static-RP 192.168.7.8 for all the group ranges represented by permit filters in grp-list ACL.

If multiple static-RPs are available for a group range, then one with the highest IP address is chosen.

Only `Permit` filters in ACL are considered as valid group ranges. The default `Permit` filter `0.0.0.0/0` is converted to the default multicast filter `224.0.0.0/4`.

After configuration, the RP-address is inserted into a static-RP group tree based on the configured group ranges. For each group range, multiple static-RPs are maintained in a linked list. This list is sorted in a descending order of IP addresses. When selecting static-RPs for a group range, the first element (which is the static-RP with highest IP address) is

chosen.

RP-address deletion is handled by removing the static-RP from all the existing group ranges and recalculating the RPs for existing TIB states if required.

Group mode and RP address mappings learned through BSR take precedence over mappings statistically defined by the **ip pim rp-address** command. Commands with the **override** keyword take precedence over dynamically learned mappings.

Example

```
awplus# configure terminal
awplus(config)# ip pim rp-address 192.168.3.4 4
```

Related Commands

ip pim rp-candidate
ip pim rp-register-kat

ip pim rp-candidate

Use this command to give the router the candidate RP (Rendezvous Point) status using the IP address of the specified interface.

Use the **no** variant of this command to remove the RP status set using the **ip pim rp-candidate** command.

Syntax

```
ip pim rp-candidate <interface>
   [priority <priority>|interval <interval>| grouplist <grouplist>]

no ip pim rp-candidate [<interface>]
```

Parameter	Description
<interface>	Interface name
<priority>	<0-255> configure priority for an RP candidate.
<interval>	advertisement interval specified in the range <1-16383> (in seconds).
<grouplist>	IP access list specifier for standard, expanded or named access lists in their respective ranges: [<1-99>|*WORD*]

Default The priority value for a candidate RP is 192 by default until specified using the **priority** parameter.

Mode Global Configuration

Usage Note that issuing the command **ip pim rp-candidate** *<interface>* without optional **priority**, **interval**, or **grouplist** parameters will configure the candidate RP with a priority value of 192.

Examples

```
awplus# configure terminal
awplus(config)# ip pim rp-candidate vlan2 priority 3
```

```
awplus# configure terminal
awplus(config)# ip pim rp-candidate vlan2 priority 3
               group-list 3
```

```
awplus# configure terminal
awplus(config)# no ip pim rp-candidate vlan2
```

Related Commands **ip pim rp-address**
ip pim rp-register-kat

ip pim rp-register-kat

Use this command to configure the Keep Alive Time (KAT) for (S,G) states at the RP (Rendezvous Point) to monitor PIM-SM Register packets.

Use the **no** variant of this command to return the PIM-SM KAT timer to its default value of 210 seconds.

Syntax

```
ip pim rp-register-kat <1-65535>
no ip pim rp-register-kat
```

Parameter	Description
<1-65536>	Specify the KAT timer in seconds. The default value is 210 seconds.

Mode Global Configuration

Default The default PIM-SM KAT timer value is 210 seconds.

Examples

```
awplus# configure terminal
awplus(config)# ip pim rp-register-kat 3454

awplus# configure terminal
awplus(config)# no ip pim rp-register-kat
```

Related Commands **ip pim rp-address**
ip pim rp-candidate

ip pim sparse-mode

Use this command to enable PIM-SM on the VLAN interface.

Use the **no** variant of this command to disable PIM-SM on the VLAN interface.

Syntax

```
ip pim sparse-mode
no ip pim sparse-mode
```

Mode Interface Configuration for a VLAN interface.

Examples

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim sparse-mode

awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim sparse-mode
```

ip pim sparse-mode passive

Use this command to enable and disable passive mode operation for local members on the VLAN interface.

Use the **no** variant of this command to disable passive mode operation for local members on the VLAN interface.

Syntax

```
ip pim sparse-mode passive
no ip pim sparse-mode passive
```

Mode Interface Configuration for a VLAN interface.

Usage Passive mode essentially stops PIM transactions on the interface, allowing only IGMP mechanism to be active. To turn off passive mode, use the **no ip pim sparse-mode passive** or the **ip pim sparse-mode** command. To turn off PIM activities on the VLAN interface, use the **no ip pim sparse-mode** command.

Examples

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim sparse-mode passive
```

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim sparse-mode passive
```

ip pim spt-threshold

This command turns on the ability for the last-hop PIM router to switch to SPT.

The **no** variant of this command turns off the ability for the last-hop PIM router to switch to SPT.

Note The switching to SPT happens either at the receiving of the first data packet, or not at all; it is not rate-based.

Syntax

```
ip pim spt-threshold
no ip pim spt-threshold
```

Mode Global Configuration

Examples

```
awplus# configure terminal
awplus(config)# ip pim spt-threshold

awplus# configure terminal
awplus(config)# no ip pim spt-threshold
```

ip pim spt-threshold group-list

Use this command to turn on/off the ability for the last-hop PIM router to switch to SPT for multicast group addresses specified by the given access-list.

The switching to SPT happens either at the receiving of the first data packet, or not at all; it is not rate-based.

Use the **no** variant of this command to turn off switching to the SPT.

Syntax

```
ip pim spt-threshold group-list {<simplerange>|<expandedrange>|
   <named-accesslist>}

no ip pim spt-threshold group-list [<simplerange>|<expandedrange>|
   <named-accesslist>]
```

Parameter	Description
<simplerange>	<1-99> IP Standard Access-list.
<expandedrange>	<1300-1999> IP Standard Access-list (expanded range).
<named-accesslist>	IP Access-list name.

Mode Global Configuration

Usage Turn on/off the ability for the last-hop PIM router to switch to SPT for multicast group addresses specified by the given access-list.

Example

```
awplus# configure terminal
awplus(config)# ip pim spt-threshold group-list 1
awplus(config)# access-list 1 permit 224.0.1.3
```

ip pim ssm

Use this command to define the Source Specific Multicast (SSM) range of IP multicast addresses. The default keyword defines the SSM range as 232/8. To define the SSM range to be other than the default, use the access-list parameter option.

Use the **no** variant of this command to disable the SSM range.

Syntax

```
ip pim ssm default
ip pim ssm range {<access-list>|<named-access-list>}
no ip pim ssm
```

Parameter	Description
<access-list>	<1-99> Simple access-list.
<named-access-list>	Named Standard Access List.

Default By default, the command is disabled.

Mode Global Configuration

Usage When an SSM range of IP multicast addresses is defined by the ip pim ssm command, the no (*,G) or (S,G,rpt) state will be initiated for groups in the SSM range.

The messages corresponding to these states will not be accepted or originated in the SSM range.

Examples The following commands show how to configure SSM service for the IP address range defined by access list 10:

```
awplus# configure terminal
awplus(config)# access-list 10 permit 225.1.1.1
awplus(config)# ip pim ssm range 10
```

The following commands show how to disable PIM-SSM:

```
awplus# configure terminal
awplus(config)# no ip pim ssm
```

show debugging pim sparse-mode

This command displays the status of the debugging of the system.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show debugging pim sparse-mode`

Mode User Exec and Privileged Exec

Example To display PIM-SM debugging settings, use the command:

```
awplus# show debugging pim sparse-mode
```

Figure 54-1: output from the show debugging pim sparse-mode command

```
Debugging status:
  PIM event debugging is on
  PIM Hello THT timer debugging is on
  PIM event debugging is on
  PIM MFC debugging is on
  PIM state debugging is on
  PIM packet debugging is on
  PIM incoming packet debugging is on
  PIM outgoing packet debugging is on
```

Related Commands **debug pim sparse-mode**

show ip pim sparse-mode bsr-router

Use this command to show the Bootstrap Router (BSR) (v2) address.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show ip pim sparse-mode bsr-router`

Mode User Exec and Privileged Exec

Output **Figure 54-2: output from the show ip pim sparse-mode bsr-router command**

```
PIMv2 Bootstrap information
  BSR address: 10.10.11.35 (?)
  Uptime:      00:00:38, BSR Priority: 0, Hash mask length: 10
  Expires:     00:01:32
  Role: Non-candidate BSR
  State: Accept Preferred
```

Related Commands **show ip pim sparse-mode rp mapping**
show ip pim sparse-mode neighbor

show ip pim sparse-mode interface

Use this command to show PIM-SM interface information.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show ip pim sparse-mode interface`

Mode User Exec and Privileged Exec

Example To display information about PIM-SM interfaces, use the command:

```
awplus# show ip pim sparse-mode interface
```

Figure 54-3: Example output from the show ip pim sparse-mode interface command

```
Total configured interfaces: 100   Maximum allowed: 100

Table 54-1: Parameters in the output from the show ip pim sparse-mode interface command

Parameters	Description
`Total configured interfaces`	The number of configured PIM Sparse Mode interfaces.
`Maximum allowed`	The maximum number of PIM Sparse Mode interfaces that can be configured.
`Total active interfaces`	The number of active PIM Sparse Mode interfaces.
`Address`	Primary PIM-SM address.
`Interface`	Name of the PIM-SM interface.
`VIF Index`	The Virtual Interface index of the VLAN.
`Ver/Mode`	PIM version/Sparse mode.
`Nbr Count`	Neighbor count of the PIM-SM interface.
`DR Priority`	Designated Router priority.
`DR`	The IP address of the Designated Router.

Related Commands

ip pim sparse-mode
show ip pim sparse-mode rp mapping
show ip pim sparse-mode neighbor

show ip pim sparse-mode interface detail

Use this command to show detailed information on a PIM-SM interface.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show ip pim sparse-mode interface detail`

Mode User Exec and Privileged Exec

Output **Figure 54-4: s Example output from the show ip pim sparse-mode interface detail command**

```
vlan3 (vif 3):
  Address 192.168.1.149, DR 192.168.1.149
  Hello period 30 seconds, Next Hello in 15 seconds
  Triggered Hello period 5 seconds
  Neighbors:
   192.168.1.22

vlan2 (vif 0):
  Address 10.10.11.149, DR 10.10.11.149
  Hello period 30 seconds, Next Hello in 18 seconds
  Triggered Hello period 5 seconds
  Neighbors:
   10.10.11.4
```

show ip pim sparse-mode local-members

Use this command to show detailed local member information on a VLAN interface configured for PIM-SM. If you do not specify a VLAN interface then detailed local member information is shown for all VLAN interfaces configured for PIM-SM.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show ipv6 pim sparse-mode local-members [<interface>]`

Parameter	Description
<interface>	Optional Specify the interface. For instance, VLAN interface `vlan2`.

Mode User Exec and Privileged Exec

Example To show detailed PIM-SM information for all PIM-SM configured VLAN interfaces, use the command:

```
awplus# show ipv6 pim sparse-mode local-members
```

Output **Figure 54-5: Example output from the show ip pim sparse-mode local-members command**

```
awplus#show ip pim sparse-mode local-members
PIM Local membership information

vlan1:

    (*, 224.0.0.4) : Include

vlan203:

    (*, 223.0.0.3) : Include
```

Example To show detailed PIM-SMv6 information for the PIM-SM configured interface `vlan1`, use the command:

```
awplus# show ipv6 pim sparse-mode local-members vlan1
```

Output **Figure 54-6: Example output from the show ip pim sparse-mode local-members vlan1 command**

```
awplus#show ip pim sparse-mode local-members vlan1
PIM Local membership information

vlan1:

    (*, 224.0.0.4) : Include
```

show ip pim sparse-mode mroute

This command displays the IP multicast routing table, or the IP multicast routing table based on the specified address or addresses.

Two group addresses cannot be used simultaneously; two source addresses cannot be used simultaneously.

Note that when a feature license is enabled, the output for the **show ip pim sparse-mode mroute** command will only show 32 interfaces because of the terminal display width limit. Use the **show ip pim sparse-mode mroute detail** command to display detailed entries of the IP multicast routing table.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show ip pim sparse-mode mroute [<group-address|<source-address>]
show ip pim sparse-mode mroute [<source-address> <group-address>]
show ip pim sparse-mode mroute [<group-address> <source-address>]
```

Parameter	Description
<group-address>	Group IP address, entered in the form A.B.C.D. Based on the group and source address, the output is the selected route if present in the multicast route tree.
<source-address>	Source IP address, entered in the form A.B.C.D. Based on the source and group address, the output is the selected route if present in the multicast route tree.

Mode User Exec and Privileged Exec

Usage Note that when a feature license is enabled, the output for **show ip pim sparse-mode mroute** command will only show 32 interfaces because of the terminal display width limit. Use the **show ip pim sparse-mode mroute detail** command to display detailed entries of the IP multicast routing table.

Examples

```
awplus# show ip pim sparse-mode mroute
awplus# show ip pim sparse-mode mroute 40.40.40.11
awplus# show ip pim sparse-mode mroute 235.0.0.1
awplus# show ip pim sparse-mode mroute 235.0.0.1 40.40.40.11
```

Figure 54-7: Example output from the show ip pim sparse-mode mroute command

```

show ip pim sparse-mode mroute detail

This command displays detailed entries of the IP multicast routing table, or detailed entries of the IP multicast routing table based on the specified address or addresses.

Two group addresses cannot be used simultaneously; two source addresses cannot be used simultaneously.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show ip pim sparse-mode mroute [<group-address>|<source-address>]
   detail

show ip pim sparse-mode mroute [<group-address> <source-address>]
   detail

show ip pim sparse-mode mroute [<source-address> <group-address>]
   detail
```

Parameter	Description
<group-address>	Group IP address, entered in the form A.B.C.D. Output is all multicast entries belonging to that group.
<source-address>	Source IP address, entered in the form A.B.C.D. Output is all multicast entries belonging to that source.
`detail`	Show detailed information.

Usage

Based on the group and source address, the output is the selected route if present in the multicast route tree.

Mode

User Exec and Privileged Exec

Examples

```
awplus# show ip pim sparse-mode mroute detail

awplus# show ip pim sparse-mode mroute 40.40.40.11 detail

awplus# show ip pim sparse-mode mroute 224.1.1.1 detail

awplus# show ip pim sparse-mode mroute 224.1.1.1 40.40.40.11
       detail
```

```

show ip pim sparse-mode neighbor

Use this command to show the PIM-SM neighbor information.

For information on output options, see "Controlling "show" Command Output" on page 1.38.

Syntax

```
show ip pim sparse-mode neighbor [<interface>] [<ip-address>]
   [detail]
```

Parameter	Description
<interface>	Interface name (e.g. `vlan2`). Show neighbors on an interface.
<ip-address>	Show neighbors with a particular address on an interface. The IP address entered in the form A.B.C.D.
`detail`	Show detailed information.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ip pim sparse-mode neighbor
```

```
awplus# show ip pim sparse-mode neighbor vlan5 detail
```

Figure 54-9: Example output from the show ip pim sparse-mode neighbor command

```

show ip pim sparse-mode nexthop

Use this command to see the nexthop information as used by PIM-SM.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show ip pim sparse-mode nexthop`

Mode User Exec and Privileged Exec

Example

```
awplus# show ip pim sparse-mode nexthop
```

Figure 54-11: Example output from the show ip pim sparse-mode nexthop command

```
Flags: N = New, R = RP, S = Source, U = Unreachable
Destination Type Nexthop Nexthop Nexthop      Nexthop    Metric Pref  Refcnt
                 Num     Addr                 Ifindex    Name
_____________________________________________________________________________
10.10.0.9   .RS.  1      0.0.0.0  4           0           0        1
```

Table 54-2: Parameters in output of the show ip pim sparse-mode nexthop command

Parameter	Description
`Destination`	The destination address for which PIM-SM requires nexthop information.
`Type`	The type of destination, as indicated by the Flags description. N = New, R= RP, S = Source, U = Unreachable.
`Nexthop Num`	The number of nexthops to the destination. PIM-SM always uses only 1 nexthop.
`Nexthop Addr`	The address of the primary nexthop gateway.
`Nexthop IfIndex`	The interface on which the nexthop gateway can be reached.
`Nexthop Name`	The name of nexthop interface.
`Metric`	The metric of the route towards the destination.
`Preference`	The preference of the route towards destination.
`Refcnt`	Only used for debugging.

show ip pim sparse-mode rp-hash

Use this command to display the Rendezvous Point (RP) to be chosen based on the group selected.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show ip pim sparse-mode rp-hash <group-addr>`

Parameter	Description
<group-addr>	The group address for which to find the RP, entered in the form A.B.C.D.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip pim sparse-mode rp-hash 224.0.1.3
```

Figure 54-12: output from the show ip pim sparse-mode rp-hash command

```
RP: 10.10.11.35
Info source: 10.10.11.35, via bootstrap
```

Related Commands **show ip pim sparse-mode rp mapping**

show ip pim sparse-mode rp mapping

Use this command to show group-to-RP (Rendezvous Point) mappings, and the RP set.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show ip pim sparse-mode rp mapping
```

Mode

User Exec and Privileged Exec

Example

```
awplus# show ip pim sparse-mode rp mapping
```

Figure 54-13: output from the show ip pim sparse-mode rp mapping command

```
PIM Group-to-RP Mappings
Group(s): 224.0.0.0/4
  RP: 10.10.0.9
    Info source: 10.10.0.9, via bootstrap, priority 0
         Uptime: 16:52:39, expires: 00:02:50
```

Related Commands

show ip pim sparse-mode rp-hash

undebug all pim sparse-mode

Use this command to disable all PIM-SM debugging.

Syntax `undebug all pim sparse-mode`

Mode Privileged Exec

Example

```
awplus# undebug all pim sparse-mode
```

Related Commands **debug pim sparse-mode**

Introduction

This chapter provides information about Protocol Independent Multicast - Sparse Mode for IPv6 (PIM-SMv6).

PIM-SMv6

Protocol Independent Multicast - Sparse Mode for IPv6 (PIM-SMv6) provides efficient communication between members of sparsely distributed groups - the type of groups that are most common in wide-area internetworks.

PIM-SMv6 helps geographically dispersed network nodes to conserver bandwidth and reduce traffic by simultaneously delivering a single stream of information to multiple locations. PIM-SMv6 uses the IPv6 multicast model of receiver-initiated membership, supporting both shared and shorted-path trees and uses mechanisms to adapt to changing network conditions. PIM-SMv6 uses a topology gathering approach to populate a multicast routing table with routes.

Note

IPv6 must be enabled on an interface with the **ipv6 enable** command, IPv6 forwarding must be enabled globally for routing IPv6 with the **ipv6 forwarding** command, and IPv6 multicasting must be enabled globally with the **ipv6 multicast-routing** command before using PIM-SMv6 commands.

Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the **clear ipv6 mroute** command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.

Note

The IPv6 Multicast addresses shown can be derived from IPv6 unicast prefixes as per RFC 3306.The IPv6 unicast prefix reserved for documentation is 2001:0db8::/32 as per RFC 3849. Using the base /32 prefix the IPv6 multicast prefix for 2001:0db8::/32 is ff3x:20:2001:0db8::/64. Where an RP address is 2001:0db8::1 the embedded RP multicast prefix is ff7x:120:2001:0db8::/96. For ASM (Any-Source Multicast) the IPV6 multicast addresses allocated for documentation purposes are ff0x::0db8:0:0/96 as per RFC 6676. This is a /96 prefix so that it can be used with group IDs as per RFC 3307. These addresses should not be used for practical networks (other than for testing purposes), nor should they appear in any public network.

Note

The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical networks (other than for testing purposes) nor should they appear on any public network.

For details of the commands used to configure PIM-SMv6, see **Chapter 56, PIM-SMv6 Commands**. For an overview of multicasting and multicasting commands, see **Chapter 50, Multicast Introduction and Commands**. For an overview of MLD and MLD commands, see **Chapter 59, MLD and MLD Snooping Introduction and Commands**.

Characteristics of PIM-SMv6

PIM Sparse Mode for IPv6 (PIM-SMv6) is designed on the principle that several hosts wishing to participate in a multicast conference does not justify flooding the entire internetwork with periodic multicast traffic. PIM-SMv6 is designed to limit multicast traffic so that only those switches interested in receiving traffic for a particular group receive the traffic.

Switches with directly attached or downstream members are required to join a Sparse Mode distribution tree by transmitting explicit join messages. If a switch does not become part of the predefined distribution tree, it does not receive multicast traffic addressed to the group. The default forwarding action of a sparse mode multicast routing protocol is to block traffic unless it is explicitly requested.

PIM-SMv6 employs the concept of a Rendezvous Point (RP) where receivers “meet” sources. The initiator of each multicast group selects a primary RP and a small ordered set of alternative RPs, known as the RP-list. For each multicast group, there is only a single active RP. Each receiver wishing to join a multicast group contacts its directly attached switch, which in turn joins the multicast distribution tree by sending an explicit join message to the group’s primary RP.

A source uses the RP to announce its presence and to find a path to members that have joined the group. This model requires Sparse Mode switches to maintain some state information (the RP-list) prior to the arrival of data packets..

Roles in PIM-SMv6

A multicast sender does not need to know the addresses of the members of the group in order to send to them, and the members of the group need not know the address of the sender. Group membership can change at any time. When PIM-SMv6 is enabled on the switch, and before the switch can route multicast traffic, it must establish which of the PIM-SMv6 routers in the network are performing some key roles:

- Designated Router.
- Rendezvous Point.
- Bootstrap Router.

Designated Router

There must be one PIM-SMv6 Designated Router (DR) in the subnetwork to which the IPv6 hosts are connected. Any PIM-SMv6 interfaces on the subnetwork elect the DR with the highest DR priority. If there is more than one router with the same priority, or no priority, they choose the interface with the highest IPv6 address number.

The DR performs all the PIM-SMv6 functionality for the subnetwork. If the current DR becomes unavailable, the remaining switches elect a new DR on the interface by DR priority or IPv6 address.

Rendezvous Point

Each multicast group must have a Rendezvous Point (RP). The RP forms the root of the group's distribution tree. The DR for a multicast sender sends multicast packets towards the RP.

DRs with group members connected to them send join messages towards the group's RP. The RP candidate with the lowest priority is elected from all the RP candidates for a group. If the RP becomes unavailable, the remaining RP candidates elect a new RP.

An RP router is configured as the root of the non-source-specific distribution tree for a multicast group. Join messages from receivers for a group are sent towards the RP. Data from senders is sent to the RP so that receivers can discover who the senders are, and receive traffic destined for the group.

Bootstrap Router

Each PIM-SMv6 network must have at least one Bootstrap Router (BSR) candidate, unless all switches in the domain are configured statically with information about all RPs in the domain. Every switch that is a BSR candidate periodically sends a Bootstrap Candidate Advertisement message to advertise that it is available as a BSR candidate.

The BSR candidates in the network elect the switches with the highest preference value to be the BSR. The elected BSR listens to PIM-SMv6 Candidate RP Advertisement messages specifying RP candidates for multicast groups. It maintains a list of RP candidates and sends a bootstrap message every BSM interval, specifying all the multicast groups in the PIM-SMv6 network, and their RP candidates. Each switch uses this information and a standardized hash mechanism to determine the RP for each group. In summary:

- Each multicast group must have at least one RP candidate
- Each PIM-SMv6 domain must have at least one BSR candidate, unless all routers in the domain are configured statically with information about all RPs in the domain
- Each subnetwork must have at least one DR candidate.

PIM-SMv6 Terminology

PIM-SMv6 hello messages

When PIM-SMv6 is enabled on a switch, it sends out a PIM-SMv6 Hello message on all its PIM-SMv6 enabled interfaces, and listens for Hello messages from its PIM-SMv6 neighbors. When a switch receives a Hello message, it records the interface, IPv6 address, priority for becoming a DR, and the timeout for the neighbor's information. The switch sends Hello messages regularly at the Hello Time interval.

Multicast Routing Information Base (MRIB)

The MRIB is a multicast topology table derived from the unicast routing table. In PIM-SMv6, the MRIB decides where to send Join/Prune messages. It also provides routing metrics for destination addresses. These metrics are used when sending and processing Assert messages.

Tree Information Base (TIB)

The TIB is the collection of states at a PIM-SMv6 router storing the state of all multicast distribution trees at that PIM-SMv6 router. It is created by receiving Join/Prune messages, Assert messages, and MLD information from local hosts.

Upstream

Upstream specifies when traffic is going towards the root of the tree. The root of the tree may be either the Source or the RP (Rendezvous Point).

Downstream

Upstream specifies when traffic is going away from the root of the tree. The root of the tree may be either the Source or the RP (Rendezvous Point).

Source-Based Trees

In the Source-Based Trees concept, the forwarding paths are based on the shortest unicast path to the source. If the unicast routing metric is the hop count, then the branches of the multicast Source-Based Trees are the minimum hop. If the routing metric is the delay, then the branches of the multicast Source-Based Trees are the minimum delay.

A corresponding multicast tree directly connects the source to all receivers for every multicast source. All traffic to the members of an associated group passes along the tree made for their source. Source-Based Trees has two entries with a list of outgoing interfaces - the source address and the multicast group.

Shared Trees

Shared Trees, or RP trees (RPT), rely on a central router called the Rendezvous Point (RP) that receives all traffic from the sources, and forwards that traffic to the receivers. Not all hosts may be receivers.

There is a single tree for each multicast group, regardless of the number of sources. Only the routers on the tree know about the group, and information is only sent to interested receivers.With an RP, receivers have a place to join, even if no source exists. The shared tree is unidirectional, and information flows only from the RP to the receivers. If a host other than the RP has to send data on the tree, then the data must first be tunneled to the RP, then multicast to the members. This means that even if a receiver is also a source, it can only use the tree to receive packets from the RP, and to send packets to the RP (unless the source is located between the RP and the receivers).

(*,G)

A 'star G entry' is a PIM-SMv6 or MLD join message that is requesting to join group G (e.g ff0e::1) from any (*) source IPv6 address.

(S,G)

An 'S G entry' is a PIM-SMv6 or MLD join message that is requesting to join group G (e.g ff0e::1) from source IPv6 address (e.g. 2001::1), where S is the source IPv6 address that is generating the multicast data for G. Note that PIM-SMv6 supports (S,G) entries, but MLDv1 does not support (S,G) entries.

BSM

Boot Strap Messages, as issued by the BSR (Boot Strap Router), which is an elected router that distributes information about the RP (Rendezvous Point), where an RP is a router in a multicast network domain that acts as a shared route for a multicast shared tree.

MLD

Multicast Listener Discovery. There are two versions: MLDv1 and MLDv2. MLDv1 is used by an IPv6 router to discover the presence of multicast listeners. MLDv2 provides additional features such as the ability to specify a source IPv6 address when sending a join.

Operation of PIM-SMv6

Once roles are established, multicast routing follows specific phases:

1. **Rendezvous Point Tree**
2. **Register Stop**
3. **Shortest Path Tree**

While multicast routing always begins with phase 1, the Designated Router (DR) for a receiver determines whether and when to move on to phases 2 and 3, depending on the amount of traffic from the source.

Rendezvous Point Tree

Phase 1 establishes and uses a shared tree rooted at the Rendezvous Point (RP) to forward all multicast data to group members.

When an IPv6 host sends an MLD join message to the local PIM DR, which is not the RP for the group, the DR sends a PIM-SMv6 join message towards the RP for the group ("upstream"). The DR determines which switch is the RP for the group from the most recent bootstrap message. Every switch the join message passes through records that there is a group member on the incoming interface.

Eventually, the join message reaches either the RP, or another switch that already knows that it has a group member downstream. If the group has many members, the join messages converge on the RP to form a Rendezvous Point Tree (RPT). This is called a shared tree because multicast data that is sent to the group by any sender shares the tree.

The multicast receiver's DR sends join messages periodically according to the upstream join timer as long as the IPv6 host is a member of the group. When the last receiver on a subnetwork leaves the group, the join messages stop, and their entries timeout on routers that are closer to the RP.

The sender's DR encapsulates the multicast data in a unicast packet in a process called **registering**, and sends these register packets to the group's RP. When the RP receives the data, it decapsulates them, and forwards them onto the shared tree.

Register Stop

Phase 2 improves efficiency and performance by using register stop. In this phase the RP joins the shortest path tree between the source and receiver. This allows the original (unencapsulated) packets to be forwarded from the sender, instead of encapsulated packets. It also allows shorter paths to receivers that are close to the sender, making it more efficient in some circumstances.

When the RP for a group receives the first encapsulated data packet from a source, it joins the shortest path tree towards the sender. Once data is able to flow along the shortest path from the sender to the RP, packets do not need to be registered. The RP sends a register stop message in reply to the next encapsulated message. When the sender's DR receives the register stop message, it stops registering.

The DR sends a null register message to the RP to find whether the RP still does not need to receive registered packets. If it receives another register stop message, the DR continues to forward only the native data packets. If the DR does not receive another register stop message within the register probe time, it resumes registering the data packets and sending them to the RP.

When the RP starts receiving native data packets from the source, it starts to discard the encapsulated packets, and starts forwarding native packets on the shared tree to all the group members. If the path from the source to the RP intersects the shared RP tree for the group, then the packets also take a short-cut onto the shared tree for delivery to the group members down its branches.

Shortest Path Tree

This phase further optimizes routing by using Shortest Path Trees (SPT). In phase 3 the receiver joins the shortest path tree between the source and receiver. This allows a multicast group member to receive multicast data by the shortest path from the sender, instead of from the shared RP tree. When the receiver's DR receives multicast data from a particular sender, it sends a join message towards the sender. When this message reaches the sender's DR, the DR starts forwarding the multicast data directly towards the receiver. As several receivers all initiate shortest paths to the sender, these paths converge, creating a SPT.

When the multicast packets start arriving from the SPT at the receiver's DR or an upstream router common to the SPT and the RPT, it starts discarding the packets from the RPT, and sends a prune message towards the RP. The prune message travels up the RPT until it reaches the RP or a switch that still needs to forward multicast packets from this sender to other receivers. Every time a switch receives a prune message, it waits a short time so that other switches on the LAN have the opportunity to override the prune message.

Multi-Access LANs

If the PIM-SMv6 network includes multi-access LAN links for transit, as well as point-to-point links, then a mechanism is needed to prevent multiple trees forwarding the same data to the same group member. Two or more switches on a LAN may have different information about how to reach the RP or the multicast sender. They could each send a join message to two different switches closer to the RP for an RPT or the sender for an SPT. This could potentially cause two copies of all the multicast traffic towards the receiver.

When PIM -SMv6 switches notice duplicate data packets on the LAN, they elect a single switch to forward the data packets, by each sending PIM-SMv6 Assert messages. If one of the upstream switches is on an SPT and the other is on an RPT, the switch on the SPT has the shortest path to the sender, and wins the Assert election. If both switches are on RPTs the switch with the shortest path to the RP (the lowest sum of metrics to the RP) wins the Assert. If both switches are on an SPT, then the switch with the shortest path to the sender (the lowest sum of metrics to the sender's DR) wins the Assert.

The switch that won the Assert election forwards these data packets, and acts as the local Designated Router for any MLD members on the LAN. The downstream switches on the LAN also receive the Assert messages, and send all their join messages to the Assert winner. The result of an Assert election will timeout after the Assert Time. As long as the situation causing the duplication remains unchanged, the Assert winner sends an Assert message at a the Assert time interval, before the previous Assert messages time out. When the last downstream switch leaves the SPT, the Assert winner sends an Assert Cancel message saying that it is about to stop forwarding data on the SPT. Any RPT downstream switches then switch back to the RP tree.

Packet Types

See the below list of PIM-SMv6 IPv6 packet types:

- **Register Packets** - unicast encapsulated multicast packets sent to the RP.
- **Hello Messages** - periodic messages sent by PIM-SMv6 routers.
- **Register-Stop Messages** - send to stop the flow of register encapsulated packets to the RP from a source.
- **Join/Prune Messages** - sent when a client joins/leaves a group to maintain PIM-SMv6.
- **Assert Messages** - sent to resolve route conflicts.

RFCs

PIM-SMv6 implements the service model from **RFC 1112** to route packets from sources to receivers with either the source or the receiver knowing of each other. This is done in three phases, which may be done at the same time. Clients join or leave multicast groups using MLD protocols. See **Chapter 59, MLD and MLD Snooping Introduction and Commands**

The operation of PIM-SMv4 and PIM-SMv6 protocols is the same. Only the addresses change from IPv4 to IPv6. See **RFC 4601** for further details about the operation of PIM-SM.

Data Flow from Source to Receivers for PIM-SMv6

See the details below for the data flow from Source to Receivers to establish the phases of the Rendezvous Point Tree, Register Stop and Shortest Path Tree as described previously:

1. **Sending out Hello Messages**
2. **Electing a Designated Router**
3. **Determining the RP**
4. **Joining the Shared Tree**
5. **Registering with the RP**
6. **Sending Register-Stop Messages**
7. **Pruning the Interface**
8. **Forwarding Multicast Packets**

Sending out Hello Messages

PIM-SMv6 router periodically send Hello messages to discover neighboring PIM-SMv6 routers. PIM-SMv6 routers do not send any acknowledgement that a Hello message was received. A holdtime value determines the length of time for which the information is valid. In PIM-SMv6, a downstream receiver must join a group before traffic is forwarded on the interface.

Electing a Designated Router

In a multi-access network with multiple PIM-SMv6 routers connected, one of the PIM-SMv6 routers is selected to act as a Designated Router (DR) for a given period. The DR is responsible for sending Join/Prune messages to the RP for local members.

Determining the RP

PIM-SMv6 uses a Boot Strap Router (BSR) to originate Boot Strap Messages (BSM, and to disseminate RP information.

The BSM messages are multicast to the group on each link. If the BSR is not apparent, then the router flood the domain with advertisements. The router with the highest priority (if priorities are the same, the the highest IPv6 address is applied) is selected to be the RP. PIM-SMv6 routers receive and store BSM messages originated by the BSR.

When a DR gets a membership indication from MLD for (or a data packet from) a directly connected host, for a a group for which it has no entry, the DR maps the group address to one of the candidate RPs that can service that group. The DR then sends a Join/Prune message towards that RP. In a small domain, the RP can also be configured statically.

Joining the Shared Tree

To join a multicast group, a host sends an MLD message to its upstream PIM-SMv6 router, after which the PIM-SMv6 router can accept multicast traffic for that group. The PIM-SMv6 router sends a Join message to its upstream PIM-SMv6 neighbor in the direction of the RP.

When a PIM-SMv6 router receive a Join message from a downstream PIM-SMv6 router, it checks to see if a state exists for the group in its multicast routing table.

If a state already exists, the Join message has reached the shared tree, and the interface from which the message was received is entered in the Outgoing Interface list.

If no state exists, an entry is created, the interface is entered in the Outgoing Interface lists, and the Join message is again sent towards the RP.

Registering with the RP

A DR can begin receiving traffic from a source without having a Source or Group state for that source. In this case, the DR has no information on how to get multicast traffic to the RP through a tree. When the source DR receives the initial multicast packet, it encapsulates it in a Register message, and unicasts it to the RP for that group. The RP de-encapsulates each Register message, and forwards the extracted data packet to downstream members on the RPT.

Once the path is established from the source to the RP, the DR begins sending traffic to the RP as standard IP multicast packets, as well as encapsulated within Register messages. The RP temporarily receives packets twice. The RP detects the normal multicast packets, it sends a Register-Stop message to the source DR, meaning it should stop sending register packets.

Sending Register-Stop Messages

When the RP begins receiving traffic from the source, both as Register messages and as unencapsulated IPv6 packets, it sends a Register-Stop message to the DR. This notifies the DR that the traffic is now being received as standard IPv6 multicast packets on the SPT. When the DR receives this message, it stops encapsulating traffic in Register messages.

Pruning the Interface

PIM-SMv6 Routers attached to receivers send Prune messages to the RP to disassociate the source from the RP. When an RP receives a Prune message, it no longer forwards traffic from the source indicated in the Prune message.

If all members of a multicast group are pruned, then the MLD state of the DR is deleted, and the interface is removed from the Source and Group lists of the group.

Forwarding Multicast Packets

PIM-SMv6 routers forward multicast traffic onto all interfaces that lead to receivers that have explicitly joined a multicast group. Messages are sent to a group address in the local subnetwork, and have a Time to Live (TTL) of 1. The PIM-SMv6 router performs an RPF check, and forwards the packet.

If a downstream PIM-SMv6 router has sent a join to this PIM-SMv6 router, or is a member of this group, then traffic that arrives on the correct interface is sent to all outgoing interfaces that lead to downstream receivers.

PIM-SMv6 Embedded RP, RP and BSR Candidate Configurations

This section provides two PIM-SMv6 configuration examples:

- **Embedded RP Configuration**
- **RP and BSR Candidate Configuration**

For details on the commands used in the following examples, refer to **Chapter 56, PIM-SMv6 Commands**.

Embedded RP Configuration

RFC 3956 describes a multicast address allocation policy, in which the address of the Rendezvous Point (RP) is encoded in the IPv6 multicast group address, and specifies a PIM-SMv6 group-to-RP mapping to use the encoding, leveraging and extending unicast-prefix-based addressing.

Embedded RP Multicast Group Address Format

RFC 3956 specifies a modification to the unicast-prefix-based address format by specifying the second high-order bit (R-bit) as follows:

Table 55-1: RFC3956 modification to the unicast-prefix-based IPv6 address format

11111111	flgs	scop	rsvd	RIID	plen	network prefix	group ID
8 bits	4 bits	4 bits	4 bits	4 bits	8 bits	64 bits	32 bits

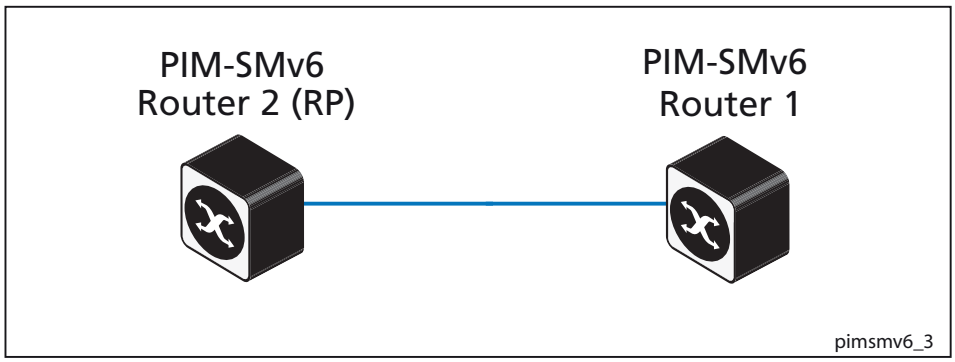
Note: **flgs** is a set of four flags - **0** - **R** - **P** - **T**

flgs the highest-order bit is 0, flag R is 1. This indicates a multicast address that embeds the address on the RP. In this case, the **P** flag must be set to 1 and the **T** flag must be set to 1. In effect, this implies the prefix **ff70::/12**. This means that the last 4 bits of the previously reserved field are interpreted as the embedded RP interface ID.

RP Address in Embedded RP Multicast Address

The address of the RP can only be embedded in unicast-prefix-based Any Source Multicast (ASM) addresses. To identify whether it is an embedded RP multicast address, and to be processed any further, an IPv6 address must satisfy all of the following criteria:

- It must be an IPv6 multicast address with **flgs** set to **0111** to be of the prefix **ff70::/12,** or with **flgs** set to **1111** to be of the prefix **fff0::/12**
- **plen** must not be set to 0 and **plen** must not be set to greater than 64.



Enable Embedded RP

Enter the following commands to enable embedded-RP to group mapping (ipv6 pim rp embedded) then configure an access-list to permit a multicast group (ipv6 access-list) and use this access-list to limit valid groups with a configured static RP (ipv6 pim rp-address):

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim rp embedded
awplus(config)# ipv6 access-list embedrp1 permit
ff70:2:2001:0db8:12::2::/96
awplus(config)# ipv6 pim rp-address ff70:2001:0db8:12::2/12
embedrp1
awplus(config)# exit
```

Disable Embedded RP

Enter the following commands to disable embedded-RP to group mapping (no ipv6 pim rp embedded) after enabling embedded RP (as shown in the previous example above):

```
awplus# configure terminal
awplus(config)# no ipv6 pim rp embedded
awplus(config)# exit
```

PIM-SMv6 Commands Used

ipv6 pim rp-address
ipv6 pim rp embedded

Verify Embedded RP Configuration

Use the following commands to verify the embedded-RP configuration. Note that the group-to-RP mapping for embedded-RP addresses is created when the group is first seen at a PIM-SMv6 router. This can be due to the MLD local receiver report, Join/Prune and Register message processing.

Verify RP-mapping in RP:

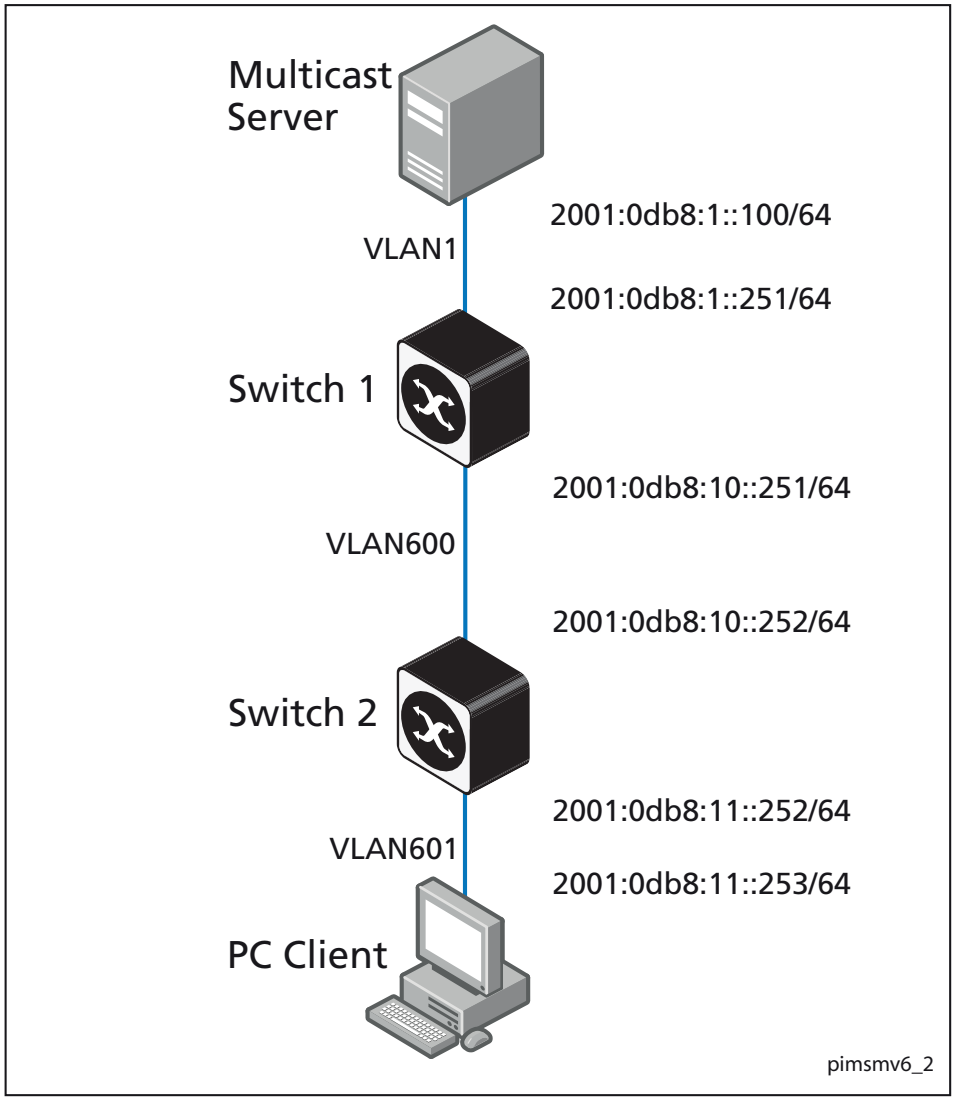
```
awplus#show ipv6 pim sparse-mode rp mapping
PIM Group-to-RP Mappings
Group(s): ff7e:240:3ffe:172:31:12::/96, Static
    RP: 3ffe:172:31:12::2
         Uptime: 00:04:12
Embedded RP Groups:
Group(s): ff7e:240:3ffe:172:31:12::/96
    RP: 3ffe:172:31:12::2, Uptime: 00:00:33
```

Verify RP-mapping in non-RP:

```
mv66#show ipv6 pim sparse-mode rp mapping
PIM Group-to-RP Mappings
Embedded RP Groups:
Group(s): ff7e:240:3ffe:172:31:12::/96
    RP: 3ffe:172:31:12::2, Uptime: 00:00:27
```

RP and BSR Candidate Configuration

Apply the configurations for **Switch 1** and **Switch 2** shown following the topology to configure **Switch 1** and **Switch 2** as RP and BSR candidates.



Note the **Multicast Server** serves multiple streams on addresses **ff0e:1::3** and **ff03:1::4**. Also note **Switch 1** and **Switch 2** are configured as BSR Candidates with **Switch 2** elected.

Switch 1 Enter this configuration to configure **Switch 1** as an RP candidate and a BSR candidate:

```
!
no ip multicast-routing
!
ipv6 multicast-routing
!
vlan database
 vlan 600 state enable
!
ipv6 pim bsr-candidate vlan600
ipv6 pim rp-candidate vlan600
!
!
interface port2.0.17
 switchport
 switchport mode access
 switchport access vlan 1
!
interface port2.0.24
 switchport
 switchport mode access
 switchport access vlan 600
!
interface vlan1
 ip address 192.168.1.101/24
 ipv6 address 2001:0db8:1::251/64
 ipv6 enable
 ipv6 router rip
 ipv6 pim sparse-mode passive
!
interface vlan600
 ipv6 address 2001:0db8:10::251/64
 ipv6 enable
 ipv6 router rip
 ipv6 pim sparse-mode
!
ipv6 forwarding
!
```

Switch 2 Enter this configuration to configure **Switch 2** as an RP candidate and a BSR candidate:

```
!
ipv6 access-list standard testacl permit ff0e:1::3/128
!
no ip multicast-routing
!
ipv6 multicast-routing
!
vlan database
 vlan 600-601 state enable
!
ipv6 pim bsr-candidate vlan600
ipv6 pim rp-candidate vlan601 group-list testacl
!
interface port1.0.11
 switchport
 switchport mode access
 switchport access vlan 600
!
interface port1.0.13-1.0.14
 switchport
 switchport mode access
 switchport access vlan 603
!
interface port1.0.15-1.0.19
 switchport
 switchport mode access
!
interface port1.0.20
 switchport
 switchport mode access
 switchport access vlan 601
!
interface port1.0.21-1.0.24
 switchport
 switchport mode access
!
interface vlan600
 ipv6 address 2001:0db8:10::252/64
 ipv6 enable
 ipv6 router rip
 ipv6 pim sparse-mode
!
interface vlan601
 ipv6 address 2001:0db8:11::252/64
 ipv6 enable
 ipv6 mld
 ipv6 router rip
 ipv6 pim sparse-mode
!
ipv6 forwarding
!
```

Verify RP and RP Candidate Configuration

Use the following commands to verify the RP candidate configuration for **Switch 1** and **Switch 2**. Note both **Switch 1** and **Switch 2** are BSR candidates and **Switch 2** is elected.

Also note **Switch 1** is a candidate RP for all multicast groups, while **Switch 2** is a candidate for only the multicast group **ff0e:1::3/128**. Therefore, **Switch 1** and **Switch 2** overlap and **Switch 1** has become the RP for **ff0e:1::4** while Switch 2 is now the RP for **ff0e:1::3**.

Verify Switch 1 Configuration:

```
awplus#show ipv6 pim sparse-mode bsr-router
PIM6v2 Bootstrap information
  BSR address: 2001:0db8:10::252 (?)
  Uptime:      01:09:46, BSR Priority: 64, Hash mask length: 126
  Expires:     00:01:44
  Role: Candidate BSR
  State: Candidate BSR

  Candidate RP: 2001:0db8:10::251(vlan600)
    Advertisement interval 60 seconds
    Next C-RP advertisement in 00:00:21

awplus#show ipv6 pim sparse-mode rp mapping
PIM Group-to-RP Mappings
Group(s): ff00::/8
  RP: 2001:0db8:10::251
    Info source: 2001:0db8:10::252, via bootstrap, priority 192
         Uptime: 01:24:33, expires: 00:02:24
Group(s): ff0e:1::3/128
  RP: 2001:11::252
    Info source: 2001:0db8:10::252, via bootstrap, priority 192
         Uptime: 00:34:06, expires: 00:02:24
Embedded RP Groups:

awplus#show ipv6 pim sparse-mode rp-hash ff0e:1::3
    RP: 2001:0db8:11::252
    Info source: 2001:0db8:10::252, via bootstrap
```

Verify Switch 2 Configuration (Switch 2 is the elected BSR):

```
awplus#show ipv6 pim sparse-mode bsr-router
PIM6v2 Bootstrap information
This system is the Bootstrap Router (BSR)
  BSR address: 2001:0db8:10::252 (?)
  Uptime:      01:08:31, BSR Priority: 64, Hash mask length: 126
  Next bootstrap message in 00:00:49
  Role: Candidate BSR
  State: Elected BSR

  Candidate RP: 2001:0db8:11::252(vlan601)
    Advertisement interval 60 seconds
    Next C-RP advertisement in 00:00:44

awplus#show ipv6 pim sparse-mode rp mapping
PIM Group-to-RP Mappings
This system is the Bootstrap Router (v2)
Group(s): ff00::/8
  RP: 2001:0db8:10::251
    Info source: 2001:0db8:10::251, via bootstrap, priority 192
         Uptime: 01:17:06, expires: 00:01:46
Group(s): ff0e:1::3/128
  RP: 2001:11::252
    Info source: 2001:0db8:10::252, via bootstrap, priority 192
         Uptime: 00:37:41, expires: 00:01:54
Embedded RP Groups:

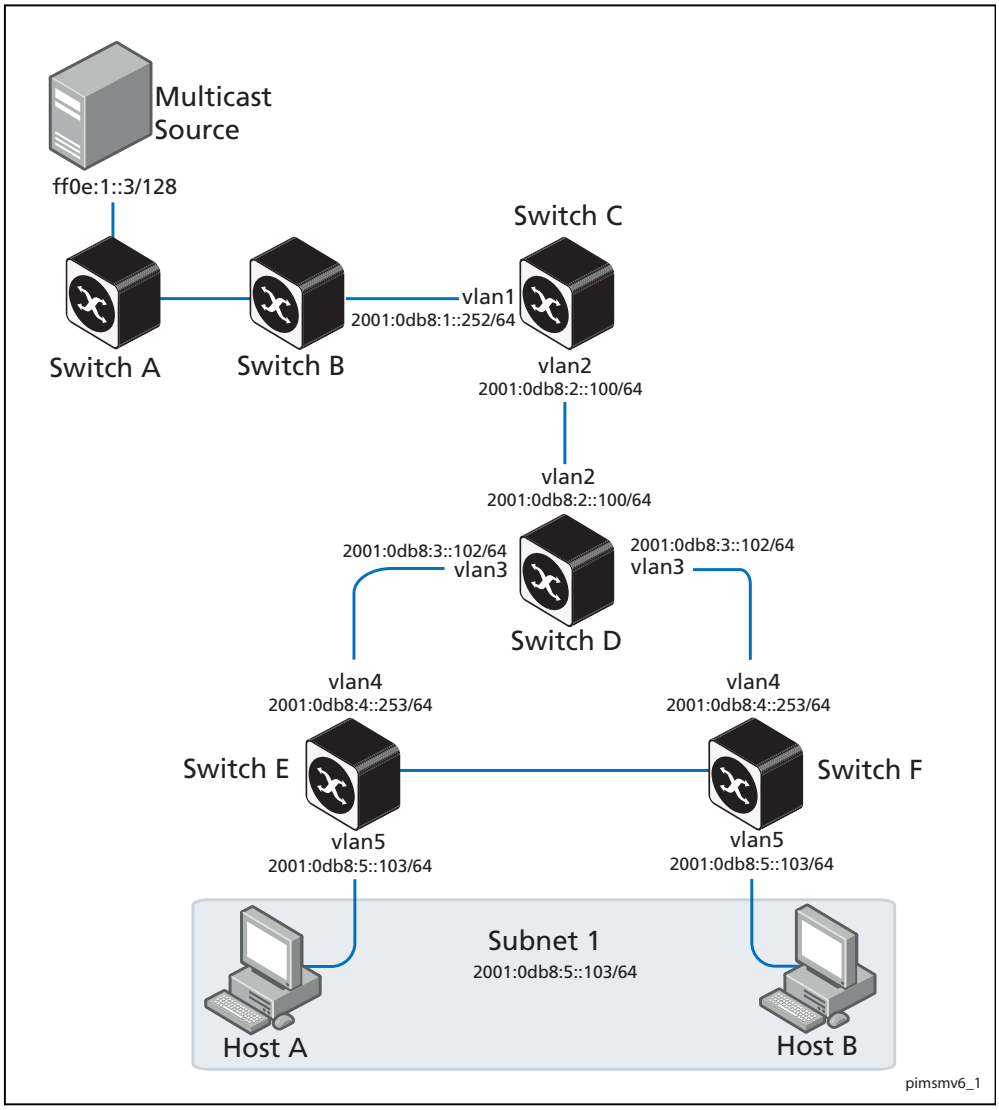
awplus#show ipv6 pim sparse-mode rp-hash ff0e:1::4
    RP: 2001:0db8:10::251
    Info source: 2001:0db8:10::252, via bootstrap
```

PIM-SMv6 Static RP, DR, BSR Configurations

This section provides three PIM-SMv6 configuration examples:

- **Static Rendezvous Point Configuration**
- **Dynamic Rendezvous Point Configuration**
- **Boot Strap Router Configuration**

Both Rendezvous Point (RP) configuration examples refer to the network topology in the following graphic and use Allied Telesis managed Layer 3 Switches as the PIM routers. For details on the commands used in the following examples, refer to **Chapter 56, PIM-SMv6 Commands**.



Static Rendezvous Point Configuration

In this example using the above network topology, Switch C is the Rendezvous Point (RP) and all switches are statically configured with RP information. Host A and Host B join group `ff0e:1::3/128` for all the sources. They send the MLD membership report to Subnet 1. Two switches are attached to Subnet 1, Switch E and Switch F. Both of these switches have default Designated Router (DR) priority on `vlan1`. Because Switch E has a higher IP address on `vlan1`, Switch E becomes the DR and is responsible for sending Join messages to the RP (Switch C).

While configuring the RP, ensure that:

- Every switch includes the **ipv6 pim rp-address 2001:0db8:1::100/64** statement, even if it does not have any source or group member attached to it.
- There is only one RP address for the whole multicast group.
- All interfaces running PIM-SMv6 must have sparse-mode enabled. In the configuration sample output below, both **vlan1** and **vlan2** are pim sparse-mode enabled.

See the following configuration output for **Switch D**:

```
hostname Switch D
!
interface vlan2
 ipv6 enable
 ipv6 pim sparse-mode
 ipv6 address 2001:0db8:2::100/64
!
interface vlan3
 ipv6 enable
 ipv6 pim sparse-mode
 ipv6 address 2001:0db8:3::102/64
!
interface lo
!
!
ipv6 multicast-routing
ipv6 pim rp-address 2001:0db8:1::100/64
!
ipv6 forwarding
!
```

Configure all the switches with the same **ipv6 pim rp-address 2001:0db8:1::100/64** statement as shown above.

Verify Static Rendezvous Point Configuration

Use the following commands to verify the RP configuration, interface details, and the multicast routing table.

RP details

For **Switch D**, the **show ipv6 pim sparse-mode rp mapping** command shows that `2001:0db8:1::100/64` is the RP for all multicast groups `ff0e:1::3/128`, and is statically configured. All other switches will have a similar output.

```
awplus#show ipv6 pim sparse-mode rp mapping
PIM Group-to-RP Mappings
Group(s): ff0e:1::3/128, Static
    RP: 2001:0db8:1::100/64
         Uptime: 5d02h15m
```

For **Switch D**, the **show ipv6 pim sparse-mode rp-hash** command displays the selected RP for the specified group, in this example `ff0e:1::3/128`.

```
awplus#show ipv6 pim sparse-mode rp-hash ff0e:1::3/128
    RP: 2001:0db8:1::100/64
```

Interface details

For **Switch E**, the **show ipv6 pim sparse-mode interface** command displays the interface details and shows that Switch E is the DR on Subnet 1.

```
awplus#show ipv6 pim sparse-mode interface
Total configured interfaces: 16   Maximum allowed: 31
Total active interfaces:     12

Address              Interface VIFindex Ver/   Nbr      DR       DR
                                        Mode   Count    Prior
2001:0db8:1::251     vlan2      0       v2/S   1        1        2001:0db8:1::100
```

IP multicast routing table

Note that the multicast routing table displayed for an RP switch is different to that displayed for other switches. For **Switch C**, because this switch is the RP and the root of this multicast tree, the **show ipv6 pim sparse-mode mroute** command shows **RPF nbr** (next-hop to reach RP) as **0.0.0.0** and **RPF idx** (incoming interface for this (*, G) state) as **None**.

```
awplus#show ipv6 pim sparse-mode mroute
IP Multicast Routing Table

(*,*,RP) Entries: 0
(*,G) Entries: 1
(S,G) Entries: 0
(S,G,rpt) Entries: 0
(*, ff0e:1::3/128)
RP: 2001:0db8:1::100/64
RPF nbr: 0.0.0.0
RPF idx: None
Upstream State: JOINED
 Local     ..............................
 Joined    j..............................
 Asserted  ..............................
 Outgoing  o..............................
```

For **Switch E**, the **show ipv6 pim sparse-mode mroute** command displays the IP multicast routing table.

```
awplus#show ipv6 pim sparse-mode mroute
IP Multicast Routing Table

(*,*,RP) Entries: 0
(*,G) Entries: 1
(S,G) Entries: 0
(S,G,rpt) Entries: 0
(*, ff0e:1::3/128)
RP: 2001:0db8:1::100/64
RPF nbr: 2001:0db8:1::100/64
RPF idx: port1.0.2
Upstream State: JOINED
 Local      ...............................
 Joined     j...............................
 Asserted   ...............................
 Outgoing   o...............................
```

On Switch E, `port1.0.2` is the incoming interface of the (*, G) entry, and `port1.0.1` is on the outgoing interface list of the (*, G) entry. This means that there is a group member through `port1.0.1`, and RP is reachable through `port1.0.2`.

Dynamic Rendezvous Point Configuration

A static RP configuration works for a small, stable PIM domain. However, it is not practical for a large and not so stable internetwork. In such a network, if the RP fails, the network administrator may have to change the static configurations on all PIM switches. An additional reason for choosing dynamic configuration high routing traffic leading to a change in the RP.

The Bootstrap Router (BSR) mechanism is used to dynamically maintain the RP information. To configure the RP dynamically in the above network topology, Switch C on `port1.0.1` and Switch D on `vlan1` are configured as RP candidates using the **ipv6 pim rp-candidate** command. Switch D on `vlan1` is also configured as the BSR candidate. Since no other device has been configured as a BSR candidate, Switch D becomes the BSR router and is responsible for sending group-to-RP mapping information to all other PIM switches in this PIM domain.

The following output displays the complete configuration at **Switch C**.

```
awplus#show run
!
interface vlan1
 ipv6 enable
 ipv6 pim sparse-mode
 ipv6 address 2001:0db8:1::252/64
!
interface vlan2
 ipv6 enable
 ipv6 pim sparse-mode
 ipv6 address 2001:0db8:2::100/64
!
interface lo
!
ipv6 multicast-routing
ipv6 pim rp-candidate vlan1
```

The following output displays the complete configuration at **Switch D**.

```
awplus#show run
!
interface vlan2
 ipv6 enable
 ipv6 pim sparse-mode
 ipv6 address 2001:0db8:2::100/64
!
interface vlan3
 ipv6 enable
 ipv6 pim sparse-mode
 ipv6 address 2001:0db8:3::102/64
!
interface lo
!
ipv6 multicast-routing
ipv6 pim bsr-candidate vlan1
ipv6 pim rp-candidate vlan1 priority 2
!
```

The highest priority switch is chosen as the RP. If two or more switches have the same priority, a hash function in the BSR mechanism is used to choose the RP to make sure that all devices in the PIM domain have the same RP for the same multicast group.

Use the `<interface> [priority <priority>]` parameters of the **ipv6 pim rp-candidate** command to change the default priority of any RP candidate.

Verify PIM group-to-RP mappings

The **show ipv6 pim sparse-mode rp mapping** command displays the group-to-RP mapping details. The output shows information about RP candidates. There are two RP candidates for the group range `ff0e:1::3/128`. RP candidate `2001:1::100/64` has a default priority of `192`, whereas RP candidate `2001:1::251/64` has been configured to have a priority of `2`. Since RP candidate `2001:1::251/64` has a higher priority, it is selected as the RP for the multicast group `ff0e:1::3/128`.

See the following configuration output for **Switch D**.

```
awplus#show ipv6 pim sparse-mode rp mapping
This system is the Bootstrap Router (v2)
Group(s): ff0e:1::3/128
  RP: 2001:0db8:1::100/64
    Info source: 2001:0db8:1::251/64, via bootstrap, priority 192
         Uptime: 00:00:13, expires: 00:02:29
```

Verify RP details

The **show ipv6 pim sparse-mode rp-hash** command displays information about the RP router for a particular group. See the following configuration output for **Switch D**. This output shows that `2001:0db8:1::251/64` has been chosen as the RP for the multicast group `ff0e:1::3/128`.

```
awplus#show ipv6 pim sparse-mode rp-hash ff0e:1::3/128
Group(s): ff0e:1::3/128
    RP: 2001:0db8:1::251/64
    Info source: 2001:0db8:1::251/64, via bootstrap
```

After RP information reaches all PIM switches in the domain, various state machines maintain all routing states as the result of Join/Prune messages from members of the multicast group.

Boot Strap Router Configuration

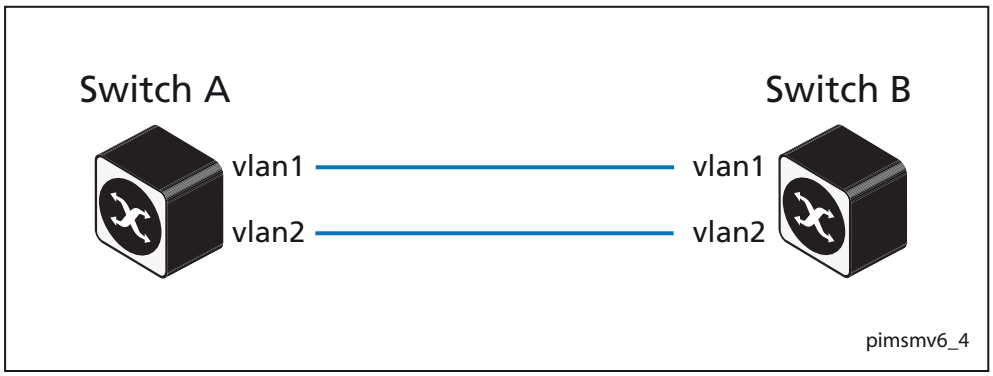
Every PIM multicast group needs to be associated with the IP address of a Rendezvous Point (RP). This address is used as the root of a group-specific distribution tree, whose branches extend to all nodes in the domain that want to receive traffic sent to the group. For all senders to reach all receivers, all devices in the domain use the same mappings of group addresses to RP addresses. In order to determine the RP for a multicast group, a PIM device maintains a collection of group-to-RP mappings, called the RP-Set.

The Boot Strap Router (BSR) mechanism for the class of multicast routing protocols in the PIM domain uses the concept of an RP as a means for receivers to discover the sources that send to a particular multicast group. The BSR mechanism is one way that a multicast router can learn the set of group-to-RP mappings required in order to function.

Some of the PIM devices within a PIM domain are configured as RP candidates. A subset of the RP candidates will eventually be used as the actual RPs for the domain. An RP configured with a lower value in the priority field has higher a priority.

Some of the PIM devices in the domain are configured to be BSR candidates. One of these BSR candidates is elected to be the BSR for the domain, and all PIM devices in the domain learn the result of this election through Bootstrap messages (BSM). The BSR candidate with highest value in the priority field is the elected BSR.

The RP candidates then report their candidacy to the elected BSR, which chooses a subset of the RP candidates, and distributes corresponding group-to-RP mappings to all the devices in the domain through Bootstrap messages.



Switch A Enter the following commands to configure `vlan1` on Switch A as the BSR candidate. The default priority is 64.

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim bsr-candidate vlan1
awplus(config)# exit
```

Switch B Enter the following commands to configure `vlan1` on Switch B as the BSR candidate with a hash mask length of 10 and a priority of 25 and to configure `vlan1` as the RP candidate with a priority of 0.

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim bsr-candidate vlan1 10 25
awplus(config)# ipv6 pim rp-candidate vlan1 priority 0
awplus(config)# exit
```

Verify Boot Strap Router Configuration

Use the **show ipv6 pim sparse-mode bsr-router** command to verify the BSR candidate state on **Switch A**.

```
awplus#show ipv6 pim sparse-mode bsr-router
PIMv2 Bootstrap information
This system is the Bootstrap Router (BSR)
  BSR address: 2001:0db8:1::251/64
  Uptime:      00:37:12, BSR Priority: 64, Hash mask length: 10
  Expires:     00:01:32
  Role: Candidate BSR
  State: Elected BSR
```

Use the **show ipv6 pim sparse-mode bsr-router** command to verify the BSR candidate state on **Switch B**. The initial state of the BSR candidate is pending before transitioning to BSR candidate.

```
awplus#show ipv6 pim sparse-mode bsr-router
PIMv2 Bootstrap information
  BSR address: 2001:0db8:1::251/64
  Uptime:      00:02:39, BSR Priority: 64, Hash mask length: 10
  Expires:     00:00:03
  Role: Candidate BSR
  State: Pending BSR

awplus#show ipv6 pim sparse-mode bsr-router
PIMv2 Bootstrap information
 BSR address: 2001:0db8:1::251/64
 Uptime:      00:40:20, BSR Priority: 64, Hash mask length: 10
 Expires:     00:02:07
 Role: Candidate BSR
 State: Candidate BSR
```

Use the **show ipv6 pim sparse-mode rp mapping** command to verify RP-set information on **Switch A**.

```
awplus#show ipv6 pim sparse-mode rp mapping
PIM Group-to-RP Mappings
This system is the Bootstrap Router (v2)
Group(s): ff0e:1::3/128
 RP: 2001:db8:1::251/64
 Info source: 2001:db8:1::251/64, via bootstrap, priority 0
 Uptime: 00:00:30, expires: 00:02:04
```

Use the **show ipv6 pim sparse-mode rp mapping** command to verify RP-set information on **Switch B**.

```
awplus#show ipv6 pim sparse-mode rp mapping
PIM Group-to-RP Mappings
Group(s): ff0e:1::3/128

Chapter 56: PIM-SMv6 Commands

Command List 56.3
clear ipv6 mroute pim 56.4
clear ipv6 pim sparse-mode bsr rp-set * 56.5
clear ipv6 mroute pim sparse-mode 56.6
debug ipv6 pim sparse-mode 56.7
debug ipv6 pim sparse-mode packet 56.9
debug ipv6 pim sparse-mode timer 56.10
ipv6 pim accept-register 56.12
ipv6 pim anycast-rp 56.13
ipv6 pim bsr-border 56.14
ipv6 pim bsr-candidate 56.15
ipv6 pim cisco-register-checksum 56.16
ipv6 pim cisco-register-checksum group-list 56.17
ipv6 pim crp-cisco-prefix 56.18
ipv6 pim dr-priority 56.19
ipv6 pim exclude-genid 56.20
ipv6 pim ext-srcs-directly-connected 56.21
ipv6 pim hello-holdtime 56.22
ipv6 pim hello-interval 56.23
ipv6 pim ignore-rp-set-priority 56.24
ipv6 pim jp-timer 56.25
ipv6 pim neighbor-filter 56.26
ipv6 pim register-rate-limit 56.27
ipv6 pim register-rp-reachability 56.28
ipv6 pim register-source 56.29
ipv6 pim register-suppression 56.30
ipv6 pim rp-address 56.31
ipv6 pim rp-candidate 56.33
ipv6 pim rp embedded 56.34
ipv6 pim rp-register-kat 56.35
ipv6 pim sparse-mode 56.36
ipv6 pim sparse-mode passive 56.37
ipv6 pim spt-threshold 56.38
ipv6 pim spt-threshold group-list 56.39
ipv6 pim unicast-bsm 56.40
show debugging ipv6 pim sparse-mode 56.41
show ipv6 pim sparse-mode bsr-router 56.42
show ipv6 pim sparse-mode interface 56.43
show ipv6 pim sparse-mode interface detail 56.44
show ipv6 pim sparse-mode local-members 56.45
show ipv6 pim sparse-mode mroute 56.46
show ipv6 pim sparse-mode mroute detail 56.48
show ipv6 pim sparse-mode neighbor 56.50
show ipv6 pim sparse-mode nexthop 56.51

undebug ipv6 pim sparse-mode 56.56

Command List

This chapter provides an alphabetical reference of PIM-SMv6 commands. For IPv6 Multicast commands, see **Chapter 50, Multicast Introduction and Commands**. For an overview of PIM-SMv6, see **Chapter 55, PIM-SMv6 Introduction and Configuration**.

Note

IPv6 must be enabled on an interface with the **ipv6 enable** command, IPv6 forwarding must be enabled globally for routing IPv6 with the **ipv6 forwarding** command, and IPv6 multicasting must be enabled globally with the **ipv6 multicast-routing** command before using PIM-SMv6 commands.

Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the **clear ipv6 mroute** command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous IPv6 static multicast routes.

Note

The IPv6 Multicast addresses shown can be derived from IPv6 unicast prefixes as per RFC 3306.The IPv6 unicast prefix reserved for documentation is 2001:0db8::/32 as per RFC 3849. Using the base /32 prefix the IPv6 multicast prefix for 2001:0db8::/32 is ff3x:20:2001:0db8::/64. Where an RP address is 2001:0db8::1 the embedded RP multicast prefix is ff7x:120:2001:0db8::/96. For ASM (Any-Source Multicast) the IPV6 multicast addresses allocated for documentation purposes are ff0x::0db8:0:0/96 as per RFC 6676. This is a /96 prefix so that it can be used with group IDs as per RFC 3307. These addresses should not be used for practical networks (other than for testing purposes), nor should they appear in any public network.

Note

The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical networks (other than for testing purposes) nor should they appear on any public network.

clear ipv6 mroute pim

Use this command to clear all Multicast Forwarding Cache (MFC) entries in PIM-SMv6.

Note

Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the **clear ipv6 mroute** command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.

Syntax

```
clear ipv6 mroute [*] pim sparse-mode
```

Parameter	Description
*	Clears all PIM-SMv6 multicast routes. Using this command without this optional operator only deletes the multicast router table entries.

Mode Privileged Exec

Example

```
awplus# clear ipv6 mroute pim sparse-mode
```

```
awplus# clear ipv6 mroute * pim sparse-mode
```

clear ipv6 pim sparse-mode bsr rp-set *

Use this command to clear all Rendezvous Point (RP) sets learned through the PIM-SMv6 Bootstrap Router (BSR).

Note Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the **clear ipv6 mroute** command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.

Syntax

```
clear ipv6 pim sparse-mode bsr rp-set *
```

Parameter	Description
*	Clears all RP sets.

Mode Privileged Exec

Usage For multicast clients, note that one router will be automatically or statically designated as the RP, and all routers must explicitly join through the RP. A Designated Router (DR) sends periodic Join/Prune messages toward a group-specific RP for each group that it has active members.

For multicast sources, note that the Designated Router (DR) unicasts Register messages to the RP encapsulating the data packets from the multicast source. The RP forwards decapsulated data packets toward group members.

Example

```
awplus# clear ipv6 pim sparse-mode bsr rp-set *
```

clear ipv6 mroute pim sparse-mode

Use this command to clear all multicast route table entries learned through PIM-SMv6 for a specified multicast group address, and optionally a specified multicast source address.

Note Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the **clear ipv6 mroute** command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.

Syntax

```
clear ipv6 mroute <Group-IPv6-add> pim sparse-mode
clear ipv6 mroute <Group-IPv6-add> <Source-IPv6-add> pim sparse-mode
```

Parameter	Description
<Group-IPv6-add>	Specify a multicast group IPv6 address, entered in the form X:X::X:X.
<Source-IPv6-add>	Specify a source group IPv6 address, entered in the form X:X::X:X.

Mode Privileged Exec

Example

```
awplus# clear ipv6 mroute 2001:db8:: pim sparse-mode

awplus# clear ipv6 mroute 2001:db8:: 2002:db8:: pim
sparse-mode
```

debug ipv6 pim sparse-mode

Use this command to activate PIM-SMv6 debugging.

Use the **no** variant of this command to deactivate PIMv6 debugging. Note that the **undebug ipv6 pim sparse-mode** command is an alias of the **no** variant of this command.

Syntax

```
debug ipv6 pim sparse-mode [all] [events] [mfc] [mib] [nexthop] [nsm]
    [state] [timer]

no debug ipv6 pim sparse-mode [all] [events] [mfc] [mib] [nexthop]
    [nsm] [state] [timer]
```

Parameter	Description
`all`	Activates/deactivates all PIM-SMv6 debugging.
`events`	Activates debug printing of PIM-SMv6 events.
`mfc`	Activates debug printing of MFC (Multicast Forwarding Cache).
`mib`	Activates debug printing of PIM-SMv6 MIBs.
`nexthop`	Activates debug printing of PIM-SMv6 nexthop communications.
`nsm`	Activates debugging of PIM-SMv6 NSM (Network Services Module) communications.
`state`	Activates debug printing of state transition on all PIM-SMv6 FSMs.
`timer`	Activates debug printing of PIM-SMv6 timers.

Mode Privileged Exec and Global Configuration

Example

```
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# debug ipv6 pim sparse-mode all

awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# debug ipv6 pim sparse-mode events

awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# debug ipv6 pim sparse-mode nexthop
```

Validation Output

Figure 56-1: Example output from the show debugging ipv6 pim sparse-mode command after issuing multiple debug ipv6 pim sparse-mode commands

```
awplus#debug ipv6 pim sparse-mode state
awplus#debug ipv6 pim sparse-mode events
awplus#debug ipv6 pim sparse-mode packet
awplus#show debugging ipv6 pim sparse-mode
PIM-SMv6 debugging status:
  PIM event debugging is on
  PIM MFC debugging is off
  PIM state debugging is on
  PIM packet debugging is on
  PIM Hello HT timer debugging is off
  PIM Hello NLT timer debugging is off
  PIM Hello THT timer debugging is off
  PIM Join/Prune JT timer debugging is off
  PIM Join/Prune ET timer debugging is off
  PIM Join/Prune PPT timer debugging is off
  PIM Join/Prune KAT timer debugging is off
  PIM Join/Prune OT timer debugging is off
  PIM Assert AT timer debugging is off
  PIM Register RST timer debugging is off
  PIM Bootstrap BST timer debugging is off
  PIM Bootstrap CRP timer debugging is off
  PIM mib debugging is off
  PIM nsm debugging is off
  PIM nexthop debugging is off
```

Related Commands

show debugging ipv6 pim sparse-mode
undebug all ipv6 pim sparse-mode
undebug ipv6 pim sparse-mode

debug ipv6 pim sparse-mode packet

Use this command to activate PIM-SMv6 packet debugging.

Use the **no** variant of this command to deactivate PIMv6 packet debugging.

Syntax

```
debug ipv6 pim sparse-mode packet {in|out}
no debug ipv6 pim sparse-mode packet {in|out}
```

Parameter	Description
`packet`	Activates debug printing of incoming and/or outgoing IPv6 packets.
`in`	Specify incoming packet debugging.
`out`	Specify outgoing packet debugging.

Mode Privileged Exec and Global Configuration

Example

```
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# debug ipv6 pim sparse-mode packet in

awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# debug ipv6 pim sparse-mode packet out

awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# no debug ipv6 pim sparse-mode packet in

awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# no debug ipv6 pim sparse-mode packet out
```

Related Commands **show debugging ipv6 pim sparse-mode**
undebug all ipv6 pim sparse-mode

debug ipv6 pim sparse-mode timer

Use this command to enable debugging for the specified PIM-SMv6 timers.

Use the **no** variants of this command to disable debugging for the specified PIM-SMv6 timers.

Syntax

```
debug ipv6 pim sparse-mode timer assert [at]
no debug ipv6 pim sparse-mode timer assert [at]
debug pim ipv6 sparse-mode timer bsr [bst|crp]
no debug pim ipv6 sparse-mode timer bsr [bst|crp]
debug pim ipv6 sparse-mode timer hello [ht|nlt|tht]
no debug pim ipv6 sparse-mode timer hello [ht|nlt|tht]
debug pim ipv6 sparse-mode timer joinprune [jt|et|ppt|kat|ot]
no debug pim ipv6 sparse-mode timer joinprune [jt|et|ppt|kat|ot]
debug pim ipv6 sparse-mode timer register [rst]
no debug pim ipv6 sparse-mode timer register [rst]
```

Parameter	Description
`assert`	Enable or disable debugging for the Assert timers.
`at`	Enable or disable debugging for the Assert Timer.
`bsr`	Enable or disable debugging for the specified Bootstrap Router timer, or all Bootstrap Router timers.
`bst`	Enable or disable debugging for the Bootstrap Router: Bootstrap Timer.
`crp`	Enable or disable debugging for the Bootstrap Router: Candidate-RP Timer.
`hello`	Enable or disable debugging for the specified Hello timer, or all Hello timers.
`ht`	Enable or disable debugging for the Hello timer: Hello Timer.
`nlt`	Enable or disable debugging for the Hello timer: Neighbor Liveness Timer.
`tht`	Enable or disable debugging for the Hello timer: Triggered Hello Timer.
`joinprune`	Enable or disable debugging for the specified JoinPrune timer, or all JoinPrune timers.
`jt`	Enable or disable debugging for the JoinPrune timer: upstream Join Timer.
`et`	Enable or disable debugging for the JoinPrune timer: Expiry Timer.
`ppt`	Enable or disable debugging for the JoinPrune timer: PrunePending Timer.
`kat`	Enable or disable debugging for the JoinPrune timer: KeepAlive Timer.

Parameter	Description
`ot`	Enable or disable debugging for the JoinPrune timer: Upstream Override Timer.
`register`	Enable or disable debugging for the Register timers.
`rst`	Enable or disable debugging for the Register timer: Register Stop Timer.

Default By default, all debugging is disabled.

Mode Privileged Exec and Global Configuration

Examples To enable debugging for the PIM-SMv6 Bootstrap Router bootstrap timer, use the commands:

```
awplus(config)# debug ipv6 pim sparse-mode timer bsr bst
```

To enable debugging for the PIM-SMv6 Hello: neighbor liveness timer, use the command:

```
awplus(config)# debug ipv6 pim sparse-mode timer hello ht
```

To enable debugging for the PIM-SMv6 Joinprune expiry timer, use the command:

```
awplus# debug ipv6 pim sparse-mode timer joinprune et
```

To disable debugging for the PIM-SMv6 Register timer, use the command:

```
awplus# no debug ipv6 pim sparse-mode timer register
```

Related Commands **show debugging ipv6 pim sparse-mode**

ipv6 pim accept-register

Use this command to configure the ability to filter out multicast sources specified by the given software IPv6 access-list at the Rendezvous Point (RP), so that the RP will accept/ refuse to perform the register mechanism for the packets sent by the specified sources. By default, the RP accepts register packets from all multicast sources.

Use the **no** variant of this command to revert to default.

Syntax

```
ipv6 pim accept-register list{<access-list>}
no ipv6 pim accept-register
```

Parameter	Description
<access-list>	Specify a Standard or an Extended software IPv6 Access list. See **Chapter 64, IPv6 Software Access Control List (ACL) Commands** for supported IPv6 ACLs.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim accept-register list G2
awplus(config)# ipv6 access-list standard G2 permit 2001:db8::/
128

awplus# configure terminal
awplus(config)# no ipv6 pim accept-register
```

ipv6 pim anycast-rp

Use this command to configure Anycast RP (Rendezvous Point) in an RP set.

Use the **no** variant of this command to remove the configuration.

Syntax

```
ipv6 pim anycast-rp <anycast-rp-address> <member-rp-address>
no ipv6 pim anycast-rp <anycast-rp-address> [<member-rp-address>]
```

Parameter	Description
<anycast-rp-address>	<X:X::X:X> Specify an Anycast IPv6 address to configure an Anycast RP (Rendezvous Point) in a RP set.
<member-rp-address>	<A:B::C:D> Specify an Anycast RP (Rendezvous Point)IPv6 address to configure an Anycast RP in a RP set.

Mode Global Configuration

Usage Anycast is a network addressing and routing scheme where data is routed to the nearest or best destination as viewed by the routing topology. Compared to unicast with a one-to-one association between network address and network endpoint, and multicast with a one-to-many association between network address and network endpoint; anycast has a one-to-many association between network address and network endpoint. For anycast, each destination address identifies a set of receiver endpoints, from which only one receiver endpoint is chosen.

Anycast is often implemented using BGP to simultaneously advertise the same destination IPv6 address range from many sources, resulting in packets address to destination addresses in this range being routed to the nearest source announcing the given destination IPv6 address.

Use this command to specify the Anycast RP configuration in the Anycast RP set. Use the **no** variant of this command to remove the Anycast RP configuration. Note that the member RP address is optional when using the **no** parameter to remove the Anycast RP configuration. removing the anycast RP address also removes the member RP address.

Examples The following example shows how to configure the Anycast RP address with **ipv6 pim anycast-rp**:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim anycast-rp 2:2::2:2 20:20::20:20
```

The following example shows how to remove the Anycast RP in the RP set specifying only the anycast RP address with **no ipv6 pim anycast-rp**, but not specifying the member RP address:

```
awplus# configure terminal
awplus(config)# no ipv6 pim anycast-rp 2:2::2:2 20:20::20:20
```

ipv6 pim bsr-border

Use the **ipv6 pim bsr-border** command to prevent Bootstrap Router (BSR) messages from being sent or received through a VLAN interface. The BSR border is the border of the PIM-SMv6 domain.

Use the **no** variant of this command to disable the configuration set with **ipv6 pim bsr-border**.

Syntax

```
ipv6 pim bsr-border
no ipv6 pim bsr-border
```

Mode Interface Configuration for a VLAN interface.

Usage When this command is configured on a VLAN interface, no PIM-SMv6 BSR messages will be sent or received through the interface. Configure an interface bordering another PIM-SMv6 domain with this command to avoid BSR messages from being exchanged between the two PIM-SMv6 domains.

BSR messages should not be exchanged between different domains, because devices in one domain may elect Rendezvous Points (RPs) in the other domain, resulting in loss of isolation between the two PIM domains that would stop the PIM-SMv6 protocol from working as intended.

Examples The following example configures the VLAN interface `vlan2` to be the PIM-SMv6 domain border:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim bsr-border
```

The following example removes the VLAN interface `vlan2` from the PIM-SMv6 domain border:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim bsr-border
```

ipv6 pim bsr-candidate

Use this command to give the device the candidate BSR (Bootstrap Router) status using the specified IPv6 address mask of the interface.

Use the **no** variant of this command to withdraw the address of the interface from being offered as a BSR candidate.

Syntax

```
ipv6 pim bsr-candidate <interface> [<hash>] [<priority>]
no ipv6 pim bsr-candidate [<interface>]
```

Parameter	Description
<interface>	Specify the interface. For instance, VLAN interface `vlan2`.
<hash>	`<0-128>` configure the hash mask length used for RP selection. The default hash value if you do not configure this parameter is 126.
<priority>	`<0-255>` configure priority for a BSR candidate. Note that you must also specify the *<hash>* (mask length) when specifying the *<priority>*. The default priority if you do not configure this parameter is 64.

Mode Global Configuration

Default The default hash parameter value is 126 and the default priority parameter value is 64.

Examples To set the BSR candidate to the VLAN interface `vlan2`, with the optional mask length and BSR priority parameters, enter the commands shown below:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim bsr-candidate vlan2 20 30
```

To withdraw the address of `vlan2` from being offered as a BSR candidate, enter:

```
awplus# configure terminal
awplus(config)# no ipv6 pim bsr-candidate vlan2
```

ipv6 pim cisco-register-checksum

Use this command to configure the option to calculate the Register Checksum over the whole packet. This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to disable this option.

Syntax

```
ipv6 pim cisco-register-checksum
no ipv6 pim cisco-register-checksum
```

Default This command is disabled by default. By default, Register Checksum is calculated only over the header.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim cisco-register-checksum

awplus# configure terminal
awplus(config)# no ipv6 pim cisco-register-checksum
```

ipv6 pim cisco-register-checksum group-list

Use this command to configure the option to calculate the Register Checksum over the whole packet on multicast groups as specified by the software IPv6 access-list. This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to revert to default settings.

Syntax

```
ipv6 pim cisco-register-checksum group-list <IPv6-access-list>
no ipv6 pim cisco-register-checksum group-list <IPv6-access-list>
```

Parameter	Description
<IPv6-access-list>	Optional. Specify a Standard or Extended software IPv6 access list. See **Chapter 64, IPv6 Software Access Control List (ACL) Commands** for supported IPv6 ACLs. Use this parameter to configure the option to calculate the Register Checksum over the whole packet on multicast groups as specified by an IPv6 access list entered after this command.

Mode Global Configuration

Default This command is disabled by default. By default, Register Checksum is calculated only over the header.

Example

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim cisco-register-checksum group-list G1
awplus(config)# ipv6 access-list standard G1 permit
ff0x::db8:0:0/96
```

ipv6 pim crp-cisco-prefix

Use this command to interoperate with Cisco devices that conform to an earlier draft standard. Some Cisco devices might not accept candidate RPs with a group prefix number of zero. Note that the latest BSR specification prohibits sending RP advertisements with prefix 0.

Use the **no** variant of this command to revert to the default settings.

Syntax

```
ipv6 pim crp-cisco-prefix
no ipv6 pim crp-cisco-prefix
```

Mode Global Configuration

Usage Cisco's BSR code does not conform to the latest BSR draft, it does not accept candidate RPs with a group prefix number of zero. To make the candidate RP work with a Cisco BSR, use the **ipv6 pim crp-cisco-prefix** command when interoperating with older versions of Cisco IOS.

Example

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim crp-cisco-prefix

awplus# configure terminal
awplus(config)# no ipv6 pim crp-cisco-prefix
```

Related Commands ipv6 pim rp-candidate

ipv6 pim dr-priority

Use this command to set the Designated Router priority value.

Use the **no** variant of this command to disable this function.

Syntax

```
ipv6 pim dr-priority  <priority>
no ipv6 pim dr-priority [<priority>]
```

Parameter	Description
<priority>	<0-4294967294> Specify the Designated Router priority value. Note that a higher value has a higher preference or higher priority.

Default The default value is 1. The negated form of this command restores the value to the default.

Mode Interface Configuration for a VLAN interface.

Examples To set the Designated Router priority value to `11234` for the VLAN interface `vlan2`, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim dr-priority 11234
```

To disable the Designated Router priority value for the VLAN interface `vlan2`, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim dr-priority
```

Related Commands **ipv6 pim ignore-rp-set-priority**

ipv6 pim exclude-genid

Use this command to exclude the GenID option from Hello packets sent out by the PIM-SMv6 module on a particular interface. This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to revert to default settings.

Syntax

```
ipv6 pim exclude-genid
no ipv6 pim exclude-genid
```

Default By default, this command is disabled; the GenID option is included.

Mode Interface Configuration for a VLAN interface.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim exclude-genid
```

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim exclude-genid
```

ipv6 pim ext-srcs-directly-connected

Use this command to configure PIM-SMv6 to treat all source traffic arriving on the interface as though it was sent from a host directly connected to the interface.

Use the **no** variant of this command to configure PIM-SMv6 to treat only directly connected sources as directly connected.

Syntax

```
ipv6 pim ext-srcs-directly-connected
no ipv6 pim ext-srcs-directly-connected
```

Default The **no** variant of this command is the default behavior.

Mode Interface Configuration for a VLAN interface.

Example To configure PIM-SMv6 to treat all sources as directly connected for VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim ext-srcs-directly-connected
```

To configure PIM-SMv6 to treat only directly connected sources as directly connected for VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim ext-srcs-directly-connected
```

ipv6 pim hello-holdtime

This command configures a hello-holdtime value. You cannot configure a hello-holdtime value that is less than the current hello-interval.

Use the **no** variant of this command to return it to its default of 3.5 * the current hello-interval.

Syntax

```
ipv6 pim hello-holdtime <holdtime>
no ipv6 pim hello-holdtime
```

Parameter	Description
<holdtime>	<1-65535> The holdtime value in seconds (no fractional seconds are accepted).

Default The default hello-holdtime value is 3.5 * the current hello-interval. The default hello-holdtime is restored using the negated form of this command.

Mode Interface Configuration for a VLAN interface.

Usage Each time the hello interval is updated, the hello holdtime is also updated, according to the following rules:

If the hello holdtime is not configured; or if the hello holdtime is configured and less than the current hello-interval value, it is modified to the (3.5 * hello interval). Otherwise, it retains the configured value.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim hello-holdtime 123
```

ipv6 pim hello-interval

This command configures a hello-interval value for PIM-SMv6.

Use the **no** variant of this command to reset the hello-interval for PIM-SMv6 to the default.

Syntax

```
ipv6 pim hello-interval <interval>
no ipv6 pim hello-interval
```

Parameter	Description
<interval>	<1-65535> The value in seconds (no fractional seconds accepted).

Default The default hello-interval value is 30 seconds. The default is restored using the negated form of this command.

Mode Interface Configuration for a VLAN interface.

Usage When the hello interval is configured, and the hello holdtime is not configured, or when the configured hello-holdtime value is less than the new hello-interval value; the holdtime value is modified to the (3.5 * hello interval). Otherwise, the hello-holdtime value is the configured value.

Example

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim hello-interval 123
```

ipv6 pim ignore-rp-set-priority

Use this command to ignore the RP-SET priority value, and use only the hashing mechanism for RP selection.

Use the **no** variant of this command to disable this setting.

Syntax

```
ipv6 pim ignore-rp-set-priority
no ipv6 pim ignore-rp-set-priority
```

Mode Global Configuration

Usage This command is used to inter-operate with older Cisco IOS versions.

Example

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim ignore-rp-set-priority

awplus# configure terminal
awplus(config)# no ipv6 pim ignore-rp-set-priority
```

ipv6 pim jp-timer

Use this command to set the PIM-SMv6 join/prune timer. Note that the value set by the join/prune timer is the value that the switch puts into the holdtime field of the join/prune packets it sends to its neighbors.

Use the **no** variant of this command to return the PIM-SMv6 join/prune timer to its default value of 210 seconds.

Syntax

```
ipv6 pim jp-timer <1-65535>
no ipv6 pim jp-timer [<1-65535>]
```

Parameter	Description
<1-65535>	Specifies the Join/Prune timer value. The default value is 210 seconds.

Default The default PIM-SMv6 join/prune timer value is 210 seconds.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim jp-timer 300

awplus# configure terminal
awplus(config)# no ipv6 pim jp-timer
```

ipv6 pim neighbor-filter

This command enables filtering of neighbors on the VLAN interface. When configuring a neighbor filter, PIM-SMv6 will either not establish adjacency with the neighbor, or terminate adjacency with the existing neighbors if denied by the filtering IPv6 access list.

Use the **no** variant of this command to disable this function.

Syntax

```
ipv6 pim neighbor-filter <IPv6-accesslist>
no ipv6 pim neighbor-filter <IPv6-accesslist>
```

Parameter	Description
<IPv6-accesslist>	Specify a Standard or an Extended software IPv6 access list name for the PIM-SMv6 neighbor filter. See **Chapter 64, IPv6 Software Access Control List (ACL) Commands** for supported IPv6 ACLs.

Default By default, there is no neighbor filtering applied to an interface.

Mode Interface Configuration for a VLAN interface.

Example

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config)# ipv6 enable
awplus(config-if)# ipv6 pim neighbor-filter filter1
awplus(config-if)# ipv6 access-list standard filter1 deny
fe80:20e:cff:fe01:facc
awplus(config-if)# ipv6 access-list standard filter1 permit
any
awplus(config-if)# exit
```

ipv6 pim register-rate-limit

Use this command to configure the rate of register packets sent by this DR, in units of packets per second. The configured rate is per (S, G) state, and is not a system wide rate.

Use the **no** variant of this command to remove the limit and reset to the default rate limit.

Syntax

```
ipv6 pim register-rate-limit <1-65535>
no ipv6 pim register-rate-limit
```

Parameter	Description
<1-65535>	Specifies the maximum number of packets that can be sent per second.

Mode Global Configuration

Default The default is 0, as reset with the **no** variant, which also specifies an unlimited rate limit.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-rate-limit 3444

awplus# configure terminal
awplus(config)# no ipv6 pim register-rate-limit 3444
```

ipv6 pim register-rp-reachability

Use this command to enable the RP reachability check for PIMv6 Register processing at the DR. The default setting is no checking for RP-reachability.

Use the **no** variant of this command to disable this processing.

Syntax

```
ipv6 pim register-rp-reachability
no ipv6 pim register-rp-reachability
```

Default This command is disabled; by default, there is no checking for RP-reachability.

Mode Global Configuration

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-rp-reachability

awplus# configure terminal
awplus(config)# no ipv6 pim register-rp-reachability
```

ipv6 pim register-source

Use this command to configure the source IPv6 address of register packets sent by this DR, overriding the default source IPv6 address, which is the IPv6 address of the RPF interface toward the source host.

Use the **no** variant of this command to remove the IPv6 source address of Register packets sent by this DR, reverting back to use the default IPv6 source address that is the address of the RPF interface toward the source host.

Syntax

```
ipv6 pim register-source [<source-IPv6-address>|<interface>]
no ipv6 pim register-source
```

Parameter	Description
<source-IPv6-address>	The IPv6 address, entered in the form X:X::X:X, to be used as the source of the register packets.
<interface>	The name of the VLAN interface to be used as the source of the register packets.

Usage The configured address must be a reachable address to be used by the RP to send corresponding Register-Stop messages in response. It is normally the local loopback IPv6 interface address, but can also be a physical IPv6 address. This IPv6 address must be advertised by unicast routing protocols on the DR. The configured interface does not have to be PIM-SMv6 enabled.

Mode Global Configuration

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-source 3ffe::24:2

awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-source vlan2

awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# no ipv6 pim register-source
```

ipv6 pim register-suppression

Use this command to configure the register-suppression time, in seconds, overriding the default of 60 seconds.

Use the **no** variant of this command to reset the value to its default of 60 seconds.

Syntax

```
ipv6 pim register-suppression <1-65535>
no ipv6 pim register-suppression
```

Parameter	Description
<1-65535>	Register suppression on time in seconds.

Mode Global Configuration

Default The default PIM-SMv6 register suppression time is 60 seconds, and is restored with the no variant of this command.

Usage Configuring this value modifies register-suppression time at the DR. Configuring this value at the RP modifies the RP-keepalive-period value if the **ipv6 pim rp-register-kat** command on page 56.35 is not used.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-suppression 192

awplus# configure terminal
awplus(config)# no ipv6 pim register-suppression
```

ipv6 pim rp-address

Use this command to statically configure RP (Rendezvous Point) address for IPv6 multicast groups.

Use the **no** variant of this command to remove a statically configured RP (Rendezvous Point) address for IPv6 multicast groups.

Syntax

```
ipv6 pimv6 rp-address <IPv6-address> [<IPv6-access-list>] [override]
no ipv6 pim rp-address <IPv6-address> [<IPv6-access-list>] [override]
```

Parameter	Description
`<IPv6-address>`	Specify the IPv6 address of the Rendezvous Point, entered in the form `X:X::X:X`.
`<IPv6-access-list>`	Specify a Standard or an Extended software IPv6 access-list name. See **Chapter 64, IPv6 Software Access Control List (ACL) Commands** for supported IPv6 ACLs.
`override`	Specify this optional parameter keyword to enable any statically defined RPs to override dynamically learned RPs.

Mode Global Configuration

Usage The AlliedWare Plus™ PIM-SMv6 implementation supports multiple static RPs. It also supports usage of static-RP and BSR mechanism simultaneously. The **ipv6 pim rp-address** command is used to statically configure the RP address for IPv6 multicast groups.

You need to understand the following information before using this command.

If the RP-address that is configured by the BSR, and the RP-address that is configured statically, are both available for a group range, then the RP-address configured through BSR is chosen over the statically configured RP-address.

A single static-RP can be configured for multiple group ranges using software IPv6 access-lists (ACLs). However, configuring multiple static RPs (using **ipv6 pim rp-address** command) with the same RP address is not allowed. The static-RP can either be configured for the whole multicast group range `ff00::/8` (without using IPv6 ACLs) or for specific group ranges (when using IPv6 ACLs).

For example, configuring **ipv6 pim rp-address 3ffe:10:10:5::153** will configure static-RP `3ffe:10:10:5::153` for the default group range `ff00::/8`. Configuring **ipv6 pim rp-address 3ffee:20:20:5::153 grp-list** will configure static-RP `3ffe:10:10:5::153` for all the group ranges represented by permit filters in the defined named **grp-list** ACL.

If multiple static-RPs are available for a group range, then one with the highest IPv6 address is chosen.

Only `permit` filters in IPv6 ACL are considered as valid group ranges. The default `permit` filter `::/0` is converted to the default multicast filter `ff00::/8`.

After configuration, the RP-address is inserted into a static-RP group tree based on the configured group ranges. For each group range, multiple static-RPs are maintained in a list. This list is sorted in a descending order of IPv6 addresses. When selecting static-RPs for a group range, the first element (which is the static-RP with highest IPv6 address) is chosen.

RP-address deletion is handled by removing the static-RP from all the existing group ranges and recalculating the RPs for existing TIB states if required.

Group mode and RP address mappings learned through BSR take precedence over mappings statistically defined by the **ipv6 pim rp-address** command. Commands with the **override** keyword take precedence over dynamically learned mappings.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 access-list standard G2 permit
2001:db8::/128
awplus(config)# ipv6 pim rp-address 3ffe:30:30:5::153 G2

awplus# configure terminal
awplus(config)# no ipv6 pim rp-address 3ffe:30:30:5::153 G2
```

Related Commands **ipv6 pim rp-candidate**
ipv6 pim rp-register-kat

ipv6 pim rp-candidate

Use this command to give the switch the candidate RP (Rendezvous Point) status using the IPv6 address of the specified VLAN interface.

Use the **no** variant of this command to remove the RP status set using the **ipv6 pim rp-candidate** command.

Syntax

```
ipv6 pim rp-candidate <interface>
   [priority <priority>|interval <interval>| grouplist <accesslist>]

no ipv6 pim rp-candidate [<interface>]
```

Parameter	Description
<interface>	Specify a VLAN interface name.
<priority>	<0-255> Specify this to configure the priority for an RP candidate.
<interval>	Specify a candidate RP advertisement interval in the range <1-16383> (seconds).
<accesslist>	Specify a Standard or an Extended software IPv6 access list name. See **Chapter 64, IPv6 Software Access Control List (ACL) Commands** for supported IPv6 ACLs.

Default The priority value for a candidate RP is 0 by default until specified using the **priority** parameter.

Mode Global Configuration

Usage Note that issuing the command **ipv6 pim rp-candidate** *<interface>* without optional **priority**, **interval**, or **grouplist** parameters will configure the candidate RP with a priority value of 0.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim rp-candidate vlan2 priority 3
```

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 access-list standard G2 permit 2001:db8::/
128
awplus(config)# ipv6 pim rp-candidate vlan2 priority 3
group-list G2
```

```
awplus# configure terminal
awplus(config)# no ipv6 pim rp-candidate vlan2
```

Related Commands **ipv6 pim rp-address**
ipv6 pim rp-register-kat

ipv6 pim rp embedded

Use this command to configure and enable embedded RP (Rendezvous Point) in PIM-SMv6.

Note: This command only applies to the embedded RP group range **ff7x::/12** and **fffx::/12**.

Use the **no** variant of this command to disable embedded RP support. Since embedded RP support is enabled by default, use the **no** variant of this command to disable the default.

Syntax

```
ipv6 pim rp embedded
no ipv6 pim rp embedded
```

Mode Global Configuration

Default Embedded RP is enabled by default in the AlliedWare Plus implementation of PIM-SMv6.

Examples The following example re-enables embedded RP support, the default state in PIM-SMv6:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim rp embedded
```

The following example disables embedded RP support, which is enabled by default in PIM-SMv6:

```
awplus# configure terminal
awplus(config)# no ipv6 pim rp embedded
```

ipv6 pim rp-register-kat

Use this command to configure the Keep Alive Time (KAT) for (S,G) states at the RP (Rendezvous Point) to monitor PIM-SMv6 Register packets.

Use the **no** variant of this command to return the PIM-SMv6 KAT timer to its default value of 210 seconds.

Syntax

```
ipv6 pim rp-register-kat <1-65535>
no ipv6 pim rp-register-kat
```

Parameter	Description
<1-65536>	Specify the KAT timer in seconds. The default value is 210 seconds.

Mode Global Configuration

Default The default PIM-SMv6 KAT timer value is 210 seconds.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim rp-register-kat 3454

awplus# configure terminal
awplus(config)# no ipv6 pim rp-register-kat
```

Related Commands **ipv6 pim rp-address**
ipv6 pim rp-candidate

ipv6 pim sparse-mode

Use this command to enable PIM-SMv6 on a VLAN interface.

Use the **no** variant of this command to disable PIM-SMv6 on a VLAN interface.

Syntax

```
ipv6 pim sparse-mode
no ipv6 pim sparse-mode
```

Mode Interface Configuration for a VLAN interface.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim sparse-mode
```

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim sparse-mode
```

ipv6 pim sparse-mode passive

Use this command to enable and disable PIM-SMv6 passive mode operation for local members on a VLAN interface.

Use the **no** variant of this command to disable PIM-SMv6 passive mode operation for local members on a VLAN interface.

Syntax

```
ipv6 pim sparse-mode passive
no ipv6 pim sparse-mode passive
```

Mode Interface Configuration for a VLAN interface.

Usage Passive mode essentially stops PIM-SMv6 transactions on the interface, allowing only the MLD mechanism to be active.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim sparse-mode passive
```

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim sparse-mode passive
```

ipv6 pim spt-threshold

This command turns on the ability for the last-hop PIM-SMv6 router to switch to SPT.

The **no** variant of this command turns off the ability for the last-hop PIM-SMv6 router to switch to SPT.

Note The switching to SPT happens either at the receiving of the first data packet, or not at all; it is not rate-based.

Syntax

```
ipv6 pim spt-threshold
no ipv6 pim spt-threshold
```

Mode Global Configuration

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim spt-threshold

awplus# configure terminal
awplus(config)# no ipv6 pim spt-threshold
```

ipv6 pim spt-threshold group-list

Use this command to turn on/off the ability for the last-hop PIM-SMv6 router to switch to SPT for multicast group addresses as specified by the given software IPv6 access-list.

Use the **no** variant of this command to turn off switching to the SPT.

Note The switching to SPT happens either at the receiving of the first data packet, or not at all; it is not rate-based.

Syntax

```
ipv6 pim spt-threshold group-list <IPv6-access-list>
no ipv6 pim spt-threshold group-list <IPv6-access-list>
```

Parameter	Description
<IPv6-access-list>	Specify a Standard or an Extended software IPv6 access-list name. See **Chapter 64, IPv6 Software Access Control List (ACL) Commands** for supported IPv6 ACLs.

Mode Global Configuration

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim spt-threshold group-list G1
awplus(config)# ipv6 access-list standard G1 permit
2001:db8::/128

awplus# configure terminal
awplus(config)# no ipv6 pim spt-threshold group-list G1
```

ipv6 pim unicast-bsm

Use this command to enable support for the sending and receiving of unicast Boot Strap Messages (BSM) on a VLAN interface.

Use the **no** variant of this command to disable the sending and receiving of unicast BSM on a VLAN interface.

Syntax

```
ipv6 pim unicast-bsm
no ipv6 pim unicast-bsm
```

Mode Interface Configuration for a VLAN interface.

Default Unicast BSM is disabled by default on an interface.

Usage This command provides backward compatibility with older versions of the Boot Strap Router (BSR) specification, which directs unicast BSM to refresh the state of new or restarting neighbors. The current BSR specification defines a No Forward BSM to achieve the same result.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim unicast-bsm

awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim unicast-bsm
```

show debugging ipv6 pim sparse-mode

This command displays the status of the PIM-SMv6 debugging on your switch.

For information on output options, see "Controlling "show" Command Output" on page 1.38.

Syntax `show debugging ipv6 pim sparse-mode`

Mode User Exec and Privileged Exec

Example To display PIM-SMv6 debugging settings, use the command:

```
awplus# show debugging ipv6 pim sparse-mode
```

Figure 56-2: Example output from the show debugging ipv6 pim sparse-mode command

```
awplus#show debugging ipv6 pim sparse-mode
Debugging status:
  PIM event debugging is on
  PIM MFC debugging is on
  PIM state debugging is on
  PIM packet debugging is on
  PIM Hello HT timer debugging is on
  PIM Hello NLT timer debugging is on
  PIM Hello THT timer debugging is on
  PIM Join/Prune JT timer debugging is on
  PIM Join/Prune ET timer debugging is on
  PIM Join/Prune PPT timer debugging is on
  PIM Join/Prune KAT timer debugging is on
  PIM Join/Prune OT timer debugging is on
  PIM Assert AT timer debugging is on
  PIM Register RST timer debugging is on
  PIM Bootstrap BST timer debugging is on
  PIM Bootstrap CRP timer debugging is on
```

Related Commands **debug ipv6 pim sparse-mode**
undebug ipv6 pim sparse-mode

show ipv6 pim sparse-mode bsr-router

Use this command to show the PIM-SMv6 Bootstrap Router (BSR) IPv6 address.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show ipv6 pim sparse-mode bsr-router`

Mode User Exec and Privileged Exec

Example To display the BSR IPv6 address, use the command:

```
awplus# show ipv6 pim sparse-mode bsr-router
```

Output **Figure 56-3: Example output from the show ipv6 pim sparse-mode bsr-router command**

```
awplus#show ipv6 pim sparse-mode bsr-router
PIM6v2 Bootstrap information
  BSR address: 2001:203::213 (?)
  Uptime:      00:36:25, BSR Priority: 64, Hash mask length: 126
  Expires:     00:01:46
  Role: Candidate BSR
  State: Candidate BSR

  Candidate RP: 2001:5::211(vlan5)
    Advertisement interval 60 seconds
    Next C-RP advertisement in 00:00:43
```

Related Commands **show ipv6 pim sparse-mode rp mapping**
show ipv6 pim sparse-mode neighbor

show ipv6 pim sparse-mode interface

Use this command to show PIM-SMv6 interface information. Note that you can specify an individual VLAN interface with the optional parameter. Alternatively, you can display PIM-SMv6 interface information for all interfaces if you omit the optional interface parameter.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show ipv6 pim sparse-mode interface`

Mode User Exec and Privileged Exec

Examples To display information about all PIM-SMv6 interfaces, use the command:

```
awplus# show ipv6 pim sparse-mode interface
```

Figure 56-4: Example output from the show ipv6 pim sparse-mode interface command

```
awplus#show ipv6 pim sparse-mode interface
Interface VIFindex Ver/   Nbr    DR
                   Mode   Count  Priority
vlan2     0        v2/S   2      1
    Address       : fe80::207:e9ff:fe02:81d
    Global Address: 3ffe:192:168:1::53
    DR            : fe80::20e:cff:fe01:facc
vlan3     2        v2/S   2      1
    Address       : fe80::207:e9ff:fe02:21a2
    Global Address: 3ffe:192:168:10::53
    DR            : this system
```

Table 56-1: Parameters in the output from the show ipv6 pim sparse-mode interface command

Parameters	Description
`Address`	Primary PIM-SMv6 address.
`Interface`	Name of the PIM-SMv6 interface.
`VIF Index`	The Virtual Interface index of the VLAN.
`Ver/Mode`	PIMv6 version/Sparse mode.
`Nbr Count`	Neighbor count of the PIM-SMv6 interface.
`DR Priority`	Designated Router priority.
`DR`	The IPv6 address of the Designated Router.

Related Commands

show ipv6 pim sparse-mode interface detail

Use this command to show detailed PIM-SMv6 information for all PIM-SMv6 configured interfaces.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show ipv6 pim sparse-mode interface detail`

Mode User Exec and Privileged Exec

Example To show detailed PIM-SMv6 information for all PIM-SMv6 configured interfaces, use the command:

```
awplus# show ipv6 pim sparse-mode interface detail
```

Output **Figure 56-5: Example output from the show ipv6 pim sparse-mode interface detail command**

```
awplus#show ipv6 pim sparse-mode interface detail
vlan2 (vif 0)
  Address fe80::207:e9ff:fe02:81d, DR fe80::20e:cff:fe01:facc

```

show ipv6 pim sparse-mode local-members

Use this command to show detailed local member information on a VLAN interface configured for PIM-SMv6. If you do not specify a VLAN interface then detailed local member information is shown for all VLAN interfaces configured for PIM-SMv6.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show ipv6 pim sparse-mode local-members [<interface>]`

Parameter	Description
<interface>	Optional Specify the interface. For instance, VLAN interface `vlan2`.

Mode User Exec and Privileged Exec

Example To show detailed PIM-SMv6 information for all PIM-SMv6 configured VLAN interfaces, use the command:

```
awplus# show ipv6 pim sparse-mode local-members
```

Output **Figure 56-6: Example output from the show ipv6 pim sparse-mode local-members command**

```
awplus#show ipv6 pim sparse-mode local-members
PIM Local membership information

vlan1:

  (*, ff02::1:ff6b:4783) : Include

vlan203:

  (*, ff0e:1::4) : Include
```

Example To show detailed PIM-SMv6 information for the PIM-SMv6 configured interface `vlan1`, use the command:

```
awplus# show ipv6 pim sparse-mode local-members vlan1
```

Output **Figure 56-7: Example output from the show ipv6 pim sparse-mode local-members vlan1 command**

```
awplus#show ipv6 pim sparse-mode local-members vlan1
PIM Local membership information

vlan1:

  (*, ff02::1:ff6b:4783) : Include
```

show ipv6 pim sparse-mode mroute

This command displays the IPv6 multicast routing table, or the IPv6 multicast routing table based on the specified IPv6 address or addresses.

Two group IPv6 addresses cannot be used simultaneously; two source IPv6 addresses cannot be used simultaneously.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show ipv6 pim sparse-mode mroute [<group-IPv6-address>|<source-IPv6-address>]

show ipv6 pim sparse-mode mroute [<group-IPv6-address> <source-IPv6-address>]

show ipv6 pim sparse-mode mroute [<source-IPv6-address> <group-IPv6-address>]
```

Parameter	Description
<group-IPv6-address>	Group IPv6 address, entered in the form X:X::X:X. Based on the group and source IPv6 address, the output is the selected route if present in the multicast route tree.
<source-IPv6-address>	Source IPv6 address, entered in the form X:X::X:X. Based on the source and group IPv6 address, the output is the selected route if present in the multicast route tree.

Mode User Exec and Privileged Exec

Usage Note that when a feature license is enabled, the output for the **show ipv6 pim sparse-mode mroute** command will only show 100 interfaces because of the terminal display width limit. Use the **show ipv6 pim sparse-mode mroute detail** command to display detailed entries of the IPv6 multicast routing table.

Examples

```
awplus# show ipv6 pim sparse-mode mroute

awplus# show ipv6 pim sparse-mode mroute 2001:db8::

awplus# show ipv6 pim sparse-mode mroute 2001:db8::
        2002:db8::
```

Figure 56-8: Example output from the show ipv6 pim sparse-mode mroute command

```
awplus#show ipv6 pim sparse-mode mroute

show ipv6 pim sparse-mode mroute detail

This command displays detailed entries of the IPv6 multicast routing table, or detailed entries of the IPv6 multicast routing table based on the specified IPv6 address or addresses.

Two group IPv6 addresses cannot be used simultaneously; two IPv6 source addresses cannot be used simultaneously.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show ipv6 pim sparse-mode mroute [<group-IPv6-address>|<source-IPv6-address>] detail

show ipv6 pim sparse-mode mroute [<group-IPv6-address> <source-IPv6-address>] detail

show ipv6 pim sparse-mode mroute [<source-IPv6-address> <group-IPv6-address>] detail
```

Parameter	Description
<group-IPv6-address>	Group IPv6 address, entered in the form X:.X::X:X. Output is all multicast entries belonging to that group.
<source-IPv6-address>	Source IPv6 address, entered in the form X:.X::X:X. Output is all multicast entries belonging to that source.
`detail`	Show detailed information.

Usage

Based on the group and source IPv6 address, the output is the selected route if present in the multicast route tree.

Mode

User Exec and Privileged Exec

Examples

```
awplus# show ipv6 pim sparse-mode mroute detail

awplus# show ipv6 pim sparse-mode mroute 2001:db8:: detail

awplus# show ipv6 pim sparse-mode mroute 2001:db8::
        2002:db8:: detail
```

Figure 56-9: Example output from the show ipv6 pim sparse-mode mroute detail command

```
awplus#show ipv6 pim sparse-mode mroute detail

show ipv6 pim sparse-mode neighbor

Use this command to show the PIM-SMv6 neighbor information.

For information on output options, see "Controlling "show" Command Output" on page 1.38.

Syntax

```
show ipv6 pim sparse-mode neighbor [<interface>] [<IPv6-address>]
   [detail]
```

Parameter	Description
<interface>	Interface name (e.g. `vlan2`). Show neighbors on an interface.
<IPv6-address>	Show neighbors with a particular address on an interface. The IPv6 address entered in the form X:X::X:X.
`detail`	Show detailed information.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ipv6 pim sparse-mode neighbor
```

```
awplus# show ipv6 pim sparse-mode neighbor vlan5 detail
```

```

show ipv6 pim sparse-mode nexthop

Use this command to see the nexthop information as used by PIM-SMv6.

For information on output options, see "Controlling "show" Command Output" on page 1.38.

Syntax `show ipv6 pim sparse-mode nexthop`

Mode User Exec and Privileged Exec

Example

```
awplus# show ipv6 pim sparse-mode nexthop
```

Figure 56-12: Example output from the show ipv6 pim sparse-mode nexthop command

```
awplus#show ipv6 pim sparse-mode nexthop
Flags: N = New, R = RP, S = Source, U = Unreachable
Destination           Type  Nexthop Nexthop Nexthop  Nexthop Metric     Pref    Refcnt
                            Num     Addr    Ifindex  Name
_____________________________________________________________________________________

```

Table 56-2: Parameters in output of the show ipv6 pim sparse-mode nexthop command

Parameter	Description
`Destination`	The destination address for which PIM-SMv6 requires nexthop information.
`Type`	The type of destination, as indicated by the Flags description. N = New, R= RP, S = Source, U = Unreachable.
`Nexthop Num`	The number of nexthops to the destination. PIM-SMv6 always uses only 1 nexthop.
`Nexthop Addr`	The address of the primary nexthop gateway.
`Nexthop IfIndex`	The interface on which the nexthop gateway can be reached.
`Nexthop Name`	The name of nexthop interface.
`Metric`	The metric of the route towards the destination.
`Preference`	The preference of the route towards destination.
`Refcnt`	Only used for debugging.

show ipv6 pim sparse-mode rp-hash

Use this command to display the Rendezvous Point (RP) to be chosen based on the IPv6 group address selected.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show ipv6 pim sparse-mode rp-hash <IPv6-group-addr>`

Parameter	Description
<IPv6-group-addr>	The IPv6 group address used to find the RP, entered in the form X:X::X:X.

Mode User Exec and Privileged Exec

Example

```
awplus# show ipv6 pim sparse-mode rp-hash ff04:10
```

Figure 56-13: output from the show ipv6 pim sparse-mode rp-hash command:

```
awplus#show ipv6 pim sparse-mode rp-hash ff04::10
    RP: 3ffe:10:10:5::153
    Info source: 3ffe:10:10:5::153, via bootstrap
```

Related Commands **show ipv6 pim sparse-mode rp mapping**

show ipv6 pim sparse-mode rp mapping

Use this command to show group-to-RP (Rendezvous Point) mappings, and the RP set.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show ipv6 pim sparse-mode rp mapping`

Mode User Exec and Privileged Exec

Example

```
awplus# show ipv6 pim sparse-mode rp mapping
```

Figure 56-14: output from the show ipv6 pim sparse-mode rp mapping command

```
awplus#show ipv6 pim sparse-mode rp mapping
PIM Group-to-RP Mappings
Group(s): ff00::/8
  RP: 3ffe:10:10:5::153
    Info source: 3ffe:10:10:5::153, via bootstrap, priority 192
         Uptime: 05:36:40
```

Related Commands **show ipv6 pim sparse-mode rp-hash**

show ipv6 pim sparse-mode rp nexthop

Use this command to display the RP (Rendezvous Point) nexthop information used by PIM-SMv6.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show ipv6 pim sparse-mode rp nexthop <RP-group-addr>`

Parameter	Description
<RP-group-addr>	Specify the RP group address used to display nexthop RP information, entered in the form X:X::X:X.

Mode User Exec and Privileged Exec

Example

```
awplus# show ipv6 pim sparse-mode rp nexthop 3ffe:10:10:5::153
```

Figure 56-15: Example output from the show ipv6 pim sparse-mode rp nexthop command

```
awplus#show ipv6 pim sparse-mode rp nexthop 3ffe:10:10:5::153
Flags: N = New, R = RP, S = Source, U = Unreachable
Destination           Type  Nexthop Nexthop Nexthop  Nexthop Metric     Pref    Refcnt
                            Num     Addr    Ifindex  Name
-------------------------------------------------------------------------------------
3ffe:10:10:5::153     .RS.  1       fe80::20e:cff:fe01:facc  2      30    110     1
```

Table 56-3: Parameters in output of the show ipv6 pim sparse-mode rp nexthop command

Parameter	Description
`Destination`	The destination address for which PIM-SMv6 requires nexthop information.
`Type`	The type of destination, as indicated by the Flags description. N = New, R= RP, S = Source, U = Unreachable.
`Nexthop Num`	The number of nexthops to the destination. PIM-SMv6 always uses only 1 nexthop.
`Nexthop Addr`	The address of the primary nexthop gateway.
`Nexthop IfIndex`	The interface on which the nexthop gateway can be reached.
`Nexthop Name`	The name of nexthop interface.
`Metric`	The metric of the route towards the destination.
`Preference`	The preference of the route towards destination.
`Refcnt`	Only used for debugging.

undebug all ipv6 pim sparse-mode

Use this command to disable all PIM-SMv6 debugging.

Syntax `undebug all ipv6 pim sparse-mode`

Mode Privileged Exec

Example

```
awplus# undebug all ipv6 pim sparse-mode
```

Related Commands **debug ipv6 pim sparse-mode**

undebug ipv6 pim sparse-mode

Use this command to deactivate PIM-SMv6 debugging. Note that this command is an alias of the **no** variant of the **debug ipv6 pim sparse-mode** command.

Syntax

```
undebug ipv6 pim sparse-mode [all] [events] [mfc] [mib] [nexthop]
    [nsm] [state] [timer]
```

Parameter	Description
`all`	Deactivates all PIM-SMv6 debugging.
`events`	Deactivates debug printing of PIM-SMv6 events.
`mfc`	Deactivates debug printing of MFC (Multicast Forwarding Cache).
`mib`	Deactivates debug printing of PIM-SMv6 MIBs.
`nexthop`	Deactivates debug printing of PIM-SMv6 nexthop communications.
`nsm`	Deactivates debugging of PIM-SMv6 NSM (Network Services Module) communications.
`state`	Deactivates debug printing of state transition on all PIM-SMv6 FSMs.
`timer`	Deactivates debug printing of PIM-SMv6 timers.

Mode Privileged Exec and Global Configuration

Example

```
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# undebug ipv6 pim sparse-mode all

awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# undebug ipv6 pim sparse-mode events

awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# undebug ipv6 pim sparse-mode nexthop
```

Validation Output

Figure 56-16: Example output from the show debugging ipv6 pim sparse-mode command after issuing the undebug ipv6 pim sparse-mode all command

```
awplus#undebug ipv6 pim sparse-mode all
awplus#show debugging ipv6 pim sparse-mode

Chapter 57: PIM-DM Introduction and Configuration

Introduction 57.2
Characteristics of PIM-DM 57.2
PIM-DM Terminology 57.3
PIM-DM Configuration 57.4
Configuration Example 57.4
Verifying Configuration 57.6

Introduction

Protocol Independent Multicast - Dense Mode (PIM-DM) is a data-driven multicast routing protocol, which builds source-based multicast distribution trees that operate on the Flood-and-Prune principle. It requires unicast-reachability information, but does not depend on a specific unicast routing protocol.

For details of the commands used to configure PIM-DM, see **Chapter 58, PIM-DM Commands**. For a general overview of multicasting, see **Chapter 50, Multicast Introduction and Commands**.

Characteristics of PIM-DM

PIM Dense Mode (PIM-DM) is a significantly less complex protocol than PIM Sparse Mode (PIM-SM). PIM-DM works on the principle that it is probable that any given multicast stream will have at least one downstream listener. PIM-DM is ideal where many hosts subscribe to receive multicast packets, so most of the PIM Routers receive and forward all multicast packets.

Where PIM-SM only forwards a multicast stream when requested, PIM-DM always floods any new multicast stream that arrives at the PIM Router and only stops flooding the multicast stream on a given link if it is explicitly told to, by receiving a Prune message from the downstream PIM Router.

PIM-DM does not include the concepts of Rendezvous Points, which are used in PIM-SM. PIM-SM explicitly builds unidirectional shared trees rooted at a Rendezvous Point (RP) per group. PIM-DM implicitly builds shortest-path trees by flooding multicast traffic domain wide, then Prunes back branches of the tree where no receivers are available. As with PIM-SM, so does PIM-DM also use Reverse Path Forwarding (RPF) to stop loops for packet forwarding for PIM Routers receiving multicast packets.

PIM-DM Terminology

See the below descriptions of the terms and concepts used to describe the PIM-DM protocol:

PIM Router Any Layer 3 routing device that is running PIM, such as an Allied Telesis managed Layer 3 switch or Allied Telesis router.

Reverse Path Forwarding Reverse Path Forwarding (RPF) is the mechanism that PIM uses to make sure it does not forward multicast streams around in loops. If a set of PIM Routers are connected in a loop, and each PIM Router is forwarding a given multicast stream, then eventually the multicast stream would be forwarded right around the loop.

To prevent this from happening, PIM makes use of the fact that the unicast routing tables in a set of PIM Routers should converge into a loop-free tree of paths to any given destination.

When a PIM Router receives a multicast stream from source address `SourceA` through an interface `IF1`, it checks whether `IF1` is the interface the PIM Router would use to reach `SourceA`. The PIM Router will only forward the multicast stream if `IF1` is the interface the PIM Router would use to reach `SourceA`.

RPF determines whether the interface is correct by consulting unicast routing tables. This ensure that the multicast stream is forwarded in a loop-free manner back up the tree of unicast paths that lead to the source.

Forwarding Multicast Packets PIM Routers forward a given multicast stream onto all PIM enabled IP interfaces that have not received a Prune for the given multicast stream. As with unicast routing, the PIM Router decrements the TTL (Time To Live) in each packet that the PIM Router forwards. The packet is discarded if the TTL is decremented to 0.

However, unlike unicast routing, the destination MAC addresses of the packets are not altered as they are forwarded by the PIM Router. The destination MAC addresses remain set to the multicast MAC addresses that correspond to the destination group address of the multicast stream.

Upstream Towards the Source.

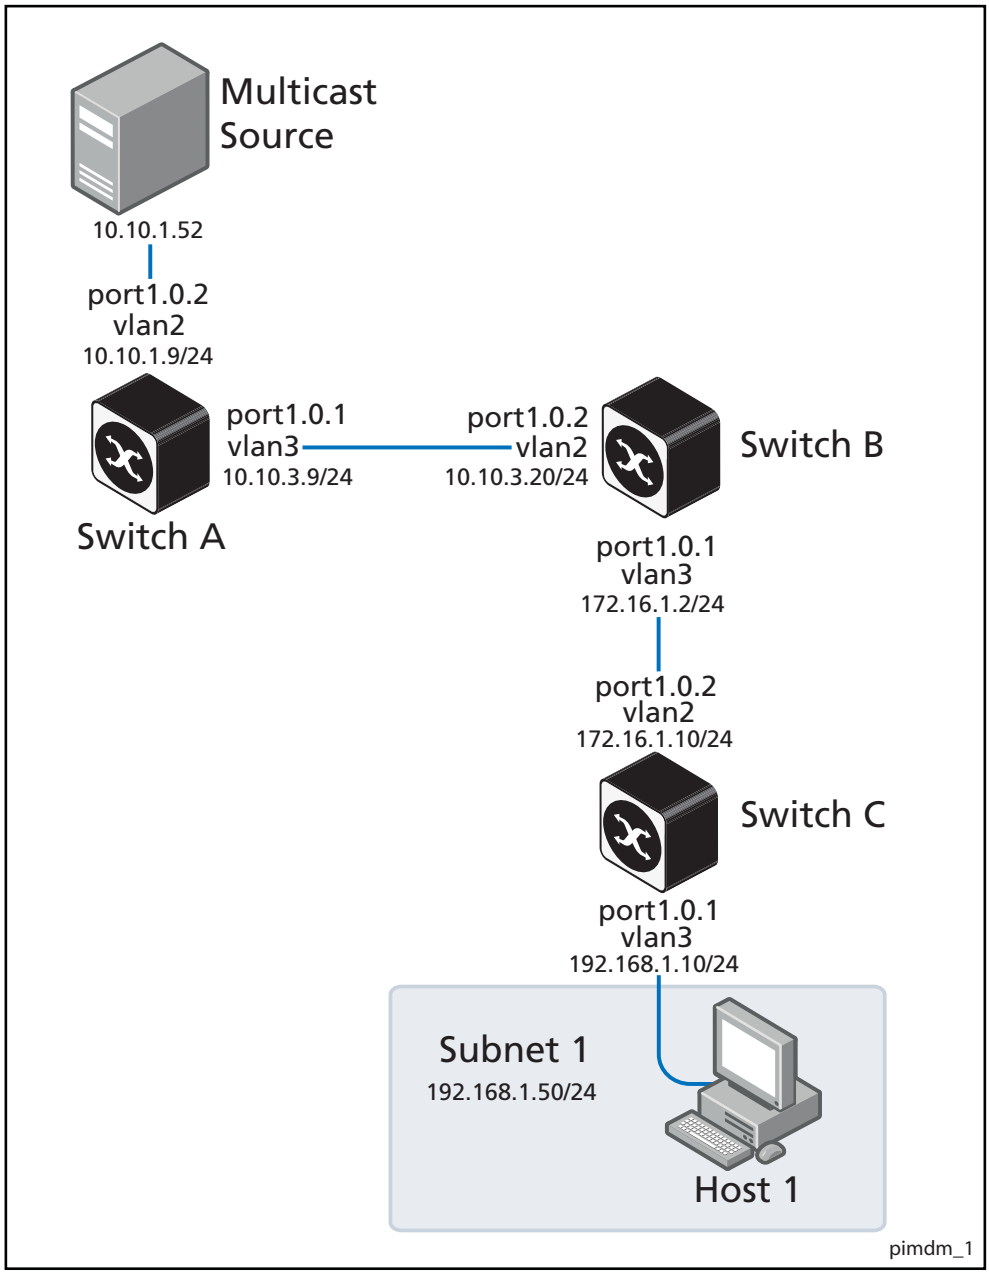
Downstream Anything other than the upstream interface for that group.

PIM-DM Configuration

The main requirement is to enable PIM-DM on the desired interfaces. This section provides a PIM-DM configuration example for a relevant scenario. The configuration uses Allied Telesis managed Layer 3 Switches as the PIM Routers. Three PIM Routers are connected in a chain, and a multicast client is attached to the third PIM Router.

Configuration Example

IIn this example, the address of the multicast source is 10.10.1.52. The following figure displays the network topology used in this example:



The steps involved in the forwarding of the multicast streams for this sample configuration are:

Switch A

1. When the PIM Routers start, they use the exchange of PIM Hello packets for PIM neighbor relationships with each other. Then each PIM Router becomes aware of the location of its PIM neighbors.

2. As a multicast stream arrives from the source to **Switch A**, it performs an RPF check on the source IP address of the multicast stream. **Switch A** determines the best route to the source IP address (10.10.1.52) is the receiving interface, so it forwards the multicast stream to its only PIM neighbor.

3. **Switch A** creates an (S, G) (Source, Group) entry in its PIM-DM forwarding table. Any further packets from the same source, which are destined to be forwarded to the same group, will be automatically forwarded without an RFP (Reverse Path Forwarding) check.

Switch B

4. When the multicast stream arrives at **Switch B**, it performs the same steps (2 and 3) as **Switch A**. This results in **Switch B** also having an (S, G) entry for the multicast stream in its PIM forwarding table, and the multicast stream is forwarded to **Switch C**.

Switch C

5. When the multicast stream arrives at **Switch C**, it will perform an RPF check on the multicast stream as it arrives, and accept it.

   This PIM Router does not have any downstream PIM Routers, but if **Switch C** has received an IGMP report from the client to request this multicast stream, **Switch C** will forward the multicast stream out port1.0.1, but no other ports.

   If the client leaves the group, and **Switch C** has no other attached clients requesting the group, then **Switch C** will send a Prune message upstream, resulting in **Switch A** and **Switch B** stopping forwarding the multicast stream to **Switch C**.

Switch A Configuration Output

See the following configuration output for **Switch A**:

```
hostname Switch A
vlan database
vlan 2 state enable
vlan 3 state enable
interface vlan2
ip address 10.10.1.9/24
ip igmp
ip pim dense-mode
!
interface vlan3
ip address 10.10.3.9/24
ip igmp
ip pim dense-mode
!
interface port1.0.1
switchport access vlan 3
!
interface port1.0.2
switchport access vlan 2
!
ip multicast-routing
!
```

Switch B Configuration Output

See the following configuration output for **Switch B**:

```
hostname Switch B
vlan database
vlan 2 state enable
vlan 3 state enable
interface vlan2
ip address 10.10.3.20/24
ip igmp
ip pim dense-mode
!
interface vlan3
ip address 172.16.1.2/24
ip igmp
ip pim dense-mode
!
interface port1.0.1
switchport access vlan 3
!
interface port1.0.2
switchport access vlan 2
!
ip multicast-routing
!
```

Switch C Configuration Output

See the following configuration output for **Switch C**:

```
hostname Switch C
vlan database
vlan 2 state enable
vlan 3 state enable
interface vlan2
ip address 172.16.1.10/24
ip igmp
ip pim dense-mode
!
interface vlan3
ip address 192.168.1.10/24
ip igmp
ip pim dense-mode
!
interface port1.0.1
switchport access vlan 3
!
interface port1.0.2
switchport access vlan 2
!
ip multicast-routing
!
```

Verifying Configuration

Use the following commands to verify the interface details and multicast routing table.

Interface Details

The **show ip pim dense-mode interface** command displays the interface details for **Switch C**.

```
Address          Interface VIFindex Ver/   Nbr
                                    Mode   Count
192.168.1.10     port1.0.1  0       v2/D   0
172.16.1.10      port1.0.2  2       v2/D   1
```

IP Multicast Routing Table

The **show ip mroute** command displays the IP multicast routing table (for **Switch C**).

```
IP Multicast Routing Table
Flags: I - Immediate Stat, T - Timed Stat, F - Forwarder
installed
Timers: Uptime/Stat Expiry
Interface State: Interface (TTL)

(10.10.1.52, 224.0.1.3), uptime 00:00:15
Owner PIM-DM, Flags: F
  Incoming interface: port1.0.2
  Outgoing interface list:
    port1.0.1 (1)
```

IP PIM-DM Multicast Routing Table

The **show ip pim dense-mode mroute** command displays the IP PIM-DM multicast routing table (for **Switch C**).

```
PIM-DM Multicast Routing Table
(10.10.1.52, 224.0.1.3)
  RPF Neighbor: 172.16.1.2, Nexthop: 172.16.1.2, port1.0.2
  Upstream IF: port1.0.2
    Upstream State: Forwarding
    Assert State: NoInfo
  Downstream IF List:
    port1.0.1, in 'olist':
      Downstream State: NoInfo
      Assert State: NoInfo
```

Command List

This chapter provides an alphabetical reference of PIM-DM commands. For commands common to PIM-SM and PIM-DM, see **Chapter 50, Multicast Introduction and Commands**.

debug pim dense-mode all

This command enables PIM-DM debugging.

The **no** variant of this command disables PIM-DM debugging.

Syntax

```
debug pim dense-mode all
no debug pim dense-mode all
```

Mode Privileged Exec and Global Configuration

Example

```
awplus# configure terminal
awplus(config)# debug pim dense-mode all
```

Output **Figure 58-1: Example output from the debug pim dense-mode all command**

```
PIM event debugging is on
PIM MFC debugging is on
PIM state debugging is on
PIM packet debugging is on
PIM incoming packet debugging is on
PIM outgoing packet debugging is on
```

Validation Commands **show debugging pim dense-mode**

Related Commands
debug pim dense-mode context
debug pim dense-mode decode
debug pim dense-mode encode
debug pim dense-mode fsm
debug pim dense-mode mrt
debug pim dense-mode nexthop
debug pim dense-mode nsm
debug pim dense-mode vif

debug pim dense-mode context

This command enables debugging of general configuration context.

The **no** variant of this command disables debugging of general configuration context.

This command also enables debugging of general configuration and Virtual Routing (VR), and Virtual Routing and Forwarding (VRF) context.

The **no** variant of this command also disables debugging of general configuration and Virtual Routing (VR), and Virtual Routing and Forwarding (VRF) context.

Syntax

```
debug pim dense-mode context
no debug pim dense-mode context
```

Mode Privileged Exec and Global Configuration

Example

```
awplus# configure terminal
awplus(config)# debug pim dense-mode context
```

Related Commands

debug pim dense-mode all
debug pim dense-mode decode
debug pim dense-mode encode
debug pim dense-mode fsm
debug pim dense-mode mrt
debug pim dense-mode nexthop
debug pim dense-mode nsm
debug pim dense-mode vif

debug pim dense-mode decode

This command enables debugging of the PIM-DM message decoder.

The **no** variant of this command disables debugging of the PIM-DM message decoder.

Syntax

```
debug pim dense-mode decode
no debug pim dense-mode decode
```

Mode Privileged Exec and Global Configuration

Example

```
awplus# configure terminal
awplus(config)# debug pim dense-mode decoder
```

Related Commands

debug pim dense-mode all
debug pim dense-mode context
debug pim dense-mode encode
debug pim dense-mode fsm
debug pim dense-mode mrt
debug pim dense-mode nexthop
debug pim dense-mode nsm
debug pim dense-mode vif

debug pim dense-mode encode

This command enables debugging of the PIM-DM message encoder.

The **no** variant of this command disables debugging of the PIM-DM message encoder.

Syntax

```
debug pim dense-mode encode
no debug pim dense-mode encode
```

Mode Privileged Exec and Global Configuration

Example

```
awplus# configure terminal
awplus(config)# debug pim dense-mode encoder
```

Related Commands

debug pim dense-mode all
debug pim dense-mode context
debug pim dense-mode decode
debug pim dense-mode fsm
debug pim dense-mode mrt
debug pim dense-mode nexthop
debug pim dense-mode nsm
debug pim dense-mode vif

debug pim dense-mode fsm

This command enables debugging of Finite-State Machine (FSM) specific information of all Multicast Routing Table (MRT) and MRT Virtual Multicast Interface (MRT-VIF) entries.

The **no** variant of this command disables debugging of Finite-State Machine (FSM) specific information of all Multicast Routing Table (MRT) and MRT Virtual Multicast Interface (MRT-VIF) entries.

Syntax

```
debug pim dense-mode fsm
no debug pim dense-mode fsm
```

Mode Privileged Exec and Global Configuration

Example

```
awplus# configure terminal
awplus(config)# debug pim dense-mode fsm
```

Related Commands

debug pim dense-mode all
debug pim dense-mode context
debug pim dense-mode decode
debug pim dense-mode encode
debug pim dense-mode mrt
debug pim dense-mode nexthop
debug pim dense-mode nsm
debug pim dense-mode vif

debug pim dense-mode mrt

This command enables debugging of MRT and MRT-VIF entry handling (for example, creation and deletion of).

The **no** variant of this command disables debugging of MRT and MRT-VIF entry handling.

Syntax

```
debug pim dense-mode mrt
no debug pim dense-mode mrt
```

Mode Privileged Exec and Global Configuration

Example

```
awplus# configure terminal
awplus(config)# debug pim dense-mode mrt
```

Related Commands

debug pim dense-mode all
debug pim dense-mode context
debug pim dense-mode decode
debug pim dense-mode encode
debug pim dense-mode fsm
debug pim dense-mode nexthop
debug pim dense-mode nsm
debug pim dense-mode vif

debug pim dense-mode nexthop

This command enables debugging of Reverse Path Forwarding (RPF) neighbor nexthop cache handling.

The **no** variant of this command disables debugging of Reverse Path Forwarding (RPF) neighbor nexthop cache handling.

Syntax

```
debug pim dense-mode nexthop
no debug pim dense-mode nexthop
```

Mode Privileged Exec and Global Configuration

Example

```
awplus# configure terminal
awplus(config)# debug pim dense-mode nexthop
```

debug pim dense-mode decode
debug pim dense-mode encode
debug pim dense-mode fsm
debug pim dense-mode mrt
debug pim dense-mode nsm
debug pim dense-mode vif

debug pim dense-mode nsm

This command enables debugging of PIM-DM interface with NSM.

The **no** variant of this command disables debugging of PIM-DM interface with NSM.

Syntax

```
debug pim dense-mode nsm
no debug pim dense-mode nsm
```

Mode Privileged Exec and Global Configuration

Example

```
awplus# configure terminal
awplus(config)# debug pim dense-mode nsm
```

Related Commands

debug pim dense-mode all
debug pim dense-mode context
debug pim dense-mode decode
debug pim dense-mode encode
debug pim dense-mode fsm
debug pim dense-mode mrt
debug pim dense-mode nexthop
debug pim dense-mode vif

debug pim dense-mode vif

This command enables debugging of VIF handling.

The **no** variant of this command disables debugging of VIF handling.

Syntax

```
debug pim dense-mode vif
no debug pim dense-mode vif
```

Mode Privileged Exec and Global Configuration

Example

```
awplus# configure terminal
awplus(config)# debug pim dense-mode vif
```

Related Commands

debug pim dense-mode decode
debug pim dense-mode encode
debug pim dense-mode fsm
debug pim dense-mode mrt
debug pim dense-mode nexthop
debug pim dense-mode nsm

ip pim dense-mode

This command enables or disables PIM-DM operation from Interface mode on the current VLAN interface. This command also disables passive mode on the VLAN interface if passive mode has been enabled using an **ip pim dense-mode passive** command.

The **no** variant of this command disables all PIM-DM activities on the interface.

Syntax

```
ip pim dense-mode
no ip pim dense-mode
```

Mode Interface Configuration for a VLAN interface.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim dense-mode
```

ip pim dense-mode passive

This command enables PIM-DM passive mode operation from Interface mode on the current VLAN interface.

The **no** variant of this command disables passive mode.

Syntax

```
ip pim dense-mode passive
no ip pim dense-mode passive
```

Mode Interface Configuration for a VLAN interface.

Usage Configuring a VLAN interface as a passive PIM-DM interface indicates that the VLAN interface is connected to a stub network (i.e. a network that does not contain any PIM Routers). So, multicast streams that arrive on other PIM-DM interfaces can be routed to hosts on the passive PIM-DM interface, but no PIM neighbor relationships will be formed on the passive PIM-DM interface.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim dense-mode passive
```

ip pim ext-srcs-directly-connected (PIM-DM)

Use this command to configure PIM to treat all source traffic arriving on the interface as though it was sent from a host directly connected to the interface.

This is an alias entry and provides a brief description to the main **Chapter 54, PIM-SM Commands** - **ip pim ext-srcs-directly-connected (PIM-SM)** command on page 54.16.

ip pim hello-holdtime (PIM-DM)

This command configures a **hello-holdtime**. The PIM **hello-holdtime** on a VLAN interface is the period which the router will wait to receive a hello from neighbors on that interface. If the router does not receive a hello from a given neighbor within that period, then it will decide that the neighbor is no longer an active PIM Router, and will terminate the neighbor relationship.

You cannot configure a **hello-holdtime** value that is less than the current **hello-interval**. Each time the **hello-interval** is updated, the **hello-holdtime** is also updated, according to the following rules:

- If the **hello-holdtime** is not configured; or if the hello holdtime is configured and less than the current **hello-interval** value, it is modified to 3.5 times the **hello-interval** value.
- Otherwise, it retains the configured value.

Use the **no** variant of this command to return the hello-holdtime value to its default of 3.5 times the current hello-interval value.

Syntax

```
ip pim hello-holdtime <holdtime>
no ip pim hello-holdtime
```

Parameter	Description
<holdtime>	<1-65535> The holdtime value in seconds (no fractional seconds are accepted).

Mode Interface Configuration for a VLAN interface.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim hello-holdtime 123
```

ip pim hello-interval (PIM-DM)

This command configures a PIM **hello-interval** value. The PIM **hello-interval** on a VLAN interface is the period at which the router will transmit PIM hello messages on that interface.

When the **hello-interval** is configured, and the **hello-holdtime** is not configured, or when the configured **hello-holdtime** value is less than the new **hello-interval** value; the **hello-holdtime** value is modified to 3.5 times the **hello-interval** value. Otherwise, the **hello-holdtime** value is the configured value. The default is 30 seconds.

Use the **no** variant of this command to reset the **hello-interval** to the default.

Syntax

```
ip pim hello-interval <interval>
no ip pim hello-interval
```

Parameter	Description
<interval>	*<1-65535>* The value in seconds (no fractional seconds accepted).

Mode Interface Configuration for a VLAN interface.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim hello-interval 123
```

ip pim max-graft-retries

This command configures PIM-DM to send a limited number of Graft message retries, after which time the device will remove all information regarding the particular (Source, Group), or until the device receives an acknowledgment, whichever occurs first.

The **no** variant of this command configures PIM-DM to send Graft message retries until the device receives an acknowledgment, which is the default behavior.

Syntax

```
ip pim max-graft-retries <1-65535>
no pim max-graft-retries
```

Parameter	Description
`no`	Negate a command or set its defaults.
`ip`	Internet Protocol (IP).
`pim`	PIM Interface commands.
`max-graft-retries`	PIM Graft message retries.
<1-65535>	Graft message retries before ceasing Graft message retries.

Default By default, Graft retries are sent by PIM-DM until the device receives an acknowledgement.

Mode Interface Configuration for a VLAN interface.

Usage Graft messages are used to reduce the join latency when a previously pruned branch of the source tree must be grafted back, when a member joins the group after the PIM-DM device has sent a Prune message to prune unwanted traffic. Graft messages are the only PIM-DM messages that receive an acknowledgement.

If Graft messages were not used, then the member waiting for pruned off traffic would have to wait up to 3 minutes for the periodic re-flooding to occur to begin receiving multicast traffic again. By using Grafts, the Prune can be reversed much faster than waiting for periodic re-flooding to begin receiving multicast traffic again.

Examples To configure PIM-DM on the VLAN interface `vlan2` to send a maximum of 10 Graft message retries, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim max-graft-retries 10
```

To configure PIM-DM on the VLAN interface `vlan2` to send Graft message retries forever, which is the default behavior, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim max-graft-retries
```

Validation Commands

show ip mroute
show ip pim dense-mode mroute
show running-config

ip pim neighbor-filter (PIM-DM)

Enables filtering of neighbors on the VLAN interface. When configuring a neighbor filter, PIM-DM will either not establish adjacency with the neighbor, or terminate adjacency with the existing neighbors if denied by the filtering access list.

Use the **no** variant of this command to disable this function.

Syntax

```
ip pim neighbor-filter [<number>|<accesslist>]
no ip pim neighbor-filter [<number>|<accesslist>]
```

Parameter	Description
<number>	*<1-99>* Standard IP access list number.
<accesslist>	IP access list name.

Default By default, there is no filtering.

Mode Interface Configuration for a VLAN interface.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim neighbor-filter 14
```

ip pim propagation-delay

This command configures the PIM **propagation-delay** value. The PIM **propagation-delay** is the expected delay in the transfer of PIM messages across the VLAN interface that it is attached to.

Use the **no** variant of this command to return the **propagation-delay** to the default (1000 milliseconds).

Syntax

```
ip pim propagation-delay <delay>
no ip pim propagation-delay
```

Parameter	Description
<delay>	*<1000-5000>* The value in milliseconds. The default is 1000 milliseconds.

Default The propagation-delay is set to 1000 milliseconds by default.

Mode Interface Configuration for a VLAN interface.

Examples

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim propagation-delay 2000

awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim propagation-delay
```

ip pim state-refresh origination-interval

This command configures a PIM **state-refresh origination-interval** value. The origination interval is the number of seconds between PIM state refresh control messages. The default is 60 seconds.

Use the **no** variant of this command to return the origination interval to the default.

Syntax

```
ip pim state-refresh origination-interval <interval>
no ip pim state-refresh origination-interval
```

Parameter	Description
<interval>	*<1-100>* The integer value in seconds (no fractional seconds accepted). The default **state-refresh origination-interval** value is 60.

Default The state-refresh origination-interval is set to 60 seconds by default, and is reset using negation.

Mode Interface Configuration for a VLAN interface.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim state-refresh origination-interval 65
```

show debugging pim dense-mode

This command displays the status of the debugging of the system.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show debugging pim dense-mode`

Mode User Exec and Privileged Exec

Output **Figure 58-2: Example output from the show debugging pim dense-mode command**

```
PIM-DM Debugging status:
  PIM-DM VR-VRF Context debugging is off
  PIM-DM Decoder debugging is off
  PIM-DM Encoder debugging is off
  PIM-DM FSM debugging is off
  PIM-DM MRT debugging is off
  PIM-DM NHOP debugging is off
  PIM-DM NSM debugging is off
  PIM-DM VIF debugging is off
```

Related Commands **debug pim dense-mode all**

show ip pim dense-mode interface

This command displays the PIM-DM interface information.

For information on output options, see "Controlling "show" Command Output" on page 1.38.

Syntax `show ip pim dense-mode interface`

Mode User Exec and Privileged Exec

Example To display information about the PIM-DM interfaces, use the command:

```
awplus# show ip pim dense-mode interface
```

Output

Figure 58-3: Example output from the show ip pim dense-mode interface command

```
Total configured interfaces: 100   Maximum allowed: 100
Total active interfaces:     100

Address          Interface VIFIndex Ver/   Nbr
                                    Mode   Count

10.2.106.10      vlan1006  10       v2/D   0
10.2.107.10      vlan1007  11       v2/D   0
```

1. Only the top entries output by this command are shown in this example.

Table 58-1: Parameters in the output of the show ip pim dense-mode interface command

Parameter	Description
`Total configured interfaces`	The number of configured PIM Dense Mode interfaces.
`Maximum allowed`	The maximum number of PIM Dense Mode interfaces that can be configured.
`Total active interfaces`	The number of active PIM Dense Mode interfaces.
`Address`	Primary PIM-DM address.
`Interface`	Name of the PIM-DM interface.
`VIF Index`	The Virtual Interface index of the VLAN.
`Ver/Mode`	PIM version/Dense mode.
`Nbr Count`	Neighbor count of the PIM-DM interface.

Related Commands ip pim dense-mode
show ip pim dense-mode neighbor

show ip pim dense-mode interface detail

This command displays detailed information on a PIM-DM interface.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show ip pim dense-mode interface detail
```

Mode

User Exec and Privileged Exec

Example

```
awplus# show ip pim dense-mode interface detail
```

Output

Figure 58-4: Example output from the show ip pim dense-mode interface detail command

```
vlan2 (vif-id: 0):
  Address 192.168.1.53/24

  Hello period 30 seconds, Next Hello in 30 seconds
  Neighbors:
    192.168.1.152/32
    192.168.1.149/32
vlan3 (vif-id: 2):
  Address 192.168.10.53/24
  Hello period 30 seconds, Next Hello in 8 seconds
  Neighbors: none
```

show ip pim dense-mode mroute

This command displays the IP PIM-DM multicast routing table.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show ip pim dense-mode mroute
```

Mode

User Exec and Privileged Exec

Example

```
awplus# show ip pim dense-mode mroute
```

Output

Figure 58-5: Example output from the show ip pim dense-mode mroute command

```
PIM-DM Multicast Routing Table
(192.168.10.52, 224.1.1.1)
  Source directly connected on vlan3
  State-Refresh Originator State: Originator
  Upstream IF: vlan3, State: Forwarding
  Downstream IF List:
    vlan2, in 'olist':
      Downstream State: NoInfo
      Assert State: NoInfo
```

show ip pim dense-mode neighbor

This command displays PIM-DM neighbor information.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show ip pim dense-mode neighbor
```

Mode

User Exec and Privileged Exec

Usage

The total number of PIM-DM neighbors is restricted to 500 PIM-DM neighbors.

When the 500 PIM-DM neighbor limit is reached, as a result of receiving hello packets from new PIM-DM neighbors, a log entry will be issued to the log file in the below format:

```
<date> <time> <facility>.<severity> <program[<pid>]>: <message>
---------------------------------------------------------------
2008 Dec 10 00:58:39 user.err x900 PIM-DM[1150]: [VIF] Nbr
Create: Cannot create more than 500 neighbours - ignoring
neighbour 100.0.1.247/32 on vlan100
```

Example

```
awplus# show ip pim dense-mode neighbor
```

Output

Figure 58-6: Example output from the show ip pim dense-mode neighbor command

```
Total number of neighbors: 500
Neighbor-Address  Interface          Uptime/Expires    Ver
192.168.1.152     vlan2                17:15:42/00:01:28 v2
192.168.1.149     vlan2                17:15:34/00:01:34 v2
```

show ip pim dense-mode neighbor detail

This command displays detailed PIM-DM neighbor information.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show ip pim dense-mode neighbor detail
```

Mode

User Exec and Privileged Exec

Example

```
awplus# show ip pim dense-mode neighbor detail
```

Output

Figure 58-7: Example output from the show ip pim dense-mode neighbor detail command

```
Neighbor 192.168.1.152 (vlan2)
 Up since 17:16:20, Expires in 00:01:20
Neighbor 192.168.1.149 (vlan2)
 Up since 17:16:12, Expires in 00:01:26
```

show ip pim dense-mode nexthop

This command displays the nexthop information as used by PIM-DM. In the context of PIM-DM, the term '**nexthop**' refers to the nexthop router on the path back to the source address of a multicast stream.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show ip pim dense-mode nexthop
```

Mode User Exec and Privileged Exec

Example

```
awplus# show ip pim dense-mode nexthop
```

Output **Figure 58-8: Example output from the show ip pim dense-mode neighbor nexthop command**

```
Destination      Nexthop   Nexthop         Nexthop          Metric Pref
                 Num       Addr            Interface
192.168.10.52    1         0.0.0.0         vlan2            3      1
```

Table 58-2: Parameters in the output of the show ip pim dense-mode neighbor nexthop command

Parameter	Description
`Destination`	Destination address for which PIM-DM requires nexthop information.
`Nexthop Num`	Number of nexthops to the destination. PIM can only use one nexthop.
`Nexthop Addr`	Address of the current nexthop gateway.
`Nexthop Interface`	Name of the nexthop interface.
`Metric`	Metric of the route towards the destination.
`Preference`	Preference of the route towards the destination.

undebug all pim dense-mode

Use this command from the Global Configuration mode to disable all PIM-DM debugging.

Syntax `undebug all pim dense-mode`

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# undebug all pim dense-mode
```

MLD Introduction

Multicast Listener Discovery (MLD) is used to exchange membership status information between IPv6 routers that support multicasting and members of multicast groups on a network segment. Host membership in a multicast group is reported by individual member hosts, and membership status is periodically polled by multicast routers. For a general overview of multicasting, see **Chapter 50, Multicast Introduction and Commands**.

MLD is defined in RFC 2710, "Multicast Listener Discovery (MLD) for IPv6." and MLDv2 is defined in RFC 3810, "Multicast Listener Discovery Version 2 (MLDv2) for IPv6." AlliedWare Plus supports both RFC 2710 and RFC 3810 for MLD and MLDv2 respectively.

Note There is a 100 MLD interface limit when applying MLD commands to multiple VLANs. Only the first 100 VLANs have the required multicast structures added to the interfaces that allow multicast routing. x908 and x900 series switches have a 256 MLD group limit for (*, G) entries. See the limits for MLD interfaces depending on the number of VLANs, ports, static and dynamic groups as shown in the relevant product data sheet for your switch.

MLD requires memory for storing data structures, as well as the hardware tables to implement hardware routing. As the number of ports, VLANs, static and dynamic groups increases then more memory is consumed. You can track the memory used for MLD with the command:

```
awplus# show memory pools nsm | grep MLD
```

Static and dynamic groups (LACP), ports and VLANs are not limited for MLD. For VLANs, this allows you to configure MLD across more VLANs with fewer ports per VLAN, or fewer VLANs with more ports per VLAN. For LACPs, you can configure MLD across more LACP groups with fewer ports per LACP, or fewer LACP groups with more ports per LACP.

Sample running-config showing MLD configuration on interface vlan2

```
!
ipv6 forwarding
!
ipv6 multicast-routing
!
interface vlan2
  ipv6 address 2001:0db8::12:252/64
  ipv6 enable
  ipv6 mld
!
```

Note IPv6 must be enabled on an interface with the **ipv6 enable** command, IPv6 forwarding must be enabled globally for routing IPv6 with the **ipv6 forwarding** command, and IPv6 multicasting must be enabled globally with the **ipv6 multicast-routing** command before using PIM-SMv6 commands.

Note The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical networks (other than for testing purposes) nor should they appear on any public network.

Note

The IPv6 Multicast addresses shown can be derived from IPv6 unicast prefixes as per RFC 3306.The IPv6 unicast prefix reserved for documentation is 2001:0db8::/32 as per RFC 3849. Using the base /32 prefix the IPv6 multicast prefix for 2001:0db8::/32 is ff3x:20:2001:0db8::/64. Where an RP address is 2001:0db8::1 the embedded RP multicast prefix is ff7x:120:2001:0db8::/96. For ASM (Any-Source Multicast) the IPV6 multicast addresses allocated for documentation purposes are ff0x::0db8:0:0/96 as per RFC 6676. This is a /96 prefix so that it can be used with group IDs as per RFC 3307. These addresses should not be used for practical networks (other than for testing purposes), nor should they appear in any public network.

MLD Snooping

MLD Snooping is a feature whereby a Layer 2 switch listens to or "snoops" the MLD messages passing through the switch or from member hosts and multicast routers. The purpose of MLD Snooping is to provide efficient Layer 2 multicast forwarding, by sending only to hosts that have expressed an interest in receiving the multicast data.

Hosts express an interest in receiving multicast data for a given multicast group by sending an MLD join message. Without MLD Snooping, if one host expresses an interest in getting multicast data for a given group, by sending an MLD join for the multicast group, then all hosts connected to the same VLAN will also receive the multicast data. This wastes bandwidth on the switch ports connected to the host that are not interested in receiving the multicast data. Snooping takes note of exactly which ports have received joins for a given group, and send that group only to those ports.

MLD Snooping is enabled by default globally for the switch. It can be enabled and disabled on a per-VLAN basis.

MLD Snooping makes a distinction between Member ports, which are ports connected to members hosts, and Router ports, which are ports connected to, or directed towards, a Layer 3 router or a Layer 3 switch.

Figure 59-1: Sample running-config showing an MLD Snooping Querier set on vlan2

```
!
ipv6 mld snooping
!
interface vlan2
   ipv6 mld snooping querier
!
```

MLD Snooping Configuration Examples

For detailed information about the commands used to configure MLD Snooping, see **Chapter 59, MLD and MLD Snooping Introduction and Commands**.

The following examples configure MLD Snooping:

- **Enabling the MLD Snooping Querier on an interface**
- **Enabling MLD Snooping globally and on an interface**
- **Configuring a Multicast Router statically on an interface**
- **Enabling MLD Snooping Fast-Leave Processing on an interface**
- **Configuring MLD Snooping Report Suppression on an interface**

Enabling the MLD Snooping Querier on an interface

Use the MLD Snooping querier to support MLD Snooping in a VLAN where PIM-SMv6 and MLD are not configured and whenever you do not need to route IPv6 multicast traffic.

You can configure the switch to generate MLD queries on a VLAN interface if multicast routing is not enabled. For each VLAN that is connected to switches that use MLD Snooping to report multicast traffic, configure one switch as the MLD Snooping Querier.

To enable and show MLD Snooping Querier on VLAN interface `vlan2`, enter the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping querier
awplus(config-if)# exit
awplus(config)# exit
awplus# show ipv6 mld interface vlan2
```

Note that the MLD Snooping Querier is configured in Interface Configuration mode only. You cannot configure MLD Snooping Querier globally for all VLAN interfaces on a switch.

Enabling MLD Snooping globally and on an interface

To globally enable and show MLD Snooping on the switch, enter the commands:

```
awplus# configure terminal
awplus(config)# ipv6 mld snooping
awplus(config)# exit
awplus# show ipv6 mld interface
```

Note that entering `show ipv6 mld interface` without an optional interface parameter displays MLD information for all configured interfaces globally on the switch.

To enable and show MLD Snooping on VLAN interface `vlan2`, enter the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping
awplus(config-if)# exit
awplus(config)# exit
awplus# show ipv6 mld interface vlan2
```

Note that entering `show ipv6 mld interface vlan2` with the optional interface parameter displays MLD information for that specified configured interface on the switch.

Configuring a Multicast Router statically on an interface

To configure and show a static connection to a Multicast Router for VLAN interface `vlan2`, enter the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping mrouter interface port1.0.2
awplus(config-if)# exit
awplus(config)# exit
awplus# show ipv6 mld interface vlan2
```

Note the VLAN interface to the Multicast Router must be administratively up and the line protocol must be up to configure a static connection to a Multicast Router on the VLAN.

Enabling MLD Snooping Fast-Leave Processing on an interface

To enable and show MLD Snooping Fast-Leave Processing on VLAN interface `vlan2`, enter the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping fast-leave
awplus(config-if)# exit
awplus(config)# exit
awplus# show ipv6 mld interface vlan2
```

Configuring MLD Snooping Report Suppression on an interface

To enable and show MLD Snooping Report Suppression on VLAN interface `vlan2`, enter the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping report-suppression
awplus(config-if)# exit
awplus(config)# exit
awplus# show ipv6 mld interface vlan2
```

Command List

This chapter provides an alphabetical reference of configuration, clear, and show commands related to MLD and MLD Snooping.

The Multicast Listener Discovery (MLD) module includes the MLD Proxy service and MLD Snooping functionality. Some of the following commands may have commonalities and restrictions; these are described under the Usage section for each command.

Note

IPv6 must be enabled on an interface with the **ipv6 enable** command, IPv6 forwarding must be enabled globally for routing IPv6 with the **ipv6 forwarding** command, and IPv6 multicasting must be enabled globally with the **ipv6 multicast-routing** command before using PIM-SMv6 commands.

Note

The IPv6 Multicast addresses shown can be derived from IPv6 unicast prefixes as per RFC 3306.The IPv6 unicast prefix reserved for documentation is 2001:0db8::/32 as per RFC 3849. Using the base /32 prefix the IPv6 multicast prefix for 2001:0db8::/32 is ff3x:20:2001:0db8::/64. Where an RP address is 2001:0db8::1 the embedded RP multicast prefix is ff7x:120:2001:0db8::/96. For ASM (Any-Source Multicast) the IPV6 multicast addresses allocated for documentation purposes are ff0x::0db8:0:0/96 as per RFC 6676. This is a /96 prefix so that it can be used with group IDs as per RFC 3307. These addresses should not be used for practical networks (other than for testing purposes), nor should they appear in any public network.

Note

The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical networks (other than for testing purposes) nor should they appear on any public network.

clear ipv6 mld

Use this command to clear all MLD local memberships on all interfaces.

Syntax `clear ipv6 mld`

Mode Privileged Exec

Usage This command applies to interfaces configured for MLD Layer-3 multicast protocols and learned by MLD Snooping.

Example

```
awplus# clear ipv6 mld
```

Related Commands **clear ipv6 mld group**
clear ipv6 mld interface

clear ipv6 mld group

Use this command to clear MLD specific local-membership(s) on all interfaces, for a particular group.

Syntax `clear ipv6 mld group {*|<ipv6-address>}`

Parameter	Description
`*`	Clears all groups on all interfaces. This is an alias to the **clear ipv6 mld** command.
`<ipv6-address>`	Specify the group address for which MLD local-memberships are to be cleared from all interfaces. Specify the IPv6 multicast group address in the format in the format X:X::X:X.

Mode Privileged Exec

Usage This command applies to groups learned by MLD Layer-3 multicast protocols and by MLD Snooping.

Example

```
awplus# clear ipv6 mld group *
```

Related Commands **clear ipv6 mld**
clear ipv6 mld interface

clear ipv6 mld interface

Use this command to clear MLD interface entries.

Syntax `clear ipv6 mld interface <interface>`

Parameter	Description
`<interface>`	Specifies name of the interface; all groups learned from this interface are deleted.

Mode Privileged Exec

Usage This command applies to interfaces configured for MLD Layer-3 multicast protocols and learned by MLD Snooping.

Example

```
awplus# clear ipv6 mld interface vlan2
```

Related Commands **clear ipv6 mld**
clear ipv6 mld group

debug mld

Use this command to enable all MLD debugging modes, or a specific MLD debugging mode.

Use the **no** variant of this command to disable all MLD debugging modes, or a specific MLD debugging mode.

Syntax

```
debug mld {all|decode|encode|events|fsm|tib}
no debug mld {all|decode|encode|events|fsm|tib}
```

Parameter	Description
`all`	Debug all MLD.
`decode`	Debug MLD decoding.
`encode`	Debug MLD encoding.
`events`	Debug MLD events.
`fsm`	Debug MLD Finite State Machine (FSM).
`tib`	Debug MLD Tree Information Base (TIB).

Mode Privileged Exec and Global Configuration

Usage This command applies to interfaces configured for MLD Layer-3 multicast protocols and learned by MLD Snooping.

Examples

```
awplus# configure terminal
awplus(config)# debug mld all

awplus# configure terminal
awplus(config)# debug mld decode

awplus# configure terminal
awplus(config)# debug mld encode

awplus# configure terminal
awplus(config)# debug mld events
```

Output

```

Related Commands **show debugging mld**

ipv6 mld

Use this command to enable the MLD protocol operation on an interface. This command enables MLD protocol operation in stand-alone mode, and can be used to learn local-membership information prior to enabling a multicast routing protocol on the interface.

Use the **no** variant of this command to return all MLD related configuration to the default (including MLD Snooping).

Note

There is a 100 MLD interface limit when applying MLD commands to multiple VLANs. Only the first 100 VLANs have the required multicast structures added to the interfaces that allow multicast routing. SBx908 and x900 series switches have a 256 MLD group limit for (*, G) entries. See the limits for MLD interfaces depending on the number of VLANs, ports, static and dynamic groups as shown in the relevant product data sheet for your switch.

Syntax

```
ipv6 mld
no ipv6 mld
```

Default MLD is disabled by default.

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage MLD requires memory for storing data structures, as well as the hardware tables to implement hardware routing. As the number of ports, VLANs, static and dynamic groups increases then more memory is consumed. You can track the memory used for MLD with the command:

```
awplus# show memory pools nsm | grep MLD
```

Static and dynamic groups (LACP), ports and VLANs are not limited for MLD. For VLANs, this allows you to configure MLD across more VLANs with fewer ports per VLAN, or fewer VLANs with more ports per VLAN. For LACPs, you can configure MLD across more LACP groups with fewer ports per LACP, or fewer LACP groups with more ports per LACP.

Example

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan1
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld
```

ipv6 mld access-group

Use this command to control the multicast local-membership groups learned on an interface.

Use the **no** variant of this command to disable this access control.

Syntax

```
ipv6 mld access-group <IPv6-access-list-name>
no ipv6 mld access-group
```

Parameter	Description
<IPv6-access-list-name>	Specify a Standard or an Extended software IPv6 access-list name. See **Chapter 64, IPv6 Software Access Control List (ACL) Commands** for supported IPv6 ACLs.

Default No access list is configured by default.

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Examples In the following example, the VLAN interface `vlan2` will only accept MLD joins for groups in the range `ff1e:0db8:0001::/64`:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 access-list standard group1 permit
ff1e:0db8:0001::/64
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld access-group group1
```

In the following example, the VLAN interfaces `vlan2-vlan4` will only accept MLD joins for groups in the range `ff1e:0db8:0001::/64`:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 access-list standard group1 permit
ff1e:0db8:0001::/64
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld access-group group1
```

ipv6 mld immediate-leave

Use this command to minimize the leave latency of MLD memberships.

Use the **no** variant of this command to disable this feature.

Syntax

```
ipv6 mld immediate-leave group-list <IPv6-access-list-name>
no ipv6 mld immediate-leave
```

Parameter	Description
<IPv6-access-list-name>	Specify a Standard or an Extended software IPv6 access-list name that defines multicast groups in which the immediate leave feature is enabled. See **Chapter 64, IPv6 Software Access Control List (ACL) Commands** for supported IPv6 ACLs.

Default Disabled

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Example The following example shows how to enable the immediate-leave feature on an interface for a specific range of multicast groups. In this example, the router assumes that the group access-list consists of groups that have only one node membership at a time per interface:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld immediate-leave v6grp
awplus(config-if)# exit
```

Related Commands **ipv6 mld last-member-query-interval**

ipv6 mld last-member-query-count

Use this command to set the last-member query-count value.

Use the **no** variant of this command to return to the default on an interface.

Syntax

```
ipv6 mld last-member-query-count <value>
no ipv6 mld last-member-query-count
```

Parameter	Description
<value>	Count value. Valid values are from `2 to 7`.

Default The default last-member query-count value is 2.

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Example

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld last-member-query-count 3
```

ipv6 mld last-member-query-interval

Use this command to configure the interval at which the router sends MLD group-specific host query messages.

Use the **no** variant of this command to set this frequency to the default.

Syntax

```
ipv6 mld last-member-query-interval <milliseconds>
no ipv6 mld last-member-query-interval
```

Parameter	Description
<milliseconds>	The time delay between successive query messages (in milliseconds). Valid values are from 1000 to 25500 milliseconds.

Default 1000 milliseconds

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Example The following example changes the MLD group-specific host query message interval to 2 seconds:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld last-member-query-interval 2000
```

Related Commands ipv6 mld immediate-leave

ipv6 mld limit

Use this command to configure a limit on the maximum number of group memberships that may be learned. The limit may be set for the switch as a whole, or for a specific interface.

Once the specified group membership limit is reached, all further local-memberships will be ignored.

Optionally, an exception access-list can be configured to specify the group-address(es) that are exempted from being subject to the limit.

Use the **no** variant of this command to unset the limit and any specified exception access-list.

Syntax

```
ipv6 mld limit <limitvalue> [except <IPv6-access-list-name>]
no ipv6 mld limit
```

Parameter	Description
<limitvalue>	<2-512> Maximum number of group membership states.
<IPv6-access-list-name>	Specify a Standard or an Extended software IPv6 access-list name that defines multicast groups, which are exempted from being subject to the configured limit. See **Chapter 64, IPv6 Software Access Control List (ACL) Commands** for supported IPv6 ACLs.

Default The default limit, which is reset by the **no** variant of this command, is the same as maximum number of group membership entries that can be learned with the **ipv6 mld limit** command.

The default limit of group membership entries that can be learned is 512 entries.

Mode Global Configuration and Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage This command applies to interfaces configured for MLD Layer-3 multicast protocols and learned by MLD Snooping.

Examples The following example configures an MLD limit of 100 group-memberships across all VLAN interfaces on which MLD is enabled, and excludes groups in the range `ff1e:0db8:0001::/64` from this limitation:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 access-list standard v6grp permit
ff1e:0db8:0001::/64
awplus(config)# ipv6 mld limit 100 except v6grp
```

The following example configures an MLD limit of 100 group-membership states on the VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld limit 100
```

The following example configures an MLD limit of 100 group-membership states on the VLAN interfaces `vlan2-vlan4`:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld limit 100
```

Related Commands **show ipv6 mld groups**

ipv6 mld querier-timeout

Use this command to configure the timeout period before the router takes over as the querier for the interface after the previous querier has stopped querying.

Use the **no** variant of this command to restore the default.

Syntax

```
ipv6 mld querier-timeout <seconds>
no ipv6 mld querier-timeout
```

Parameter	Description
<seconds>	Number of seconds that the router waits after the previous querier has stopped querying before it takes over as the querier. Valid values are from `2 to 65535 seconds`.

Default 255 seconds

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage This command applies to interfaces configured for MLD Layer-3 multicast protocols.

Example The following example configures the router to wait 120 seconds from the time it received the last query before it takes over as the querier for the interface:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld querier-timeout 120
```

Related Commands ipv6 mld query-interval

ipv6 mld query-interval

Use this command to configure the frequency of sending MLD host query messages.

Use the **no** variant of this command to return to the default frequency.

Syntax

```
ipv6 mld query-interval <seconds>
no ipv6 mld query-interval
```

Parameter	Description
<seconds>	Variable that specifies the time delay between successive MLD host query messages (in seconds). Valid values are from `1 to 18000 seconds`.

Default The default query interval is 125 seconds.

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage This command applies to interfaces configured for MLD Layer-3 multicast protocols.

Example The following example changes the frequency of sending MLD host-query messages to 2 minutes:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld query-interval 120
```

Related Commands ipv6 mld querier-timeout

ipv6 mld query-max-response-time

Use this command to configure the maximum response time advertised in MLD queries.

Use the **no** variant of with this command to restore the default.

Syntax

```
ipv6 mld query-max-response-time <seconds>
no ipv6 mld query-max-response-time
```

Parameter	Description
<seconds>	Maximum response time (in seconds) advertised in MLD queries. Valid values are from 1 to 240 seconds.

Default 10 seconds

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage This command applies to interfaces configured for MLD Layer-3 multicast protocols.

Example The following example configures a maximum response time of 8 seconds:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld query-max-response-time 8
```

ipv6 mld robustness-variable

Use this command to change the robustness variable value on an interface.

Use the **no** variant of this command to return to the default on an interface.

Syntax

```
ipv6 mld robustness-variable <value>
no ipv6 mld robustness-variable
```

Parameter	Description
<value>	Valid values are from `1 to 7`.

Default The default robustness variable value is 2.

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage This command applies to interfaces configured for MLD Layer-3 multicast protocols.

Example

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld robustness-variable 3
```

ipv6 mld snooping

Use this command to enable MLD Snooping. When this command is issued in the Global Configuration mode, MLD Snooping is enabled globally for the switch. When this command is issued in Interface mode for a VLAN then MLD Snooping is enabled for the specified VLAN. Note that MLD Snooping is enabled on the VLAN only if it is enabled globally and on the VLAN.

Use the **no** variant of this command to globally disable MLD Snooping in Global Configuration mode, or for the specified VLAN interface in Interface mode.

Note

There is a 100 MLD interface limit when applying MLD commands to multiple VLANs. Only the first 100 VLANs have the required multicast structures added to the interfaces that allow multicast routing. x908 and x900 series switches have a 256 MLD group limit for (*, G) entries. See the limits for MLD interfaces depending on the number of VLANs, ports, static and dynamic groups as shown in the relevant product data sheet for your switch.

Syntax

```
ipv6 mld snooping

no ipv6 mld snooping
```

Default By default, MLD Snooping is enabled both globally and on all VLANs.

Mode Global Configuration and Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage For MLD Snooping to operate on particular VLAN interfaces, it must be enabled both globally by using this command in Global Configuration mode, and on individual VLAN interfaces by using this command in Interface Configuration mode (Both are enabled by default).

MLD requires memory for storing data structures, as well as the hardware tables to implement hardware routing. As the number of ports, VLANs, static and dynamic groups increases then more memory is consumed. You can track the memory used for MLD with the command:

```
awplus# show memory pools nsm | grep MLD
```

Static and dynamic groups (LACP), ports and VLANs are not limited for MLD. For VLANs, this allows you to configure MLD across more VLANs with fewer ports per VLAN, or fewer VLANs with more ports per VLAN. For LACPs, you can configure MLD across more LACP groups with fewer ports per LACP, or fewer LACP groups with more ports per LACP.

Examples To configure MLD Snooping on the VLAN interface `vlan2`, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping
```

To configure MLD Snooping on the VLAN interfaces `vlan2-vlan4`, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 mld snooping
```

To disable MLD Snooping for the VLAN interface `vlan2`, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config)# no ipv6 mld snooping
```

To disable MLD Snooping for the VLAN interfaces `vlan2-vlan4`, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config)# no ipv6 mld snooping
```

To configure MLD Snooping globally for the switch, enter the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 mld snooping
```

To disable MLD Snooping globally for the switch, enter the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 mld snooping
```

ipv6 mld snooping fast-leave

Use this command to enable MLD Snooping fast-leave processing. Fast-leave processing is analogous to immediate-leave processing; the MLD group-membership is removed as soon as an MLD leave group message is received, without sending out a group-specific query.

Use the **no** variant of this command to disable fast-leave processing.

Syntax

```
ipv6 mld snooping fast-leave
no ipv6 mld snooping fast-leave
```

Default MLD Snooping fast-leave processing is disabled.

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage This MLD Snooping command can only be configured on VLAN interfaces.

Examples This example shows how to enable fast-leave processing on the VLAN interface `vlan2`.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping fast-leave
```

This example shows how to enable fast-leave processing on the VLAN interface `vlan2-vlan4`.

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 mld snooping fast-leave
```

ipv6 mld snooping mrouter

Use this command to statically configure the specified port as a Multicast Router interface for MLD Snooping within the specified VLAN.

See detailed usage notes below to configure static multicast router ports when using static IPv6 multicast routes with EPSR, and the destination VLAN is an EPSR data VLAN.

Use the **no** variant of this command to remove the static configuration of the interface as a Multicast Router interface.

Syntax

```
ipv6 mld snooping mrouter interface <port>
no ipv6 mld snooping mrouter interface <port>
```

Parameter	Description
<port>	Specify the name of the port.

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage This MLD Snooping command statically configures a switch port as a Multicast Router interface.

Note that if static IPv6 multicast routing is being used with EPSR and the destination VLAN is an EPSR data VLAN, then multicast router (mrouter) ports must be statically configured. This minimizes disruption for multicast traffic in the event of ring failure or restoration.

When configuring the EPSR data VLAN, statically configure mrouter ports so that the multicast router can be reached in either direction around the EPSR ring.

For example, if `port1.0.1` and `port1.0.14` are ports on an EPSR data VLAN `vlan101`, which is the destination for a static IPv6 multicast route, then configure both ports as multicast router (mrouter) ports as shown in the example commands listed below:

Output **Figure 59-2: Example ipv6 mld snooping mrouter commands when static IPv6 multicast routing is being used and the destination VLAN is an ESPR data VLAN:**

```
awplus>enable
awplus#configure terminal
awplus(config)#interface vlan101
awplus(config-if)#ipv6 mld snooping mrouter interface port1.0.1
awplus(config-if)#ipv6 mld snooping mrouter interface port1.0.14
```

Examples This example shows how to specify the next-hop interface to the multicast router for VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping mrouter interface
port1.0.5
```

This example shows how to specify the next-hop interface to the multicast router for VLAN interfaces `vlan2-vlan4`:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 mld snooping mrouter interface
port1.0.5
```

Related Commands **ipv6 multicast route**

ipv6 mld snooping querier

Use this command to enable MLD querier operation on a subnet (VLAN) when no multicast routing protocol is configured in the subnet (VLAN). When enabled, the MLD Snooping querier sends out periodic MLD queries for all interfaces on that VLAN.

Use the **no** variant of this command to disable MLD querier configuration.

Syntax

```
ipv6 mld snooping querier
no ipv6 mld snooping querier
```

Mode Interface Configuration for a specified VLAN interface.

Usage This command can only be configured on a single VLAN interface - not on multiple VLANs.

The MLD Snooping querier uses the 0.0.0.0 Source IP address because it only masquerades as an MLD querier for faster network convergence.

The MLD Snooping querier does not start, or automatically cease, the MLD Querier operation if it detects query message(s) from a multicast router. It restarts as an MLD Snooping querier if no queries are seen within the other querier interval.

Do not enable MLD Snooping querier if you have already enabled MLD on your device. Do not enable MLD Snooping querier on your device and then enable MLD afterwards.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping querier
```

ipv6 mld snooping report-suppression

Use this command to enable report suppression from hosts for Multicast Listener Discovery version 1 (MLDv1) on a VLAN in Interface Configuration mode.

Use the **no** variant of this command to disable report suppression on a VLAN in Interface Configuration mode.

Syntax

```
ipv6 mld snooping report-suppression
no ipv6 mld snooping report-suppression
```

Default Report suppression does not apply to MLDv2, and is turned on by default for MLDv1 reports.

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage This MLD Snooping command can only be configured on VLAN interfaces.

MLDv1 Snooping maybe configured to suppress reports from hosts. When a querier sends a query, only the first report for particular set of group(s) from a host will be forwarded to the querier by the MLD Snooping switch. Similar reports (to the same set of groups) from other hosts, which would not change group memberships in the querier, will be suppressed by the MLD Snooping switch to prevent 'flooding' of query responses.

Examples This example shows how to enable report suppression for MLD reports on VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping report-suppression
```

This example shows how to disable report suppression for MLD reports on VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 mld snooping report-suppression
```

This example shows how to enable report suppression for MLD reports on VLAN interfaces `vlan2-vlan4`:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 mld snooping report-suppression
```

This example shows how to disable report suppression for MLD reports on VLAN interfaces `vlan2-vlan4`:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# no ipv6 mld snooping report-suppression
```

ipv6 mld static-group

Use this command to statically configure IPv6 group membership entries on an interface. To statically add only a group membership, do not specify any parameters.

Use the **no** variant of this command to delete static group membership entries.

Syntax

```
ipv6 mld static-group <ipv6-group-address>
   [source <ipv6-source-address>|ssm-map] [interface <port>]

no ipv6 mld static-group <ipv6-group-address>
   [source <ipv6-source-address>|ssm-map] [interface <port>]
```

Parameter	Description
<ipv6-group-address>	Specify a standard IPv6 Multicast group address to be configured as a static group member. The IPv6 address uses the format X:X::X:X.
<ipv6-source-address>	Optional. Specify a standard IPv6 source address to be configured as a static source from where multicast packets originate. The IPv6 address uses the format X:X::X:X.
ssm-map	Mode of defining SSM mapping. SSM mapping statically assigns sources to MLDv1 groups to translate these (*,G) groups' memberships to (S,G) memberships for use with PIM-SSM.
<port>	Optional. Physical interface. This parameter specifies a physical port. If this parameter is used, the static configuration is applied to just to that physical interface. If this parameter is not used, the static configuration is applied on all ports in the VLAN.

Mode Interface Configuration for a VLAN interface.

Usage This command applies to MLD Snooping on a VLAN interface to statically add groups and/or source records.

Examples The following examples show how to statically add group and/or source records for MLD:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ff1e::10

awplus # configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ff1e::10 source
fe80::2fd:6cff:fe1c:b
```

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ff1e::10 source
ssm-map
```

The following examples show how to statically add group and/or source records for MLD Snooping on VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ff1e::10
```

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ff1e::10 source
fe80::2fd:6cff:fe1c:b
```

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ff1e::10 source
ssm-map
```

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ff1e::10 interface
port1.0.8
```

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ff1e::10 source
fe80::2fd:6cff:fe1c:b interface port1.0.8
```

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ff1e::10 source
ssm-map interface port1.0.8
```

ipv6 mld version

Use this command to set the current MLD protocol version on an interface.

Use the **no** variant of this command to return to the default version on an interface.

Syntax

```
ipv6 mld version <version>
no ipv6 mld version
```

Parameter	Description
<version>	MLD protocol version number. Valid version numbers are 1 and 2

Default The default MLD protocol version number is 2.

Mode Interface Configuration for a VLAN interface.

Usage This command applies to interfaces configured for MLD Layer-3 multicast protocols, MLD Snooping. Note this command is intended for use where there is another querier (when there is another device with MLD enabled) on the same link that can only operate with MLD version 1. Otherwise, the default MLD version 2 is recommended for performance.

Example

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld version 1
```

show debugging mld

Use this command to display the MLD debugging modes enabled with the **debug mld** command.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show debugging mld
```

Mode

Privileged Exec

Example

```
awplus# show debugging mld
```

Output

```
show debugging mld
MLD Debugging status:
  MLD Decoder debugging is on
  MLD Encoder debugging is on
  MLD Events debugging is on
  MLD FSM debugging is on
  MLD Tree-Info-Base (TIB) debugging is on
```

Related Commands

debug mld

show ipv6 mld groups

Use this command to display the multicast groups with receivers directly connected to the router, and learned through MLD.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show ipv6 mld groups [<ipv6-address> |<interface>] [detail]
```

Parameter	Description
<ipv6-address>	Optional. Specify Address of the multicast group in format X:X::X:X.
<interface>	Optional. Specify the Interface name for which to display local information.

Mode User Exec and Privileged Exec

Examples The following command displays local-membership information for all interfaces:

```
awplus# show ipv6 mld groups
```

Output

```
MLD Connected Group Membership
Group Address Interface  Uptime  Expires Last Reporter
ff08::1     port2.0.1 00:00:24 stopped fe80::eecd:6dff:fe6b:4783
```

The following command displays local-membership information for all interfaces:

```
awplus# show ipv6 mld groups detail
```

Output

```
MLD Connected Group Membership Details for port2.0.1
Interface:      port2.0.1
Group:          ff08::1
Uptime:         00:00:13
Group mode:     Include ()
Last reporter:  fe80::eecd:6dff:fe6b:4783
Group source list: (R - Remote, M - SSM Mapping, S - Static )
  Source Address                Uptime    v2 Exp    Fwd  Flags
  2001:db8::1                   00:00:13  00:04:07  Yes  R
  2002:db8::3                   00:00:13  00:04:07  Yes  R
```

show ipv6 mld interface

Use this command to display the state of MLD and MLD Snooping for a specified interface, or all interfaces.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show ipv6 mld interface [<interface>]`

Parameter	Description
<interface>	Interface name.

Mode User Exec and Privileged Exec

Example The following command displays MLD interface status on all interfaces enabled for MLD:

```
awplus# show ipv6 mld interface
```

Output

```
awplus#show ipv6 mld interface
Interface vlan1 (Index 301)
 MLD Enabled, Active, Querier, Version 2 (default)
 Internet address is fe80::215:77ff:fec9:7468
 MLD interface has 0 group-record states
 MLD activity: 0 joins, 0 leaves
 MLD robustness variable is 2
 MLD last member query count is 2
 MLD query interval is 125 seconds
 MLD querier timeout is 255 seconds
 MLD max query response time is 10 seconds
 Last member query response interval is 1000 milliseconds
 Group Membership interval is 260 seconds
 MLD Snooping is globally enabled
 MLD Snooping is enabled on this interface
 MLD Snooping fast-leave is not enabled
 MLD Snooping querier is enabled
 MLD Snooping report suppression is enabled
```

show ipv6 mld snooping mrouter

Use this command to display the multicast router interfaces, both configured and learned, in a VLAN. If you do not specify a VLAN interface then all the VLAN interfaces are displayed.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show ipv6 mld snooping mrouter [<interface>]`

Parameter	Description
<interface>	Optional. Specify the name of the VLAN interface. Note: If you do not specify a single VLAN interface, then all VLAN interfaces are shown.

Mode User Exec and Privileged Exec

Examples The following command displays the multicast router interfaces in `vlan2`:

```
awplus# show ipv6 mld snooping mrouter vlan2
```

Output

```
awplus#show ipv6 mld snooping mrouter vlan2
VLAN    Interface    Static/Dynamic
2       port1.0.2    Dynamically Learned
2       port1.0.3    Dynamically Learned
```

The following command displays the multicast router interfaces for all VLAN interfaces:

```
awplus# show ipv6 mld snooping mrouter
```

Output

```
awplus#show ipv6 mld snooping mrouter
VLAN    Interface    Static/Dynamic
2       port1.0.2    Dynamically Learned
2       port1.0.3    Dynamically Learned
3       port1.0.4    Statically Assigned
3       port1.0.5    Statically Assigned
```

show ipv6 mld snooping statistics

Use this command to display MLD Snooping statistics data.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show ipv6 mld snooping statistics interface <interface>`

Parameter	Description
<interface>	The name of the VLAN interface.

Mode User Exec and Privileged Exec

Example The following command displays MLDv2 statistical information for `vlan1`:

```
awplus# show ipv6 mld snooping statistics interface vlan1
```

Output

```
awplus#show ipv6 mld snooping statistics interface vlan1
MLD Snooping statistics for vlan1
Interface:      port2.0.1
Group:          ff08::1
Uptime:         00:02:18
Group mode:     Include ()
Last reporter:  fe80::eecd:6dff:fe6b:4783
Group source list: (R - Remote, M - SSM Mapping, S - Static )
  Source Address       Uptime    v2 Exp    Fwd  Flags
  2001:db8::1          00:02:18  00:02:02  Yes  R
  2001:db8::3          00:02:18  00:02:02  Yes  R
```

Introduction

This chapter describes Access Control Lists (ACLs), and general ACL configuration information.

See **Chapter 61, IPv4 Hardware Access Control List (ACL) Commands** and **Chapter 63, IPv6 Hardware Access Control List (ACL) Commands** for detailed command information and command examples about IPv4 and IPv6 hardware ACLs that are applied directly to interfaces.

See **Chapter 62, IPv4 Software Access Control List (ACL) Commands** and **Chapter 64, IPv6 Software Access Control List (ACL) Commands** for detailed command information and command examples about IPv4 and IPv6 software ACLs as applied to Routing and Multicasting.

See all relevant Routing commands and configurations in **"Layer Three, Switching and Routing"** and all relevant Multicast commands and configurations in **"Multicast Applications"**.

Overview

An Access Control List (ACL) is one filter, or a sequence of filters, that are applied to an interface to either block, pass, or when using QoS, apply priority to, packets that match the filter definitions. ACLs are used to restrict network access by hosts and devices and to limit network traffic.

An ACL contains an ordered list of filters. Each filter specifies either permit or deny and a set of conditions the packet must satisfy in order to match the filter. The meaning of permit or deny entries depends on the context in which the ACL is used - either on an inbound or an outbound interface.

When a packet is received on an interface, the switch compares fields in the packet against filters in the ACL to check whether the packet has permission to be forwarded, based on the filter properties. The first match determines whether the switch accepts or rejects the packets. If no entries match, the switch rejects the packets. If there are no restrictions, the switch forwards the packets.

Because filters in an ACL are applied sequentially and their action stops at the first match, it is very important that you apply the filters in the correct order. For example you might want to pass all traffic from VLAN 4 except for that arriving from two selected addresses A and B. Setting up a filter that first passes all traffic from VLAN 4 then denies traffic from addresses A and B will not filter out traffic from A and B if they are members VLAN 4. To ensure that the traffic from A and B is always blocked you should first apply the filter to block traffic from A and B, then apply the filter to allow all traffic from VLAN 4.

You can assign sequence numbers to filters. See **"ACL Filter Sequence Numbers" on page 60.17** for more information.

ACL Rules

- The source or destination address or the protocol of each packet being filtered are tested against the filters in the ACL, one condition at a time (for a permit or a deny filter).
- If a packet does not match a filter then the packet is checked against the next filter in the ACL.
- If a packet and a filter match, the subsequent filters in the ACL are not checked and the packet is permitted or denied as specified in the matched filter.
- The first filter that the packet matches determines whether the packet is permitted or denied. After the first match, no subsequent filters are considered.
- If the ACL denies the address or protocol then the software discards the packet.
- For software ACLs, if no filters match then the packet is dropped.
- For hardware ACLs, if no filters match then the packet is forwarded.
- Checking stops after the first match, so the order of the filters in the ACL is critical. The same permit or deny filter specified in a different order could result in a packet being passed in one situation and denied in another situation.
- One ACL per interface, per protocol, per direction is allowed. However, each ACL assigned per interface, per protocol, per direction may also have multiple filters.
- For inbound ACLs, a permit filter continues to process the packet after receiving it on an inbound interface, and a deny filter discards the packet.

ACL Source and Destination Addresses

Configure source addresses in ACL filters to filter packets coming **from** specified networking devices or hosts. Configure destination addresses in ACL filters to filter packets going **to** specified networking devices or hosts.

ACL Reverse Masking

ACLs uses reverse masking, also referred to as wildcard masking, to indicate to the switch whether to check or ignore corresponding IP address bits when comparing the address bits in an ACL filter to a packet being submitted to the ACL.

Reverse masking for IP address bits specify how the switch treats the corresponding IP address bits. A reverse mask is also called an inverted mask because a 1 and 0 mean the opposite of what they mean in a subnet or a network mask.

- A reverse mask bit 0 means check the corresponding bit value.
- A reverse mask bit 1 means ignore the corresponding bit value.

Hardware and Software ACL Types

Access Control Lists (ACLs) used in AlliedWare Plus™ are separated into two different types, **Software ACLs** and **Hardware ACLs**. You can define both types as either named or numbered.

Note

The filtering principles applied to software ACLs (those in the range 1 to 2699) are different to those applied to hardware ACLs (those in the range 3000 to 4699).
Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.
Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

Numbered ACLs (for Hardware and Software ACLs)

Numbered ACLs are assigned an ACL number within the range 1 to 4699. ACL numbers are grouped into ranges, where each range denotes a specific functionality. The following table shows the number ranges and functionality that your switch supports.

Table 60-1: ACL Numeric Ranges and Functionality

ACL Number Range	Function
1 to 99	IP standard ACL [1]
100 to 199	IP extended ACL [1]
1300 to 1999	IP standard expanded ACL [1]
2000 to 2699	IP extended expanded ACL [1]
3000 to 3699	Hardware IP ACL
4000 to 4699	Hardware MAC ACL

1. **Software ACLs that use either the ranges 1-99, 100-199, 1300-1999, 2000-2699, or are named ACLs (that use the standard or extended keyword followed by a text string), are used in features such as SNMP, IGMP and OSPF.**

Hardware ACLs

These ACL types are applied directly to an interface, or are used for QoS classifications. They use the following ranges:

- 3000-3699 for Hardware IP ACLs
- 4000-4699 for Hardware MAC ACLs
- named hardware IPv4 ACLs
- named hardware IPv6 ACLs

See **Chapter 61, IPv4 Hardware Access Control List (ACL) Commands** and **Chapter 63, IPv6 Hardware Access Control List (ACL) Commands** for detailed command information and command examples about IPv4 and IPv6 hardware ACLs that are applied directly to interfaces.

Software ACLs

These ACLs types can be either named ACLs, using the standard or extended keyword followed by a text string, or they can use the following ranges:

- 1-99 (IP standard ACL range)
- 100-199 (IP extended ACL range)
- 1300-1999 (IP standard expanded ACL range)
- 2000-2699 (IP extended expanded ACL range)
- named standard IPv4 ACLs
- named extended IPv4 ACLs
- named standard IPv6 ACLs
- named extended IPv6 ACLs

Software ACLs are used in features such as SNMP, PIM, IGMP and OSPF.

See **Chapter 62, IPv4 Software Access Control List (ACL) Commands** and **Chapter 64, IPv6 Software Access Control List (ACL) Commands** for detailed command information and command examples about IPv4 and IPv6 software ACLs as applied to Routing and Multicasting. See all relevant Routing commands and configurations in **"Layer Three, Switching and Routing"** and all relevant Multicast commands and configurations in **"Multicast Applications"**.

Defining Hardware MAC ACLs

These are used to filter traffic based on specific source or destination MAC addresses contained within the data frames. They can be applied to ports in the form of access groups.

A MAC access list requires the following components:

- an ACL number in the range 4000-4699
- an action, permit, deny etc. See **"Actions for Hardware ACLs" on page 60.7**
- a source MAC address. You can use the format, HHHH.HHHH.HHHH to filter on a specific MAC address (where H is a hexadecimal number), or you can filter on any source MAC address by entering the word "any".
- a source MAC mask. This mask determines which portion of the source MAC address header will be compared with that found in the incoming packets. The mask is configured in the format <HHHH.HHHH.HHHH> where each H is a hexadecimal number. In practice each hex number will normally be either 0 (to represent a match) or F (to represent a don't care condition). A mask is not required if the source address is specified as "any".
- a destination MAC address. You can use the format, HHHH.HHHH.HHHH to filter on a specific MAC address (where H is a hexadecimal number), or you can filter on any destination MAC address by entering the word "any".
- a destination MAC mask. This mask determines which portion of the destination MAC address header will be compared with that found in the incoming packets. The mask is configured in the format <HHHH.HHHH.HHHH> where each H is a hexadecimal number. In practice each hex number will normally be either 0 (to represent a match) or F (to represent a don't care condition). A mask is not required if the source address is specified as "any".

Example To permit packets coming from a specific MAC address of 0030.841A.1234 and with any destination address:

```
awplus# configure terminal
awplus(config)# access-list 4000 permit 0030.841A.1234
0000.0000.0000 any
```

Defining Hardware IP ACLs

These are used to filter traffic based on specific source or destination IP addresses contained within the data frames. They can be applied to ports in the form of access groups.

An IP access list requires the following components:

- an ACL number in the range 3000-3699
- an action, see **"Actions for Hardware ACLs" on page 60.7**
- a packet type:
  - « IP: This matches any type of IP packet. A source and destination address must also be specified, although they can be "any".
  - « ICMP: This matches ICMP packets. A source and destination address must also be specified, although they can be "any". An ICMP type can optionally be specified after the destination address.
  - « TCP: This matches TCP packets. A source and destination address must also be specified, although they can be "any". After the source address, a source port can optionally be specified and after the destination address a destination port can optionally be specified. The port matching can be done using **eq** (equal to), **gt** (greater than), **lt** (less than), **ne** (not equal to), or **range** (for a range of ports, which requires a start port and an end port).
  - « UDP: This matches UDP packets and has the same options as TCP.
  - « proto: This allows any IP protocol type to be specified (e.g. 89 for OSPF). A source and destination address must be also specified, although they can be "any".

For example, to match (and permit) any type of IP packet containing a destination address of 192.168.1.1

```
awplus(config)# access-list 3000 permit ip any 192.168.1.1/32
```

To match (and permit) an ICMP packet with a source address of 192.168.x.x and an ICMP code of 4

```
awplus(config)# access-list 3001 permit icmp 192.168.0.0/16
any icmp-type 4
```

To match a TCP packet with a source address of 192.168.x.x, source port of 80 and a destination port from 100 to 150:

```
awplus(config)# access-list 3002 permit tcp 192.168.0.0/16 eq
80 any range 100 150
```

To match a UDP packet with a source address of 192.168.x.x, a destination address of 192.168.1.x, and a destination port greater than 80:

```
awplus(config)# access-list 3003 permit udp 192.168.0.0/16
                192.168.1.0/24 gt 80
```

To match to any OSPF packet:

```
awplus(config)# access-list 3004 permit proto 89 any any
```

Note that an IP address mask can be specified using either of the following notations:

- "A.B.C.D/M": This is the most common; e.g. 192.168.1.0/24
- "A.B.C.D A.B.C.D": 192.168.1.1 0.0.0.0 is the same as 192.168.1.1/32 and 192.168.1.1 255.255.255.255 is the same as "any"
- "host A.B.C.D": This is the same as A.B.C.D/32

Actions for Hardware ACLs

The following actions are available for Hardware ACLs:

- deny: Discard the packet.
- permit: Allow the packet.
- copy-to-cpu: Send a copy of the packet to the CPU and forward it as well. This is the same as copy,forward in AW hardware filters.
- send-to-cpu: Send the packet to the CPU and does not forward it. Note that specifying this action could result in EPSR healthcheck messages and other control packets being dropped.
- copy-to-mirror: Send a copy of the packet to the mirror port and forward it as well.

Attaching hardware ACLs to interfaces

A hardware ACL is attached directly to a switchport using the **access-group** command. For example, to permit traffic from 192.168.1.x, but discard from 192.168.x.x:

```
          awplus# configure terminal
   awplus(config)# access-list 3000 permit ip 192.168.1.0/24
                   any
   awplus(config)# access-list 3001 deny ip 192.168.0.0/24 any
   awplus(config)# interface port1.0.1
awplus(config-if)# access-group 3000
awplus(config-if)# access-group 3001
```

Hardware ACLs and QoS classifications

Interface ACLs and QoS policies can both be attached to the same port. Where this is done, packets received on the port will be matched against the ACLs first.

The interface ACLs and QoS classifications are implemented by taking the first matching filter and applying the action defined for that filter. All subsequent matches in the table are then ignored. Thus, because ACLs are also matched first, if the matching ACL has a permit action, the packet is forwarded due to that rule's action and any subsequent QoS rules are bypassed.

You can also apply permit rules using QoS.

For example, you might want to permit a source IP address of 192.168.1.x, but block everything else on 192.168.x.x.

In this case you could create both the permit and deny rules using QoS.

Classifying Your Traffic

Classification is the process of **filtering** and **marking**. Filtering involves sorting your data into appropriate traffic types. Marking involves tagging the data so that downstream ports and routers can apply appropriate service policy rules.

There are two reasons to classify data:

1. To provide network security (Security ACLs)
2. To apply service quality criteria QoS.

Security ACLs

The main application of security ACLs is to block undesired traffic. Other applications include:

- copy-to-cpu
- copy-to-mirror
- send-to-cpu

For more information on these applications see **"Actions for Hardware ACLs" on page 60.7**

QoS ACLs

When using ACLs though QoS, the same classification and action abilities are available, but QoS has some additional fields that it can match on (see Match Commands) and also provides the ability to perform metering, marking and remarking on packets that match the filter definitions.

The action used by a QoS class-map is determined by the ACL that is attached to it. If no ACL is attached, it uses the permit action. If an ACL is not required by the class-map (for example, only matching on the VLAN) and a deny action is required, a MAC ACL should be added with `any` for source address and `any` for destination address.

The following example creates a class-map with will deny all traffic on vlan 2:

```
awplus(config)# access-list 4000 deny any any
awplus(config)# class-map cmap1
awplus(config-cmap)# match access-group 4000
awplus(config-cmap)# match vlan 2
```

The default class-map matches to all traffic and so cannot have any match or ACL commands applied to it. The action for this class-map is set via the default-action command and is `permit` by default. It can be changed to `deny` by using the following commands:

```
awplus(config)# policy-map pmap1
awplus(config-pmap)# default-action deny
```

For more information on applying QoS filtering, see **"Classifying your Data" on page 65.7**.

Profile Limitations

A profile is a mask that comprises 16 bytes. Each filter item that is added to the ACL set will consume a portion of the 16 bytes. Note that Hardware ACLs and QoS filters both share this single mask. However each time a mask component is defined within the mask, it can by used in many ACLs - so it is the **number** of different components that is important.

The following table will help you manage your ACL mask.

Protocol Component	Bytes Used in the Mask
Protocol Type	2
Ethernet format	2
VLAN ID	2
IP protocol type (TCP, UDP, etc.)	1
source IPv4 address[1]	0
destination IPv4 address[1]	0
source IPv6 address[1]	0
destination IPv6 address	10
IPv6 Next Header	1
TCP port number	2

Protocol Component	Bytes Used in the Mask
UDP port number	2
DSCP	1
MAC source address	6
MAC destination address	6

1. **Most classification fields use some of the 16 'profile bytes' that are available to classify incoming packets. For example, an ACL with both source and destination MAC address fields set will consume 12 of the 16 bytes. However IPv6 source address, and IPv4 source and destination address, will not consume any bytes, allowing greater freedom in ACL configuration options.**

Hardware Filter Example

If you make a hardware filter that matches on destination IP address and source TCP port, this adds 3 bytes to the mask:

- 1 byte for the IP protocol field (to indicate TCP)
- 2 bytes for the source TCP port number.

If you now create the following (additional) hardware filters:

- A hardware filter that matches on source MAC address: this adds 6 more bytes to the mask
- A QoS class map that matches on destination IP address and DSCP (1 byte): this adds 1 more byte to the mask, for the DSCP.
- A hardware filter that matches on source IP address and source TCP port: this does not change the mask, because the switch already matches on source TCP port, and source IP address does not use any bytes.
- A hardware filter that matches on source UDP port: this does not add any length to the mask, because it shares the same 2 bytes as the source TCP port. However, if you next make a hardware filter that matches on destination TCP or UDP port, that uses another 2 bytes.

Are there now enough bytes for your set of filters?

The mask has a maximum size of 16 bytes. When it reaches the 16-byte limit, no more classifiers can be used that would cause the mask to increase in size. The switch can still accept classifiers that use fields that have already been included in the mask.

There is no particular number of hardware filters or QoS flow groups that will cause the mask to reach its 16-byte limit - it could happen after a few filters, or you might be able to create hundreds of filters without the mask reaching its limit.

So to determine whether you will have enough filter length, look at the fields you want to filter, determine the number of bytes for each field, and sum up the total number of bytes. If that number is less than 16, there is enough filter length. Don't forget to count TCP and UDP source port as a single field, and likewise to count TCP and UDP destination port as a single field.

Maximum number of hardware ACLs

The maximum number of individual hardware ACLs depends on the hardware type of the port you apply the ACLs to, and the setting of the **platform hwfilter-size** command.

Two hardware types exist: **Hardware Version 1** and **Hardware Version 2**. The following table shows the hardware modules and the version to which each belongs.

Hardware Version 1	Hardware Version 2
Baseboard	AT-XEM-12Sv2
AT-XEM-12T	AT-XEM-12Tv2
AT-XEM-12XS	AT-XEM-2XP
AT-XEM-1XP	AT-XEM-2XS
	AT-XEM-2XT
	AT-XEM-24T

The following table shows the maximum number of filters for each hardware type and **platform hwfilter-size**option.

Hardware Type	Setting of platform hwfilter-size	Maximum
Hardware Type 1	ipv4-full-ipv6 (Default. Can filter on MAC addresses and IPv4 and IPv6 settings)	1024
Hardware Type 1	basic (Can only filter on MAC addresses and IPv4 settings)	2048
Hardware Type 2	ipv4-full-ipv6	4096
Hardware Type 2	basic	8192

Viewing the number of hardware ACLs and bytes used

The number of hardware ACLs and bytes used are displayed in the output from the **show platform classifier statistics utilization brief** command, as shown in **Figure 60-1**.

Figure 60-1: Example output from the show platform classifier statistics utilization brief command

```
[Instance 0]
  [port1.0.1-port1.0.12]
  Number of PCE Entries:

  Note: Total available rules depends on routingratio
setting
                  Used / Total
  --------------------------------
  MC V6            128 ('ipv6 multicast-routing' uses this)
  System             0
  DHCP Snooping      0
  Web Auth           0
  Loop Detection     0
  EPSR               0
  SNAP               0
  Global ACL         0
  ACL                0
  QoS                0
  RA Guard           0
  MLD Snooping       0
  Total             128 / 1024 (12.50%)

  UDB Usage:
  Legend of Offset Type) 1:Ether 2:IP 3:TCP/UDP

  IPv4           0000000000000000    0 / 16
  Ethernet       0000000000000000    0 / 16
  IPv6           0000000000000000    0 / 16
.
.
```

Attaching hardware ACLs using QoS

The same functionality can be achieved using QoS, by attaching the ACL to a class-map, attaching the class-map to a policy-map and attaching the policy-map to a port:

Step 1: Enable QoS on the switch

```
awplus(config)# mls qos enable
```

Step 2: Create access lists

Create ACL 3000 to permit all packets from the 192.168.1 subnet:

```
awplus(config)# access-list 3000 permit ip 192.168.1.0/24 any
```

Create ACL 3001 to deny all packets from the 192.168.0 subnet.:

```
awplus(config)# access-list 3001 deny ip 192.168.0.0/24 any
```

Step 3: Attach access-groups to class-maps

Attach ACL 3000 to the class-map cmap1:

```
awplus(config)# class-map cmap1
awplus(config-cmap)# match access-group 3000
awplus(config-cmap)# exit
```

Attach ACL 3001 to the same class-map (cmap2):

```
awplus(config-cmap)# match access-group 3001
awplus(config-cmap)# exit
```

Step 4: Attach class-maps to policy-maps

Attach the class-map cmap1 to policy-map pmap1:

```
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# exit
```

Add the class-map cmap2 to the policy-map pmap1:

```
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# exit
```

Return to Global Configuration mode:

```
awplus(config-pmap)# exit
```

Step 5: Add policy-maps to ports

Add policy-map `pmap1` to `port1.0.1`:

```
awplus(config)# interface port1.0.1
awplus(config-if)# service-policy input pmap1
```

Note that multiple interface ACLs can be attached to the same port, or either type and can be interleaved. The order of matching is based on the order in which the ACLs were attached to the port. Only one ACL can be attached to a class-map, but multiple class-maps can be attached to a policy-map. Interface ACLs can be attached to the same port as a QoS policy, with the interface ACLs being matched first as described at the beginning of the Classification section.

Filtering hardware ACLs with QoS

Another reason for using QoS rather than interface ACLs is that QoS provides a lot more fields on which to match. These are accessed through the match commands in config-cmap mode.

Config-cmap mode describes the fields that can be matched on. Only one of each type can be matched, with the exception of tcp-flags (see below for classification). If multiple matches are specified, they are ANDed together.

The following example shows how you can match a packet on vlan 2, that has a source IP address of 192.168.x.x and a DSCP of 12:

Create ACL `3000` to permit all packets from the 192.168 subnet.:

```
awplus# configure terminal
awplus(config)# access-list 3000 permit ip 192.168.0.0/16 any
```

Apply ACL 3000 to the class-map cmap1 and add the matching criteria of vlan 2 and DSCP 12:

```
awplus(config)# class-map cmap1
awplus(config-cmap)# match access-group 3000
awplus(config-cmap)# match vlan 2
awplus(config-cmap)# match dscp 12
awplus(config-cmap)# exit
```

Using QoS Match Commands with TCP Flags

Usually, if multiple matches of the same type are specified, the matching process will apply to the last match that you specified. For TCP flags however, the arguments are ANDed together. For example, the following series of commands will match on a packet that has ack, syn and fin set:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match tcp-flags ack
awplus(config-cmap)# match tcp-flags syn
awplus(config-cmap)# match tcp-flags fin
awplus(config-cmap)# exit
```

The following commands will achieve the same result:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match tcp-flags ack syn fin
awplus(config-cmap)# exit
```

Note that the matching is looking to see whether "any" of the specified flags are set. There is no checking for whether any of these flags are unset. Therefore the following commands will match on a packet in any of the following combinations of syn and ack status flags as shown in the following table:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match tcp-flags syn
awplus(config-cmap)# exit
```

Syn	Ack	Match on Packet
Set	Set	Yes
Set	Unset	Yes
Unset	Set	No
Unset	Unset	No

If you want to drop packets with syn only, but not with ack and syn, the following two class-maps can be used (note that ACL 4000 is used to apply a drop action as described in **"Actions for Hardware ACLs" on page 60.7**):

Step 1: Create access lists

Create ACL `4000` to deny all packets with `any` source or destination address:

```
awplus# configure terminal
awplus(config)# access-list 4000 deny any any
```

Step 2: Create class-maps

Create the class-map `cmap1` and configure it to match on the TCP flags, `ack` and `syn`:

```
awplus(config)# class-map cmap1
awplus(config-cmap)# match tcp-flags ack syn
awplus(config-cmap)# exit
```

Create the class-map `cmap2` and configure it to match on the TCP flag, `syn`:

```
awplus(config)# class-map cmap2
awplus(config-cmap)# match tcp-flags syn
```

Step 3: Apply access-groups to class-maps

Apply ACL `4000` to this class-map (i.e. to `cmap2`):

```
awplus(config-cmap)# match access-group 4000
awplus(config-cmap)# exit
```

Step 4: Create policy-maps

Create the policy-map pmap1 and associate it with cmap1:

```
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# exit
```

Step 5: Associate class-maps with policy-maps

Associate `cmap2` with this policy-map (`pmap1`):

```
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# exit
```

ACL Filter Sequence Numbers

To help you manage ACLs you can apply sequence numbers to filters. This allows you to remove filters from named and numbered ACLs without having to reconfigure an ACL.

The ability to add sequence numbers to filters simplifies updates through the ability to position a filter within an ACL. When you add a new filter, you can specify a sequence number to position the filter in the ACL and you can also remove a current filter in an ACL by specifying a sequence number.

ACL Filter Sequence Number Behavior

- If filters with no sequence numbers are applied then the first filter is assigned a sequence number of 10, and successive filters are incremented by 10. Sequence numbers are generated automatically if they are not specified at entry.
- The maximum filter sequence number is 65535. If the sequence number exceeds this maximum, the command will not be recognized and will show the error message:
  `% Unrecognized command`
- If you enter a filter without a sequence number it is assigned a sequence number that is 10 greater than the last sequence number and is placed at the end of the ACL.
- If you enter a filter that matches an already existing filter then the first filter is overwritten with the subsequent filter.
- ACL sequence numbers determine the order of execution of filters in an ACL. Filters in a ACL with a lower value sequence number are executed before filters with a higher value.
- Output from **show running-config** displays ACL entries without filter sequence numbers. Output from relevant **show** commands displays ACL entries with their sequence numbers.
- ACL sequence numbers are re-numbered upon switch restart following a **reload** command, or after powering off and powering on the switch. ACL sequence numbers are renumbered starting from 10 and increment by 10 for each filter. See the sample output in the configuration section that follows for an illustration of this behavior. No ACL sequence number re-number command is available to perform this action.
- The ACL sequence number feature works with numbered and named standard and extended IPv4 and IPv6 access lists, plus named hardware IPv4 and IPv6 access lists
- The name of an access list can be designated as a number. Number in named ACLs must not exist within the range of designated numbered ACLs. (where <1-99> and <1300-1999> are standard numbered ACLs, <100-199> and <2000-2699> are extended numbered ACLs, <3000-3699> and <4000-4699> are hardware numbered ACLs).

ACL Filter Sequence Number Applicability

The ACL sequence number support feature is available with numbered and named standard and extended IPv4 and IPv6 ACLs, and the named hardware IPv4 and IPv6 ACLs.

Numbered standard ACLs are available in the range `<1-99>` and `<1300-1999>`, which permit or deny source addresses to control packets coming from network devices or hosts, in software.

Numbered extended ACLs are available in the range <100-199> and <2000-2699>, which permit or deny source addresses and destination addresses (plus ICMP, TCP, UDP messages) to control packets coming from and going to network devices or hosts.

Named hardware IPv4 and IPv6 ACLs are available which permit or deny IP and MAC source and destination addresses plus VLAN IDs to control packets coming from and going to network device and hosts. Named hardware IPv4 and IPv6 ACLs use the ACL sequence number support feature for ACL revision.

The ACL sequence number support feature is available for use with named hardware IPv4 and IPv6 ACLs, but this feature is not available for use with the numbered hardware IPv4 ACLs.

Numbered hardware ACLs are available in the range <3000-3699>, which permit or deny IP source addresses, IP destination addresses, and VLAN IDs to control packets coming from and going to network devices and hosts, in hardware.

Numbered hardware ACLs are available in the range <4000-4699>, which permit or deny MAC source addresses, MAC destination addresses, and VLAN IDs to control packets coming from and going to network devices and hosts, in hardware.

ACL Filter Sequence Number Types

There are ACL filter sequence numbers available for the following types of ACLs:

ACL Type	ACL Command Syntax
IPv4 Standard Numbered ACLs	**access-list <1-99>** **access-list <1300-1999>**
IPv4 Extended Numbered ACLs	**access-list <100-199>** **access-list <2000-2699>**
IPv4 Standard Named ACLs	**access-list standard <*name*>**
IPv4 Extended Named ACLs	**access-list extended <*name*>**
IPv4 Hardware Named ACLs	**access-list hardware <*name*>**
IPv6 Standard Named ACLs	**ipv6 access-list standard <*name*>**
IPv6 Extended Named ACLs	**ipv6 access-list extended <*name*>**
IPv6 Hardware Named ACLs	**ipv6 access-list <*name*>**

Note that ACL sequence number support for these ACL commands is optional not required. An ACL sequence number will be added automatically, starting at 10 and incrementing by 10.

ACL Commands Without ACL Filter Sequence Numbers

ACL filter sequence numbers are not available for numbered hardware ACL commands:

access-list <3000-3699>
access-list <4000-4699>

ACL Filter Sequence Number Entry Examples

See the below CLI entry examples for prompt sub-modes for ACL filters after ACL commands:

- To create an IPv4 Standard ACL and then define ACL filters at the IPv4 Standard ACL Configuration mode prompt **awplus(config-ip-std-acl)#**, enter the following commands:

```
awplus(config)# access-list 1
awplus(config-ip-std-acl)# permit 192.168.1.0 0.0.0.255

awplus(config)# access-list standard std_name
awplus(config-ip-std-acl)# permit 192.168.1.0/24
```

- To create an IPv4 Extended ACL and then define ACL filters at the IPv4 Extended ACL Configuration mode prompt **awplus(config-ip-ext-acl)#**, enter the following commands:

```
awplus(config)# access-list 100
awplus(config-ip-ext-acl)# permit ip 192.168.1.0 0.0.0.255
                           192.168.2.0 0.0.0.255

awplus(config)# access-list extended ext_name
awplus(config-ip-ext-acl)# permit ip 192.168.1.0 0.0.0.255
                           192.168.2.0 0.0.0.255
```

- To create an IPv4 Hardware ACL and then define ACL filters at the IPv4 Hardware ACL Configuration mode prompt **awplus(config-ip-hw-acl)#**, enter the following commands:

```
awplus(config)# access-list hardware hw_name
awplus(config-ip-hw-acl)# permit ip 192.168.1.0 0.0.0.255
                           192.168.2.0 0.0.0.255
```

- To create an IPv6 Standard ACL and then define ACL filters at the IPv6 Standard ACL Configuration mode prompt **awplus(config-ipv6-std-acl)#**, enter the following commands:

```
awplus(config)# ipv6 access-list standard
                ipv6_std_name
awplus(config-ipv6-std-acl)# permit 2001:db8::/64
```

- To create an IPv6 Extended ACL and then define ACL filters at the IPv6 Extended Configuration mode prompt **awplus(config-ipv6-ext-acl)#**, enter the following commands:

```
awplus(config)# ipv6 access-list extended
                ipv6_ext_name
awplus(config-ipv6-ext-acl)# permit ip 2001:db8::/64
                              2001:db9::/64
```

- To create an IPv6 Hardware ACL and then define ACL filters at the IPv6 Hardware Configuration mode prompt **awplus(config-ipv6-hw-acl)#**, enter the following commands:

```
awplus(config)# ipv6 access-list ipv6_hw_name
awplus(config-ipv6-hw-acl)# permit ip 2001:db8::/64 2001:db9::/
                            64
```

ACL Filter Sequence Configuration

First create a named or numbered ACL to enter ACL filters in the ACL sub-modes available:

Step 1: Create a new ACL and add a new filter

Create ACL `10` and then add a new filter to the access-list to permit all packets from the `192.168.1` subnet:

```
awplus# configure terminal
awplus(config)# access-list 10
awplus(config-ip-std-acl)# permit 192.168.1.0 0.0.0.255
awplus(config-ip-std-acl)# end
awplus# show access-list 10
```

```
Standard IP access list 10
   10 permit 192.168.1.0, wildcard bits 0.0.0.255
```

Step 2: Add another filter to the ACL

Append to, or add at the end of, ACL `10` a new filter to deny all packets from the `192.168.2` subnet:

```
awplus# configure terminal
awplus(config)# access-list 10
awplus(config-ip-std-acl)# deny 192.168.2.0 0.0.0.255
awplus(config-ip-std-acl)# end
awplus# show access-list 10
```

```
Standard IP access list 10
   10 permit 192.168.1.0, wildcard bits 0.0.0.255
   20 deny   192.168.2.0, wildcard bits 0.0.0.255
```

Note that if you add a filter to an ACL without specifying a sequence number the new filter is automatically assigned a sequence number. Sequence numbers are assigned in multiples of ten from the sequence number of the last filter.

Step 3: Insert a filter into the ACL

Insert a new filter with the sequence number `15` into ACL `10` to permit packets from the `192.168.3` subnet:

```
                    awplus# configure terminal
             awplus(config)# access-list 10
awplus(config-ip-std-acl)# 15 permit 192.168.3.0 0.0.0.255
awplus(config-ip-std-acl)# end
                    awplus# show access-list 10
```

```
Standard IP access list 10
   10 permit 192.168.1.0, wildcard bits 0.0.0.255
   15 permit 192.168.3.0, wildcard bits 0.0.0.255
   20 deny   192.168.2.0, wildcard bits 0.0.0.255
```

The new filter has precedence over the filter with the sequence number `20`.

Step 4: Remove a filter from the ACL by specifying a filter pattern

Remove the filter with the IP address `192.168.2` from ACL `10`:

```
                    awplus# configure terminal
             awplus(config)# access-list 10
awplus(config-ip-std-acl)# no deny 192.168.2.0 0.0.0.255
awplus(config-ip-std-acl)# end
                    awplus# show access-list 10
```

```
Standard IP access list 10
   10 permit 192.168.1.0, wildcard bits 0.0.0.255
   15 permit 192.168.3.0, wildcard bits 0.0.0.255
```

Step 5: Remove a filter from the ACL by specifying a sequence number

Remove the filter with the sequence number 10 from ACL 10:

```
                    awplus# configure terminal
             awplus(config)# access-list 10
awplus(config-ip-std-acl)# no 10
awplus(config-ip-std-acl)# end
                    awplus# show access-list
```

```
Standard IP access list 10
   15 permit 192.168.3.0, wildcard bits 0.0.0.255
```

Creating ACLs in Global Configuration Mode

You can add new filters in **Global Configuration** mode with the **access-list (standard numbered)** command on page 62.30. In this mode the filters are assigned a sequence number corresponding to the order in which they are entered, i.e. the first filter entered has higher precedence in the ACL.

Step 1: Add filters with the access-list command

Add filters to ACL 10 using the **access-list** command:

```
          awplus# configure terminal
awplus(config)# access-list 10 permit 192.168.1.0 0.0.0.255
awplus(config)# access-list 10 deny 192.168.2.0 0.0.0.255
awplus(config)# end
          awplus# show access-list 10
```

```
Standard IP access list 10
   15 permit 192.168.3.0, wildcard bits 0.0.0.255
   20 permit 192.168.1.0, wildcard bits 0.0.0.255
   30 deny 192.168.2.0, wildcard bits 0.0.0.255
```

You can then enter the **IPv4 Standard ACL Configuration** mode and use the **(access-list standard numbered filter)** command on page 62.34 to specify sequence numbers to reorder the filters.

Step 2: Reorder the filters

Reorder the filters in ACL `10` by specifying a sequence number for each filter. The specified sequence number will overwrite the previous sequence number assigned to the filter:

```
                awplus# configure terminal
          awplus(config)# access-list 10
awplus(config-ip-std-acl)# 1021 permit 192.168.1.0 0.0.0.255
awplus(config-ip-std-acl)# 3333 permit 192.168.3.0 0.0.0.255
awplus(config-ip-std-acl)# 2772 deny 192.168.2.0 0.0.0.255
awplus(config-ip-std-acl)# end
                awplus# show access-list 10
```

```
Standard IP access list 10
 1021 permit 192.168.1.0, wildcard bits 0.0.0.255
 2772 deny   192.168.2.0, wildcard bits 0.0.0.255
 3333 permit 192.168.3.0, wildcard bits 0.0.0.255
```

Step 3: Copy the running-config file into the startup-config file

Copy the running-config into the file set as the current startup-config file and then reload the device. Before the reload occurs, you will receive a confirmation request saying: "`reboot system? (y/n):`".

When the device has reboot you can then enter **Global Configuration** mode and use the **show access-list (IPv4 Software ACLs)** command to display ACL `10`:

```
awplus(config)# exit
       awplus# copy running-config startup-config
       awplus# reload
       awplus# show access-list 10
```

```
Standard IP access list 10
   10 permit 192.168.1.0, wildcard bits 0.0.0.255
   20 deny   192.168.2.0, wildcard bits 0.0.0.255
   30 permit 192.168.3.0, wildcard bits 0.0.0.255
```

After the device has reboot the sequence numbers of the filters in the ACL have been reassigned incrementing from 10.

Display the ACL configuration details

Display the running system status and configuration details for ACLs:

```
awplus# show running-config access-list
```

```
!
access-list 1 deny 10.1.1.0 0.0.0.255
access-list 1 permit any
access-list 2
access-list 5
access-list 10 permit 192.168.1.0 0.0.0.255
access-list 10 deny 192.168.2.0 0.0.0.255
access-list 10 permit 192.168.3.0 0.0.0.255
access-list 20
access-list 25 permit 10.1.2.0 0.0.0.255
access-list 25 deny 192.168.1.0 0.0.0.255
access-list 50
access-list 95 permit any
access-list 100
access-list 1300
access-list 2000
access-list extended acl
access-list extended my-list
access-list extended name
access-list extended name1
access-list standard name3
ipv6 access-list extended ipv6_acl
ipv6 access-list standard ipv6_acl2
ipv6 access-list extended my-ipv6-list
ipv6 access-list extended my-list
ipv6 access-list standard my-new-list
ipv6 access-list standard name
ipv6 access-list standard name1 deny any
ipv6 access-list extended name5
ipv6 access-list standard name6
access-list hw_acl
access-list icmp
access-list my-hw-list
access-list name2
access-list name4
!
```

For more information see **show running-config access-list** command on page 7.40.

Chapter 61: IPv4 Hardware Access Control List (ACL) Commands

show access-group 61.38
show access-list (IPv4 Hardware ACLs) 61.39
show interface access-group 61.41

Introduction

This chapter provides an alphabetical reference for the IPv4 Hardware Access Control List (ACL) commands, and contains detailed command information and command examples about IPv4 hardware ACLs, which are applied directly to interfaces using the **access-group** command.

Note

See **Chapter 60, Access Control Lists Introduction** for descriptions of ACLs, and for further information about rules when applying ACLs see the **ACL Rules** section.

See **ACL Filter Sequence Numbers** and **ACL Filter Sequence Number Behavior** sections in **Chapter 60, Access Control Lists Introduction** about ACL Filters.

To apply ACLs to an LACP channel group, apply it to all the individual switch ports in the channel group. To apply ACLs to a static channel group, apply it to the static channel group itself. For more information on link aggregation see **Chapter 22, Link Aggregation Introduction and Configuration**, and **Chapter 23, Link Aggregation Commands**.

Note

Text in parenthesis in command names indicates usage not keyword entry. For example, **access-list hardware (named)** indicates named IPv4 hardware ACLs entered as `access-list hardware` <*name*> where <*name*> is a placeholder not a keyword.

Note

Parenthesis surrounding ACL filters indicates the type of ACL filter not the keyword entry in the CLI, such as **(access-list standard numbered filter)** represents command entry in the format shown in the syntax `[<sequence-number>] {deny|permit} {<source>|host <host-address>|any}`.

Note

Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

IPv4 Hardware Access List Commands and Prompts

Many of the ACL commands operate from sub-modes that are specific to particular ACL types. The table **"IPv4 Hardware Access List Commands and Prompts"** shows the CLI prompts at which ACL commands are entered.

Table 61-1: IPv4 Hardware Access List Commands and Prompts

Command Name	Command Mode	Prompt
show interface access-group	Privileged Exec	`awplus#`
show access-group	Privileged Exec	`awplus#`
show access-list (IPv4 Hardware ACLs)	Privileged Exec	`awplus#`
show interface access-group	Privileged Exec	`awplus#`
access-group	Global Configuration	`awplus(config)#`
access-list (hardware IP numbered)	Global Configuration	`awplus(config)#`
access-list (hardware MAC numbered)	Global Configuration	`awplus(config)#`
access-list hardware (named)	Global Configuration	`awplus(config)#`
access-group	Interface Configuration	`awplus(config-if)#`
(access-list hardware ICMP filter)	IPv4 Hardware ACL Configuration	`awplus(config-ip-hw-acl)#`
(access-list hardware IP protocol filter)	IPv4 Hardware ACL Configuration	`awplus(config-ip-hw-acl)#`
(access-list hardware MAC filter)	IPv4 Hardware ACL Configuration	`awplus(config-ip-hw-acl)#`
(access-list hardware TCP UDP filter)	IPv4 Hardware ACL Configuration	`awplus(config-ip-hw-acl)#`
commit (IPv4)	IPv4 Hardware ACL Configuration	`awplus(config-ip-hw-acl)#`

Command List

access-group

This command adds or removes a hardware-based access-list to a switch port interface. The number of hardware numbered and named access-lists that can be added to a switch port interface is determined by the available memory in hardware-based packet classification tables.

This command works in both Global Configuration and Interface Configuration modes to apply hardware access-lists to all switch port interfaces or selected switch port interfaces respectively.

The **no** variant of this command removes the selected access-list from an interface.

Syntax

```
access-group [<3000-3699>|<4000-4699>|<hardware-access-list-name>]
no access-group [<3000-3699>|4000-4699|<hardware-access-list-name>]
```

Parameter	Description
<3000-3699>	Hardware IP access-list.
<4000-4699>	Hardware MAC access-list.
<hardware-access-list-name>	The hardware access-list name.

Mode Interface Configuration or Global Configuration

Default Any traffic on an interface controlled by a hardware ACL that does not explicitly match a filter is permitted.

Usage First create an IP access-list that applies the appropriate permit, deny requirements etc with the **access-list (hardware IP numbered)** command on page 61.6, the **access-list (hardware MAC numbered)** command on page 61.16 or the **access-list hardware (named)** command on page 61.19. Then use this command to apply this hardware access-list to a specific port or port range. Note that this command will apply the access-list only to incoming data packets.

To apply ACLs to an LACP aggregated link, apply it to all the individual switch ports in the aggregated group. To apply ACLs to a static channel group, apply it to the static channel group itself. An ACL can even be applied to a static aggregated link that spans more than one switch instance (**Chapter 23, Link Aggregation Commands**).

Note that you cannot apply software standard and extended numbered ACLs to switch port interfaces with the access-group command. This command will only apply hardware ACLs.

Note Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

Examples To add the numbered hardware access-list `3005` to all switch ports, enter the following

commands:

```
awplus# configure terminal
awplus(config)# access-group 3005
```

To add the numbered hardware access-list `3005` to switch port interface `port1.0.1`, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# access-group 3005
```

To add the named hardware access-list `hw-acl` to switch port interface `port1.0.2`, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# access-group hw-acl
```

To apply an ACL to static channel group 2 containing switch `port1.0.5` and `port1.0.6`, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.5-1.0.6
awplus(config-if)# static-channel-group 2
awplus(config)# interface sa2
awplus(config-if)# access-group 3000
```

Related Commands

access-list hardware (named)
access-list (hardware IP numbered)
access-list (hardware MAC numbered)
show interface access-group

access-list (hardware IP numbered)

This command creates an access-list for use with hardware classification, such as QoS. The access-list will match on either TCP or UDP type packets that have the specified source and destination IP addresses and Layer 4 port values or ranges. The parameter **any** may be specified if an address does not matter and the port values are optional.

Note that specifying the **send-to-cpu** parameter could result in EPSR healthcheck messages and other control packets being dropped.

The optional **vlan** parameter can be applied to match tagged (802.1q) packets.

The **no** variant of this command removes the previously specified IP hardware access-list.

Syntax [ip]

```
access-list <3000-3699>
   {deny|permit|copy-to-cpu|copy-to-mirror|send-to-cpu} ip <source>
   <destination> [vlan <1-4094>]
```

Syntax [icmp]

```
access-list <3000-3699>
   {deny|permit|copy-to-cpu|copy-to-mirror|send-to-cpu} icmp
   <source> <destination> [icmp-type <type-number>]
   [vlan <1-4094>]

no access-list <3000-3699>
```

Table 61-2: Parameters in the access-list (hardware IP numbered) command - ip|icmp

Parameter	Description
<3000-3699>	Hardware IP access-list number.
deny	Access-list rejects packets that match the source and destination filtering specified with this command.
permit	Access-list permits packets that match the source and destination filtering specified with this command.
copy-to-cpu	Specify packets to copy to the CPU.
copy-to-mirror	Specify packets to copy to the mirror port.
send-to-cpu	Specify packets to send to the CPU. Specifying this parameter could result in EPSR healthcheck messages and other control packets being dropped.
icmp	ICMP packet.
ip	IP packet.

Table 61-2: Parameters in the access-list (hardware IP numbered) command - ip|

Parameter(cont.)	**Description**(cont.)	
<source>	The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:	
	`any`	Matches any source IP address.
	`host` *<ip-addr>*	Matches a single source host with the IP address given by *<ip-addr>* in dotted decimal notation.
	<ip-addr>/*<prefix>*	An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.
	<ip-addr> *<reverse-mask>*	Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering `192.168.1.1 0.0.0.255` is the same as entering `192.168.1.1/24`.
<destination>	The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:	
	`any`	Matches any destination IP address.
	`host` *<ip-addr>*	Matches a single destination host with the IP address given by *<ip-addr>* in dotted decimal notation.
	<ip-addr>/*<prefix>*	An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.
	<ip-addr> *<reverse-mask>*	Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering `192.168.1.1 0.0.0.255` is the same as entering `192.168.1.1/24`.
`icmp-type`	Matches only a specified type of ICMP messages. This is valid only when the filtering is set to match ICMP packets.	

Table 61-2: Parameters in the access-list (hardware IP numbered) command - ip|

Parameter(cont.)	**Description**(cont.)	
<type-number>	The ICMP type, as defined in RFC792 and RFC950. Specify one of the following integers to create a filter for the ICMP message type:	
	0	Echo replies.
	3	Destination unreachable messages.
	4	Source quench messages.
	5	Redirect (change route) messages.
	8	Echo requests.
	11	Time exceeded messages.
	12	Parameter problem messages.
	13	Timestamp requests.
	14	Timestamp replies.
	15	Information requests.
	16	Information replies.
	17	Address mask requests.
	18	Address mask replies.
`vlan`	Specifies that the ACL will match on the ID in the packet's VLAN tag.	
<1-4094>	The VLAN VID.	

Syntax [tcp|udp]

```
access-list <3000-3699>
    {copy-to-cpu|copy-to-mirror|deny|permit|send-to-cpu} {tcp|udp}
    <source>
    {eq <sourceport>|lt <sourceport>|gt <sourceport>|ne <sourceport>|
    [range <start-range> <end-range>}
    <destination>
    [eq <destport>|lt <destport>|gt <destport>|ne <destport>]
    [range <start-range> <end-range>]

no access-list <3000-3699>
```

Table 61-3: Parameters in the access-list (hardware IP numbered) command - tcp|udp

Parameter	Description	
<3000-3699>	Hardware IP access-list.	
copy-to-cpu	Specify packets to copy to the CPU.	
copy-to-mirror	Specify packets to copy to the mirror port.	
deny	The access-list rejects packets that match the type, source, and destination filtering specified with this command.	
permit	The access-list permits packets that match the type, source, and destination filtering specified with this command.	
send-to-cpu	Specify packets to send to the CPU. Specifying this parameter could result in EPSR healthcheck messages and other control packets being dropped.	
tcp	The access-list matches only TCP packets.	
udp	The access-list matches only UDP packets.	
<source>	The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:	
	any	Matches any source IP address.
	host *<ip-addr>*	Matches a single source host with the IP address given by *<ip-addr>* in dotted decimal notation.
	<ip-addr>/<prefix>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.
	<ip-addr> *<reverse-mask>*	Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering 192.168.1.1 0.0.0.255 is the same as entering 192.168.1.1/24.

Table 61-3: Parameters in the access-list (hardware IP numbered) command - tcp|

Parameter(cont.)	**Description**(cont.)	
<destination>	The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:	
	`any`	Matches any destination IP address.
	`host` *<ip-addr>*	Matches a single destination host with the IP address given by *<ip-addr>* in dotted decimal notation.
	<ip-addr>/*<prefix>*	An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.
	<ip-addr> *<reverse-mask>*	Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering `192.168.1.1 0.0.0.255` is the same as entering `192.168.1.1/24`.
<sourceport>	The source (TCP or UDP) port number, specified as an integer between 0 and 65535.	
`range`	Range of port numbers.	
<start-range>	Port number at start of range *<0-65535>*.	
<end-range>	Port number at end of range *<0-65535>*.	
<destport>	The destination (TCP or UDP) port number, specified as an integer between 0 and 65535.	
`eq`	Matches port numbers that are equal to the port number specified immediately after this parameter.	
`lt`	Matches port numbers that are less than the port number specified immediately after this parameter.	
`gt`	Matches port numbers that are greater than the port number specified immediately after this parameter.	
`ne`	Matches port numbers that are not equal to the port number specified immediately after this parameter.	
`range`	Range of port numbers.	
<start-range>	Port number at start of range *<0-65535>*.	
<end-range>	Port number at end of range *<0-65535>*.	
`vlan`	Specifies that the ACL will match on the ID in the packet's VLAN tag.	
<1-4094>	The VLAN VID.	

Syntax [proto]

```
access-list <3000-3699>
    {copy-to-cpu|copy-to-mirror|deny|permit|send-to-cpu} proto <ip-
    protocol> <source> <destination>

no access-list <3000-3699>
```

Table 61-4: Parameters in the access-list (hardware IP numbered) command - proto

Parameter	Description	
<3000-3699>	Hardware IP access-list.	
`copy-to-cpu`	Specify packets to copy to the CPU.	
`copy-to-mirror`	Specify packets to copy to the mirror port.	
`deny`	Access-list rejects packets that match the source and destination filtering specified with this command.	
`permit`	Access-list permits packets that match the source and destination filtering specified with this command.	
`send-to-cpu`	Specify packets to send to the CPU. Specifying this parameter could result in EPSR healthcheck messages and other control packets being dropped.	
<source>	The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:	
	`any`	Matches any source IP address.
	`host` *<ip-addr>*	Matches a single source host with the IP address given by *<ip-addr>* in dotted decimal notation.
	<ip-addr>/<prefix>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.
	<ip-addr> <reverse-mask>	Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering `192.168.1.1 0.0.0.255` is the same as entering `192.168.1.1/24`.

Table 61-4: Parameters in the access-list (hardware IP numbered) command - proto

Parameter(cont.)	**Description**(cont.)	
<destination>	The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:	
	`any`	Matches any destination IP address.
	`host` *<ip-addr>*	Matches a single destination host with the IP address given by *<ip-addr>* in dotted decimal notation.
	<ip-addr>/*<prefix>*	An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.
	<ip-addr> *<reverse-mask>*	Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering `192.168.1.1 0.0.0.255` is the same as entering `192.168.1.1/24`.
`proto`	Matches only a specified type of IP Protocol <1-255>.	
<ip-protocol>	The IP protocol number, as defined by IANA (Internet Assigned Numbers Authority **http://www.iana.org/assignments/protocol-numbers**)	
	Protocol Number	Protocol Description [RFC Reference]
	1	Internet Control Message [RFC792]
	2	Internet Group Management [RFC1112]
	3	Gateway-to-Gateway [RFC823]
	4	IP in IP [RFC2003]
	5	Stream [RFC1190] [RFC1819]
	6	TCP (Transmission Control Protocol) [RFC793]
	8	EGP (Exterior Gateway Protocol) [RFC888]
	9	IGP (Interior Gateway Protocol) [IANA]
	11	Network Voice Protocol [RFC741]
	17	UDP (User Datagram Protocol) [RFC768]
	20	Host monitoring [RFC869]
	27	RDP (Reliable Data Protocol) [RFC908]
	28	IRTP (Internet Reliable Transaction Protocol) [RFC938]
	29	ISO-TP4 (ISO Transport Protocol Class 4) [RFC905]

Table 61-4: Parameters in the access-list (hardware IP numbered) command - proto

Parameter(cont.)	**Description**(cont.)	
<ip-protocol> (cont.)	30	Bulk Data Transfer Protocol [RFC969]
	33	DCCP (Datagram Congestion Control Protocol) [RFC4340]
	48	DSR (Dynamic Source Routing Protocol) [RFC4728]
	50	ESP (Encap Security Payload) [RFC2406]
	51	AH (Authentication Header) [RFC2402]
	54	NARP (NBMA Address Resolution Protocol) [RFC1735]
	88	EIGRP (Enhanced Interior Gateway Routing Protocol)
	89	OSPFIGP [RFC1583]
	97	Ethernet-within-IP Encapsulation / RFC3378
	98	Encapsulation Header / RFC1241
	108	IP Payload Compression Protocol / RFC2393
	112	Virtual Router Redundancy Protocol / RFC3768
	134	RSVP-E2E-IGNORE / RFC3175
	135	Mobility Header / RFC3775
	136	UDPLite / RFC3828
	137	MPLS-in-IP / RFC4023
	138	MANET Protocols / RFC-ietf-manet-iana-07.txt
	139-252	Unassigned / IANA
	253	Use for experimentation and testing / RFC3692
	254	Use for experimentation and testing / RFC3692
	255	Reserved / IANA
vlan	Specifies that the ACL will match on the ID in the packet's VLAN tag.	
<1-4094>	The VLAN VID.	

Mode Global Configuration

Default Any traffic on an interface controlled by a hardware ACL that does not explicitly match a filter is permitted.

Usage This command creates an access-list for use with hardware classification, such as when applying QoS. This command can be used to match ICMP packets, IP protocols, or TCP/UDP packets.

For ICMP packets, the <3000-3699> range IP hardware access-list will match any ICMP packet that has the specified source and destination IP addresses and ICMP type.

You may apply the **any** parameter if the source or destination IP address is not important. The ICMP type is an optional parameter.

Note Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

Examples Follow the below example commands to configure access-lists for ICMP, IP protocol and TCP.

ICMP Example To create an access-list that will permit ICMP packets with a source address of `192.168.1.0/24` with any destination address and an ICMP type of `5` enter the below commands:

```
awplus# configure terminal
awplus(config)# access-list 3000 permit icmp 192.168.1.0/24
any icmp-type 5
```

To destroy the access-list with an access-list identity of `3000` enter the below commands:

```
awplus# configure terminal
awplus(config)# no access-list 3000
```

IP Example To create an access-list that will permit any type of IP packet with a source address of `192.168.1.1` and any destination address, enter the commands:

```
awplus# configure terminal
awplus(config)# access-list 3000 permit ip 192.168.1.1/32 any
```

To create an access-list that will deny all IGMP packets (IP protocol `2`) from the `192.168.0.0` network, enter the commands:

```
awplus# configure terminal
awplus(config)# access-list 3000 deny proto 2 192.168.0.0/16
any
```

TCP Example

To create an access-list that will permit TCP packets with a destination address of 192.168.1.1, a destination port of 80 and any source address and source port, enter the commands:

```
awplus# configure terminal
awplus(config)# access-list 3000 permit tcp any 192.168.1.1/32
eq 80
```

copy-to-mirror Example

To create an access-list that will copy-to-mirror TCP packets with a destination address of 192.168.1.1, a destination port of 80 and any source address and source port for use with the **mirror interface** command, enter the commands:

```
awplus# configure terminal
awplus(config)# access-list 3000 copy-to-mirror tcp any
192.168.1.1/32 eq 80
```

Related Commands

access-group
mirror interface
show running-config
show access-list (IPv4 Hardware ACLs)

access-list (hardware MAC numbered)

This command creates an access-list for use with hardware classification, such as QOS. The access-list will match on packets that have the specified source and destination MAC addresses. The parameter **any** may be specified if an address does not matter.

Note that specifying the **send-to-cpu** parameter could result in EPSR healthcheck messages and other control packets being dropped.

Optionally, the **vlan** and **inner-vlan** parameters can be matched for tagged (802.1q) packets.

The **no** variant of this command removes the specified MAC hardware filter access-list.

Syntax

```
access-list <4000-4699>
    {copy-to-cpu|copy-to-mirror|deny|permit|send-to-cpu}
    {<source-mac-address> <source-mac-mask>|any}
    {<destination-mac-address> <destination-mac-mask>|any}
    [vlan <1-4094> [inner-vlan <1-4094>]]

no access-list <4000-4699>
```

Parameter	Description
<4000-4699>	Hardware MAC access-list.
`copy-to-cpu`	Specify packets to copy to the CPU.
`copy-to-mirror`	Specify packets to copy to the mirror port.
`deny`	Access-list rejects packets that match the source and destination filtering.
`permit`	Access-list permits packets that match the source and destination filtering.
`send-to-cpu`	Specify packets to send to the CPU. Specifying this parameter could result in EPSR healthcheck messages and other control packets being dropped.
<source-mac-address>	The source MAC address of the packets. Enter this in the format <HHHH.HHHH.HHHH> Where each *H* is a hexadecimal number that represents a 4 bit binary number.
<source-mac-mask	The mask that will be applied to the source MAC addresses. Enter this in the format <HHHH.HHHH.HHHH> Where each *H* is a hexadecimal number that represents a 4 bit binary number. For a mask, each value will be either `0` or `F`. Where Hex `FF` = Ignore, and Hex `00` = Match.
`any`	Any source MAC address.
<destination-mac-address>	The destination MAC address of the packets. Enter this in the format <HHHH.HHHH.HHHH> Where each H is a hexadecimal number that represents a 4 bit binary number.

Parameter(cont.)	**Description**(cont.)
<destination-mac-mask>	The mask that will be applied to the destination MAC addresses. Enter this in the format <HHHH.HHHH.HHHH> Where each H is a hexadecimal number that represents a 4 bit binary number. For a mask, each value will be either `0` or `F`. Where Hex `FF` = Ignore, and Hex `00` = Match.
`any`	Any destination MAC address.
`vlan`	Specifies that the ACL will match on the ID in the packet's VLAN tag.
<1-4094>	The VLAN VID.
`inner-vlan`	This parameter is used within double-tagged VLANs. It is the inner VLAN tag (VID); sometimes referred to as the C-TAG (Customer VLAN TAG), where the vlan VID tag is referred to as the S-TAG (Service VLAN TAG).
<1-4094>	The inner VLAN VID.

Mode Global Configuration

Default Any traffic on an interface controlled by a hardware ACL that does not explicitly match a filter is permitted.

Usage This command creates an access-list for use with hardware classification, such as when applying QoS. The <4000-4699> range MAC hardware access-list will match on packets that have the specified source and destination MAC addresses. You may apply the **any** parameter if the source or destination MAC host address is not important.

Note Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

Examples

To create an access-list that will permit packets with a MAC address of `0000.00ab.1234` and any destination address enter the commands:

```
awplus# configure terminal
awplus(config)# access-list 4000 permit 0000.00ab.1234
0000.0000.0000 any
```

To create an access-list that will permit packets with an initial MAC address component of `0000.00ab` and any destination address, enter the commands:

```
awplus# configure terminal
awplus(config)# access-list 4001 permit 0000.00ab.1234
0000.0000.FFFF any
```

To create an access-list that will copy-to-mirror packets with an initial MAC address component of `0000.00ab` and any destination address for use with the **mirror interface** command, enter the commands:

```
awplus# configure terminal
awplus(config)# access-list 4001 copy-to-mirror 0000.00ab.1234
0000.0000.FFFF any
```

To destroy the access-list with an access-list identity of `4000` enter the commands:

```
awplus# configure terminal
awplus(config)# no access-list 4000
```

Related Commands

access-group
mirror interface
show running-config
show access-list (IPv4 Hardware ACLs)

access-list hardware (named)

This command creates a named hardware access-list that can be applied to a switch port interface. ACL filters for a named hardware ACL are created in the IPv4 Hardware ACL Configuration mode.

The **no** variant of this command removes the specified named hardware ACL.

Syntax

```
access-list hardware <hardware-access-list-name>
no access-list hardware <hardware-access-list-name>
```

Parameter	Description
<hardware-access-list-name>	Specify the hardware ACL name to then define ACL filters for in the subsequent IPv4 Hardware ACL Configuration mode.

Mode Global Configuration

Default Any traffic on an interface controlled by a hardware ACL that does not explicitly match a filter is permitted.

Usage Use this command to name a hardware ACL and enter the IPv4 Hardware ACL Configuration mode. If the named hardware ACL doesn't exist, it will be created after entry. If the named hardware ACL does exist, then you can enter IPv4 Hardware ACL Configuration mode for that existing ACL.

Entering this command with the hardware ACL name moves you to the `(config-ip-hw-acl)` prompt for the IPv4 Hardware ACL Configuration mode so you can enter ACL filters with sequence numbers. From this prompt, configure the filters for the ACL. See **Chapter 60, Access Control Lists Introduction** for complete examples of configured sequenced numbered ACLs.

See also the table **"IPv4 Hardware Access List Commands and Prompts"** in this chapter. This table shows the relevant prompts at which ACL commands and ACL filters are entered for sequenced ACLs.

Note Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

Example To create the hardware access-list named `ACL-1` and enter the IPv4 Hardware ACL Configuration mode to specify the ACL filter entry, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware ACL-1
awplus(config-ip-hw-acl)#
```

To remove the hardware access-list named `ACL-1`, use the commands:

```
awplus# configure terminal
awplus(config)# no access-list hardware ACL-1
```

Related Commands

- access-group
- (access-list hardware ICMP filter)
- (access-list hardware IP protocol filter)
- (access-list hardware TCP UDP filter)
- (access-list standard named filter)
- show access-group
- show access-list (IPv4 Hardware ACLs)

(access-list hardware ICMP filter)

Use this ACL filter to add a new ICMP filter entry to the current hardware access-list. The filter will match on any ICMP packet that has the specified source and destination IP addresses and ICMP type. The parameter **any** may be specified if an address does not matter and the ICMP type is an optional parameter. If a sequence number is specified, the new filter is inserted at the specified location. Otherwise, the new filter is added at the end of the access-list.

Note that specifying the **send-to-cpu** parameter could result in EPSR healthcheck messages and other control packets being dropped.

The optional **vlan** parameter can be applied to match tagged (802.1q) packets.

The **no** variant of this command removes an ICMP filter entry from the current hardware access-list. You can specify the ICMP filter entry for removal by entering either its sequence number (e.g. `no 10`), or by entering its ICMP filter profile without specifying its sequence number.

Note that the sequence number can be found by running the command, the **show access-list (IPv4 Hardware ACLs)** command on page 61.39.

Syntax [icmp]

```
[<sequence-number>]
   {deny|permit|send-to-cpu|copy-to-cpu|copy-to-mirror}
   icmp <source> <destination>
   [icmp <icmp-value>] [vlan <1-4094>]

no {deny|permit|send-to-cpu|copy-to-cpu|copy-to-mirror}
   icmp <source> <destination>
   [icmp <icmp-value>] [vlan <1-4094>]

no <sequence-number>
```

Parameter	Description
<sequence-number>	<1-65535> The sequence number for the filter entry of the selected access control list.
`deny`	Access-list rejects packets that match the source and destination filtering specified with this command.
`permit`	Access-list permits packets that match the source and destination filtering specified with this command.
`send-to-cpu`	Specify packets to send to the CPU. Specifying this parameter could result in EPSR healthcheck messages and other control packets being dropped.
`copy-to-cpu`	Specify packets to copy to the CPU.
`copy-to-mirror`	Specify packets to copy to the mirror port.
`icmp`	ICMP packet type.

Parameter(cont.)	**Description**(cont.)	
<source>	The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:	
	<ip-addr>/ <prefix>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.
	<ip-addr> <reverse-mask>	Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering `192.168.1.1 0.0.0.255` is the same as entering `192.168.1.1/24`.
	`host` *<ip-addr>*	Matches a single source host with the IP address given by *<ip-addr>* in dotted decimal notation.
	`any`	Matches any source IP address.
<destination>	The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:	
	<ip-addr>/ <prefix>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.
	<ip-addr> <reverse-mask>	Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering `192.168.1.1 0.0.0.255` is the same as entering `192.168.1.1/24`.
	`host` *<ip-addr>*	Matches a single destination host with the IP address given by *<ip-addr>* in dotted decimal notation.
	`any`	Matches any destination IP address.
`icmp-type`	The ICMP type.	
<icmp-value>	The value of the ICMP type.	
`vlan`	Specifies that the ACL will match on the ID in the packet's VLAN tag.	
<1-4094>	The VLAN VID.	

Mode IPv4 Hardware ACL Configuration

Default Any traffic on an interface controlled by a hardware ACL that does not explicitly match a filter is permitted.

Usage First create a named hardware access-list that applies the appropriate permit, deny requirements etc. Then use the **access-group** command on page 61.4 to apply this access-list to a specific port or range. Note that this command will apply the access-list only to **incoming** data packets.

An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 10 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

Note

You must reach the prompt `awplus(config-ip-hw-acl)#` by running the **access-list hardware (named)** command on page 61.19, and entering an appropriate access-list name.

Note

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

Example To add an access-list filter entry with a sequence number of `100` to the access-list named `my-list` that will permit ICMP packets with a source address of `192.168.1.0/24`, any destination address and an icmp type of `5`, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# 100 permit icmp 192.168.1.0/24 any
icmp-type 5
```

To remove an access-list filter entry with a sequence number of `100` in the access-list named `my-list`, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# no 100
```

Related Commands
access-list hardware (named)
show running-config
show access-list (IPv4 Hardware ACLs)

(access-list hardware IP protocol filter)

Use this ACL filter to add an IP protocol type filter entry to the current hardware access-list. The filter will match on any IP packet that has the specified source and destination IP addresses and IP protocol type, or has the optionally specified source and destination MAC addresses. The parameter **any** may be specified if an address does not matter. If a sequence number is specified, the new filter is inserted at the specified location. Otherwise, the new filter is added at the end of the access-list.

Note that specifying the **send-to-cpu** parameter could result in EPSR healthcheck messages and other control packets being dropped.

The optional **vlan** parameter can be applied to match tagged (802.1q) packets.

The **no** variant of this command removes an IP protocol type filter entry from the current hardware access-list. You can specify the IP protocol type filter entry for removal by entering either its sequence number (e.g. `no 10`), or by entering its IP protocol type filter profile without specifying its sequence number.

Note that the sequence number can be found by running the **show access-list (IPv4 Hardware ACLs)** command on page 61.39.

Syntax [any|ip|proto]

```
[<sequence-number>]
    {deny|permit|send-to-cpu|copy-to-cpu|copy-to-mirror}
    {any|ip|proto <ip-protocol>}
    {<source>|dhcpsnooping|any} {<destination>|any}
    [mac {<mac-source-address> <mac-source-mask>|any]
    {<mac-destination-address> <mac-destination-mask>|any}
    [vlan <1-4094>]

no {deny|permit|send-to-cpu|copy-to-cpu|copy-to-mirror}
    {any|ip|proto <ip-protocol>}
    {<source>|dhcpsnooping} {<destination>|any}
    [mac {<mac-source-address> <mac-source-mask>|any]
    {<mac-destination-address> <mac-destination-mask>|any}
    [vlan <1-4094>]

no <sequence-number>
```

Parameter	Description
`<sequence-number>`	`<1-65535>` The sequence number for the filter entry of the selected access control list.
`deny`	Access-list rejects packets of the type specified.
`permit`	Access-list allows packets of the type specified
`send to cpu`	Specify packets to send to the CPU. Specifying this parameter could result in EPSR healthcheck messages and other control packets being dropped.
`copy to cpu`	Specify packets to copy to the CPU.
`copy to mirror`	Specify packets to copy to the mirror port.
`ip`	IP packets.
`any`	Any packet.

Parameter(cont.)	**Description**(cont.)
`proto <ip-protocol>`	The IP Protocol type specified by it protocol number <1-255>.
`<ip-protocol>`	The IP protocol number, as defined by IANA (Internet Assigned Numbers Authority **http://www.iana.org/assignments/protocol-numbers**)

Protocol Number	Protocol Description [RFC Reference]

	254	Use for experimentation and testing / RFC3692
	255	Reserved / IANA
`dhcpsnooping`	The source address learned from the DHCP Snooping binding database.	

Parameter(cont.)	**Description**(cont.)	
<source>	The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:	
	`any`	Matches any source IP address.
	`host` *<ip-addr>*	Matches a single source host with the IP address given by *<ip-addr>* in dotted decimal notation.
	<ip-addr>`/`*<prefix>*	An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.
	<ip-addr> *<reverse-mask>*	Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering `192.168.1.1 0.0.0.255` is the same as entering `192.168.1.1/24`.
<destination>	The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:	
	`any`	Matches any destination IP address.
	`host` *<ip-addr>*	Matches a single destination host with the IP address given by *<ip-addr>* in dotted decimal notation.
	<ip-addr>`/`*<prefix>*	An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.
	<ip-addr> *<reverse-mask>*	Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering `192.168.1.1 0.0.0.255` is the same as entering `192.168.1.1/24`.
`mac`	Signifies a MAC and based hardware access-list.	
<mac-source-address>	The source host's MAC address, entered in HHHH.HHHH.HHHH format.	
<mac-source-mask>	The source host's MAC wildcard mask entered in HHHH.HHHH.HHHH format. Where Hex `FF` = Ignore, and Hex `00` = Match.	

Parameter(cont.)	**Description**(cont.)
`any`	Matches any source MAC address.
<mac-destination-address>	The destination host's MAC address, entered in HHHH.HHHH.HHHH format.
<mac-destination-mask>	The destination host's wildcard mask entered in HHHH.HHHH.HHHH format. Where Hex `FF` = Ignore, and Hex `00` = Match.
`any`	Matches any destination MAC address.
`vlan`	Specifies that the ACL will match on the ID in the packet's VLAN tag.
<1-4094>	The VLAN VID.

Mode IPv4 Hardware ACL Configuration

Default Any traffic on an interface controlled by a hardware ACL that does not explicitly match a filter is permitted.

Usage First create a named hardware access-list that applies the appropriate permit, deny requirements etc. Then use the **access-group** command on page 61.4 to apply this access-list to a specific port or range. Note that this command will apply the access-list only to **incoming** data packets.

An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 10 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

Note
The access control list being configured is selected by running the **access-list hardware (named)** command on page 61.19. with the required access control list number, or name, but with no further parameters selected.

Note
Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

Examples To add an access-list filter entry to the access-list named `my-list` that will permit any type of IP packet with a source address of `192.168.1.1` and any destination address, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# permit ip 192.168.1.1/32 any
```

To add an access-list filter entry to the access-list named `my-list` that will permit any type of IP packet with a source address of `192.168.1.1` and a MAC source address of `ffee.ddcc.bbaa` with any IP and MAC destination address, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# permit ip 192.168.1.1/32 any mac
ffee.ddcc.bbaa any
```

To add an access-list filter entry to the access-list named `my-list` a filter that will deny all IGMP packets (protocol `2`) from the `192.168.0.0` network with sequence number `50` in access-list, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# 50 deny proto 2 192.168.0.0/16 any
```

To add an access-list filter entry to the access-list named `my-list` that will deny all IP packets on vlan `2`, use the commands:

```
awplus# enable
awplus(config)# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# deny ip any any vlan 2
```

Related Commands

access-list hardware (named)
show running-config
show access-list (IPv4 Hardware ACLs)

(access-list hardware MAC filter)

Use this ACL filter to add a MAC filter entry to the current hardware access-list. The filter will match on any IP packet that has the specified source and destination MAC addresses. The parameter **any** may be specified if an address does not matter. If a sequence number is specified, the new filter is inserted at the specified location. Otherwise, the new filter is added at the end of the access-list.

Note that specifying the **send-to-cpu** parameter could result in EPSR healthcheck messages and other control packets being dropped.

Optionally, the **vlan** and **inner-vlan** parameters can be matched for tagged (802.1q) packets.

The **no** variant of this command removes a MAC filter entry from the current hardware access-list. You can specify the MAC filter entry for removal by entering either its sequence number (e.g. `no 10`), or by entering its MAC filter profile without specifying its sequence number.

Note that the sequence number can be found by running the **show access-list (IPv4 Hardware ACLs)** command on page 61.39.

Syntax [mac]

```
[<sequence-number>]
   {deny|permit|send-to-cpu|copy-to-cpu|copy-to-mirror}
   mac {<source-mac-address> <source-mac-mask>|any}
   {<destination-mac-address> <destination-mac-mask>|any}
   [{vlan <1-4094>|inner-vlan <1-4094>}]

no {deny|permit|send-to-cpu|copy-to-cpu|copy-to-mirror}
   mac {<source-mac-address> <source-mac-mask>|any}
   {<destination-mac-address> <destination-mac-mask>|any}
   [{vlan <1-4094>|inner-vlan <1-4094>}]

no <sequence-number>
```

Parameter	Description
<sequence-number>	<1-65535> The sequence number for the filter entry of the selected access control list.
deny	Specify packets to reject.
permit	Specify packets to accept.
send-to-cpu	Specify packets to send to the CPU. Specifying this parameter could result in EPSR healthcheck messages and other control packets being dropped.
copy-to-cpu	Specify packets to copy to the CPU.
copy-to-mirror	Specify packets to copy to the CPU.
mac	MAC address.
<source-mac-address>	The source MAC address of the packets. Enter this in the format <HHHH.HHHH.HHHH> Where each H is a hexadecimal number that represents a 4 bit binary number.

Parameter(cont.)	Description(cont.)
<source-mac-mask	The mask that will be applied to the source MAC addresses. Enter this in the format <HHHH.HHHH.HHHH> Where each H is a hexadecimal number that represents a 4 bit binary number. For a mask, each value will be either `0` or `F`. Where Hex `FF` = Ignore, and Hex `00` = Match.
`any`	Any source MAC host.
<destination-mac-address>	The destination MAC address of the packets. Enter this in the format <HHHH.HHHH.HHHH> Where each H is a hexadecimal number that represents a 4 bit binary number.
<destination-mac-mask>	The mask that will be applied to the destination MAC addresses. Enter this in the format <HHHH.HHHH.HHHH> Where each H is a hexadecimal number that represents a 4 bit binary number. For a mask, each value will be either `0` or `F`. Where Hex `FF` = Ignore, and Hex `00` = Match.
`any`	Any destination MAC host.
`vlan`	Specifies that the ACL will match on the ID in the packet's VLAN tag.
<1-4094>	The VLAN VID.
`inner-vlan`	This parameter is used within double-tagged VLANs. It is the inner VLAN tag (VID); sometimes referred to as the C-TAG (Customer VLAN TAG), where the vlan VID tag is referred to as the S-TAG (Service VLAN TAG).
<1-4094>	The inner VLAN VID.

Mode IPv4 Hardware ACL Configuration

Default Any traffic on an interface controlled by a hardware ACL that does not explicitly match a filter is permitted.

Usage First create a named hardware access-list that applies the appropriate permit, deny requirements etc. Then use the **access-group** command on page 61.4 to apply this access-list to a specific port or range. Note that this command will apply the access-list only to **incoming** data packets.

An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 10 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number

Note

The access control list being configured is selected by running the **access-list hardware (named)** command on page 61.19. with the required access control list number, or name, but with no further parameters selected.

Note Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

Example To add an access-list filter entry to the access-list named `my-list` that will permit packets with a source MAC address of `0000.00ab.1234` and any destination MAC address, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# permit mac 0000.00ab.1234
0000.0000.0000 any
```

Example To remove an access-list filter entry that permit packets with a source MAC address of `0000.00ab.1234` and any destination MAC address, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# no permit mac 0000.00ab.1234
0000.0000.0000 any
```

Related Commands
access-group
access-list hardware (named)
show running-config

(access-list hardware TCP UDP filter)

Use this ACL filter to add a TCP or UDP filter entry to the current hardware access-list. The filter will match on any TCP or UDP type packet that has the specified source and destination IP addresses. The parameter **any** may be specified if an address does not matter. If a sequence number is specified, the new filter is inserted at the specified location. Otherwise, the new filter is added at the end of the access-list.

Note that specifying the **send-to-cpu** parameter could result in EPSR healthcheck messages and other control packets being dropped.

The optional **vlan** parameter can be applied to match tagged (802.1q) packets.

The **no** variant of this command removes a TCP or UDP filter entry from the current hardware access-list. You can specify the TCP or UDP filter entry for removal by entering either its sequence number (e.g. `no 10`), or by entering its TCP or UDP filter profile without specifying its sequence number.

Note that the sequence number can be found by running the **show access-list (IPv4 Hardware ACLs)** command on page 61.39.

Syntax [tcp|udp]

```
[<sequence-number>]
   {deny|permit|send-to-cpu|copy-to-cpu|copy-to-mirror}
   {tcp|udp}
   [<source>|
   eq <sourceport>|gt <sourceport>|lt <sourceport>|
   ne <sourceport>|range <start-range> <end-range>]
   [<destination>|
   eq <destport>|gt <destport>|lt <destport>|
   ne <destport>|range <start-range> <end-range>]
   [vlan <1-4094>]

no {deny|permit|send-to-cpu|copy-to-cpu|copy-to-mirror}
   {tcp|udp}
   [<source>|
   eq <sourceport>|gt <sourceport>|lt <sourceport>|
   ne <sourceport>|range <start-range> <end-range>]
   [<destination>|
   eq <destport>|gt <destport>|lt <destport>|
   ne <destport>|range <start-range> <end-range>]
   [vlan <1-4094>]

no <sequence-number>
```

Parameter	Description
<sequence-number>	<1-65535> The sequence number for the filter entry of the selected access control list.
deny	Access-list rejects packets that match the source and destination filtering specified with this command.
permit	Access-list permits packets that match the source and destination filtering specified with this command.
send-to-cpu	Specify packets to send to the CPU. Specifying this parameter could result in EPSR healthcheck messages and other control packets being dropped.

Parameter(cont.)	**Description**(cont.)	
`copy-to-cpu`	Specify packets to copy to the CPU.	
`copy-to-mirror`	Specify packets to copy to the mirror port.	
`tcp`	TCP packets.	
`udp`	UDP packets.	
<source>	The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:	
	`any`	Matches any source IP address.
	`host` *<ip-addr>*	Matches a single source host with the IP address given by *<ip-addr>* in dotted decimal notation.
	<ip-addr>/*<prefix>*	An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.
	<ip-addr> *<reverse-mask>*	Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering `192.168.1.1 0.0.0.255` is the same as entering `192.168.1.1/24`.
<sourceport>	The source TCP or UDP port number, specified as an integer between 0 and 65535.	

Parameter(cont.)	**Description**(cont.)	
<destination>	The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:	
	`any`	Matches any destination IP address.
	`host` *<ip-addr>*	Matches a single destination host with the IP address given by *<ip-addr>* in dotted decimal notation.
	<ip-addr>`/`*<prefix>*	An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.
	<ip-addr> *<reverse-mask>*	Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering `192.168.1.1 0.0.0.255` is the same as entering `192.168.1.1/24`.
`eq`	Equal to.	
`lt`	Less than.	
`gt`	Greater than.	
`ne`	Not equal to.	
<destport>	The source TCP or UDP port number, specified as an integer between 0 and 65535.	
`range`	Specify the range of port numbers between 0 and 65535.	
<start-range>	The source or destination port number at the start of the range *<0-65535>*.	
<end-range>	The source or destination port number at the end of the range *<0-65535>*.	
`vlan`	Specifies that the ACL will match on the ID in the packet's VLAN tag.	
<1-4094>	The VLAN VID.	

Mode IPv4 Hardware ACL Configuration

Default Any traffic on an interface controlled by a hardware ACL that does not explicitly match a filter is permitted.

Usage

First create a named hardware access-list that applies the appropriate permit, deny requirements etc. Then use the **access-group** command on page 61.4 to apply this access-list to a specific port or range. Note that this command will apply the access-list only to **incoming** data packets.

An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 10 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

Note

The access control list being configured is selected by running the **access-list hardware (named)** command on page 61.19. with the required access control list number, or name, but with no further parameters selected.

Note

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

Related Commands

access-list hardware (named)
show running-config
show access-list (IPv4 Hardware ACLs)

commit (IPv4)

Use this command to commit the IPv4 ACL filter configuration entered at the console to the hardware immediately without exiting the IPv4 Hardware ACL Configuration mode.

This command forces the associated hardware and software IPv4 ACLs to synchronize.

Syntax `commit`

Mode IPv4 Hardware ACL Configuration

Usage Normally, when an IPv4 hardware ACL is edited, the new configuration state of the IPv4 ACL is not written to hardware until you exit IPv4 Hardware ACL Configuration mode. By entering this command you can ensure that the current state of a hardware access-list that is being edited is written to hardware immediately.

Scripts typically do not include the **exit** command to exit configuration modes, potentially leading to IPv4 ACL filters in hardware not being correctly updated. Using this **commit** command in a configuration script after specifying an IPv4 hardware ACL filter ensures that it is updated in the hardware immediately.

Examples To update the hardware with the IPv4 ACL filter configuration, use the command:

```
awplus# configure terminal
awplus(config)# access-list hardware my-hw-list
awplus(config-ip-hw-acl)# commit
```

Related Commands **access-list hardware (named)**

show access-group

Use this command to show the access-lists attached globally. If an access-list is specified, only that access-list will be displayed.

Syntax `show access-group [{<3000-3699>|<4000-4699>|<access-list-name>}]`

Parameter	Description
<3000-3699>	Specify a Hardware IP access-list.
<4000-4699>	Specify a Hardware MAC access-list.
<access-list-name>	Specify a Hardware IPv4 access-list name.

Mode User Exec and Privileged Exec

Example To show all access-lists attached globally:

```
awplus# show access-group
```

Output **Figure 61-1: Example output from the show access-group command**

```
Global access control list
access-group 3000
access-group 4000
```

Related Commands ip prefix-list

show access-list (IPv4 Hardware ACLs)

Use this command to display the specified access-list, or all access-lists if none have been specified. Note that only defined access-lists are displayed. An error message is displayed for an undefined access-list.

Syntax

```
show access-list
    [<1-99>|<100-199>|<1300-1999>|<2000-2699>|<3000-3699>|
    <4000-4499>|<access-list-name>]
```

Parameter	Description
<1-99>	IP standard access-list.
<100-199>	IP extended access-list.
<1300-1999>	IP standard access-list (standard - expanded range).
<2000-2699>	IP extended access-list (extended - expanded range).
<3000-3699>	Hardware IP access-list.
<4000-4499>	Hardware MAC access-list.
<access-list-name>	IP named access-list.

Mode User Exec and Privileged Exec

Example To show all access-lists configured on the switch:

```
awplus# show access-list
```

```
Standard IP access list 1
    deny 172.16.2.0, wildcard bits 0.0.0.255
Standard IP access list 20
    deny 192.168.10.0, wildcard bits 0.0.0.255
    deny 192.168.12.0, wildcard bits 0.0.0.255
Hardware IP access list 3001
    permit ip 192.168.20.0 255.255.255.0 any
Hardware IP access list 3020
    permit tcp any 192.0.2.0/24
awplus#show access-list 20
```

Example To show the access-list with an ID of 20:

```
awplus# show access-list 20
```

```
Standard IP access-list 20
    deny 192.168.10.0, wildcard bits 0.0.0.255
    deny 192.168.12.0, wildcard bits 0.0.0.255
```

Note the below error message if you attempt to show an undefined access-list:

```
awplus# show access-list 2
```

```
% Can't find access-list 2
```

Related Commands

access-list extended (named)
access-list (hardware MAC numbered)
access-list hardware (named)

show interface access-group

Use this command to display the access groups attached to a port. If an access group is specified, then the output only includes the ports that the specified access group is attached to. If no access group is specified then this command displays all access groups that are attached to the ports that are specified with *<port-list>*.

Note that **access group** is the term given for an access-list when it is applied to an interface.

Note This command will function on your switch in stand-alone mode. but is not supported when the device forms part of a VCStack.

Syntax

```
show interface <port-list> access-group
   [<3000-3699>|<4000-4699>|<access-list-name>]

show interface <port-list> access-group [<3000-3699>|<4000-4699>]
```

Parameter	Description
<port-list>	Specify the ports to display information. A port-list can be either: ■ a switch port (e.g. port1.0.12) a static channel group (e.g., sa3) or a dynamic (LACP) channel group (e.g., po3) ■ a continuous range of ports separated by a hyphen, e.g., port1.0.1-1.0.24 or port1.0.1-port1.0.24 or po1-po4 ■ a comma-separated list of ports and port ranges, e.g. port1.0.1,port1.0.3-1.0.24. Do not mix switch ports, static channel groups, and LACP channel groups in the same list.
`access group`	Select the access group whose details you want to show.
<3000-3699>	Specifies the Hardware IP access-list.
<4000-4699>	Specifies the Hardware MAC access-list.
<access-list-name>	Specify the Hardware IPv4 access-list name.

Mode User Exec and Privileged Exec

Example To show all access-lists attached to `port1.0.1`, use the command:

```
awplus# show interface port1.0.1 access-group
```

Output **Figure 61-2: Example output from the show interface access-group command**

```
Interface port1.0.1
  access-group 3000
  access-group 3002
  access-group 3001
```

Introduction

This chapter provides an alphabetical reference for the IPv4 Software Access Control List (ACL) commands, and contains detailed command information and command examples about IPv4 software ACLs as applied to Routing and Multicasting, which are not applied to interfaces.

Note

See **Chapter 60, Access Control Lists Introduction** for descriptions of ACLs, and for further information about rules when applying ACLs see the **ACL Rules** section.

See **ACL Filter Sequence Numbers** and **ACL Filter Sequence Number Behavior** sections in **Chapter 60, Access Control Lists Introduction** about ACL Filters.

See all relevant Routing commands and configurations in **"IPv4 Software Access Control List (ACL) Commands"** and all relevant Multicast commands and configurations in **"Multicast Applications"**.

To apply ACLs to an LACP channel group, apply it to all the individual switch ports in the channel group. To apply ACLs to a static channel group, apply it to the static channel group itself. For more information on link aggregation see **Chapter 22, Link Aggregation Introduction and Configuration**, and **Chapter 23, Link Aggregation Commands**.

Note

Text in parenthesis in command names indicates usage not keyword entry. For example, **access-list hardware (named)** indicates named IPv4 hardware ACLs entered as `access-list hardware` <*name*> where <*name*> is a placeholder not a keyword.

Note

Parenthesis surrounding ACL filters indicates the type of ACL filter not the keyword entry in the CLI, such as **(access-list standard numbered filter)** represents command entry in the format shown in the syntax `[<sequence-number>] {deny|permit} {<source>|host <host-address>|any}`.

Note

Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

IPv4 Software Access List Commands and Prompts

Many of the ACL commands operate from sub-modes that are specific to particular ACL types. The table **"IPv4 Software Access List Commands and Prompts"** shows the CLI prompts at which ACL commands are entered.

Table 62-1: IPv4 Software Access List Commands and Prompts

Command Name	Command Mode	Prompt
clear ip prefix-list	Privileged Exec	awplus#
show ip access-list	Privileged Exec	awplus#
show ip prefix-list	Privileged Exec	awplus#
access-group	Global Configuration	awplus(config)#
access-list (extended numbered)	Global Configuration	awplus(config)#

(access-list extended IP protocol filter)	IPv4 Extended ACL Configuration	awplus(config-ip-ext-acl)#
(access-list extended TCP UDP filter)	IPv4 Extended ACL Configuration	awplus(config-ip-ext-acl)#
(access-list standard named filter)	IPv4 Standard ACL Configuration	awplus(config-ip-std-acl)#
(access-list standard numbered filter)	IPv4 Standard ACL Configuration	awplus(config-ip-std-acl)#

Command List

access-list extended (named)

This command configures an extended named access-list that permits or denies packets from specific source and destination IP addresses. You can either create an extended named ACL together with an ACL filter entry in the Global Configuration mode, or you can use the IPv4 Extended ACL Configuration mode for sequenced ACL filter entry after entering a list name.

The **no** variant of this command removes a specified extended named access-list.

Syntax [list-name]

```
access-list extended <list-name>

no access-list extended <list-name>
```

Parameter	Description
<list-name>	A user-defined name for the access-list

Syntax [icmp]

```
access-list extended <list-name>
   {deny|permit}
   icmp <source> <destination>
   [icmp-type <type-number>]
   [log]

no access-list extended <list-name>
   {deny|permit}
   icmp <source> <destination>
   [icmp-type <type-number>]
   [log]
```

Table 62-2: Parameters in the access-list extended (named) command - icmp

Parameter	Description
<list-name>	A user-defined name for the access-list.
deny	The access-list rejects packets that match the type, source, and destination filtering specified with this command.
permit	The access-list permits packets that match the type, source, and destination filtering specified with this command.
icmp	The access-list matches only ICMP packets.
icmp-type	Matches only a specified type of ICMP messages. This is valid only when the filtering is set to match ICMP packets.

Table 62-2: Parameters in the access-list extended (named) command - icmp(cont.)

Parameter(cont.)	**Description**(cont.)	
<source>	The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:	
	`any`	Matches any source IP address.
	`host` *<ip-addr>*	Matches a single source host with the IP address given by *<ip-addr>* in dotted decimal notation.
	<ip-addr>`/` *<prefix>*	An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.
	<ip-addr> *<reverse-mask>*	Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering `192.168.1.1 0.0.0.255` is the same as entering `192.168.1.1/24`.
<destination>	The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:	
	`any`	Matches any destination IP address.
	`host` *<ip-addr>*	Matches a single destination host with the IP address given by *<ip-addr>* in dotted decimal notation.
	<ip-addr>`/` *<prefix>*	An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.
	<ip-addr> *<reverse-mask>*	Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering `192.168.1.1 0.0.0.255` is the same as entering `192.168.1.1/24`.

Table 62-2: Parameters in the access-list extended (named) command - icmp(cont.)

Parameter(cont.)	**Description**(cont.)	
<type-number>	The ICMP type, as defined in RFC792 and RFC950. Specify one of the following integers to create a filter for the ICMP message type:	
	0	Echo replies.
	3	Destination unreachable messages.
	4	Source quench messages.
	5	Redirect (change route) messages.
	8	Echo requests.
	11	Time exceeded messages.
	12	Parameter problem messages.
	13	Timestamp requests.
	14	Timestamp replies.
	15	Information requests.
	16	Information replies.
	17	Address mask requests.
	18	Address mask replies.
`log`	Logs the results.	

Syntax [tcp|udp]

```
access-list extended <list-name>
    {deny|permit}
    {tcp|udp}
    <source>
    [eq <sourceport>|lt <sourceport>|gt <sourceport>|ne <sourceport>]
    <destination>
    [eq <destport>|lt <destport>|gt <destport>|ne <destport>]
    [log]]

no access-list extended <list-name>
    {deny|permit}
    {tcp|udp}
    <source>
    [eq <sourceport>|lt <sourceport>|gt <sourceport>|ne <sourceport>]
    <destination>
    [eq <destport>|lt <destport>|gt <destport>|ne <destport>]
    [log]]
```

Table 62-3: Parameters in the access-list extended (named) command - tcp|udp

Parameter	Description	
<list-name>	A user-defined name for the access-list.	
deny	The access-list rejects packets that match the type, source, and destination filtering specified with this command.	
permit	The access-list permits packets that match the type, source, and destination filtering specified with this command.	
tcp	The access-list matches only TCP packets.	
udp	The access-list matches only UDP packets.	
<source>	The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:	
	any	Matches any source IP address.
	host *<ip-addr>*	Matches a single source host with the IP address given by *<ip-addr>* in dotted decimal notation.
	<ip-addr>/<prefix>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.
	<ip-addr> <reverse-mask>	Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering `192.168.1.1 0.0.0.255` is the same as entering `192.168.1.1/24`.

Table 62-3: Parameters in the access-list extended (named) command - tcp|

Parameter(cont.)	**Description**(cont.)	
<destination>	The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:	
	`any`	Matches any destination IP address.
	`host` *<ip-addr>*	Matches a single destination host with the IP address given by *<ip-addr>* in dotted decimal notation.
	<ip-addr>/ *<prefix>*	An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.
	<ip-addr> *<reverse-mask>*	Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering `192.168.1.1 0.0.0.255` is the same as entering `192.168.1.1/24`.
<sourceport>	The source port number, specified as an integer between 0 and 65535.	
<destport>	The destination port number, specified as an integer between 0 and 65535.	
`eq`	Matches port numbers equal to the port number specified immediately after this parameter.	
`lt`	Matches port numbers less than the port number specified immediately after this parameter.	
`gt`	Matches port numbers greater than the port number specified immediately after this parameter.	
`ne`	Matches port numbers not equal to the port number specified immediately after this parameter.	
`log`	Log the results.	

Syntax [proto|any|ip]

```
access-list extended <list-name>
    {deny|permit}
    {proto <ip-protocol>|any|ip}
    {<source>}
    {<destination>}
    [log]

no access-list extended <list-name>
    {deny|permit}
    {proto <ip-protocol>|any|ip}
    {<source>}
    {<destination>}
    [log]
```

Table 62-4: Parameters in the access-list extended (named) command - proto|ip|any

Parameter	Description	
<list-name>	A user-defined name for the access-list.	
deny	The access-list rejects packets that match the type, source, and destination filtering specified with this command.	
permit	The access-list permits packets that match the type, source, and destination filtering specified with this command.	
proto	Matches only a specified type of IP Protocol.	
any	The access-list matches any type of IP packet.	
ip	The access-list matches only IP packets.	
<source>	The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:	
	any	Matches any source IP address.
	host *<ip-addr>*	Matches a single source host with the IP address given by *<ip-addr>* in dotted decimal notation.
	<ip-addr>/*<prefix>*	An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.
	<ip-addr> *<reverse-mask>*	Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering 192.168.1.1 0.0.0.255 is the same as entering 192.168.1.1/24.

Table 62-4: Parameters in the access-list extended (named) command - proto|ip|

Parameter(cont.	Description(cont.)	
<destination>	The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:	
	`any`	Matches any destination IP address.
	`host` *<ip-addr>*	Matches a single destination host with the IP address given by *<ip-addr>* in dotted decimal notation.
	<ip-addr>`/`*<prefix>*	An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.
	<ip-addr> *<reverse-mask>*	Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering `192.168.1.1 0.0.0.255` is the same as entering `192.168.1.1/24`.
`log`	Logs the results.	
<ip-protocol>	The IP protocol number, as defined by IANA (Internet Assigned Numbers Authority **http://www.iana.org/assignments/protocol-numbers**)	
	Protocol Number	**Protocol Description [RFC Reference]**
	`1`	Internet Control Message [RFC792]
	`2`	Internet Group Management [RFC1112]
	`3`	Gateway-to-Gateway [RFC823]
	`4`	IP in IP [RFC2003]

Table 62-4: Parameters in the access-list extended (named) command - proto|ip|

Parameter(cont.	Description(cont.)	
<ip-protocol> (cont.)	**Protocol Number**	**Protocol Description [RFC Reference]**
	33	Datagram Congestion Control Protocol [RFC4340]
	48	DSR (Dynamic Source Routing Protocol) [RFC4728]
	50	ESP (Encap Security Payload) [RFC2406]
	51	AH (Authentication Header) [RFC2402]
	54	NARP (NBMA Address Resolution Protocol) [RFC1735]
	88	EIGRP (Enhanced Interior Gateway Routing Protocol)
	89	OSPFIGP [RFC1583]
	97	Ethernet-within-IP Encapsulation / RFC3378
	98	Encapsulation Header / RFC1241
	108	IP Payload Compression Protocol / RFC2393
	112	Virtual Router Redundancy Protocol / RFC3768
	134	RSVP-E2E-IGNORE / RFC3175
	135	Mobility Header / RFC3775
	136	UDPLite / RFC3828
	137	MPLS-in-IP / RFC4023
	138	MANET Protocols / RFC-ietf-manet-iana-07.txt
	139-252	Unassigned / IANA
	253	Use for experimentation and testing / RFC3692
	254	Use for experimentation and testing / RFC3692
	255	Reserved / IANA

Mode Global Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage Use this command when configuring access-list for filtering IP software packets. To enable backwards compatibility you can either create access-lists from within this command, or you can enter **access-list** followed by only the number. This latter method moves you to the IPv4 Extended ACL Configuration mode for the selected access-list number, and from here you can configure your access-lists by using the commands **(access-list extended ICMP filter)**, **(access-list extended IP filter)**, and **(access-list extended IP protocol filter)**.

The table **"IPv4 Software Access List Commands and Prompts" on page 62.3** shows the prompts at which ACL commands are entered. See the relevant links shown for the **Related Commands**.

Note that packets must match both the source and the destination details.

Note Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Example You can enter the extended named ACL in the Global Configuration mode together with the ACL filter entry on the same line, as in previous software releases as shown below:

```
awplus# configure terminal
awplus(config)# access-list extended TK deny tcp 2.2.2.3/24 eq
14 3.3.3.4/24 lt 12 log
```

Alternatively, you can enter the extended named ACL in Global Configuration mode before specifying the ACL filter entry in the IPv4 Extended ACL Configuration mode, as shown below:

```
awplus# configure terminal
awplus(config)# access-list extended TK
awplus(config-ip-ext-acl)# deny tcp 2.2.2.3/24 eq 14 3.3.3.4/24
lt 12 log
```

Related Commands
(access-list extended ICMP filter)
(access-list extended IP filter)
(access-list extended TCP UDP filter)
show access-group
show running-config
show ip access-list

access-list (extended numbered)

This command configures an extended numbered access-list that permits or denies packets from specific source and destination IP addresses. You can either create an extended numbered ACL together with an ACL filter entry in the Global Configuration mode, or you can use the IPv4 Extended ACL Configuration mode for sequenced ACL filter entry after entering a list number.

The **no** variant of this command removes a specified extended named access-list.

Syntax [list-number]

```
access-list {<100-199>|<2000-2699>}

no access-list {<100-199>|<2000-2699>}
```

Parameter	Description
<100-199>	IP extended access-list.
<2000-2699>	IP extended access-list (expanded range).

Syntax [deny|permit]

```
access-list {<100-199>|<2000-2699>}
   {deny|permit}
   ip <source> <destination>

no access-list {<100-199>|<2000-2699>}
   {deny|permit}
   ip <source> <destination>
```

Parameter	Description	
<100-199>	IP extended access-list.	
<2000-2699>	IP extended access-list (expanded range).	
`deny`	Access-list rejects packets that match the source and destination filtering specified with this command.	
`permit`	Access-list permits packets that match the source and destination filtering specified with this command.	
<source>	The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:	
	`any`	Matches any source IP address.
	`host` *<ip-addr>*	Matches a single source host with the IP address given by *<ip-addr>* in dotted decimal notation.
	<ip-addr> *<reverse-mask>*	An IPv4 address, followed by a reverse mask in dotted decimal format. For example, entering `192.168.1.1 0.0.0.255` is the same as entering `192.168.1.1/24`. This matches any source IP address within the specified subnet.

Parameter(cont.)	Description(cont.)	
<destination>	The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:	
	`any`	Matches any destination IP address.
	`host` *<ip-addr>*	Matches a single destination host with the IP address given by *<ip-addr>* in dotted decimal notation.
	<ip-addr> *<reverse-mask>*	An IPv4 address, followed by a reverse mask in dotted decimal format. For example, entering `192.168.1.1 0.0.0.255` is the same as entering `192.168.1.1/24`. This matches any destination IP address within the specified subnet.

Mode Global Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage Use this command when configuring access-list for filtering IP software packets. To enable backwards compatibility you can either create access-lists from within this command, or you can enter **access-list** followed by only the number. This latter method moves you to the IPv4 Extended ACL Configuration mode for the selected access-list number, and from here you can configure your access-lists by using the commands **(access-list extended ICMP filter)**, **(access-list extended IP filter)**, and **(access-list extended IP protocol filter)**.

The table **"IPv4 Software Access List Commands and Prompts" on page 62.3** shows the prompts at which ACL commands are entered. See the relevant links shown for the **Related Commands**.

Note that packets must match both the source and the destination details.

Note Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Example You can enter the extended named ACL in the Global Configuration mode together with the ACL filter entry on the same line, as in previous software releases as shown below:

```
awplus# configure terminal
awplus(config)# access-list 101 deny ip 172.16.10.0 0.0.0.255
any
```

Alternatively, you can enter the extended named ACL in Global Configuration mode before specifying the ACL filter entry in the IPv4 Extended ACL Configuration mode, as shown below:

```
awplus# configure terminal
awplus(config)# access-list 101
awplus(config-ip-ext-acl)# deny ip 172.16.10.0 0.0.0.255 any
```

Related Commands

(access-list extended ICMP filter)
(access-list extended IP filter)
(access-list extended TCP UDP filter)
show access-group
show running-config
show ip access-list

(access-list extended ICMP filter)

Use this ACL filter to add a new ICMP filter entry to the current extended access-list. If the sequence number is specified, the new filter is inserted at the specified location. Otherwise, the new filter is added at the end of the access-list.

The **no** variant of this command removes an ICMP filter entry from the current extended access-list. You can specify the ICMP filter entry for removal by entering either its sequence number (e.g. `no 10`), or by entering its ICMP filter profile without specifying its sequence number.

Note that the sequence number can be found by running the **show access-list (IPv4 Software ACLs)** command.

Syntax [icmp]

```
[<sequence-number>] {deny|permit}
    icmp <source> <destination>
    [icmp-type <icmp-value>] [log]

no {deny|permit} icmp <source> <destination>
    [icmp-type <icmp-value>] [log]

no <sequence-number>
```

Parameter	Description	
<sequence-number>	<1-65535> The sequence number for the filter entry of the selected access control list.	
deny	Access-list rejects packets that match the source and destination filtering specified with this command.	
permit	Access-list permits packets that match the source and destination filtering specified with this command.	
icmp	ICMP packet type.	
<source>	The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:	
	<ip-addr>/<prefix>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.
	any	Matches any source IP address.
<destination>	The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:	
	<ip-addr>/<prefix>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.
	any	Matches any destination IP address.
icmp-type	The ICMP type.	

Parameter(cont.)	Description(cont.)
<icmp-value>	The value of the ICMP type.
log	Log the results.

Mode IPv4 Extended ACL Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 10 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

Note
The access control list being configured is selected by running the **access-list (extended numbered)** command or the **access-list extended (named)** command, with the required access control list number, or name - but with no further parameters selected.

Note
Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Examples To add a new entry in access-list called `my-list` that will reject ICMP packets from `10.0.0.1` to `192.168.1.1`, use the commands:

```
awplus# configure terminal
awplus(config)# access-list extended my-list
awplus(config-ip-ext-acl)# deny icmp 10.0.0.1/32 192.168.1.1/32
```

Use the following commands to add a new filter at sequence number `5` position of the access-list called `my-list`. The filter will accept the ICMP type `8` packets from `10.1.1.0/24` network, to `192.168.1.0` network:

```
awplus# configure terminal
awplus(config)# access-list extended my-list
awplus(config-ip-ext-acl)# 5 permit icmp 10.1.1.0/24
192.168.1.0/24 icmp-type 8
```

Related Commands
access-group
show access-group
show running-config
show ip access-list

(access-list extended IP filter)

Use this ACL filter to add a new IP filter entry to the current extended access-list. If the sequence number is specified, the new filter is inserted at the specified location. Otherwise, the new filter is added at the end of the access-list.

The **no** variant of this command removes an IP filter entry from the current extended access-list. You can specify the IP filter entry for removal by entering either its sequence number (e.g. `no 10`), or by entering its IP filter profile without specifying its sequence number.

Note that the sequence number can be found by running the **show access-list (IPv4 Software ACLs)** command.

Syntax [ip]

```
[<sequence-number>] {deny|permit} ip <source> <destination>
no {deny|permit} ip <source> <destination>
no <sequence-number>
```

Parameter	Description	
<sequence-number>	<1-65535> The sequence number for the filter entry of the selected access control list.	
`deny`	Access-list rejects packets that match the source and destination filtering specified with this command.	
`permit`	Access-list permits packets that match the source and destination filtering specified with this command.	
<source>	The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:	
	`any`	Matches any source IP address.
	`host` *<ip-addr>*	Matches a single source host with the IP address given by *<ip-addr>* in dotted decimal notation.
	<ip-addr> *<reverse-mask>*	Alternatively, enter an IPv4 address followed by a reverse mask in dotted decimal format. For example, enter `192.168.1.1 0.0.0.255`.
<destination>	The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:	
	`any`	Matches any destination IP address.
	`host` *<ip-addr>*	Matches a single destination host with the IP address given by *<ip-addr>* in dotted decimal notation.
	<ip-addr> *<reverse-mask>*	Alternatively, enter an IPv4 address followed by a reverse mask in dotted decimal format. For example, enter `192.168.1.1 0.0.0.255`.

Mode Extended ACL Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 10 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

Note

The access control list being configured is selected by running the **access-list (extended numbered)** command or the **access-list extended (named)** command, with the required access control list number, or name - but with no further parameters selected.

Note

Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Example 1 [list-number] First use the following commands to enter the IPv4 Extended ACL Configuration mode and define a numbered extended access-list `101`:

```
awplus# configure terminal
awplus(config)# access-list 101
awplus(config-ip-ext-acl)#
```

Then use the following commands to add a new entry to the numbered extended access-list `101` that will reject packets from `10.0.0.1` to `192.168.1.1`:

```
awplus(config-ip-ext-acl)# deny ip host 10.0.0.1 host
                           192.168.1.1
awplus(config-ip-ext-acl)# 20 permit ip any any
```

Example 2 [list-name] First use the following commands to enter the IPv4 Extended ACL Configuration mode and define a named access-list called `my-acl`:

```
awplus# configure terminal
awplus(config)# access-list extended my-acl
awplus(config-ip-ext-acl)#
```

Then use the following commands to add a new entry to the named access-list `my-acl` that will reject packets from `10.0.0.1` to `192.168.1.1`:

```
awplus(config-ip-ext-acl)# deny ip host 10.0.0.1 host
                           192.168.1.1
awplus(config-ip-ext-acl)# 20 permit ip any any
```

Example 3 [list-number] Use the following commands to remove the access-list filter entry with sequence number `20` from extended numbered access-list `101`.

```
awplus# configure terminal
awplus(config)# access-list 101
awplus(config-ip-ext-acl)# no 20
```

Example 4 [list-name] Use the following commands to remove the access-list filter entry with sequence number `20` from extended named access-list `my-acl`:.

```
awplus# configure terminal
awplus(config)# access-list extended my-acl
awplus(config-ip-ext-acl)# no 20
```

Related Commands

access-list extended (named)
access-list (extended numbered)
show access-group
show running-config
show ip access-list

(access-list extended IP protocol filter)

Use this ACL filter to add a new IP protocol type filter entry to the current extended access-list. If the sequence number is specified, the new filter is inserted at the specified location. Otherwise, the new filter is added at the end of the access-list.

The **no** variant of this command removes an IP protocol filter entry from the current extended access-list. You can specify the IP filter entry for removal by entering either its sequence number (e.g. `no 10`), or by entering its IP filter profile without specifying its sequence number.

Note that the sequence number can be found by running the **show access-list (IPv4 Software ACLs)** command.

Syntax [proto]

```
[<sequence-number>] {deny|permit} proto <ip-protocol>
   <source> <destination> [log]

no {deny|permit} proto <ip-protocol> <source> <destination> [log]

no <sequence-number>
```

Parameter	Description
<sequence-number>	<1-65535> The sequence number for the filter entry of the selected access control list.
`deny`	Access-list rejects packets that match the source and destination filtering specified with this command.
`permit`	Access-list permits packets that match the source and destination filtering specified with this command.
`proto` *<ip-protocol>*	The IP Protocol type specified by its protocol number <1-255>.
<ip-protocol>	The IP protocol number, as defined by IANA (Internet Assigned Numbers Authority **http://www.iana.org/assignments/protocol-numbers**).

Protocol Number	Protocol Description [RFC Reference]
1	Internet Control Message [RFC792]
2	Internet Group Management [RFC1112]
3	Gateway-to-Gateway [RFC823]
4	IP in IP [RFC2003]

	139-252	Unassigned / IANA
	253	Use for experimentation and testing / RFC3692
	254	Use for experimentation and testing / RFC3692
	255	Reserved / IANA

Parameter(cont.)	Description(cont.)	
<source>	The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:	
	<ip-addr>/<prefix>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.
	any	Matches any source IP address.
<destination>	The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:	
	<ip-addr>/<prefix>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.
	any	Matches any destination IP address.
log	Log the results.	

Mode IPv4 Extended ACL Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 10 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

Note The access control list being configured is selected by running the **access-list (extended numbered)** command or the **access-list extended (named)** command, with the required access control list number, or name - but with no further parameters selected.

Note Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Example 1 [creating a list] Use the following commands to add a new access-list filter entry to the access-list named `my-list` that will reject IP packets from source address `10.10.1.1/32` to destination address `192.68.1.1/32`:

```
awplus# configure terminal
awplus(config)# access-list extended my-list
awplus(config-ip-ext-acl)# deny ip 10.10.1.1/32 192.168.1.1/32
```

Example 2 [adding to a list]

Use the following commands to add a new access-list filter entry at sequence position `5` in the access-list named `my-list` that will accept packets from source address `10.10.1.1/24` to destination address `192.68.1.1/24`:

```
awplus# configure terminal
awplus(config)# access-list extended my-list
awplus(config-ip-ext-acl)# 5 permit ip 10.10.1.1/24 192.168.1.1/
24
```

Related Commands

access-list extended (named)
access-list (extended numbered)
show access-group
show running-config
show ip access-list

(access-list extended TCP UDP filter)

Use this ACL filter to add a new TCP or UDP filter entry to the current extended access-list. If the sequence number is specified, the new filter is inserted at the specified location. Otherwise, the new filter is added at the end of the access-list.

The **no** variant of this command removes a TCP or UDP filter entry from the current extended access-list. You can specify the TCP or UDP filter entry for removal by entering either its sequence number (e.g. `no 10`), or by entering its TCP or UDP filter profile without specifying its sequence number.

Note that the sequence number can be found by running the **show access-list (IPv4 Software ACLs)** command.

Syntax [tcp|udp]

```
[<sequence-number>] {deny|permit} {tcp|udp}
   <source>
   {eq <sourceport>|lt <sourceport>|gt <sourceport>|ne <sourceport>}
   <destination>
   [eq <destport>|lt <destport>|gt <destport>|ne <destport>]
   [log]

no {deny|permit} {tcp|udp}
   <source>
   {eq <sourceport>|lt <sourceport>|gt <sourceport>|ne <sourceport>}
   <destination>
   [eq <destport>|lt <destport>|gt <destport>|ne <destport>]
   [log]

no <sequence-number>
```

Parameter	Description	
<sequence-number>	<1-65535> The sequence number for the filter entry of the selected access control list.	
deny	Access-list rejects packets that match the source and destination filtering specified with this command.	
permit	Access-list permits packets that match the source and destination filtering specified with this command.	
tcp	The access-list matches only TCP packets.	
udp	The access-list matches only UDP packets.	
<source>	The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:	
	<ip-addr>/<prefix>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.
	any	Matches any source IP address.
<sourceport>	The source port number, specified as an integer between 0 and 65535.	

Parameter(cont.)	Description(cont.)	
<destination>	The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:	
	<ip-addr>/<prefix>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.
	`any`	Matches any destination IP address.
<destport>	The destination port number, specified as an integer between 0 and 65535.	
`eq`	Matches port numbers equal to the port number specified immediately after this parameter.	
`lt`	Matches port numbers less than the port number specified immediately after this parameter.	
`gt`	Matches port numbers greater than the port number specified immediately after this parameter.	
`ne`	Matches port numbers not equal to the port number specified immediately after this parameter.	
`log`	Log the results.	

Mode IPv4 Extended ACL Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 10 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

Note The access control list being configured is selected by running the **access-list (extended numbered)** command or the **access-list extended (named)** command, with the required access control list number, or name - but with no further parameters selected.

Note Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Example 1 [creating a list] To add a new entry to the access-list named `my-list` that will reject TCP packets from `10.0.0.1` on TCP port `10` to `192.168.1.1` on TCP port `20`, use the commands:

```
awplus# configure terminal
awplus(config)# access-list extended my-list
awplus(config-ip-ext-acl)# deny tcp 10.0.0.1/32 eq 10
                           192.168.1.1/32 eq 20
```

Example 2 [adding to a list]

To insert a new entry with sequence number `5` of the access-list named `my-list` that will accept UDP packets from `10.1.1.0/24` network to `192.168.1.0/24` network on UDP port `80`, use the commands:

```
awplus# configure terminal
awplus(config)# access-list extended my-list
awplus(config-ip-ext-acl)# 5 permit udp 10.1.1.0/24
192.168.1.0/24 eq 80
```

Related Commands

access-list extended (named)
access-list (extended numbered)
show access-group
show running-config
show ip access-list

access-list standard (named)

This command configures a standard named access-list that permits or denies packets from a specific source IP address. You can either create a standard named ACL together with an ACL filter entry in the Global Configuration mode, or you can use the IPv4 Standard ACL Configuration mode for sequenced ACL filter entry after first entering an access-list name.

The **no** variant of this command removes a specified standard named access-list.

Syntax [list-name]

```
access-list standard <standard-access-list-name>

no access-list standard <standard-access-list-name>
```

Parameter	Description
<standard-access-list-name>	Specify a name for the standard access-list.

Syntax [deny|permit]

```
access-list standard <standard-access-list-name> {deny|permit}
    <source>

no access-list standard <standard-access-list-name> {deny|permit}
    <source>
```

Parameter	Description	
<standard-access-list-name>	Specify a name for the standard access-list.	
deny	The access-list rejects packets that match the source filtering specified with this command.	
permit	The access-list permits packets that match the source filtering specified with this command.	
<source>	The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:	
	<ip-addr>/<prefix>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.
	any	Matches any source IP address.

Mode Global Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage Use this command when configuring a standard named access-list for filtering IP software packets. For backwards compatibility you can either create the access-list from within this command, or you can enter this command followed by only the standard access-list name then enter. This latter method moves you to the IPv4 Standard ACL Configuration mode for the selected standard named access-list, and from here you can configure the deny or permit filters for this selected standard named access-list.

See the table **"IPv4 Software Access List Commands and Prompts"** in this chapter which shows the prompts at which ACL commands are entered. See the relevant links shown for the **Related Commands**.

Note Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Examples To define a standard access-list named `my-list` and deny any packets from any source, use the commands:

```
awplus# configure terminal
awplus(config)# access-list standard my-list deny any
```

Alternatively, to define a standard access-list named `my-list` and enter the IPv4 Standard ACL Configuration mode to deny any packets from any source, use the commands:

```
awplus# configure terminal
awplus(config)# access-list standard my-list
awplus(config-ip-std-acl)# 5 deny any
```

Related Commands
(access-list standard named filter)
show access-group
show running-config
show ip access-list

access-list (standard numbered)

This command configures a standard numbered access-list that permits or denies packets from a specific source IP address. You can either create a standard numbered ACL together with an ACL filter entry in the Global Configuration mode, or you can use the IPv4 Standard ACL Configuration mode for sequenced ACL filter entry after first entering an access-list number.

The **no** variant of this command removes a specified standard numbered access-list.

Syntax [list-number]

```
access-list {<1-99>|<1300-1999>}
no access-list {<1-99>|<1300-1999>}
```

Parameter	Description
<1-99>	IP standard access-list.
<1300-1999>	IP standard access-list (expanded range).

Syntax [deny|permit]

```
access-list {<1-99>|<1300-1999>} {deny|permit} <source>
no access-list {<1-99>|<1300-1999>} {deny|permit} <source>
```

Parameter	Description	
<1-99>	IP standard access-list.	
<1300-1999>	IP standard access-list (expanded range).	
`deny`	Access-list rejects packets from the specified source.	
`permit`	Access-list accepts packets from the specified source.	
<source>	The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:	
	<ip-addr> <reverse-mask>	Enter an IPv4 address followed by a reverse mask in dotted decimal format. For example, entering `192.168.1.1 0.0.0.255` is the same as entering `192.168.1.1/24`.
	`any`	Matches any source IP address.

Mode Global Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage Use this command when configuring a standard numbered access-list for filtering IP software packets. For backwards compatibility you can either create the access-list from within this command, or you can enter this command followed by only the standard access-list name. This moves you to the IPv4 Standard ACL Configuration mode for the selected standard numbered access-list, and from here you can configure the deny or permit filters for this selected standard numbered access-list.

See the table **"IPv4 Software Access List Commands and Prompts"** in this chapter which shows the prompts at which ACL commands are entered. See the relevant links shown for the **Related Commands**.

Note Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Example To create ACL number `67` that will deny packets from subnet `172.16.10`, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 67 deny 172.16.10.0 0.0.0.255
```

Alternatively, to enter the IPv4 Standard ACL Configuration mode to create the ACL filter and deny packets from subnet `172.16.10.0` for the standard numbered access-list `67`, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 67
awplus(config-ip-std-acl)# deny 172.16.10.0 0.0.0.255
```

Related Commands
(access-list standard named filter)
show access-group
show running-config
show ip access-list

(access-list standard named filter)

This ACL filter adds a source IP address filter entry to a current named standard access-list. If the sequence number is specified, the new filter entry is inserted at the specified location. Otherwise, the new entry is added at the end of the access-list.

The **no** variant of this command removes a source IP address filter entry from the current named standard access-list. You can specify the source IP address filter entry for removal by entering either its sequence number (e.g. `no 10`), or by entering its source IP address filter profile without specifying its sequence number.

Note that the sequence number can be found by running the **show access-list (IPv4 Software ACLs)** command.

Syntax

```
[<sequence-number>] {deny|permit} {<source> [exact-match]|any}
no {deny|permit} {<source> [exact-match]|any}
no <sequence-number>
```

Parameter	Description	
<sequence-number>	<1-65535> The sequence number for the filter entry of the selected access control list.	
deny	Access-list rejects packets of the source filtering specified.	
permit	Access-list allows packets of the source filtering specified	
<source>	The source address of the packets. You can specify either a subnet or all sources. The following are the valid formats for specifying the source:	
	<ip-addr>/<prefix>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.
	<ip-addr>	An IPv4 address in a.b.c.d format.
exact-match	Specify an exact IP prefix to match on.	
any	Matches any source IP address.	

Mode IPv4 Standard ACL Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 10 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

Note The access control list being configured is selected by running the **access-list standard (named)** command with the required access control list number, or name, but with no further parameters selected.

Note Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Example Use the following commands to add a new filter entry to access-list `my-list` that will reject IP address `10.1.1.1`:

```
awplus# configure terminal
awplus(config)# access-list standard my-list
awplus(config-ip-std-acl)# deny 10.1.1.1/32
```

Example Use the following commands to insert a new filter entry into access-list `my-list` at sequence position number `15` that will accept IP network `10.1.2.0`:

```
awplus# configure terminal
awplus(config)# access-list standard my-list
awplus(config-ip-std-acl)# 15 permit 10.1.2.0/24
```

Related Commands
access-list standard (named)
show access-group
show running-config
show ip access-list

(access-list standard numbered filter)

This ACL filter adds a source IP address filter entry to a current standard numbered access-list. If a sequence number is specified, the new filter entry is inserted at the specified location. Otherwise, the new filter entry is added at the end of the access-list.

The **no** variant of this command removes a source IP address filter entry from the current standard numbered access-list. You can specify the source IP address filter entry for removal by entering either its sequence number (e.g. `no 10`), or by entering its source IP address filter profile without specifying its sequence number.

Note that the sequence number can be found by running the **show access-list (IPv4 Software ACLs)** command.

Syntax

```
[<sequence-number>] {deny|permit} {<source>|host <host-address>|any}
no {deny|permit} {<source>|host <host-address>|any}
no <sequence-number>
```

Parameter	Description	
<sequence-number>	<1-65535> The sequence number for the filter entry of the selected access control list.	
deny	Access-list rejects packets of the type specified.	
permit	Access-list allows packets of the type specified	
<source>	The source address of the packets. You can specify either a subnet or all sources. The following are the valid formats for specifying the source:	
	<ip-addr> <reverse-mask>	Enter a reverse mask for the source address in dotted decimal format. For example, entering `192.168.1.1 0.0.0.255` is the same as entering `192.168.1.1/24`.
	<ip-addr>	An IPv4 address in a.b.c.d format.
host	A single source host.	
<host-address>	Single source host address.	
any	Matches any source IP address.	

Mode IPv4 Standard ACL Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 10 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

Note The access control list being configured is selected by running the **access-list standard (named)** command with the required access control list number, or name, but with no further parameters selected.

Note Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Example To add a new entry accepting the IP network `10.1.1.0/24` at the sequence number `15` position, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 99
awplus(config-ip-std-acl)# 15 permit 10.1.2.0 0.0.0.255
```

Related Commands
access-list (standard numbered)
show access-group
show running-config
show ip access-list

clear ip prefix-list

Use this command to reset the hit count to zero in the prefix-list entries.

Syntax `clear ip prefix-list [<list-name>] [<ip-address>/<mask>]`

Parameter	Description
<list-name>	The name of the prefix-list.
<ip-address>/<mask>	The IP prefix and length.

Mode Privileged Exec

Example To clear a prefix-list named List1:

```
awplus# clear ip prefix-list List1
```

ip prefix-list

Use this command to create an entry for an IPv4 prefix list.

Use the **no** variant of this command to delete the IPv4 prefix-list entry.

Syntax

```
ip prefix-list <list-name> [seq <1-429496725>]
   {deny|permit}
   {any|<ip-prefix>}
   [ge <0-32>] [le <0-32>]

ip prefix-list <list-name> description <text>

ip prefix-list sequence-number

no ip prefix-list <list-name> [seq <1-429496725>]

no ip prefix-list <list-name> [description <text>]

no ip prefix-list sequence-number
```

Parameter	Description
`<list-name>`	Specifies the name of a prefix list.
`seq <1-429496725>`	Sequence number of the prefix list entry.
`deny`	Specifies that the prefixes are excluded from the list.
`permit`	Specifies that the prefixes are included in the list.
`<ip-prefix>`	Specifies the IPv4 address and length of the network mask in dotted decimal in the format A.B.C.D/M.
`any`	Any prefix match. Same as **0.0.0.0/0 le 32**.
`ge <0-32>`	Specifies the minimum prefix length to be matched.
`le <0-32>`	Specifies the maximum prefix length to be matched.
`description <text>`	Text description of the prefix list.
`sequence-number`	Specify sequence numbers included or excluded in prefix list.

Mode Global Configuration

Usage When the device processes a prefix list, it starts to match prefixes from the top of the prefix list, and stops whenever a permit or deny occurs. To promote efficiency, use the **seq** parameter and place common permits or denials towards the top of the list. If you do not use the **seq** parameter, the sequence values are generated in a sequence of 5.

The parameters **ge** and **le** specify the range of the prefix lengths to be matched. When setting these parameters, set the **le** value to be less than 32, and the **ge** value to be less than or equal to the **le** value and greater than the ip-prefix mask length.

Prefix lists implicitly exclude prefixes that are not explicitly permitted in the prefix list. This means if a prefix that is being checked against the prefix list reaches the end of the prefix list without matching a permit or deny, this prefix will be denied.

Example In the below sample configuration, the last `ip prefix-list` command in the below list matches all, and the first `ip prefix-list c`ommand denies the IP network `76.2.2.0`:

```
awplus(config)# router bgp 100
awplus(config-router)# network 172.1.1.0
awplus(config-router)# network 172.1.2.0
awplus(config-router)# neighbor 10.6.5.3 remote-as 300
awplus(config-router)# neighbor 10.6.5.3 prefix-list mylist out
awplus(config-router)# exit
awplus(config)# ip prefix-list mylist seq 5 deny
                 76.2.2.0/24
awplus(config)# ip prefix-list mylist seq 100 permit any
```

To deny the IP addresses between `10.0.0.0/14` (`10.0.0.0 255.252.0.0`) and `10.0.0.0/22` (`10.0.0.0 255.255.252.0`) within the `10.0.0.0/8` (`10.0.0.0 255.0.0.0`) addressing range, enter the following commands:.

```
awplus# configure terminal
awplus(config)# ip prefix-list mylist seq 12345 deny 10.0.0.0/
                8 ge 14 le 22
```

Related Commands

match ip address
neighbor prefix-list (BGP and BGP4+)
area filter-list
clear ip prefix-list
match route-type
show access-group
show ip prefix-list

maximum-access-list

Sets the maximum number of filters that can be added to any access-list. These are access-lists within the ranges <1-199>, <1300-1999> and <2000-2699> and named standard and extended access-lists.

The **no** variant of this command removes the limit on the number of filters that can be added to a software access-list

Syntax

```
maximum-access-list <1-4294967294>
no maximum-access-list
```

Parameter	Description
<1-4294967294>	Filter range.

Mode Global Configuration

Example To set the maximum number of software filters to `200`:

```
awplus# configure terminal
awplus(config)# maximum-access-list 200
```

show access-list (IPv4 Software ACLs)

Use this command to display the specified access-list, or all access-lists if none have been specified. Note that only defined access-lists are displayed. An error message is displayed for an undefined access-list

Syntax

```
show access-list
    [<1-99>|<100-199>|<1300-1999>|<2000-2699>|<3000-3699>|
    <4000-4499>|<access-list-name>]
```

Parameter	Description
<1-99>	IP standard access-list.
<100-199>	IP extended access-list.
<1300-1999>	IP standard access-list (standard - expanded range).
<2000-2699>	IP extended access-list (extended - expanded range).
<3000-3699>	Hardware IP access-list.
<4000-4499>	Hardware MAC access-list.
<access-list-name>	IP named access-list.

Mode User Exec and Privileged Exec

Example To show all access-lists configured on the switch:

```
awplus# show access-list
```

```
Standard IP access list 1
    deny 172.16.2.0, wildcard bits 0.0.0.255
Standard IP access list 20
    deny 192.168.10.0, wildcard bits 0.0.0.255
    deny 192.168.12.0, wildcard bits 0.0.0.255
Hardware IP access list 3001
    permit ip 192.168.20.0 255.255.255.0 any
Hardware IP access list 3020
    permit tcp any 192.0.2.0/24
awplus#show access-list 20
```

Example To show the access-list with an ID of 20:

```
awplus# show access-list 20
```

```
Standard IP access-list 20
    deny 192.168.10.0, wildcard bits 0.0.0.255
    deny 192.168.12.0, wildcard bits 0.0.0.255
```

Note the below error message if you attempt to show an undefined access-list:

```
awplus# show access-list 2
```

```
% Can't find access-list 2
```

Related Commands

access-list standard (named)
access-list (standard numbered)
access-list (extended numbered)

show ip access-list

Use this command to display IP access-lists.

Syntax

```
show ip access-list [<1-99>|<100-199>|<1300-1999>|<2000-2699>|
   <access-list-name>]
```

Parameter	Description
<1-99>	IP standard access-list.
<100-199>	IP extended access-list.
<1300-1999>	IP standard access-list (expanded range).
<2000-2699>	IP extended access-list (expanded range).
<access-list-name>	IP named access-list.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip access-list
```

Output **Figure 62-1: Example output from the show ip access-list command**

```
Standard IP access-list 1
    permit 172.168.6.0, wildcard bits 0.0.0.255
    permit 192.168.6.0, wildcard bits 0.0.0.255
```

show ip prefix-list

Use this command to display the IPv4 prefix-list entries. Note that this command is valid for RIP and BGP routing protocols only.

Syntax `show ip prefix-list [<name>|detail|summary]`

Parameter	Description
<name>	Specify the name of a prefix list in this placeholder.
`detail`	Specify this parameter to show detailed output for all IPv4 prefix lists.
`summary`	Specify this parameter to show summary output for all IPv4 prefix lists.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip prefix-list
awplus# show ip prefix-list 10.10.0.98/8
awplus# show ip prefix-list detail
```

Related Commands ip prefix-list

Chapter 63: IPv6 Hardware Access Control List (ACL) Commands

Introduction 63.2
IPv6 Hardware Access List Commands and Prompts 63.3
Command List 63.4
commit (IPv6) 63.4
ipv6 access-list (named) 63.5
(ipv6 access-list named ICMP filter) 63.7
(ipv6 access-list named protocol filter) 63.10
(ipv6 access-list named TCP UDP filter) 63.14
ipv6 traffic-filter 63.18
show ipv6 access-list (IPv6 Hardware ACLs) 63.20

Introduction

This chapter provides an alphabetical reference for the IPv6 Hardware Access Control List (ACL) commands, and contains detailed command information and command examples about IPv6 hardware ACLs, which are applied directly to interfaces using the **ipv6 traffic-filter** command.

Note

See **Chapter 60, Access Control Lists Introduction** for descriptions of ACLs, and for further information about rules when applying ACLs see the **ACL Rules** section.

See **ACL Filter Sequence Numbers** and **ACL Filter Sequence Number Behavior** sections in **Chapter 60, Access Control Lists Introduction** about ACL Filters.

To apply ACLs to an LACP channel group, apply it to all the individual switch ports in the channel group. To apply ACLs to a static channel group, apply it to the static channel group itself. For more information on link aggregation see **Chapter 22, Link Aggregation Introduction and Configuration**, and **Chapter 23, Link Aggregation Commands**.

Note that text in parenthesis in command names indicates usage not keyword entry. For example, **ipv6-access-list (named)** indicates named IPv6 ACLs entered as `ipv6-access-list <name>` where `<name>` is a placeholder not a keyword.

Note also that parenthesis surrounding ACL filters indicates the type of ACL filter not the keyword entry in the CLI, such as (**ipv6 access-list standard IPv6 filter**) represents command entry in the format shown in the syntax `[<sequence-number>] {deny|permit} {<IPv6-source-address/prefix-length>|any}`.

Note

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

IPv6 Hardware Access List Commands and Prompts

Many of the ACL commands operate from sub-modes that are specific to particular ACL types. The table **"IPv6 Hardware Access List Commands and Prompts"** shows the CLI prompts at which ACL commands are entered.

Table 63-1: IPv6 Hardware Access List Commands and Prompts

Command Name	Command Mode	Prompt
show ipv6 access-list (IPv6 Hardware ACLs)	Privileged Exec	`awplus#`
ipv6 access-list (named)	Global Configuration	`awplus(config)#`
(ipv6 access-list named ICMP filter)	Global Configuration	`awplus(config)#`
ipv6 traffic-filter	Interface Configuration	`awplus(config-if)#`
commit (IPv6)	IPv6 Hardware ACL Configuration	`awplus(config-ipv6-hw-acl)#`
(ipv6 access-list named ICMP filter)	IPv6 Hardware ACL Configuration	`awplus(config-ipv6-hw-acl)#`
(ipv6 access-list named protocol filter)	IPv6 Hardware ACL Configuration	`awplus(config-ipv6-hw-acl)#`
(ipv6 access-list named TCP UDP filter)	IPv6 Hardware ACL Configuration	`awplus(config-ipv6-hw-acl)#`

Command List

commit (IPv6)

Use this command to commit the IPv6 ACL filter configuration entered at the console to the hardware immediately without exiting the IPv6 Hardware ACL Configuration mode.

This command forces the associated hardware and software IPv6 ACLs to synchronize.

Syntax `commit`

Mode IPv6 Hardware ACL Configuration

Usage Normally, when an IPv6 hardware ACL is edited, the new configuration state of the IPv6 ACL is not written to hardware until you exit IPv6 Hardware ACL Configuration mode. By entering this command you can ensure that the current state of a hardware access-list that is being edited is written to hardware immediately.

Scripts typically do not include the **exit** command to exit configuration modes, potentially leading to IPv6 ACL filters in hardware not being correctly updated. Using this **commit** command in a configuration script after specifying an IPv6 hardware ACL filter ensures that it is updated in the hardware.

Examples To update the hardware with the IPv6 ACL filter configuration, use the command:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-ipv6-acl
awplus(config-ipv6-hw-acl)# commit
```

Related Commands **ipv6 access-list (named)**

ipv6 access-list (named)

Use this command to either create a new IPv6 hardware access-list, or to select an existing IPv6 hardware access-list in order to apply a filter entry to it.

This command is only available if **platform hwfilter-size** is set to **ipv4-full-ipv6.**

Use the **no** variant of this command to delete an existing IPv6 hardware access-list.

Note Before you can delete an access-list, you must first remove it from any interface it is assigned to.

Syntax

```
ipv6 access-list <ipv6-access-list-name>
no ipv6 access-list <ipv6-access-list-name>
```

Parameter	Description
<ipv6-access-list-name>	Specify an IPv6 access-list name.

Mode Global Configuration

Default Any traffic on an interface controlled by a hardware ACL that does not explicitly match a filter is permitted.

Usage Use IPv6 hardware named access-lists to control the transmission of IPv6 packets on an interface, and restrict the content of routing updates. The switch stops checking the IPv6 hardware named access-list when a match is encountered.

For backwards compatibility you can either create IPv6 hardware named access-lists from within this command, or you can enter `ipv6 access-list` followed by only the IPv6 hardware named access-list name. This latter (and preferred) method moves you to the `(config-ipv6-hw-acl)` prompt for the selected IPv6 hardware named access-list number, and from here you can configure the filters for this selected IPv6 hardware named access-list.

Note Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

Examples To create an IPv6 access-list named `my-ipv6-acl`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-ipv6-acl
awplus(config-ipv6-hw-acl)#
```

To delete the IPv6 access-list named `my-ipv6-acl`, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 access-list my-ipv6-acl
```

Validation Commands

show ipv6 access-list (IPv6 Hardware ACLs)

Related Commands

(ipv6 access-list named ICMP filter)
(ipv6 access-list named protocol filter)
(ipv6 access-list named TCP UDP filter)
ipv6 traffic-filter
show ipv6 access-list (IPv6 Hardware ACLs)
platform hwfilter-size

(ipv6 access-list named ICMP filter)

Use this ACL filter to add a filter entry for an IPv6 source and destination address and prefix, with ICMP (Internet Control Message Protocol) packets, to the current named IPv6 access-list. If a sequence number is specified, the new entry is inserted at the specified location. Otherwise, the new entry is added at the end of the access-list.

Note that specifying the **send-to-cpu** parameter could result in EPSR healthcheck messages and other control packets being dropped.

As an optional parameter **vlan** can be matched for tagged (802.1q) packet.

The **no** variant of this command removes a filter entry for an IPv6 source and destination address and prefix, with ICMP (Internet Control Message Protocol) packets, from the current named IPv6 access-list. You can specify the filter entry for removal by entering either its sequence number, or its filter entry profile.

Note Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

Syntax [ip|icmp]

```
[<sequence-number>
    {deny|permit|send-to-cpu|copy-to-cpu|copy-to-mirror}
    {ipv6|icmp}
    {<ipv6-source-address/prefix-length>|
    <ipv6-source-address> <ipv6-source-wildcard>|
    host <ipv6-source-host>|any}
    {<ipv6-destination-address/prefix-length>|
    <ipv6-destintation-addr> <ipv6-destination-wildcard>|
    host <ipv6-destination-host-address>|any} [<icmp-type>]
    [vlan <1-4094>]

no [<sequence-number>]
    {deny|permit|send-to-cpu|copy-to-cpu|copy-to-mirror}
    {ip|icmp}
    {<ipv6-source-address/prefix-length>|
    <ipv6-source-address> <ipv6-source-wildcard>|
    host <ipv6-source-host>|any}
    {<ipv6-destination-address/prefix-length>|
    <ipv6-destination-address> <ipv6-destination-wildcard>|
    host <ipv6-destination-host-address>|any} [<icmp-type>]
    [vlan <1-4094>]

no [<sequence-number>]
```

Parameter	Description
<sequence-number>	<1-65535> *The sequence number for the filter entry of the selected access control list.*
deny	Specifies the packets to reject.
permit	Specifies the packets to permit.
send-to-cpu	Specifies the packets to send to the CPU. Specifying this parameter could result in EPSR healthcheck messages and other control packets being dropped.

Parameter(cont.)	Description(cont.)
copy-to-cpu	Specifies the packets to copy to the CPU.
copy-to-mirror	Specifies the packets to copy to the mirror port.
ipv6	IPv6 packet, defined by the following parameters.
icmp	ICMP packet, defined by the following parameters.
<ipv6-source-address/ prefix-length>	Specifies a source address and prefix length. The IPv6 address prefix uses the format X:X::/ prefix-length. The prefix-length is usually set between 0 and 64.
<ipv6-source-address>	Specifies the IPv6 source address. The IPv6 address uses the format X:X::X:X.
<ipv6-source-wildcard>	Specifies source wildcard bits in IPv6 format X:X::X:X. Note that binary 1 represents a don't care condition, and binary 0 represents a match.
host *<ipv6-source-host>*	Specifies a single source host address. The IPv6 address uses the format X:X::X:X.
any	Specifies any Source host.
<ipv6-destination-address/prefix-length>	Specifies a destination address and prefix length. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.
<ipv6-destination-addrress>	Specifies a destination address. The IPv6 address uses the format X:X::X:X.
<ipv6-destination-wildcard>	Specify destination Wildcard bits in IPv6 format X:X::X:X.
host *<ipv6-destination-host-address>*	Specify a single destination host address. The IPv6 address uses the format X:X::X:X.
any	Specifies any destination host.
<icmp-type>	Optional. Specify to filter by ICMP message type number. Valid values are from 0 to 255.
vlan	This parameter can be used in either single or double-tagged VLAN networks. It is the conventional VLAN tag (VID). In a double-tagged network it is sometimes referred to as the STAG.
<1-4094>	The VLAN VID.

Mode IPv6 Hardware ACL Configuration

Default Any traffic on an interface controlled by a hardware ACL that does not explicate match a filter is permitted.

Examples To specify a hardware IPv6 access-list named `my-acl1` and add an ACL filter entry that blocks all ICMP6 echo requests, enter the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl1
awplus(config-ipv6-hw-acl)# deny icmp any any icmp-type 128
```

To specify a hardware IPv6 access-list named `my-acl2` and add an ACL filter entry that blocks all ICMP6 echo requests on the default VLAN (`vlan1`), enter the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl2
awplus(config-ipv6-hw-acl)# deny icmp any any icmp-type 128
vlan 1
```

To remove an ACL filter entry that blocks all ICMP6 echo requests from he hardware IPv6 access-list named `my-acl1`, enter the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl1
awplus(config-ipv6-hw-acl)# no deny icmp any any icmp-type 128
```

Validation Commands **show ipv6 access-list (IPv6 Hardware ACLs)**

Related Commands **ipv6 access-list (named)**
(ipv6 access-list named protocol filter)
(ipv6 access-list named TCP UDP filter)
ipv6 traffic-filter
show ipv6 access-list (IPv6 Hardware ACLs)

(ipv6 access-list named protocol filter)

Use this ACL filter to add a filter entry for an IPv6 source and destination address and prefix, with an IP protocol type specified, to the current named IPv6 access-list. If a sequence number is specified, the new entry is inserted at the specified location. Otherwise, the new entry is added at the end of the access-list.

Note that specifying the **send-to-cpu** parameter could result in EPSR healthcheck messages and other control packets being dropped.

The **no** variant of this command removes a filter entry for an IPv6 source and destination address and prefix, with an IP protocol type specified, from the current named IPv6 access-list. You can specify the filter entry for removal by entering either its sequence number, or its filter entry profile.

Syntax

```
[<sequence-number>
   {deny|permit|send-to-cpu|copy-to-cpu|copy-to-mirror}
   {ipv6|proto <ip-protocol>}
   {<ipv6-source-prefix/prefix-length>|<ipv6-source-address>
   <ipv6-source-wildcard>|host <ipv6-source-host>|any}
   {<ipv6-destination-prefix/prefix-length>|
   <ipv6-destination-address> <ipv6-destination-wildcard>|
   host <ipv6-destination-host>|any}

[<sequence-number>]
   no {deny|permit|send-to-cpu|copy-to-cpu|copy-to-mirror}
   {ipv6|proto <ip-protocol>}
   {<ipv6-source-prefix/prefix-length>|<ipv6-source-address>
   <ipv6-source-wildcard>|host <ipv6-source-host>|any}
   {<ipv6-destination-prefix/prefix-length>|
   <ipv6-destination-address> <ipv6-destination-wildcard>|
   host <ipv6-destination-host>|any}

no [<sequence-number>]
```

Parameter	Description
<sequence-number>	<1-65535> *The sequence number for the filter entry of the selected access control list.*
deny	Specifies packets to reject.
permit	Specifies packets to permit.
send-to-cpu	Specifies packets to send to the CPU. Specifying this parameter could result in EPSR healthcheck messages and other control packets being dropped.
copy-to-cpu	Specifies packets to copy to the CPU.
copy-to-mirror	Specifies packets to copy to the mirror port.
ipv6	Specifies IPv6 packet.
proto *<ip-protocol>*	Specify IP protocol number <1-255>.

Parameter(cont.)	Description(cont.)
<ip-protocol>	The IP protocol number, as defined by IANA (Internet Assigned Numbers Authority **http://www.iana.org/assignments/protocol-numbers**)

Protocol Number	Protocol Description [RFC Reference]
1	Internet Control Message [RFC792]
2	Internet Group Management [RFC1112]
3	Gateway-to-Gateway [RFC823]
4	IP in IP [RFC2003]
5	Stream [RFC1190] [RFC1819]
6	TCP (Transmission Control Protocol) [RFC793]
8	EGP (Exterior Gateway Protocol) [RFC888]
9	IGP (Interior Gateway Protocol) [IANA]
11	Network Voice Protocol [RFC741]
17	UDP (User Datagram Protocol) [RFC768]
20	Host monitoring [RFC869]
27	RDP (Reliable Data Protocol) [RFC908]
28	IRTP (Internet Reliable Transaction Protocol) [RFC938]
29	ISO-TP4 (ISO Transport Protocol Class 4) [RFC905]
30	Bulk Data Transfer Protocol [RFC969]
33	DCCP (Datagram Congestion Control Protocol) [RFC4340]
48	DSR (Dynamic Source Routing Protocol) [RFC4728]
50	ESP (Encap Security Payload) [RFC2406]
51	AH (Authentication Header) [RFC2402]
54	NARP (NBMA Address Resolution Protocol) [RFC1735]
58	ICMP for IPv6 [RFC1883]
59	No Next Header for IPv6 [RFC1883]
60	Destination Options for IPv6 [RFC1883]
88	EIGRP (Enhanced Interior Gateway Routing Protocol)
89	OSPFIGP [RFC1583]

Parameter(cont.)	Description(cont.)	
<ip-protocol>	97	Ethernet-within-IP Encapsulation / RFC3378
(cont.)	98	Encapsulation Header / RFC1241
	108	IP Payload Compression Protocol / RFC2393
	112	Virtual Router Redundancy Protocol / RFC3768
	134	RSVP-E2E-IGNORE / RFC3175
	135	Mobility Header / RFC3775
	136	UDPLite / RFC3828
	137	MPLS-in-IP / RFC4023
	138	MANET Protocols / RFC-ietf-manet-iana-07.txt
	139-252	Unassigned / IANA
	253	Use for experimentation and testing / RFC3692
	254	Use for experimentation and testing / RFC3692
	255	Reserved / IANA
<ipv6-source-prefix/ prefix-length>	Specify source address and mask. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.	
<ipv6-source-address>	Specifies the source address. The IPv6 address uses the format X:X::X:X.	
<ipv6-source-wildcard>	Specifies the source wildcard bits, in IPv6 format X:X::X:X .	
host *<ipv6-source-host>*	Specifies a single source host. The IPv6 address uses the format X:X::X:X.	
any	Specifies any source host. An abbreviation for the IPv6 prefix *::/0*	
<ipv6-dest-prefix/prefix-length>	Specifies a destination address and mask. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.	
<ipv6-destination-address>	Specify destination address. The IPv6 address uses the format X:X::X:X.	
<ipv6-destination-wildcard>	Specify destination wildcard bits in IPv6 format X:X::X:X	
host *<ipv6-destination-host>*	Specify a single destination host address. The IPv6 address uses the format X:X::X:X.	
any	Specifies any destination host. An abbreviation for the IPv6 prefix *::/0*	

Parameter(cont.)	Description(cont.)
`vlan`	This parameter can be used in either single or double-tagged VLAN networks. It is the conventional VLAN tag (VID). In a double-tagged network it is sometimes referred to as the STAG.
<1-4094>	The VLAN VID.

Mode IPv6 Hardware ACL Configuration

Default Any traffic on an interface controlled by a hardware ACL that does not explicate match a filter is permitted.

Usage This command adds a hardware classification filter (for use with features such as QoS), to a current standard IPv6 access-list. The filter will match on any IP protocol type packet that has the specified source and destination IPv6 addresses and the specified IP protocol type. The parameter `any` may be specified if an address does not matter,

Note Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

Examples To add an ACL filter entry to block IP traffic from network `2001:0db8::0/64` to the hardware IPv6 access-list named `my-acl`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# deny ipv6 2001:0db8::0/64
```

To remove an ACL filter entry that blocks all IPv6 traffic from network `2001:0db8::0/64` from the hardware IPv6 access-list named `my-acl`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# no deny ipv6 2001:0db8::0/64
```

Validation Commands **show ipv6 access-list (IPv6 Hardware ACLs)**

Related Commands **ipv6 access-list (named)**
(ipv6 access-list named ICMP filter)
(ipv6 access-list named TCP UDP filter)
ipv6 traffic-filter
show ipv6 access-list (IPv6 Hardware ACLs)

(ipv6 access-list named TCP UDP filter)

Use this ACL filter to add a filter entry for an IPv6 source and destination address and prefix, with TCP (Transmission Control Protocol) or UDP (User Datagram Protocol) source and destination ports specified, to the current named IPv6 access-list. If a sequence number is specified, the new entry is inserted at the specified location. Otherwise, the new entry is added at the end of the access-list.

Note that specifying the **send-to-cpu** parameter could result in EPSR healthcheck messages and other control packets being dropped.

The **no** variant of this command removes a filter entry for an IPv6 source and destination address and prefix, with TCP or UDP source and destination ports specified, from the current named IPv6 access-list. You can specify the filter entry for removal by entering either its sequence number, or its filter entry profile.

Syntax

```
[<sequence-number>]
   {deny|permit|send-to-cpu|copy-to-cpu|copy-to-mirror} {tcp|udp}
   {<ipv6-source-prefix/prefix-length>|
   <ipv6-source-address> <ipv6-source-wildcard>|
   host <ipv6-source-host>|any}
   {eq <sourceport>|lt <sourceport>|gt <sourceport>|ne <sourceport>}|
   [range <start-range> <end-range>]
   {<ipv6-destination-prefix/prefix-length>|
   <ipv6-destination-address> <ipv6-destination-wildcard>|
   host <ipv6-destination-host>|any}
   {[eq <destport>|lt <destport>|gt <destport>|ne <destport>}
   [range <start-range> <end-range>]

no {deny|permit|send-to-cpu|copy-to-cpu|copy-to-mirror} {tcp|udp}
   {<ipv6-source-prefix/prefix-length>|
   <ipv6-source-address> <ipv6-source-wildcard>|
   host <ipv6-source-host>|any}
   {eq <sourceport>|lt <sourceport>|gt <sourceport>|ne <sourceport>}|
   [range <start-range> <end-range>]
   {<ipv6-destination-prefix/prefix-length>|
   <ipv6-destination-address> <ipv6-destination-wildcard>
   |host <ipv6-destination-host>|any}
   {eq <destport>|lt <destport>|gt <destport>|ne <destport>}|
   [range <start-range> <end-range>]

no <sequence-number>
```

Parameter	Description
<sequence-number>	<1-65535> *The sequence number for the filter entry of the selected access control list.*
deny	Specify packets to reject.
permit	Specifies the packets to permit.
send-to-cpu	Specifies the packets to send to the CPU. Specifying this parameter could result in EPSR healthcheck messages and other control packets being dropped.
copy-to-cpu	Specifies the packets to copy to the CPU.
copy-to-mirror	Specifies the packets to copy to the mirror port.

Parameter(cont.)	Description(cont.)
`tcp`	Specifies a TCP packet.
`udp`	Specifies a UDP packet.
<ipv6-source-prefix/ prefix-length>	Specifies the source address with mask. The IPv6 address prefix uses the format X:X::/ prefix-length. The prefix-length is usually set between 0 and 64.
<ipv6-source-address>	Specifies the source address. The IPv6 address uses the format X:X::X:X.
<ipv6-source-wildcard>	Specifies the Source Wildcard bits in IPv6 format X:X::X:X.
`host` *<ipv6-source-host>*	Specifies the a single source host. The IPv6 address uses the format X:X::X:X.
`any`	Specifies any Source host. An abbreviation for the IPv6 prefix *::/0*.
`eq`	Equal to.
`lt`	Less than.
`gt`	Greater than.
`ne`	Not equal to.
<sourceport>	The source port number, specified as an integer between 0 and 65535.
<destport>	The destination port number, specified as an integer between 0 and 65535.
`range`	Range of port numbers. Match only packets within range.
<start-range>	The port number at the start of the range *<0-65535>*.
<end-range>	The port number at the end of the range *<0-65535>*.
<ipv6-dest-prefix/ prefix-length>	Specify destination address with mask. The IPv6 address prefix uses the format X:X::/ prefix-length. The prefix-length is usually set between 0 and 64.
<ipv6-destination-address>	Specify destination address. The IPv6 address uses the format X:X::X:X.
<ipv6-destination-wildcard>	Specify destination wildcard bits in IPv6 format X:X::X:X .
`host` *<ipv6-destination-host>*	Specify a single destination host address. The IPv6 address uses the format X:X::X:X.
`any`	Specifies any destination host. An abbreviation for the IPv6 prefix **::/0**.

Parameter(cont.)	Description(cont.)
`vlan`	This parameter can be used in either single or double-tagged VLAN networks. It is the conventional VLAN tag (VID). In a double-tagged network it is sometimes referred to as the STAG.
<1-4094>	The VLAN VID.

Mode IPv6 Hardware ACL Configuration

Default Any traffic on an interface controlled by a hardware ACL that does not explicate match a filter is permitted.

Usage The filter entry will match on any TCP or UDP packet that has the specified source and destination IPv6 addresses and TCP or UDP type. The parameter `any` may be specified if an address does not matter.

Note Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

Example To add an ACL filter entry that blocks all SSH traffic from network `2001:0db8::0/64` to the hardware IPv6 access-list named `my-acl`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# deny tcp 2001:0db8::0/64 any eq 22
```

To add an ACL filter entry that blocks all SSH traffic from network `2001:0db8::0/64` on the default VLAN (`vlan1`) to the hardware IPv6 access-list named `my-acl`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# deny tcp 2001:0db8::0/64 any eq 22
vlan 1
```

To remove an ACL filter entry that blocks all SSH traffic from network `2001:0db8::0/64` from the hardware IPv6 access-list named `my-acl`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# no deny tcp 2001:0db8::0/64 any eq
22
```

Validation Commands **show ipv6 access-list (IPv6 Hardware ACLs)**

Related Commands

ipv6 access-list (named)
(ipv6 access-list named ICMP filter)
(ipv6 access-list named protocol filter)
ipv6 traffic-filter
show ipv6 access-list (IPv6 Hardware ACLs)

ipv6 traffic-filter

This command adds an IPv6 hardware-based access-list to an interface. The number of access-lists that can be added is determined by the amount of available space in the hardware-based packet classification tables. You can apply an IPv6 hardware access-list to all ports or selected ports.

Use the **no** variant of this command to remove an IPv6 hardware-based access-list from an interface. You can remove an IPv6 hardware access-list from all ports or selected ports as required.

Syntax

```
ipv6 traffic-filter <ipv6-access-list-name>
no ipv6 traffic-filter <ipv6-access-list-name>
```

Parameter	Description
`<ipv6-access-list-name>`	Hardware IPv6 access-list name.

Mode Interface Configuration (to apply an IPv6 hardware ACL to a specific switch port) and Global Configuration (to apply an IPv6 hardware ACL to all of the switch ports)

Usage This command adds an IPv6 hardware-based access-list to an interface. The number of access-lists that can be added is determined by the amount of available space in the hardware-based packet classification tables.

To apply the access-list to all ports on the switch, execute the command in the Global Configuration mode. To apply the access-list to a Layer 2 interface or Layer 2 interface range, apply the command in the Interface Configuration mode. See the examples for each mode below.

Examples To add access-list `acl1` as a traffic-filter to all ports on the switch, enter the commands:

```
awplus# configure terminal
awplus(config)# ipv6 traffic-filter acl1
```

To add access-list `acl1` as a traffic-filter to interface `port1.0.1`, enter the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# ipv6 traffic-filter acl1
```

To remove access-list `acl1` as a traffic-filter from all ports on the switch, enter the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 traffic-filter acl1
```

To remove access-list `acl1` as a traffic-filter from interface `port1.0.1`, enter the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no ipv6 traffic-filter acl1
```

Related Commands

(ipv6 access-list named ICMP filter)
(ipv6 access-list named protocol filter)
(ipv6 access-list named TCP UDP filter)
ipv6 traffic-filter
show ipv6 access-list (IPv6 Hardware ACLs)

show ipv6 access-list (IPv6 Hardware ACLs)

Use this command to display all configured hardware IPv6 access-lists or the IPv6 access-list specified by name. Omitting the optional access-list name parameter will display all IPv6 ACLs.

Use the **show ipv6 access-list standard** command to display the IPv6 access-list specified by name as defined from the **ipv6 access-list (named)** command.

Syntax

```
show ipv6 access-list [<access-list-name>]
show ipv6 access-list standard [<access-list-name>]
```

Parameter	Description
standard	Named standard access-list.
<access-list-name>	Hardware IPv6 access-list name.

Mode User Exec and Privileged Exec

Example To show the standard named ipv6 access-list acl_name use the following command:

```
awplus# show ipv6 access-list standard acl_name
```

Output **Figure 63-1: Example output from the show ipv6 access-list standard command**

```
Named Standard IPv6 access-list acl_name
  deny any
```

Example To show all configured ipv6 access-lists use the command:

```
awplus# show ipv6 access-list
```

Output **Figure 63-2: Example output from the show ipv6 access-list command**

```
IPv6 access-list deny_icmp
  deny icmp any any vlan 1

IPv6 access-list deny_ssh
  deny tcp abcd::0/64 any eq 22
```

Chapter 64: IPv6 Software Access Control List (ACL) Commands

Introduction 64.2
IPv6 Software Access List Commands and Prompts 64.3
Command List 64.4
ipv6 access-list extended (named) 64.4
ipv6 access-list extended proto 64.9
(ipv6 access-list extended IP protocol filter) 64.12
(ipv6 access-list extended TCP UDP filter) 64.15
ipv6 access-list standard (named) 64.17
(ipv6 access-list standard filter) 64.19
ipv6 prefix-list 64.21
show ipv6 access-list (IPv6 Software ACLs) 64.23
show ipv6 prefix-list 64.24

Introduction

This chapter provides an alphabetical reference for the IPv6 Software Access Control List (ACL) commands, and contains detailed command information and command examples about IPv6 software ACLs as applied to Routing and Multicasting, which are not applied to interfaces.

Note

See **Chapter 60, Access Control Lists Introduction** for descriptions of ACLs, and for further information about rules when applying ACLs see the **ACL Rules** section.

See **ACL Filter Sequence Numbers** and **ACL Filter Sequence Number Behavior** sections in **Chapter 60, Access Control Lists Introduction** about ACL Filters.

See all relevant Routing commands and configurations in **"Layer Three, Switching and Routing"** and all relevant Multicast commands and configurations in **"Multicast Applications"**.

To apply ACLs to an LACP channel group, apply it to all the individual switch ports in the channel group. To apply ACLs to a static channel group, apply it to the static channel group itself. For more information on link aggregation see **Chapter 22, Link Aggregation Introduction and Configuration**, and **Chapter 23, Link Aggregation Commands**.

Note that text in parenthesis in command names indicates usage not keyword entry. For example, **ipv6-access-list (named)** indicates named IPv6 ACLs entered as `ipv6-access-list <name>` where `<name>` is a placeholder not a keyword.

Note also that parenthesis surrounding ACL filters indicates the type of ACL filter not the keyword entry in the CLI. For example, **(ipv6 access-list standard IPv6 filter)** represents command entry in the format:
`[<sequence-number>] {deny|permit} {<IPv6-source-address/prefix-length>|any}`.

Note

Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

IPv6 Software Access List Commands and Prompts

Many of the ACL commands operate from sub-modes that are specific to particular ACL types. The table **"IPv6 Software Access List Commands and Prompts"** shows the CLI prompts at which ACL commands are entered.

Table 64-1: IPv6 Software Access List Commands and Prompts

Command Name	Command Mode	Prompt
show ipv6 access-list (IPv6 Software ACLs)	Privileged Exec	`awplus#`
ipv6 access-list extended (named)	Global Configuration	`awplus(config)#`
ipv6 access-list standard (named)	Global Configuration	`awplus(config)#`
(ipv6 access-list extended IP protocol filter)	IPv6 Extended ACL Configuration	`awplus(config-ipv6-ext-acl)#`
(ipv6 access-list extended TCP UDP filter)	IPv6 Extended ACL Configuration	`awplus(config-ipv6-ext-acl)#`
(ipv6 access-list standard filter)	IPv6 Standard ACL Configuration	`awplus(config-ipv6-std-acl)#`

Command List

ipv6 access-list extended (named)

Use this command when configuring an IPv6 extended access-list for filtering frames that permit or deny IP, ICMP, TCP, UDP packets or ICMP packets with a specific value based on the source or destination.

The **no** variant of this command removes a specified IPv6 extended access-list.

Syntax [list-name]

```
ipv6 access-list extended <list-name>

no ipv6 access-list extended <list-name>
```

Parameter	Description
<list-name>	A user-defined name for the IPv6 software extended access-list.

Syntax [any|icmp|ip]

```
ipv6 access-list extended <list-name>
    {deny|permit} {any|icmp|ip}
    {<ipv6-source-address/prefix-length>|any}
    {<ipv6-destination-address/prefix-length>|any}
    [<icmp-type <icmp-type>][log]

no ipv6 access-list extended <list-name>
    {deny|permit} {any|icmp|ip}
    {<ipv6-source-address/prefix-length>|any}
    {<ipv6-destination-address/prefix-length>|any}
    [<icmp-type <icmp-type>][log]
```

Syntax [tcp|udp]

```
ipv6 access-list extended <list-name>
    {deny|permit} {tcp|udp}
    {<ipv6-source-address/prefix-length>|any}
    {eq <sourceport>|lt <sourceport>|gt <sourceport>|ne <sourceport>}
    {<ipv6-destination-address/prefix-length>|any}
    {eq <destport>|lt <destport>|gt <destport>|ne <destport>}
    [log]

no ipv6 access-list extended <list-name> {deny|permit} {tcp|udp}
    {<ipv6-source-address/prefix-length>|any}
    {eq <sourceport>|lt <sourceport>|gt <sourceport>|ne <sourceport>}
    {<ipv6-destination-addr/prefix-length>|any}
    {eq <destport>|lt <destport>|gt <destport>|ne <destport>}
    [log]
```

Parameter	Description
<list-name>	A user-defined name for the IPv6 software extended access-list.
deny	The IPv6 software extended access-list rejects packets that match the type, source, and destination filtering specified with this command.

Parameter(cont.)	**Description**(cont.)
`permit`	The IPv6 software extended access-list permits packets that match the type, source, and destination filtering specified with this command.
`any`	For ICMP|IP The IPv6 software extended access-list matches any type of packet.
`ip`	For ICMP|IP The IPv6 software extended access-list matches only IP packets.
`icmp`	For ICMP|IP The IPv6 software extended access-list matches only ICMP packets.
`tcp`	For TCP/UDP The IPv6 software extended access-list matches only TCP packets.
`udp`	For TCP/UDP The IPv6 software extended access-list matches only UDP packets.
<ipv6-source-address/prefix-length>	Specifies a source address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.
<ipv6-destination-address/prefix-length>	Specifies a destination address and prefix length. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.
`any`	Matches any IPv6 address.
<sourceport>	For TCP/UDP The source port number, specified as an integer between 0 and 65535.
<destport>	For TCP/UDP The destination port number, specified as an integer between 0 and 65535.
`icmp-type`	For ICMP|IP Matches only a specified type of ICMP messages. This is valid only when the filtering is set to match ICMP packets.
`eq`	For TCP/UDP Matches port numbers equal to the port number specified immediately after this parameter.
`lt`	For TCP/UDP Matches port numbers less than the port number specified immediately after this parameter.

Parameter(cont.)	**Description**(cont.)	
`gt`	For TCP/UDP Matches port numbers greater than the port number specified immediately after this parameter.	
`ne`	For TCP/UDP Matches port numbers not equal to the port number specified immediately after this parameter.	
<icmp-type>	For ICMP|IP The ICMP type, as defined in RFC792 and RFC950. Specify one of the following integers to create a filter for the ICMP message type:	
	0	Echo replies.
	3	Destination unreachable messages.
	4	Source quench messages.
	5	Redirect (change route) messages.
	8	Echo requests.
	11	Time exceeded messages.
	12	Parameter problem messages.
	13	Timestamp requests.
	14	Timestamp replies.
	15	Information requests.
	16	Information replies.
	17	Address mask requests.
	18	Address mask replies.
`log`	Logs the results.	

Mode Global Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage Use IPv6 extended access-lists to control the transmission of IPv6 packets on an interface, and restrict the content of routing updates. The switch stops checking the IPv6 extended access-list when a match is encountered.

For backwards compatibility you can either create IPv6 extended access-lists from within this command, or you can enter `ipv6 access-list extended` followed by only the IPv6 extended access-list name. This latter (and preferred) method moves you to the `(config-ipv6-ext-acl)` prompt for the selected IPv6 extended access-list number, and from here you can configure the filters for this selected access-list.

Note Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Example 1 [creating a list] To add a new filter to the access-list named `my-list` that will reject incoming ICMP packets from `2001:0db8::0/64` to `2001:0db8::f/64`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# icmp 2001:0db8::0/64 2001:0db8::f/64
```

Example 2 [adding to a list] To insert a new filter at sequence number `5` of the access-list named `my-list` that will accept ICMP type 8 packets from the `2001:0db8::0/64` network to the `2001:0db8::f/64` network, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# 5 icmp 2001:0db8::0/64
2001:0db8::f/64
```

Example 3 [list with filter] To create the access-list named `TK` to deny TCP protocols, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended TK deny tcp any eq
14 any lt 12 log
```

Related Commands

ipv6 access-list extended proto

show running-config

ipv6 access-list extended proto

Use this command when configuring an IPv6 extended access-list for filtering frames that permit or deny packets with a specific value based on the IP protocol number specified.

The **no** variant of this command removes a specified IPv6 extended access-list with an IP protocol number.

Syntax

```
ipv6 access-list extended <list-name>
   {deny|permit} proto <ip-protocol>}
   {<ipv6-source-address/prefix>|any}
   {<ipv6-destination-address/prefix>|any} [log]

no ipv6 access-list extended <list-name>
   {deny|permit} proto <ip-protocol>
   {<ipv6-source-address/prefix>|any}
   {<ipv6-destination-address/prefix>|any} [log]
```

Parameter	Description
<list-name>	A user-defined name for the IPv6 software extended access-list.
deny	Specifies the packets to reject.
permit	Specifies the packets to accept.
proto	The IP Protocol type specified by it protocol number <1-255>.
<ip-protocol>	The IP protocol number, as defined by IANA (Internet Assigned Numbers Authority **http://www.iana.org/assignments/protocol-numbers**).

<ipv6-source-address/prefix>	IPv6 source address, or local address. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.
any	Any source address or local address.
<ipv6-destination-address/prefix>	IPv6 destination address, or local address. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.

Parameter(cont.)	Description(cont.)
any	Any destination address or remote address.
log	Log the results.

Mode Global Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage Use IPv6 extended access-lists to control the transmission of IPv6 packets on an interface, and restrict the content of routing updates. The switch stops checking the IPv6 extended access-list when a match is encountered.

The filter entry will match on any IP protocol type packet that has the specified source and destination IPv6 addresses and the specified IP protocol type. The parameter `any` may be specified if an address does not matter.

Note Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Examples To create the IPv6 access-list named `ACL-1` to deny IP protocol `9` packets from `2001:0db8:1::1/128` to `2001:0db8:f::1/128`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended ACL-1 deny proto 9
2001:0db8:1::1/128 2001:0db8:f::1/128
```

To remove the IPv6 access-list named `ACL-1` to deny IP protocol `9` packets from `2001:0db8:1::1/128` to `2001:0db8:f::1/128`, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 access-list extended ACL-1 deny proto
10 2001:0db8:1::1/128 2001:0db8:f::1/128
```

Related Commands
ipv6 access-list extended (named)
(ipv6 access-list extended IP protocol filter)
show ipv6 access-list (IPv6 Software ACLs)
show running-config

(ipv6 access-list extended IP protocol filter)

Use this ACL filter to add a filter entry for an IPv6 source and destination address and prefix, with or without an IP protocol specified, to the current extended IPv6 access-list. If a sequence is specified, the new entry is inserted at the specified location. Otherwise, the new entry is added at the end of the access-list.

The **no** variant of this command removes a filter entry for an IPv6 source and destination address and prefix, with or without an IP protocol filter entry, from the current extended IPv6 access-list. You can specify the ACL filter entry by entering either its sequence number, or its filter entry profile.

Syntax [ip|proto]

```
[<sequence-number>]
   {deny|permit} {ip|any|proto <ip-protocol>}
   {<ipv6-source-address/prefix>|any}
   {<ipv6-destination-address/prefix>|any} [log]

no {deny|permit} {ip|any|proto <ip-protocol>}
   {<ipv6-source-address/prefix>|any}
   {<ipv6-destination-address/prefix>|any} [log]

no [<sequence-number>]
```

Parameter	Description
<sequence-number>	<1-65535> The sequence number for the filter entry of the selected access control list.
deny	Specifies the packets to reject.
permit	Specifies the packets to accept.
ip	IP packet.
any	Any packet.
proto *<ip-protocol>*	The IP Protocol type specified by it protocol number <1-255>.
<ip-protocol>	The IP protocol number, as defined by IANA (Internet Assigned Numbers Authority **http://www.iana.org/assignments/protocol-numbers**).

<ipv6-source-address/prefix>	IPv6 source address, or local address. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.
any	Any source address or local address.
<ipv6-destination-address/prefix>	IPv6 destination address, or local address. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.

Parameter(cont.)	Description(cont.)
any	Any destination address or remote address.
log	Log the results.

Mode IPv6 Extended ACL Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage The filter entry will match on any IP protocol type packet that has the specified source and destination IPv6 addresses and the specified IP protocol type. The parameter `any` may be specified if an address does not matter.

Note Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Examples To add a new ACL filter entry to the extended IPv6 access-list named `my-list` with sequence number `5` rejecting the IPv6 packet from `2001:db8:1:1` to `2001:db8:f:1`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# 5 deny ip 2001:db8:1::1/128
2001:db8:f::1/128
```

To remove the ACL filter entry to the extended IPv6 access-list named `my-list` with sequence number `5`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# no 5
```

Related Commands
ipv6 access-list extended (named)
show ipv6 access-list (IPv6 Software ACLs)
show running-config

(ipv6 access-list extended TCP UDP filter)

Use this ACL filter to add a filter entry for an IPv6 source and destination address and prefix, with a TCP (Transmission Control Protocol) or UDP (User Datagram Protocol) source and destination port specified, to the current extended IPv6 access-list. If a sequence number is specified, the new entry is inserted at the specified location. Otherwise, the new entry is added at the end of the access-list.

The **no** variant of this command removes a filter entry for an IPv6 source and destination address and prefix, with a TCP or UDP source and destination port specified, from the current extended IPv6 access-list. You can specify the filter entry for removal by entering either its sequence number, or its filter entry profile.

Syntax [tcp|udp]

```
[<sequence-number>] {deny|permit} {tcp|udp}
    {<ipv6-source-address/prefix>|any}
    {eq <sourceport>|lt <sourceport>|gt <sourceport>|ne <sourceport>}
    {<IPv6-destination-address/prefix>|any}
    {eq <destport>|lt <destport>|gt <destport>|ne <destport>} [log]

no {deny|permit} {tcp|udp}
    {<ipv6-source-address/prefix>|any}
    {eq <sourceport>|lt <sourceport>|gt <sourceport>|ne <sourceport>}}
    {<IPv6-destination-address/prefix>|any}
    {eq <destport>|lt <destport>|gt <destport>|ne <destport>} [log]

no <sequence-number>
```

Parameter	Description
<sequence-number>	<1-65535> The sequence number for the filter entry of the selected access control list.
deny	Specifies the packets to reject.
permit	Specifies the packets to accept.
tcp	TCP packet.
udp	UDP packet.
<ipv6-source-address/prefix>	IPv6 source address, or local address. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.
any	Any source address or local address.
eq	Equal to.
lt	Less than.
gt	Greater than.
ne	Not equal to.
<sourceport>	The source port number, specified as an integer between 0 and 65535.
<ipv6-destination-address/prefix>	IPv6 destination address, or local address. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.

Parameter(cont.)	Description(cont.)
<destport>	The destination port number, specified as an integer between 0 and 65535.
log	Log the results.

Mode IPv6 Extended ACL Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage The filter entry will match on any packet that has the specified source and destination IPv6 addresses and the specified TCP or UDP source and destination port. The parameter `any` may be specified if an address does not matter.

Note Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Examples To add a new filter entry with sequence number `5` to the access-list named `my-list` to reject TCP packets from `2001:0db8::0/64` port `10` to `2001:0db8::f/64` port `20`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# 5 deny tcp 2001:0db8::0/64 eq 10
2001:0db8::f/64 eq 20
```

To add a new filter entry with sequence number `5` to the extended IPv6 access-list named `my-list` to reject UDP packets from `2001:0db8::0/64` port `10` to `2001:0db8::f/64` port `20`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# 5 deny udp 2001:0db8::0/64 eq 10
2001:0db8::f/64 eq 20
```

To remove the filter entry with sequence number `5` to the extended IPv6 access-list named `my-list`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# no 5
```

Related Commands **ipv6 access-list extended (named)**
show ipv6 access-list (IPv6 Software ACLs)
show running-config

ipv6 access-list standard (named)

This command configures an IPv6 standard access-list for filtering frames that permit or deny IPv6 packets from a specific source IPv6 address.

The **no** variant of this command removes a specified IPv6 standard access-list.

Syntax [list-name]

```
ipv6 access-list standard <ipv6-acl-list-name>

no ipv6 access-list standard <ipv6-acl-list-name>
```

Parameter	Description
<ipv6-acl-list-name>	A user-defined name for the IPv6 software standard access-list.

Syntax [deny|permit]

```
ipv6 access-list standard <ipv6-acl-list-name>
   [{deny|permit}
   {<ipv6-source-address/prefix-length>|any}
   [exact-match]]

no ipv6 access-list standard <ipv6-acl-list-name>
   [{deny|permit}
   {<ipv6-source-address/prefix-length>|any}
   [exact-match]]
```

Parameter	Description
<ipv6-acl-list-name>	A user-defined name for the IPv6 software standard access-list.
`deny`	The IPv6 software standard access-list rejects packets that match the type, source, and destination filtering specified with this command.
`permit`	The IPv6 software standard access-list permits packets that match the type, source, and destination filtering specified with this command.
<ipv6-source-address/ prefix-length>	Specifies a source address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.
`any`	Matches any source IPv6 address.
`exact-match`	Exact match of the prefixes.

Mode Global Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage Use IPv6 standard access-lists to control the transmission of IPv6 packets on an interface, and restrict the content of routing updates. The switch stops checking the IPv6 standard access-list when a match is encountered.

For backwards compatibility you can either create IPv6 standard access-lists from within this command, or you can enter `ipv6 access-list standard` followed by only the IPv6 standard access-list name. This latter (and preferred) method moves you to the `(config-ipv6-std-acl)` prompt for the selected IPv6 standard access-list, and from here you can configure the filters for this selected IPv6 standard access-list.

Note Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Example To enter the IPv6 Standard ACL Configuration mode for the access-list named `my-list`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list standard my-list
awplus(config-ipv6-std-acl)#
```

Related Commands
(ipv6 access-list standard filter)
show ipv6 access-list (IPv6 Software ACLs)
show running-config

(ipv6 access-list standard filter)

Use this ACL filter to add a filter entry for an IPv6 source address and prefix length to the current standard IPv6 access-list. If a sequence number is specified, the new entry is inserted at the specified location. Otherwise, the new entry is added at the end of the access-list.

The **no** variant of this command removes a filter entry for an IPv6 source address and prefix from the current standard IPv6 access-list. You can specify the filter entry for removal by entering either its sequence number, or its filter entry profile.

Syntax [icmp]

```
[<sequence-number>] {deny|permit}
    {<ipv6-source-address/prefix-length>|any}

no {deny|permit}
    {<ipv6-source-address/prefix-length>|any}

no <sequence-number>
```

Parameter	Description
<sequence-number>	<1-65535> The sequence number for the filter entry of the selected access control list.
deny	Specifies the packets to reject.
permit	Specifies the packets to accept.
<ipv6-source-address/prefix-length>	IPv6 source address and prefix-length in the form X:X::X:X/P.
any	Any IPv6 source host address.

Mode IPv6 Standard ACL Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage The filter entry will match on any IPv6 packet that has the specified IPv6 source address and prefix length. The parameter `any` may be specified if an address does not matter.

Note Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Examples To add an ACL filter entry with sequence number `5` that will deny any IPv6 packets to the standard IPv6 access-list named `my-list`, enter the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list standard my-list
awplus(config-ipv6-std-acl)# 5 deny any
```

To remove the ACL filter entry that will deny any IPv6 packets from the standard IPv6 access-list named `my-list`, enter the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list standard my-list
awplus(config-ipv6-std-acl)# no deny any
```

Alternately, to remove the ACL filter entry with sequence number `5` to the standard IPv6 access-list named `my-list`, enter the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list standard my-list
awplus(config-ipv6-std-acl)# no 5
```

Related Commands

ipv6 access-list standard (named)
show ipv6 access-list (IPv6 Software ACLs)
show running-config

ipv6 prefix-list

Use this command to create an IPv6 prefix list or an entry in an existing prefix list.

Use the no variant of this command to delete a whole prefix list or a prefix list entry.

Syntax

```
ipv6 prefix-list <list-name> [seq <1-429496725>]
   {deny|permit}
   {any|<ipv6-prefix>}
   [ge <0-128>] [le <0-128>]

ipv6 prefix-list <list-name> description <text>

no ipv6 prefix-list <list-name> [seq <1-429496725>]

no ipv6 prefix-list <list-name> [description <text>]
```

Parameter	Description
`<list-name>`	Specifies the name of a prefix list.
`seq <1-429496725>`	Sequence number of the prefix list entry.
`deny`	Specifies that the prefixes are excluded from the list.
`permit`	Specifies that the prefixes are included in the list.
`<ipv6-prefix>`	Specifies the IPv6 prefix and prefix length in hexadecimal in the format X:X::X:X/M.
`any`	Any prefix match. Same as **::0/0 le 128**.
`ge <0-128>`	Specifies the minimum prefix length to be matched.
`le <0-128>`	Specifies the maximum prefix length to be matched.
`description`	Prefix list specific description.
`<text>`	Up to 80 characters of text description of the prefix list.

Mode Global Configuration

Usage When the device processes a prefix list, it starts to match prefixes from the top of the prefix list, and stops whenever a permit or deny occurs. To promote efficiency, use the seq parameter and place common permits or denials towards the top of the list. If you do not use the seq parameter, the sequence values are generated in a sequence of 5.

The parameters ge and le specify the range of the prefix lengths to be matched. The parameters ge and le are only used if an ip-prefix is stated. When setting these parameters, set the le value to be less than 128, and the ge value to be less than or equal to the le value and greater than the ip-prefix mask length.

Prefix lists implicitly exclude prefixes that are not explicitly permitted in the prefix list. This means if a prefix that is being checked against the prefix list reaches the end of the prefix list without matching a permit or deny, this prefix will be denied.

Example To check the first 32 bits of the prefix `2001:db8::` and the subnet mask must be greater than or equal to `34 and less than or equal to 40`, enter the following commands:

```
awplus# configure terminal

awplus(config)# ipv6 prefix-list mylist seq 12345 permit
2001:db8::/32 ge 34 le 40
```

Related Commands
match ipv6 address
show ipv6 prefix-list
show running-config ipv6 prefix-list

show ipv6 access-list (IPv6 Software ACLs)

Use this command to display all configured IPv6 access-lists or the IPv6 access-list specified by name. Omitting the optional access-list name parameter placeholder will display all IPv6 ACLs.

Use the **show ipv6 access-list standard** command to display a specified standard named IPv6 access-list that has been defined using the **ipv6 access-list standard (named)** command.

Syntax

```
show ipv6 access-list [<access-list-name>]
show ipv6 access-list standard <access-list-name>
```

Parameter	Description
`standard`	Named standard access-list.
<access-list-name>	Specify an IPv6 access-list name.

Mode User Exec and Privileged Exec

Example To show the ipv6 access-list specified with the name `acl_name` use the following command:

```
awplus# show ipv6 access-list standard acl_name
```

Output **Figure 64-1: Example output from the show ipv6 access-list command**

```
Named Standard IPv6 access-list name
  deny any
```

Example To show all configured IPv6 access-lists use the following command:

```
awplus# show ipv6 access-list
```

Output **Figure 64-2: Example output from the show ipv6 access-list command**

```
IPv6 access-list deny_icmp
  deny icmp any any vlan 1

IPv6 access-list deny_ssh
  deny tcp abcd::0/64 any eq 22
```

ipv6 access-list standard (named)
(ipv6 access-list standard filter)

show ipv6 prefix-list

Use this command to display the prefix-list entries. Note that this command is valid for RIPng and BGP4+ routing protocols only.

Syntax `show ipv6 prefix-list [<name>|detail|summary]`

Parameter	Description
<name>	Specify the name of an individual IPv6 prefix list.
`detail`	Specify this parameter to show detailed output for all IPv6 prefix lists.
`summary`	Specify this parameter to show summary output for all IPv6 prefix lists.

Mode User Exec and Privileged Exec

Example

```
awplus# show ipv6 prefix-list
awplus# show ipv6 prefix-list 10.10.0.98/8
awplus# show ipv6 prefix-list detail
```

Introduction

This chapter introduces the concept of Quality of Service (QoS) with particular reference to Allied Telesis switches running the AlliedWare Plus™ Operating System. For additional information on using QoS on AT switches see, *How To Configure QoS on x900-24, x900-12, and SwitchBlade x908 Series Switches*. This How To Note is available from **http://www.alliedtelesis.com**.

The concept of QoS is a departure from the original networking concept of treating all network traffic in the same way. Without QoS, all traffic types are equally likely to be dropped when a link becomes oversubscribed. With QoS, certain traffic types can be given preferential treatment. QoS is therefore a very useful tool both to control congestion and to meter or cap data in order to apply pre-agreed service levels.

Operationally, QoS is applied within the link and network layers. Functionally it provides the capability to intelligently transport your network traffic in order to provide stable and predictable end-to-end network performance.

Business benefits

Quality of Service mechanisms enable:

- network service providers to sell different levels of service to customers, based on what their customers require, and be confident in their ability to guarantee the reliable delivery of these services
- enterprise and educational organizations to actively manage and provide many services across one network, for example live video streaming and standard data services, with preferential treatment being given to mission-critical traffic
- network administrators to manage network congestion as network traffic levels increase and time-critical applications, such as streaming media, become more widely in demand by customers and organizations

QoS Operations

Quality of Service is typically based on how the switch performs the following functions:

- assigns priority to incoming frames (that do not already carry priority information)
- correlates prioritized frames with traffic classes, or maps frames to traffic classes based on other criteria
- correlates traffic classes with egress queues, or maps prioritized frames to egress queues
- provides minimum and maximum bandwidths for traffic classes, egress queues, and/or ports
- schedules frames in egress queues for transmission (for example, empty queues in strict priority or sample each queue)
- re-labels the priority of outgoing frames
- determines which frames to drop or re-queue if the network becomes congested
- reserves memory for switching/routing or QoS operation (for example, reserving buffers for egress queues or buffers to store packets with particular characteristics)

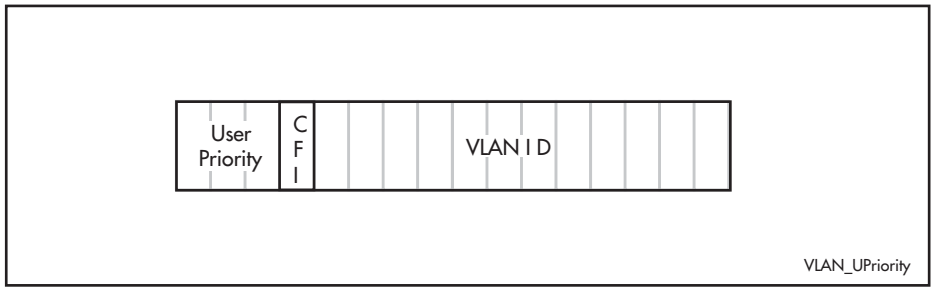
QoS Packet Information

Provision for QoS information to be embedded within the data fields exists within both the data link and network layer protocols. This information can then be used to assess the priority of the data and the resource preferences that need to be applied. The process of applying these service quality tags to your data is known as marking.

Link Layer QoS

Link layer frames entering a port may either be tagged or untagged. VLAN tagged frames contain the additional 802.1Q tag fields shown in **Figure 65-1** below. Located within the TCI is a three bit User Priority field. This field is specifically provided to attach QoS based priority information, often referred to as the Class of Service (CoS) field.

Figure 65-1: IEEE 802.1Q Tagging



Appendix G of the IEEE Standard 802.1D provides some useful guidelines on applying priorities to 7 traffic types: These are summarized in the **Table 65-1** below:

Table 65-1: CoS Traffic Mapping Guidelines

User Priority	Traffic Types
1	Background
2	Spare
0	Best Effort
3	Excellent Effort
4	Controlled Load
5	Video <100 ms latency and jitter
6	Voice <10 ms latency and jitter
7	Network Control

On the switch you can use the **match cos** command to select frames that match a particular User Priority value and assign them to a particular class-map. You can then map these incoming frames to one of eight egress queues. This facility enables you to accept frames that are already carrying meaningful priority information and automatically assign them to an appropriate egress queue. For example, you could decide to send frames with a User Priority value of 2 to queue 0. The process of assigning queues based on CoS tags is commonly known as “PreMarking”.

Note

You configure the pre-marking steps on an ingress port. This process marks the data packets so that when they reach the egress port the decisions made during pre-marking can be applied in accordance with the configuration of the egress port.

Application with VLAN double tagging

Note that if you are using VLAN double tagging, you could use the **match cos** command to set the individual QoS requirements *within* each client network and also separately within the provider network. You can then use the **match inner-cos** command to apply particular *client* QoS requirements that you want to apply within the provider network. This process applies two levels of QoS within the provider network; one that operates specifically for the network provider, and another that is specific for traffic belonging to selected clients. See **"VLAN Double Tagging (VLAN Stacking)" on page 18.5**.

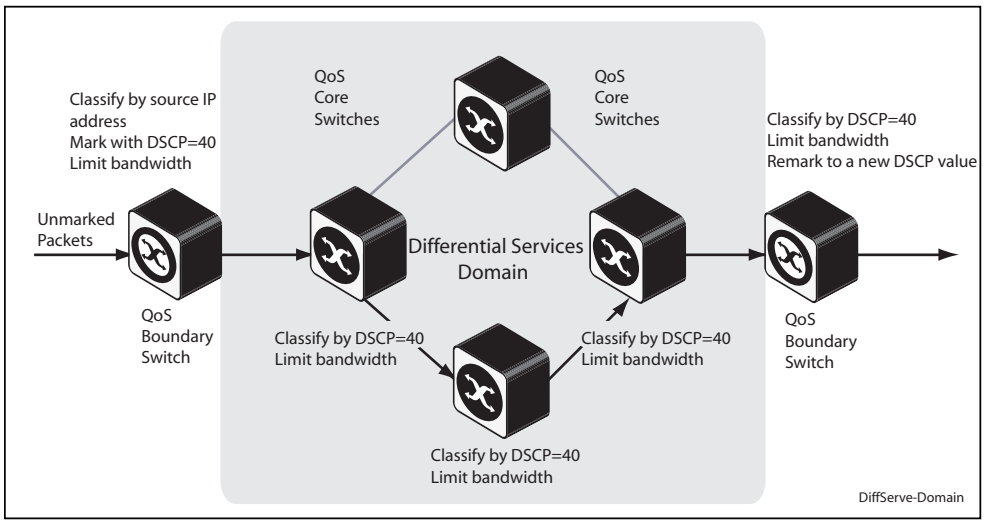
At the network layer IPv4 packets contain an 8 bit field specifically to carry QoS information. This field, defined in RFC 1349, was originally named the Type of Service (ToS) field and contained a *ToS* component and a *Precedence* component. The ToS field however, has since been replaced by the Differentiated Services field.

Differentiated Services Architecture

Whilst a full description of the differential services model is outside the scope of this software reference, a brief introduction is provided. For further information, RFC 2475 provides an in depth definition of the architecture.

The basic differential services model envisages a multi router network within which common service qualities are applied. At the network boundary, *QoS Edge Routers* inspect the traffic and classify it into common service quality groups called Per Hop Behaviors (PHBs). A specific marker value called a Differential Services Code Point (DSCP) is added to the IP header of each packet, which allocates it to a PHB. *QoS Core Routers* within the network can then use the DSCP to decide on an appropriate service quality level to apply. When a network contains a consistently applied differential services code points DSCP it is referred as a Differential Services Domain (often shortened to DiffServe Domain). **Figure 65-2** shows a simple Differential Services Domain.

Figure 65-2: Differentiated Services Domain

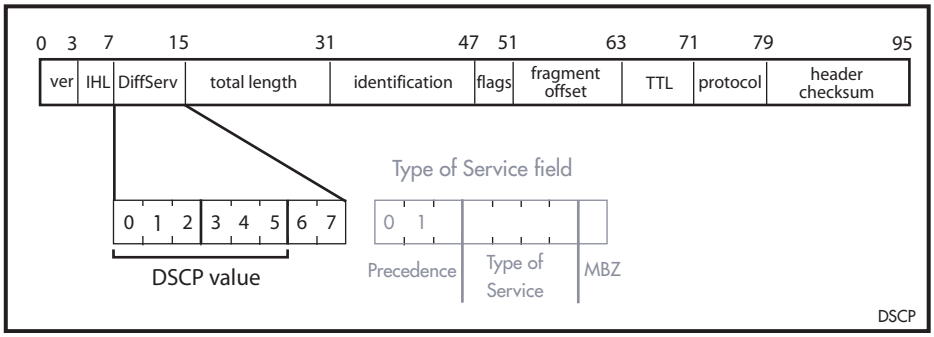


The Differential Services Field

Figure 65-3 shows an IP header containing a Differentiated Services field. The format of this redefined field is explained in RFC 2474; the main difference being that the old ToS field has been replaced by a 6 byte Differentiated Services Code Point (DSCP) field, which now provides for up to 64 defined values.

By applying this model only the QoS edge routers need to fully interrogate the incoming data packets; the QoS core routers are then relieved of this processing task and need only to inspect the DCSP before applying its appropriate forwarding, queueing, and shaping rules.

Figure 65-3: The DSCP bits of the DS field in the IPv4 header



On the switch you can use the **match inner-vlan** command to select frames containing a particular DSCP value, and associate them with a particular class-map and policy-map.

You can then use the **set queue** command to directly map these incoming frames to one of eight egress queues. This facility enables you to accept frames that are already carrying meaningful priority information to be automatically assigned to an appropriate egress queue. For example, you could decide to send frames with a User Priority value of 2 to queue 0.

Because the model offers considerable flexibility, and the mapping of traffic types to DCSPs is individual for each network, this locally applied definition is known as a *Differential Services Domain*. The previous section introduced the concept of a Per Hop (service quality) Behaviors or PHBs. RFC 2597 defines a specific PHB group called Assured Forwarding (AF). The AF PHB group provides delivery of IP packets in four independently forwarded AF classes. Within each AF class, an IP packet can be assigned one of three different levels of drop precedence. **Table 65-2** shows a list of recommended AF code points.

Table 65-2: Recommended DSCP Code Points

	(Lowest Priority) **Class 1 (001xxxx)**	**Class 2 (010xxxx)**	**Class 3 (011xxxx)**	(Highest Priority) **Class 4 (100xxxx)**
Low Drop Precedence	001010 AF11 Decimal 10	010010 AF21 Decimal 18	011010 AF31 Decimal 26	100010 AF41 Decimal 34
Medium Drop Precedence	001100 AF12 Decimal 12	010100 AF22 Decimal 20	011100 AF32 Decimal 28	100100 AF42 Decimal 36
High Drop Precedence	001110 AF13 Decimal 14	010110 AF23 Decimal 22	011110 AF33 Decimal 30	100110 AF43 Decimal 38

Processing pre-marked packets

A logical question to ask at this point is: how does the QoS switch deal with data that arrives with a pre-existing service level tag such as a DSCP? As previously touched on, the differentiated services model envisages a network that comprises QoS boundary routers at its edge and QoS core routers in its core network.

At the network edge the QoS boundary routers filter the incoming data based on specific packet components. Based on this filtering each packet is assigned a DSCP value. This value will determine the service level - priority, queueing etc - that will be applied.

Within the network core, the packet filtering required is reduced to simply reading the DSCP within each incoming packet, and applying the appropriate set of service levels. This relieves the core routers of the processing overhead of applying complex filtering to its high speed data streams.

Applying QoS on Your Switch

This section steps you through the various stages of QoS set-up and introduces the QoS commands and how to apply them. Note that before you can configure any QoS functions on your switch, you must first enable QoS by using the **mls qos enable** command.

Hardware Versions

Some QoS behavior depends on the hardware type of the ports it applies to.

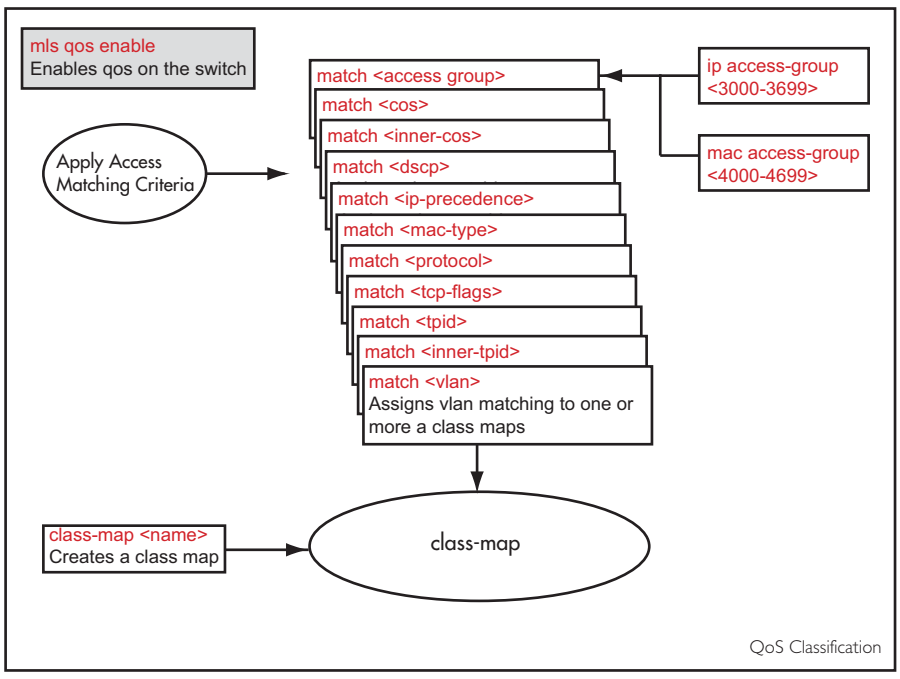
Two hardware types exist: **Hardware Version 1** and **Hardware Version 2**. The following table shows the hardware modules and the version to which each belongs.

Hardware Version 1	Hardware Version 2
Baseboard	AT-XEM-12Sv2
AT-XEM-12T	AT-XEM-12Tv2
AT-XEM-12XS	AT-XEM-2XP
AT-XEM-1XP	AT-XEM-2XS
	AT-XEM-2XT
	AT-XEM-24T

Classifying your Data

One of the early steps in setting up QoS on a network is planning and applying your classification rules. Classification is the process of **Filtering** and **Marking**. Filtering involves sorting your data into appropriate traffic types. Marking involves tagging the data so that downstream ports and routers can apply appropriate service policy rules. This process is known as **premarking**. Figure 65-4 illustrates the classifying process, and will be referred to in the examples that follow.

Figure 65-4: QoS Classification Process



At the premarking stage you can assign your data a particular priority level by giving it a link level user priority, see **"Link Layer QoS" on page 65.3**, or a network level DSCP **"Differentiated Services Architecture" on page 65.4**. You can also assign the data to a particular output (or egress) queue.

Class Maps

Class Maps are among the pivotal QoS components. They provide the means that associate the classified traffic with its appropriate QoS actions. They are the linking elements for the following functions:

- classification
- policy-mapping
- aggregate policing and metering
- pre-marking

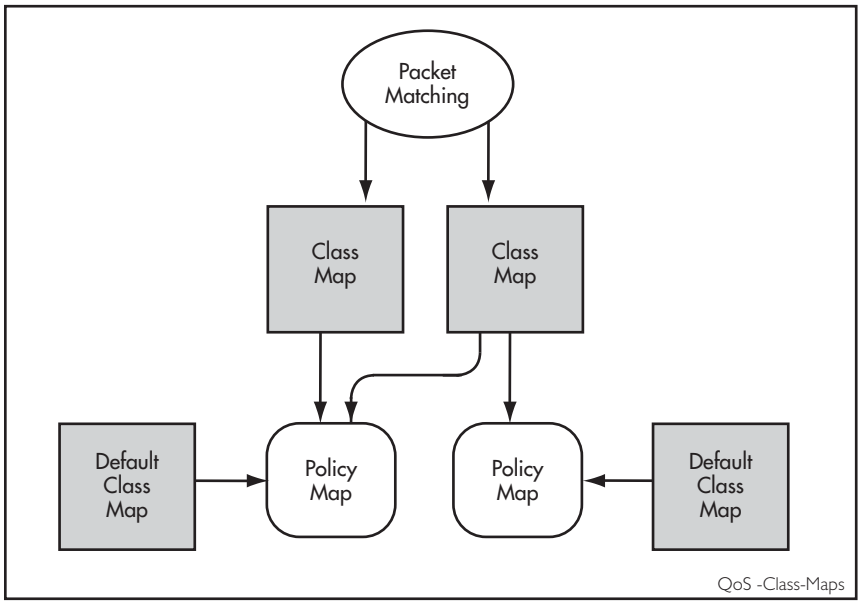
Figure 65-5 shows the relationship between a class-map and its associated functions. Note that the relationship between a class-map and a policy-map can be one-to-one or many-to-one. For information on policy-maps see the section, **"Policy Maps" on page 65.10**.

Note

If a conflict occurs between the settings in two class-maps, priority will be applied to the class-map that was created first.

An example of such a conflict is the arrival of a packet that meets the classification requirements of two class-maps each configured to the same policy-map and set to apply different priority settings to the packet.

Figure 65-5: Relationship between a class-map and its associated functions



Creating a class-map

To create a class-map, use the **class-map** command on page 66.4.

This example creates a class-map called **video-traffic** and another called **data-traffic**:

```
awplus# configure terminal
awplus(config)# class-map video-traffic
awplus(config-cmap)# exit
awplus(config)# class-map data-traffic
awplus(config-cmap)#
```

Creating and configuring default class-maps

These (automatically created) default class-maps serve as the means to specify the action that will apply to all unclassified data, i.e. all data within a policy-map that is not captured by any of the applied match commands that are applied to the policy-map by its class-maps.

Each time a new policy-map is created a new class-map called "default" is also automatically created and assigned to the new policy-map. You can configure any of the default class-maps by using the **default-action** command on page 66.6

To set the default class-map for the policy-map **p-map1** to have the action of `deny`:

```
awplus# config
awplus(config)# policy-map p-map1
awplus(config-pmap)# default-action deny
```

Applying a match command to a class-map

To apply a matching filter to a class-map use one of the match commands.

This example creates a filter to select VLAN 5 traffic and applies this filter to the class-map named **video-traffic**.

```
awplus# config terminal
awplus(config)# class-map video-traffic
awplus(config-cmap)# match vlan 5
```

Associating a class-map with a policy-map

To associate a class-map with a policy-map, use the **class** command on page 66.3.

Note A maximum of 128 class-maps may be attached to each policy-map.

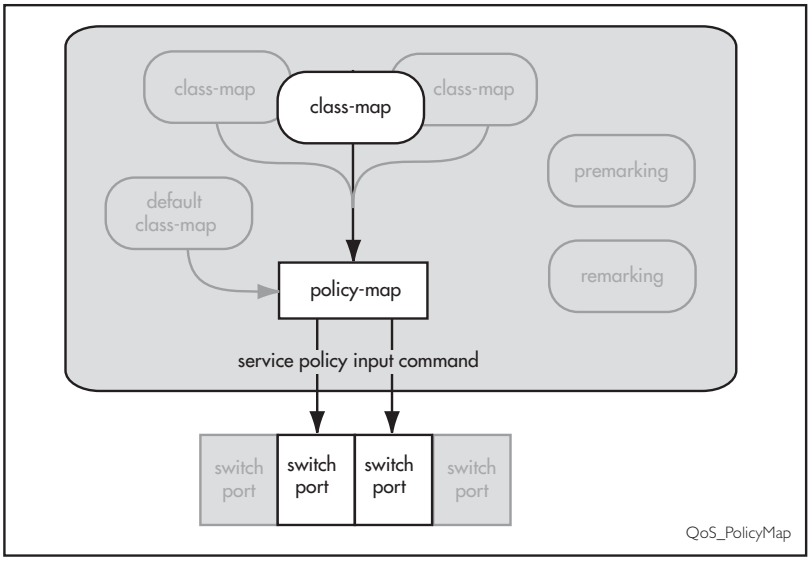
The following example creates a policy-map called **policy-one**, and associates it with the class-maps named **video-traffic**, and **database-traffic**:

```
awplus# configure terminal
awplus(config)# policy-map policy-one
awplus(config-pmap)# class video-traffic
awplus(config-pmap-c)# exit
awplus(config-pmap)# class database-traffic
awplus(config-pmap-c)#
```

Policy Maps

Policy maps are the means by which you apply your class-map properties to physical switch ports. **Figure 65-8 on page 65.19** illustrates this concept. Note that whilst a policy-map can be assigned to several ports, a port cannot have more than one policy-map assigned to it.

Figure 65-6: Policy Maps and Related Entities



To create and name a new policy-map you use the **policy-map** command on page 66.54.

To create a policy-map called `pmap1` use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
```

Having created the policy-map `pmap1` we can use the **class** command on page 66.3 to assign it to one or more class-maps. Since we created the class-maps `video-traffic` and `office-traffic` earlier in this chapter, we can now attach the policy-map `pmap1` to both class-maps.

Use the **class** command to assign the policy-map `pmap1` to the class-maps `video-traffic` and `office-traffic`:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class video-traffic
awplus(config-pmap-c)# exit
awplus(config-pmap)# class office-traffic
awplus(config-pmap-c)#
```

Premarking Your Traffic

Premarking relates to adding QoS markers to your incoming data traffic before it is metered (policed). Network switches will often be configured with two different premarking profiles, one for the QoS edge switches and another for the QoS core switches. This situation would apply if you are operating DSCP domains.

QoS markers can be applied at both the link layer (within the CoS field), and at the network layer (within the DSCP field). For more information on this topic see **"QoS Packet Information" on page 65.3**.

For boundary QoS switches

Traffic entering QoS boundary switches is unlikely to contain pre-existing QoS tagging. In this case, you can apply one or more of the following QoS mapping options.

- Assign an output queue to data associated with a particular class-map, using the **set queue** command, and apply it to the input (ingress) port.
- Assign a CoS tag to data associated with a particular class-map using the **set cos** command. You can then map the CoS tag to an output (egress) port queue (using the **mls qos map cos-queue to** command).
- Assign a DSCP tag to data associated with a particular class-map using the **set dscp** command. Alternatively, you can use the **trust dscp** command to map the DSCP tag to an egress port queue, a CoS value, or both. At the premarking stage you can set this mapping using the **mls qos map premark-dscp to** command. After policing, you can then use the remarking command **mls qos map policed-dscp to** in order to reassign a particular DSCP to a specific egress queue, CoS value, or both.

When no other mapping is set, all traffic is sent to the queue that is set by the **mls qos queue** command. If this command is unset (i.e. in the absence of any other queue selection) and the packet is untagged, traffic will be sent to queue 2.

For core QoS switches

Traffic entering ports within the QoS core network will almost certainly contain some pre-existing QoS tagging. Where this is the case, you can apply one of the following QoS mapping options.

- Map the CoS tag to an egress queue. You can do this either for the whole switch or for specific ports via their assigned policy-maps. See **"CoS to egress queue premarking" on page 65.12**.
- Map the DSCP tag to an output queue. You can do this either for the whole switch or for specific ports via their assigned policy-maps. When no other mapping is set, all traffic is sent to the queue that is set by the **mls qos queue** command.
- Remap incoming data DSCP or CoS tags to values that are more appropriate for a particular switch or network.
- Assign bandwidth classes for your packets, based on the incoming DSCP. See **Setting the Trust DSCP Map** command on page 65.15.

CoS to egress queue premarking

If you are using CoS tagging for your QoS functions, your traffic is likely to be either entering the switch with a pre-existing CoS tag, or will have appropriate tags attached via your class-maps and policy-maps. You can now mark the data for a particular egress queue, which will take effect when the data reaches its output port. There are two fundamental methods of applying CoS tagged packets to egress queues:

1. Apply a global mapping of CoS tags to egress queues for all ports.

2. Apply a CoS to egress queue mapping for the class-map / policy-map. This mapping - which forms part of the policy-map - is applied at an input port, but will take effect at the packet's destination output port. Note that this procedure takes priority over that described in method (1) above.

These methods and their related commands will be now be described in greater detail.

CoS tagging commands

Table 65-3 shows the commands that can set or change the CoS tag within a packet.

Table 65-3: CoS Mapping Commands in Hierarchical Order

Command	Function
set cos	Assigns a CoS tag to a particular class-map / policy-map.
mls qos map premark-dscp to	Where a packet contains CoS tag and a DSCP tags. The table set by this command contains a configurable DSCP to CoS tag mapping.
mls qos map policed-dscp to	Finally, the remarking function applied by this command can remap all previously set CoS tagging.

Where a packet entering a port contains a pre-existing DSCP, You can use the command **mls qos map policed-dscp to** change the following components, DSCP tag, CoS tag, bandwidth class.

Note

Where a packet contains both a CoS and a DSCP field, and each field maps to a different class-map; the switch will apply a priority based on the creation date of the class-maps to which they apply - the earlier the creation date, the higher the priority

Mapping CoS tags to traffic types

The command **mls qos map cos-queue to** enables you to create a switch-wide mapping of CoS values to egress queues. The default mappings for this command are:

```
COS :           0 1 2 3 4 5 6 7
--------------------------------
QUEUE:          2 0 1 3 4 5 6 7
```

These mappings match the CoS guidelines documented in Annex H.2 of ANSI/IEEE 802.1D 1988 Edition. Table H-15 on page 355 of the standard shows a table of user priorities for specific traffic types. **Table 65-4** shows an adapted version of the ANSI/IEEE table.

Table 65-4: Traffic Type Guidelines

User Priority (egress queue)	CoS Value	Acronym	Traffic type	Internal Traffic Queue Defaults
0 (lowest)	1	BK	Background	
1	2	-	Spare	
2	0	BE	Best Effort	Default
3	3	EE	Excellent Effort	

Table 65-4: Traffic Type Guidelines(cont.)

User Priority (egress queue)	CoS Value	Acronym	Traffic type	Internal Traffic Queue Defaults
4	4	CL	Controlled Load	
5	5	VI	"Video," <100 ms latency and jitter	
6	6	VO	"Voice," <10 ms latency and jitter	EPSR-Management BPDU ARP-Requests
7 (highest)	7	NC	Network Control	Stack Management

CoS settings for VCStack operation

In general you can apply the same principles when configuring QoS on a VCStack as you would for a single switch; however there are a few specific changes that you will need to make.

Switches within a VCStack exchange their stack management traffic and user data over their high speed inter-stacking links. The stack management traffic is pre-assigned to the egress queue 7. This is the highest value queue, and (in a stacked configuration) its traffic should not be shared with any user data. However, any CoS tagging of 7 applied to the incoming data will automatically be assigned to queue 7 as it crosses the internal stacking links. You will therefore need to reconfigure your CoS to Queue settings to ensure that no user data is sent to queue 7.

To prevent this from happening, we recommend that you make appropriate changes to your queue settings (mappings) to reflect the stacking requirement previously described. For more information on this topic, see **"Mapping CoS tags to traffic types" on page 65.13**.

This process should include (but not be limited to) running the following command to ensure that any remaining user still carrying a CoS 7 tag will be mapped to egress queue 6.

To remap priority CoS traffic to egress queue 6, run the following command.

```
awplus# config terminal
awplus(config)# mls qos map cos-queue 7 to 6
```

DSCP to egress queue premarking

If you are using DSCP tagging for your QoS functions, your traffic is likely to be entering the switch either with a pre-existing DSCP tag, or will have appropriate DSCP tags attached via your class-maps and policy-maps. You can now mark the data for a particular egress queue, which will take effect when the data reaches its output port.

If your switch forms part of a DSCP domain, you can adapt the steps in this section to apply the mappings and settings to match the standards you have selected for the domain. This mapping - which forms part of the policy-map - is applied at an input port, but will take effect at the packet's destination output port.

DSCP to egress queue premarking commands

A number of commands can be used for mapping DSCP tags. Where these conflict, the switch applies a pre-defined set of priorities. **Table 65-5** lists these priorities in order (lowest priority first).

Where a packet that contains both CoS and a DSCP fields and each field maps to a different class-map / policy-map, the switch will apply a priority based on the creation date of class-maps - the earlier the creation date, the higher the priority priorities.

Table 65-5: DSCP Mapping Commands in Hierarchical Order

Command	Function
mls qos map policed-dscp to	This remarking function can remap previously set dscp values and queue selections.
trust dscp	Setting the trust dscp enables the **mls qos map premark-dscp to** command to apply. See, **"Setting the Trust DSCP Map" on page 65.15**.
set dscp	With the trust dscp set, this command will change the dscp value in the packet.
mls qos map premark-dscp to	With the trust dscp set, this command applies a remapping table whose values include the dscp and egress queues.
mls qos queue	Sets a default egress queue for each individual port (or range of ports) on the switch.

If no overriding commands have been configured, and there is no CoS value in the packet, then the default setting of the **mls qos queue** command will send all data out via its port's egress queue 2. You can use the **mls qos queue** command to reset the egress queue for each port on the switch. If the packet does contain a CoS tag value, then this queue will be that shown in the mapping in the section **"Mapping CoS tags to traffic types" on page 65.13**.

Setting the Trust DSCP Map

The Trust DSCP mapping table assigns a new set of QoS values for a DSCP value supplied as table input. To configure this table you use the **mls qos map premark-dscp to** command.

Table 65-6: Drop Probability Table

Table Input	**---------- Table Output ----------**			
Existing DSCP	New DSCP Value	New CoS Value	New Queue No	New BW Class green yellow red

The Trust DSCP map provides the highest priority of all the pre-marking controls. To apply this table you must first apply the trust setting by using the **trust dscp** command.

At this point the DSCP input to the table will be that existing in the incoming packet. However, by setting the **set dscp** command you can change the DSCP for all packets within the specified class-map or policy-map (for hardware type 2 modules) specified. Note, that with the trust DSCP set, the DSCP value that is used for table lookup will depend on the applied port's platform type:

- on switch ports belonging to a hardware type 2 module, lookup is on the DSCP of the incoming packet.
- on switch ports belonging to a hardware type 1 module, lookup is on either the DSCP of the incoming packet, or the DSCP applied to the selected class-map (i.e. that set by the **set dscp** command).

See **"Hardware Versions" on page 65.7**) to see which XEMs are hardware types 1 and 2.

Policing (Metering) Your Data

Once you have set-up your classification and created your class-maps, you can start conditioning your traffic flows. One tool used for traffic conditioning is the policer (or meter). The principle of policing is to measure the data flow that matches the definitions for a particular class-map; then, by selecting appropriate data rates, allocate the flows into one of three categories: Red, Yellow, or Green. You then decide what action to apply to the Red, Yellow and Green data.

Two metering types can be configured from the **mls qos aggregate-police action** command on page 66.23, these types are:

- single-rate three-color
- twin-rate three-color

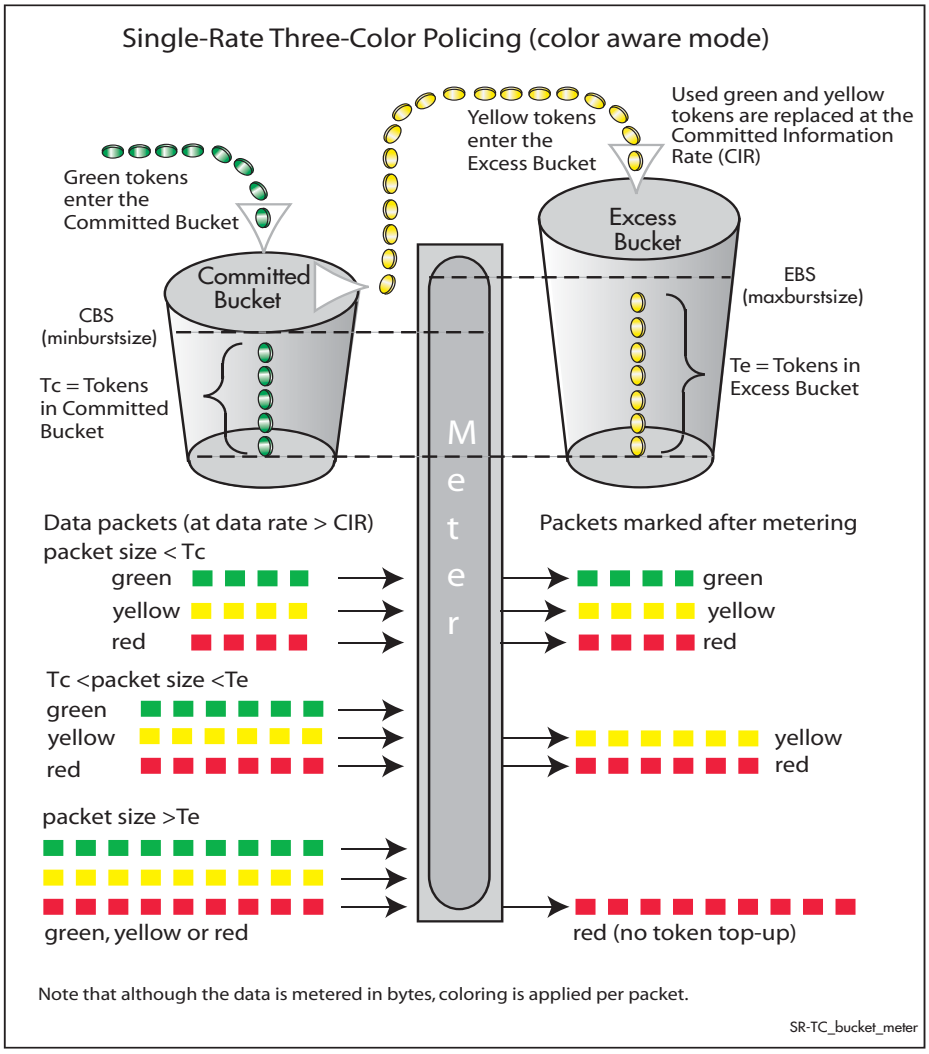
Note that the although the color marking process is carried out on the input port (on ingress), the egress port can also use this color marking to modify its output data flows. The meter operates in the color aware mode; however the premarker that precedes it senses all input data as being green. Note that all external data entering a switch port is considered to be marked green. This means that unless you have re-colored your data at the premarking stage - by using the **set bandwidth-class** command on page 66.57 - the data entering the meter will be green.

The metering levels, CIR, CBS etc are defined within a policer. This class-map (along with others) is then added to a policy-map, which in turn is attached to a port.

Single-rate Three-color Policing

This policing method is based on that defined in RFC 2697. The principle of single-rate three-color policing is shown in **Figure 65-7**. For a given class-map, a meter monitors both the token count in the buckets, and the input data flow.

Figure 65-7: Single-rate Three-color Policing



Each byte entering the meter is paired with a token in one of the buckets, and a token is removed as each byte is accepted. If the input data rate is the same as the CIR then the data passes through the port at the same rate as its bucket fills. Hence the bucket level remains constant. In this model, the data buffer is represented by two data buckets. You can specify the CIR using the **police single-rate action** command.

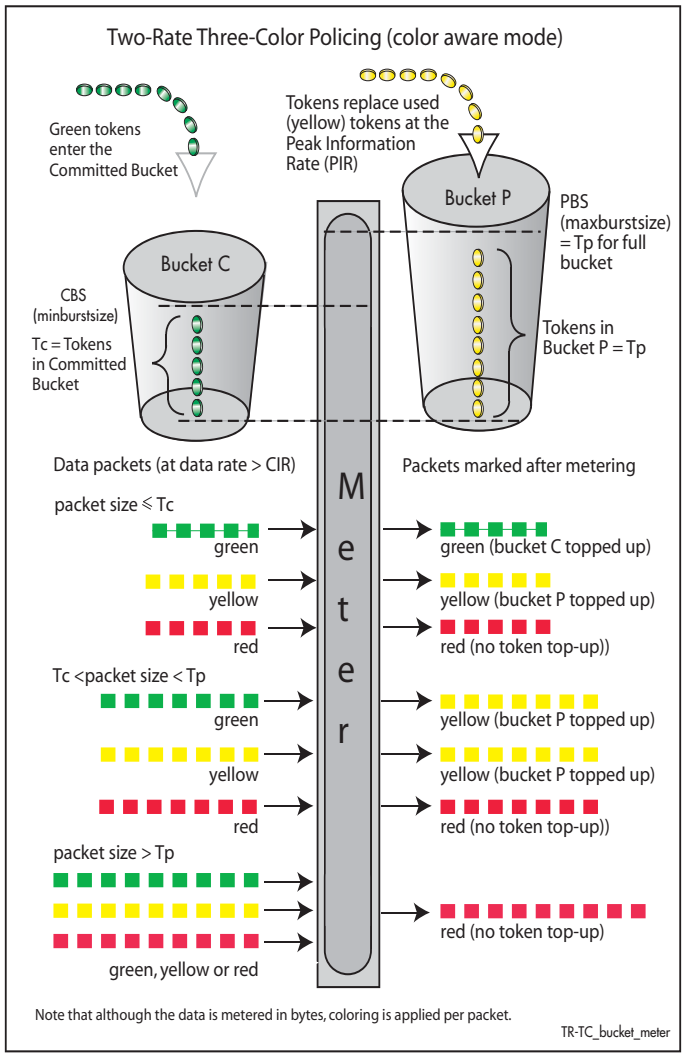
Initially both buckets have their full token count. A surge of data exceeding the CIR will begin to empty the bucket. As the data and tokens are paired, data bytes that match tokens below the CBS level are marked green, those that are between CBS and EBS will be marked yellow, and those that are above EBS are marked red.

Note that although the data is metered per byte, the color marking process is applied per packet. This means that if there were only sufficient tokens available to match part of a packet, then the whole packet would be marked red. Then, depending on the **action** parameter of the **police single-rate action** command, the whole packet will be either dropped or forwarded. In either situation, the red marked packet will leave the bucket counts unchanged.

Two-rate Three-color Policing

This policing method is based on that defined in RFC 2698. The principle of two-rate three-color policing is shown in **Figure 65-8**.

Figure 65-8: Two-rate Three-color Policer



For a given class-map, the meter monitors the token count in both buckets, and the input data flow. Initially tokens enter both buckets until full. As the data enters a port, the meter pairs each byte to a token in one of the buckets, then removes a token from the appropriate bucket. Bucket C is topped up with tokens at the Committed Information Rate (CIR), and bucket P is topped up at the Peak Information Rate (PIR).

When data enters the port at the CIR, the bucket fills at the same rate as the incoming data, thus the token count in bucket C remains constant. Similarly, if data enters the port at the PIR, then the token count in bucket P remains constant. You can specify the CIR and the PIR by using either the **police twin-rate action** command or the **mls qos aggregate-police action** command. The function of each of these commands is explained in the section **"Configuring and Applying a Policer" on page 65.20**.

A surge of data exceeding the CIR will begin to empty bucket C. If bucket C empties to a point where it has insufficient tokens to match to an incoming data packet, then the data packet will be marked yellow. The data will now be measured against the level in bucket P and tokens will be removed from this bucket to match the incoming data. If the incoming data rate drops to less than the CIR then the data will continue to be marked yellow until the level in bucket C has had a chance to fill, whereupon it will be marked *green*.

If the incoming data is greater than the PIR, then bucket P begins to empty. If bucket P empties to a point where it has insufficient tokens to match to an incoming data packet, then the data packet will be marked *red*. In this situation no tokens are removed from either bucket.

Note that although the data is metered per byte, the color marking process is applied per packet. This means that if there were only sufficient tokens available to match part of a packet, then the whole packet would be marked red. Then, depending on the **action** parameter of the **police twin-rate action** command, the whole packet will be either dropped, or marked and forwarded. In either situation, the red marked packet will leave the bucket counts unchanged.

Configuring and Applying a Policer

The previous section showed how the policer works and how to select either the single rate or twin rate action. There are two methods to apply a policy to class-maps.

1. Select your policy-map and class-map from the command prompt, then enter either the **police single-rate action** command or the **police twin-rate action** command whilst selecting the appropriate command parameters.

   This will apply the command to the selected class-map. By running this command several times, each for a different class-map, you can apply separate meter settings to each class-map.

2. Use the **mls qos aggregate-police action** to create a “named” aggregate policer whilst selecting the appropriate command parameters. Once you have done this, you can use the **police-aggregate** command to apply the aggregator to the policy-map and class-map selected from the command prompt. Note that you cannot apply an aggregate policer to a class-map that has already been attached to a policer by using either the **police single-rate action**, or the **police twin-rate action** commands.

The main difference between these two methods is that you use method (1) to apply policing to a number of class-maps, each having its own individually configured meter settings; whereas you use method (2) to apply policing to a number of class-maps and police them all using a single meter setting.

Note

A set of class-maps that contribute traffic into a given aggregate policer can belong to different policy-maps. This means that the aggregate policer can meter packets destined for different egress ports.

Remarking Your Data

The remarking process enables you to change the QoS tagging and queue assignments etc from data that has already been marked by the policer. To do this you fill entries in the remarking table by using the **mls qos map policed-dscp to** command on page 66.32. In order to remark your data ensure that the **action** parameter of either the **police single-rate action** or the **police twin-rate action** is set to **policed-dscp-transmit**.

The following table shows the remarking options

Table 65-7: Remarking Options

Existing DSCP	BANDWIDTH CLASS		
	Green	Yellow	Red
DSCP value in the packet leaving the meter	New value for DSCP New value for CoS Tag New bandwidth class (Red, Yellow, or Green) New value for egress queue	New value for DSCP New value for CoS Tag New bandwidth class (Red, Yellow, or Green) New value for egress queue	New value for DSCP New value for CoS Tag New bandwidth class (Red, Yellow, or Green) New value for egress queue

Example Traffic whose existing DSCP value is 15 and has its data marked either Green, Yellow or Red is to be remarked to have its existing policed green traffic tagged as follows:

- new DSCP of 20
- new CoS of 3
- new queue of 4
- new bandwidth class of yellow

Table 65-8: Remarking Table Example

DSCP	BANDWIDTH CLASS		
	Green	Yellow	Red
Existing dscp = 1	Remapping for DSCP 1	Remapping for DSCP 1	Remapping for DSCP 1
. . .	Remapping for DSCPs 2 to 14	Remapping for DSCPs 2 to 14	Remapping for DSCPs 2 to 14
Existing dscp =15	New DSCP = 20 New CoS Tag = 3 New bandwidth class = Yellow New egress queue = 4		
. . .	Remapping for DSCPs 2 to 62	Remapping for DSCPs 2 to 62	Remapping for DSCPs 2 to 62
Existing dscp = 63	Remapping for DSCP 63	Remapping for DSCP 63	Remapping for DSCP 63

To configure this setting, you would enter the following commands:

```
awplus# config terminal

awplus(config)# mls qos map policed-dscp 15 bandwidth-class
green to new-dscp 20 new-cos 3 new-queue 4
new-bandwidth-class yellow
```

Configuring the Egress Queues

Previous sections have explained the ingress functions. These include, how the incoming data can be classified and marked according to its priority and allocated to an egress queue, then finally how metering and remarking is applied. At this point the data then flows across the switch to its destination egress port where its transit to the egress queues is controlled.

The means by which data is applied to the egress queues is dependant on three functions:

- Egress queue and QoS markers that are set within each data packet
- Egress controls that are applied to the whole switch
- Egress that are applied to each individual switch port

Fabric queues - The Internal Paths

Although the internal hardware functions of the switch are outside the scope of this manual, the section, **"QoS and the Switching Fabric" on page 65.37** provides some background information to help you understand and use the **mls qos fabric-queue** command. Basically, the internal path that links the fabric adaptors terminates in four fabric queues. These queues schedule the data between the internal fabric adaptors and each port's egress queue.

The **mls qos fabric-queue** command, mentioned above, enables you to select the scheduling algorithm to be either strict priority, or weighted round robin (WRR). Use **show mls qos fabric-queue** to see the present settings on your switch.

The **mls qos fabric-queue** command enables you to map the egress queues to the internal processor fabric queues. The commands section provides more information such as their default settings and how to reconfigure them.

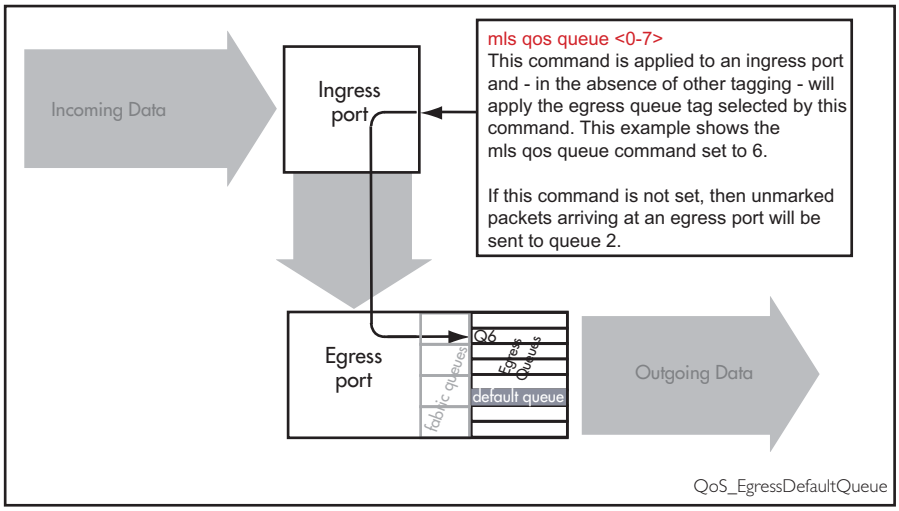
Caution Fabric queue 3 is reserved for VCStack control traffic. Do not use queue 3 for any other traffic. Do not set queue 3 to weighted round robin scheduling. It must use strict priority scheduling.

Egress Queues and QoS markers

Once the data packets have been appropriately filtered, classified, policed, and remarked, they travel across the switch's internal paths carrying their assigned QoS tag markers such as their priority, class and destination queues. For more details on ingress data marking, refer to the earlier sections of this chapter. At the egress port these markers are read and used to determine which queues each data packet will be forwarded to, and the priorities that will be applied.

There are eight egress queues allocated to each egress port. The egress queue that a particular packet passes through is determined by either the configuration of the switch, or by the markers contained within the packet itself.

Figure 65-9: Default Egress Queue



Egress Queue Commands Hierarchy

The destination queue that any one packet will take depends on the markers within the packet, and the way the queueing commands have been set. Also, some queueing commands will override others. Here is how the switch prioritizes its queueing commands.

Imagine a packet entering an ingress port then traveling through the switch fabric to reach its appropriate egress port. In this situation the following hierarchy will apply:

1. If the packet enters an egress port carrying no QoS markers and no QoS queueing commands have been set on the switch, then the packet will exit the port via queue number 2.

2. If the packet containing CoS marker arrives at an egress port, then with no other configuration applying, then its queue mapping will be subject to the setting of the **mls qos map cos-queue to** command.

3. Situations (1) and (2) can be overridden by the **mls qos queue** command. This command sets a default queue for each switch port.

4. If the **set queue** command has been applied to specific ports via its class-map / policy-map combination, then the queue mapping of this command will override that set by the **mls qos queue** command for those specific ports.

5. If the **trust dscp** then the egress queue assignment will be based on the entries in the mls qos map, which is set by the **mls qos queue** command. This mapping table will override all the previous commands in this list.

6. Finally all the above mappings may be modified by the remarker, by using the **mls qos map policed-dscp to** command.

Egress Queue Shaping

This section is concerned with how the egress queues are cleared. It does NOT apply to ports on hardware type 2 modules (see **"Hardware Versions" on page 65.7**).

There are two aspects to queue shaping:

- Scheduling (strict priority or weighted round robin)
- Drop Mode (tail-drop or weighted early discard)

Scheduling

The scheduler determines how packets in the egress port queues are serviced. Two servicing methods can be applied:

- strict priority
- weighted round robin

Strict priority servicing

By default, all queues on all ports are serviced in a strict priority order. This means that the highest numbered priority queue (queue 7) is emptied first; then when it is completely empty, the next highest priority queue is processed, and so on. Thus, for a strict priority queue to be processed, all higher priority queues must be empty.

Strict priority servicing is the default setting; however if your system is configured for weighted round robin (WRR), you can return it to priority queueing by using the commands shown in the following example.

To return queue 2 of `port1.0.1` from WRR servicing to strict priority queueing, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# priority-queue 2
```

Weighted round robin servicing

The device supports two independent round robin groups. Within each round robin group, a queue will be picked with respect to their configured weight. The queue will then be compared to all the groups (strict priority, weighted round robin group 1, and weighted round robin group 2) queue candidate. The queue with the highest number will be transmitting packets.

Example To configure wrr-queue group 1 applying a weighting value of 6 to queues 0 1 2:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# wrr-queue group 1 weight 6 queues 0 1 2
```

Example To configure wrr-queue group 2 applying a weighting value of 12 to queues 3 4 5:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# wrr-queue group 2 weight 12 queues 3 4 5
```

Example In this example port 1.0.1 has queues configured as follows:

- queues 6 and 7 are configured strict priority
- queues 3, 4 and 5 are WRR group 1 with weighting values of 6, 6 and 12 respectively
- queues 0, 1 and 2 are WRR group 2 all with a weighting value of 6

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# priority-queue 6 7
awplus(config-if)# wrr-queue group 1 weight 6 queues 3 4
awplus(config-if)# wrr-queue group 1 weight 12 queues 5
awplus(config-if)# wrr-queue group 2 weight 6 queues 0 1 2
```

In this example, the queues are processed as follows:

1. Queue 7 is processed first.
2. If queue 7 is empty, Queue 6 is processed next.
3. If queues 6 and 7 are empty, queues 3, 4 and 5 are processed with a ratio of 1:1:2.
4. If queues 3 to 7 are empty, queues 0, 1 and 2 are processed with equal weighting.

Drop Mode

Note that this section does not apply to ports on hardware type 2 modules (see **"Hardware Versions" on page 65.7**).

The drop mode sets the limits for packets in the eight egress queues and determines how packets will be dropped if the queues become congested. Two drop methods may be employed, these are:

- Tail Drop
- Weighted Random Early Discard (WRED)

For both the above methods there are 4 pre-existing queue-sets numbered 1-4. You can configure each queue-set with a separate drop mode profile for each of the 8 egress queues.

Your switch has 4 pre-existing queue-sets, one pre-configured for 1G ports and another for 10 G ports. These configurations are shown in **Table 65-10 on page -28** and **Table 65-11 on page -29**. You can name and reconfigure these profiles and change the association of queue sets to switch ports. These steps are explained later in this section.

Note

The default drop mode operation is Tail Drop. In this situation the value set by the **mls qos queue-set drop-probability** command is ignored, and a drop value of 0 (i.e 100%) is internally applied. Also the value set for the minimum threshold is ignored, and the averaging factor is replaced by an instantaneous comparison of queue size with the maximum threshold figure (Maxth).

Figure 65-10: Queue-Set Defaults for 1G Ports

```
awplus#show mls qos queue-set

Queue Set 1:
Description: 1G Defaults

             BandwidthClass   Min           Max           Drop Probability

            | Red              1 MB           1 MB           1 (50%)
-------------------------------------------------------------------------------
Queue 5     | Green            1 MB           1 MB           1 (50%)
            | Yellow           1 MB           1 MB           1 (50%)
            | Red              1 MB           1 MB           1 (50%)
-------------------------------------------------------------------------------
Queue 6     | Green            1 MB           1 MB           1 (50%)
            | Yellow           1 MB           1 MB           1 (50%)
            | Red              1 MB           1 MB           1 (50%)
-------------------------------------------------------------------------------
Queue 7     | Green            1 MB           1 MB           1 (50%)
            | Yellow           1 MB           1 MB           1 (50%)
            | Red              1 MB           1 MB           1 (50%)
-------------------------------------------------------------------------------

Queue Length Averaging Factor
  Queue 0: 9
  Queue 1: 9
  Queue 2: 9
  Queue 3: 9
  Queue 4: 9
  Queue 5: 9
  Queue 6: 9
  Queue 7: 9
```

Assigning a queue-set description

You can use the **mls qos queue-set description** command to assign each of the queue-sets with an appropriate description. For example, you could name your triple-play traffic “Triple-Play” as shown below. You could then assign appropriate profiles for each of 8 triple-play queues within the queue-set.

Example To set the description for queue-set 4 to be “Triple-Play,” use the command:

```
awplus# config terminal
awplus(config)# mls qos queue-set 4 description "Triple-Play"
```

Once you have configured your queue-sets, you can apply each to specific ports by using the **mls qos queue-set** command. You also use this command to select the drop-mode to apply.

Note the following rules when applying queue-sets to queues and ports:

- a port can only have one queue-set applied to it
- a queue-set can be applied to many ports

Example To set port 1.0.1 to use queue-set 2 in random-detect mode, use the command:

```
awplus# config terminal
awplus(config)# interface port1.0.1
awplus(config-if)# mls qos queue-set 2 random-detect
```

Tail Drop

Note that this section does not apply to ports on hardware type 2 modules (see **"Hardware Versions" on page 65.7**).

In this drop mode each egress queue is configured with a maximum threshold value. This value represents the point where the egress buffer queues are full and the egress port must start dropping data. The port does this by dropping data packets destined for the full queue on a "last in first dropped" basis. This enables the port to clear its data already queued for egress.

If a "reliable" transport protocol, such as TCP is used, this data should be retransmitted, but at a slower rate due to lack of returning "acknowledgements". The queue threshold value is set using the **mls qos queue-set threshold** command.

Tail drop is far simpler to configure than its alternative random-detect (RED) and in most situations offers similar performance. In some situations, such as when using the UDP protocol, it is more appropriate to use tail-drop than RED. This is because UDP (unlike TCP) is not a sliding window protocol. UDP is also a popular protocol for "real time" data such as voice and video conferencing. The defaults for tail-drop are shown in **Figure 65-10 on page 65.28** and **Figure 65-11 on page 65.29**.

Note

The default drop mode operation is Tail Drop. In this situation the value set by the **mls qos queue-set drop-probability** command is ignored, and a drop value of 0 (i.e 100%) is internally applied. Also the value set for the minimum threshold is ignored, and the averaging factor is replaced by an instantaneous comparison of queue size with the maximum threshold figure (Maxth).

To reset a port from RED drop-mode to tail drop mode, use the **mls qos queue-set** command.

Example To set port 1.0.1 to tail-drop to use the command:

```
awplus# config terminal
awplus(config)# interface port1.0.1
awplus(config-if)# mls qos queue-set 2 taildrop
```

Random Early Detection (RED)

Note that this section does not apply to ports on hardware type 2 modules (see **"Hardware Versions" on page 65.7**).

This drop mode was developed as a more graceful way of managing queue congestion than that obtained using the tail-drop method described in the previous section. RED is however far more complex to configure than tail-drop. As previously mentioned, in some situations, such as when using the UDP protocol, it is more appropriate to use tail-drop than RED. This is because UDP (unlike TCP) is not a sliding window protocol and so dropping packets does nothing to slow the incoming data flow. Because UDP is also a popular protocol for "real time" data such as voice and video conferences, dropping packets as the egress queue fills, can result in unnecessary performance degradation of the end-user application.

AlliedWare Plus™ enables you to create different RED curves for each traffic class. This feature is known as Weighted Random Early Detection (WRED).

The defaults for WRED configuration are shown in **Figure 65-10 on page 65.28** and **Figure 65-11 on page 65.29**.

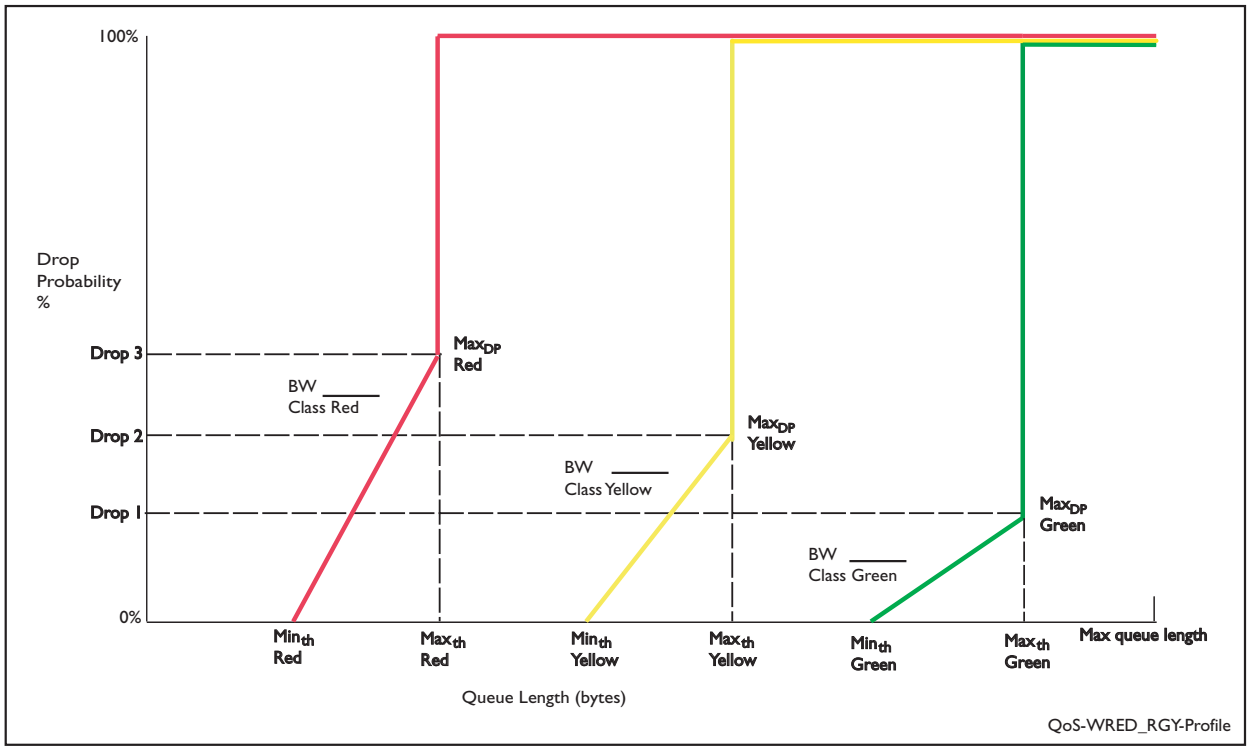
Random early detection operates in a similar way to tail drop but begins to (gracefully) drop packets as the *average queue length*[1] approaches the Maximum threshold point (Max_{th}). The concept is illustrated in **Figure 65-12 on page 65.32**. This figure shows how packets in the three classes, Red, Yellow, and Green are progressively dropped as their egress queue begins to fill.

Each queue has an allocated buffer size, illustrated in the figure by the MAX queue length on the graph's x axis. Traffic entering the queue can be marked either Green (most conformant), Yellow, or Red (least conformant). As the queue length increases it will first reach point $Mint_h$ Red the minimum threshold for Red traffic. At this point the port begins to drop some of its red class traffic. If the current data flow continues and the queue continues to fill, traffic is dropped in increasing amounts. The vertical axis of the graph shows the probability of a packet being dropped.

1. **The following equation is used to calculate the average queue length (Qave):**
   Qave = [(1 - 1/2n) * Qave] + [1/2n * (Current queue length)]

   Where n = the averaging factor
   See the mls qos queue-set averaging-factor command on page 66.42**.**

Figure 65-12: Random Early Detect - Drop Profile



As the buffer further increases it will reach the point Max_{th}. At this point the drop probability is at the point Max_dp on the chart's vertical axis. From this point on, any further increase in queue size results in all packets in red traffic being dropped. This should increase the queue space for the remaining yellow and green traffic.

If the queue continues to fill, the above situation will then apply to the yellow and green traffic, as the queue size meets their own configurable thresholds Min_{th} yellow, Max_{th} yellow etc. Setting these thresholds is covered in **"Configuring Tail Drop and Random Early Detection" on page 65.32**.

Configuring Tail Drop and Random Early Detection

Note that this section does not apply to ports on hardware type 2 modules (see **"Hardware Versions" on page 65.7**).

As previously mentioned the defaults for both drop methods can be seen from **Figure 65-10 on page 65.28** and **Figure 65-11 on page 65.29**. These tables show the same output for both tail-drop and RED detection methods. However, when tail-drop is applied the values for Min_{th} and average queue length (Q_{ave}) are ignored, and the drop probability is either 0 (for a current queue size $<Max_{th}$) or 100% for a current queue size $>Max_{th}$).

The defaults shown are simply factory presets and are not intended to produce a functional configuration. The information in this section is to provide the basic guidelines required for you to set-up a tail-drop or RED detection method based on you own QoS standards.

Some Rules and Guidelines for the x.900 and SwitchBlade® x908 series switches.

- Each port on your switch will be a member of a single switch processor instance: All ports within a XEM are members of the same processor instance. On 24 port

switches, such as the x900-24 series, ports 1-12 and ports 13-24 belong to separate processors.

- Each port contains 8 egress queues; these share the total queue buffer space allocated for the port. The per port upper limit is:
  - 1.8 MB when configured for normal size frames
  - 8.25 MB when configured for Jumbo frames
- Each processor instance has the following buffer limits:
  - When the switch is configured for normal frames, 8.2 MB is shared between its ports. For a 12 port processor, the buffer limit = 0.68 MB_{avg} per port, and for a single port processor, such as a XEM, the buffer limit is 8.2 MB.
  - When the switch is configured for jumbo frames 32 MB is shared between its ports.
    For a 12 port processor, the buffer limit = 2.6 MB_{avg} per port.
    For a single port processor, such as a XEM, the buffer limit = 32 MB.

Note

For each queue-set, use the **wrr-queue queue-limit** command on page 66.92 to allocate the buffer size for each of a ports 8 egress queues (see note below), then select suitable threshold values for each of the classes Red, Yellow, and Green for each queue. See **mls qos queue-set threshold** command on page 66.46.

When setting the **wrr-queue queue-limit** command, we recommend setting the average queue length for a maximum queue ratio of 37% across all used queues on the particular port (i.e. 4.62% per queue when using 8 queues). This will provide 667 KB per port (83 KB per queue) when the switch is set for normal frame sizes; and 3.1 MB per port (388 KB per queue) when the switch is set to support Jumbo frames. You can then use these values to form the basis for setting the Maxth value for your Green traffic. Once you have set the Maxth Green you can work back from this point to choose appropriate values for your Red and Yellow traffic.

At this point you should be ready to apply your configurations using tail-drop. If you want to use RED you will need to take the following additional steps. Configuring RED for more than a marginal performance advantage over tail-drop, will require a good understanding of RED configuration principles and of your networks traffic profiles and service quality expectations.
The following steps are intended to configure a basic RED system using some rule-of-thumb settings. You will probably want to fine tune these settings for real traffic profiles.

- Using the Drop Probability Table below, select an appropriate value for the maximum drop probability value for each of the colors. For TCP traffic we suggest using a drop probability of 3 or 4. For Green traffic using UDP we suggest using a value of 7, for reasons given in the earlier part of this section. See **mls qos queue-set drop-probability** command on page 66.44.

Table 65-9: Drop Probability Table

Drop Value	0	1	2	3	4	5	6	7
Drop Probability	100%	50%	25%	12.5%	6.25%	3.12%	1.56%	0.78%

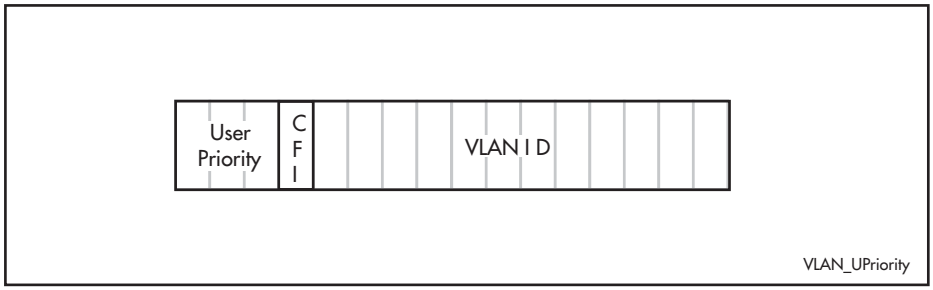
- For each queue-set, select suitable values for Min_{th} for each of the classes Red, Yellow, and Green for each queue within the set. We suggest that you start by setting each Min_{th} to be approximately half the value of the Max_{th} setting that you have already set for that particular color. See the **mls qos queue-set threshold** command on page 66.46.
- Select a value for the Queue Length Averaging Factor. We suggest you initially use the default of 9. See the **mls qos queue-set averaging-factor** command on page 66.42.

Egress Queue Mapping

On the switch you can use the **match inner-vlan** command on page 66.14 to select frames of a particular type. You can then assign these frames with a particular User Priority value then map them to one of eight egress queues. This facility enables you to accept frames that are already carrying meaningful priority information to be automatically assigned to an appropriate egress queue. For example, you could decide to send frames with a User Priority value of 7 to queue 3, and frames with a User Priority value of 2 to queue 7.

Frames entering a port at Layer 2 may be tagged or untagged. VLAN tagged frames contain 3 additional fields as shown in **Figure 65-13** below. The User Priority field enables you to map incoming frames to any one of eight egress queues. This facility enables you can accept frames that are already carrying meaningful priority information to be automatically assigned to an appropriate egress queue. For example, you could decide to send frames with a User Priority value of 7 to queue 3, and frames with a User Priority value of 2 to queue 7.

Figure 65-13: User Priority Field



Mapping an Untagged frame to an Egress Queue

Frames entering a port with no VLAN tag and hence no User Priority Field, can be mapped to one of the eight Egress queue by using the **mls qos queue** command on page 66.39. For example, you could decide to send all untagged frames to a low priority egress queue such as queue 7.

Mapping an IEEE 802.1P value to an Egress Queue

Immediately after ingress, a VLAN-tagged Ethernet frame can be assigned to an appropriate egress queue, based on the priority value that is set within the frame's VLAN Tag Information Field (TIF). To create the mapping between the TIF and a ports egress queue see the **mls qos map cos-queue to** command on page 66.29.

Storm Protection

Storm protection uses QoS mechanisms to classify on traffic likely to cause a packet storm (broadcast and multicast). Unless you are running an enhanced storm protection feature such as Loop Protection, the per-port storm protection mechanism simply discards any traffic over the configured limit. However, with QoS storm protection, several actions are possible when a storm is detected:

- You can disable the port physically.
- You can disable the port logically.
- You can disable the port for a particular VLAN.

Before you can configure storm protection, you must first set the silicon profile to either **extended** or **qoscounters**. Silicon profiles are hardware-dependent - see the **platform silicon-profile** command on page 17.34. Storm protection is activated on a port after port state decisions have been made, and the port is in the STP forwarding state to forward frames and learn addresses.

To enable the policy-based storm protection, use the **storm-protection** command on page 66.81.

When a storm is detected on a port, a message is automatically recorded in the log, and you can configure an SNMP trap to signal that a port has been disabled. When a storm is detected on a trunk or port group, the entire trunk or port group is disabled.

The following table explains the basic concepts involved with storm protection.

Concept	Description
Window	The frequency at which traffic is measured to determine whether storm protection should be activated.
Rate	The amount of traffic per second that must be exceeded before the switch takes the configured action.
Action	What the switch does when it detects a storm on a port.
Timeout	The length of time the port remains disabled after a port has been disabled due to a packet storm.

To set the action to take when triggered by QoS Storm Protection (QSP), use the **storm-action** command on page 66.79.

To set the time to re-enable the port once disabled by QSP, use the **storm-downtime** command on page 66.80.

QoS and the Switching Fabric

Ports on the x900 series switches belong to one of four switch processor instances: two on the base board and one on each expansion module. Switch instances exchange packets over a switching fabric. The switching fabric recognizes the priorities assigned to each packet and performs QoS queuing.

The switching fabric is different from the switch processor instance in that the switching fabric has four queues, whereas each switch port in a switch processor instance has eight egress queues. These two types of queues must be mapped to each other.

To specify the mapping of the 8 switch processor port queues to the fabric queues, use the **mls qos map fabric-queue** command on page 66.30.

You can also configure the switching fabric to use different scheduling methods for each of the four fabric queues. This controls the way that fabric queues share the available bandwidth during congested times. See the **mls qos map fabric-queue** command on page 66.30.

To display information about settings for the switching fabric, use the command: **show mls qos fabric-queue** command on page 66.64.

Caution

Fabric queue 3 is reserved for VCStack control traffic. Do not use queue 3 for any other traffic. Do not set queue 3 to weighted round robin scheduling. It must use strict priority scheduling.

Policy-Based Routing

Policy based routing provides a means to create multiple paths to the same destination. The specific path that any particular packet will take can be based on configurable network metrics such as priority, protocol, or VLAN membership. For example, policy based routing can implement policies to allow or deny paths based on the identity of user devices, application, or packet sizes.

Practical Example

The example shown makes use of policy based routing to achieve the following:

1. Ensure that traffic being sent between local VLANs is switched normally.

2. Selects a particular egress path for traffic destined for the wide are networks.

Configuration Overview

A large government building houses employees from three separate government departments: Heath, Welfare, and Employment. Each department has its own local subnet, and an associated VLAN; these are:

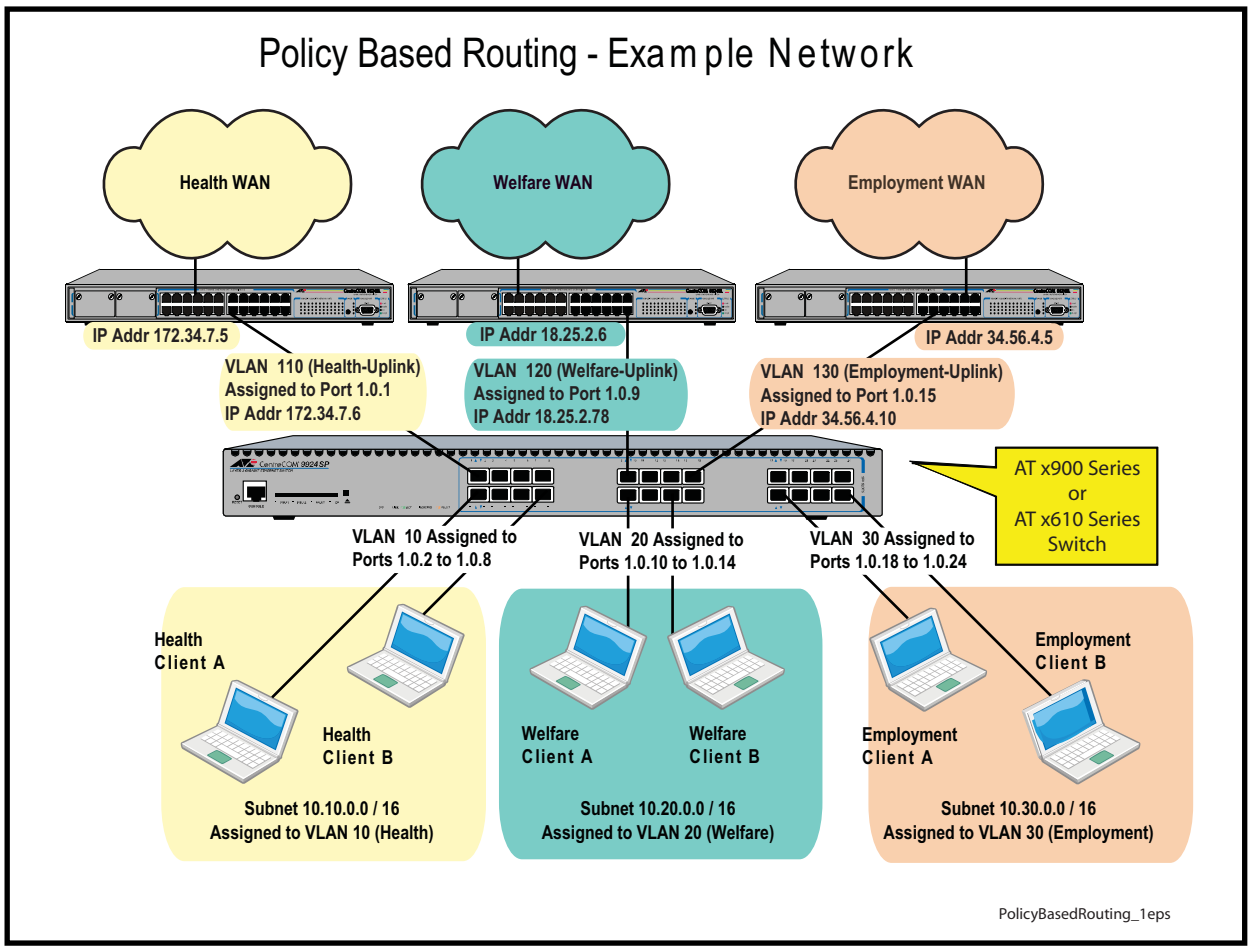
- 10.10.0.0/16 Health, VLAN 10
- 10.20.0.0/16 Welfare, VLAN 20
- 10.30.0.0/16 Employment, VLAN 30

Enquiries to each department are fed through a common Allied Telesis switch. The switch has 3 uplink ports, each of which (for simplicity) will be in a different VLAN and each will supply a connection to its relevant government department and to the Internet via each departments particular ISP (Internet Service Provider). These are:

- Port 1.0.1 Health Uplink, VLAN 110
- Port 1.0.5 Welfare Uplink, VLAN 120
- Port 1.0.21 Employment Uplink, VLAN 130

This configuration is illustrated in **Figure 65-14**:

Figure 65-14: Policy-Based Routing Example



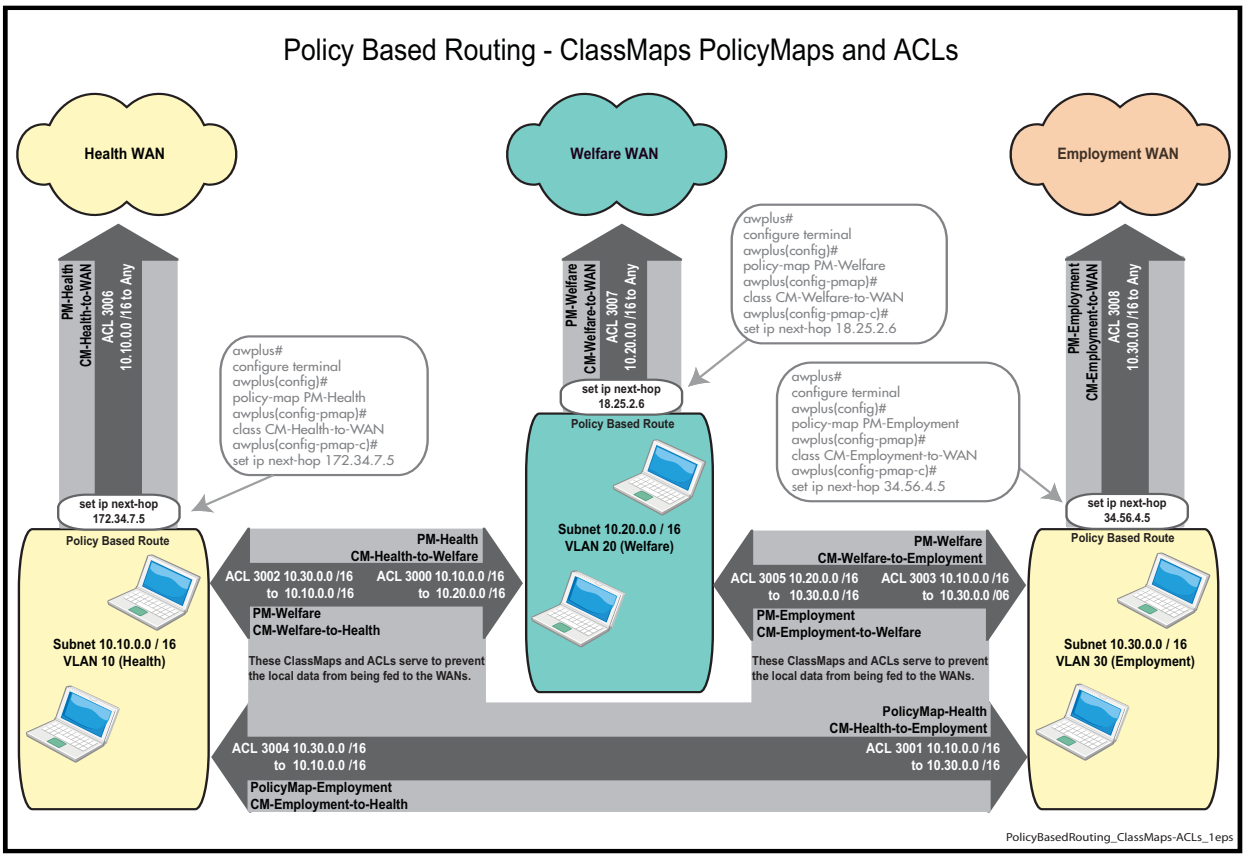
Configuration Steps

The following steps can be used to setup this example network. Since each step involves entering several instances of a command type, a single practical command entry is shown at the end of each step. The set of steps comprise the following:

1. Create VLANs on the switch.
2. Create access control lists (ACLs) that will match the data flows between local subnets.
3. Create ACLs that will match the data flows between local devices and other destinations.
4. Setup class-maps for each department and apply an access-list to each of the class-maps.
5. Setup class-maps for each department's wide area connection and apply an access-list to each of these class-maps.
6. Create the departmental policy-maps and associate them with their appropriate class-maps.
7. Apply these policy-maps to their appropriate ports.

These class-maps and ACLs are shown diagrammatically in **Figure 65-15** below.

Figure 65-15: Policy Based Routing Example - ClassMaps and ACLs



Step 1: Create VLANs on the switch

- Create VLANs 10, 20, and 30
- Apply these VLANs to their appropriate local ports

Practical example: Create VLAN `10` and apply it to `port1.0.2-port1.0.8`.

```
awplus# configure terminal
awplus(config)# interface port port1.0.2-port1.0.8
awplus(config)# switchport mode access
awplus(config)# switchport access vlan 10
```

- Create VLANs 110, 120, and 130
- Apply these VLANs to their appropriate WAN ports

Practical example: Create VLAN `110` and apply it to `port1.0.1`.

```
awplus# configure terminal
awplus(config)# interface port port1.0.1
awplus(config)# switchport mode access
awplus(config)# switchport access vlan 110
```

Step 2: Create access control lists (ACLs) that will match the data flows between local user devices.

- access-list 3000 permit ip 10.10.0.0/16 10.20.0.0/16
  Matches for packets from the Health user devices to Welfare user devices.
- access-list 3001 permit ip 10.10.0.0/16 10.30.0.0/16
  Matches packets from the Health user devices to Employment user devices.
- access-list 3002 permit ip 10.20.0.0/16 10.10.0.0/16
  Matches packets from the Welfare user devices to Health user devices.
- access-list 3003 permit ip 10.20.0.0/16 10.30.0.0/16
  Matches packets from the Welfare user devices to Employment user devices.
- access-list 3004 permit ip 10.30.0.0/16 10.10.0.0/16
  Matches packets from the Employment user devices to Health user devices.
- access-list 3005 permit ip 10.30.0.0/16 10.20.0.0/16
  Matches packets from the Employment user devices to Welfare user devices.

Practical example: Create an ACL that matches packets from the Health user devices to Welfare user devices.

```
awplus# configure terminal
awplus(config)# access-list 3000 permit ip 10.10.0.0/16
10.20.0.0/16
```

Step 3: Create access control lists (ACLs) that will match the data flows between user devices and all other destinations.

- access-list 3006 permit ip 10.10.0.0/16 any
  Matches packets from Health user devices to all other destinations.
- access-list 3007 permit ip 10.20.0.0/16 any
  Matches packets from Welfare user devices all other destinations.
- access-list 3008 permit ip 10.30.0.0/16 any
  Matches packets from Employment user devices to all other destinations.

Practical example: Matches packets from the Health user devices to all other destinations.

```
awplus# configure terminal
awplus(config)# access-list 3006 permit ip 10.10.0.0/16 any
```

Step 4: Setup class-maps for each department and apply an access-list to each of the class-maps.

- class-map CM-Health-to-Welfare
  Creates a class-map called **CM-Health-to-Welfare**
- match access-group 3000
  Applies the access-list 3000 to the **CM-Health-to-Welfare** class-map, so that this class-map applies to all packets matching this ACL.
- class-map CM-Health-to-Employment
  Creates a class-map called **CM-Health-to-Employment.**
- match access-group 3001
  Applies the access-list 3001 to the **CM-Health-to-Employment** class-map, so that this class-map applies to all packets matching this ACL.
- class-map CM-Welfare-to-Health
  Creates a class-map called **CM-Welfare-to-Health.**
- match access-group 3002
  Applies the access-list 3002 to the **CM-Welfare-to-Health** class-map, so that this class-map applies to all packets matching this ACL.
- class-map CM-Welfare-to-Employment
  Creates a class-map called **CM-Welfare-to-Employment.**
- match access-group 3003
  Applies the access-list 3003 to the **CM-Welfare-to-Employment** class-map, so that this class-map applies to all packets matching this ACL.
- class-map CM-Employment-to-Health
  Creates a class-map called Employment-to-Health.
- match access-group 3004
  Applies the access-list 3004 to the **CM-Employment-to-Health** class-map, so that this class-map applies to all packets matching this ACL.
- class-map CM-Employment-to-Health
  Creates a class-map called **CM-Employment-to-Health.**
- match access-group 3005
  Applies the access-list 3005 to the class-map **CM-Employment-to-Health** class-map, so that this class-map applies to all packets matching this ACL.

Practical example: Create the class-map CM-Health-to-Welfare, then apply access list `3000` to it.

```
awplus# configure terminal
awplus(config)# class-map CM-Health-to-Welfare
awplus(config-cmap)# match access-group 3000
```

Step 5: Setup class-maps for each department's wide area connection and apply an access-list to each of these class-maps.

- class-map CM-Health-to-WAN
  Creates a class-map called CM-Health-to-WAN.
- match access-group 3006
  Applies the access-list 3006 to the **CM-Health-to-WAN** class-map, so that this class-map applies to all packets matching this ACL.
- class-map CM-Welfare-to-WAN
  Creates a class-map called Welfare-to-WAN
- match access-group 3007
  Applies the access-list 3007 to the **CM-Welfare-to-WAN** class-map, so that this class-map applies to all packets matching this ACL.
- class-map CM-Employment-to-WAN
  Creates a class-map called Employment-to-WAN.
- match access-group 3008
  Applies the access-list 3008 to the **CM-Employment-to-WAN** class-map, so that this class-map applies to all packets matching this ACL.

Practical example: Create the class-map Health-to-WAN, then apply access list `3006` to it.

```
awplus# configure terminal
awplus(config)# class-map CM-Health-to-WAN
awplus(config-cmap)# match access-group 3006
```

Step 6: Create the Departmental Policy-Maps and associate them with their appropriate Class-Maps.

- policy-map PM-Health
  Creates the policy-map called PM-Health
- class CM-Health-to-Welfare
- class CM-Health-to-Employment
  Attaches the local Health class-maps to the PM-Health policy-map. Note that no action is applied to these two class-maps. Packets that match either of these two class-maps will be forwarded across the local network using normal routing / forwarding procedures.
- class CM-Health-to-WAN
- set ip next-hop 172.34.7.5
  Attaches the CM-Health-to-WAN class-map to this policy-map, and gives it a policy-routing action.
- policy-map PM-Welfare
  Creates the policy-map called PM-Welfare
- class CM-Welfare-to-Health
- class CM-Welfare-to-Employment
  Attaches the local Welfare class-maps to the PM-Welfare policy-map. Note that no action is applied to these two class-maps. Packets that match either of these two class-maps will be forwarded across the local network using normal routing / forwarding procedures.
- class CM-Welfare-to-WAN

- set ip next-hop 18.25.2.6
  Attaches the Welfare-to-WAN class-map to this policy-map, and gives it a policy-routing action.
- policy-map PM-Employment
  Creates the policy-map called PM- Employment
- class CM-Employment-to-Health
- class CM-Employment-to-Welfare
  Attaches the local Employment class-maps to the PM-Employment policy-map. Note that no action is applied to these two class-maps. Packets that match either of these two class-maps will be forwarded across the local network using normal routing / forwarding procedures.
- class CM-Employment-to-WAN
- set ip next-hop 34.56.4.5
  Attaches the Employment-to-WAN class-map to this policy-map, and gives it a policy-routing action.

Practical example: Create the policy-map called PM-Employment and attach its appropriate classmaps.

```
awplus# configure terminal
awplus(config)# policy-map PM-Employment
awplus(config-pmap)# class CM-Employment-to-Health
awplus(config-pmap-c)# exit
awplus(config-pmap)# class CM-Employment-to-Welfare
awplus(config-pmap-c)# exit
awplus(config-pmap)# class CM-Employment-to-WAN
awplus(config-pmap-c)# set ip next-hop 34.56.4.5
```

Step 7: Apply these Policy Maps to appropriate ports.

- service-policy input Health-to-WAN
- service-policy input Welfare-to-WAN
- service-policy input Employment-to-WAN

Practical example: To apply a policy-map named PM-Employment to `port 1.0.18-port1.0.24`:

```
awplus# configure terminal
awplus(config)# interface port1.0.18-port1.0.24
awplus(config-if)# service-policy input PM-Employment
```

Chapter 66: QoS Commands

Command List 66.3
class 66.3
class-map 66.4

wrr-queue egress-rate-limit queues 66.89
wrr-queue group weight queues 66.90
wrr-queue queue-limit 66.92

Command List

This chapter provides an alphabetical reference for Quality of Service commands. For more information, see **Chapter 65, Quality of Service (QoS) Introduction** and **Chapter 60, Access Control Lists Introduction**.

class

Use this command to associate an existing class-map to a policy or policy-map (traffic classification), and to enter Policy Map Class Configuration mode to configure the class-map.

Use the **no** variant of this command to delete an existing class-map.

For more information on class-maps and policy-maps, see the following sections:**"Class Maps" on page 65.8** and **"Policy Maps" on page 65.10**.

Note that if your class-map does not exist, you can create it by using the **class-map** command.

Syntax

```
class {<name>|default}
no class <name>
```

Parameter	Description
<name>	Name of the (already existing) class-map.
`default`	Specify the default class-map.

Mode Policy Map Configuration

Example The following example creates the policy-map `pmap1`(using the policy-map command), then associates this to an already existing class-map named `cmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)#
```

Related Commands **class-map**
policy-map

class-map

Use this command to create a class-map.

Use the **no** variant of this command to delete the named class-map.

Syntax

```
class-map <name>
no class-map <name>
```

Parameter	Description
<name>	Name of the class-map to be created.

Mode Global Configuration

Example This example creates a class-map called `cmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)#
```

clear mls qos interface policer-counters

Resets an interface's policer counters to zero. This can either be for a specific class-map or for all class-maps.

Before running this command you must first enable the QoS counter platform enhanced mode.

Syntax

```
clear mls qos interface <port> policer-counters
   [class-map <class-map>]
```

Parameter	Description
<port>	The port may be a switch port (e.g. `port1.0.4`), a static channel group (e.g. `sa3`), or a dynamic (LACP) channel group (e.g. `po4`).
`class-map`	Select a class-map.
<class-map>	Class-map name.

Mode Privileged Exec

Example To reset the policy counters to zero for all class-maps for `port1.0.1`, use the command:

```
awplus# clear mls qos interface port1.0.1 policer-counters
```

Related Commands

platform silicon-profile
show mls qos interface policer-counters

default-action

Sets the action for the default class-map belonging to a particular policy-map. The action for a non-default class-map depends on the action of any ACL that is applied to the policy-map.

The default action can therefore be thought of as specifying the action that will be applied to any data that does not meet the criteria specified by the applied matching commands.

Use the **no** variant of this command to reset to the default action of 'permit'.

Syntax

```
default-action [permit|deny|send-to-cpu|copy-to-cpu|copy-to-mirror]
no default-action
```

Parameter	Description
`permit`	Packets to permit.
`deny`	Packets to deny.
`send-to-cpu`	Specify packets to send to the CPU.
`copy-to-cpu`	Specify packets to copy to the CPU.
`copy-to-mirror`	Specify packets to copy to the mirror port.

Default The default is '`permit`'.

Mode Policy Map Configuration

Examples To set the action for the default class-map to `deny`, use the command:

```
awplus(config-pmap)# default-action deny
```

To set the action for the default class-map to `copy-to-mirror` for use with the **mirror interface** command, use the command:

```
awplus(config-pmap)# default-action copy-to-mirror
```

Related Commands **mirror interface**

description (QoS policy-map)

Adds a textual description of the policy-map. This can be up to 80 characters long.

Use the **no** variant of this command to remove the current description from the policy-map.

Syntax

```
description <line>
no description
```

Parameter	Description
<line>	Up to 80 character long line description.

Mode Policy Map Configuration

Example To add the description, VOIP traffic, use the commands:

```
awplus(config-pmap)# description VOIP traffic
```

egress-rate-limit

Sets a limit on the amount of traffic that can be transmitted per second from this port.

Use the **no** variant of this command to disable the limiting of traffic egressing on the interface.

Syntax

```
egress-rate-limit <bandwidth>
no egress-rate-limit
```

Parameter	Description
<bandwidth>	Bandwidth <1-10000000 units per second> (usable units: k, m, g). The minimum bandwidth depends on the type of card the port is on. The default unit is Kb (**k**), but Mb (**m**) or Gb (**g**) can also be specified. The command syntax is not case sensitive, so a value such as 20m or 20M will be taken to mean 20 megabits.

Mode Interface Configuration

Usage You cannot use this command at the same time as the **wrr-queue queue-limit** or **strict-priority-queue queue-limit** commands.

Examples To enable egress rate limiting on a port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# egress-rate-limit 500m
% Egress rate limit has been set to 499922 Kb
```

To disable egress rate limiting on a port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no egress-rate-limit
```

match access-group

Use this command to define match criterion for a class-map.

Syntax

```
match access-group {<hw-IP-ACL>|<hw-MAC-ACL>|<hw-named-ACL>}
no match access-group {<hw-IP-ACL>|<hw-MAC-ACL>|<hw-named-ACL>}
```

Parameter	Description
<hw-IP-ACL>	Specify a hardware IP ACL number in the range <3000-3699>.
<hw-MAC-ACL>	Specify a hardware MAC ACL number in the range <4000-4699>.
<hw-named-ACL>	Specify the hardware named ACL.

Mode Class Map Configuration

Usage First create an access-list that applies the appropriate permit, deny requirements etc. Then use the **match access-group** command to apply this access-list for matching to a class-map. Note that this command will apply the access-list matching only to *incoming* data packets.

Examples To configure a class-map named `cmap1` with one match criterion: `access-list 3001`, which allows IP traffic from any source to any destination, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 3001 permit ip any any
awplus(config)# class-map cmap1
awplus(config-cmap)# match access-group 3001
```

To configure a class-map named `cmap2` with one match criterion: `access-list 3001`, which allows MAC traffic from any source to any destination, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 4001 permit any any
awplus(config)# class-map cmap2
awplus(config-cmap)# match access-group 4001
```

To configure a class-map named `cmap3` with one match criterion: `access-list hw_acl`, which allows IP traffic from any source to any destination, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware hw_acl
awplus(config-ip-hw-acl)# permit ip any any
awplus(config)# class-map cmap3
awplus(config-cmap)# match access-group hw_acl
```

Related Commands class-map

match cos

Sets the CoS for a class-map to match on.

Use the **no** variant of this command to remove CoS.

Syntax

```
match cos <0-7>
no match cos
```

Parameter	Description
<0-7>	Specify the CoS value.

Mode Class Map Configuration

Examples To set the class-map's CoS to 4, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match cos 4
```

To remove CoS from a class-map, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match cos
```

match dscp

Use this command to define the DSCP to match against incoming packets.

Use the **no** variant of this command to remove a previously defined DSCP.

Syntax

```
match dscp <0-63>
no match dscp
```

Parameter	Description
<0-63>	Specify DSCP value (only one value can be selected).

Mode Class Map Configuration

Usage Use the **match dscp** command to define the match criterion after creating a class-map.

Examples To configure a class-map named `cmap1` with criterion that matches IP DSCP 56, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match dscp 56
```

To remove a previously defined DSCP from a class-map named cmap1, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match dscp
```

Related Commands class-map

match inner-cos

Sets the Inner CoS for a class-map to match on.

Use the **no** variant of this command to remove CoS.

Syntax

```
match inner-cos <0-7>
no match inner-cos
```

Parameter	Description
<0-7>	Specify the Inner CoS value.

Mode Class Map Configuration

Examples To set the class-map's inner-cos to 4, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match inner-cos 4
```

To remove CoS from the class-map, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match inner-cos
```

match inner-tpid

Sets the Inner Tag Protocol Identifier (TPID) for a class-map to match on.

Use the **no** variant of this command to remove the TPID for a class-map.

Syntax

```
match inner-tpid <tpid>
no match inner-tpid
```

Parameter	Description
<tpid>	Two byte hexadecimal number representing the TPID.

Mode Class Map Configuration

Examples To set the class-map's inner-tpid to 0x9100, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match inner-tpid 0x9100
```

To remove the class-map's inner-tpid, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match inner-tpid
```

match inner-vlan

Use this command to define the inner VLAN ID used as match criteria to classify a traffic class.

Use the **no** variant of this command to disable the VLAN ID used as match criteria.

Syntax

```
match inner-vlan <1-4094>
no match inner-vlan
```

Parameter	Description
<1-4094>	The VLAN number.

Mode Class Map Configuration

Usage This command is used in double-tagged networks to match on a VLAN ID belonging to the client network. For more information on VLAN double-tagged networks, see **"VLAN Double Tagging (VLAN Stacking)" on page 18.5**.

Examples To configure a class-map named `cmap1` to include traffic from inner VLAN 3, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match inner-vlan 3
```

To disable the configured VLAN ID as a match criteria for the class-map named `cmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match inner-vlan
```

match ip-precedence

Use this command to identify IP precedence values as match criteria.

Use the **no** variant of this command to remove IP precedence values from a class-map.

Syntax

```
match ip-precedence <0-7>
no match ip-precedence
```

Parameter	Description
<0-7>	The precedence value to be matched.

Mode Class Map Configuration

Example To configure a class-map named `cmap1` to evaluate all IPv4 packets for a precedence value of `5`, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match ip-precedence 5
```

match mac-type

Use this command to set the MAC type for a class-map to match on.

Use **no** variant of this command to remove the MAC type match entry.

Syntax

```
match mac-type {l2bcast|l2mcast|l2ucast}
no match mac-type
```

Parameter	Description
l2bcast	Layer 2 Broadcast traffic.
l2mcast	Layer 2 Multicast traffic.
l2ucast	Layer 2 Unicast traffic.

Mode Class Map Configuration

Examples To set the class-map's MAC type to Layer 2 multicast, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match mac-type l2mcast
```

To remove the class-map's MAC type entry, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match mac-type
```

match protocol

This command sets the ethernet format and the protocol for a class-map to match on.

Select one Layer 2 format and one Layer 3 protocol when you issue this command.

Use the **no** variant of this command to remove the configured ethernet format and protocol from a class-map.

Syntax `match eth-format <layer-two-format> protocol <layer-three-protocol>`

`no match eth-format protocol`

Parameter	Description
<layer-two-formats>	
`802dot2-tagged`	802.2 Tagged Packets (enter the parameter name).
`802dot2-untagged`	802.2 Untagged Packets (enter the parameter name).
`ethii-tagged`	EthII Tagged Packets (enter the parameter name).
`ethii-untagged`	EthII Untagged Packets (enter the parameter name).
`netwareraw-tagged`	Netware Raw Tagged Packets (enter the parameter name).
`netwareraw-untagged`	Netware Raw Untagged Packets (enter the parameter name).
`snap-tagged`	SNAP Tagged Packets (enter the parameter name).
`snap-untagged`	SNAP Untagged Packets (enter the parameter name).
<layer-three-protocols>	
`<word>`	A Valid Protocol Number in hexidecimal.
`any`	Note that the parameter “any” is only valid when used with the netwarerawtagged and netwarerawuntagged protocol options.
`sna-path-control`	Protocol Number 04 (enter the parameter name or its number).
`proway-lan`	Protocol Number 0E (enter the parameter name or its number).
`eia-rs Protocol`	Number 4E (enter the parameter name or its number).
`proway Protocol`	Number 8E (enter the parameter name or its number).
`ipx-802dot2`	Protocol Number E0 (enter the parameter name or its number).
`netbeui`	Protocol Number F0 (enter the parameter name or its number).
`iso-clns-is`	Protocol Number FE (enter the parameter name or its number).

Parameter(cont.)	Description(cont.)
xdot75-internet	Protocol Number 0801(enter the parameter name or its number).
nbs-internet	Protocol Number 0802 (enter the parameter name or its number).
ecma-internet	Protocol Number 0803 (enter the parameter name or its number).
chaosnet	Protocol Number 0804 (enter the parameter name or its number).
xdot25-level-3	Protocol Number 0805 (enter the parameter name or its number).
arp Protocol	Number 0806 (enter the parameter name or its number).
xns-compat	Protocol Number 0807 (enter the parameter name or its number).
banyan-systems	Protocol Number 0BAD (enter the parameter name or its number).
bbn-simnet	Protocol Number 5208 (enter the parameter name or its number).
dec-mop-dump-ld	Protocol Number 6001 (enter the parameter name or its number).
dec-mop-rem-cdons	Protocol Number 6002 (enter the parameter name or its number).
dec-decnet	Protocol Number 6003 (enter the parameter name or its number).
dec-lat	Protocol Number 6004 (enter the parameter name or its number).
dec-diagnostic	Protocol Number 6005 (enter the parameter name or its number).
dec-customer	Protocol Number 6006 (enter the parameter name or its number).
dec-lavc	Protocol Number 6007 (enter the parameter name or its number).
rarp	Protocol Number 8035 (enter the parameter name or its number).
dec-lanbridge	Protocol Number 8038 (enter the parameter name or its number).
dec-encryption	Protocol Number 803D (enter the parameter name or its number).
appletalk	Protocol Number 809B (enter the parameter name or its number).

Parameter(cont.)	Description(cont.)
ibm-sna	Protocol Number 80D5 (enter the parameter name or its number).
appletalk-aarp	Protocol Number 80F3 (enter the parameter name or its number).
snmp	Protocol Number 814Cv.
ethertalk-2	Protocol Number 809B (enter the parameter name or its number).
ethertalk-2-aarp	Protocol Number 80F3 (enter the parameter name or its number).
ipx-snap	Protocol Number 8137 (enter the parameter name or its number).
ipx-802dot3	Protocol Number FFFF (enter the parameter name or its number).
ip	Protocol Number 0800 (enter the parameter name or its number).
ipx	Protocol Number 8137 (enter the parameter name or its number).
ipv6	Protocol Number 86DD (enter the parameter name or its number).

Mode Class Map Configuration

Examples To remove the eth-format and the protocol from the class-map `cmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match eth-format protocol
```

To set the eth-format to `ethii-tagged` and the protocol to `0800` (IP) for class-map `cmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match eth-format ethii-tagged protocol
0800
```

or

```
awplus(config-cmap)# match eth-format ethii-tagged protocol ip
```

match tcp-flags

Sets one or more tcp flags (control bits) for a class-map to match on.

Use the **no** variant of this command to remove one or more tcp flags for a class-map to match on.

Syntax

```
match tcp-flags {[ack][fin][rst][syn][urg]}
no match tcp-flags {[ack][fin][rst][syn][urg]}
```

Parameter	Description
ack	Acknowledge.
fin	Finish.
rst	Reset.
syn	Synchronize.
urg	Urgent.

Mode Class Map Configuration

Examples To set the class-map's tcp flags to `ack` and `syn`, use the commands:

```
awplus# configure terminal
awplus(config)# class-map
awplus(config-cmap)# match tcp-flags ack syn
```

To remove the tcp-flags `ack` and `rst`, use the commands:

```
awplus# configure terminal
awplus(config)# class-map
awplus(config-cmap)# no match tcp-flags ack rst
```

match tpid

Sets the Tag Protocol Identifier (TPID) for a class-map to match on.

Use the **no** variant of this command to remove the TPID for a class-map.

Syntax

```
match tpid <tpid>
no match tpid
```

Parameter	Description
<tpid>	Specify the Tag Protocol Identifier.

Mode Class Map Configuration

Examples To set the TPID of class-map named `cmap1` to `0x9100`, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match tpid 0x9100
```

To remove the TPID set previously for class-map named `cmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match tpid
```

match vlan

Use this command to define the VLAN ID used as match criteria to classify a traffic class.

Use the **no** variant of this command to disable the VLAN ID used as match criteria.

Syntax

```
match vlan <1-4094>
no match vlan
```

Parameter	Description
<1-4094>	The VLAN number.

Mode Class Map Configuration

Examples To configure a class-map named `cmap1` to include traffic from VLAN 3, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match vlan 3
```

To disable the configured VLAN ID as a match criteria for the class-map named `cmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match vlan
```

mls qos aggregate-police action

This command creates or reconfigures an aggregate-policer for a class-map.

The **no** variant of this command removes a previously configured exceed action.

Syntax For single rate metering:

```
mls qos aggregate-police <name> single-rate <CIR> <CBS> <EBS>
   action [drop-red|policed-dscp-transmit]
```

For twin rate metering:

```
mls qos aggregate-police <name> twin-rate <CIR> <CBS> <EIR> <PBS>
   action [drop-red|policed-dscp-transmit]
```

```
no mls qos aggregate-police <name>
```

Parameter	Description
<name>	Specify aggregate-policer name.
`single-rate`	Single rate meter (one rate and two burst sizes).
`twin-rate`	Twin rate meter (two rates and two burst sizes).
<CIR>	The Committed Information Rate. Specify an average traffic rate, 1-16000000 (kbps).
<CBS>	The amount by which the data is allowed to burst beyond the value set by the CIR. Specify a value from 0-16777216 (bytes).
<EIR>	Excess Information Rate. Specify an average traffic rate, 1-16000000 (kbps).
<EBS>	*For single-rate metering*, this is the amount by which the data is allowed to burst beyond the value set by the CIR.
<PBS>	*For twin-rate metering*, this is the amount by which the data is allowed to burst beyond the value set by the EIR. Specify a value from 1-16777216 (bytes).
`action`	Specify the action: either drop-red or policed-dscp-transmit.
`drop-red`	Drop the red packets.
`policed-dscp-transmit`	Change packet per policed-dscp map and send it.

Mode Global Configuration

Usage A policer can be used to meter the traffic classified by the class-map and as a result will be given one of three bandwidth classes. These are green (conforming), yellow (partially-conforming), and red (non-conforming).

Once you have created an aggregate policer, you can use the **police-aggregate** command on page 66.49 to assign it to one or more class-maps. This enables traffic classified by different characteristics to have accumulative application to the same policer. Another application of aggregate policers is to attach them to a single class-map but apply the class-maps to multiple ports (via its policy-map). This enables the same traffic to have accumulative policed application over multiple ports.

A single-rate policer is based on three values. These are:

- average rate (or Committed Information Rate CIR)
- minimum burst (or Committed Burst Size CBS)
- maximum burst (or Excess Burst Size EBS)

Traffic is classed as green if the rate is less than the combined CIR plus CBS values. Traffic is classed as yellow if the data rate is between the CBS and the EBS. Traffic is classed as red if the rate exceeds the average rate and the EBS.

A dual-rate policer is based on four values. These are:

- average rate (or Committed Information Rate CIR)
- minimum burst (or Committed Burst Size CBS)
- maximum burst (or Excess Burst Size EBS)
- Excess Information Rate (EIR)

Traffic is classed as green if the rate is less than the CIR and CBS. Traffic is classed as yellow if the rate is between the CBS and the EBS. Traffic is classed as red if the rate exceeds the average rate and the EBS.

Using an action of **drop-red** will result in all packets classed as red being discarded.

When using an action of **policed-dscp-transmit** the packet will be remarked with the values configured in the policed-dscp map. The index into this map is determined by the DSCP in the packet. If a DSCP index is to be forced regardless of the packet DSCP the **set dscp** command can be used to achieve this. If no DSCP is present in the packet an index of 0 will be used.

Example To create a single rate meter measuring traffic of 10 Mbps that drops any traffic bursting over 30000 bytes, use the commands:

```
awplus# configure terminal
awplus(config)# mls qos aggregate-police ap1 single-rate 10000
                20000 30000 action drop-red
awplus(config)#
```

Related Commands

police-aggregate
show mls qos aggregate-policer
show mls qos maps policed-dscp

mls qos cos

This command assigns a CoS (Class of Service) user-priority value to untagged frames entering a specified interface. By default, all untagged frames are assigned a CoS value of 0.

Use the **no** variant of this command to return the interface to the default CoS setting for untagged frames entering the interface.

Syntax

```
mls qos cos <0-7>
no mls qos cos
```

Parameter	Description
<0-7>	The Class of Service, user-priority value.

Default By default, all untagged frames are assigned a CoS value of 0. Note that for tagged frames, the default behavior is not to alter the CoS value.

Mode Interface Configuration

Example To assign a CoS user priority value of 2 to all untagged packets entering ports 1.0.1 to 1.0.20, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.20
awplus(config-if)# mls qos cos 2
```

mls qos enable

Use this command to globally enable QoS on the switch or stack.

Use the **no** variant of this command to globally disable QoS and remove all QoS configuration. The **no** variant of this command removes all class-maps, policy-maps, policers, and queue-sets that have been created. Running the **no mls qos** command will therefore remove all pre-existing QoS configurations on the switch.

Mode Global Configuration

Syntax

```
mls qos enable
no mls qos
```

Example To enable QoS on the switch, use the commands:

```
awplus# configure terminal
awplus(config)# mls qos enable
```

mls qos fabric-queue

Configures the scheduling algorithm for one or more fabric queues. If the scheduler is weighted round robin (WRR), a weighting can also be specified. You must specify at least one queue when setting this command.

The **no** variant of this command resets the scheduling algorithm for one or more input fabric queues.

Syntax

```
mls qos fabric-queue {[0][1][2]}{priority|wrr [weight <1-30>]}
no mls qos fabric-queue [0][1][2][3]
```

Parameter	Description
`0, 1, 2`	Fabric queues being configured.
`priority`	Applies strict priority queue servicing to the selected queues.
`wrr`	Applies weighted round robin queue servicing to the selected queues.
`weight`	The weight for weighted round robin selection. Queues will then be serviced in proportion to their applied weights. Default is 1.
<1-30>	The weight value.

Default Priority

Mode Global Configuration

Usage Queues can be serviced in either priority sequence or a weighted round-robin sequence. By default all queues are set to priority servicing.

Priority Sequencing

In this mode the queue with the highest number, i.e. queue 3 will be emptied first, then queues 2, 1 and 0. Note that the lower queues will only be serviced if there is no data waiting in the higher numbered queues.

Weighted Round Robin Sequencing

In this mode the weighting that you assign to each queue will determine how often it is serviced with respect to the other WRR queues. For example, if queue 0 is configured with a weight of 5 and queue 1 is configured with a weight of 1, then queue 0 will be serviced 5 times more than queue 1. Setting all weights to the same value will therefore apply an unweighted round selection method.

Mixed Sequencing

If you configure the queues with a mix of priority queueing and WRR, the priority queues will be completely emptied, before the any WRR queue is serviced.

Caution Fabric queue 3 is reserved for VCStack control traffic. Do not set queue 3 to weighted round robin scheduling. It must use strict priority scheduling.

Examples To set the scheduler for fabric queues `0` and `1` to WRR and both have a weight of `5`, use the command:

```
awplus# configure terminal
awplus(config)# mls qos fabric-queue 0 1 wrr weight 5
```

To reset the scheduling algorithm for fabric-queues `0` and `1`, use the command:

```
awplus# configure terminal
awplus(config)# no mls qos fabric-queue 0 1
```

Related Commands
mls qos fabric-queue
show mls qos fabric-queue
show mls qos maps fabric-queue

mls qos map cos-queue to

Used to set the default CoS to queue mapping. This is the default queue mapping for packets that do not get assigned a queue via any other QoS functionality.

Use the **no** variant of this command to reset the cos-queue map back to its default setting. The default mappings for this command are:

```
CoS Priority :      0 1 2 3 4 5 6 7
--------------------------------
CoS QUEUE:          2 0 1 3 4 5 6 7
```

For more information see, **"Mapping CoS tags to traffic types" on page 65.13**.

Syntax

```
mls qos map cos-queue <cos-priority> to <queue-number>
no mls qos map cos-queue
```

Parameter	Description
<cos-priority>	CoS priority value. Can take a value 0 to 7.
<queue-number>	Queue number. Can take a value 0 to 7.

Mode Global Configuration

Examples To set the cos-queue map back to its defaults, use the command:

```
awplus# configure terminal
awplus(config)# no mls qos map cos-queue
```

To map CoS 2 to queue 0, use the command:

```
awplus# configure terminal
awplus(config)# mls qos map cos-queue 2 to 0
```

mls qos map fabric-queue

This command maps eight egress queues to four fabric queues. Note that when entering this command, you must supply a mapping for all eight egress queues.

Use the **no** variant of this command to reset the fabric queue map.

The default maps egress queues 0 and 1 to fabric queue 0, egress queues 2 to 5 to fabric queue 1, and egress queues 6 and 7 to fabric queue 2.

The fourth fabric queue (queue 3) is reserved for VCStack control traffic. Do not use queue 3 for any other traffic.

Syntax

```
mls qos map fabric-queue q0 q1 q2 q3 q4 q5 q6 q7
no mls qos map fabric-queue
```

Parameter	Description
q0	Egress queue 0 (Select a value 0 to 2 to map this egress queue to one of the fabric queues 0 to 2).
q1	Egress queue 1 (Select a value 0 to 2 to map this egress queue to one of the fabric queues 0 to 2).
q2	Egress queue 2 (Select a value 0 to 2 to map this egress queue to one of the fabric queues 0 to 2).
q3	Egress queue 3 (Select a value 0 to 2 to map this egress queue to one of the fabric queues 0 to 2).
q4	Egress queue 4 (Select a value 0 to 2 to map this egress queue to one of the fabric queues 0 to 2).
q5	Egress queue 5 (Select a value 0 to 2 to map this egress queue to one of the fabric queues 0 to 2).
q6	Egress queue 6 (Select a value 0 to 2 to map this egress queue to one of the fabric queues 0 to 2)).
q7	Egress queue 7 (Select a value 0 to 2 to map this egress queue to one of the fabric queues 0 to 2).

Mode Global Configuration

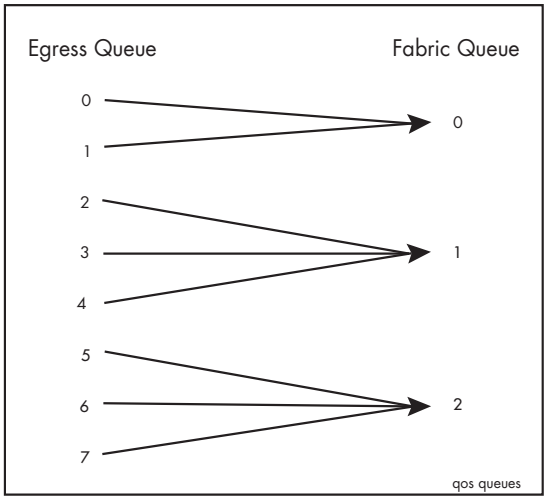
Examples This example changes the default settings so that egress queue 5 is mapped to fabric queue 2, as shown in **Figure 66-1 on page 66.31**:

```
awplus# configure terminal
awplus(config)# mls qos map fabric-queue 0 0 1 1 1 2 2 2
```

The following table shows how the queue mapping operates in the above example:

Egress Queue	0	1	2	3	4	5	6	7
Fabric Queue Mapping	0	0	1	1	1	2	2	2

Figure 66-1: Egress Queue to Fabric Queue mapping:



To reset the fabric-queue map, use the command:

```
awplus# configure terminal
awplus(config)# no mls qos map fabric-queue
```

Related Commands

mls qos fabric-queue
show mls qos fabric-queue
show mls qos maps fabric-queue

mls qos map policed-dscp to

Configures the policed-dscp map. This is used when a policer is configured with an exceed action of "policed-dscp-transmit". Bandwidth-class is optional - if omitted, the changes will be applied to all bandwidth classes. At least one "new" parameter must be specified.

Use the **no** variant of this command to reset the policed-dscp map to its default. This is used when a policer is configured with an exceed action of "policed-dscp-transmit". Specifying DSCP and bandwidth-class is optional. If no DSCP is specified then all DSCP entries will be reset to their defaults. If no bandwidth-class is specified then all bandwidth-class entries will be reset to their defaults.

Syntax

```
mls qos map policed-dscp <existing-dscp> [bandwidth-class {green|
   yellow|red}] to {[new-dscp <0-63] [new-cos <0-7>]
   [new-queue <0-7>] [new-bandwidth-class {green|yellow|red}]}

no mls qos map policed-dscp [<new-dscp>] [bandwidth-class {green|
   yellow|red}]
```

Parameter	Description
<existing-dscp>	The value of the DSCP when it leaves the policer (meter) *<0-63>*.
bandwidth-class	Bandwidth Class.
green	Mark the packet as green.
yellow	Mark the packet as yellow.
red	Mark the packet as red.
to	Change the value to:
new-dscp	Modify Egress DSCP.
<0-63>	Egress DSCP value (marked down DSCP).
new-cos	Modify Egress CoS.
<0-7>	Egress CoS value (marked down CoS).
new-queue	Modify Egress Queue.
<0-7>	Egress Queue value (marked down Queue).
new-bandwidth-class	Modify Egress Bandwidth-class.
green	Egress Bandwidth-class green (marked down Bandwidth-class).
yellow	Egress Bandwidth-class yellow (marked down Bandwidth-class).
red	Egress Bandwidth-class red (marked down Bandwidth-class).
<new-dscp>	DSCP entry to reset.
bandwidth-class	bandwidth class to reset.
green	Green traffic.

Parameter(cont.)	Description(cont.)
yellow	Yellow traffic.
red	Red traffic.

Mode Global Configuration

Example To set the entry at DSCP 2 to remark the policed green traffic to a new DSCP of 2, a new CoS of 3, and new queue of 4 and a new bandwidth class of yellow, use the command:

```
awplus# configure terminal
awplus(config)# mls qos map policed-dscp 2 bandwidth-class
green to new-dscp 5 new-cos 3 new-queue 4 new-
bandwidth-class yellow
```

Related Commands **mls qos map policed-dscp to**
police single-rate action
police twin-rate action
show mls qos maps policed-dscp

mls qos map premark-dscp to

The behavior of this command depends on the hardware type of the ports it applies to.

Two hardware types exist: **Hardware Version 1** and **Hardware Version 2**. The following table shows the hardware modules and the version to which each belongs.

Hardware Version 1	Hardware Version 2
Baseboard	AT-XEM-12Sv2
AT-XEM-12T	AT-XEM-12Tv2
AT-XEM-12XS	AT-XEM-2XP
AT-XEM-1XP	AT-XEM-2XS
	AT-XEM-2XT
	AT-XEM-24T

Hardware Version 2 XEMs

This command configures the premark-dscp map. It is used when traffic is classified by a class-map that has **trust dscp** configured. Based on a lookup DSCP, the map determines a new DSCP, CoS, queue and band width class for the traffic.

The **no** variant of this command resets the premark-dscp map to its defaults. If no DSCP is specified then all DSCP entries will be reset to their defaults.

Syntax

```
mls qos map premark-dscp <0-63> to {[new-dscp <0-63>]
    [new-cos <0-7>] [new-queue <0-7>] [new-bandwidth-class{green|
    yellow|red}]}

no mls qos map premark-dscp [<0-63>]
```

Parameter	Description
`premark-dscp <0-63>`	The DSCP value on ingress.
`new-dscp <0-63>`	The DSCP value that the packet will have on egress. If unspecified, this value will remain the DSCP ingress value.
`new-cos <0-7>`	The CoS value that the packet will have on egress. If unspecified, this value will retain its value on ingress.
`new-queue <0-7>`	Modify Egress Queue.
`new-bandwidth-class`	Modify Egress Bandwidth-class. If unspecified, this value will be set to green.
`green`	Egress Bandwidth-class green (marked down Bandwidth-class).
`yellow`	Egress Bandwidth-class yellow (marked down Bandwidth-class).
`red`	Egress Bandwidth-class red (marked down Bandwidth-class).

Mode Global Configuration

Usage With the **trust dscp** command set, this command (**mls qos map premark-dscp**) enables you to make the following changes:

1. remap the DSCP (leaving the other settings unchanged)
2. remap any or all of CoS, output queue, or bandwidth class values (leaving the DSCP unchanged)

Note If you attempt to remap both the DSCP and another setting, only the DSCP remap will take effect.

Example To set the entry for DSCP `1` to use a new DSCP of `2`, a new CoS of `3`, a new queue of `4` and a new bandwidth class of `yellow`, use the commands :

```
awplus# configure terminal
awplus(config)# mls qos map premark-dscp 1 to new-dscp 2
awplus(config)# mls qos map premark-dscp 2 to new-cos 3
awplus(config)# mls qos map premark-dscp 2 to new-queue 4
awplus(config)# mls qos map premark-dscp 2 to new-bandwidth-
class yellow
```

Hardware Version 1 XEMs and the Baseboard

This command configures the premark-dscp map. It is used when traffic is classified by a class-map that has **trust dscp** configured. Based on a lookup DSCP, the map determines a new DSCP, COS, queue and bandwidth class for the traffic.

If the **set dscp** command has also been specified for that class-map, the set value is used for the lookup of the premark-dscp map. Otherwise the DSCP value in the packet is used for the lookup.

The **no** variant of this command resets the premark-dscp map to its defaults. If no DSCP is specified then all DSCP entries will be reset to their defaults.

Syntax

```
mls qos map premark-dscp <0-63> to {[new-dscp <0-63>]
   [new-cos <0-7>] [new-queue <0-7>] [new-bandwidth-class {green|
   yellow|red}]}

no mls qos map premark-dscp [<0-63>]
```

Parameter	Description
`premark-dscp <0-63>`	The DSCP value on ingress.
`new-dscp <0-63>`	The DSCP value that the packet will have on egress. If unspecified, this value will remain the DSCP ingress value.
`new-cos <0-7>`	The CoS value that the packet will have on egress. If unspecified, this value will be set to zero.
`new-queue <0-7>`	Modify Egress Queue.
`new-bandwidth-class`	Modify Egress Bandwidth-class. If unspecified, this value will be set to green.
`green`	Egress Bandwidth-class green (marked down Bandwidth-class).
`yellow`	Egress Bandwidth-class yellow (marked down Bandwidth-class).
`red`	Egress Bandwidth-class red (marked down Bandwidth-class).

Mode Global Configuration

Usage With the **"trust dscp" on page 66.85** set, this command (**mls qos map premark-dscp**) enables you to remap any or all of the dscp, CoS, output queue, or bandwidth class values in one step, i.e. a single run of this command.

Example To reset the entry for DSCP `1` use the command:

```
awplus# configure terminal
awplus(config)# no mls qos map premark-dscp 1
```

Example To set the entry for DSCP 1 to use a new DSCP of 2, a new CoS of 3, a new queue of 4 and a new bandwidth class of yellow, use the command:

```
awplus# configure terminal
awplus(config)# mls qos map premark-dscp 1 to new-dscp 2 new-
cos 3 new-queue 4 new-bandwidth-class yellow
```

Related Commands
mls qos map policed-dscp to
set dscp
show mls qos maps premark-dscp
trust dscp

mls qos queue

Configures the default egress queue for any packet arriving on the specified interface. When no default queue is configured the cos-queue map is used to choose the queue for the packet.

Use the **no** variant of this command to turn off the use of a default queue on the interface.

Syntax

```
mls qos queue <0-7>

no mls qos queue
```

Parameter	Description
<0-7>	The particular queue number.

Mode Interface Configuration

Examples To set the default egress queue to `7`, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# mls qos queue 7
```

To turn off the default mls queue usage on `port1.0.1` use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no mls qos queue
```

Related Commands **show mls qos interface**

mls qos queue-set

Two hardware types exist: **Hardware Version 1** and **Hardware Version 2**. The following table shows the hardware modules and the version to which each belongs.

Hardware Version 1	Hardware Version 2
Baseboard	AT-XEM-12Sv2
AT-XEM-12T	AT-XEM-12Tv2
AT-XEM-12XS	AT-XEM-2XP
AT-XEM-1XP	AT-XEM-2XS
	AT-XEM-2XT
	AT-XEM-24T

This command will only run on hardware version one modules.

Sets an interface to use the specified queue-set in either taildrop or random-detect mode.

When operating in taildrop mode only the maximum threshold parameters for each bandwidth-class are used from the queue-set. When the actual queue-length for any bandwidth-class exceeds this threshold the packets are discarded instead of being enqueued to the egress port.

When operating in random-detect mode all the parameters from the queue-set are used. The queue-length that is used in this mode is a calculated “average” queue length which can vary depending on what the averaging-factor has been configured to. This provides a more randomized discarding of packets during congestion and prevents TCP global flow synchronization. The down side of this is that more packets are dropped.

By default all ports are assigned to a queue-set created for each class of port (100 M, 1G or 10 G). All ports are also set to operate in taildrop mode. Also all traffic destined for the CPU will use queue-set 4.

Use the **no** variant of this command to reset a queue-set back to its defaults. If one or more queues are specified then only those queue’s will be reset. Otherwise, if no queue is specified the entire queue-set will be reset.

Syntax

```
mls qos queue-set <1-4> [random-detect|taildrop]
no mls qos queue-set <1-4> queues [0][1][2][3][4][5][6][7]
```

Parameter	Description
`<1-4>`	Queue-set ID.
`random-detect`	Apply this queue-set via Weighted Random Detect mode.
`taildrop`	Apply this queue-set via Taildrop mode.
`[0][1]...[7]`	Egress queues.

Mode Global Configuration and Interface Configuration

Usage This command is not applied to ports on hardware version two.

Examples

To set `port1.0.1` to use queue-set `2` in random-detect mode, use the command:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# mls qos queue-set 2 random-detect
```

To reset queue-set `2` back to its defaults for queues 1-3, use the command:

```
awplus# configure terminal
awplus(config)# no mls qos queue-set 2 queues 1 2 3
```

Related Commands

mls qos queue-set averaging-factor
mls qos queue-set description
mls qos queue-set drop-probability
mls qos queue-set threshold
show mls qos interface
show mls qos queue-set

mls qos queue-set averaging-factor

Sets the averaging-factor for the specified queue-set and queue. This determines how quickly the **average** queue length follows the **actual** queue length. With a small averaging-factor, the average queue length follows the actual queue length quickly. As you increase the averaging-factor the average queue length will take longer to follow the actual queue length.

The **queues** parameter is optional and if not specified will default to setting the thresholds for all queues.

This parameter is only valid when a port is using this queue-set in random-detect mode.

Syntax

```
mls qos queue-set <1-4> queues {0 |1 |2 |3 |4 |5 |6 |7} averaging-
    factor <0-15>
```

Parameter	Description
<1-4>	Queue-set ID.
`queues`	List of queues to configure. Up to 8 queues (0-7) can be configured within a particular queue set.
`averaging-factor`	Configure queue length averaging factor.
<0-15>	Averaging factor value.

Mode Global Configuration

Usage This command is not applicable to ports on hardware type 2 modules (see **"Hardware Versions" on page 65.7**)

Example To set the averaging-factor for queues 1-3 in queue-set `1` to be `4`, use the command:

```
awplus# configure terminal
awplus(config)# mls qos queue-set 1 queues 1 2 3 averaging-
                factor 4
```

Related Commands

mls qos queue-set
mls qos queue-set description
mls qos queue-set drop-probability
mls qos queue-set threshold
show mls qos interface
show mls qos queue-set

mls qos queue-set description

Sets the description for the specified queue-set. This is a textual string that can be up to 80 characters long.

Syntax `mls qos queue-set <1-4> description <line>`

Parameter	Description
<1-4>	Queue-set ID.
<line>	Description up to 80 characters.

Mode Global Configuration

Example To set the description for queue-set `1` to be "`Customized defaults`", use the commands:

```
awplus# configure terminal
awplus(config)# mls qos queue-set 1 description "Customized
defaults"
```

Related Commands
mls qos queue-set averaging-factor
mls qos queue-set drop-probability
mls qos queue-set threshold
show mls qos interface

mls qos queue-set drop-probability

Sets the drop probability for each bandwidth-class. This probability is the likelihood that a packet is dropped when the average queue length is between the minimum and maximum threshold for that bandwidth class. Once the average queue length is above the maximum threshold the probability jumps to 100%.

The queues parameter is optional and if not specified will default to setting the thresholds for all queues. This parameter is only valid when a port is using this queue-set in random-detect mode.

Syntax

```
mls qos queue-set <1-4> queues [0][1][2][3][4][5][6][7]
   drop-probability <0-15> <0-15> <0-15>
```

Parameter	Description
`<1-4>`	Queue-set ID.
`[0][2]...[7]`	List of queues to configure. Up to 8 queues (0-7) can be configured within a particular queue set.
`drop-probability`	Configure maximum drop probability for each bandwidth-class. See the following Drop Probability table.
`<0-15>`	Maximum drop-probability factor for green traffic.
`<0-15>`	Maximum drop-probability factor for yellow traffic.
`<0-15>`	Maximum drop-probability factor for red traffic.

The drop probability is 100% for a setting of 0 and halves for each integer value increase. The following table shows probability values for drop values of 0 to 7. Default: 1.

Drop Probability

Drop Value	0	1	2	3	4	5	6	7
Drop Probability	100%	50%	25%	12.5%	6.25%	3.125%	1.562%	0.781%

Mode Global Configuration

Usage This command is not applied to ports on hardware type 2 modules (see **"Hardware Versions" on page 65.7**).

Example To set the drop-probability for queues 1-3 in queue-set `2` to be 50%, use the command:

```
awplus# configure terminal
awplus(config)# mls qos queue-set 2 queues 1 2 3
drop-probability 1 1 1
```

The drop-probability parameter specifies the maximum drop-probability for packets when using the random-detect (RED) drop mode. This is the probability that a packet will be dropped when the computed average queue length reaches the Max threshold value setting for a specific traffic class within a specific queue.

The drop-probability is 100% for a drop value of 0, and halves with each increment. For example, a drop1 value of 4 gives a drop probability of 1/16, or 6.25%. The default is 1.

Related Commands

mls qos queue-set
mls qos queue-set averaging-factor
mls qos queue-set description
mls qos queue-set threshold
show mls qos interface
show mls qos queue-set

mls qos queue-set threshold

Sets the threshold parameters for the specified queue-set. There are six threshold parameters, which comprise a minimum and a maximum threshold value for each bandwidth-class.

The queues parameter is optional and if not specified will default to setting the thresholds for all queues. The minimum parameters are only valid when a port is using this queue-set in random-detect mode.

Note that only the **maximum threshold** setting will be applied when tail-drop mode is selected. However you must still enter a value for the **minimum threshold**; one method is to enter the same value for both maximum and minimum entries. See examples.

Syntax

```
mls qos queue-set <1-4> queues {0|1|2|3|4|5|6|7} threshold
   <1-16000000> <1-16000000> <1-16000000> <1-16000000> <1-16000000>
   <1-16000000>

no mls qos queue-set <1-4> queues {0|1|2|3|4|5|6|7}
```

Parameter	Description
<1-4>	Queue-set ID.
queues	List of queues to configure. Up to 8 queues (0-7) can be configured within a particular queue set.
threshold	Configure thresholds.
<1-16000000>	Minimum threshold for green traffic (Bytes).
<1-16000000>	Maximum threshold for green traffic (Bytes).
<1-16000000>	Minimum threshold for yellow traffic (Bytes).
<1-16000000>	Maximum threshold for yellow traffic (Bytes).
<1-16000000>	Minimum threshold for red traffic (Bytes).
<1-16000000>	Maximum threshold for red traffic (Bytes).

Mode Global Configuration

Usage This command is not applied to ports on hardware type 2 modules (see **"Hardware Versions" on page 65.7**).

Examples Random Early Discard (RED) Example
To set the thresholds for queues 1-3 in queue-set 1 to a minimum or 1KB and a maximum of 2 KB, use the commands:

```
awplus# configure terminal
awplus(config)# mls qos queue-set 1 queues 1 2 3 threshold
                1024 2048 1024 2048 1024 2048
```

Tail Drop Example

To set the thresholds for queue 2 in queue-set 1 to 1KB, use the commands:

```
awplus# configure terminal

awplus(config)# mls qos queue-set 1 queues 2 threshold 1024
                1024 1024 1024 1024 1024
```

Related Commands

no police

Disables any policer previously configured on the class-map.

Syntax `no police`

Mode Policy Map Class Configuration

Usage This command disables any policer previously configured on the class-map.

Example To disable policing on a class-map use the command:

```
awplus# configure terminal
awplus(config)# policy-map name
awplus(config-pmap)# class classname
awplus(config-pmap-c)# no police
```

Related Commands
mls qos map policed-dscp to
police single-rate action
police twin-rate action
show mls qos maps policed-dscp

police-aggregate

Use this command to apply a previously created aggregate-policer to the class-map.

Use the **no** variant of this command to remove a previously created aggregate-policer from the class-map.

Syntax

```
police-aggregate <name>
no police-aggregate <name>
```

Parameter	Description
<name>	Specify a aggregate policer name.

Mode Policy Map Class Configuration

Usage This command enables you to apply an aggregate policer to a number of different class-maps, and meter them as one group. Note that you cannot apply this command to any class-map that already has a policer assigned by using the **police single (or twin) rate exceed action** command.

Examples To apply aggregate policer `ap1` to a class-map, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map name
awplus(config-pmap)# class classname
awplus(config-pmap-c)# police-aggregate ap1
```

To remove a previously created aggregate-policer from the class-map, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map name
awplus(config-pmap)# class classname
awplus(config-pmap-c)# no police-aggregate ap1
```

Related Commands
mls qos aggregate-police action
mls qos map policed-dscp to
show mls qos aggregate-policer
show mls qos maps policed-dscp

police single-rate action

Configures a single-rate policer for a class-map.

Syntax

```
police single-rate <cir> <cbs> <ebs> action
   {drop-red|policed-dscp-transmit}
```

Parameter	Description	
<*cir*>	Specify the Committed Information Rate (CIR) (1-16000000 kbps).	
<*cbs*>	Specify the Committed Burst Size (CBS) (0-16777216 bytes).	
<*ebs*>	Specify a Excess Burst Size (EBS) (0-16777216 bytes).	
`action`	Specify the action if rate is exceeded.	
	`drop-red`	Drop the red packets.
	`policed-dscp-transmit`	Modify packets using the *policed-dscp map*, then transmit. You can configure the remark policed-dscp map using the **mls qos map policed-dscp to** command on page 66.32.

Mode Policy Map Class Configuration

Usage A policer can be used to meter the traffic classified by the class-map and as a result will be given one of three bandwidth classes. These are green (conforming), yellow (partially-conforming), and red (non-conforming). A single-rate policer is based on three values. These are the average rate, minimum burst and maximum burst.

Color	Definition
`green`	The traffic rate is less than the average rate and minimum burst.
`yellow`	The traffic rate is between the minimum burst and the maximum burst.
`red`	The traffic rate exceeds the average rate and the maximum burst.

Using an action of drop-red means that any packets classed as red are discarded.

Note

This command will not take effect when applied to a class-map that attaches to a channel group whose ports span processor instances.

Example To configure a single rate meter measuring traffic of 10 Mbps that drops a sustained burst of traffic over this rate, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map name
awplus(config-pmap)# class classname
awplus(config-pmap-c)# police single-rate 10000 1875000 1875000
action drop-red
```

Related Commands
mls qos map policed-dscp to
no police
police twin-rate action
show mls qos maps policed-dscp

police twin-rate action

Configures a twin-rate policer for a class-map.

Syntax

```
police twin-rate <cir> <pir> <cbs> <pbs> action
   {drop-red|policed-dscp-transmit}
```

Parameter	Description	
<cir>	Specify the Committed Information Rate (CIR) (1-16000000 kbps).	
<pir>	Specify the Peak Information Rate (PIR) (kbps).	
<pbs>	Specify the Peak Burst Size (PBS) (0-16777216 bytes).	
action	Specify the action if rate is exceeded.	
	drop-red	Drop the red packets.
	policed-dscp-transmit	Modify packets using the *policed-dscp map*, then transmit. You can configure the remark policed-dscp map using the **mls qos map policed-dscp to** command on page 66.32.

Mode Policy Map Class Configuration

Usage A policer can be used to meter the traffic classified by the class-map and as a result will be given one of three bandwidth classes. These are green (conforming), yellow (partially-conforming), and red (non-conforming).

A twin-rate policer is based on four values. These are the minimum rate, minimum burst size, maximum rate, and maximum burst size.

Bandwidth Class	Definition
green	The sum of the number of existing (buffered) bytes plus those arriving at the port per unit time results in a value that is less than that set for the CBS.
yellow	The sum of the number of existing (buffered) bytes plus those arriving at the port per unit time results in a value that is between those set for the CBS and the PBS.
red	The sum of the number of existing (buffered) bytes plus those arriving at the port per unit time, result in a value that exceeds that set for the PBS.

Using an action of drop-red means that any packets classed as red will be discarded.

When using an action of policed-dscp-transmit the packet will be remarked with the values configured in the policed-dscp map. The index into this map is determined by the DSCP in the packet. If a DSCP index is to be forced regardless of the packet DSCP the **set dscp** command can be used to achieve this. If no DSCP is present in the packet an index of 0 is used.

Example To configure a twin rate meter measuring a minimum rate of 10 Mbps and a maximum rate of 20 Mbps that uses the policed-dscp map to remark any non-conforming traffic, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map name
awplus(config-pmap)# class classname
awplus(config-pmap-c)# police twin-rate 10000 20000 1875000
3750000 action policed-dscp-transmit
```

Related Commands
mls qos map policed-dscp to
no police
police twin-rate action
show mls qos maps policed-dscp

policy-map

Use this command to create a policy-map and to enter Policy Map Configuration mode to configure the specified policy-map.

Use the **no** variant of this command to delete an existing policy-map.

Syntax

```
policy-map <name>
no policy-map <name>
```

Parameter	Description
<name>	Name of the policy-map.

Mode Global Configuration

Example To create a policy-map called `pmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)#
```

Related Commands class-map

priority-queue

Configures strict priority based scheduling on the specified egress queues. You must specify at least one queue.

Syntax `priority-queue {0}[1][2][3][4][5][6][7]`

Parameter	Description
`{0}[1]...[7]`	Specify the queues that will use strict priority scheduling. With strict priority scheduling, the switch will completely empty the highest numbered queue first, then start processing the next lowest numbered queue.

Mode Interface Configuration

Usage By default, the queues on all ports are set for priority queueing. You can change the queue emptying sequence to weighted round robin, by using the commands:**mls qos fabric-queue** command on page 66.27, or **wrr-queue group weight queues** command on page 66.90. You can then use the **priority-queue** command to reset the selected queues to priority queueing. Note that the emptying sequence for priority queueing is always highest queue number to lowest queue number.

For more information on queueing operation, see the chapter **Quality of Service (QoS) Introduction**.

Example To apply priority based scheduling to egress queues 1 and 2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# priority-queue 1 2
```

Related Commands
mls qos fabric-queue
show mls qos interface
show mls qos interface queue-counters
wrr-queue group weight queues

service-policy input

Use this command to apply a policy-map to the input of an interface.

Use the **no** variant of this command to remove a policy-map and interface association.

Syntax

```
service-policy input <policy-map>
no service-policy input <policy-map>
```

Parameter	Description
<policy-map>	Policy map name that the input will applied to.

Mode Interface Configuration

Usage This command can be applied to switch ports or static channel groups, but not to dynamic (LACP) channel groups.

Example To apply a policy-map named `pmap1` to interface `port1.0.2`, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# service-policy input pmap1
```

set bandwidth-class

Use this command to set a bandwidth-class color to assign to classified traffic. The color represents the traffic's conformance to the policers allocated bandwidth. Green traffic is assumed to be conforming, yellow is semi-conforming, and red is non-conforming.

Use the **no** variant of this command to turn off a bandwidth-class color assigned to classified traffic.

Syntax

```
set bandwidth-class {green|yellow|red}
no set bandwidth-class {green|yellow|red}
```

Parameter	Description
green	Mark the packet as green.
yellow	Mark the packet as yellow.
red	Mark the packet as red.

Mode Policy Map Class Configuration

Examples To set the bandwidth class for all traffic classified by this class-map, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# set bandwidth-class green
```

Note that the class-map and policy-map should already have been created by using the **class-map** command on page 66.4 and the **policy-map** command on page 66.54.

To turn off the setting of a packets in the green bandwidth-class, for the policy `pmap1` and the class `cmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# no set bandwidth-class green
```

Related Commands

class-map
set cos
set dscp
set queue
trust dscp

set cos

Use this command to set a CoS value to assign to classified traffic.

Use the **no** variant of this command to turn off the CoS value assigned to classified traffic.

Note that this command is not valid with **trust dscp** on Hardware Version 1 ports (see **"Hardware Versions" on page 65.7**).

Syntax

```
set cos <0-7>
no set cos
```

Parameter	Description
<0-7>	The new CoS value to be assigned.

Mode Policy Map Class Configuration

Examples To set the CoS value to 7 for all traffic classified by the selected class-map and policy-map, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# set cos 7
```

To turn off the above setting, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# no set cos
```

Related Commands

set bandwidth-class
set dscp
set queue
set dscp

set dscp

For a specific class-map and policy-map this command will assign or change the DSCP value within the packet. Note that where more than one class-map has been assigned to a particular DSCP, the switch will apply the action of the class-map that was created first.

On Hardware Version 1 ports (see **"Hardware Versions" on page 65.7**), the behavior of this command changes if you use it with the premark-dscp map (i.e. if you enter the **trust dscp** command). If you enter the **trust dscp** command, then the switch uses the **set dscp** command's value as the lookup value for the premark-dscp map. The switch then assigns the map's DSCP to the traffic.

The **no** variant of this command will negate the DSCP value specified with the **set dscp** command.

Syntax

```
set dscp <0-63>
no set dscp
```

Parameter	Description
<0-63>	The new DSCP value. A value between 0 and 63.

Mode Policy Map Class Configuration

Example To set a DSCP value of `35` to all traffic classified by a class-map of `cmap1` and a policy-map of `pmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# set dscp 35
```

Related Commands

set bandwidth-class
set cos
set queue
trust dscp

set ip next-hop (PBR)

Forwards traffic matching this class-map to the specified nexthop.

When this command is set, all packets that match a selected class-map will be forwarded to the specified nexthop.

The **no** variant of this command removes the next-hop address (in the context of its policy-map and class-map) from the configuration.

Syntax

```
set ip next-hop <ip-addr>
no set ip next-hop
```

Parameter	Description
<ip-addr>	The IP address of the next hop destination.

Mode Policy Map Class Configuration

Usage In typical deployments of policy-based routing, some traffic types require normal routing (i.e. via the routes in the IP routing table) while other traffic types require policy based routing.

Where the traffic to be policy routed is a subset of the traffic that is to be normally routed, then the configuration is reasonably simple. The policy-map will contain one or more classes that match the traffic to be policy routed, and will have their next-hop configured by this command - **set ip next-hop (PBR).** The remaining traffic will be conventionally routing routed according to the rules set for the default class - providing that this is not subject to the **set ip next-hop (PBR).**

The situation becomes a little more complex where the traffic requiring normal routing is a subset of the traffic to be policy-routed. In this situation the policy-map would need to contain one, or more, classes that match the requirement for normal routing, These classes would not be configured with a **set ip next-hop (PBR)** command. Then the remaining traffic classes that require normal routing would have the **set ip next-hop (PBR)** command applied to them. Note that this traffic could be just the default class, if ALL other traffic types were to be policy-routed.

Also note that the order in which the classes are configured in the policy-map is important; because traffic is matched against the classes in the order that they were assigned to the policy-map.

Details of a practical example of such a policy-based routing is shown in **"Policy-Based Routing" on page 65.38**.

Example To forward a packet to a 192.168.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# set ip next-hop 192.168.1.1
```

set queue

Use this command to set a queue value to assign to classified traffic. This will override the default queue as configured by the **mls qos queue** command, but may be overridden by subsequent QoS mechanisms (such as remarking).

Use the **no** variant of this command to negate the queue value assigned to classified traffic by the **set queue** command.

Note that this command is not valid with **trust dscp** on Hardware Version 1 ports (see **"Hardware Versions" on page 65.7**).

Syntax

```
set queue <0-7>
no set queue
```

Parameter	Description
<0-7>	Specify a new Queue value.

Mode Policy Map Class Configuration

Example To set the queue to value `7` for all traffic classified as `cmap1` and `pmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# set queue 7
```

Related Commands

set bandwidth-class
set cos
set dscp
trust dscp

show class-map

Use this command to display the QoS class-maps to define the match criteria to classify traffic.

Syntax `show class-map <class-map name>`

Parameter	Description
<class-map name>	Name of the class-map.

Mode User Exec and Privileged Exec

Example To display the QoS class-maps to define the match criteria to classify traffic, use the command:

```
awplus# show class-map cmap1
```

Output **Figure 66-2: Example output from the show class-map command**

```
CLASS-MAP-NAME: cmap1
      Set IP DSCP: 56
      Match IP DSCP: 7
```

Related Commands class-map

show mls qos aggregate-policer

Displays all or a single aggregate-policer. If no name is specified, all aggregate policers will be displayed.

Syntax

```
show mls qos aggregate-policer [<name>]
```

Parameter	Description
<name>	Aggregate policer name.

Mode User Exec and Privileged Exec

Example To display all aggregate-policers, use the command:

```
awplus# show mls qos aggregate-policer
```

Output **Figure 66-3: Example output from the show mls qos aggregate-policer command**

```
AGGREGATE-POLICER-NAME: ap1
Policer single-rate action drop-red:
average rate(1 kbps) minimum burst(2 B) maximum burst(3 B)
AGGREGATE-POLICER-NAME: ap2
Policer twin-rate action drop-red policed-dscp-tx:
minimum rate(1 kbps) maximum rate(2 kbps) minimum burst(3 B)
maximum burst(4 B)
```

Related Commands **mls qos aggregate-police action**
police-aggregate

show mls qos fabric-queue

Displays the scheduling algorithms for the fabric queues.

Syntax `show mls qos fabric-queue`

Mode User Exec and Privileged Exec

Example To display all scheduling algorithms for the fabric-queues, use the command:

```
awplus# show mls qos fabric-queue
```

Output **Figure 66-4: Example output from the show mls qos fabric-queue command**

```
fabric queue: 0
Scheduler: WRR
Weight: 5
Fabric Queue: 1
Scheduler: WRR
Weight: 1
Fabric Queue: 2
Scheduler: Priority
Fabric Queue: 3
Scheduler: Priority
```

Related Commands **mls qos fabric-queue**
show mls qos maps fabric-queue

show mls qos interface

Displays the current settings for the interface. This includes its default CoS and queue, scheduling used for each queue, and any policies/maps that are attached.

Syntax `show mls qos interface [<port>]`

Parameter	Description
<port>	Switch port.

Mode User Exec and Privileged Exec

Example To display current CoS and queue settings for interface `port1.0.1`, use the command:

```
awplus# show mls qos interface port1.0.1
```

Output **Figure 66-5: Example output from the show mls qos interface command**

```
Default CoS:   7
    Default Queue: 7
    Number of egress queues: 8
    Queue Set: 1
    Egress Queue:         0
      Status:             Enabled
      Scheduler:          Strict Priority
      Queue Limit:        12%
      Egress Rate Limit: 0 Kb
    Egress Queue:         1
      Status:             Enabled
      Scheduler:          Strict Priority
      Queue Limit:        12%
      Egress Rate Limit: 0 Kb
    Egress Queue:         2
      Status:             Enabled
      Scheduler:          Strict Priority

      Egress Rate Limit: 0 Kb
    Egress Queue:         3
      Status:             Enabled
      Scheduler:          Wrr Group 2
      Weight:             10
      Queue Limit:        12%
      Egress Rate Limit: 0 Kb
    Egress Queue:         4
      Status:             Enabled
      Scheduler:          Wrr Group 1
      Weight:             10
      Queue Limit:        12%
      Egress Rate Limit: 0 Kb
    Egress Queue:         5
      Status:             Enabled
      Scheduler:          Strict Priority
      Queue Limit:        12%
      Egress Rate Limit: 0 Kb
    Egress Queue:         6
      Status:             Enabled
      Scheduler:          Strict Priority
      Queue Limit:        12%
      Egress Rate Limit: 0 Kb
    Egress Queue:         7
      Status:             Enabled
      Scheduler:          Strict Priority
      Queue Limit:        12%
      Egress Rate Limit: 0 Kb
```

Table 66-1: Parameters in the output of the show mls qos interface command

Parameter	Description
`Default CoS`	The default CoS priority that will be applied to all packets arriving on this interface.
`Default Queue`	The default queue that will be applied to all packets arriving on this interface.
`Number of egress queues`	The total number of egress queues available on this interface.
`Queue Set`	Drop queue set that has been applied to the port. This could either be operating in threshold or random-detect mode.
`Egress Queue X`	Number of this egress queue.
`Status`	Queue can either be enabled or disabled.
`Scheduler`	The scheduling mode being used for servicing the transmission of packets on this port.
`Queue Limit`	The percentage of the port's buffers that have been allocated to this queue.
`Egress Rate Limit`	The amount of traffic that can be transmitted via this queue per second. 0 Kb means there is currently no rate-limiting enabled.

Related Commands

mls qos queue
wrr-queue group weight queues
wrr-queue queue-limit

show mls qos interface policer-counters

This command displays an interface's policer counters. This can either be for a specific class-map or for all class-maps attached to the interface. If no class-map is specified then all class-map policer counters attached to the interface are displayed.

Note that these counters are based on metering performed on the specified class-map. Therefore, the '`Dropped Bytes`' counter is the number of bytes dropped due to metering. This is different from packets dropped via a 'deny' action in the ACL. If a policer is configured to perform re-marking, bytes can be marked Red but are not dropped, and is shown with a value of 0 for the Dropped field and a non-0 value for the '`Red Bytes`' field.

Syntax

```
show mls qos interface <port> policer-counters
   [class-map <class-map>]
```

Parameter	Description
<port>	Switch port.
`class-map`	Select a class-map.
<class-map>	Class-map name.

Mode User Exec and Privileged Exec

Usage You must enable the QoS counters by selecting the **qoscounters** parameter with the **platform silicon-profile** command before running this command.

Example To show the counters for all class-maps attached to `port1.0.1`, use the command:

```
awplus# show mls qos interface port1.0.1 policer-counters
```

Output **Figure 66-6: Example output from show mls qos interface policer-counters**

```
awplus#show mls qos int port1.0.1 policer-counters
Interface:                port1.0.1
  Class-map:              default
    Green Bytes:          0
    Yellow Bytes:         0
    Red Bytes:            0
    Dropped Bytes:        0
    Non-dropped Bytes:    0
  Class-map:              cmap1
    Green Bytes:          882368
    Yellow Bytes:         699968
    Red Bytes:            2723072
    Dropped Bytes:        0
    Non-dropped Bytes:    4305408
```

This output shows a policer configured with remarking through '`action policed-dscp-transmit`', so although bytes are marked as Red, none are dropped. Therefore, the '`Non-dropped Bytes`' field shows a summation of Green, Yellow and Red bytes.

Related Commands
mls qos queue
wrr-queue group weight queues
wrr-queue queue-limit

show mls qos interface queue-counters

This command displays an interface's egress queue counters. This can either be for a specific queue or for all queues on the interface. If no queue is specified all queue counters on the interface will be displayed.

The counters show the number of frames currently in the queue and the maximum number of frames allowed in the queue, for individual egress queues and the port's queue (which will be a sum of all egress queues).

Syntax `show mls qos interface <port> queue-counters [queue <0-7>]`

Parameter	Description
<port>	Switch port.
<0-7>	Queue.

Mode User Exec and Privileged Exec

Usage The maximum queue limit depends on the hardware type (see **"Hardware Versions" on page 65.7**). For ports on hardware version 2 modules, the portion of the port's buffer pool that is assigned to each queue is divided by three, with one third applied to each of the three drop precedence colors, red, green, and yellow. See the Usage section of the **wrr-queue queue-limit** command on page 66.92 for details.

Example To show the counters for all queues on `port1.0.1`, use the command:

```
awplus# show mls qos interface port1.0.1 queue-counters
```

Output **Figure 66-7: Example output from the show mls qos interface queue-counters command**

```
Interface port1.0.1 Queue Counters:
 Port queue length       71 (maximum 896)
 Egress Queue length:
   Queue 0                0 (maximum 912)
   Queue 1                0 (maximum 912)
   Queue 2               71 (maximum 912)
   Queue 3                0 (maximum 912)
   Queue 4                0 (maximum 912)
   Queue 5                0 (maximum 912)
   Queue 6                0 (maximum 912)
   Queue 7                0 (maximum 912)
```

Table 66-2: Parameters in the output of the show mls qos interface queue-counters command

Parameter	Description
`Interface`	Port we are showing the counters for.
`Port queue length`	Number of frames in the port's queue. This will be the sum of all egress queues on the port.
`Egress Queue length`	Number of frames in a specific egress queue, subject to the specific operation on hardware type 2 modules (see **"Hardware Versions" on page 65.7** and the Usage Section for this command.

Related Commands **wrr-queue queue-limit**

show mls qos interface storm-status

Show the current configuration and status of the QoS Storm Protection (QSP) on the given port.

Syntax `show mls qos interface <port> storm-status`

Parameter	Description
<port>	Switch port.

Mode User Exec and Privileged Exec

Example To see the QSP status on `port1.0.1`, use command:

```
awplus# show mls qos interface port1.0.1 storm-status
```

Output **Figure 66-8: Example output from the show mls qos interface storm-status command**

```
Interface:           port1.0.1
Storm-Protection:    Enabled
Port-status:         Enabled
Storm Action:        vlandisable
Storm Window:        5000 ms
Storm Downtime:      0 s
Timeout Remaining:   0 s
Last read data-rate: 0 kbps
Storm Rate:          1000 kbps
```

Related Commands
storm-action
storm-downtime
storm-protection
storm-rate
storm-window

show mls qos maps cos-queue

Show the current configuration of the cos-queue map.

Syntax `show mls qos maps cos-queue`

Mode User Exec and Privileged Exec

Example To display the current configuration of the cos-queue map, use the command:

```
awplus# show mls qos maps cos-queue
```

Output **Figure 66-9: Example output from the show mls qos maps cos-queue command**

```
COS-TO-QUEUE-MAP:
      COS :            0 1 2 3 4 5 6 7
      --------------------------------
      QUEUE:           0 7 1 3 4 5 6 7
```

Related Commands mls qos map cos-queue to

show mls qos maps fabric-queue

Displays the fabric queue map, which is a table mapping eight egress queues to four input fabric queues.

Syntax `show mls qos maps fabric-queue`

Mode User Exec and Privileged Exec

Example To display the `fabric-queue` map, use the command:

```
awplus# show mls qos maps fabric-queue
```

Output **Figure 66-10: Example output from the show mls qos maps fabric-queue command**

```
Egress Queue    Fabric Queue
    ----------------------
    0                0
    1                0
    2                1
    3                1
    4                1
    5                1
    6                2
    7                2
```

Output Parameter	Meaning
`Egress Queue`	Egress queue indexing the table
`Fabric Queue`	Resulting fabric queue for the egress queue lookup.

Related Commands **mls qos fabric-queue**
show mls qos fabric-queue

show mls qos maps policed-dscp

Displays the policed-dscp map. This is used when a policer is configured with an exceed action of "policed-dscp-transmit".

Syntax

```
show mls qos maps policed-dscp [<0-63>]
```

Parameter	Description
<0-63>	DSCP table entry.

Mode User Exec and Privileged Exec

Example To display the policed-dscp map for DSCP `1`, use the command:

```
awplus# show mls qos maps policed-dscp 1
```

Output **Figure 66-11: Example output from the show mls qos maps policed-dscp command**

```
POLICED-DSCP-MAP:
DSCP 1
Bandwidth Class Green Yellow Red
-------------------------------------------------
New DSCP 1 1 1
New CoS 0 0 0
New Queue 0 0 0
New Bandwidth Class green yellow red
```

Related Commands

mls qos map premark-dscp to
no police
police single-rate action
police twin-rate action

show mls qos maps premark-dscp

This command displays the premark-dscp map. This map is used when the **trust dscp** command has been specified for a policy-map's class-map to replace the DSCP, CoS, queue, and bandwidth class of a packet matching the class-map based on a lookup DSCP value.

If the **set dscp** command has also been specified for that class-map, the set value is used for the lookup of the premark-dscp map. Otherwise the DSCP value in the packet is used for the lookup.

Syntax

```
show mls qos maps premark-dscp [<0-63>]
```

Parameter	Description
<0-63>	DSCP table entry.

Mode User Exec and Privileged Exec

Example To display the premark-dscp map for DSCP `1`, use the command:

```
awplus# show mls qos maps premark-dscp 1
```

Output **Figure 66-12: Example output from the show mls qos maps premark-dscp command**

```
PREMARK-DSCP-MAP:

    DSCP 1
    Bandwidth Class         Green    Yellow   Red
    ------------------------------------------------
    New DSCP                1        -        -
    New CoS                 0        -        -
    New Queue               0        -        -
    New Bandwidth Class     green    -        -
```

Related Commands

trust dscp

show mls qos queue-set

Displays the specified queue-set and its parameters. If no queue-set is specified then all queue sets will be displayed.

Syntax `show mls qos queue-set [<1-4>]`

Parameter	Description
<1-4>	Queue Set ID.

Mode User Exec and Privileged Exec

Usage This show output is invalid for ports on hardware type 2 modules (see **"Hardware Versions" on page 65.7**).

Example To display `queue-set 1`, use the command:

```
awplus# show mls qos queue-set 1
```

Output **Figure 66-13: Example output from the show mls qos queue-set command**

```
Queue Set 1:
  Description: 1G Defaults

```

Table 66-3: Parameters in the output of the show mls qos queue-set command

Parameter	Description
`Queue Set`	Queue-set number.
`Description`	Textual description for this queue-set.
`Queue X`	Parameter set for egress queue X.
`BandwidthClass`	Parameter set per-bandwidth-class per-queue.
`Min`	The amount of traffic required in the queue before packets start getting dropped.
`Max`	The amount of traffic required in the queue before all packets are dropped.
`Drop Probability`	The probability that a packet is dropped when the queue length is between the minimum and maximum for the bandwidth-class.
`Averaging Factor`	Determines how quickly the average queue length follows the actual queue length. A small averaging factor will cause the average to follow the actual more quickly and visa versa for a large averaging factor.

Related Commands

show mls qos interface
show mls qos queue-set

show policy-map

Displays the policy-maps configured on the switch. The output also shows whether or not they are connected to a port (attached / detached) and shows their associated class-maps.

Syntax `show policy-map [<name>]`

Parameter	Description
<name>	The name of a specific policy-map.

Mode User Exec and Privileged Exec

Example To display a listing of the policy-maps configured on the switch, use the command:

```
awplus# show policy-map
```

Output **Figure 66-14: Example output from the show policy-map command**

```
POLICY-MAP-NAME: general-traffic
  State: attached
    Default class-map action: permit
    CLASS-MAP-NAME: default
    CLASS-MAP-NAME: database-traffic
```

Related Commands **no police**
service-policy input

storm-action

Sets the action to take when triggered by QoS Storm Protection (QSP). There are three available options:

- **portdisable** will disable the port in software.
- **vlandisable** will disable the port from the VLAN matched by the class-map in class-map.
- **linkdown** will physically bring the port down. The **vlandisable** requires the match vlan class-map to be present in the class-map.

The **no** variant of this command will negate the action set by the **storm-action** command.

Syntax

```
storm-action {portdisable|vlandisable|linkdown}
no storm-action
```

Parameter	Description
portdisable	Disable the port in software.
vlandisable	Disable the VLAN.
linkdown	Shutdown the port physically.

Mode Policy Map Class Configuration

Examples To apply the storm protection of `vlandisable` to the policy-map named `pmap2`, and the class-map named `cmap1`, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap1
awplus(config-pmap-c# storm-action vlandisable
```

To negate the storm protection set on the policy-map named `pmap2`, and the class-map named `cmap1`, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap1
awplus(config-pmap-c# no storm-action
```

Related Commands
storm-downtime
storm-protection
storm-rate
storm-window

storm-downtime

Sets the time to re-enable the port once disabled by QoS Storm Protection (QSP). The time is given in seconds, from a minimum of one second to maximum of 86400 seconds (i.e. one day).

The **no** variant of this command resets the time to the default value of 10 seconds.

Syntax

```
storm-downtime <1-86400>
no storm-downtime
```

Parameter	Description
<1-86400>	Seconds.

Default 10 seconds

Mode Policy Map Class Configuration

Examples To re-enable the port in 1 minute, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# storm-downtime 60
```

To re-set the port to the default (10 seconds), use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# no storm-downtime
```

Related Commands

storm-action
storm-protection
storm-rate
storm-window

storm-protection

Use this command to enable the policy-based storm protection (such as QSP - QoS Storm Protection). Storm protection is activated on a port after port state decisions have been made.

The **no** variant of this command disables Policy Based Storm Protection.

Syntax

```
storm-protection
no storm-protection
```

Default By default, storm protection is disabled.

Mode Policy Map Class Configuration

Usage Before you can configure storm protection, you must first set the silicon profile to either **extended** or **qoscounters**. Silicon profiles are hardware-dependent—see the **platform silicon-profile** command on page 17.34.

Examples To enable QSP on `cmap2` in `pmap2`, use the following commands:

```
awplus# configure terminal
awplus(config)# platform silicon-profile qoscounters
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# storm-protection
```

To disable QSP on `cmap2` in `pmap2`, use the following commands:

```
awplus# policy-map pmap2
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# no storm-protection
```

Related Commands

platform silicon-profile
storm-action
storm-downtime
storm-rate
storm-window

storm-rate

Sets the data rate that triggers the storm-action. The rate is in kbps and the range is from 1kbps to 10Gbps.

Note that this setting is made in conjunction with the **storm window** command.

Use the **no** variant of this command to negate the **storm-rate** command.

Syntax

```
storm-rate <1-10000000>
no storm-rate
```

Parameter	Description
<1-10000000>	The range of the storm-rate.

Default No default

Mode Policy Map Class Configuration

Usage This setting is made in conjunction with the **storm-window** command on page 66.83.

Examples To the limit to 1Mbps, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# storm-rate 1000
```

To negate the limit set previously, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# storm-rate 1000
```

Related Commands

storm-action
storm-downtime
storm-protection
storm-window

storm-window

Sets the window size of QoS Storm Protection (QSP). This sets the time to poll the data-rate every given milliseconds. Minimum window size of 100 ms and the maximum is 60 sec.

Use the **no** variant of this command to negate the **storm-window** command.

Syntax

```
storm-window <100-60000>
no storm-window
```

Parameter	Description
<100-60000>	The window size, measured in milliseconds.

Default No default

Mode Policy Map Class Configuration

Usage This command should be set in conjunction with the **storm-rate** command on page 66.82.

Examples To set the QSP window size to `5000` ms, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# storm-window 5000
```

To negate the QSP window size set previously, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# storm-window 5000
```

Related Commands

strict-priority-queue queue-limit

This command is the same as the **wrr-queue queue-limit** command.

It sets the percentages of a port's total buffer pool that each queue is allowed to use. This queue limit is applicable no matter what type of scheduling is configured for the specified queues (i.e. WRR or strict priority).

See **wrr-queue queue-limit** for command details.

trust dscp

The behavior of this command depends on the hardware type of the ports it applies to.

Two hardware types exist: **Hardware Version 1** and **Hardware Version 2**. The following table shows the hardware modules and the version to which each belongs.

Hardware Version 1	Hardware Version 2
Baseboard	AT-XEM-12Sv2
AT-XEM-12T	AT-XEM-12Tv2
AT-XEM-12XS	AT-XEM-2XP
AT-XEM-1XP	AT-XEM-2XS
	AT-XEM-2XT
	AT-XEM-24T

On Hardware Version 2 XEMs

This command enables the premark-dscp map to replace the bandwidth-class, cos, dscp, and queue of classified traffic based on a lookup DSCP value.

With the no variant of this command, no premark-dscp mapping function will be applied for the selected class-map. QoS components of the packet existing either at ingress, or applied by the class-map, will pass unchanged.

Note This command is accessed in the **Policy-Map mode**. In this respect it can be thought of as a "per port" setting.

Syntax

```
trust dscp
no trust
```

Mode Policy-Map Configuration

Usage If the **set dscp** command has also been specified for the class-map, the set value is used for the lookup of the premark-dscp map. Otherwise the DSCP value in the packet is used for the lookup.

Note that the set bandwidth-class, set cos and set queue are not valid with **trust dscp**.

Examples To enable the premark-dscp map lookup for policy-map `pmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# trust dscp
```

To disable the premark-dscp map lookup for policy-map `pmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# no trust
```

Related Commands

mls qos map premark-dscp to
set bandwidth-class
set cos
set dscp
set queue

On Hardware Version 1 XEMs and the Baseboard

On version 1 hardware types, this command enables the premark-dscp map to replace the bandwidth-class, cos, dscp, and queue of classified traffic within a policy-map based on a lookup DSCP value. This command is configured in a policy-map.

With the **no** variant of this command, no premark-dscp mapping function will be applied for the selected policy-map. QoS components of the packet existing at ingress will pass unchanged.

Note

Each class map is applied through a policy map and can contain trust-dscp settings. The pre-mark table is only looked-up when this classmap is matched.

Syntax

```
trust dscp
no trust
```

Mode

P-Map-C mode

Usage

The DSCP value in the packet is used for lookup, regardless of whether the policy-map has any class-map (with an assigned DSCP) attached to it.

Examples

To enable the premark-dscp map lookup for class-map cmap1 inside policy-map `pmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# trust dscp
```

To disable the premark-dscp map lookup for class-map cmap1 inside policy-map pmap1, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# no trust
```

Related Commands

mls qos map premark-dscp to
set bandwidth-class
set cos
set dscp
set queue
trust dscp

wrr-queue disable queues

Use this command to disable an egress queue from transmitting traffic.

The **no** variant of this command enables an egress queue to transmit traffic.

Syntax

```
wrr-queue disable queues [0][1][2][3][4][5][6][7]
no wrr-queue disable queues [0][1][2][3][4][5][6][7]
```

Parameter	Description
`[0][2]...[7]`	Selects one or more queues numbered 0 to 7.

Mode Interface Configuration

Examples To enable queue 1 to transmit traffic, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no wrr-queue disable queues 1
```

To disable queue 1 from transmitting traffic, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# wrr-queue disable queues 1
```

Related Commands show mls qos interface

wrr-queue egress-rate-limit queues

Sets a limit on the amount of traffic that can be transmitted per second from these queues. The default unit is in Kb, but Mb or Gb can also be specified. The minimum is 651Kb.

Syntax

```
wrr-queue egress-rate-limit <bandwidth> queues
    {0}[1][2][3][4][5][6][7]

no wrr-queue egress-rate-limit <bandwidth> queues
    {0}[1][2][3][4][5][6][7]
```

Parameter	Description
<bandwidth>	Bandwidth <1-10000000 kbits> (usable units: k, m, g).
{0}[1]...[7]	Selects one or more queues to apply the bandwidth limit to as specified in the preceding *<bandwidth>* parameter.

Mode Interface Configuration

Example To limit the egress rate of queues 0, 1 and 2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# wrr-queue egress-rate-limit 500M
queues 0 1 2
```

Related Commands show mls qos interface

wrr-queue group weight queues

Configures weighted round-robin based scheduling on the specified egress queues on switch port interfaces and static aggregated interfaces.

The queues can be placed into either group 1 or group 2. Both groups are still serviced in a round-robin order according to the specified weights, but all queues in group 1 must be empty before any packets in group 2 can be sent. The weights are specified as ratio's relative to each other.

Note that switch port interfaces or static aggregated interfaces within a round robin group must be contiguous.

Syntax `wrr-queue group <1-2> weight <6-255> queues {0}[1][2]3][4][5][6][7]`

Parameter	Description
<1-2>	WRR group 1 or 2.
<6-255>	Weight.
`{0}[1]...[7]`	Egress queues 0-7 to select and assign a priority in the range <0-7>. The queue number is indicated by the order of entry. For example, queue 1 2 assigns priority 1 and 2 to queues 0 and 1 due to the order of entry. Queue 0 is a required queue.

Mode Interface Configuration for both switch port interfaces and static aggregated interfaces.

Usage Weighted round-robin based scheduling may be applied to switch port interfaces (for example, `awplus(config)#interface port1.0.2`) and to static aggregated interfaces (for example, `awplus(config)#interface sa2`).

Examples To configure wrr-queue group `1` weight `6` queues `0 1 2` on the switch port interface `port1.0.1`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# wrr-queue group 1 weight 6 queues 0 1 2
```

To configure a static aggregated interface `sa2` on switch port interface `port1.0.2` and configure wrr-queue group `2` weight `9` queues `0 1` on interface `sa2`, use these commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# static-channel-group 2
awplus(config-if)# exit
awplus(config)# interface sa2
awplus(config-if)# wrr-queue group 2 weight 9 queues 0 1
```

Related Commands **priority-queue**
show mls qos interface

wrr-queue queue-limit

Sets the percentages of a port's total buffer pool that each queue is allowed to use. This queue limit is applicable no matter what type of scheduling is configured for the specified queues (i.e. WRR or strict priority).

This command is the same as the **strict-priority-queue queue-limit** command.

Syntax

```
wrr-queue queue-limit <1-100> <1-100> <1-100> <1-100> <1-100> <1-100>
   <1-100> <1-100>

no wrr-queue queue-limit
```

Parameter	Description
<1-100>	Queue ratio for Queue 0.
<1-100>	Queue ratio for Queue 1.
<1-100>	Queue ratio for Queue 2.
<1-100>	Queue ratio for Queue 3.
<1-100>	Queue ratio for Queue 4.
<1-100>	Queue ratio for Queue 5.
<1-100>	Queue ratio for Queue 6.
<1-100>	Queue ratio for Queue 7.

Mode Interface Configuration

Usage Two hardware types exist: **Hardware Version 1** and **Hardware Version 2**. The following table shows the hardware modules and the version to which each belongs.

Hardware Version 1	Hardware Version 2
Baseboard	AT-XEM-12Sv2
AT-XEM-12T	AT-XEM-12Tv2
AT-XEM-12XS	AT-XEM-2XP
AT-XEM-1XP	AT-XEM-2XS
	AT-XEM-2XT
	AT-XEM-24T

For ports on hardware version 2 modules, the portion of the port's buffer pool that is assigned to each queue is divided by three, with one third applied to each of the three drop precedence colors, red, green, and yellow.

Where no color metering is applied, the queue limit is effectively reduced to a third of the configured value, because in this situation all traffic is classed as green. For example, if the overall queue size available is 792 frames, and equal portions (12.5% of 792 = 99 frames) are assigned to each queue, then 33 frames are assigned to each of the three drop precedence colors. Where no color metering is applied, all traffic is (by default) defined as green, and so is allocated 33 frames per queue. Tail dropping is then applied when each queue is only one third full.

On hardware version 1 modules, no per precedence queuing is applied; therefore in the above example all 99 frames per queue would be available.

Note that you cannot use this command at the same time as the **egress-rate-limit** command.

Example To configure a wrr-queue queue-limit on `port1.0.1` to `port1.0.12` for each queue, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.12
awplus(config-if)# wrr-queue queue-limit 12 12 12 12 12 12 12
12
```

Related Commands **show mls qos interface queue-counters**

Chapter 67: 802.1X Introduction and Configuration

Introduction 67.2
802.1X System Components 67.2
The 802.1X Implementation 67.5
Configuring 802.1X 67.7

Introduction

802.1X is an IEEE standard providing a mechanism for authenticating devices attached to a LAN port or wireless device. Devices wishing to access services behind a port must authenticate themselves before any Ethernet packets are allowed to pass through. The protocol is referred to as 802.1X because it was initially defined in the IEEE standard 802.1X, published in 2001 and revised in 2004 and again as the current 802.1X 2010 standard.

Networks have two important requirements:

- Security: Authentication and Authorisation
- Flexibility: The ability for users to roam

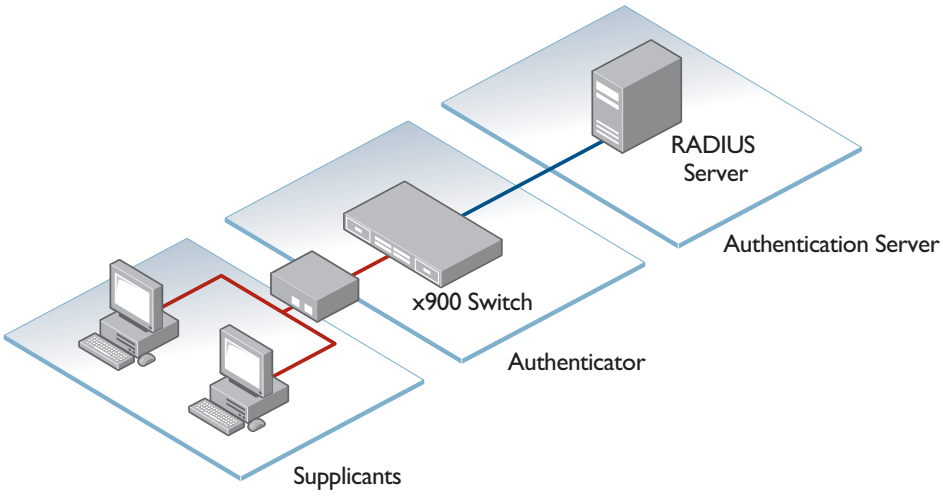
Networks need a device authentication method that is highly secure, but not tied to a port's physical location. Network resources presented to a given user need to be determined from their authentication credentials.

802.1X user authentication satisfies these requirements. It is relatively uncomplicated and has little impact on network performance. It is a protocol that is medium-independent — being equally as effective on wireless connections (802.11i) and wired connections. 802.1X user authentication is rapidly becoming an expected component on networks.

802.1X System Components

There are three main components to a system using 802.1X port authentication control:

- Authenticator: The device that wishes to enforce authentication before allowing access to services that are accessible behind it. An example of this is a switch that has 802.1X port authentication control enabled.
- Supplicant: The client that wishes to access services offered by the authenticator's system. An example of this is a Windows XP Professional PC with an 802.1X client.
- Authentication server: The device that uses the authentication credentials supplied by the supplicant, to determine if the authenticator should grant access to its services. The AlliedWare Plus implementation of 802.1X supports the use of a RADIUS authentication server using Extensible Authentication Protocol (EAP) in conjunction with RADIUS.

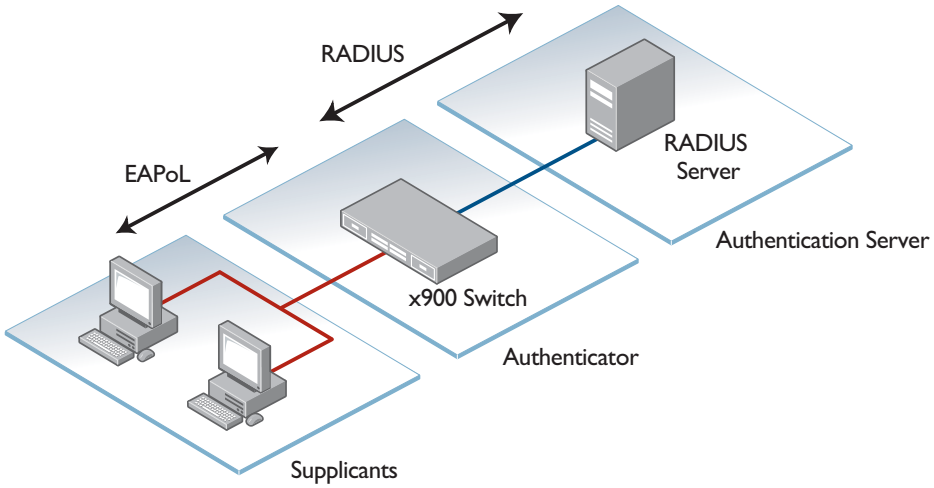


802.1X component protocols

There are two protocols involved in the authentication conversation:

- EAPoL exchanged between the supplicant and authenticator.
  - « EAPoL—Extensible Authentication Protocol over LAN— is the protocol defined in IEEE802.1X.
- RADIUS exchanged between the authenticator and authentication server.
  - « RADIUS has received specific extensions to interoperate with EAPoL.

The diagram below illustrates where EAPoL and RADIUS protocols are used in the authentication conversation:



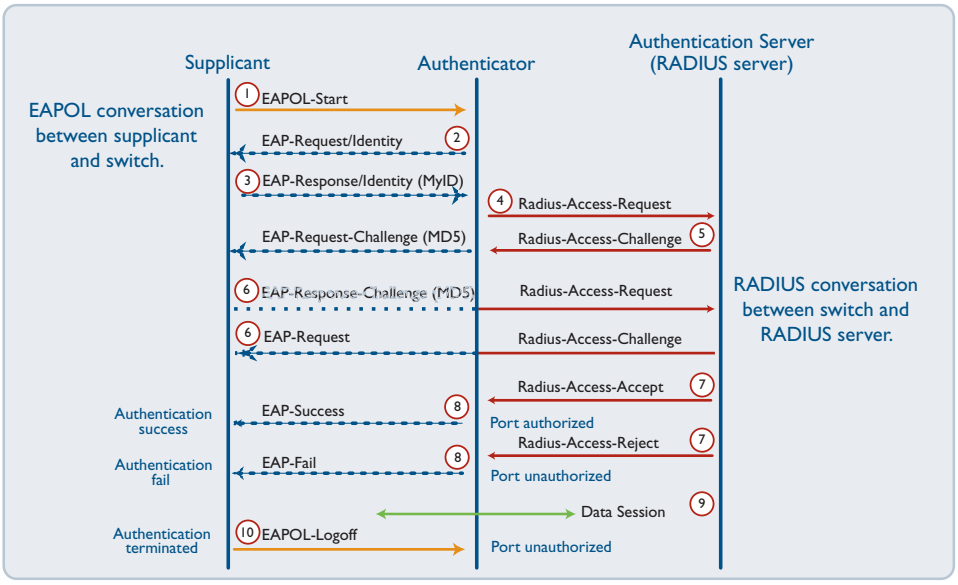
Basic steps in an 802.1X conversation

Step	Action
1	The supplicant informs the authenticator that it wants to initiate the conversation.
2	The authenticator requests the supplicant's credentials.
3	The supplicant sends username/password or X.509 certificate.
4	The authenticator wraps the supplicant's reply into a RADIUS packet and sends it to the RADIUS server.
5	The RADIUS server chooses an authentication method, and sends an appropriate request to the supplicant as a 'challenge'.
6	The RADIUS server and supplicant exchange some messages, ferried by the authenticator.
7	The RADIUS server eventually decides if the supplicant is allowed access and the RADIUS server sends an Access-Accept or Access-Reject message to the Authenticator.
8	The authenticator sends an EAPoL-Success or EAPoL-Fail to the supplicant.
9	The supplicant has a session using the network (if accepted).
10	When the session is over, the supplicant sends a log-off message.

Example message sequence

The diagram below illustrates an exchange using the EAP-MD5 authentication method, which is the simplest authentication method supported by 802.1X.

The EAPoL logoff message, of course, is not sent immediately after the other messages in the diagram, but is sent later on, at the end of the supplicant's data session, when it wishes to disconnect from the network.The EAPoL logoff message, of course, is not sent immediately after the other messages in the diagram, but is sent later on, at the end of the supplicant's data session, when it wishes to disconnect from the network.



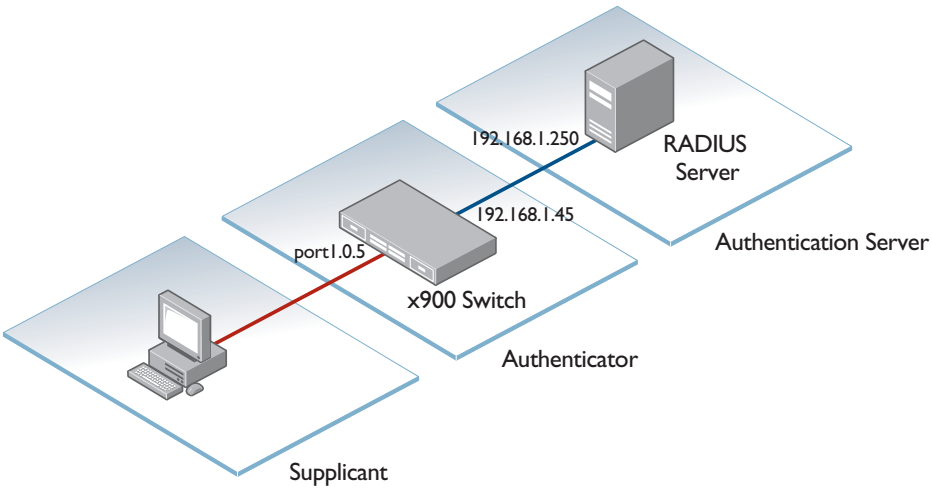
The 802.1X Implementation

802.1X port access control is achieved by making devices attached to a controlled port authenticate themselves via communication with an authentication server before these devices are allowed to access the network behind the controlled port.

Authentication is required on a per-port basis. The main components of an 802.1X implementation are:

- the authenticator - the port on this device that wishes to enforce authentication before allowing access to services that are accessible behind it.
- the supplicant - the port that wishes to access services offered by the authenticator's system. The supplicant may be a port on a PC or other device connected to this device.
- the authentication server - a device that uses the authentication credentials supplied by the supplicant, via the authenticator, to determine if the authenticator should grant access to its services.

To configure the switch operating as authenticator, follow the instructions below:



1. Configure a RADIUS server for the switch to send requests to

```
awplus(config)# radius-server host 192.168.1.250 key
                <secret-key>
```

2. Instruct 802.1X to use the configured RADIUS server

```
awplus(config)# aaa authentication dot1x default group radius
```

3. Configure port1.0.5 for 802.1X authentication

```
   awplus(config)# interface port1.0.5
awplus(config-if)# dot1x port-control auto
awplus(config-if)# spanning-tree portfast
```

Configuring 802.1X

The following example explains how to configure 802.1X. In this example, the RADIUS Server keeps the Client information, validating the identity of the Client and updating the switch about the authentication status of the client. The switch is the physical access between the two clients and the server. It requests information from the client, relays information to the server and then back to the client.

To configure 802.1X authentication, first enable authentication on `port1.0.1` and `port1.0.2` and then specify the RADIUS Server IP address and port.

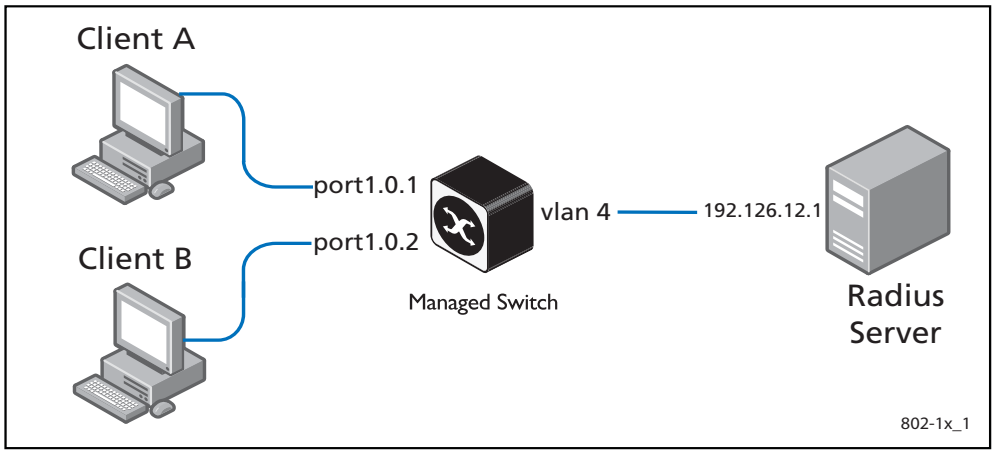


Table 67-1: 802.1X configuration on the switch

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`aaa authentication dot1x default group radius`	Enable authentication globally.
`awplus(config)#`	
`interface port1.0.1`	Specify the interface (`port1.0.1`) to be configured and enter the Interface mode.
`awplus(config-if)#`	
`dot1x port-control auto`	Enable authentication (via RADIUS) on `port1.0.1`.
`awplus(config-if)#`	
`dot1x control-direction both`	Block traffic in both directions, other than authentication packets, until authentication is complete.
`awplus(config-if)#`	
`exit`	Exit the Interface Configuration mode and enter the Global Configuration mode.
`awplus(config)#`	
`interface port1.0.2`	Specify the interface (`port1.0.2`) you are configuring and enter the Interface mode.
`awplus(config-if)#`	
`dot1x port-control auto`	Enable authentication (via RADIUS) on `port1.0.2`.

Table 67-1: 802.1X configuration on the switch

`awplus(config-if)#`	
`exit`	Exit the Interface Configuration mode and enter the Global Configuration mode.
`awplus(config)#`	
`radius-server host 192.126.12.1 auth-port 1812`	Specify the RADIUS Server address (`192.126.12.1`) and authentication port.
`awplus(config)#`	
`radius-server key secret`	Specify the shared key `secret` between the RADIUS server and the client.
`awplus(config)#`	
`interface vlan4`	Specify the vlan (`vlan4`) to be configured and enter the Interface mode.
`awplus(config-if)#`	
`ip address 192.126.12.2/24`	Set the IP address on `vlan4`.

Command List

This chapter provides an alphabetical reference of commands used to configure 802.1X port access control.

debug dot1x

Use this command to enable 802.1X IEEE Port-Based Network Access Control troubleshooting functions.

Use the **no** variant of this command to disable this function.

Syntax

```
debug dot1x [all|auth-web|event|nsm|packet|timer]
no debug all dot1x
no debug dot1x [all|auth-web|event|nsm|packet|timer]
```

Parameter	Description
`all`	Used with the **no** variant of this command exclusively; turns off all debugging for 802.1X.
`auth-web`	Specifies debugging for 802.1X auth-web information.
`events`	Specifies debugging for 802.1X events.
`nsm`	Specifies debugging for NSM messages.
`packet`	Specifies debugging for 802.1X packets.
`timer`	Specifies debugging for 802.1X timers.

Mode Privileged Exec and Global Configuration

Usage This command without any parameters turns on normal 802.1X debug information.

```
awplus# debug dot1x

awplus# show debugging dot1x
```

```
802.1X debugging status:
  802.1X events debugging is
  802.1X timer debugging is on
  802.1X packets debugging is on
  802.1X NSM debugging is on
```

Examples

```
awplus# debug dot1x

awplus# debug dot1x all
```

Related Commands **show debugging dot1x**
undebug dot1x

dot1x control-direction

This command sets the direction of the filter for the unauthorized interface.

If the optional **in** parameter is specified with this command then packets entering the specified port are discarded. The **in** parameter discards the ingress packets received from the supplicant.

If the optional **both** parameter is specified with this command then packets entering (ingress) and leaving (egress) the specified port are discarded. The **both** parameter discards the packets received from the supplicant and sent to the supplicant.

The **no** variant of this command sets the direction of the filter to **both**. The port will then discard both ingress and egress traffic.

Syntax

```
dot1x control-direction {in|both}
no dot1x control-direction
```

Parameter	Description
`in`	Discard received packets from the supplicant (ingress packets).
`both`	Discard received packets from the supplicant (ingress packets) and transmitted packets to the supplicant (egress packets).

Default The authentication port direction is set to **both** by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Example To set the port direction to the default (**both**) for `port1.0.2`, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x control-direction
```

To set the port direction to **in** for `port1.0.2`, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x control-direction in
```

Validation Commands

show dot1x
show dot1x interface
show auth-mac interface
show auth-web interface

dot1x eap

This command selects the transmit mode for the EAP packet. If the authentication feature is not enabled then EAP transmit mode is not enabled. The default setting discards EAP packets.

Syntax `dot1x eap {discard|forward|forward-untagged-vlan|forward-vlan}`

Parameter	Description
`discard`	Discard.
`forward`	Forward to all ports on the switch.
`forward-untagged-vlan`	Forward to ports with the same untagged VLAN.
`forward-vlan`	Forward to ports with the same VLAN.

Default The transmit mode is set to `discard` EAP packets by default.

Mode Global Configuration

Example To set the transmit mode of EAP packet to `forward` to forward EAP packets to all ports on the switch, use the commands:

```
awplus# configure terminal
awplus(config)# dot1x eap forward
```

To set the transmit mode of EAP packet to `discard` to discard EAP packets, use the commands:

```
awplus# configure terminal
awplus(config)# dot1x eap discard
```

To set the transmit mode of EAP packet to `forward-untagged-vlan` to forward EAP packets to ports with the same untagged vlan, use the commands:

```
awplus# configure terminal
awplus(config)# dot1x eap forward-untagged-vlan
```

To set the transmit mode of EAP packet to `forward-vlan` to forward EAP packets to ports with the same vlan, use the commands:

```
awplus# configure terminal
awplus(config)# dot1x eap forward-vlan
```

dot1x eapol-version

This command sets the EAPOL protocol version for EAP packets when 802.1X port authentication is applied.

Use the **no** variant of this command to set the EAPOL protocol version to 1.

The default EAPOL protocol version is version 1.

Syntax

```
dot1x eapol-version {1|2}
no dot1x eapol-version
```

Parameter	Description
1	EAPOL version.
2	EAPOL version.

Default The EAP version for 802.1X authentication is set to 1 by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Example To set the EAPOL protocol version to `2` for `port1.0.2`, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x eapol-version 2
```

To set the EAPOL protocol version to the default version (1) for interface `port1.0.2`, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x eapol-version
```

Validation Commands **show dot1x**
show dot1x interface

dot1x initialize interface

This command removes authorization for a connected **interface** with the specified *<interface-list>*. The connection will attempt to re-authorize when the specified **port** attempts to make use of the network connection.

Note Reauthentication could be a long time after the use of this command because the reauthorization attempt is not triggered by this command. The attempt is triggered by the first packet from the interface trying to access the network resources.

Syntax `dot1x initialize interface <interface-list>`

Parameter	Description
<interface-list>	The interfaces or ports to configure. An interface-list can be: ■ an interface (e.g. `vlan2`), a switch port (e.g. `port1.0.12`), a static channel group (e.g. `sa3`) or a dynamic (LACP) channel group (e.g. `po4`) ■ a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. `vlan2-8`, or `port1.0.1-1.0.24`, or `sa2-4`, or `po1-3` ■ a comma-separated list of the above; e.g. `port1.0.1,port1.0.8-1.0.24`. Do not mix interface types in a list The specified interfaces must exist.

Mode Privileged Exec

Example To initialize 802.1X port authentication on the interface `port1.0.2`, use the command:

```
awplus# dot1x initialize interface port1.0.2
```

To unauthorize switch `port1.0.1` and attempt reauthentication on switch `port1.0.1`, use the command:

```
awplus# dot1x initialize interface port1.0.1
```

To unauthorize all switch ports for a 24 switch port device and attempt reauthentication, use the command:

```
awplus# dot1x initialize interface port1.0.1-port1.0.24
```

Validation Commands **show dot1x**
show dot1x interface

Related Commands **dot1x initialize supplicant**

dot1x initialize supplicant

This command removes authorization for a connected *supplicant* with the specified **MAC address** or **username**. The connection will attempt to re-authorize when the specified supplicant attempts to make use of the network connection.

Note Reauthentication could be a long time after the use of this command because the reauthorization attempt is not triggered by this command. The attempt is triggered by the first packet from the supplicant trying to access the network resources.

Syntax

```
dot1x initialize supplicant {<macadd>|username}
```

Parameter	Description
dot1x	IEEE 802.1X Port-Based Access Control.
initialize	Initialize the port to attempt reauthentication.
supplicant	Specify the supplicant to initialize.
<*macadd*>	MAC (hardware address of the supplicant.
username	The name of the supplicant entry.

Mode Privileged Exec

Example To initialize the supplicant authentication, use the commands

```
awplus# configure terminal
awplus(config)# dot1x initialize supplicant
0090.99ab.a020
awplus(config)# dot1x initialize supplicant guest
```

Validation Commands **show dot1x**
show dot1x supplicant

Related Commands **dot1x initialize interface**

dot1x keytransmit

This command enables key transmission on the interface specified previously in Interface mode.

The **no** variant of this command disables key transmission on the interface specified.

Syntax

```
dot1x keytransmit
no dot1x keytransmit
```

Default Key transmission for port authentication is enabled by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Usage Use this command to enable key transmission over an Extensible Authentication Protocol (EAP) packet between the authenticator and supplicant. Use the **no** variant of this command to disable key transmission.

Example To enable the key transmit feature on interface `port1.0.2`, after it has been disabled by negation, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x keytransmit
```

To disable the key transmit feature from the default startup configuration on interface `port1.0.2`, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x keytransmit
```

Validation Commands **show dot1x**
show dot1x interface

dot1x max-auth-fail

Use this command to configure the maximum number of login attempts for a supplicant (client device) using the **auth-fail vlan** feature, when using 802.1X port authentication on an interface.

The **no** variant of this command resets the maximum login attempts for a supplicant (client device) using the auth-fail vlan feature, to the default configuration of 3 login attempts.

Syntax

```
dot1x max-auth-fail <0-10>
no dot1x max-auth-fail
```

Parameter	Description
<0-10>	Specify the maximum number of login attempts for supplicants on an interface using 802.1X port authentication.

Default The default maximum number of login attempts for a supplicant on an interface using 802.1X port authentication is three (3) login attempts.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Usage This command sets the maximum number of login attempts for supplicants on an interface. The supplicant is moved to the auth-fail VLAN from the Guest VLAN after the number of failed login attempts using 802.1X authentication is equal to the number set with this command.

See the related **auth auth-fail vlan** command on page 70.3. See also the section **"Failed Authentication VLAN" on page 69.29** for information about the auth-fail VLAN feature.

See the section **"Limitations on Allowed Feature Combinations" on page 69.29** for information about restrictions regarding combinations of authentication enhancements working together.

Examples To configure the maximum number of login attempts for a supplicant on interface `port1.0.2` to a single (`1`) login attempt, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x max-auth-fail 1
```

To configure the maximum number of login attempts for a supplicant on interface `port1.0.2` to the default number of three (`3`) login attempts, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x max-auth-fail
```

Validation Commands **show running-config**

Related Commands **auth auth-fail vlan**
dot1x max-reauth-req
show dot1x interface

dot1x max-reauth-req

This command sets the number of reauthentication attempts before an interface is unauthorized.

The **no** variant of this command resets the reauthentication delay to the default.

Syntax

```
dot1x max-reauth-req <1-10>
no dot1x max-reauth-req
```

Parameter	Description
<1-10>	Specify the maximum number of reauthentication attempts for supplicants on an interface using 802.1X port authentication.

Default The default maximum reauthentication attempts for interfaces using 802.1X port authentication is two (2) reauthentication attempts, before an interface is unauthorized.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Usage Use this command to set the maximum reauthentication attempts after failure.

Examples To configure the maximum number of reauthentication attempts for interface `port1.0.2` to a single (1) reauthentication request, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x max-reauth-req 1
```

To configure the maximum number of reauthentication attempts for interface `port1.0.2` to the default maximum number of two (2) reauthentication attempts, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x max-reauth-req
```

Validation Commands **show running-config**

Related Commands **dot1x max-auth-fail**
show dot1x interface

dot1x port-control

This command enables 802.1X port authentication on the interface specified, and sets the control of the authentication port. When **port-control** is set to **auto**, the 802.1X authentication feature is executed on the interface, but only if the **aaa authentication dot1x** command has been issued.

The **no** variant of this command disables the port authentication on the interface specified.

Syntax

```
dot1x port-control {force-unauthorized|force-authorized|auto}
no dot1x port-control
```

Parameter	Description
`force-unauthorized`	Force port state to unauthorized. Specify to force a port to always be in an unauthorized state.
`force-authorized`	Force port state to authorized. Specify to force a port to always be in an authorized state.
`auto`	Allow port client to negotiate authentication. Specify to enable authentication on port.

Default 802.1X port control is disabled by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Usage Use this command to force a port state. Note that all **dot1x** commands can only be applied to switch ports. They cannot be applied to dynamic (LACP) or static channel groups.

Example To enable port authentication on the interface `port1.0.2`, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x port-control auto
```

To enable port authentication force authorized on the interface `port1.0.2`, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x port-control force-authorized
```

To disable port authentication on the interface `port1.0.2`, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x port-control
```

Validation Commands **show dot1x interface**

Related Commands **aaa authentication dot1x**

dot1x timeout tx-period

This command sets the transmit timeout for the authentication request on the specified interface.

The **no** variant of this command resets the transmit timeout period to the default (30 seconds).

Syntax

```
dot1x timeout tx-period <1-65535>
no dot1x timeout tx-period
```

Parameter	Description
<1-65535>	Seconds.

Default The default transmit period for port authentication is 30 seconds.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Usage Use this command to set the interval between successive attempts to request an ID.

Example To set the transmit timeout period to 5 seconds on interface `port1.0.2`, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x timeout tx-period 5
```

To reset transmit timeout period to the default (30 seconds) on interface `port1.0.2`, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x timeout tx-period
```

Validation Commands **show dot1x**
show dot1x interface

show debugging dot1x

Use this command to display the 802.1X debugging option set.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show debugging dot1x`

Mode User Exec and Privileged Exec

Usage This is a sample output from the `show debugging dot1x` command.

```
awplus# debug dot1x

awplus# show debugging dot1x

802.1X debugging status:
  802.1X events debugging is on
  802.1X timer debugging is on
  802.1X packets debugging is on
  802.1X NSM debugging is on
```

Example

```
awplus# show debugging dot1x
```

Related Commands **debug dot1x**

show dot1x

This command shows authentication information for dot1x (802.1X) port authentication.

If you specify the optional **all** parameter then this command also displays all authentication information for each port available on the switch.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show dot1x [all]`

Parameter	Description
`all`	Displays all authentication information for each port available on the switch.

Mode Privileged Exec

Example

```
awplus# show dot1x all
```

Table 68-1: Example output from the show dot1x command

```
awplus# show dot1x all

show dot1x diagnostics

This command shows 802.1X authentication diagnostics for the specified interface (optional), which may be a static channel (or static aggregator) or a dynamic (or LACP) channel group or a switch port.

If no interface is specified then authentication diagnostics are shown for all interfaces.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show dot1x diagnostics [interface <interface-list>]`

Parameter	Description
`interface`	Specify a port to show.
`<interface-list>`	The interfaces or ports to configure. An interface-list can be: ■ an interface (e.g. `vlan2`), a switch port (e.g. `port1.0.12`), a static channel group (e.g. `sa3`) or a dynamic (LACP) channel group (e.g. `po4`) ■ a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. `vlan2-8`, or `port1.0.1-1.0.24`, or `sa2-4`, or `po1-3` ■ a comma-separated list of the above; e.g. `port1.0.1,port1.0.8-1.0.24`. Do not mix interface types in a list The specified interfaces must exist.

Mode Privileged Exec

Example See the sample output below showing 802.1X authentication diagnostics for `port1.0.12`:

```
awplus# show dot1x diagnostics interface port1.0.12
```

Output **Figure 68-1: Example output from the show dot1x diagnostics command**

```
Authentication Diagnostics for interface port1.0.12
    Supplicant address: 00d0.59ab.7037
      authEnterConnecting: 2
      authEaplogoffWhileConnecting: 1

      BackendAuthSuccess: 1
```

show dot1x interface

This command shows the status of 802.1X port-based authentication on the specified interface, which may be a static channel (or static aggregator) or a dynamic (or LACP) channel group or a switch port.

Use the optional **diagnostics** parameter to show authentication diagnostics for the specified interfaces. Use the optional **sessionstatistics** parameter to show authentication session statistics for the specified interfaces. Use the optional **statistics** parameter to show authentication diagnostics for the specified interfaces. Use the optional **supplicant** parameter to show the supplicant state for the specified interfaces.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show dot1x interface <interface-list>
   [diagnostics|sessionstatistics|statistics|supplicant [brief]]
```

Parameter	Description
<interface-list>	The interfaces or ports to configure. An interface-list can be: ■ an interface (e.g. `vlan2`), a switch port (e.g. `port1.0.12`), a static channel group (e.g. `sa3`) or a dynamic (LACP) channel group (e.g. `po4`) ■ a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. `vlan2-8`, or `port1.0.1-1.0.24`, or `sa2-4`, or `po1-3` ■ a comma-separated list of the above; e.g. `port1.0.1,port1.0.8-1.0.24`. Do not mix interface types in a list The specified interfaces must exist.
`diagnostics`	Diagnostics.
`sessionstatistics`	Session Statistics.
`statistics`	Statistics.
`supplicant`	Supplicant.
`brief`	Brief summary of supplicant state.

Mode Privileged Exec

Example See the sample output below showing 802.1X authentication status for `port1.0.12`:

```
awplus# show dot1x interface port1.0.12
```

Table 68-2: Example output from the show dot1x interface command for a port

```
awplus#show dot1x interface port1.0.12

Table 68-3: Parameters in the output of the show dot1x interface command

Parameter	Description
portEnabled	Interface operational status (Up-true/down-false).
portControl	Current control status of the port for 802.1X control.
portStatus	802.1X status of the port (authorized/unauthorized).
reAuthenticate	Reauthentication enabled/disabled status on port.
reAuthPeriod	Value holds meaning only if reauthentication is enabled.
abort	Indicates that authentication should be aborted when set to true.
fail	Indicates failed authentication attempt when set to false.
start	Indicates authentication should be started when set to true.
timeout	Indicates authentication attempt timed out when set to true.
success	Indicates authentication successful when set to true.
state	Current 802.1X operational state of interface.
mode	Configured 802.1X mode.
reAuthCount	Reauthentication count.
quietperiod	Time between reauthentication attempts.
reAuthMax	Maximum reauthentication attempts.
BE	Backend authentication state machine variables and constants.
state	State of the state machine.
reqCount	Count of requests sent to server.
suppTimeout	Supplicant timeout.
serverTimeout	Server timeout.
maxReq	Maximum requests to be sent.
CD	Controlled Directions State machine.
adminControlledDirections	Administrative value (Both/In).
operControlledDirections	Operational Value (Both/In).

Table 68-3: Parameters in the output of the show dot1x interface command (cont.)

Parameter	Description
KR	Key receive state machine.
rxKey	True when EAPOL-Key message is received by supplicant or authenticator. false when key is transmitted.
KT	Ket Transmit State machine.
keyAvailable	False when key has been transmitted by authenticator, true when new key is available for key exchange.
keyTxEnabled	Key transmission enabled/disabled status.

Related Commands

show auth-web diagnostics
show dot1x sessionstatistics
show dot1x statistics interface
show dot1x supplicant interface

show dot1x sessionstatistics

This command shows authentication session statistics for the specified interface, which may be a static channel (or static aggregator) or a dynamic (or LACP) channel group or a switch port.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show dot1x sessionstatistics [interface <interface-list>]`

Parameter	Description
`interface`	Specify a port to show.
<interface-list>	The interfaces or ports to configure. An interface-list can be: ■ an interface (e.g. `vlan2`), a switch port (e.g. `port1.0.12`), a static channel group (e.g. `sa3`) or a dynamic (LACP) channel group (e.g. `po4`) ■ a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. `vlan2-8`, or `port1.0.1-1.0.24`, or `sa2-4`, or `po1-3` ■ a comma-separated list of the above; e.g. `port1.0.1,port1.0.8-1.0.24`. Do not mix interface types in a list The specified interfaces must exist.

Mode Privileged Exec

Example See sample output below showing 802.1X (`dot1x`) authentication session statistics for `port1.0.12`:

```
awplus# show dot1x sessionstatistics interface port1.0.12
```

```
Authentication session statistics for interface port1.0.12
    session user name: manager
        session authentication method: Remote server
        session time: 19440 secs
        session terminat cause: Not terminated yet
```

show dot1x statistics interface

This command shows the authentication statistics for the specified interface, which may be a static channel (or static aggregator) or a dynamic (or LACP) channel group or a switch port.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show dot1x statistics interface <interface-list>`

Parameter	Description
<interface-list>	The interfaces or ports to configure. An interface-list can be: ■ an interface (e.g. `vlan2`), a switch port (e.g. `port1.0.12`), a static channel group (e.g. `sa3`) or a dynamic (LACP) channel group (e.g. `po4`) ■ a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. `vlan2-8`, or `port1.0.1-1.0.24`, or `sa2-4`, or `po1-3` ■ a comma-separated list of the above; e.g. `port1.0.1,port1.0.8-1.0.24`. Do not mix interface types in a list The specified interfaces must exist.

Mode Privileged Exec

Example See sample output below showing 802.1X authentication statistics for `port1.0.12`:

```
awplus# show dot1x statistics interface port1.0.12
```

```
802.1X statistics for interface port1.0.12
    EAPOL Frames Rx: 5 - EAPOL Frames Tx: 16
    EAPOL Start Frames Rx: 0 - EAPOL Logoff Frames Rx: 0
    EAP Rsp/Id Frames Rx: 3 - EAP Response Frames Rx: 2
    EAP Req/Id Frames Tx: 8 - EAP Request Frames Tx: 2
    Invalid EAPOL Frames Rx: 0 - EAP Length Error Frames Rx: 0
    EAPOL Last Frame Version Rx: 1 - EAPOL Last Frame
Src:00d0.59ab.7037
```

show dot1x supplicant

This command shows the supplicant state of the authentication mode set for the switch.

This command shows a summary when the optional **brief** parameter is used.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show dot1x supplicant [<macadd>] [brief]`

Parameter	Description
<macadd>	MAC (hardware) address of the Supplicant.
`brief`	Brief summary of the Supplicant state.

Mode Privileged Exec

Example See sample output below showing the 802.1X authenticated supplicant on the switch:

```
awplus# show dot1x supplicant
```

```
authenticationMethod: dot1x
totalSupplicantNum: 1
authorizedSupplicantNum: 1
macBasedAuthenticationSupplicantNum: 0
dot1xAuthenticationSupplicantNum: 1
webBasedAuthenticationSupplicantNum: 0
Supplicant name: manager
Supplicant address: 00d0.59ab.7037
    authenticationMethod: dot1x
    Two-Step Authentication:
      firstAuthentication: Pass - Method: mac
      secondAuthentication: Pass - Method: dot1x
portStatus: Authorized - currentId: 4
abort:F fail:F start:F timeout:F success:T
PAE: state: Authenticated - portMode: Auto
PAE: reAuthCount: 0 - rxRespId: 0
PAE: quietPeriod: 60 - maxReauthReq: 2 - txPeriod: 30
BE: state: Idle - reqCount: 0 - idFromServer: 3
BE: suppTimeout: 30 - serverTimeout: 30
CD: adminControlledDirections: in - operControlledDirections: in
CD: bridgeDetected: false
KR: rxKey: false
KT: keyAvailable: false - keyTxEnabled: false
```

See sample output below showing the supplicant on the switch using the `brief` parameter:

```
awplus# show dot1x supplicant 00d0.59ab.7037 brief
```

```
Interface port1.0.12
   authenticationMethod: dot1x
   totalSupplicantNum: 1
   authorizedSupplicantNum: 1
       macBasedAuthenticationSupplicantNum: 0
       dot1xAuthenticationSupplicantNum: 1
       webBasedAuthenticationSupplicantNum: 0
Interface    VID Mode MAC Address     Status        IP Address     Username
=========    === ==== ===========     ======        ==========     ========
port1.0.12    2  D    00d0.59ab.7037  Authenticated 192.168.2.201  manager
```

See sample output below showing the supplicant on the switch using the `brief` parameter:

```
awplus# show dot1x supplicant brief
```

For example, if two-step authentication is configured with 802.1X authentication as the first method and web authentication as the second method then the output is as follows:

```
Interface port1.0.8
  authenticationMethod: dot1x/web
  Two-Step Authentication
    firstMethod: dot1x
    secondMethod: web
  totalSupplicantNum: 1
  authorizedSupplicantNum: 1
    macBasedAuthenticationSupplicantNum: 0
    dot1xAuthenticationSupplicantNum: 0
    webBasedAuthenticationSupplicantNum: 1
    otherAuthenticationSupplicantNum: 0

Interface    VID  Mode MAC Address    Status            IP Address      Username
=========== ==== ==== ============== ================= =============== ========
port1.0.8    5    W    0008.0d5e.c216 Authenticated     192.168.1.200   web
```

Related Commands **show dot1x supplicant interface**

show dot1x supplicant interface

This command shows the supplicant state of the authentication mode set for the interface, which may be a static channel (or static aggregator) or a dynamic (or LACP) channel group or a switch port.

This command shows a summary when the optional **brief** parameter is used.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show dot1x supplicant interface <interface-list> [brief]`

Parameter	Description
<interface-list>	The interfaces or ports to configure. An interface-list can be: ■ an interface (e.g. `vlan2`), a switch port (e.g. `port1.0.12`), a static channel group (e.g. `sa3`) or a dynamic (LACP) channel group (e.g. `po4`) ■ a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. `vlan2-8`, or `port1.0.1-1.0.24`, or `sa2-4`, or `po1-3` ■ a comma-separated list of the above; e.g. `port1.0.1,port1.0.8-1.0.24`. Do not mix interface types in a list The specified interfaces must exist.
`brief`	Brief summary of the Supplicant state.

Mode Privileged Exec

Example See sample output below showing the supplicant on the interface `port1.0.19`:

```
awplus# show dot1x interface port1.0.19
```

```
Interface port1.0.19
 authenticationMethod: dot1x
  totalSupplicantNum: 1
 authorizedSupplicantNum: 1
   macBasedAuthenticationSupplicantNum: 0
   dot1xAuthenticationSupplicantNum: 1
   webBasedAuthenticationSupplicantNum: 0
   otherAuthenticationSupplicantNum: 0

 Supplicant name: VCSPCVLAN10
 Supplicant address: 0000.cd07.7b60
   authenticationMethod: 802.1X
 Two-Step Authentication:
   firstAuthentication: Pass - Method: mac
   secondAuthentication: Pass - Method: dot1x
   portStatus: Authorized - currentId: 3
   abort:F fail:F start:F timeout:F success:T
   PAE: state: Authenticated - portMode: Auto
   PAE: reAuthCount: 0 - rxRespId: 0

Authentication Introduction

Authentication commands enable you to specify three different types of device authentication: 802.1X-authentication, Web-authentication, and MAC-authentication.

802.1X is an IEEE standard providing a mechanism for authenticating devices attached to a LAN port or wireless device. Web-authentication is applicable to devices that have a human user who opens the web browser and types in a user name and password when requested. MAC-authentication is used to authenticate devices that have neither a human user nor implement 802.1X supplicant when making a network connection request.

Configuring a Guest VLAN

In a secure network, the default behavior is to deny any access to supplicants that cannot be authenticated. However, it is often convenient to allow unauthenticated users to have limited access. A popular solution is to define a limited-access VLAN, called the Guest VLAN, and assign unauthenticated users into that VLAN. Unauthenticated supplicants are either supplicants who have attempted and failed authentication or haven't performed any authentication.

See the **auth guest-vlan** command on page 70.8 for command information about Guest VLAN.

By default, traffic from unauthenticated supplicants in the Guest VLAN will only be L2 switched within the Guest VLAN. But, if the **routing** parameter for the **auth guest vlan** command is configured, then the switch will route unauthenticated supplicants' traffic to other VLANs if required, and will relay their DHCP requests to servers in other VLANs if required.

You can configure 802.1X to accept a Dynamic VLAN assignment, or fall back to a Guest VLAN upon failure.

To configure a switch to perform 802.1X authentication, and assign VLAN IDs to ports where devices authentication successfully, and put non-authenticated users into a Guest VLAN, proceed as follows:

```
awplus# configure terminal
awplus(config)# radius-server host <ip-address> key
<key-string>
awplus(config)# aaa authentication dot1x default group
radius
awplus(config)# interface <interface-range>
awplus(config-if)# switchport mode access
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth dynamic-vlan-creation
awplus(config-if)# auth guest-vlan 100
```

802.1X-Authentication

802.1X is an IEEE standard providing a mechanism for authenticating devices attached to a LAN port or wireless device. Devices wishing to access services behind a port must authenticate themselves before any Ethernet packets are allowed to pass through. The protocol is referred to as 802.1X because it was initially defined in the IEEE standard 802.1X, published in 2001 and revised in 2004 and again as the current 802.1X 2010 standard.

For more information about 802.1X, see **Chapter 67, 802.1X Introduction and Configuration**.

Web-Authentication

What is Web-Authentication?

Web-authentication is a convenient alternative to 802.1X authentication. It's commonly used to authenticate users in educational institutions, where regular users' workstations are not managed by the network administrator. Web-authentication enables the switch to detect an unauthenticated workstation web browsing into the network, then redirect the user's web browser to its own authentication web page.

Web-authentication works like this:

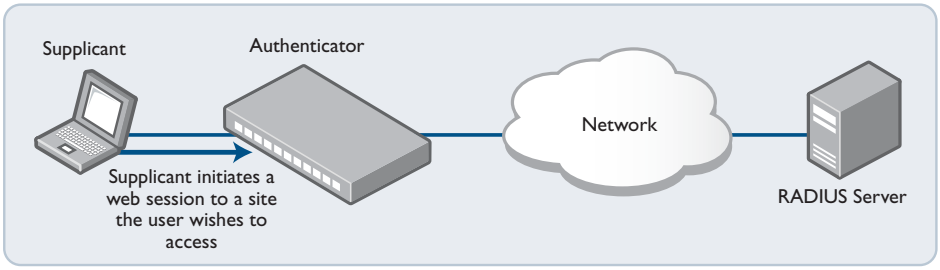
- The user enters their username and password into the web page, which the switch then sends to a RADIUS server for checking.
- If the RADIUS server accepts the user's credentials, the switch then allows their traffic into the network.

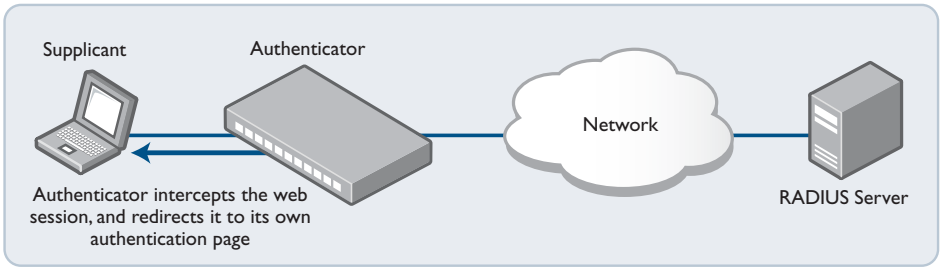
The Web-authenticating switch interacts with a RADIUS server in the same way as an 802.1X authenticator. The two methods can be used together in the same network, using the same RADIUS server.

Web-Authentication Basics

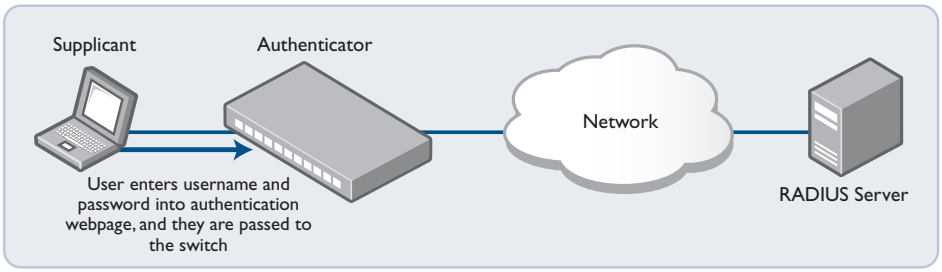
The operation of Web-authentication is explained as below:

1. The authenticating switch receives HTTP or HTTPS traffic from an unauthenticated supplicant. It intercepts the supplicant's web session and redirects it to its own internal web server.

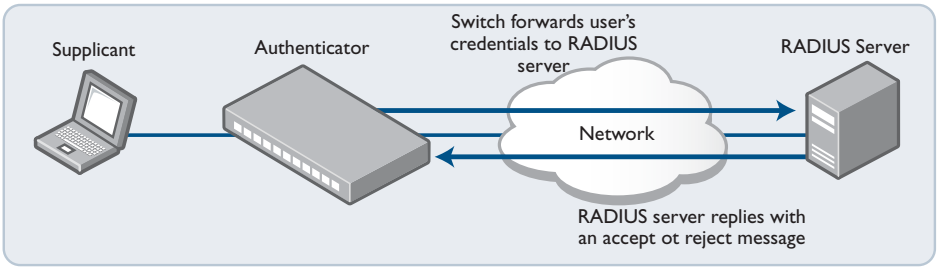




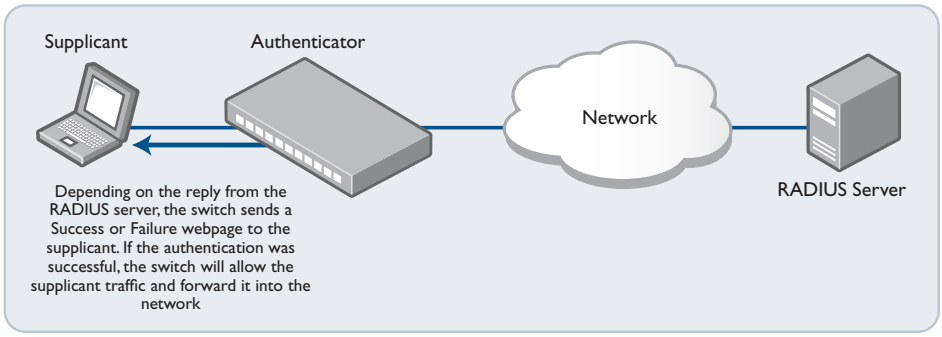
2. The web server serves up an authentication page on which the user enters their username and password.



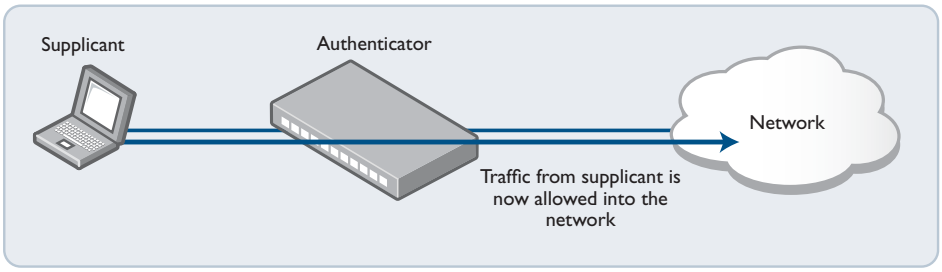
3. The username and password are sent to a RADIUS server, which informs the authenticating switch whether or not the supplicant is authenticated.



4. The user is then informed of the RADIUS server's verdict.



5. If the supplicant has been successfully authenticated, the authenticating switch will give the supplicant workstation access to the network.



Configuring Web-Authentication

Web-authentication can be configured on a switch in the following steps:

1. Configure a RADIUS server.

```
awplus(config)# radius-server host <server-ip-address> key
                <shared-secret>
```

2. Instruct Web-authentication to use the configured RADIUS server.

```
awplus(config)# aaa authentication auth-web default group
                radius
```

3. Define the IP address through which the Web-authentication service will be accessed.

```
awplus(config)# auth-web-server ipaddress <ip-address>
```

4. Configure ports for Web-authentication.

```
        awplus# interface port1.0.1-1.0.20
awplus(config)# auth-web enable
```

Choosing the Web-authentication server address

When you come to configure Web-authentication, you need to answer some questions:

Questions What IP address should I specify as the Web-authentication server address? Is it okay to use just any IP address that is configured on one of the switch's VLANs, or is the choice more constrained than that?

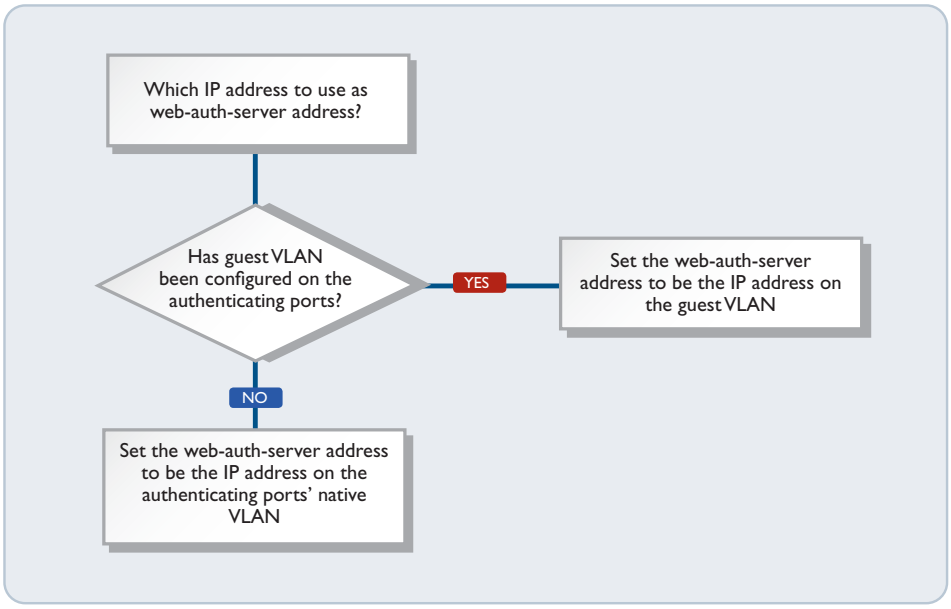
Answer You must use the IP address that is configured on the VLAN that the supplicant's packets will arrive on.

The logic that the switch uses in deciding which VLAN to associate non-authenticated supplicants' packets with is:

- If guest VLAN has been configured on the port where the packet arrives, then associate the packet with the guest VLAN.
- Otherwise associate the packet with the port's native VLAN.

If you configure the supplicant-connected ports with guest VLAN, then use the IP address on the guest VLAN as the IP address of the Web-authentication server. Otherwise use the IP address on the supplicant-connected ports' native VLAN.

The diagram below illustrates how to decide which IP address to use as the Web-auth-server address:



Configuration Example 1: Using a guest VLAN

```
VLAN database
    VLAN 20 name guest
    VLAN 10 name edge
    VLAN 30 name core

radius-server host 192.168.30.129 key verysecret
aaa authentication auth-Web default group RADIUS
auth-Web-server ipaddress 192.168.20.1

int vlan10
    ip address 192.168.10.1/24
int vlan20
    ip address 192.168.20.1/24
int vlan30
ip address 192.168.30.1/24

int port1.0.1-1.0.20
  switchport access vlan 10
 auth-Web enable
  auth guest-vlan 20

int port1.0.21-1.0.22
  switchport access vlan 30
```

Configuration Example 2: Not using a guest VLAN

```
VLAN database
    VLAN 10 name edge
    VLAN 30 name core

radius-server host 192.168.30.129 key verysecret
aaa authentication auth-web default group radius
auth-web-server ipaddress 192.168.10.1

int vlan10
    ip address 192.168.10.1/24
int vlan30
ip address 192.168.30.1/24

int port1.0.1-1.0.20
  switchport access vlan 10
  auth-Web enable

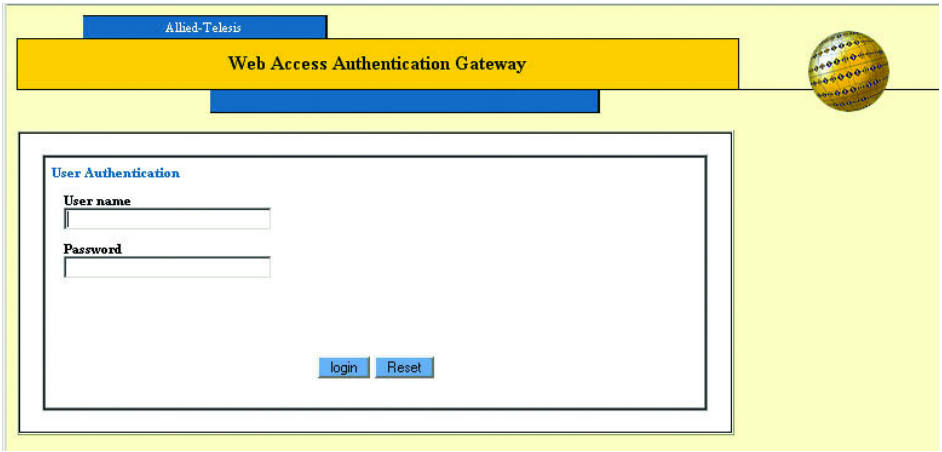
int port1.0.21-1.0.22
  switchport access vlan 30
```

Starting a Web-Authentication Session

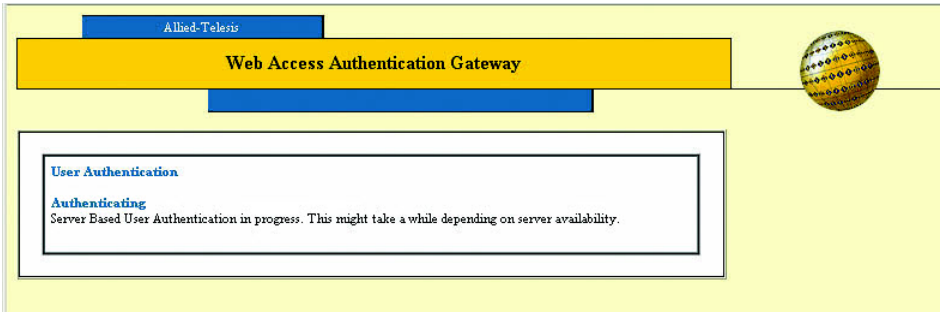
This section explains what the user actually sees in a Web-authentication session:

1. The user starts their Web browser, and browses to a page they wish to view. Shortly thereafter, the address in the browser's address bar automatically changes to the address of the authenticating switch's authentication page.

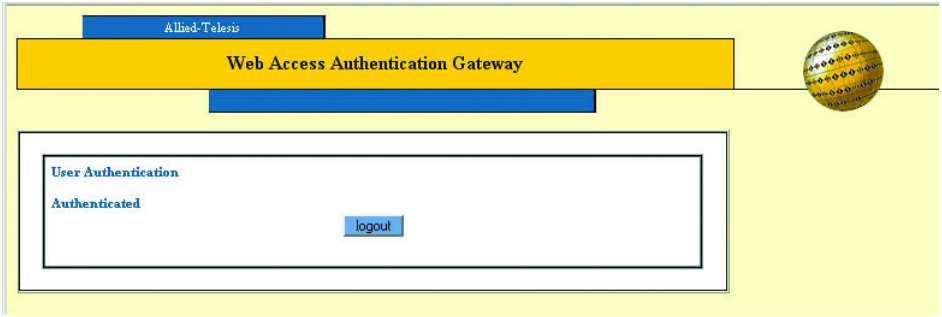
2. In the switch's authentication page, the user enters their user name and password, and clicks **login**. The maximum length of the user name and password is 64 characters. The local RADIUS server has a password length limit of 31 characters.



3. The switch displays a page that informs them that authentication is in progress.

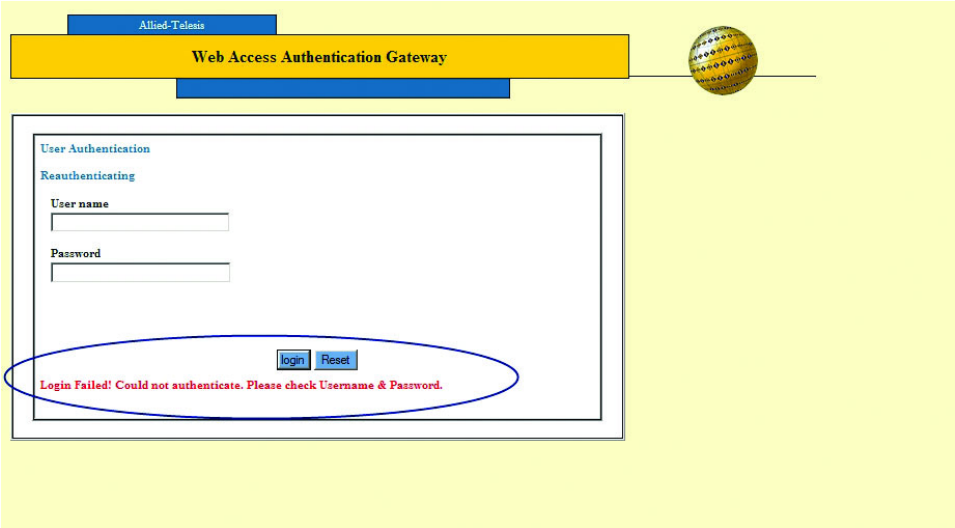


4. Once authentication is complete, the authentication result is displayed.



If the user enters a username/password combination that is not accepted by the RADIUS server, the switch presents an invitation to check the username and password.

If the user enters incorrect usernames/passwords several times, the authentication fails. The number of times a user can try to login is configurable but it is set to 3 by default.



Support for Protocols Underlying Web-Authentication

Web-authentication does not use a dedicated protocol like 802.1X, with a standards-defined set of messages for authentication conversation. Instead, the switch overlays the Web-authentication process on top of the web browser communication process. The browser communication process was not designed for authentication and is itself reliant on IP addressing, ARP, and DNS.

The authentication needs to occur in a seamless manner for all users, irrespective of their IP and DNS setting, and before they have full access to the network.

To make this possible, the switch needs to provide facilities that enable the user's PC to access the authentication web page.

Following features of Web-authentication work together to achieve this.

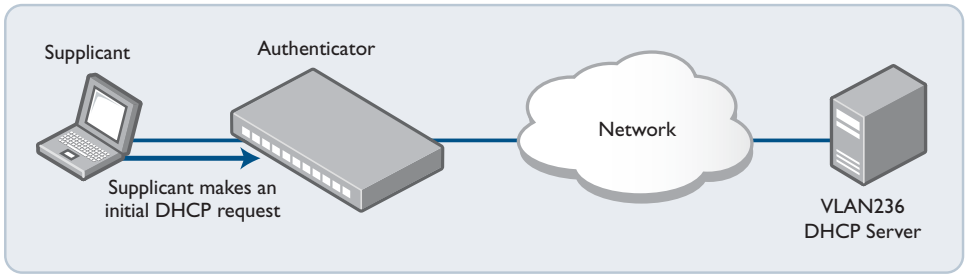
- DHCP server for Web-authentication
- Interception of clients' ARPs
- Proxy DNS response

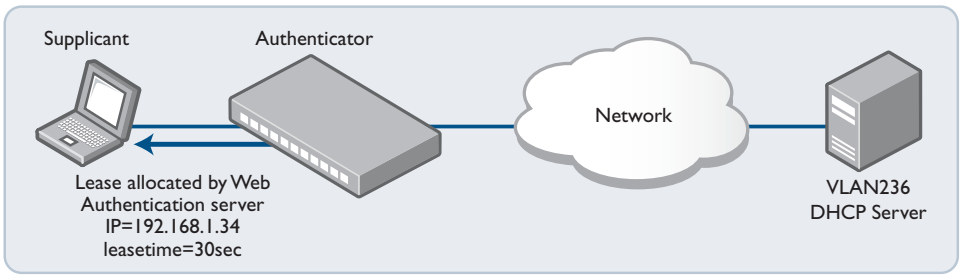
DHCP server for Web-authentication

To initiate a web browsing session, the supplicant needs an IP address. If the supplicant has been configured to obtain its IP address by DHCP, then the authenticating switch needs to ensure that the supplicant will be served an IP address.

The simplest way to achieve this, is to have the Web-authentication process itself act as a DHCP server. This avoids forwarding the supplicant's DHCP request to any other DHCP server. Therefore, there is a DHCP server built in to Web-authentication.

This DHCP server is dedicated to serving IP addresses to be used by Web-authentication clients.





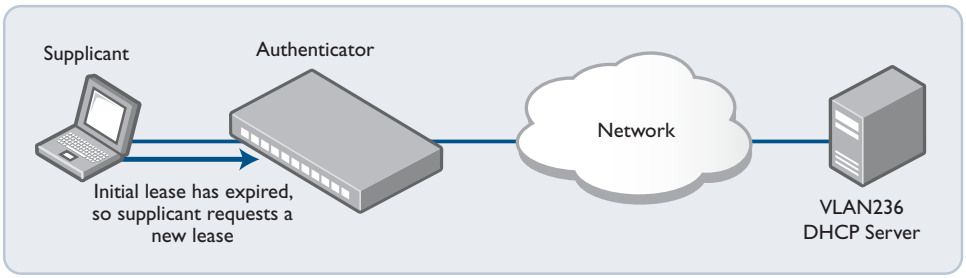
This DHCP service is configured by the command:

```
awplus(config)# auth-web-server dhcp ipaddress <ip-address/
                prefix-length>
```

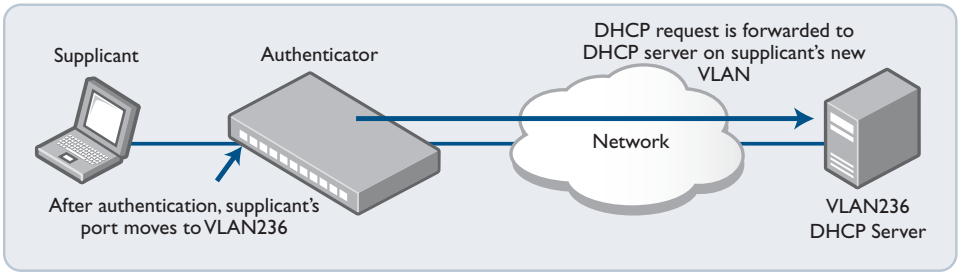
See the **auth-web-server dhcp ipaddress** command on page 70.39 and the **auth-web-server dhcp lease** command on page 70.40 for details about configuring the Web-authentication DHCP Server.

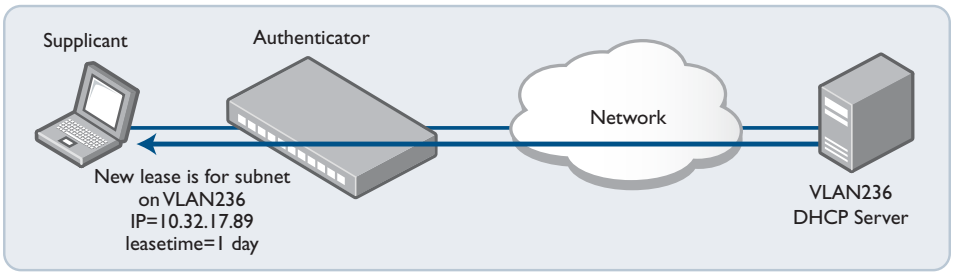
How can we force the supplicant to request a new DHCP lease after the completion of the authentication process? There is no mechanism by which the supplicant's web browser signals down to the DHCP client process to say "I've just completed an authentication session, you need to request a new DHCP lease".

The solution is to ensure that the lease allocated by the dedicated Web-authentication DHCP service is of a very short duration. This way the lease will expire within a short time from the completion of the authentication process, resulting in the supplicant requesting a new lease.



This new request will now be serviced by the DHCP server on the supplicant's new VLAN.

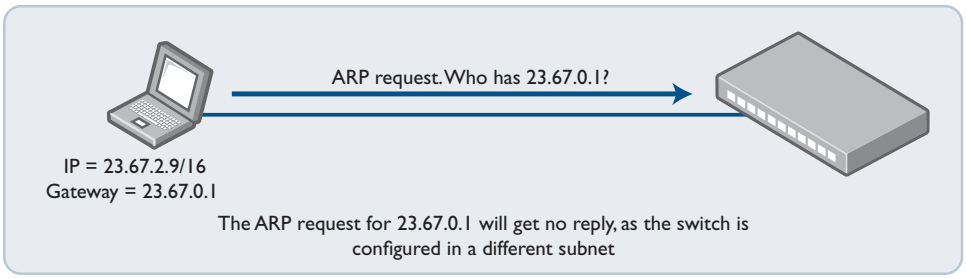




Interception of clients' ARPs

If the supplicant has been configured with a static IP address, then it is more than likely that the supplicant's IP configuration bears no relation to the Web-authentication server address. A computer's IP communications will always be preceded by sending out ARP requests for host addresses in its local subnet, or for its gateway address.

If the IP address and gateway address have been statically configured on the computer, and the subnet used in this static configuration is different to that on the authenticating switch, then the ARP requests will receive no reply, and the PC will not begin IP communication.



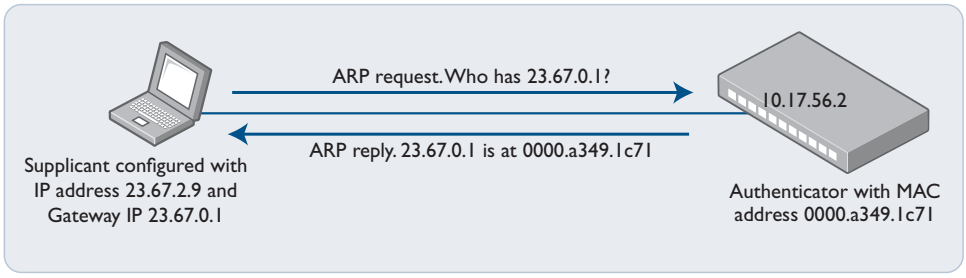
To deal with any arbitrary IP configuration on the supplicants, Web-authentication needs a method for replying to arbitrary ARP requests. This is the ARP interception feature.

ARP interception can operate in three modes.

1. **Intercept** – will respond to ARP requests for any IP address that is in the same subnet as the switch's own IP address. Will provide its own MAC address in the ARP reply, irrespective of what IP address (within its own subnet) was being requested.

2. **None** – will only respond to ARP requests for its own IP address.

3. **Promiscuous** – will respond to **any** ARP request. Will provide its own MAC address in the ARP reply, irrespective of what IP address was being requested. When this mode is configured, the Web-authentication server can interoperate with **any** static IP configuration on a supplicant.



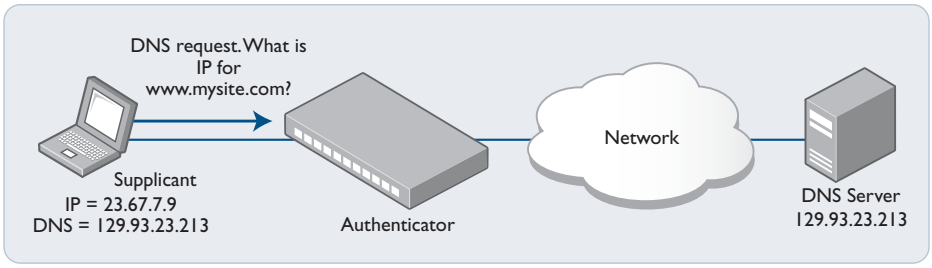
In promiscuous mode, the switch will send its own MAC address in response to an ARP request for ANY address, no matter whether the requested address bears any relation to the switch's own IP address on the interface where the ARP is received.

See the **auth-web-server mode** command on page 70.47 for command information about setting the Web-authentication mode.

Proxy DNS response

Typically, an HTTP session from a web browser is preceded by a DNS request for the IP address of the web site the user wishes to browse to. If the DNS request receives no reply, the web browser will never progress on to connecting an HTTP session.

The Web-authentication server needs a mechanism to reply to DNS requests, so that the Web-authentication session can begin.



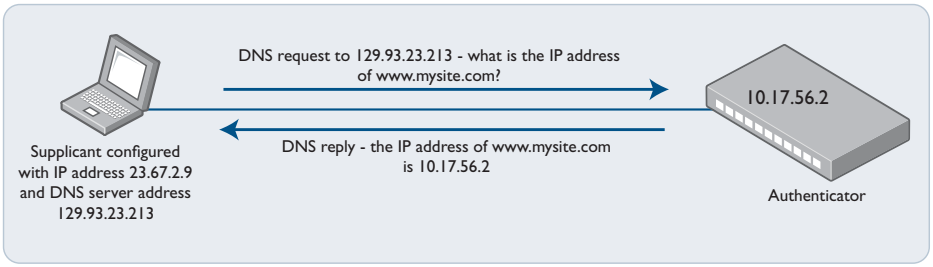
A web browser must request a DNS Server for the IP address corresponding to a URL. But the switch will not forward the request if the supplicant is not yet authenticated

The three modes listed also control the operation of the proxy DNS replies.

1. **Intercept** – responds to DNS requests whose source IP address is within the same subnet as the IP address on the switch. The IP address provided as the resolution of the DNS lookup is the switch's own IP address, so that the subsequent HTTP traffic will be directed to the switch.

2. **None** – the default. Does not respond to DNS requests.

3. **Promiscuous** – responds to DNS requests from any source IP address. The IP address provided as the resolution of the DNS lookup is the switch's own IP address, so that the subsequent HTTP traffic will be directed to the switch.



In promiscuous mode, the switch will reply to ANY DNS request from an authenticated supplicant, regardless of whether the destination IP address of the DNS server bears any relation to the switch's own IP address. The DNS reply from the switch will always specify its own IP address as the URL that was being requested.

See the **auth-web-server mode** command on page 70.47 for command information about setting the Web-authentication mode.

You can use the parameter <*ip-address*> of the **auth-web forward** command to specify a server for the switch to send packets from the supplicant to, for example DNS packets. For more information and an example, see the "Forwarding DNS packets using Auth-web forward command" section in the **Alliedware Plus Technical Tips and Tricks.**

Web-Authentication Timeout Connect

The command **auth timeout connect-timeout** allows you to increase the connection period for a supplicant's interface port.

The default timeout period is 30 seconds, but this command allows the timeout period to be set from 1 second to 65535 seconds. When **auth-web-server session-keep** or **auth two-step enable** is enabled, it is recommended to configure a longer connect-timeout period.

Web Authorization Proxy

Without this feature, AlliedWare Plus Web-authentication intercepts a supplicant's initial TCP port 80 connection to a web page and sends it to the Web-authentication Login page. However, if the supplicant is configured to use a web proxy, then it will usually be using TCP port 8080 (or another user configured port number). In this case Web-authentication cannot intercept the connection.

To overcome this limitation, use the command **auth-web-server intercept-port**.

When a supplicant is configured to use WPAD (Web Proxy Auto-Discovery) the supplicant's web browser will use TCP port 80 as usual, and so it can be intercepted by Web-authentication as normal, and the Web-authentication Login page is sent. However, after authentication, it does not know where to get the WPAD file (usually named proxy.pac) that tells it what its web proxy is and so cannot access external web pages.

You can use the **auth-web-server dhcp-wpad-option** command to tell the supplicant where to find the proxy.pac file. This proxy.pac file contains the URL and/or IP address of the web proxy server that it should use.

For more information and examples, see the "Web Auth Proxy" section in the **Alliedware Plus Technical Tips and Tricks.**

MAC-Authentication

Why is MAC-Authentication Required?

The authentication mechanisms provided by 802.1X and Web authentication are powerful and effective. But, they are not universally applicable. Web authentication is only applicable to devices that have a human user who opens the web browser and types in a username and password when requested. 802.1X authentication is only possible from devices whose software implements an 802.1X supplicant.

There are plenty of network-connected devices, like printers, scanners, fire-alarm monitors and so on, that have neither a human user nor implement an 802.1X supplicant. In a network that ensures all access is authenticated, there needs to be a mechanism for authenticating these devices.

Fortunately, all Ethernet transceivers have a unique identifier—their MAC address. Hence, even without user input of a username and password, any Ethernet device will automatically identify itself simply by virtue of the source MAC address in the packets it sends. The method that has been developed for authenticating these devices uses the MAC address as the identifier, and so is called MAC-based authentication.

How Does MAC-Authentication Work?

In essence, MAC-authentication works little differently from 802.1X or Web-based authentication.

Here are the main steps:

1. The supplicant is connected to the switch.
2. The switch (acting as the authenticator) receives an ID from the supplicant.
3. The switch passes the supplicant's ID to a RADIUS server in an Access-Request packet
4. The RADIUS server returns an Access-Accept or an Access-Deny. The Access-Accept can be accompanied with other attributes, for dynamic VLAN assignment.

The unique aspects of MAC-authentication are in steps 2 and 3.

MAC-authentication does not involve a process whereby the switch sends an ID request to the supplicant. The switch receives the ID from the supplicant by simply looking at the source MAC in the packets being sent from the supplicant.

The MAC address of the supplicant is a single identifier. But a RADIUS access-request requires both a username and a password. The workaround employed by MAC-authentication is simply to use the MAC address as both username and password.

The switch extracts the source MAC address from the supplicant's packets and puts it into a string of the form xx-xx-xx-xx-xx-xx, using lower-case letters for any hex digits in the range a-f. This string is then used as both the username and the password in the RADIUS access-request packet. The supplicant MAC address is also sent in the attribute 31 “calling-station-id” as usual.

Configuring MAC-Authentication

Under AlliedWare Plus, there are two steps to setting up MAC-authentication.

1. Define the authentication method list that is used for MAC-authentication.

There is only one method list that can be created for MAC-authentication—the default method list. Moreover, the only authentication server type that can be used is RADIUS.

The command for defining the method list is:

```
awplus(config)# aaa authentication auth-mac default group
                radius
```

Enable MAC-authentication on the ports that are to perform this authentication:

```
awplus(config)# interface port1.0.2
awplus(config)# auth-mac enable
awplus(config)# spanning-tree edgeport
```

On the RADIUS server, it is necessary to create user entries where both the username and password are the MAC address of the supplicant, in the form xx-xx-xx-xx-xx-xx. For example on the AlliedWare Plus local RADIUS server, the configuration is:

```
        awplus(config)# radius-server local
awplus(config-radsrv)# user xx-xx-xx-xx-xx-xx
                      password xx-xx-xx-xx-xx-xx
```

The supplicant, requires no configuration, as the whole purpose of MAC-authentication is to authenticate devices that cannot be configured for authentication.

It is also possible to configure the authentication protocol that the switch uses in its interaction with the RADIUS server. There are two choices of protocol: EAP-MD5 and PAP. The default method is PAP, and can be changed by using the command:

```
awplus(config-if)# auth-mac method [eap-md5|pap]
```

Tri-Authentication

The switch supports three types of authentication for devices that connect to switch ports.

- 802.1X-authentication of devices connecting to switch ports
- MAC-authentication of devices connecting to switch ports
- Web-authentication of devices connecting to switch ports

All three types can be configured to run simultaneously on a switch port. The simultaneous configuration and authentication of all three types on a port is called tri-authentication.

Tri-Authentication Configuration

Follow the below three steps to configure tri-authentication across a range of switch ports:

Step 1: Define the RADIUS Server:

Define the RADIUS Server where the switch will send authentication requests by using the below commands:

```
awplus# configure terminal
awplus(config)# radius-server host <ip-address> key
<key-string>
```

These commands adds the RADIUS Server address and set parameters to the RADIUS server. The key parameter specifies the secret key for the server.

Note The RADIUS Server, where the switch sends authentication requests, can be the switch's own Local RADIUS Server. For information on how to configure Local RADIUS Server see **Chapter 77, Local RADIUS Server Introduction and Configuration**.

Step 2: Define the default authentication server lists:

Define the default authentication server lists for 802.1X authentication, Web-authentication, and MAC-authentication:

```
awplus# configure terminal
awplus(config)# aaa authentication dot1x default group radius
awplus(config)# aaa authentication auth-web default group
radius
awplus(config)# aaa authentication auth-mac default group
radius
```

Step 3: Enable 802.1X-authentication, Web-authentication, and MAC-authentication:

Follow the instructions below to enable 802.1X-authentication, Web-authentication, and MAC-authentication on switch ports to attach supplicant devices. This authenticates the supplicant if any of the three methods that the supplicant tries work, depending on the auth-fail VLAN settings. After enabling the authentication, refer to earlier chapters to configure VLAN, IP address and other authentication configurations for the authentication type you want.

```
awplus# configure terminal
awplus(config)# interface <interface-range>
awplus(config-if)# switchport mode access
awplus(config-if)# switchport access vlan 1
awplus(config-if)# auth-web enable
awplus(config-if)# auth-mac enable
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth dynamic-vlan-creation
```

Two-step Authentication

The single step authentication methods (either user or device authentication) have a potential security risk:

- an unauthorized user can access the network with an authorized device, or
- an authorized user can access the network with an unauthorized device

Two-step authentication solves this problem by authenticating both the user and the device. The supplicant will only become authenticated if both these steps are successful. If the first authentication step fails, then the second step is not started.

The following authentication sequences are supported for two-step authentication:

MAC Authentication followed by 802.1X Authentication

MAC Authentication followed by Web Authentication

802.1X Authentication followed by Web Authentication.

To configure two-step authentication:

1. Configure the first authentication method.
2. Configure the second authentication method.
3. Specify the command **auth two-step enable**.
4. Make sure that both authentication steps require different authentication credentials. See **"Ensuring Authentication Methods Require Different Usernames and Passwords" on page 69.22**.

For more information and examples, see the "Two-step authentication" section in the **Alliedware Plus Technical Tips and Tricks.**

Ensuring Authentication Methods Require Different Usernames and Passwords

If you configure a user or device to use multiple authentication methods, you need to set up your system to avoid a potential vulnerability.

The vulnerability occurs because there is no way for a RADIUS server to determine what authentication method you are using. Authentication simply queries a RADIUS server to see whether a username/password pair is valid.

This means that if you use the same RADIUS server for multiple authentication methods, a user can enter the *same* username/password pair for each of these authentication methods. If that username/password pair is valid for one of the methods, it will work for all of them.

This vulnerability is particularly significant for MAC authentication, because the default username and password is the MAC address of the supplicant device, which is easy to discover.

For example, if you set up two-step authentication of MAC authentication and 802.1X authentication, and both use the same RADIUS server, then an attacker does not need to know the 801.1x username and password. Instead, they can pass the 802.1X authentication step by entering the device's MAC address into the 802.1X username and password fields.

To avoid this vulnerability:

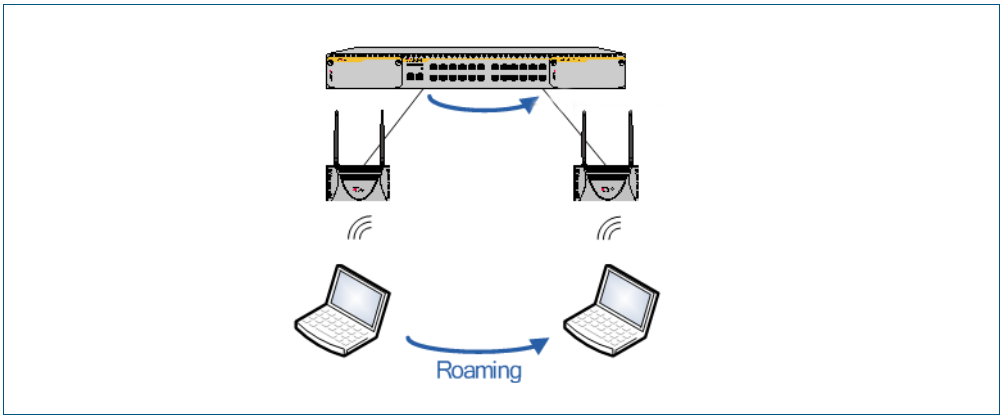
- Use different RADIUS servers for each authentication method, and/or
- Change the default password for MAC authentication, by using the **auth-mac password** command on page 70.31.

Roaming Authentication

When network security is required, the usability of network security must be considered. The Roaming Authentication feature improves the usability of network security by enabling users to move within the network without requiring them to re-authenticate each time they move.

If a supplicant (client device) moves from one wireless access point to another wireless access point, and the wireless access points are connected to different ports, then the switch (authenticator) recognizes that the supplicant has been authenticated and accepts the supplicant without requiring re-authentication.

Figure 69-1: Diagram showing Roaming Authentication running on a standalone switch

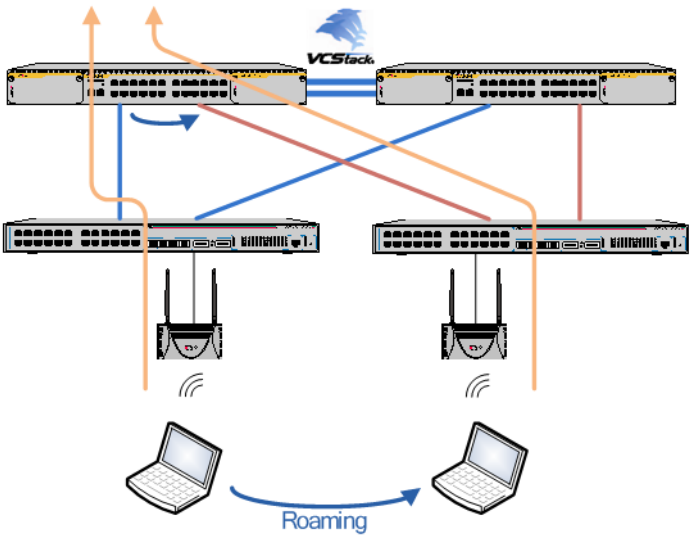


Web-authentication and MAC-authentication are the authentication methods in a Wireless LAN environment, and 802.1X is the authentication method used for supplicants attached to edge switches.

Roaming Authentication is normally enabled using the **auth roaming enable** command on page 70.17 command. However, Roaming Authentication has been extended (with the **auth roaming disconnected** command on page 70.15) to work where an interface is link down. This allows you to enable supplicants to move from authenticated interfaces that are link down, without requiring re-authentication.

Roaming Authentication is available for use with the VCStack feature, and is available on static and dynamic (LACP) channel group interfaces.

Figure 69-2: Diagram showing Roaming Authentication running with VCStack



Roaming Authentication Overview

Without the Roaming Authentication feature enabled, if a supplicant moves from one switch port to another switch port, the supplicant's authenticated status, authentication, and assigned VLAN is deleted and the supplicant is re-authenticated so the supplicant can access the network, and all traffic from the supplicant is dropped while the supplicant is being re-authenticated.

With the Roaming Authentication feature enabled, a switch port inherits the status of a supplicant from the switch port that the supplicant was moved from. If the Roaming Authentication feature is enabled on a switch, then once a supplicant (client device) is authenticated on the switch it does not have to be re-authenticated if it moves between ports of that switch. Supplicant traffic is not dropped because there is no delay for re-authentication, during which the supplicant cannot access the network.

For example, when the Roaming Authentication feature is used in an wireless LAN environment with wireless access points, then the wireless clients can roam between wireless access points connected to different switch ports without re-authentication.

The Roaming Authentication feature also supports VCStack operation and works on defined static channel group (static aggregators) and dynamic channel group (LACP) interfaces. When VCStack and Roaming Authentication features are used together, the status of a supplicant is inherited from one aggregated interface to another aggregated interface over the stack.

See the **auth roaming disconnected** command on page 70.15 and the **auth roaming enable** command on page 70.17 for further information about configuring Roaming Authentication.

Roaming Authentication Feature Interactions

When the Roaming Authentication feature is disabled, a supplicant must be re-authenticated on the destination interface when it roams. When the Roaming Authentication is enabled, the following supplicant authentication status and information is inherited from the source interface:

- Authentication status
- Authentication method
- Supplicant MAC address
- Supplicant IP address
  (if an authenticated interface is configured for Web authentication)
- Supplicant name
- Authorized dynamic VLAN ID
- Authorized RADIUS server
- Reauthentication timer
  (if configured using the **auth timeout reauth-period** command on page 70.23)

Roaming Authentication is only supported between interfaces with the same authentication configuration. If source and destination interfaces have different authentication configuration then the supplicant will be re-authenticated at the destination interface.

When the host mode is set with the **auth host-mode** command on page 70.10, a supplicant is not authenticated on a destination interface, and the authentication status is deleted on the source interface.

When a supplicant moves from an interface with authentication configured to an interface without authentication configured, the supplicant's authentication status is deleted.

A supplicant is re-authenticated when it moves to a destination interface that is configured on a different VLAN than the VLAN that is configured for the source interface.

See the following Roaming Authentication feature interactions:

- The Roaming Authentication feature will not function with Dynamic VLANs.
- The Roaming Authentication feature will not function with Guest VLANs.

When the Roaming Authentication feature is configured for use on a stack with the VCStack feature, note that supplicants are initialized and re-authenticated if a VCStack failover occurs.

Unauthenticated Supplicant Traffic

When any authentication is configured on a switch port, the question arises as to what the switch does with packets that arrive into the switch port from unauthenticated supplicants.

Unauthenticated supplicants fall into three categories listed below:

- Newly attached supplicants, which are still in the process of their first authentication attempt
- Supplicants that have made an authentication attempt, but have failed authentication
- Supplicants that have been attached, but have not made an authentication attempt. For example, on a port that has only 802.1X authentication enabled, any supplicant that has no 802.1X client software will not be able to attempt 802.1X authentication.

In switches that are running the AlliedWare Plus™ Operating System, packets from all these three categories of unathenticated supplicants are treated equally; no distinction is made between these three categories. The treatment of the traffic from unauthenticated supplicants does, however, depend on two factors:

- Whether a Guest VLAN has been configured on the switch port to which the supplicant is attached
- Whether Web authentication has been configured on the switch port to which the supplicant is attached

The rules governing the treatment of packets from unauthenticated supplicants are laid out in the table below:

Table 69-1: Treatment of packets from unauthenticated supplicants

Switch port configuration	No Guest VLAN configured	No Guest VLAN configured, auth-fail VLAN configured	Guest VLAN configured
Web-authentication configured	Packets from unauthenticated supplicants are associated with the Native VLAN of the port. Packets from unauthenticated supplicants are processed according these rules: ■ Packets destined to the WebAuth server IP address/ TCP port are forwarded to the server (which may well be the switch itself). ■ DHCP packets are sent to the CPU, to be processed by a local DHCP server, or relayed to another DHCP server, depending on the configuration of the switch. ■ DNS packets are forwarded to the CPU, and then sent on to a DNS server, if the switch is configured with a DNS server address. ■ ARP packets are forwarded to the CPU, and an ARP entry for the supplicant is learnt. ■ If web-auth forwarding is enabled for particular types of packets, then those packets will be forwarded within the Native VLAN ■ All other packets are dropped.	Packets from unauthenticated supplicants are associated with the Native VLAN of the port. If newly connected supplicants attempt 802.1X port authentication or Web-authentication and fail, then they are moved to the auth-fail VLAN.	Packets from unauthenticated supplicants are associated with the Guest VLAN of the port. Packets from unauthenticated supplicants are processed according to these rules: ■ Packets destined to the WebAuth server IP address/ TCP port are forwarded to the server (which may well be the switch itself). ■ DHCP packets are sent to the CPU, to be processed by a local DHCP server, or relayed to another DHCP server, depending on the configuration of the switch. ■ DNS packets are forwarded to the CPU, and then sent on to a DNS server, if the switch is configured with a DNS server address. ■ ARP packets are forwarded to the CPU, and an ARP entry for the supplicant is learnt. ■ Drop all other packets destined to the IP address of the Guest VLAN. ■ Layer 2 forward packets destined to other addresses within the Guest VLAN. ■ All other packets are dropped.
No Web-authentication configured	All non-eap packets from unauthenticated supplicants are dropped.	All non-eap packets from unauthenticated supplicants are dropped.	Packets from unauthenticated supplicants are associated with the Guest VLAN of the port. The packets are processed according to these rules: ■ Drop packets destined to the IP address of the Guest VLAN. ■ Layer 2 forward packets destined to other addresses within the Guest VLAN. ■ Drop all other packets.

Deciding When a Supplicant Fails Authentication

Although the treatment of packets from unauthenticated supplicants does not differentiate between the three categories of supplicant, it is still useful to know for sure when the switch decides that a supplicant has failed authentication.

The rules for deciding that a supplicant has failed authentication are listed below for each type of authentication available:

Deciding when a supplicant fails 802.1X authentication

If the supplicant responds to EAP authentication requests, and the supplicant's authentication information is sent to the RADIUS server, and the RADIUS server replies with an Authentication-Reject, then the supplicant is immediately deemed to have failed authentication.

If the supplicant does not respond to EAP authentication requests, then the switch will resend the authentication requests up to a maximum number of attempts set by the command **dot1x max-reauth-req** (the default is 2). The interval between the attempts is set by the command **dot1x timeout tx-period** (the default is 30 seconds). If the supplicant still has not responded after this, it is deemed to have not attempted authentication.

See **Chapter 68, 802.1X Commands** for 802.1X authentication command information.

Deciding when a supplicant fails Web authentication

As soon as the supplicant attempts any web-browsing, the switch will intercept the web session, and present the supplicant with an authentication request page. If the user enters a username and password, and clicks the login button, then the switch will send the username and password to the RADIUS server. If the RADIUS server replies with an Authentication-Reject, then the supplicant is immediately deemed to have failed authentication.

Until the supplicant has attempted any web-browsing, or has received the authentication request page, but not yet clicked the login button, the supplicant is deemed to be not yet authenticated (as against not able to authenticate).

See **Chapter 70, Authentication Commands** for Web authentication command information.

Deciding when a supplicant fails MAC authentication

As soon as the supplicant sends any packet, the source MAC address from the packet will be sent to the RADIUS server for authentication. If the RADIUS server replies with an Authentication-Reject, then the supplicant is immediately deemed to have failed authentication.

With MAC auth there really is no concept of not-yet-attempted authentication, because authentication is attempted as soon as a supplicant sends a packet.

See **Chapter 70, Authentication Commands** for MAC authentication command information.

Failed Authentication VLAN

The auth-fail VLAN feature allows the network administrator to separate the supplicants who attempted authentication, but failed, from the supplicants who did not attempt authentication.

This feature enables the network administrator to enact a security policy in which the supplicants who fail authentication are given extremely limited access, or are given access to remedial applications.

If the Guest VLAN and auth-fail VLAN are both configured on a switch, then a newly connected supplicant initially belongs to the Guest VLAN. If newly connected supplicants attempt 802.1X port authentication or Web-authentication and fail, then they are moved from the Guest VLAN to the auth-fail VLAN.

The criteria for how many failed authentication attempts are allowed before the supplicant is moved to the auth-fail VLAN differs, depending on the authentication method used.

If Web-authentication is used, then the supplicant is moved to the auth-fail VLAN after the first failed attempt. If 802.1X port authentication is used, then the supplicant is moved to the auth-fail VLAN after the number of failed attempts is equal to the value configured by the dot1x max-auth-fail command (by default, three failed 802.1X authentication attempts are allowed).

The MAC-authentication feature does not support the max-auth-fail option. If auth-fail VLAN feature is used in conjunction with MAC-authentication only one attempt is allowed for a MAC-authentication supplicant. If the attempt fails, then the supplicant will be treated as “Authenticated” and the interface will be added to the configured auth-fail VLAN.

Limitations on Allowed Feature Combinations

Note that the Web-authentication feature cannot be used with the Guest VLAN or auth-fail VLAN features. For further limitation information see the below tables:

Table 69-2: Interoperation of authentication types with Guest VLAN and auth-fail VLAN

Authentication Type:	Guest VLAN (without routing mode)	Guest VLAN (with routing mode)	Failed Authentication VLAN
802.1X-authentication	Layer 2 forward packets destined to other addresses within the Guest VLAN.	Unauthorized supplicant can access Guest VLAN. Use ACL for security on the interface.	Failed authentication supplicant can access auth-fail VLAN. See limitations table below for ACL usage limitation.
MAC-authentication	Layer 2 forward packets destined to other addresses within the Guest VLAN.	Unauthorized supplicant can access Guest VLAN. Use ACL for security on the interface.	Failed authentication supplicant can access auth-fail VLAN. See limitations table below for ACL usage limitation.
Web-authentication (without intercept mode)	Layer 2 forward packets destined to other addresses within the Guest VLAN.	Unauthorized supplicant can access Guest VLAN. Use ACL for security on the interface.	Failed authentication supplicant can access auth-fail VLAN. See limitations table below for ACL usage limitation.
Web-authentication (with intercept mode)	(Not Available)	(Not Available)	(Not Available)

Table 69-3: Interactions between Guest VLAN and auth-fail VLAN

Authentication Feature:	Guest VLAN (without routing mode)	Guest VLAN (with routing mode)	Failed Authentication VLAN
Guest VLAN (without routing mode)	(Not Available)	(Not Available)	Cannot configure ACLs on the Guest VLAN when it is not in routing mode. The Guest VLAN without routing mode has reserved ACLs already attached to it.
Guest VLAN (with routing mode)	(Not Available)	(Not Available)	Configuration of ACLs for additional interface security is recommended.
Failed Authentication VLAN	Cannot configure ACLs on the Guest VLAN when it is not in routing mode. The Guest VLAN without routing mode has reserved ACLs already attached to it.	Configuration of ACLs for additional interface security is recommended.	Failed authentication supplicant can access auth-fail VLAN. See limitations table below for ACL usage limitation.

Command List

This chapter provides an alphabetical reference for Authentication commands.

auth auth-fail vlan

Use this command to enable the **auth-fail vlan** feature on the specified vlan interface. This feature assigns supplicants (client devices), which have failed port authentication, to the specified VLAN interface.

Use the **no** variant of this command to disable the **auth-fail vlan** feature for a specified VLAN interface.

Syntax `auth auth-fail vlan <1-4094>`

`no auth auth-fail vlan`

Parameter	Description
<1-4094>	Assigns the VLAN ID to any supplicants that have failed port authentication.

Default The **auth-fail vlan** feature is disabled by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Usage Use the **auth-fail vlan** feature when using Web-authentication instead of the Guest VLAN feature, when you need to separate networks where one supplicant (client device) requires authentication and another supplicant does not require authentication from the same interface.

This is because the DHCP lease time using the Web authentication feature is shorter, and the **auth fail vlan** feature enables assignment to a different VLAN if a supplicant fails authentication.

When using 802.1X port authentication, use a **dot1x max-auth-fail** command to set the maximum number of login attempts. Three login attempts are allowed by default for 802.1X port authentication before supplicants trying to authenticate are moved from the Guest VLAN to the auth-fail VLAN. See the **"dot1x max-auth-fail" on page 68.10** for command information.

See the section **"Failed Authentication VLAN" on page 69.29** in **Chapter 69, Authentication Introduction and Configuration** for further overview information about the auth-fail VLAN feature, which allows the Network Administrator to separate the supplicants who attempted authentication, but failed, from the supplicants who did not attempt authentication.

See the section **"Limitations on Allowed Feature Combinations" on page 69.29** for information about restrictions regarding combinations of authentication enhancements working together.

Use appropriate ACLs (Access Control Lists) on interfaces for extra security if a supplicant allocated to the designated auth-fail vlan can access the same network as a supplicant on the Guest VLAN. For more information about ACL concepts, and configuring ACLs see **Chapter 60, Access Control Lists Introduction**. For more information about ACL commands see:

- **Chapter 61, IPv4 Hardware Access Control List (ACL) Commands**
- **Chapter 62, IPv4 Software Access Control List (ACL) Commands**
- **Chapter 63, IPv6 Hardware Access Control List (ACL) Commands**
- **Chapter 64, IPv6 Software Access Control List (ACL) Commands**

Examples

To enable **auth-fail vlan** for `port1.0.2` and assign VLAN `100`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth auth-fail vlan 100
```

To disable the **auth-fail vlan** feature for `port1.0.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth auth-fail vlan
```

Validation Commands

show running-config

Related Commands

dot1x max-auth-fail
show dot1x
show dot1x interface

auth critical

This command enables the critical port feature on the interface. When the critical port feature is enabled on an interface, and all the RADIUS servers are unavailable, then the interface becomes authorized.

The **no** variant of this command disables critical port feature on the interface.

Syntax

```
auth critical
no auth critical
```

Default The critical port of port authentication is disabled.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Examples To enable the critical port feature on interface `port1.0.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth critical
```

To disable the critical port feature on interface `port1.0.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth critical
```

Validation Commands

show auth-web-server
show dot1x
show dot1x interface
show running-config

auth dynamic-vlan-creation

This command enables and disables the Dynamic VLAN assignment feature.

The Dynamic VLAN assignment feature allows a supplicant (client device) to be placed into a specific VLAN based on information returned from the RADIUS server during authentication, on a given interface.

Use the **no** variant of this command to disable the Dynamic VLAN assignment feature.

Syntax

```
auth dynamic-vlan-creation [rule {deny|permit}]
no auth dynamic-vlan-creation
```

Parameter	Description
`rule`	VLAN assignment rule.
`deny`	Deny a differently assigned VLAN ID. This is the default rule.
`permit`	Permit a differently assigned VLAN ID.

Default By default, the Dynamic VLAN assignment feature is disabled.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Usage If the Dynamic VLAN assignment feature is enabled (disabled by default), VLAN assignment is dynamic. If the Dynamic VLAN assignment feature is disabled then RADUS attributes are ignored and configured VLANs are assigned to ports.

The optional **rule** parameter specifies the VLAN assignment rule when the second supplicant's VLAN ID is different from VLAN ID from the first supplicant. If the **deny** value is applied with the command then the second supplicant with a different VLAN ID is rejected. If the **permit** value is applied with the command then the second supplicant with a different VLAN ID is accepted and assigned to the first supplicant's VLAN.

If you issue an **auth dynamic-vlan-creation** command without an optional **rule** parameter and a required **deny** or **permit** keyword value then a second supplicant with a different VLAN ID is rejected. It is not assigned to the first supplicant's VLAN. Issuing an **auth dynamic-vlan-creation** command without an optional **rule** parameter has the same effect as issuing an **auth dynamic-vlan-creation rule deny** command rejecting supplicants with differing VIDs.

Examples To enable the Dynamic VLAN assignment feature on interface `port1.0.2`, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth dynamic-vlan-creation
```

To disable the Dynamic VLAN assignment feature on interface `port1.0.2`, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth dynamic-vlan-creation
```

Validation Commands

show dot1x
show dot1x interface
show running-config

Related Commands

auth host-mode

auth guest-vlan

This command enables and configures the Guest VLAN feature on the interface specified by associating a Guest VLAN with an interface. This command does not start authentication. The supplicant's (client device's) traffic is associated with the native VLAN of the interface if its not already associated with another VLAN. The **routing** option enables routing from the Guest VLAN to another VLAN, so the switch can lease DHCP addresses and accept access to a limited network.

The **no** variant of this command disables the guest vlan feature on the interface specified.

Syntax

```
auth guest-vlan <1-4094> [routing]
no auth guest-vlan [routing]
```

Parameter	Description
<1-4094>	VLAN ID (VID).
`routing`	Enables routing from the Guest VLAN to other VLANs.

Default The Guest VLAN authentication feature is disabled by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Usage The Guest VLAN feature may be used by supplicants (client devices) that have not attempted authentication, or have failed the authentication process. Note that if a port is in multi-supplicant mode with per-port dynamic VLAN configuration, after the first successful authentication, subsequent hosts cannot use the guest VLAN due to the change in VLAN ID. This may be avoided by using per-user dynamic VLAN assignment.

When using the Guest VLAN feature with the multi-host mode, a number of supplicants can communicate via a guest VLAN before authentication. A supplicant's traffic is associated with the native VLAN of the specified switch port. The supplicant must belong to a VLAN before traffic from the supplicant can be associated.

Note that you must first define the VLAN with the **vlan** command that you will assign as a guest VLAN using this command. Also note that 802.1X must first be enabled on the port.

Guest VLAN authentication cannot be enabled if DHCP snooping is enabled (**service dhcp-snooping** command on page 83.24), and vice versa.

The Guest VLAN feature in previous releases had some limitations that have been removed. Until this release the Guest VLAN feature could not lease the IP address to the supplicant using DHCP Server or DHCP Relay features unless Web authentication was also applied. When using NAP authentication, the supplicant should have been able to log on to a domain controller to gain certification, but the Guest VLAN would not accept access to another VLAN.

The Guest VLAN routing mode in this release overcomes these issues. With the Guest VLAN routing mode, the switch can lease DHCP addresses and accept access to a limited network.

See the section **"Configuring a Guest VLAN" on page 69.2** for information about the Guest VLAN feature.

See the section **"Limitations on Allowed Feature Combinations" on page 69.29** for information about restrictions regarding combinations of authentication enhancements working together.

Examples

To define `vlan100` and assign the guest VLAN feature to `vlan100` on interface `port1.0.2`, and enable routing from the guest vlan to other VLANs, use the following commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 100
awplus(config-vlan)# exit
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth guest-vlan 100 routing
```

To disable the guest vlan feature on interface `port1.0.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth guest-vlan
```

Validation Commands

auth host-mode

This command selects host mode on the interface. Multi-host is an extension to IEEE802.1X.

Use the **no** variant of this command to set host mode to the default setting (single host).

Syntax

```
auth host-mode {single-host|multi-host|multi-supplicant}
no auth host-mode
```

Parameter	Description
`single-host`	Single host mode.
`multi-host`	Multi host mode.
`multi-supplicant`	Multi supplicant (client device) mode.

Default The default host mode for port authentication is for a single host.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Examples To set the host mode to multi-supplicant on interface `port1.0.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth host-mode multi-supplicant
```

To set the host mode to default (single host) on interface `port1.0.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth host-mode
```

Validation Commands

show dot1x
show dot1x interface
show running-config

auth log

Use this command to configure the types of authentication feature log messages that are output to the log file.

Use the **no** variant of this command to remove either specified types or all types of authentication feature log messages that are output to the log file.

Syntax

```
auth log {dot1x|auth-mac|auth-web} {success|failure|logoff|all}
no auth log {do1x|auth-mac|auth-web} {success|failure|logoff|all}
```

Parameter	Description
`dot1x`	Specify only 802.1X authentication log messages are output to the log file.
`auth-mac`	Specify only MAC authentication log messages are output to the log file.
`auth-web`	Specify only Web authentication log messages are output to the log file.
`success`	Specify only successful authentication log messages are output to the log file.
`failure`	Specify only authentication failure log messages are output to the log file.
`logoff`	Specify only authentication logoff messages are output to the log file. Note that link down, age out and expired ping polling messages will be included.
`all`	Specify all types of authentication log messages are output to the log file Note that this is the default behavior for the authentication logging feature.

Default All types of authentication log messages are output to the log file by default.

Mode Interface Configuration

Examples To configure the logging of MAC authentication failures to the log file for supplicants (client devices) connected to interface `port1.0.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth log auth-mac failure
```

To configure the logging of all types of authentication log messages to the log file for supplicants (client devices) connected to interface `port1.0.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth log all
```

Validation Commands **show running-config**

auth max-supplicant

This command sets the maximum number of supplicants (client devices) on the interface that can be authenticated. After this value is exceeded supplicants are not authenticated.

The **no** variant of this command resets the maximum supplicant number to the default (1024).

Syntax

```
auth max-supplicant <2-1024>
no auth max-supplicant
```

Parameter	Description
<2-1024>	Limit number.

Default The max supplicant of port authentication is 1024.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Examples To set the maximum number of supplicants to `10` on interface `port1.0.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth max-supplicant 10
```

To reset the maximum number of supplicant to default on interface `port1.0.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth max-supplicant
```

Validation Commands
show dot1x
show dot1x interface
show running-config

auth reauthentication

This command enables re-authentication on the interface specified in the Interface mode, which may be a static channel group (or static aggregator) or a dynamic (or LACP) channel group or a switch port.

Use the **no** variant of this command to disables reauthentication on the interface.

Syntax

```
auth reauthentication
no auth reauthentication
```

Default Reauthentication of port authentication is disabled by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Examples To enable reauthentication on interface `port1.0.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth reauthentication
```

Validation Commands

show dot1x
show dot1x interface
show running-config

auth roaming disconnected

This command enables the roaming authentication feature on an authenticated interface that is link down. A supplicant (a client device) is not reauthenticated when moved between authenticated interfaces, providing both interfaces have the roaming authentication feature enabled before the supplicant is moved.

Use the **auth roaming enable** command before using this command. The **auth roaming disconnected** command on its own will have no effect on the operation of the switch. This command will only come into effect once the base Roaming Authentication feature is enabled, using the **auth roaming enable** command.

The **no** variant of this command disables the roaming authentication feature on an interface, and forces a supplicant to be reauthenticated when moving between interfaces.

See **"Web-Authentication" on page 69.4** for further information about this feature.

Syntax

```
auth roaming disconnected

no auth roaming disconnected
```

Default The roaming authentication `disconnected` feature is disabled by default on an interface. Authentication status for a roaming supplicant is deleted by default when an interface goes down.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Usage This command allows a supplicant to move to another authenticating interface without reauthentication, if the link is down for the interface that the supplicant is moved from.

Note that 802.1X port authentication, or MAC authentication, or Web Authentication must first be enabled on an interface to use this feature. The port that the supplicant is moving to must have the same authentication configuration as the port the supplicant is moving from.

Configure **auth roaming enable** on an interface before configuring **auth roaming disconnected** if you require **auth roaming disconnected** configured on an interface for a roaming supplicant.

Roaming authentication cannot be enabled if DHCP snooping is enabled (**service dhcp-snooping** command on page 83.24), and vice versa.

Examples To enable roaming authentication `disconnected` feature for `port1.0.2`, after enabling 802.1x authentication and enabling roaming authentication `enable`, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth roaming enable
awplus(config-if)# auth roaming disconnected
```

To disable roaming authentication disconnected feature for `port1.0.2`, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth roaming disconnected
```

Validation Commands

show running-config

auth roaming enable

This command enables the roaming authentication feature on an authenticated interface that is link up. A supplicant (a client device) is not reauthenticated when moved between authenticated interfaces, providing both interfaces have the roaming authentication feature enabled before the supplicant is moved.

Use the **auth roaming enable** command before using **auth roaming disconnected** command. The **auth roaming disconnected** command on its own will have no effect on the operation of the switch. This command will only come into effect once the base Roaming Authentication feature is enabled, using the **auth roaming enable** command.

The **no** variant of this command disables the roaming authentication feature on an interface, and forces a supplicant to be reauthenticated when moving between interfaces.

See **"Web-Authentication" on page 69.4** for further information about this feature.

Syntax

```
auth roaming enable

no auth roaming enable
```

Default The roaming authentication enable feature is disabled by default on an interface. Authentication status for a roaming supplicant is deleted by default when an interface goes down.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Usage This command allows a supplicant to move to another authenticating interface without reauthentication, providing the link is up for the interface that the supplicant is moved from.

Note that 802.1X port authentication, or MAC authentication, or Web Authentication must first be enabled on an interface to use this feature. The port that the supplicant is moving to must have the same authentication configuration as the port the supplicant is moving from.

Configure **auth roaming enable** on an interface before configuring **auth roaming disconnected** if you require **auth roaming disconnected** configured on an interface for a roaming supplicant.

Roaming authentication cannot be enabled if DHCP snooping is enabled (**service dhcp-snooping** command on page 83.24), and vice versa.

Examples To enable the roaming authentication enable feature for interface `port1.0.4`, after enabling 802.1x authentication, since an authentication method is required, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth roaming enable
```

To disable roaming authentication enable for `port1.0.4`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# no auth roaming enable
```

auth supplicant-mac

This command adds a supplicant (client device) mac address on a given interface with the parameters as specified in the table below.

Use the **no** variant of this command to delete the supplicant MAC address added by the **auth supplicant-mac** command, and resets to the default for the supplicant parameter.

Syntax

```
auth supplicant <mac-addr>
    [max-reauth-req <1-10>]
    [port-control {auto | force-authorized | force-unauthorized |
    skip-second-auth}]
    [quiet-period <1-65535>]
    [reauth-period <1-4294967295>]
    [supp-timeout <1-65535>]
    [server-timeout <1-65535>][reauthentication]

no auth supplicant-mac <macadd> [reauthentication]
```

Parameter	Description
<mac-addr>	MAC (hardware) address of the Supplicant entry in HHHH.HHHH.HHHH MAC address hexadecimal format.
`port-control`	Port control commands.
`auto`	Allow port client to negotiate authentication.
`force-authorized`	Force port state to authorized.
`force-unauthorized`	Force port state to unauthorized.
`skip-second-auth`	Skip the second authentication.
`quiet-period`	Quiet period in the HELD state (default 60 seconds).
<1-65535>	Seconds for quiet period.
`reauth-period`	Seconds between reauthorization attempts (default 3600 seconds).
<1-4294967295>	Seconds for reauthorization attempts (reauth-period).
`supp-timeout`	Supplicant response timeout (default 30 seconds).
<1-65535>	Seconds for supplicant response timeout.
`server-timeout`	Authentication server response timeout (default 30 seconds).
<1-65535>	Seconds for authentication server response timeout.
`reauthentication`	Enable reauthentication on a port.
`max-reauth-req`	No of reauthentication attempts before becoming unauthorized (default 2).
<1-10>	Count of reauthentication attempts.

Default No supplicant MAC address for port authentication exists by default until first created with the **auth supplicant-mac** command. The defaults for parameters applied are as shown in the table.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Examples To add the supplicant MAC address `0009.41A4.5943` to force authorized port control for interface `port1.0.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth supplicant-mac 0009.41A4.5943 port-
control force-authorized
```

To delete the supplicant MAC address `0009.41A4.5943` for interface `port1.0.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth supplicant-mac 0009.41A4.5943
```

To reset reauthentication to disable for the supplicant MAC address `0009.41A4.5943`, for interface `port1.0.2` use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth supplicant-mac 0009.41A4.5943
reauthentication
```

Validation Commands **show dot1x**
show dot1x interface
show running-config

auth timeout connect-timeout

This command sets the connect-timeout period for the interface.

Use the **no** variant of this command to reset the connect-timeout period to the default (30 seconds).

Syntax

```
auth timeout connect-timeout <1-65535>
no auth timeout connect-timeout
```

Parameter	Description
<1-65535>	Seconds.

Default The connect-timeout default is 30 seconds.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Usage This command is used for MAC and Web authentication. If the connect-timeout has lapsed and the supplicant has the state **connecting**, then the supplicant is deleted. When **auth-web-server session-keep** or **auth two-step enable** is enabled it is recommended to configure a longer connect-timeout period.

Examples To set the connect-timeout period to `3600` for interface `port1.0.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth timeout connect-timeout 3600
```

To reset the connect-timeout period to the default (30 seconds) for interface `port1.0.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth timeout connect-timeout
```

Validation Commands **show dot1x**
show dot1x interface

auth timeout quiet-period

This command sets the time period for which the authentication request is not accepted on a given interface, after the authentication request has failed an authentication.

Use the **no** variant of this command to reset quiet period to the default (60 seconds).

Syntax

```
auth timeout quiet-period <1-65535>
no auth timeout quiet-period
```

Parameter	Description
<1-65535>	Seconds.

Default The quiet period of port authentication is 60 seconds.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Examples To set the quiet period to `10` for interface `port1.0.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth timeout quiet-period 10
```

To reset the quiet period to the default (60 seconds) for interface `port1.0.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth timeout quiet-period
```

auth timeout reauth-period

This command sets the timer for reauthentication on a given interface. The re-authentication for the supplicant (client device) is executed at this timeout. The timeout is only applied if the **auth reauthentication** command is applied.

Use the **no** variant of this command to reset the **reauth-period** parameter to the default (3600 seconds).

Syntax

```
auth timeout reauth-period <1-4294967295>
no auth timeout reauth-period
```

Parameter	Description
<1-4294967295>	Seconds.

Default The default reauthentication period for port authentication is 3600 seconds, when reauthentication is enabled on the port.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Examples To set the reauthentication period to 1 day for interface `port1.0.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth timeout reauth-period 86400
```

To reset the reauthentication period to the default (3600 seconds) for interface `port1.0.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth timeout reauth-period
```

Validation Commands **show dot1x**
show dot1x interface
show running-config

Related Commands **auth reauthentication**

auth timeout server-timeout

This command sets the timeout for the waiting response from the RADIUS server on a given interface.

The **no** variant of this command resets the server-timeout to the default (30 seconds).

Syntax

```
auth timeout server-timeout <1-65535>
no auth timeout server-timeout
```

Parameter	Description
<1-65535>	Seconds.

Default The server timeout for port authentication is 30 seconds.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Examples To set the server timeout to 120 seconds for interface `port1.0.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth timeout server-timeout 120
```

To set the server timeout to the default (30 seconds) for interface `port1.0.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth timeout server-timeout
```

Validation Commands
show dot1x
show dot1x interface
show running-config

auth timeout supp-timeout

This command sets the timeout of the waiting response from the supplicant (client device) on a given interface.

The **no** variant of this command resets the supplicant timeout to the default (30 seconds).

Syntax

```
auth timeout supp-timeout <1-65535>
no auth timeout supp-timeout
```

Parameter	Description
<1-65535>	Seconds.

Default The supplicant timeout of port authentication is 30 seconds.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Examples To set the server timeout to `2` seconds for interface `port1.0.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth timeout supp-timeout 2
```

To reset the server timeout to the default (30 seconds) for interface `port1.0.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth timeout supp-timeout
```

Validation Commands

show dot1x
show dot1x interface
show running-config

auth two-step enable

This command enables a two-step authentication feature on an interface. When this feature is enabled, the supplicant is authorized in a two-step process. If authentication succeeds, the supplicant becomes authenticated. This command will apply the two-step authentication method based on 802.1X, MAC or Web authentication.

The **no** variant of this command disables the two-step authentication feature.

Syntax

```
auth two-step enable
no auth two-step enable
```

Default Default.

Mode Interface Configuration for a port.

Usage The single step authentication methods (either user or device authentication) have a potential security risk:

- an unauthorized user can access the network with an authorized device, or
- an authorized user can access the network with an unauthorized device.

Two-step authentication solves this problem by authenticating both the user and the device. The supplicant will only become authenticated if both these steps are successful. If the first authentication step fails, then the second step is not started.

Examples To enable the two step authentication feature, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth two-step enable
```

To disable the two step authentication feature, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth two-step enable
```

To enable MAC authentication followed by 802.1X authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode access
awplus(config-if)# auth-mac enable
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth dynamic-vlan-creation
awplus(config-if)# auth two-step enable
```

To enable MAC authentication followed by web authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode access
awplus(config-if)# auth-mac enable
awplus(config-if)# auth-web enable
awplus(config-if)# auth dynamic-vlan-creation
awplus(config-if)# auth two-step enable
```

To enable 802.1X authentication followed by web authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode access
awplus(config-if)# auth-web enable
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth dynamic-vlan-creation
awplus(config-if)# auth two-step enable
```

auth-mac enable

This command enables MAC based authentication on the interface specified in the Interface command mode.

Use the **no** variant of this command to disable MAC based authentication on an interface.

Syntax

```
auth-mac enable
no auth-mac enable
```

Default MAC authentication is disabled by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Usage Enabling **spanning-tree edgeport** on ports after enabling MAC based authentication avoids unnecessary re-authentication when the port state changes, which does not happen when spanning tree edgeport is enabled. Note that re-authentication is correct behavior without **spanning-tree edgeport** enabled.

Applying **switchport mode access** on ports is also good practice to set the ports to access mode with ingress filtering turned on, whenever ports for MAC authentication are in a VLAN.

Examples To enable MAC authentication on interface `port1.0.2` and enable spanning tree edgeport to avoid unnecessary re-authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth-mac enable
awplus(config-if)# spanning-tree edgeport
awplus(config-if)# switchport mode access
```

To disable MAC authentication on interface `port1.0.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth-mac enable
```

Validation Commands
show auth-mac
show auth-mac interface
show running-config

auth-mac method

This command sets the type of authentication method for MAC authentication that is used with RADIUS on the interface specified in the Interface command mode.

The **no** variant of this command resets the authentication method used to the default method (PAP) as the RADIUS authentication method used by the MAC authentication.

Syntax

```
auth-mac method [eap-md5|pap]
no auth-mac method
```

Parameter	Description
eap-md5	Enable EAP-MD5 of authentication method.
pap	Enable PAP of authentication method.

Default The mac authentication method is PAP.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Examples To set the MAC authentication method to `pap` on interface `port1.0.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth-mac method pap
```

To set the MAC authentication method to the default on interface `port1.0.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth-mac method
```

Validation Commands

show auth-mac
show auth-mac interface
show running-config

auth-mac password

This command changes the password for MAC-based authentication.

Use the **no** variant of this command to return the password to its default.

Syntax

```
auth-mac [encrypted] password <password>
no auth-mac password
```

Parameter	Description
`auth-mac`	MAC-Based Authentication
`encrypted`	Specify an encrypted password
`password`	Configure the password
<password>	The new password. Passwords can be up to 64 characters in length and can contain any printable characters except ■ ? ■ " (double quotes) and ■ space

Default By default, the password is the MAC address of the supplicant

Mode Global Configuration

Usage Changing the password increases the security of MAC-based authentication, because the default password is easy for an attacker to discover. This is particularly important if:

- some MAC-based supplicants on the network are intelligent devices, such as computers, and/or
- you are using Two-step authentication (see **"Ensuring Authentication Methods Require Different Usernames and Passwords" on page 69.22**)

Examples To change the password to `verySecurePassword`, use the commands:

```
awplus# configure terminal
awplus(config)# auth-mac password verySecurePassword
```

Validation Command **show running-config**

Related Commands **auth two-step enable**
show auth-mac

auth-mac reauth-relearning

This command sets the MAC address learning of the supplicant (client device) to re-learning for re-authentication on the interface specified in the Interface command mode.

Use the **no** variant of this command to disable the auth-mac re-learning option.

Syntax

```
auth-mac reauth-relearning
no auth-mac reauth-relearning
```

Default Re-learning for port authentication is disabled by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Examples To enable the re-authentication re-learning feature on interface `port1.0.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth-mac reauth-relearning
```

To disable the re-authentication re-learning feature on interface `port1.0.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth-mac reauth-relearning
```

Validation Commands

show auth-mac
show auth-mac interface
show running-config

auth-web enable

This command enables Web-based authentication in Interface mode on the interface specified.

Use the **no** variant of this command to disable Web-based authentication on an interface.

Syntax

```
auth-web enable
no auth-web enable
```

Default Web authentication is disabled by default.

Mode Interface Configuration for a static channel or a switch port.

Usage Web-based authentication cannot be enabled if DHCP snooping is enabled (**service dhcp-snooping** command on page 83.24), and vice versa.

Examples To enable Web authentication on static-channel-group 2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# static-channel-group 2
awplus(config-if)# exit
awplus(config)# interface sa2
awplus(config-if)# auth-web enable
```

To disable Web authentication on static-channel-group 2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# static-channel-group 2
awplus(config-if)# exit
awplus(config)# interface sa2
awplus(config-if)# no auth-web enable
```

Validation Commands
show auth-web
show auth-web interface
show running-config

Related Commands
aaa accounting auth-web default
aaa authentication auth-web

auth-web forward

This command enables the web authentication packet forwarding feature on the interface specified. This command also enables ARP forwarding, and adds forwarded packets to the **tcp** or **udp** port number specified.

The **no** variant of this command disables or deletes the packet forwarding feature on the interface.

Syntax

```
auth-web forward [<ip-address>]{arp|dhcp|dns|tcp <1-65535>|udp <1-65535>}
no auth-web forward [<ip-address>]{arp|dhcp|dns|tcp <1-65535>|udp <1-65535>}
```

Parameter	Description
<ip-address>	Enable forwarding to the destination IPv4 address.
arp	Enable forwarding of ARP.
dhcp	Enable forwarding of DHCP (67/udp).
dns	Enable forwarding of DNS (53/udp).
tcp	Enable forwarding of TCP specified port number.
<1-65535>	TCP Port number.
udp	Enable forwarding of UDP specified port number.
<1-65535>	UDP Port number.

Default Packet forwarding for port authentication is disabled by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Usage For more information about the *<ip-address>* parameter, and an example, see the "auth-web forward" section in the **Alliedware Plus Technical Tips and Tricks.**

Examples To enable the arp forwarding feature on interface `port1.0.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth-web forward arp
```

To add the tcp forwarding port 137 on interface `port1.0.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth-web forward tcp 137
```

To add the DNS Server IP address 192.168.1.10 on interface `port1.0.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode access
awplus(config-if)# auth-web enable
awplus(config-if)# auth dynamic-vlan-creation
awplus(config-if)# auth-web forward 192.168.1.10 dns
```

To disable the ARP forwarding feature on interface `port1.0.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth-web forward arp
```

To delete the tcp forwarding port 137 on interface `port1.0.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth-web forward tcp 137
```

To delete the all of tcp forwarding on interface `port1.0.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth-web forward tcp
```

Validation Commands

show auth-web
show auth-web interface
show running-config

auth-web max-auth-fail

This command sets the number of authentication failures allowed before rejecting further authentication requests. When the supplicant (client device) fails more than has been set to the maximum number of authentication failures then login requests are refused during the quiet period.

The **no** variant of this command resets the maximum number of authentication failures to the default (3 authentication failures).

Syntax

```
auth-web max-auth-fail <0-10>
no auth-web max-auth-fail
```

Parameter	Description
<0-10>	Lock count specified.

Default The **max-auth-fail** lock counter is set to 3 authentication failures by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Examples To set the lock count to `5` on interface `port1.0.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth-web max-auth-fail 5
```

To set the lock count to the default on interface `port1.0.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth-web max-auth-fail
```

Validation Commands **show auth-web**
show auth-web interface
show running-config

Related Commands **auth timeout quiet-period**

auth-web method

This command sets the authentication method of WEB authentication that is used with RADIUS on the interface specified.

The **no** variant of this command sets the authentication method to PAP for the interface specified when Web authentication is also used with the RADIUS authentication method.

Syntax

```
auth-web method {eap-md5|pap}
no auth-web method
```

Parameter	Description
`eap-md5`	Enable EAP-MD5 as the authentication method.
`pap`	Enable PAP as the authentication method.

Default The web authentication method is set to PAP by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Example To set the web authentication method to eap-md5 on interface `port1.0.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth-web method eap-md5
```

Validation Commands
show auth-web
show auth-web interface
show running-config

auth-web-server blocking-mode

Use this command to enable blocking mode for the web authentication server. The blocking mode displays an authentication success or failure screen immediately from the response result from a RADIUS server.

Use the **no** variant of this command to disable blocking mode for the web authentication server.

Syntax

```
auth-web-server blocking-mode

no auth-web-server blocking-mode
```

Parameter	Description
`blocking-mode`	Use blocking authentication server process.
`no`	Disable blocking mode.

Default By default, blocking mode is disabled for the web authentication server.

Mode Global Configuration

Example To enable blocking mode for the web authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server blocking-mode
```

To disable blocking mode for the web authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server blocking-mode
```

Validation Commands **show running-config**

Related Commands **show auth-web-server**
auth-web-server mode
auth-web-server redirect-delay-time

auth-web-server dhcp ipaddress

Use this command to assign an IP address and enable the DHCP service on the web authentication server for supplicants (client devices).

Use the **no** variant of this command to remove an IP address and disable the DHCP service on the web authentication server for supplicants.

Syntax

```
auth-web-server dhcp ipaddress <ip-address/prefix-length>
no auth-web-server dhcp ipaddress
```

Parameter	Description
<ip-addr/prefix-length>	The IPv4 address and prefix length assigned for the DHCP service on the web authentication server for supplicants.

Default No IP address for the web authentication server is set by default.

Mode Global Configuration

Usage See the section **"DHCP server for Web-authentication" on page 69.10** in **Chapter 69, Authentication Introduction and Configuration** for further overview information about the Web-authentication enhancements, allowing Web-authentication to work as seamlessly as 802.1X authentication.

See the section **"Limitations on Allowed Feature Combinations" on page 69.29** for information about restrictions regarding combinations of authentication enhancements working together.

Examples To assign the IP address `10.0.0.1` to the web authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server dhcp ipaddress 10.0.0.1/8
```

To remove an IP address on the web authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server dhcp ipaddress
```

Validation Commands **show running-config**

Related Commands **show auth-web-server**
auth-web-server dhcp lease

auth-web-server dhcp lease

Use this command to set the DHCP lease time for supplicants (client devices) using the DHCP service on the web authentication server.

Use the **no** variant of this command to reset to the default DHCP lease time for supplicants using the DHCP service on the web authentication server.

Syntax

```
auth-web-server dhcp lease <20-60>
no auth-web-server dhcp lease
```

Parameter	Description
<20-60>	DHCP lease time for supplicants using the DHCP service on the web authentication server in seconds.

Default The default DHCP lease time for supplicants using the DHCP service on the web authentication server is set to 30 seconds.

Mode Global Configuration

Usage See the section **"DHCP server for Web-authentication" on page 69.10** in **Chapter 69, Authentication Introduction and Configuration** for further overview information about the Web-authentication enhancements, allowing Web-authentication to work as seamlessly as 802.1X authentication.

See the section **"Limitations on Allowed Feature Combinations" on page 69.29** for information about restrictions regarding combinations of authentication enhancements working together.

Examples To set the DHCP lease time to 1 minute for supplicants using the DHCP service on the web authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server dhcp lease 60
```

To reset the DHCP lease time to the default setting (30 seconds) for supplicants using the DHCP service on the web authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server dhcp lease
```

Validation Commands **show running-config**

Related Commands **show auth-web-server**
auth-web-server dhcp ipaddress

auth-web-server dhcp-wpad-option

This command sets the DHCP WPAD (Web Proxy Auto-Discovery) option for the web authentication temporary DHCP service.

For more information and examples, see the "Web Auth Proxy" section in the **Alliedware Plus Technical Tips and Tricks.**

Use the **no** variant of this command to disable the DHCP WPAD function.

Syntax

```
auth-web-server dhcp wpad-option <url>
no auth-web-server dhcp wpad-option
```

Parameter	Description
<url>	URL to the server which gets a pac file.

Default The web authentication server DHCP WPAD option is not set.

Mode Global Configuration

Usage If the supplicant is configured to use WPAD, the supplicant's web browser will use TCP port 80 as usual. Therefore, the packet can be intercepted by Web Authentication as normal, and the Web Authentication Login page can be sent. However, after authentication, the browser does not know where to get the WPAD file and so cannot access external web pages. The WPAD file is usually named proxy.pac file and tells the browser what web proxy to use.

Use this command to tell the supplicant where it can get this file from. The switch itself can be specified as the source for this file, and it can deliver it to the supplicant on request.

Example To specify that the proxy.pac file is found on the server at 192.168.1.100, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server dhcp wpad-option
http://192.168.1.100/proxy/
proxy.pac
```

Related Commands **show auth-web-server**

auth-web-server gateway

Use this command to register the gateway information when the supplicant is authorized. This ensures the supplicant's gateway information is correct and allows the supplicant to access external subnets when an external DHCP server is used.

Use the **no** variant of this command to remove gateway IP address from the web authentication server and disable the registration of gateway entry.

Syntax

```
auth-web-server gateway <ip-address> vlan <1-4094>

no auth-web-server gateway <ip-address>
```

Parameter	Description
`gateway`	Configure the default gateway information.
`<ip-address>`	Web authentication server dotted decimal IP address in A.B.C.D format.
`vlan`	Set the VLAN ID.
`<1-4094>`	VLAN ID.
`no`	Remove gateway IP address.

Default There is no default gateway entry.

Mode Global Configuration

Usage This command registers the gateway IP address that supplicants should use after web authentication has succeeded. The switch finds the MAC address for this gateway device. Then, after a supplicant has authenticated, the switch sends out a gratuitous ARP advertising the gateway IP address with the MAC address that the switch has discovered belongs to that gateway device. This ensures the supplicant's gateway information is correct, and erases the fact that the switch had previously fooled the supplicant into thinking that the switch's MAC address was the MAC address of the gateway. By providing the supplicant with the correct MAC address for the gateway, the switch enables the supplicant to access external subnets.

Example To add the gateway IP address `192.168.1.1` and VLAN ID `10`, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server gateway 192.168.1.1 vlan 10
```

To remove the gateway IP address `192.168.1.1`, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server gateway 192.168.1.1
```

Validation Commands **show running-config**

Related Commands **show auth-web-server**
auth-web enable
auth-web-server mode

auth-web-server http-redirect

This command enables the HTTP redirect feature on every interface on which web-based port authentication is enabled. When the HTTP redirect feature is enabled, any HTTP request received on an unauthorized interface is redirected to the web authentication server automatically.

Use the **no** variant of this command to disable the HTTP redirect feature.

Syntax

```
auth-web-server http-redirect
no auth-web-server http-redirect
```

Default The HTTP redirect feature is enabled by default.

Mode Global Configuration

Examples To disable the HTTP redirect feature, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server http-redirect
```

To re-enable the HTTP redirect feature, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server http-redirect
```

Validation Commands

show auth-web
show auth-web-server
show running-config

auth-web-server intercept-port

This command specifies any additional TCP port numbers that the web authentication server is to intercept.

Use the **no** variant of this command to stop intercepting the TCP port numbers.

Syntax

```
auth-web-server intercept-port <1-65535>
no auth-web-server intercept-port <1-65535>
```

Parameter	Description
<1-65535>	TCP port number.

Default No additional TCP port numbers are intercepted by default.

Mode Global Configuration

Usage If this command is not specified, AlliedWare Plus Web Authentication intercepts the supplicant's initial TCP port 80 connection to a web page and sends it the Web Authentication Login page. However, if the supplicant is configured to use a web proxy, then it will usually be using TCP port 8080 (or another user configured port number). In this case Web Authentication cannot intercept the connection.

To overcome this limitation you can now use this command to tell the switch which additional port it should intercept, and then send the Web Authentication Login page to the supplicant.

When you use this command in conjunction with a proxy server configured in the web browser, you must add the proxy server's network as a 'No Proxy' network. You can specify 'No Proxy' networks in the proxy settings in your web browser. For more information, see the "Web Auth Proxy" section in the **Alliedware Plus Technical Tips and Tricks.**

Example To additionally intercept port number 3128, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server intercept-port 3128
```

Related Commands **show auth-web-server**

auth-web-server ipaddress

This command sets the IP address for the web authentication server.

Use the **no** variant of this command to delete the IP address for the web authentication server.

Syntax

```
auth-web-server ipaddress <ip-address>
no auth-web-server ipaddress
```

Parameter	Description
<ip-address>	Web authentication server dotted decimal IP address in A.B.C.D format.

Default The web authentication server address on the system is not set by default.

Mode Global Configuration

Examples To set the IP address `10.0.0.1` to the web authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ipaddress 10.0.0.1
```

To delete the IP address from the web authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ipaddress
```

Validation Commands
show auth-web
show auth-web-server
show running-config

auth-web-server mode

Use this command with required keyword to configure an intercept mode (from the intercept, none, or promiscuous modes available) on the web authentication server for supplicants (client devices). The intercept modes available affect the interception of clients' ARPs and the proxy DNS response when using Web-authentication. These enhancements ensure that Web-authentication will proceed smoothly irrespective of the IP configuration on the client PC.

Use the **no** variant of this command to disable the intercept mode (either the intercept, none, or promiscuous intercept modes) configured on the web authentication server for supplicants.

Syntax

```
auth-web-server mode {intercept|none|promiscuous}

no auth-web-server mode {intercept|promiscuous}
```

Parameter	Description
`intercept`	Selecting this parameter results in web authentication server on the switch intercepting and replying to ARP and DNS messages from the same interface and IP address.
`none`	Selecting this parameter disables the intercept mode on the web authentication server. No ARP and DNS messages are intercepted and replied to from the switch from any interfaces or from any IP addresses.
`promiscuous`	Selecting this parameter results in the web authentication server on the switch intercepting and replying to any ARP or DNS messages from any IP address.

Default Intercept mode on the web authentication server is set to **none** by default.

Mode Global Configuration

Usage See **Chapter 69, Authentication Introduction and Configuration** for overview information about Web-authentication, allowing Web-authentication to work as seamlessly as 802.1X authentication.

See the sub-sections **"Interception of clients' ARPs" on page 69.12** and **"Proxy DNS response" on page 69.13** for an details of the associated usage of the available intercept modes.

See the section **"Limitations on Allowed Feature Combinations" on page 69.29** for information about restrictions regarding combinations of authentication enhancements working together.

Examples To enable the intercept mode on the web authentication server, resulting in the switch intercepting and replying to ARP and DNS messages from the same interface and IP address, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server mode intercept
```

To disable the intercept mode on the web authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server mode intercept
```

To reset the intercept mode to the default setting of none on the web authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server mode none
```

To enable the promiscuous mode on the web authentication server, resulting in the switch intercepting and replying to any ARP or DNS messages from any IP address, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server mode promiscuous
```

To disable the promiscuous mode on the web authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server mode promiscuous
```

Validation Commands **show running-config**

Related Commands **show auth-web-server**

auth-web-server ping-poll enable

This command enables the ping polling to the supplicant (client device) that is authenticated by web authentication.

The **no** variant of this command disables the ping polling to the supplicant that is authenticated by web authentication.

Syntax

```
auth-web-server ping-poll enable
no auth-web-server ping-poll enable
```

Default The ping polling feature for web authentication is disabled by default.

Mode Global Configuration

Examples To enable the ping polling feature for web authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll enable
```

To disable the ping polling feature for web authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll enable
```

Validation Commands

show auth-web
show auth-web-server
show running-config

auth-web-server ping-poll failcount

This command sets a fail count for the ping polling feature when used with web authentication. The **failcount** parameter specifies the number of unanswered pings. A supplicant (client device) is logged off when the number of unanswered pings are greater than the failcount set with this command.

Use the **no** variant of this command to resets the fail count for the ping polling feature to the default (5 pings).

Syntax

```
auth-web-server ping-poll failcount <1-100>
no auth-web-server ping-poll failcount
```

Parameter	Description
<1-100>	Count.

Default The default failcount for ping polling is 5 pings.

Mode Global Configuration

Examples To set the failcount of ping polling to `10` pings, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll failcount 10
```

To set the failcount of ping polling to default, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll failcount
```

Validation Commands

show auth-web
show auth-web-server
show running-config

auth-web-server ping-poll interval

This command is used to change the ping poll interval. The interval specifies the time period between pings when the supplicant (client device) is reachable.

Use the **no** variant of this command to reset to the default period for ping polling (30 seconds).

Syntax

```
auth-web-server ping-poll interval <1-65535>
no auth-web-server ping-poll interval
```

Parameter	Description
<1-65535>	Seconds.

Default The interval for ping polling is 30 seconds by default.

Mode Global Configuration

Examples To set the interval of ping polling to `60` seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll interval 60
```

To set the interval of ping polling to the default (30 seconds), use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll interval
```

Validation Commands

show auth-web
show auth-web-server
show running-config

auth-web-server ping-poll reauth-timer-refresh

This command modifies the **reauth-timer-refresh** parameter for the web-authentication feature. The **reauth-timer-refresh** parameter specifies whether a re-authentication timer is reset and when the response from a supplicant (a client device) is received.

Use the **no** variant of this command to reset the **reauth-timer-refresh** parameter to the default setting (disabled).

Syntax

```
auth-web-server ping-poll reauth-timer-refresh
no auth-web-server ping-poll reauth-timer-refresh
```

Default The `reauth-timer-refresh` parameter is disabled by default.

Mode Global Configuration

Examples To enable the `reauth-timer-refresh` timer, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll reauth-timer-refresh
```

To disable the `reauth-timer-refresh` timer, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll reauth-timer-
refresh
```

Validation Commands

show auth-web
show auth-web-server
show running-config

auth-web-server ping-poll timeout

This command modifies the ping poll **timeout** parameter for the web authentication feature. The **timeout** parameter specifies the time in seconds to wait for a response to a ping packet.

Use the **no** variant of this command to reset the timeout of ping polling to the default (1 second).

Syntax

```
auth-web-server ping-poll timeout <1-30>
no auth-web-server ping-poll timeout
```

Parameter	Description
<1-30>	Seconds.

Default The default timeout for ping polling is 1 second.

Mode Global Configuration

Examples To set the timeout of ping polling to 2 seconds, use the command:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll timeout 2
```

To set the timeout of ping polling to the default (1 second), use the command:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll timeout
```

Validation Commands
show auth-web
show auth-web-server
show running-config

auth-web-server port

This command sets the HTTP port number for the web authentication server.

Use the **no** variant of this command to reset the HTTP port number to the default (80).

Syntax

```
auth-web-server port <port-number>
no auth-web-server port
```

Parameter	Description
<port-number>	Set the local web authentication server port within the TCP port number range 1 to 65535.

Default The web authentication server HTTP port number is set to 80 by default.

Mode Global Configuration

Examples To set the HTTP port number `8080` for the web authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server port 8080
```

To reset to the default HTTP port number `80` for the web authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server port
```

Validation Commands

show auth-web
show auth-web-server
show running-config

auth-web-server redirect-delay-time

Use this command to set the delay time in seconds before redirecting the supplicant to a specified URL when the supplicant is authorized.

Use the variant **no** to reset the delay time set previously.

Syntax

```
auth-web-server redirect-delay-time <5-60>
no auth-web-server redirect-delay-time
```

Parameter	Description
`redirect-delay-time`	Set the delay time before jumping to a specified URL after the supplicant is authorized.
<5-60>	The time in seconds.

Default The default redirect delay time is `5` seconds.

Mode Global Configuration

Examples To set the delay time to `60` seconds for the web authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server redirect-delay-time 60
```

To reset the delay time, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server redirect-delay-time
```

Validation Command **show auth-web-server**
show running-config

Related Commands **auth-web-server redirect-url**
show auth-web-server

auth-web-server redirect-url

This command sets a URL for supplicant (client device) authentication. When a supplicant is authorized it will be automatically redirected to the specified URL. Note that if the http redirect feature is used then this command is ignored.

Use the **no** variant of this command to delete the URL string set previously.

Syntax

```
auth-web-server redirect-url <url>
no auth-web-server redirect-url
```

Parameter	Description
<url>	URL (hostname or dotted IP notation).

Default The redirect URL for the web authentication server feature is not set by default (null).

Mode Global Configuration

Examples To enable and set redirect a URL string `www.alliedtelesis.com` for the web authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server redirect-url
http://www.alliedtelesis.com
```

To delete a redirect URL string, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server redirect-url
```

Validation Commands
show auth-web
show auth-web-server
show running-config

Related Commands
auth-web-server http-redirect
auth-web-server redirect-delay-time

auth-web-server session-keep

This command enables the session-keep feature to jump to the original URL after being authorized by web authentication.

Use the **no** variant of this command to disable the session keep feature.

Syntax

```
auth-web-server session-keep
no auth-web-server session-keep
```

Default The session-keep feature is disabled by default.

Mode Global Configuration

Examples To enable the session-keep feature, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server session-keep
```

To disable the session-keep feature, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server session-keep
```

Validation Commands

show auth-web
show auth-web-server
show running-config

auth-web-server ssl

This command enables HTTPS functionality for the web authentication server feature.

Use the **no** variant of this command to disable HTTPS functionality for the web authentication server.

Syntax

```
auth-web-server ssl
no auth-web-server ssl
```

Default HTTPS functionality for the web authentication server feature is disabled by default.

Mode Global Configuration

Examples To enable HTTPS functionality for the web authentication server feature, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ssl
```

To disable HTTPS functionality for the web authentication server feature, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ssl
```

Validation Commands

show auth-web
show auth-web-server
show running-config

auth-web-server sslport

This command sets the HTTPS port number for the web authentication server feature.

Use the **no** variant of this command to reset the HTTPS port number to the default port number (443) for the web authentication server feature.

Syntax

```
auth-web-server sslport <1-65535>
no auth-web-server sslport
```

Parameter	Description
<1-65535>	Set the local web authentication server port within the TCP port number range 1to 65535.

Default The HTTPS port number for the web authentication server feature is set to 443 by default.

Mode Global Configuration

Examples To set the HTTPS port number to 4433 for the web authentication server, use the command:

```
awplus# configure terminal
awplus(config)# auth-web-server sslport 4433
```

To reset the HTTPS port number for the web authentication server to the default (443), use the command:

```
awplus# configure terminal
awplus(config)# no auth-web-server sslport
```

Validation Commands
show auth-web
show auth-web-server
show running-config

copy proxy-autoconfig-file

Use this command to download the proxy auto configuration (PAC) file to your switch. The web authentication supplicant can get the downloaded file from the system web server.

Syntax `copy <filename> proxy-autoconfig-file`

Parameter	Description
<filename>	The URL of the PAC file.

Mode Privileged Exec

Example To download the PAC file to this device, use the command:

```
awplus# copy tftp://server/proxy.pac proxy-autoconfig-file
```

Related Commands **show proxy-autoconfig-file**
erase proxy-autoconfig-file

copy web-auth-https-file

Use this command to download the SSL server certificate for web-based authentication. The file must be in PEM (Privacy Enhanced Mail) format, and contain the private key and the server certificate.

Syntax `copy <filename> web-auth-https-file`

Parameter	Description
<filename>	The URL of the server certificate file.

Mode Privileged Exec

Example To download the server certificate file `veriSign_cert.pem` from the TFTP server directory `server`, use the command:

```
awplus# copy tftp://server/veriSign_cert.pem web-auth-https-
        file
```

Related Commands
auth-web-server ssl
erase web-auth-https-file
show auth-web-server

erase proxy-autoconfig-file

Use this command to remove the proxy auto configuration file.

Syntax `erase proxy-autoconfig-file`

Mode Privileged Exec

Example To remove the proxy auto configuration file, use the command:

```
awplus# erase proxy-autoconfig-file
```

Related Commands **show proxy-autoconfig-file**
copy proxy-autoconfig-file

erase web-auth-https-file

Use this command to remove the SSL server certificate for web-based authentication.

Syntax `erase web-auth-https-file`

Mode Privileged Exec

Example To remove the SSL server certificate file for web-based authentication use the command:

```
awplus# erase web-auth-https-file
```

Related Commands
auth-web-server ssl
copy web-auth-https-file
show auth-web-server

show auth two-step supplicant brief

This command displays the supplicant state of the two-step authentication feature on the interface.

Syntax `show auth two-step supplicant [interface <ifrange>] brief`

Parameter	Description
`interface`	The interface selected for display.
<ifrange>	The interface which can be specified as <*ifrange*> - Switch port (e.g. port1.0.12) - Static channel group (e.g. sa3) - Dynamic (LACP) channel group (e.g. po4)

Mode Privileged Exec

Usage Do not mix interface types in a list. The specified interfaces must exist.

Example To display the supplicant state of the two-step authentication feature, enter the command:

```
awplus# show two-step supplicant interface
        port1.0.12 brief
```

Output **Figure 70-1: Example output from the show auth two-step supplicant brief command**

```
interface port1.0.12
  authenticationMethod: dot1x/mac
  Two-Step Authentication:
    firstMethod:mac
    secondMethod:dot1x
  totalSupplicantNum: 1
  authorizedSupplicantNum: 1
    macBasedAuthenticationSupplicantNum: 0
    dot1xAuthenticationSupplicantNum: 1
    webBasedAuthenticationSupplicantNum: 0
    otherAuthenticationSupplicantNum: 0

Interface  VID Mode  MAC Address       Status          FirstStep     SecondStep
========== === ====  ==========        ======          =========     ==========
port1.0.12   1   D     000b..db67.00f7   Authenticated   Pass          Pass
```

Related Commands **auth two-step enable**

show auth-mac

This command shows authentication information for MAC-based authentication.

Syntax

```
show auth-mac [all]
```

Parameter	Description
`all`	Display all authentication information for each interface available on the switch.

Mode Privileged Exec

Example To display all MAC based authentication information, enter the command:

```
awplus# show auth-mac all
```

Output **Figure 70-2: Example output from the show auth-mac command**

```
802.1X Port-Based Authentication Disabled
MAC-based Port Authentication Enabled
WEB-based Port Authentication Disabled
```

Related Commands **show dot1x**
show auth-web

show auth-mac diagnostics

This command shows MAC authentication diagnostics, optionally for the specified interface, which may be a static channel (or static aggregator) or a dynamic (or LACP) channel group or a switch port.

If no interface is specified then authentication diagnostics are shown for all interfaces.

Syntax `show auth-mac diagnostics [interface <interface-list>]`

Parameter	Description
`interface`	Specify an interface to show
<interface-list>	The interfaces or ports to configure. An interface-list can be: ■ an interface (e.g. `vlan2`), a switch port (e.g. `port1.0.12`), a static channel group (e.g. `sa3`) or a dynamic (LACP) channel group (e.g. `po4`) ■ a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. `vlan2-8`, or `port1.0.1-1.0.24`, or `sa2-4`, or `po1-3` ■ a comma-separated list of the above; e.g. `port1.0.1,port1.0.8-1.0.24`. Do not mix interface types in a list The specified interfaces must exist.

Mode Privileged Exec

Example To display authentication diagnostics for `port1.0.12`, enter the command:

```
awplus# show auth-mac diagnostics interface port1.0.12
```

Output **Figure 70-3: Example output from the show auth-mac diagnostics command**

```
Authentication Diagnostics for interface port1.0.12
    Supplicant address: 00d0.59ab.7037
        authEnterConnecting: 2
        authEaplogoffWhileConnecting: 1
        authEnterAuthenticating: 2
        authSuccessWhileAuthenticating: 1
        authTimeoutWhileAuthenticating: 1
        authFailWhileAuthenticating: 0
        authEapstartWhileAuthenticating: 0
        authEaplogoggWhileAuthenticating: 0
        authReauthsWhileAuthenticated: 0
        authEapstartWhileAuthenticated: 0
        authEaplogoffWhileAuthenticated: 0
        BackendResponses: 2
        BackendAccessChallenges: 1
        BackendOtherrequestToSupplicant: 3
        BackendAuthSuccess: 1
```

show auth-mac interface

This command shows the status for MAC based authentication on the specified interface, which may be a static channel (or static aggregator) or a dynamic (or LACP) channel group or a switch port.

Use the optional **diagnostics** parameter to show authentication diagnostics for the specified interface. Use the optional **sessionstatistics** parameter to show authentication session statistics for the specified interface. Use the optional **statistics** parameter to show authentication diagnostics for the specified interface. Use the optional **supplicant** (client device) parameter to show the supplicant state for the specified interface.

Syntax

```
show auth-mac interface <interface-list>
   [diagnostics|sessionstatistics|statistics|supplicant [brief]]
```

Parameter	Description
<interface-list>	The interfaces or ports to configure. An interface-list can be: ■ an interface (e.g. `vlan2`), a switch port (e.g. `port1.0.12`), a static channel group (e.g. `sa3`) or a dynamic (LACP) channel group (e.g. `po4`) ■ a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. `vlan2-8`, or `port1.0.1-1.0.24`, or `sa2-4`, or `po1-3` ■ a comma-separated list of the above; e.g. `port1.0.1,port1.0.8-1.0.24`. Do not mix interface types in a list The specified interfaces must exist.
`diagnostics`	Diagnostics.
`sessionstatistics`	Session statistics.
`statistics`	Statistics.
`supplicant`	Supplicant (client device).
`brief`	Brief summary of supplicant state.

Mode Privileged Exec

Examples To display MAC based authentication status for `port1.0.12`, enter the command:

```
awplus# show auth-mac interface port1.0.2
```

```
% Port-Control not configured on port1.0.2
```

To display MAC authentication diagnostics for `port1.0.12`, enter the command:

```
awplus# show auth-mac interface port1.0.12 diagnostics
```

```
Authentication Diagnostics for interface port1.0.2
    Supplicant address: 00d0.59ab.7037
        authEnterConnecting: 2
        authEaplogoffWhileConnecting: 1
        authEnterAuthenticating: 2
        authSuccessWhileAuthenticating: 1
        authTimeoutWhileAuthenticating: 1
        authFailWhileAuthenticating: 0
        authEapstartWhileAuthenticating: 0
        authEaplogoggWhileAuthenticating: 0
        authReauthsWhileAuthenticated: 0
        authEapstartWhileAuthenticated: 0
        authEaplogoffWhileAuthenticated: 0
        BackendResponses: 2
        BackendAccessChallenges: 1
        BackendOtherrequestToSupplicant: 3
        BackendAuthSuccess: 1
```

To display authentication session statistics for `port1.0.12`, enter the command:

```
awplus# show auth-mac interface port1.0.12 sessionstatistics
```

```
Authentication session statistics for interface port1.0.12
    session user name: manager
        session authentication method: Remote server
        session time: 19440 secs
        session terminat cause: Not terminated yet
```

To display MAC authentication statistics for `port1.0.12`, enter the command:

```
awplus# show auth-mac interface port1.0.12 statistics
```

To display the MAC authenticated supplicant on interface `port1.0.12`, enter the command:

```
awplus# show auth-mac interface port1.0.12 supplicant
```

Related Commands

show dot1x sessionstatistics
show dot1x statistics interface
show dot1x supplicant interface

show auth-mac sessionstatistics

This command shows authentication session statistics for the specified interface, which may be a static channel (or static aggregator) or a dynamic (or LACP) channel group or a switch port.

Syntax `show auth-mac sessionstatistics [interface <interface-list>]`

Parameter	Description
`interface`	Specify an interface to show.
`<interface-list>`	The interfaces or ports to configure. An interface-list can be: ■ an interface (e.g. `vlan2`), a switch port (e.g. `port1.0.12`), a static channel group (e.g. `sa3`) or a dynamic (LACP) channel group (e.g. `po4`) ■ a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. `vlan2-8`, or `port1.0.1-1.0.24`, or `sa2-4`, or `po1-3` ■ a comma-separated list of the above; e.g. `port1.0.1,port1.0.8-1.0.24`. Do not mix interface types in a list The specified interfaces must exist.

Mode Privileged Exec

Example To display output displaying MAC authentication session statistics for `port1.0.12`, enter the command:

```
awplus# show auth-mac sessionstatistics interface port1.0.12
```

Output **Figure 70-4: Example output from the show auth-mac sessionstatistics command**

```
Authentication session statistics for interface port1.0.12
    session user name: manager
        session authentication method: Remote server
        session time: 19440 secs
        session terminat cause: Not terminated yet
```

show auth-mac statistics interface

This command shows the authentication statistics for the specified interface, which may be a static channel (or static aggregator) or a dynamic (or LACP) channel group or a switch port.

Syntax `show auth-mac statistics [interface <interface-list>]`

Parameter	Description
`interface`	Specify ports to show.
`<interface-list>`	The interfaces or ports to configure. An interface-list can be: ■ an interface (e.g. `vlan2`), a switch port (e.g. `port1.0.12`), a static channel group (e.g. `sa3`) or a dynamic (LACP) channel group (e.g. `po4`) ■ a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. `vlan2-8`, or `port1.0.1-1.0.24`, or `sa2-4`, or `po1-3` ■ a comma-separated list of the above; e.g. `port1.0.1,port1.0.8-1.0.24`. Do not mix interface types in a list The specified interfaces must exist.

Mode Privileged Exec

Example To display MAC authentication statistics for `port1.0.12`, enter the command:

```
awplus# show auth-mac statistics interface port1.0.12
```

Related Commands **show dot1x interface**

show auth-mac supplicant

This command shows the supplicant (client device) state when MAC authentication is configured for the switch. This command shows a summary when the optional **brief** parameter is used.

Syntax `show auth-mac supplicant [<macadd>] [brief]`

Parameter	Description
<macadd>	Mac (hardware) address of the Supplicant Entry format is HHHH.HHHH.HHHH (hexadecimal).
`brief`	Brief summary of the Supplicant state.

Mode Privileged Exec

Example To display the MAC authenticated supplicant for MAC address `00d0.59ab.7037`, enter the command:

```
awplus# show auth-mac supplicant 00d0.59ab.7037
```

```
Web authentication server
    Server status: enabled
    Server address: -
    HTTP Port No: 80
    Security: enabled
    Certification: default
    SSL Port No: 443
    Redirect URL:
    Redirect Delay Time: 30
    HTTP Redirect: disabled
    Session keep: disabled
    PingPolling: disable
    PingInterval: 30
    Timeout: 1
    FailCount: 5
    ReauthFresh: disabled
```

show auth-mac supplicant interface

This command shows the supplicant (client device) state for the MAC authenticated interface, which may be a static channel (or static aggregator) or a dynamic (or LACP) channel group or a switch port. This command shows a summary when the optional **brief** parameter is used.

Syntax `show auth-mac supplicant [interface <interface-list>] [brief]`

Parameter	Description
`interface`	Specify ports to show.
<interface-list>	The interfaces or ports to configure. An interface-list can be: ■ an interface (e.g. `vlan2`), a switch port (e.g. `port1.0.12`), a static channel group (e.g. `sa3`) or a dynamic (LACP) channel group (e.g. `po4`) ■ a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. `vlan2-8`, or `port1.0.1-1.0.24`, or `sa2-4`, or `po1-3` ■ a comma-separated list of the above; e.g. `port1.0.1,port1.0.8-1.0.24`. Do not mix interface types in a list The specified interfaces must exist.
`brief`	Brief summary of the supplicant state.

Mode Privileged Exec

Examples To display the MAC authenticated supplicant on the interface `port1.0.12`, enter the command:

```
awplus# show auth-mac supplicant interface port1.0.12
```

show auth-web

This command shows authentication information for Web-based authentication.

Syntax `show auth-web [all]`

Parameter	Description
`all`	Display all authentication information for each authenticated interface. This can be a static channel (or static aggregator), or a dynamic (or LACP) channel group, or a switch port.

Mode Privileged Exec

Example To display all Web authentication information, enter the command:

```
awplus# show auth-web all
```

Output **Figure 70-5: Example output from the show auth-web command**

```
awplus# show auth-web all

```

Related Commands **show dot1x interface**

show auth-web interface

This command shows the status for Web based authentication on the specified interface, which may be a static channel (or static aggregator) or a dynamic (or LACP) channel group or a switch port.

Use the optional **diagnostics** parameter to show authentication diagnostics for the specified interface. Use the optional **sessionstatistics** parameter to show authentication session statistics for the specified interface. Use the optional **statistics** parameter to show authentication diagnostics for the specified interface. Use the optional **supplicant** (client device) parameter to show the supplicant state for the specified interface.

Syntax

```
show auth-web interface <interface-list>
   [diagnostics|sessionstatistics|statistics|supplicant [brief]]
```

Parameter	Description
<interface-list>	The interfaces or ports to configure. An interface-list can be: ■ an interface (e.g. `vlan2`), a switch port (e.g. `port1.0.12`), a static channel group (e.g. `sa3`) or a dynamic (LACP) channel group (e.g. `po4`) ■ a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. `vlan2-8`, or `port1.0.1-1.0.24`, or `sa2-4`, or `po1-3` ■ a comma-separated list of the above; e.g. `port1.0.1,port1.0.8-1.0.24`. Do not mix interface types in a list The specified interfaces must exist.
`diagnostics`	Diagnostics.
`sessionstatistics`	Session statistics.
`statistics`	Statistics.
`supplicant`	Supplicant (client device).
`brief`	Brief summary of supplicant state.

Mode Privileged Exec

Example To display the Web based authentication status for `port1.0.12`, enter the command:

```
awplus# show auth-web interface port1.0.12
```

If web-based authentication is not configured, the output will be

```
% Port-Control not configured on port1.0.12
```

To display the Web based authentication status for `port1.0.1`, enter the command:

```
awplus# show auth-web interface port1.0.1
```

To display Web authentication diagnostics for `port1.0.12`, enter the command:

```
awplus# show auth-web interface port1.0.12 diagnostics
```

```
Authentication Diagnostics for interface port1.0.12
    Supplicant address: 00d0.59ab.7037

show auth-web sessionstatistics

This command shows authentication session statistics for the specified interface, which may be a static channel (or static aggregator) or a dynamic (or LACP) channel group or a switch port.

Syntax `show auth-web sessionstatistics [interface <interface-list>]`

Parameter	Description
`interface`	Specify ports to show.
`<interface-list>`	The interfaces or ports to configure. An interface-list can be: ■ an interface (e.g. `vlan2`), a switch port (e.g. `port1.0.12`), a static channel group (e.g. `sa3`) or a dynamic (LACP) channel group (e.g. `po4`) ■ a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. `vlan2-8`, or `port1.0.1-1.0.24`, or `sa2-4`, or `po1-3` ■ a comma-separated list of the above; e.g. `port1.0.1,port1.0.8-1.0.24`. Do not mix interface types in a list The specified interfaces must exist.

Mode Privileged Exec

Example To display authentication statistics for `port1.0.12`, enter the command:

```
awplus# show auth-web sessionstatistics interface port1.0.12
```

Output **Figure 70-7: Example output from the show auth-web sessionstatistics command**

```
Authentication session statistics for interface port1.0.12
    session user name: manager
        session authentication method: Remote server
        session time: 19440 secs
        session terminat cause: Not terminated yet
```

show auth-web statistics interface

This command shows the authentication statistics for the specified interface, which may be a static channel (or static aggregator) or a dynamic (or LACP) channel group or a switch port.

Syntax `show auth-web statistics interface <interface-list>`

Parameter	Description
<interface-list>	The interfaces or ports to configure. An interface-list can be: ■ an interface (e.g. `vlan2`), a switch port (e.g. `port1.0.12`), a static channel group (e.g. `sa3`) or a dynamic (LACP) channel group (e.g. `po4`) ■ a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. `vlan2-8`, or `port1.0.1-1.0.24`, or `sa2-4`, or `po1-3` ■ a comma-separated list of the above; e.g. `port1.0.1,port1.0.8-1.0.24`. Do not mix interface types in a list The specified interfaces must exist.

Mode Privileged Exec

Example To display Web authentication statistics for `port1.0.12`, enter the command:

```
awplus# show dot1x statistics interface port1.0.12
```

Related Commands **show dot1x interface**

show auth-web supplicant

This command shows the supplicant (client device) state when Web authentication is configured for the switch. This command shows a summary when the optional **brief** parameter is used.

Syntax `show auth-web supplicant [<macadd>] [brief]`

Parameter	Description
<macadd>	Mac (hardware) address of the supplicant Entry format is HHHH.HHHH.HHHH (hexadecimal).
`brief`	Brief summary of the supplicant state.

Mode Privileged Exec

Examples To display Web authenticated supplicant information on the switch, enter the command:

```
awplus# show auth-web supplicant
```

show auth-web supplicant interface

This command shows the supplicant (client device) state for the Web authenticated interface, which may be a static channel (or static aggregator) or a dynamic (or LACP) channel group or a switch port. This command shows a summary when the optional **brief** parameter is used.

Syntax `show auth-web supplicant interface <interface-list> [brief]`

Parameter	Description
<interface-list>	The interfaces or ports to configure. An interface-list can be: ■ an interface (e.g. `vlan2`), a switch port (e.g. `port1.0.12`), a static channel group (e.g. `sa3`) or a dynamic (LACP) channel group (e.g. `po4`) ■ a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. `vlan2-8`, or `port1.0.1-1.0.24`, or `sa2-4`, or `po1-3` ■ a comma-separated list of the above; e.g. `port1.0.1,port1.0.8-1.0.24`. Do not mix interface types in a list The specified interfaces must exist.
`brief`	Brief summary of the supplicant state.

Mode Privileged Exec

Examples To display the Web authenticated supplicant on the interface `port1.0.12`, enter the command:

```
awplus# show auth-web supplicant interface port1.0.12
```

To display brief summary output for the Web authenticated supplicant, enter the command:

```
awplus# show auth-web supplicant brief
```

show auth-web-server

This command shows the web authentication server configuration and status on the switch.

Syntax `show auth-web-server`

Mode Privileged Exec

Example To display web authentication server configuration and status, enter the command:

```
awplus# show auth-web-server
```

Output **Figure 70-8: Example output from the show auth-web-server command**

```
Web authentication server
    Server status: enabled
    Server mode: none
    Server address: 192.168.1.1/24
      DHCP server enabled
      DHCP lease time: 20
      DHCP WPAD Option URL: http://192.168.1.1/proxy.pac
    HTTP Port No: 80
    Security: disabled
    Certification: default
    SSL Port No: 443
    Redirect URL: --
    Redirect Delay Time: 5
    HTTP Redirect: enabled
    Session keep: disabled
    PingPolling: disabled
    PingInterval: 30
    Timeout: 1
    FailCount: 5
    ReauthTimerReFresh: disabled
```

auth-web-server http-redirect
auth-web-server ipaddress
auth-web-server port
auth-web-server redirect-delay-time
auth-web-server redirect-url
auth-web-server session-keep
auth-web-server ssl
auth-web-server sslport

show proxy-autoconfig-file

This command displays the contents of the proxy auto configuration (PAC) file.

Syntax `show proxy-autoconfig-file`

Mode Privileged Exec

Example To display the contents of the proxy auto configuration (PAC) file, enter the command:

```
awplus# show auth proxy-autoconfig-file
```

Output **Figure 70-9: Example output from the show proxy-autoconfig-file**

```
function FindProxyForURL(url,host)
{
 if (isPlainHostName(host) ||
     isInNet(host, "192.168.1.0","255.255.255.0")) {
   return "DIRECT";
}
 else {
   return "PROXY 192.168.110.1:8080";
 }
}
```

Sample MAC Authentication Configuration 71.8
Sample Web-Authentication Configuration 71.9
Sample Tri-Authentication Configuration 71.10

AAA Introduction

AAA is the collective title for the three related functions of Authentication, Authorization and Accounting. These function can be applied in a variety of methods with a variety of servers. The purpose of the AAA commands is to map instances of the AAA functions to sets of servers.

The Authentication function can be performed in multiple contexts, such as authentication of users logging in at a console, or 802.1x authentication of devices connecting to Ethernet ports.

For each of these contexts, you may want to use different sets of servers for examining the proffered authentication credentials and deciding if they are valid. AAA Authentication commands enable you to specify which servers will be used for different types of authentication.

Available functions and server types

Authentication, Authorization and Accounting functions are available.

Authentication is performed in the following contexts:

- Login authentication of user shell sessions on the console port, and via telnet/SSH
- Enable password authentication for user shell sessions on the console port, and via telnet/SSH (TACACS+ only)
- 802.1x authentication of devices connecting to switch ports
- MAC authentication of devices connecting to switch ports
- Web-based authentication of devices connecting to switch ports

Authorization is performed in the following context:

- TACACS+ login authentication. Note that with the AlliedWare Plus TACACS+ implementation:
  - « authorization cannot be performed independently of the login authentication process
  - « authorization will not be attempted if enable password authentication is configured
  - « there are no authorization commands available

Accounting is performed in the following contexts:

- Accounting of console, telnet, and SSH login sessions
- Accounting of commands executed within user shell sessions (TACACS+ only)
- Accounting of 802.1x-authenticated connections
- Accounting of MAC-authenticated connections
- Accounting of Web-authenticated connections

The three types of servers that can be used are:

- Local user database
- RADIUS servers
- TACACS+ servers

Server Groups and Method Lists

There are two constructs that underlie the structure of the AAA commands:

- Server groups are lists of RADIUS servers
- Method Lists are lists of server types

Server Groups

A server group is defined by the command **aaa group server**. This command puts you into Server Group configuration mode. Once in that mode you can add servers to the group by using the command **server auth-port**.

Any number of servers can be added to a group. Typically, you will add servers which have already been configured by the command **radius-server host**. If you add a server that has not yet been configured by the command **radius-server host**, you will receive a warning that the server has not yet been configured, but the command will be accepted.

There is one server group that is always present on the switch by default that cannot be removed. It is the group simply named **radius** that comprises all servers that have been configured using the command **radius-server host**. As soon as a server is configured by the command **radius-server host**, it is automatically a member of the server group **radius** and cannot be removed from it.

Method Lists

A method list defines the set of server types that you want to be used for authenticating a user/device, and the order in which you want the server types to be used.

- You may want the usernames proffered for logging in at the console to be checked for in the local user database. You can create a server list that specifies **local**.
- You may want to check the TACACS+ servers first, and resort to the local user database if none of the TACACS+ servers respond. You can create a server list that specifies **group tacacs+** first, followed by **local**.
- You may want to check the RADIUS servers first, and resort to the local user database if none of the RADIUS servers respond. You can create a server list that specifies **group radius** first, followed by **local**.

A method list defines the servers where authentication requests are sent. The first server listed is used to authenticate users; if that server fails then the next authentication server type in the method list is selected. This process continues until there is a successful authentication or until all server types fail.

When a user attempts to log in, the switch sends an authentication request to the first authentication server in the method list. If the first server in the list is reachable and it contains a username and password matching the authentication request, the user is authenticated and the login succeeds. If the authentication server denies the authentication request because of an incorrect username or password, the user login fails. If the first server in the method list is unreachable, the switch sends the request to the next server in the list, and so on.

For example, if the method list specifies `group tacacs+ local`, and a user attempts to log in with a password that does not match a user entry in the first TACACS+ server, if this TACACS+ server denies the authentication request, then the switch does not try any other TACACS+ servers not the local user database; the user login fails.

Default Method Lists

For every authentication or accounting type, it is always possible to define a method list called **default**. For most of the authentication and accounting types, the only method list that can be defined is default.

As soon as the default method list is defined for a given authentication or accounting type, it is automatically applied as the method list to be used for any instance of that type of authentication or accounting, except for instances to which another named method list has been specifically applied.

Configuring AAA Login Authentication

To configure AAA authentication, create default or a named method list for different authentication types. In the case of login authentication, the named method lists are then applied to consoles or VTY lines.

AAA Configuration Tasks

To define how a given accounting or authentication type will be applied to a given port or line:

- either create a server group using the **aaa group server** command (RADIUS only),
- or create a method list for the authentication or accounting type as required,
- then apply that method list to the port or line as required.

Step 1: Define a group of RADIUS Servers:

Create a server group using the **aaa group server** command.

To create a RADIUS server group named `GROUP1` with hosts `192.168.1.1`, `192.168.2.1` and `192.168.3.1`, use the commands:

```
awplus(config)# aaa group server radius GROUP1
awplus(config-sg)# server 192.168.1.1 auth-port 1812 acct-port 1813
awplus(config-sg)# server 192.168.2.1 auth-port 1812 acct-port 1813
awplus(config-sg)# server 192.168.3.1 auth-port 1812 acct-port 1813
```

Step 2: Specify the login authentication or accounting Method List:

Create a method list for the authentication (**aaa authentication login**) or accounting (**aaa accounting login**) type as required.

To configure a user login authentication method list called `USERS` to use first all available RADIUS servers for user login authentication and then the local user database, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication login default group radius local
```

To configure RADIUS accounting for login shell sessions, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting login default start-stop group radius
```

To configure a user login authentication method list called `USERS` to use first the TACACS+ servers for user login authentication and then the local user database, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication login USERS group tacacs+
local
```

Step 3: Apply Method List to Interface Port or Line:

Apply that method list to the port or line as required.

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# login authentication USERS
```

For most Authentication and Accounting types, the only possible server list is **default**, and the only server that can be put into it is **radius**. You will typically use all RADIUS servers, so **group radius** can be used, rather than having to create a specific user group. Often the configuration of a given Authentication or Accounting type will consist of a single command, the command that defines the default server list, which contains just one server.

AAA 802.1x Authentication Configuration:

AAA 802.1x authentication will typically be configured with the following commands.

To enable 802.1x Authentication globally for all RADIUS servers, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication dot1x default group radius
```

Sample Authentication Configurations

Sample 802.1X Authentication Configuration

See the below sample configuration script for a sample 802.1X authentication configuration. Copy and paste then edit the sample 802.1X authentication configuration in your config file. See the **edit** command in the **Chapter 7, File Management Commands** for further information.

Output

Figure 71-1: Sample 802.1X Authentication Configuration

```
!
 radius-server host 127.0.0.1 key awplus-local-radius-server
!
 aaa authentication dot1x default group radius
!
 radius-server local
 server enable
 nas 127.0.0.1 key awplus-local-radius-server
 user guest password guest!
!
 no spanning-tree rstp enable
!
 interface port1.0.1
 switchport
 switchport mode access
 dot1x port-control auto
!
 interface vlan1
 ip address 192.168.1.120/24
!
```

The 802.1X authentication feature needs the **aaa authentication dot1x** command and the **dot1x port-control** command configured on an interface. See **Chapter 72, AAA Commands** and **Chapter 68, 802.1X Commands** for command information to edit this configuration.

Local RADIUS Server has been configured to use 802.1X authentication in this sample configuration. See the **radius-server local** and **server enable** commands in **Chapter 78, Local RADIUS Server Commands** for command information to edit this sample configuration.

This sample configuration enables 802.1X authentication on interface `vlan1` with IP address `192.168.1.120`. Change the VLAN ID and IP address as required for your configuration.

Sample MAC Authentication Configuration

See the below sample configuration script for a sample MAC authentication configuration. Copy, paste, and edit the sample MAC authentication configuration in the config file. See the **edit** command in the **Chapter 7, File Management Commands** for further information.

Output

Figure 71-2: Sample MAC Authentication Configuration

```
!
 radius-server host 127.0.0.1 key awplus-local-radius-server
!
 aaa authentication auth-mac default group radius
!
 radius-server local
 server enable
 nas 127.0.0.1 key awplus-local-radius-server
 user 00-d0-59-ab-70-37 password 00-d0-59-ab-70-37
!
 no spanning-tree rstp enable
!
 interface port1.0.1
 switchport
 switchport mode access
 auth-mac enable
!
 interface vlan1
 ip address 192.168.1.120/24
!
```

The MAC authentication feature needs the **aaa authentication auth-mac** and the **auth-mac enable** commands configured on an interface. See **Chapter 72, AAA Commands** and **Chapter 70, Authentication Commands** for command information to edit this configuration.

Local RADIUS Server has been configured to use MAC authentication in this sample configuration. See the **radius-server local** and **server enable** commands in **Chapter 78, Local RADIUS Server Commands** for command information to edit this sample configuration.

See the **user (RADIUS server)** command in **Chapter 78, Local RADIUS Server Commands** for command information to edit the MAC address of the supplicant for use with local RADIUS server as the RADIUS user name and the user password, as shown in the above configuration.

This configuration enables MAC authentication on `vlan1` with IP address `192.168.1.120`. Change the interface VLAN ID, MAC, and IP addresses as needed in your configuration.

Sample Web-Authentication Configuration

See the below sample configuration script for a sample Web-authentication configuration. Copy, paste, and edit the sample Web-authentication configuration for your config file. See the **edit** command in the **Chapter 7, File Management Commands** for further information.

Output

Figure 71-3: Sample Web-Authentication Configuration

```
!
 radius-server host 127.0.0.1 key awplus-local-radius-server
!
 aaa authentication auth-web default group radius
!
 radius-server local
 server enable
 nas 127.0.0.1 key awplus-local-radius-server
 user guest encrypted password
 l+lWcLjLm29bCAXwWRPHXK0PFlsA7gNpR+P7wO4kwQQ=
!
 no spanning-tree rstp enable
!
 interface port1.0.1
 switchport
 switchport mode access
 auth-web enable
!
 interface vlan1
 ip address 192.168.1.120/24
!
```

The Web-authentication feature needs the **aaa authentication auth-web** and the **auth-web enable** commands configured on an interface. See **Chapter 72, AAA Commands** and **Chapter 70, Authentication Commands** for command information to edit this configuration.

Local RADIUS Server has been configured to use Web-authentication in this sample configuration. See the **radius-server local** and **server enable** commands in **Chapter 78, Local RADIUS Server Commands** for command information to edit this sample configuration.

The above sample Web-authentication configuration requires the user name '`guest`' with password '`guest!`' on IP address `192.168.1.120` from interface `port1.0.1`.

Sample Tri-Authentication Configuration

See the below sample configuration script for a sample tri-authentication configuration that configures 802.1X authentication, MAC authentication, and Web-authentication on the same interface. Copy, paste, and edit the sample tri-authentication configuration for your config file. See the **edit** command in the **Chapter 7, File Management Commands** for further information.

Output

Figure 71-4: Sample Tri-Authentication Configuration

```
!
 radius-server host 127.0.0.1 key awplus-local-radius-server
!
 aaa authentication dot1x default group radius
 aaa authentication auth-mac default group radius
 aaa authentication auth-web default group radius
!
 radius-server local
 server enable
 nas 127.0.0.1 key awplus-local-radius-server
 user guest password guest!
 user 00-d0-59-ab-70-37 password 00-d0-59-ab-70-37
!
 no spanning-tree rstp enable
!
 interface port1.0.1
 switchport
 switchport mode access
 dot1x port-control auto
 auth-mac enable
 auth-web enable
!
 interface vlan1
 ip address 192.168.1.120/24
!
```

The 802.1X authentication feature needs the **aaa authentication dot1x** command and the **dot1x port-control** command configured on an interface. See **Chapter 72, AAA Commands** and **Chapter 68, 802.1X Commands** for command information to edit this configuration.

The MAC authentication feature needs the **aaa authentication auth-mac** and the **auth-mac enable** commands configured on an interface. See **Chapter 72, AAA Commands** and **Chapter 70, Authentication Commands** for command information to edit this configuration.

The Web-authentication feature needs the **aaa authentication auth-web** and the **auth-web enable** commands configured on an interface. See **Chapter 72, AAA Commands** and **Chapter 70, Authentication Commands** for command information to edit this configuration.

Local RADIUS Server has been configured to use tri-authentication in this sample configuration. See the **radius-server local** and **server enable** commands in **Chapter 78, Local RADIUS Server Commands** for command information to edit this sample configuration.

This sample tri-authentication configuration requires a user name '`guest`' with password '`guest!`' on IP address `192.168.1.120` from `port1.0.1`. Note this sample also configures 802.1X and MAC authentication on `vlan1` with IP address `192.168.1.120`. Change the interface VLAN ID, MAC and IP address as needed for your configuration.

Note that when tri-authentication is applied to the same interface then the order of execution is MAC authentication first, then 802.1X or Web-authentication, if MAC authentication fails.

Chapter 72: AAA Commands

Command List 72.2
aaa accounting auth-mac default 72.2
aaa accounting auth-web default 72.4

debug aaa 72.26
login authentication 72.27
show debugging aaa 72.28
undebug aaa 72.29

Command List

This chapter provides an alphabetical reference for AAA commands for Authentication, Authorization and Accounting. For more information, see **Chapter 71, AAA Introduction and Configuration**.

aaa accounting auth-mac default

This command configures a default accounting method list for MAC-based Authentication. The default accounting method list specifies what type of accounting messages are sent and specifies which RADIUS Servers the accounting messages are sent to. The default accounting method list is automatically applied to interfaces with MAC-based Authentication enabled.

Use the **no** variant of this command to disable AAA accounting for MAC-based Authentication globally.

Syntax

```
aaa accounting auth-mac default {start-stop|stop-only|none}
   group {<group-name>|radius}

no aaa accounting auth-mac default
```

Parameter	Description
`start-stop`	Start and stop records to be sent.
`stop-only`	Stop records to be sent.
`none`	No accounting record to be sent.
`<group-name>`	Server group name.
`radius`	Use all RADIUS servers

Default RADIUS accounting for MAC-based Authentication is disabled by default

Mode Global Configuration

Usage There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius** : use all RADIUS servers configured by **radius-server host** command
- **group <*group-name*>** : use the specified RADIUS server group configured with the **aaa group server** command

The accounting event to send to the RADIUS server is configured with the following options:

- **start-stop** : sends a **start** accounting message at the beginning of a session and a **stop** accounting message at the end of the session.
- **stop-only** : sends a **stop** accounting message at the end of a session.
- **none** : disables accounting.

Examples To enable RADIUS accounting for MAC-based Authentication, and use all available RADIUS Servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting auth-mac default start-stop
group radius
```

To disable RADIUS accounting for MAC-based Authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting auth-mac default
```

Related Commands **aaa authentication auth-mac**

aaa accounting auth-web default

This command configures a default accounting method list for Web-based Port Authentication. The default accounting method list specifies what type of accounting messages are sent and specifies which RADIUS Servers the accounting messages are sent to. The default accounting method list is automatically applied to interfaces with Web-based Authentication enabled.

Use the **no** variant of this command to disable AAA accounting for Web-based Port Authentication globally.

Syntax

```
aaa accounting auth-web default {start-stop|stop-only|none}
   group {<group-name>|radius}

no aaa accounting auth-web default
```

Parameter	Description
`start-stop`	Start and stop records to be sent.
`stop-only`	Stop records to be sent.
`none`	No accounting record to be sent.
`<group-name>`	Server group name.
`radius`	Use all RADIUS servers.

Default RADIUS accounting for WEB-based Port Authentication is disabled by default.

Mode Global Configuration

Usage There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius** : use all RADIUS servers configured by **radius-server host** command
- **group <*group-name*>** : use the specified RADIUS server group configured with the **aaa group server** command

Configure the accounting event to be sent to the RADIUS server with the following options:

- **start-stop** : sends a **start** accounting message at the beginning of a session and a **stop** accounting message at the end of the session.
- **stop-only** : sends a **stop** accounting message at the end of a session.
- **none** : disables accounting.

Examples To enable RADIUS accounting for Web-based Authentication, and use all available RADIUS Servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting auth-web default start-stop
group radius
```

To disable RADIUS accounting for Web-based Authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting auth-web default
```

Related Commands **aaa authentication auth-web**

aaa accounting commands

Use this command to configure and enable TACACS+ command accounting. When command accounting is enabled, information about a command entered at a specified privilege level on a device is sent to a TACACS+ server. To account for all commands entered on a device you need to configure command accounting for each discrete privilege level. A command accounting record includes the command as entered for the specified privilege level, the date and time each command execution finished, and the username of the user who executed the command.

This command creates a default method list that is applied to every console and vty line. The **stop-only** parameter indicates that an accounting message is sent to the TACACS+ server when a command has stopped executing.

Note that up to four TACACS+ servers can be configured for accounting. The servers are checked for reachability in the order they are configured and only the first reachable server is used. If no server is found the accounting message is dropped.

Use the **no** variant of this command to disable command accounting.

Syntax

```
aaa accounting commands <1-15> default stop-only group tacacs+
no aaa accounting commands <1-15> default
```

Parameter	Description
<1-15>	The privilege level, in the range 1 to 15.

Default TACACS+ command accounting is disabled by default.

Mode Global Configuration

Usage When command accounting is enabled, the command as entered is included in the accounting packets sent to the TACACS+ accounting server.

You cannot enable command accounting if a trigger is configured. An error message is displayed if you attempt to enable command accounting and a trigger is configured.

The **show tech-support** command runs a number of commands and each command is accounted separately.

When the **copy <*filename*> running-config** command is executed all the commands of a configuration file copied into the running-config are accounted separately.

Examples To configure command accounting for privilege level 15 commands, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting commands 15 default stop-only
group tacacs+
```

To disable command accounting for privilege level 15 commands, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting commands 15 default
```

Related Commands

aaa authentication login
aaa accounting login
accounting login
tacacs-server host

aaa accounting dot1x

This command configures the default accounting method list for IEEE 802.1x-based Authentication. The default accounting method list specifies what type of accounting messages are sent and specifies which RADIUS Servers the accounting messages are sent to. The default accounting method list is automatically applied to interfaces with IEEE 802.1x-based Authentication enabled.

Use the **no** variant of this command to disable AAA accounting for 802.1x-based Port Authentication globally.

Syntax

```
aaa accounting dot1x default {start-stop|stop-only|none}
   group {<group-name>|radius}

no aaa accounting dot1x default
```

Parameter	Description
`start-stop`	Start and stop records to be sent.
`stop-only`	Stop records to be sent.
`none`	No accounting record to be sent.
<group-name>	Server group name.
`radius`	Use all RADIUS servers.

Default RADIUS accounting for 802.1X-based Port Authentication is disabled by default. (There is no default server set by default).

Mode Global Configuration

Usage There are two ways to define servers where RADIUS accounting messages will be sent:

- **group radius** : use all RADIUS servers configured by **radius-server host** command
- **group <*group-name*>** : use the specified RADIUS server group configured with the **aaa group server** command

The accounting event to send to the RADIUS server is configured by the following options:

- **start-stop** : sends a **start** accounting message at the beginning of a session and a **stop** accounting message at the end of the session.
- **stop-only** : sends a **stop** accounting message at the end of a session.
- **none** : disables accounting.

Example To enable RADIUS accounting for 802.1x-based Authentication, and use all available RADIUS Servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting dot1x default start-stop group
radius
```

To disable RADIUS accounting for 802.1x-based Authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting dot1x default
```

Related Commands

aaa accounting update
aaa authentication dot1x
aaa group server
dot1x port-control
radius-server host

aaa accounting login

This command configures RADIUS and TACACS+ accounting for login shell sessions. The specified method list name can be used by the **accounting login** command in the Line Configuration mode. If the **default** parameter is specified, then this creates a default method list that is applied to every console and vty line, unless another accounting method list is applied on that line.

Note that unlimited RADIUS servers and up to four TACACS+ servers can be configured and consulted for accounting. The first server configured is regarded as the primary server and if the primary server fails then the backup servers are consulted in turn. A backup server is consulted if the primary server fails, i.e is unreachable.

Use the **no** variant of this command to remove an accounting method list for login shell sessions configured by an **aaa accounting login** command. If the method list being deleted is already applied to a console or vty line, accounting on that line will be disabled. If the default method list name is removed by this command, it will disable accounting on every line that has the default accounting configuration.

Syntax

```
aaa accounting login {default|<list-name>}
   {start-stop|stop-only|none} {group {radius|tacacs+|<group-name>}}

no aaa accounting login {default|<list-name>}
```

Parameter	Description
`default`	Default accounting method list.
`<list-name>`	Named accounting method list.
`start-stop`	Start and stop records to be sent.
`stop-only`	Stop records to be sent.
`none`	No accounting record to be sent.
`group`	Specify the servers or server group where accounting packets are sent.
`radius`	Use all RADIUS servers configured by the **radius-server host** command on page 74.6.
`tacacs+`	Use all TACACS+ servers configured by the **tacacs-server host** command.
`<group-name>`	Use the specified RADIUS server group, as configured by the **aaa group server** command.

Default Accounting for login shell sessions is disabled by default.

Mode Global Configuration

Usage This command enables you to define a named accounting method list. The items that you define in the accounting options are:

- the types of accounting packets that will be sent
- the set of servers to which the accounting packets will be sent

You can define a default method list with the name `default` and any number of other named method lists. The *<list-name>* for any method list that you define can then be used as the *<list-name>* parameter in the **accounting login** command available from Line Configuration mode.

If the method list name already exists, the command will replace the existing configuration with the new one.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius** use all RADIUS servers configured by **radius-server host** command
- **group <*group-name*>** use the specified RADIUS server group configured with the **aaa group server** command

There is one way to define servers where TACACS+ accounting messages are sent:

- **group tacacs+** use all TACACS+ servers configured by **tacacs-server host** command

The accounting event to send to the RADIUS or TACACS+ server is configured with the following options:

- **start-stop** sends a **start** accounting message at the beginning of a session and a **stop** accounting message at the end of the session.
- **stop-only** sends a **stop** accounting message at the end of a session.
- **none** disables accounting.

Examples To configure RADIUS accounting for login shell sessions, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting login default start-stop group
radius
```

To configure TACACS+ accounting for login shell sessions, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting login default start-stop group
tacacs+
```

To reset the configuration of the default accounting list, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting login default
```

Related Commands
aaa accounting commands
aaa authentication login
aaa accounting login
aaa accounting update
accounting login

tacacs-server host

aaa accounting update

This command enables periodic accounting reporting to either the RADIUS or TACACS+ accounting server(s) wherever login accounting has been configured.

Note that unlimited RADIUS servers and up to four TACACS+ servers can be configured and consulted for accounting. The first server configured is regarded as the primary server and if the primary server fails then the backup servers are consulted in turn. A backup server is consulted if the primary server fails, i.e is unreachable.

Use the **no** variant of this command to disable periodic accounting reporting to the accounting server(s).

Syntax

```
aaa accounting update [periodic <1-65535>]
no aaa accounting update
```

Parameter	Description
`periodic`	Send accounting records periodically.
<1-65535>	The interval to send accounting updates (in minutes). The default is 30 minutes.

Default Periodic accounting update is disabled by default.

Mode Global Configuration

Usage Use this command to enable the device to send periodic AAA login accounting reports to the accounting server. When periodic accounting report is enabled, interim accounting records are sent according to the interval specified by the **periodic** parameter. The accounting updates are start messages.

If the **no** variant of this command is used to disable periodic accounting reporting, any interval specified by the **periodic** parameter is reset to the default of 30 minutes when accounting reporting is reenabled, unless this interval is specified.

Example To configure the switch to send period accounting updates every 30 minutes, the default period, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting update
```

To configure the switch to send period accounting updates every 10 minutes, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting update periodic 10
```

To disable periodic accounting update wherever accounting has been configured, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting update
```

Related Commands

aaa accounting auth-web default
aaa accounting dot1x
aaa accounting login

aaa authentication auth-mac

This command enables MAC-based Port Authentication globally and allows you to specify an authentication method list. It is automatically applied to every interface running MAC-based Port Authentication.

Use the **no** variant of this command to globally disable MAC-based Port Authentication.

Syntax

```
aaa authentication auth-mac default group {<group-name>|radius}
no aaa authentication auth-mac default
```

Parameter	Description
<group-name>	Server group name.
radius	Use all RADIUS servers.

Default MAC-based Port Authentication is disabled by default.

Mode Global Configuration

Usage There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius** : use all RADIUS servers configured by **radius-server host** command
- **group <*group-name*>** : use the specified RADIUS server group configured with the **aaa group server** command

All configured RADIUS Servers are automatically members of the server group **radius**. If a server is added to a named group **<*group-name*>**, it also remains a member of the group **radius**.

Example To enable MAC-based Port Authentication globally for all RADIUS servers, and use all available RADIUS servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authentication auth-mac default group
radius
```

To disable MAC-based Port Authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication auth-mac default
```

Related Commands
aaa accounting auth-mac default
auth-mac enable

aaa authentication auth-web

This command enables Web-based Port Authentication globally and allows you to enable an authentication method list (in this case, a list of RADIUS Servers). It is automatically applied to every interface running Web-based Port Authentication.

Use the **no** variant of this command to globally disable Web-based Port Authentication.

Syntax

```
aaa authentication auth-web default group {<group-name>|radius}
no aaa authentication auth-web default
```

Parameter	Description
<group-name>	Server group name.
radius	Use all RADIUS servers.

Default Web-based Port Authentication is disabled by default.

Mode Global Configuration

Usage There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius** : use all RADIUS servers configured by **radius-server host** command
- **group <*group-name*>** : use the specified RADIUS server group configured with the **aaa group server** command

Example To enable Web-based Port Authentication globally for all RADIUS servers, and use all available RADIUS servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authentication auth-web default group
radius
```

To disable Web-based Port Authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication auth-web default
```

Related Commands

aaa accounting auth-web default
auth-mac enable

aaa authentication dot1x

This command enables 802.1X-based Port Authentication globally and allows you to enable an authentication method list. It is automatically applied to every interface running 802.1X-based Port Authentication.

Use the **no** variant of this command to globally disable 802.1X-based Port Authentication.

Syntax

```
aaa authentication dot1x default group {<group-name>|radius}
no aaa authentication dot1x default
```

Parameter	Description
`radius`	Use all RADIUS servers.
<group-name>	Server group name.

Default 802.1x-based Port Authentication is disabled by default.

Mode Global Configuration

Usage Use this command to specify the default method list to use for authentication on all switch ports with 802.1X enabled. Use the **no** variant of this command to reset the default authentication method list for 802.1X, to its default, that is, to use the group **radius**, containing all RADIUS servers configured by the **radius-server host** command.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius** : use all RADIUS servers configured by **radius-server host** command
- **group *<group-name>*** : use the specified RADIUS server group configured with the **aaa group server** command

Example To enable 802.1X-based Port Authentication globally with all RADIUS servers, and use all available RADIUS servers, use the command:

```
awplus# configure terminal
awplus(config)# aaa authentication dot1x default group radius
```

To disable 802.1X-based Port Authentication, use the command:

```
awplus# configure terminal
awplus(config)# no aaa authentication dot1x default
```

Related Commands

aaa accounting dot1x
aaa group server
dot1x port-control
radius-server host

aaa authentication enable default group tacacs+

This command enables AAA authentication to determine the privilege level a user can access for passwords authenticated against the TACACS+ server.

Use the **no** variant of this command to disable privilege level authentication.

Syntax

```
aaa authentication enable default group tacacs+ [local] [none]
no aaa authentication enable default
```

Parameter	Description
`local`	Use the locally configured enable password (**enable password** command) for authentication.
`none`	No authentication.

Default Local privilege level authentication is enabled by default (**aaa authentication enable default local** command).

Mode Global Configuration

Usage A user is configured on a TACACS+ server with a maximum privilege level. When they enter the **enable (Privileged Exec mode)** command they are prompted for an enable password which is authenticated against the TACACS+ server. If the password is correct and the specified privilege level is equal to or less than the users maximum privilege level, then they are granted access to that level. If the user attempts to access a privilege level that is higher than their maximum configured privilege level, then the authentication session will fail and they will remain at their current privilege level.

Note If both **local** and **none** are specified, you must always specify **local** first.

If the TACACS+ server goes offline, or is not reachable during enable password authentication, and command level authentication is configured as:

- **aaa authentication enable default group tacacs+**
  then the user is never granted access to Privileged Exec mode.
- **aaa authentication enable default group tacacs+ local**
  then the user is authenticated using the locally configured enable password, which if entered correctly grants the user access to Privileged Exec mode. If no enable password is locally configured (**enable password** command), then the enable authentication will fail until the TACACS+ server becomes available again.
- **aaa authentication enable default group tacacs+ none**
  then the user is granted access to Privileged Exec mode with no authentication. This is true even if a locally configured enable password is configured.
- **aaa authentication enable default group tacacs+ local none**
  then the user is authenticated using the locally configured enable password. If no enable password is locally configured, then the enable authentication will grant access to Privileged Exec mode with no authentication.

If the password for the user is not successfully authenticated by the server, then the user is again prompted for an enable password when they enter **enable** via the CLI.

Example To enable a privilege level authentication method that will not allow the user to access Privileged Exec mode if the TACACS+ server goes offline, or is not reachable during enable password authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication enable default group tacacs+
```

To enable a privilege level authentication method that will allow the user to access Privileged Exec mode if the TACACS+ server goes offline, or is not reachable during enable password authentication, and a locally configured enable password is configured, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication enable default group tacacs+
local
```

To disable privilege level authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication enable default
```

Related Commands
aaa authentication login
aaa authentication enable default local
enable (Privileged Exec mode)
enable password
enable secret
tacacs-server host

aaa authentication enable default local

This command enables AAA authentication to determine the privilege level a user can access for passwords authenticated locally.

Syntax `aaa authentication enable default local`

Default Local privilege level authentication is enabled by default.

Mode Global Configuration

Usage The privilege level configured for a particular user in the local user database is the privilege threshold above which the user is prompted for an **enable (Privileged Exec mode)** command.

Example To enable local privilege level authentication command, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication enable default local
```

To disable privilege level authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication enable default
```

Related Commands
aaa authentication enable default group tacacs+
aaa authentication login
enable (Privileged Exec mode)
enable password
enable secret
tacacs-server host

aaa authentication login

Use this command to create an ordered list of methods to use to authenticate user login, or to replace an existing method list with the same name. Specify one or more of the options **local** or **group**, in the order you want them to be applied. If the **default** method list name is specified, it is applied to every console and VTY line immediately unless another method list is applied to that line by the **login authentication** command. To apply a non-default method list, you must also use the **login authentication** command.

Use the **no** variant of this command to remove an authentication method list for user login. The specified method list name is deleted from the configuration. If the method list name has been applied to any console or VTY line, user login authentication on that line will fail.

Note that the **no aaa authentication login default** command does not remove the default method list. This will return the default method list to its default state (**local** is the default).

Syntax

```
aaa authentication login {default|<list-name>}
   {[local] [group {radius|tacacs+|<group-name>}]}

no aaa authentication login {default|<list-name>}
```

Parameter	Description
`default`	Set the default authentication server for user login.
`<list-name>`	Name of authentication server.
`local`	Use the local username database.
`group`	Use server group.
`radius`	Use all RADIUS servers configured by the **radius-server host** command on page 74.6.
`tacacs+`	Use all TACACS+ servers configured by the **tacacs-server host** command.
`<group-name>`	Use the specified RADIUS server group, as configured by the **aaa group server** command.

Default If the default server is not configured using this command, user login authentication uses the local user database only.

If the **default** method list name is specified, it is applied to every console and VTY line immediately unless a named method list server is applied to that line by the **login authentication** command.

local is the default state for the default method list unless a named method list is applied to that line by the **login authentication** command. Reset to the default method list using the **no aaa authentication login default** command.

Mode Global Configuration

Usage When a user attempts to log in, the switch sends an authentication request to the first authentication server in the method list. If the first server in the list is reachable and it contains a username and password matching the authentication request, the user is authenticated and the login succeeds. If the authentication server denies the authentication request because of an incorrect username or password, the user login fails. If the first server in the method list is unreachable, the switch sends the request to the next server in the list, and so on.

For example, if the method list specifies group tacacs+ local, and a user attempts to log in with a password that does not match a user entry in the first TACACS+ server, if this TACACS+ server denies the authentication request, then the switch does not try any other TACACS+ servers not the local user database; the user login fails.

Examples To configure the default authentication method list for user login to use first all available RADIUS servers for user login authentication and then the local user database, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication login default group radius
local
```

To configure a user login authentication method list called `USERS` to use first the RADIUS server group `RAD_GROUP1` for user login authentication and then the local user database, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication login USERS group
RAD_GROUP1 local
```

To configure a user login authentication method list called `USERS` to use first the TACACS+ servers for user login authentication and then the local user database, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication login USERS group tacacs+
local
```

To return to the default method list (**local** is the default server), use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication login default
```

To delete an existing authentication method list `USERS` created for user login authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication login USERS
```

Related Commands **aaa accounting commands**
aaa authentication enable default group tacacs+
login authentication

aaa group server

This command configures a RADIUS server group. A server group can be used to specify a subset of RADIUS servers in **aaa** commands. The group name **radius** is predefined, which includes all RADIUS servers configured by the **radius-server host** command.

RADIUS servers are added to a server group using the **server** command. Each RADIUS server should be configured using the **radius-server host** command.

Use the **no** variant of this command to remove an existing RADIUS server group.

Syntax

```
aaa group server radius <group-name>
no aaa group server radius <group-name>
```

Parameter	Description
<group-name>	Server group name.

Mode Global Configuration

Usage Use this command to create an AAA group of RADIUS servers, and to enter Server Group Configuration mode, in which you can add servers to the group. Use a server group to specify a subset of RADIUS servers in AAA commands. Each RADIUS server must be configured by the **radius-server host** command. To add RADIUS servers to a server group, use the **server** command.

Example To create a RADIUS server group named `GROUP1` with hosts `192.168.1.1`, `192.168.2.1` and `192.168.3.1`, use the commands:

```
awplus(config)# aaa group server radius GROUP1
awplus(config-sg)# server 192.168.1.1 auth-port 1812 acct-
port 1813
awplus(config-sg)# server 192.168.2.1 auth-port 1812 acct-
port 1813
awplus(config-sg)# server 192.168.3.1 auth-port 1812 acct-
port 1813
```

To remove a RADIUS server group named `GROUP1` from the configuration, use the command:

```
awplus(config)# no aaa group server radius GROUP1
```

aaa local authentication attempts lockout-time

This command configures the duration of the user lockout period.

Use the **no** variant of this command to restore the duration of the user lockout period to its default of 300 seconds (5 minutes).

Syntax

```
aaa local authentication attempts lockout-time <lockout-tiime>
no aaa local authentication attempts lockout-time
```

Parameter	Description
<lockout-time>	<0-10000>. Time in seconds to lockout the user.

Mode Global Configuration

Default The default for the lockout-time is 300 seconds (5 minutes).

Usage While locked out all attempts to login with the locked account will fail. The lockout can be manually cleared by another privileged account using the **clear aaa local user lockout** command.

Example To configure the lockout period to 10 minutes (600 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# aaa local authentication attempts lockout-time
600
```

To restore the default lockout period of 5 minutes (300 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# no aaa local authentication attempts
lockout-time
```

Related Commands **aaa local authentication attempts max-fail**

aaa local authentication attempts max-fail

This command configures the maximum number of failed login attempts before a user account is locked out. Every time a login attempt fails the failed login counter is incremented.

Use the **no** variant of this command to restore the maximum number of failed login attempts to the default setting (5 failed login attempts).

Syntax

```
aaa local authentication attempts max-fail <failed-logins>
no aaa local authentication attempts max-fail
```

Parameter	Description
<failed-logins>	<1-32>. Number of login failures allowed before locking out a user.

Mode Global Configuration

Default The default for the maximum number of failed login attempts is 5 failed login attempts.

Usage When the failed login counter reaches the limit configured by this command that user account is locked out for a specified duration configured by the **aaa local authentication attempts lockout-time** command.

When a successful login occurs the failed login counter is reset to 0. When a user account is locked out all attempts to login using that user account will fail.

Example To configure the number of login failures that will lock out a user account to 2 login attempts, use the commands:

```
awplus# configure terminal
awplus(config)# aaa local authentication attempts max-fail 2
```

To restore the number of login failures that will lock out a user account to the default number of login attempts (5 login attempts), use the commands:

```
awplus# configure terminal
awplus(config)# no aaa local authentication attempts max-fail
```

Related Commands

aaa local authentication attempts lockout-time
clear aaa local user lockout

accounting login

This command applies a login accounting method list to console or vty lines for user login. When login accounting is enabled using this command, then logging events generate an accounting record to the accounting server.

The accounting method list must be configured first using this command. If an accounting method list is specified that has not been created by this command then accounting will be disabled on the specified lines.

The **no** variant of this command resets AAA (Authentication, Authorization, Accounting) Accounting applied to console or vty lines for local or remote login. **default** login accounting is applied after issuing the **no accounting login** command. Accounting is disabled with **default**.

Syntax

```
accounting login {default|<list-name>}
no accounting login
```

Parameter	Description
`default`	Default accounting method list.
<list-name>	Named accounting method list.

Default By default login accounting is disabled in the **default** accounting server. No accounting will be performed until accounting is enabled using this command beforehand.

Mode Line Configuration

Example To apply the accounting server `USERS` to all vty lines use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 32
awplus(config-line)# accounting login USERS
```

To reset accounting for login sessions on the console, use the following commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# no accounting login
```

Related Commands **aaa accounting commands**
aaa accounting login

clear aaa local user lockout

Use this command to clear the lockout on a specific user account or all user accounts.

Syntax `clear aaa local user lockout {username <username>|all}`

Parameter	Description
`username`	Clear lockout for the specified user.
<username>	Specifies the user account.
`all`	Clear lockout for all user accounts.

Mode Privileged Exec

Examples To unlock the user account 'bob' use the following command:

```
awplus# clear aaa local user lockout username bob
```

To unlock all user accounts use the following command:

```
awplus# clear aaa local user lockout all
```

Related Commands **aaa local authentication attempts lockout-time**

debug aaa

This command enables AAA debugging.

Use the **no** variant of this command to disable AAA debugging.

Syntax

```
debug aaa [accounting|all|authentication|authorization]
no debug aaa [accounting|all|authentication|authorization]
```

Parameter	Description
`accounting`	Accounting debugging.
`all`	All debugging options are enabled.
`authentication`	Authentication debugging.
`authorization`	Authorization debugging.

Default AAA debugging is disabled by default.

Mode Privileged Exec

Example To enable authentication debugging for AAA, use the command:

```
awplus# debug aaa authentication
```

To disable authentication debugging for AAA, use the command:

```
awplus# no debug aaa authentication
```

Related Commands **show debugging aaa**
undebug aaa

login authentication

Use this command to apply an AAA server for authenticating user login attempts from a console or remote logins on these console or VTY lines. The authentication method list must be specified by the **aaa authentication login** command. If the method list has not been configured by the **aaa authentication login** command, login authentication will fail on these lines.

Use the **no** variant of this command to reset AAA Authentication configuration to use the default method list for login authentication on these console or VTY lines.

Command Syntax

```
login authentication {default|<list-name>}
no login authentication
```

Parameter	Description
`default`	The default authentication method list. If the default method list has not been configured by the **aaa authentication login** command, the local user database is used for user login authentication.
<list-name>	Named authentication server.

Default The default login authentication method list, as specified by the **aaa authentication login** command, is used to authenticate user login. (If this has not been specified, the default is to use the local user database.)

Mode Line Configuration

Examples To apply the authentication method list called `CONSOLE` to the console port terminal line (asyn 0), use the following commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# login authentication CONSOLE
```

To reset user authentication configuration on all VTY lines, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 32
awplus(config-line)# no login authentication
```

Related Commands **aaa authentication login**
line

show debugging aaa

This command displays the current debugging status for AAA (Authentication, Authorization, Accounting).

Syntax `show debugging aaa`

Mode User Exec and Privileged Exec

Example To display the current debugging status of AAA, use the command:

```
awplus# show debug aaa
```

Output **Figure 72-1: Example output from the show debug aaa command**

```
AAA debugging status:
    Authentication debugging is on
    Accounting debugging is off
```

undebug aaa

This command applies the functionality of the **no debug aaa** command on page 72.26.

Introduction

The main purpose of RADIUS (Remote Authentication Dial In User Service) is to enable the authentication of network users stored in a database on a server known as a RADIUS Server.

When users connect to the network, the switch the users connect to can challenge the users for authentication, and pass on the authentication to the RADIUS server to check. Based on the result of the check against the database, the RADIUS Server informs the switch whether or not to allow the connected user access to the network.

A RADIUS Server can do more than allow or deny access to the network. A RADIUS Server can send back parameters to the connected users, such as an IP address for the user, or a VLAN for the user, or a privilege level for a session. RADIUS also provides an accounting service. Switches can inform the RADIUS Server how long a user has been connected to the network, and how much traffic the user has sent and received while connected to the network.

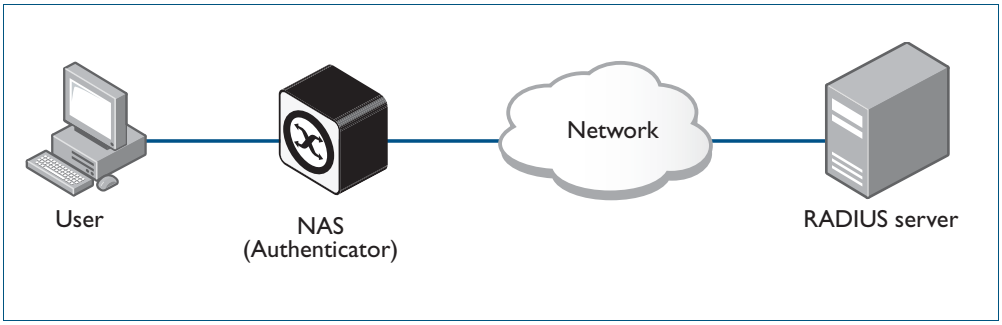
The original use for RADIUS was for the authentication of users dialling into an ISP (Internet Service Provider). A PPP (Point-to-Point Protocol) connection would be established between the remote client and the ISP's access switch. The ISP's access switch would receive the client's username and password using PAP (Password Authentication Protocol) or using CHAP (Challenge Handshake Authentication Protocol) and pass on the client's username and password to the RADIUS server to authenticate the client. The RADIUS Server's response to the authentication request would be sent back to the client as a PAP or CHAP allow or deny.

RADIUS has been adapted to network access authentication applications. Network access authentication using RADIUS follows a similar method to the PPP dial-up application for ISPs. For general network access authentication there is the RADIUS Server where the database of user authentication data is stored and a NAS (Network Access Server), which is the switch that user connects to first. The RADIUS Server and the NAS communicate with each other through exchanging attributes. Usernames and passwords are treated as attributes in RADIUS packets to and from a RADIUS Server and a NAS. The RADIUS Server is configured with a list of valid NASs that are allowed to send authentication requests to the RADIUS Server.

The RADIUS Server will not accept authentication requests from a NAS that is not on the list of valid NASs. Each NAS has a shared secret, which is a shared key with the RADIUS Server that is used to authenticate requests. The RADIUS Server has access to a list of user authentication data, stored within the RADIUS Server or accessed from another server.

Communication between the NAS and RADIUS Server uses the RADIUS protocol. The RADIUS protocol uses UDP packets. There are two UDP ports used as the destination port for RADIUS authentication packets (ports 1645 and 1812). Note that port 1812 is in more common use than port 1645 for authentication packets. UDP ports (ports 1646 and 1813) are used for RADIUS accounting separately from the ports used for RADIUS authentication.

Figure 73-1: Example showing a User to a NAS to a RADIUS Server network connection



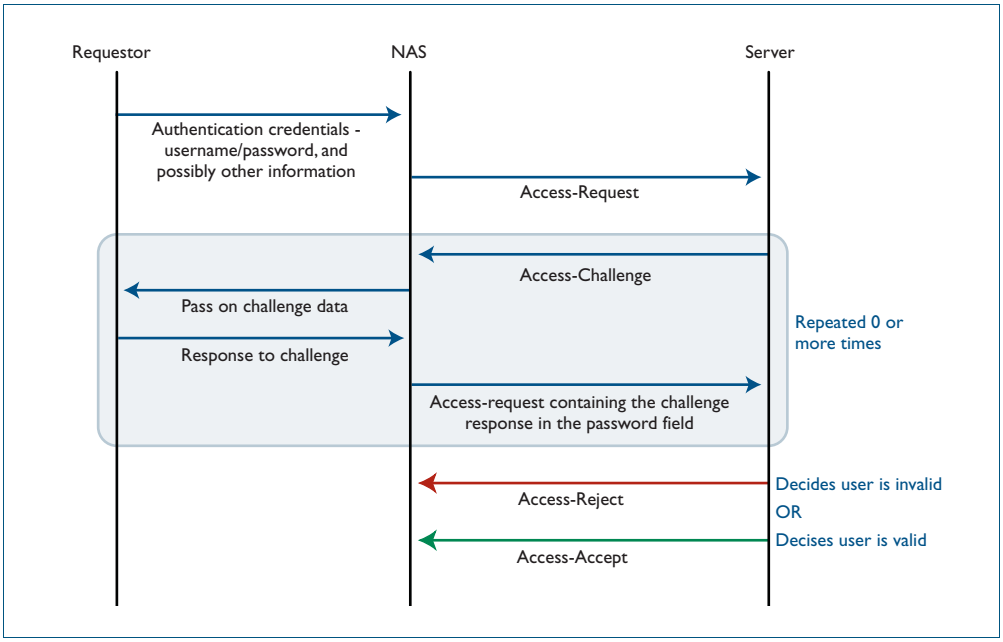
RADIUS Packets

The RADIUS RFCs define the RADIUS packet types and attributes. RADIUS authentication is defined by RFC2058, RFC2138, RFC2865, and RFC2868. RADIUS accounting is defined by RFC2059, RFC2139, RFC2866, and RFC2867. These RADIUS RFCs define over fifty attributes and six packets types (`Access-Request, Access-Accept, Access-Reject, Accounting-Request, Accounting-Response, Access-Challenge`).

A RADIUS exchange is initiated by the NAS when a user requests access to the NAS. The NAS obtains the user authentication data adds them into a RADIUS `Access-Request` packet type and sends the RADIUS `Access-Request` packet to the RADIUS Server.

- If a RADIUS Server has not been configured for authentication request from a NAS then it will silently discard an `Access-Request` packet from it.
- If the RADIUS Server accepts the request from the NAS it considers the authentication date provided in the `Access-Request` packet. The RADIUS Server may verify the user from its own database or it may connect to other servers to verify.
- If the RADIUS Server decides that the user is not allowed access to the NAS it responds to the NAS with an `Access-Reject` packet and the NAS will block the user.
- If the RADIUS Server decides that the user is valid but needs more information to verify that the user is not an imposter, it may send an `Access-Challenge` packet to the NAS that the NAS forwards to the user. The NAS forwards the user response to the `Access-Challenge` packet in an `Access-Request` packet to the RADIUS Server to accept or reject to allow or deny NAS user access.
- If the RADIUS Server rejects the user it sends an `Access-Reject` packet to the NAS.
- If the RADIUS Server accepts the user it sends an `Accept-Accept` packet to the NAS. The `Accept-Accept` packet to the NAS contains attributes that the NAS can apply.

Figure 73-2: Example showing an exchange from a Requestor to a NAS to a RADIUS Server



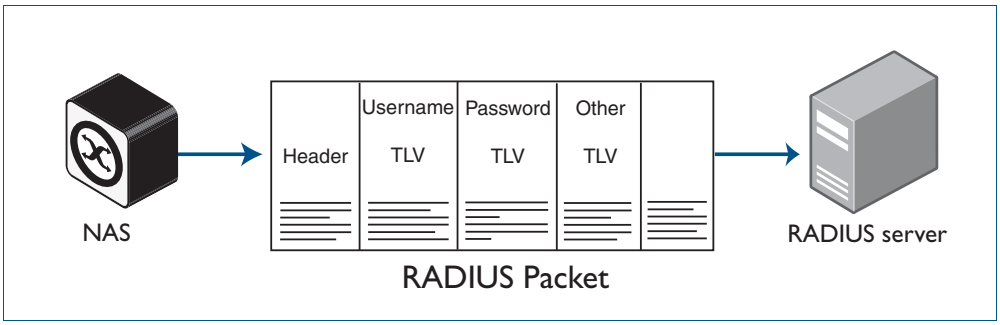
RADIUS Attributes

Each attribute is identified by its RFC-defined name, followed by its attribute ID in parenthesis.

- **User-name(1)**
  User-names are strings of at least three characters and have a maximum of 253 characters, which is the upper limit on all RADIUS attributes.
- **User-password(2)**
  User-passwords are encrypted using an MD5 hash of the password, the NAS's shared secret with the RADIUS Server, and a request authenticator value. User-passwords can either be used at the initial authentication attempt or in response to an Access-Challenge packet type from the RADIUS Server to the NAS.
- **CHAP-password(3)**
  CHAP-passwords are used if the NAS is using CHAP to authenticate the user, and doesn't receive the use the user's password but sends the CHAP response to the RADIUS Server instead. The CHAP password is an encrypted string that is an MD5 hash of the password and challenge value sent by the user.
- **Framed-IP-Address(8)**
  Used for dial-in user making PPP connections to the NAS who are dynamically allocated an IP address that they can use for the duration of their connect. The RADIUS Server sends the Framed-IP-Address to the NAS to allocate.
- **Service-Type(6)**
  Used when the NAS is authenticating a user who wants to open a management session on the NAS, and is sent by the RADIUS Server back to the NAS in an Access-Accept type packet to indicate the level of access the NAS gives a user. Service-Type(6) is mapped to a Privileged management session for AlliedWare Plus.
- **NAS-Port-Type(61)**
  Identifies the type of port on which the user is accessing the NAS. The NAS-Port-Type(61) attribute is sent by the NAS to the RADIUS Server in Access-Request type packet, so the RADIUS Server may use it to choose access type. For 802.1X sessions, the NAS-Port-Type sent by the NAS is Ethernet (15).
- **802.1X VLAN assignment uses:**
  Tunnel-Type(64), Tunnel-Medium-Type(65), Tunnel-Private-Group-ID(81), Egress-VLANID(56), and Egress-VLAN-Name(58) attributes (specified in RFC4675 used to specify 802.1Q tagged and untagged VLAN assignments with LLDP-MED/Voice-VLAN).

Attributes are carried within RADIUS packets in the form of TLVs (Type Length Values). Every attribute has an attribute ID number in the Type field of the TLV. The Length field holds a one-byte number that represents then length of the TLV. The Value field holds the value of the attribute.

Figure 73-3: Example showing TLVs in a RADIUS Packet from a NAS to a RADIUS Server



RADIUS Security

RADIUS is used for network security and carries user authentication information, so can be a target for security attacks. To counter threats there are three elements to RADIUS security:

- **Shared secret**
- **Authenticator**
- **Password Encryption**

Shared Secret

Every NAS and server are configured with a pre-shared key, called the "shared secret", which is a key string, with no particular format of at least 16 characters.

The protocol has no method for choosing and sharing the secret between the NAS and the server. The secret must be manually generated and separately configured on the NAS and on the server.

The shared secret itself never appears in any RADIUS packets. It is used as an input to the algorithms used for creating encrypted values that are carried in the packets.

Authenticator

The authenticator is a random 16-byte value generated by the NAS. The NAS creates a new authenticator value for each `Access-Request` that it sends.

The response packets that come back from the server contain a value called the Response Authenticator. This is a value that is created by performing an MD5 hash on a string that is created by concatenating the packet type identifier, Session ID, Authenticator sent in the request packet, Attribute fields in the packet, Shared secret that the server shares with the NAS to which it is responding.

When the NAS receives the response packet, it performs the same hash on the same values, and verifies that it comes up with the same result. If not, then it must assume that the response packet has been spoofed, and silently discards it.

Password Encryption

The value placed in the user-password TLV of an `Access-Request` packet is not simply an exact copy of the password sent from the requestor to the NAS.

The NAS concatenates together the shared secret and the authenticator that it has randomly generated for this request and then performs manipulations (MD5, XOR) on that concatenation, and the password to create the value to go into password TLV.

When the server validates the `Access-Request`, it retrieves the user's password from the user credentials database, and performs the same manipulation upon that password. If the result matches the value in the user-password field of the `Access-Request`, then the password sent by the requestor is deemed to be correct.

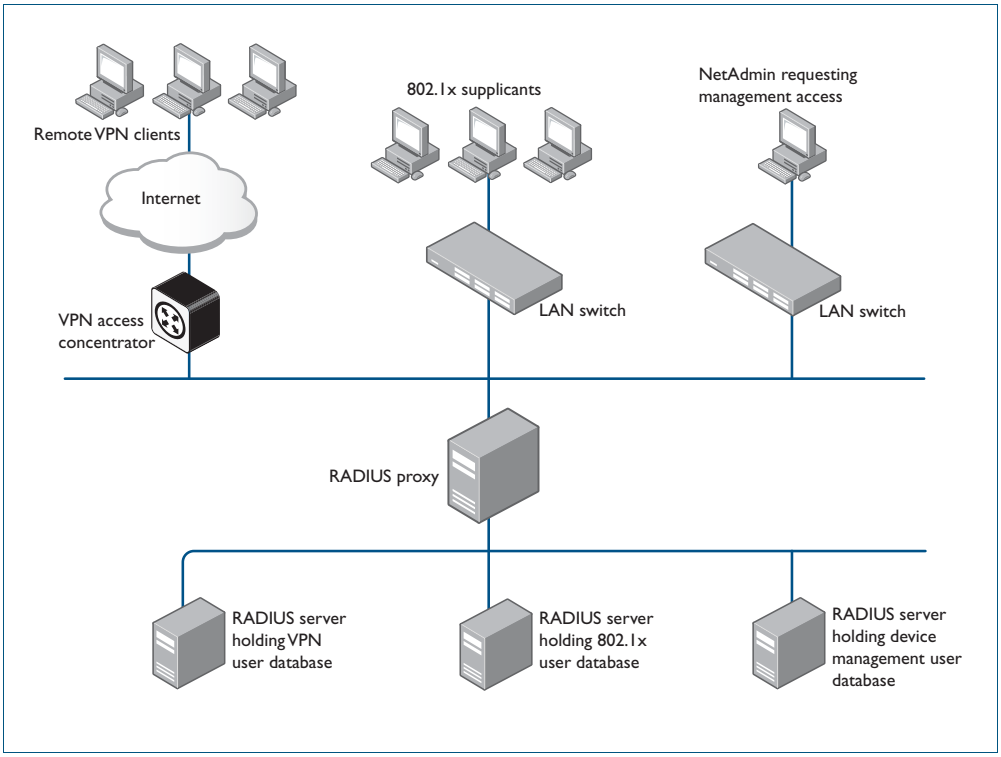
RADIUS Proxy

The user database, which user credentials sent to a RADIUS server are looked up in, may not reside on the RADIUS server itself. The external user database may reside on another RADIUS server, and the communication to that server uses RADIUS. In the case where a RADIUS server communicates with a NAS, but also acts as a client to another RADIUS server, is said to be acting as a RADIUS proxy.

There are a variety of situations where RADIUS proxy is useful. Multiple RADIUS servers could have been set up, holding user databases for different purposes such as Authentication, Switch management sessions, Authenticating VPN connections, and Authenticating 802.1X sessions.

But it is convenient for there to be just one address that all the NASs in the network use as their RADIUS server. That one RADIUS server that the NASs send their requests to, can act as a proxy for all the servers holding the different user databases.

Figure 73-4: Example showing RADIUS Proxy



RADIUS Accounting

There are only two types of RADIUS accounting packet: `Accounting-Request` and `Accounting-Response`.

The `Accounting-Request` packets are always sent from the NAS to the server. The `Accounting-Response` packets are always sent from the server to the NAS, and are effectively ACKs of the `Accounting-Request` packets.

The `Accounting-Request` packets always carry the attribute `Acct-Status-Type`. The most commonly used values of this attribute are:

- **Start** – which denotes a packet marking that a session is beginning
- **Stop** – which denotes a packet marking that a session is ending
- **Interim update** – packets sent periodically during the session to give update reports on the statistics that are being collected.

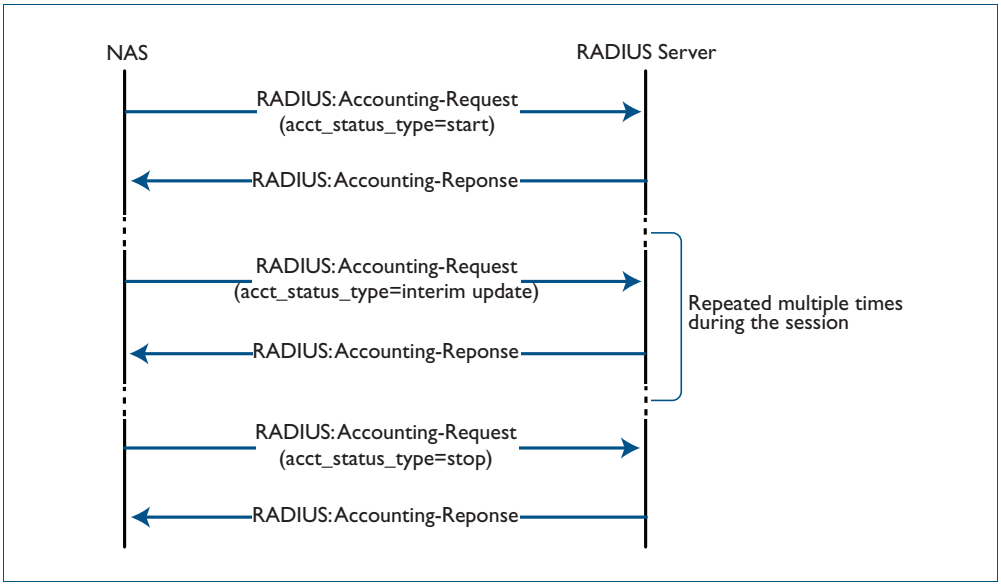
The statistics that can be exchanged in the session are:

- **Input Octets**
- **Input Packets**
- **Output Octets**
- **Output Packets**
- **Session Duration**

There is no requirement to exchange all these statistics – NAS implementations are at liberty to choose which statistics they will send. Each of these statistics has a corresponding attribute type. The attributes are sent in Interim-Update and Stop accounting request packets.

Each accounting session has a unique session ID, which is chosen by the NAS. The session ID is carried in an `Acct-Session-Id` attribute, that should be present in every packet involved in the session. The accounting packets typically do not use the same UDP port as the authentication packets. The default port for RADIUS accounting is 1813.

Figure 73-5: Example showing RADIUS Accounting between a NAS and a RADIUS Server



RADIUS Configuration

This section describes how to configure RADIUS with the available AAA commands. For a description of AAA commands, refer to the **AAA Commands** chapter. For a description of the RADIUS commands used, refer to the **RADIUS Commands** chapter.

RADIUS is often used in a variety of networks that need high security while maintaining access for remote users. RADIUS is suitable for the following networks that require access security:

- Networks with multiple-vendor access servers, each supporting RADIUS. For example, access servers from several vendors use a single RADIUS server-based security database.
- Networks in which a user may access a single service. Using RADIUS, you can control user access to a single host, or to a single utility such as Telnet.
- Networks that require accounting. You can use RADIUS accounting independent of RADIUS authentication. The RADIUS accounting functions allow data to be sent at the start and end of services, indicating the amount of resources (time, packets, bytes) used.

Switch Configuration Tasks

To configure RADIUS on your switch or access server, you must perform the following tasks:

- Use the **aaa authentication** command to define method lists for RADIUS authentication. For information about this command, refer to the **AAA Commands** chapter.
- Use authentication commands to enable the defined method lists to be used. For more information, refer to the **Authentication Commands** chapter.

The following configuration tasks are optional:

- You can use the **aaa group server** command to group selected RADIUS hosts for specific services. For detailed information about this command, refer to the **AAA Server Groups Configuration** section in this chapter and refer to the **AAA Commands** chapter.
- You can use the **aaa accounting login** command to enable accounting for RADIUS connections. For information about this command, refer to the **AAA Commands** chapter.

This section describes how to set up RADIUS for authentication and accounting on your network, and includes the following sections:

- Switch to RADIUS Server Communication (Required)
- Configuring AAA Server Groups (Optional)
- Configuring AAA Server Groups with Deadtime (Optional)
- Specifying RADIUS Authentication
- Specifying RADIUS Accounting (Optional)

For RADIUS configuration examples using the commands in this chapter, refer to the section **RADIUS Configuration Examples** at the end of this chapter.

Switch to RADIUS Server Communication

The RADIUS host is normally a multiuser system running RADIUS server software from a software provider. Switch to RADIUS server communication has several components:

- Host name or IP address
- Authentication destination port
- Accounting destination port
- Timeout period
- Retransmission value
- Key string

RADIUS security servers are identified on the basis of their host name or IP address, host name and specific UDP port numbers, or IP address and specific UDP port numbers. The combination of the IP address and UDP port number creates a unique identifier, allowing different ports to be individually defined as RADIUS hosts providing a specific AAA service. This unique identifier enables RADIUS requests to be sent to multiple UDP ports on a server at the same IP address.

A RADIUS server and a switch use a shared secret text string to encrypt passwords and exchange responses. To configure RADIUS using the AAA security commands, you must specify the host running the RADIUS server daemon and a secret text string that it shares with the switch, which you can specify using the **key** parameter in the **radius-server host** command.

The timeout, retransmission, and encryption key values are configurable globally for all RADIUS servers, on a per-server basis, or in some combination of global and per-server settings. To apply these settings globally to all RADIUS servers communicating with the switch, use the three global commands: **radius-server timeout**, **radius-server retransmit**, and **radius-server key**. To apply these values on a specific RADIUS server, use the **radius-server host** command.

Note

You can configure both global and per-server timeout, retransmission, and key value commands simultaneously on the same Network Access Server.

If both global and per-server functions are configured on a switch, the per-server timer, retransmission, and key value commands override global timer, retransmission, and key value commands.

To configure per-server RADIUS server communication, use the following command in the Global Configuration mode:

Mode and Command	Command Purpose

`awplus(config)#`
`radius-server host`
`{<hostname>|`
`<ip-address>}`
`[auth-port <port-number>]`
`[acct-port <port-number>]`
`[timeout <seconds>]`
`[retransmit <retries>]`
`[key <string>]`
	Specifies the IP address or host name of the remote RADIUS server host and assigns authentication and accounting destination UDP port numbers.
	Use the `auth-port <port-number>` option to configure a specific UDP port on this RADIUS server to be used solely for authentication.
	Use the `acct-port <port-number>` option to configure a specific UDP port on this RADIUS server to be used solely for accounting.
	To configure the network access server to recognize more than one host entry associated with a single IP address, simply repeat this command as many times as necessary, making sure that each UDP port number is different.
	Set the timeout, retransmit, and encryption key values to use with the specific RADIUS host. If no timeout is set, the global value is used; otherwise, enter a value in the range 1 to 1000.
	If no retransmit value is set, the global value is used; otherwise enter a value in the range 1 to 1000. If no key string is specified, the global value is used.

To configure global communication settings between the switch and a RADIUS server, use the following **radius-server** commands in the Global Configuration mode:

Mode and Command	Command Purpose
`awplus(config)#` `radius-server key <key>`	Specifies the shared secret text string used between the switch and a RADIUS server (no default is set).

`awplus(config)#`
`radius-server retransmit`
`<retries>`
	Specifies how many times the switch transmits each RADIUS request to the RADIUS server before giving up (the default is 3).

`awplus(config)#`
`radius-server timeout`
`<seconds>`
	Specifies for how many seconds a switch waits for a reply to a RADIUS request before retransmitting the request.

`awplus(config)#`
`radius-server deadtime`
`<minutes>`
	Specifies for how many minutes a RADIUS server that is not responding to authentication requests is passed over by requests for RADIUS authentication.

AAA Server Groups Configuration

Configuring the switch to use AAA server groups provides a way to group existing server hosts. This allows you to select a subset of the configured server hosts and use them for a particular service. A server group is used in conjunction with a global server-host list. The server group lists the IP addresses of the selected server hosts.

Server groups also can include multiple host entries for the same server, as long as each entry has a unique identifier. The combination of an IP address and a UDP port number creates a unique identifier, allowing different ports to be individually defined as RADIUS hosts providing a specific AAA service.

To define a server host with a server group name, enter the following commands in the Global Configuration mode. The listed RADIUS server must exist in the Global Configuration mode:

Mode and Command	Command Purpose
awplus(config)# radius-server host {*<hostname>*| *<ip-address>*} [auth-port *<port-number>*] [acct-port *<port-number>*] [timeout *<seconds>*] [retransmit *<retries>*] [key *<string>*]	Specifies and defines the IP address of the server host before configuring the AAA server-group. Refer to the section **Switch to RADIUS Server Communication** of this chapter for more information on the **radius-server host** command.
awplus(config-if)# aaa group server *<group-name>*	Defines the AAA server group with a group name. This command puts the switch in server group sub configuration mode.
awplus(config-sg)# server {*<hostname>*|*<ip-address>*} [auth-port *<port-number>*] [acct-port *<port-number>*]	Associates a particular RADIUS server with the defined server group. Each security server is identified by its IP address and UDP port number. Repeat this step for each RADIUS server in the AAA server group. Each server in the group must be defined previously using the radius-server host command.

Configuring AAA Server Groups with Deadtime

After you have configured a server host with a server name, you can use the **deadtime (RADIUS server group)** command to configure each server per server group. Configuring deadtime within a server group allows you to direct AAA traffic to separate groups of servers that have different operational characteristics.

Configuring **deadtime** is no longer limited to a global configuration. A separate timer has been attached to each server host in every server group. When a server is found to be unresponsive after numerous retransmissions and time-outs, the server is assumed to be dead. The timers attached to each server host in all server groups are triggered. In essence, the timers are checked and subsequent requests to a server, once it is assumed to be dead, are directed to alternate servers, if configured. When the network access server receives a reply from the server, it checks and stops all configured timers, if running, for that server in all server groups.

If the timer has expired, only the server to which the timer is attached is assumed to be alive. This becomes the only server that can be tried for later AAA requests using the server groups to which the timer belongs.

Note Since one server has different timers and may have different deadtime values configured in the server groups, the same server may in the future have different states, dead and alive, at the same time. To change the state of a server, you must start and stop all configured timers in all server groups.

The size of the server group will be increased because of the addition of new timers and the deadtime attribute. The overall impact of the structure depends on the number and size of the server groups and how the servers are shared among server groups in a specific configuration.

To configure deadtime within a server group, use the following commands beginning in the Global Configuration mode:

Mode and Command	Command Purpose
`awplus(config)# aaa group server radius group1`	Defines a RADIUS type server group.
`awplus(config-sg)# deadtime 1`	Configures and defines a deadtime value in minutes.
`awplus(config-sg)# exit`	Exits server group configuration mode.

Specifying RADIUS Authentication

After you have identified the RADIUS server and defined the RADIUS authentication key, you must define method lists for RADIUS authentication. Because RADIUS authentication is facilitated through AAA, you must enter the **aaa authentication login** command, specifying RADIUS as the authentication method. For detailed **aaa authentication login** command information, refer to the **AAA Commands** chapter.

Specifying RADIUS Accounting

The AAA accounting feature enables you to track the services users are accessing as well as the amount of network resources they are consuming. Because RADIUS accounting is facilitated through AAA, you must issue the **aaa accounting login** command, specifying RADIUS as the accounting method. For detailed **aaa accounting login** command information, refer to the **AAA Commands** chapter.

Monitoring and Maintaining RADIUS

To monitor and maintain RADIUS, use the following commands in Privileged Exec mode:

Mode and Command	Command Purpose
`awplus#` `debug radius`	Displays information associated with RADIUS. For detailed **debug radius** command information, refer to the **RADIUS Commands** chapter.
`awplus#` `show radius statistics`	Displays the RADIUS statistics for accounting and authentication packets. For detailed **show radius statistics** command information, refer to the **RADIUS Commands** chapter.

RADIUS Configuration Examples

The following sections provide RADIUS configuration examples:

- RADIUS Authentication
- Single RADIUS Server Configuration
- Multiple RADIUS Server Configuration
- RADIUS Server Group Configuration
- RADIUS Server Configuration using Server Groups

RADIUS Authentication

Example The following example shows how to configure the switch to authenticate using RADIUS:

Figure 73-6: Sample RADIUS Authentication to configure the switch to authenticate users

```
!
radius-server host 172.10.10.1
radius-server key radiuspass
username newuser password newpass
aaa authentication login admin
!
```

The lines in this example RADIUS authentication and accounting configuration are defined as follows:

- The **radius-server host** command defines the IP address of the RADIUS server host.
- The **radius-server key** command defines the shared secret text string between the network access server and the RADIUS server host.
- The **aaa authentication login** command defines a method list named **admin** for login authentication.

Example The following example shows how to configure the switch to authenticate logins using RADIUS:

Figure 73-7: Sample RADIUS Authentication to authenticate logins

```
!
aaa authentication login radius-login group radius
!
```

This sample RADIUS authentication configuration is defined as follows:

- The **aaa authentication login radius-login group radius** command configures the switch to use RADIUS for authentication at the login prompt.

Example The following example shows how to configure the authentication method to verify a username and password at login. In this example, if a username is entered at the username prompt, that username is used for authentication.

Figure 73-8: Sample RADIUS Authentication to verify a username and password

```
!
aaa authentication login default group radius
radius-server host 172.10.10.1 auth-port 1812 acct-port 1813
!
```

The lines in this sample RADIUS authentication configuration are defined as follows:

- The **aaa authentication login default group radius** command specifies that the username and password are verified by RADIUS.
- The **radius-server host 172.10.10.1 auth-port 1812 acct-port 1813** command specifies the IP address of the RADIUS server host, the UDP destination port for authentication requests, and the UDP destination port for accounting requests.

Single RADIUS Server Configuration

Example The following example shows how to configure server-specific timeout, retransmit, and key values for the RADIUS server with IP address 172.2.2.2:

Figure 73-9: Single RADIUS Server sample configuration

```
!
radius-server host 172.2.2.2 timeout 5 retransmit 5 key 10
!
```

Multiple RADIUS Server Configuration

Example The following example shows how to configure two RADIUS servers with specific timeout, retransmit, and key values. The **radius-server retransmit** command changes the global retransmission value to 4 for all RADIUS servers. The **radius-server host** command configures specific timeout, retransmission, and key values for the RADIUS server hosts with IP addresses `172.2.2.2` and `172.1.1.1`

Figure 73-10: Multiple RADIUS Server sample configuration

```
!
! Enable and configure radius authentication and accounting
! services on the switch:
!
aaa authentication login default group radius
aaa accounting default start-stop group radius
!
! Change the retransmission value for all RADIUS servers:
!
radius-server retransmit 4
!
! Configure per-server specific timeout, retransmission, and
! key values. Change the default auth-port and acct-port
! values.
!
radius-server host 172.2.2.2 auth-port 1645 acct-port 1646
timeout 3 retransmit 3 key radkey
!
! Configure per-server specific timeout and key values. This
! server uses the global retransmission value.
!
radius-server host 172.1.1.1 timeout 6 key rad123
!
```

RADIUS Server Group Configuration

Example The following example shows how to create server group `group2` with three RADIUS server members, each with the same IP address but with unique authentication and accounting ports:

Figure 73-11: RADIUS Server Group sample configuration using the same IP address

```
!
aaa group server radius group2
  server 172.1.1.1 auth-port 1645 acct-port 1646
  server 172.1.1.1 auth-port 1812 acct-port 1813
  server 172.1.1.1 auth-port 2000 acct-port 2001
!
```

RADIUS Server Configuration using Server Groups

The following example shows how to configure the network access server to recognize two different RADIUS server groups.

One of these groups, `group1`, has two different host entries on the same RADIUS server configured for the same services. The second host entry configured acts as fail over backup to the first one. Each group is individually configured for `deadtime`; `deadtime` for `group1` is one minute, and `deadtime` for `group2` is two minutes.

Figure 73-12: Multiple RADIUS Servers using Server Groups sample configuration

```
!
! The following command configures default RADIUS parameters:
!
aaa authentication login default group group1
!
! The following commands define the group1 RADIUS server group
! and associate servers with it and configures a deadtime of
! one minute:
!
aaa group server radius group1
  server 172.1.1.1 auth-port 1645 acct-port 1646
  server 172.2.2.2 auth-port 1812 acct-port 1813
  deadtime 1
!
! The following commands define the group2 RADIUS server group
! and associate servers with it and configures a deadtime of
! two minutes:
!
aaa group server radius group2
  server 172.2.2.2 auth-port 1812 acct-port 1813
  server 172.3.3.3 auth-port 2000 acct-port 2001
  deadtime 2
!
! The following commands configure the RADIUS attributes
! for each host entry associated with one of the defined
! server groups:
!
radius-server host 172.1.1.1 auth-port 1645 acct-port 1646
radius-server host 172.2.2.2 auth-port 1812 acct-port 1813
radius-server host 172.3.3.3 auth-port 2000 acct-port 2001
!
```

Chapter 74: RADIUS Commands

Command List 74.2
deadtime (RADIUS server group) 74.2
debug radius 74.3
ip radius source-interface 74.4
radius-server deadtime 74.5
radius-server host 74.6
radius-server key 74.10
radius-server retransmit 74.11
radius-server timeout 74.12
server (Server Group) 74.14
show debugging radius 74.16
show radius 74.17
show radius statistics 74.19
undebug radius 74.20

Command List

This chapter provides an alphabetical reference for commands used to configure the device to use RADIUS servers.

deadtime (RADIUS server group)

Use this command to configure the **deadtime** parameter for the RADIUS server group. This command overrides the global dead-time configured by the **radius-server deadtime** command on page 74.5. The configured deadtime is the time period in minutes to skip a RADIUS server for authentication or accounting requests if the server is "dead". Note that a RADIUS server is considered "dead" if there is no response from the server within a defined time period.

Use the **no** variant of this command to reset the deadtime configured for the RADIUS server group. If the global deadtime for RADIUS server is configured the value will be used for the servers in the group. The global deadtime for the RADIUS server is set to 0 minutes by default.

Syntax

```
deadtime <0-1440>
no deadtime
```

Parameter	Description
<0-1440>	Amount of time in minutes.

Default The deadtime is set to 0 minutes by default.

Mode Server Group Configuration

Usage If the RADIUS server does not respond to a request packet, the packet is retransmitted the number of times configured for the **retransmit** parameter (after waiting for a **timeout** period to expire). The server is then marked "dead", and the time is recorded. The **deadtime** parameter configures the amount of time to skip a dead server; if a server is dead, no request message is sent to the server for the **deadtime** period.

Examples To configure the deadtime for 5 minutes for the RADIUS server group "GROUP1", use the command:

```
awplus(config)# aaa group server radius GROUP1
awplus(config-sg)# server 192.168.1.1
awplus(config-sg)# deadtime 5
```

To remove the deadtime configured for the RADIUS server group "GROUP1", use the command:

```
awplus(config)# aaa group server radius GROUP1
awplus(config-sg)# no deadtime
```

Related Commands **aaa group server**
radius-server deadtime

debug radius

This command enables RADIUS debugging. If no option is specified, all debugging options are enabled.

Use the **no** variant of this command to disable RADIUS debugging. If no option is specified, all debugging options are disabled.

Syntax

```
debug radius [packet|event|all]
no debug radius [packet|event|all]
```

Parameter	Description
`packet`	Debugging for RADIUS packets is enabled or disabled.
`event`	Debugging for RADIUS events is enabled or disabled.
`all`	Enable or disable all debugging options.

Default RADIUS debugging is disabled by default.

Mode Privileged Exec

Examples To enable debugging for RADIUS packets, use the command:

```
awplus#  debug radius packet
```

To enable debugging for RADIUS events, use the command:

```
awplus#  debug radius event
```

To disable debugging for RADIUS packets, use the command:

```
awplus# no debug radius packet
```

To disable debugging for RADIUS events, use the command:

```
awplus# no debug radius event
```

Related Commands **show debugging radius**
undebug radius

ip radius source-interface

This command configures the source IP address of every outgoing RADIUS packet to use a specific IP address or the IP address of a specific interface. If the specified interface is down or there is no IP address on the interface, then the source IP address of outgoing RADIUS packets depends on the interface the packets leave.

Use the **no** variant of this command to remove the source interface configuration. The source IP address in outgoing RADIUS packets will be the IP address of the interface from which the packets are sent.

Syntax

```
ip radius source-interface {<interface>|<ip-address>}
no ip radius source-interface
```

Parameter	Description
<interface>	Interface name.
<ip-address>	IP address in the dotted decimal format A.B.C.D.

Default Source IP address of outgoing RADIUS packets depends on the interface the packets leave.

Mode Global Configuration

Examples To configure all outgoing RADIUS packets to use the IP address of the interface “vlan1” for the source IP address, use the following commands:

```
awplus# configure terminal
awplus(config)# ip radius source-interface vlan1
```

To configure the source IP address of all outgoing RADIUS packets to use 192.168.1.10, use the following commands:

```
awplus# configure terminal
awplus(config)# ip radius source-interface 192.168.1.10
```

To reset the source interface configuration for all outgoing RADIUS packets, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip radius source-interface
```

Related Commands radius-server host
show radius statistics

radius-server deadtime

Use this command to specify the global **deadtime** for all RADIUS servers. If a RADIUS server is considered dead, it is skipped for the specified deadtime. This command specifies for how many minutes a RADIUS server that is not responding to authentication requests is passed over by requests for RADIUS authentication.

Use the **no** variant of this command to reset the global deadtime to the default of 0 seconds, so that RADIUS servers are not skipped even if they are dead.

Syntax

```
radius-server deadtime <minutes>
no radius-server deadtime
```

Parameter	Description
<minutes>	RADIUS server deadtime in minutes in the range 0 to 1440 (24 hours).

Default The default RADIUS deadtime configured on the system is 0 seconds.

Mode Global Configuration

Usage The RADIUS client considers a RADIUS server to be dead if it fails to respond to a request after it has been retransmitted as often as specified globally by the **radius-server retransmit** command or for the server by the **radius-server host** command. To improve RADIUS response times when some servers may be unavailable, set a **deadtime** to skip dead servers.

Examples To set the dead time of the RADIUS server to 60 minutes, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server deadtime 60
```

To disable the dead time of the RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server deadtime
```

Related Commands

deadtime (RADIUS server group)
radius-server host
radius-server retransmit
show radius statistics

radius-server host

Use this command to specify a remote RADIUS server host for authentication or accounting, and to set server-specific parameters. The parameters specified with this command override the corresponding global parameters for RADIUS servers. This command specifies the IP address or host name of the remote RADIUS server host and assigns authentication and accounting destination UDP port numbers.

This command adds the RADIUS server address and sets parameters to the RADIUS server. The RADIUS server is added to the running configuration after you issue this command. If parameters are not set using this command then common system settings are applied.

Use the **no** variant of this command to remove the specified server host as a RADIUS authentication and/or accounting server and set the destination port to the default RADIUS server port number (1812).

Syntax

```
radius-server host {<host-name>|<ip-address>} [acct-port <0-65535>]
   [auth-port <0-65535>] [key <key-string>] [retransmit <0-100>]
   [timeout <1-1000>]

no radius-server host {<host-name>|<ip-address>}
   [acct-port <0-65535>] [auth-port <0-65535>]
```

Parameter	Description
`<host-name>`	Server host name. The DNS name of the RADIUS server host.
`<ip-address>`	The IP address of the RADIUS server host.
`acct-port`	Accounting port. Specifies the UDP destination port for RADIUS accounting requests. If 0 is specified, the server is not used for accounting. The default UDP port for accounting is 1813.
`<0-65535>`	UDP port number (Accounting port number is set to 1813 by default) Specifies the UDP destination port for RADIUS accounting requests. If 0 is specified, the host is not used for accounting.
`auth-port`	Authentication port. Specifies the UDP destination port for RADIUS authentication requests. If 0 is specified, the server is not used for authentication. The default UDP port for authentication is 1812.
`<0-65535>`	UDP port number (Authentication port number is set to 1812 by default) Specifies the UDP destination port for RADIUS authentication requests. If 0 is specified, the host is not used for authentication.

Parameter(cont.)	Description(cont.)
`timeout`	Specifies the amount of time to wait for a response from the server. If this parameter is not specified the global value configured by the **radius-server timeout** command is used.
<1-1000>	Time in seconds to wait for a server reply (timeout is set to 5 seconds by default) The time interval (in seconds) to wait for the RADIUS server to reply before retransmitting a request or considering the server dead. This setting overrides the global value set by the **radius-server timeout** command. If no timeout value is specified for this server, the global value is used.
`retransmit`	Specifies the number of retries before skip to the next server. If this parameter is not specified the global value configured by the **radius-server retransmit** command is used.
<0-100>	Maximum number of retries (maximum number of retries is set to 3 by default) The maximum number of times to resend a RADIUS request to the server, if it does not respond within the timeout interval, before considering it dead and skipping to the next RADIUS server. This setting overrides the global setting of the **radius-server retransmit** command. If no retransmit value is specified, the global value is used.
`key`	Set shared secret key with RADIUS servers
`<key-string>`	Shared key string applied Specifies the shared secret authentication or encryption key for all RADIUS communications between this device and the RADIUS server. This key must match the encryption used on the RADIUS daemon. All leading spaces are ignored, but spaces within and at the end of the string are used. If spaces are used in the string, do not enclose the string in quotation marks unless the quotation marks themselves are part of the key. This setting overrides the global setting of the **radius-server key** command. If no key value is specified, the global value is used.

Default The RADIUS client address is not configured (null) by default. No RADIUS server is configured.

Mode Global Configuration

Usage Multiple **radius-server host** commands can be used to specify multiple hosts. The software searches for hosts in the order they are specified. If no host-specific timeout, retransmit, or key values are specified, the global values apply to that host. If there are multiple RADIUS servers for this client, use this command multiple times—once to specify each server.

If you specify a host without specifying the auth port or the acct port, it will by default be configured for both authentication and accounting, using the default UDP ports. To set a host to be a RADIUS server for authentication requests only, set the **acct-port** parameter to 0; to set the host to be a RADIUS server for accounting requests only, set the auth-port parameter to 0.

A RADIUS server is identified by IP address, authentication port and accounting port. A single host can be configured multiple times with different authentication or accounting ports. All the RADIUS servers configured with this command are included in the predefined RADIUS server group radius, which may be used by AAA authentication, authorization and accounting commands. The client transmits (and retransmits, according to the **retransmit** and **timeout** parameters) RADIUS authentication or accounting requests to the servers in the order you specify them, until it gets a response.

Examples To add the RADIUS server `10.0.0.20`, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host 10.0.0.20
```

To set the secret key to **allied** on the RADIUS server `10.0.0.20`, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host 10.0.0.20 key allied
```

To delete the RADIUS server `10.0.0.20`, use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server host 10.0.0.20
```

To configure `rad1.company.com` for authentication only, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host rad1.company.com
                acct-port 0
```

To remove the RADIUS server `rad1.company.com` configured for authentication only, use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server host rad1.company.com
                acct-port 0
```

To configure `rad2.company.com` for accounting only, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host rad2.company.com
                auth-port 0
```

To configure 192.168.1.1 with authentication port 1000, accounting port 1001 and retransmit count 5, use the following commands:

```
awplus# configure terminal

awplus(config)# radius-server host 192.168.1.1 auth-port 1000
acct-port 1001 retransmit 5
```

Related Commands

radius-server key

This command sets a global secret key for RADIUS authentication on the switch. The shared secret text string is used for RADIUS authentication between the switch and a RADIUS server.

Note that if no secret key is explicitly specified for a RADIUS server, the global secret key will be used for the shared secret for the server.

Use the **no** variant of this command to reset the secret key to the default (null).

Syntax

```
radius-server key <key>
no radius-server key
```

Parameter	Description
<key>	Shared secret among radius server and 802.1X client.

Default The RADIUS server secret key on the system is not set by default (null).

Mode Global Configuration

Usage Use this command to set the global secret key shared between this client and its RADIUS servers. If no secret key is specified for a particular RADIUS server using the **radius-server host** command, this global key is used.

After enabling AAA authentication with the **aaa authentication login** command, set the authentication and encryption key using the **radius-server key** command so the key entered matches the key used on the RADIUS server.

Examples To set the global secret key to **allied** for RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server key allied
```

To set the global secret key to **secret** for RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server key secret
```

To delete the global secret key for RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server key
```

Related Commands **radius-server host**
show radius statistics

radius-server retransmit

This command sets the retransmit counter to use RADIUS authentication on the switch. This command specifies how many times the switch transmits each RADIUS request to the RADIUS server before giving up.

This command configures the **retransmit** parameter for RADIUS servers globally. If the **retransmit** parameter is not specified for a RADIUS server by the **radius-server host** command then the global configuration set by this command is used for the server instead.

Use the **no** variant of this command to reset the re-transmit counter to the default (3).

Syntax

```
radius-server retransmit <retries>
no radius-server retransmit
```

Parameter	Description
<retries>	RADIUS server retries in the range <0-100> The number of times a request is resent to a RADIUS server that does not respond, before the server is considered dead and the next server is tried. If no retransmit value is specified for a particular RADIUS server using the **radius-server host** command, this global value is used.

Default The default RADIUS retransmit count on the switch is 3.

Mode Global Configuration

Examples To set the RADIUS **retransmit** count to 1, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server retransmit 1
```

To set the RADIUS **retransmit** count to the default (3), use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server retransmit
```

To configure the RADIUS **retransmit** count globally with 5, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server retransmit 5
```

To disable retransmission of requests to a RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server retransmit 0
```

Related Commands

radius-server deadtime
radius-server host

radius-server timeout

Use this command to specify the RADIUS global timeout value. This is how long the device waits for a reply to a RADIUS request before retransmitting the request, or considering the server to be dead. If no timeout is specified for the particular RADIUS server by the **radius-server host** command, it uses this global timeout value.

Note that this command configures the **timeout** parameter for RADIUS servers globally.

The **no** variant of this command resets the transmit timeout to the default (5 seconds).

Syntax

```
radius-server timeout <seconds>
no radius-server timeout
```

Parameter	Description
<seconds>	RADIUS server timeout in seconds in the range 1 to 1000. The global time in seconds to wait for a RADIUS server to reply to a request before retransmitting the request, or considering the server to be dead (depending on the **radius-server retransmit** command).

Default The default RADIUS transmit timeout on the system is 5 seconds.

Mode Global Configuration

Examples To globally set the device to wait 20 seconds before retransmitting a RADIUS request to unresponsive RADIUS servers, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server timeout 20
```

To set the RADIUS **timeout** parameter to 1 second, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server timeout 1
```

To set the RADIUS **timeout** parameter to the default (5 seconds), use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server timeout
```

To configure the RADIUS server **timeout** period globally with 3 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server timeout 3
```

To reset the global **timeout** period for RADIUS servers to the default, use the following command:

```
awplus# configure terminal
awplus(config)# no radius-server timeout
```

Related Commands

server (Server Group)

This command adds a RADIUS server to a server group in Server-Group Configuration mode. The RADIUS server should be configured by the **radius-server host** command.

The server is appended to the server list of the group and the order of configuration determines the precedence of servers. If the server exists in the server group already, it will be removed before added as a new server.

The server is identified by IP address and authentication and accounting UDP port numbers. So a RADIUS server can have multiple entries in a group with different authentication and/or accounting UDP ports. The **auth-port** specifies the UDP destination port for authentication requests to the server. To disable authentication for the server, set `auth-port` to 0. If the authentication port is missing, the default port number is 1812. The **acct-port** specifies the UDP destination port for accounting requests to the server. To disable accounting for the server, set `acct-port` to 0. If the accounting port is missing, the default port number is 1812.

Use the **no** variant of this command to remove a RADIUS server from the server group.

Syntax

```
server {<hostname>|<ip-address>}
    [auth-port <0-65535>][acct-port <0-65535>]

no server {<hostname>|<ip-address>}
    [auth-port <0-65535>][acct-port <0-65535>]
```

Parameter	Description
`<hostname>`	Server host name
`<ip-address>`	Server IP address The server is identified by IP address, authentication and accounting UDP port numbers. So a RADIUS server can have multiple entries in a group with different authentication and/or accounting UDP ports.
`auth-port`	Authentication port The **auth-port** specifies the UDP destination port for authentication requests to the server. To disable authentication for the server, set **auth-port** to 0. If the authentication port is missing, the default port number is 1812.
`<0-65535>`	UDP port number (default: 1812)
`acct-port`	Accounting port The **acct-port** specifies the UDP destination port for accounting requests to the server. To disable accounting for the server, set **acct-port** to 0. If the accounting port is missing, the default port number is 1813.
`<0-65535>`	UDP port number (default: 1813)

Default The default Authentication port number is 1812 and the default Accounting port number is 1813.

Mode Server Group Configuration

Usage The RADIUS server to be added must be configured by the **radius-server host** command. In order to add or remove a server, the **auth-port** and **acct-port** parameters in this command must be the same as the corresponding parameters in the **radius-server host** command.

Examples To create a RADIUS server group RAD_AUTH1 for authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa group server radius RAD_AUTH1
awplus(config-sg)# server 192.168.1.1 acct-port 0
awplus(config-sg)# server 192.168.2.1 auth-port 1000
acct-port 0
```

To create a RADIUS server group RAD_ACCT1 for accounting, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa group server radius RAD_ACCT1
awplus(config-sg)# server 192.168.2.1 auth-port 0
acct-port 1001
awplus(config-sg)# server 192.168.3.1 auth-port 0
```

To remove server 192.168.3.1 from the existing server group **GROUP1**, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa group server radius GROUP1
awplus(config-sg)# no server 192.168.3.1
```

show debugging radius

This command displays the current debugging status for the RADIUS servers.

Syntax `show debugging radius`

Mode User Exec and Privileged Exec

Example To display the current debugging status of RADIUS servers, use the command:

```
awplus# show debugging radius
```

Output **Figure 74-1: Example output from the show debugging radius command**

```
RADIUS debugging status:
RADIUS event debugging is off
RADIUS packet debugging is off
```

show radius

This command displays the current RADIUS server configuration and status.

Syntax `show radius`

Mode User Exec and Privileged Exec

Example To display the current status of RADIUS servers, use the command:

```
awplus# show radius
```

Output **Figure 74-2: Example output from the show radius command showing RADIUS servers**

```
RADIUS Global Configuration
Source Interface : not configured
Secret Key : secret
Timeout : 5 sec
Retransmit Count : 3
Deadtime : 20 min
Server Host : 192.168.1.10
Authentication Port : 1812
Accounting Port : 1813
Secret Key : secret
Timeout : 3 sec
Retransmit Count : 2
Server Host : 192.168.1.11
Authentication Port : 1812
Accounting Port : not configured
Server Name/Auth Acct Auth Acct
IP Address Port Port Status Status
-------------------------------------------------------------
192.168.1.10 1812 1813 Alive Alive
192.168.1.11 1812 N/A Alive N/A
```

Example See the sample output below showing RADIUS client status and RADIUS configuration:

```
awplus# show radius
```

Output **Figure 74-3: Example output from the show radius command showing RADIUS client status**

```
RADIUS global interface name: awplus
Secret key:
Timeout: 5
Retransmit count: 3
Deadtime: 0

Server Address: 150.87.18.89
Auth destination port: 1812
Accounting port: 1813
Secret key: swg
Timeout: 5
Retransmit count: 3
Deadtime: 0show radius local-server group
```

Output Parameter	Meaning	
Source Interface	The interface name or IP address to be used for the source address of all outgoing RADIUS packets.	
Secret Key	A shared secret key to a radius server.	
Timeout	A time interval in seconds.	
Retransmit Count	The number of retry count if a RADIUS server does not response.	
Deadtime	A time interval in minutes to mark a RADIUS server as “dead”.	
Interim-Update	A time interval in minutes to send Interim-Update Accounting report.	
Group Deadtime	The deadtime configured for RADIUS servers within a server group.	
Server Host	The RADIUS server hostname or IP address.	
Authentication Port	The destination UDP port for RADIUS authentication requests.	
Accounting Port	The destination UDP port for RADIUS accounting requests.	
Auth Status	The status of the authentication port. The status (“dead”, “error”, or “alive”) of the RADIUS authentication server and, if dead, how long it has been dead for.	
	Alive	The server is alive.
	Error	The server is not responding.
	Dead	The server is detected as dead and it will not be used for deadtime period. The time displayed in the output shows the server is in dead status for that amount of time.
	Unknown	The server is never used or the status is unknown.
Acct Status	The status of the accounting port. The status (“dead”, “error”, “alive”) of the RADIUS accounting server and, if dead, how long it has been dead for.	

show radius statistics

This command shows the RADIUS client statistics for the switch.

Syntax `show radius statistics`

Mode User Exec and Privileged Exec

Example See the sample output below showing RADIUS client statistics and RADIUS configuration:

```
awplus# show radius statistics
```

Output **Figure 74-4: Example output from the show radius statistics command:**

```
RADIUS statistics for Server: 150.87.18.89
Access-Request Tx : 5 - Retransmit : 0
Access-Accept Rx : 1 - Access-Reject Rx : 2
Access-Challenge Rx : 2
Unknown Type : 0 - Bad Authenticator: 0
Malformed Access-Resp: 0 - Wrong Identifier: 0
Bad Attribute : 0 - Packet Dropped : 0
TimeOut : 0 - Dead count : 0
Pending Request: 0
```

undebug radius

This command applies the functionality of the **no debug radius** command on page 74.3.

Chapter 75: TACACS+ Introduction and Configuration

Introduction 75.2
TACACS+ Overview 75.2
The AlliedWare Plus TACACS+ Implementation 75.2
Authentication 75.3
Authorization 75.3
Accounting 75.4
Configuration 75.5
Configure TACACS+ 75.5
TACACS+ Configuration Example 75.7

Introduction

This chapter provides information about the AlliedWare Plus implementation of TACACS+ and how to configure it on this switch. For detailed descriptions of the commands used to configure TACACS+, see **Chapter 76, TACACS+ Commands**. For information about Authentication, Authorization and Accounting (AAA), see **Chapter 71, AAA Introduction and Configuration** and **Chapter 72, AAA Commands**.

TACACS+ Overview

TACACS+ (Terminal Access Controller Access-Control System Plus) provides a method for securely managing multiple network access points from a single management service.

TACACS+ is a TCP-based access control protocol, utilizing TCP port 49, that allows a device to forward a user's username and password to an authentication server to determine whether access can be allowed. In addition to this authentication service, TACACS+ can also provide authorization and accounting services.

One of the features of TACACS+ is the ability to separate authentication, authorization and accounting so that these functions can be provided independently on separate servers. Authentication involves identifying a user, typically by requiring the user to supply a valid username and password before access is granted. Following authentication, the user must gain authorization to perform tasks. For example, after logging into a switch, a user may try to issue configuration commands. The authorization process determines whether the user has the authority to issue these commands. Authorization is always preceded by authentication.

The AlliedWare Plus TACACS+ Implementation

The AlliedWare Plus TACACS+ implementation provides authentication, authorization, and accounting. Note that:

- Authorization cannot be performed independently of the authentication process. There are no authorization commands available.
- Authentication and authorization must be configured on the same server.
- Authorization is only applicable if enable password authentication has not been configured with the **aaa authentication enable default group tacacs+** command.

With the AlliedWare Plus TACACS+ implementation, all traffic that passes between the TACACS+ client and the TACACS+ servers on the network is encrypted. TACACS+ encrypts the entire payload of packets, which means that it encrypts the user's password between the client and the server.

A TACACS+ client is available on your switch. You need a system running TACACS+ server software from a software provider to use the TACACS+ functionality on your switch.

Authentication

The TACACS+ protocol can forward many types of username and password information. The AlliedWare Plus TACACS+ implementation supports username and password login authentication, as well as enable password authentication. This information is encrypted over the network with MD5 (Message Digest 5).

When TACACS+ login authentication is enabled on the switch with the **aaa authentication login** command and at least one TACACS+ server is configured and reachable, all user login authentications are authenticated against the TACACS+ server. No local login or other means of authentication is allowed or accepted by the switch unless the switch has been configured to use another authentication method as a backup, and the TACACS+ server is not reachable.

When TACACS+ enable password authentication is enabled on the switch with the **aaa authentication enable default group tacacs+** command and at least one TACACS+ server is configured and reachable, all user attempts to access a higher privilege level using the **enable (Privileged Exec mode)** command are authenticated against the TACACS+ server. If TACACS+ enable password authentication is enabled and the TACACS+ server is not reachable, then the user is only granted access to the desired privilege level if a backup authentication method is also configured.

Note

If TACACS+ login authentication is enabled on the switch, and enable password authentication is configured as default with the **aaa authentication enable default local** command, then a local enable password must be configured for each privilege level that needs to be accessible to users.

Authorization

In the AlliedWare Plus TACACS+ implementation, authorization cannot be performed independently of the authentication process. Authorization is concerned with what users are allowed to do once they have gained access to the managed device. This involves the passing of Attribute Value pairs (AV pairs) from the TACACS+ server to the managed device. An AV pair is made up of two pieces of information: the attribute that identifies the parameter to be set, and the value that specifies the value to assign to that parameter. These AV pairs are configured on a per-user or per-group basis on the TACACS+ server. The AV pairs that are supported by the AlliedWare Plus TACACS+ implementation are:

- Privilege Level

  Privilege levels range from 1 to 15, with 15 being the highest. For information about privilege levels see **"How to Add and Remove Users" on page 1.28** and the **username** command on page 5.38.

- Timeout

  The value assigned to this attribute specifies the length of time that the session can exist. After this value has expired, the session will either be disconnected, or have the privilege of the user reduced. The valid range of timeout values is 0 to 65535 (minutes).

- Idletime

  If no input or output traffic is received or sent in the period specified by the value for this attribute, the session is disconnected. The valid idletime range is 0 to 65535 (minutes).

Note

In the AlliedWare Plus TACACS+ implementation, authorization for privilege level, timeout, and idletime AV pairs is only attempted if enable password authentication (**aaa authentication enable default group tacacs+** command) is not configured. If enable password authentication is configured then the privilege level a user is granted access to is determined during the enable password authentication session.

Accounting

TACACS+ accounting usually takes place after authentication and authorization. However, because TACACS+ separates these three functions, neither authentication nor authorization are required for accounting to function. TACACS+ accounting provides the following two distinct functions:

- a record of services used for billing purposes
- an audit trail for user exec sessions

The AlliedWare Plus TACACS+ accounting implementation supports an audit trail for user exec sessions only. This includes the ability to configure accounting for user logins and logouts, and accounting of any commands executed by the user while they are logged into the switch.

TACACS+ accounting includes three different types of accounting records:

- **start** records that indicate a service is about to start
- **stop** records that indicate a service has just ended
- **update** records that indicate a service is still in progress

Configuration

This section describes how to set up TACACS+ for login authentication, enable password authentication, and accounting.

The TACACS+ server is normally a multiuser system running TACACS+ server software from a software provider. TACACS+ servers are identified on the basis of their host name or IP address. A TACACS+ server and a switch use a shared secret text string to encrypt passwords and exchange responses. To configure TACACS+, you must specify the host running the TACACS+ server software and a secret text string that it shares with the switch.

Configure TACACS+

Table 75-1: General configuration procedure for TACACS+ authentication and accounting

Specify a remote TACACS+ server and the shared secret key	
`awplus#`	
`configure terminal`	Enter Global Configuration mode.
`awplus(config)#`	
`tacacs-server host {<host-name>|<ip-address>} [key [8]<key-string>]`	Specify the IP address or host name of the remote TACACS+ server host and the shared secret key to use with the specified TACACS+ server. Specify 8 if you are entering a password as a string that has already been encrypted instead of entering a plain text password. As many as four TACACS+ servers can be configured and consulted for authentication and accounting. The first server configured is regarded as the primary server and if the primary server fails then the backup servers are consulted in turn.
`awplus(config)#`	
`tacacs-server key [8] <key-string>`	Specify the global shared secret text string used between the switch and **all** TACACS+ servers. Specify `8` if you are entering a password as a string that has already been encrypted instead of entering a plain text password. If no secret key is explicitly specified for a TACACS+ server with the **tacacs-server host** command, the global secret key will be used.
Specify the timeout value	
`awplus(config)#`	
`tacacs-server timeout <seconds>`	Specify for how many seconds a switch waits for a reply to a TACACS+ request before considering the TACACS+ server dead.

Table 75-1: General configuration procedure for TACACS+ authentication and accounting(cont.)

Define the method list for TACACS+ login authentication	
`awplus(config)#`	
`aaa authentication login {default|<list-name>} {[local] [group {radius|tacacs+|<group-name>}]}`	This method list defines the AAA server type used for login authentication. The server types are always used in the order specified with this command. If the first server in the method list is unreachable, the switch sends the request to the next server in the list. If the authentication server denies the authentication request because of an incorrect username or password then the user login fails.
Define the method list for TACACS+ enable password authentication	
`awplus(config)#`	
`aaa authentication enable default group tacacs+ [local] [none]`	This method list defines the authentication method used to determine the privilege command level a user can access. Specify **local** to use the locally configured enable password and **none** to grant access to Privileged Exec mode with no authentication, if the TACACS+ server goes offline, or is not reachable during enable password authentication.
Define the method for TACACS+ login accounting	
`awplus(config)#`	
`aaa accounting login {default|<list-name>} {start-stop|stop-only|none} {group {radius|tacacs+|<group-name>}}`	You can only define one method for login accounting, either RADIUS or TACACS+. Specify **start-stop** to send both start and stop login accounting records, **stop-only** to send only stop login accounting records, or **none** to disable the sending of login accounting records.
Configure TACACS+ command accounting	
`awplus(config)#`	
`aaa accounting commands <1-15> default stop-only group tacacs+`	TACACS+ command accounting is configured per privilege level and only commands of the specified privilege level are accounted. Therefore, if you require that all commands are accounted to the TACACS+ server, you must configure command accounting for each privilege level separately. Commands are accounted to the TACACS+ server after they have successfully executed.
Troubleshooting TACACS+	
`awplus(config)#`	
`show tacacs+`	Display the current TACACS+ server configuration and status.
`awplus#`	
`debug aaa authentication`	Enable debug output for TACACS+ authentication.
`awplus#`	
`debug aaa authorization`	Enable debug output for TACACS+ authorization.
`awplus#`	
`debug aaa accounting`	Enable debug output for TACACS+ accounting.

TACACS+ Configuration Example

Example The following example shows how to configure the switch to authenticate and account using TACACS+.

Figure 75-1: Sample TACACS+ authentication and accounting to configure the switch to authenticate and account user exec sessions

```
!
tacacs-server host 172.10.10.1
tacacs-server key tacacspass
aaa authentication login admin group tacacs+ local
aaa authentication enable default group tacacs+ local
aaa accounting login admin start-stop group tacacs+
aaa accounting commands 1 default stop-only group tacacs+
aaa accounting commands 7 default stop-only group tacacs+
aaa accounting commands 15 default stop-only group tacacs+

line console 0
login authentication admin
accounting login admin
!
```

The lines in this example TACACS+ authentication and accounting configuration are defined as follows:

- The **tacacs-server host** command defines the IP address of the TACACS+ server host.
- The **tacacs-server key** command defines the global shared secret text string between the network access server and the TACACS+ server host.
- The **aaa authentication login** command defines a method list named **admin** to use first the TACACS+ servers and then the local user database for user login authentication.
- The **aaa authentication enable default group tacacs+** command defines a method list to use first the TACACS+ servers and then the local enable passwords, set with the **enable password** command, for user enable password authentication.
- The **aaa accounting login** command defines a method named **admin** to use TACACS+ servers for login accounting.
- The **aaa accounting commands** command specifies the privilege level of the commands that will be accounted.
- The **login authentication** command specifies that this method list will be used for authenticating users logging in on the asynchronous console port.
- The **accounting login** command specifies that this method list will be used for accounting users logging in on the asynchronous console port.

Chapter 76: TACACS+ Commands

Command List 76.2
tacacs-server host 76.2
tacacs-server key 76.4
tacacs-server timeout 76.5
show tacacs+ 76.6

Command List

This chapter provides an alphabetical reference for commands used to configure the device to use TACACS+ servers. For more information about TACAC+, see **Chapter 75, TACACS+ Introduction and Configuration**.

tacacs-server host

Use this command to specify a remote TACACS+ server host for authentication, authorization and accounting, and to set the shared secret key to use with the TACACS+ server. The parameters specified with this command override the corresponding global parameters for TACACS+ servers.

Use the **no** variant of this command to remove the specified server host as a TACACS+ authentication and authorization server.

Syntax

```
tacacs-server host {<host-name>|<ip-address>} [key [8]<key-string>]
no tacacs-server host {<host-name>|<ip-address>}
```

Parameter	Description
<host-name>	Server host name. The DNS name of the TACACS+ server host.
<ip-address>	The IP address of the TACACS+ server host, in dotted decimal notation A.B.C.D.
`key`	Set shared secret key with TACACS+ servers.
`8`	Specifies that you are entering a password as a string that has already been encrypted instead of entering a plain text password. The running config displays the new password as an encrypted string even if password encryption is turned off.
<key-string>	Shared key string applied, a value in the range 1 to 64 characters. Specifies the shared secret authentication or encryption key for all TACACS+ communications between this device and the TACACS+ server. This key must match the encryption used on the TACACS+ server. This setting overrides the global setting of the **tacacs-server key** command. If no key value is specified, the global value is used.

Default No TACACS+ server is configured by default.

Mode Global Configuration

Usage A TACACS+ server host cannot be configured multiple times like a RADIUS server.

As many as four TACACS+ servers can be configured and consulted for login authentication, enable password authentication and accounting. The first server configured is regarded as the primary server and if the primary server fails then the backup servers are consulted in turn. A backup server is consulted if the primary server fails, not if a login authentication attempt is rejected. The reasons a server would fail are:

- it is not network reachable
- it is not currently TACACS+ capable
- it cannot communicate with the switch properly due to the switch and the server having different secret keys

Examples To add the server `tac1.company.com` as the TACACS+ server host, use the following commands:

```
awplus# configure terminal
awplus(config)# tacacs-server host tac1.company.com
```

To set the secret key to `secret` on the TACACS+ server `192.168.1.1`, use the following commands:

```
awplus# configure terminal
awplus(config)# tacacs-server host 192.168.1.1 key secret
```

To remove the TACACS+ server `tac1.company.com`, use the following commands:

```
awplus# configure terminal
awplus(config)# no tacacs-server host tac1.company.com
```

Related Commands
aaa accounting commands
aaa authentication login
tacacs-server key
tacacs-server timeout
show tacacs+

tacacs-server key

This command sets a global secret key for TACACS+ authentication, authorization and accounting. The shared secret text string is used for TACACS+ communications between the switch and all TACACS+ servers.

Note that if no secret key is explicitly specified for a TACACS+ server with the **tacacs-server host** command, the global secret key will be used for the shared secret for the server.

Use the **no** variant of this command to remove the global secret key.

Syntax

```
tacacs-server key [8] <key-string>
no tacacs-server key
```

Parameter	Description
8	Specifies a string in an encrypted format instead of plain text. The running config will display the new password as an encrypted string even if password encryption is turned off.
<key-string>	Shared key string applied, a value in the range 1 to 64 characters. Specifies the shared secret authentication or encryption key for all TACACS+ communications between this device and all TACACS+ servers. This key must match the encryption used on the TACACS+ server.

Mode Global Configuration

Usage Use this command to set the global secret key shared between this client and its TACACS+ servers. If no secret key is specified for a particular TACACS+ server using the **tacacs-server host** command, this global key is used.

Examples To set the global secret key to `secret` for TACACS+ server, use the following commands:

```
awplus# configure terminal
awplus(config)# tacacs-server key secret
```

To delete the global secret key for TACACS+ server, use the following commands:

```
awplus# configure terminal
awplus(config)# no tacacs-server key
```

Related Commands **tacacs-server host**
show tacacs+

tacacs-server timeout

Use this command to specify the TACACS+ global timeout value. The timeout value is how long the device waits for a reply to a TACACS+ request before considering the server to be dead.

Note that this command configures the **timeout** parameter for TACACS+ servers globally.

The **no** variant of this command resets the transmit timeout to the default (5 seconds).

Syntax

```
tacacs-server timeout <seconds>
no tacacs-server timeout
```

Parameter	Description
<seconds>	TACACS+ server timeout in seconds, in the range 1 to 1000.

Default The default timeout value is 5 seconds.

Mode Global Configuration

Examples To set the timeout value to 3 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# tacacs-server timeout 3
```

To reset the timeout period for TACACS+ servers to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# no tacacs-server timeout
```

Related Commands **tacacs-server host**
show tacacs+

show tacacs+

This command displays the current TACACS+ server configuration and status.

Syntax `show tacacs+`

Mode User Exec and Privileged Exec

Example To display the current status of TACACS+ servers, use the command:

```
awplus# show tacacs+
```

Output **Figure 76-1: Example output from the show tacacs+ command**

```
TACACS+ Global Configuration
  Timeout              : 5 sec

Server Host/       Server
IP Address         Status
------------------------------------------------------------
192.168.1.10       Alive
192.168.1.11       Unknown
```

Table 76-1: Parameters in the output of the show tacacs+ command

Output Parameter	Meaning	
`Timeout`	A time interval in seconds.	
`Server Host/IP Address`	TACACS+ server hostname or IP address.	
`Server Status`	The status of the authentication port.	
	`Alive`	The server is alive.
	`Dead`	The server has timed out.
	`Error`	The server is not responding or there is an error in the key string entered.
	`Unknown`	The server is never used or the status is unkown.
	`Unreachable`	The server is unreachable.
	`Unresolved`	The server name can not be resolved.

Chapter 77: Local RADIUS Server Introduction and Configuration

Local RADIUS Server Introduction 77.2
- Enable the Local RADIUS Server 77.2
- Add the Local RADIUS Server as a RADIUS Server 77.3
- Add authenticators to the list of authenticators 77.3
- Configure the Local RADIUS Server User Database 77.4
- Authenticating login sessions 77.5
- RADIUS Authentication with User Privileges 77.5
- Creating certificates for single users and all users 77.8

Defined RADIUS attributes list 77.9

Local RADIUS Server Introduction

Local RADIUS Server provides a user authentication service feature. This feature must be enabled on the switch, because it is disabled by default. For details of commands used to configure the local RADIUS server, see **Chapter 78, Local RADIUS Server Commands**.

Enable the Local RADIUS Server

The Local RADIUS Server is disabled by default. Enter the following commands to enable the Local RADIUS Server:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# server enable
```

This will automatically initialize the internal Certificate Authority (CA) in the switch. It will also automatically create a server certificate and enrol the certificate with the Local CA by implicitly executing the following commands:

```
awplus(config)# crypto pki trustpoint local
awplus(config)# crypto pki enroll local
```

The **crypto pki trustpoint local** command declares the Local CA as the CA from which to obtain Certificates. The Local CA has be defined first so Certificates can be obtained from it. The crypto pki enroll local command obtains the system certificate from the Local CA.

The switch is automatically added to the list of authenticators that may send authentication requests to the Local RADIUS Server by implicitly executing the following commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# nas 127.0.0.1 key awplus-local-radius-
server
```

Note

The key **awplus-local-radius-server** is a pre-defined component that can be used for internal exchanges between the switch's RADIUS client and its RADIUS server.

Add the Local RADIUS Server as a RADIUS Server

Although the switch is automatically defined as a NAS (Network Access Server) for the Local RADIUS Server, you must manually add the Local RADIUS Server to the server list defined for the Local RADIUS Client.

Use the following commands to add the Local RADIUS Server as a RADIUS Server. The Local RADIUS Client can then send authentication requests to its Local RADIUS Server:

```
awplus# configure terminal
awplus(config)# radius-server host 127.0.0.1 key awplus-local-
radius-server
```

Add authenticators to the list of authenticators

Authenticators can send authentication requests to the Local RADIUS Server.

Use the following commands to add other authenticators to the list of authenticators.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# nas <nas-ip-address> key <nas-keystring>
```

Configure the Local RADIUS Server User Database

Add users to the RADIUS user list without assigning VLANs

For entries that will be used to authenticate dot1x supplicants, but not assign them to a VLAN, the following commands will add users to the RADIUS user list:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# user <radius-user-name> password <user-password>
```

Add users to the RADIUS user list and assign VLANs

Add users to the RADIUS user list, and define a VLAN ID that will be assigned to them.

To add entries to be used to authenticate dot1x supplicants, and assign them to a VLAN, follow the two steps shown below:

Step 1: Create groups associated with the VIDs that will be allocated

Enter the following commands to create groups with the VIDs that will be allocated to them:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group VLAN10Users
awplus(config-radsrv)# vlan 10
awplus(config-radsrv)# group VLAN11Users
awplus(config-radsrv)# vlan 11
```

Step 2: Add the users after creating groups

Add the users and refer to the relevant group in the command that creates the user as below:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# user VCSPCVLAN10 password VCSPCPass
group VLAN10Users
awplus(config-radsrv)# user VCSPCVLAN11 password VCSPCPass
group VLAN11Users
```

Authenticating login sessions

Authentication can be performed in multiple contexts, such as the authentication of users logging in at a console, as well as tri-authentication of devices connecting to switch ports, see **Tri-Authentication Configuration** in **Chapter 69, Authentication Introduction and Configuration**.

RADIUS Authentication with User Privileges

There are three groups of privilege levels:

- Users with privilege levels 1 to 6 have access to privilege 1 level commands.
- Users with privilege 7 to 14 have access to privilege level 1 commands and all show commands.
- Users with privilege level 15 have access to all commands.

When a user logs into a management session on a switch by console, telnet, or SSH and is being authenticated by RADIUS, the RADIUS server needs to be able to indicate to the switch what privilege level to assign to the user's session.

The way that the privilege level is associated with a user is to use the RADIUS attributes. The attributes are configured on RADIUS groups.

Because there are three group of security privilege levels there will need to be up to three different groups for login users; each group specifying a different privilege level.

The attributes that need to be configured on the three different RADIUS groups are as follows:

1. For the users with a privilege level of 1-6 use just the RADIUS `attribute Service-Type`, and assign it the value `NAS-Prompt-User`:

```
attribute Service-Type NAS-Prompt-User
```

2. For users with the security privilege of 7-14 use the following 2 RADIUS attributes:

```
attribute Cisco-AVPair shell:priv-lvl=7
attribute Service-Type NAS-Prompt-User
```

3. User with the administrator security privilege use just the RADIUS `attribute Service-Type`, and assign it the value `Administrative-User`:

```
attribute Service-Type Administrative-User
```

Since there is not an explicit RADIUS attribute for the users with the security privilege level 7, use "`Cisco-AVPair`" to specify this user privilege. Also, it is very important that you specify the attribute `Service-Type NAS-Prompt-User` as well, otherwise the following error is generated when a user allocated to this group tries to login into the AlliedWare Plus switch:

```
19:09:14 awplus login[16974]: Invalid user name "tests" in
main:698. Abort.
```

The RADIUS Server attribute `NAS-Prompt-User` is used for non-privileged level users as per the RADIUS RFC. This attribute is used for users with security privilege levels of 1 to 6.

Configuring these RADIUS Server attributes is achieved using Local RADIUS Server commands:

```
                    awplus# configure terminal
             awplus(config)# radius-server local
        awplus(config-radsrv)# group users
awplus(config-radsrv-group)# attribute Service-Type NAS-
                              Prompt_User
```

See the below sample configuration for an AlliedWare Plus switch acting as the RADIUS Server, with the three different security privileges for `admin`, `middle-management`, and `users` groups:

Figure 77-1: Sample RADIUS Server configuration for three different security privileges:

```
crypto pki trustpoint local
!
crypto pki enroll local
radius-server local
 server enable
 nas 10.1.1.1 key test
 nas 127.0.0.1 key awplus-local-radius-server
 group admin
  attribute Service-Type Administrative-User
 group middle-management
  attribute Cisco-AVPair shell:priv-lvl=7
  attribute Service-Type NAS-Prompt-User
 group users
  attribute Service-Type NAS-Prompt-User
 user test encrypted password UukoSyvxY2v9iWXm8e/
JMDJd9iIc3RPyY09lGOb3pA4= group  users
 user tested encrypted password
sEDhM4iJRfJrLhhs+RgjpgkDXtCwuji6AllpApi9EjA= group admin
 user tests encrypted password il9aIh8JLOT6kHDV+Ix7/
8fzyfVpAwRErJg6NPQdJy8= group middle-management
```

Removing users from the RADIUS users list

To remove the user Tom from the user database of the Local RADIUS server, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no user Tom
```

Creating certificates for single users and all users

Create a certificate for a single user

A certificate for user Tom can be created from the local CA by using the commands:

```
awplus# configure terminal
awplus(config)# crypto pki enroll local user Tom
```

Create a certificate for all users

Certificates can be created for all currently defined users by using the commands:

```
awplus# configure terminal
awplus(config)# crypto pki enroll local local-radius-all-users
```

Exporting certificates

User certificates can be exported in PKCS12 format.

To export a certificate for user Tom and upload it to the TFTP server at 192.168.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# crypto pki export local pkcs12 Tom tftp://
192.168.1.1/tomcert.pkcs
```

Defined RADIUS attributes list

This is a full list of valid attributes and pre-defined values that may be used in conjunction with the **attribute** command on page 78.2, to show or configure defined RADIUS attributes.

Table 77-1 lists all Standard attributes and values, **Table 77-2** lists the Vendor-Specific attribute (attribute ID 26) names and values.

More detailed information can be found in the following RFCs, defining the attributes and values for RADIUS server:

- RFC2865: Remote Authentication Dial In User Service (RADIUS)
- RFC2866: RADIUS Accounting
- RFC2867: RADIUS Accounting Modifications for Tunnel Protocol Support
- RFC2868: RADIUS Attributes for Tunnel Protocol Support
- RFC2869: RADIUS Extensions
- RFC3162: RADIUS and IPv6
- RFC3576: Dynamic Authorization Extensions to Remote Authentication Dial In User Service (RADIUS)
- RFC3580: IEEE 802.1X Remote Authentication Dial In User Service (RADIUS) Usage Guidelines
- RFC4072: Diameter Extensible Authentication Protocol (EAP) Application
- RFC4372: Chargeable User Identity
- RFC4603: Additional Values for the NAS-Port-Type Attribute
- RFC4675: RADIUS Attributes for Virtual LAN and Priority Support
- RFC4679: DSL Forum Vendor-Specific RADIUS Attributes
- RFC4818: RADIUS Delegated-IPv6-Prefix Attribute
- RFC4849: RADIUS Filter Rule Attribute
- RFC5176: Dynamic Authorization Extensions to Remote Authentication Dial In User Service (RADIUS)
- RFC5580: Carrying Location Objects in RADIUS and Diameter
- RFC5607: Remote Authentication Dial-In User Service (RADIUS) Authorization for Network Access Server (NAS) Management
- RFC5904: RADIUS Attributes for IEEE 802.16 Privacy Key Management Version 1 (PKMv1) Protocol Support

Table 77-1: Standard RADIUS Attributes

Attribute ID and Name		Value Type/Pre-defined Values
1	User-Name	string
2	User-Password	string
3	CHAP-Password	octets (Hexadecimal string followed by 0x)
4	NAS-IP-Address	ipaddr (IPv4 address)
5	NAS-Port	Integer
6	Service-Type	Integer. Valid values are: ■ Administrative-User (6) ■ Authenticate-Only (8) ■ Authorize-Only (17) ■ Callback-Administrative (11) ■ Callback-Framed-User (4) ■ Callback-Login-User (3) ■ Callback-NAS-Prompt (9) ■ Call-Check (10) ■ Framed-Management (18) ■ Framed-User (2) ■ Login-User (1) ■ NAS-Prompt-User (7) ■ Outbound-User (5)
7	Framed-Protocol	Integer. Valid values are: ■ ARAP (3) ■ Gandalf-SLML (4) ■ PPP (1) ■ SLIP (2) ■ X.75-Synchronous (6) ■ Xylogics-IPX-SLIP (5)
8	Framed-IP-Address	ipaddr (IPv4 address)
9	Framed-IP-Netmask	ipaddr (IPv4 address)
10	Framed-Routing	integer. Valid values are: ■ Broadcast (1) ■ Broadcast-Listen (3) ■ Listen (2) ■ None (0)
11	Filter-Id	string
12	Framed-MTU	Integer
13	Framed-Compression	Integer. Valid values are: ■ IPX-Header-Compression (2) ■ None (0) ■ Stac-LZS (3) ■ Van-Jacobson-TCP-IP (1)
14	Login-IP-Host	IP Address

Table 77-1: Standard RADIUS Attributes(cont.)

Attribute ID and Name		Value Type/Pre-defined Values
15	Login-Service	Integer. Valid values are: ■ LAT (4) ■ PortMaster (3) ■ Rlogin (1) ■ TCP-Clear (2) ■ TCP-Clear-Quiet (8) ■ Telnet (0) ■ X25-PAD (5) ■ X25-T3POS (6)
16	Login-TCP-Port	Integer. Valid values are: ■ Rlogin (513) ■ Rsh (514) ■ Telnet (23)
18	Reply-Message	string
19	Callback-Number	string
20	Callback-Id	string
22	Framed-Route	string
23	Framed-IPX-Network	IP address
24	State	octets (Hexadecimal string followed by 0x)
25	Class	octets (Hexadecimal string followed by 0x)
26	Vendor-Specific	Use the Vendor-specific Attribute Name. For valid values, see **"Vendor-Specific RADIUS Attributes" on page 77.18**.
27	Session-Timeout	Integer
28	Idle-Timeout	Integer
29	Termination-Action	Integer. Valid values are: ■ Default (0) ■ RADIUS-Request (1)
30	Called-Station-Id	string
31	Calling-Station-Id	string
32	NAS-Identifier	string
33	Proxy-State	octets (Hexadecimal string followed by 0x)

Command List

This chapter provides an alphabetical reference for commands used to configure the local RADIUS server on the device. For more information, see **Chapter 77, Local RADIUS Server Introduction and Configuration**.

attribute

Use this command to define a RADIUS attribute for the local RADIUS server user group.

For a complete list of defined RADIUS attributes and values, see **"Defined RADIUS attributes list" on page 77.9**.

When used with the **help** parameter the **attribute** command displays a list of standard and vendor specific valid RADIUS attributes that are supported by the local RADIUS server.

If an attribute name is specified with the **help** parameter, then the **attribute** command displays a list of predefined attribute names. Note that you can only use the defined RADIUS attribute names and not define your own.

When used with the **value** parameter the **attribute** command configures RADIUS attributes to the user group. If the specified attribute is already defined then it is replaced with the new value.

Use the **no** variant of this command to delete an attribute from the local RADIUS server user group.

Syntax

```
attribute [<attribute-name>|<attribute-id>] help
attribute {<attribute-name>|<attribute-id>} <value>
no attribute {<attribute-name>|<attribute-id>}
```

Parameter	Description
<attribute-name>	RADIUS attribute name for standard attributes (see **Table 77-1 on page 77.10**) or Vendor-Specific attributes (see **Table 77-2 on page 77.18**).
<attribute-id>	RADIUS attribute numeric identifier for standard attributes (**Table 77-1 on page 77.10**).
<value>	RADIUS attribute value.
`help`	Display a list of available attribute types.

Default By default, no attributes are configured.

Mode RADIUS Server Group Configuration

Usage For the Standard attributes, the attribute may be specified using either the attribute name, or its numeric identifier. For example, command:

```
awplus(config-radsrv-group)# attribute acct-terminate-cause
                             help
```

will produce the same results as command:

```
awplus(config-radsrv-group)# attribute 49 help
```

In the same way, where the specific attribute has a pre-defined value, the parameter <*value*> may be substituted with the Value Name or with its numeric value, for example command:

```
awplus(config-radsrv-group)# attribute acct-terminate-cause
                             user-request
```

will produce the same results as command:

```
awplus(config-radsrv-group)# attribute 49 1
```

or command:

```
awplus(config-radsrv-group)# attribute acct-terminate-cause 1
```

Example To check a list of all available defined RADIUS attribute names, use the following commands:

```
                    awplus# configure terminal
             awplus(config)# radius-server local
       awplus(config-radsrv)# group Admin
awplus(config-radsrv-group)# attribute help
```

A list of Vendor-specific Attributes displays after the list of defined Standard Attributes.

To get help for valid RADIUS attribute values for the attribute `Service-Type`, use the following commands:

```
                    awplus# configure terminal
             awplus(config)# radius-server local
       awplus(config-radsrv)# group Admin
awplus(config-radsrv-group)# attribute Service-Type help
```

```
Service-Type : integer (Integer number)
Pre-defined values :
    Administrative-User (6)
    Authenticate-Only (8)
    Authorize-Only (17)
    Callback-Administrative (11)
    Callback-Framed-User (4)
    Callback-Login-User (3)
    Callback-NAS-Prompt (9)
    Call-Check (10)
    Framed-User (2)
    Login-User (1)
    NAS-Prompt-User (7)
    Outbound-User (5)
```

To define the attribute name 'Service-Type' with Administrative User (6) to the RADIUS User Group 'Admin', use the following commands:

```
                    awplus# configure terminal
                 awplus(config)# radius-server local
           awplus(config-radsrv)# group Admin
awplus(config-radsrv-group)# attribute Service-Type 6
```

To delete the attribute 'Service-Type' from the RADIUS User Group 'Admin', use the following commands:

```
                    awplus# configure terminal
                 awplus(config)# radius-server local
           awplus(config-radsrv)# group Admin
awplus(config-radsrv-group)# no attribute Service-Type
```

Related Commands **egress-vlan-id**
egress-vlan-name

authentication

Use this command to enable the specified authentication methods on the local RADIUS server.

Use the **no** variant of this command to disable specified authentication methods on the local RADIUS server.

Syntax

```
authentication {mac|eapmd5|eaptls|peap}
no authentication {mac|eapmd5|eaptls|peap}
```

Parameter	Description
mac	Enable MAC authentication method.
eapmd5	Enable EAP-MD5 authentication method.
eaptls	Enable EAP-TLS authentication method.
peap	Enable EAP-PEAP authentication method.

Default All authentication methods are enabled by default.

Mode RADIUS Server Configuration

Example The following commands enable EAP-MD5 authentication methods on the local RADIUS server.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# authentication eapmd5
```

The following commands disable EAP-MD5 authentication methods on Local RADIUS server.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no authentication eapmd5
```

Related Commands **server enable**
show radius local-server statistics

clear radius local-server statistics

Use this command to clear the statistics stored on the switch for the local RADIUS server.

Use this command without any parameters to clear all types of local RADIUS server statistics.

Syntax `clear radius local-server statistics [nas|server|user]`

Parameter	Description
`nas`	Clear the NAS (Network Access Server) statistics on the switch. For example, clearing statistics stored for NAS server invalid passwords.
`server`	Clear the Local RADIUS Server statistics on the switch. For example, clearing Local RADIUS Servers statistics for all failed login attempts.
`user`	Clear the Local RADIUS Server user statistics. For example, clearing statistics stored for the number of successful user logins.

Mode Privileged Exec

Usage Refer to the sample output for the **show radius local-server statistics** for further information about the type of statistics each parameter option for this command clears. Both the **nas** and **server** parameters clear unknown username and invalid passwords statistics, while the `user` parameter clears the number of successful and failed logins for each local RADIUS server user.

Example To clear the NAS (Network Access Server) statistics stored on the switch, use the command:.

```
awplus# clear radius local-server statistics nas
```

To clear the local RADIUS server statistics stored on the switch, use the command:.

```
awplus# clear radius local-server statistics server
```

To clear the local RADIUS server user statistics stored on the switch, use the command:.

```
awplus# clear radius local-server statistics user
```

Related Commands **show radius local-server statistics**

copy fdb-radius-users (to file)

Use this command to create a set of local RADIUS server users from MAC addresses in the local FDB. A local RADIUS server user created using this command can be used for MAC authentication.

Syntax

```
copy fdb-radius-users {local-radius-user-db|flash|nvs|card|debug|
   tftp|scp|<url>} [interface <port>] [vlan <vid>] [group <name>]
   [export-vlan [<group-name>]]
```

Parameter	Description
`local-radius-user-db`	Copy the local RADIUS server users created to the local RADIUS server.
`flash`	Copy the local RADIUS server users created to Flash memory.
`nvs`	Copy the local RADIUS server users created to NVS memory.
`card`	Copy the local RADIUS server users created to SD card.
`debug`	Copy the local RADIUS server users created to debug.
`tftp`	Copy the local RADIUS server users created to the TFTP destination.
`scp`	Copy the local RADIUS server users created to the SCP destination.
`<url>`	Copy the local RADIUS server users created to the specified URL.
`interface <port>`	Copy only MAC addresses learned on a specified switch port. Wildcards may be used when specifying an interface name. For example, when you specify interface port1.* then this command generates RADIUS server users for MAC addresses learned on stack 1.
`vlan <vid>`	Copy only MAC addresses learned on a specified VLAN.
`group <name>`	Assign a RADIUS group name to the local RADIUS server users created.
`export-vlan <group-name>`	Assign a RADIUS group name to the assigned export VLAN.

Mode Privileged Exec

Usage The local RADIUS server users created are written to a specified destination file in local RADIUS user CSV (Comma Separated Values) format. The local RADIUS server users can then be imported to a local RADIUS server using the **copy local-radius-user-db (from file)** command.

The name and password of the local RADIUS server users created use a MAC address, which can be used for MAC authentication.

This command does not copy a MAC address learned by the CPU or the management port.

This command can filter FDB entries by the interface name and the VLAN ID. When the interface name and the VLAN ID are specified, this command generates local RADIUS

server users from only the MAC address learned on the specified interface and on the specified VLAN.

Examples

To register the local RADIUS server users from the local FDB directly to the local RADIUS server, use the command:

```
awplus# copy fdb-radius-users local-radius-user-db
```

To register the local RADIUS server users from the interface `port1.0.1` to the local RADIUS server, use the command:

```
awplus# copy fdb-radius-users local-radius-user-db interface
        port1.0.1
```

To copy output generated as local RADIUS server user data from MAC addresses learned on `vlan10` on interface `port1.0.1` to the file `radius-user.csv`, use the command:

```
awplus# copy fdb-radius-users radius-user.csv interface
        port1.0.1 vlan10
```

Related Commands

copy local-radius-user-db (to file)
copy local-radius-user-db (from file)

copy local-radius-user-db (from file)

Use this command to copy the Local RADIUS server user data from a file. The file, including the RADIUS user data in the file, must be in the CSV (Comma Separated Values) format.

You can select **add** or **replace** as the copy method. The **add** parameter option copies the contents of specified file to the local RADIUS server user database. If the same user exists then the old user is removed before adding a new user. The **replace** parameter option deletes all contents of the local RADIUS server user database before copying the contents of specified file.

Syntax

```
copy <source-url> local-radius-user-db [add|replace]
```

Parameter	Description
<source-url>	URL of the source file.
`add`	Add file contents to local RADIUS server user database.
`replace`	Replace current local RADIUS server user database with file contents.

Default When no copy method is specified with this command the **replace** option is applied.

Mode Privileged Exec

Examples To replace the current local RADIUS server user data to the contents of http://datahost/user.csv, use the following command:

```
awplus# copy http://datahost/user.csv local-radius-user-db
```

To add the contents of http://datahost/user.csv to the current local RADIUS server user database, use the following command:

```
awplus# copy http://datahost/user.csv local-radius-user-db add
```

Related commands

copy fdb-radius-users (to file)
copy local-radius-user-db (to file)

copy local-radius-user-db (to file)

Use this command to copy the local RADIUS server user data to a file. The output file produced is CSV (Comma Separated Values) format.

Syntax `copy local-radius-user-db {flash|nvs|card|tftp|scp|<destination-url>}`

Parameter	Description
`flash`	Copy to flash memory.
`nvs`	Copy to NVS memory.
`card`	Copy to SD card.
`tftp`	Copy to TFTP destination.
`scp`	Copy to SCP destination.
<destination-url>	URL of the Destination file.

Mode Privileged Exec

Example Copy the current local RADIUS server user data to http://datahost/user.csv.

```
awplus# copy local-radius-user-db http://datahost/user.csv
```

Related Commands **copy fdb-radius-users (to file)**
copy local-radius-user-db (from file)

crypto pki enroll local

Use this command to obtain a system certificate from the Local CA (Certificate Authority).

Use the **no** variant of this command to delete system certificates created by a Local CA (Certificate Authority).

Syntax

```
crypto pki enroll local
no crypto pki enroll local
```

Default The system certificate is not available until this command is issued.

Mode Global Configuration

Example The following command obtains the system certificate from the Local CA (Certificate Authority).

```
awplus# configure terminal
awplus(config)# crypto pki enroll local
```

The following command deletes the system certificate created by the Local CA (Certificate Authority).

```
awplus# configure terminal
awplus(config)# no crypto pki enroll local
```

Related Commands **crypto pki trustpoint local**
group

crypto pki enroll local local-radius-all-users

Use this command to create certificates for all users registered in the local RADIUS server. These certificates are created by the Local Certificate Authority (CA) on the switch.

Syntax `crypto pki enroll local local-radius-all-users`

Default By default, there are no certificates for users in the local RADIUS server.

Mode Global Configuration

Example The following command obtains the local RADIUS server certificates for the user from the Local CA (Certificate Authority).

```
awplus# configure terminal
awplus(config)# crypto pki enroll local local-radius-all-users
```

Related Commands **crypto pki trustpoint local**
show crypto pki certificates

crypto pki enroll local user

Use this command to obtain a local user certificate from the Local CA (Certificate Authority).

Use the **no** variant of this command to delete user certificates created by the Local CA (Certificate Authority).

Syntax

```
crypto pki enroll local user <user-name>
no crypto pki enroll local user <user-name>
```

Parameter	Description
<user-name>	User name.

Default By default, there is no user certificate.

Mode Global Configuration

Example The following command obtains Tom's certificate from the Local CA (Certificate Authority).

```
awplus# configure terminal
awplus(config)# crypto pki enroll local user Tom
```

The following command deletes Tom's certificates created by the Local CA (Certificate Authority):

```
awplus# configure terminal
awplus(config)# no crypto pki enroll local user Tom
```

Related Commands **crypto pki trustpoint local**
show crypto pki certificates

crypto pki export local pem

Use this command to export the certificate associated with the Local CA to a PEM format file.

Syntax `crypto pki export local pem url <url>`

Parameter	Description
<url>	URL string.

Mode Global Configuration

Example The following command exports the Local CA certificate to a PEM format file.

```
awplus# configure terminal
awplus(config)# crypto pki export local pem url tftp://
192.168.1.1/cacert.pem
```

Related Commands crypto pki enroll local

crypto pki export local pkcs12

Use this command to export a specified certificate to a PKCS12 format file.

This command cannot be used for exporting certificates for the local system.

Syntax `crypto pki export local pkcs12 <user-name> <destination-url>`

Parameter	Description
<user-name>	User name.
<destination-url>	Destination URL string.

Mode Global Configuration

Example The following commands exports a certificate for a user named **client** to a PKCS12 format file.

```
awplus# configure terminal
awplus(config)# crypto pki export local pkcs12 client tftp://
192.168.1.1/cacert.pem
```

To export Tom's certificate to PKSC12 format file, use the commands:

```
awplus# configure terminal
awplus(config)# crypto pki export local pksc12 Tom tftp://
192.168.1.1/tom.pfx
```

Related Commands crypto pki enroll local

crypto pki trustpoint local

Use this command to declare the Local CA (Certificate Authority) as the trustpoint that the system uses. The ca-trustpoint configuration mode is available after this command is issued.

Use the **no** variant of this command to delete all information and certificates associated with Local CA as the trustpoint.

Syntax

```
crypto pki trustpoint local
no crypto pki trustpoint local
```

Default Local CA is not a trustpoint.

Mode Global Configuration

Examples Use the following commands to declare the Local CA as the trustpoint.

```
awplus# configure terminal
awplus(config)# crypto pki trustpoint local
```

Use the following commands to delete all information and certificates associated with the Local CA.

```
awplus# configure terminal
awplus(config)# no crypto pki trustpoint local
```

To create a client certificate for all users registered to the local RADIUS server, use the following commands:

```
awplus(config)# crypto pki trustpoint local
awplus(ca-trust-point)# exit
awplus(config)# crypto pki enroll local alternative
```

Related Commands

crypto pki enroll local
show crypto pki trustpoints

debug crypto pki

Use this command to enable Public Key Infrastructure (PKI) debugging. When PKI debugging is enabled, the PKI module starts generating diagnostic messages to the system log.

Use the **no** variant of this command to disable Public Key Infrastructure (PKI) debugging. When PKI debugging is disabled, the PKI module stops generating diagnostic messages to the system log.

Syntax

```
debug crypto pki
no debug crypto pki
```

Default PKI debugging is disabled by default

Mode Privileged Exec

Example To enable the PKI debugging facility, use the command:

```
awplus# debug crypto pki
```

To disable the PKI debugging facility, use the command:

```
awplus# no debug crypto pki
```

domain-style

Use this command to enable a specified domain style on the local RADIUS server. The local RADIUS server decodes the domain portion of a username login string when this command is enabled.

Use the **no** variant of this command to disable the specified domain style on the local RADIUS server.

Syntax `domain-style {suffix-atsign|ntdomain}`

Parameter	Description
`suffix-atsign`	Enable at sign "@" delimited suffix style, i.e. "user@domain".
`ntdomain`	Enable NT domain style, i.e. "domain\user".

Default This feature is disabled by default.

Mode RADIUS Server Configuration

Usage When both domain styles are enabled, the first domain style configured has the highest priority. A username login string is matched against the first domain style enabled. Then, if the username login string is not decoded, it is matched against the second domain style enabled.

Example To enable NT domain style on the local RADIUS server, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# domain-style ntdomain
```

To disable NT domain style on the local RADIUS server, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no domain-style ntdomain
```

Related Commands server enable

egress-vlan-id

Use this command to configure the standard RADIUS attribute "Egress-VLANID (56)" for the local RADIUS Server user group.

Use the **no** variant of this command to remove the Egress-VLANID attribute from the local RADIUS server user group.

Syntax

```
egress-vlan-id <vid> [tagged|untagged]
no egress-vlan-id
```

Parameter	Description
`<vid>`	The VLAN identifier to be used for the Egress VLANID attribute, in the range 1 to 4094.
`tagged`	Set frames on the VLAN as tagged. This sets the tag indication field to indicate that all frames on this VLAN are tagged.
`untagged`	Set all frames on the VLAN as untagged. This sets the tag indication field to indicate that all frames on this VLAN are untagged.

Default By default, no Egress-VLANID attributes are configured.

Mode RADIUS Server Group Configuration

Usage When a Voice VLAN is configured for dynamic VLAN allocation (**switchport voice vlan** command on page 19.32), the RADIUS server must be configured to send the VLAN information when an IP phone is successfully authenticated. Use either the **egress-vlan-id** command or the **egress-vlan-name** command on page 78.20, and specify the **tagged** parameter.

Examples To set the "Egress-VLANID" attribute for the NormalUsers local RADIUS server user group to VLAN identifier 200, with tagged frames, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# egress-vlan-id 200 tagged
```

To remove the "Egress-VLANID" attribute for the NormalUsers local RADIUS server user group, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# no egress-vlan-id
```

Related Commands

attribute
egress-vlan-name
switchport voice vlan

egress-vlan-name

Use this command to configure the standard RADIUS attribute "Egress-VLAN-Name (58)" for the local RADIUS server user group.

Use the **no** variant of this command to remove the Egress-VLAN-Name attribute from the local RADIUS server user group.

Syntax

```
egress-vlan-name <vlan-name> [tagged|untagged]
no egress-vlan-name
```

Parameter	Description
<vlan-name>	The VLAN name to be configured as the Egress-VLAN-Name attribute.
`tagged`	Set frames on the VLAN as tagged. This sets the tag indication field to indicate that all frames on this VLAN are tagged.
`untagged`	Set all frames on the VLAN as untagged. This sets the tag indication field to indicate that all frames on this VLAN are untagged.

Default By default, no Egress-VLAN-Name attributes are configured.

Mode RADIUS Server Group Configuration

Usage When a Voice VLAN is configured for dynamic VLAN allocation (**switchport voice vlan** command on page 19.32), the RADIUS server must be configured to send the VLAN information when an IP phone is successfully authenticated. Use either the **egress-vlan-id** command on page 78.19 or the **egress-vlan-name** command, and specify the **tagged** parameter.

Examples To configure the "Egress-VLAN-Name" attribute for the RADIUS server user group NormalUsers with the VLAN name "vlan2" and all frames on this VLAN tagged, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# egress-vlan-name vlan2 tagged
```

To delete the "Egress-VLAN-Name" attribute for the NormalUsers group, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# no egress-vlan-name
```

Related Commands

attribute
egress-vlan-id
switchport voice vlan

group

Use this command to create a local RADIUS server user group, and enter local RADIUS Server User Group Configuration mode.

Use the **no** variant of this command to delete the local RADIUS server user group.

Syntax

```
group <user-group-name>
no group <user-group-name>
```

Parameter	Description
<user-group-name>	User group name string.

Mode RADIUS Server Configuration

Example The following command creates the user group NormalUsers.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
```

The following command deletes user group NormalUsers.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no group NormalUsers
```

Related Commands

user (RADIUS server)
show radius local-server user
vlan (RADIUS server)

nas

This command adds a client device (the Network Access Server or the NAS) to the list of devices that are able to send authentication requests to the local RADIUS server. The NAS is identified by its IP address and a shared secret (also referred to as a shared key) must be defined that the NAS will use to establish its identity.

Use the **no** variant of this command to remove a NAS client from the list of devices that are allowed to send authentication requests to the local RADIUS server.

Syntax

```
nas <ip-address> key <nas-keystring>
no nas <ip-address>
```

Parameter	Description
<ip-address>	RADIUS NAS IP address.
<nas-keystring>	NAS shared keystring.

Mode RADIUS Server Configuration

Example The following commands add the NAS with an IP address of `192.168.1.2` to the list of clients that may send authentication requests to the local RADIUS server. Note the shared key that this NAS will use to establish its identify is `NAS_PASSWORD`.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# nas 192.168.1.2 key NAS_PASSWORD
```

The following commands remove the NAS with an IP address of `192.168.1.2` from the list of clients that are allowed to send authentication requests to the local RADIUS server:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no nas 192.168.1.2
```

Related Commands **show radius local-server nas**

radius-server local

Use this command to navigate to the Local RADIUS server configuration mode `(config-radsrv)` from the Global Configuration mode `(config)`.

Syntax `radius-server local`

Mode Global Configuration

Example Local RADIUS Server commands are available from `config-radsrv` configuration mode. To change mode from User Exec mode to the Local RADIUS Server mode (config-radsrv), use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)#
```

Output

```
awplus(config)#radius-server local
Creating Local CA repository.....OK
Enrolling Local System to local trustpoint..OK
awplus(config-radsrv)#
```

Related Commands

server enable
show radius local-server group

server auth-port

Use this command to change the UDP port number for local RADIUS server authentication.

Use the **no** variant of this command to reset the RADIUS server authentication port back to the default.

Syntax

```
server auth-port <1-65535>
no server auth-port
```

Parameter	Description
<1-65535>	UDP port number.

Default The default local RADIUS server UDP authentication port number is 1812.

Mode RADIUS Server Configuration

Example The following commands set the RADIUS server authentication port to 10000.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# server port 10000
```

The following commands reset the RADIUS server authentication port back to the default UDP port of 1812.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no server port
```

Related Commands

server enable
show radius local-server statistics

server enable

This command enables the local RADIUS server. The local RADIUS server feature is started immediately when this command is issued.

The **no** variant of this command disables local RADIUS server. When this command is issued, the local RADIUS server stops operating.

Syntax

```
server enable
no server enable
```

Default The local RADIUS server is disabled by default and must be enabled for use with this command.

Mode RADIUS Server Configuration

Examples To enable the local RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# server enable
```

To disable the local RADIUS server, use the command:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no server enable
```

Related Commands **server auth-port**
show radius local-server statistics

show crypto pki certificates

Use this command to display certificate information for Local CA and Local System certificates.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show crypto pki certificates [local-ca|local]`

Parameter	Description
`local-ca`	Local CA certificate.
`local`	Local system certificate.

Mode User Exec and Privileged Exec

Example The following command displays Local CA (Certificate Authority) certificate information.

```
awplus# show crypto pki certificates local-ca
```

The following command displays Local System certificate information.

```
awplus# show crypto pki certificates local
```

The following command displays information for all Local CA and Local System certificates.

```
awplus# show crypto pki certificates
```

Output

Figure 78-1: Example output from the show crypto pki certificates command showing Local System and Local CA certificates

```
awplus#show crypto pki certificates
Certificate: Local System
    Data:
        Version: 3 (0x2)
        Serial Number: 4 (0x4)
        Signature Algorithm: sha1WithRSAEncryption
        Issuer: O=Allied-Telesis, CN=AlliedwarePlusCA
        Validity
            Not Before: Oct  8 07:50:55 2009 GMT
            Not After : Oct  6 07:50:55 2019 GMT
        Subject: O=Allied-Telesis, CN=Tom
Certificate: Local CA
    Data:
        Version: 3 (0x2)
        Serial Number: 0 (0x0)
        Signature Algorithm: sha1WithRSAEncryption
        Issuer: O=Allied-Telesis, CN=AlliedwarePlusCA
        Validity
            Not Before: Oct  8 07:55:55 2009 GMT
            Not After : Oct  6 07:55:55 2019 GMT
        Subject: O=Allied-Telesis, CN=Tom
```

Table 78-1: Parameters in the output of the show crypto pki certificates command

Parameter	Description
`Certificate`	Certificate name.
`Version`	Protocol version.
`Serial Number`	Serial number of the certificate.
`Signature Algorithm`	Algorithm used for the certificate signature.
`Issuer`	Subject of issuer creating the certificate.
`Validity`	Validity period.
`Subject`	Subject of the certificate.

Related Commands crypto pki enroll local

show crypto pki certificates local-radius-all-users

Use this command to display certificate information for local RADIUS server users.

For information on output options, see "Controlling "show" Command Output" on page 1.38.

Syntax `show crypto pki certificates local-radius-all-users`

Mode User Exec and Privileged Exec

Example The following command displays information of all local RADIUS server user certificates.

```
awplus# show crypto pki certificates local-radius-all-users
```

Output

Figure 78-2: Example output from the show crypto pki certificates local-radius-all-users command

```
awplus#show crypto pki certificates local-radius-all-users
Certificate:
    Data:
        Version: 3 (0x2)
        Serial Number: 2 (0x2)
        Signature Algorithm: sha1WithRSAEncryption
        Issuer: O=Allied-Telesis, CN=AlliedwarePlusCA
        Validity

        Subject: O=Allied-Telesis, CN=Tom
```

Table 78-2: Parameters in the output of the show crypto pki certificates local-radius-all-users command

Parameter	Description
`Certificate`	Certificate name.
`Version`	Protocol version.
`Serial Number`	Serial number of the certificate.
`Signature Algorithm`	Algorithm used for the certificate signature.
`Issuer`	Subject of issuer creating the certificate.
`Validity`	Validity period.
`Subject`	Subject of the certificate.

Related Commands crypto pki enroll local local-radius-all-users

show crypto pki certificates user

Use this command to display certificate information for a specified local RADIUS server user.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show crypto pki certificates user [<user-name>]`

Parameter	Description
<user-name>	User name.

Mode User Exec and Privileged Exec

Example The following command displays Tom's certificate information.

```
awplus# show crypto pki certificates user Tom
```

Output

Figure 78-3: Example output from the show crypto pki certificates user command to show certificate information for user Tom

```
awplus#show crypto pki certificates user Tom
Certificate:
    Data:
        Version: 3 (0x2)
        Serial Number: 2 (0x2)
        Signature Algorithm: sha1WithRSAEncryption
        Issuer: O=Allied-Telesis, CN=AlliedwarePlusCA
        Validity
            Not Before: Oct  8 07:50:55 2009 GMT
            Not After : Oct  6 07:50:55 2019 GMT
        Subject: O=Allied-Telesis, CN=Tom
```

Table 78-3: Parameters in the output of the show crypto pki certificates user command

Parameter	Description
`Certificate`	Certificate name.
`Version`	Protocol version.
`Serial Number`	Serial number of the certificate.
`Signature Algorithm`	Algorithm used for the certificate signature.
`Issuer`	Subject of issuer creating the certificate.
`Validity`	Validity period.
`Subject`	Subject of the certificate.

Related Commands **crypto pki enroll local user**

show crypto pki trustpoints

Use this command to display trustpoint information.

For information on output options, see "Controlling "show" Command Output" on page 1.38.

Syntax

```
show crypto pki trustpoints
```

Mode

User Exec and Privileged Exec

Example

The following command displays trustpoint information.

```
awplus# show crypto pki trustpoint
```

Output

Figure 78-4: Example output from the show crypto pki trustpoints command

```
Trustpoint local:
Subject Name:
CN = AlliedwarePlusCA
o = Allied-Telesis
Serial Number:0C
```

Table 78-4: Parameters in the output of the show crypto pki trustpoints command

Parameter	Description
`Subject Name`	CA certificate subject.
`Serial Number`	Current serial number of CA.

Related Commands

crypto pki enroll local

show radius local-server group

Use this command to display information about the local RADIUS server user group.

For information on output options, see "Controlling "show" Command Output" on page 1.38.

Syntax

```
show radius local-server group [<user-group-name>]
```

Parameter	Description
<user-group-name>	User group name string.

Mode User Exec and Privileged Exec

Example The following command displays Local RADIUS server user group information.

```
awplus# show radius local-server group
```

Output

Figure 78-5: Example output from the show radius local-server group command

```
Group-Name          Vlan
-------------------------------------------------------------------
NetworkOperators    ManagementNet
NormalUsers         CommonNet
```

Table 78-5: Parameters in the output of the show radius local-server group command

Parameter	Description
Group-Name	Group name.
Vlan	VLAN name assigned to the group.

Related Commands group

show radius local-server nas

Use this command to display information about NAS (Network Access Servers) registered to the local RADIUS server.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show radius local-server nas [<ip-address>]`

Parameter	Description
`<ip-address>`	Specify NAS IP address for show output.

Mode User Exec and Privileged Exec

Example The following command displays NAS information.

```
awplus# show radius local-server nas
```

Output

Figure 78-6: Example output from the show radius local-server nas command

```
NAS-Address     Shared-Key
-----------------------------------------------------------
127.0.0.1       awplus-local-radius-server
```

Table 78-6: Parameters in the output of the show radius local-server nas command

Parameter	Description
`NAS-Address`	IP address of NAS.
`Shared-Key`	Shared key used for RADIUS connection.

Related Commands **nas**

show radius local-server statistics

Use this command to display statistics about the local RADIUS server.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show radius local-server statistics
```

Mode

User Exec and Privileged Exec

Usage

Both unknown usernames and invalid passwords will display as failed logins in the show output.

Example

The following command displays Local RADIUS server statistics.

```
awplus# show radius local-server statistics
```

Output

Figure 78-7: Example output from the show radius local-server statistics command

```

show radius local-server user

Use this command to display information about the local RADIUS server user.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show radius local-server user [<user-name>]
show radius local-server user <user-name> format csv
```

Parameter	Description
`<user-name>`	RADIUS user name. If no user name is specified, information for all users is displayed.
`format`	File format.
`csv`	Comma separated value format.

Mode User Exec and Privileged Exec

Usage You can send output from any show command, including the CSV format output from this command, to a file. See **"Controlling "show" Command Output" on page 1.38**.

Example The following command displays Local RADIUS server user information for user Tom.

```
awplus# show radius local-server user Tom
```

Figure 78-8: Example output from the show radius local-server user command

```
User-Name   Password    Group          Vlan
-----------------------------------------------------------------
Tom         abcd        NetworkOperators ManagementNet
```

The following command displays all Local RADIUS server information for all users.

```
awplus# show radius local-server user
```

The following command displays Local RADIUS server user information for TOM in CSV format.

```
awplus# show radius local-server user Tom format csv
```

Figure 78-9: Example output from the show radius local-server user csv command

```
true,"NetworkOperators","Tom",
"abcd",0,2099/01/
01,1,"","","ManagementNet",false,3600,false,0,"",false,"
```

Table 78-7: Parameters in the output from the show radius local-server user command

Parameter	Description
`User-Name`	User name.
`Password`	User password.
`Group`	Group name assigned to the user.
`Vlan`	VLAN name assigned to the user.

Related Commands

group
user (RADIUS server)

user (RADIUS server)

Use this command to register a user to the local RADIUS server.

Use the **no** variant of this command to delete a user from the local RADIUS server.

Syntax

```
user <radius-user-name> [encrypted] password <user-password>
    [group <user-group>]

no user <radius-user-name>
```

Parameter	Description
<radius-user-name>	RADIUS user name. This can also be a MAC address in the IEEE standard format of HH-HH-HH-HH-HH-HH if you are configuring MAC authentication to use local RADIUS server.
encrypted	Specifies that the password is being entered in its encrypted form, so that it is not further encrypted. When creating a new user, enter the password in plaintext, and do not use the **encrypted** parameter. Use the **encrypted** parameter only when referring to a user that has previously been created. For instance, when adding an existing user from another RADIUS server, use the **encrypted** parameter, and enter the encrypted version of the password that appears in the output of **show** commands for the user.
<user-password>	User password. This can also be a MAC address in the IEEE standard format of HH-HH-HH-HH-HH-HH if you are configuring MAC authentication to use local RADIUS server.
group	Specify the group for the user.
<user-group>	User group name.

Mode RADIUS Server Configuration

Usage RADIUS user names cannot contain question mark (?), space ( ), or quote (" ") characters. RADIUS user names containing the below characters cannot use certificate authentication:

```
/ \ ' $ & ( ) * ; < > ` |
```

Certificates cannot be created and exported for RADIUS user names that contain the above characters. We advise you to avoid using these characters in RADIUS user names if you need to use certificate authentication, because you will not be able to create and export certificates.

You also can use the IEEE standard format hexadecimal notation (HH-HH-HH-HH-HH-HH) to specify a supplicant MAC address to configure the user name and user password parameters to use local RADIUS server for MAC Authentication. See the **Sample MAC Authentication Configuration** in **Chapter 71, AAA Introduction and Configuration**. See also the command **user 00-db-59-ab-70-37 password 00-db-59-ab-70-37** as shown in the command examples.

Examples The following commands add user `Tom` to the local RADIUS server and sets his password to `QwerSD`.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# user Tom password QwerSD
```

The following commands add user `Tom` to the local RADIUS server user group NormalUsers and sets his password `QwerSD`.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# user Tom password QwerSD group
NormalUsers
```

The following commands remove user Tom from the local RADIUS server:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no user Tom
```

The following commands add the supplicant MAC address 00-d0-59-ab-70-37 to the local RADIUS server:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# user 00-db-59-ab-70-37 password 00-db-
59-ab-70-37
```

The following commands remove the supplicant MAC address 00-d0-59-ab-70-37 from the local RADIUS server:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no user 00-db-59-ab-70-37
```

Related Commands **group**
show radius local-server user

vlan (RADIUS server)

Use this command to set the VLAN ID or name for the local RADIUS server user group. The VLAN information is used for authentication with the dynamic VLAN feature.

Use the **no** variant of this command to clear the VLAN ID or VLAN name for the local RADIUS server user group.

Syntax

```
vlan {<vid>|<vlan-name>}
no vlan
```

Parameter	Description
<vid>	VLAN ID.
<vlan-name>	VLAN name.

Default VLAN information is not set by default.

Mode RADIUS Server Group Configuration

Example The following commands set VLAN ID 200 to the group named NormalUsers:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# vlan 200
```

The following commands remove VLAN ID 200 from the group named NormalUsers:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# no vlan
```

Related Commands

group
show radius local-server user

Introduction

This chapter describes how the Secure Shell protocol is implemented in the AlliedWare Plus™ Operating System. It covers:

- Support for Secure Shell.
- Configuring your device as a Secure Shell server and client.
- Using Secure Shell to manage your device.

The AlliedWare Plus™ OS supports SSH version 2 and SSH version 1.5, making it backwards compatible with SSH version 1.

Secure management is important in modern networks, as the ability to easily and effectively manage switches and routers, and the requirement for security, are two almost universal requirements. Protocols such as Telnet and rlogin allow you to manage devices remotely, but can have serious security problems, such as relying on reusable plaintext passwords that are vulnerable to wiretapping or password guessing. The Secure Shell (SSH) protocol is superior to these protocols by providing encrypted and strongly authenticated remote login sessions.

SSH provides sessions between a host running a SSH server and a machine with a SSH client. The AlliedWare Plus™ OS includes both a SSH server and a SSH client to enable you to securely—with the benefit of cryptographic authentication and encryption—manage your devices over an insecure network:

- SSH replaces Telnet for remote terminal sessions; SSH is strongly authenticated and encrypted.
- Remote command execution allows you to send commands to a device securely and conveniently, without requiring a terminal session on the device.
- SSH allows you to connect to another host from your switch or router.

The AlliedWare Plus™ OS supports Secure Copy (SCP) and SSH File Transfer Protocol (SFTP). Both these protocols allow you to securely copy files between your device and remote machines. SFTP provides additional features from SCP, such as allowing you to manipulate the remote files, and halt or resume file transfers without closing the session.

Secure Shell on the AlliedWare Plus OS

The AlliedWare Plus™ OS implementation of SSH is compatible with the following RFCs and Internet Drafts:

- The Secure Shell (SSH) Protocol Architecture (RFC 4251)
- The Secure Shell (SSH) Authentication Protocol (RFC 4252)
- The Secure Shell (SSH) Transport Layer Protocol (RFC 4253)
- The Secure Shell (SSH) Connection Protocol (RFC 4254)
- The SSH (Secure Shell) Remote Login Protocol (draft-ylonen-ssh-protocol-00.txt)
- SSH File Transfer Protocol (draft-ietf-secsh-filexfer-13.txt)

Secure Shell supports the following features for both SSH version 2 and SSH version 1.5:

- Inbound SSH connections (server mode) and outbound SSH connections (client mode).
- File loading to and from remote machines using Secure Copy, using either the SSH client or SSH server mode.
- RSA public keys with lengths of 768–32768 bits, and DSA keys with lengths of 1024 bits. Keys are stored in a format compatible with other SSH implementations, and mechanisms are provided to copy keys to and from your device.
- Secure encryption, such as Triple DES and Blowfish.
- Remote non-interactive shell that allows arbitrary commands to be sent securely to your device, possibly automatically.
- Compression of Secure Shell traffic.
- Tunnelling of TCP/IP traffic.

Secure Shell supports the following features for SSH version 2 only:

- File loading from remote machines using SSH File Transfer Protocol (SFTP).
- A login banner on the SSH server, that displays when SSHv2 clients connect to the server.

Configuring the SSH Server

This section provides instructions on:

- **Creating a Host Key**
- **Enabling the Server**
- **Modifying the Server**
- **Validating the Server Configuration**
- **Adding SSH Users**
- **Authenticating SSH Users**
- **Adding a Login Banner**
- **Monitoring the Server and Managing Sessions**
- **Debugging the Server**

Creating a Host Key

The SSH server uses either an RSA or DSA host key to authenticate itself with SSH clients. This key must be configured before the SSH server can operate. If no host key exists, you cannot start the SSH server.

Once created, the host key is stored securely on the device. To generate a host key for the SSH server, use the command:

```
awplus(config)# crypto key generate hostkey {dsa|rsa|rsa1}
                [<768-32768>]
```

This command has two parameters for creating RSA keys. The **rsa** parameter creates a host key for SSH version 2 sessions only. To create a host key for SSH version 1 sessions, use the **rsa1** parameter.

To destroy a host key, use the command:

```
awplus(config)# crypto key destroy hostkey {dsa|rsa|rsa1}
```

To display a host key stored on your device, use the command:

```
awplus(config)# show crypto key hostkey [dsa|rsa|rsa1]
```

Enabling the Server

You must enable the SSH server before connections from SSH, SCP, and SFTP clients are accepted. When the SSH server is disabled it rejects connections from SSH clients. The SSH server is disabled by default on your device.

To enable the SSH server, use the command:

```
awplus(config)# service ssh [ip|ipv6]
```

To disable the SSH server, use the command:

```
awplus(config)# no service ssh [ip|ipv6]
```

When enabled, the SSH server allows SCP and SFTP sessions by default. To disable these services, use the commands:

```
awplus(config)# no ssh server scp

awplus(config)# no ssh server sftp
```

This allows you to reject SCP or SFTP file transfer requests, while still allowing Secure Shell connections. To re-enable SCP and SFTP services, use the command:

```
awplus(config)# ssh server scp

awplus(config)# ssh server sftp
```

Modifying the Server

To modify the SSH version that the server supports, or the TCP port that the server listens to for incoming sessions, use the command:

```
awplus(config)# ssh server {[v1v2|v2only]|<1-65535>}
```

The server listens on port 22 for incoming sessions, and supports both SSH version 2 and SSH version 1, by default.

To modify session and login timeouts on the SSH server, and the number of unauthenticated connections the server allows, use the command:

```
awplus(config)# ssh server {[session-timeout <0-3600>]
               [login-timeout <1-600>]
               [max-startups <1-128>]}
```

The SSH server waits 60 seconds for a client to authenticate itself, by default. You can alter this waiting time by using the **login-timeout** parameter. If the client is still not authenticated after the set timeout, then the SSH server disconnects the session.

The SSH server only allows only 10 unauthenticated SSH sessions at any point in time, by default. You can modify the number of unauthenticated sessions it allows, by using the **max-startups** parameter.

Once a client has authenticated, the SSH session does not time out, by default. Use the **session-timeout** parameter to set a **maximum time period the server waits before deciding that a session is inactive and terminating it**

For example, to set the session timeout to 600 seconds, the login timeout to 30 seconds, and the maximum number of concurrent unauthenticated sessions to 5, use the command:

```
awplus(config)# ssh server session-timeout 600 login-timeout
               30 max-startups 5
```

To remove the configured session timeout, login timeout, or maximum startups, use the command:

```
awplus(config)# no ssh server session-timeout login-timeout
               max-startups
```

Validating the Server Configuration

To validate the SSH server configuration, use the command:

```
awplus(config)# show running-config ssh
```

Adding SSH Users

The SSH server requires you to register SSH users. Users that are not registered cannot access the SSH server. Ensure first that you have defined the user in the Authorized User Database of your device. To add a new user, use the command:

```
awplus(config)# username USERNAME (privilege 1-15) password
                PASSWORD
```

To register a user with the SSH server, use the command:

```
awplus(config)# ssh server allow-users <username-pattern>
                [<hostname-pattern>]
```

Registered entries can contain just the username, or the username with some host details, such as an IP address range. Additionally you can specify a range of users or hostname details by using an asterisk to match any string of characters. For example, to allow any user from the IP range 192.168.1.1 to 192.168.1.255, use the command:

```
awplus(config)# ssh server allow-users * 192.168.1.*
```

To display the list of allowed users, use the command:

```
awplus# show ssh server allow-users
```

To delete an entry from the list of allowed users, use the command:

```
awplus(config)# no ssh server allow-users <username-pattern>
                [<hostname-pattern>]
```

The SSH server also contains a list of denied users. The server checks all incoming sessions against this list and denies any matching session, regardless of whether the session matches an entry in the allowed users list. To add an entry to the list of denied users, use the command:

```
awplus(config)# ssh server deny-users <username-pattern>
                [<hostname-pattern>]
```

This allows you to deny specific users from a range of allowed users. For example, to deny a user with the IP address 192.168.1.12, use the command:

```
awplus(config)# ssh server deny-users * 192.168.1.12
```

To display the database of denied users, use the command:

```
awplus# show ssh server deny-users
```

To delete a client from the database of denied users, use the command:

```
awplus(config)# no ssh server deny-users <username-pattern>
                [<hostname-pattern>]
```

Authenticating SSH Users

SSH users can use either their password or public key authentication to authenticate themselves with the SSH server. To use public key authentication, copy the user's public key file from their client device to the SSH server. To associate the key with a user, use the command:

```
awplus(config)# crypto key pubkey-chain userkey <username>
                [<filename>]
```

For example, to associate the file key.pub with the user "langley", use the command:

```
awplus(config)# crypto key pubkey-chain userkey langley
                key.pub
```

To add a key as text into the terminal for user "geoff", first enter the command:

```
awplus(config)# crypto key pubkey-chain userkey geoff
```

then paste or type the key in as text.

You can add multiple keys for the same user. To display the list of public keys associated with a user, use the command:

```
awplus(config)# show crypto key pubkey-chain userkey
                <username> [<1-65535>]
```

The **<1-65535>** parameter allows you to display an individual key.

To delete a key associated with a user from your device, use the command:

```
awplus(config)# no crypto key pubkey-chain userkey
                <username> <1-65535>
```

Adding a Login Banner

You can add a login banner to the SSH server for sessions with SSH version 2 clients. The server displays the banner to clients before the login prompt. To set the login banner's message, use the command:

```
awplus(config)# banner login
```

then enter your message and use Ctrl+D to finish.

To view the configured login banner, use the command:

```
awplus# show banner login
```

To remove the configured message for the login banner, use the command:

```
awplus(config)# no banner login
```

Monitoring the Server and Managing Sessions

To display the current status of the SSH server, use the command:

```
awplus# show ssh server
```

To display the current status of SSH sessions on your device, use the command:

```
awplus# show ssh
```

Note that this displays both SSH server and SSH client sessions that your Allied Telesis device is running. Use this command to view the unique identification number assigned to each incoming or outgoing SSH session. You need the ID number when terminating a specific session from your device.

To terminate a session, or all sessions, use the command:

```
awplus# clear ssh {<1-65535>|all}
```

Debugging the Server

Information which may be useful for troubleshooting the SSH server is available using the SSH debugging function. You can enable server debugging while the SSH server is functioning. Use the command:

```
awplus# debug ssh server [brief|full]
```

To disable SSH server debugging, use the command:

```
awplus# no debug ssh server
```

Configuring the SSH Client

This section provides instructions on:

- **Modifying the Client**
- **Adding SSH Servers**
- **Authenticating with a Server**
- **Connecting to a Server and Running Commands**
- **Copying files to and from the Server**
- **Debugging the Client**

Modifying the Client

You can configure a selection of variables when using the SSH client. Note that the following configuration commands apply only to client sessions initiated after the command. The configured settings are not saved; after you have logged out from the SSH client, the client returns to using the default settings. Use the command:

```
awplus(config)# ssh client {port <1-65535>|version {1|2}|
                session-timeout <0-3600>|connect-timeout
                <1-600>}
```

The SSH client uses TCP port 22, by default. You can change the TCP port for the remote SSH server by using the **port** parameter.

The client supports both SSH version 1 and version 2 sessions, by default. To change the SSH client to only use a specific SSH version for sessions, for example SSH version 1, use the **version** parameter.

The client terminates sessions that are not established after 30 seconds, by default. You can change this time period by using the session-timeout parameter.

Once the client has authenticated with a server, the client does not time out the SSH session, by default. Use the **session-timeout** parameter to set a maximum time period the client waits before deciding that a session is inactive and terminating the session.

To modify the SSH client so that it uses port 2000 for sessions, and supports only SSH version 1 connections, use the command:

```
awplus(config# ssh client port 2000 version 1
```

To modify the SSH client so that unestablished sessions time out after 60 seconds, and inactive sessions time out after 100 seconds, use the command:

```
awplus(config)# ssh client session-timeout 100 connect-timeout
                100
```

To remove the configured port, SSH version, session timeout, and connection timeout settings, use the command:

```
awplus(config)# no ssh client port version session-timeout
                connect-timeout
```

Adding SSH Servers

SSH servers identify themselves using a host key (see **"Creating a Host Key" on page 79.4**). Before the SSH client establishes a session with a SSH server, it confirms that the host key sent by the server matches its database entry for the server. If the database does not contains a host key for the server, then the SSH client requires you to confirm that the host key sent from the server is correct.

To add an SSH server to the client's database, use the command:

```
awplus# crypto key pubkey-chain knownhosts [vrf
<vrf-name>] [ip|ipv6] <hostname> [rsa|dsa|rsa1]
```

To display the SSH servers in the client's database, use the command:

```
awplus# show crypto key pubkey-chain knownhosts [vrf
<vrf-name>|global] [<1-65535>]
```

To remove an entry in the database, use the command:

```
awplus# no crypto key pubkey-chain knownhosts [vrf
<vrf-name>] <1-65535>
```

Authenticating with a Server

You can authenticate your session with a server by either using a password, or using RSA or DSA public key authentication. To use public key authentication, you must generate a pair of keys, one private and one public, and copy the public key onto the SSH server.

To generate an RSA or DSA set of private and public keys for an SSH user, use the command:

```
awplus(config)# crypto key generate userkey <username> {dsa|
rsa|rsa1} [<768-32768>]
```

You can generate one key of each encryption type per user on your client. When authenticating with an SSH server that supports SSH version 1 only, you must use a key generated by the **rsa1** parameter.

To copy the public key onto the SSH server, you must display the key onscreen. To display the public key associated with a user, use the command:

```
awplus# show crypto key userkey <username> [dsa|rsa|
rsa1]
```

To display the public keys set for other users, you must specify their username. Only users with the highest privilege setting can use this command to view the keys of other users.

To delete a public and private pair of keys associated with a user, use the command:

```
awplus(config)# crypto key destroy userkey <username> {dsa|rsa|
rsa1}
```

Connecting to a Server and Running Commands

To connect to a remote SSH server and execute a command, use the command:

```
awplus# ssh [vrf <vrf-name>] [ip|ipv6][{[user
        <username>]|[port <1-65535>]|[version {1|2}]}]
        <hostname> [<line>]
```

By default, the SSH client attempts to use SSH version 2 with the SSH server. If this fails, the client uses SSH version 1.

For example, to connect to the SSH server at 192.168.1.2 as user “john”, and execute the command “show sys”, use the command:

```
awplus# ssh user john 192.168.1.2 “show sys”
```

Copying files to and from the Server

You can use either the SCP or SFTP client to transfer files from a remote SSH server. Use the command:

```
awplus# copy <source-url> <destination-url>
```

For example, to use SFTP to load a file from the SSH server 192.168.1.2, onto the flash memory of your device, use the command:

```
awplus# copy sftp://192.168.1.2/key.pub flash
```

To upload files to the SSH server, you must use SCP. For example, to upload the file bobskey.pub as the user “bob”, use the command:

```
awplus# copy flash:/bobskey.pub scp://bob@192.168.1.2
```

For more information see **Chapter 6, Creating and Managing Files**.

Debugging the Client

Information which may be useful for troubleshooting the SSH client is available using the SSH debugging function. You can enable client debugging while the SSH client is functioning. Use the command:

```
awplus# debug ssh client [brief|full]
```

To disable SSH client debugging, use the command:

```
awplus# no debug ssh client
```

Chapter 80: Secure Shell (SSH) Configuration

SSH Server Configuration Example 80.2

SSH Server Configuration Example

This chapter provides a Secure Shell server configuration example. For more information about the SSH server, see **Chapter 79, Secure Shell (SSH) Introduction**. For detailed information about the commands used to configure the SSH server, see **Chapter 81, Secure Shell (SSH) Commands**.

The following example configures a SSH server where:

- the SSH server uses RSA encryption
- the SSH server is compatible with both SSH version 1 and version 2 clients
- three SSH users are configured: Manager, John and Asuka. “Manager” can connect from only a defined range of hosts, while “john” and “asuka” can SSH from all hosts
- the SSH users use RSA private and public key authentication

This example shows how to create RSA encryption keys, configure the Secure Shell server, and register users to make Secure Shell connections to your device.

Step 1: Login as a highest Privileged User.

To create the keys and add users, you must login as a privileged user.

Step 2: Create encryption keys.

Two RSA private keys are required before enabling the Secure Shell server for each type of SSH version. Use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate hostkey rsa
awplus(config)# crypto key generate hostkey rsa1
awplus(config)# exit
```

To verify the key creation, use the command:

```
awplus# show crypto key hostkey
```

Step 3: Enable the Secure Shell server.

Enable Secure Shell on the device using the commands:

```
awplus# configure terminal
awplus(config)# service ssh
```

Modify the SSH server settings as desired. For example, to set the login-timeout to 60, and the session-timeout to 3600, use the commands:

```
awplus(config)# ssh server session-timeout 3600 login-timeout 60
```

To verify the server configuration, use the command:

```
awplus# show ssh
```

Step 4: Create SSH users.

In order to connect and execute commands, you must register users in the SSH user database, and in the User Authentication Database of the device.

To create the users `john` and `asuka` in the User Authentication Database, use the commands:

```
awplus# configure terminal
awplus(config)# username john privilege 15 password secret
awplus(config)# username asuka privilege 15 password
very-secret
```

To register `john` and `asuka` as SSH clients, use the commands:

```
awplus(config)# ssh server allow-users john
awplus(config)# ssh server allow-users asuka
```

To register “manager” as an SSH client so that can only connect from the IP address 192.168.1.1, use the command:

```
awplus(config)# ssh server allow-users manager 192.168.1.1
```

Step 5: Set up Authentication.

SSH users cannot connect unless the server can authenticate them. There are two ways to authenticate an SSH session: password authentication, and RSA or DSA private/public key authentication. When using password authentication, the user must supply their User Authentication Database password.

To use private/public key authentication, copy the public keys for each user onto the device. To copy the files onto flash from the key directory of an attached TFTP server, use the command:

```
awplus# copy tftp://key/john.pub flash:/john.pub
awplus# copy tftp://key/asuka.pub flash:/asuka.pub
```

To associate the key file with each user, use the command:

```
awplus# configure terminal
awplus(config)# crypto key pubkey-chain userkey john john.pub
awplus(config)# crypto key pubkey-chain userkey asuka
asuka.pub
awplus(config)# crypto key pubkey-chain userkey manager
manager.pub
```

Chapter 81: Secure Shell (SSH) Commands

Introduction 81.2
Command List 81.2
banner login (SSH) 81.2
clear ssh 81.3

undebug ssh server 81.41

Introduction

This chapter provides an alphabetical reference for commands used to configure Secure Shell (SSH). For more information, see **Chapter 79, Secure Shell (SSH) Introduction**, and **Chapter 80, Secure Shell (SSH) Configuration**.

Command List

banner login (SSH)

This command configures a login banner on the SSH server. This displays a message on the remote terminal of the SSH client before the login prompt. SSH client version 1 does not support this banner.

To add a banner, first enter the command **banner login**, and hit [Enter]. Write your message. You can use any character and spaces. Use Ctrl+D at the end of your message to save the text and re-enter the normal command line mode.

The banner message is preserved if the device restarts.

The **no** variant of this command deletes the login banner from the device.

Syntax

```
banner login
no banner login
```

Default No banner is defined by default.

Mode Global Configuration

Examples To set a login banner message, use the commands:

```
awplus# configure terminal
awplus(config)# banner login

Type CNTL/D to finish.
... banner message comes here ...
^D
awplus(config)#
```

and enter the message. Use Ctrl+D to finish.

To remove the login banner message, use the commands:

```
awplus# configure terminal
awplus(config)# no banner login
```

Related Commands **show banner login**

clear ssh

This command deletes Secure Shell sessions currently active on the device. This includes both incoming and outgoing sessions. The deleted sessions are closed. You can only delete an SSH session if you are a system manager or the user who initiated the session. If **all** is specified then all active SSH sessions are deleted.

Syntax `clear ssh {<1-65535>|all}`

Parameters	Description
`<1-65535>`	Specify a session ID in the range 1 to 65535 to delete a specific session.
`all`	Delete all SSH sessions.

Mode Privileged Exec

Examples To stop the current SSH session 123, use the command:

```
awplus# clear ssh 123
```

To stop all SSH sessions active on the device, use the command:

```
awplus# clear ssh all
```

Related Commands **service ssh**
ssh

crypto key destroy hostkey

This command deletes the existing public and private keys of the SSH server. Note that for an SSH server to operate it needs at least one set of hostkeys configured before an SSH server is started.

Syntax `crypto key destroy hostkey {dsa|rsa|rsa1}`

Parameters	Description
`dsa`	Deletes the existing DSA public and private keys.
`rsa`	Deletes the existing RSA public and private keys configured for SSH version 2 connections.
`rsa1`	Deletes the existing RSA public and private keys configured for SSH version 1 connections.

Mode Global Configuration

Example To destroy the RSA host key used for SSH version 2 connections, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key destroy hostkey rsa
```

Related Commands **crypto key generate hostkey**
service ssh

crypto key destroy userkey

This command destroys the existing public and private keys of an SSH user configured on the device.

Syntax `crypto key destroy userkey <username> {dsa|rsa|rsa1}`

Parameters	Description
`<username>`	Name of the user whose userkey you are destroying. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols.
`dsa`	Deletes the existing DSA userkey.
`rsa`	Deletes the existing RSA userkey configured for SSH version 2 connections.
`rsa1`	Deletes the existing RSA userkey for SSH version 1 connections.

Mode Global Configuration

Example To destroy the RSA user key for the SSH user `remoteuser`, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key destroy userkey remoteuser rsa
```

Related Commands
crypto key generate hostkey
show ssh
show crypto key hostkey

crypto key generate hostkey

This command generates public and private keys for the SSH server using either an RSA or DSA cryptography algorithm. You must define a host key before enabling the SSH server. Start SSH server using the **service ssh** command. If a host key exists with the same cryptography algorithm, this command replaces the old host key with the new key.

This command is not saved in the device configuration. However, the device saves the keys generated by this command in the non-volatile memory.

Syntax `crypto key generate hostkey {dsa|rsa|rsa1} [<768-32768>]`

Parameters	Description
`dsa`	Creates a DSA hostkey. Both SSH version 1 and 2 connections can use the DSA hostkey.
`rsa`	Creates an RSA hostkey for SSH version 2 connections.
`rsa1`	Creates an RSA hostkey for SSH version 1 connections.
<768-32768>	The length in bits of the generated key. The default is 1024 bits.

Default 1024 bits is the default key length. The DSA algorithm supports 1024 bits.

Mode Global Configuration

Examples To generate an RSA host key for SSH version 2 connections that is 2048 bits in length, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate hostkey rsa 2048
```

To generate a DSA host key, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate dsa
```

Related Commands
crypto key destroy hostkey
service ssh
show crypto key hostkey

crypto key generate userkey

This command generates public and private keys for an SSH user using either an RSA or DSA cryptography algorithm. To use public key authentication, copy the public key of the user onto the remote SSH server.

This command is not saved in the device configuration. However, the device saves the keys generated by this command in the non-volatile memory.

Syntax `crypto key generate userkey <username> {dsa|rsa|rsa1} [<768-32768>]`

Parameters	Description
`<username>`	Name of the user that the user key is generated for. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols.
`dsa`	Creates a DSA userkey. Both SSH version 1 and 2 connections can use a key created with this command.
`rsa`	Creates an RSA userkey for SSH version 2 connections.
`rsa1`	Creates an RSA userkey for SSH version 1 connections.
`<768-32768>`	The length in bits of the generated key. The DSA algorithm supports only 1024 bits. Default: 1024.

Mode Global Configuration

Examples To generate a 2048-bits RSA user key for SSH version 2 connections for the user `bob`, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate userkey bob rsa 2048
```

To generate a DSA user key for the user `lapo`, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate userkey lapo dsa
```

Related Commands **crypto key destroy userkey**
show crypto key userkey

crypto key pubkey-chain knownhosts

This command adds a public key of the specified SSH server to the known host database on your switch. The SSH client on your switch uses this public key to verify the remote SSH server.

The key is retrieved from the server. Before adding a key to this database, check that the key sent to you is correct.

If the server's key changes, or if your SSH client does not have the public key of the remote SSH server, then your SSH client will inform you that the public key of the server is unknown or altered.

The **no** variant of this command deletes the public key of the specified SSH server from the known host database on your device.

Syntax

```
crypto key pubkey-chain knownhosts [ip|ipv6] <hostname> [rsa|dsa|
   rsa1]

no crypto key pubkey-chain knownhosts <1-65535>
```

Syntax (VRF Lite)

```
crypto key pubkey-chain knownhosts [vrf <vrf-name>] [ip|ipv6]
   <hostname> [rsa|dsa|rsa1]

no crypto key pubkey-chain knownhosts [vrf <vrf-name>] <1-65535>
```

Parameter	Description
`vrf`	Apply this command to the specified VRF instance.
<vrf-name>	The VRF instance name
`ip`	Keyword used prior to specifying an IPv4 address
`ipv6`	Keyword used prior to specifying an IPv6 address
<hostname>	IPv4/IPv6 address or hostname of a remote server in the format `a.b.c.d` for an IPv4 address, or in the format `x:x::x:x` for an IPv6 address.
`rsa`	Specify the RSA public key of the server to be added to the known host database.
`dsa`	Specify the DSA public key of the server to be added to the known host database.
`rsa1`	Specify the SSHv1 public key of the server to be added to the know host database.
<1-65535>	Specify a key identifier when removing a key using the **no** parameter.

Default If no cryptography algorithm is specified, then **rsa** is used as the default cryptography algorithm.

Mode Privilege Exec

Usage

This command adds a public key of the specified SSH server to the known host database on the switch. The key is retrieved from the server. The remote SSH server is verified by using this public key. The user is requested to check the key is correct before adding it to the database.

If the remote server's host key is changed, or if the device does not have the public key of the remote server, then SSH clients will inform the user that the public key of the server is altered or unknown.

Examples

To add the RSA host key of the remote SSH host IPv4 address `192.0.2.11` to the known host database, use the command:

```
awplus# crypto key pubkey-chain knownhosts 192.0.2.11
```

To delete the second entry in the known host database, use the command:

```
awplus# no crypto key pubkey-chain knownhosts 2
```

Example (VRF Lite)

To add the RSA host key of the remote SSH host IPv4 address `192.0.2.11` in VRF `red` to the known host database, use the command:

```
awplus# crypto key pubkey-chain knownhosts vrf red 192.0.2.11
```

To delete the second entry in the known host database in VRF `red`, use the command:

```
awplus# no crypto key pubkey-chain knownhosts vrf red 2
```

Validation Commands

show crypto key pubkey-chain knownhosts

crypto key pubkey-chain userkey

This command adds a public key for an SSH user on the SSH server. This allows the SSH server to support public key authentication for the SSH user. When configured, the SSH user can access the SSH server without providing a password from the remote host.

The **no** variant of this command removes a public key for the specified SSH user that has been added to the public key chain. When a SSH user's public key is removed, the SSH user can no longer login using public key authentication.

Syntax

```
crypto key pubkey-chain userkey <username> [<filename>]

no crypto key pubkey-chain userkey <username> <1-65535>
```

Parameters	Description
<username>	Name of the user that the SSH server associates the key with. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols. Default: no default
<filename>	Filename of a key saved in flash. Valid characters are any printable character. You can add a key as a hexadecimal string directly into the terminal if you do not specify a filename.
<1-65535>	The key ID number of the user's key. Specify the key ID to delete a key.

Mode Global Configuration

Usage You should import the public key file from the client node. The device can read the data from a file on the flash or user terminal.

Or you can add a key as text into the terminal. To add a key as text into the terminal, first enter the command **crypto key pubkey-chain userkey <*username*>**, and hit [Enter]. Enter the key as text. Note that the key you enter as text must be a valid SSH RSA key, not random ASCII text. Use [Ctrl]+D after entering it to save the text and re-enter the normal command line mode.

Note you can generate a valid SSH RSA key on the switch first using the **crypto key generate host rsa** command. View the SSH RSA key generated on the switch using the **show crypto hostkey rsa** command. Copy and paste the displayed SSH RSA key after entering the **crypto key pubkey-chain userkey <*username*>** command. Use [Ctrl]+D after entering it to save it.

Examples To generate a valid SSH RSA key on the switch and add the key, use the following commands:

```
awplus# configure terminal
awplus(config)# crypto key generate host rsa
awplus(config)# exit
awplus# show crypto key hostkey rsa
AAAAB3NzaC1yc2EAAAABIwAAAIEAr1s7SokW5aW2fcOw1TStpb9J

+6NvNbk+h+c/pqGDijj4SvfZZfeITzvvyZW4/I4pbN8=
control-D
awplus(config)#
```

To add a public key for the user `graydon` from the file `key.pub`, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key pubkey-chain userkey graydon key.pub
```

To add a public key for the user `tamara` from the terminal, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key pubkey-chain userkey tamara
```

and enter the key. Use Ctrl+D to finish.

To remove the first key entry from the public key chain of the user `john`, use the commands:

```
awplus# configure terminal
awplus(config)# no crypto key pubkey-chain userkey john 1
```

Related Commands **show crypto key pubkey-chain userkey**

debug ssh client

This command enables the SSH client debugging facility. When enabled, any SSH, SCP and SFTP client sessions send diagnostic messages to the login terminal.

The **no** variant of this command disables the SSH client debugging facility. This stops the SSH client from generating diagnostic debugging message.

Syntax

```
debug ssh client [brief|full]
no debug ssh client
```

Parameter	Description
`brief`	Enables brief debug mode.
`full`	Enables full debug mode.

Default SSH client debugging is disabled by default.

Mode Privileged Exec and Global Configuration

Examples To start SSH client debugging, use the command:

```
awplus# debug ssh client
```

To start SSH client debugging with extended output, use the command:

```
awplus# debug ssh client full
```

To disable SSH client debugging, use the command:

```
awplus# no debug ssh client
```

Related Commands
debug ssh server
show ssh client
undebug ssh client

debug ssh server

This command enables the SSH server debugging facility. When enabled, the SSH server sends diagnostic messages to the system log. To display the debugging messages on the terminal, use the **terminal monitor** command.

The **no** variant of this command disables the SSH server debugging facility. This stops the SSH server from generating diagnostic debugging messages.

Syntax

```
debug ssh server [brief|full]
no debug ssh server
```

Parameter	Description
`brief`	Enables brief debug mode.
`full`	Enables full debug mode.

Default SSH server debugging is disabled by default.

Mode Privileged Exec and Global Configuration

Examples To start SSH server debugging, use the command:

```
awplus# debug ssh server
```

To start SSH server debugging with extended output, use the command:

```
awplus# debug ssh server full
```

To disable SSH server debugging, use the command:

```
awplus# no debug ssh server
```

Related Commands
debug ssh client
show ssh server
undebug ssh server

service ssh

This command enables the Secure Shell server on the device. Once enabled, connections coming from SSH clients are accepted.

SSH server needs a host key before it starts. If an SSHv2 host key does not exist, then this command fails. If SSHv1 is enabled but a host key for SSHv1 does not exist, then SSH service is unavailable for version 1.

The **no** variant of this command disables the Secure Shell server. When the Secure Shell server is disabled, connections from SSH, SCP, and SFTP clients are not accepted. This command does not affect existing SSH sessions. To terminate existing sessions, use the **clear ssh** command.

Syntax

```
service ssh [ip|ipv6]
no service ssh [ip|ipv6]
```

Default The Secure Shell server is disabled by default. Both IPv4 and IPv6 Secure Shell server are enabled when you issue **service ssh** without specifying the optional **ip** or **ipv6** parameters.

Mode Global Configuration

Examples To enable both the IPv4 and the IPv6 Secure Shell server, use the commands:

```
awplus# configure terminal
awplus(config)# service ssh
```

To enable the IPv4 Secure Shell server only, use the commands:

```
awplus# configure terminal
awplus(config)# service ssh ip
```

To enable the IPv6 Secure Shell server only, use the commands:

```
awplus# configure terminal
awplus(config)# service ssh ipv6
```

To disable both the IPv4 and the IPv6 Secure Shell server, use the commands:

```
awplus# configure terminal
awplus(config)# no service ssh
```

To disable the IPv4 Secure Shell server only, use the commands:

```
awplus# configure terminal
awplus(config)# no service ssh ip
```

To disable the IPv6 Secure Shell server only, use the commands:

```
awplus# configure terminal
awplus(config)# no service ssh ipv6
```

show banner login

This command displays the banner message configured on the device. The banner message is displayed to the remote user before user authentication starts.

Syntax

```
show banner login
```

Mode

User Exec, Privileged Exec, Global Configuration, Interface Configuration, Line Configuration

Example

To display the current login banner message, use the command:

```
awplus# show banner login
```

Related Commands

banner login (SSH)

show crypto key hostkey

This command displays the SSH host keys generated by RSA and DSA algorithm.

A host key pair (public and private keys) is needed to enable SSH server. The private key remains on the device secretly. The public key is copied to SSH clients to identify the server

Syntax `show crypto key hostkey [dsa|rsa|rsa1]`

Parameter	Description
`dsa`	Displays the DSA algorithm public key.
`rsa`	Displays the RSA algorithm public key for SSH version 2 connections.
`rsa1`	Displays the RSA algorithm public key for SSH version 1 connections.

Mode User Exec, Privileged Exec and Global Configuration

Output **Figure 81-1: Example output from the show crypto key hostkey command**

```
Type Bits   Fingerprint
-------------------------------------------------------------
rsa  2058   4e:7d:1d:00:75:79:c5:cb:c8:58:2e:f9:29:9c:1f:48
dsa  1024   fa:72:3d:78:35:14:cb:9a:1d:ca:1c:83:2c:7d:08:43
rsa1 1024   e2:1c:c8:8b:d8:6e:19:c8:f4:ec:00:a2:71:4e:85:8b
```

Table 81-1: Parameters in output of the show crypto key hostkey command

Parameter	Description
`Type`	Algorithm used to generate the key.
`Bits`	Length in bits of the key.
`Fingerprint`	Checksum value for the public key.

Examples To show the public keys generated on the device for SSH server, use the command:

```
awplus# show crypto key hostkey
```

To display the RSA public key of the SSH server, use the command:

```
awplus# show crypto key hostkey rsa
```

Related Commands **crypto key destroy hostkey**
crypto key generate hostkey

show crypto key pubkey-chain knownhosts

This command displays the list of public keys maintained in the known host database on the device.

Syntax show crypto key pubkey-chain knownhosts [<*1-65535*>]

Syntax (VRF Lite)

```
show crypto key pubkey-chain knownhosts [vrf <vrf-name>|global]
    [<1-65535>]
```

Parameter	Description
`global`	When VRF-Lite is configured, apply the command to the global routing and forwarding table.
`vrf`	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
<1-65535>	Key identifier for a specific key. Displays the public key of the entry if specified.

Default Display all keys.

Mode User Exec, Privileged Exec and Global Configuration

When VRF-Lite is configured:

- If **vrf** is specified, this command displays the known host database from the specified VRF instance.
- If **global** is specified, this command displays the known host database from the global routing environment.
- If neither **vrf** nor **global** is specified, this command displays the known host database from the global routing environment and each configured VRF.

For more information about VRF see, **Chapter 48, VRF-Lite Introduction and Configuration** and **Chapter 49, VRF-Lite Commands**.

Output **Figure 81-2: Example output from the show crypto key public-chain knownhosts command**

```
No     Hostname         Type Fingerprint
-------------------------------------------------------------------------
1      172.16.23.1      rsa  c8:33:b1:fe:6f:d3:8c:81:4e:f7:2a:aa:a5:be:df:18
2      172.16.23.10     rsa  c4:79:86:65:ee:a0:1d:a5:6a:e8:fd:1d:d3:4e:37:bd
3      5ffe:1053:ac21:ff00:0101:bcdf:ffff:0001
                        rsa1 af:4e:b4:a2:26:24:6d:65:20:32:d9:6f:32:06:ba:57
```

Table 81-2: Parameters in the output of the show crypto key public-chain knownhosts command

Parameter	Description
`No`	Number ID of the key.
`Hostname`	Host name of the known SSH server.
`Type`	The algorithm used to generate the key.
`Fingerprint`	Checksum value for the public key.

Examples To display public keys of known SSH servers, use the command:

```
awplus# show crypto key pubkey-chain knownhosts
```

To display the key data of the first entry in the known host data, use the command:

```
awplus# show crypto key pubkey-chain knownhosts 1
```

Related Commands **crypto key pubkey-chain knownhosts**

show crypto key pubkey-chain userkey

This command displays the public keys registered with the SSH server for SSH users. These keys allow remote users to access the device using public key authentication. By using public key authentication, users can access the SSH server without providing password.

Syntax `show crypto key pubkey-chain userkey <username> [<1-65535>]`

Parameter	Description
<username>	User name of the remote SSH user whose keys you wish to display. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols.
<1-65535>	Key identifier for a specific key.

Default Display all keys.

Mode User Exec, Privileged Exec and Global Configuration

Output **Figure 81-3: Example output from the show crypto key public-chain userkey command**

```
No Type Bits Fingerprint
-----------------------------------------------------------------
1  dsa  1024 2b:cc:df:a8:f8:2e:8f:a4:a5:4f:32:ea:67:29:78:fd
2  rsa  2048 6a:ba:22:84:c1:26:42:57:2c:d7:85:c8:06:32:49:0e
```

Table 81-3: Parameters in the output of the show crypto key userkey command

Parameter	Description
`No`	Number ID of the key.
`Type`	The algorithm used to generate the key.
`Bits`	Length in bits of the key.
`Fingerprint`	Checksum value for the key.

To display the public keys for the user `manager` that are registered with the SSH server, use the command:

```
awplus# show crypto key pubkey-chain userkey manager
```

Related Commands crypto key pubkey-chain userkey

show crypto key userkey

This command displays the public keys created on this device for the specified SSH user.

Syntax `show crypto key userkey <username> [dsa|rsa|rsa1]`

Parameter	Description
<username>	User name of the local SSH user whose keys you wish to display. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols.
`dsa`	Displays the DSA public key.
`rsa`	Displays the RSA public key used for SSH version 2 connections.
`rsa1`	Displays the RSA key used for SSH version 1 connections.

Mode User Exec, Privileged Exec and Global Configuration

Output **Figure 81-4: Example output from the show crypto key userkey command**

```
Type Bits   Fingerprint
------------------------------------------------------------
rsa  2048   e8:d6:1b:c0:f4:b6:e6:7d:02:2e:a9:d4:a1:ca:3b:11
rsa1 1024   12:25:60:95:64:08:8e:a1:8c:3c:45:1b:44:b9:33:9b
```

Table 81-4: Parameters in the output of the show crypto key userkey command

Parameter	Description
`Type`	The algorithm used to generate the key.
`Bits`	Length in bits of the key.
`Fingerprint`	Checksum value for the key.

Examples To show the public key generated for the user, use the command:

```
awplus# show crypto key userkey manager
```

To store the RSA public key generated for the user manager to the file "user.pub", use the command:

```
awplus# show crypto key userkey manager rsa > manager-rsa.pub
```

Related Commands crypto key generate userkey

show running-config ssh

This command displays the current running configuration of Secure Shell (SSH).

Syntax `show running-config ssh`

Mode Privileged Exec and Global Configuration

Output **Figure 81-5: Example output from the show running-config ssh command**

```
!
ssh server session-timeout 600
ssh server login-timeout 30
ssh server allow-users manager 192.168.1.*
ssh server allow-users john
ssh server deny-user john*.a-company.com
ssh server
```

Table 81-5: Parameters in the output of the show running-config ssh command

Parameter	Description
`ssh server`	SSH server is enabled.
`ssh server v2`	SSH server is enabled and only support SSHv2.
`ssh server <port>`	SSH server is enabled and listening on the specified TCP port.
`no ssh server scp`	SCP service is disabled.
`no ssh server sftp`	SFTP service is disabled.
`ssh server session-timeout`	Configure the server session timeout.
`ssh server login-timeout`	Configure the server login timeout.
`ssh server max-startups`	Configure the maximum number of concurrent sessions waiting authentication.
`no ssh server authentication password`	Password authentication is disabled.
`no ssh server authentication publickey`	Public key authentication is disabled.
`ssh server allow-users`	Add the user (and hostname) to the allow list.
`ssh server deny-users`	Add the user (and hostname) to the deny list.

Example To display the current configuration of SSH, use the command:

```
awplus# show running-config ssh
```

Related Commands **service ssh**
show ssh server

show ssh

This command displays the active SSH sessions on the device, both incoming and outgoing.

Syntax `show ssh`

Mode User Exec, Privileged Exec and Global Configuration

Output **Figure 81-6: Example output from the show ssh command**

```
Secure Shell Sessions:
ID  Type Mode   Peer Host    Username   State       Filename
-----------------------------------------------------------------
414 ssh  server 172.16.23.1  root       open
456 ssh  client 172.16.23.10 manager    user-auth
459 scp  client 172.16.23.12 root       download    550dev_.awd
463 ssh  client 5ffe:33fe:5632:ffbb:bc35:ddee:0101:ac51
                             manager    user-auth
```

Table 81-6: Parameters in the output of the show ssh command

Parameter	Description	
ID	Unique identifier for each SSH session.	
Type	Session type; either SSH, SCP, or SFTP.	
Mode	Whether the device is acting as an SSH client (client) or SSH server (server) for the specified session.	
Peer Host	The hostname or IP address of the remote server or client.	
Username	Login user name of the server.	
State	The current state of the SSH session. One of:	
	connecting	The device is looking for a remote server.
	connected	The device is connected to the remote server.
	accepted	The device has accepted a new session.
	host-auth	host-to-host authentication is in progress.
	user-auth	User authentication is in progress.
	authenticated	User authentication is complete.
	open	The session is in progress.
	download	The user is downloading a file from the device.
	upload	The user is uploading a file from the device.
	closing	The user is terminating the session.
	closed	The session is closed.
Filename	Local filename of the file that the user is downloading or uploading.	

Example To display the current SSH sessions on the device, use the command:

```
awplus# show ssh
```

Related Commands clear ssh

show ssh client

This command displays the current configuration of the Secure Shell client.

Syntax `show ssh client`

Mode User Exec, Privileged Exec and Global Configuration

Output **Figure 81-7: Example output from the show ssh client command**

```
Secure Shell Client Configuration
-----------------------------------------------------------------
Port                                : 22
Version                             : 2,1
Connect Timeout                     : 30 seconds
Session Timeout                     : 0 (off)
Debug                               : NONE
```

Table 81-7: Parameters in the output of the show ssh client command

Parameter	Description
`Port`	SSH server TCP port where the SSH client connects to. The default is port 22.
`Version`	SSH server version; either “1”, “2” or “2,1”.
`Connect Timeout`	Time in seconds that the SSH client waits for an SSH session to establish. If the value is 0, the connection is terminated when it reaches the TCP timeout.
`Debug`	Whether debugging is active on the client.

Example To display the current configuration for SSH clients on the login shell, use the command:

```
awplus# show ssh client
```

Related Commands **show ssh server**

show ssh server

This command displays the current configuration of the Secure Shell server.

Note that changes to the SSH configuration affects only new SSH sessions coming from remote hosts, and does not affect existing sessions.

Syntax `show ssh server`

Mode User Exec, Privileged Exec and Global Configuration

Output **Figure 81-8: Example output from the show ssh server command**

```
Secure Shell Server Configuration
-----------------------------------------------------------------
SSH Server                          : Enabled
Port                                : 22
Version                             : 2
Services                            : scp, sftp
User Authentication                 : publickey, password
Idle Timeout                        : 60 seconds
Maximum Startups                    : 10
Debug                               : NONE
```

Table 81-8: Parameters in the output of the show ssh server command

Parameter	Description
`SSH Server`	Whether the Secure Shell server is enabled or disabled.
`Port`	TCP port where the Secure Shell server listens for connections. The default is port 22.
`Version`	SSH server version; either “1”, “2” or “2,1”.
`Services`	List of the available Secure Shell service; one or more of SHELL, SCP or SFTP.
`Authentication`	List of available authentication methods.
`Login Timeout`	Time (in seconds) that the SSH server will wait the SSH session to establish. If the value is 0, the client login will be terminated when TCP timeout reaches.
`Idle Timeout`	Time (in seconds) that the SSH server will wait to receive data from the SSH client. The server disconnects if this timer limit is reached. If set at 0, the idle timer remains off.
`Maximum Startups`	The maximum number of concurrent connections that are waiting authentication. The default is 10.
`Debug`	Whether debugging is active on the server.

Example To display the current configuration of the Secure Shell server, use the command:

```
awplus# show ssh server
```

Related Commands **show ssh**
show ssh client

show ssh server allow-users

This command displays the user entries in the allow list of the SSH server.

Syntax `show ssh server allow-users`

Mode User Exec, Privileged Exec and Global Configuration

Output **Figure 81-9: Example output from the show ssh server allow-users command**

```
Username          Remote Hostname (pattern)
----------------- --------------------------------
awplus            192.168.*
john
manager           *.alliedtelesis.com
```

Table 81-9: Parameters in the output of the show ssh server allow-users command

Parameter	Description
`Username`	User name that is allowed to access the SSH server.
`Remote Hostname (pattern)`	IP address or hostname pattern of the remote client. The user is allowed requests from a host that matches this pattern. If no hostname is specified, the user is allowed from all hosts.

Example To display the user entries in the allow list of the SSH server, use the command:

```
awplus# show ssh server allow-users
```

Related Commands ssh server allow-users
ssh server deny-users

show ssh server deny-users

This command displays the user entries in the deny list of the SSH server. The user in the deny list is rejected to access the SSH server. If a user is not included in the access list of the SSH server, the user is also rejected.

Syntax `show ssh server deny-users`

Mode User Exec, Privileged Exec and Global Configuration

Output **Figure 81-10: Example output from the show ssh server deny-user command**

```
Username          Remote Hostname (pattern)
----------------- --------------------------------
john              *.b-company.com
manager           192.168.2.*
```

Table 81-10: Parameters in the output of the show ssh server deny-user command

Parameter	Description
`Username`	The user that this rule applies to.
`Remote Hostname (pattern)`	IP address or hostname pattern of the remote client. The user is denied requests from a host that matches this pattern. If no hostname is specified, the user is denied from all hosts.

Example To display the user entries in the deny list of the SSH server, use the command:

```
awplus# show ssh server deny-users
```

Related Commands **ssh server allow-users**
ssh server deny-users

ssh

This command initiates a Secure Shell connection to a remote SSH server.

If the server requests a password for the user login, the user needs to type in the correct password on “Password:” prompt.

SSH client identifies the remote SSH server by it’s public key registered on the client device. If the server identification is changed, server verification fails. If the public key of the server has been changed, it is required that the public key of the server should be explicitly added to the known host database.

Note Note that any hostname specified with ssh cannot begin with a hyphen (-) character.

Syntax

```
ssh [ip|ipv6][{[user <username>]|[port <1-65535>]|[version {1|2}]}]
   <hostname> [<line>]
```

Syntax (VRF Lite)

```
ssh [vrf <vrf-name>] [ip|ipv6][{[user <username>]|[port <1-65535>]|
   [version {1|2}]}] <hostname> [<line>]
```

Parameter	Description	
`vrf`	Apply the command to the specified VRF instance.	
`<vrf-name>`	The name of the VRF instance.	
`ip`	Specify IPv4 SSH.	
`ipv6`	Specify IPv6 SSH.	
`user`	Login user. If user is specified, the username is used for login to the remote SSH server when user authentication is required. Otherwise the current user name is used.	
	`<username>`	User name to login on the remote server.
`port`	SSH server port. If port is specified, the SSH client connects to the remote SSH server with the specified TCP port. Other- wise, the client port configured by “ssh client” command or the default TCP port (22) is used.	
	`<1-65535>`	TCP port.
`version`	SSH client version. If version is specified, the SSH client supports only the specified SSH version. By default, SSH client uses SSHv2 first. If the server does not support SSHv2, it will try SSHv1. The default version can be configured by “ssh client” command.	
	`1`	Use SSH version 1.
	`2`	Use SSH version 2.

Parameter(cont	Description(cont.)	
<hostname>	IPv4/IPv6 address or hostname of a remote server in the format `a.b.c.d` for an IPv4 address, or in the format `x:x::x:x` for an IPv6 address corresponding to the ip or ipv6 optional keywords used. Note that any hostname specified with ssh cannot begin with a hyphen (-) character.	
	<line>	Command to execute on the remote server. If a command is specified, the command is executed on the remote SSH server and the session is disconnected when the remote command finishes.

Mode User Exec and Privileged Exec

Examples To login to the remote SSH server at 192.0.2.5, use the command:

```
awplus# ssh ip 192.0.2.5
```

To login to the remote SSH server at 192.0.2.5 as user **manager**, use the command:

```
awplus# ssh ip user manager 192.0.2.5
```

To login to the remote SSH server at 192.0.2.5 that is listening TCP port 2000, use the command:

```
awplus# ssh port 2000 192.0.2.5
```

To login to the remote SSH server with example_host using IPv6 session, use the command:

```
awplus# ssh ipv6 example_host
```

To run the **cmd** command on the remote SSH server at 192.0.2.5, use the command:

```
awplus# ssh ip 192.0.2.5 cmd
```

Example (VRF Lite) To login to the remote SSH server at 192.168.1.1 on VRF `red`, use the command:

```
awplus# ssh vrf red 192.168.1.1
```

Related Commands

ssh client

ssh client

This command modifies the default configuration parameters of the Secure Shell (SSH) client. The configuration is used for any SSH client on the device to connect to remote SSH servers. Any parameters specified on SSH client explicitly override the default configuration parameters.

The change affects the current user shell only. When the user exits the login session, the configuration does not persist. This command does not affect existing SSH sessions.

The **no** variant of this command resets configuration parameters of the Secure Shell (SSH) client changed by the **ssh client** command, and restores the defaults.

This command does not affect the existing SSH sessions.

Syntax

```
ssh client {port <1-65535>|version {1|2}|session-timeout <0-3600>|
    connect-timeout <1-600>}

no ssh client {port|version|session-timeout|connect-timeout}
```

Parameter	Description	
`port`	The default TCP port of the remote SSH server. If an SSH client specifies an explicit port of the server, it overrides the default TCP port. Default: **22**	
	<1-65535>	TCP port number.
`version`	The SSH version used by the client for SSH sessions. The SSH client supports both version 2 and version 1 Default: **version 2** **Note**: SSH version 2 is the default SSH version. SSH client supports SSH version 1 if SSH version 2 is not configured using a **ssh version** command.	
	`1`	SSH clients on the device supports SSH version 1 only.
	`2`	SSH clients on the device supports SSH version 2 only
`session-timeout`	The global session timeout for SSH sessions. If the session timer lapses since the last time an SSH client received data from the remote server, the session is terminated. If the value is 0, then the client does not terminate the session. Instead, the connection is terminated when it reaches the TCP timeout. Default: **0** (session timer remains off)	
	<0-3600>	Timeout in seconds.
`connect-timeout`	The maximum time period that an SSH session can take to become established. The SSH client terminates the SSH session if this timeout expires and the session is still not established. Default: **30**	
	<1-600>	Timeout in seconds.

Mode Privileged Exec

Examples

To configure the default TCP port for SSH clients to 2200, and the session timer to 10 minutes, use the command:

```
awplus# ssh client port 2200 session-timeout 600
```

To configure the connect timeout of SSH client to 10 seconds, use the command:

```
awplus# ssh client connect-timeout 10
```

To restore the connect timeout to its default, use the command:

```
awplus# no ssh client connect-timeout
```

Related Commands

show ssh client
ssh

ssh server

This command modifies the configuration of the SSH server. Changing these parameters affects new SSH sessions connecting to the device.

The **no** variant of this command restores the configuration of a specified parameter to its default. The change affects the SSH server immediately if the server is running. Otherwise, the configuration is used when the server starts.

To enable the SSH server, use the **service ssh** command.

Syntax

```
ssh server {[v1v2|v2only]|<1-65535>}
ssh server {[session-timeout <0-3600>] [login-timeout <1-600>]
    [max-startups <1-128>]}
no ssh server {[session-timeout] [login-timeout] [max-startups]}
```

Parameter	Description
v1v2	Supports both SSHv2 and SSHv1client connections. Default: **v1v2**
v2only	Supports SSHv2 client connections only.
<1-65535>	The TCP port number that the server listens to for incoming SSH sessions. Default: **22**
session-timeout	There is a maximum time period that the server waits before deciding that a session is inactive and should be terminated. The server considers the session inactive when it has not received any data from the client, and when the client does not respond to keep alive messages. Default: **0** (session timer remains off).
	<0-3600> Timeout in seconds.
login-timeout	The maximum time period the server waits before disconnecting an unauthenticated client. Default: **60**
	<1-600> Timeout in seconds.
max-startups	The maximum number of concurrent unauthenticated connections the server accepts. When the number of SSH connections awaiting authentication reaches the limit, the server drops any additional connections until authentication succeeds or the login timer expires for a connection. Default: **10**
	<1-128> Number of sessions.

Mode Global Configuration

Examples

To configure the session timer of SSH server to 10 minutes (600 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# ssh server login-timeout 600
```

To configure the login timeout of SSH server to 30 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server login-timeout 30
```

To limit the number of SSH client connections waiting authentication from SSH server to 3, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server max-startups
```

To set max-startups parameters of SSH server to the default configuration, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server max-startups
```

To support the Secure Shell server with TCP port 2200, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server 2200
```

To force the Secure Shell server to support SSHv2 only, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server v2only
```

To support both SSHv2 and SSHv1, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server v1v2
```

Related Commands

show ssh server
ssh client

ssh server allow-users

This command adds a username pattern to the allow list of the SSH server. If the user of an incoming SSH session matches the pattern, the session is accepted.

When there are no registered users in the server's database of allowed users, the SSH server does not accept SSH sessions even when enabled.

SSH server also maintains the deny list. The server checks the user in the deny list first. If a user is listed in the deny list, then the user access is denied even if the user is listed in the allow list.

The **no** variant of this command deletes a username pattern from the allow list of the SSH server. To delete an entry from the allow list, the username and hostname pattern should match exactly with the existing entry.

Syntax

```
ssh server allow-users <username-pattern> [<hostname-pattern>]
no ssh server allow-users <username-pattern> [<hostname-pattern>]
```

Parameter	Description
<username-pattern>	The username pattern that users can match to. An asterisk acts as a wildcard character that matches any string of characters.
<*hostname-pattern*>	The host name pattern that hosts can match to. If specified, the server allows the user to connect only from hosts matching the pattern. An asterisk acts as a wildcard character that matches any string of characters.

Mode Global Configuration

Example To allow the user `john` to create an SSH session from any host, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server allow-users john
```

To allow the user `john` to create an SSH session from a range of IP address (from 192.168.1.1 to 192.168.1.255), use the commands:

```
awplus# configure terminal
awplus(config)# ssh server allow-users john 192.168.1.*
```

To allow the user `john` to create a SSH session from `a-company.com` domain, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server allow-users john *.a-company.com
```

To delete the existing user entry `john 192.168.1.*` in the allow list, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server allow-users john 192.168.1.*
```

Related Commands

show running-config ssh
show ssh server allow-users
ssh server deny-users

ssh server authentication

This command enables RSA public-key or password user authentication for SSH Server. Apply the **password** keyword with the **ssh server authentication** command to enable password authentication for users. Apply the **publickey** keyword with the **ssh server authentication** command to enable RSA public-key authentication for users.

Use the **no** variant of this command to disable RSA public-key or password user authentication for SSH Server. Apply the **password** keyword with the **no ssh authentication** command to disable password authentication for users. Apply the required **publickey** keyword with the **no ssh authentication** command to disable RSA public-key authentication for users.

Syntax

```
ssh server authentication {password|publickey}
no ssh server authentication {password|publickey}
```

Parameter	Description
`password`	Specifies user password authentication for SSH server.
`publickey`	Specifies user publickey authentication for SSH server.

Default Both RSA public-key authentication and password authentication are enabled by default.

Mode Global Configuration

Usage For password authentication to authenticate a user, password authentication for a user must be registered in the local user database or on an external RADIUS server, before using the **ssh server authentication password** command.

For RSA public-key authentication to authenticate a user, a public key must be added for the user, before using the **ssh server authentication publickey** command.

Example To enable `password` authentication for users connecting through SSH, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server authentication password
```

To enable `publickey` authentication for users connecting through SSH, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server authentication publickey
```

To disable `password` authentication for users connecting through SSH, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server authentication password
```

To disable `publickey` authentication for users connecting through SSH, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server authentication publickey
```

Related Commands

crypto key pubkey-chain userkey
service ssh
show ssh server

ssh server deny-users

This command adds a username pattern to the deny list of the SSH server. If the user of an incoming SSH session matches the pattern, the session is rejected.

SSH server also maintains the allow list. The server checks the user in the deny list first. If a user is listed in the deny list, then the user access is denied even if the user is listed in the allow list.

If a hostname pattern is specified, the user is denied from the hosts matching the pattern.

The **no** variant of this command deletes a username pattern from the deny list of the SSH server. To delete an entry from the deny list, the username and hostname pattern should match exactly with the existing entry.

Syntax

```
ssh server deny-users <username-pattern> [<hostname-pattern>]
no ssh server deny-users <username-pattern> [<hostname-pattern>]
```

Parameter	Description
<username-pattern>	The username pattern that users can match to. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen, full stop and asterisk symbols. An asterisk acts as a wildcard character that matches any string of characters.
<hostname-pattern>	The host name pattern that hosts can match to. If specified, the server denies the user only when they connect from hosts matching the pattern. An asterisk acts as a wildcard character that matches any string of characters.

Mode Global Configuration

Example To deny the user `john` to access SSH login from any host, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server deny-users john
```

To deny the user john to access SSH login from a range of IP address (from 192.168.2.1 to 192.168.2.255), use the commands:

```
awplus# configure terminal
awplus(config)# ssh server deny-users john 192.168.2.*
```

To deny the user `john` to access SSH login from `b-company.com` domain, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server deny-users john*.b-company.com
```

To delete the existing user entry `john 192.168.2.*` in the deny list, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server deny-users john 192.168.2.*
```

Related Commands
show running-config ssh
show ssh server deny-users
ssh server allow-users

ssh server resolve-host

This command enables resolving an IP address from a host name using a DNS server for client host authentication.

The **no** variant of this command disables this feature.

Syntax

```
ssh server resolve-hosts
no ssh server resolve-hosts
```

Default This feature is disabled by default.

Mode Global Configuration

Usage Your device has a DNS Client that is enabled automatically when you add a DNS server to your device. To add a DNS server to the list of servers that the device sends DNS queries to use the **ip name-server** command on page 27.50.

For information about configuring DNS see **"Domain Name System (DNS)" on page 26.8**.

Example To resolve a host name using a DNS server, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server resolve-hosts
```

Related Commands
ip name-server
show ssh server
ssh server allow-users
ssh server deny-users

ssh server scp

This command enables the Secure Copy (SCP) service on the SSH server. Once enabled, the server accepts SCP requests from remote clients.

You must enable the SSH server as well as this service before the device accepts SCP connections. The SCP service is enabled by default as soon as the SSH server is enabled.

The **no** variant of this command disables the SCP service on the SSH server. Once disabled, SCP requests from remote clients are rejected.

Syntax

```
ssh server scp
no ssh server scp
```

Mode Global Configuration

Examples To enable the SCP service, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server scp
```

To disable the SCP service, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server scp
```

Related Commands **show running-config ssh**
show ssh server

ssh server sftp

This command enables the Secure FTP (SFTP) service on the SSH server. Once enabled, the server accepts SFTP requests from remote clients.

You must enable the SSH server as well as this service before the device accepts SFTP connections. The SFTP service is enabled by default as soon as the SSH server is enabled. If the SSH server is disabled, SFTP service is unavailable.

The **no** variant of this command disables SFTP service on the SSH server. Once disabled, SFTP requests from remote clients are rejected.

Syntax

```
ssh server sftp
no ssh server sftp
```

Mode Global Configuration

Examples To enable the SFTP service, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server sftp
```

To disable the SFTP service, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server sftp
```

- Configure DHCP Snooping 82.10
- Disabling DHCP Snooping 82.15
- Related Features 82.16

Introduction

This chapter provides information about DHCP snooping, support for it on this switch, and how to configure it.

For detailed descriptions of the commands used to configure DHCP snooping, see **Chapter 83, DHCP Snooping Commands**; for related ACL commands, see **Chapter 61, IPv4 Hardware Access Control List (ACL) Commands**. For information about Dynamic Host Configuration protocol and how to configure it, see **Chapter 92, Dynamic Host Configuration Protocol (DHCP) Introduction** and **Chapter 93, Dynamic Host Configuration Protocol (DHCP) Commands**.

DHCP Snooping

DHCP snooping provides an extra layer of security on the switch via dynamic IP source filtering. DHCP snooping filters out traffic received from unknown, or 'untrusted' ports, and builds and maintains a DHCP snooping database.

Dynamic Host Configuration Protocol (DHCP) dynamically assigns IP addresses to client devices. The use of dynamically assigned addresses requires traceability, so that a service provider can determine which clients own a particular IP address at a certain time.

With DHCP snooping, IP sources are dynamically verified, and filtered accordingly. IP packets that are not sourced from recognized IP addresses can be filtered out. This ensures the required traceability.

With DHCP snooping, an administrator can control port-to-IP connectivity by:

- permitting port access to specified IP addresses only
- permitting port access to DHCP issued IP addresses only
- dictating the number of IP clients on any given port
- passing location information about an IP client to the DHCP server
- permitting only known IP clients to ARP

Ports on the switch are classified as either trusted or untrusted:

- Trusted ports receive only messages from within your network.
- Untrusted ports receive messages from outside your network.

DHCP snooping blocks unauthorized IP traffic from untrusted ports, and prevents it from entering the trusted network. It validates DHCP client packets from untrusted ports and forwards them to trusted ports in the VLAN.

On this switch, DHCP snooping is disabled by default, and can be enabled on per-VLAN basis to operate over switch ports and over static and dynamic (LACP) link aggregators (channel groups).

DHCP Snooping Database

When you enable DHCP snooping, the switch intercepts all DHCP packets it receives, and sends them to the Central Processing Unit (CPU), where they are verified. The DHCP snooping database stores and maintains this information. The database contains entries for:

- current IP address leases dynamically allocated by a DHCP server
- static or dynamic entries added from the command line—typically used to add a DHCP snooping entry for a client that has a preconfigured IP address on an untrusted port

Database backup

The switch periodically saves the dynamic entries in the DHCP snooping database to a hidden file (**.dhcp.dsn.gz**) in Non-Volatile Storage (NVS), or can be configured to save it to Flash memory or to an SD card.

If such a database file exists, it is loaded when the switch starts up with DHCP snooping enabled, or when DHCP snooping is subsequently enabled.

Lease entries

Each entry in the database corresponds to a DHCP IP address lease.

For dynamic entries added automatically by DHCP snooping, each entry contains the following information:

- the IP address that was allocated to that client
- the MAC address of the client device
- the time until expiry
- the VLAN to which the client is attached
- the port to which the client is attached
- the IP address of the DHCP server

For static entries added from the command line, each entry contains the following subset of information:

- the IP address allocated to the client
- the MAC address of the client device (optional)
- the VLAN to which the client is attached
- the port to which the client is attached

Each entry also shows its source: Dynamic or Static.

On this switch, the maximum number of lease entries that can be stored in the DHCP snooping database for each port can be configured—the default is 1.

Expired entries

For dynamic entries, the switch receives expiry information with the client lease information in DHCP packets. Entries expire when the time left to expiry is 0 seconds. Expired entries are automatically deleted from the database. Static entries have no expiry information, and are not checked. All dynamic entries in the database are written to the backup file. Whenever DHCP snooping is enabled, the DHCP snooping database is repopulated from the backup file and any static entries in the start-up configuration file. Any entries present in the backup file that have expired are ignored.

DHCP Relay Agent Option 82

If the switch is at the edge of the network, it can be configured to insert DHCP Relay Agent Option 82 information into client-originated BOOTP/DHCP packets that it is forwarding to a DHCP server. The switch also removes DHCP Relay Agent Option 82 information from BOOTP reply packets destined for an untrusted port if the DHCP client hardware is directly attached to a port on the switch.

DHCP servers that are configured to recognize DHCP Relay Agent Option 82 may use the information to implement IP address or other parameter assignment policies, based on the network location of the client device.

When DHCP Relay Agent Option 82 information for DHCP snooping is enabled, the switch inserts DHCP Relay Agent Option 82 information into BOOTP request packets received from an untrusted port. The switch inserts the following DHCP Relay Agent Option 82 information:

- Remote ID: this identifies the host. By default, this is the MAC address of the switch (sub-option1).
- Circuit ID: this specifies the switch port and VLAN ID that the client-originated DHCP packet was received on (sub-option2). By default, this is the VLAN ID and the Ifindex (interface number).
- Subscriber ID (optional): this is a string of up to 50 characters that differentiates or groups client ports on the switch (sub-option 6).

Support on this switch

This switch inserts DHCP Relay Agent Option 82 (agent option) information into DHCP packets received through untrusted ports, and removes it from DHCP packets transmitted through untrusted ports. This is enabled by default, and can be disabled if required.

You can specify values for the Remote ID and Circuit ID sub-options of the DHCP Relay Agent Option 82 field. The Remote ID can be specified as an alphanumeric (ASCII) string, 1 to 63 characters in length. The Circuit ID can be specified as the VLAN ID and port number.

Subscriber IDs can be configured for ports, and if they have been configured, they are inserted in DHCP packets as part of the DHCP Relay Agent Option 82 information.

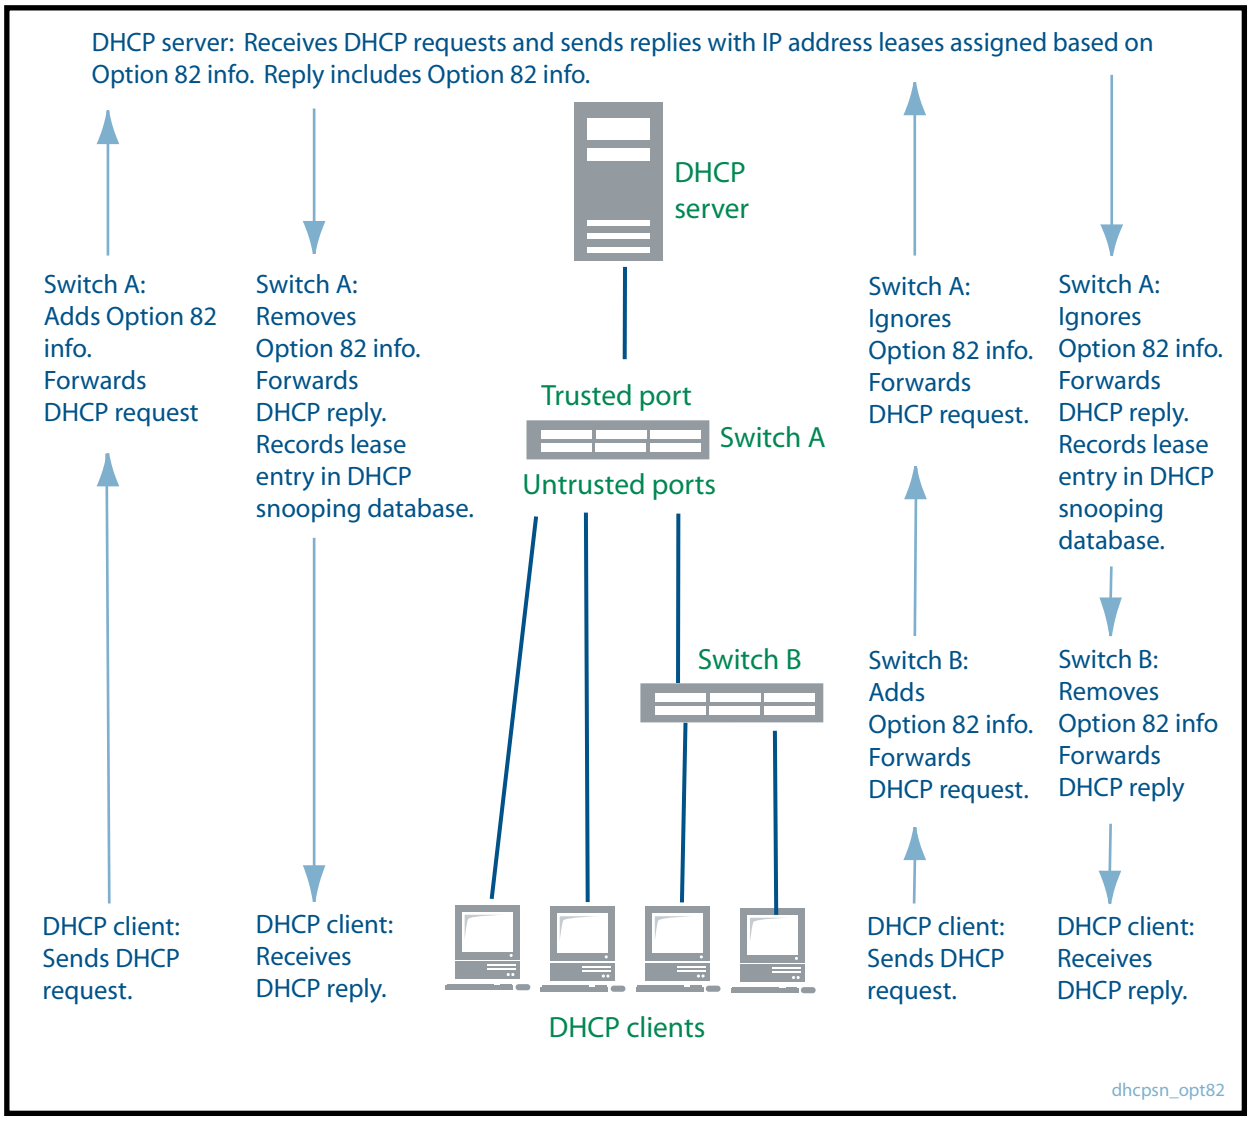
Regardless of whether DHCP Relay Agent Option 82 is enabled for DHCP snooping, if the switch receives a BOOTP/DHCP request packet on a trusted port, and the packet contains DHCP Relay Agent Option 82 information, it does not update the DHCP Relay Agent Option 82 information for the receiver port. By default, if it receives a DHCP request packet containing DHCP Relay Agent Option 82 information on an untrusted port, it drops the packet. However, if the switch is connected via untrusted ports to edge switches that insert DHCP Relay Agent Option 82 information into DHCP packets, you may need to allow these DHCP packets through the untrusted ports—the switch can be configured to forward these packets.

Note that the DHCP Relay Agent Option 82 agent information inserted by the DHCP snooping differs from the information added by DHCP Relay (see **"DHCP Relay Agent Introduction" on page 92.9**). The switch cannot be configured to use both the DHCP relay agent option and DHCP snooping.

Operation **Figure 82-1** shows DHCP packet flow between DHCP clients and server, where:

- Switch A has DHCP snooping enabled. The DHCP server is connected to a trusted port on Switch A; DHCP clients and Switch B are connected to untrusted ports.
- Switch A is configured to add and remove DHCP Relay Agent Option 82 information (**ip dhcp snooping agent-option** command on page 83.10).
- Switch A is configured to forward DHCP packets that already contain DHCP Relay Agent Option 82 information without changing it (**ip dhcp snooping agent-option allow-untrusted** command on page 83.11).
- Switch B is Layer 2 switching traffic from downstream DHCP clients, and adds and removes DHCP Relay Agent Option 82 information.

Figure 82-1: DHCP packet flow with DHCP snooping and DHCP Relay Agent Option 82 (agent option)



For more information about DHCP Relay Agent Option 82, see RFC 3046, DHCP Relay Agent Information Option.

Traffic Filtering with DHCP Snooping

DHCP filtering prevents IP addresses from being falsified or 'spoofed'. This guarantees that customers cannot avoid detection by spoofing IP addresses that are not actually allocated to them. With DHCP filtering, the switch permits packets to enter over a specific port if their source IP address is currently allocated to a client connected to that port.

Support on this switch

On this switch, Access Control Lists (ACLs) based on DHCP snooping can be used with access groups to filter IP packets. For instance, IP traffic on untrusted ports can be limited to packets matching valid DHCP lease information stored in the DHCP snooping database. Quality of Service (QoS) configuration can also be applied to these ACLs.

The DHCP snooping feature is enabled or disabled per VLAN, and several of the related configuration settings are applied per port. If there are multiple VLANs on a port, all the VLANs will be subject to the same per-port settings.

Operation

Table 82-1 on page 82.7 shows the filtering that is applied by DHCP snooping on a switch with the following DHCP filtering configuration for untrusted ports:

- DHCP snooping is enabled on all VLANs (**service dhcp-snooping** command on page 83.24, **ip dhcp snooping** command on page 83.9)
- ARP security (**arp security** command on page 83.2) is enabled on all VLANs
- MAC address verification is enabled on the switch (**ip dhcp snooping verify mac-address** command on page 83.21; enabled by default), and all DHCP clients are directly connected to the switch.
- Access Control Lists allow IP packets that match the source IP address and MAC address of a valid lease entry in the DHCP snooping database, and deny other IP packets (**access-list** commands in **Chapter 61, IPv4 Hardware Access Control List (ACL) Commands**).
- DHCP requests containing DHCP Relay Agent Option 82 info are not allowed (**ip dhcp snooping agent-option allow-untrusted** command on page 83.11 this is disabled by default).
- Log messages and SNMP notifications are enabled for DHCP snooping and ARP security violations (**ip dhcp snooping violation** command on page 83.22, **arp security violation** command on page 83.3, **snmp-server enable trap** command on page 97.19).

Table 82-1: DHCP filtering on the switch

When the switch ...	And ...	Then the switch ...
DHCP packets		
Receives a DHCP BOOTP packet on a trusted port		Forwards the DHCP packet.
	The packet contains a valid IP address lease for a client, and the maximum number of leases for the client port has not been reached.	Adds or updates a lease entry in the DHCP snooping database.
	The maximum number of leases for the client port has been reached.	Drops the DHCP packet, generates a log message for the violation, generates an SNMP notification (trap), and does not add a lease entry to the database.
A lease entry in the DHCP snooping database expires		Removes the expired entry from the database.
Receives a DHCP BOOTP request packet on an untrusted port	The source MAC address and client hardware address match.	
Receives a DHCP BOOTP request packet on an untrusted port	The source MAC address and client hardware address do not match.	Drops the packet, generates a log message for the violation, and sends an SNMP notification (trap).
Receives a DHCP BOOTP request packet on an untrusted port	The packet contains DHCP Relay Agent Option 82 info.	Drops the DHCP packet, generates a log message for the violation, and sends an SNMP notification (trap).
Receives a DHCP BOOTP reply packet on an untrusted port		Drops the DHCP packet, generates a log message for the violation, and sends an SNMP notification (trap).
IP packets		
Receives an IP packet on a trusted port		Forwards the IP packet.
Receives an IP packet on an untrusted port	Its source MAC address, IP address, and receiving port match a valid lease entry in the DHCP snooping database.	Forwards the IP packet.
Receives an IP packet on an untrusted port	Its source MAC address, IP address, and receiving port do not match a valid lease entry in the DHCP snooping database.	Drops the packet. Does not generate a log message or an SNMP notification.
ARP packets		
Receives an ARP request on a trusted port		Forwards the ARP packet.
Receives an ARP request on an untrusted port	Its source MAC address, IP address, and receiving port match a valid entry in the DHCP snooping database	Forwards the ARP packet.
Receives an ARP request on an untrusted port	Its source MAC address, IP address, and receiving port do not match an entry in the DHCP snooping database	Drops the packet, generates a log message for the violation, and sends an SNMP notification (trap).

ARP Security

ARP security prevents ARP spoofing. ARP spoofing occurs when devices send fake, or 'spoofed', ARP messages to an Ethernet LAN. This makes it possible for an unauthorized host to claim to be an authorized host. The unauthorized host can then intercept traffic intended for the authorized host, and can access the wider network.

Spoofed ARP messages contain the IP address of an authorized host, with a MAC address which does not match the real MAC address of the host. When ARP security is enabled for DHCP snooping, the switch checks ARP packets sourced from untrusted ports against the entries in the DHCP snooping binding database. If it finds a matching entry, it forwards the ARP packet as normal. If it does not find a matching entry, it drops the ARP packet. This ensures that only trusted clients (with a recognized IP address and MAC address) can generate ARP packets into the network. ARP security is not applied to packets received on trusted ports.

ARP security is disabled by default, and can be enabled on VLANs to ensure that on untrusted ports, only trusted clients (with a recognized IP address and MAC address) can generate ARP packets into the network. ARP security is applied to both dynamic and static DHCP snooping entries. For static DHCP entries without a MAC address defined, ARP security compares only the IP address details.

MAC Address Verification

When MAC address verification is enabled, the switch forwards DHCP packets received on untrusted ports only if the source MAC address and client hardware address match. MAC address verification is enabled by default.

DHCP Snooping Violations

Packets violating DHCP snooping or ARP security checks (if these are enabled) are automatically dropped. The switch can also be configured to send SNMP notifications (atDhcpsnTrap and atArpsecTrap), to generate log messages, or to shut down the link on which the packet was received.

If the switch is configured to send notifications for DHCP snooping or ARP security violations, the rate is limited to one notification per second. If there are any further violations within a second, no notifications are sent for them. After one second, the switch only sends further notifications if the source MAC address and/or the violation reason are different from previous notifications. (If log messages are also generated for ARP security and DHCP snooping violations, you can see a record of all violations in the log, even if notifications were not sent for all of them.)

Interactions with Other Features

DHCP snooping interacts with other switch features as follows:

- Ports in trunk mode

  The DHCP snooping feature is enabled or disabled per VLAN, and several of the related configuration settings are applied to ports. If there are multiple VLANs on a port, all the VLANs will be subject to the same per-port settings.

- DHCP relay

  The switch cannot use DHCP snooping to filter IP traffic from a DHCP relay device.

  DHCP snooping (**service dhcp-snooping** command on page 83.24) and the DHCP relay agent option (**ip dhcp-relay agent-option** command on page 93.15) cannot both be enabled on the switch at the same time.

- DHCP snooping can be configured with port provisioning.

- Authentication

  DHCP snooping cannot be enabled on a switch that is configured for web authentication (**auth-web enable** command on page 70.33), roaming authentication (**auth roaming enable** command on page 70.17, **auth roaming disconnected** command on page 70.15), or guest VLAN authentication (**auth guest-vlan** command on page 70.8), or vice versa.

- Stacking

  If DHCP snooping is enabled in a stack, the DHCP snooping database and its backup file are automatically synchronized across all stack members, so that a new stack master can reinstate this database.

- Link aggregators

  DHCP snooping can operate over switch ports, and over static and dynamic (LACP) link aggregators (channel groups). If a switch port is added to an aggregator, DHCP snooping configuration is applied to the aggregator; configuration of the original switch port is not preserved. If the switch port is then removed from the aggregator, it returns to default DHCP snooping settings.

- Private VLANs

  Private VLANs are not supported for DHCP snooping.

Configuration

This section provides a general configuration procedure for DHCP snooping.

Configure DHCP Snooping

Note that if a port in trunk mode has multiple VLANs attached, then the DHCP snooping configuration settings for the port apply to all the VLANs.

Table 82-2: General configuration procedure for DHCP snooping

Enable DHCP snooping		
1.	`awplus#` `configure terminal`	Enter Global Configuration mode.
2.	`awplus(config)#` `service dhcp-snooping`	Enable DHCP snooping on the switch. Default: disabled
3.	`awplus(config)#` `interface <vid-list>`	Enter Interface Configuration mode for the VLANs to enable DHCP snooping on.
4.	`awplus(config-if)#` `ip dhcp snooping`	Enable DHCP snooping on these VLANs. Default: disabled
5.	`awplus(config-if)#` `exit`	Return to Global Configuration mode.
6.	`awplus(config-if)#` `interface <port-list>`	Enter Interface Configuration mode for ports connected to the trusted network. The port(s) connected to the DHCP server(s) must be configured as trusted ports.
7.	`awplus(config-if)#` `ip dhcp snooping trust`	Set these ports to be trusted ports. Default: untrusted
8.	`awplus(config-if)#` `exit`	Return to Global Configuration mode.
9.	`awplus(config)#` `interface <port-list>`	If you want to allow more than one DHCP lease for any ports, enter Interface Configuration mode for the required ports. The default is likely to be suitable for edge ports; on an aggregation switch, you may need to increase the maximum number of leases for ports connected to other switches and/or for multiple VLANs. Note that you cannot change this setting once DHCP snooping ACLs are attached to these interfaces.

Table 82-2: General configuration procedure for DHCP snooping(cont.)

10.	`awplus(config-if)#` `ip dhcp snooping max-bindings <0-520>`	Change the maximum number of leases for these ports. Default: 1
11.	`awplus(config-if)#` `exit`	Return to Global Configuration mode.
Configure DHCP filtering		
12.	`awplus(config)#` `access-list hardware <name>`	Create a hardware access list, and enter Hardware Access List Configuration mode to configure it. See the **access-list hardware (named)** command on page 61.19.

13.	`awplus(config-ip-hw-acl)#`
	`[<seqnum>] permit ip dhcpsnooping any`
	`[<seqnum>] deny ip any any`
		Configure the hardware access list to permit traffic with *source IP address* matching valid entries in the DHCP snooping database, and to deny other traffic. (The last filter applied to the ports by any access list must be the filter that denies all other traffic.)
		OR

	`awplus(config-ip-hw-acl)#`
	`[<seqnum>] permit ip dhcpsnooping any mac dhcpsnooping any`
	`[<seqnum>] deny ip any any mac any any`
		Configure the hardware access list to permit traffic with *source IP address and source MAC address* matching valid entries in the DHCP snooping database, and to deny other traffic. (The last filter applied to the ports by any access list must be the filter that denies all other traffic.)
		See the **(access-list hardware IP protocol filter)** command on page 61.24.

14.	`awplus(config-ip-hw-acl)#` `exit`	Return to Global Configuration mode.
15.	`awplus(config)#` `interface <port-list>`	Enter Interface Configuration mode for the ports to add the DHCP snooping access list to. Typically this would be all untrusted ports.
16.	`awplus(config-if)#` `access-group <name>`	Add the hardware-based access list(s) to these ports. The *name* in this command is the name of the access list specified in **Step 12**.
17.	`awplus(config-if)#` `exit`	Return to Global Configuration mode.

Table 82-2: General configuration procedure for DHCP snooping(cont.)

Configure ARP security		
18.	`awplus(config)#` `interface <vid-list>`	Enter Interface Configuration mode for the VLANs to enable ARP security on. Default: disabled
19.	`awplus(config-if)#` `arp security`	Enable ARP security on particular VLANs if required. On untrusted ports, ARP security forwards ARP packets that have a source IP address and MAC address matching a dynamic entry in the DHCP snooping database, or an IP address matching a static entry. It drops other ARP packets, and treats them as ARP security violations. Default: disabled
20.	`awplus(config-if)#` `exit`	Return to Global Configuration mode.
Configure DHCP Relay Agent Option 82		
21.	`awplus(config)#` `no ip dhcp snooping agent-option`	If you do not want the switch to insert DHCP Relay Agent Option 82 information into DHCP packets received on untrusted ports, or to remove this information from DHCP packets transmitted on untrusted ports, disable the DHCP Relay Agent Option 82 agent option. Default: enabled if DHCP snooping is enabled.
22.	`awplus(config)#` `ip dhcp snooping agent-option allow-untrusted`	If there are edge switches that add the DHCP Relay Agent Option 82 information to DHCP packets, and that are connected to untrusted ports on this switch, you may wish to enable this switch to forward these packets, and the associated DHCP reply packets, without changing the DHCP Relay Agent Option 82 information in them. Default: disabled.
23.	`awplus(config)#` `interface <port-list>`	Enter Interface Configuration mode for one or more ports to add a Subscriber ID for.
24.	`awplus(config-if)#` `ip dhcp snooping subscriber-id [<sub-id>]`	Add the Subscriber ID for these ports. The Subscriber ID is included in DHCP Relay Agent Option 82 information. Default: no Subscriber ID.
25.	`awplus(config)#` `interface <interface-list>`	Enter Interface Configuration mode for one or more VLANs to add a Circuit ID for.

Table 82-2: General configuration procedure for DHCP snooping(cont.)

26.	`awplus(config-if)#` `ip dhcp snooping agent-option circuit-id vlantriplet`	Specify the Circuit ID for the VLAN or group of VLANs as the VLAN ID and port number. Default: VLAN ID and Ifindex number.
27.	`awplus(config)#` `interface <interface-list>`	Enter Interface Configuration mode for one or more VLANs to add a Remote ID for.
28.	`awplus(config-if)#` `ip dhcp snooping agent-option remote-id <remote-id>`	Specify the Remote ID for the VLAN or group of VLANs as an alphanumeric (ASCII) string, 1 to 63 characters in length. Default: the switch's MAC address.
29.	`awplus(config-if)#` `exit`	Return to Global Configuration mode.
Configure MAC address verification		
30.	`awplus(config)#` `no ip dhcp snooping verify mac-address`	If not required, disable MAC address verification. Default: enabled
Configure the DHCP snooping database		
31.	`awplus(config)#` `ip dhcp snooping database {nvs|flash|card}`	If required, change the location of the file to which the switch writes the dynamic entries from the DHCP snooping database. Default: nvs (non-volatile storage)
32.	`awplus(config)#` `no ip dhcp snooping delete-by-client`	By default, the switch deletes DHCP lease entries from the DHCP snooping database when it receives matching DHCP release messages. Disable these deletions if required, so that lease entries remain in the database until they expire. Default: enabled—entries are deleted when leases are released.
33.	`awplus(config)#` `ip dhcp snooping delete-by-linkdown`	If required, set the switch to delete dynamic entries from the DHCP snooping database when their ports go down. Default: disabled—entries remain if links go down.
34.	`awplus(config)#` `ip source binding <ipaddr> [<macaddr>] vlan <vid> interface <port>`	You can actively add, modify, or remove static entries from the DHCP snooping database.

Table 82-2: General configuration procedure for DHCP snooping(cont.)

35.	`awplus#` `ip dhcp snooping binding <ipaddr> [<macaddr>] vlan <vid> interface <port> expiry <expiry-time>`	You can actively add or remove dynamic entries from the DHCP snooping database. These changes affect the current database and backup file, but are not stored in the running configuration.
Configure violation actions		
36.	`awplus(config)#` `interface <port-list>`	Enter Interface Configuration mode for the ports for which you want to configure actions in response to DHCP snooping or ARP security violations.

37.	`awplus(config-if)#`
	`ip dhcp snooping violation {log|trap|link-down} ...`
	`arp security violation {log|trap|link-down} ...`
		If required, set the switch to generate an SNMP notification (trap), to generate a log message, and/or to block traffic on the port on which a DHCP snooping and/or ARP security violation is detected.
		Default: By default, if a packet does not match the DHCP snooping and ARP security restrictions, the packet is dropped, but no other action is taken.

38.	`awplus(config-if)#` `exit`	Return to Global Configuration mode.
39.	`awplus(config)#` `snmp-server enable trap dhcpsnooping`	In order to send SNMP notifications: ■ set the action for violations to trap (**Step 37**) ■ configure SNMP—see **Chapter 97, SNMP Commands** ■ set the SNMP server to enable DHCP snooping notifications (by default notifications are disabled on the SNMP server). The port connecting the switch to the SNMP manager should be set as a trusted port (**Step 7 on page 82.10**).
40.	`awplus(config)#` `exit`	Return to Privileged Exec mode.
Check the configuration		

41.	`awplus#`
	`show ip dhcp snooping`
	`show ip dhcp snooping interface [<port-list>]`
	`show ip dhcp snooping acl`
	`show arp security`
	`show arp security interface [<port-list>]`
	`show running-config dhcp`
		Check the DHCP snooping configuration.

Table 82-2: General configuration procedure for DHCP snooping(cont.)

Troubleshooting DHCP snooping		
42.	`awplus#` `show ip dhcp snooping binding`	Check all entries in the DHCP snooping database.
43.	`awplus#` `show ip source binding`	Check the static entries in the DHCP snooping database.

44.	`awplus#`
	`show ip dhcp snooping statistics [detail] [interface <interface-list>]`
	`clear ip dhcp snooping statistics [interface <port-list>]`
		Check DHCP snooping statistics.

45.	`awplus#`
	`show arp security statistics [detail] [interface <port-list>]`
	`clear arp security statistics [interface <port-list>]`
		Check ARP security statistics.

46.	`awplus#`
	`debug ip dhcp snooping {all|acl|db|packet [detail]}`
	`show debugging ip dhcp snooping`
	`debug arp security`
	`show debugging arp security`
		Enable debug output for DHCP snooping and/or ARP security.

47.		If you have not already set the switch to log DHCP snooping and ARP security violations, you can do this for troubleshooting purposes. See **Step 37 on page 82.14**.
48.	`awplus#` `show log`	Display the contents of the buffered log, including any DHCP snooping log and debug messages. (See also **Chapter 12, Logging Commands**.)

Disabling DHCP Snooping

If you disable DHCP snooping on the whole switch (**no service dhcp-snooping** command on page 83.24), all the DHCP snooping configuration is removed, except for the Access Control Lists (ACL). Any ACLs on a port that permit traffic matching DHCP snooping entries and block other traffic, will block all traffic if DHCP snooping is disabled on the port. If you disable DHCP snooping either on the whole switch or on particular VLANs (**no ip dhcp snooping** command on page 83.9), you must also remove any DHCP snooping ACLs from the ports to maintain connectivity (**no access-group** command on page 61.4).

Related Features

In addition to configuring DHCP snooping as described in **Table 82-2**, consider whether you also need to configure the following:

- VLANs—see **Chapter 18, VLAN Introduction** and **Chapter 19, VLAN Commands**
- Additional ACL filters—see **Chapter 60, Access Control Lists Introduction** and **Chapter 62, IPv4 Software Access Control List (ACL) Commands**
- QoS—see **Chapter 65, Quality of Service (QoS) Introduction** and **Chapter 66, QoS Commands**
- SNMP—**Chapter 96, SNMP Introduction** and **Chapter 97, SNMP Commands**

Chapter 83: DHCP Snooping Commands

Command List 83.2
arp security 83.2
arp security violation 83.3
clear arp security statistics 83.4
clear ip dhcp snooping binding 83.5
clear ip dhcp snooping statistics 83.6
debug arp security 83.7

show ip source binding 83.44

Command List

This chapter gives detailed information about the commands used to configure DHCP snooping. For detailed descriptions of related ACL commands, see **Chapter 61, IPv4 Hardware Access Control List (ACL) Commands**. For more information about DHCP snooping, see **Chapter 82, DHCP Snooping Introduction and Configuration**.

DHCP snooping can operate on static link aggregators (e.g., sa2) and dynamic link aggregators (e.g. po3) link aggregators, as well as switch ports (e.g., port1.0.2).

arp security

Use this command to enable ARP security on untrusted ports in the VLANs, so that the switch only responds to/forwards ARP packets if they have recognized IP and MAC source addresses.

Use the **no** variant of this command to disable ARP security on the VLANs.

Syntax

```
arp security
no arp security
```

Default Disabled

Mode Interface Configuration (VLANs)

Usage Enable ARP security to provide protection against ARP spoofing. DHCP snooping must also be enabled on the switch (**service dhcp-snooping** command on page 83.24), and on the VLANs (**ip dhcp snooping** command on page 83.9).

Example To enable ARP security on VLANs 2 to 4, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# arp security
```

Related Commands

arp security violation
show arp security
show arp security interface
show arp security statistics

arp security violation

Use this command to specify an additional action to perform if an ARP security violation is detected on the ports. ARP security must also be enabled (**arp security** command on page 83.2).

Use the **no** variant of this command to remove the specified action, or all actions. Traffic violating ARP security will be dropped, but no other action will be taken.

Syntax

```
arp security violation {log|trap|link-down} ...
no arp security violation [log|trap|link-down] ...
```

Parameter	Description
`log`	Generate a log message. To display these messages, use the **show log** command on page 12.40.
`trap`	Generate an SNMP notification (trap). To send SNMP notifications, SNMP must also be configured, and DHCP snooping notifications must be enabled using the **snmp-server enable trap** command on page 97.19. Notifications are limited to one per second and to one per source MAC and violation reason. Additional violations within a second of a notification being sent will not result in further notifications. Default: disabled.
`link-down`	Shut down the port that received the packet. Default: disabled.

Default When the switch detects an ARP security violation, it drops the packet. By default, it does not perform any other violation actions.

Mode Interface Configuration (switch ports, static or dynamic aggregated links)

Usage When the switch detects an ARP security violation on an untrusted port in a VLAN that has ARP security enabled, it drops the packet. This command sets the switch to perform additional actions in response to ARP violations.

If a port has been shut down in response to a violation, to bring it back up again after any issues have been resolved, use the **no shutdown** command on page 14.13.

Example To send SNMP notifications for ARP security violations on ports 1.0.1 to 1.0.8, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap dhcpsnooping
awplus(config)# interface port1.0.1-port1.0.8
awplus(config-if)# arp security violation trap
```

Related Commands

arp security
show arp security interface
show arp security statistics
show log
snmp-server enable trap

clear arp security statistics

Use this command to clear ARP security statistics for the specified ports, or for all ports.

Syntax

```
clear arp security statistics [interface <port-list>]
```

Parameter	Description
<port-list>	The ports to clear statistics for. If no ports are specified, statistics are cleared for all ports. The ports may be switch ports, or static or dynamic link aggregators.

Mode

Privileged Exec

Example

To clear statistics for ARP security on interface port1.0.1, use the command:

```
awplus# clear arp security statistics interface port1.0.1
```

Related Commands

arp security violation
show arp security
show arp security statistics

clear ip dhcp snooping binding

Use this command to remove one or more DHCP Snooping dynamic entries from the DHCP Snooping binding database. If no options are specified, all entries are removed from the database.

Caution

If you remove entries from the database for current clients, they will lose IP connectivity until they request and receive a new DHCP lease. If you clear all entries, all clients connected to untrusted ports will lose connectivity.

Syntax

```
clear ip dhcp snooping binding [<ipaddr>] [interface <port-list>]
   [vlan <vid-list>]
```

Parameter	Description
<ipaddr>	Remove the entry for this client IP address.
<port-list>	Remove all entries for these ports. The port list may contain switch ports, and static or dynamic link aggregators (channel groups).
<vid-list>	Remove all entries associated with these VLANs.

Mode Privileged Exec

Usage This command removes dynamic entries from the database. Note that dynamic entries can also be deleted by using the **no** variant of the **ip dhcp snooping binding** command on page 83.14.

Dynamic entries can individually restored by using the **ip dhcp snooping binding** command.

To remove static entries, use the **no** variant of the **ip source binding** command on page 83.23.

Example To remove a dynamic lease entry from the DHCP snooping database for a client with the IP address 192.168.1.2, use the command:

```
awplus# clear ip dhcp snooping binding 192.168.1.2
```

Related Commands

ip dhcp snooping binding
ip source binding
show ip dhcp snooping binding

clear ip dhcp snooping statistics

Use this command to clear DHCP snooping statistics for the specified ports, or for all ports.

Syntax `clear ip dhcp snooping statistics [interface <port-list>]`

Parameter	Description
<port-list>	The ports to clear statistics for. If no ports are specified, statistics are cleared for all ports. The port list can contain switch ports, or static or dynamic link aggregators.

Mode Privileged Exec

Example To clear statistics for the DHCP snooping on interface port1.0.1, use the command:

```
awplus# clear ip dhcp snooping statistics interface port1.0.1
```

Related Commands
clear arp security statistics
show ip dhcp snooping
show ip dhcp snooping statistics

debug arp security

Use this command to enable ARP security debugging.

Use the **no** variant of this command to disable debugging for ARP security.

Syntax

```
debug arp security
no debug arp security
```

Default Disabled

Mode Privileged Exec

Example To enable ARP security debugging, use the commands:

```
awplus# debug arp security
```

Related Commands

show debugging arp security
show log
terminal monitor

debug ip dhcp snooping

Use this command to enable the specified types of debugging for DHCP snooping.

Use the **no** variant of this command to disable the specified types of debugging.

Syntax

```
debug ip dhcp snooping {all|acl|db|packet [detail]}
no debug ip dhcp snooping {all|acl|db|packet [detail]}
```

Parameter	Description
`all`	All DHCP snooping debug.
`acl`	DHCP snooping access list debug.
`db`	DHCP snooping binding database debug.
`packet`	DHCP snooping packet debug. For the **no** variant of this command, this option also disables detailed packet debug, if it was enabled.
`detail`	Detailed packet debug.

Default Disabled

Mode Privileged Exec

Example To enable access list debugging for DHCP snooping, use the commands:

```
awplus# debug ip dhcp snooping acl
```

Related Commands

debug arp security
show debugging ip dhcp snooping
show log
terminal monitor

ip dhcp snooping

Use this command to enable DHCP snooping on one or more VLANs.

Use the **no** variant of this command to disable DHCP snooping on the VLANs.

Syntax

```
ip dhcp snooping
no ip dhcp snooping
```

Default DHCP snooping is disabled on VLANs by default.

Mode Interface Configuration (VLANs)

Usage For DHCP snooping to operate on a VLAN, it must:

- be enabled on the particular VLAN by using this command
- be enabled globally on the switch by using the **service dhcp-snooping** command on page 83.24
- have at least one port connected to a DHCP server configured as a trusted port by using the **ip dhcp snooping trust** command on page 83.20

Any ACLs on a port that permit traffic matching DHCP snooping entries and block other traffic, will block all traffic if DHCP snooping is disabled on the port. If you disable DHCP snooping on particular VLANs using this command, you must also remove any DHCP snooping ACLs from the ports to maintain connectivity (**no access-group** command on page 61.4).

Examples To enable DHCP snooping on VLANs 2 to 4, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ip dhcp snooping
```

To disable DHCP snooping on the switch, use the command:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# no ip dhcp snooping
```

Related Commands

ip dhcp snooping trust
service dhcp-snooping
show ip dhcp snooping

ip dhcp snooping agent-option

Use this command to enable DHCP Relay Agent Option 82 information insertion on the switch. When this is enabled, the switch:

- inserts DHCP Relay Agent Option 82 information into DHCP packets that it receives on untrusted ports
- removes DHCP Relay Agent Option 82 information from DHCP packets that it sends to untrusted ports.

Use the **no** variant of this command to disable DHCP Relay Agent Option 82 insertion.

Syntax

```
ip dhcp snooping agent-option
no ip dhcp snooping agent-option
```

Default DHCP Relay Agent Option 82 insertion is enabled by default when DHCP snooping is enabled.

Mode Global Configuration

Usage DHCP snooping must also be enabled on the switch (**service dhcp-snooping** command on page 83.24), and on the VLANs (**ip dhcp snooping** command on page 83.9).

If a subscriber ID is configured for the port (**ip dhcp snooping subscriber-id** command on page 83.19), the switch includes this in the DHCP Relay Agent Option 82 information it inserts into DHCP packets received on the port.

Example To disable DHCP Relay Agent Option 82 on the switch, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp snooping agent-option
```

Related Commands

ip dhcp snooping
ip dhcp snooping agent-option allow-untrusted
ip dhcp snooping subscriber-id
service dhcp-snooping
show ip dhcp snooping

ip dhcp snooping agent-option allow-untrusted

Use this command to enable DHCP Relay Agent Option 82 information reception on untrusted ports. When this is enabled, the switch accepts incoming DHCP packets that contain DHCP Relay Agent Option 82 information on untrusted ports.

Use the **no** variant of this command to disable DHCP Relay Agent Option 82 information reception on untrusted ports.

Syntax

```
ip dhcp snooping agent-option allow-untrusted
no ip dhcp snooping agent-option allow-untrusted
```

Default Disabled

Mode Global Configuration

Usage If the switch is connected via untrusted ports to edge switches that insert DHCP Relay Agent Option 82 information into DHCP packets, you may need to allow these DHCP packets through the untrusted ports, by using this command.

When this is disabled (default), the switch treats incoming DHCP packets on untrusted ports that contain DHCP Relay Agent Option 82 information as DHCP snooping violations: it drops them and applies any violation action specified by the **ip dhcp snooping violation** command on page 83.22. The switch stores statistics for packets dropped; to display these statistics, use the **show ip dhcp snooping statistics** command on page 83.41.

Example To enable DHCP snooping Option 82 information reception on untrusted ports, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp snooping agent-option allow-untrusted
```

Related Commands

ip dhcp snooping agent-option
ip dhcp snooping violation
show ip dhcp snooping
show ip dhcp snooping statistics

ip dhcp snooping agent-option circuit-id vlantriplet

Use this command to specify the Circuit ID sub-option of the DHCP Relay Agent Option 82 field as the VLAN ID and port number. The Circuit ID specifies the switch port and VLAN ID that the client-originated DHCP packet was received on.

Use the **no** variant of this command to set the Circuit ID to the default, the VLAN ID and Ifindex (interface number).

Syntax

```
ip dhcp snooping agent-option circuit-id vlantriplet
no ip dhcp snooping agent-option circuit-id
```

Default By default, the Circuit ID is the VLAN ID and Ifindex (interface number).

Mode Interface Configuration for a VLAN interface.

Usage The Circuit ID sub-option is included in the DHCP Relay Agent Option 82 field of forwarded client DHCP packets:

- DHCP snooping Option 82 information insertion is enabled (**ip dhcp snooping agent-option** command on page 83.10; enabled by default), and
- DHCP snooping is enabled on the switch (**service dhcp-snooping**) and on the VLAN to which the port belongs (**ip dhcp snooping**)

Examples To set the Circuit ID to `vlantriplet` for client DHCP packets received on `vlan1`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip dhcp snooping agent-option circuit-id
vlantriplet
```

To return the Circuit ID format to the default for `vlan1`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# no ip dhcp snooping agent-option circuit-id
```

Related Commands

ip dhcp snooping agent-option
ip dhcp snooping agent-option remote-id
show ip dhcp snooping
show ip dhcp snooping agent-option

ip dhcp snooping agent-option remote-id

Use this command to specify the Remote ID sub-option of the DHCP Relay Agent Option 82 field. The Remote ID identifies the device that inserted the Option 82 information. If a Remote ID is not specified, the Remote ID sub-option is set to the switch's MAC address.

Use the **no** variant of this command to set the Remote ID to the default, the switch's MAC address.

Syntax

```
ip dhcp snooping agent-option remote-id <remote-id>
no ip dhcp snooping agent-option remote-id
```

Parameter	Description
<remote-id>	An alphanumeric (ASCII) string, 1 to 63 characters in length. If the Remote ID contains spaces, it must be enclosed in double quotes. Wildcards are not allowed.

Default The Remote ID is set to the switch's MAC address by default.

Mode Interface Configuration for a VLAN interface.

Usage The Remote ID sub-option is included in the DHCP Relay Agent Option 82 field of forwarded client DHCP packets:

- DHCP snooping Option 82 information insertion is enabled (**ip dhcp snooping agent-option** command on page 83.10; enabled by default), and
- DHCP snooping is enabled on the switch (**service dhcp-snooping**) and on the VLAN to which the port belongs (**ip dhcp snooping**)

Examples To set the Remote ID to `myid` for client DHCP packets received on `vlan1`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip dhcp snooping agent-option remote-id
myid
```

To return the Remote ID format to the default for `vlan1`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# no ip dhcp snooping agent-option remote-id
```

Related Commands

ip dhcp snooping agent-option
ip dhcp snooping agent-option circuit-id vlantriplet
show ip dhcp snooping
show ip dhcp snooping agent-option

ip dhcp snooping binding

Use this command to manually add a dynamic-like entry (with an expiry time) to the DHCP snooping database. Once added to the database, this entry is treated as a dynamic entry, and is stored in the DHCP snooping database backup file. This command is not stored in the switch's running configuration.

Use the **no** variant of this command to delete a dynamic entry for an IP address from the DHCP snooping database, or to delete all dynamic entries from the database.

Caution **If you remove entries from the database for current clients, they will lose IP connectivity until they request and receive a new DHCP lease. If you clear all entries, all clients connected to untrusted ports will lose connectivity.**

Syntax

```
ip dhcp snooping binding <ipaddr> [<macaddr>] vlan <vid> interface
   <port> expiry <expiry-time>

no ip dhcp snooping binding [<ipaddr>]
```

Parameter	Description
<ipaddr>	Client's IP address.
<macaddr>	Client's MAC address in HHHH.HHHH.HHHH format.
<vid>	The VLAN ID for the entry, in the range 1 to 4094.
<port>	The port the client is connected to. The port can be a switch port, or a static or dynamic link aggregation (channel group).
<expiry-time>	The expiry time for the entry, in the range 5 to 2147483647 seconds.

Mode Privileged Exec

Usage Note that dynamic entries can also be deleted from the DHCP snooping database by using the **clear ip dhcp snooping binding** command on page 83.5.

To add or remove static entries from the database, use the **ip source binding** command on page 83.23.

Example To restore an entry in the DHCP snooping database for a DHCP client with the IP address 192.168.1.2, MAC address 0001.0002.0003, on port1.0.6 of vlan6, and with an expiry time of 1 hour, use the commands:

```
awplus# ip dhcp snooping binding 192.168.1.2 0001.0002.0003
        vlan 6 interface port1.0.6 expiry 3600
```

Related Commands
clear ip dhcp snooping binding
ip source binding
show ip dhcp snooping binding

ip dhcp snooping database

Use this command to set the location of the file to which the dynamic entries in the DHCP snooping database are written. This file provides a backup for the DHCP snooping database.

Use the **no** variant of this command to set the database location back to the default, **nvs**.

Syntax

```
ip dhcp snooping database {nvs|flash|card}
no ip dhcp snooping database
```

Parameter	Description
`nvs`	The switch checks the database and writes the file to non-volatile storage (NVS) on the switch at 2 second intervals if it has changed.
`flash`	The switch checks the database and writes the file to Flash memory on the switch at 60 second intervals if it has changed.
`card`	The switch checks the database and writes the file to an SD card installed in the switch at 2 second intervals if it has changed. Note that a current DHCP snooping backup database file is essential to maintain connectivity for DHCP clients after a switch reboot. If you configure the switch to save this file to an SD card, we recommend that you ensure the card is always present.

Default NVS

Mode Global Configuration

Usage In a stack, the backup file is automatically synchronized across all stack members to the location configured. If the backup file is stored on an SD card on the stack master, it is only synchronized across stack members that also have an SD card installed.

If the location of the backup file is changed by using this command, a new file is created in the new location, and the old version of the file remains in the old location. This can be removed if necessary (hidden file: **.dhcp.dsn.gz**).

Example To set the location of the DHCP snooping database to non-volatile storage on the switch, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp snooping database nvs
```

Related Commands show ip dhcp snooping

ip dhcp snooping delete-by-client

Use this command to set the switch to remove a dynamic entry from the DHCP snooping database when it receives a valid DHCP release message with matching IP address, VLAN ID, and client hardware address on an untrusted port, and to discard release messages that do not match an entry in the database.

Use the **no** variant of this command to set the switch to forward DHCP release messages received on untrusted ports without removing any entries from the database.

Syntax

```
ip dhcp snooping delete-by-client
no ip dhcp snooping delete-by-client
```

Default Enabled: by default, DHCP lease entries are deleted from the DHCP snooping database when matching DHCP release messages are received.

Mode Global Configuration

Usage DHCP clients send a release message when they no longer wish to use the IP address they have been allocated by a DHCP server. Use this command to enable DHCP snooping to use the information in these messages to remove entries from its database immediately. Use the **no** variant of this command to ignore these release messages. Lease entries corresponding to ignored DHCP release messages eventually time out when the lease expires.

Examples To set the switch to delete DHCP snooping lease entries from the DHCP snooping database when a matching release message is received, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp snooping delete-by-client
```

To set the switch to forward and ignore the content of any DHCP release messages it receives, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp snooping delete-by-client
```

Related Commands **show ip dhcp snooping**

ip dhcp snooping delete-by-linkdown

Use this command to set the switch to remove a dynamic entry from the DHCP snooping database when its port goes down. If the port is part of an aggregated link, the entries in the database are only deleted if all the ports in the aggregated link are down.

Use the **no** variant of this command to set the switch not to delete entries when ports go down.

Syntax

```
ip dhcp snooping delete-by-linkdown
no ip dhcp snooping delete-by-linkdown
```

Default Disabled: by default DHCP Snooping bindings are not deleted when an interface goes down.

Mode Global Configuration

Usage If this command is enabled in a stack, and the master goes down and is replaced by a new master, entries in the DHCP snooping database for ports on the master are removed, unless they are part of link aggregators that are still up.

Examples To set the switch to delete DHCP snooping lease entries from the DHCP snooping database when links go down, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp snooping delete-by-linkdown
```

To set the switch *not* to delete DHCP snooping lease entries from the DHCP snooping database when links go down, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp snooping delete-by-linkdown
```

Related Commands **show ip dhcp snooping**

ip dhcp snooping max-bindings

Use this command to set the maximum number of DHCP lease entries that can be stored in the DHCP snooping database for each of the ports. Once this limit has been reached, no further DHCP lease allocations made to devices on the port are stored in the database.

Use the **no** variant of this command to reset the maximum to the default, 1.

Syntax

```
ip dhcp snooping max-bindings <0-520>
no ip dhcp snooping max-bindings
```

Parameter	Description
<0-520>	The maximum number of bindings that will be stored for the port in the DHCP snooping binding database. If 0 is specified, no entries will be stored in the database for the port.

Default The default for maximum bindings is 1.

Mode Interface Configuration (port)

Usage The maximum number of leases cannot be changed for a port while there are DHCP snooping Access Control Lists (ACL) associated with the port. Before using this command, remove any DHCP snooping ACLs associated with the ports. To display ACLs used for DHCP snooping, use the **show ip dhcp snooping acl** command on page 83.33.

In general, the default (1) will work well on an edge port with a single directly connected DHCP client. If the port is on an aggregation switch that is connected to an edge switch with multiple DHCP clients connected through it, then use this command to increase the number of lease entries for the port.

If there are multiple VLANs configured on the port, the limit is shared between all the VLANs on this port. For example, the default only allows one lease to be stored for one VLAN. To allow connectivity for the other VLANs, use this command to increase the number of lease entries for the port.

Example To set the maximum number of bindings to be stored in the DHCP snooping database to 10 per port for ports 1.0.1 to 1.0.8, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.8
awplus(config-if)# ip dhcp snooping max-bindings 10
```

Related Commands

access-group
show ip dhcp snooping acl
show ip dhcp snooping interface

ip dhcp snooping subscriber-id

Use this command to set a Subscriber ID for the ports.

Use the **no** variant of this command to remove Subscriber IDs from the ports.

Syntax

```
ip dhcp snooping subscriber-id [<sub-id>]
no ip dhcp snooping subscriber-id
```

Parameter	Description
<sub-id>	The Subscriber ID; an alphanumeric (ASCII) string 1 to 50 characters in length. If the Subscriber ID contains spaces, it must be enclosed in double quotes. Wildcards are not allowed.

Default No Subscriber ID.

Mode Interface Configuration (port)

Usage The Subscriber ID sub-option is included in the DHCP Relay Agent Option 82 field of client DHCP packets forwarded from a port if:

- a Subscriber ID is specified for the port using this command, and
- DHCP snooping Option 82 information insertion is enabled (**ip dhcp snooping agent-option** command on page 83.10; enabled by default), and
- DHCP snooping is enabled on the switch (**service dhcp-snooping**) and on the VLAN to which the port belongs (**ip dhcp snooping**)

Examples To set the Subscriber ID for port 1.0.3 to **room_534**, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.3
awplus(config-if)# ip dhcp snooping subscriber-id room_534
```

To remove the Subscriber ID from port 1.0.3, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.3
awplus(config-if)# no ip dhcp snooping subscriber-id
```

Related Commands
ip dhcp snooping agent-option
show ip dhcp snooping interface

ip dhcp snooping trust

Use this command to set the ports to be DHCP snooping trusted ports.

Use the **no** variant of this command to return the ports to their default as untrusted ports.

Syntax

```
ip dhcp snooping trust
no ip dhcp snooping trust
```

Default All ports are untrusted by default.

Mode Interface Configuration (port)

Usage Typically, ports connecting the switch to trusted elements in the network (towards the core) are set as trusted ports, while ports connecting untrusted network elements are set as untrusted. Configure ports connected to DHCP servers as trusted ports.

Example To set switch ports 1.0.1 and 1.0.2 to be trusted ports, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.2
awplus(config-if)# ip dhcp snooping trust
```

Related Commands **show ip dhcp snooping interface**

ip dhcp snooping verify mac-address

Use this command to verify that the source MAC address and client hardware address match in DHCP packets received on untrusted ports.

Use the **no** variant of this command to disable MAC address verification.

Syntax

```
ip dhcp snooping verify mac-address
no ip dhcp snooping verify mac-address
```

Default Enabled—source MAC addresses are verified by default.

Mode Global Configuration

Usage When MAC address verification is enabled, the switch treats DHCP packets with source MAC address and client hardware address that do not match as DHCP snooping violations: it drops them and applies any other violation action specified by the **ip dhcp snooping violation** command on page 83.22. To bring the port back up again after any issues have been resolved, use the **no shutdown** command on page 14.13.

Example To disable MAC address verification on the switch, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp snooping verify mac-address
```

Related Commands
ip dhcp snooping violation
show ip dhcp snooping
show ip dhcp snooping statistics

ip dhcp snooping violation

Use this command to specify the action the switch will take when it detects a DHCP snooping violation by a DHCP packet on the ports.

Use the **no** variant of this command to disable the specified violation actions, or all violation actions.

Syntax

```
ip dhcp snooping violation {log|trap|link-down} ...
no ip dhcp snooping violation [{log|trap|link-down} ...]
```

Parameter	Description
`log`	Generate a log message. To display these messages, use the **show log** command on page 12.40. Default: disabled.
`trap`	Generate an SNMP notification (trap). To send SNMP notifications, SNMP must also be configured, and DHCP snooping notifications must be enabled using the **snmp-server enable trap** command on page 97.19. Notifications are limited to one per second and to one per source MAC and violation reason. Default: disabled.
`link-down`	Set the port status to link-down. Default: disabled.

Default By default, DHCP packets that violate DHCP snooping are dropped, but no other violation action is taken.

Mode Interface Configuration (port)

Usage If a port has been shut down in response to a violation, to bring it back up again after any issues have been resolved, use the **no shutdown** command on page 14.13.

IP packets dropped by DHCP snooping filters do not result in other DHCP snooping violation actions.

Example To set the switch to send an SNMP notification and set the link status to link-down if it detects a DHCP snooping violation on switch ports 1.0.1 to 1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap dhcpsnooping
awplus(config)# interface port1.0.1-port1.0.4
awplus(config-if)# ip dhcp snooping violation trap link-down
```

Related Commands

show ip dhcp snooping interface
show log
snmp-server enable trap

ip source binding

Use this command to add or replace a static entry in the DHCP snooping database.

Use the **no** variant of this command to delete the specified static entry or all static entries from the database.

Syntax

```
ip source binding <ipaddr> [<macaddr>] vlan <vid> interface <port>
no ip source binding [<ipaddr>]
```

Parameter	Description
<ipaddr>	Client's IP address. If there is already an entry in the DHCP snooping database for this IP address, then this command replaces it with the new entry.
<macaddr>	Client's MAC address in HHHH.HHHH.HHHH format.
<vid>	The VLAN ID associated with the entry.
<port>	The port the client is connected to.

Mode Global Configuration

Usage This command removes static entries from the database.

To remove dynamic entries, use the **clear ip dhcp snooping binding** command on page 83.5 or the **no** variant of the **ip dhcp snooping binding** command on page 83.14.

Examples To add a static entry to the DHCP snooping database for a client with the IP address 192.168.1.2, MAC address 0001.0002.0003, on port1.0.6 of vlan6, use the command:

```
awplus# configure terminal
awplus(config)# ip source binding 192.168.1.2 0001.0002.0003
vlan 6 interface port1.0.6
```

To remove the static entry for IP address 192.168.1.2 from the database, use the commands:

```
awplus# configure terminal
awplus(config)# no ip source binding 192.168.1.2
```

To remove all static entries from the database, use the commands:

```
awplus# configure terminal
awplus(config)# no ip source binding
```

Related Commands

clear ip dhcp snooping binding
ip dhcp snooping binding
show ip dhcp snooping binding
show ip source binding

service dhcp-snooping

Use this command to enable the DHCP snooping service globally on the switch. This must be enabled before other DHCP snooping configuration commands can be entered.

Use the **no** variant of this command to disable the DHCP snooping service on the switch. This removes all DHCP snooping configuration from the running configuration, except for any DHCP snooping maximum bindings settings (**ip dhcp snooping max-bindings** command on page 83.18), and any DHCP snooping-based Access Control Lists (ACLs), which are retained when the service is disabled.

Syntax

```
service dhcp-snooping

no service dhcp-snooping
```

Default DHCP snooping is disabled on the switch by default.

Mode Global Configuration

Usage For DHCP snooping to operate on a VLAN, it must be enabled on the switch by using this command, and also enabled on the particular VLAN by using the **ip dhcp snooping** command on page 83.9.

For DHCP snooping to operate on a VLAN, it must:

- be enabled globally on the switch by using this command
- be enabled on the particular VLAN by using the **ip dhcp snooping** command on page 83.9
- have at least one port connected to a DHCP server configured as a trusted port by using the **ip dhcp snooping trust** command on page 83.20

If you disable the DHCP snooping service by using the **no** variant of this command, all DHCP snooping configuration (including ARP security, but excluding maximum bindings and ACLs) is removed from the running configuration, and the DHCP snooping database is deleted from active memory. If you re-enable the service, the switch:

- repopulates the DHCP snooping database from the dynamic lease entries in the database backup file (in NVS by default—see the **ip dhcp snooping database** command on page 83.15). The lease expiry times are updated.

The DHCP snooping service cannot be enabled on a switch that is configured with any of the following features, or vice versa:

- web authentication (**auth-web enable** command on page 70.33)
- roaming authentication (**auth roaming enable** command on page 70.17, **auth roaming disconnected** command on page 70.15)
- guest VLAN authentication (**auth guest-vlan** command on page 70.8).
- DHCP relay agent option (**ip dhcp-relay agent-option** command on page 93.15)

Any ACLs on a port that permit traffic matching DHCP snooping entries and block other traffic, will block all traffic if DHCP snooping is disabled on the port. If you disable DHCP snooping on the switch using this command, you must also remove any DHCP snooping ACLs from the ports to maintain connectivity (**no access-group** command on page 61.4).

Examples To enable DHCP snooping on the switch, use the command:

```
awplus# configure terminal
awplus(config)# service dhcp-snooping
```

To disable DHCP snooping on the switch, use the command:

```
awplus# configure terminal
awplus(config)# no service dhcp-snooping
```

Related Commands
ip dhcp snooping
ip dhcp snooping database
ip dhcp snooping max-bindings
show ip dhcp snooping

show arp security

Use this command to display ARP security configuration.

Syntax `show arp security`

Mode User Exec and Privileged Exec

Example To display ARP security configuration on the switch use the command:

```
awplus# show arp security
```

Figure 83-1: Example output from the show arp security command

```
awplus# show arp security

ARP Security Information:
  Total VLANs enabled ..... 2
  Total VLANs disabled ..... 11
  vlan1 ..... Disabled
  vlan2 ..... Disabled
  vlan3 ..... Disabled
  vlan4 ..... Disabled
  vlan5 ..... Disabled
  vlan100 ..... Disabled
  vlan101 ..... Disabled
  vlan102 ..... Disabled
  vlan103 ..... Disabled
  vlan104 ..... Disabled
  vlan105 ..... Enabled
  vlan1000 ..... Disabled
  vlan1001 ..... Enabled
```

Table 83-1: Parameters in the output from the show arp security command

Parameter	Description
`Total VLANs enabled`	The number of VLANs that have ARP security enabled.
`Total VLANs disabled`	The number of VLANs that have ARP security disabled.

Related Commands
arp security
show arp security interface
show arp security statistics

show arp security interface

Use this command to display ARP security configuration for the specified ports or all ports.

Syntax `show arp security interface [<port-list>]`

Parameter	Description
<port-list>	The ports to display ARP security information about. The port list can include switch ports, and static or dynamic aggregated links.

Mode User Exec and Privileged Exec

Example To display ARP security configuration for ports, use the command:

```
awplus# show arp security interface
```

Figure 83-2: Example output from the show arp security interface command

```
awplus#show arp security interface

Arp Security Port Status and Configuration:

  Port: Provisioned ports marked with brackets, e.g. (portx.y.z)
  KEY:  LG = Log
        TR = Trap
        LD = Link down

Port         Action
------------------------------
port1.0.1    -- -- --
port1.0.2    -- -- --

```

Table 83-2: Parameters in the output from the show arp security interface command

Parameter	Description
`Action`	The action the switch takes when it detects an ARP security violation on the port.
`Port`	The port. Parentheses indicate that ports are configured for provisioning.
`LG, Log`	Generate a log message
`TR, Trap`	Generate an SNMP notification (trap).
`LD, Link down`	Shut down the link.

Related Commands
arp security violation
show arp security
show arp security statistics

show log
snmp-server enable trap

show arp security statistics

Use this command to display ARP security statistics for the specified ports or all ports.

Syntax `show arp security statistics [detail] [interface <port-list>]`

Parameter	Description
`detail`	Display detailed statistics.
`interface <port-list>`	Display statistics for the specified ports.

Mode User Exec and Privileged Exec

Example To display the brief statistics for the ARP security, use the command:

```
awplus# show arp security statistics
```

Figure 83-3: Example output from the show arp security statistics command

```
awplus# show arp security statistics

DHCP Snooping ARP Security Statistics:

              In          In
 Interface    Packets     Discards
---------------------------------
 port1.0.3    20          20
 port1.0.4    30          30
 port1.0.12   120         0
```

Table 83-3: Parameters in the output from the show arp security statistics command

Parameter	Description
`Interface`	A port name. Parentheses indicate that ports are configured for provisioning.
`In Packets`	The total number of incoming APR packets that are processed by DHCP Snooping ARP Security
`In Discards`	The total number of ARP packets that are dropped by DHCP Snooping ARP Security.

Figure 83-4: Example output from the show arp security statistics detail command

```
awplus#show arp security statistics detail

DHCP Snooping ARP Security Statistics:

Interface ..................... port1.0.3

show ip dhcp snooping acl

Use this command to display information about the Access Control Lists (ACL) that are using the DHCP snooping database.

Syntax

```
show ip dhcp snooping acl

show ip dhcp snooping acl [detail|hardware] [interface
   [<interface-list>]]
```

Parameter	Description
`detail`	Detailed DHCP Snooping ACL information.
`hardware`	DHCP Snooping hardware ACL information.
`interface`	ACL Interface information.
<interface-list>	The interfaces to display information about.

Mode User Exec and Privileged Exec

Example To display DHCP snooping ACL information, use the command:

```
awplus# show ip dhcp snooping acl
```

Figure 83-8: Example output from the show ip dhcp snooping acl command

```
awplus#show ip dhcp snooping acl

DHCP Snooping Based Filters Summary:

                       Maximum   Template  Attached
Interface    Bindings  Bindings  Filters   Hardware Filters
-------------------------------------------------------------------
 port1.0.1   1         520       0         0
 port1.0.2   1         3         2         6
 port1.0.3   1         2         4         8
 port1.0.4   1         2         7         14
 port1.0.5   0         2         6         12
 port1.0.6   0         1         0         0
 port1.0.7   0         1         0         0
 port1.0.8   0         1         0         0
 port1.0.9   0         1         0         0
 port1.0.10  0         1         0         0
 port1.0.11  0         1         0         0
 port1.0.12  0         1         0         0
(port2.0.1 ) 0         520       0         0
(port2.0.2 ) 0         1         0         0
```

To display DHCP snooping hardware ACL information, use the command:

```
awplus# show ip dhcp snooping acl hardware
```

Figure 83-9: Example output from the show ip dhcp snooping acl hardware command

Related Commands **access-list hardware (named)**
show access-list (IPv4 Hardware ACLs)

show ip dhcp snooping agent-option

Use this command to display DHCP snooping Option 82 information for all interfaces, a specific interface or a range of interfaces.

Syntax `show ip dhcp snooping agent-option [interface <interface-list>]`

Parameter	Description
`interface`	Specify the interface.
<interface-list>	The name of the interface or interface range.

Mode User Exec and Privileged Exec

Examples To display DHCP snooping Option 82 information for all interfaces, use the command:

```
awplus# show ip dhcp snooping agent-option
```

To display DHCP snooping Option 82 information for `port1.0.1`, use the command:

```
awplus# show ip dhcp snooping agent-option interface
        port1.0.1
```

To display DHCP snooping Option 82 information for `vlan1`, use the command:

```
awplus# show ip dhcp snooping agent-option interface vlan1
```

To display DHCP snooping Option 82 information for `port2.0.1`, `port4.0.2` and ports in the range from `port4.0.10` to `port4.0.15`, use the command:

```
awplus# show ip dhcp snooping agent-option interface
        port2.0.1,port4.0.2,port4.0.10-port4.0.15
```

Output

Figure 83-11: Example output from the show ip dhcp snooping agent-option command

```
awplus#show ip dhcp snooping agent-option

Total number of bindings in database: 9
```

Table 83-4: Parameters in the output from the show ip dhcp snooping binding command

Parameter	Description
`Client IP Address`	The IP address of the DHCP client.
`MAC Address`	The MAC address of the DHCP client.
`Server IP Address`	The IP address of the DHCP server.
`VLAN`	The VLAN associated with this entry.
`Port`	The port the client is connected to.
`Expires (sec)`	The time in seconds until the lease expires.
`Type`	The source of the entry: ■ Dyna: dynamically entered by snooping DHCP traffic, configured by the **ip dhcp snooping binding** command, or loaded from the database backup file. ■ Stat: added statically by the **ip source binding** command
`Total number of bindings in database`	The total number of dynamic and static lease entries in the DHCP snooping database.

Related Commands

ip dhcp snooping binding

show ip source binding

show ip dhcp snooping interface

Use this command to display information about DHCP snooping configuration and leases for the specified ports, or all ports.

Syntax `show ip dhcp snooping interface [<port-list>]`

Parameter	Description
<port-list>	The ports to display DHCP snooping configuration information for. If no ports are specified, information for all ports is displayed.

Mode User Exec and Privileged Exec

Example To display DHCP snooping information for all ports, use the command:

```
awplus# show ip dhcp snooping interface
```

Figure 83-13: Example output from the show ip dhcp snooping interface command

```
awplus#show ip dhcp snooping interface

DHCP Snooping Port Status and Configuration:

  Port: Provisioned ports marked with brackets, e.g. (portx.y.z)
  Action: LG = Log
          TR = Trap
          LD = Link down

                       Full    Max
 Port         Status     Leases  Leases  Action     Subscriber-ID
-------------------------------------------------------------------------------
 port1.0.1    Untrusted  1       1       LG -- --

 port1.0.12   Trusted    0       1       -- -- --
```

Table 83-5: Parameters in the output from the show ip dhcp snooping interface command

Parameter	Description
`Port`	The port interface name.
`Status`	The port status: untrusted (default) or trusted.
`Full Leases`	The number of entries in the DHCP snooping database for the port.
`Max Leases`	The maximum number of entries that can be stored in the database for the port.
`Action`	The DHCP snooping violation actions for the port.
`Subscriber ID`	The subscriber ID for the port. If the subscriber ID is longer than 34 characters, only the first 34 characters are displayed. To display the whole subscriber ID, use the **show running-config dhcp** command on page 7.44.

Related Commands

show ip dhcp snooping
show ip dhcp snooping statistics
show running-config dhcp

show ip dhcp snooping statistics

Use this command to display DHCP snooping statistics.

Syntax `show ip dhcp snooping statistics [detail] [interface <interface-list>]`

Parameter	Description
`detail`	Display detailed statistics.
`interface <interface-list>`	Display statistics for the specified interfaces. The interface list can contain switch ports, static or dynamic link aggregators (channel groups), or VLANs.

Mode User Exec and Privileged Exec

Example To show the current DHCP snooping statistics for all interfaces, use the command:

```
awplus# show ip dhcp snooping statistics
```

Figure 83-14: Example output from the show ip dhcp snooping statistics command

```
awplus# show ip dhcp snooping statistics

Table 83-6: Parameters in the output from the show ip dhcp snooping statistics command

Parameter	Description
`Interface`	The interface name.
`In Packets`	The total number of incoming packets that are processed by DHCP Snooping.
`In BOOTP Requests`	The total number of incoming BOOTP Requests.
`In BOOTP Replies`	The total number of incoming BOOTP Replies.
`In Discards`	The total number of incoming packets that have been discarded.
`Invalid BOOTP Information`	Packet contained invalid BOOTP information, such as an invalid BOOTP.OPCode.
`Invalid DHCP ACK`	A DHCP ACK message was discarded, for reasons such as missing Server Option or Lease Option.
`Invalid DHCP Release or Decline`	A DHCP Release or Decline message was discarded, for reasons such as mismatch between received interface and current binding information.
`Invalid IP/UDP Header`	A problem was detected in the IP or UDP header of the packet.
`Max Bindings Exceeded`	Accepting the packet would cause the maximum number of bindings on a port to be exceeded.
`Option 82 Insert Error`	An error occurred while trying to insert DHCP Relay Agent Option 82 information.

Table 83-6: Parameters in the output from the show ip dhcp snooping statistics command(cont.)

Parameter	Description
`Option 82 Received Invalid`	The DHCP Relay Agent Option 82 information received did not match the information inserted by DHCP Snooping.
`Option 82 Received On Untrusted Port`	A packet containing DHCP Relay Agent Option 82 information was received on an untrusted port.
`Option 82 Transmit On Untrusted Port`	A packet containing DHCP Relay Agent Option 82 information was to be sent on an untrusted port.
`Reply Received On Untrusted Port`	A BOOTP reply was received on an untrusted port.
`Source MAC/CHADDR Mismatch`	The L2 Source MAC address of the packet did not match the client hardware address field (BOOTP.CHADDR).
`Static Entry Already Exists`	An entry could not be added as a static entry already exists.

Related Commands

clear ip dhcp snooping statistics
ip dhcp snooping
ip dhcp snooping violation

show ip source binding

Use this command to display static entries in the DHCP snooping database. These are the entries that have been added by using the **ip source binding** command on page 83.23.

Syntax `show ip source binding`

Mode User Exec and Privileged Exec

Example To display static entries in the DHCP snooping database information, use the command:

```
awplus# show ip source binding
```

Figure 83-16: Example output from the show ip source binding command

```
awplus# show ip source binding

IP Source Bindings:

Client       MAC                              Expires
IP Address   Address          VLAN  Port        (sec)      Type
-------------------------------------------------------------------
 1.1.1.1     0000.1111.2222   1     port1.0.1   Infinite   Static
```

Table 83-7: Parameters in the output from the show ip source binding command

Parameter	Description
`Client IP Address`	The IP address of the DHCP client.
`MAC Address`	The MAC address of the DHCP client.
`VLAN`	The VLAN ID the packet is received on.
`Port`	The Layer 2 port name the packet is received on.
`Expires (sec)`	Always infinite for static bindings, or when the leave time in the DHCP message was 0xffffffff (infinite).
`Type`	DHCP Snooping binding type: Static

VRRP Introduction

This chapter describes the Virtual Router Redundancy Protocol (VRRP) feature provided by the switch, and how to configure the switch to participate in a virtual router. For detailed VRRP command descriptions, examples and output, see **Chapter 85, VRRP Commands**.

One function of a switch is to act as a gateway to the WAN for hosts on a LAN. On larger LANs, two or more switches may act as the gateway, and hosts use a dynamic routing protocol, such as RIP or OSPF, to determine the gateway switch to use as the next hop in order to reach a specific IP destination. However, there are a number of factors, such as administrative or processing overhead or even support for the protocols, which may make it undesirable to use a dynamic routing protocol. One alternative is to use static routing; however, if the statically configured first hop switch fails, the hosts on the LAN are unable to communicate with those on the WAN.

The Virtual Router Redundancy Protocol is defined in RFC 5798 (Virtual Router Redundancy Protocol (VRRP) Version 3 for IPv4 and IPv6). It provides a solution to the problem by combining two or more physical switches into a logical grouping called a **virtual router** (VR). The physical switches then operate together to provide a single logical gateway for hosts on the LAN.

A virtual router is configured as the host's gateway and comprises a number of physical routers. The hosts can only see the virtual router so the number of physical routers that make up the virtual router is transparent. If physical routers in the virtual router fail, then traffic to and from the hosts will still be forwarded, so long as there is at least one functioning physical router, no configuration changes will be required by the hosts.

The VRRP virtual router comprises a router and a number of backup routers. The router is the router responsible for forwarding packets between the hosts and the remote network. It is also responsible for informing backup router of its presence. Should the router fail, then one of the backup routers takes over the router role.

The virtual router uses a special reserved MAC address, which is called VRRP virtual MAC. This MAC address is returned by the router of the virtual router in any ARP responses relating to the gateway IP address, regardless of which device is acting as the router. By using this unified MAC address across routers, host maintain connectivity with the remote network if a router fails with a backup taking over a master.

Note If there are PIM-SM routers using VRRP the Bootstrap Router (BSR) function will not work properly.

Virtual Router Redundancy Protocol

The virtual router has a virtual MAC address that is known by all its participating switches or routers. The virtual MAC address is derived from the virtual router identifier - a user-defined value from 1 to 255. At the network level, all hosts on the LAN are configured with a common IP address that is used as the first hop. This IP address is typically owned by the virtual router's preferred individual switch or router. When available, this device performs the duties of the virtual router, and is referred to as the **master**. The switch that owns the IP address associated with the virtual router is referred to as the **preferred master**. When a virtual router is configured so that none of the participating switches owns the IP address, the virtual router has no preferred master.

When a switch takes the role of for a virtual router, it is responsible for the following:

- Responding to ARP and Neighbor solicitation packets that contain IP addresses associated with the virtual router. The ARP reply or Neighbor response contains the virtual MAC address of the virtual router so that the hosts on the LAN associate the virtual MAC address with their configured first-hop IP address. Note that with VRRPv3 supporting both IPv4 and IPv6, the IP address in this context can be an IPv4 or an IPv6 address.
- Forwarding packets with a destination link layer MAC address equal to the virtual router MAC address.
- The VRRPv3 accept mode is enabled by default in the AlliedWare Plus VRRPv3 implementation. This enables a VRRP to accept packets addresses to the virtual router IP address even if this IP address is not owned by the VRRP master.
- Broadcasting advertisement packets at regular intervals (at the specified advertisement interval) to inform backup switches that it is still acting as the switch.

Each of the other switches participating in the virtual router is considered to be a backup switch. A switch can be a member of several different virtual routers on one LAN, but each virtual router must have a unique identifier (VRID). When a switch has the role of backup for a virtual router, it must be able to perform the following tasks:

- Receive advertisement packets from the and check that the information contained in them is consistent with their own configuration; ignoring and discarding advertisement packets that do not match.
- Assume the role of for the virtual router if an advertisement packet is not received for a given period, (the master-down time), based on the specified advertisement interval, (for example: **awplus(config-router)# advertisement-interval 5** will set the advertisement-interval to 5 seconds). The master-down time is approximately three times the advertisement interval.
- Assume the role of if it receives an advertisement packet from another switch with a lower priority than its own, and if preempt mode is on.

If a VRRP instance is running on a VLAN interface and the VLAN interface goes down, then the VRRP instance, whether it is a VRRP or a VRRP backup, moves to an INIT state. During the INIT state the VRRP instance on the VLAN interface cannot receive traffic, and will not be active until the VLAN interface is up.

Note

When using VRRPv3 with VCStacking, ensure that the VRRPv3 advertisement-interval is configured to a longer time than the VCStacking failover time.
If the VRRPv3 advertisement-interval is shorter than the VCStacking failover time, then a VRRPv3 failover will also occur whenever a VCStacking failover occurs. Use seconds not centiseconds to ensure interoperability with VRRPv2.

VRRP Configuration for IPv4

VRRP for IPv4 is disabled by default. Once you have defined a virtual router session, you must enable VRRP to make the session operational for a given interface. You can then enable or disable the virtual router as shown:

To enable VRRP

`awplus(config)#`	
`router vrrp 1 vlan2`	Create a new VRRP session on the router, specify the virtual router ID (VRID) for the session, and specify the interface (`vlan2`) that will participate in virtual routing.
`awplus(config-router)#`	
`enable`	Enable the VRRP session on the switch.
`awplus(config-router)#`	
`exit`	Return to the Global Configuration mode.
`awplus(config)#`	Global Configuration mode prompt.

To disable VRRP

`awplus(config)#`	
`router vrrp 1 vlan2`	Specify an existing VRRP session, specify the virtual router ID (VRID) for the session, and specify the interface (`vlan2`) that will participate in virtual routing.
`awplus(config-router)#`	
`disable`	Disable the VRRP session on the switch.
`awplus(config-router)#`	
`exit`	Return to the Global Configuration mode.
`awplus(config)#`	Global Configuration mode prompt.

A virtual router must be defined on at least two switches before it operates correctly. Use the following steps to configure virtual routing on a switch. Note that this example assumes that VLAN 2 already exists on the switch. See **"Configuring VLANs" on page 18.3**.

To configure virtual routing on a switch

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`router vrrp 1 vlan2`	Create a new VRRP session on the router, specify the VRID for the session, and specify the interface (vlan2) that will participate in virtual routing.

To configure virtual routing on a switch(cont.)

`awplus(config-router)#`	
`virtual-ip 10.10.10.50 master`	Set the virtual IP address for the VRRP session. Define the default state (or backup) of the VRRP router within the virtual router. This sets the default priority value of 255 without needing to issue a priority command separately.
`awplus(config-router)#`	
`enable`	Enable the VRRP session on the switch.
`awplus(config-router)#`	
`exit`	Return to the Global Configuration mode.
`awplus(config)#`	Global Configuration mode prompt.

To destroy a virtual router on the LAN, it must be removed from all participating switches. Use the following commands to remove a virtual router so that the switch no longer participates in virtual routing.

To remove the virtual router VRRP 1 from a switch

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`no router vrrp 1 vlan2`	Remove the VRRP session on the switch for the specified interface `vlan2`.
`awplus(config-router)#`	
`exit`	Return to the Global Configuration mode.
`awplus(config)#`	Global Configuration mode prompt.

Alternatively, you can simply disable the virtual router and retain the configuration.

To disable the router and retain the configuration

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`router vrrp 1 vlan2`	Select the VRRP session on the switch, specify the VRID for the session, and specify the interface (`vlan2`) used for virtual routing.
`awplus(config-router)#`	
`disable`	Disable the VRRP session on the switch.
`awplus(config-router)#`	
`exit`	Return to the Global Configuration mode.
`awplus(config)#`	Global Configuration prompt.

VRRP election and preempt for IPv4

If the switch that is the current VRRP becomes unavailable, the role is taken by the switch with the next highest priority. The priority is a value from 1 to 255, with a default of 100. The value 255 is reserved for the switch that owns the virtual router's IP address. The new takes over all the responsibilities of the original master.

By default, when a switch becomes available that has a higher priority than the master, this switch takes over as master. This is referred to as **preempt mode** and can be set **on** or **off**. Even with preempt mode **off**, the switch that owns the IP address always becomes the when available. Preempt mode should be the same for all switches in the virtual router.

If two switches are configured with the same priority and a conflict occurs when they both transition to simultaneously, the one with the highest IP address has higher priority. Due to timing differences the conflict may not always occur and simply the first switch to respond will become the master.

Hosts on the LAN can continue sending packets to the virtual MAC address they originally associated with the first hop IP address, even though the switch that owns the IP address is not currently available. When the original switch becomes available again, and if it is a preferred switch (i.e. it owns the virtual router IP address) then it resumes the role of master.

Use the following commands to set the priority and preempt mode when you create the virtual router:

To set the priority and preempt mode for VRRP 1

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`router vrrp 1 vlan2`	Select the VRRP session on the switch, specify the VRID for the session, and specify the interface (`vlan2`) used for virtual routing.
`awplus(config-router)#`	
`priority 255`	Set the VRRP priority for the switch
`awplus(config-router)#`	
`preempt-mode true`	Select the preempt mode for VRRP 1. Note only select preempt mode to true if this has been set to false. Preempt is true by default.
`awplus(config-router)#`	
`enable`	Enable the VRRP session on the switch.
`awplus(config-router)#`	
`exit`	Return to the Global Configuration mode.
`awplus(config)#`	Global Configuration prompt

The advertisement interval determines the rate that the sends its advertisement packets. This rate must be the same value for all switches in the virtual router. The default advertisement interval of 1second can be used for most networks. However, you can modify this interval by using the **advertisement-interval** command, as shown in the following procedure:

To set the advertisement interval to 5 seconds on VRRP1

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config#`	
`router vrrp 1 vlan2`	Select the VRRP session on the switch, specify the VRID for the session, and specify the interface (`vlan2`) used for virtual routing.
`awplus(config-router)#`	
`advertisement-interval 5`	Set the advertisement interval to `5` seconds.

VRRP Configuration for IPv6

VRRP for IPv6 is disabled by default. Once you have defined a virtual router session, you must enable VRRP to make the session operational for a given interface. You can then enable or disable the virtual router as shown:

To enable VRRP

`awplus(config)#`	
`router ipv6 vrrp 1 vlan2`	Create a new VRRP session on the router, specify the virtual router ID (VRID) for the session, and specify the interface (`vlan2`) that will participate in virtual routing.
`awplus(config-router)#`	
`enable`	Enable the VRRP session on the switch.
`awplus(config-router)#`	
`exit`	Return to the Global Configuration mode.
`awplus(config)#`	Global Configuration mode prompt.

To disable VRRP

`awplus(config)#`	
`router ipv6 vrrp 1 vlan2`	Specify an existing VRRP session, specify the virtual router ID (VRID) for the session, and specify the interface (`vlan2`) that will participate in virtual routing.
`awplus(config-router)#`	
`disable`	Disable the VRRP session on the switch.
`awplus(config-router)#`	
`exit`	Return to the Global Configuration mode.
`awplus(config)#`	Global Configuration mode prompt.

A virtual router must be defined on at least two switches before it operates correctly. Use the following steps to configure virtual routing on a switch. Note that this example assumes that VLAN 2 already exists on the switch. See **"Configuring VLANs" on page 18.3**.

To configure virtual routing on a switch

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`router ipv6 vrrp 1 vlan2`	Create a new VRRP session on the router, specify the VRID for the session, and specify the interface (vlan2) that will participate in virtual routing.

To configure virtual routing on a switch(cont.)

`awplus(config-router)#`	
`virtual-ipv6 fe80::1 master`	Set the virtual IP address for the VRRP session. Define the default state (or backup) of the VRRP router within the virtual router. This sets the default priority value of 255 without needing to issue a priority command separately. Note that `fe80::1` is an IPv6 link-local address. AlliedWare Plus only supports one IPv6 virtual IP address per virtual router ID as per VRRPv3 RFC 5798. See the **Usage** note for the **virtual-ipv6** command for implementation information about link-local addresses in AlliedWare Plus.
`awplus(config-router)#`	
`enable`	Enable the VRRP session on the switch.
`awplus(config-router)#`	
`exit`	Return to the Global Configuration mode.
`awplus(config)#`	Global Configuration mode prompt.

To destroy a virtual router on the LAN, it must be removed from all participating switches. Use the following commands to remove a virtual router so that the switch no longer participates in virtual routing.

To remove the virtual router VRRP 1 from a switch

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`no router ipv6 vrrp 1 vlan2`	Remove the VRRP session on the switch for the specified interface `vlan2`.
`awplus(config-router)#`	
`exit`	Return to the Global Configuration mode.
`awplus(config)#`	Global Configuration mode prompt.

Alternatively, you can simply disable the virtual router and retain the configuration.

To disable the router and retain the configuration

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`router ipv6 vrrp 1 vlan2`	Select the VRRP session on the switch, specify the VRID for the session, and specify the interface (`vlan2`) used for virtual routing.
`awplus(config-router)#`	
`disable`	Disable the VRRP session on the switch.
`awplus(config-router)#`	
`exit`	Return to the Global Configuration mode.
`awplus(config)#`	Global Configuration prompt.

VRRP election and preempt for IPv6

If the switch that is the current VRRP becomes unavailable, the role is taken by the switch with the next highest priority. The priority is a value from 1 to 255, with a default of 100. The value 255 is reserved for the switch that owns the virtual router's IP address. The new takes over all the responsibilities of the original master.

By default, when a switch becomes available that has a higher priority than the master, this switch takes over as master. This is referred to as **preempt mode** and can be set **on** or **off**. Even with preempt mode **off**, the switch that owns the IP address always becomes the when available. Preempt mode should be the same for all switches in the virtual router.

If two switches are configured with the same priority and a conflict occurs when they both transition to simultaneously, the one with the highest IP address has higher priority. Due to timing differences the conflict may not always occur and simply the first switch to respond will become the master.

Hosts on the LAN can continue sending packets to the virtual MAC address they originally associated with the first hop IP address, even though the switch that owns the IP address is not currently available. When the original switch becomes available again, and if it is a preferred switch (i.e. it owns the virtual router IP address) then it resumes the role of master.

Use the following commands to set the priority and preempt mode when you create the virtual router:

To set the priority and preempt mode for VRRP 1

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`router ipv6 vrrp 1 vlan2`	Select the VRRP session on the switch, specify the VRID for the session, and specify the interface (`vlan2`) used for virtual routing.
`awplus(config-router)#`	
`priority 255`	Set the VRRP priority for the switch
`awplus(config-router)#`	
`preempt-mode true`	Select the preempt mode for VRRP 1. Note only select preempt mode to true if this has been set to false. Preempt is true by default.
`awplus(config-router)#`	
`enable`	Enable the VRRP session on the switch.
`awplus(config-router)#`	
`exit`	Return to the Global Configuration mode.
`awplus(config)#`	Global Configuration prompt

The advertisement interval determines the rate that the sends its advertisement packets. This rate must be the same value for all switches in the virtual router. The default advertisement interval of 1second can be used for most networks. However, you can modify this interval by using the **advertisement-interval** command, as shown in the following procedure:

To set the advertisement interval to 5 seconds on VRRP1

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config#`	
`router ipv6 vrrp 1 vlan2`	Select the VRRP session on the switch, specify the VRID for the session, and specify the interface (`vlan2`) used for virtual routing.
`awplus(config-router)#`	
`advertisement-interval 5`	Set the advertisement interval to `5` seconds.

VRRP debugging

VRRP debugging displays data that is useful for troubleshooting. To enable or disable debugging use the following commands:

To select and deselect VRRP debugging

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`debug vrrp [all|events|packet]`	Enable the selected debugging type.
`awplus(config)#`	
`no debug vrrp [all|events|packet]`	Disable the selected debugging type.

It is important that all switches involved in a virtual router are configured with the same values for the following:

- VRRP virtual router identifier
- IP address
- advertisement interval
- preempt mode
- authentication type
- password

Inconsistent configuration causes advertisement packets to be rejected and the virtual router cannot perform properly.

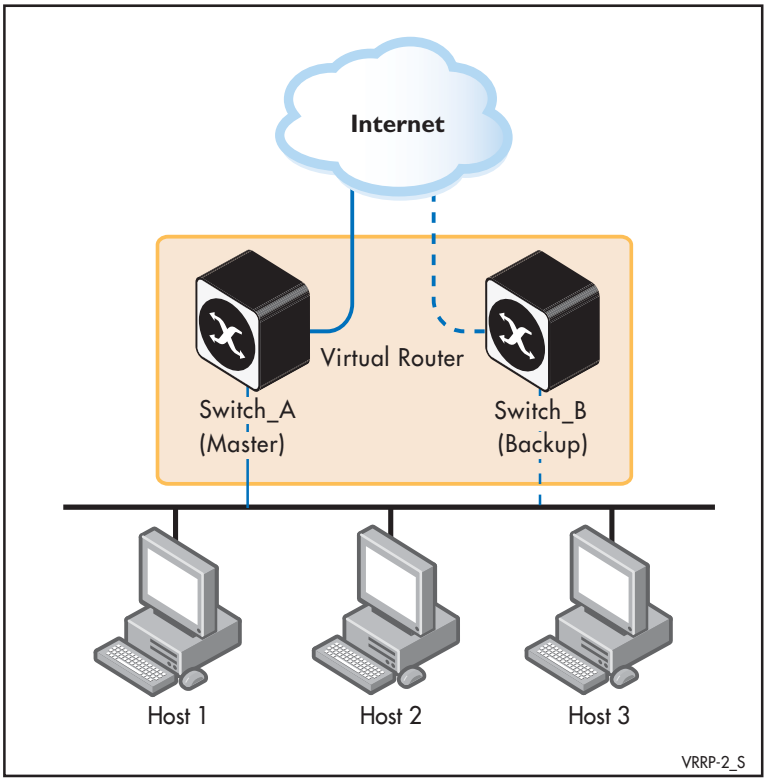
VRRP Configuration Examples

The following examples show how to configure a virtual router in a LAN:

- **VRRP Preferred with Backup Configuration**
- **VRRP Circuit Failover Configuration**
- **VRRPv2 to VRRPv3 Transition Configuration**
- **VRRP IPv6 Configuration Example**

VRRP Preferred with Backup Configuration

This example show how to configure a basic virtual router with a preferred and a backup.



Switch_A owns the IP address of the virtual router, and always assumes the role of whenever it is available. Switch_B is the backup, and assumes the role of master, backing up this IP address if A becomes unavailable.

Step 1: Configure Switch_A

At this point we assume that you have already created VLAN 2 on Switch_A.
See "Configuring VLANs" on page 18.3 for detailed information about creating VLANs.

Configure an IP address on VLAN 2

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`hostname Switch_A`	Assign the host name `Switch_A`.
`Switch_A(config)#`	
`interface vlan2`	Specify the interface (`vlan2`) that will participate in virtual routing to first configure an IP address for `vlan2`.
`Switch_A(config-if)#`	
`ip address 192.168.1.1/24`	Specify the IP address and mask for interface `vlan2`.

Create the Virtual Router

`Switch_A(config)#`	
`spanning-tree mode stp`	Configure STP for interfaces on `Switch_A`.
`Switch_A(config)#`	
`router vrrp 1 vlan2`	Create a new VRRP session on the router, specify the VRID for the session, and specify the interface (`vlan2`) that will participate in virtual routing.
`Switch_A(config-router)#`	
`virtual-ip 192.168.1.1 master`	Set the virtual IP address for the VRRP session. Define the default state of the VRRP router within the virtual router.
`Switch_A(config-router)#`	
`enable`	Enable the VRRP session on the router.
`Switch_A(config-router)#`	
`exit`	Exit the Router Configuration mode and enter the Global Configuration mode.
`Switch_A(config)#`	
`exit`	Exit the Global Configuration mode and enter the Privileged Exec mode.
`Switch_A#`	Privileged Exec mode prompt.

Step 2: Configure Switch_B

At this point we assume that you have already created VLAN 2 on Switch_B.
See "Configuring VLANs" on page 18.3 for detailed information about creating VLANs.

Configure an IP address on VLAN 2

`awplus#`	
`configure terminal`	Enter Global Configuration mode.
`awplus(config)#`	
`hostname Switch_B`	Assign the host name `Switch_B`.
`Switch_B(config)#`	
`interface vlan2`	Specify the interface (`vlan2`) that will participate in virtual routing.
`Switch_B(config)#`	
`ip address 192.168.1.2/24`	Specify the IP address and mask for interface

Create the Backup Virtual Router

`Switch_B(config)#`	
`router vrrp 1 vlan2`	Create a new VRRP session on the router, specify the VRID for the session, and specify the interface (`vlan2`) that will participate in virtual routing.
`Switch_B(config-router)#`	
`virtual-ip 192.168.1.1 backup`	Set the virtual IP address for the VRRP session. Define the default state of the VRRP router within the virtual router.
`Switch_B(config-router)#`	
`enable`	Enable the VRRP session on the router.
`Switch_B(config-router)`	
`exit`	Exit the Interface Configuration mode and enter the Global Configuration mode.
`Switch_B(config)#`	
`exit`	Return to the Privileged Exec mode.
`Switch_B#`	Privileged Exec mode prompt.

Commands Used

enable (VRRP)
router vrrp (interface)
virtual-ip

Validation Commands

show vrrp

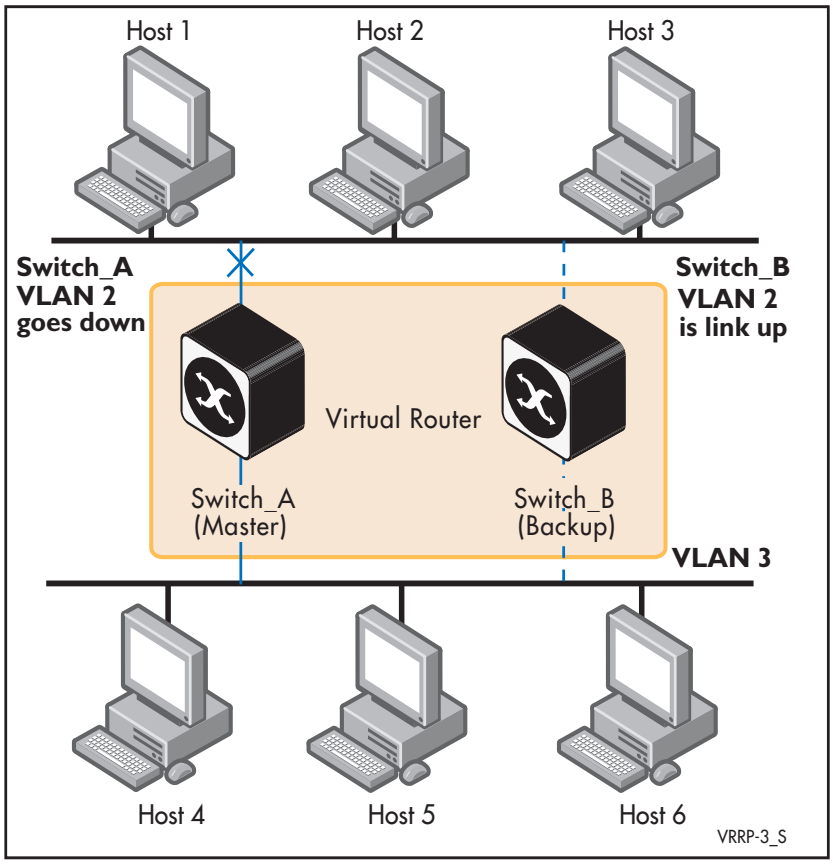
VRRP Circuit Failover Configuration

This example show how to configure a circuit-failover on a virtual router. This example configures redundancy between Switch_A and Switch_B for hosts on VLAN 2 and VLAN 3.

The need for VRRP Circuit Failover arose because VRRPv2 was unable to track the gateway interface status. The AlliedWare Plus VRRP Circuit Failover feature provides a dynamic failover of an entire circuit in the event that one of the members of the group fails.

This introduces the concept of a circuit, where two or more Virtual Routers on a single system are grouped. In the event of a failure occurring a Virtual Router performs the to Backup transition and notifies the other Virtual Routers. These are then forced into the to Backup transition, so that both incoming and outgoing packets are routed through the same gateway router, eliminating the problem for NAT environments.

To configure VRRP Circuit Failover, each circuit is configured to have a corresponding priority delta value, which is passed to VRRP when a failure occurs. The priority of each Virtual Router on the circuit is decremented by the priority delta value, which causes the Virtual Router to Virtual Router Backup transition. In this example, two switches Switch_A and Switch_B are configured as backup routers with different priorities. The priority delta value is configured to be greater that the difference of both the priorities.



Switch_A is configured to have a priority of 100, and Switch_B is configured to have a priority of 90. Switch_A with a greater priority is the Virtual Router Master. The priority delta value is 20, greater than 10 (100 minus 90). On Switch_A, when vlan2 fails, the priority of Switch_A becomes 80 (100 minus 20). Since Switch_B has a greater priority (90) than Switch_A, Switch_B becomes the Virtual Router Master, and routing of packets continues without interruption. When this Virtual Router Backup (Switch_A) is up again, it regains its original priority (100), and becomes the Virtual Router again.

See also the **circuit-failover** command description in **Chapter 85, VRRP Commands**.

Step 1: Configure Switch_A

At this point we assume that you have already created VLAN 2 on VR1.
See "Configuring VLANs" on page 18.3 for detailed information about creating VLANs.

Configure an IP address on VLAN 2

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`hostname Switch_A`	Assign the host name `Switch_A`.
`Switch_A(config)#`	
`interface vlan2`	Specify the interface (`vlan2`) that will participate in virtual routing to first configure an IP address for `vlan2`.
`Switch_A(config-if)#`	
`ip address 192.168.1.1/24`	Specify the IP address and mask for interface `vlan2`.

Configure an IP address on VLAN 3

`Switch_A(config-if)#`	
`exit`	Exit the Interface Configuration mode and enter the Global Configuration mode.
`Switch_A(config)#`	
`interface vlan3`	Specify the interface (`vlan3`) that will participate in virtual routing to first configure an IP address for `vlan3`.
`Switch_A(config-if)#`	
`ip address 192.168.2.1/24`	Specify the IP address and mask for interface `vlan3`.

Create the Virtual Router

`Switch_A(config)#` `router vrrp 1 vlan2`	Create a new VRRP session on the router, specify the VRID for the session, and specify the interface (`vlan2`) that will participate in virtual routing.
`Switch_A(config-router)#` `virtual-ip 192.168.1.1 backup`	Set the virtual IP address for the VRRP session. Define the default state of the VRRP router within the virtual router.
`Switch_A(config-router)#` `priority 100`	Set the VRRP priority to 100 as the default priority for a backup virtual router.
`Switch_A(config-router)#` `preempt-mode true`	Set preempt mode to true to specify that the highest priority will own the virtual IP address when there is a failure and will function as the backup virtual router.
`Switch_B(config-router)#` `advertisement-interval 5`	Configure the default value for the advertisement interval. The configurable range for the advertisement interval is 1-10.
`Switch_A(config-router)#` `circuit-failover vlan2 20`	Configure circuit failover to 20 on Switch_A. This configures a priority delta value, greater than the difference of priorities on and backup routers. This priority delta value is subtracted from the current VR Router priority value.
`Switch_A(config-router)#` `enable`	Enable the VRRP session on the router.
`Switch_A(config-router)#` `exit`	Exit the Router Configuration mode and enter the Global Configuration mode.
`Switch_A(config)#` `exit`	Exit the Global Configuration mode and enter the Privileged Exec mode.
`Switch_A#`	Privileged Exec mode prompt.
`Switch_A#` `copy running-config startup-config`	Copy the contents of the running-configuration to the startup-configuration.

Step 2: Configure Switch_B

At this point we assume that you have already created VLAN2on Switch_B.
See "Configuring VLANs" on page 18.3 for detailed information about creating VLANs.

Configure an IP address on VLAN 2

`awplus#`	
`configure terminal`	Enter Global Configuration mode.
`awplus(config)#`	
`hostname Switch_B`	Assign the host name `Switch_B`.
`Switch_B(config)#`	
`interface vlan2`	Specify the interface (`vlan2`) that will participate in virtual routing.
`Switch_B(config-if)#`	
`ip address 192.168.1.2/24`	Specify the IP address and mask for the interface

Configure an IP address on VLAN 3

`Switch_B(config-if)#`	
`exit`	Exit the Interface Configuration mode and enter the Global Configuration mode.
`Switch_B(config)#`	
`interface vlan3`	Specify the interface (`vlan3`) that will participate in virtual routing.
`Switch_B(config-if)#`	
`ip address 192.168.2.2/24`	Specify the IP address and mask for the interface

Create the Backup Virtual Router

`Switch_B(config)#`	
`router vrrp 1 vlan2`	Create a new VRRP session on the router, specify the VRID for the session, and specify the interface (`vlan2`) that will participate in virtual routing.
`Switch_B(config-router)#`	
`virtual-ip 192.168.1.1 backup`	Set the virtual IP address for the VRRP session. Define the default state of the VRRP router within the virtual router.
`Switch_B(config-router)#`	
`priority 90`	Set the VRRP priority to 90 (less than 100) because Switch_B is the backup virtual router .
`Switch_B(config-router)#`	
`preempt-mode true`	Set preempt mode to true to specify that the highest priority will own the virtual IP address when there is a failure and will function as the backup virtual router.
`Switch_B(config-router)#`	
`advertisement-interval 5`	Configure the default value for the advertisement interval. The configurable range for the advertisement interval is 1-10.
`Switch_B(config-router)#`	
`enable`	Enable the VRRP session on the router.
`Switch_A(config-router)#`	
`exit`	Exit the Router Configuration mode and enter the Global Configuration mode.
`Switch_A(config)#`	
`exit`	Exit the Global Configuration mode and enter the Privileged Exec mode.
`Switch_A#`	Privileged Exec mode prompt.
`Switch_A#`	
`copy running-config startup-config`	Copy the contents of the running-configuration to the startup-configuration.

Commands Used

advertisement-interval
circuit-failover
enable (VRRP)
preempt-mode
priority
router vrrp (interface)
virtual-ip

Validation Commands

show vrrp

VRRPv2 to VRRPv3 Transition Configuration

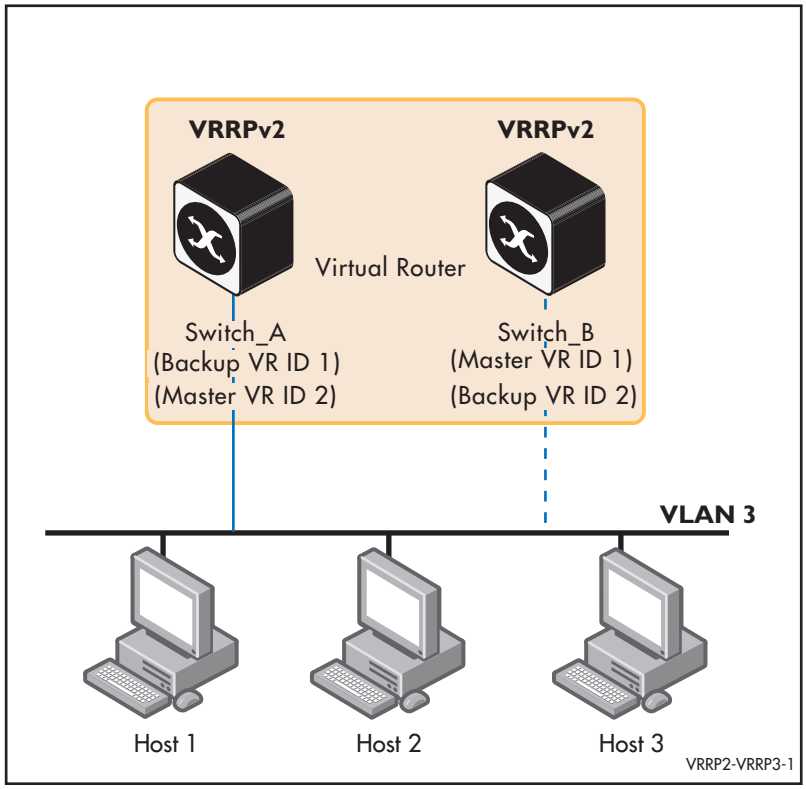
This example shows how to configure the transition from VRRPv2 to VRRPv3 on a virtual router. This example configures VRRPv3 from VRRPv2 on Switch_A and Switch_B for hosts on VLAN 3. See also the **transition-mode** command in **Chapter 85, VRRP Commands**.

Transition mode allows interoperability for IPv4 VRRP instances between VRRPv2 and VRRPv3 virtual routers. RFC 5798 for VRRPv3 allows a VRRPv3 virtual router to send both VRRPv2 and VRRPv3 advertisements. Note that this feature is only for IPv4 interoperability. Note that when **transition-mode** is set to true then VRRPv3 will also accept and process VRRPv2 advertisement packets received should there be a VRRPv2 on the network.

You should upgrade your VRRPv2 virtual routers to VRRPv3 as a long term solution and only use transition mode for a staged VRRPv2 to VRRPv3 roll out. Transition mode is disabled by default and is enabled by issuing the **transition-mode true** command.

Note that you should ensure that the advertisement interval for a VRRPv2 instance is configured to greater than 1 second (100 centiseconds). If the advertisement interval is configured to less than 1 second (100 centiseconds) then ensure the VRRPv2 virtual router has a lower priority with the **priority** command than the VRRPv2/VRRPv3 virtual router.

When you configure a VRRPv3 instance with **transition-mode true** also configure it as the VRRP instance, either by configuring it to own the IP address or with a high priority. Also configure the advertisement interval to whole seconds to maintain compatibility with VRRPv2 hosts. All matching VRRP instances should be configured with the same advertisement interval to eliminate instance contention on VRRP startup as well.



Follow the steps listed over the page to disable VRRPv2 on Switch_A before saving the running and startup configurations then rebooting Switch_A to upgrade to VRRPv3.

Note that after upgrading Switch_A to VRRPv3 you can leave Switch_B running VRRPv2, or you can upgrade Switch_B to VRRPv3. Running VRRPv3 on both is highly recommended. The above illustration shows both Switch_A and Switch_B running VRRPv2 to upgrade.

Follow **Step 1** to upgrade Switch_A from VRRPv2 to VRRPv3 and follow **Step 2** to upgrade Switch_B from VRRPv2 to VRRPv3. You can follow **Step 1** only if Switch_B is not upgraded. Only Switch_A needs transition-mode enabled to upgrade then disabled after upgrading.

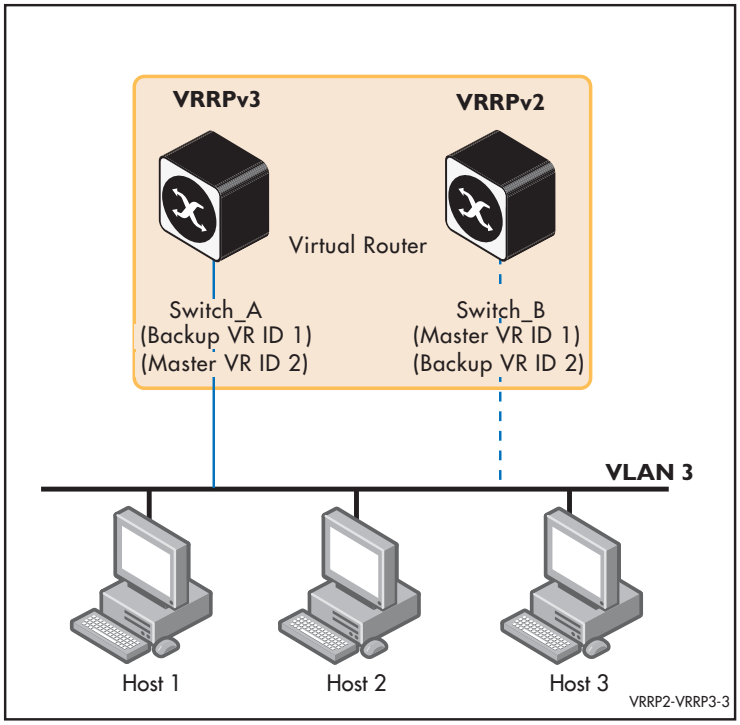
Step 1: Upgrade Switch_A from VRRPv2 to VRRPv3

At this point we assume that you have already copied the current release of AlliedWare Plus with VRRPv3 to flash and only need to make this release the boot version and restart. We also assume that you have already created VLAN 3 on Switch_B. See **"Configuring VLANs" on page 18.3** for detailed information about creating VLAN 3 as needed.

Disable VRRPv2 on Switch_A and enable VRRPv3 on Switch_A

`Switch_A#` `configure terminal`	Enter the Global Configuration mode for `Switch_A`.
`Switch_A(config)#` `router vrrp 1 vlan3`	Select the VRRPv2 backup session on the router, specify the VRID for the session (`1`), and specify the interface (`vlan3`).
`Switch_A(config-router)#` `disable`	Disable the VRRPv2 backup on Switch_A.
`Switch_A(config-router)#` `exit`	Exit the Router Configuration mode and enter the Global Configuration mode.
`Switch_A(config)#` `router vrrp 2 vlan3`	Select the VRRPv2 session on the router, specify the VRID for the session (`2`), and specify the interface (`vlan3`).
`Switch_A(config-router)#` `disable`	Disable the VRRPv2 on Switch_A.
`Switch_A(config-router)#` `exit`	Exit the Router Configuration mode and enter the Global Configuration mode.
`Switch_A(config)#` `exit`	Exit the Global Configuration mode and enter the Privileged Exec mode.
`Switch_A#` `copy running-config startup-config`	Copy the contents of the running-configuration to the startup-configuration.
`Switch_A#` `configure terminal`	Enter the Global Configuration mode.
`Switch_A(config)#` `reload`	Restart `Switch_A` to load the AlliedWare Plus release with VRRPv3 as configured with the **boot system** command earlier.

`Switch_A(config)#` `router vrrp 1 vlan3`	Enter Router Configuration mode for the backup VRRPv3 session on the router, specifying the VRID for the session (`1`), and specifying the interface (`vlan3`).
`Switch_A(config-router)#` `transition-mode true`	Set transition mode to true to turn on transition mode enabling VRRPv2 and VRRPv3 advertisement on VRRPv3.
`Switch_A(config-router)#` `enable`	Enable the VRRPv3 backup on Switch_A.
`Switch_A(config)#` `router vrrp 2 vlan3`	Create a VRRPv3 session on the router, specify the VRID for the session (`2`), and specify the interface (`vlan3`).
`Switch_A(config-router)#` `transition-mode true`	Set transition mode to true to turn on transition mode enabling VRRPv2 and VRRPv3 advertisement on VRRPv3.
`Switch_A(config-router)#` `enable`	Enable the VRRPv3 on Switch_A.
`Switch_A(config-router)#` `exit`	Exit the Router Configuration mode and enter the Global Configuration mode.
`Switch_A(config)#` `exit`	Exit the Global Configuration mode and enter the Privileged Exec mode.
`Switch_A#` `copy running-config startup-config`	Copy the contents of the running-configuration to the startup-configuration.



The above illustration shows Switch_A running VRRPv3 and Switch_B running VRRPv2. Note that Switch_A running VRRPv3 with **transition-mode true** configured sends both VRRPv3 and VRRPv2 advertisements. This is an interim solution for IPv4 VRRPv2 and VRRPv3 interoperability. Only VRRPv3 should be used on both devices for IPv6 use.

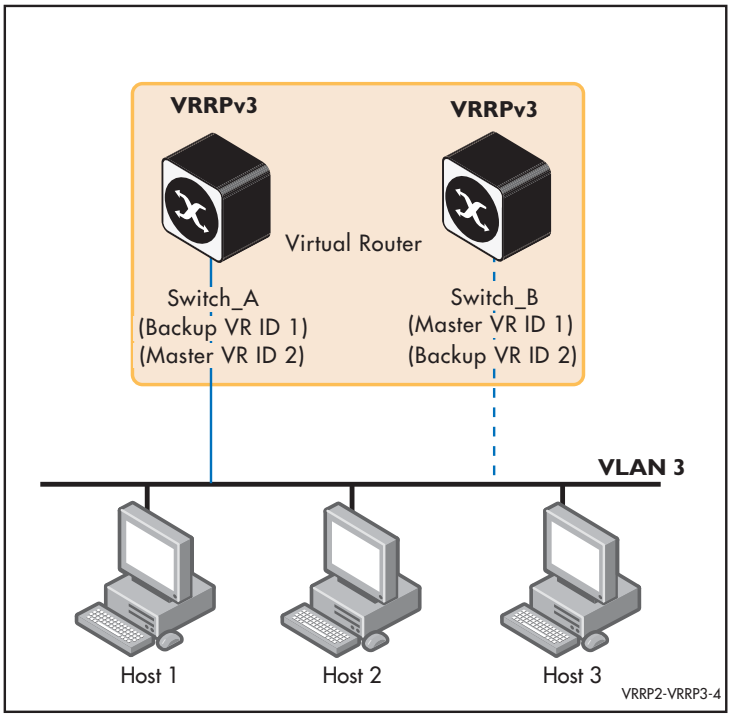
Step 2: Upgrade Switch_B from VRRPv2 to VRRPv3

At this point we assume that you have already copied the current release of AlliedWare Plus with VRRPv3 to flash and only need to make this release the boot version and restart. We also assume that you have already created VLAN 3 on Switch_B. See **"Configuring VLANs" on page 18.3** for detailed information about creating VLAN 3 as needed.

Disable VRRPv2 on Switch_B and enable VRRPv3 on Switch_B

`Switch_B#`	
`configure terminal`	Enter the Global Configuration mode for `Switch_B`.
`Switch_B(config)#`	
`router vrrp 1 vlan3`	Select the VRRPv2 session on the router, specify the VRID for the session (`1`), and specify the interface (`vlan3`).
`Switch_B(config-router)#`	
`disable`	Disable the VRRPv2 on Switch_B.
`Switch_B(config-router)#`	
`exit`	Exit the Router Configuration mode and enter the Global Configuration mode.
`Switch_B(config)#`	
`router vrrp 2 vlan3`	Select the VRRPv2 backup session on the router, specify the VRID for the session (`2`), and specify the interface (`vlan3`).

`Switch_B(config-router)#` `disable`	Disable the VRRPv2 backup on Switch_B.
`Switch_B(config-router)#` `exit`	Exit the Router Configuration mode and enter the Global Configuration mode.
`Switch_B(config)#` `exit`	Exit the Global Configuration mode and enter the Privileged Exec mode.
`Switch_B#` `copy running-config startup-config`	Copy the contents of the running-configuration to the startup-configuration.
`Switch_B#` `configure terminal`	Enter the Global Configuration mode.
`Switch_B(config)#` `reload`	Restart `Switch_A` to load the AlliedWare Plus release with VRRPv3 as configured with the **boot system** command earlier.
`Switch_B(config)#` `router vrrp 1 vlan3`	Enter Router Configuration mode for the VRRPv3 session on the router, specifying the VRID for the session (`1`), and specifying the interface (`vlan3`).
`Switch_B(config-router)#` `enable`	Enable the VRRPv3 on Switch_B.
`Switch_B(config-router)#` `exit`	Exit the Router Configuration mode and enter the Global Configuration mode.
`Switch_B(config)#` `router vrrp 2 vlan3`	Enter Router Configuration mode for the backup VRRPv3 session on the router, specifying the VRID for the session (`2`), and specifying the interface (`vlan3`).
`Switch_B(config-router)#` `enable`	Enable the VRRPv3 backup on Switch_B.
`Switch_B(config-router)#` `exit`	Exit the Router Configuration mode and enter the Global Configuration mode.
`Switch_B(config)#` `exit`	Exit the Global Configuration mode and enter the Privileged Exec mode.
`Switch_B#` `copy running-config startup-config`	Copy the contents of the running-configuration to the startup-configuration.



The above illustration shows both Switch_A and Switch_B running VRRPv3. Note that transition mode should be turned off Switch_A once VRRPv3 is active on both to stop Switch_A from continuing to send VRRPv2 and VRRPv3 advertisements to Switch_B.

`Switch_A#`	
`configure terminal`	Enter the Global Configuration mode for `Switch_A`.
`Switch_A(config)#`	
`router vrrp 1 vlan3`	Enter Router Configuration mode for the backup VRRPv3 session on the router, specifying the VRID for the session (`1`), and specifying the interface (`vlan3`).
`Switch_A(config-router)#`	
`transition-mode false`	Set transition mode to false to turn off transition mode now VRRPv3 is on Switch_A and Switch_B.
`Switch_A(config-router)#`	
`exit`	Exit the Router Configuration mode and enter the Global Configuration mode.
`Switch_A(config)#`	
`router vrrp 2 vlan3`	Enter Router Configuration mode for the VRRPv3 session on the router, specifying the VRID for the session (`2`), and specifying the interface (`vlan3`).
`Switch_A(config-router)#`	
`transition-mode false`	Set transition mode to false to turn off transition mode now VRRPv3 is on Switch_A and Switch_B.

Commands Used

disable (VRRP)
enable (VRRP)
router vrrp (interface)
transition-mode

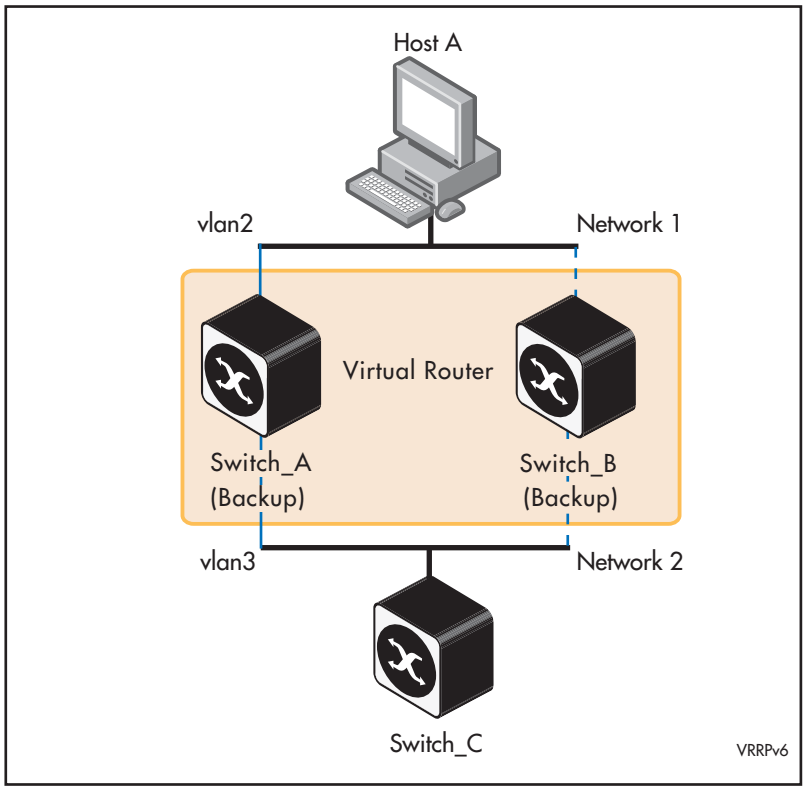
VRRP IPv6 Configuration Example

This section shows a Virtual Router Redundancy Protocol IPv6 (VRRPv3) configuration example. For detailed VRRP command descriptions, configuration command examples and relevant sample show command output, see **Chapter 85, VRRP Commands**.

VRRPv3 eliminates the risk of a single point of failure inherent in a static default routing environment. VRRPv3 specifies an election protocol that dynamically assigns responsibility for a virtual router to one of the devices configured with VRRPv3 on a LAN.

VRRRv3 only allows Master/Non-Owner setup. You can configure the priority of the routers. Router with the higher priority takes the role of master.

In this example, VRRPv3 is enabled on Switch_A, the Backup Virtual Router, and on Switch_B, the Backup Virtual Router. In Switch_A, the static routes are redistributed.



Switch_A owns the IP address of the virtual router, and assumes the role of master because it is configured with a higher priority. Switch_B is the backup, and assumes the role of master, backing up this IP address if A becomes unavailable. No authentication is used for this simple virtual router.

See the sample output following the sample command configuration tables for each device. See relevant VRRP show commands that are useful to validate configurations.

AlliedWare Plus only supports one IPv6 virtual IP address per virtual router ID as per VRRPv3 RFC 5798. Note in the command examples, fe80::1 is an IPv6 link-local address. An IPv6 link-local address is used because IPv6 link-local addresses are used by IPv6 ND (Neighbor Discovery). A host's default route to a router points to the IPv6 link-local address, not a specific global IPv6 address for the router. For the host's traffic to switch over a backup router, the IPv6 link-local address of the router is used by VRRPv3.

Step 1: Configure Switch_A (Backup Virtual Router)

At this point we assume that you have already created VLAN 2 and VLAN 3 on Switch_A. See "Configuring VLANs" on page 18.3 for detailed information about creating VLANs.

Configure IPv6 addresses on VLAN 2 and VLAN 3

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`hostname Switch_A`	Assign a host name to `Switch_A`.
`Switch_A(config)#`	
`interface vlan2`	Specify the interface (`vlan2`) that will participate in virtual routing to first configure an IP address for `vlan2`.
`Switch_A(config-if)#`	
`ipv6 address 2001:db8:2::2/64`	Specify the IPv6 address and mask for interface `vlan2`.
`Switch_A(config-if)#`	
`exit`	Return to Global Configuration mode.
`Switch_A(config)#`	
`interface vlan3`	Specify the interface (`vlan3`) that will participate in virtual routing to first configure an IP address for `vlan3`.
`Switch_A(config-if)#`	
`ipv6 address 2001:db8:3::2/64`	Specify the IPv6 address and mask for interface `vlan3`.
`Switch_A(config-if)#`	
`exit`	Return to Global Configuration mode.

Create the Backup Virtual Router on Switch_A

`Switch_A(config)#`	
`router ipv6 vrrp 1 vlan2`	Create a new VRRPv3 session on Switch_A, specify the VRID for the session, and specify the interface (`vlan2`) that will participate in virtual routing.
`Switch_A(config-router)#`	
`virtual-ipv6 fe80::1 backup`	Set the virtual IP address for the VRRPv3 session. Define the default state of the VRRPv3 router within the virtual router. Note that `fe80::1` is an IPv6 link-local address. AlliedWare Plus only supports one IPv6 virtual IP address per virtual router ID as per VRRPv3 RFC 5798. See the **Usage** note for the **virtual-ipv6** command for implementation information about link-local addresses in AlliedWare Plus.
`Switch_A(config-router)#`	
`advertisement-interval 5`	Configure the default value for the advertisement interval. The configurable range for the advertisement interval is 1-10.
`Switch_A(config-router)#`	
`priority 255`	Configure the default priority value of 255 when the device is the Master Virtual Router.
`Switch_A(config-router)#`	
`preempt-mode true`	Set the preempt-mode to true for Switch_A. The default preempt mode ensures that the highest priority switch available always takes the role.
`Switch_A(config-router)#`	
`enable`	Enable the VRRPv3 session on Switch_A.
`Switch_A(config-router)#`	
`exit`	Exit the Router Configuration mode and enter the Global Configuration mode.
`Switch_A(config)#`	
`exit`	Return to Privileged Exec mode.
`Switch_A#`	
`copy running-config startup-config`	Copy the running-config to the startup-config to enable this configuration to execute after restarting Switch_A.

Step 2: Configure Switch_B (Backup Virtual Router)

At this point we assume that you have already created VLAN 2 and VLAN 3 on Switch_B. See "Configuring VLANs" on page 18.3 for detailed information about creating VLANs.

Configure IPv6 addresses on VLAN 2 and VLAN 3

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`hostname Switch_B`	Assign a host name to `Switch_B`.
`Switch_B(config)#`	
`interface vlan2`	Specify the interface (`vlan2`) that will participate in virtual routing to first configure an IP address for `vlan2`.
`Switch_B(config-if)#`	
`ipv6 address 2001:db8:2::3/64`	Specify the IPv6 address and mask for interface `vlan2`.
`Switch_B(config-if)#`	
`exit`	Return to Global Configuration mode.
`Switch_B(config)#`	
`interface vlan3`	Specify the interface (`vlan3`) that will participate in virtual routing to first configure an IP address for `vlan3`.
`Switch_B(config-if)#`	
`ipv6 address 2001:db8:3::3/64`	Specify the IPv6 address and mask for interface `vlan3`.
`Switch_B(config-if)#`	
`exit`	Return to Global Configuration mode.

Create the Backup Virtual Router on Switch_B

`Switch_B(config)#`	
`router ipv6 vrrp 1 vlan2`	Create a new VRRPv3 session on Switch_B, specify the VRID for the session, and specify the interface (`vlan2`) that will participate in virtual routing.
`Switch_B(config-router)#`	
`virtual-ipv6 fe80::1 backup`	Set the virtual IP address for the VRRP session. Define the default state of the VRRP router within the virtual router. Note that `fe80::1` is an IPv6 link-local address. AlliedWare Plus only supports one IPv6 virtual IP address per virtual router ID as per VRRPv3 RFC 5798. See the **Usage** note for the **virtual-ipv6** command for implementation information about link-local addresses in AlliedWare Plus.
`Switch_B(config-router)#`	
`advertisement-interval 5`	Configure the default value for the advertisement interval. The configurable range for the advertisement interval is 1-10.
`Switch_B(config-router)#`	
`priority 100`	Configure the priority value of 100 when the device is the Backup Virtual Router.
`Switch_B(config-router)#`	
`preempt-mode true`	Set the preempt-mode to true for Switch_B. The default preempt mode ensures that the highest priority switch available always takes the role.
`Switch_B(config-router)#`	
`enable`	Enable the VRRPv3 session on Switch_B.
`Switch_B(config-router)#`	
`exit`	Exit the Router Configuration mode and enter the Global Configuration mode.
`Switch_B(config)#`	
`exit`	Exit the Global Configuration mode and enter the Privileged Exec mode.
`Switch_B#`	
`copy running-config startup-config`	Copy the running-config to the startup-config to enable this configuration to execute after restarting Switch_B.

Step 3: Configure Host_A

At this point we assume that you have already created VLAN 2 and VLAN 3 on Host_A. See "Configuring VLANs" on page 18.3 for detailed information about creating VLANs.

Configure an IPv6 address on VLAN 2 and a static IPv6 route to reach Switch_C on VLAN 3

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`hostname Host_A`	Assign the host name to `Host_A`.
`Host_A(config)#`	
`interface vlan2`	Specify the interface (`vlan2`) that will participate in virtual routing to first configure an IP address for `vlan2`.
`Host_A(config-if)#`	
`ipv6 address 2001:db8:2::1/64`	Specify the IPv6 address and mask for interface `vlan2`.
`Host_A(config-if)#`	
`exit`	Return to Global Configuration mode.
`Host_A(config)#`	
`ipv6 route 2001:db8::/64`	Configure an IPv6 static route to reach interface `vlan3` of Host_A.
`Host_A(config)#`	
`exit`	Return to Privileged Exec mode.
`Host_A#`	
`copy running-config startup-config`	Copy the running-config to the startup-config to enable this configuration to execute after restarting Host_A.

Step 4: Configure Switch_C

At this point we assume that you have already created VLAN 2 and VLAN 3 on Switch_B. See "Configuring VLANs" on page 18.3 for detailed information about creating VLANs..

Configure IPv6 addresses on VLAN 2 and VLAN 3

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`hostname Switch_C`	Assign the host name `Switch_C`.
`Switch_C(config)#`	
`interface vlan2`	Specify the interface (`vlan2`) that will participate in virtual routing to first configure an IP address for `vlan2`.
`Switch_C(config-if)#`	
`ipv6 address 2001:db8:2::4/64`	Specify the IPv6 address and mask for interface `vlan2`.
`Switch_C(config-if)#`	
`exit`	Return to Global Configuration mode.
`Switch_C(config)#`	
`interface vlan3`	Specify the interface (`vlan3`) that will participate in virtual routing to first configure an IP address for `vlan3`.
`Switch_C(config-if)#`	
`ipv6 address 2001:db8:3::4/64`	Specify the IPv6 address and mask for interface `vlan3`.
`Switch_C(config-if)#`	
`exit`	Return to Global Configuration mode.
`Switch_C(config)#`	
`exit`	Return to Privileged Exec mode.
`Switch_C#`	
`copy running-config startup-config`	Copy the running-config to the startup-config to enable this configuration to execute after restarting Switch_C.

Commands Used

advertisement-interval
enable (VRRP)
preempt-mode
priority
router ipv6 vrrp (interface)
virtual-ipv6

Validation Commands

show vrrp ipv6

VRRPv3 Configuration Validation Commands and Output:

Switch_A To display information about the configured VRRPv3 session, to validate configuration as the Virtual Router following the earlier configuration steps, enter the command:

```
Switch_A# show vrrp ipv6 vlan2
```

Output **Figure 84-1: Example output from the show vrrp ipv6 vlan2 command on Switch_A**

```
Switch_A#show vrrp ipv6 vlan2
VrId <2>
 State is Master
 Virtual IP is 2001:db8::1 (Not-owner)
 Interface is vlan2
 Priority is 255
 Advertisement interval is 1 sec
 Preempt mode is TRUE
```

Switch_B To display information about the configured VRRPv3 session, to validate configuration as the Backup Virtual Router following the earlier configuration steps, enter the command:

```
Switch_B# show vrrp ipv6 vlan2
```

Output **Figure 84-2: Example output from the show vrrp ipv6 vlan2 command on Switch_B**

```
Switch_B#show vrrp ipv6 vlan2
VrId <2>
 State is Backup
 Virtual IP is 2001:db8::1 (Not-owner)
 Interface is vlan2
 Priority is 100
 Advertisement interval is 1 sec
 Preempt mode is TRUE
```

Then disable the Virtual Router and validate the Backup Virtual Router takes over:

Shutdown the interface on the Virtual Router so the Backup Virtual Router takes over:

`Switch_A#`	
`configure terminal`	Specify the interface (`vlan2`) that will participate in virtual routing to first configure an IP address for `vlan2`.
`Switch_A(config)#`	
`interface vlan2`	Specify the interface (`vlan2`) that will participate in virtual routing to first configure an IP address for `vlan2`.
`Switch_A(config)#`	
`shutdown`	Shutdown the interface (`vlan2`) that participates as the Virtual Router on Switch_A. This will make Switch_B, which is configured as the Backup Virtual Router, become the Virtual Router.

Switch_A To validate Switch_A is not the Virtual Router after a shutdown on interface vlan2, so Switch_B will take over as Virtual Router from Switch_A, enter the command:

```
Switch_A# show vrrp ipv6 vlan2
```

Output **Figure 84-3: Example output from the show vrrp ipv6 vlan2 command on Switch_A**

```
Switch_A#show vrrp ipv6 vlan2
VrId <2>
 State is Initialize
 Virtual IP is 2001:db8::1 (Owner)
 Interface is vlan2
 Priority is 255
 Advertisement interval is 1 sec
 Preempt mode is TRUE
```

Switch_B To validate Switch_B is the Virtual Router after a shutdown on interface vlan2 on Switch_A, so Switch_B takes over as the Virtual Router, enter the command:

```
Switch_B# show vrrp ipv6 vlan2
```

Output **Figure 84-4: Example output from the show vrrp ipv6 vlan2 command on Switch_B**

```
Switch_B#show vrrp ipv6 vlan2
VrId <2>
 State is Master
 Virtual IP is 2001:db8::1 (Not-owner)
 Interface is vlan2
 Priority is 100
 Advertisement interval is 1 sec
 Preempt mode is TRUE
```

Command List

This chapter provides an alphabetical reference for commands used to configure the Virtual Router Redundancy Protocol (VRRP). For more information, see **Chapter 84, VRRP Introduction and Configuration**.

For information about modifying or redirecting the output from **show** commands to a file, see **"Controlling "show" Command Output" on page 1.38**.

accept-mode

Use this command to configure accept mode for a master virtual router. If the accept-mode is set to **true**, then the switch will reply to ping, telnet, and ssh requests to the virtual IP address. The switch will reply even if it does not own the virtual IP address.

If the accept-mode is set to **false**, then the switch will not reply to requests from ping, telnet, or ssh.

Syntax `accept-mode {true|false}`

Parameter	Description
`true`	Accept-mode is enabled.
`false`	Accept-mode is disabled.

Default The default is **true**.

Mode Router Configuration

Usage For VRRPv3 IPv4 configuration details, see **Chapter 84, VRRP Introduction and Configuration** and the section **"VRRP Configuration for IPv4" on page 84.4**.

For VRRPv3 IPv6 configuration details, see **Chapter 84, VRRP Introduction and Configuration** and the section **"VRRP IPv6 Configuration Example" on page 84.28**.

Examples The example below shows you how to configure accept-mode as true for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# accept-mode true
```

The example below shows you how to configure accept-mode as false for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# accept-mode false
```

The example below shows you how to configure accept-mode as true for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# accept-mode true
```

The example below shows you how to configure accept-mode as false for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# accept-mode false
```

Related Commands

router vrrp (interface)
router ipv6 vrrp (interface)

advertisement-interval

Use this command to configure the advertisement interval of the virtual router. This is the length of time, in seconds, between each advertisement sent from the master to its backup(s).

IPv6 VRRP advertisements are sent to the multicast address assigned to the VRRP group (ff02:0:0:0:0) and a backup virtual router has to join all multicast groups within this range. VRRP advertisements are sent to a multicast address (ff02::12) every second by default.

Use the **no** variant of this command to remove an advertisement interval of the virtual router, which has been set using the **advertisement-interval** command, and revert to the default advertisement interval of 1 second.

Syntax

```
advertisement-interval [<1-255>|csec <1-4095>]
no advertisement-interval
```

Parameter	Description
<1-255>	Specifies the advertisement interval in seconds.
`csec`	Use centiseconds instead of seconds for the advertisement interval.
<1-4095>	Specifies the advertisement interval in centiseconds.

Default The default advertisement interval is 1 second.

Mode Router Configuration

Usage Note when using VRRP with VCStacking, ensure the VRRP advertisement-interval is larger than the VCStacking failover time to avoid VCStacking failovers causing VRRP failovers.

See the **Virtual Router Redundancy Protocol** section in **Chapter 84, VRRP Introduction and Configuration** about setting the advertisement-interval when configuring VRRP.

See the **VRRPv2 to VRRPv3 Transition Configuration** section in **Chapter 84, VRRP Introduction and Configuration** about using seconds for VRRPv2 host compatibility whenever you use **transition-mode** to upgrade or transition from VRRPv2 to VRRPv3.

For VRRPv3 IPv4 configuration details, see **Chapter 84, VRRP Introduction and Configuration** and the section **"VRRP Configuration for IPv4" on page 84.4**.

For VRRPv3 IPv6 configuration details, see **Chapter 84, VRRP Introduction and Configuration** and the section **"VRRP IPv6 Configuration Example" on page 84.28**.

Note

When using VRRPv3 with VCStacking, ensure that the VRRPv3 advertisement-interval is configured to a longer time than the VCStacking failover time. If the VRRPv3 advertisement-interval is shorter than the VCStacking failover time, then a VRRPv3 failover will also occur whenever a VCStacking failover occurs. Use seconds not centiseconds to ensure interoperability with VRRPv2.

Example The example below shows you how to configure the advertisement interval to 6 seconds for the VRRP IPv4 session with VR ID 5 on interface vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# advertisement-interval 6
```

The example below shows you how to reset the advertisement interval to the default of 1 second for the VRRP IPv4 session with VR ID 5 on interface vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# no advertisement-interval
```

The example below shows you how to configure the advertisement interval to 6 seconds for the VRRPv3 IPv6 session with VR ID 5 on interface vlan2:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 5 vlan2
awplus(config-router)# advertisement-interval 6
```

Related Commands **router vrrp (interface)**
router ipv6 vrrp (interface)

circuit-failover

Use this command to enable the VRRP circuit failover feature. See the **VRRP Circuit Failover Configuration** in **Chapter 84, VRRP Introduction and Configuration**.

Use the **no** variant of this command to disable this feature.

Syntax

```
circuit-failover <interface> <1-253>
no circuit-failover [<interface> <1-253>]
```

Parameter	Description
<interface>	The interface of the router that is monitored. Interface must exist on the router, and is usually an upstream interface. Should the interface go down, then another router that is configured as a backup router in the group takes over as the master. You should configure the circuit failover on an interface other than the active VRRP interface.
<1-253>	Delta value. The value by which virtual routers decrement their priority value during a circuit failover event. Configure this value to be greater than the difference of priorities on the master and backup routers. In the case of failover, this priority delta value is subtracted from the current VR Master Router priority value.

Mode Router Configuration

Example The example below shows you how to configure circuit failover on interface vlan2 for the VRRP IPv4 session with VR ID 1, where interface vlan2 is considered the monitored interface:

```
awplus# configure terminal
awplus(config)# router vrrp 1 vlan2
awplus(config-router)# circuit-failover vlan2 30
```

The example below shows you how to remove all configured circuit failovers for the VRRP IPv4 session with VR ID 1 on interface vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 1 vlan2
awplus(config-router)# no circuit-failover
```

The example below shows you how to configure circuit failover on interface vlan2 for the VRRPv3 IPv6 session with VR ID 2, where interface vlan2 is considered the monitored interface:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 2 vlan2
awplus(config-router)# circuit-failover vlan2 30
```

The example below shows you how to remove all configured circuit failovers for the VRRPv3 IPv6 session with VR ID 1 on interface vlan2:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 1 vlan2
awplus(config-router)# no circuit-failover
```

Related Commands
router vrrp (interface)
router ipv6 vrrp (interface)

debug vrrp

Use this command to specify debugging options for VRRP. The **all** parameter turns on all the debugging options.

Use the **no** variant of this command to disable this function.

Syntax

```
debug vrrp [all]
no debug vrrp [all]
```

Mode Privileged Exec and Global Configuration

Usage For VRRPv3 debugging details, see **Chapter 84, VRRP Introduction and Configuration** and the section **"VRRP debugging" on page 84.13**.

Examples The example below shows you how to enable all debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp all
```

The example below shows you how to disable all debugging for VRRP:

```
awplus# configure terminal
awplus(config)# no debug vrrp all
```

Related Commands
show debugging vrrp
undebug vrrp

debug vrrp events

Use this command to specify debugging options for VRRP event troubleshooting.

Use the **no** variant of this command to disable this function.

Syntax

```
debug vrrp events
no debug vrrp events
```

Mode Privileged Exec and Global Configuration

Usage The **debug vrrp events** command enables the display of debug information related to VRRP internal events.

For VRRPv3 debugging details, see **Chapter 84, VRRP Introduction and Configuration** and the section **"VRRP debugging" on page 84.13**.

Examples The example below shows you how to enable events debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp events
```

The example below shows you how to disable events debugging for VRRP:

```
awplus# configure terminal
awplus(config)# no debug vrrp events
```

Related Commands

show debugging vrrp
undebug vrrp events

debug vrrp packet

Use this command to specify debugging options for VRRP packets.

Use the **no** variant of this command to disable this function.

Syntax

```
debug vrrp packet [send|recv]
no debug vrrp packet [send|recv]
```

Parameter	Description
`send`	Specifies the debug option set for sent packets.
`recv`	Specifies the debug option set for received packets.

Mode Privileged Exec and Global Configuration

Usage The **debug vrrp packet** command enables the display of debug information related to the sending and receiving of packets.

For VRRPv3 debugging details, see **Chapter 84, VRRP Introduction and Configuration** and the section **"VRRP debugging" on page 84.13**.

Examples The example below shows you how to enable received and sent packet debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp packet
```

The example below shows you how to enable only received packet debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp packet recv
```

The example below shows you how to enable only sent packet debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp packet send
```

The example below shows you how to disable packet debugging for VRRP:

```
awplus# configure terminal
awplus(config)# no debug vrrp packet
```

Related Commands **show debugging vrrp**
undebug vrrp packet

disable (VRRP)

Use this command to disable a VRRP IPv4 session or a VRRPv3 IPv6 session on the router to stop it participating in virtual routing. Note that when this command is configured then a backup router assumes the role of master router depending on its priority. See the **enable (VRRP)** command to enable a VRRP IPv4 session or a VRRPv3 IPv6 session on the router.

Syntax

```
disable
```

Mode

Router Configuration

Usage

For VRRPv3 IPv4 configuration details, see **Chapter 84, VRRP Introduction and Configuration** and the section **"VRRP Configuration for IPv4" on page 84.4**.

For VRRPv3 IPv6 configuration details, see **Chapter 84, VRRP Introduction and Configuration** and the section **"VRRP IPv6 Configuration Example" on page 84.28**.

Example

The example below shows you how to disable the VRRP session for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# disable
```

The example below shows you how to disable the VRRPv3 session for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# disable
```

Related Commands

enable (VRRP)
router vrrp (interface)
router ipv6 vrrp (interface)
show vrrp

enable (VRRP)

Use this command to enable the VRRP session on the router to make it participate in virtual routing. To make an changes to the VRRP configuration, first disable the router from participating in virtual routing using the **disable (VRRP)** command.

Syntax `enable`

Mode Router Configuration

Usage You must configure the virtual IP address and define the interface for the VRRP session (using the **virtual-ip** or **virtual-ipv6** and the **router vrrp (interface)** or **router ipv6 vrrp (interface)** commands) before using this command.

For VRRPv3 IPv4 configuration details, see **Chapter 84, VRRP Introduction and Configuration** and the section **"VRRP Configuration for IPv4" on page 84.4**.

For VRRPv3 IPv6 configuration details, see **Chapter 84, VRRP Introduction and Configuration** and the section **"VRRP IPv6 Configuration Example" on page 84.28**.

Example The example below shows you how to enable the VRRP session for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# enable
```

The example below shows you how to enable the VRRPv3 session for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# enable
```

Related Commands
disable (VRRP)
router vrrp (interface))
router ipv6 vrrp (interface)
show vrrp
virtual-ip
virtual-ipv6

preempt-mode

Use this command to configure preempt mode. If preempt-mode is set to **true**, then the highest priority backup will always be the master when the default master is unavailable.

If preempt-mode is set to **false**, then a higher priority backup will not preempt a lower priority backup who is acting as master.

Syntax `preempt-mode {true|false}`

Parameter	Description
`true`	Preemption is enabled.
`false`	Preemption is disabled.

Default The default is **true**.

Mode Router Configuration

Usage When the master router fails, the backup routers come online in priority order—highest to lowest. Preempt mode means that a higher priority back up router will take over the master role from a lower priority back up. Preempt mode on **true** allows a higher priority backup router to relieve a lower priority backup router.

By default, a preemptive scheme is enabled whereby a higher priority backup virtual router that becomes available take over for the backup virtual router that was elected to become the master virtual router.

This preemptive scheme can be disabled using the **preempt-mode false** command. If preemption is disabled, the backup virtual router that is currently elected as the master virtual router does not transition to backup virtual router again whenever the alternate backup router with a higher priority becomes available.

See **"VRRP election and preempt for IPv6" on page 84.11** for further information on preempt mode.

For VRRPv3 IPv4 configuration details, see **Chapter 84, VRRP Introduction and Configuration** and the section **"VRRP Configuration for IPv4" on page 84.4**.

For VRRPv3 IPv6 configuration details, see **Chapter 84, VRRP Introduction and Configuration** and the section **"VRRP IPv6 Configuration Example" on page 84.28**.

Examples The example below shows you how to configure preempt-mode as true for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# preempt-mode true
```

The example below shows you how to configure preempt-mode as false for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# preempt-mode false
```

The example below shows you how to configure preempt-mode as true for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# preempt-mode true
```

The example below shows you how to configure preempt-mode as false for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# preempt-mode false
```

Related Commands

circuit-failover
priority
router vrrp (interface)
router ipv6 vrrp (interface)

priority

Use this command to configure the VRRP router priority within the virtual router. The highest priority router is Master (unless **preempt-mode** is false).

Use the **no** variant of this command to remove the VRRP router priority within the virtual router, which has been set using the **priority** command.

Syntax

```
priority <1-255>
no priority
```

Parameter	Description
<1-255>	The priority. For the master router, use 255 for this parameter; otherwise use any number from the range <1-254>.

Default Defaults for priority are: **master router** = 255; **backup** = 100.

Mode Router Configuration

Usage Priority determines the role that each VRRP router plays and what happens if the master virtual router fails. If a VRRP router owns the IP address of the virtual router and the IP address of the interface, then this VRRP router functions as the master virtual router.

Priority also determines whether a VRRP router functions as a backup virtual router and the order of ascendancy to becoming a master virtual router if the master virtual router fails. Configure the priority of each backup virtual router with a a value of 1 through 254.

For VRRPv3 IPv4 configuration details, see **Chapter 84, VRRP Introduction and Configuration** and the section **"VRRP Configuration for IPv4" on page 84.4**.

For VRRPv3 IPv6 configuration details, see **Chapter 84, VRRP Introduction and Configuration** and the section **"VRRP IPv6 Configuration Example" on page 84.28**.

Examples The example below shows you how to configure 101 as the priority for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# priority 101
```

The example below shows you how to remove the priority configured for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# no priority
```

The example below shows you how to configure 101 as the priority for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# priority 101
```

The example below shows you how to remove the configured priority for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# no priority
```

Related Commands **circuit-failover**
preempt-mode

router vrrp (interface)

Use this command to configure VRRP IPv4 and define the interface that will participate in virtual routing to send and receive advertisement messages. This command allows you to enter the Router Configuration mode.

Use the **no** variant of this command to remove the VRRP IPv4 configuration. Disable the VRRP session before using the **no** variant of this command.

Syntax

```
router vrrp <vrid> <interface>
no router vrrp <vrid> <interface>
```

Parameter	Description
<vrid>	*<1-255>* The ID of the virtual router VRRP IPv4 session to create.
<interface>	Specify the name of the interface that will participate in the virtual routing. The interface must exist on the router. The interface specified sends and receives VRRP IPv4 advertisement messages.

Mode Global Configuration

Usage Use the required *<interface>* placeholder to define the interface that will participate in virtual routing. This interface is used for two purposes - to send/receive advertisement messages and to forward on behalf of the virtual router when in master state.

For VRRPv3 IPv4 configuration details, see **Chapter 84, VRRP Introduction and Configuration** and the section **"VRRP Configuration for IPv4" on page 84.4**.

Examples The example below shows you how to enable a VRRP session with VR ID 5 on vlan1:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan1
awplus(config-router)# enable
awplus(config-router)#
```

The example below shows you how to disable a VRRP session with VR ID 5 on vlan1:

```
awplus(config-router)# disable
awplus(config-router)# exit
awplus(config)# no router vrrp 5 vlan1
awplus(config)#
```

Related Commands
advertisement-interval
circuit-failover

enable (VRRP)

router ipv6 vrrp (interface)

Use this command to configure VRRPv3 for IPv6 and define the interface that will participate in virtual routing to send and receive advertisement messages. This command allows you to enter the Router Configuration mode.

Use the **no** variant of this command to remove the VRRPv3 for IPv6 configuration. Disable the VRRP session before using the **no** variant of this command.

Syntax

```
router ipv6 vrrp <vrid> <interface>
no router ipv6 vrrp <vrid> <interface>
```

Parameter	Description
<vrid>	*<1-255>* The ID of the virtual router VRRPv3 IPv6 session to create.
<interface>	Specify the name of the interface that will participate in the virtual routing. The interface must exist on the router. The interface specified sends and receives VRRPv3 IPv6 advertisement messages.

Mode Global Configuration

Usage Use the required *<interface>* placeholder to define the interface that will participate in virtual routing. This interface is used for two purposes - to send/receive advertisement messages and to forward on behalf of the virtual router when in master state.

For VRRPv3 IPv6 configuration details, see **Chapter 84, VRRP Introduction and Configuration** and the section **"VRRP IPv6 Configuration Example" on page 84.28**.

Examples The example below shows you how to enable a VRRPv3 session with VR ID 3 on vlan2:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan2
awplus(config-router)# enable
awplus(config-router)#
```

The example below shows you how to disable a VRRPv3 session with VR ID 3 on vlan2:

```
awplus(config-router)# disable
awplus(config-router)# exit
awplus(config)# no router ipv6 vrrp 3 vlan2
awplus(config)#
```

Related Commands **advertisement-interval**
circuit-failover

show debugging vrrp

Use this command to display the set VRRP debugging option. Use the **terminal monitor** command to display output on the console otherwise debug output is in the log file.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

For VRRPv3 debugging details, see **Chapter 84, VRRP Introduction and Configuration** and the section **"VRRP debugging" on page 84.13**.

Syntax
```
show debugging vrrp
```

Mode User Exec and Privileged Exec

Example The example below shows you how to display VRRP debugging:
```
awplus# show debugging vrrp
```

Related Commands
debug vrrp
debug vrrp events
debug vrrp packet

show running-config router vrrp

Use this command to show the running configuration for VRRP IPv4.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

For VRRPv3 IPv4 configuration details, see **Chapter 84, VRRP Introduction and Configuration** and the section **"VRRP Configuration for IPv4" on page 84.4**.

Syntax
```
show running-config router vrrp
```

Mode Privileged Exec, Global Configuration, Line Configuration, and Interface Configuration.

Example The example below shows you how to display the running configuration for VRRP IPv4:
```
awplus# show running-config router vrrp
```

Output **Figure 85-1: Example output from the show running-config router vrrp command**

```
!
router vrrp 2 vlan2
 circuit-failover vlan2 2
 advertisement-interval 4
 preempt-mode true
!
```

show running-config router ipv6 vrrp

Use this command to show the running configuration for VRRPv3 IPv6.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

For VRRPv3 IPv6 configuration details, see **Chapter 84, VRRP Introduction and Configuration** and the section **"VRRP IPv6 Configuration Example" on page 84.28**.

Syntax `show running-config router vrrp`

Mode Privileged Exec, Global Configuration, Line Configuration, and Interface Configuration.

Example The example below shows you how to display the running configuration for VRRPv3 IPv6:

```
awplus# show running-config router ipv6 vrrp
```

Output **Figure 85-2: Example output from the show running-config router ipv6 vrrp command**

```
!
router ipv6 vrrp 3 vlan3
 virtual-ip fe80::202:b3ff:fed5:983e master
 circuit-failover vlan3 3
 advertisement-interval 6
 preempt-mode false
!
```

show vrrp

Use this command to display information about all VRRP IPv4 sessions. This command shows a summary when the optional **brief** parameter is used.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

For VRRPv3 IPv4 configuration details, see **Chapter 84, VRRP Introduction and Configuration** and the section **"VRRP Configuration for IPv4" on page 84.4**.

Syntax

```
show vrrp [brief]
```

Parameter	Description
`brief`	Brief summary of VRRP sessions.

Mode User Exec and Privileged Exec

Example To display information about all VRRP IPv4 sessions, enter the command:

```
awplus# show vrrp
```

To display brief summary output about VRRP IPv4 sessions, enter the command:

```
awplus# show vrrp brief
```

Output

Figure 85-3: Example output from the show vrrp command

```
awplus#show vrrp
VMAC enabled
Address family IPv4
VRRP Id: 1 on interface: vlan2
 State: AdminUp    - Master
 Virtual IP address: 192.168.1.2 (Not-owner)
 Priority is 100
 Advertisement interval: 100 centiseconds
 Preempt mode: TRUE
 Multicast membership on IPv4 interface vlan2: JOINED
 Transition mode: FALSE
 Accept mode: FALSE
 Master address: 192.168.1.3
```

Figure 85-4: Example output from the show vrrp brief command

```
awplus#show vrrp brief
Interface        Grp  Prio Own  Pre  State      Master addr      Group addr
 vlan10            1   200   N    P  Master     192.168.10.4     192.168.10.253

```

Related Commands

enable (VRRP)
disable (VRRP)

show vrrp ipv6

Use this command to display information about all configured VRRPv3 IPv6 sessions for all interfaces, or all VRRPv3 IPv6 sessions for a given interface with the optional parameter.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

For VRRPv3 IPv6 configuration details, see **Chapter 84, VRRP Introduction and Configuration** and the section **"VRRP IPv6 Configuration Example" on page 84.28**.

Syntax

```
show vrrp ipv6 [<interface>]
```

Parameter	Description
<interface>	Specify the name of the interface that will participate in the virtual routing. The interface must exist on the router. The interface specified sends and receives VRRPv3 IPv6 advertisement messages.

Mode User Exec and Privileged Exec

Example To display information about all VRRPv3 IPv6 sessions, enter the command:

```
awplus# show vrrp ipv6
```

Output **Figure 85-5: Example output from the show vrrp ipv6 vlan2 command**

```
awplus#show vrrp ipv6 vlan2
VrId <1>
 State is Master
 Virtual IP is fe80::202:b3ff:fed5:983e (Owner)
 Interface is vlan2
 Priority is 255
 Advertisement interval is 4 sec
 Preempt mode is FALSE
```

Related Commands

enable (VRRP)
disable (VRRP)

show vrrp counters

This command displays VRRP SNMP counters on the console, as described in the VRRP MIB and RFC2787, for debugging use while you configure VRRP with commands in this chapter.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

For VRRPv3 IPv4 configuration details, see **Chapter 84, VRRP Introduction and Configuration** and the section **"VRRP Configuration for IPv4" on page 84.4**.

Syntax `show vrrp counters`

Mode User Exec and Privileged Exec

Usage The output has a section for global counters and a section of counters for each VRRP instance configured. See the descriptions of the counters below the sample output as per RFC2787.

Note

Note that the counters displayed with this commands are the same counters as described in RFC 2787 (Copyright (C) The Internet Society (2000). All Rights Reserved) except for the `Monitored Circuit Up` and `Monitored Circuit Down` counters which are additions beyond the MIB.

Example To display information about VRRP SNMP counters on the console, enter the command:

```
awplus# show vrrp counters
```

Figure 85-6: Example output from the show vrrp counters command

```
awplus#show vrrp counters
VRRP Global Counters:
  Checksum Errors .... 230
  Version Errors ..... 0
  VRID Errors ........ 230

VRRP IPv4 counters for VR 10/vlan10:
  Master Transitions ........ 0
  Received Advertisements ... 0
  Internal Errors ........... 0
  TTL Errors ................ 0
  Received Priority 0 Pkt ... 0
  Sent Priority 0 Pkt ....... 0
  Received Invalid Type ..... 0
  Address List Errors ....... 0
  Packet Length Errors ...... 0
  Monitored Circuit Up ...... 0
  Monitored Circuit Down..... 0

VRRP IPv4 counters for VR 100/vlan100:
  Master Transitions ........ 1
  Received Advertisements ... 1614
  Internal Errors ........... 0
  TTL Errors ................ 0
  Received Priority 0 Pkt ... 0
  Sent Priority 0 Pkt ....... 0
  Received Invalid Type ..... 0
  Address List Errors ....... 0
  Packet Length Errors ...... 0
  Monitored Circuit Up ...... 0
  Monitored Circuit Down..... 2
```

Table 85-1: Global counters with descriptions for the show vrrp counters command:

Counter	Description
`Checksum Errors`	The total number of VRRP packets received with an invalid VRRP checksum value.
`Version Errors`	The total number of VRRP packets received with an unknown or unsupported version number.
`VRID Errors`	The total number of VRRP packets received with an invalid VRID for this virtual router.

Table 85-2: Per VR counters with descriptions for the show vrrp counters command:

Counter	Description
`Master Transitions`	The total number of times that this virtual router's state has transitioned to MASTER.
`Received Advertisements`	The total number of VRRP advertisements received by this virtual router.
`Internal Errors`	The total number of VRRP advertisement packets received for which the advertisement interval is different than the one configured for the local virtual router.
`TTL Errors`	The total number of VRRP packets received by the virtual router with IP TTL (Time-To-Live) not equal to 255.
`Received Priority 0 Pkt`	The total number of VRRP packets received by the virtual router with a priority of '`0`'.
`Sent Priority 0 Pkt`	The total number of VRRP packets sent by the virtual router with a priority of '`0`'.
`Received Invalid Type`	The number of VRRP packets received by the virtual router with an invalid value in the '`type`' field.
`Address List Errors`	The total number of packets received for which the address list does not match the locally configured list for the virtual router.
`Packet Length Errors`	The total number of packets received with a packet length less than the length of the VRRP header.
`Monitored Circuit Up`	The total number of times the monitored circuit has generated the UP event.
`Monitored Circuit Down`	The total number of times the monitored circuit has generated the down event.

show vrrp (session)

Use this command to display information for a particular VRRP session.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

For VRRPv3 IPv4 configuration details, see **Chapter 84, VRRP Introduction and Configuration** and the section **"VRRP Configuration for IPv4" on page 84.4**.

Syntax `show vrrp <vrid> <interface>`

Parameter	Description
<vrid>	*<1-255>* The virtual router ID for which to display information. Session must already exist.
<interface>	The interface to display information about, for instance, `vlan2`.

Mode User Exec and Privileged Exec

Usage See the below sample output from the **show vrrp** command displaying information about VRRP session 1 configured on **vlan2**. Output shows that a Virtual IP address has been set.

```
awplus# show vrrp 1 vlan2
```

```
awplus#show vrrp 1 vlan2
Address family IPv4
VrId <1>
 Interface is vlan2
 State is Initialize
 Virtual IP address is 10.10.11.250 (Not IP owner)
 Priority is 100
 Advertisement interval is 1 sec
 Preempt mode is TRUE
```

See the below sample output from the **show vrrp** command displaying information about VRRP session 1 configured on **vlan3**. Output shows a Virtual IP address has not been set.

```
awplus# show vrrp 1 vlan3
```

```
awplus#show vrrp 1 vlan3
Address family IPv4
VrId <1>
 Interface is vlan3
 State is Initialize
 Virtual IP address is unset
 Priority is 100
 Advertisement interval is 1 sec
 Preempt mode is TRUE
```

Example The following command shows information about VRRP session 5 for interface **vlan2**.

```
awplus# show vrrp 5 vlan2
```

transition-mode

Use this command to configure the IPv4 transition mode. Transition mode allows you to upgrade from VRRPv2 to VRRPv3 and gives interoperability between VRRPv2 and VRRPv3.

If transition-mode is set to **true**, then the IPv4 transition mode is enabled and VRRPv2 and VRRPv3 advertisements are sent allowing VRRPv2 and VRRPv3 interoperability. Received VRRPv2 advertisement packets are accepted and processed when transition-mode is true.

If transition-mode is set to **false**, then the IPv4 transition mode is disabled and only VRRPv3 advertisements are sent. Received VRRPv2 advertisement packets are dropped.

Note the **advertisement-interval** should not be configured to less than 1 second when using transition-mode. VRRPv2 can only use advertisements in whole second intervals.

Syntax `transition-mode {true|false}`

Parameter	Description
`true`	Transition mode is enabled. This results in VRRPv2 and VRRPv3 IPv4 advertisements being sent. Transition mode is only available on VRRPv3 for interoperability with VRRPv2 while upgrading to VRRPv3.
`false`	Transition mode is disabled. This stops VRRPv2 IPv4 advertisements being sent. Only VRRPv3 advertisements are sent when disabled. Disable transition-mode after upgrading from VRRPv2 to VRRPv3.

Default The default is **false**.

Mode Router Configuration

Usage See **"VRRPv2 to VRRPv3 Transition Configuration" on page 84.22** for further information about configuring transition mode to upgrade from VRRPv2 to VRRPv3.

For VRRPv3 IPv4 configuration details, see **Chapter 84, VRRP Introduction and Configuration** and the section **"VRRP Configuration for IPv4" on page 84.4**.

For VRRPv3 IPv6 configuration details, see **Chapter 84, VRRP Introduction and Configuration** and the section **"VRRP IPv6 Configuration Example" on page 84.28**.

Examples The example below shows you how to configure IPv4 transition-mode as true for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# transition-mode true
```

The example below shows you how to configure IPv4 transition-mode as false for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# transition-mode false
```

Related Commands router vrrp (interface)

undebug vrrp

Use this command to disable all VRRP debugging.

Syntax
```
undebug vrrp all
```

Mode Privileged Exec

Example The example below shows you how to disable all VRRP debugging:
```
awplus# undebug vrrp all
```

Related Commands debug vrrp

undebug vrrp events

Use this command to disable debugging options for VRRP event troubleshooting.

Syntax
```
undebug vrrp events
```

Mode Privileged Exec

Example The example below shows you how to disable VRRP event debugging:
```
awplus# undebug vrrp events
```

Related Commands debug vrrp events

undebug vrrp packet

Use this command to disable debugging options for VRRP packets.

Syntax `undebug vrrp packet [send|recv]`

Parameter	Description
`send`	Disable the debug option set for sent packets.
`recv`	Disable the debug option set for received packets.

Mode Privileged Exec

Examples The example below shows you how to disable VRRP sent packet debugging:

```
awplus# undebug vrrp packet send
```

The example below shows you how to disable VRRP received packet debugging:

```
awplus# undebug vrrp packet recv
```

The example below shows you how to disable all VRRP packet debugging:

```
awplus# undebug vrrp packet
```

Related Commands **debug vrrp packet**

virtual-ip

Use this command to set the virtual IP address for the VRRP session. This is the IP address of the virtual router that end hosts set as their default gateway.

Use the **no** variant of this command to disable this feature.

Syntax

```
virtual-ip <ip-address> [master|backup|owner]
no virtual-ip
```

Parameter	Description
<ip-address>	The virtual IPv4 address of the virtual router, entered in dotted decimal format A.B.C.D.
`master`	Sets the default state of the VRRP router within the Virtual Router as **master**. For master, the router must own the Virtual IP address. Specify the **owner** option before using **master** option.
`backup`	Sets the default state of the VRRP router within the Virtual Router as **backup**.
`owner`	Sets the IPv6 address of the VRRP router within the Virtual Router as the **owner**. Specify this before using the **master** option.

Mode Router Configuration

Usage The VRRP master and owner of the virtual IPv4 address for the VRRP session only responds to the packets destined to the virtual IPv6 address. The VRRP master that is not an owner of the virtual IPv4 address for the VRRP session does not respond to the packets destined to the virtual IPv4 address, but forwards packets with a VMAC as the destination address. See the **vrrp vmac** command to enable and disable this feature.

For VRRPv3 IPv4 configuration details, see **Chapter 84, VRRP Introduction and Configuration** and the section **"VRRP Configuration for IPv4" on page 84.4**.

Examples The example below shows you how to set the virtual IP address for VRRP VR ID 5 and the router as the VRRP master:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# virtual-ip 192.0.2.30 master
```

The example below shows you how to set the virtual IPv4 address for VRRP VR ID 5 and the router as the VRRP backup:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# virtual-ip 192.0.2.30 backup
```

The example below shows you how to set the virtual IPv4 address for VRRP VR ID 5 and the router as owner of the virtual IPv4 address:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# virtual-ip 192.0.2.30 owner
```

The example below shows you how to disable the virtual IPv4 address for VRRP VR ID 5

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# no virtual-ip
```

Related Commands

router vrrp (interface)
enable (VRRP)
vrrp vmac

virtual-ipv6

Use this command to set the virtual IPv6 address for the VRRPv3 session. This is the IPv6 address of the virtual router that end hosts set as their default gateway.

Note that the IPv6 address specified is an IPv6 link-local address. See the **Usage** note below for further information.

Use the **no** variant of this command to disable this feature.

Syntax

```
virtual-ipv6 <ipv6-address> [master|backup|owner]
no virtual-ipv6
```

Parameter	Description
<ipv6-address>	The virtual IPv6 address of the virtual router, entered in hexadecimal, in the format X:X::X.X. This is an IPv6 link-local address. See the **Usage** note below for further information.
`master`	Sets the default state of the VRRPv3 router within the Virtual Router as **master**. For master, the router must own the Virtual IP address. Specify the **owner** option before using **master** option.
`backup`	Sets the default state of the VRRPv3 router within the Virtual Router as **backup**.
`owner`	Sets the IPv6 address of the VRRPv3 router within the Virtual Router as the **owner**. Specify this before using the **master** option.

Mode Router Configuration

Usage The VRRP master and owner of the virtual IPv6 address for the VRRPv3 session only responds to the packets destined to the virtual IPv6 address. The VRRP master that is not an owner of the virtual IPv6 address for the VRRPv3 session does not respond to the packets destined to the virtual IPv6 address, but forwards packets with a VMAC as the destination address. See the **vrrp vmac** command to enable and disable this feature.

AlliedWare Plus only supports one IPv6 virtual IP address per virtual router ID as per VRRPv3 RFC 5798. Note in the command examples fe80::1 is an IPv6 link-local address. An IPv6 link-local address is used because IPv6 link-local addresses are used by IPv6 ND (Neighbor Discovery). A host's default route to a router points to the IPv6 link-local address, not a specific global IPv6 address for the router. For the host's traffic to switch over a backup router, the IPv6 link-local address of the router is used by VRRPv3.

For VRRPv3 IPv6 configuration details, see **Chapter 84, VRRP Introduction and Configuration** and the section **"VRRP IPv6 Configuration Example" on page 84.28**.

Examples

The example below shows you how to set the virtual IPv6 address for VRRPv3 VR ID 3 and the router as the VRRPv3 master:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# virtual-ipv6 fe80::1 master
```

The example below shows you how to set the virtual IPv6 address for VRRPv3 VR ID 3 and the router as the VRRPv3 backup:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# virtual-ipv6 fe80::1 backup
```

The example below shows you how to set the virtual IPv6 address for VRRPv3 VR ID 3 and the router as owner of the virtual IPv6 address:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# virtual-ipv6 fe80::1 owner
```

The example below shows you disable the virtual IPv6 address for VRRPv3 VR ID 3:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# no virtual-ipv6
```

Related Commands

router ipv6 vrrp (interface)
enable (VRRP)
vrrp vmac

vrrp vmac

Use this command to enable or disable the VRRP Virtual MAC feature. This feature is used by VRRP to make the hosts use the virtual MAC address as the physical hardware address of their gateway.

A VRRP router master will use the virtual MAC address for any ARP responses associated with the virtual IP address, or any gratuitous ARPs sent on behalf of the virtual IP address.

All VRRP advertisements are sent using this virtual MAC address as the source MAC address.

The virtual MAC address has the form: 00:00:5e:00:01:<VRID>, where VRID is the ID of the Virtual Router.

Syntax `vrrp vmac {enable|disable}`

Mode Global Configuration

Examples To enable Virtual MAC enter:

```
awplus# configure terminal
awplus(config)# vrrp vmac enable
```

To disable Virtual MAC enter:

```
awplus# configure terminal
awplus(config)# vrrp vmac disable
```

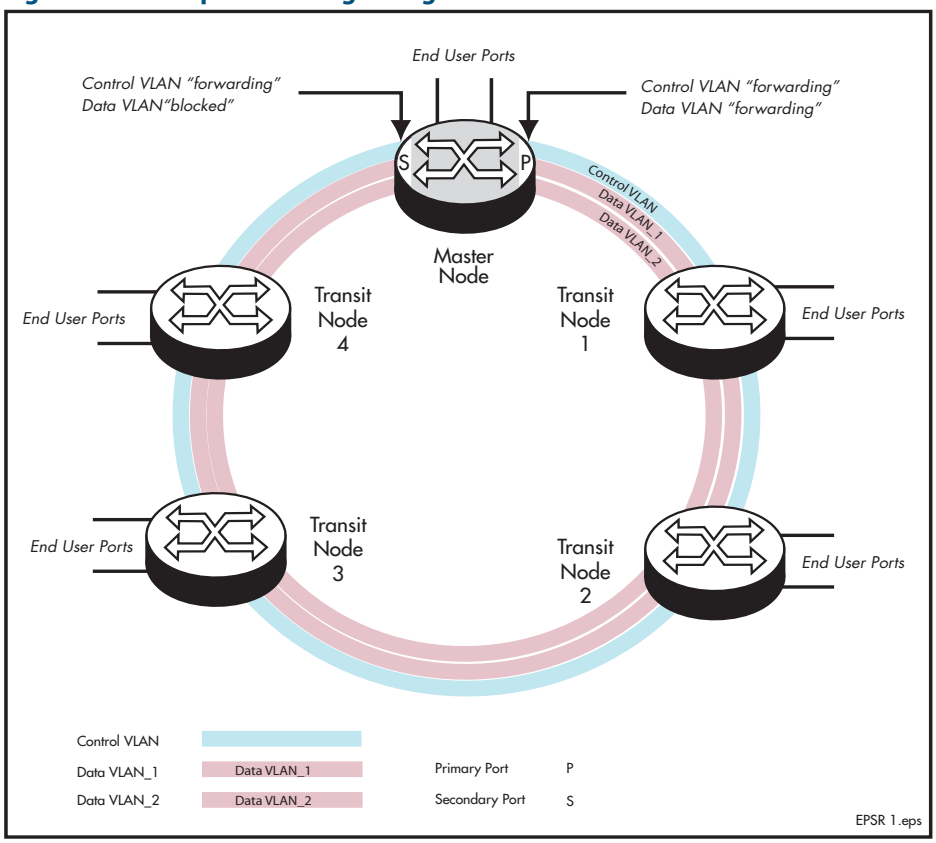
Introduction

Ethernet Protection Switching Ring (EPSR) is a protection system that prevents loops within Ethernet ring based topologies. EPSR offers a rapid detection and recovery time (in the order of 50 ms, depending on configuration) if a link or node fails. This rapid recovery time makes EPSR a more effective alternative to spanning tree options when using ring-based topologies to create high speed resilient Layer 2 networks.

Ring Components and Operation

EPSR operates only on ring-based topologies. An EPSR ring comprises a series of nodes (Ethernet bridges) connected end to end. The figure below shows a basic ring configuration. A ring comprises one master node and a number of transit nodes. Each node connects to the ring via two ports. On the master node one port is configured to be the primary port and the other, the secondary port.

Figure 86-1: Simple EPSR ring configuration



EPSR instances and domains

Each physical EPSR ring contains one or more EPSR domains. An EPSR instance can be thought of as a component of an EPSR ring domain that exists on a single node. A set of instances across the whole ring is called a "domain." Therefore a ring whose individual nodes each have two instances results in a two domain ring. Each instance contains a control VLAN and a number of data VLANs.

The EPSR control VLAN and its associated data VLANs form a Ring Domain. Although a physical ring can have more than one domain, each domain must operate as a separate logical group of VLANs and must have its own master node. This means that several domains may share the same physical network, but must operate as logically separate VLAN groups.

Control VLAN The function of the control VLAN is to monitor the ring domain and maintain its operational functions. To do this it transmits and monitors operational healthcheck messages using EPSR healthcheck control frames. The control VLAN carries no user data.

Caution

Specifying the Access Control List (ACL) filter action, send-to-cpu, could result in EPSR healthcheck messages and other control packets being dropped.

Data VLAN The data VLAN carries the user data around the ring. Several data VLANs can share a common control VLAN.

Master node The master node controls the ring operation. It issues healthcheck messages at regular intervals from its primary port and monitors their arrival back at its secondary port - after they have circled the ring. Under normal operating conditions the master node's secondary port is always in the blocking state to all data VLAN traffic. This is to prevent data loops forming within the ring. This port however, operates in the forwarding state for the traffic on the control VLAN. Loops do not occur on the control VLAN because the control messages stop at the secondary port, having completed their path around the ring.

Transit nodes The transit nodes operate as conventional Ethernet bridges, but with the additional capability of running the EPSR protocol. This protocol requires the transit nodes to forward the healthcheck messages from the master node, and respond appropriately when a ring fault is detected. The fault condition procedure is explained in **"Fault Detection and Recovery" on page 86.4**.

Fault Detection and Recovery

EPSR uses the following methods to detect outages in a node or a link in the ring:

- Master node polling fault detection
- Transit node unsolicited fault detection

Master node polling

The master node issues healthcheck messages from its primary port as a means of checking the condition of the EPSR network ring. These messages are sent at regular periods, controlled by the **hellotime** parameter of the **epsr** command on page 87.4. A failover timer is set each time a healthcheck message leaves the master node's primary port. The timeout value for this timer is set by the **failover** parameter of the **epsr** command on page 87.4. If the failover timer expires before the transmitted healthcheck message is received by the master node's secondary port, the master node assumes that there is a fault in the ring, and implements its fault recovery procedures. Because this method relies on a timer expiry, its operation is inherently slower than the "transit node unsolicited detection method" described next.

Transit node unsolicited

Transit node unsolicited fault detection relies on transit nodes detecting faults at their interfaces, and immediately notifying master nodes about the break. When a transit node detects a connectivity loss, it sends a "links down" message over its good link. Because a link spans two nodes, both nodes send the "links down" message back to the master node. These nodes also change their state from "links up" to "links down," and change the state of the port connecting to the broken link, from "forwarding" to "blocking."

Fault Recovery

When the master node detects an outage in the ring by using its detection methods, it does the following:

1. Declares the ring to be in a "failed" state.
2. Unblocks its secondary port to enable the data VLAN traffic to pass between its primary and secondary ports.
3. Flushes its own forwarding database (FDB) for (only) the two ring ports.
4. Sends an EPSR Ring-Down-Flush-FDB control message to all the transit nodes, via both its primary and secondary ports.

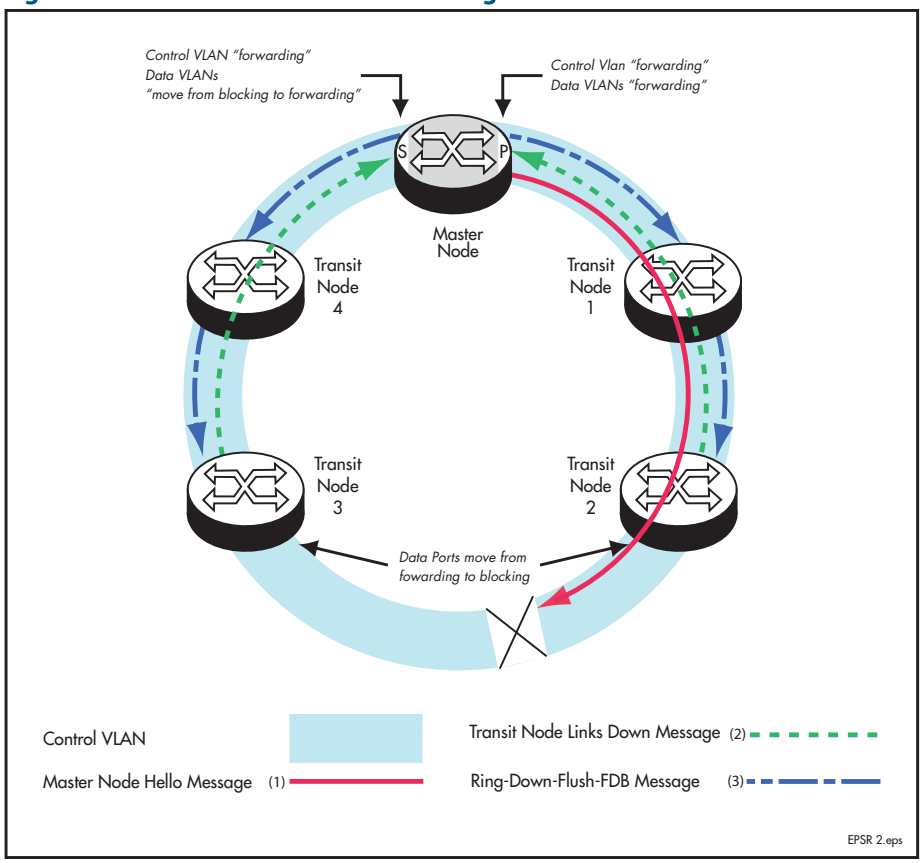
Transit nodes respond to the Ring-Down-Flush-FDB message by flushing their forward databases for each of their ring ports. As the data starts to flow in the ring's new configuration, each of the nodes (master and transit) re-learn their Layer 2 addresses. During this period, the master node continues to send health check messages over the control VLAN. This situation continues until the faulty link or node is repaired. For a multi-domain ring, this process occurs separately for each domain within the ring.

Note

When VCStack is used with EPSR, the EPSR **failovertime** must be set to at least 5 seconds to avoid any broadcast storms during failover. Broadcast storms may occur if the switch cannot failover quickly enough before the EPSR **failovertime** expires. See the **epsr** command for further information about the EPSR **failovertime**.
See the **reboot rolling** command for further information about VCStack failover.

The following figure shows the flow of control frames under fault conditions.

Figure 86-2: EPSR Fault Detection Messages



Restoring Normal Operation

Transit nodes

Once a fault in the ring or node has been rectified, the transit nodes that span the previously faulty link section detect that link connectivity has returned. They then move their appropriate ring port state, from Links-Down to Pre-Forwarding, and await the Ring-Up-Flush control message from the master node.

Once these transit nodes receive the Ring-Up-Flush message, they:

- flush their forward databases for both their ring ports.
- change the state of their ports from blocking to forwarding, which allows data to flow through their previously blocked ring ports.

Note

The transit nodes do not enter the forward state until they have received the Ring-Up-Flush message. This prevents the possibility of a loop condition occurring caused by the transit nodes moving into the forwarding state before the master node secondary port can return to the blocking state. During such a period, the ring would have no ports blocked.

Master node

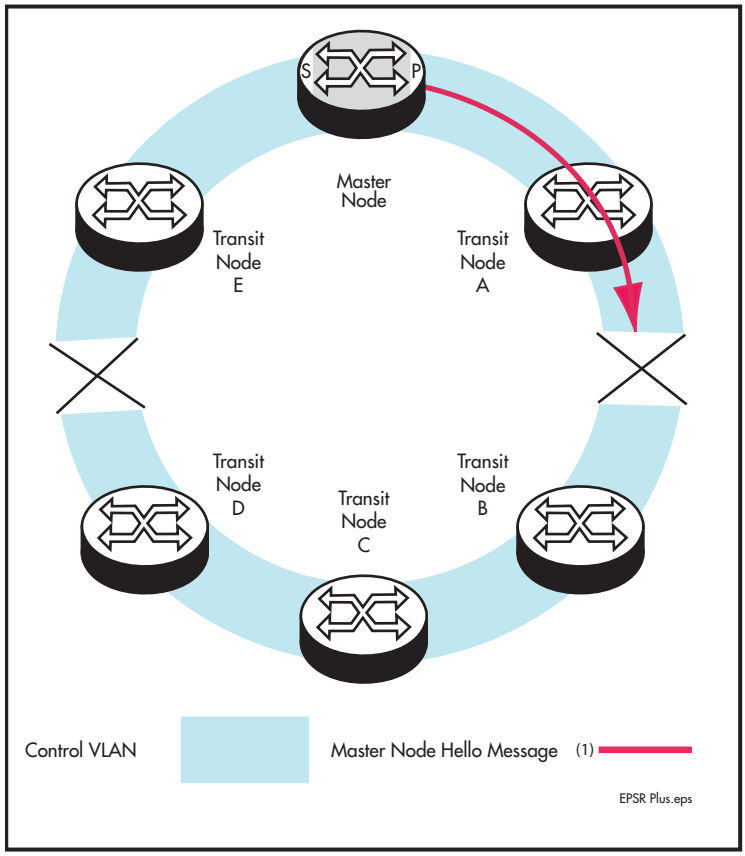
With the link restored, the healthcheck messages that are sent from the primary port of the master node now complete the loop and arrive at the master node's secondary port. The master node restores normal conditions as follows:

1. Declares the ring to be in a "complete" state.
2. Blocks its secondary port for data (non-control) traffic.
3. Flushes its forwarding database for its two ring ports.
4. Sends a Ring-Up-Flush-FDB message from its primary port, to all transit nodes.

Managing Rings with Two Breaks

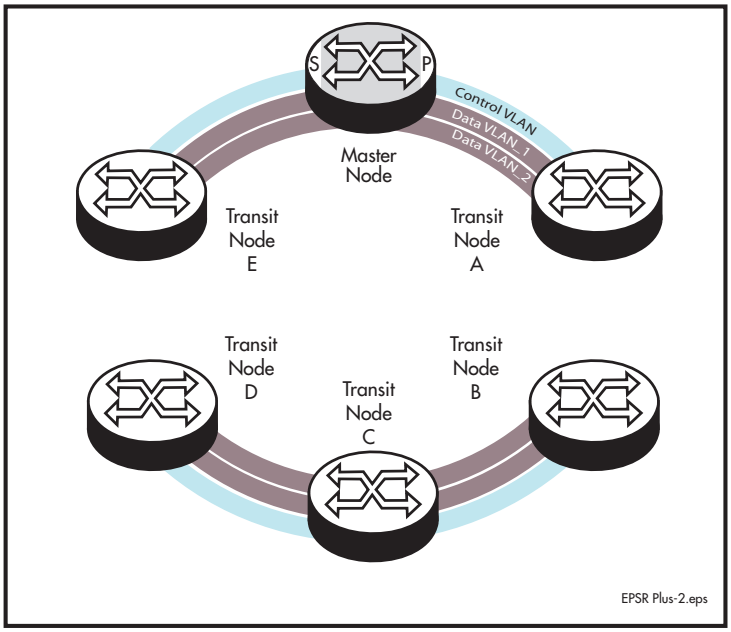
To restore a link with two breaks you need to run the EPSR Enhanced Recovery feature. Consider the network shown below:

Figure 86-3: EPSR Ring with Two Breaks



In this situation the ring will attempt to recover as previously described in **"Fault Recovery" on page 86.4**. This will result in the split-ring operation shown in **Figure 86-4 on page 86.8**.

Figure 86-4: EPSR Split Ring

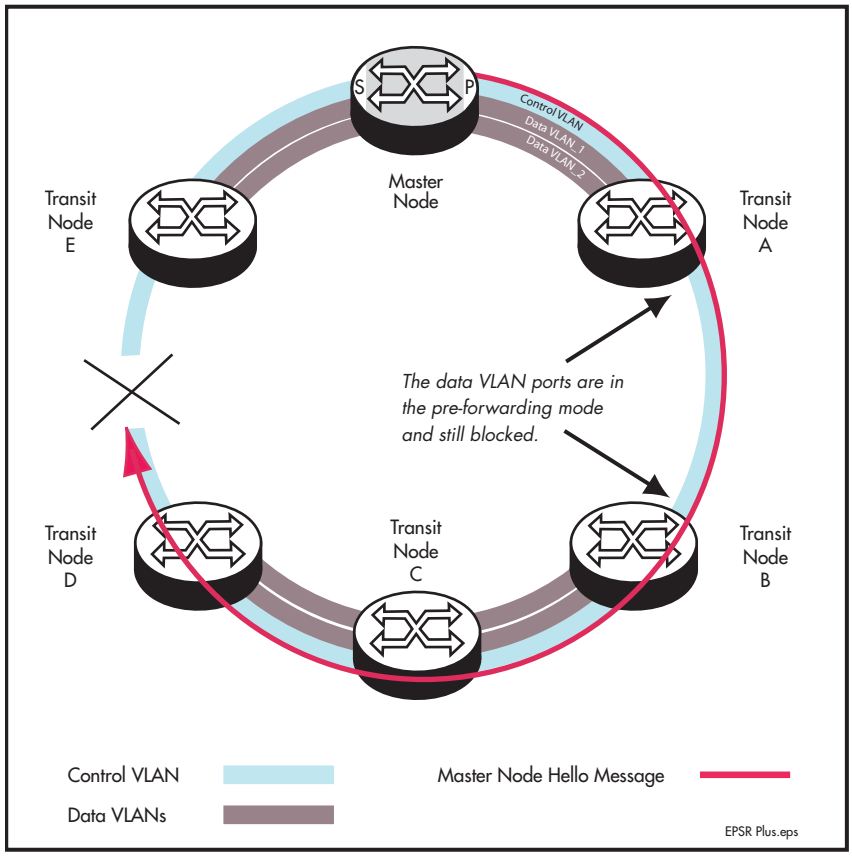


In this operational mode each portion of the ring operates as an independent link layer broadcast domain each containing the original data VLANs and control VLAN.

Recovery When One Break is Restored

Figure 86-5 on page 86.9 shows a ring with the link between nodes A and B restored. At this point the ring's behavior will depend on whether the **epsr enhancedrecovery enable** command on page 87.7 has been set.

Figure 86-5: EPSR Ring with One Link Restored



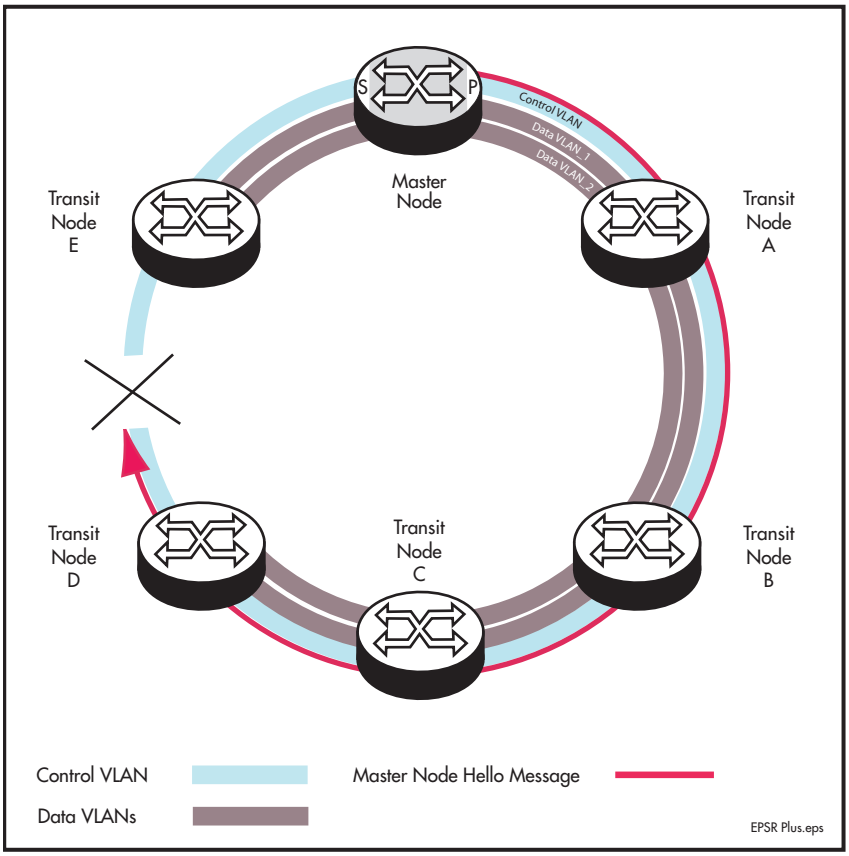
Enhanced Recovery Disabled

With the enhanced recovery feature disabled, the Hello messages will now reach the remaining ring break; however from a users perspective, the ring will remain as shown in the split state shown in **Figure 86-4**.

Enhanced Recovery Enabled

With the enhanced recovery feature enabled, switch nodes A and B are able to detect the restored link, and will place all their ring ports in the forwarding state. Although the ring will remain in the "failed" state because of the remaining break; communication between the nodes is restored. The network then operates as shown in **Figure 86-6**.

Figure 86-6: EPSR Operation in Partially Recovered State



Configuration Examples

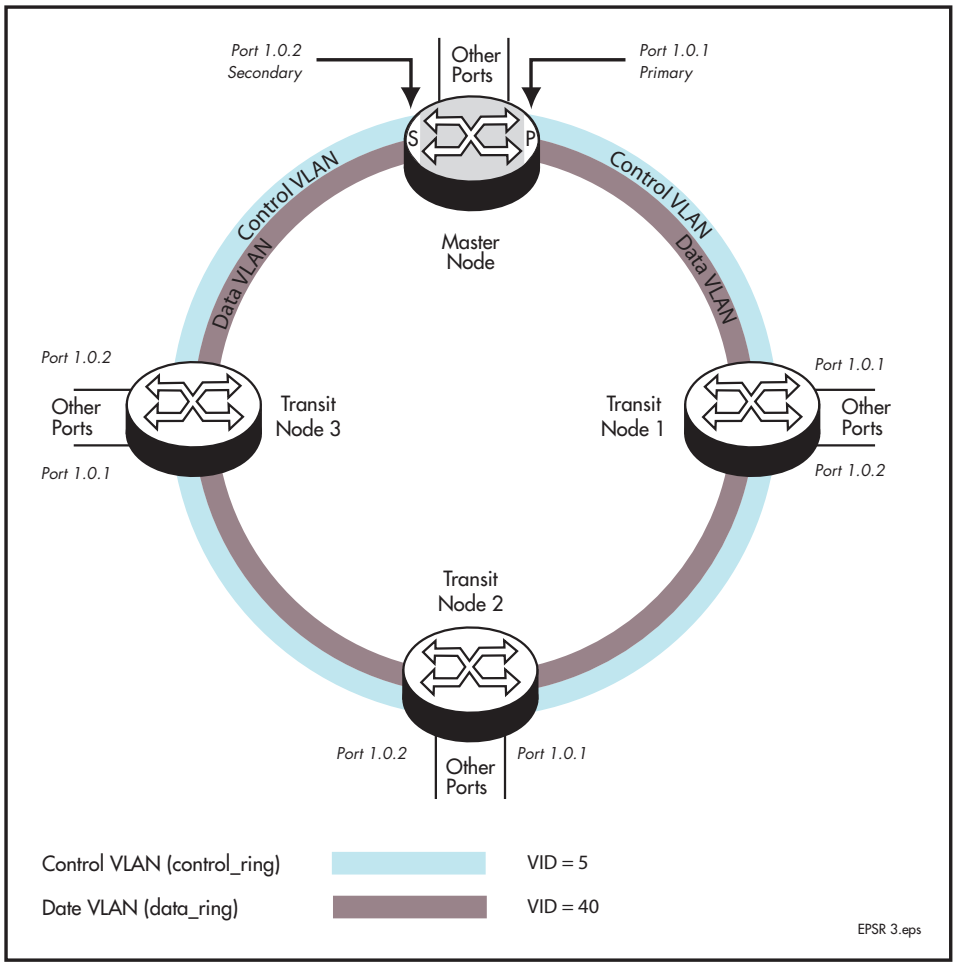
This section describes how to configure EPSR in following ways:

- **Single Domain, Single Ring Network**
- **Single Ring, Dual Domain Network**
- **EPSR and Spanning Tree Operation**

Single Domain, Single Ring Network

This example shows a simple single ring, single domain configuration with no connecting lobes.

Figure 86-7: EPSR single domain, single ring network



Configure the Master Node

Step 1: Create the control and data VLANs on the Master Node

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`vlan database`	Enter the VLAN Configuration mode.
`awplus(config-vlan)#`	
`vlan 5 name control_vlan state enable`	Enable VLAN 5 called `control_vlan` on the Master Node. Specifying the enable state allows forwarding of frames on the VLAN-aware node.
`awplus(config-vlan)#`	
`vlan 40 name data_vlan state enable`	Enable VLAN 40 called `data_vlan` on the Master Node. Specifying the enable state allows forwarding of frames on the VLAN-aware node.
`awplus(config-vlan)#`	
`exit`	Exit the VLAN Configuration mode and enter the Global Configuration mode.

Step 2: Add port1.0.1 to these VLANs

`awplus(config)#`	
`interface port1.0.1`	Specify the interface (`port1.0.1`) that you are configuring and enter the Interface Configuration mode.
`awplus(config-if)#`	
`switchport mode trunk`	Set the switching characteristics of this port to Trunk mode.
`awplus(config-if)#`	
`switchport trunk allowed vlan add 5`	Enable VLAN 5 on this port.
`awplus(config-if)#`	
`switchport trunk allowed vlan add 40`	Enable VLAN 40 on this port.
`awplus(config-if)#`	
`exit`	Exit the Interface mode and enter the Global Configuration mode.

Step 3: Add port1.0.2 to these VLANs

`awplus(config)#`	
`interface port1.0.2`	Specify the interface (`port1.0.2`) that you are configuring and enter the Interface Configuration mode.
`awplus(config-if)#`	
`switchport mode trunk`	Set the switching characteristics of this port to Trunk mode.
`awplus(config-if)#`	
`switchport trunk allowed vlan add 5`	Enable VLAN 5 on this port.
`awplus(config-if)#`	
`switchport trunk allowed vlan add 40`	Enable VLAN 40 on this port.
`awplus(config-if)#`	
`exit`	Exit the Interface Configuration mode and enter the Global Configuration mode.

Step 4: Create the EPSR Instance called “blue” on the master node, make VLAN 5 the control VLAN and port 1.0.1 the primary port

`awplus(config)#`	
`epsr configuration`	Enter the EPSR Configuration mode.
`awplus(config-epsr)#`	
`epsr blue mode master controlvlan 5 primaryport port1.0.1`	Create an EPSR instance called `blue` on `vlan5`. Make `vlan5` the control VLAN. Make `port 1.0.1` the primary port. Make this node the master.

Step 5: Add a data VLAN to the EPSR Instance called “blue” on the Master Node

`awplus(config-epsr)#`	
`epsr blue datavlan 40`	On epsr instance called `blue` make `vlan40` the data VLAN.

Step 6: Enable the EPSR Instance called “blue” on the Master Node

`awplus(config-epsr)#`	
`epsr blue state enable`	Enable the EPSR instance named `blue`.
`awplus(config-epsr)#`	
`exit`	Exit the EPSR Configuration mode.

Now you can configure the transit nodes.

Step 7: Create the Control and Data VLANs on a Transit Node

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`vlan database`	Enter the VLAN Configuration mode.
`awplus(config-vlan)#`	
`vlan 5 name control_vlan state enable`	Enable VLAN 5 called `control_vlan` on the Transit Node. Specifying the enable state allows forwarding of frames on the VLAN-aware node.
`awplus(config-vlan)#`	
`vlan 40 name data_vlan state enable`	Enable VLAN 40 called `data_vlan` on the Transit Node. Specifying the enable state allows forwarding of frames on the VLAN-aware node.
`awplus(config-vlan)#`	
`exit`	Exit the VLAN Configuration mode and enter the Global Configuration mode.

Step 8: Add port1.0.1 to the VLANs

`awplus(config)#`	
`interface port1.0.1`	Specify the interface (`port1.0.1`) that you are configuring and enter the Interface Configuration mode.
`awplus(config-if)#`	
`switchport mode trunk`	Set the switching characteristics of this port to Trunk mode.
`awplus(config-if)#`	
`switchport trunk allowed vlan add 5`	Enable VLAN 5 on this port.
`awplus(config-if)#`	
`switchport trunk allowed vlan add 40`	Enable VLAN 40 on this port.
`awplus(config-if)#`	
`exit`	Exit the Interface Configuration mode and enter the Global Configuration mode.

Step 9: Add port1.0.2 to the VLANs

`awplus(config)#`	
`interface port1.0.2`	Specify the interface (`port1.0.2`) that you are configuring and enter the Interface Configuration mode.
`awplus(config-if)#`	
`switchport mode trunk`	Set the switching characteristics of this port to Trunk mode.
`awplus(config-if)#`	
`switchport trunk allowed vlan add 5`	Enable VLAN 5 on this port.
`awplus(config-if)#`	
`switchport trunk allowed vlan add 40`	Enable VLAN 40 on this port.
`awplus(config-if)#`	
`exit`	Exit the Interface Configuration mode and enter the Global Configuration mode.

Step 10: Create the EPSR Instance called “blue” on a transit node, make VLAN 5 the control VLAN

`awplus(config)#`	
`epsr configuration`	Enter the EPSR Configuration mode.
`awplus(config-epsr)#`	
`epsr blue mode transit controlvlan 5`	Create an EPSR instance called `blue` on `vlan5`. Make `vlan5` the control VLAN. Make this node a transit node.

Step 11: Add a data VLAN to the EPSR Instance called “blue” on the transit node

`awplus(config-epsr)#`	
`epsr blue datavlan 40`	On the EPSR instance called `blue` make `vlan40` the data VLAN.

Step 12: Enable the EPSR Instance called “blue” on the transit node

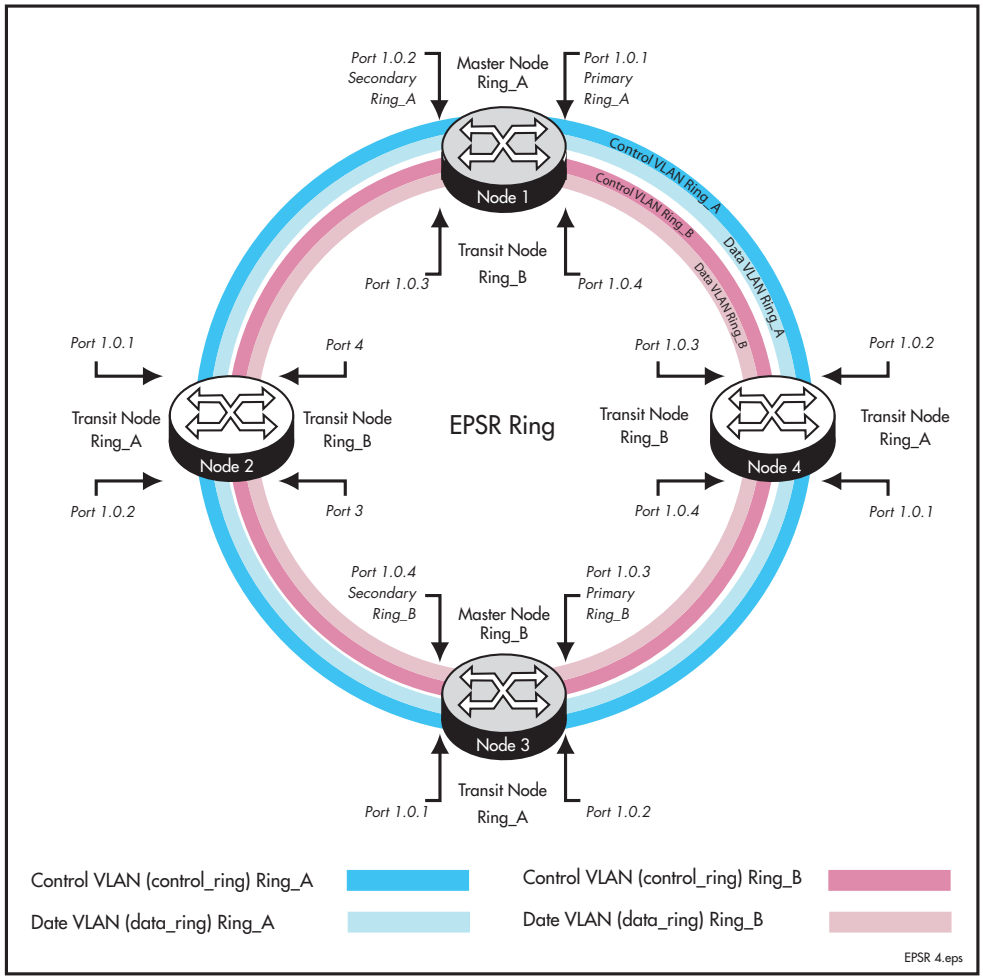
`awplus(config-epsr)#`	
`epsr blue state enable`	Enable the EPSR instance named `blue`.
`awplus(config-epsr)#`	
`exit`	Exit the EPSR Configuration mode.

Now you can use the same procedure to configure the remaining transit nodes.

Single Ring, Dual Domain Network

This example shows an EPSR configuration where two EPSR domains share the same physical ring. This configuration enables two sets of users to run totally separate Layer 2 networks. Better load distribution around the ring can be achieved by configuring different nodes to be the master for each ring.

Figure 86-8: EPSR single ring network, two domain network.

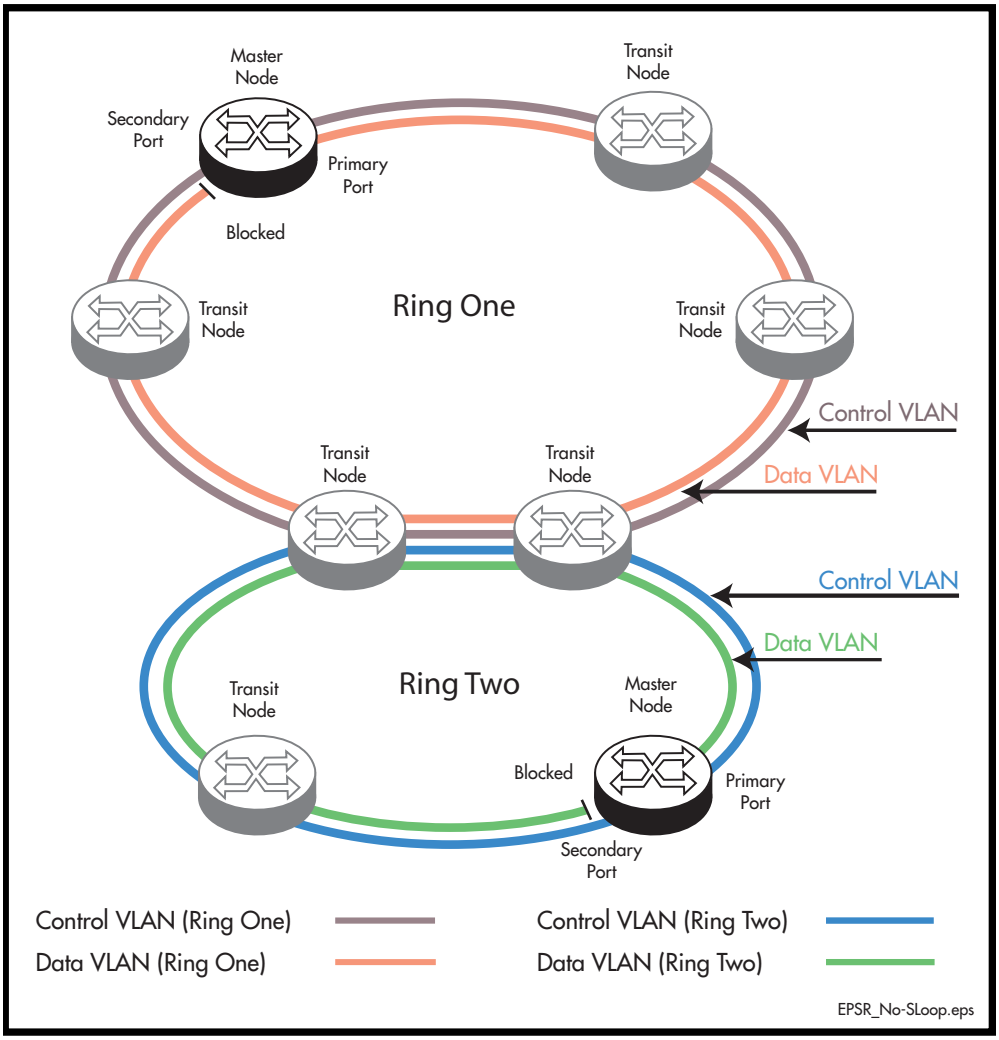


Interconnected Rings

This example shows an EPSR configuration where two rings share a common segment. This configuration will operate as two independent rings, providing that there is no data VLAN sharing between the two rings. If a break occurs in either ring then, each ring will implement its own independent recovery procedures. If a break occurs in the common segment, then each Master node will unblock its secondary port using the normal fault recovery procedure.

Where data VLANS are shared between the rings a fault condition know as “SuperLoop” can occur. The next section deals with superloops and how to manage them.

Figure 86-9: Interconnected EPSR Rings with No Data VLAN Sharing



Superloop Protection

Careful attention must be paid when creating EPSR networks with interconnecting links, to avoid an error condition known as superloops. This sections explains what superloops are and how to prevent them.

What is a an EPSR Superloop?

An EPSR superloop is a data loop whose path traverses more than a single EPSR ring. This fault condition usually occurs when there is a break in a physical segment that is shared by the two rings. For a superloop condition to occur, the two physical rings must share some of their data VLANS. **Figure 86-10 on page 86.18**shows an EPSR ring with a superloop condition caused by a break in the common ring segment. **Figure 86-11 on page 86.19** shows the Superloop data path ring caused by the broken common ring segment. The superloop condition occurs because both rings detect the ring segment break and as a result both master nodes unblock their secondary ports.

Figure 86-10: Interconnected EPSR Rings with Data VLAN Sharing

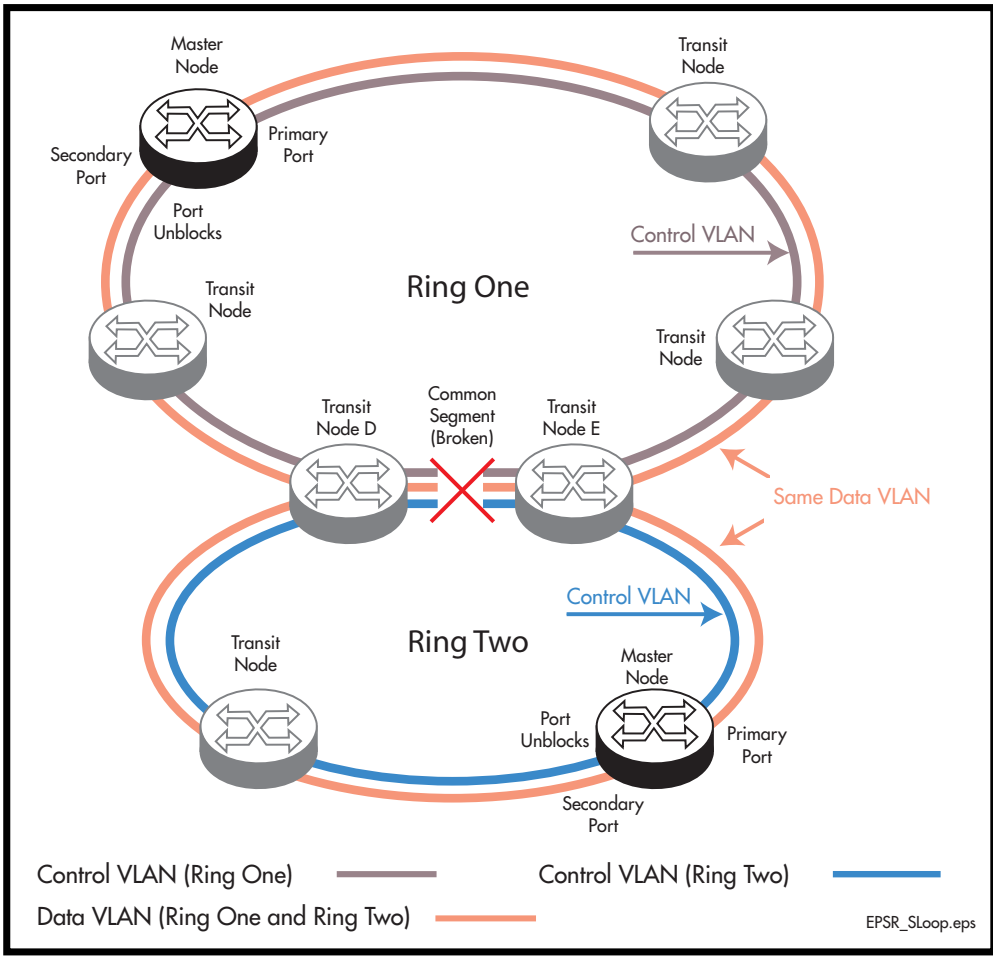


Figure 86-11: EPSR Superloop data path caused by a broken common ring segment

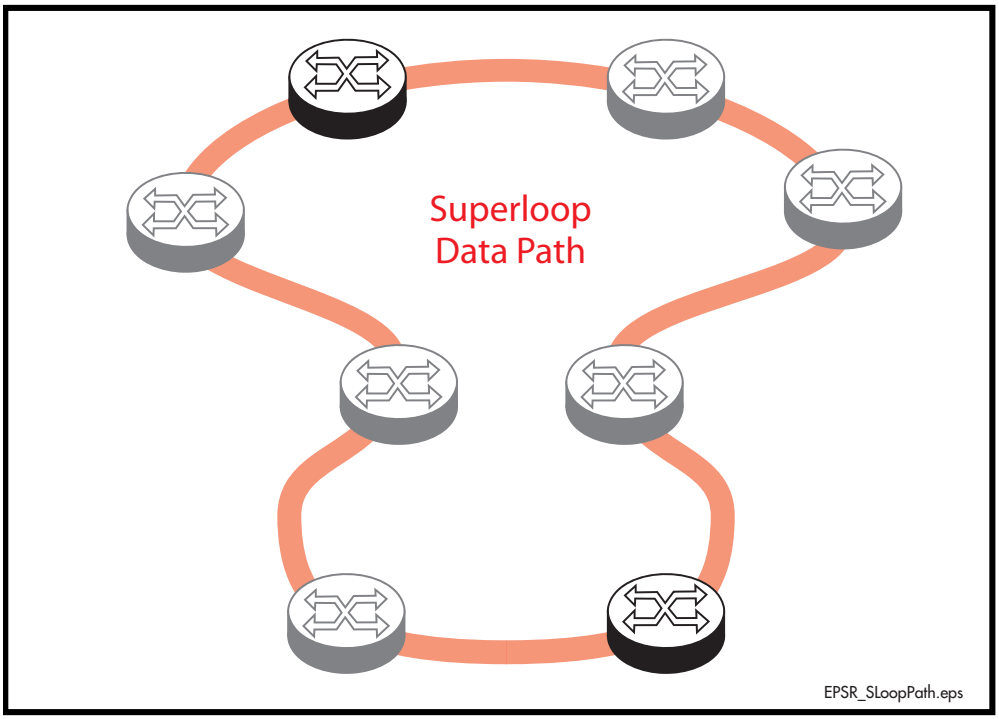


EPSR Superloop Prevention

Alliedware Plus version 5.4.2 onwards contains mechanisms to prevent superloops forming. The Superloop prevention facility enables rings to be assigned priority level between 0 and 127, with 1 representing the lowest priority and 127 the highest. Level 0 (the default setting) applies the functionality of no Superloop prevention. Enabling superloop prevention changes the way the EPSR nodes respond under fault conditions.

Superloop prevention is enabled for an EPSR ring instance by setting the **epsr priority** command on page 87.10. Setting a priority value greater than 0 applies superloop prevention to that particular instance. How the superloop function is applied will depend on the role of the node within the ring, i.e. whether it is a master node or a transit node, and its physical location within the ring. Here is how the functions of Superloop prevention modify the nodal behavior for a particular ring instance:

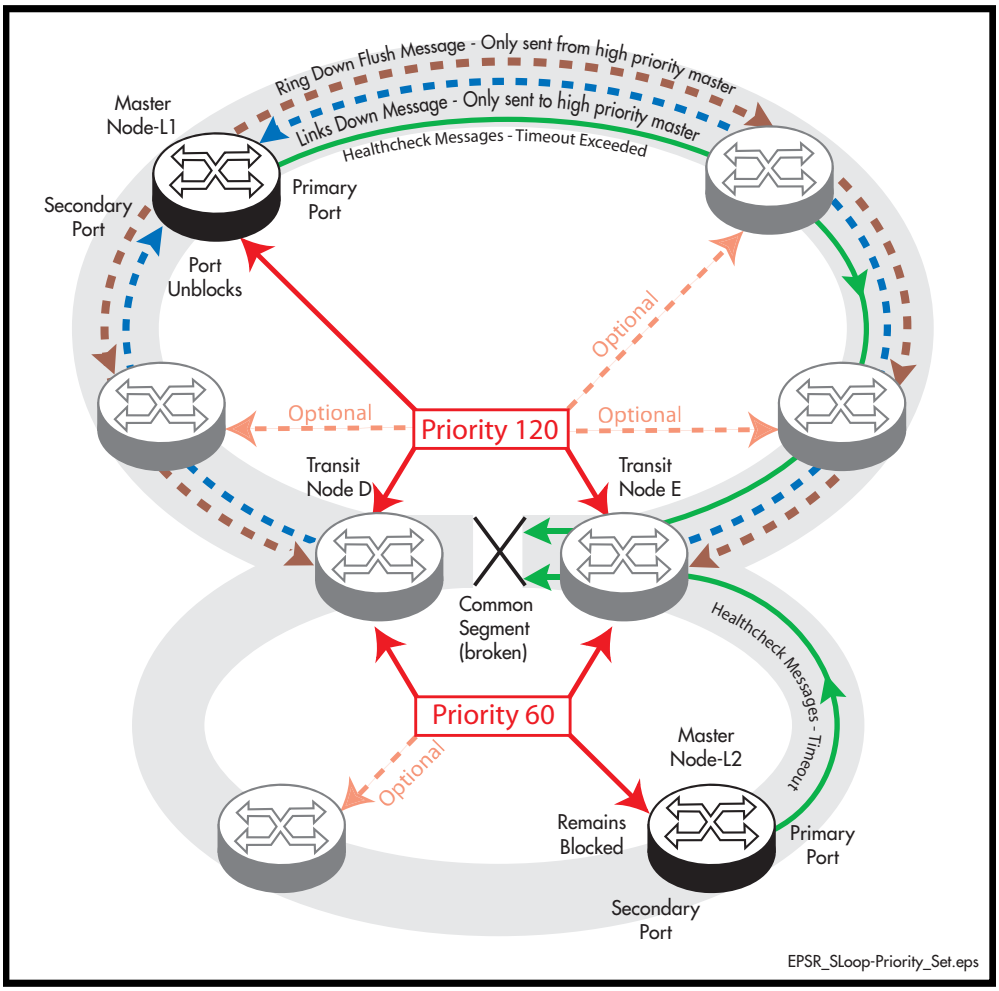
- A master node with its epsr priority set to zero will consider the superloop function to be turned off.
- A master node with its epsr priority set within the range 1-127 will consider the superloop function to be enabled, and will change its behavior in the following ways.
  - « It will **not** unblock its secondary port following the expiry of the Master Node Hello message timer. However, a ring-down-flush message will still be sent.
  - « It **will** only unblock its secondary port when it receives a Links Down message from a transit node.
- A transit node that is not connect to a shared link will be unaffected by having its epsr priority set for any of its instances.
- A transit node that is connected to a shared link will change its behavior in the following ways:
  - « It will compare its priority settings applied to each of the instances sharing the common link. So for the network of **Figure 86-10 on page 86.18** Transit Node D

will compare the priority setting for Ring One, with the priority setting for Ring Two.

If the shared link fails, the transit node will only issue a **Transit Node Links Down message** on the ring that is configured with the highest priority.

The result of these behavior changes is that when the shared link fails, only the master node located on the higher priority ring will unblock its secondary port; because this is the only master node that will receive the **Transit Node Links Down message**. Note also that the master node will receive these messages from the transit nodes at either end of the broken shared link (Nodes D and E). This concept is illustrated in

Figure 86-12: EPSR behavior under fault conditions with Superloop enabled



For this process to work requires certain configuration rules to be obeyed.

Configuration Rules for Superloop Protected EPSR Rings

The following configuration rules are advised when configuring EPSR rings that share one or more common segments.

- Allocate a priority order to each of the interconnected rings, with 127 being the highest priority and 1 the lowest.
- A higher priority ring can have its master node located in any position; although, where possible, avoid connecting a common segment to the secondary port of a master node.
- Do not locate the master node on a segment that is shared with a higher priority ring, but you "can" locate it on a common segment that is shared with a lower priority ring. In this situation however, the port that connects to the common segment must be configured as the primary port.

  For example, in **Figure 86-12**, the upper portion of Node D could be configured as a Master Node of the upper ring (having a priority of 120), but its lower portion must be configured as a Transit Node (having the lower priority of 60).
- On the transit nodes that connect to shared links, allocate the ring's priority to the ports that connect to each ring. Note that both of these nodes "must" be set to the same priority value.

Note

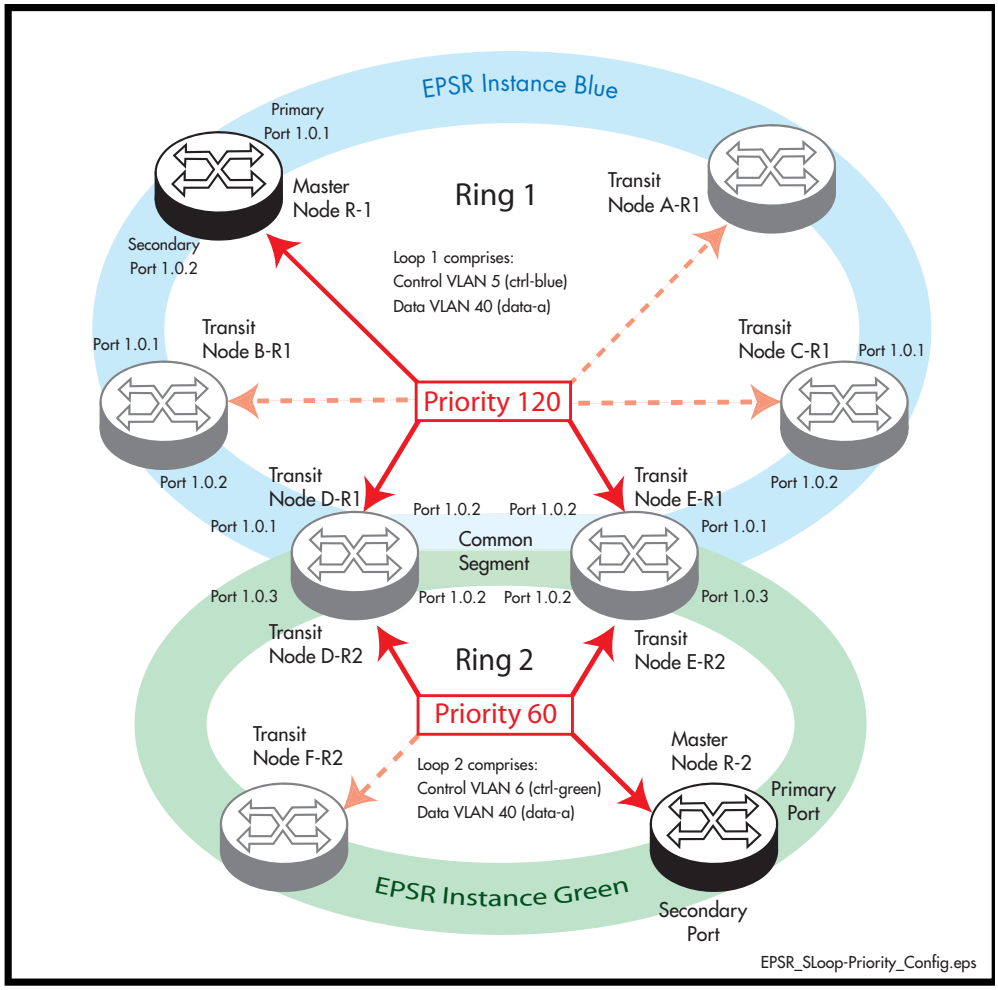
For good practice, we advise that you set all nodes within a ring to the priority assigned to that ring. So, for the network of **Figure 86-12** each of the nodes that form part of the upper ring would be configured with a priority of 120, and each of the nodes that form the lower ring would all be configured with a priority of 60.

Configuring a Basic Superloop Protected Two Ring EPSR Network

Configuration Example

This section shows how to configure a basic EPSR network such as that shown in **Figure 86-13** below.

Figure 86-13: EPSR Two Shared Ring Example



The configuration suggested comprises the following basic steps:

- **"On Ring 1- Configure the Master Node R-1" on page 86.23**
- **"On Ring 1 - Configure the Transit Nodes A to C" on page 86.25**
- **"On Ring 2 - Configure the Master Node R-2" on page 86.27**
- **"On Rings 1 and 2 - Configure the Transit Nodes D and E" on page 86.29**
- **"On Ring 2 - Configure the Transit Node F" on page 86.35**

On Ring 1- Configure the Master Node R-1

Step 1: Create the control and data VLANs (Configure on the Master Node R-1)

`awplus#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config)#` `vlan database`	Enter the VLAN Configuration mode.
`awplus(config-vlan)#` `vlan 5 name ctrl-blue state enable`	Enable VLAN 5 called ctrl-blue on the Master Node R-1. Specifying the enable state allows forwarding of frames on the VLAN-aware node.
`awplus(config-vlan)#` `vlan 40 name data-a state enable`	Enable VLAN 40 called **data-a** on the Master Node R-1. Specifying the enable state allows forwarding of frames on the VLAN-aware node.
`awplus(config-vlan)#` `exit`	Exit the VLAN Configuration mode and enter the Global Configuration mode.

Step 2: Add the control VLAN (ctrl-blue) to the Ring Ports

`awplus(config)#` `interface port1.0.1,port1.0.2`	Specify the two ring ports (`port1.0.1 and port1.0.2`) that you are configuring and enter the Interface Configuration mode.
`awplus(config-if)#` `switchport mode trunk`	Set the switching characteristics of these ports to Trunk mode.
`awplus(config-if)#` `switchport trunk allowed vlan add 5`	Enable VLAN 5 on these ports.
`awplus(config-if)#` `switchport trunk native vlan none`	Remove the native VLAN from these ring ports.

Step 3: Create the EPSR Instance called "blue", make VLAN 5 the control VLAN and port 1.0.1 the primary port (Configure on the Master Node R-1)

`awplus(config)#`	
`epsr configuration`	Enter the EPSR Configuration mode.
`awplus(config-epsr)#`	
`epsr blue mode master controlvlan 5 primaryport port1.0.1`	Create an EPSR instance called `blue` on `vlan 5`. Make `vlan 5` the control VLAN. Make `port 1.0.1` the primary port. Make this node the master.

Step 4: Add a data VLAN to the EPSR Instance called "blue" (Configure on the Master Node R-1)

`awplus(config-epsr)#`	
`epsr blue datavlan 40`	On epsr instance called blue data-a the data VLAN.

Step 5: Assign a priority to the ring instance (Configure on the Master Node R-1)

`awplus(config-epsr)#`	
`epsr blue priority 120`	Set the ring instance priority to the value selected for the ring. The priority value selected is 120.
`awplus(config-epsr)#`	
`exit`	Exit the EPSR Configuration mode.

Step 6: Enable the EPSR Instance called "blue" (Configure on the Master Node R-1)

`awplus(config-epsr)#`	
`epsr blue state enable`	Enable the EPSR instance named `blue`.
`awplus(config-epsr)#`	
`exit`	Exit the EPSR Configuration mode.

Step 7: Add port1.0.1 to these VLANs (Configure on the Master Node R-1)

`awplus(config)#`	
`interface port1.0.1,port1.0.2`	Specify the EPSR ring ports (`port1.0.1 and 1.0.2`) that you are configuring and enter the Interface Configuration mode.
`awplus(config-if)#`	
`switchport trunk allowed vlan add 40`	Enable VLAN 40 on this port.
`awplus(config-if)#`	
`exit`	Exit the Interface mode and enter the Global Configuration mode.

On Ring 1 - Configure the Transit Nodes A to C

Step 1: Create the control and data VLANs (on Transit Nodes A to C)

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`vlan database`	Enter the VLAN Configuration mode.
`awplus(config-vlan)#`	
`vlan 5 name ctrl-blue state enable`	Enable VLAN 5 called `ctrl-blue` on the Transit Node. Specifying the enable state allows forwarding of frames on the VLAN-aware node.
`awplus(config-vlan)#`	
`vlan 40 name data-a state enable`	Enable VLAN 40 called `data-a` on the Transit Node. Specifying the enable state allows forwarding of frames on the VLAN-aware node.
`awplus(config-vlan)#`	
`exit`	Exit the VLAN Configuration mode and enter the Global Configuration mode.

Step 2: Add the EPSR control vlan (ctrl-blue) to EPSR ring ports

`awplus(config)#`	
`interface port1.0.1,port1.0.2`	Specify the two ring ports (`port1.0.1 and port1.0.2`) that you are configuring and enter the Interface Configuration mode.
`awplus(config-if)#`	
`switchport mode trunk`	Set the switching characteristics of this port to Trunk mode.
`awplus(config-if)#`	
`switchport trunk allowed vlan add 5`	Enable VLAN 5 on these ports.
`awplus(config-if)#`	
`switchport trunk native vlan none`	Remove the native VLAN from the ring ports.

Step 3: Create the EPSR Instance called “blue”, make VLAN 5 the control VLAN (on Transit Nodes A to C)

`awplus(config)#`	
`epsr configuration`	Enter the EPSR Configuration mode.
`awplus(config-epsr)#`	
`epsr blue mode transit controlvlan 5`	Create an EPSR instance called `blue` on `vlan 5`. Make `vlan 5` the control VLAN. Make this node a transit node.

Step 4: Add a data VLAN to the EPSR Instance called "blue" (on Transit Nodes A to C)

`awplus(config-epsr)#`	
`epsr blue datavlan 40`	On the EPSR instance called `blue` make `vlan 40` the data VLAN.

Step 5: Assign a priority to the ring instance (on Transit Nodes A to C)

This step is **mandatory on transit nodes that connect to a common segment**, and good practice on other transit nodes.

`awplus(config-epsr)#`	
`epsr blue priority 120`	Set the ring instance priority to the priority selected for the ring 120.

Step 6: Enable the EPSR Instance called "blue" (on Transit Nodes A to C)

`awplus(config-epsr)#`	
`epsr blue state enable`	Enable the EPSR instance named `blue`.
`awplus(config-epsr)#`	
`exit`	Exit the EPSR Configuration mode.

Step 7: Add the physical port 1.0.1 to VLAN 40 (on Transit Nodes A to C)

`awplus(config)#`	
`interface port1.0.1,port1.0.2`	Specify the physical ring ports (`ports1.0.1` and ports 1.0.2) that you are configuring and enter the Interface Configuration mode.
`awplus(config-if)#`	
`switchport trunk allowed vlan add 40`	Enable VLAN 40 on this port.
`awplus(config-if)#`	
`exit`	Exit the Interface mode and enter the Global Configuration mode.

On Ring 2 - Configure the Master Node R-2

Step 1: Create the control and data VLANs (Configure on the Master Node R-2)

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`vlan database`	Enter the VLAN Configuration mode.
`awplus(config-vlan)#`	
`vlan 6 name ctrl-green state enable`	Enable vlan 6 called ctrl-green on the Master Node R-2. Specifying the enable state allows forwarding of frames on the VLAN-aware node.
`awplus(config-vlan)#`	
`vlan 40 name data-a state enable`	Enable VLAN 40 called data-a on the Master Node R-2. Specifying the enable state allows forwarding of frames on the VLAN-aware node.
`awplus(config-vlan)#`	
`exit`	Exit the VLAN Configuration mode and enter the Global Configuration mode.

Step 2: Add the control VLAN (ctrl-green) to the Ring Ports

`awplus(config)#`	
`interface port1.0.1,port1.0.2`	Specify the ports (`port1.0.1 and port1.0.2`) that you are configuring, and enter the Interface Configuration mode.
`awplus(config-if)#`	
`switchport mode trunk`	Set the switching characteristics of these ports to Trunk mode.
`awplus(config-if)#`	
`switchport trunk allowed vlan add 6`	Enable vlan 6 on these ports.
`awplus(config-if)#`	
`switchport trunk native vlan none`	Remove the native VLAN from these ring ports.

Step 3: Create the EPSR Instance called "green", make vlan 6 the control VLAN and port1.0.1 the primary port (Configure on the Master Node R-2)

`awplus(config)#`	
`epsr configuration`	Enter the EPSR Configuration mode.
`awplus(config-epsr)#`	
`epsr green mode master controlvlan 6 primaryport port1.0.1`	Create an EPSR instance called `ctrl-green` on `vlan 6`. Make `vlan 6` the control VLAN. Make `port 1.0.1` the primary port. Make this node the master.

Step 4: Add a data VLAN to the EPSR Instance called "green" (Configure on the Master Node R-2)

`awplus(config-epsr)#`	
`epsr green datavlan 40`	On epsr instance called green make `vlan 40` the data VLAN.

Step 5: Assign a priority to the ring instance (Configure on the Master Node R-2)

This step is **mandatory on transit nodes that connect to a common segment**, and good practice on other transit nodes.

`awplus(config-epsr)#`	
`epsr green priority 60`	Set the ring instance priority to the value selected for the ring. The priority value selected is 60.

Step 6: Enable the EPSR Instance called "green" (Configure on the Master Node R-2)

`awplus(config-epsr)#`	
`epsr green state enable`	Enable the EPSR instance named green.
`awplus(config-epsr)#`	
`exit`	Exit the EPSR Configuration mode.

Step 7: Add ports 1.0.1 and 1.0.2 to these VLANs (Configure on the Master Node R-2)

`awplus(config)#`	
`interface port1.0.1,port1.0.2`	Specify the ports (`port1.0.1 and port1.0.2`) that you are configuring and enter the Interface Configuration mode.
`awplus(config-if)#`	
`switchport mode trunk`	Set the switching characteristics of these ports to Trunk mode.
`awplus(config-if)#`	
`switchport trunk allowed vlan add 40`	Enable VLAN 40 on this port
`awplus(config-if)#`	
`exit`	Exit the Interface mode and enter the Global Configuration mode.

On Rings 1 and 2 - Configure the Transit Nodes D and E

Step 1: Create the control and data VLANs (on Transit Nodes D and E)

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`vlan database`	Enter the VLAN Configuration mode.
`awplus(config-vlan)#`	
`vlan 5 name ctrl-blue state enable`	Enable VLAN 5 called `ctrl-blue` on the Transit Node. Specifying the enable state allows forwarding of frames on the VLAN-aware node.
`awplus(config-vlan)#`	
`vlan 40 name data-a state enable`	Enable VLAN 40 called `data-a` on the Transit Node. Specifying the enable state allows forwarding of frames on the VLAN-aware node.
`awplus(config-vlan)#`	
`vlan 6 name ctrl-green state enable`	Enable VLAN 6 called `ctrl-green` on the Transit Node. Specifying the enable state allows forwarding of frames on the VLAN-aware node.
`awplus(config-vlan)#`	
`exit`	Exit the VLAN Configuration mode and enter the Global Configuration mode.

Step 2: Add physical port1.0.1 to these VLANs (on Transit Nodes D and E)

`awplus(config)#`	
`interface port1.0.1`	Specify the physical `interface (port1.0.1)` that you are configuring and enter the Interface Configuration mode.
`awplus(config-if)#`	
`switchport mode trunk`	Set the switching characteristics of this port to Trunk mode.
`awplus(config-if)#`	
`switchport trunk allowed vlan add 5`	Enable VLAN 5 on this port.
`awplus(config-if)#`	
`switchport trunk native vlan none`	Remove the native VLAN.
`awplus(config-if)#`	
`exit`	Exit the Interface mode and enter the Global Configuration mode.

Step 3: Add physical port1.0.2 to these VLANs (on Transit Nodes D and E)

`awplus(config)#`	
`interface port1.0.2`	Specify the physical `interface (port1.0.2)` that you are configuring and enter the Interface Configuration mode.
`awplus(config-if)#`	
`switchport mode trunk`	Set the switching characteristics of this port to Trunk mode.
`awplus(config-if)#`	
`switchport trunk allowed vlan add 5`	Enable VLAN 5 (ctrl-blue) on this port.
`awplus(config-if)#`	
`switchport trunk allowed vlan add 6`	Enable VLAN 6 (ctrl-green) on this port.
`awplus(config-if)#`	
`switchport trunk native vlan none`	Remove the native VLAN.
`awplus(config-if)#`	
`exit`	Exit the Interface mode and enter the Global Configuration mode.

Step 4: Add physical port1.0.3 to these VLANs (on Transit Nodes D and E)

`awplus(config)#`	
`interface port1.0.3`	Specify the physical `interface (port1.0.3)` that you are configuring and enter the Interface Configuration mode.
`awplus(config-if)#`	
`switchport mode trunk`	Set the switching characteristics of this port to Trunk mode.

`awplus(config-if)#`	
`switchport trunk allowed vlan add 6`	Enable VLAN 6 on this port.
`awplus(config-if)#`	
`switchport trunk native vlan none`	Remove the native VLAN.
`awplus(config-if)#`	
`exit`	Exit the Interface mode and enter the Global Configuration mode.

Step 5: Create the EPSR Instance called "blue" on a transit node, make VLAN 5 the control VLAN (on Transit Nodes D and E)

`awplus(config)#`	
`epsr configuration`	Enter the EPSR Configuration mode.
`awplus(config-epsr)#`	
`epsr blue mode transit controlvlan 5`	Create an EPSR instance called `blue` on `vlan 5`. Make `vlan 5` the control VLAN. Make this node a transit node.

Step 6: Add a data VLAN to the EPSR Instance called "blue" (on Transit Nodes D and E)

`awplus(config-epsr)#`	
`epsr blue datavlan 40`	On the EPSR instance called `blue` make `vlan 40` the data VLAN.

Step 7: Assign a priority to the ring instance (on Transit Nodes D and E)

This step is **mandatory on transit nodes that connect to a common segment**, and good practice on other transit nodes.

`awplus(config-epsr)#`	
`epsr blue priority 120`	Set the ring instance priority to 120 - the value selected for the ring.
`awplus(config-epsr)#`	
`exit`	Exit the EPSR Configuration mode.

Step 8: Enable the EPSR Instance called "blue" (on Transit Nodes D and E)

`awplus(config-epsr)#`	
`epsr blue state enable`	Enable the EPSR instance named `blue`.

Step 9: Create the EPSR Instance called “green” on a transit node, make VLAN 6 the control VLAN (on Transit Nodes D and E)

`awplus(config-epsr)#`	
`epsr green mode transit controlvlan 6`	Create an EPSR instance called `green` on `vlan 6`. Make `vlan 6` the control VLAN. Make this node a transit node.

Step 10: Add a data VLAN to the EPSR Instance called "green" (on Transit Nodes D and E)

`awplus(config-epsr)#`	
`epsr green datavlan 40`	On the EPSR instance called `green` make `vlan 40` the data VLAN.

Step 11: Assign a priority to the ring instances (on Transit Nodes D and E)

This step is **mandatory on transit nodes that connect to a common segment**, and good practice on other transit nodes.

`awplus(config-epsr)#`	
`epsr green priority 60`	Set the ring instance priority to 60 - this being the priority selected for the ring.
`awplus(config-epsr)#`	
`exit`	Exit the EPSR Configuration mode.

Step 12: Enable the EPSR Instance called "green" (on Transit Nodes D and E)

`awplus(config-epsr)#`	
`epsr green state enable`	Enable the EPSR instance named `green`.
`awplus(config-epsr)#`	
`exit`	Exit the EPSR Configuration mode.

Step 13: Add the physical port 1.0.1 to these VLANs (on Transit Nodes D and E)

`awplus(config)#`	
`interface port1.0.1`	Specify the physical interface (`port1.0.1`) that you are configuring, and enter the Interface Configuration mode.
`awplus(config-if)#`	
`switchport mode trunk`	Set the switching characteristics of this port to Trunk mode.
`awplus(config-if)#`	
`switchport trunk allowed vlan add 40`	Enable VLAN 40 on this port.
`awplus(config-if)#`	
`exit`	Exit the Interface Configuration mode and enter the Global Configuration mode.

Step 14: Add the physical port1.0.2to these VLANs (on Transit Nodes D and E)

`awplus(config)#`	
`interface port1.0.2`	Specify the physical interface (`port1.0.2`) that you are configuring and enter the Interface Configuration mode.
`awplus(config-if)#`	
`switchport mode trunk`	Set the switching characteristics of this port to Trunk mode.
`awplus(config-if)#`	
`switchport trunk allowed vlan add 40`	Enable VLAN 40 on this port.
`awplus(config-if)#`	
`exit`	Exit the Interface Configuration mode and enter the Global Configuration mode.

Step 15: Add the physical port1.0.3to these VLANs (on Transit Nodes D and E)

`awplus(config)#`	
`interface port1.0.3`	Specify the physical interface (`port1.0.3`) that you are configuring and enter the Interface Configuration mode.
`awplus(config-if)#`	
`switchport mode trunk`	Set the switching characteristics of this port to Trunk mode.
`awplus(config-if)#`	
`switchport trunk allowed vlan add 40`	Enable VLAN 40 on this port.
`awplus(config-if)#`	
`exit`	Exit the Interface Configuration mode and enter the Global Configuration mode.

On Ring 2 - Configure the Transit Node F

Step 1: Create the control and data VLANs (on Transit Node F)

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`vlan database`	Enter the VLAN Configuration mode.
`awplus(config-vlan)#`	
`vlan 6 name ctrl-green state enable`	Enable VLAN 6 called `ctrl-green` on the Transit Node. Specifying the enable state allows forwarding of frames on the VLAN-aware node.
`awplus(config-vlan)#`	
`vlan 40 name data-a state enable`	Enable VLAN 40 called `data-a` on the Transit Node. Specifying the enable state allows forwarding of frames on the VLAN-aware node.
`awplus(config-vlan)#`	
`exit`	Exit the VLAN Configuration mode and enter the Global Configuration mode.

Step 2: Create the EPSR Instance called "green" on a transit node, make VLAN 6 the control VLAN (on Transit Node F)

`awplus(config)#`	
`epsr configuration`	Enter the EPSR Configuration mode.
`awplus(config-epsr)#`	
`epsr green mode transit controlvlan 6`	Create an EPSR instance called `green` on `vlan 6`. Make `vlan 6` the control VLAN. Make this node a transit node.

Step 3: Add a data VLAN to the EPSR Instance called "green" (on Transit Node F)

`awplus(config-epsr)#`	
`epsr green datavlan 40`	On the EPSR instance called `green` make `vlan 40` the data VLAN.

Step 4: Enable the EPSR Instance called "green" (on Transit Node F)

`awplus(config-epsr)#`	
`epsr green state enable`	Enable the EPSR instance named `green`.

Step 5: Assign a priority to the ring instance (on Transit Node F)

This step is **mandatory on transit nodes that connect to a common segment**, and good practice on other transit nodes.

`awplus(config-epsr)#`	
`epsr green priority 120`	Set the ring instance priority to the priority selected for the ring 120.
`awplus(config-epsr)#`	
`exit`	Exit the EPSR Configuration mode.

Step 6: Add the physical port1.0.1 to VLANs 6 and 40 (on Transit Node F)

`awplus(config)#`	
`interface port1.0.1`	Specify the physical interface (`port1.0.1`) that you are configuring and enter the Interface Configuration mode.
`awplus(config-if)#`	
`switchport mode trunk`	Set the switching characteristics of this port to Trunk mode.
`awplus(config-if)#`	
`switchport trunk allowed vlan add 6`	Enable VLAN 6 on this port.
`awplus(config-if)#`	
`switchport trunk allowed vlan add 40`	Enable VLAN 40 on this port.
`awplus(config-if)#`	
`switchport trunk native vlan none`	Remove the native VLAN
`awplus(config-if)#`	
`exit`	Exit the Interface mode and enter the Global Configuration mode.

Step 7: Add the physical port1.0.2 to VLANs 6 and 40 (on Transit Node F)

`awplus(config)#`	
`interface port1.0.2`	Specify the interface (`port1.0.2`) that you are configuring and enter the Interface Configuration mode.
`awplus(config-if)#`	
`switchport mode trunk`	Set the switching characteristics of this port to Trunk mode.
`awplus(config-if)#`	
`switchport trunk allowed vlan add 6`	Enable VLAN 6 on this port.
`awplus(config-if)#`	
`switchport trunk allowed vlan add 40`	Enable VLAN 40 on this port.
`awplus(config-if)#`	
`switchport trunk native vlan none`	Remove the native VLAN
`awplus(config-if)#`	
`exit`	Exit the Interface Configuration mode and enter the Global Configuration mode.

Sample Show Output

For the above network configuration, running the command **show epsr** on node R1 will display the following output when operating normally. Note the blocked state of its secondary port.

Figure 86-14: Output from the show epsr command run on Master Node R1 - with Ring 1 - EPSR Instance blue operating normally

```
 EPSR Information
-----------------------------------------------------------------
 Name .....................blue
 Mode .....................Master
 Status ...................Enabled
 State ....................Complete
 Control Vlan .............5
 Data VLAN(s) .............40
 Interface Mode ...........Ports Only
 Primary Port .............port1.0.1
   Status .................Forwarding
   Is On Common Segment ...No
   Blocking Control .......Physical
 Secondary Port ...........port1.0.2
   Status .................Blocked
   Is On Common Segment ...No
   Blocking Control .......Physical
 Hello Time ...............1 s
 Failover Time ............2 s
 Ring Flap Time ...........0 s
 Trap .....................Enabled
 Enhanced Recovery ........Disabled
 Priority .................120
-----------------------------------------------------------------
```

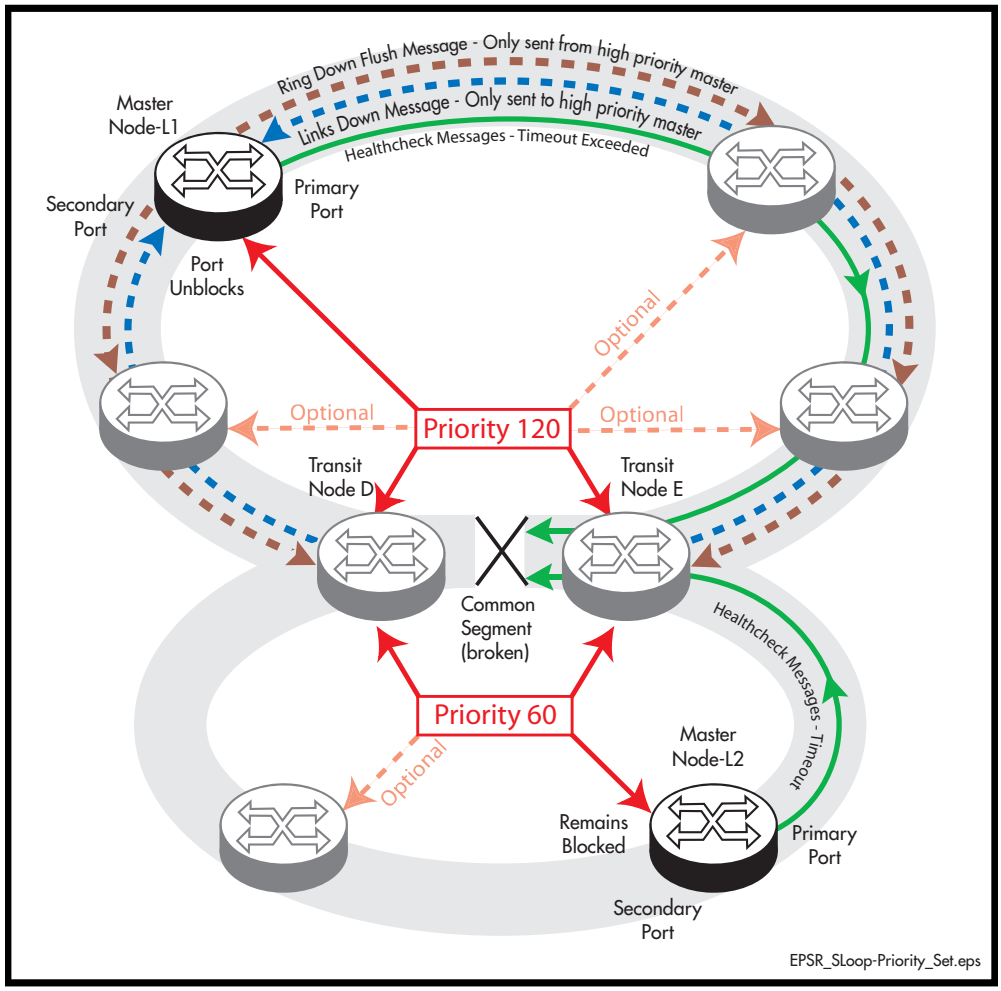
If a fault occurs somewhere within the blue network ring the Master Node-R1 would respond by placing its secondary port into the forwarding state. Figure **Figure 86-15** displays its resultant state. Note that the state of its secondary port has now moved from Blocked, Forwarding.

Figure 86-15: Output from the show epsr command run on Master Node R2, where a break exists within the Ring 1 - EPSR instance blue.

```
 EPSR Information
-----------------------------------------------------------------
 Name .....................blue
 Mode .....................Master
 Status ...................Enabled
 State ....................Failed
 Control Vlan .............6
 Data VLAN(s) .............40
 Interface Mode ...........Ports Only
 Primary Port .............port1.0.1
   Status .................Forwarding
   Is On Common Segment ...No
   Blocking Control .......Physical
 Secondary Port ...........port1.0.2
   Status .................Forwarding
   Is On Common Segment ...No
   Blocking Control .......Physical
 Hello Time ...............1 s
 Failover Time ............2 s
 Ring Flap Time ...........0 s
 Trap .....................Enabled
 Enhanced Recovery ........Disabled
 Priority .................60
-----------------------------------------------------------------
```

If a fault occurs in the common segment of the ring then the Master Node-R2 being on the lower priority ring would detect a timeout of its transmitted Healthcheck Message. It would also detect the absence of the expected **Ring Down Flush** message, see **Figure 86-16**. The Master node then assumes that there is a break somewhere in the Common Segment, and will display the status shown in **Figure 86-17**.

Figure 86-16: EPSR behavior with a faulty common segment and Superloop enabled



Note that the secondary port on Master Node-L2 remains in the blocked state; its state now appears in show output as being as blocked (for superloop prevention), See **Figure 86-17**.

The Master-L1 on the blue ring will also detect a timeout in the healthcheck message, but because ring 1 has the higher priority (of 120), it will receive a Links Down message from each of the Transit Nodes (D and E) that connect to the common segment. As a result, the state of the Master Node will be as shown in Figure **Figure 86-17**; note particularly the change in its Secondary Port status.

Figure 86-17: Output from the show epsr command run on Master Node L2 (green)

```
 EPSR Information
----------------------------------------------------------------
 Name .....................green
 Mode .....................Master
 Status ...................Enabled
 State ....................Failed
 Control Vlan .............6
 Data VLAN(s) .............40
 Interface Mode ...........Ports Only
 Primary Port .............port1.0.1
   Status .................Forwarding
   Is On Common Segment ...No
   Blocking Control .......Physical
 Secondary Port ...........port1.0.2
   Status .................Blocked (for superloop prevention)
   Is On Common Segment ...No
   Blocking Control .......Physical
 Hello Time ...............1 s
 Failover Time ............2 s
 Ring Flap Time ...........0 s
 Trap .....................Enabled
 Enhanced Recovery ........Disabled
 Priority .................60
----------------------------------------------------------------
```

Adding a new data VLAN to a functioning superloop topology

This example shows how to add another data VLAN called **data-b** to the superloop topology. We recommend that you apply the configuration steps in the order shown.

1. Add VLAN to the common segment (for both instances)
2. Add VLAN to blue master
3. Add VLAN to other blue transits
4. Add VLAN to green master
5. Add VLAN to other green transits

On Ring 1 EPSR Instance Blue - Configure each of the Transit Nodes that Connect to the Common Segment

Select one of the transit nodes that connects to the common segment, and carry out the following steps:

Step 1: Add VLAN 50 to the VLAN database and set its state to enable

`awplus#`	
`configure terminal`	Enter terminal config mode
`awplus(config)#`	
`vlan database`	Enter the EPSR Configuration mode.
`awplus(config-epsr)#`	
`vlan 50 name data-b enable`	Create vlan 50, name it data-b and enable it.

Step 2: Add the VLAN 50 to the EPSR Instances called “blue” and “green” on the transit nodes

`awplus(config)#`	
`epsr configuration`	Enter the EPSR Configuration mode.
`awplus(config-epsr)#`	
`epsr blue datavlan 50`	On the EPSR instance called `blue` add `vlan 50` as a data VLAN.
`awplus(config-epsr)#`	
`epsr green datavlan 50`	On the EPSR instance called `green` add `vlan 50` as a data VLAN.

Step 3: Add the common physical port (port1.0.2 in this example) to VLAN 50

`awplus(config)#`	
`interface port1.0.2`	Specify the physical interface (`port1.0.2`) that you are configuring and enter the Interface Configuration mode.
`awplus(config-if)#`	
`switchport trunk allowed vlan add 50`	Enable VLAN 50 on this port.
`awplus(config-if)#`	
`exit`	Exit the Interface mode and enter the Global Configuration mode.

Step 4: Add physical port1.0.1 to VLAN 50

`awplus(config)#`	
`interface port1.0.1`	Specify the interface (`port1.0.1`) that you are configuring and enter the Interface Configuration mode.
`awplus(config-if)#`	
`switchport trunk allowed vlan add 50`	Enable VLAN 50 on this port.
`awplus(config-if)#`	
`exit`	Exit the Interface Configuration mode and enter the Global Configuration mode.

Step 5: Add physical port1.0.3 to VLAN 50

`awplus(config)#`	
`interface port1.0.3`	Specify the interface (`port1.0.3`) that you are configuring and enter the Interface Configuration mode.
`awplus(config-if)#`	
`switchport trunk allowed vlan add 50`	Enable VLAN 50 on this port.
`awplus(config-if)#`	
`exit`	Exit the Interface Configuration mode and enter the Global Configuration mode.

Select the next transit node that connects to the common segment, and repeat the above steps:

On Ring 1 EPSR Instance Blue - Add VLAN 50 to the Master Node

Carry out this process using the same basic procedure shown in of Steps 1 to 5

On Ring 1 EPSR Instance Blue - Add VLAN 50 to the Transit Nodes

Carry out this process using the same basic procedure shown in of Steps 1 to 5

On Ring 2 EPSR Instance Green - Add VLAN 50 to the Master Node

Carry out this process using the same basic procedure shown in of Steps 1 to 5

On Ring 2 EPSR Instance Green - Add VLAN 50 to the remaining Transit Node

Carry out this process using the same basic procedure shown in of Steps 1 to 5

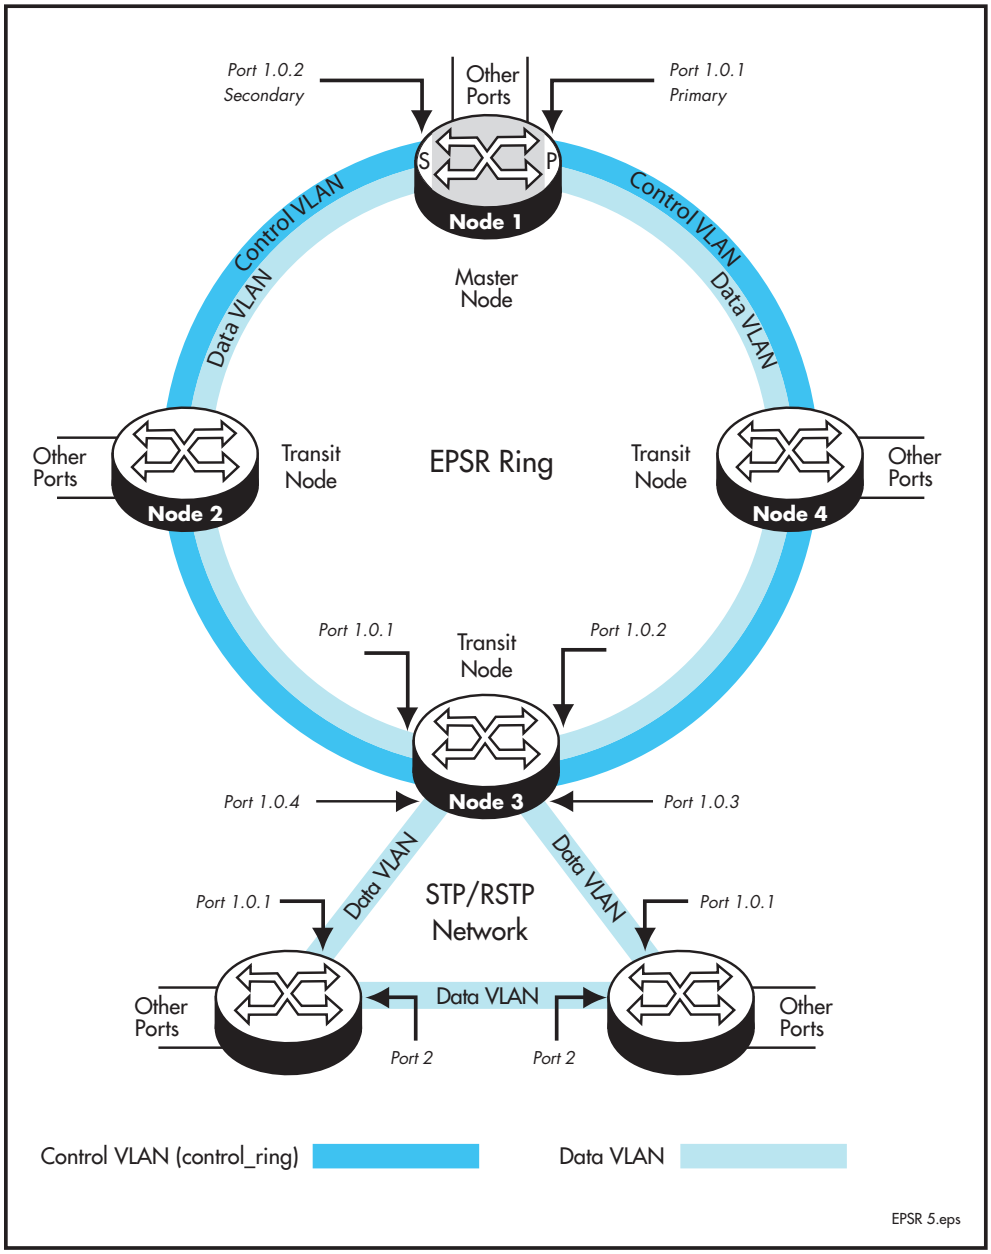
EPSR and Spanning Tree Operation

EPSR and the Spanning Tree protocol (STP) address data loop prevention, although they do it differently. EPSR is manually configured to explicitly identify which links are broken in the defined ring, whereas STP/RSTP calculates where to break links based on user-provided values (metrics) that are compared to determine the “best” (or lowest cost) paths for data traffic.

At the practical level you can use these two techniques to create complementary hybrid EPSR /STP configurations. This configuration might have a high speed fibre loop topology backbone-controlled and managed using EPSR. Lobes could extend out from each loop node into a user mesh network. Any loops in this mesh network would be controlled and managed using STP/RSTP. Note that EPSR and STP cannot share the same ports.

The following figure shows a basic combined EPSR / STP network.

Figure 86-18: EPSR and spanning tree operation



Chapter 87: EPSR Commands

Command List 87.2
debug epsr 87.2
epsr 87.4
epsr configuration 87.5
epsr datavlan 87.6
epsr enhancedrecovery enable 87.7
epsr mode master controlvlan primaryport 87.8
epsr mode transit controlvlan 87.9
epsr priority 87.10
epsr state 87.11
epsr trap 87.12
show debugging epsr 87.13
show epsr 87.14
show epsr word 87.17
show epsr word counters 87.18
show epsr counters 87.19
undebug epsr 87.20

Command List

This chapter provides an alphabetical reference for commands used to configure EPSR. For more information, see **Chapter 86, EPSR Introduction and Configuration**.

For information about modifying or redirecting the output from **show** commands to a file, see

"Controlling "show" Command Output" on page 1.38.

debug epsr

This command enables EPSR debugging.

The **no** variant of this command disables EPSR debugging.

Syntax

```
debug epsr {info|msg|pkt|state|timer|all}
no debug epsr {info|msg|pkt|state|timer|all}
```

Parameter	Description
`info`	Send general EPSR information to the console. Using this parameter with the **no debug epsr** command will explicitly exclude the above information from being sent to the console.
`msg`	Send the decoded received and transmitted EPSR packets to the console. Using this parameter with the **no debug epsr** command will explicitly exclude the above packets from being sent to the console.
`pkt`	Send the received and transmitted EPSR packets as raw ASCII text to the console. Using this parameter with the **no debug epsr** command will explicitly exclude the above packets from being sent to the console.
`state`	Send EPSR state transitions to the console. Using this parameter with the **no debug epsr** command will explicitly exclude state transitions from being sent to the console.
`timer`	Send EPSR timer information to the console. Using this parameter with the **no debug epsr** command will explicitly exclude timer information from being sent to the console.
`all`	Send all EPSR debugging information to the console. Using this parameter with the **no debug epsr** command will explicitly exclude any debugging information from being sent to the console.

Mode Privileged Exec and Global Configuration

Examples To enable state transition debugging, use the command:

```
awplus# debug epsr state
```

To disable EPSR packet debugging, use the command:

```
awplus# no debug epsr pkt
```

Related Commands **undebug epsr**

epsr

This command sets the timer values for an EPSR instance. It is only valid for master nodes.

Syntax

```
epsr <epsr-name> {hellotime <1-32767>|failovertime <2-65535>|
   ringflaptime <0-65535>}

no epsr <epsr-name>
```

Caution **Using the "no" variant of this command will remove the specified EPSR instance.**

Parameter	Description
<epsr-name>	Name of the EPSR instance.
`hellotime` *<1-32767>*	The number of seconds between the transmission of health check messages.
`failovertime` *<2-65535>*	The number of seconds that a master waits for a returning health check message before entering the failed state. **The failover time should be greater than twice the hellotime.** This is to force the master node to wait until it detects the absence of two sequential healthcheck messages before entering the failed state.
`ringflaptime` *<0-65535>*	The minimum number of seconds that a master must remain in the failed state.

Mode EPSR Configuration

Examples To set the hellotimer to 5 seconds for the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# epsr blue hellotime 5
```

Note When VCStack is used with EPSR, the EPSR **failovertime** should be at least 5 seconds.

To delete the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# no epsr blue
```

Related Commands

epsr mode master controlvlan primaryport
epsr mode transit controlvlan
epsr configuration
epsr datavlan
epsr state
epsr trap
reboot rolling
show epsr

epsr configuration

Use this command to enter EPSR Configuration mode so that EPSR can be configured.

Syntax `epsr configuration`

Mode Global Configuration

Example To change to EPSR mode, use the command:

```
awplus(config)# epsr configuration
```

Related Commands **epsr mode master controlvlan primaryport**
epsr
show epsr

epsr datavlan

This command adds a data VLAN or a range of VLAN identifiers to a specified EPSR instance.

The **no** variant of this command removes a data vlan or data vlan range from an EPSR instance.

Syntax

```
epsr <epsr-name> datavlan {<vlanid>|<vlanid-range>}
no epsr <epsr-name> datavlan {<vlanid>|<vlanid-range>}
```

Parameter	Description
<epsr-name>	Name of the EPSR instance.
`datavlan`	Adds a data VLAN to be protected by the EPSR instance.
<vlanid>	The VLAN's VID - a number between 1 and 4094 excluding the number selected for the control VLAN.
<vlanid-range>	Specify a range of VLAN identifiers using a hyphen to separate identifiers.

Mode EPSR Configuration

Usage We suggest setting the epsr controlvlan to vlan2 using the **epsr mode master controlvlan primaryport** and **epsr mode transit controlvlan** commands, then setting the EPSR data VLAN between to be a value 3 and 4094 using the **epsr datavlan** command.

Examples To add `vlan3` to the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# epsr blue datavlan vlan3
```

To add `vlan2` and `vlan3` to the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# epsr blue datavlan vlan2-vlan3
```

To remove `vlan3` from the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# no epsr blue datavlan vlan3
```

To remove `vlan2` and `vlan3` from the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# no epsr blue datavlan vlan2-vlan3
```

Related Commands
epsr mode master controlvlan primaryport
epsr mode transit controlvlan
show epsr

epsr enhancedrecovery enable

This command enables EPSR's enhanced recovery mode. Enhanced recovery mode enables a ring to apply additional recovery procedures when a ring with more than one break, partially mends. For more information see, **"Managing Rings with Two Breaks" on page 86.7**.

The **no** variant of this command disables the enhancedrecovery mode.

Syntax

```
epsr <epsr-name> enhancedrecovery enable
no epsr <epsr-name> enhancedrecovery enable
```

Parameter	Description
<epsr-name>	Name of the EPSR instance.

Default Default is enhancedrecovery mode disabled.

Mode EPSR Configuration

Example To apply enhanced recovery on the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# epsr blue enhancedrecovery enable
```

Related Commands **show epsr**

epsr mode master controlvlan primaryport

This command creates a master EPSR instance

Syntax `epsr <epsr-name> mode master controlvlan <2-4094> primaryport <port>`

Parameter	Description
`<epsr-name>`	Name of the EPSR instance.
`mode`	Determines the node is acting as a master.
`master`	Sets switch to be the master node for the named EPSR ring.
`controlvlan`	The VLAN that will transmit EPSR control frames.
`<2-4094>`	VLAN id.
`primaryport`	Primary port for the EPSR instance.
`<port>`	The primary port. The port may be a switch port (e.g. `port1.0.4`) or a static channel group (e.g. `sa3`). It cannot be a dynamic (LACP) channel group.

Note

The software allows you to configure more than two ports or static channel groups to the control VLAN within a single switch or stacked node. However, we advise against this because in certain situations it can produce unpredictable results.

If the control VLAN contains more than two ports (or static channels) an algorithm selects the two ports or channels with the lowest number to be the ring ports. However if the switch has only one channel group is defined to the control vlan, EPSR will not operate on the secondary port.

EPSR does not support Dynamic link aggregation (LACP).

Mode EPSR Configuration

Example To create a master EPSR instance called `blue` with `vlan2` as the control VLAN and `port1.0.1` as the primary port, use the command:

```
awplus(config-epsr)# epsr blue mode master controlvlan vlan2
                     primaryport port1.0.1
```

Related Commands **epsr mode transit controlvlan**
show epsr

epsr mode transit controlvlan

This command creates a transit EPSR instance.

Syntax `epsr <epsr-name> mode transit controlvlan <2-4094>`

Parameter	Description
`<epsr-name>`	Name of the EPSR instance.
`mode`	Determines the node is acting as a transit node.
`transit`	Sets switch to be the transit node for the named EPSR ring.
`controlvlan`	The VLAN that will transmit EPSR control.
`<2-4094>`	VLAN id.

Note

The software allows you to configure more than two ports or static channel groups to the control VLAN within a single switch or stacked node. However, we advise against this because in certain situations it can produce unpredictable results.

If the control VLAN contains more than two ports (or static channels) an algorithm selects the two ports or channels with the lowest number to be the ring ports. However if the switch has only one channel group is defined to the control vlan, EPSR will not operate on the secondary port.

EPSR does not support Dynamic link aggregation (LACP).

Mode EPSR Configuration

Example To create a transit EPSR instance called `blue` with `vlan2` as the control VLAN, use the command:

```
awplus(config-epsr)# epsr blue mode transit controlvlan vlan2
```

Related Commands

epsr mode master controlvlan primaryport
epsr mode transit controlvlan
show epsr

epsr priority

This command sets the priority of an EPSR instance on an EPSR node. Priority is used to prevent superloops forming under fault conditions with particular ring configurations. Setting a node to a value greater than one, also has the effect of turning on **superloop protection**.

The **no** variant of this command returns the priority of the EPSR instance back to its default value of 0, which also disables EPSR Superloop prevention.

Syntax

```
epsr <epsr-name> priority <0-127>

no <epsr-name> priority
```

Parameter	Description
<epsr-name>	Name of the EPSR instance.
`priority`	The priority of the ring instance selected by the epsr-name parameter.
<0-127>	The priority to be applied (0 is the lowest priority and represents no superloop protection).

Default The default priority of an EPSR instance on an EPSR node is 0. The negated form of this command resets the priority of an EPSR instance on an EPSR node to the default value.

Mode EPSR Configuration

Example To set the priority of the EPSR instance called `blue` to the highest priority (127), use the command:

```
awplus(config-epsr)# epsr blue priority 127
```

To reset the priority of the EPSR instance called `blue` to the default (0), use the command:

```
awplus(config-epsr)# no epsr blue priority
```

Related Commands epsr configuration

epsr state

This command enables or disables an EPSR instance.

Syntax `epsr <epsr-name> state {enabled|disabled}`

Parameter	Description
`<epsr-name>`	The name of the EPSR instance.
`state`	The operational state of the ring.
`enabled`	EPSR instance is enabled.
`disabled`	EPSR instance is disabled.

Mode EPSR Configuration

Example To enable the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# epsr blue state enabled
```

Related Commands **epsr mode master controlvlan primaryport**
epsr mode transit controlvlan

epsr trap

This command enables SNMP traps for an EPSR instance. The traps will be sent when the EPSR instance changes state.

The **no** variant of this command disables SNMP traps for an EPSR instance. The traps will no longer be sent when the EPSR instance changes state.

Syntax

```
epsr <epsr-name> trap
no epsr <epsr-name> trap
```

Parameter	Description
<*epsr-name*>	Name of the EPSR instance.
trap	SNMP trap for the EPSR instance.

Mode EPSR Configuration

Example To enable traps for the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# epsr blue trap
```

To disable traps for the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# no epsr blue trap
```

Related Commands

epsr mode master controlvlan primaryport
epsr mode transit controlvlan
show epsr

show debugging epsr

This command shows the debugging modes enabled for EPSR.

Syntax `show debugging epsr`

Mode User Exec and Privileged Exec

Example To show the enabled debugging modes, use the command:

```
awplus# show debugging epsr
```

Related Commands debug epsr

show epsr

This command displays information about all EPSR instances.

Syntax `show epsr`

Mode User Exec and Privileged Exec

Example To show the current settings of all EPSR instances, use the command:

```
awplus# show epsr
```

Output The following examples show the output display for a **non** superloop topology network.

Figure 87-1: Example output from the show epsr command run on a transit node

```

Table 87-1: Parameters displayed in the output of the show epsr command

Parameter on Master Node	Parameter on Transit Node	Description
Name	Name	The name of the EPSR instance.
Mode	Mode	The mode in which the EPSR instance is configured - either Master or Transit
Status	Status	Indicates whether the EPSR instance is enabled or disabled
State	State	Indicates state of the EPSR instance's state machine. Master states are: Idle, Complete, and Failed. Transit states are Links-Up, Links-Down, and Pre-Forwarding.
Control Vlan	Control Vlan	Displays the VID of the EPSR instance's control VLAN.
Data VLAN(s)	Data VLAN(s)	The VID(s) of the instance's data VLANs.
Interface Mode	Interface Mode	Whether the EPSR instance's ring ports are both physical ports (Ports Only) or are both static aggregators (Channel Groups Only).
Primary Port	First Port	The EPSR instance's primary ring port.
- Status	- Status	Whether the ring port is forwarding (Forwarding) or blocking (Blocked), or has link down (Down), and if forwarding or blocking, "(logical)" indicates the instance has only logically set the blocking state of the port because it does not have physical control of it.
	- Direction	The ring port on which the last EPSR control packet was received is indicated by "Upstream". The other ring port is then "Downstream"

Table 87-1: Parameters displayed in the output of the show epsr command

Parameter on Master	Parameter on Transit	Description(cont.)
- Is On Common Segment	- Is On Common Segment	Whether the ring port is on a shared common segment link to another node, and if so, "(highest rank)" indicates it is the highest priority instance on that common segment.
- Blocking Control	- Blocking Control	Whether the instance has "physical" or "logical" control of the ring port's blocking in the instance's data VLANs.
Secondary Port	Second Port	The EPSR instance's secondary port.
- Status	- Status	Whether the ring port is forwarding (Forwarding) or blocking (Blocked), or has link down (Down), and if forwarding or blocking, "(logical)" indicates the instance has only logically set the blocking state of the port, because it does not have physical control of it. Note that on a master configured for SuperLoop Prevention (non-zero priority) its secondary ring port can be physically forwarding, but logically blocking. This situation arises when it is not the highest priority node in the topology (and so does not receive LINKS-DOWN messages upon common segment breaks) and a break on a common segment in its ring is preventing reception of its own health messages.
	- Direction	The ring port on which the last EPSR control packet was received is indicated by "Upstream". The other ring port is then "Downstream"
- Is On Common Segment	- Is On Common Segment	Whether the ring port is on a shared common segment link to another node, and if so, "(highest rank)" indicates it is the highest priority instance on that common segment
- Blocking Control	- Blocking Control	Whether the instance has "physical" or "logical" control of the ring port's blocking in the instance's data VLANs
Hello Time		The EPSR instance's setting for the interval between transmissions of health check messages (in seconds)
Failover Time		The time (in seconds) the EPSR instance waits to receive a health check message before it decides the ring is down
Ring Flap Time		The minimum time the EPSR instance must remain in the failed state
Trap	Trap	Whether the EPSR instance has EPSR SNMP traps enabled
Enhanced Recovery	Enhanced Recovery	Whether the EPSR instance has enhanced recovery mode enabled
SLP Priority	SLP Priority	The EPSR instance's priority (for SuperLoop Prevention)

Related Commands **epsr mode master controlvlan primaryport**
epsr mode transit controlvlan
show epsr counters

show epsr word

This command displays information about the specified EPSR instance.

Syntax `show epsr <epsr-name>`

Parameter	Description
<epsr-name>	Name of the EPSR instance.

Mode User Exec and Privileged Exec

Example To show the current settings of the EPSR instance called `blue`, use the command:

```
awplus# show epsr blue
```

Related Commands
epsr mode master controlvlan primaryport
epsr mode transit controlvlan
show epsr counters

show epsr word counters

This command displays counter information about the specified EPSR instance.

Syntax `show epsr <epsr-name> counters`

Parameter	Description
<epsr-name>	Name of the EPSR instance.

Mode User Exec and Privileged Exec

Example To show the counters of the EPSR instance called `blue`, use the command:

```
awplus# show epsr blue counters
```

Related Commands
epsr mode master controlvlan primaryport
epsr mode transit controlvlan

Introduction to AMF

The Allied Telesis Management Framework (AMF) is a suite of features that combine to simplify network management across all supported network switches from the core to the edge.

AMF also provides simplified switch recovery and firmware upgrade management. The primary function of AMF is to reduce the management and maintenance overhead on a network, while improving on responsiveness and handling of switch failures within the network.

This chapter provides a conceptual introduction to AMF together with its benefits, together with configuration guidelines showing how to use AMF in practical networks. For more information on the commands used in this chapter, see the chapter, **"AMF Commands" on page 89.1**.

AMF Supported Products and Software Versions.

The following list shows which Allied Telesis switches are capable of running AMF and indicates those capable of operating as Master Nodes.

An AMF-Master feature license is required for each AMF master node in the AMF network. AMF-Master feature licenses are available for the SBx8100, SBx908, and x610 platforms. A license may be required for certain AMF member nodes such as the x210 series.

- SwitchBlade™ x8100 family (Master Node capability)
- SwitchBlade™ x908 series switches (Master Node capability)
- x900 series switches (Network node capability)
- x610 series switches (Master Node capability)
- x510 series switches (Network node capability)
- IX5-28GPX switches (Network node capability)
- x210 series switches (For network node capability, an all clients license is required)

Key benefits of AMF

The key benefits of AMF include its unified command-line, simple configuration backup and recovery process, and time-saving rolling firmware upgrade.

Unified command-line

The conventional means of configuring and controlling AlliedWare Plus (AW+) switches is to use their text-based command-line interface (CLI). In existing networks, the CLI is available via a serial console port and also to remote login sessions such as SSH.

AMF, extends this facility by adding the capability to control either a network portion, or an entire network, of AW+ switches by using a single (unified) CLI session. Using the unified CLI, a network administrator can nominate all nodes or a subset of nodes within the AMF network to comprise an entity known as a "**working-set**". Commands can then be executed concurrently across all switching nodes within the defined working-set as if they were a single unit. Any existing configuration or diagnostic actions can thus be applied to multiple devices using a single command sequence, thus reducing maintenance costs and configuration complexity, while still retaining complete flexibility in network design and control.

Multiple AMF networks can exist side by side across a single physical network. Note that AMF treats a Virtual Chassis Stack (VCStack) as a single node.

Configuration backup and recovery

Master nodes use external storage to automatically backup the complete configuration information for all their member nodes, including boot configuration, firmware, licenses, and user scripts.

If an AMF member node should fail, the AMF process will automatically recognize and reconfigure an unconfigured replacement (standby) unit, completely recreating the stored configuration of the failed unit into the replacement unit. The new unit will then reboot and resume service, without any need for user intervention beyond physical hardware replacement and cable connection. In this way AMF provides a complete zero-touch recovery solution.

Rolling firmware upgrade

Installing Firmware upgrades on a production network is typically an infrequent but sensitive and labour-intensive process. AMF is able to roll-out upgrades to a user-selected subset of nodes. All that needs to be entered is target group of nodes, and the location where the new firmware is stored; AMF will then take care of the rest. Nodes are upgraded in a serial fashion, with each node tested before continuing the upgrade on the next node.

If an upgrade fails on a particular node, the upgrade process is automatically terminated and that node will revert to its previous firmware version. In this way firmware updates are almost completely hands-free, whilst also providing confidence that a bad update will not result in loss of service.

AMF Terminology

This section contains a glossary of terminology used to describe AMF networking.

Network name The AMF network name is used to determine the AMF network a node belongs to. All nodes within an AMF network must be configured with the same AMF name.

Node AMF members are commonly referred to as nodes. A node can be a single switch, or a VCStack.

Master nodes AMF master nodes are user defined and form the core domain of the AMF network. They are:

- responsible for performing file system backups of all nodes in the AMF network.
- required before an AMF network can form; at least one must be present.

AMF master nodes are supported on SBx908, SBx8100 and x610 platforms; an AMF licence is required for each master. On the SBx8100 Series, only one AMF master license is required even if two CFCs are installed. The license is for the chassis, not the CFC.

Note Although AMF regards a VCStack as a single AMF device; the VCStack must have consistent licensing on all stack members. Therefore, in a VCStack containing two switches, two AMF master licenses would be required for the stack to operate as an AMF master.

- Where more than one AMF master node exists in an AMF network, it is important to note that each master operates completely independently of the other, and that there is no synchronization between them.
- multiple master nodes can be used to provide master-node redundancy, with each master being able to operate as a master node for the network. But, there is no synchronization of status or data files between the masters. The behavior of a master node is not changed at all by the presence of other master nodes. However where a backup up config is to be loaded to a switch, and the config versions differ between AMF masters, the most recent version of the config will be selected for downloading.

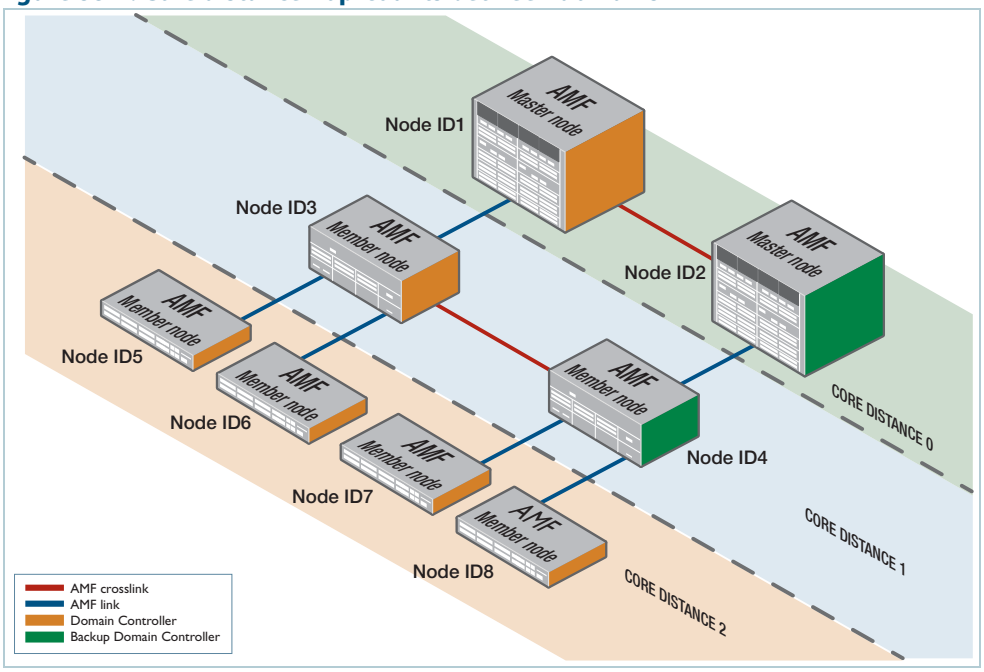
Domains Every AMF node belongs to an AMF domain, which may be comprised of multiple nodes or only a single node. AMF master nodes are included in the core domain, and all other domains are rooted in the core domain. AMF domains are determined by AMF crosslinks, (see **"Crosslinks" on page 88.6**). All nodes connected via AMF crosslinks are part of the same domain, and nodes connected via regular AMF links will be part of a higher or lower domain depending on whether they are closer to or further away from the core domain. Nodes within a domain must be connected in either a chain or ring topology.

This means that a maximum of two crosslinks should be configured on any single node. The advantage of an AMF domain is that two links from a domain to a single higher level domain (closer to the core) will provide redundant AMF links. It is recommended that an AMF domain should only be connected to a single higher level domain, though it may be connected to multiple lower level domains.

Note We recommend a maximum number of 12 nodes per domain.

Core distance This is the distance (hop count) between a particular domain and its Core domain. The Core domain has a Core distance of 0, and the maximum recommended Core distance in an AMF network is 8.

Figure 88-1: Core distance hop-counts between domains

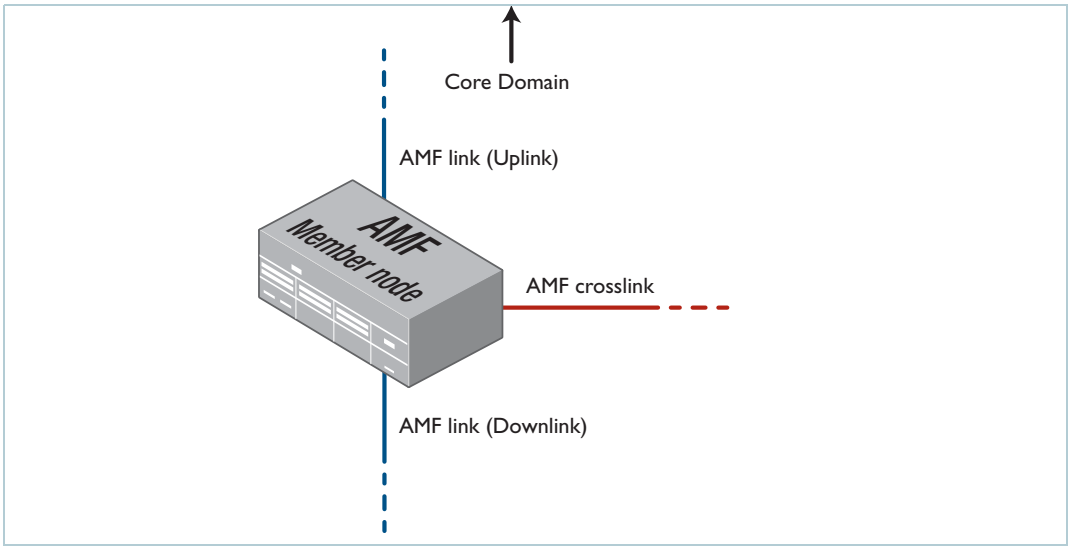


Links This is the distance (hop count) between a domain and the Core domain. The Core domain has a Core distance of 0, and the maximum recommended Core distance in an AMF network is 8.

AMF links are used to pass AMF management traffic between nodes, but can also be used to carry other network traffic. Configuring an interface as an atmf-link will automatically put the port into trunk mode. An AMF link must have at least one tagged VLAN, or have a native VLAN defined. An AMF link can be either a single link or a static aggregator. For more information on trunk mode see **"Configuring VLANs" on page 18.3**.

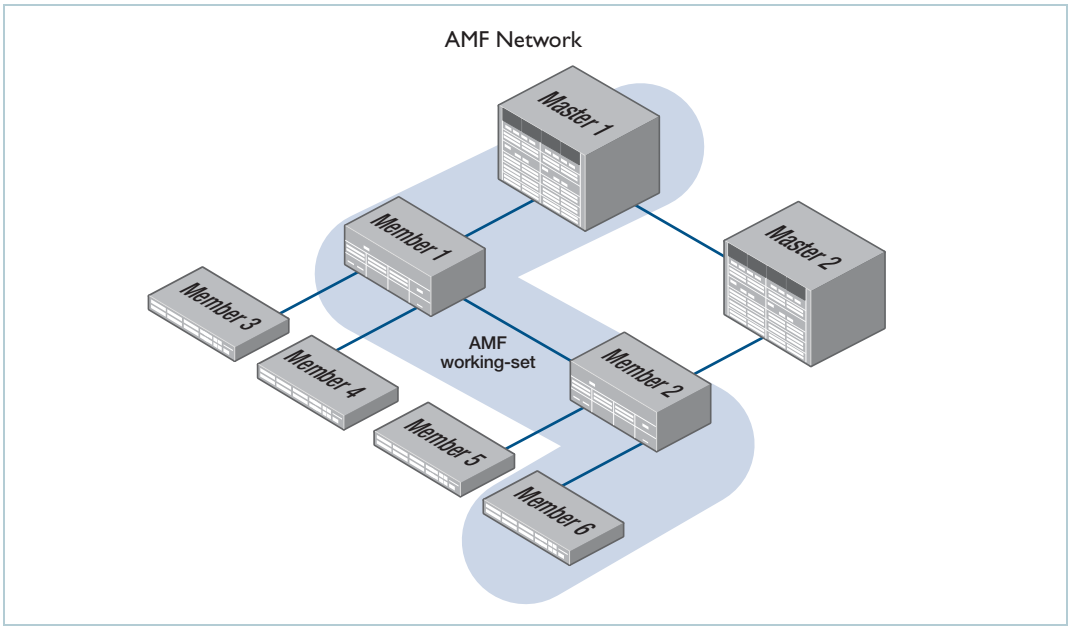
Crosslinks AMF crosslinks are used to connect AMF nodes to other AMF nodes within the same AMF domain. AMF master nodes must be connected using AMF crosslinks to ensure they are part of the core domain. Configuring an interface as an atmf-crosslink will automatically put the port into trunk mode. A crosslink can be either a single link or a static aggregator.

Figure 88-2: AMF Uplinks, Downlinks, and Crosslinks



Working-set An AMF working-set is a set of nodes, which is either arbitrarily user defined, or one of the pre-defined working-set groups. Specifying or selecting a working-set allows CLI commands to be executed on all nodes within the selected working-set with a single command. A working-set can be defined, selected and configured from any node within an AMF network.

Figure 88-3: AMF Working-set



AMF network guidelines

Retention and use of the ‘manager’ username

The default **username** for an Alliedware Plus login is manager, with a documented default **password**. Users should change this password on all their nodes to provide login security. In order to centrally manage nodes undergoing automated node recovery, or to expand the network by adding a new unconfigured node, it will be necessary to login with the default manager username.

It is possible to add new usernames and passwords to nodes, but to retain the ability to centrally manage the network, usernames should be uniformly configured across all AMF nodes within the AMF network.

Loop-free data plane

The current version of AMF does not control the data plane, so it is a requirement that the network is configured such that the data plane (i.e. the paths defined by the data VLANs) is kept loop free.

Note

Currently AMF does not support the use of STP on links between AMF nodes. Using STP with redundant network links has the potential to block AMF control connections, and also could lead to periods of traffic leakage during the start of automatic node recovery. Hence, if there are physical loops in any of the data VLANs in the network, then EPSR must be used as the protection mechanism for those loops.

Aggregators

Dynamic Aggregators (LACP) cannot be used on ports configured as AMF links or cross-links. Therefore any aggregated links in an AMF network need to be configured as static aggregators.

VCStacks

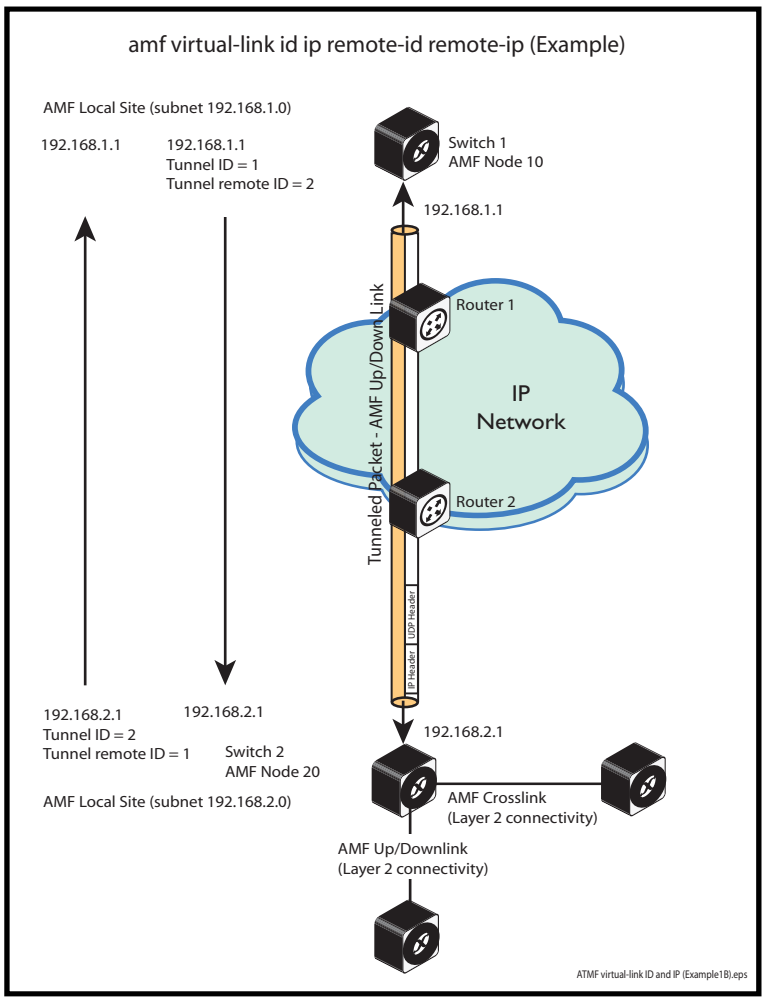
If any VCStacks are included as AMF nodes it is a requirement that the VCS virtual MAC feature is enabled to ensure correct operation of the AMF network. If the VCStack is running as an AMF master node it is also a requirement that removable external storage media is installed in both stack members.

AMF Tunneling (virtual links)

AMF Tunneling enables you to extend your local uplinks and downlinks across a wide area network. The tunneled data is then wrapped in a layer three IP packet for transmission across a wide area IP network. A simple AMF tunnel is shown in **“AMF Virtual Link” on page 88.8**. Switches 1 and 2 encapsulate the layer two AMF uplink and downlink data and wrap this inside a layer 3 IP packet to enable it to traverse an IP Network. Routers 1 and 2 (and any other routers within the cloud) perform a conventional routing function, reading the IP addresses of the tunneled packets and forwarding them to their destination.

Once connected through the tunnel, the remote AMF members will have the same AMF capabilities as a directly connected AMF member.

Figure 88-4: AMF Virtual Link



Configuring a Virtual Link

The Layer two tunnel that this command creates enables a local AMF session to appear to pass transparently across a Wide Area Network (WAN) such as the Internet. The addresses configured as the local and remote tunnel IP addresses must have IP connectivity to each other. If the tunnel is configured to connect a head office and branch office over the Internet, typically this would involve using some type of managed WAN service such as a site-to-site VPN. Tunnels are only supported using IPv4.

Configuration involves creating the following:

- local tunnel ID
- local IP address
- remote tunnel ID
- remote IP address

A reciprocal configuration is also required on the corresponding remote device. The local tunnel ID must be unique to the device on which it is configured.

The tunneled link may operate via external (non AlliedWare Plus) routers in order to provide wide area network connectivity. However in this configuration, these devices perform a conventional router to router connection. The protocol tunneling function is accomplished by the AMF nodes.

Note The requirement to preconfigure the local IP address and tunnel ID on a device located at the far end of an AMF virtual-link tunnel means that zero touch device replacement cannot be achieved on a remote device that terminates the tunnel connection.

Example Use the following command to create the tunnel shown in figure **Figure 88-4 on page 88.8**.

```
Node_10(config)# atmf virtual-link id 1 ip 192.168.1.1
                 remote-id 2 remote-ip 192.168.2.1

Node_20(config)# atmf virtual-link id 2 ip 192.168.2.1
                 remote-id 1 remote-ip 192.168.1.1
```

Prioritizing the tunneled traffic

On the switches that interface to the wide area network router, we advise that you prioritize the tunneled traffic to the CPU to be processed with a higher priority than other user data passing through these switches.

AMF external removable media

All AMF master nodes require external storage media (e.g. USB memory stick, SD card) to be installed. This external storage is used to hold a backup of all relevant files from all nodes within the AMF network, including other master nodes, so it must be large enough to be able to accommodate all of the backed up files. Files that are backed up include all configuration files, release files, and scripts, but not core dumps, exception logs, or technical support files.

Typically a 4GB capacity external media device would be of sufficient size to hold backups for a 40 node AMF network.

AMF interaction with QoS and ACLs

It's important that ACL and QoS rules do not block any traffic on VLANs 4091 and 4092 because they are the default AMF control VLANs. Similarly, ACL and QoS rules should not block any Layer 3 traffic on 172.31.0.* or 172.31.128.* as these are the default AMF management traffic subnets. Packets with protocol type 0xfbae and BPDU packets that use the MAC address: 0180.c200.002e should also not be blocked.

Note

The AMF control VLANs and AMF management subnets can be manually changed

NTP and AMF

AMF uses NTP to synchronize the system clocks across nodes within the network. For this to operate there must either be one or more external NTP servers configured on the network, or one single AMF node must be configured as the NTP 'master' using the **ntp master** command on page 91.6.

Note

It is invalid to have an NTP master configured on an AMF node anywhere in the network if any external NTP servers exist, because this will prevent clock synchronization.

If there is no external server, and instead the network has a node configured with the command: **ntp master**, the following commands will work as expected:

```
awplus(config)# atmf working set group all
awplus(config)# clock set 16:51:00 24 Aug 2012
```

The **clock set** command may also be used prior to configuring an external NTP server to get the network roughly up to the correct time, so that NTP will synchronize faster.

The primary function of NTP within an AMF network is to ensure that time and date stamps on backups are consistent across member nodes within the backup. This is particularly important in an AMF network that has multiple AMF master nodes, to ensure that node recovery is performed with the most up to date backup.

Configuring AMF

The following configuration example uses a simplified network to explain the steps required to configure AMF.

Simple AMF example with a single master

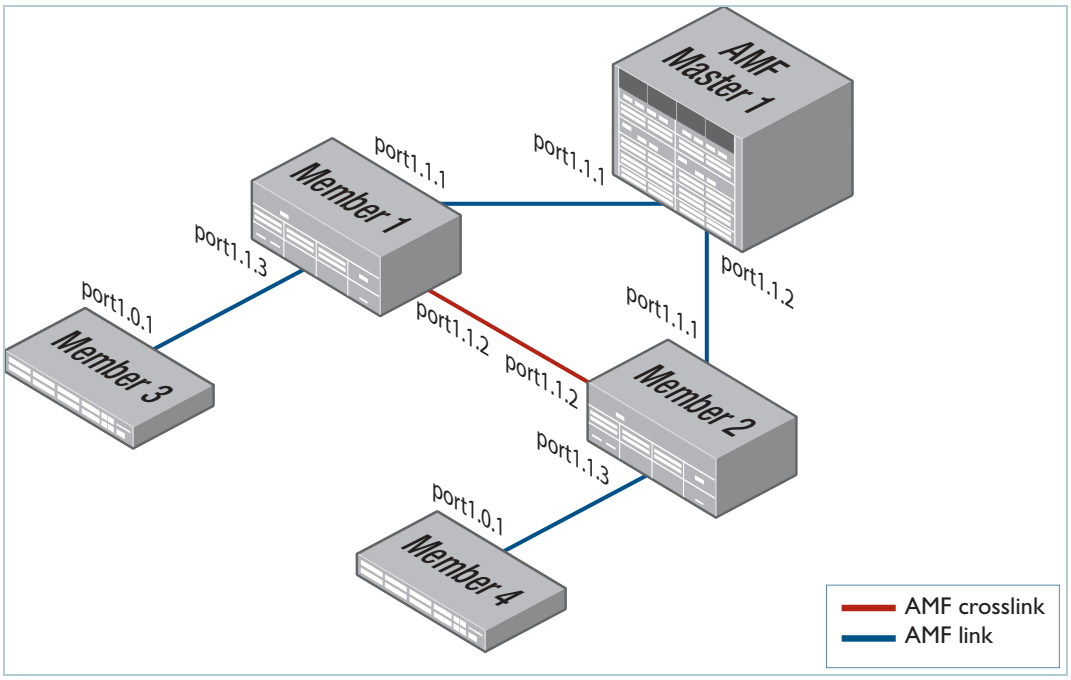


Table 88-1: Configure the AMF Master node

Description	Prompt	Command
Step 1. Set the host name.		
Enter Global Configuration mode	(awplus#)	configure terminal
Set the host name	awplus(config)#)	hostname AMF_Master
Note that host names are used as the AMF node name and must be unique within the AMF network.		
Step 2. Set the AMF network name.		
Set the AMF network name.	AMF_Master(config)#	atmf network-name atmf1
Note that the AMF network name must be the same on all nodes within the AMF network, and the device must be rebooted before the AMF network name takes effect.		
Step 3. Configure the switch to be the AMF master.		
	AMF_Master(config)#	atmf master
An AMF network must have at least one master configured. A licence is required for each AMF master in the AMF network. If an AT-SBx8100 with dual CFCs is configured as an AMF master a licence is only required on the CFC master, as the licence with be synchronized across CFCs. If an AT-SBx908 or x610 VCStack is configured as an AMF master, a licence is required to be installed on **both** stack members.		
Step 4. Configure the data VLANs.		
	AMF_Master(config)#	vlan database
	AMF_Master(config-vlan)#	vlan 2-3
Step 5. Disable RSTP globally (this is enabled by default).		
	AMF_Master(config)#	no spanning-tree rstp enable
Step 6. Configure ports as AMF-links.		
	AMF_Master(config)#	interface port1.1.1-1.1.2
	AMF_Master(config-if)#	switchport atmf-link
Step 7. Configure data VLANs on AMF-links as required.		
	AMF_Master(config-if)#	switchport trunk allowed vlan add 2-3
Step 8. Save the configuration and reboot the switch.		
	AMF_Master#	copy running-config startup-config
Building configuration...[OK]		
	AMF_Master#	reload
Are you sure you want to reboot the whole chassis? (y/n): y		

Table 88-2: Configure the first member node (Member1)

Description	Prompt	Command
Step 1. Set the host name.		
Enter Global Configuration mode	(awplus#)	configure terminal
Set the host name	awplus(config)#)	hostname Member1
Note that host names are used as the AMF node name and must be unique within the AMF network.		
Step 2. Set the AMF network name.		
Set the AMF network name to atmf1.	Member1(config)#	atmf network-name atmf1
Note that the AMF network name must be the same on all nodes within the AMF network, and the device must be rebooted before the AMF network name takes effect.		
Step 3. Configure the data VLANs		
Enter the VLAN Configuration mode	Member1(config)#	vlan database
Create VLANs 2 and 3	Member1(config-vlan)#	vlan 2-3
Step 4. Disable RSTP globally (this is enabled by default).		
	Member1(config)#	no spanning-tree rstp enable
Step 5. Configure ports as AMF-links.		
Enter Interface Configuration mode for ports 1.1.1 to 1.1.3	Member1(config)#	interface port1.1.1-1.1.3
Configure these ports as AMF links	Member1(config-if)#	switchport atmf-link
Step 6. Configure data VLANs on the AMF-links as required.		
Set VLANs 2 to 3 to be data VLANs	Member1(config-if)#	switchport trunk allowed vlan add 2-3
Step 7. Configure AMF-crosslink		
Enter the Interface Configuration mode for port 1.1.2	Member1(config)#	interface port1.1.2
Set this port to be an AMF crosslink	Member1(config-if)#	switchport atmf-crosslink
	Member1(config-if)#	switchport trunk native vlan none
Note that AMF links and crosslinks do not need to be configured with data VLANs and can be used solely to provide AMF management VLAN redundancy.		
Step 8. Save the configuration and reboot the switch.		
	Member1#	copy running-config startup-config
Building configuration...[OK]		

Table 88-2: Configure the first member node (Member1)(cont.)

Description	Prompt	Command
	Member1#	reload
Are you sure you want to reboot the whole chassis? (y/n):		y

.

Table 88-3: Configure the first member node (Member2)

Description	Prompt	Command
Step 1. Set the host name.		
Enter Global Configuration mode	awplus#)	configure terminal
Set the host name	awplus(config)#)	hostname Member2
Note that host names are used as the AMF node name and must be unique within the AMF network.		
Step 2. Set the AMF network name.		
Set the AMF network name to atmf1.	Member2(config)#	atmf network-name atmf1
Note that the AMF network name must be the same on all nodes within the AMF network, and the device must be rebooted before the AMF network name takes effect.		
Step 3. Configure the data VLANs		
Enter the VLAN Configuration mode	Member2(config)#	vlan database
Create VLANs 2 and 3	Member2(config-vlan)#	vlan 2-3
Step 4. Disable RSTP globally (this is enabled by default).		
	Member2(config)#	no spanning-tree rstp enable
Step 5. Configure ports as AMF-links.		
Enter Interface Configuration mode for ports 1.1.1 to 1.1.3	Member2(config)#	interface port1.1.1-1.1.3
Configure these ports as AMF links	Member2(config-if)#	switchport atmf-link
Step 6. Configure data VLANs on the AMF-links as required.		
Set VLANs 2 to 3 to be data VLANs	Member2(config-if)#	switchport trunk allowed vlan add 2-3
Step 7. Configure AMF-crosslink		
Enter the Interface Configuration mode for port 1.1.2	Member2(config)#	interface port1.1.2
Set this port to be an AMF crosslink	Member2(config-if)#	switchport atmf-crosslink
	Member2(config-if)#	switchport trunk native vlan none
Note that AMF links and crosslinks do not need to be configured with data VLANs and can be used solely to provide AMF management VLAN redundancy.		
Step 8. Save the configuration and reboot the switch.		
	Member2#	copy running-config startup-config

Table 88-3: Configure the first member node (Member2)(cont.)

Description	Prompt	Command
Building configuration...[OK]		
	Member2#	reload
Are you sure you want to reboot the whole chassis? (y/n):		y

.

Table 88-4: Configure the first member node (Member3)

Description	Prompt	Command
Step 1. Set the host name.		
Enter Global Configuration mode	(awplus#)	configure terminal
Set the host name	awplus(config)#)	hostname Member3
Note that host names are used as the AMF node name and must be unique within the AMF network.		
Step 2. Set the AMF network name.		
Set the AMF network name to atmf1.	Member3(config)#	atmf network-name atmf1
Note that the AMF network name must be the same on all nodes within the AMF network, and the device must be rebooted before the AMF network name takes effect.		
Step 3. Configure the data VLANs		
Enter the VLAN Configuration mode	Member3(config)#	vlan database
Create VLANs 2 and 3	Member3(config-vlan)#	vlan 2-3
Step 4. Disable RSTP globally (this is enabled by default).		
	Member3(config)#	no spanning-tree rstp enable
Step 5. Configure ports as AMF-links.		
Enter Interface Configuration mode for ports 1.0.1 to 1.0.3	Member3(config)#	interface port1.0.1-1.0.3
Configure these ports as AMF links	Member3(config-if)#	switchport atmf-link
Step 6. Configure data VLANs on the AMF-links as required.		
Set VLANs 2 to 3 to be data VLANs	Member3(config-if)#	switchport trunk allowed vlan add 2-3
Step 7. Configure AMF-crosslink		
Enter the Interface Configuration mode for port 1.0.2	Member3(config)#	interface port1.0.2
Set this port to be an AMF crosslink	Member3(config-if)#	switchport atmf-crosslink
	Member3(config-if)#	switchport trunk native vlan none
Note that AMF links and crosslinks do not need to be configured with data VLANs and can be used solely to provide AMF management VLAN redundancy.		
Step 8. Save the configuration and reboot the switch.		
	Member3#	copy running-config startup-config

Table 88-4: Configure the first member node (Member3)(cont.)

Description	Prompt	Command
Building configuration...[OK]		
	Member3#	reload
Are you sure you want to reboot the whole chassis? (y/n):		y

.

Table 88-5: Configure the first member node (Member4)

Description	Prompt	Command
Step 1. Set the host name.		
Enter Global Configuration mode	`(awplus#)`	`configure terminal`
Set the host name	`awplus(config)#)`	`hostname Member4`
Note that host names are used as the AMF node name and must be unique within the AMF network.		
Step 2. Set the AMF network name.		
Set the AMF network name to atmf1.	`Member4(config)#`	`atmf network-name atmf1`
Note that the AMF network name must be the same on all nodes within the AMF network, and the device must be rebooted before the AMF network name takes effect.		
Step 3. Configure the data VLANs		
Enter the VLAN Configuration mode	`Member4(config)#`	`vlan database`
Create VLANs 2 and 3	`Member4(config-vlan)#`	`vlan 2-3`
Step 4. Disable RSTP globally (this is enabled by default).		
	`Member4(config)#`	`no spanning-tree rstp enable`
Step 5. Configure ports as AMF-links.		
Enter Interface Configuration mode for ports 1.0.1 to 1.0.3	`Member4(config)#`	`interface port1.0.1-1.0.3`
Configure these ports as AMF links	`Member4(config-if)#`	`switchport atmf-link`
Step 6. Configure data VLANs on the AMF-links as required.		
Set VLANs 2 to 3 to be data VLANs	`Member4(config-if)#`	`switchport trunk allowed vlan add 2-3`
Step 7. Configure AMF-crosslink		
Enter the Interface Configuration mode for port 1.0.2	`Member4(config)#`	`interface port1.0.2`
Set this port to be an AMF crosslink	`Member4(config-if)#`	`switchport atmf-crosslink`
	`Member4(config-if)#`	`switchport trunk native vlan none`
Note that AMF links and crosslinks do not need to be configured with data VLANs and can be used solely to provide AMF management VLAN redundancy.		

Table 88-5: Configure the first member node (Member4)(cont.)

Description	Prompt	Command
Step 8. Save the configuration and reboot the switch.		
	`Member4#`	`copy running-config startup-config`
Building configuration...[OK]		
	`Member4#`	`reload`
Are you sure you want to reboot the whole chassis? (y/n):		`y`

Verifying the AMF network

To check that all nodes have joined the AMF network use the **show atmf** command on page 89.40 with the summary parameter. You can run this command from any node in the AMF network:

```
AMF_Master#show atmf summary
ATMF Summary Information:
ATMF Status            : Enabled
Network Name           : atmf1
Node Name              : AMF_Master
Role                   : Master
Current ATMF Nodes     : 5
AMF_Master#
```

The **Current ATMF Nodes** field in the output above shows that all 5 nodes have joined the AMF network.

Use the **show atmf** command on page 89.40 with the nodes parameter, to check information on individual nodes:

```
AMF_Master#show atmf nodes
Node Information:
  * = Local device
 SC = Switch Configuration:
  C = Chassis    S = Stackable    N = Standalone
Node              Device          ATMF                          Node
Name              Type            Master      SC  Parent        Depth
-----------------------------------------------------------------------
* AMF_Master        AT-SBx81CFC400      Y      C   none             0
  Member1           SwitchBlade x908    N      S   AMF_Master       1
  Member2           SwitchBlade x908    N      S   AMF_Master       1
  Member4            x510-52GTX         N      S   Member2          2
  Member3            x510-52GTX         N      S   Member2          2
 Current ATMF node count 5
```

Note The *Parent* field refers to the parent *domain* and not the upstream device. In the example output above, Member2 is the domain controller for the parent domain for Member3 and Member4.

Using the AMF network

AMF backups

AMF backups are an essential part of AMF network operation. They are the mechanism by which AMF master nodes update their records of the AMF network. By default, AMF master nodes are configured to perform automatic scheduled backups of the entire AMF network once per day at 3.00am. AMF backups are stored on external removable media such as USB Flash sticks or SD cards. It is therefore a requirement that all AMF masters have external removable media installed with sufficient capacity to hold all of the relevant files stored in the Flash by every node in the AMF network.

Typically a 4GB capacity external media storage would be of sufficient size to hold backups for a 40 node AMF network.

The AMF node backup system has been designed such that the external media used to store the backup data can still be used to store other data, however care needs to be taken to ensure that enough space is reserved for future AMF backups.

- AMF requires up to 128MB backup space for SBx8100 nodes and up to 64MB backup space for other nodes. The output from the **show atmf backup** command on page 89.45 will provide warnings if capacity on the backup media falls below a safe level.

Here is some example output of the **show atmf backup** command showing a backup media space warning:

```
master1#show atmf backup

Scheduled Backup ...... Disabled
  Schedule ............ 1 per day starting at 12:45
  Next Backup Time .... 25 May 2012 12:45
Backup Media .......... SD (Total 3827.0MB, Free 7.1MB)
                        WARNING: Space on backup media is below 64MB
Current Action ........ Idle
  Started ............. -
  Current Node ........ -
```

Safe removal of external storage media

Removing external storage media, or rebooting the master node, while an AMF backup is underway could potentially cause corruption to files in the backup. Although files damaged as a result of mishandling backup media will be replaced during the next backup cycle, if the file system on the media becomes damaged it may require reformatting before being inserted into the AMF master. To avoid any damage to the AMF backup files or file system it is recommended that the following procedure is followed before rebooting or removing any external storage media from an AMF master.

1. Disable backups to prevent a scheduled backup from occurring while the card is being removed.

2. Terminate any backup already in process.

3. Verify that it is safe to remove the media by checking for a Disabled scheduler and Idle backup.

Here is an example output showing the safe external storage media removal procedure:

```
master1#conf t

master1(config)#no atmf backup enable
master1(config)#exit
master1#atmf backup stop
master1#show atmf backup

Scheduled Backup ...... Disabled
  Schedule ............ 1 per day starting at 12:45
  Next Backup Time .... 25 May 2012 12:45
Backup Media .......... SD (Total 3827.0MB, Free 3257.1MB)
Current Action ........ Idle
  Started ............. -
  Current Node ........ -
```

Once the media has been reinstalled, ensure that the backup scheduler is re-enabled.

Performing a manual backup

Whenever a new device is added to the AMF network or when the configuration has changed on a member node, it is always advisable to perform a manual backup from the AMF master in order to ensure the removable media installed on the master node has an up to date backup of all nodes within the AMF.

To perform a manual backup of the entire AMF network, on the AMF master enter the command **atmf backup now** command on page 89.6:

```
Master1# atmf backup now
Master1(config)# atmf backup enable
Master1(config)# exit
```

To perform an immediate manual backup of the entire AMF network, on AMF Master1, enter the command **atmf backup now**:

To check the status of the backup use the **show atmf backup** command on page 89.45.

Here is an example output from the **show atmf backup** entered during a backup:

```
AMF_Master#show atmf backup
Scheduled Backup ...... Enabled
  Schedule ............ 1 per day starting at 03:00
  Next Backup Time .... 14 Dec 2012 03:00
Backup Media .......... USB (Total 3692.6MB, Free 1782.7MB)
Current Action ........ Doing manual backup
  Started ............. 13 Dec 2012 05:20
  Current Node ........ Member1
Node Name                      Date         Time       In ATMF  On Media  Status
-------------------------------------------------------------------------------
AMF_Master                13 Dec 2012  05:20:16      Yes      Yes      Good
Member1                        -            -         Yes      Yes       -
Member2                        -            -         Yes      No        -
Member3                        -            -         Yes      No        -
Member4                        -            -         Yes      No        -
```

Here is an example output from the **show atmf backup** entered after the backup has completed:

```
AMF_Master#show atmf backup
Scheduled Backup ...... Enabled
  Schedule ............ 1 per day starting at 03:00
  Next Backup Time .... 13 Dec 2012 03:00
Backup Media .......... USB (Total 3692.6MB, Free 1651.1MB)
Current Action ........ Idle
  Started ............. -
  Current Node ........ -

Node Name                      Date         Time     In ATMF  On Media  Status
-------------------------------------------------------------------------------
ATMF_Master                13 Dec 2012  05:20:16  Yes      Yes       Good
Member1                    13 Dec 2012  05:20:27  Yes      Yes       Good
Member2                    13 Dec 2012  05:20:40  Yes      Yes       Good
Member3                    13 Dec 2012  05:20:52  Yes      Yes       Good
Member4                    13 Dec 2012  05:21:08  Yes      Yes       Good
```

Note

The file system used by the AMF backup does not support the backing up of files that have the same name but have different case (e.g. “test.txt” and “TEST.txt”), and only one of these files will be stored in the backup. For this reason it is recommended that all files on a node have unique file names.

Backups on VCStacks running as AMF masters

When a VCStack or SBx8100 with dual CFCs is running as an AMF master node, it is important to note that an AMF backup will only occur on the external removable media installed in the VCS master (or Active CFC). This means that following a failover event, the new VCS master will not have an AMF backup stored on its external storage media, and will not be able to provide configuration backup and recovery when required.

To avoid this situation, the recommended solution is to use trigger scripts to automatically perform a manual backup of the AMF network following a failover event.

Example manual backup activation script called **triggered-atmfbackup.scp:**

To perform a manual backup of the entire AMF network, on the AMF master enter the **atmf backup now** command on page 89.6:

```
enable
wait 180
atmf backup now
```

Note There is a syntax difference between the configuration commands required to create the necessary trigger on the SBx8100 and SBx908.

Example This example shows a trigger script configuration for the SBx8100:

```
awplus# conf t
awplus(config)# trigger 1
awplus(config)# type chassis active-CFC-fail
awplus(config)# script 1 triggered-atmfbackup.scp
```

This example shows a trigger script configuration for the SBx908:

```
awplus# conf t
awplus(config)# trigger 1
awplus(config)# type chassis active-CFC-fail
awplus(config)# script 1 triggered-atmfbackup.scp
```

If there are multiple AMF master nodes in the network, you may also want to use a trigger script or perform a manual backup of all master nodes whenever there is a failover event to ensure that all backups are up to date. Create an atmf working-set group which contains all master nodes, and then use the atmf **atmf working-set** command in the trigger script to execute the manual backup on all nodes within the working set group.

To create a working-set containing all AMF master nodes, first manually select all AMF masters using the **atmf working-set** command:

```
            Master# atmf working-set Master1,Master2
      awplus(config)# trigger 1
 Master1,Master2
   Working set join
          atmf1[2]#
```

Next, create a user defined working-set group containing the nodes in the current working-set using the **atmf group (membership)** command:

```
          atmf1[2]# conf t
   atmf1[2](config)# atmf group AMF_masters
```

Here is an example manual backup activation script called atmfbackup_all_masters.scp:

```
enable
wait 180
atmf working-set group AMF_masters
atmf backup now
```

Node recovery

Automatic node recovery

Within an AMF network, a node that has failed can be replaced with an unconfigured device of the same type, and AMF will automatically upgrade and configure the new device from the most recent backup. Often the replacement device will be a factory default, brand new "out of the box" device, but it may be that you want to replace the failed unit with one that has been previously used elsewhere. In this instance it is necessary to return the replacement device to a "clean" state so that AMF can recognize it as a suitable replacement, and begin automatic recovery. (See section "A "Clean" node" on page 29)

Note

This feature is not intended to support the simultaneous recovery of multiple nodes.

When a failed node is replaced with an unconfigured device, AMF immediately disables forwarding on the device, shuts down all non-AMF ports, and applies the AMF safe configuration. (See **"AMF safe configuration" on page 32**.) AMF then checks whether any of the AMF master nodes has a valid backup for the replacement node, and if it finds one it begins to attempt automatic node recovery. Once automatic node recovery has completed, it will then reboot the replacement node which will then rejoin the AMF network with identical files and configuration, to the failed node it replaced.

Here is some example console output showing automatic node recovery.

Caution

No changes should be made to the device's configuration while a node recovery is underway. A log message will appear on the console or other logged in session indicating when recovery has finished (whether successfully or with errors). This message can also be found by viewing the log with the **show log**.

```
23:03:15 awplus ATMF[863]: ATMF network detected
23:03:15 awplus ATMF[863]: ATMF safe config applied (forwarding disabled)
23:03:25 awplus ATMF[863]: Shutting down all non ATMF ports
23:03:26 x510_1 ATMF[863]: Automatic node recovery started
23:03:26 x510_1 ATMF[863]: Attempting to recover as x510_1
23:03:26 x510_1 ATMF[863]: Checking master node availability
23:03:32 x510_1 ATMF[863]: Master has joined. 2 members in total.
23:03:32 x510_1 ATMF[863]: x908_VCS_2 has joined. 3 members in total.
23:03:32 x510_1 ATMF[863]: x908_VCS_1 has joined. 4 members in total.
23:03:37 x510_1 ATMFFSR[2950]: Retrieving recovery data from master node Master
23:05:18 x510_1 ATMFFSR[2950]: File recovery from master node succeeded. Node will
now reboot
Flushing file system buffers...
Unmounting any remaining filesystems...
Restarting system.
```

A “Clean” node

The recommended procedure for returning a device to a “clean” state is to remove any pre-existing boot configuration, including any backup boot configuration, and delete all configuration files from Flash. If the device you are cleaning has previously had VCStack enabled, it is also necessary to delete the stacking configuration file.

Example

```
          atmf1[2]# configure terminal
atmf1[2](config)# no boot config-file
                  no boot config-file backup
                  exit
                  delete force *.cfg
                  delete force .configs/stk.conf
```

Any user created folders in Flash will have to be removed. Firstly, identify if any user created folders exist.

```
cd flash:
dir
...
0 drwx Aug 20 2012 15:01:44  example_dir/
...
```

A folder is identified as having permissions **drwx**. Once you have identified them, any user created folder and its contents should be removed.

```
rmdir force example_dir
```

In addition, any external media installed in the device should be physically removed. If you are unable to remove the external media from the device then make sure any autoboot.txt files are removed from the external media. This may be achieved with one of the following command examples:

```
delete force card:autoboot.txt
delete force usb:autoboot.txt
```

Note

The procedure above contains the minimum requirements to return a device to a clean state in order for AMF automatic node recovery to work. However, it should be noted that any other user files that remain in Flash will be overwritten during the automatic recovery process. If there are any files stored in the Flash of the replacement device that need to be retained, these files should be backed up prior to installing the device into the AMF network.

Manual node recovery

There are certain situations where, for a number of different reasons, automatic recovery may fail. Automatic recovery has been deliberately designed to be cautious in its approach to recovering a node and for reasons such as:

- The backup stored on the AMF masters not having a “Good” status
- The replacement device is of a different type to the node being replaced

When these situations occur, automatic node recovery may fail.

If automatic node recovery fails, the replacement device will have AMF safe configuration mode applied (see **“AMF safe configuration” on page 32**). If automatic node recovery fails, you may wish to proceed with manual node recovery, which can be initiated by entering the following command:

```
atmf recover {<node_name>} {<master_node_name>}
```

Where:

- **node_name** is the host name of the device you wish to recover.
- **master_node_name** is the host name of the AMF master that contains the backup you want to use for the recovery.

Here is an example showing manual recovery:

```
awplus#atmf recover x510_1 Master
This command will erase ALL flash contents.  Continue node recovery? (y/n)y
Manual node recovery successfully initiated
x510_1#23:15:32 x510_1 ATMFFSR[8477]: Retrieving recovery data from master node
Master
23:17:17 x510_1 ATMFFSR[8477]: Manual node recovery completed
x510_1#
```

Note The manual recovery command will bypass the usual checks performed by automatic node recovery. It is important to be confident that the backup configuration stored on the specified AMF master is correct prior to executing the command.

If the replacement device is of a different type to the one stored in the backup on the specified AMF master node, the incompatible release file from the backup will not be copied to the replacement device. Instead, the existing release on the replacement device will be used, in order to ensure the device is able to join the AMF network and function correctly.

Node recovery on VCStacks

Node recovery on VCStacks that are part of an AMF network is somewhat different to node recovery of standalone devices. This is because VCStack has its own node recovery mechanism which has different requirements to AMF.

Typically a failure on a VCStack will only affect one stack member.

- The replacement device is running a compatible firmware version
- The Stack ID on the replacement device is set to the same ID as the device being replaced
- The replacement device is installed with the same licences as other stack members

Then, VCStack will synchronize the configuration and firmware.

In the extremely unlikely situation of needing to replace an entire VCStack that is a member of an AMF network, you can use AMF automatic node recovery to first recover stack ID 1, which will become the VCstack master.

The replacement device which will become the VCStack master must be a clean unit, (see the section **"A "Clean" node" on page 29**).

The procedure for recovering an entire stack is as follows:

1. Connect a **clean** device to the AMF network, and power it on. The connections into the AMF network should be between the appropriately configured AMF links on the neighboring node, and the ports previously configured as AMF links in the backup for the failed node configuration.
2. The AMF network should detect the replacement device and begin automatic node recovery. Wait until automatic node recovery completes and check that the replacement device has come up correctly as VCStack ID 1, and that the configuration is correct.
3. Configure the next replacement device as VCStack ID 2. Ensure it is installed with a compatible release and the same set of licences that exist on ID 1. Connect the VCStack cables and power it on.
4. VCStack ID 1 should detect ID 2 and synchronize the configuration and firmware release. Once this has completed, check that the VCStack has formed correctly, and then connect the remaining network connections.

For any additional VCStack members, repeat the last two steps, ensuring that the VCStack ID is set to the next sequential value for each additional device that is added to the VCStack.

AMF safe configuration

If, for any reason, AMF automatic node recovery fails, AMF contains a safety net feature which puts the replacement node into a safe configuration state. This is to prevent an unconfigured device from joining the network and creating loops.

How can I tell if my device has had AMF safe configuration applied?

A log message will be generated when AMF safe configuration is applied. This message will appear in the log some time after the startup sequence.

The message will also be output to the console or any connected VTY session.

What does safe config do?

The components of the AMF safe configuration are:

- A special VLAN is created in the disabled state and given the name atmf_node_recovery_safe_vlan. The index of this VLAN is determined dynamically to ensure it does not conflict with AMF management VLANs which are detected through the AMF network.
- All ports are removed from their default VLAN membership (VLAN 1).
- All ports are set as tagged members of the safe VLAN.
- Additionally, all ports that are not an AMF link or cross-link are shutdown. The links and crosslinks are detected by AMF and added to the dynamic configuration. This is done to ensure correct behavior of static aggregators and Layer 3 protocols configured on the neighboring devices.

See below for example output of the**show vlan** command with the brief parameter set for a device in AMF safe configuration mode:

```
awplus#sh vlan brief

VLAN ID  Name            Type    State   Member ports   (u)-Untagged, (t)-Tagged
======= ================ ======= ======= =======================================
1       default          STATIC  ACTIVE
4090    atmf_node_recovery_safe_vlan
                         STATIC  SUSPEND port1.0.1(t)  port1.0.2(t) port1.0.3(t)
                                         port1.0.4(t)  port1.0.5(t) port1.0.6(t)
                                         port1.0.7(t)  port1.0.8(t) port1.0.9(t)
                                         port1.0.10(t) port1.0.11(t)
                                         port1.0.12(t) port1.0.13(t)
                                         port1.0.14(t) port1.0.15(t)
                                         port1.0.16(t) port1.0.17(t)
                                         port1.0.18(t) port1.0.19(t)
                                         port1.0.20(t) port1.0.21(t)
                                         port1.0.22(t) port1.0.23(t)
                                         port1.0.24(t)
```

See below for an example excerpt from the **show running-config** command on page 7.38 for a device in AMF safe configuration mode:

```
awplus#show running-config
...
!
vlan database
 vlan 4090 name atmf_node_recovery_safe_vlan
 vlan 4090 state disable
!
interface port1.0.1-1.0.4
 shutdown
 switchport
 switchport mode trunk
 switchport trunk allowed vlan add 4090
 switchport trunk native vlan none
!
interface port1.0.5
 switchport
 switchport atmf-link
 switchport mode trunk
 switchport trunk allowed vlan add 4090
 switchport trunk native vlan none
!
interface port1.0.6-1.0.24
 shutdown
 switchport
 switchport mode trunk
 switchport trunk allowed vlan add 4090
 switchport trunk native vlan none
!
...
```

How can I undo a safe configuration?

If your node has had AMF safe configuration applied, you can use normal CLI configuration commands to modify the running-configuration to whatever configuration is required.

See below for an example of returning a device from AMF safe configuration to default VLAN and port settings. Note that in this example a 24-port device has been used.

```
awplus# configure terminal
atmf1[2](config)# interface port1.0.1-port1.0.24
atmf1[2](config-if)# switchport trunk native vlan 1
atmf1[2](config-if)# switchport trunk allowed vlan remove 4090
atmf1[2](config-if)# switchport mode access
                    % port1.0.5 has ATMF link configured so
                    mode cannot be changed
```

```
atmf1[2](config-if)# no shutdown
atmf1[2](config-if)# exit
atmf1[2](config-if)# vlan database
atmf1[2](config-if)# no vlan 4090
atmf1[2](config-if)# end
```

In order to retain connectivity to the AMF network, AMF link and crosslink settings should not be changed. In the example above you can see that port1.0.5 is an automatically configured AMF link. You can see the error message indicating it was skipped by the **switchport mode access** command on page 19.17, because AMF links must be in trunk mode.

Caution No changes should be made to the device's configuration while a node recovery is underway. A log message will appear on the console or other logged in session indicating when recovery has finished (whether successfully or with errors). This message can also be found by viewing the log with the **show log** command on page 12.40.

Adding a preconfigured device to the network

In many cases when a new device is to be added to the network, a user will want to fully preconfigure it before connecting it to the network. This is for the obvious reason that it is generally not a good idea to have an unconfigured device connected to the network.

With AMF it is possible to perform this preconfiguration by cloning the configuration from the backup of an existing AMF node. The cloned configuration will be applied in a safe way to the similar node that you wish to join the AMF network. In this way a node can be added to the network without the need to construct the configuration elements that are common to another node.

There are two methods that can be used to achieve this:

1. By connecting an unconfigured clean node (see section **"A "Clean" node" on page 88.29**), to the AMF network. Wait for automatic node recovery to fail and the AMF safe configuration to be applied. Then use the **atmf recover** command, followed by the node name of a similar node, to replicate the desired configuration to the new unit.

2. By preconfiguring the new device with the AMF network name, a node name, and an AMF link prior to connecting it to the AMF network. Then use the **atmf recover** command followed by the node name of a similar node, to replicate the desired configuration to the new switch.

In both methods it is necessary to configure an AMF link on the neighboring node that is to be connected to the new node, so the new node will be able to join the AMF network.

Note We recommend that you select the donor node to be as close as possible to the new node, and for it to contain the same number of ports or if applicable, has the same XEMs installed in the same bays. This will limit the number of manual changes that will be required to the replicated configuration of the new node.

If using the first method described above, it is safe to connect ports other than the AMF link. This is because forwarding will be disabled and all ports administratively shutdown when the AMF safe configuration is applied.

If using the second method described above, it is important to only connect the atmf-link until the configuration can be appropriately edited and the node rebooted. Following this procedure ensures that there is no possibility of creating loops by having an unconfigured node connected to the network.

The example below shows a clean node that has been connected to a port on a neighboring AMF node that configured as an atmf-link. AMF detects the new node and attempts automatic node recovery, but because the new node is not present in the backup stored on the AMF master, the automatic recovery fails and the AMF safe configuration is applied:

```
04:26:36 awplus ATMF[846]: ATMF network detected
04:26:36 awplus ATMF[846]: ATMF safe config applied (forwarding disabled)
04:26:46 awplus ATMF[846]: Shutting down all non ATMF ports
04:26:46 awplus ATMF[846]: host_0000_cd28_08cd has left. 0 member in total.
04:26:46 awplus ATMF[846]: host_0000_cd28_08cd has joined. 1 member in total.
04:26:46 awplus ATMF[846]: No identity found for this device so automatic node
recovery is not possible
04:26:53 awplus ATMF[846]: x510_1 has joined. 2 members in total.
04:26:53 awplus ATMF[846]: Master has joined. 3 members in total.
04:26:53 awplus ATMF[846]: x908_VCS_2 has joined. 4 members in total.
04:26:53 awplus ATMF[846]: x908_VCS_1 has joined. 5 members in total.
```

Once automatic recovery has failed you can now use the **atmf recover** command to replicate the configuration from the designated similar node:

```
awplus#atmf recover x510_2
This command will erase ALL flash contents.  Continue node recovery? (y/n)y

Manual node recovery successfully initiated

awplus#04:38:24 awplus ATMFFSR[15686]: Retrieving recovery data from master node
Maste
r
04:40:11 awplus ATMFFSR[15686]: Manual node recovery completed
```

When the recovery has completed, the new node will be configured to boot from the cloned configuration, but the configuration will not be applied to the node until it is rebooted. This way the configuration can be appropriately modified using the AlliedWare Plus in built editor before the unit is rebooted and the configuration applied.

Using the unified CLI with working-sets

The unified CLI is a central component of AMF. It provides users with a configuration and display interface that can control the entire AMF network from a single point. Control of the nodes within an AMF network is provided through the **atmf working-set command**.

The working-set

An AMF working-set is a set of nodes, which is either arbitrarily user defined or one of the pre-defined working-set groups. Specifying or selecting a working-set allows CLI commands to be executed on all nodes within the selected working-set with a single command. A working-set can be defined, selected and configured from any node within an AMF network.

By default, when you first log into a node that is part of an AMF network, you are implicitly placed into the working-set group local, a working-set which only contains the local node. In this instance the CLI prompt when you log in will look the same as on any other AlliedWare plus device.

```
Node1# atmf working-set Node1,Node2

          Working set join

atmf1[2]#
```

Working-set AMF contains the ability to have working-set groups, so that it is not always necessary to use a comma separated list to specify a working-set.

AMF working-set groups can be split into two types:

- Automatic
- User-defined

Automatic working-set groups

There are three automatic working-set groups that will exist on every AMF network:

1. All—all nodes within the AMF network.
2. Current—the current working-set of nodes. This group is useful for adding additional nodes to the current working-set.
3. Local—the local device

In any AMF network there will also be a number of other automatic working-set groups that are dependent on the platform types which exist within the network. To see the platform dependent automatic working-set groups that exist on the AMF network use the command **show atmf group** with the automatic parameter:

```
x908_VCS_1#show atmf group members automatic

Retrieving Automatic groups from:
x510_1 Master x908_VCS_2 x908_VCS_1

ATMF Group membership

Automatic        Total
Groups           Members   Members
poe              1         Master
x510             1         x510_1
SBx8100          1         Master
x900             2         x908_VCS_2 x908_VCS_1
```

To select a working-set group use the **atmf working-set** command with the group parameter, followed by the group name. You can specify a single group, a comma separated list of groups, or even a comma separated list of individual nodes, followed by a comma separated list of groups:

```
atmf1[3]# atmf working-set group x511Node2

                Working set join

% Warning - working set is now empty

atmf1[0]#
```

User-defined working-set groups

In addition to the automatic working-set groups, it is also possible to create user-defined groups for arbitrary sets of nodes that the user may wish to group together. For example, all AMF master nodes.

To create and use a user-defined working-set group:

1. Create a working-set containing the desired nodes.
2. In global configuration mode use the command: **atmf group (membership)**

```
Master# atmf working-set Master1,Master2

                Working set join

% Warning - working set is now empty

atmf1[2]# conf t

atmf1[2]# atmf group Masters
```

You can see all user-defined working-set groups that exist on the AMF network with the command **show atmf group members**

```
x908_VCS_1#show atmf group members automatic

Retrieving Automatic groups from:
x510_1 Master x908_VCS_2 x908_VCS_1

ATMF Group membership

Automatic        Total
Groups           Members   Members
poe              1         Master
x510             1         x510_1
SBx8100          1         Master
x900             2         x908_VCS_2 x908_VCS_1
```

Executing commands on working-sets

Once you have selected the desired working-set of nodes on which you wish to execute commands, in general there is no difference to executing commands on a single AlliedWare Plus device. When a command is executed that is valid for all nodes within the working-set, the output is displayed for each of the nodes separately.

Here is an example output of the **show arp** command run from a working-set:

```
atmf1[4]#show arp
=======
Master:
=======

 IP Address      MAC Address   Interface    Port      Type
172.31.0.1      eccd.6d7d.a542 ATMF       sa1         dynamic
172.31.0.3      0000.cd2b.0329 ATMF       sa1         dynamic
172.31.0.10     0000.cd37.0163 ATMF       sa1         dynamic

=======
x510_1:
=======

 IP Address      MAC Address   Interface    Port      Type
172.31.0.2      eccd.6d03.10f9 ATMF       sa4         dynamic

===========
x908_VCS_1:
===========

 IP Address      MAC Address   Interface    Port      Type
172.31.0.2      0000.cd37.1050 ATMF       sa1         dynamic

===========
x908_VCS_2:
===========

 IP Address      MAC Address   Interface    Port      Type
172.31.0.2      0000.cd37.1050 ATMF       sa3         dynamic

atmf1[4]#
```

Some commands are invalid for nodes in a working-set

There will be some commands, however, which will only be valid to execute on some of the nodes within the working-set. In this case the command will be executed on all nodes within the working-set. However, for any node for which the command is not valid, the command execution will fail and the output displayed will indicate the nodes on which the command succeeded and nodes on which the command failed.

The following is example output of the **show card** command run from a working-set, which is only a valid command for the SBx8100 series switches:

```
atmf1[4]# show card
=======
Master:
=======

Slot Card Type        State
-------------------------------------------------------------------
1    AT-SBx81GP24     Online
2    AT-SBx81GP24     Online
3    AT-SBx81GP24     Online
4    AT-SBx81XS6      Online
5    AT-SBx81CFC400   Online (Active)
6    -                -
7    -                -
8    -                -
9    -                -
10   -                -
11   -                -
12   -                -
-------------------------------------------------------------------

==============================
x510_1, x908_VCS_1, x908_VCS_2:
==============================
% Invalid input detected at '^' marker.
```

Sub-configuration limitations for some nodes in a working-set

There will also be some instances where a sub-configuration mode is only valid for some of the nodes in the working-set. One example of this case would be when entering interface configuration mode for a port that exists on some members of the working-set and not on others. For example:

```
                atmf1[4]# conf t
         atmf1[4](config)# int port2.1.1
 % Can't find interface port2.1.1
    atmf1[4:2](config-if)# conf t
```

In the example above the interface **port2.1.1** exists on two of the nodes in the working-set, but doesn't exist on nodes "Master" and "x510_1". The interface configuration mode fails for these nodes and a warning message is output to indicate this. The numbers within the square brackets next to the AMF network name prompt also change. The first number indicates the total number of nodes in the working set, and the second number indicates the number of nodes in the sub-configuration mode that has been entered. Any configuration commands configured in this mode will only be executed on the nodes that successfully entered the sub-configuration mode.

Entering **exit** while in this mode will return to global configuration mode for all nodes within the working-set:

```
atmf1[4:2](config-if)# exit

     atmf1[4](config)# (config)#
```

Interactive commands

There is one other command type, known as **interactive** commands, for which it is not appropriate to execute the commands simultaneously across multiple nodes within a working-set. When any interactive commands are entered from within a working-set they will be executed on the local node only.

The list of current interactive commands, including any optional parameters are:

- ping
- mtrace/mstat
- traceroute
- boot system
- boot configuration-file
- banner login
- tcpdump
- edit
- copy
- mail
- delete
- move
- terminal monitor

Rolling-reboot firmware upgrade

The Rolling-reboot firmware upgrade feature allows nodes within an AMF network to be rebooted and upgraded in a rolling sequence in order to minimize downtime and reduce the management overhead. First specify a set of nodes within the AMF network using the **atmf working-set** command, then use the **atmf reboot-rolling** command so all nodes in the specified working-set will be rebooted and upgraded one by one starting with the nodes furthest from the core domain, and ending with nodes closest to or in the core domain.

Once the rebooted node has finished running its configuration and has brought its ports up it re-joins the AMF network and the next node in the working-set is rebooted and upgraded.

Note The atmf rolling-reboot command can also be used to reboot a set of nodes without upgrading the firmware.

To upgrade firmware, a download URL can be selected from any media location.

Supported media locations include:

- flash:
- card:
- usb:
- tftp:
- scp:
- http:

The latest compatible release for a node will be selected from this location. Several checks are performed to ensure the upgrade will succeed. This includes checking the current node release boots from Flash and that there is enough space in Flash on this node. The new release name is updated using the **boot system backup** command. The old release will become the backup release file.

Note If the release file is to be copied from a remote location (e.g. via TFTP, HTTP, etc.), then the URL should specify the exact release filename without using wild card characters.

The node is rebooted and the new software version will be used. On boot up, the software release is verified. Should an upgrade fail, the upgrading unit will fail back to old software. At the completion of this command, a report is run showing the release upgrade status of each node.

Supported units include SBx8100, SBx908, x900, x610, and x510.

The **force** parameter enforces a node reboot, even though the node may not be suitable for upgrading software. This command can take a significant amount of time to complete.

Note Rolling reboot firmware upgrades can be performed on a working-set which includes the controlling node, although in this instance the user will not be presented with a summary report upon completion.

Here is an example of a Rolling Reboot firmware upgrade summary report:

```
=================================================================
ATMF Rolling Reboot Complete
Node Name       Reboot Status    Release Name              Release Status
-----------------------------------------------------------------
Node1      Rebooted         x510-main-20121018-2.rel            Upgraded
Node2      Rebooted         x900-main-20121018-2.rel            Upgraded
Node3      Rebooted         x900-main-20121018-2.rel            Upgraded
Node4      Rebooted         x900-main-20121018-2.rel            Upgraded

=================================================================
```

Performing a rolling reboot upgrade

To perform a Rolling Reboot firmware upgrade on all nodes in the AMF network, first select all nodes using the default working-set group all:

```
SBx8100# atmf working-set group all

SBx8100, SBx908-VCS1, SBx908-VCS2, x510_1, x510_2:

                    Working set join
```

Next, using the **atmf reboot-rolling** command, specify the path to the release files to which you wish to upgrade the nodes in the AMF network. In this example the release files are stored on the external USB storage media installed in the node controlling the rolling reboot firmware upgrade, in a directory called "rel". Note that because the node controlling the rolling reboot firmware upgrade is included in the nodes to be upgraded, a message is output indicating that no summary will be available on completion.

```
csg_vcf[5]#atmf reboot-rolling usb:/rel/*.rel
Retrieving data from SBx8100
Retrieving data from SBx908-VCS2
Retrieving data from x510_1
Retrieving data from x510_2
Retrieving data from SBx908-VCS1

ATMF Rolling Reboot Nodes:

                    Timeout
Node Name           (Minutes)  New Release File           Status
-----------------------------------------------------------------------
x510_2              9          x510-main-20121203-1.rel   Release ready
x510_1              6          x510-main-20121203-1.rel   Release ready
SBx908-VCS1         9          x900-main-20121203-1.rel   Release ready
SBx908-VCS2         9          x900-main-20121203-1.rel   Release ready
SBx8100            11         SBx81CFC400-main-20121203  Release ready
                                 -1.rel
% The controlling node (SBx8100) is included in the
rolling reboot and will be rebooted last.
No summary will be available on completion.
Continue upgrading releases ? (y/n):
=================================================================
Copying Release    : x510-main-20121203-1.rel to x510_2
Updating Release   : x510-main-20121203-1.rel information on x510_2
=================================================================
ATMF Rolling Reboot: Rebooting x510_2
=================================================================
02:11:32 SBx8100 ATMF[1973]: x510_2 has left. 4 members in total.

% x510_2 has left the working-set
02:13:30 SBx8100 ATMF[1973]: x510_2 has joined. 5 members in total.
Reboot of x510_2 has completed
```

Although in this example no summary report was generated, you can refer to the progress messages output to the console to confirm that the upgrades were successful. You can also use the **atmf working-set** and the **show boot** commands to confirm the current boot image for each node in the AMF network.

Introduction

This chapter provides an alphabetical reference for AMF commands.

AMF Naming Convention

When AMF is enabled on a switch, it will automatically be assigned a host name. If a host name has already been assigned, by using the command,**"hostname" on page 10.23**, this will remain. If however, no host name has been assigned, then the name applied will be the prefix, **host_** followed (without a space) by the MAC address of the device. For example, a device whose MAC address is **0016.76b1.7a5e** will have the name **host_0016_76b1_7a5e** assigned to it.

To efficiently manage your network using AMF, we strongly advise that you devise a naming convention for your network switches, and accordingly apply an appropriate hostname to each switch in your AMF network.

atmf backup

This command can only be applied to a master node. It manually schedules an AMF backup to start at a specified time and to execute a specified number of times per day.

Syntax

```
atmf backup {default|<hh:mm> frequency <1-24>}
no atmf backup enable
```

Parameter	Description
`default`	Restore the default backup schedule.
<hh:mm>	Sets the time of day to apply the first backup, in hours and minutes. Note that this parameter uses the 24 hour clock.
`backup`	Enables AMF backup to external media.
`frequency <1-24>`	Sets the number of times per day that backups will be taken.

Default Backups run daily at 03:00 AM, by default

Mode Global Configuration

Usage Running this command only configures the schedule. To enable the schedule, you should then apply the command **atmf backup enable**.

Running the **"no"** variant of this command will disable the schedule.

Example To schedule backup requests to begin at 11 pm and execute daily, use the following command:

```
VCF_1# configure terminal
VCF_1(config)# atmf backup 23:00 frequency 1
```

Caution File names that comprise identical text, but with differing case, such as Test.txt and test.txt, will not be recognized as being different on a FAT32 based backup media such as a USB storage device. However, these filenames will be recognized as being different on your Linux based switch. Therefore, for good practice, ensure that you apply a consistent case structure for your back-up file names.

Related Commands

atmf backup enable
atmf backup stop
show atmf backup

atmf backup bandwidth

This command sets the maximum bandwidth in kilobytes per second (kBps) available to the AMF backup process. Basically this command enables you to restrict the bandwidth that is utilized for downloading file contents during a backup.

Note

This command will only run on an AMF master. An error message will be generated if run on a node if the command is attempted on node that is not a master.

Also note that setting the bandwidth value to zero will allow the transmission of as much bandwith as is available, which can excede the maximum configurable speed of 100 kBps. So effectively, zero means unlimited.

Use the no variant of this command to reset (to its default value of zero) the maximum bandwidth in kilobytes per second (kBps) available when initiating an AMF backup. A value of zero tells the backup process to transfer files using unlimited bandwidth.

Syntax

```
atmf backup bandwidth <0-1000>

no atmf backup bandwidth
```

Parameter	Description
<0-1000>	Sets the bandwidth in kilobytes per second (kBps)

Default The default value is zero, allowing unlimited bandwidth when executing an AMF backup.

Mode Global Configuration

Examples To set an atmf backup bandwidth of 750 kBps, use the commands:

```
node2# configure terminal
node2(config)# atmf backup bandwidth 750
```

To set the atmf backup bandwidth to the default value for unlimited bandwidth, use the commands:

```
node2# configure terminal
node2(config)# no atmf backup bandwidth
```

Related Commands show atmf backup

atmf backup enable

This command enables automatic AMF backups on the AMF master node. By default, automatic backup starts at 3:00 AM. However, this schedule can be changed by the **atmf backup** command on page 89.3. Note that backups are initiated and stored only on the master nodes.

The **"no"** variant of this command disables any AMF backups that have been scheduled and previously enabled.

Syntax

```
atmf backup enable

no atmf backup enable
```

Parameter	Description
`atmf`	The Allied Telesis Management Framework (AMF)
`backup`	The AMF backup process.
`enable`	Enables AMF backup to external media.

Default Automatic AMF backup functionality is enabled on the AMF master when it is configured and external media, i.e. an SD card or a USB storage device, is detected.

Mode Global Configuration

Usage A warning message will appear if you run the **atmf backup enable** command with either insufficient or marginal memory availability on your external storage device.

You can use the command **"show atmf backup" on page 89.45** to check the amount of space available on your external storage device.

Example To turn on automatic AMF backup, use the following command:

```
VCF_1# configure terminal
VCF_1(config)# atmf backup enable
```

atmf enable

atmf backup now

This command initiates an immediate AMF backup of either all AMF members, or a selected AMF member. Note that this backup information is stored in the external media on the master nodes, even though the selected AMF member may not be a master node.

Syntax `atmf backup now [<nodename>]`

Parameter	Description
`backup`	The AMF backup process.
`now`	Immediately applies the command's action.
<nodename> *or* *<hostname>*	The name of the AMF member to be backed up - as set by the command **"hostname" on page 10.23**. Where no name has been assigned to this device, then you must apply the prefix, host underscore followed (without a space) by the MAC address of the device to be backed up. For example `host_0016_76b1_7a5e` Note that the node-name appear as the command Prompt when in Privileged Exec mode.

Default A backup is initiated for all nodes on the AMF (but stored on the master nodes).

Mode Privileged Exec

Usage Although this command will select the AMF node to be backed-up; it can only be run from an AMF master node.

Note The backup produced will be for the selected node but the backed-up config will reside on the external media of the AMF master on which the command was run. However, this process will result in the information on one master being more up-to-date. To maintain concurrent backups on both masters, you can apply the backup now command to the master working-set. This is shown in **"Example-4" on page 89.7**.

Example-1 In this example, an AMF member has not been assigned a host name. The following command is run on the atmf_master_2 node to immediately backup the device - identified by its MAC address of 0016.76b1.7a5e:

```
atmf_master_2# atmf backup now host_0016_76b1_7a5e
```

Note When a host name is derived from its MAC address, the syntax format entered changes from XXXX.XXXX.XXXX to XXXX_XXXX_XXXX.

Example-2 In this example, an AMF member has the host name, **office_annex**. The following command will immediately backup this device:.

```
atmf_master_2# atmf backup now office_annex
```

This command is initiated on the switch named **amf_master_2** and initiates an immediate backup on the switch named **office_annex**.

Example-3 To initiate (from the amf_master_1 node) an immediate backup of all AMF member nodes, use the following command:

```
amf_master_1# amf backup now
```

Example-4 To initiate an immediate backup of the node with the host-name “office_annex” and store the configuration on both masters, use the following process:

From the node amf_master_1, set the working-set to comprise only of the automatic group, master nodes.

```
amf_master_1# atmf working-set group master
```

This command returns the following display:

```
============================
atmf_master_1, atmf_master_2
============================

Working set join
```

Backup the AMF member with the host name, **office_annex** on both the master nodes as defined by the working set.

```
atmf_net[2]# atmf backup now office_annex
```

Note that the [2] shown in the command prompt indicates a 2 node working-set.

Related Commands

atmf backup
atmf backup stop
hostname
show atmf backup

atmf backup stop

Running this command will immediately stop a currently executing AMF backup. This command can only be applied to the master node.

Syntax `atmf backup stop`

Parameter	Description
`backup`	The amf backup process.
`stop`	Immediately halts the running process.

Mode Privileged Exec

Mode This command is used to halt an AMF backup that is in progress. In this situation the backup process will finish on its current node and then stop.

Example To stop a backup that is currently executing:

```
VCF-1# amf backup stop
```

Related Commands
atmf backup
atmf backup enable
atmf backup now
show atmf backup

atmf distribute firmware

This command can be used to upgrade software one AMF node at a time. A URL can be selected from any media location. The latest compatible release for a node will be selected from this location.

Several checks are performed to ensure the upgrade will succeed. This includes checking the current node release boots from flash. If there is enough space on flash the software release is copied to flash on the new location. The new release name is updated using the **boot system** command. The old release will become the backup release file

If a release file exists in a remote device (e.g. TFTP, HTTP, etc.), then the URL should specify the exact release filename without using a wild card character.

Supported units include, x908, x8100, x610, x210, and all stack configurations.

The command will continue to upgrade software until all nodes are upgraded. At the end of the upgrade cycle the **reboot** command should be used on the working-set.

Syntax `atmf distribute firmware <url> .`

Parameter	Description
<url>	The URL of the file. See **"URL syntax" on page 6.12** for valid URL syntax.

Mode Privileged Exec

Examples To upgrade nodes in a atmf network with a predefined AMF group called `sw_team`, use the following commands:

```
SW_Team1# atmf working-set group sw_team
```

Command Returns

```
============================
SW_Team1, SW_Team2, SW_Team3:
============================

Working set join
```

```
ATMF_NETWORK[3]# atmf distribute firmware card:*.rel
```

Command Returns

```
Retrieving data from SW_Team1
Retrieving data from SW_Team2
Retrieving data from SW_Team3

ATMF Firmware Upgrade:

Node Name          New Release File           Status
-----------------------------------------------------------------
SW_Team1           x510-main-20140204-2.rel   Release ready
SW_Team2           x610-main-20140204-2.rel   Release ready
SW_Team3           x610-main-20140204-2.rel   Release ready
Continue the rolling reboot ? (y/n):y

=================================================================
Copying Release    : x610-main-20140204-2.rel to SW_Team3
Updating Release   : x610-main-20140204-2.rel information on SW_Team3

=================================================================
New firmware will not take effect until nodes are rebooted.
=================================================================

ATMF_NETWORK[3]#
```

Related Commands **atmf working-set**

atmf domain vlan

The AMF domain vlan is one of the internal VLANs that are used to communicate information about the state of the AMF network between nodes. AMF uses its internal VLANS (the management VLAN and the domain VLAN) to communicate its inter nodal network status information. These VLANs must be reserved for AMF and not used for other purposes.

When an AMF network is first created all its nodes are assigned a domain VLAN with a default (domain) VID of 4091. An important point conceptually is that although this VLAN then exists globally across the AMF network; it is assigned separately to each domain. The AMF network therefore can be thought of as comprising a series of domain VLANS each having the same VID and each being applied to a horizontal slice (domain) of the AMF. It follows therefore that the domain VLANs are only applied to ports that form cross-links and not to ports that form uplinks/downlinks.

If you assign a VLAN ID to this VLAN (i.e. changing its value from the default of 4091) then you will need to do this separately on every device within the AMF network. The AMF domain subnet will then be applied to this new VID when all devices within the AMF network are next rebooted.

The "no" variant of this command resets the VLAN ID to its default value of 4091.

Syntax

```
atmf domain vlan <2-4090>

no atmf domain vlan .
```

Parameter	Description
`domain vlan`	The VLAN that is assigned (separately) to each domain within the AMF network.
<2-4090>	The VLAN number in the range 2 to 4090.

Default The default domain VLAN ID for the AMF is 4091.

Mode Global Configuration

Usage The VLANs involved in this process, must be reserved for AMF and cannot be used for other purposes. This command enables you to change the domain VLAN to match your network's specific configuration.

Caution

Setting this command, then rebooting the switch will only apply the AMF VLAN for the switch being configured. The new domain vlan will not become effective for the AMF network until all its member nodes have been updated, and all its member switches rebooted.

As part of its automatic creation process, this VLAN will also be assigned an IP subnet address based on the value configured by the command **"atmf management subnet" on page 89.17**. Refer to this command for more information.

Examples To change the AMF domain VLAN to 4000 use the following commands:

```
VCF-1# configure terminal
VCF-1(config)# atmf domain vlan 4000
```

To reset the AMF domain VLAN to its default of 4091, use the following commands:

```
VCF-1# configure terminal
VCF-1(config)# no atmf domain vlan
```

atmf enable

This command manually enables (turns on) the AMF feature for the switch being configured.

The "no" variant of this command disables (turns off) the AMF feature on the member node.

Syntax

```
atmf enable
no atmf enable
```

Default Once AMF is configured, the AMF feature starts automatically when the switch starts up.

Mode Global Configuration

Usage The switch does not auto negotiate AMF domain specific settings such as the Network Name. You should therefore, configure your switch with any domain specific (non default) settings before enabling AMF.

Examples To turn on the AMF the feature

```
MyNode# config terminal
MyNode(config)# atmf enable
```

To turn off the AMF feature

```
MyNode(config)# no atmf enable
```

This command returns the following display:

```
% Warning: The ATMF network config has been set to enable
% Save the config and restart the system for this change to take
effect.
```

atmf group (membership)

This command configures a switch to be a member of one or more AMF groups. Groups exist in three forms: Implicit Groups, Automatic Groups, and User-defined Groups.

- Implicit Groups
  - « all - All nodes in the AMF
  - « current - The current working-set
  - « local - The originating node.

  Note that the Implicit Groups do not appear in show group output.
- Automatic Groups - These are defined by hardware architecture. e.g x510, x610, x900, x8100.
- User Defined Groups - These enable you to define arbitrary groups of AMF members based on your own criteria.

Each node in the AMF is automatically assigned membership to the implicit groups, and the automatic groups that are appropriate to its node type, e.g. x610, PoE. Similarly, nodes that are configured as masters are automatically assigned to the master group.

Syntax

```
atmf group <group-list>
no atmf group <group-list>
```

Parameter	Description
`group`	An AMF group is a named collection of AMF nodes or modules. These definitions may be pre-existing and applied via hardware generated commands, or may be manually configured, changed, or removed. Group names are case sensitive and must be less than 64 characters long.
`<group-list>`	A list of group names. These should be entered as a comma delimited list without spaces.

Mode Global Configuration

Usage You can use this command to define your own arbitrary groups of AMF members based on your own network's configuration requirements. Applying a node to a non existing group will result in the group automatically being created.

Note that the master nodes are automatically assigned to be members of the pre-existing master group

The following example configures the switch to be members of three groups; two are company departments, and one comprises all devices located in building_2. To avoid having to run this command separately on each device that is to be added to these groups; you can remotely assign all of these devices to a working-set, then use the capabilities of the working-set to apply the **atmf group (membership)** command to all members of the working set.

Example To specify the switch to be a member of AMF groups named, Marketing, Sales, and Building_2, use the following command:

```
VCF-1# configure terminal
VCF-1(config)# atmf group marketing,sales,building_2
```

First add the nodes “master_node1” and “member_node_1” to the working-set:

```
master_node# atmf working-set master_node1,member_node_1
```

This command returns the following output confirming that the nodes “master_node” and “node_2” are now part of the working-set:

```
====================
master_node1, member_node_1
======================

Working set join
```

```
atmf-net[2]# configure terminal
```

Add the groups building1 and sales to the working-set

```
atmf-net[2](config)# atmf group building1,sales
atmf-net[2](config)# exit
```

Show the groups that are members of the working-set

```
atmf-net[2]# show atmf group
```

This command returns the following output displaying the groups that are members of the working-set.

```
====================
master_node1
======================

AMF group information

building1, sales, master, poe, x8100
```

Related Commands **show atmf group**
show atmf group members

atmf log-verbose

This command limits the number of log messages displayed on the console or permanently logged.

Default: The default log display is 3 which matches 5.4.3 implementation

Syntax

```
atmf log-verbose <1-3>

no atmf log-verbose
```

Parameter	Description
`atmf`	Manage the AMF feature
`log-verbose`	Apply the verbose log message limitation
`<1-3>`	The verbose limitation (3 = noisiest, 1 = quietest)

Default This command is intended for use in large networks where the number of nodes can make the console unusable for large periods of time while nodes are joining

and leaving. - for example, as nodes join or leave the AMF network - can render the console unusable for large periods of time.

Mode Global Configuration

Usage Typically

Examples To set the log-verbose to noise level 2, use the command

```
VCF-1# configure terminal
VCF-1(config)# atmf log-verbose 2
```

Validation Command **show atmf**

atmf management subnet

This command is used to assign a subnet that will be allocated to the AMF management and domain management VLANs. From the address space defined by this command, two subnets are created, a management subnet component and a domain component, as explained in the Usage section of this command description.

AMF uses these internal IPv4 subnets when exchanging its internodal status packets. These subnet addresses must be reserved for AMF and should be used for no other purpose.

The new management subnet will not become effective until all members of the AMF network have been updated and all its units rebooted.

Syntax

```
atmf management subnet <a.b.0.0>
no atmf management subnet
```

Parameter	Description
`atmf management subnet`	A subnet that is assigned for AMF management purposes.
`<a.b.0.0>`	The IP address selected for the management subnet. Because a mask of 255.255.0.0 (i.e. /16) will be applied automatically, an IP address in the format a.b.0.0 must be selected. Usually this subnet address is selected from an appropriate range from within the private address space of 172.16.0 to 172.31.255.255, or 192.168.0.0 as defined in RFC1918.

Default 172.31.0.0 (Note that a subnet mask of 255.255.0.0 will automatically be applied).

Mode Global Configuration

Usage Typically a network administrator would use this command to change the default subnet address to match local network requirements.

As previously mentioned, running this command will result in the creation of a further two subnets (within the class B address space assigned) and the mask will extend from /16 to /17.

For example, if the management subnet is assigned the address 172.31.0.0/16, this will result in the automatic creation of the following two subnets:

- 172.31.0.0/17 assigned to the **atmf management vlan**
- 172.31.128.0/17 assigned to the **atmf domain vlan**.

Examples To change the AMF management subnet address on node VCF-1 to 172.25.0.0:

```
VCF-1# configure terminal
VCF-1(config)# atmf management subnet 172.25.0.0
```

To change the AMF management subnet address on node VCF-1 back to its default of 172.31.0.0:

```
VCF-1# configure terminal
VCF-1(config)# no atmf management subnet
```

atmf management vlan

The AMF management VLAN is created when the AMF network is first initiated and is assigned its default VID of 4092. This command enables you to change the VID from this default value.

The AMF management vlan is one of the internal VLANs that are used to communicate information about the state of the AMF network between nodes. AMF uses its internal VLANS (such as the management VLAN and the domain VLAN) to communicate its inter nodal network status information. These VLANs must be reserved for AMF and not used for other purposes.

If you assign a VLAN ID to this VLAN (i.e. change its value from the default of 4092) then you will need to do this separately on every device within the AMF. The AMF management subnet will then be applied to this new VID when all devices within the AMF network are next rebooted.

Syntax

```
atmf management vlan <2-4090>
no atmf management vlan
```

Parameter	Description
`atmf management vlan`	The VLAN that is assigned for AMF management.
`<2-4090>`	The VID assigned to the AMF management VLAN.

Default The default VLAN ID for the AMF is 4092.

Note Although the value applied by default lies outside the user configurable range. You can use the "no" form of this command to reset the VLAN to its default value.

Mode Global Configuration

Usage You can use this command to change the management VLAN to meet your network's requirements and standards, particularly in situations where the default address value is unacceptable.

Note This VLAN will automatically be assigned an IP subnet address based on the value configured by the command **"atmf management subnet" on page 89.17**. Refer to this command description for further details.

Examples To change the AMF management VLAN to 4090 use the following commands:

```
VCF-1# configure terminal
VCF-1(config)# atmf management vlan 4090
```

To reset the AMF domain VLAN to its default of 4092, use the following commands:

```
VCF-1# configure terminal
VCF-1(config)# no atmf management vlan
```

Related Commands **atmf domain vlan**
show atmf

atmf master

This command configures the switch to be an AMF master node and automatically creates an AMF master group. The master node is considered to be the core of the AMF network, and must be present for the AMF to form. The AMF master has its node depth set to 0. Note that the node depth vertical distance is determined by the number of Up/Down links that exist between the node and its master.

An AMF master node must be present for an AMF network to form. Up to two AMF master nodes may exist in a network, and they "must" be connected by an AMF crosslink.

Note
Master nodes are an essential component of an AMF network. In order to run AMF, an AMF License is required for each master node.

If the crosslink between two AMF masters fails, then one of the masters will become isolated from the rest of the AMF network

The "no" variant of this command removes the switch as an AMF master node. The node will retain its node depth of 0 until the network is rebooted.

Note
Node depth is the vertical distance (or level) from the master node (whose depth value is 0).

Syntax

```
atmf master
no atmf master
```

Default The switch is not configured to be an AMF master node.

Mode Global Configuration

Example To specify that this node is an AMF master, use the following command:

```
VCF-1# configure terminal
VCF-1(config)# atmf master
```

Related Commands

show atmf
show atmf group

atmf network-name

This command applies an AMF network name to a (prospective) AMF node. In order for an AMF network to be valid, its network-name must be configured on at least two nodes, one of which must be configured as a master and have an AMF License applied. These nodes may be connected using either AMF downlinks or crosslinks.

For more information on configuring an AMF master node see, **"atmf master" on page 89.21**.

Syntax

```
atmf network-name <name>

no atmf network-name
```

Parameter	Description
`atmf`	The Allied Telesis Management Framework (AMF)
`network-name`	A name that is assigned to an AMF network.
`<name>`	The AMF network name. Up to 15 printable characters can be entered for the network-name.

Mode Global Configuration

Usage This is one of the essential commands when configuring AMF and must be entered on each node that is to be part of the AMF. This command will not take effect until the particular node is rebooted.

A switching node (master or member) be a member of only one AMF network.

Caution **Ensure that you enter the correct network name. Entering an incorrect name will cause the AMF network to fragment (at the next reboot).**

Example To set the AMF network name to amf_net use the command:

```
Node_1(config)# atmf network-name amf_net
```

atmf reboot-rolling

This command enables you to reboot the nodes in an AMF working-set, one at a time, as a rolling sequence in order to minimize downtime. Once a rebooted node has finished running its configuration and has brought its ports up it re-joins the AMF network and the next node is rebooted.

By adding the url parameter, you can also upgrade your switches' software one AMF node at a time.

The force command enforces a node reboot even if a previous node does not rejoin the AMF network. In this situation the unsuitable node will time-out and the rolling reboot process stops. However, with the **force** parameter applied, the process will ignore the timeout and move on to reboot the next node in the sequence.

This command can take a significant amount of time to complete.

Syntax `atmf reboot-rolling [force] [<url>]`

Parameter	Description
`atmf`	The Allied Telesis Management Framework (AMF)
`reboot-rolling`	Initiates the rolling reboot operation.
`force`	Ignore a failed node and move on to the next node. Where a node fails to reboot a timeout is applied based on the time taken during the last reboot.
`<url>`	The url path to the software upgrade file.

Mode Privileged Exec

Usage You can load the software from a variety of locations. The latest compatible release for a node will be selected from your selected location - based on the parameters and URL you have entered.

For example card:/5.4.3/x*-5.4.3-*.rel will select from the folder card:/5.4.3 the latest file that matches the selection x (wildcard) -5.4.3-(wildcard).rel. Because x* is applied, each switch type will be detected and its appropriate release file will be installed.

Other allowable entries are:

- card:*.rel:
  Used when loading SW from SD cards.
- tftp:ip address:
  Used when loading SW from a TFTP server.
- usb:
  Used when loading SW from a USB flash drive.
- flash:
  Used when loading SW from flash memory, i.e. from one x900 switch to another.
- scp
  Used when loading SW from a secure copy.
- http:
  Used when loading SW from an HTTP file server site.

Several checks are performed to ensure the upgrade will succeed. These include checking the current node release boots from flash. If there is enough space on flash, the software release is copied to flash to a new location on each node as it is processed. The new release name will be updated using the "boot system <release-name>" command, and the old release will become the backup release file.

Note If you are using TFTP, HTTP, etc, to access a file on a remote device, then the URL should specify the exact release filename without using wild card characters.

On bootup the software release is verified. Should an upgrade fail, the upgrading unit will fail back to old software. At the completion of this command, a report is run showing the release upgrade status of each node.

This function is supported on the following switches: AT-SBx908, SBx8100 Series, x610 Series, x510 Series and AT-IX5-28GPX. It is supported on all stack configurations.

Note Take care when removing external media or rebooting your switches. Removing an external media while files are being written entails a significant risk of causing a file corruption.

Example-1 To reboot all x510 nodes in an AMF network, use the following commands

```
Bld2_Floor_1# atmf working-set group x510
```

This command returns the following type of screen output:

```
====================
node1, node2, node3:
====================

Working set join

AMF_NETWORK_Name[3]#
```

```
ATMF_NETWORK[3]# atmf reboot-rolling
```

When the reboot has completed, a number of status screens appear. The selection of these screens will depending on the parameters set.

```
Bld2_Floor_1#atmf working-set group x510

Continue upgrading releases ? (y/n):
```

atmf recover

This command is used to manually initiate the recovery (or replication) of an AMF node, usually when a node is being replaced. The recovery/replication process involves loading the configuration file for a node that is either about to be replaced or has experienced some problem. The configuration file of the device being replaced is selected by the nodename parameter, and the master node holding the config file is specified by the parameter <*master-nodename*>.

If the <*nodename*> parameter is not entered then the node will attempt to use one that has been previously configured. If the replacement node has no previous configuration (and has no previously used nodename), then the recovery will fail.

If the <*master-nodename*> parameter is not specified then the device will poll all known AMF masters and execute an election process (based on the last successful backup and its timestamp) to determine which master node to use. If no valid backup master is found, then this command will fail.

Syntax `atmf recover [<nodename> <master-nodename>]`

Parameter	Description
`atmf`	The Allied Telesis Management Framework (AMF)
`recover`	Initiates the manual node recovery process.
<*nodename*>	The name of the device whose configuration is to be recovered or replicated.
<*master-nodename*>	The name of the master device that holds the required configuration information. Note that although you can omit both the nodename and the master nodename; you can only omit the master nodename if you also omit the nodename.

Mode Privileged Exec

Usage No error checking occurs when this command is run, and regardless of the last backup status, the recovering node will attempt to load its configuration from the master node specified by the master-nodename parameter.

Note that if the node has previously been configured, we recommend that you suspend any AMF backup before running this command. This is to prevent corruption of the backup files on the AMF master as it attempts to both backup and recover the node at the same time.

Example To recover the AMF node named Node_10 from the AMF master node named Master_2, use the following command:

```
Master_2# atmf recover Node_10 Master_2
```

Related Commands
atmf backup stop
show atmf backup
show atmf

atmf remote-login

Use this command to remotely login to other AMF nodes in order to run commands as if a local user of that node.

Syntax `atmf remote-login [user <name>] <nodename>`

Parameter	Description
`atmf`	The Allied Telesis Management Framework (AMF)
`remote-login`	Remote login.
`user`	User login.
<name>	User name.
<nodename>	Node name.

Default Needs to be entered

Mode Privileged Exec (This command will only run at privilege level 15)

Usage You do not need a valid login on the local device in order to run this command. The session will take you to the enable prompt on the new device. If the remote login session exits for any reason (i.e device reboot) you will be returned to the originating node.

The software will not allow you to run multiple remote login sessions. You must exit an existing session before starting a new one.

Example-1 To remotely login from node Node10 to Node20 use the following command

```
Node10# atmf remote-login node20
```

Example-2 In this example, user Whitney is a valid user of node5. She can remotely login from node5 to node3 by using the following commands:

```
node5# atmf remote-login user whitney
       node3
Type 'exit' to return to node5#

node3> enable
```

Note In the above example the user name whitney is valid on both nodes.

Therefore, to prevent unauthorized access, user names should be unique across all nodes within the AMF network.

atmf restricted-login

This command restricts the use of the **atmf working-set** command on all AMF master nodes to privilege 15 users only. Once entered on any AMF master node, this command will propagate across the network.

Note that once you have run this command, certain other commands that utilise the AMF working-set command, such as the include, atmf reboot-rolling and show atmf group membership commands, will operate only on master nodes.

The "no" variant of this command disables restricted login on the AMF network. This allows access to the atmf working-set command from any node in the AMF network.

Syntax

```
atmf restricted-login
no atmf restricted-login
```

Parameter	Description
`atmf`	The Allied Telesis Management Framework (AMF)
`restricted-login`	Restricts the login privilege.

Mode Privileged Exec

Default Master nodes operate with atmf restricted-login disabled.

Member nodes operate with atmf restricted-login enabled.

Example To enable restricted login, use the command

```
Node_20(config)# atmf restricted-login node20
```

Validation Command **show atmf**

atmf virtual-link id ip remote-id remote-ip

This command creates one or more layer two tunnels that enable AMF nodes to transparently communicate across a wide area network using layer two connectivity protocols.

Once connected through the tunnel, the remote member will have the same AMF capabilities as a directly connected AMF member.

Use the "no" variant of this command to remove the specified virtual link.

Syntax

```
atmf virtual-link id <1-32> ip a.b.c.d remote-id <1-32> remote-ip
   a.b.c.d

no atmf virtual-link id <1-32>
```

Parameter	Description
`atmf`	The Allied Telesis Management Framework (AMF)
`virtual-link`	Setup a link to a remote AMF node.
`id`	The ID of the tunnel that will be applied by the local node. Note that this must match the remote-id that is defined on the remote node. This means that (for the same tunnel) the local and remote tunnel IDs are reversed on the local and remote nodes.
`<1-32>`	The ID range 1-32.
`ip`	The Internet Protocol (IP).
`a.b.c.d`	The IP address, of the local amf node (at its interface to the tunnel) entered in a.b.c.d format.
`remote-id`	The ID of the (same) tunnel that will be applied by the remote node. Note that this must match the local-id that is defined on the remote node. This means that (for the same tunnel) the local and remote tunnel IDs are reversed on the local and remote nodes.
`<1-32>`	The ID range 1-32.
`remote-ip`	The IP address of the remote node
`a.b.c.d`	The IP address, of the remote node (at its interface to the tunnel) entered in a.b.c.d format.

Mode Privileged Exec

Default None

Usage The Layer two tunnel that this command creates enables a local AMF session to appear to pass transparently across a Wide Area Network (WAN) such as the Internet. The addresses configured as the local and remote tunnel IP addresses must have IP connectivity to each other. If the tunnel is configured to connect a head office and branch office over the Internet, typically this would involve using some type of managed WAN service such as a site-to-site VPN. Tunnels are only supported using IPv4.

Configuration involves creating a local tunnel ID, a local IP address, a remote tunnel ID and a remote IP address. A reciprocal configuration is also required on the corresponding remote device. The local tunnel ID must be unique to the device on which it is configured.

The tunneled link may operate via external (non AlliedWare Plus) routers in order to provide wide area network connectivity. However in this configuration, the routers perform a conventional router to router connection. The protocol tunneling function is accomplished by the AMF nodes.

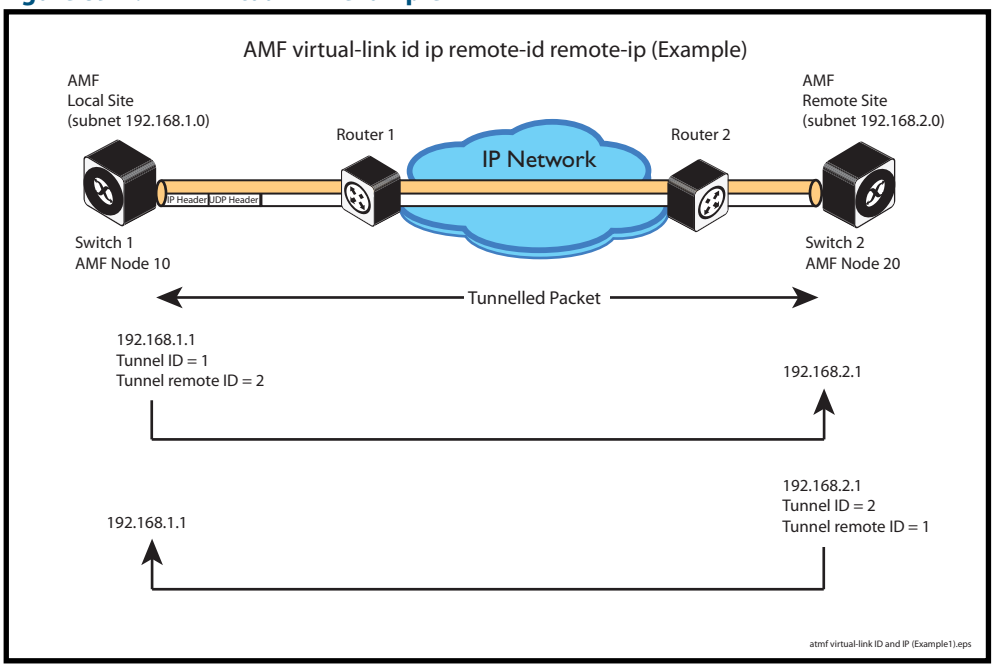
Note The requirement to preconfigure the local IP address and tunnel ID on a device located at the far end of an AMF virtual-link tunnel means that zero touch device replacement cannot be achieved on a remote device that terminates the tunnel connection.

Example Use the following command to create the tunnel shown in figure **Figure 89-1 on page 89.31**.

```
Node_10(config)# atmf virtual-link id 1 ip 192.168.1.1
                 remote-id 2 remote-ip 192.168.2.1

Node_20(config)# atmf virtual-link id 2 ip 192.168.2.1
                 remote-id 1 remote-ip 192.168.1.1
```

Figure 89-1: AMF virtual link example



Validation Command **show atmf**

atmf working-set

The AMF working-set command enables you to execute commands across an individually listed set (or preselected group) of AMF nodes. Group selection is made using the **atmf group (membership)** command on page 89.14.

This command opens a session on multiple network devices. When you change the working set to anything other than the local device, the prompt will change to the AMF network name, followed by the size of the working set, shown in square brackets. This command has to be run at privilege level 15.

In addition to the user defined groups, the following system assigned groups are automatically created:

- Implicit Groups
  - « all - All nodes in the AMF
  - « current - All nodes that comprise the current working-set
  - « local - The originating node.
- Automatic Groups - These can be defined by hardware architecture. i.e. x510, x610, x900, x8100, or by certain AMF nodal designations such as master.

Note that the Implicit Groups do not appear in show group output.

If a node is an AMF master it will be automatically added to the master group.

Syntax

```
atmf working-set {[<node-list>][group{<group-list>|all|local|
   current}]}
```

Parameter	Description
`atmf`	The Allied Telesis Management Framework (AMF)
`working-set`	Defines the scope of the working set.
`<node-list>`	A comma delimited list (without spaces) of nodes to be included in the working-set.
`group`	The AMF group.
`<group-list>`	A comma delimited list (without spaces) of groups to be included in the working-set. Note that this can include either defined groups, or any of the Automatic, or Implicit Groups shown earlier in the bulleted list of groups.
`all`	All nodes in the AMF.
`local`	Local node Running this command with the parameters **group local** will return you to the local prompt and local node connectivity.
`current`	Nodes in current list.

Default Needs to be entered

Mode Privileged Exec

Example-1 To add all nodes in the AMF to the working-set, use the command:

```
node1# atmf working-set group all
```

Note This command adds the implicit group “all” to the working set; where “all” comprises all nodes in the AMF.

Displays an output screen similar to the one shown below:

```
=========================================
node1, node2, node3, node4, node5, node6:
=========================================

Working set join

ATMF_NETWORK_Name[6]#
```

Example-2 To return to the local prompt, and connectivity to only the local node; use the command:

```
ATMF_NETWORK_Name[6]# atmf working-set group local

node1#
```

Parameter definitions from the working-set command

Parameter	Definition
node1, node2 etc	The name of the nodes - as set by the **hostname** command on page 10.23.
ATMF_Network_Name	The name of the AMF network - as set by the **atmf network-name** command on page 89.22.
[6]	The number of nodes in the working-set.

clear atmf links statistics

This command resets the values of all AMF link, port, and global statistics to zero.

Syntax `clear atmf links statistics`

Mode Privilege Exec

Example To reset the AMF link statistics values, use the command:

```
node_1# clear atmf links statistics
```

Related Commands show atmf links statistics

debug atmf

This command enables the AMF debugging facilities, and displays information that is relevant (only) to the current node. The detail of the debugging displayed depends on the parameters specified.

If no additional parameters are specified, then the command output will display all AMF debugging information, including link events, topology discovery messages and all notable AMF events.

The "no" variant of this command disables either all AMF debugging information, or only the particular information as selected by the command's parameters.

Syntax

```
debug atmf [link|crosslink|database|neighbor|error|all]
no debug atmf [link|crosslink|database|neighbor|error|all]
```

Parameter	Description
`debug`	Enables the AMF debugging facility.
`atmf`	The Allied Telesis Management Framework (AMF).
`link`	Output displays debugging information relating to uplink or downlink information.
`crosslink`	Output displays all crosslink events.
`database`	Output displays only notable database events.
`neighbor`	Output displays only notable AMF neighbor events.
`error`	Output displays AMF error events.
`all`	Output displays all AMF events.

Default All debugging facilities are disabled.

Mode User Exec and Global Configuration

Usage If no additional parameters are specified, then the command output will display all AMF debugging information, including link events, topology discovery messages and all notable AMF events.

Note An alias to the no variant of this command - **undebug atmf** - exists elsewhere in this chapter.

Examples To debug all AMF debugging, use the command:

```
node_1# debug atmf
```

To debug all AMF link debugging, use the command:

```
node_1# debug atmf link
```

To debug all AMF crosslink debugging, use the command:

```
node_1# debug atmf crosslink
```

To debug all AMF database debugging, use the command:

```
node_1# debug atmf database
```

To debug all AMF neighbor debugging, use the command:

```
node_1# debug atmf neighbor
```

To debug all AMF error debugging, use the command:

```
node_1# debug atmf error
```

To debug all AMF facilities, use the command:

```
node_1# debug atmf all
```

Related Commands **no debug all**

debug atmf packet

This command configures AMF Packet debugging parameters. The debug only displays information relevant to the current node. The command has following parameters:

Syntax `debug atmf packet[[direction {rx|tx|both}][level {1|2|3}][timeout <SECONDS>][num-pkts <PACKETS>][filter node <NAME> ][interface <IFNAME>][pkt-type {[1][2][3][4][5][6][7][8][9][10][11]]]`

Simplified Syntax

debug atmf packet		[direction {rx|tx|both}]
		[level {[1][2|3}]
		[timeout <*SECONDS*>]
		[num-pkts <*QUANTITY*>]
debug atmf packet	filter	[node <*NAME*>]
		[interface <*IFNAME*>]
		[pkt-type [1][2][3][4][5][6][7][8][9][10][11]]

Note You can combine the syntax components shown, but when doing so, you must retain their original order.

Example This example applies the debug atmf packet command and combines many of its options:

```
node_1# debug atmf packet direction rx level 1 num-pkts
60 filter node x900 interface port1.0.1 pkt-
type 4 7 10
```

Example This example applies the debug atmf packet command and combines many of its options:

```
node_1# debug atmf packet direction rx level 1 num-pkts
60 filter node x900 interface port1.1.1 pkt-
type 4 7 10
```

Parameter	Description
debug	Debugging functions
atmf	The Allied Telesis Management Framework (AMF)
packet	AMF packet events
direction	Sets debug to packet received, transmitted, or both
rx	packets received by this node
tx	Packets sent from this node
1	AMF Packet Control header Information, Packet Sequence Number. Enter 1 to select this level.
2	AMF Detailed Packet Information. Enter 2 to select this level.
3	AMF Packet HEX dump. Enter 3 to select this level.
timeout	Sets the execution timeout for packet logging
<Seconds>	Seconds
num-pkts	Sets the number of packets to be dumped
pkts	The actual number of packets
filter	Sets debug to filter packets
node	Sets the filter on packets for a particular Node
<name>	Node name
interface	Sets the filter to dump packets from an interface (portx.x.x)
ifname	Interface port or virtual-link
pkt-type	Sets the filter on packets with a particular AMF packet type
1	Crosslink Hello BPDU packet with crosslink links information. Enter 1 to select this packet type.
2	Crosslink Hello BPDU packet with downlink domain information. Enter 2 to select this packet type.
3	Crosslink Hello BPDU packet with uplink information. Enter 3 to select this packet type.
4	Downlink and uplink hello BPDU packets. Enter 4 to select this packet type.
5	Non broadcast hello unicast packets. Enter 5 to select this packet type.
6	Stack hello unicast packets. Enter 6 to select this packet type.
7	Database description. Enter 7 to select this packet type.
8	DBE request. Enter 8 to select this packet type.
9	DBE update. Enter 9 to select this packet type.

Parameter	Description
10	DBE bitmap update. Enter 10 to select this packet type.
11	DBE acknowledgment. Enter 11 to select this packet type.

Mode User Exec and Global Configuration

Usage If no additional parameters are specified, then the command output will apply a default selection of parameters shown below

Default Level 1, both Tx and Rx, a timeout of 60 seconds with no filters applied.

.

An alias to the no variant of this command - **undebug atmf** - exists elsewhere in this chapter.

Examples To set a packet debug on node 1 with level 1 and no timeout, use the command:

```
node_1# debug atmf packet direction tx timeout 0
```

Examples To set a packet debug with level 3 and filter packets received from AMF node 1:

```
node_1# debug atmf packet direction tx level 3 filter
node_1
```

Examples To enable send and receive 500 packets only on vlink1 for packet types 1, 7 and 11, use the command:

```
node_1# debug atmf packet num-pkts 500 filter interface
vlink1 pkt-type 1 7 11
```

Examples This example applies the debug atmf packet command and uses all of its options:

```
node_1# debug atmf packet direction rx level 1 num-pkts
60 filter node x900 interface port1.0.1 pkt-
type 10
```

show atmf

Displays information about the current AMF node.

Syntax `show atmf [summary|tech|nodes|session]`

Parameter	Description
`summary`	Displays summary information about the current AMF node.
`tech`	Displays global AMF information.
`nodes`	Displays information about AMF network nodes.
`session`	Displays information on an AMF session.

Default Only summary information is displayed.

Mode User Exec and Privileged Exec

Usage AMF uses internal VLANs to communicate between nodes about the state of the AMF network. Two VLANs have been selected specifically for this purpose. Once these have been assigned, they are reserved for AMF and cannot be used for other purposes

Example-1 To show summary information on AMF node_1 use the following command:

```
node_1 show atmf summary
```

The following figure shows some example output from running this command for a specific AMF node.

Figure 89-2: Output from the show atmf summary command

```
node_1#show atmf
ATMF Summary Information:

ATMF Status             : Enabled
Network Name            : ATMF_NET
Node Name               : node_1
Role                    : Master
Current ATMF Nodes      : 8
```

Example-3 To show information specific to AMF nodes use the following command:

```
node_1 show atmf nodes
```

Figure 89-3: Output from the show atmf nodes command

```
Node Information:

  * = Local device

 SC = Switch Configuration:
  C = Chassis    S = Stackable    N = Standalone

 Current AMF node count 8
```

The show AMF session command displays all CLI (Command Line Interface) sessions for users that are currently logged in and running a CLI session. For example, in the case below, node_1 and node5 have active users logged in.

Example-4 To display AMF active sessions, use the following command

```
node_1 show atmf sessions
```

Figure 89-4: Output from the show atmf sessions command

```
node_1#show atmf session

DBE Request List Length                 : 0
```

The AMF tech command collects all the AMF commands, and displays them. You can use this command when you want to see an overview of the AMF network.

Example-5 To display AMF technical information, use the following command:

```
node_1 show atmf tech
```

Figure 89-5: Output from the show atmf nodes command

```
node_1#show atmf tech
ATMF Summary Information:

ATMF Status            : Enabled

```

Table 89-1: Parameter definitions from the show atmf command

Parameter	Definition
ATMF Status	The Node's AMF status, either Enabled or Disabled.
Network Name	The AMF network that a particular node belongs to.
Node Name	The name assigned to a particular node.
Role	The role configured for this AMF device, either Master or Member.
Current ATMF Nodes	The count of AMF nodes in an AMF Network.
Node Address	An Address used to access a remotely located node (.atmf).
