Getting the most from this manual

Although you can view this document using Acrobat version 5, to get the best from this manual, we recommend using Adobe Acrobat Reader version 8. You can download Acrobat Reader 8 free from **http://www.adobe.com/**.

New features in this software version

For a list of new and enhanced features and commands in this version, see **Appendix B: Changes in Version 5.4.4-0.4** (with links to corresponding sections in this Software Reference), or the Software Release Note for Version 5.4.4-0.4. Documentation can be downloaded from the Support area of our website at **http://www.alliedtelesis.com**. Note that to download software files, you need a valid user account.

Table of Contents

Part 1: Setting up the Switch

Chapter 1: Getting Started

Introduction 1.2
How to Login 1.2
How to get Command Help 1.3
Viewing a List of Valid Parameters 1.3
Completing Keywords 1.5
Viewing Command Error Messages 1.6
How to Work with Command Modes 1.7
Entering Privileged Exec Commands When in a Configuration Mode 1.9
How to See the Current Configuration 1.10
Default Settings 1.11
The Default Configuration Script 1.12
How to Change the Password 1.13
How to Set Strong Passwords 1.14
How to Set a Management IP Address 1.16
How to Set an IP Address on VLAN 1 ..... 1.17
How to Save and Boot from the Current Configuration 1.18
How to Save to the Default Configuration File 1.18
How to Create and Use a New Configuration File 1.18
How to Return to the Factory Defaults 1.20
How to See System Information 1.21
Viewing Overall System Information 1.21
Viewing Temperature, Voltage, and Fan Status 1.21
Viewing the Serial Number 1.22
How to Set System Parameters 1.22
How to Change the Telnet Session Timeout 1.23
How to Name the Switch 1.24
How to Display a Text Banner at Login 1.25
How to Set the Time and Date 1.26
How to Show Current Settings 1.26
How to Set the Time and Date 1.26
How to Set the Timezone 1.27
How to Configure Summer-time 1.27
How to Add and Remove Users 1.28
Pre-encrypted Passwords 1.29
How to Undo Settings 1.31
How to Use the *no* Parameter 1.31
How to Use the *default* Parameter 1.31
How to Upgrade the Firmware 1.32
Save Power With the Eco-Friendly Feature 1.33
Eco-Friendly 1.33
Trouble-shoot fiber and pluggable issues 1.34
Using the Find Me feature 1.35
Continuous Reboot Prevention 1.36

Controlling “show” Command Output 1.38
AlliedWare Plus GUI 1.40

Chapter 2: Command Syntax Conventions in this Software Reference

Chapter 3: Start-up Sequence

AlliedWare Plus Start-up 3.2
Diagnostic Menu 3.3
Bootloader Menu 3.5
Start-up Sequence 3.9

Chapter 4: CLI Navigation Commands

Command List 4.2

Chapter 5: User Access Commands

Introduction 5.2
Command List 5.2

Chapter 6: Creating and Managing Files

Introduction 6.2
SD support 6.2
Working With Files 6.2
- Listing files 6.2
- Displaying the contents of configuration and text files 6.4
- Navigating through the filesystem 6.4
- Using the editor 6.6

Creating and Using Configuration Files 6.8
- Creating a configuration file 6.8
- Specifying the start-up configuration script 6.8
- Working with configuration files 6.9
- The configuration file fallback order 6.10

Copying Files To and From Your Device 6.12
- URL syntax 6.12
- Copying files 6.13
- Copying from a Server to Running Configuration 6.17

The Autoboot Feature 6.19
- Restoring a switch using Autoboot from external media 6.20
- Configure Autoboot 6.21

Chapter 7: File Management Commands

Introduction 7.3
- URL Syntax and Keyword Usage 7.3

Command List 7.5

Chapter 8: Licensing Introduction and Configuration

Introduction 8.2
About licensing VCStack 8.2
Release Licenses (SwitchBlade x908 only) 8.3
License Certificate Files (SwitchBlade x908 only) 8.4
Licensing Terminology 8.6
Applying a new feature license on a stand-alone switch 8.7
Applying a release license on a SwitchBlade x908 switch 8.8
VCStack Licensing Configuration 8.10
Adding a new switch to a VCStack 8.10
Adding a new feature license to a VCStack 8.13
Upgrading release licensing on a switch 8.16

Chapter 9: Licensing Commands

Command List 9.2

Chapter 10: System Configuration and Monitoring Commands

Command List 10.3

Chapter 11: Debugging and Logging

Introduction 11.2
Debugging 11.2
Logging to terminal 11.2
Turning off debugging 11.3
Logging 11.3
Log Outputs 11.4

Chapter 12: Logging Commands

Command List 12.2

Chapter 13: Scripting Commands

Command List 13.2

Chapter 14: Interface Commands

Command List 14.2

Chapter 15: Interface Testing Commands

Command List 15.2

Part 2: Layer Two Switching

Chapter 16: Switching Introduction

Introduction 16.2
Physical Layer Information 16.3
- Switch Ports 16.3
- Activating and Deactivating Switch Ports 16.4
- Autonegotiation 16.4
- Duplex mode 16.4
- Speed options 16.4
- MDI/MDIX Connection Modes 16.5

Switch Bay Provisioning 16.7
- Provisioned Board Classes 16.7
- Applying Hardware Provisioning 16.7
- Removing or Changing XEM BAY Provisioning 16.8
- Displaying Provisioned Configurations 16.8
- Provisioning and Change Management 16.10
- Provisioning and Software Version Aspects 16.11

The Layer 2 Switching Process 16.12
- The Ingress Rules 16.12
- The Learning Process 16.13
- The Forwarding Process 16.14
- The Egress Rules 16.14

Layer 2 Filtering 16.15
- Ingress Filtering 16.15

Storm-control 16.16
Loop Protection 16.17
- Loop Detection 16.17
- Thrash Limiting 16.18

Support for Jumbo Frames 16.19
Port Mirroring 16.20
Port Security 16.21
- MAC Address Learn Limits 16.21
- IEEE 802.1X 16.21

Quality of Service 16.22
IGMP Snooping 16.23

Chapter 17: Switching Commands

Command List 17.3

Chapter 18: VLAN Introduction

Introduction 18.2
Virtual LANs (VLANs) 18.2
- Configuring VLANs 18.3

VLAN Double Tagging (VLAN Stacking) 18.5
- How double-tagged VLANs work 18.5
- VLAN Rules for double tagging 18.5
- Restrictions when using double-tagged VLANs 18.6
- Configuring double-tagged VLANs 18.6

Private VLANs 18.11
- Private VLANs for ports in access mode 18.11
- Private VLAN operation with ports in access mode 18.13
- Access mode private VLAN configuration example 18.14
- Private VLANs for trunked ports 18.17

Trunked port private VLAN configuration example 18.18
Protocol based VLAN configuration example 18.21

Chapter 19: VLAN Commands

Command List 19.2

Chapter 20: Spanning Tree Introduction: STP, RSTP, and MSTP

Introduction 20.2
Overview of Spanning Trees 20.2
Spanning tree operation 20.2
Spanning tree modes 20.4
Spanning Tree Protocol (STP) 20.5
Configuring STP 20.6
Rapid Spanning Tree Protocol (RSTP) 20.8
Configuring RSTP 20.9
Multiple Spanning Tree Protocol (MSTP) 20.11
Multiple Spanning Tree Instances (MSTI) 20.12
MSTP Regions 20.13
Common and Internal Spanning Tree (CIST) 20.15
MSTP Bridge Protocol Data Units (BPDUs) 20.17
Configuring MSTP 20.19

Chapter 21: Spanning Tree Commands

Command List 21.3

Chapter 22: Link Aggregation Introduction and Configuration

Introduction and Overview 22.2
Static and Dynamic (LACP) Link Aggregation 22.3
Static Channel Groups 22.3
Dynamic (LACP) Channel Groups 22.3
Link Aggregation Control Protocol (LACP) 22.3
Configuring an LACP Channel Group 22.5
Minimal LACP Group Configuration 22.8
Configuring a Static Channel Group 22.9

Chapter 23: Link Aggregation Commands

Introduction 23.2
Command List 23.3

Chapter 24: GVRP Introduction and Configuration

Introduction 24.2
GVRP Example 24.3
GVRP Guidelines 24.4
GVRP and Network Security 24.5
GVRP-inactive Intermediate Switches 24.5
Enabling GVRP on the Switch 24.5
Enabling GVRP on the Ports 24.6
Setting the GVRP Timers 24.6
Disabling GVRP on the Ports 24.7
Disabling GVRP on the Switch 24.7
Configuring and validating GVRP 24.8

Chapter 25: GVRP Commands

Command List 25.2

Part 3: Layer Three, Switching and Routing

Chapter 26: Internet Protocol (IP) Addressing and Protocols

Introduction 26.2
Address Resolution Protocol (ARP) 26.3
- Static ARP Entries 26.3
- Timing Out ARP Entries 26.3
- Deleting ARP Entries 26.4
- Proxy ARP 26.4
- ARP Logging 26.7

Domain Name System (DNS) 26.8
- Domain name parts 26.8
- Server hierarchy 26.8
- DNS Client 26.9
- DNS Relay 26.10
- DNS Operation With VRF Lite 26.12
- DHCP options 26.13
- DHCP Operation With VRF Lite 26.14

Internet Control Message Protocol (ICMP) 26.15
ICMP Router Discovery Protocol (IRDP) 26.16
- Router discovery 26.16
- Router discovery process 26.16
- Configuration procedure 26.18

Checking IP Connections 26.20
- Ping 26.20
- Traceroute 26.20

IP Helper 26.21
IP Directed Broadcast 26.22

Chapter 27: IP Addressing and Protocol Commands

Introduction 27.3
Command List 27.4

Chapter 28: IPv6 Introduction

Introduction 28.2
Overview 28.2
IPv6 Addresses and Prefixes 28.3
- Address types 28.3
- IPv6 Headers 28.5
- The Internet Control Message Protocol (ICMPv6) 28.7
- IPv6 Routing 28.10
- Integration of IPv4 and IPv6 ..... 28.10

IPv6 on your Switch 28.11
- Enabling IPv6 ..... 28.11
- IPv6 Stateless Address Autoconfiguration (SLAAC) 28.11
- IPv6 EUI-64 Addressing 28.11

IPv6 Link-local Addresses....28.12
IPv6 RA Guard....28.13
RA Guard Introduction....28.13
Enabling IPv6 RA Guard....28.13

Chapter 29: IPv6 Commands

Command List....29.2

Chapter 30: IPv6to4 Tunneling Configuration

Introduction....30.2
6to4 Automatic Tunnel Configuration....30.2
Tunneling Operation....30.2
6to4 tunnels operation and configuration summary....30.3
Example 6to4 configuration....30.4

Chapter 31: IPv6to4 Tunneling Commands

Command List....31.2

Chapter 32: Routing Protocol Overview

Introduction....32.2
RIP....32.2
OSPF....32.2
BGP....32.3
PIM-SM....32.4
VRRP....32.4

Chapter 33: Route Selection

Introduction....33.2
Types of Routes....33.2
Interface Routes....33.2
Static Routes....33.2
Dynamic Routes....33.3
RIB and FIB Routing Tables....33.4
Understanding the Routing Information Base (RIB)....33.4
Administrative Distance....33.6
Metric....33.9
Equal Cost Multipath Routing....33.9
How AlliedWare Plus Deletes Routes....33.9
How AlliedWare Plus Adds Routes....33.10
Troubleshooting routes not installed to the RIB....33.11
Troubleshooting routes not installed to the FIB....33.11

Chapter 34: Routing Commands

Introduction....34.2
Command List....34.2

Chapter 35: RIP Configuration

Introduction....35.2

Enabling RIP 35.2
Specifying the RIP Version 35.4
RIPv2 Authentication (Single Key) 35.6
RIPv2 Text Authentication (Multiple Keys) 35.8
RIPv2 md5 authentication (Multiple Keys) 35.12

Chapter 36: RIP Commands

Introduction 36.2
Command List 36.2

Chapter 37: RIPng for IPv6 Configuration

Introduction 37.2
Enabling RIPng 37.2
Troubleshooting RIPng Adjacency 37.5

Chapter 38: RIPng for IPv6 Commands

Introduction 38.2
Command List 38.2

Chapter 39: OSPF Introduction and Configuration

OSPF Introduction 39.2
Features 39.2
OSPF Components 39.2
- Autonomous Systems 39.2
- Routing Areas 39.3
- Adjacencies and Designated Routers 39.3
- Link State Advertisements 39.4
- OSPF Packet Types 39.4
- OSPF States 39.5
- OSPF Metrics 39.6
- Automatic Cost Calculation 39.6
- Routing with OSPF 39.7
- Network Types 39.7
- Passive Interfaces 39.8
- Authenticating OSPF 39.8
- Redistributing External Routes 39.9

Enabling OSPF on an Interface 39.10
Setting priority 39.12
Configuring an Area Border Router 39.14
Redistributing Routes Into OSPF 39.15
OSPF Cost 39.17
Configuring Virtual Links 39.20
OSPF Authentication 39.22
OSPF Multi-Area Loopback Configuration 39.25

Chapter 40: OSPF Commands

Introduction 40.3
Command List 40.3

Chapter 41: OSPFv3 for IPv6 Introduction and Configuration

OSPFv3 Introduction 41.2
Features 41.2

Licensing 41.3
Routing Overview 41.3
OSPF Components 41.4
Autonomous Systems 41.4
Routing Areas 41.4
Relationships Between Routers 41.4
OSPFv3 Packet Types 41.4
Link State Advertisements (LSAs) 41.8
LSA Header 41.9
OSPFv3 States 41.10
OSPFv3 Metrics 41.10
Automatic Cost Calculation 41.11
Network Types 41.11
Passive Interfaces 41.12
Redistributing External Routes 41.13
Differences between OSPFv2 and OSPFv3 ..... 41.14
Protocol processing applied per-link rather than per-subnet 41.14
Removed address semantics 41.14
Neighbors are identified by Router ID 41.14
New link-local flooding scope for link state advertisements 41.15
Uses link-local unicast addresses 41.15
Support provided for multiple OSPF instances per link 41.15
Unknown LSAs are handled more effectively 41.15
OSPFv3 Authentication and Encryption Overview 41.16
OSPFv3 Authentication and Encryption Support 41.17
OSPFv3 Virtual Links 41.18
Configuring OSPFv3 ..... 41.19
Example 1: Single-Area Network Configuration 41.19
Example 2: Two-Area Network Configuration 41.28
Setting Up the Metrics 41.30
Configuring OSPFv3 Authentication and Encryption 41.35
Configuring OSPFv3 Authentication on a VLAN 41.36
Configuring OSPFv3 Encryption on a VLAN 41.37
Configuring OSPFv3 Authentication in an OSPFv3 Area 41.38
Configuring OSPFv3 Encryption in an OSPFv3 Area 41.39
Configuring OSPFv3 Authentication and Encryption for a Virtual Link 41.40
OSPFv3 Authentication in an OSPFv3 Area 41.41
OSPFv3 Encryption in an OSPFv3 Area 41.43
OSPFv3 Authentication on a VLAN 41.45
OSPFv3 Encryption on a VLAN 41.47
OSPFv3 Authentication with two VLANs 41.49
OSPFv3 Encryption with two VLANs 41.51
OSPFv3 Authentication for a Virtual Link 41.53
OSPFv3 Encryption for a Virtual Link 41.55

Chapter 42: OSPFv3 for IPv6 Commands

Command List 42.3

Chapter 43: BGP and BGP4+ Introduction

Introduction 43.3
BGP and BGP4+ ASNs and AS_Path Attributes 43.4
Internal and External BGP Concepts 43.5
Public and Private ASNs 43.5
Outbound Routing Toward the Internet 43.5
External BGP (eBGP) Concepts 43.6
External BGP (eBGP) 43.6

Verifying BGP 43.7
Advertising eBGP routes to ISPs 43.8
Internal BGP (iBGP) Concepts 43.9
iBGP between Internet connected routers 43.9
Configuring iBGP 43.9
Verifying iBGP 43.10
How to configure BGP and BGP4+ 43.12
Initial BGP and BGP4+ Configuration Tasks 43.12
How to enable BGP and BGP4+ Routing 43.12
How to configure BGP and BGP4+ Neighbors 43.12
BGP and BGP4+ Neighbor Route Filtering 43.13
BGP and BGP4+ Path Filtering by Neighbor 43.13
How to disable next hop processing for BGP or BGP4+ updates 43.14
How to use Route Maps for BGP or BGP4+ updates 43.15
BGP and BGP4+ Peer Groups 43.16
How to create a Peer Group for BGP 43.16
How to assign options to the created Peer Group 43.16
How to make neighbors members of a Peer Group 43.19
BGP and BGP4+ Prefix Lists 43.20
How to create and configure a Prefix List for BGP or BGP4+ 43.21
How to delete Prefix List Entries 43.21
How to display IPv4 and IPv6 Prefix Entries 43.22
BGP and BGP4+ Route Dampening 43.23
How to enable BGP and BGP4+ Route Dampening 43.24
How to monitor BGP and BGP4+ Route Dampening 43.24
BGP and BGP4+ Synchronization 43.26
BGP and BGP4+ Weights 43.27
BGP and BGP4+ Aggregate Addresses 43.28
How to enable and disable Automatic Summarization 43.28
BGP and BGP4+ monitoring 43.29
How to clear BGP and BGP4+ tables 43.29
How to display BGP and BGP4+ statistics 43.30
BGP Neighbor status logging 43.31
BGP Connections Reset 43.32
BGP Versions 43.32
BGP Confederations 43.32
BGP Route Reflectors 43.33
BGP Community Filtering 43.34
BGP Optimization 43.35
How to determine Backdoor Routes 43.35
How to set the BGP Administrative Distance 43.35
How to change BGP default local preference value 43.35
How to redistribute the default network 0.0.0.0 ..... 43.36
How to adjust BGP Timers 43.36
How to adjust the eBGP advertisement interval 43.37
How to adjust the iBGP advertisement interval 43.37
How to adjust the AS origination interval 43.38
How to remove private AS numbers for BGP 43.39
BGP and BGP4+ Terminology 43.42
BGP Attributes 43.45

Chapter 44: BGP and BGP4+ Configuration

Introduction 44.2
BGP Configurations 44.3
Enabling BGP Peers In The Same Autonomous System 44.3
Enabling BGP Between Different Autonomous Systems 44.5

Configuring a BGP Route Reflector 44.6
Configuring a BGP Confederation 44.8
Configuring BGP Authentication 44.11
Configuring BGP Graceful Reset 44.13
Configuring BGP Distance 44.15
Configuring BGP Graceful Restart 44.18
Configuring BGP Weight per Peer 44.20
BGP4+ Configurations 44.23
Enabling iBGP Peering using a Global Address 44.23
Enabling iBGP Peering using a Link-local Address 44.26
Enabling eBGP Peering between different Autonomous Systems 44.29
Configuring Route-Maps with BGP4+ 44.31
Configuring BGP4+ Graceful Restart 44.35
Configuring BGP4+ Distance 44.39
Configuring BGP4+ Graceful Reset 44.43

Chapter 45: BGP and BGP4+ Commands

Introduction 45.5
Controlling “show” Command Output 45.6
Command List 45.8

Chapter 46: Route Map Configuration

Introduction 46.2
Structure of a route map 46.2
Route-Map example for filtering BGP 46.3
Configuring route maps for filtering and modifying OSPF routes 46.5
Configuring a match clause 46.5
Configuring a set clause 46.6
Applying route maps in OSPF 46.7

Chapter 47: Route Map Commands

Command List 47.2

Chapter 48: VRF-Lite Introduction and Configuration

Introduction to VRF Lite 48.2
VRF-Lite 48.2
Configuring VRF-Lite 48.6
Creating and Partitioning VRF Instances 48.6
Sharing Connectivity Between VRF Instances 48.7
Intra-VRF Routing 48.13
Inter-VRF Routing 48.13
Static Inter-VRF Routing 48.14
Dynamic VRF Routing 48.15
Utilities Available within VRF-Lite 48.15
Utilities Unavailable within VRF-Lite 48.16

Chapter 49: VRF-Lite Commands

Introduction 49.3
Command List 49.3

Part 4: Multicast Applications

Chapter 50: Multicast Introduction and Commands

Multicast Introduction 50.2
Multicast groups 50.3
Components in a multicast network 50.3
Command List 50.5

Chapter 51: IGMP and IGMP Snooping Introduction

Introduction 51.2
IGMP 51.2
Joining a multicast group (Membership report) 51.3
Staying in the multicast group (Query message) 51.4
Leaving the multicast group (Leave message) 51.4
IGMP Snooping 51.5
How IGMP Snooping operates 51.5
IGMP Snooping and Querier configuration example 51.6
Query Solicitation 51.9
How Query Solicitation Works 51.9
Query Solicitation Operation 51.9
Speeding up IGMP convergence in a non-looped topology 51.12
Enabling Query Solicitation on multiple switches in a looped topology 51.12

Chapter 52: IGMP and IGMP Snooping Commands

Introduction 52.2
Command List 52.2

Chapter 53: PIM-SM Introduction and Configuration

Introduction 53.2
PIM-SM 53.2
Characteristics of PIM-SM 53.2
Roles in PIM-SM 53.3
Operation of PIM-SM 53.4
PIM-SM Configuration 53.6
Static Rendezvous Point configuration 53.7
Dynamic Rendezvous Point configuration 53.9
Bootstrap Router configuration 53.11
PIM-SSM 53.14
Characteristics of PIM-SSM 53.14
PIM-SSM IP Address Range 53.14
IGMPv3 and SSM-Mapping 53.14
How PIM-SSM Works 53.15
How IGMP SSM-Mapping Works 53.16
Configure PIM-SSM 53.16

Chapter 54: PIM-SM Commands

Command List 54.2

Chapter 55: PIM-SMv6 Introduction and Configuration

Introduction 55.2
PIM-SMv6 ..... 55.2
Characteristics of PIM-SMv6 ..... 55.3

Roles in PIM-SMv6 ..... 55.4
PIM-SMv6 Terminology 55.5
Operation of PIM-SMv6 ..... 55.6
Data Flow from Source to Receivers for PIM-SMv6 ..... 55.8
PIM-SMv6 Embedded RP, RP and BSR Candidate Configurations 55.10
Embedded RP Configuration 55.10
Verify Embedded RP Configuration 55.11
RP and BSR Candidate Configuration 55.13
Verify RP and RP Candidate Configuration 55.15
PIM-SMv6 Static RP, DR, BSR Configurations 55.17
Static Rendezvous Point Configuration 55.18
Verify Static Rendezvous Point Configuration 55.19
Dynamic Rendezvous Point Configuration 55.20
Verify PIM group-to-RP mappings 55.21
Verify RP details 55.21
Boot Strap Router Configuration 55.22
Verify Boot Strap Router Configuration 55.23

Chapter 56: PIM-SMv6 Commands

Command List 56.3

Chapter 57: PIM-DM Introduction and Configuration

Introduction 57.2
Characteristics of PIM-DM 57.2
PIM-DM Terminology 57.3
PIM-DM Configuration 57.4
Configuration Example 57.4
Verifying Configuration 57.6

Chapter 58: PIM-DM Commands

Command List 58.2

Chapter 59: MLD and MLD Snooping Introduction and Commands

MLD Introduction 59.2
MLD Snooping 59.3
MLD Snooping Configuration Examples 59.4
Command List 59.7

Part 5: Access and Security

Chapter 60: Access Control Lists Introduction

Introduction 60.2
- Overview 60.2
- ACL Rules 60.3
- ACL Source and Destination Addresses 60.3
- ACL Reverse Masking 60.3

Hardware and Software ACL Types 60.4
- Defining Hardware MAC ACLs 60.5
- Defining Hardware IP ACLs 60.6
- Actions for Hardware ACLs 60.7
- Attaching hardware ACLs to interfaces 60.7

Hardware ACLs and QoS classifications 60.8
- Classifying Your Traffic 60.8
- Security ACLs 60.8
- QoS ACLs 60.9
- Profile Limitations 60.9
- Hardware Filter Example 60.10
- Maximum number of hardware ACLs 60.11
- Viewing the number of hardware ACLs and bytes used 60.11
- Attaching hardware ACLs using QoS 60.13
- Filtering hardware ACLs with QoS 60.14
- Using QoS Match Commands with TCP Flags 60.15

ACL Filter Sequence Numbers 60.17
- ACL Filter Sequence Number Behavior 60.17
- ACL Filter Sequence Number Applicability 60.17
- ACL Filter Sequence Number Types 60.18

ACL Filter Sequence Configuration 60.20
- Creating ACLs in Global Configuration Mode 60.22
- Display the ACL configuration details 60.24

Chapter 61: IPv4 Hardware Access Control List (ACL) Commands

Introduction 61.2
IPv4 Hardware Access List Commands and Prompts 61.3
Command List 61.4

Chapter 62: IPv4 Software Access Control List (ACL) Commands

Introduction 62.2
IPv4 Software Access List Commands and Prompts 62.3
Command List 62.4

Chapter 63: IPv6 Hardware Access Control List (ACL) Commands

Introduction 63.2
IPv6 Hardware Access List Commands and Prompts 63.3
Command List 63.4

Chapter 64: IPv6 Software Access Control List (ACL) Commands

Introduction 64.2

IPv6 Software Access List Commands and Prompts 64.3
Command List 64.4

Chapter 65: Quality of Service (QoS) Introduction

Introduction 65.2
QoS Operations 65.2
QoS Packet Information 65.3
Link Layer QoS 65.3
Differentiated Services Architecture 65.4
The Differential Services Field 65.5
Processing pre-marked packets 65.6
Applying QoS on Your Switch 65.7
Classifying your Data 65.7
Class Maps 65.8
Policy Maps 65.10
Premarking Your Traffic 65.12
CoS to egress queue premarking 65.12
DSCP to egress queue premarking 65.14
Policing (Metering) Your Data 65.17
Single-rate Three-color Policing 65.18
Two-rate Three-color Policing 65.19
Configuring and Applying a Policer 65.20
Remarking Your Data 65.21
Configuring the Egress Queues 65.23
Fabric queues - The Internal Paths 65.23
Egress Queues and QoS markers 65.23
Egress Queue Commands Hierarchy 65.24
Egress Queue Shaping 65.25
Scheduling 65.25
Drop Mode 65.27
Egress Queue Mapping 65.34
Storm Protection 65.36
QoS and the Switching Fabric 65.37
Policy-Based Routing 65.38
Practical Example 65.38

Chapter 66: QoS Commands

Command List 66.3

Chapter 67: 802.1X Introduction and Configuration

Introduction 67.2
802.1X System Components 67.2
The 802.1X Implementation 67.5
Configuring 802.1X 67.7

Chapter 68: 802.1X Commands

Command List 68.2

Chapter 69: Authentication Introduction and Configuration

Authentication Introduction 69.2
Configuring a Guest VLAN 69.2
802.1X-Authentication 69.3
Web-Authentication 69.4

What is Web-Authentication? 69.4
Web-Authentication Basics 69.4
Configuring Web-Authentication 69.6
Starting a Web-Authentication Session 69.8
Support for Protocols Underlying Web-Authentication 69.10
Web-Authentication Timeout Connect 69.14
Web Authorization Proxy 69.15
MAC-Authentication 69.16
Why is MAC-Authentication Required? 69.16
How Does MAC-Authentication Work? 69.16
Configuring MAC-Authentication 69.17
Tri-Authentication 69.18
Tri-Authentication Configuration 69.19
Two-step Authentication 69.21
Ensuring Authentication Methods Require Different Usernames and Passwords 69.22
Roaming Authentication 69.23
Roaming Authentication Overview 69.24
Roaming Authentication Feature Interactions 69.25
Unauthenticated Supplicant Traffic 69.26
Deciding When a Supplicant Fails Authentication 69.28
Failed Authentication VLAN 69.29
Limitations on Allowed Feature Combinations 69.29

Chapter 70: Authentication Commands

Command List 70.3

Chapter 71: AAA Introduction and Configuration

Chapter 88: AMF Introduction and Configuration

Introduction to AMF 88.2
AMF Supported Products and Software Versions 88.2
Key benefits of AMF 88.3
- Unified command-line 88.3
- Configuration backup and recovery 88.3
- Rolling firmware upgrade 88.3

AMF Terminology 88.4
AMF network guidelines 88.7
- Retention and use of the 'manager' username 88.7
- Loop-free data plane 88.7
- Aggregators 88.7
- VCStacks 88.7
- AMF Tunneling (virtual links) 88.7
- AMF external removable media 88.9
- AMF interaction with QoS and ACLs 88.10
- NTP and AMF 88.10

Configuring AMF 88.11
- Simple AMF example with a single master 88.11

Verifying the AMF network 88.21
Using the AMF network 88.22
- AMF backups 88.22
- Safe removal of external storage media 88.22

Performing a manual backup 88.24
Backups on VCStacks running as AMF masters 88.26
Node recovery 88.28
- Automatic node recovery 88.28
- A "Clean" node 88.29
- Manual node recovery 88.30
- Node recovery on VCStacks 88.31

AMF safe configuration 88.32
- Adding a preconfigured device to the network 88.34
- Using the unified CLI with working-sets 88.35
- Automatic working-set groups 88.36
- User-defined working-set groups 88.37
- Executing commands on working-sets 88.38
- Interactive commands 88.40

AlliedWare Plus GUI 1.40

Introduction

This chapter introduces a number of commonly-used management features of the AlliedWare Plus™ Operating System (OS).

How to Login

Step 1: Set the console baud rate

The default baud rate is 9600.

By default the AlliedWare Plus™ OS supports VT100 compatible terminals on the console port. This means that the terminal size is 80 columns by 24 rows.

Step 2: Login with manager/friend

The defaults are:

```
username: manager
password: friend
```

The switch logs you into User Exec mode. From User Exec mode, you can perform high-level diagnostics (some **show** commands, ping, traceroute etc), start sessions (Telnet, SSH), and change mode.

How to get Command Help

The following kinds of command help are available:

- lists of valid parameters with brief descriptions (the ? key)
- completion of keywords (the Tab key)
- error messages for incomplete or incorrect syntax

Command Abbreviations

The AlliedWare Plus™ CLI contains a number of abbreviations for its commands. For example, the **show interface** command can be entered in the abbreviated form shown below:

```
awplus# sh in vlan100
```

Viewing a List of Valid Parameters

To get syntax help, type ? (i.e. "space question mark") after:

- the prompt. This will list all commands available in the mode you are in.
- one or more parameters. This will list parameters that can come next in the partial command.
- one or more letters of a parameter. This will list matching parameters.

Note

The AlliedWare Plus™ OS only displays one screenful of text at a time, with the prompt "--More--" at the end of each screenful. Press the space bar to display the next screenful or the Q key to return to the command prompt.

Example

To see which commands are available in Privileged Exec mode, enter "?" at the Privileged Exec mode command prompt:

```
awplus# ?
```

This results in output like the following output:

Figure 1-1: Example output from the ? command

```
Exec commands:
activate        Activate a script
cd              Change the current working directory
clear           Reset functions
clock           Manage clock
configure       Enter configuration mode
copy            Copy from one file to another
.
.
.
```

Example

To see which **show** commands that start with "i" are available in Privileged Exec mode, enter "?" after **show i**:

```
awplus# show i?
```

This results in the following output:

Figure 1-2: Example output from the show i? command

```
interface          Select an interface to configure
ip                 Internet Protoc6ol (IP)
ipv6               Internet Protocol version 6 (IPv6)
```

Examples To use the ? help to work out the syntax for the **clock timezone** command, enter the following sequence of commands:

```
awplus(config)# clock ?
```

```
summer-time  Manage summer-time
timezone     Set clock timezone
```

```
awplus(config)# clock timezone ?
```

```
TIMEZONE  Timezone name, up to 5 characters
```

```
awplus(config)# clock timezone NZST ?
```

```
minus  negative offset
plus   positive offset
```

```
awplus(config)# clock timezone NZST plus ?
```

```
<0-12>  Time zone offset to UTC
```

```
awplus(config)# clock timezone NZST plus 12
```

The above example demonstrates that the ? help only indicates what you can type **next**. For commands that have a series of parameters, like **clock timezone**, the ? help does not make the number of parameters obvious.

Completing Keywords

To complete keywords, type the Tab key after part of the command.

If only one keyword matches the partial command, the AlliedWare Plus™ OS fills in that keyword. If multiple keywords match, it lists them.

Examples In this example we use Tab completion in successive steps to build the complete command **show ip dhcp server summary**. We have included "<Tab>" to show where to type the Tab key - this is not displayed on screen.

```
awplus# show ip <Tab>
```

Figure 1-3: Example output after entering the command, show ip <Tab>

```
as-path-access-list  bgp                  community-list

```

Viewing Command Error Messages

The switch displays the following generic error messages about command input:

% Incomplete command—this message indicates that the command requires more parameters. Use the ? help to find out what other parameters are available.

```
awplus# interface
```

```
% Incomplete command.
```

% Invalid input detected at '^' marker—this indicates that the switch could not process the command you entered. The switch also prints the command and marks the first invalid character by putting a '^' under it. Note that you may get this error if you enter a command in the wrong mode, as the following output shows.

```
awplus# interface port1.0.1
```

```
interface port1.0.1
  ^
% Invalid input detected at '^' marker.
```

% Unrecognized command—when you try to use ? help and get this message, it indicates that the switch can not provide help on the command because it does not recognize it. This means the command does not exist, or that you have entered it in the wrong mode, as the following output shows.

```
awplus# interface ?
```

```
% Unrecognized command
```

Note

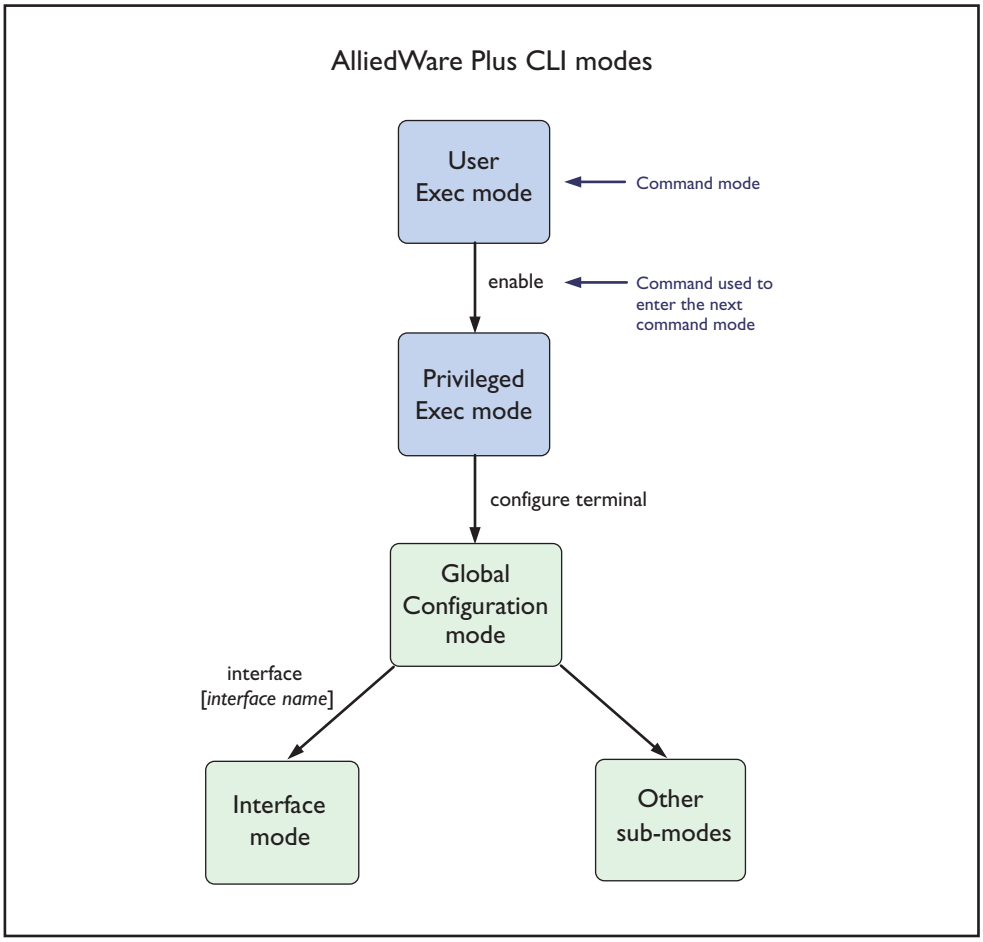
The AlliedWare Plus™ OS does not tell you when commands are successful. If it does not display an error message, you can assume the command was successful.

How to Work with Command Modes

The following figure shows the command mode hierarchy and the commands you use to move to lower-level modes.

Multiple users can telnet and issue commands using the User Exec mode and the Privileged Exec mode. However, only one user is allowed to use the Configure mode at a time. This prevents multiple users from issuing configuration commands simultaneously.

Figure 1-7: AlliedWare Plus™ CLI modes



User Exec mode

User Exec mode is the mode you log into on the switch.

It lets you perform high-level diagnostics (**show** commands, ping, traceroute etc), start sessions (Telnet, SSH), and change mode.

The default User Exec mode prompt is **awplus>**.

Privileged Exec mode

To change from User Exec to Privileged Exec mode, enter the command:

```
awplus> enable
```

Privileged Exec mode is the main mode for monitoring—for example, running **show** commands and debugging. From Privileged Exec mode, you can do all the commands from User Exec mode plus many system commands.

The default Privileged Exec mode prompt is **awplus#.**

Global Configuration mode

To change from Privileged Exec to Global Configuration mode, enter the command:

```
awplus# configure terminal
```

From Global Configuration mode, you can configure most aspects of the switch.

The default Global Configuration mode prompt is **awplus(config)#**.

Lower-level configuration modes

A number of features are configured by entering a lower-level mode from Global Configuration mode.

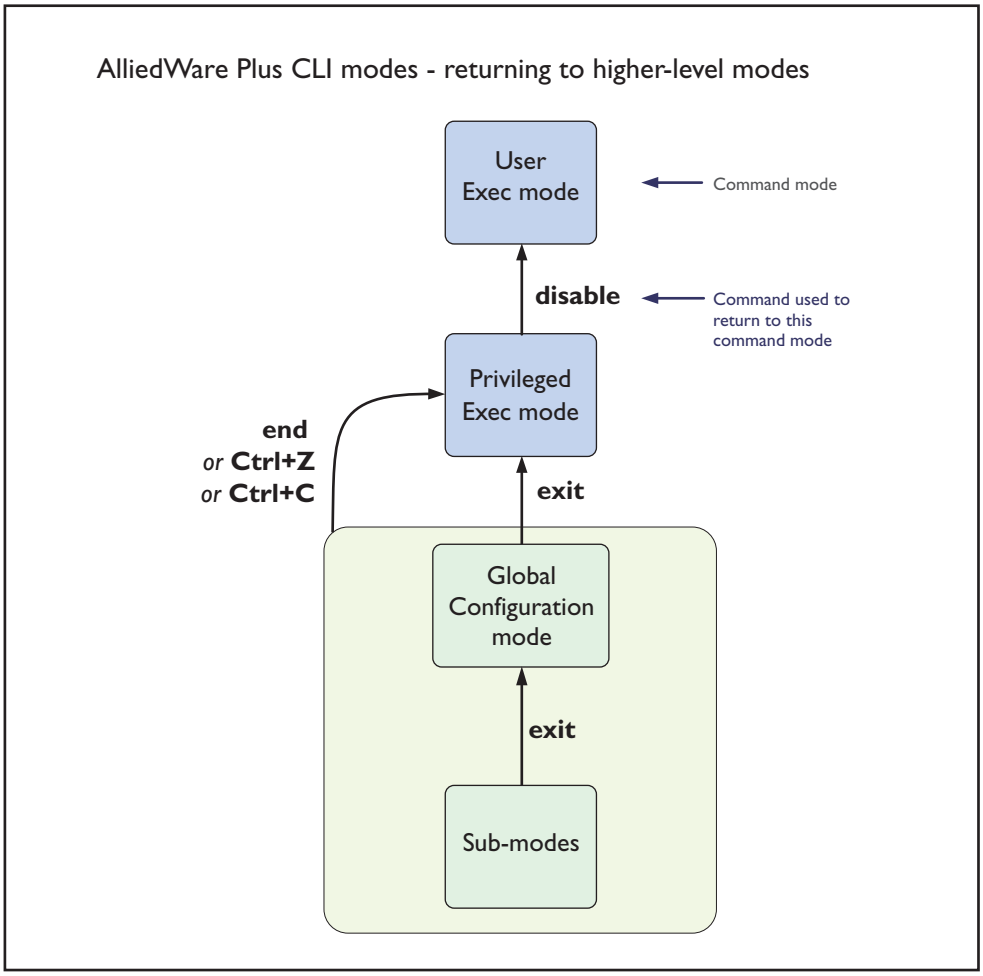
Some protocols have commands in both Global Configuration mode and lower-level configuration modes. For example, to configure MSTP, you use:

- Global Configuration mode to select MSTP as the spanning tree mode
- MST mode to create instances and specify other MSTP settings
- Interface Configuration mode to associate the instances with the appropriate ports.

Returning to higher-level modes

The following figure shows the commands to use to move from a lower-level mode to a higher-level mode.

Figure 1-8: Returning to higher-level modes



Examples To go from Interface Configuration to Global Configuration mode:

```
awplus(config-if)# exit
   awplus(config)#
```

To go from Interface Configuration to Privileged Exec mode:

```
awplus(config-if)# end
          awplus#
```

To go from Privileged Exec to User Exec:

```
          awplus# exit
          awplus>
```

Entering Privileged Exec Commands When in a Configuration Mode

As you configure the switch you will be constantly entering various **show** commands to confirm your configuration. This requires constantly changing between configuration modes and Privileged Exec mode.

However, you can run Privileged Exec commands without changing mode, by using the command:

```
do <command you want to run>
```

You cannot use the ? help to find out command syntax when using the **do** command.

Example To display information about the IP interfaces when in Global Configuration mode, enter the command:

This results in the following output:

```
awplus(config)# do show ip int brief
```

Figure 1-9: Example output after entering the command "do show ip int brief"

```
Interface          IP-Address      Status          Protocol
vlan1              unassigned      admin up        running
vlan2              unassigned      admin up        running
```

How to See the Current Configuration

The current configuration is called the running-config. To see it, enter the following command in either Privileged Exec mode or any configuration mode:

```
awplus# show running-config
```

To see only part of the current configuration, enter the command:

```
awplus# show running-config|include <word>
```

This displays only the lines that contain *word*.

To start the display at a particular place, enter the command:

```
awplus# show running-config |begin <word>
```

This searches the running-config for the first instance of *word* and begins the display with that line.

Note

The **show running-config** command works in all modes except User Exec mode.

Default Settings

When the switch first starts up with the AlliedWare Plus™ OS, it applies default settings and copies these defaults dynamically into its running-config.

These default settings mean that the AlliedWare Plus™ OS:

- encrypts passwords, such as user passwords
- records log message priority in log messages
- turns on jumbo frame support for all ports
- turns on the telnet server so that you can telnet to the switch
- enables the switch to look up domain names (but for domain name lookups to work, you have to configure a DNS server)
- turns off L3 multicast packet switching in the switch's hardware. This prevents L3 multicast from flooding the switch's CPU in its default state as an L2 switch
- sets the maximum number of ECMP routes to 4
- turns on RSTP on all ports. Note that the ports are not set to be edge ports
- sets all the switch ports to access mode. This means they are untagged ports, suitable for connecting to hosts
- creates VLAN 1and adds all the switch ports to it
- allows logins on the serial console port
- allows logins on VTY sessions (for telnet etc)
- has switching enabled, so Layer 2 traffic is forwarded appropriately without further configuration
- allocates all the routing table memory space to IPv4 and IPv6 routes
- has ports set to autonegotiate their speed and duplex mode
- has copper ports set to auto MDI/MDI-X mode

The Default Configuration Script

Most of the above default settings are in the form of commands, which the switch copies to its running-config when it first boots up.

The switch stores a copy of the default configuration commands in the file, **default.cfg** and uses this as its default start-up file.

For more information about start-up files, see **"How to Save and Boot from the Current Configuration" on page 1.18**.

How to Change the Password

To change the password for the manager account, enter Global Configuration mode and enter the following command:

```
awplus(config)# username manager password <new-password>
```

The password can be up to 23 characters in length and include characters from up to four categories. The password categories are:

- uppercase letters: A to Z
- lowercase letters: a to z
- digits: 0 to 9
- special symbols: all printable ASCII characters not included in the previous three categories.The question mark ? cannot be used as it is reserved for help functionality.

How to Set Strong Passwords

The password security rules are disabled by default. To set password security rules for users with administrative rights, or privilege level 15, enter Global Configuration mode.

You can then either specify whether the user is forced to change an expired password at the next login, or specify whether the user is not allowed to login with an expired password. You will need to specify a password lifetime greater than 0 before selecting either of these features. Note that the **security-password forced-change** and the **security-password reject-expired-pwd** commands cannot be enabled concurrently.

Password lifetime

Enter the following command to specify the password lifetime in days:

```
awplus(config)# security-password lifetime <0-1000>
```

Note that the value 0 will disable lifetime functionality and passwords will never expire. If lifetime functionality is disabled, the **security-password forced-change** command and the **security-password warning** command are also disabled.

Password forced change

To specify that a user is forced to change an expired password at the next login, enter the following command:

```
awplus(config)# security-password forced-change
```

If the **security-password forced-change** command is enabled, users with expired passwords are forced to change to a password that must comply with the current password security rules at the next login.

Reject expired password

To specify that a user is not allowed to login with an expired password, enter the following command:

```
awplus(config)# security-password reject-expired-pwd
```

If the **security-password reject-expired-pwd** command is enabled, users with expired passwords are rejected at login. Users then have to contact the Network Administrator to change their password.

Caution

Once all users' passwords are expired you are unable to login to the device again if the security-password reject-expired-pwd command has been executed. You will have to reboot the device with a default configuration file, or load an earlier software version that does not have the security password feature.
We recommend you never have the command line "security-password reject-expired-pwd" in a default config file.

Use other password security rules to further configure password security settings.

Password warning

To specify the number of days before the password expires that the user will receive a warning message specifying the remaining lifetime of the password, enter the command:

```
awplus(config)# security-password warning <0-1000>
```

The value 0 will disable warning functionality and the warning period must be less than, or equal to, the password lifetime.

Password history

To specify the number of previous passwords that are unable to be reused enter the command:

```
awplus(config)# security-password history <0-15>
```

The value `0` will disable history functionality. If history functionality is disabled, all users' password history is reset and all password history is lost. A new password is invalid if it matches a password retained in the password history.

Password minimum length

To specify the minimum allowable password length, enter the command:

```
awplus(config)# security-password minimum-length <1-23>
```

Password minimum categories

To specify the minimum number of categories that the password must contain in order to be considered valid, enter the command:

```
awplus(config)# security-password minimum-categories <1-4>
```

The password categories are:

- uppercase letters: A to Z
- lowercase letters: a to z
- digits: 0 to 9
- special symbols: all printable ASCII characters not included in the previous three categories. The question mark ? cannot be used as it is reserved for help functionality

To ensure password security, the minimum number of categories should align with the lifetime selected, i.e. the fewer categories specified the shorter the lifetime specified.

How to add a user is described in **"How to Add and Remove Users" on page 1.28**.

Display security password settings

To list the configuration settings for the various security password rules, enter the command:

```
awplus(config)# show security-password configuration
```

To list users remaining lifetime or last password change, enter the command:

```
awplus(config)# show security-password user
```

How to Set a Management IP Address

This section describes how to set an IP address on the eth0 management port.

Step 1: If desired, check the current configuration

After logging in, enter Privileged Exec mode by using the command:

```
awplus>enable
```

Then check the current configuration by using one of the following commands:

```
awplus# show ip interface eth0 brief
```

This results in the following output:

```
Interface              IP-Address      Status          Protocol
eth0                   172.28.8.200    admin up        running
```

```
awplus# show running-config interface eth0
```

This results in the following output:

```
!
interface eth0
 ip address 172.28.8.200/16
!
```

Step 2: Enter Interface Configuration mode for the eth0 interface

Enter Global Configuration mode and enter the command:

```
awplus(config)# interface eth0
```

Step 3: Enter the IP address and mask

Enter the command:

```
awplus(config-if)# ip address <address/mask>
```

For example, to set the address to 172.28.8.210/16, enter the command:

```
awplus(config-if)# ip address 172.28.8.210/16
```

How to Set an IP Address on VLAN 1

This section describes how to set an IP address on the default VLAN (**vlan1**).

Step 1: If desired, check the current configuration

After logging in, enter Privileged Exec mode by using the command:

```
awplus# enable
```

Then check the current configuration by using one of the following commands:

```
awplus# show ip interface vlan1 brief
```

This results in the following output:

```
Interface            IP-Address      Status          Protocol
vlan1                172.28.8.200    admin up        running
```

```
awplus# show running-config interface vlan1
```

This results in the following output:

```
!
interface vlan1
 ip address 172.28.8.200/16
!
```

Step 2: Enter Interface Configuration mode for the vlan1 interface

Enter Global Configuration mode and enter the command:

```
awplus(config)# interface vlan1
```

Step 3: Enter the IP address and mask

Enter the command:

```
awplus(config-if)# ip address <address/mask>
```

For example, to set the address to 172.28.8.210/16, enter the command:

```
awplus(config-if)# ip address 172.28.8.210/16
```

How to Save and Boot from the Current Configuration

This section tells you how to save your configuration and run the saved configuration when the switch starts up.

You can either:

- save the configuration to the switch's default configuration file (called "default.cfg"). By default, the switch uses that file at start-up.
- create a new configuration file and set the switch to use the new configuration file at start-up.

How to Save to the Default Configuration File

Enter Privileged Exec mode and enter the command:

```
awplus# copy running-config startup-config
```

The parameter **startup-config** is a short-cut for the current boot configuration file, which will be the default configuration file unless you have changed it, as described in the next section.

How to Create and Use a New Configuration File

Step 1: Copy the current configuration to a new file

Enter Privileged Exec mode and enter the command:

```
awplus# copy running-config <destination-url>
```

Example To save the current configuration in a file called `example.cfg`, enter the command

```
awplus# copy running-config example.cfg
```

Step 2: Set the switch to use the new file at startup

To run the new file's configuration when the switch starts up, enter Global Configuration mode and enter the command:

```
awplus(config)# boot config-file <filepath-filename>
```

Note that you can set the switch to use a configuration file on an SD card if you have saved the configuration file to a card. You can only specify that the configuration file is on an SD card if there is a backup configuration file already specified in Flash.

To set a backup configuration file to load if the main configuration file cannot be loaded, enter the command:

```
awplus(config)# boot config-file backup <filepath-filename>
```

For an explanation of the configuration fallback order, see **"The configuration file fallback order" on page 6.10**.

Example To run the commands in `example.cfg` on startup, enter the command:

```
awplus(config)# boot config-file flash:/example.cfg
```

To set `backup.cfg` as the backup to the main configuration file, enter the command:

```
awplus(config)# boot config-file backup flash:/backup.cfg
```

Step 3: Display the new settings

To see the files that the switch uses at startup, enter Privileged Exec mode and enter the command:

```
awplus# show boot
```

The output looks like this:

```
Boot configuration
-----------------------------------------------------------------
Current software   : x900-5.4.4-0.4.rel
Current boot image : flash:/x900-5.4.4-0.4.rel
Backup  boot image : flash:/x900-5.4.4-0.4.rel
Default boot config: flash:/default.cfg
Current boot config: card:/example.cfg (file exists)
Backup  boot config: flash:/backup.cfg (file exists)
```

Step 4: Continue updating the file when you change the configuration

When you next want to save the current configuration, enter Privileged Exec mode and enter the command:

```
awplus# copy running-config startup-config
```

The parameter **startup-config** is a short-cut for the current boot configuration file.

How to Return to the Factory Defaults

The switch dynamically adds the default settings to the running-config at start-up if the default file is not present. This section describes how to use this feature to return to the factory defaults.

Note

After reboot the show running-config output will show the default factory settings for your switch once you have removed the default.cfg file. To recreate the default.cfg file enter copy running-config startup-config. When you enter copy running-config startup-config commands the default.cfg file is updated with the startup-config.

Completely restore defaults

To completely remove your configuration and return to the factory default configuration, delete or rename the default file and make sure no other file is set as the start-up configuration file.

To find the location of the default boot configuration file, enter Privileged Exec mode and enter the command:

```
awplus# show boot
```

To delete the default file when it is the current boot configuration file, enter Privileged Exec mode and enter either of the commands:

```
awplus# delete force <filename>
```

or:

```
awplus# erase startup-config
```

Note that erasing startup-config deletes the current boot configuration file—it does not simply stop the file from being the boot file.

To make sure that no other file is loaded at start-up, enter Global Configuration mode and enter the command:

```
awplus(config)# no boot config-file
```

Partially restore defaults

To partially restore the default settings, make a configuration file that contains the settings you want to keep and set this as the start-up configuration file. On start-up, the switch will add the missing settings to the running-config.

For example, to use default settings but still keep an IP address on the eth0 management port, create a file like the following one and set it as the boot configuration file:

```
awplus# show file eth0-ip.cfg
```

The output looks like this:

```
!
interface eth0
 ip address 172.28.8.210/16
!
ip route 0.0.0.0/0 172.28.0.1
!
end
```

How to See System Information

This section describes how to view the following system information:

- overview information
- details of temperature and voltage
- serial number

Viewing Overall System Information

To display an overview of the switch hardware, software, and system settings, enter User Exec or Privileged Exec mode and enter the command:

```
awplus# show system
```

The output looks like this:

```
Switch System Status                                    Fri Dec  5 02:55:58 2012
Board       ID  Bay   Board Name                              Rev  Serial number
-------------------------------------------------------------------------------
Base       280        x900-24XT-N                             A-0  45AX5300X
PSU        212  PSU2  AT-PWR01-AC                             B-1  61400717
Fan module 214  PSU1  AT-FAN01                                F-1  66111841
-------------------------------------------------------------------------------

Territory          : japan
System Name
System Contact
System Location
```

Viewing Temperature, Voltage, and Fan Status

The switch monitors the environmental status of the switch and its power supplies and fan. To display this information, enter User Exec or Privileged Exec mode and enter the command:

```
awplus# show system environment
```

The output looks like the following figure.

```
awplus#show system environment
Environment Monitoring Status
Overall Status: Normal

Resource ID: 1  Name: PSU bay 1
ID  Sensor (Units)                      Reading  Low Limit High Limit Status
1   Device Present                         Yes        -          -       Ok
2   PSU Overtemp                            No        -          -       Ok
3   PSU Fan Fail                            No        -          -       Ok
4   PSU Power Output                        No        -          -       Ok

Resource ID: 2  Name: PSU bay 2
ID  Sensor (Units)                      Reading  Low Limit High Limit Status
1   Device Present                         Yes        -          -       Ok
2   PSU Overtemp                            No        -          -       Ok
3   PSU Fan Fail                            No        -          -       Ok
4   PSU Power Output                       Yes        -          -       Ok

Resource ID: 3  Name: x900-24XT-N
ID  Sensor (Units)                      Reading  Low Limit High Limit Status
1   Voltage: 2.5V (Volts)                2.565      2.344      2.865     Ok
2   Voltage: 1.65V (Volts)               1.629      1.488      1.816     Ok
3   Voltage: 3.3V (Volts)                3.334      2.973      3.627     Ok
4   Voltage: 1.8V (Volts)                1.771      1.615      1.979     Ok
5   Voltage: 12V (Volts)                12.000     10.813     13.188     Ok
6   Temp: Ambient (Degrees C)              33       -127         55      Ok
7   Temp: Mid Internal (Degrees C)         52       -127         85      Ok
8   Temp: Bk Internal (Degrees C)          47       -127         75      Ok
```

Viewing the Serial Number

The switch's serial number is displayed in the output of the **show system** command on page 10.54, but for convenience, you can also display it by itself. To do this, enter User Exec or Privileged Exec mode and enter the command:

```
awplus# show system serialnumber
```

The output looks like this:

```
P1FY7502C
```

How to Set System Parameters

You can set system parameters to personalize the switch and make it easy to identify it when troubleshooting. This section describes how to configure the following system parameters:

- telnet session timeout
- switch name
- login banner

How to Change the Telnet Session Timeout

By default, telnet sessions time out after 10 minutes of idle time. If desired, you can change this.

To change the timeout for all telnet sessions, enter Global Configuration mode and enter the commands:

```
awplus(config)# line vty 0 32
awplus(config-line)# exec-timeout <new-timeout>
```

The new timeout value only applies to new sessions, not current sessions.

Examples To set the timeout to 30 minutes, enter the command:

```
awplus(config-line)# exec-timeout 30
```

To set the timeout to 30 seconds, enter the command:

```
awplus(config-line)# exec-timeout 0 30
```

To set the timeout to infinity, so that sessions never time out, enter either of the commands:

```
awplus(config-line)# no exec-timeout
awplus(config-line)# exec-timeout 0 0
```

How to Name the Switch

To give the switch a name, enter Global Configuration mode and enter the command:

```
awplus(config)# hostname <name>
```

For example, to name the switch “mycompany”:

```
awplus(config)# hostname mycompany
```

The prompt displays the new name:

```
mycompany(config)#
```

The name can contain hyphens and underscore characters, for example:

```
mycompany(config)#hostname mycompany_more_words
mycompany_more_words(config)#hostname mycompany-hyphenated
mycompany-hyphenated(config)
```

However, the name must be a single word, as the following example shows.

```
mycompany(config)#hostname mycompany more words
                                   ^
% Invalid input detected at '^' marker.
```

It also cannot be surrounded by quote marks, as the following example shows.

```
awplus(config)#hostname "mycompany more words"
% hostname contains invalid characters
```

Removing the name

To remove the hostname, enter the command:

```
mycompany(config)# no hostname
```

The prompt changes back to the default prompt:

```
awplus(config)#
```

How to Display a Text Banner at Login

By default, the switch displays the AlliedWare Plus™ OS version and build date before login. You can customize this by changing the Message of the Day (MOTD) banner.

To enter a new MOTD banner, enter Global Configuration mode and enter the command:

```
awplus(config)# banner motd <banner-text>
```

The text can contain spaces and other printable characters. You do not have to surround words with quote marks.

Example

To display "this is a new banner" when someone logs in, enter the command:

```
awplus(config)# banner motd this is a new banner
```

This results in the following output at login:

```
awplus login: manager
Password:
this is a new banner
awplus>
```

Removing the banner

To return to the default banner (AlliedWare Plus™ OS version and build date), enter the command:

```
awplus(config)# banner motd default
```

To remove the banner instead of replacing it, enter the command:

```
awplus(config)# no banner motd
```

How to Set the Time and Date

There are three aspects to setting the time and date:

- setting the current time and date (**"How to Set the Time and Date" on page 1.26**)
- setting the timezone (**"How to Set the Timezone" on page 1.27**)
- configuring the switch to automatically change the time when summer-time begins and ends (**"How to Configure Summer-time" on page 1.27**)

Instead of manually setting the time, you can use NTP to automatically get the time from another device.

How to Show Current Settings

To display the current time, timezone and date, enter Privileged Exec mode and enter the command:

```
awplus# show clock
```

The output looks like this:

```
UTC Time:   Wed,  16 May 2013 16:08:14 +0000
Timezone: UTC
Timezone Offset: +00:00
Summer time zone: None
```

How to Set the Time and Date

To set the time and date, enter Privileged Exec mode and enter the **clock set** command:

```
clock set <hh:mm:ss> <day> <month> <year>
```

:where:

- *hh* is two digits giving the hours in 24-hour format (e.g. **14**)
- *mm* is two digits giving the minutes
- *ss* is two digits giving the seconds
- *day* is two digits giving the day of the month
- *month* is the first three letters of the month name (e.g. **sep**)
- *year* is four digits giving the year

Example To set the time to 14:00:00 on 25 January 2012, use the command:

```
awplus# clock set 14:00:00 25 jan 2012
```

How to Set the Timezone

To set the timezone, enter Global Configuration mode and enter the **clock timezone** command:

```
clock timezone <timezone-name> {plus|minus} <0-12>
```

The <*timezone-name*> can be any string up to 6 characters long.

To return the timezone to UTC+0, enter the command:

```
awplus(config)# no clock timezone
```

Example To set the timezone to Eastern Standard Time, use the command:

```
awplus(config)# clock timezone EST minus 5
```

How to Configure Summer-time

There are two approaches for setting summer-time:

- *recurring*, when you specify the week when summer-time starts and ends and each year the switch changes the time at those weeks. For example, Eastern Daylight Time (EDT) starts at 2 am on the second Sunday in March and ends at 2 am on the first Sunday in November.
- *date-based*, when you specify the start and end dates for summer-time for a particular year. For example, Eastern Daylight Time (EDT) starts at 2 am on Sunday, 8 March 2008 and ends at 2 am on Sunday, 2 November 2008.

Recurring To set summer-time with recurring dates, enter Global Configuration mode and enter the **clock summer-time recurring** command:

```
clock summer-time <zone-name> recurring <start-week> <start-
day> <start-month> <start-time> <end-week> <end-day>
<end-month> <end-time> <1-180>
```

The <*zone-name*> can be any string up to 6 characters long.

The <*start-time*> and <*end-time*> are in the form `hh:mm`, in 24-hour time.

Note that if you specify 5 for the week, this changes the time on the last day of the month, not the 5th week.

Example To configure EDT, enter the command:

```
awplus(config)# clock summer-time EDT recurring 2 Sun Mar 02:00
                1 Sun Nov 02:00 60
```

Date-based To set summer-time for a single year, enter Global Configuration mode and enter the **clock summer-time date** command:

```
clock summer-time <zone-name> date <start-day> <start-month>
<start-year> <start-time> <end-day> <end-month> <end-year>
<end-time> <1-180>
```

The <*zone-name*> can be any string up to 6 characters long.

The <*start-time*> and <*end-time*> are in the form `hh:mm`, in 24-hour time.

Example For example, to configure EDT for 2008 enter the command:

```
awplus(config)# clock summer-time EDT date 8 Mar 2008 02:00 2
                Nov 2008 02:00 60
```

How to Add and Remove Users

Adding users To add a new user with administrative rights, enter Global Configuration mode and enter the command:

```
awplus(config)# username <name> privilege 15 password
                <password>
```

Both <*name*> and <*password*> can contain any printable character and are case sensitive.

When you add a user with administrative rights, <*password*> will have to conform to the rules specified by the **security-password minimum-categories** command on page 5.20 and the **security-password minimum-length** command on page 5.21. If the **security-password history** command on page 5.17 is enabled, <*password*> is invalid if it matches a password retained in the password history.

The AlliedWare Plus™ OS gives you a choice of **1** or **15** for the privilege level. Level **1** users are limited to User Exec mode so you need to set most users to level **15**.

For example, to add user Bob with password 123$%^, enter the command:

```
awplus(config)# username Bob privilege 15 password 123$%^
```

Removing users To remove a user, enter Global Configuration mode and enter the command:

```
no username <name>
```

For example, to remove user Bob, enter the command:

```
awplus(config)# no username Bob
```

Note that you can delete all users, including the user called “manager” and the user you are logged in as. If all privilege **15** user accounts are deleted, a warning message is generated:

```
% Warning: No privileged users exist.
```

If all privilege level **15** user accounts are deleted, and there are no other users configured for the device, you may have to reboot with the default configuration file.

If there is a user account on the device with a lower privilege level and a password has already been set with the **enable password** command on page 5.4, you can login and still enter privileged mode. When executing the **enable** command, enter the password created with the **enable password** command. For example, if the password is mypassword:

```
awplus> enable mypassword

awplus#
```

Displaying users

To list the currently logged-in users, enter User Exec or Privileged Exec mode and enter the command:

```
awplus# show users
```

The output looks like this:

```
Line     User             Host(s)  Idle      Location        Priv Idletime Timeout
con 0    manager          idle     00:00:00  ttyS0           15   10       N/A
vty 0    bob              idle     00:00:03  172.16.11.3     1    0        5
```

To list all configured users, enter User Exec or Privileged Exec mode and enter the command:

```
awplus# show running-config |include username
```

The output looks like this:

```
username manager privilege 15 password 8 $1$bJoVec4D$JwOJGPr7YqoExA0GVasdE0
username Bob privilege 15 password 8 $1$gXJLY8dw$iqkMXLgQxbzSOutNUa5E2.
```

Pre-encrypted Passwords

The running-config output above includes the number 8 after the **password** parameter. This indicates that the password is displayed in its encrypted form.

You can enter the number 8 and a pre-encrypted password on the command line. You may want to pre-encrypt passwords if you need to load them onto switches via an insecure method (such as HTTP, or by emailing them to remote users).

Caution Only enter the number 8 if you are entering a pre-encrypted password—otherwise, you will be unable to log in using the password and will be unable to access the switch through that username. The next section describes why.

Testing this feature

If you want to test the effect of this, *create a new user* for the test instead of using the manager user. The test stops you from logging in as the test user, so you need to have the manager user available to log in as.

The following output shows how specifying the number 8 puts the password into the running-config exactly as you typed it:

```
awplus(config)#username Bob privilege 15 password 8 friend
awplus(config)#show running-config |include username Bob
username Bob privilege 15 password 8 friend
```

After entering the command above, logging in as “Bob” with a password of “friend” does not work. This is because the switch takes the password you enter (“friend”), hashes it, and compares the hash with the string in the running-config (“friend”). The hashed value and “friend” are not the same, so the switch rejects the login.

How to Undo Settings

There are two possibilities for undoing settings: the **no** parameter and the **default** parameter.

How to Use the *no* Parameter

To undo most settings, simply re-enter the first parameters of the configuration command with the parameter **no** before them.

Example You can set the timezone to Eastern Standard Time by entering the command:

```
awplus(config)# clock timezone EST minus 5
```

To remove the timezone setting, enter the command:

```
awplus(config)# no clock timezone
```

How to Use the *default* Parameter

Some commands have a **default** parameter that returns the feature to its default setting.

Example You can change the login banner to “this is a new banner” by entering the command:

```
awplus(config)# banner motd this is a new banner
```

To return to the default banner, enter the command:

```
awplus(config)# banner motd default
```

Note that this command also has a **no** parameter that lets you remove the banner altogether.

How to Upgrade the Firmware

New releases of the AlliedWare Plus™ OS become available regularly. Contact your customer support representative for more information.

Step 1: Put the new release onto your TFTP server.

Step 2: If necessary, create space in the switch's Flash memory for the new release

Note that you cannot delete the current release file.

To see how much space is free, use the command:

```
awplus# show file systems
```

Step 3: Copy the new release from your TFTP server onto the switch

Follow the relevant instructions in "Copying with Trivial File Transfer Protocol (TFTP)" on page 6.16.

Step 4: Set the switch to boot from the new release

Enter Global Configuration mode and enter the command:

```
awplus(config)# boot system backup <filepath-
                filename>
```

You can set a backup release file to load if the main release file cannot be loaded. Enter the command:

```
awplus(config)# boot system backup backup <filepath-
                filename>
```

Step 5: Check the boot settings

Enter Privileged Exec mode and enter the command:

```
awplus# show boot
```

Step 6: Reboot

Enter Privileged Exec mode and enter the command:

```
awplus# reboot
```

Save Power With the Eco-Friendly Feature

Eco-Friendly

You can conserve power by enabling the eco-friendly LED (Light Emitting Diode) feature with the **ecofriendly led** command on page 10.18. This feature disables power to the port LEDs on XEMs installed in the switch, the stack ID LED on the XEM-STK and all port LEDs on the switch, except the eth0 port. On the switch, power to the fault, SD and PSU LEDs is not disabled, and in addition, on the SwitchBlade® x908 power to the stacking status LED is not disabled. On the XEM-1XP and XEM-2XP power to the XFP LED is not disabled.

When the eco-friendly LED feature is enabled, a change of port status will not affect the display of the associated LED. When the eco-friendly feature is disabled and power is returned to port LEDs, the LEDs will correctly show the current state of the ports.

In a stack environment, enabling the eco-friendly LED feature on the stack master will apply the feature to every member of the stack.

The eco-friendly LED feature is disabled by default. To enable the feature, enter the commands:

```
awplus# configure terminal
awplus(config)# ecofriendly led
```

For an example of how to configure a trigger to enable the eco-friendly LED feature, see **"Turn Off Power to Port LEDs" on page 105.7**.

You can also conserve power by enabling the eco-friendly LPI (Low Power Idle) feature with the **ecofriendly lpi** command on page 10.19. This feature reduces the power supplied to the ports on XEMs installed in the switch, except the eth0 port, whenever ports are idle and are connected to IEEE802.3az Energy Efficient Ethernet compliant host devices. All ports configured for LPI must support LPI in hardware and must be configured to autonegotiate by default or by using the **speed** and **duplex** commands as needed.

LPI is a feature of the IEEE 802.3az Energy Efficient Ethernet (EEE) standard. LPI lowers power consumption of switch ports during periods of low link utilization when connected to IEEE 802.3az compliant host devices. If no data is sent then the switch port can enter a sleep state, called Low Power Idle (LPI), to conserve power used by the switch.

The eco-friendly LPI (Low Power Idle) feature is disabled by default. To enable the feature for a switch port, or for a range of switch ports in the example below, enter the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2-port1.0.22
awplus(config-if)# ecofriendly lpi
```

For an example of how to configure a trigger to enable the eco-friendly LPI feature, see **"Reduce Power Supplied to Ports" on page 105.9**.

Trouble-shoot fiber and pluggable issues

Digital Optical Monitoring (DOM) for XFP (10 Gigabit Small Form Factor Pluggable) transceivers and Digital Diagnostics Monitoring (DDM) for SFP (1 Gigabit Small Form-factor Pluggable) and SFP+ (10 Gigabit Small Form-factor Pluggable) transceivers, allow you to measure optical parameters for pluggables installed in a switch and trouble shoot fiber issues.

Fiber cable can be vulnerable to damage. Patch panels and patch cables can be connected with the wrong type of fiber, fiber splices can become faulty and fiber cables can be cut accidentally. Trouble shooting fiber issues has required special equipment and expertise to find the source of a problem causing signal attenuation. Digital monitoring features help find fiber issues.

Different types of transceivers are supported in different models of switch. See your Allied Telesis dealer for more information about the particular models of pluggables that your switch supports, and if these transceivers also support digital monitoring.

To display information about transceivers installed on your switch, enter the following command:

```
awplus# show system pluggable diagnostics
```

The following parameters are measured and are displayed in **show system pluggable diagnostics** command output:

- Temperature (Centigrade) inside the transceiver
- Vcc (Volts) voltage supplied to the transceiver
- Tx Bias (mA) current to the Laser Diode in the transceiver
- Tx Power (mW) the amount of light transmitted from the transceiver
- Rx Power (mW) the amount of light received in the transceiver

You can track Tx Bias to find out how the Laser Diode in the transceiver is aging by comparing the Tx Bias for one transceiver against Tx Bias for others. You can use this information to see if any transceivers may need replacement.

You can trouble shoot fiber connectivity issues by checking the Tx Power at one end of the fiber link against the Rx Power at the other end of the fiber link to measure the attenuation. Knowing the attenuation enables you to determine if there are anomalies in the fiber cable.

Note that Tx Power differences between the same type of transceivers installed on a switch may indicate that a transceiver is not seated or locked. Ensuring transceivers are seated and locked in place with the retaining clip will keep the fiber link up if there is any vibration or movement that can dislodge a fiber cable. Rx Power differences may indicate poor fiber patch cables, poor connectors or poor splices. Tracking Tx Bias for installed transceivers and measuring attenuation for fiber links allows you to perform periodic preventative maintenance, instead of reacting to a failure. Tracking Tx Power differences can be used as an indicator of failure in an which may need replacing.

Using the Find Me feature

The Find Me feature enables you to physically locate a specific device from a group of similar devices.

Running the **findme** command on page 10.21 causes the device's LEDs to alternately flash green and amber at a rate of 1 Hz. If the switch has no amber LED, then the green LED will flash on/off at a rate of 1 Hz.

An optional **interface** parameter specifies one or more interfaces to flash, while an optional **member** parameter specifies a particular stack member. Both these parameters are mutually exclusive. If no **interface** or **member** parameter is specified, then all ports on the device or stack are flashed.

An optional **timeout** parameter specifies the flash behavior **duration**. The default time is one minute (60 seconds). Normal LED behavior is restored automatically after either the default time, or a specified time, has elapsed or a **no findme** command is used.

Continuous Reboot Prevention

Occasionally, due to network conditions or to recover from a software failure, the recovery mechanism of the switch is to reboot to resume normal operation. Provided the same error condition does not recur within a short period of time this is acceptable behavior. However, if the error condition repeatedly occurs within a short time period, the switch will go into a cycle of continuous reboots, causing network problems.

Although a switch continuously rebooting will come to the attention of a network administrator who can then resolve the issue, it is likely that in the meantime network problems have arisen. For example, a broadcast storm due to STP becoming unstable and trying to continually reconverge could cause the switch to reboot continuously.

In a VCStack situation, a continually rebooting switch will destabilize the stack and may cause the master and member devices to continually swap roles as they both reboot. This can seriously affect the network, because both devices will become too busy rebooting and forming the stack to forward traffic.

The continuous reboot prevention feature, enabled with the **continuous-reboot-prevention** command on page 10.13, allows the user to configure a switch to stop rebooting if the device gets into a cycle of continuous rebooting. The user can configure the time period, the maximum number of times the switch can reboot within the specified time period, referred to as the threshold, and the action to take if the threshold is exceeded.

There are three actions you can specify:

- linkdown

  The reboot procedure continues and all switch ports and stack ports stay link down. This is the default action.

- logonly

  The reboot procedure continues normally.

- stopreboot

  The reboot procedure stops and the user is prompted to enter the key "c" via the CLI. Normal reboot procedure then continues.

Note that when the continuous reboot prevention feature is enabled on the switch, user initiated reboots via the CLI and software version auto-synchronization reboots (VCStack implementation) are not counted toward the threshold value.

The continuous reboot prevention feature is disabled by default. To enable the feature, enter the following commands:

```
awplus# configure terminal
awplus(config)# continuous-reboot-prevention enable
```

Unless the **period**, **threshold** and **action** parameter values are explicitly set, the defaults are used:

- period - 600 seconds
- threshold - 1 reboot event
- action - linkdown

To configure the **period**, **threshold** and the **action** to take if the number of reboots exceeds the specified threshold, enter the following commands:

```
awplus# configure terminal
awplus(config)# continuous-reboot-prevention [period <60-
604800>] [threshold <1-10>]
[action [linkdown|logonly|stopreboot]]
```

If the action **stopreboot** is specified, the reboot procedure stops and the following message is displayed:

```
Please input key 'c' if you want to continue processing.
```

When the user has input “c” via the CLI, the reboot procedure continues.

To disable the continuous reboot prevention feature, enter the following commands:

```
awplus# configure terminal
awplus(config)# no continuous-reboot-prevention enable
```

To return either one or more of the **period**, **threshold** and the **action** parameters to the default, use the commands:

```
awplus# configure terminal
awplus(config)# no continuous-reboot-prevention [period]
[threshold] [action]
```

To display the current continuous reboot prevention configuration, enter the command:

```
awplus# show continuous-reboot-prevention
```

To display the reboot history of the switch, enter the command:

```
awplus# show reboot history
```

Controlling “show” Command Output

You can control the output of **show** commands by using the | and > or >> tokens in the following ways:

- To display only part of the output, follow the command with **|** and then other keywords (see **Output Modifiers** below)
- To save the output to a file, follow the command with **> *filename***
- To append the output to an existing file, follow the command with **>> *filename***

Using the ? after typing the **show** command displays the following information about these tokens:

```
awplus#  show users
```

```
| Output modifiers
> Output redirection
>> Output redirection (append)
```

Output Modifiers

Type the | (vertical bar) to use **Output modifiers**.

```
append    Append output
begin     Begin with the first line that contains
          matching output
exclude   Exclude lines that contain matching output
include   Include lines that contain matching output
redirect  Redirect output
```

Begin

The **begin** parameter causes the display to begin at the first line that contains the input string.

```
awplus#  show run | begin vlan1
```

```
...skipping
interface vlan1
 ip address 192.168.14.1
!!
line con 0
 login
line vty 0 4
 login
!
end
```

Exclude The **exclude** parameter excludes all lines of output that contain the input string. In the following output all lines containing the word "input" are excluded:

```
awplus#  show interface vlan1 | exclude input
```

```
Interface vlan1
  Scope: both
  Hardware is Ethernet, address is 192.168.14.1
  index 3 metric 1 mtu 1500 <UP,BROADCAST,RUNNING,MULTICAST>
  Label switching is disabled
  No Virtual Circuit configured
  Administrative Group(s): None
  DSTE Bandwidth Constraint Mode is MAM
    output packets 4438, bytes 394940, dropped 0
    output errors 0, aborted 0, carrier 0, fifo 0, heartbeat 0,
window 0
    collisions 0
```

Include The include parameter includes only those lines of output that contain the input string. In the output below, all lines containing the word "input" are included:

```
awplus#  show interface vlan1 | include input
```

```
input packets 80434552, bytes 2147483647, dropped 0, multicast packets 0
input errors 0, length 0, overrun 0, CRC 0, frame 0, fifo 1, missed 0
```

Redirect The **redirect** parameter puts the lines of output into the specified file. If the file already exists, the new output overwrites the file's contents; the new output is not appended to the existing file contents.

| **redirect** and > are synonyms.

```
awplus#  show history | redirect history.txt
```

Output Redirection The output redirection token > puts the lines of output into the specified file. If the file already exists, the new output overwrites the file's contents; the new output is not appended to the existing file contents.

| **redirect** and > are synonyms.

```
awplus#  show history > history.txt
```

Append Output The append output token >> adds the lines of output into the specified file. The file must already exist, for the new output to be added to the end of the file's contents; the new output is appended to the existing file contents.

| **append** and >> are synonyms.

```
awplus#  show history >> history.txt
```

AlliedWare Plus GUI

Information on loading and using the AlliedWare Plus™ GUI is outside the scope of the main body of this reference manual. This topic is covered in a separate appendix to this document. See **"Appendix C: GUI Reference"**.

Chapter 2: Command Syntax Conventions in this Software Reference

The following table describes how command line interface syntax is shown in this Software Reference.

Syntax element	Example	What to enter in the command line

Keywords are shown in lowercase fixed-width font or bold variable-width font.	`show spanning-tree mst`
	or
	`show ip route`
		Some keywords are required, and others are optional parameters. Type keywords exactly as they appear in the command syntax.

Number ranges are enclosed in angle-brackets < > and separated by a hyphen.	`<0-255>`	Enter a number from the range. Do not enter the angle brackets.

Placeholders are shown in lowercase italics within angle-brackets < >, or in uppercase italics.	`<port-list>`
	or
	`ip dhcp pool NAME`
		Replace the placeholder with the value you require. The placeholder may be an IP address, a text string, or some other value. See the parameter table for the command for information about the type of value to enter.
		Do not enter the angle-brackets.

Repeats are shown with ellipsis.	`param1...`	Enter the parameter one or more times.
Optional elements are shown in brackets: [ ]	`vlan <vid> [name <vlan-name>]`	If you need the optional parameter, enter it. Do not enter the brackets.
Required choices are enclosed in braces and separated by a vertical bar (pipe) : {|}.	`spanning-tree {mstp|rstp|stp} enable`	Enter one only of the options. Do not enter the braces or vertical bar.
Optional choices are enclosed in or brackets and separated by a vertical bar (pipe): [|]	`[param1|param2]`	If needed, enter one only of the options. Do not enter the brackets or vertical bar.
Inclusive options are enclosed in braces, and separated by brackets: {[ ] [ ]}.	`{[param1] [param2] [param3]}`	Enter one or more of the options and separate them with a space. Do not enter the braces or brackets.

Chapter 3: Start-up Sequence

AlliedWare Plus Start-up 3.2
Diagnostic Menu 3.3
Bootloader Menu 3.5
Start-up Sequence 3.9

AlliedWare Plus Start-up

Every switch has a start-up process. A specified version of product software must be loaded and executed. The bootloader is the executable code responsible for setting up the system and loading the release software.

The bootloader is the software that runs the unit when it first powers up, performing basic initialization and executing the product software release. As part of the start-up process of the switch, the bootloader allows you various options before running the product release software.

Previous versions of AlliedWare provide the option to boot to EPROM if a software release cannot be loaded, is unlicensed, or if selected by the user. The EPROM provides enough basic functionality to get a working software release loaded and operational on the switch. In AlliedWare Plus™ this task is handled by the bootloader.

As AlliedWare Plus™ begins its start-up process; there are two options that allow you to access either the diagnostic menu, or the bootloader menu. The following prompt is displayed when these options are temporarily available:

```
Bootloader 1.0.9 loaded
Press <Ctrl+B> for the Boot Menu
```

You can now enter one of the following two options to determine how the start-up process proceeds:

- Enter Ctrl+D to display the diagnostic menu.
- Enter Ctrl+B to display the bootloader menu.

Diagnostic Menu

Enter Ctrl+D during start-up to access the bootloader diagnostic menu, and provide options for performing various hardware tests. This can be useful as a tool for confirming a suspected hardware problem at the direction of network engineering personnel. When you enter Ctrl+D, the stage 1 diagnostics menu is displayed:

```
Bootup Stage 1 Diagnostics Menu:
  0. Restart
  1. Full RAM test
  2. Quick RAM test
  3. Battery backed RAM (NVS) test
  4. Bootloader ROM checksum test
  ---------------------------------
  7. Bootup stage 2 diagnostics menu
  ---------------------------------
  8. Quit to U-Boot shell
  9. Quit and continue booting
Enter selection ==>
```

The options in the stage 1 diagnostics menu allow you to initiate the following tests:

- RAM
  The Bootloader fully tests any/all SDRAM installed in the system.
- NVS
  The Bootloader fully tests any/all non-volatile (battery backed) SRAM installed in the system.
- checksum
  The Bootloader checksum ROM memory for error detection.

For example, enter “2” to select a Quick RAM test:

```
Quick RAM test - press Q to quit, S to skip when failing
Writing pattern  ..............................
Checking pattern ..............................
Writing complemented pattern ..................
Checking complemented pattern ..................
Pass 1  total errors 0
```

Enter “7” to display the stage 2 diagnostics menu:

```
Entering stage 2...
Bootup Stage 2 Diagnostics Menu:
  0. Restart
  2. Test FLASH (Filesystem only)
  4. Erase FLASH (Filesystem only)
  5. Card slot test
  ---------------------------------
  8. Quit to U-Boot shell
  9. Quit and continue booting
```

The options in the stage 2 diagnostics menu allow you to initiate the following tests:

- Flash
  The Bootloader tests the user file system area of Flash. The bootloader is stored in a protected area of Flash that is not accessed by the user file system.
- Flash Erase
  The Bootloader erases the user file system area of Flash only.
- SD (and SDHC) Card slot
  The Bootloader tests the Card slot.

Once any required tests are completed from the diagnostics menu, enter “9” to quit the diagnostic menu and continue the switch boot-up process.

Bootloader Menu

Enter Ctrl+B during start-up to access the bootloader menu where boot options can be set. The boot options shown are explained in detail under this example.

```
Boot Menu:

  ------------------------------------------------------
  B. Boot backup software
  ------------------------------------------------------
  0. Restart
  1. Perform one-off boot from alternate source
  2. Change the default boot source (for advanced users)
  3. Update Bootloader
  4. Adjust the console baud rate
  5. Special boot options
  6. System information
  7. Restore Bootloader factory settings
  ------------------------------------------------------
  9. Quit and continue booting
```

Boot options

A powerful feature of AlliedWare Plus™ is the ability to boot from a variety of sources. Previously the switch was constrained to just booting off the release loaded into Flash memory. The only software release upgrade path being to load a new release into Flash memory and then set this release to be loaded at the next restart.

With AlliedWare Plus™ the switch can boot from other sources, such as an SD card or network server. This provides a very flexible system, with multiple options to upgrade software releases and for system recovery.

Details of the bootloader menu options are as follows:

1. Perform one-off boot from alternate source

Enter "1" to provide the following one-off boot options:

```
Enter selection ==> 1

Select device:

  0. Return to previous menu
  ------------------------------------------------------
  1. Flash   (flash:)
  2. SD Card (card:)
  3. TFTP    (tftp://)
  4. YMODEM  (ymodem:)

Enter selection ==>
```

You can select a one-off boot from Flash, SD (or SDHC) card, network server (TFTP), or ymodem. The selected option will be used for the next restart (only) of the switch. If you select to boot from the network, the bootloader prompts the user for the required network address details.

Note

These settings are specific to the Bootloader.
They are not related in any way to what may be configured by the main software release.

```
  Enter IP version [4|6]......... [4]:
  Enter IP address for eth0 ..... [0.0.0.0]: 172.28.8.210
  Enter subnet mask ............. [0.0.0.0]: 255.255.0.0
  Enter gateway IP .............. [0.0.0.0]: 172.28.0.1
  Enter TFTP server IP .......... [0.0.0.0]: 172.30.1.242
  Enter filename ................ []: x900-5.4.4-0.4.rel
Loading tftp://172.30.1.242/x900-5.4.4-0.4.rel...
```

When the switch is booted up using the 'one-off' selected source for the software release, it provides the option to copy the release just used to Flash for further/ permanent use:

```
login: manager
Password: ******
The system has been booted using the one off boot/recovery
mechanism.
Bootup has successfully completed.
Write this release to flash? (y/n):
```

2. Change the default boot source (for advanced users)

Entering "2" provides the option to set the boot source permanently.

```
NOTE: These settings are specific to the Bootloader.
  They are not related in any way to what may be configured
  by the 'boot system' command in the main software release.
Select device:

  0. Return to previous menu
  ------------------------------------------------------
  1. Flash   (flash:)
  2. SD Card (card:)
  3. TFTP    (tftp://)
  4. YMODEM  (ymodem:)
  ------------------------------------------------------
  9. Boot from default (determined by main CLI)

Enter selection ==>
```

The same four boot source options are provided as with the one-off selection, but this time every restart of the switch will result in the unit booting from the selected source.

3. Update Bootloader

This option allows for the bootloader code to be updated. It is not detailed here, as it is envisioned that this would rarely need to be done, and only at the request of (and with support from) Allied Telesis engineering.

4. Adjust the console baud rate

The baud rate of the console session is set here to match the terminal program being used for management of the switch when connected directly to the asynchronous port. The switches default value is 9600. The baud rate selected can be set as the 'new' default for future use if preferred.

```
Select baud rate:

  0. Return to previous menu
  ------------------------------------------------------
  1. 9600
  2. 19200
  3. 38400
  4. 57600
  5. 115200
  6. 230400 (Setting can't be made permanent)
  7. 460800 (Setting can't be made permanent)

Enter selection ==>  1

Change your terminal program baud rate to 9600 and press
enter...  if for some reason you are unable to do this,
power cycle the device and the existing baud rate will be
restored.
Use this baud rate by default? (Y/N) ==> n
```

5. Special boot options

The special boot options allow for system recovery in the event of a forgotten password or to the default configuration.

```
Special boot options menu:

  0. Return to previous menu
  ------------------------------------------------------
  1. Skip startup script (Use system defaults)

Enter selection ==>
```

6. System information

The system information option provides some details on the hardware platform in use, such as CPU, memory, hardware (MAC) address and so on.

```
System information:

  System (Detected values)
  -----------------------------------------------------
  CPU:
    Type ..............: MPC8541E
    Speed .............: 666 MHz
  Memory:
    Total installed ....: 512 MB
    Speed .............: 133 MHz
  Flash:
    Total installed ....: 32 MB
  -----------------------------------------------------

  Product information
  -----------------------------------------------------
  Compatible software ..: 1 (r1)
  Serial ..............: 45AX5300X
  Manufacture date .....: 03/2005
  Product ..............: 280
  Product name .........: x900-24XT-N
  Revision .............: A
  First MAC address ....: 00:00:CD:23:55:C8
  -----------------------------------------------------

  Boot software information
  -----------------------------------------------------
  Version ..............: 1.0.9
  Build time ...........: Aug  3 2007 - 09:07:12
  Built by .............: matthewm
  Build host ...........: matthewm-dl
  Build key ............: at9924ts
  Compatible products:
    255 ................: AT-9924Ts
    256 ................: AT-9924SPs
    270 ................: x900-24XT
    271 ................: x900-24XS
    280 ................: x900-24XT-N
    287 ................: x900-12XT/S
  -----------------------------------------------------

Press any key to continue...
```

7. Restore Bootloader factory settings

This option allows the bootloader to be set back to factory defaults.

Caution

This option erases any settings that may have been configured by this menu
Are you sure? (Y/N) ==>

The bootloader menu provides a powerful set of options for flexibility in the way software releases are upgraded on the switch, and system recovery is performed.

Start-up Sequence

The start-up sequence for a device running AlliedWare Plus™ under normal circumstances will be as seen in the following pages - this sequence will be seen when everything loads and runs as expected.

Note

To enter the bootloader or diagnostic menus discussed previously, Ctrl+B or Ctrl+D must be entered when prompted before the software modules start loading.

Password:

AlliedWare Plus (TM) 5.4.3 11/14/12 13:00:27

Bootloader 1.0.9 loaded
Press <Ctrl+B> for the Boot Menu
```

There are three possible status results displayed for each module loaded - OK, INFO, ERROR:

- OK means that the module has loaded correctly.
- INFO means that an error occurred, but the device is usable.
- ERROR means that an error occurred and device operation may be affected.

Additional specific information accompanies an INFO or ERROR status result. For example, if a corrupt release file was set as the startup release, the following error message would be seen:

```
Bootloader 1.0.9 loaded
Press <Ctrl+B> for the Boot Menu
Reading filesystem...
Error: Release filename is invalid (should be <release>.rel)
Error: There is no backup release file set
Error: Boot failed. Please recover the system using the Boot Menu
Restarting...Bootloader 1.0.9 loaded
Press <Ctrl+B> for the Boot Menu
```

Whether an error message results in a case of the device being unusable will depend on the specific error and message, so will need to be dealt with on a case by case basis. If a software release has been corrupted, as shown on start-up, a new release may need to be loaded.

Chapter 4: CLI Navigation Commands

Command List 4.2
configure terminal 4.2
disable (Privileged Exec mode) 4.2
do 4.3
enable (Privileged Exec mode) 4.4
end 4.6
exit 4.6
help 4.7
logout 4.7
show history 4.8

Command List

This chapter provides an alphabetical reference for the commands used to navigate between different modes. This chapter also provides a reference for the help and show commands used to help navigate within the CLI.

configure terminal

This command enters the Global Configuration command mode.

Syntax `configure terminal`

Mode Privileged Exec

Example To enter the Global Configuration command mode (note the change in the command prompt), enter the command:

```
awplus# configure terminal
awplus(config)#
```

disable (Privileged Exec mode)

This command exits the Privileged Exec mode, returning the prompt to the User Exec mode. To end a session, use the **exit** command.

Syntax `disable`

Mode Privileged Exec

Example To exit the Privileged Exec mode, enter the command:

```
awplus# disable
awplus>
```

Related Commands **enable (Privileged Exec mode)**
end
exit

do

This command lets you to run User Exec and Privileged Exec mode commands when you are in a Configuration mode.

Syntax `do <command>`

Parameter	Description
<command>	Specify the command and its parameters.

Mode Any configuration mode

Example To run the ping command from Configuration mode using the “do” command.

```
awplus# configure terminal
awplus(config)# do ping 192.0.2.23
```

enable (Privileged Exec mode)

This command enters the Privileged Exec mode and optionally changes the privilege level for a session. If a privilege level is not specified then the maximum privilege level (15) is applied to the session. If the optional privilege level is omitted then only users with the maximum privilege level can access Privileged Exec mode without providing the password as specified by the **enable password** or **enable secret** commands. If no password is specified then only users with the maximum privilege level set with the **username** command can assess Privileged Exec mode.

Syntax `enable [<privilege-level>]`

Parameter	Description
<privilege-level>	Specify the privilege level for a CLI session in the range <1-15>, where 15 is the maximum privilege level, 7 is the intermediate privilege level and 1 is the minimum privilege level. The privilege level for a user must match or exceed the privilege level set for the CLI session for the user to access Privileged Exec mode. Privilege level for a user is configured by **username**.

Mode User Exec

Usage Many commands are available from the Privileged Exec mode that configure operating parameters for the switch, so you should apply password protection to the Privileged Exec mode to prevent unauthorized use. Passwords can be encrypted but then cannot be recovered. Note that un-encrypted passwords are shown in plain text in configurations.

The **username** command sets the privilege level for the user. After login, users are given access to privilege level 1. Users access higher privilege levels with the **enable (Privileged Exec mode)** command. If the privilege level specified is higher than the users configured privilege level specified by the **username** command, then the user is prompted for the password for that level.

Note that a separate password can be configured for each privilege level using the **enable password** and the **enable secret** commands from the Global Configuration mode. The **service password-encryption** command encrypts passwords configured by the **enable password** and the **enable secret** commands, so passwords are not shown in plain text in configurations.

Example The following example shows the use of the **enable** command to enter the Privileged Exec mode (note the change in the command prompt).

```
awplus> enable

awplus#
```

The following example shows the **enable** command enabling access the Privileged Exec mode for users with a privilege level of 7 or greater. Users with a privilege level of 7 or greater do not need to enter a password to access Privileged Exec mode. Users with a privilege level 6 or less need to enter a password to access Privilege Exec mode. Use the **enable password** command or the **enable secret** commands to set the password to enable access to Privileged Exec mode.

```
awplus> enable 7

awplus#
```

Related Commands

disable (Privileged Exec mode)
enable password
enable secret
exit
service password-encryption
username

end

This command returns the prompt to the Privileged Exec command mode from any other advanced command mode.

Syntax `end`

Mode All advanced command modes, including Global Configuration and Interface Configuration modes.

Example The following example shows the use of the `end` command to return to the Privileged Exec mode directly from Interface mode.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# end
awplus#
```

Related Commands
disable (Privileged Exec mode)
enable (Privileged Exec mode)
exit

exit

This command exits the current mode, and returns the prompt to the mode at the previous level. When used in User Exec mode, the **exit** command terminates the session.

Syntax `exit`

Mode All command modes, including Global Configuration and Interface Configuration modes.

Example The following example shows the use of `exit` command to exit Interface mode, and return to Configure mode.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# exit
awplus(config)#
```

Related Commands
disable (Privileged Exec mode)
enable (Privileged Exec mode)
end

help

This command displays a description of the AlliedWare Plus™ OS help system.

Syntax `help`

Mode All command modes

Example To display a description on how to use the system help, use the command:

```
awplus# help
```

Output **Figure 4-1: Example output from the help command**

```
When you need help at the command line, press '?'.

If nothing matches, the help list will be empty. Delete
characters until entering a '?' shows the available options.

Enter '?' after a complete parameter to show remaining valid
command parameters (e.g. 'show ?').

Enter '?' after part of a parameter to show parameters that
complete the typed letters (e.g. 'show ip?').
```

logout

This command exits the User Exec or Privileged Exec modes and ends the session.

Syntax `logout`

Mode User Exec and Privileged Exec

Example To exit the User Exec mode, use the command:

```
awplus# logout
```

show history

This command lists the commands entered in the current session. The history buffer is cleared automatically upon reboot.

The output lists all command line entries, including commands that returned an error.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show history`

Mode User Exec and Privileged Exec

Example To display the commands entered during the current session, use the command:

```
awplus# show history
```

Output **Figure 4-2: Example output from the show history command**

```
1 en
2 show ru
3 con t
4 route-map er deny 3
5 exit
6 ex
7 di
```

Chapter 5: User Access Commands

Introduction 5.2
Command List 5.2
clear line console 5.2
clear line vty 5.3
enable password 5.4
enable secret 5.7
exec-timeout 5.10
flowcontrol hardware (asyn/console) 5.11
length (asyn) 5.13
line 5.14
privilege level 5.16
security-password history 5.17
security-password forced-change 5.18
security-password lifetime 5.19
security-password minimum-categories 5.20

service terminal-length 5.28
show security-password configuration 5.29
show security-password user 5.30
show privilege 5.31
show telnet 5.32
show users 5.33
telnet 5.34
telnet server 5.35
terminal length 5.36
terminal resize 5.37
username 5.38

Introduction

This chapter provides an alphabetical reference of commands used to configure user access.

Command List

clear line console

This command resets a console line. If a terminal session exists on the line then the terminal session is terminated. If console line settings have changed then the new settings are applied.

Syntax `clear line console 0`

Mode Privileged Exec

Example To reset the console line (asyn), use the command:

```
awplus# clear line console 0

        % The new settings for console line 0 have been
        applied
```

Related Commands
clear line vty
flowcontrol hardware (asyn/console)
line
show users

clear line vty

This command resets a VTY line. If a session exists on the line then it is closed.

Syntax `clear line vty <0-32>`

Parameter	Description
<0-32>	Line number

Mode Privileged Exec

Example To reset the first vty line, use the command:

```
awplus# clear line vty 1
```

Related Commands
privilege level
line
show telnet
show users

enable password

To set a local password to control access to various privilege levels, use the **enable password** Global Configuration command. Use the **enable password** command to modify or create a password to be used, and use the **no enable password** command to remove the password.

Note that the **enable secret** command is an alias for the **enable password** command, and the **no enable secret** command is an alias for the **no enable password** command. Issuing a **no enable password** command removes a password configured with the **enable secret** command. The **enable password** command is shown in the running and startup configurations. Note that if the **enable secret** command is entered then **enable password** is shown in the configuration.

Note Do not use encrypted passwords for GUI users. The GUI requires unencrypted user passwords only - not encrypted user passwords. Do not use option `8` for GUI users.

Syntax

```
enable password [<plain>|8 <hidden>|level <1-15> 8 <hidden>]
no enable password [level <1-15>]
```

Parameter	Description
<plain>	Specifies the unencrypted password.
`8`	Specifies a hidden password will follow.
<hidden>	Specifies the hidden encrypted password. Use an encrypted password for better security where a password crosses the network or is stored on a TFTP server.
`level`	Privilege level <1-15>. Level for which the password applies. You can specify up to 16 privilege levels, using numbers 1 through 15. Level 1 is normal EXEC-mode user privileges for **User Exec** mode. If this argument is not specified in the command or the **no** variant of the command, the privilege level defaults to 15 (enable mode privileges) for **Privileged Exec** mode. A privilege level of 7 can be set for intermediate CLI security.

Default The privilege level for enable password is level 15 by default. Previously the default was level 1.

Mode Global Configuration

Usage This command enables the Network Administrator to set a password for entering the Privileged Exec mode when using the **enable (Privileged Exec mode)** command. There are three methods to enable a password. In the examples below, for each method, note that the configuration is different and the configuration file output is different, but the password string to be used to enter the Privileged Exec mode with the **enable** command is the same (**mypasswd**).

A user can now have an intermediate CLI security level set with this command for privilege level 7 to access all the show commands in Privileged Exec mode and all the commands in User Exec mode, but not any configuration commands in Privileged Exec mode.

Note that the **enable password** command is an alias for the **enable secret** command and one password per privilege level is allowed using these commands. Do not assign one password to a privilege level with **enable password** and another password to a privilege level with **enable secret**. Use **enable password** or **enable secret** commands. Do not use both on the same level.

Using Plain Passwords

The plain password is a clear text string that appears in the configuration file as configured.

```
awplus#  configure terminal
awplus(config)#  enable password mypasswd
awplus(config)#  end
```

This results in the following show output

```
awplus#show run
Current configuration:
hostname awplus
enable password mypasswd
!
interface lo
```

Using Encrypted Passwords

Configure an encrypted password using the **service password-encryption** command. First, use the enable password command to specify the string that you want to use as a password (**mypasswd**). Then, use the **service password-encryption** command to encrypt the specified string (**mypasswd**). The advantage of using an encrypted password is that the configuration file does not show **mypasswd**, it will only show the encrypted string **fU7zHzuutY2SA.**

Note Do not use encrypted passwords for GUI users. The GUI requires unencrypted user passwords only - not encrypted user passwords. Do not use option `8` for GUI users.

```
awplus#  configure terminal
awplus(config)#  enable password mypasswd
awplus(config)#  service password-encryption
awplus(config)#  end
```

This results in the following show output.

```
awplus#show run
Current configuration:
hostname awplus
enable password 8 fU7zHzuutY2SA
service password-encryption
!
interface lo
```

Using Hidden Passwords

Configure an encrypted password using the **HIDDEN** parameter (**8**) with the **enable password** command. Use this method if you already know the encrypted string corresponding to the plain text string that you want to use as a password. It is not required to use the **service password-encryption** command for this method. The output in the configuration file will show only the encrypted string, and not the text string

```
awplus#  configure terminal
awplus(config)#  enable password 8 fU7zHzuutY2SA
awplus(config)#  end
```

This results in the following show output.

```
awplus#show run
Current configuration:
hostname awplus
enable password 8 fU7zHzuutY2SA
!
interface lo
```

Related Commands

enable (Privileged Exec mode)
enable secret
service password-encryption
privilege level
show privilege
username
show running-config

enable secret

To set a local password to control access to various privilege levels, use the **enable secret** Global Configuration command. Use the **enable secret** command to modify or create a password to be used, and use the **no enable secret** command to remove the password.

Note that the **enable secret** command is an alias for the **enable password** command, and the **no enable secret** command is an alias for the **no enable password** command. Issuing a **no enable password** command removes a password configured with the **enable secret** command. The **enable password** command is shown in the running and startup configurations. Note that if the **enable secret** command is entered then **enable password** is shown in the configuration.

Note Do not use encrypted passwords for GUI users. The GUI requires unencrypted user passwords only - not encrypted user passwords. Do not use option `8` for GUI users.

Syntax

```
enable secret [<plain>|8 <hidden>|level <0-15> 8 <hidden>]
no enable secret [level <1-15>]
```

Parameter	Description
`<plain>`	Specifies the unencrypted password.
`8`	Specifies a hidden password will follow.
`<hidden>`	Specifies the hidden encrypted password. Use an encrypted password for better security where a password crosses the network or is stored on a TFTP server.
`level`	Privilege level <1-15>. Level for which the password applies. You can specify up to 16 privilege levels, using numbers 1 through 15. Level 1 is normal EXEC-mode user privileges for **User Exec** mode. If this argument is not specified in the command or the **no** variant of the command, the privilege level defaults to 15 (enable mode privileges) for **Privileged Exec** mode. A privilege level of 7 can be set for intermediate CLI security.

Default The privilege level for enable secret is level 15 by default.

Mode Global Configuration

Usage This command enables the Network Administrator to set a password for entering the Privileged Exec mode when using the **enable (Privileged Exec mode)** command. There are three methods to enable a password. In the examples below, for each method, note that the configuration is different and the configuration file output is different, but the password string to be used to enter the Privileged Exec mode with the **enable** command is the same (**mypasswd**).

A user can have an intermediate CLI security level set with this command for privilege level 7 to access all the show commands in Privileged Exec mode and all the commands in User Exec mode, but not any configuration commands in Privileged Exec mode.

Note that the **enable secret** command is an alias for the **enable password** command and one password per privilege level is allowed using these commands. Do not assign one password to a privilege level with **enable password** and another password to a privilege level with **enable secret**. Use **enable password** or **enable secret** commands. Do not use both on the same level.

Using Plain Passwords

The plain password is a clear text string that appears in the configuration file as configured.

```
        awplus#  configure terminal
awplus(config)#  enable secret mypasswd
awplus(config)#  end
```

This results in the following show output

```
awplus#show run
Current configuration:
hostname awplus
enable password mypasswd
!
interface lo
```

Using Encrypted Passwords

Configure an encrypted password using the **service password-encryption** command. First, use the enable password command to specify the string that you want to use as a password (**mypasswd**). Then, use the **service password-encryption** command to encrypt the specified string (**mypasswd**). The advantage of using an encrypted password is that the configuration file does not show **mypasswd**, it will only show the encrypted string **fU7zHzuutY2SA.**

Note Do not use encrypted passwords for GUI users. The GUI requires unencrypted user passwords only - not encrypted user passwords. Do not use option `8` for GUI users.

```
        awplus# configure terminal
awplus(config)# enable secret mypasswd
awplus(config)# service password-encryption
awplus(config)# end
```

This results in the following show output:

```
awplus#show run
Current configuration:
hostname awplus
enable password 8 fU7zHzuutY2SA
service password-encryption
!
interface lo
```

Using Hidden Passwords

Configure an encrypted password using the **HIDDEN** parameter (**8**) with the **enable password** command. Use this method if you already know the encrypted string corresponding to the plain text string that you want to use as a password. It is not required to use the **service password-encryption** command for this method. The output in the configuration file will show only the encrypted string, and not the text string:

```
awplus#  configure terminal
awplus(config)#  enable secret 8 fU7zHzuutY2SA
awplus(config)#  end
```

This results in the following show output.

```
awplus#show run
Current configuration:
hostname awplus
enable password 8 fU7zHzuutY2SA
!
interface lo
```

exec-timeout

This command sets the interval your device waits for user input from either a console or VTY connection. Once the timeout interval is reached, the connection is dropped. This command sets the time limit when the console or VTY connection automatically logs off after no activity.

The **no** variant of this command removes a specified timeout and resets to the default timeout (10 minutes).

Syntax

```
exec-timeout {<minutes>} [<seconds>]
no exec-timeout
```

Parameter	Description
<minutes>	<0-35791> Required integer timeout value in minutes
<seconds>	<0-2147483> Optional integer timeout value in seconds

Default The default for the **exec-timeout** command is 10 minutes and 0 seconds (**exec-timeout 10 0**)

Mode Line Configuration

Usage This command is used set the time the telnet session waits for an idle VTY session, before it times out. An **exec-timeout 0 0** setting will cause the telnet session to wait indefinitely. The command **exec-timeout 0 0** is useful while configuring a device, but reduces device security.

If no input is detected during the interval then the current connection resumes. If no connections exist then the terminal returns to an idle state and disconnects incoming sessions.

Examples To set VTY connections to timeout after 2 minutes, 30 seconds if there is no response from the user, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 32
awplus(config-line)# exec-timeout 2 30
```

To reset the console connection to the default timeout of 10 minutes 0 seconds if there is no response from the user, use the following commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# no exec-timeout
```

Validation Commands **show running-config**

Related Commands **line**
service telnet

flowcontrol hardware (asyn/console)

Use this command to enable RTS/CTS (Ready To Send/Clear To Send) hardware flow control on a terminal console line (asyn port) between the DTE (Data Terminal Equipment) and the DCE (Data Communications Equipment).

Syntax

```
flowcontrol hardware

no flowcontrol hardware
```

Mode Line Configuration

Default Hardware flow control is disabled by default.

Usage Hardware flow control makes use of the RTS and CTS control signals between the DTE and DCE where the rate of transmitted data is faster than the rate of received data. Flow control is a technique for ensuring that a transmitting entity does not overwhelm a receiving entity with data. When the buffers on the receiving device are full, a message is sent to the sending device to suspend the transmission until the data in the buffers has been processed.

Hardware flow control can be configured on terminal console lines (e.g. asyn0). For Reverse Telnet connections, hardware flow control must be configured to match on both the Access Server and the Remote Device. For terminal console sessions, hardware flow control must be configured to match on both the DTE and the DCE. Settings are saved in the running configuration. Changes are applied after reboot, clear line console, or after closing the session.

Use **show running-config** and **show startup-config** commands to view hardware flow control settings that take effect after reboot for a terminal console line. See the **show running-config** command output:

```
awplus#show running-config
!
line con 1
  speed 9600
  mode out 2001
  flowcontrol hardware
!
```

Note that line configuration commands do not take effect immediately. Line configuration commands take effect after one of the following commands or events:

- issuing a **clear line console** command
- issuing a **reboot** command
- logging out of the current session

Examples To enable hardware flow control on terminal console line asyn0, use the commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# flowcontrol hardware
```

To disable hardware flow control on terminal console line asyn0, use the commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# no flowcontrol hardware
```

Related Commands

clear line console
show running-config
speed (asyn)

length (asyn)

Use this command to specify the number of rows of output that the device will display before pausing, for the console or VTY line that you are configuring.

The **no** variant of this command restores the length of a line (terminal session) attached to a console port or to a VTY to its default length of 22 rows.

Syntax

```
length <0-512>
no length
```

Parameter	Description
<0-512>	Number of lines on screen. Specify 0 for no pausing.

Mode Line Configuration

Default The length of a terminal session is 22 rows. The **no length** command restores the default.

Usage If the output from a command is longer than the length of the line the output will be paused and the '–More–' prompt allows you to move to the next screen full of data.

A length of 0 will turn off pausing and data will be displayed to the console as long as there is data to display.

Examples To set the terminal session length on the console to 10 rows, use the command:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# length 10
```

To reset the terminal session length on the console to the default (22 rows), use the command:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# no length
```

To display output to the console continuously, use the command:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# length 0
```

Related Commands
service terminal-length
terminal length
terminal resize

line

Use this command to enter line configuration mode for the specified VTYs or the console. The command prompt changes to show that the switch is in Line Configuration mode.

Syntax

```
line vty <first-line> [<last-line>]
line console 0
```

Parameter	Description
<first-line>	<0-32> Specify the first line number.
<last-line>	<0-32> Specify the last line number.
console	The console terminal line(s) for local access.
vty	Virtual terminal for remote console access.

Mode Global Configuration

Usage In Line Configuration mode, you can configure console and virtual terminal settings, including setting **speed (asyn)**, **length (asyn)**, **privilege level**, and authentication (**login authentication**) or accounting (**accounting login**) method lists.

To change the console (asyn) port speed, use this **line** command to enter Line Configuration mode before using the **speed (asyn)** command on page 10.75. Set the console speed (Baud rate) to match the transmission rate of the device connected to the console (asyn) port on your switch.

Note that line configuration commands do not take effect immediately. Line configuration commands take effect after one of the following commands or events:

- issuing a **clear line console** command
- issuing a **reboot** command
- logging out of the current session

Examples To enter Line Configuration mode in order to configure all VTYs, use the commands:

```
awplus# configure terminal
awplus(config)# line vty 0 32
awplus(config-line)#
```

To enter Line Configuration mode to configure the console (asyn 0) port terminal line, use the commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)#
```

Related Commands

privilege level

This command sets a privilege level for VTY or console connections. The configured privilege level from this command overrides a specific user's initial privilege level at the console login.

Syntax `privilege level <1-15>`

Mode Line Configuration

Usage You can set an intermediate CLI security level for a console user with this command by applying privilege level 7 to access all show commands in Privileged Exec and all User Exec commands. However, intermediate CLI security will not show configuration commands in Privileged Exec.

Examples To set the console connection to have the maximum privilege level, use the following commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# privilege level 15
```

To set all vty connections to have the minimum privilege level, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 5
awplus(config-line)# privilege level 1
```

To set all vty connections to have an intermediate CLI security level, to access all show commands, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 5
awplus(config-line)# privilege level 7
```

Related Commands **enable password**
line
show privilege
username

security-password history

This command specifies the number of previous passwords that are unable to be reused. A new password is invalid if it matches a password retained in the password history.

The **no security-password history** command disables the security password history functionality.

Syntax

```
security-password history <0-15>

no security-password history
```

Parameter	Description
<0-15>	The allowable range of previous passwords to match against. A value of *0* will disable the history functionality and is equivalent to the **no security-password history** command. If the history functionality is disabled, all users' password history is reset and all password history is lost.

Default The default history value is `0`, which will disable the history functionality.

Mode Global Configuration

Examples To restrict reuse of the three most recent passwords, use the command:

```
awplus# configure terminal
awplus(config)# security-password history 3
```

To allow the reuse of recent passwords, use the command:

```
awplus# configure terminal
awplus(config)# no security-password history
```

security-password lifetime
security-password minimum-categories
security-password minimum-length
security-password reject-expired-pwd
security-password warning

security-password forced-change

This command specifies whether or not a user is forced to change an expired password at the next login. If this feature is enabled, users whose passwords have expired are forced to change to a password that must comply with the current password security rules at the next login.

Note that to use this command, the lifetime feature must be enabled with the **security-password lifetime** command and the reject-expired-pwd feature must be disabled with the **security-password reject-expired-pwd** command.

The **no security-password forced-change** command disables the forced-change feature.

Syntax

```
security-password forced-change
no security-password forced-change
```

Default The forced-change feature is disabled by default.

Mode Global Configuration

Example To force a user to change their expired password at the next login, use the command:

```
awplus# configure terminal
awplus(config)# security-password forced-change
```

Validation Commands
show running-config security-password
show security-password configuration

Related Commands
security-password history
security-password lifetime
security-password minimum-categories
security-password minimum-length
security-password reject-expired-pwd
security-password warning

security-password lifetime

This command enables password expiry by specifying a password lifetime in days.

Note that when the password lifetime feature is disabled, it also disables the **security-password forced-change** command and the **security-password warning** command.

The **no security-password lifetime** command disables the password lifetime feature.

Syntax

```
security-password lifetime <0-1000>
no security-password lifetime
```

Parameter	Description
<0-1000>	Password lifetime specified in days. A value of *0* will disable lifetime functionality and the password will never expire. This is equivalent to the **no security-password lifetime** command.

Default The default password lifetime is `0`, which will disable the lifetime functionality.

Mode Global Configuration

Example To configure the password lifetime to 10 days, use the command:

```
awplus# configure terminal
awplus(config)# security-password lifetime 10
```

Validation Commands
show running-config security-password
show security-password configuration

Related Commands
security-password history
security-password forced-change
security-password minimum-categories
security-password minimum-length
security-password reject-expired-pwd
security-password warning
show security-password user

security-password minimum-categories

This command specifies the minimum number of categories that the password must contain in order to be considered valid. The password categories are:

- uppercase letters: A to Z
- lowercase letters: a to z
- digits: 0 to 9
- special symbols: all printable ASCII characters not included in the previous three categories. The question mark ? cannot be used as it is reserved for help functionality.

Note that to ensure password security, the minimum number of categories should align with the lifetime selected, i.e. the fewer categories specified the shorter the lifetime specified.

Syntax

```
security-password minimum-categories <1-4>
```

Parameter	Description
<1-4>	Number of categories the password must satisfy, in the range *1* to *4*.

Default The default number of categories that the password must satisfy is `1`.

Mode Global Configuration

Example To configure the required minimum number of character categories to be *3*, use the command:

```
awplus# configure terminal
awplus(config)# security-password minimum-categories 3
```

Validation Commands
show running-config security-password
show security-password configuration

Related Commands
security-password history
security-password forced-change
security-password lifetime
security-password minimum-length
security-password reject-expired-pwd
security-password warning
username

security-password minimum-length

This command specifies the minimum allowable password length. This value is checked against when there is a password change or a user account is created.

Syntax `security-password minimum-length <1-23>`

Parameter	Description
<1-23>	Minimum password length in the range from 1 to 23.

Default The default minimum password length is `1`.

Mode Global Configuration

Example To configure the required minimum password length as `8`, use the command:

```
awplus# configure terminal
awplus(config)# security-password minimum-length 8
```

Validation Commands
show running-config security-password
show security-password configuration

Related Commands
security-password history
security-password forced-change
security-password lifetime
security-password minimum-categories
security-password reject-expired-pwd
security-password warning
username

security-password reject-expired-pwd

This command specifies whether or not a user is allowed to login with an expired password. Users with expired passwords are rejected at login if this functionality is enabled. Users then have to contact the Network Administrator to change their password.

Caution

Once all users' passwords are expired you are unable to login to the device again if the security-password reject-expired-pwd command has been executed. You will have to reboot the device with a default configuration file, or load an earlier software version that does not have the security password feature.
We recommend you never have the command line "security-password reject-expired-pwd" in a default config file.

Note that when the reject-expired-pwd functionality is disabled and a user logs on with an expired password, if the forced-change feature is enabled with **security-password forced-change** command, a user may have to change the password during login depending on the password lifetime specified by the **security-password lifetime** command.

The **no security-password reject-expired-pwd** command disables the reject-expired-pwd feature.

Syntax

```
security-password reject-expired-pwd
no security-password reject-expired-pwd
```

Default The reject-expired-pwd feature is disabled by default.

Mode Global Configuration

Example To configure the system to reject users with an expired password, use the command:

```
awplus# configure terminal
awplus(config)# security-password reject-expired-pwd
```

Validation Commands
show running-config security-password
show security-password configuration

Related Commands

security-password forced-change
security-password lifetime
security-password minimum-categories
security-password minimum-length
security-password warning
show security-password user

security-password warning

This command specifies the number of days before the password expires that the user will receive a warning message specifying the remaining lifetime of the password.

Note that the warning period cannot be set unless the lifetime feature is enabled with the **security-password lifetime** command.

The **no security-password warning** command disables this feature.

Syntax

```
security-password warning <0-1000>
no security-password warning
```

Parameter	Description
<0-1000>	Warning period in the range from *0* to *1000* days. A value *0* disables the warning functionality and no warning message is displayed for expiring passwords. This is equivalent to the **no security-password warning** command. The warning period must be less than, or equal to, the password lifetime set with the **security-password lifetime** command.

Default The default warning period is 0, which disables warning functionality.

Mode Global Configuration

Example To configure a warning period of three days, use the command:

```
awplus# configure terminal
awplus(config)# security-password warning 3
```

Validation Commands
show running-config security-password
show security-password configuration

Related Commands

service advanced-vty

This command enables the advanced-vty help feature. This allows you to use TAB completion for commands. Where multiple options are possible, the help feature displays the possible options.

The **no service advanced-vty** command disables the advanced-vty help feature.

Syntax

```
service advanced-vty
no service advanced-vty
```

Default The advanced-vty help feature is enabled by default.

Mode Global Configuration

Examples To disable the advanced-vty help feature, use the command:

```
awplus# configure terminal
awplus(config)# no service advanced-vty
```

To re-enable the advanced-vty help feature after it has been disabled, use the following commands:

```
awplus# configure terminal
awplus(config)# service advanced-vty
```

service http

This command enables the HTTP (Hypertext Transfer Protocol) service. The HTTP service is enabled by default and is required to support the AlliedWare Plus™ GUI Java applet on a Java enabled browser. See **Appendix C: GUI Reference** for further information about installing and using the AlliedWare Plus™ GUI.

The **no service http** command disables the HTTP feature.

Syntax

```
service http
no service http
```

Default The HTTP service is enabled by default.

Mode Global Configuration

Examples To disable the HTTP service, use the command:

```
awplus# configure terminal
awplus(config)# no service http
```

To re-enable the HTTP service after it has been disabled, use the following commands:

```
awplus# configure terminal
awplus(config)# service http
```

service password-encryption

Use this command to enable password encryption. This is enabled by default. When password encryption is enabled, the device displays passwords in the running config in encrypted form instead of in plain text.

Use the **no service password-encryption** command to stop the device from displaying newly-entered passwords in encrypted form. This does not change the display of existing passwords.

Note Do not use encrypted passwords for GUI users. The GUI requires unencrypted user passwords only - not encrypted user passwords. Do not use option `8` for GUI users.

Syntax

```
service password-encryption
no service password-encryption
```

Mode Global Configuration

Example To enable password encryption, use the following commands.

```
awplus# configure terminal
awplus(config)# service password-encryption
```

Validation Commands **show running-config**

Related Commands **enable password**

service telnet

Use this command to enable the telnet server. The server is enabled by default. Enabling the telnet server starts the switch listening for incoming telnet sessions on the configured port.

The server listens on port 23, unless you have changed the port by using the **privilege level** command on page 5.16.

Use the **no** variant of this command to disable the telnet server. Disabling the telnet server will stop the switch listening for new incoming telnet sessions. However, existing telnet sessions will still be active.

Syntax

```
service telnet [ip|ipv6]
no service telnet [ip|ipv6]
```

Default The IPv4 and IPv6 telnet servers are enabled by default.

The configured telnet port is TCP port 23 by default.

Mode Global Configuration

Examples To enable both the IPv4 and IPv6 telnet servers, use the following commands:

```
awplus# configure terminal
awplus(config)# service telnet
```

To enable the IPv6 telnet server only, use the following commands:

```
awplus# configure terminal
awplus(config)# service telnet ipv6
```

To disable both the IPv4 and IPv6 telnet servers, use the following commands:

```
awplus# configure terminal
awplus(config)# no service telnet
```

To disable the IPv6 telnet server only, use the following commands:

```
awplus# configure terminal
awplus(config)# no service telnet ipv6
```

Related Commands

clear line vty
show telnet
telnet server

service terminal-length

Use this command to specify the number of rows of output that the device will display before pausing, for all console and VTY lines.

Use the **no** variant of this command to remove the length specified by this command. The default length will apply unless you have changed the length for some or all lines by using the **length (asyn)** command on page 5.13.

Syntax

```
service terminal-length <lines>
no service terminal-length <lines>
```

Parameter	Description
`terminal-length`	Establish system-wide terminal length configuration.
`<lines>`	`<0-512>` Number of rows that the device will display before pausing.

Mode Global Configuration

Usage This command overrides any lengths set by using the **length (asyn)** command on page 5.13 in Line mode.

Example To display 60 rows of text before pausing, use the following command:

```
awplus# configure terminal
awplus(config)# service terminal-length 60
```

Related Commands

service terminal-length
terminal length
terminal resize

show security-password configuration

This command displays the configuration settings for the various security password rules.

Syntax `show security-password configuration`

Mode Privileged Exec

Example To display the current security-password rule configuration settings, use the command:

```
awplus# show security-password configuration
```

Output **Figure 5-1: Example output from the show security-password configuration command**

```
Security Password Configuration
Minimum password length ............................ 8
Minimum password character categories to match ..... 3
Number of previously used passwords to restrict..... 4
Password lifetime .................................. 30 day(s)
  Warning period before password expires ........... 3 day(s)
Reject expired password at login ................... Disabled
  Force changing expired password at login ......... Enabled
```

Related Commands **show running-config security-password**
show security-password user

show security-password user

This command displays user account and password information for all users.

Syntax `show security-password user`

Mode Privileged Exec

Example To display the system users' remaining lifetime or last password change, use the command:

```
awplus# show security-password user
```

Output **Figure 5-2: Example output from the show security-password user command**

```
User account and password information

UserName          Privilege Last-PWD-Change   Remaining-lifetime
------------------------------------------------------------------------------
manager           15          4625 day(s) ago   No Expiry
bob15             15             0 day(s) ago   30 days
ted7              7              0 day(s) ago   No Expiry
mike1             1              0 day(s) ago   No Expiry
```

Related Commands **show running-config security-password**
show security-password configuration

show privilege

This command displays the current user privilege level, which can be any privilege level in the range <1-15>. Privilege levels <1-6> allow limited user access (all User Exec commands), privilege levels <7-14> allow restricted user access (all User Exec commands plus Privileged Exec show commands). Privilege level 15 gives full user access to all Privileged Exec commands.

Syntax `show privilege`

Mode User Exec and Privileged Exec

Usage A user can have an intermediate CLI security level set with this command for privilege levels <7-14> to access all show commands in Privileged Exec mode and all commands in User Exec mode, but no configuration commands in Privileged Exec mode.

Example To show the current privilege level of the user, use the command:

```
awplus# show privilege
```

Output **Figure 5-3: Example output from the show privilege command**

```
awplus#show privilege
Current privilege level is 15
awplus#disable
awplus>show privilege
Current privilege level is 1
```

Related Commands privilege level

show telnet

This command shows the Telnet server settings.

Syntax `show telnet`

Mode User Exec and Privileged Exec

Example To show the Telnet server settings, use the command:

```
awplus# show telnet
```

Output **Figure 5-4: Example output from the show telnet command**

```
Telnet Server Configuration
-------------------------------------------------------------
Telnet server                : Enabled
Protocol                     : IPv4,IPv6
Port                         : 23
```

Related Commands
clear line vty
service telnet
show users
telnet server

show users

This command shows information about the users who are currently logged into the device.

Syntax `show users`

Mode User Exec and Privileged Exec

Example To show the users currently connected to the device, use the command:

```
awplus# show users
```

Output **Figure 5-5: Example output from the show users command**

```
Line    User            Host(s)  Idle      Location        Priv Idletime Timeout
con 0   manager         idle     00:00:00  ttyS0           15   10       N/A
vty 0   bob             idle     00:00:03  172.16.11.3     1    0        5
```

Table 5-1: Parameters in the output of the show users command

Parameter	Description
`Line`	Console port user is connected to.
`User`	Login name of user.
`Host(s)`	Status of the host the user is connected to.
`Idle`	How long the host has been idle.
`Location`	URL location of user.
`Priv`	The privilege level in the range 1 to 15, with 15 being the highest.
`Idletime`	The time interval the device waits for user input from either a console or VTY connection.
`Timeout`	The time interval before a server is considered unreachable.

telnet

Use this command to open a telnet session to a remote device.

Syntax

```
telnet {<hostname>|[ip] <ipv4-addr>|[ipv6] <ipv6-addr>} [<port>]
```

Syntax (VRF Lite)

```
telnet [vrf <vrf-name>] {<hostname>|[ip] <ipv4-addr>|
   [ipv6] <ipv6-addr>} [<port>]
```

Parameter	Description
`vrf`	Apply this command to a VRF instance.
<vrf-name>	The name of the VRF instance.
<hostname>	The host name of the remote system.
`ip`	Keyword used to specify the IPv4 address or host name of a remote system.
<ipv4-addr>	An IPv4 address of the remote system.
`ipv6`	Keyword used to specify the IPv6 address of a remote system
<ipv6-addr>	Placeholder for an IPv6 address in the format `x:x::x:x`, for example, `2001:db8::8a2e:7334`
<port>	Specify a TCP port number (well known ports are in the range 1-1023, registered ports are 1024-49151, and private ports are 49152-65535).

Mode User Exec and Privileged Exec

Examples To connect to TCP port `2602` on the device at `10.2.2.2`, use the command:

```
awplus# telnet 10.2.2.2 2602
```

To connect to the telnet server `host.example`, use the command:

```
awplus# telnet host.example
```

To connect to the telnet server `host.example` on TCP port `100`, use the command:

```
awplus# telnet host.example 100
```

Example (VRF Lite) To open a telnet session to a remote host `192.168.0.1` associated with VRF instance `red`, use the command:

```
awplus# telnet vrf red ip 192.168.0.1
```

telnet server

This command enables the telnet server on the specified TCP port. If the server is already enabled then it will be restarted on the new port. Changing the port number does not affect the port used by existing sessions.

Syntax `telnet server {<1-65535>|default}`

Parameter	Description
<1-65535>	The TCP port to listen on.
`default`	Use the default TCP port number 23.

Mode Global Configuration

Example To enable the telnet server on TCP port 2323, use the following commands:

```
awplus# configure terminal
awplus(config)# telnet server 2323
```

Related Commands show telnet

terminal length

Use the **terminal length** command to specify the number of rows of output that the device will display before pausing, for the currently-active terminal only.

Use the **terminal no length** command to remove the length specified by this command. The default length will apply unless you have changed the length for some or all lines by using the **length (asyn)** command on page 5.13.

Syntax

```
terminal length <length>
terminal no length [<length>]
```

Parameter	Description
<length>	<0-512> Number of rows that the device will display on the currently-active terminal before pausing.

Mode User Exec and Privileged Exec

Examples The following example sets the number of lines to 15.

```
awplus# terminal length 15
```

The following example removes terminal length set previously.

```
awplus# terminal no length
```

Related Commands

length (asyn)
service terminal-length
terminal resize

terminal resize

Use this command to automatically adjust the number of rows of output on the console, which the device will display before pausing, to the number of rows configured on the user's terminal.

Syntax `terminal resize`

Mode User Exec and Privileged Exec

Usage When the user's terminal size is changed, then a remote session via SSH or TELNET adjusts the terminal size automatically. However, this cannot normally be done automatically for a serial or console port. This command automatically adjusts the terminal size for a serial or console port.

Examples The following example automatically adjusts the number of rows shown on the console:

```
awplus# terminal resize
```

Related Commands **length (asyn)**
service terminal-length
terminal length

username

This command creates or modifies a user to assign a privilege level and a password.

Note

The default username privilege level of 1 is not shown in running-config output. Any username privilege level that has been modified from the default is shown.

Syntax

```
username <name> privilege <0-15> [password [8] <password>]
username <name> password [8] <password>
no username <name>
```

Parameter	Description	
<name>	The login name for the user. Do not use punctuation marks such as single quotes (‘ ‘), double quotes (“ “), or colons (:) with the user login name.	
`privilege`	The user’s privilege level. Use the privilege levels to set the access rights for each user.	
	<0-15>	A privilege level: either 0 (no access), 1-14 (limited access) or 15 (full access). A user with privilege level 1-14 can only access higher privilege levels if an **enable password** has been configured for the level the user tries to access and the user enters that password. A user at privilege level 1 can access the majority of show commands. A user at privilege level 7 can access the majority of show commands including platform show commands. Privilege Level 15 (to access the Privileged Exec command mode) is required to access configuration commands as well as show commands in Privileged Exec.
`password`	A password that the user must enter when logging in.	
	`8`	Specifies that you are entering a password as a string that has already been encrypted, instead of entering a plain-text password. The running-config displays the new password as an encrypted string even if password encryption is turned off. Note that the user enters the plain-text version of the password when logging in.
	<password>	The user’s password. The password can be up to 23 characters in length and include characters from up to four categories. The password categories are: ■ uppercase letters: A to Z ■ lowercase letters: a to z ■ digits: 0 to 9 ■ special symbols: all printable ASCII characters not included in the previous three categories. The question mark ? cannot be used as it is reserved for help functionality.

Mode Global Configuration

Default The privilege level is 1 by default. Note the default is not shown in running-config output.

Usage An intermediate CLI security level (privilege level 7 to privilege level 14) allows a CLI user access to the majority of show commands, including the platform show commands that are available at privilege level 1 to privilege level 6). Note that some show commands, such as show running-configuration and show startup-configuration, are only available at privilege level 15.

A privilege level of 0 can be set for port authentication purposes from a RADIUS server.

Examples To create the user `bob` with a privilege level of `15`, for all show commands including show running-configuration and show startup-configuration and to access configuration commands in Privileged Exec command mode, and the password `bobs_secret`, use the commands:

```
awplus# configure terminal
awplus(config)# username bob privilege 15 password bobs_secret
```

To create a user `junior_admin` with a privilege level of `7`, for intermediate CLI security level access for most show commands, and the password `show_only`, use the commands:

```
awplus# configure terminal
awplus(config)# username junior_admin privilege 7 password
show_only
```

Related Commands

The Autoboot Feature 6.19
- Restoring a switch using Autoboot from external media 6.20
- Configure Autoboot 6.21

Introduction

This chapter provides information on:

- **SD support**
- **Working With Files**
- **Creating and Using Configuration Files**
- **Copying Files To and From Your Device**

SD support

Your switch supports both SD and SDHC cards.

Working With Files

The AlliedWare Plus™ OS lets you create directory trees for file storage. This section shows:

- **"Listing files" on page 6.2**—listing files and seeing how much free space you have
- **"Displaying the contents of configuration and text files" on page 6.4**
- **"Navigating through the filesystem" on page 6.4**—identifying the current directory, changing directories, and creating and deleting directories
- **"Using the editor" on page 6.6**

Flash compaction

The Flash memory on the switch automatically compacts itself to recover space available from deleted files. The switch only does this when necessary, and not every file deletion causes Flash compaction. Flash compaction can occur after a file of any size is added to or deleted from the switch.

Caution While Flash is compacting, the console is unresponsive. Do not restart the switch, as interrupting Flash compaction can damage files.

Listing files

To list files, enter Privileged Exec mode and enter the command:

```
awplus# dir
```

The output lists files and directories in order of modification date, descending. It looks like this:

```
-rw-       534 Jul 12 2011 17:52:50  stp.cfg
-rw-       534 Jul 12 2011 17:12:50  example.cfg
-rw- 12429011 Jul 12 2011 16:26:06  x900-5.4.4-0.4.rel
```

Listing files including hidden system files

The **dir** command does not list all files—it hides system files and directories because users generally do not need to create or edit them. To list all files including system files, enter Privileged Exec mode and enter the command:

```
awplus# dir all
```

The output looks like this:

```
drwx        0 Jul 12 2011 17:16:32  ./
-rw-      401 Jul 12 2011 17:16:32  example.cfg
-rw-      534 Jul 12 2011 17:52:50  stp.cfg
-rw- 12429011 Jul 12 2011 16:26:06  x900-5.4.4-0.4.rel
drwx      216 Jul  9 2011 11:31:18  ../
drwx        0 Jun 13 2011 04:31:51  .configs/
-rw-       17 Jun 13 2011 04:27:27  .release
drwx        0 Jul 10 2011 23:40:00  .ssh/
```

The hidden files and directories begin with a dot.

Seeing information about the filesystem

To display information about the different memory types on the switch, enter Privileged Exec mode and enter the command:

```
awplus# show file systems
```

The output includes the amount of free memory and the prefix you type to access that memory type, and looks like this:

```
 Size(b) Free(b)  Type   Flags  Prefixes   S/D/V   Lcl/Ntwk  Avail
-------------------------------------------------------------------
  31.0M    6.0M   flash     rw  flash:     static  local      Y
      -       -   system    rw  system:    virtual local      -
 499.0k  444.0k   nvs       rw  nvs:       static  local      Y
      -       -   sdcard    rw  card:      dynamic local      N
      -       -   tftp      rw  tftp:      -       network    -
      -       -   scp       rw  scp:       -       network    -
      -       -   sftp      ro  sftp:      -       network    -
      -       -   http      ro  http:      -       network    -
```

Listing files in a subdirectory

To list the contents of a directory, enter Privileged Exec mode and enter the command:

```
awplus# dir <directory-name>
```

Tip You can specify the directory with or without a / after the directory name.

Example To display the contents of a directory called “example”, enter the command:

```
awplus# dir example
```

Listing files in NVS memory or on an SD (or SDHC) card

To list the contents of a directory in NVS, enter Privileged Exec mode and enter the command:

```
awplus# dir nvs:<directory-name>
```

To list the contents of a directory on an SD card, enter the command:

```
awplus# dir card:<directory-name>
```

Example To display the contents of a directory in NVS called "example", enter the command:

```
awplus# dir nvs:example
```

Displaying the contents of configuration and text files

To display the contents of a file, enter Privileged Exec mode and enter the command:

```
awplus# show file <filename>
```

Example To display the contents of the file called "example.cfg", enter the command:

```
awplus# show file example.cfg
```

Navigating through the filesystem

Showing the current directory

To see which directory you are currently in, enter Privileged Exec mode and enter the command:

```
awplus# pwd
```

For the top-level directory, the output looks like this:

```
flash:/
```

Changing directories

To change to another directory, enter Privileged Exec mode and enter the command:

```
awplus# cd <directory-name>
```

To go to a directory one level higher in the directory tree, enter the command:

```
awplus# cd ..
```

Example To change to a directory called “example”, enter the command:

```
awplus# cd example
```

To go up one level, which returns you to the top level directory, enter the command:

```
awplus# cd ..
```

Changing to a directory in NVS memory or on an SD card

To change to the top-level directory in the NVS memory filesystem, enter Privileged Exec mode and enter the command:

```
awplus# cd nvs:
```

To change to the top-level directory on an SD card, enter the command:

```
awplus# cd card:/
```

Note that the prefix for the SD card is “card” not “sdcard”.

Next, you can change to other directories by entering the command:

```
awplus# cd <directory-name>
```

Alternatively, you can go straight from Flash to a subdirectory in the alternative filesystem, by entering one of the commands:

```
awplus# cd nvs:<directory-name>
```

```
awplus# cd card:/<directory-name>
```

To return to the Flash filesystem, enter the command:

```
awplus# cd flash:/
```

Example To change to the directory within NVS called “example”, enter the command:

```
awplus# cd nvs:example
```

To go up one level, which returns you to the top-level directory of NVS memory, enter the command:

```
awplus# cd ..
```

Creating new directories

To create a directory, enter Privileged Exec mode and enter the command:

```
awplus# mkdir <directory-name>
```

Example To make a directory called “example” within the Flash filesystem, enter the command:

```
awplus# mkdir example
```

Deleting directories

To delete an empty directory, enter Privileged Exec mode and enter the command:

```
awplus# rmdir <directory-name>
```

To delete a directory and all its contents, enter Privileged Exec mode and enter the command:

```
awplus# delete recursive <directory-name>
```

The switch prompts you for confirmation.

Example To delete an empty directory called “example” from within the Flash filesystem, enter the command:

```
awplus# rmdir example
```

Using the editor

The inbuilt editor is JOE (Joe’s Own Editor).

To edit an existing file, enter Privileged Exec mode and enter the command:

```
awplus# edit <filename>
```

To open the editor with an empty file, enter the command:

```
awplus# edit
```

When you save the new file, you may need to specify the filesystem to store it on. For Flash, use **flash:/<filename>**.

Using JOE To format and manipulate text in JOE, you use control-character sequences. The following table summarizes a few useful sequences—for details, see: **joe-editor.sourceforge.net/manpage.html.**

Function	Control-character sequence
Access the help	Ctrl-K-H
Save the file without exiting (for new files, this prompts for a filename)	Ctrl-K-D

Function	Control-character sequence
Save the file and exit (this prompts for a filename)	Ctrl-K-X
Exit without saving the file	Ctrl-C
Go to the beginning of the file	Ctrl-K-U
Go to the end of the file	Ctrl-K-V
Go up one full screen of text in the file	Ctrl-U
Go down one full screen of text in the file	Ctrl-V
Select a block of text:	
Mark the beginning of the block	Ctrl-K-B
Mark the end of the block	Ctrl-K-K
Copy and paste a selected block of text	Place cursor at destination then enter Ctrl-K-C
Move a selected block of text	Place cursor at destination then enter Ctrl-K-M
Delete a selected block of text	Ctrl-K-Y

Creating and Using Configuration Files

This section provides instructions on:

- **Creating a configuration file**
- **Specifying the start-up configuration script**
- **Working with configuration files**

Creating a configuration file

A **configuration file** is a text file that contains a sequence of standard commands for a specific purpose. Configuration files have a **.cfg** extension. Your device has a default configuration script called **default.cfg**.

You can create and edit configuration files on your device by:

- saving the dynamic configuration on the device, known as the **running-config** (see **"Working with configuration files"**). Use the command:

```
awplus# copy running-config (destination-URL)
```

  Where URL specifies a file in Flash.

- using the device's text editor. Use the command:

```
awplus# edit (source-URL)
```

  where **source-URL** is the name of the copied file in Flash memory.

- creating a file on a remote PC, then copying it to onto your device. See **"Copying files"** for more information about using the **copy** commands.

Once you have created a configuration file, you can use it as the ***startup-config*** file. See **"Specifying the start-up configuration script"** for more information.

Specifying the start-up configuration script

When you restart your device, or when it automatically restarts, it executes the pre-configured commands in a configuration script known as the **boot config** or **startup-config** file.

When you first start your device, the script set as the startup-config file is **default.cfg**. If desired, you can overwrite **default.cfg** with another configuration. Alternatively, you can change the startup-config by specifying a new file as the startup-config. Use the command:

```
awplus(config)# boot config-file backup URL
```

where **URL** specifies the name and location of a configuration file. At the next restart, the device executes the commands in the specified file.

You can specify that the configuration file is either in the Flash or the SD card filesystem. However, if you specify that the configuration file is on an SD card then you must first create a backup configuration file stored in Flash.

To specify a backup configuration file, use the command:

```
awplus(config)# boot config-file backup backup URL
```

where **URL** specifies the name and location of a configuration file.

You can change the content of the file set as the startup-config file by:

- entering commands directly into the CLI, then saving this configuration using the command:

  ```
  awplus# copy running-config startup-config
  ```

  This command saves the device's dynamic configuration into the file that is currently configured as the startup-config file.

- writing commands into a configuration file (see **"Creating a configuration file"** below), then using the command:

  ```
  awplus# copy SOURCE-URL startup-config
  ```

  This command saves the script from the source file into the file that is currently configured as the startup-config file.

To display the name of the configuration file that is set to execute when the device restarts, enter the command:

```
awplus# show boot
```

To see the commands in the startup-config file, use the command:

```
awplus# show startup-config
```

To erase the file set as the startup-config file, use the command:

```
awplus# erase startup-config
```

At the next restart that occurs after you've erased the file, the device loads the configuration in the file **default.cfg**. This file is set on the system as a backup configuration file that loads if no other file is set as the startup-config file.

Working with configuration files

When you use the CLI or GUI to configure your device, it stores this dynamic configuration as a list of commands called the **running-config**. To view the device's running-config, use the command:

```
awplus# show running-config
```

If you turn off the device or restart it, any unsaved changes to the running-config are lost. To save the running-config as a configuration script, use the command:

```
awplus# copy running-config destination-url
```

You may have many configuration files. Storing them on a device allows you to keep a backup device with configuration scripts for every device in the network to speed up network recovery time. Multiple scripts also let you test new configuration scripts before

setting them as the startup-config. For example, to test a new script named test.cfg, enter the command:

```
awplus# copy flash:/test.cfg running-config
```

This allows you to run a configuration file any time without restarting the device, by replacing the system's current dynamic configuration with the script in the configuration file. However, note that some commands require you to restart the device before they can take effect, such as the **platform** commands.

You can also set a trigger to automatically execute a configuration script when a predetermined event occurs. For information about creating triggers, see **Chapter 104, Triggers Introduction**.

The configuration file fallback order

The configuration fallback order is: configuration file, backup configuration file, default configuration file and then the factory default configuration. It is important to note the there is a distinction in system behavior between when writing to the startup-config file and when the system boots up.

When you copy a configuration script from a source file into the startup-config file the system will write to the first file that is configured. Potentially, this means that if a configuration file and a backup configuration file are not set you will write to the default.cfg.

At system startup the device goes through the fallback sequence until it finds a file that exists. For example, if the configuration file is not found then the backup configuration file becomes the current boot configuration, or startup-config, and so on. In the output displayed by the **show boot** command, the **Current boot config** parameter shows the startup-config file that the switch will load during the next boot cycle. The fallback sequence when configuration files are deleted is shown below in output from the **show boot** command.

In the example output below, the current boot configuration file, **my.cfg**, is set on the SD card. This is the startup-config file that the device loads at the next boot cycle.

```
awplus#show boot
Boot configuration
-----------------------------------------------------------------
Current software   : x900-5.4.4-0.4.rel
Current boot image : card:/x900-5.4.4-0.4.rel
Backup  boot image : flash:/x900-5.4.4-0.4.rel
Default boot config: flash:/default.cfg
Current boot config: card:/my.cfg (file exists)
Backup  boot config: flash:/backup.cfg (file exists)
```

In the example output below, the **no boot-config** command has been used to delete the configuration file **my.cfg** on the SD card. The backup configuration file **backup.cfg** in Flash then becomes the current boot config.

```
awplus#show boot
Boot configuration
-----------------------------------------------------------------
Current software   : x900-5.4.4-0.4.rel
Current boot image : card:/x900-5.4.4-0.4.rel
Backup  boot image : flash:/x900-5.4.4-0.4.rel
Default boot config: flash:/default.cfg
Current boot config: flash:/backup.cfg (file exists)
Backup  boot config: flash:/backup.cfg (file exists)
```

In the example output below, the **no boot-config backup** command has been used to delete the backup configuration file **backup.cfg**. The default configuration file **default.cfg** then becomes the current boot config.

```
awplus#show boot
Boot configuration
-----------------------------------------------------------------
Current software   : x900-5.4.4-0.4.rell
Current boot image : card:/x900-5.4.4-0.4.rel
Backup  boot image : flash:/x900-5.4.4-0.4.rel
Default boot config: flash:/default.cfg
Current boot config: flash:/default.cfg (file exists)
Backup  boot config: Not set
```

If the current boot configuration file is set on an SD card and then this card has been removed from the switch, the **Current boot config** parameter field indicates that this file cannot be found, as shown in the following example output.

```
awplus#show boot
Boot configuration
-----------------------------------------------------------------
Current software   : x900-5.4.4-0.4.rel
Current boot image : card:/x900-5.4.4-0.4.rel
Backup  boot image : flash:/x900-5.4.4-0.4.rel
Default boot config: flash:/default.cfg
Current boot config: card:/my.cfg (file not found)
Backup  boot config: flash:/backup.cfg (file exists)
```

At system startup the switch will load the backup configuration file as the startup-config.

Copying Files To and From Your Device

This section provides instructions on:

- **URL syntax**
- **Copying files**

URL syntax

Many of the file management commands use the placeholder "URL" to represent the name and location of the file that you want to act on. The following table explains the syntax of this URL for each different type of file location.

When you copy a file...	Use this syntax:
In local Flash memory	`flash:[/][<directory>/] <filename>`
To or from an SD (or SDHC) card	`card:[/][<directory>/] <filename>`
Copying with Hypertext Transfer Protocol (HTTP)	`http://[[<username>:<password>]@] {<hostname>|<host-ip>}[/<filepath>]/<filename>`
Copying with Trivial File Transfer Protocol (TFTP)	`tftp://[[<location>]/<directory>]/<filename>`
Copying with Secure Copy (SCP)	`scp://<username>@<location>[/<directory>][/<filename>]`
Copying with SSH File Transfer Protocol (SFTP)	`sftp://[[<location>]/<directory>]/<filename>`
To or from stack member Flash	`<hostname>-<stack_ID>/flash:[/][<directory>] <stack_member_filename>`

The URL can include characters from up to four categories. The URL categories are:

1. uppercase letters: A to Z
2. lowercase letters: a to z
3. digits: 0 to 9
4. special symbols: all printable ASCII characters not included in the previous three categories. Including the following characters:
   - « -
   - « /
   - « .
   - « _
   - « @
   - « "
   - « '
   - « *
   - « :
   - « ~
   - « ?

Do not use spaces or parentheses within filenames. Use hyphens or underlines instead.

Copying files

To copy files, use the **copy** commands. These commands allow you to copy files:

- between different memory types attached to your device. Use the command:

```
awplus# copy <local-source> <local-destination> <filename>
```

  See **"Copying within a filesystem"** and **""** for further details.

- across a serial connection using ZMODEM. Use the command:

```
awplus# copy zmodem
```

  See **"Copying with ZMODEM"** for further details.

- from your device onto a remote device, or to your device from a remote device. To copy a file across an interface with IP configured, use the command:

```
awplus# copy SOURCE-URL DESTINATION-URL
```

To copy files across these interfaces you can use the following protocols:

- **"Copying with Hypertext Transfer Protocol (HTTP)"**
- **"Copying with Trivial File Transfer Protocol (TFTP)"**
- **"Copying with Secure Copy (SCP)"**
- **"Copying with SSH File Transfer Protocol (SFTP)"**

Copying within a filesystem

Within a directory

To copy a file within the same directory, enter Privileged Exec mode and enter the command:

```
awplus# copy <source-filename> <destination-filename>
```

If the file already exists, the switch asks whether to overwrite it, with a message like this:

```
Overwrite flash:/example.cfg? (y/n)[n]:
```

To overwrite, press the "y" key then the Enter key.

Between directories

To copy a file to another directory within the same filesystem, enter the command:

```
awplus# copy <source-filename> <directory-name>
```

The / after the directory name is required. Otherwise the switch displays an error ("37: Destination file is a directory").

The switch then prompts you for the destination filename. To give the copy a new name, type the name at the prompt. You can include directory names in the path.

To use the same filename as the original, press the Enter key (do not press the "y" key—that names the copy "y").

Example

To put a copy of example.cfg into the example directory, enter the command:

```
awplus# copy example.cfg example/
```

The prompt and messages look like this:

```
Enter destination file name [example.cfg]:
Copying from source file, please wait...
Copying to destination file, please wait...
0: Successful operation
```

Copying to and from NVS or SD (or SDHC) card

In a stacked environment you can only access `flash` and `nvs` using the stack member file path. To access an SD card on a backup stack member, use the **remote-login** command on page 112.10.

To copy between filesystems, you need to specify the filesystem prefix (`nvs:` or `card:`).

For example, to copy from Flash to NVS when your current directory is the top-level Flash directory, enter Privileged Exec mode and enter the command:

```
awplus# copy <source-filename> nvs:
```

The switch prompts you for the filename, as described in the previous section.

To copy from NVS to Flash when your current directory is the top-level Flash directory, enter the command:

```
awplus# copy nvs:<source-filename> <destination-filename>
```

Example To copy the file “example.txt” from the directory in NVS called “example” to the top level of Flash, enter the command:

```
awplus# copy nvs:example/example.txt example.txt
```

Copying with ZMODEM

ZMODEM allows you to copy files from a network host over an asynchronous port. Use the command:

```
awplus# copy zmodem
```

to open Minicom and transfer a file. Alternatively you can specify the file name within the command:

```
awplus# copy SOURCE-URL zmodem
```

For example, to copy the file “july.cfg” from Flash memory using ZMODEM, use the command:

```
awplus# copy flash:/july.cfg zmodem
```

Copying with Hypertext Transfer Protocol (HTTP)

You device has a built-in HTTP client. The HTTP client enables the device to act as a browser by sending HTTP “get” or “post” requests to an HTTP server. The client is enabled by default.

For example, to load the file “bob.key” onto Flash from the security directory on the web server at www.company.com, use the command:

```
awplus# copy http://www.company.com/security/bob.key
       flash:/bob.key
```

Copying with Trivial File Transfer Protocol (TFTP)

TFTP runs over User Datagram Protocol (UDP). It is simpler and faster than FTP but has minimal capability, such as no provisions for user authentication.

To copy a file from a TFTP server to Flash memory, enter Privileged Exec mode and enter the command:

```
awplus# copy tftp flash
```

Note You can specify the server and filename in the command instead of waiting for prompts. Use a format like the following:

```
copy tftp://172.1.1.1/example.cfg flash
```

The switch prompts you for the:

- TFTP server hostname (you can enter its IP address instead)
- source filename on the TFTP server
- destination filename in Flash on the switch

To copy a file from Flash to a TFTP server, enter the command:

```
awplus# copy flash tftp
```

Follow the prompts for source filename, server, and destination filename.

If the file is not in the top level of the TFTP server, include the path as part of the filename.

Example To copy example.cfg to the TFTP server at 172.1.1.1, enter the command:

```
awplus# copy flash tftp
```

The prompts, responses, and messages look like this:

```
Enter source file name []:example.cfg
Enter destination host name []:172.1.1.1
Enter destination file name [example.cfg]:
Copying from source file, please wait...
Copying to destination file, please wait...
0: Successful operation
```

To load the file “bob.key” from a TFTP server, where the file is in the folder “security”, use the command:

```
awplus# copy tftp://security/bob.key flash:/bob.key
```

Copying with Secure Copy (SCP)

Secure Copy (SCP) provides a secure way to copy files to and from a remote device using SSH. The AlliedWare Plus™ OS includes both a SSH server and a SSH client. You must enable the SSH server before your device accepts connections from SCP clients. See the **Chapter 79, Secure Shell (SSH) Introduction** for more information.

For example, to load the file “beth.key” onto Flash from the key directory on a remote SSH server at 10.10.0.12, using the username “bob”, use the command:

```
awplus# copy scp://bob@10.10.0.12/key/beth.key
       flash:/beth.key
```

Copying with SSH File Transfer Protocol (SFTP)

SSH File Transfer Protocol (SFTP) provides a secure way to copy files onto your device from a remote device. The AlliedWare Plus™ OS includes both a SSH server and a SSH client. SFTP provides additional features from SCP, such as allowing you to manipulate the remote files, and halt or resume file transfers without closing the session.

For example, to load the file “rei.cfg” onto Flash memory from the remote server at 10.0.0.5, use the command:

```
awplus# copy sftp://10.0.0.5/rei.cfg flash:/rei.cfg
```

Copying from a Server to Running Configuration

Use the **copy tftp** variant of the **copy running-config** command on page 7.14 to load a configuration file from a server to the running configuration of the switch.

The configuration will be added to the running configuration as if the commands were typed in the command line interface.

The resulting configuration file will be a combination of the previous running configuration and the loaded configuration file. The loaded configuration file has precedence.

The Autoboot Feature

The Autoboot feature enables your switch to automatically load a specific release file and/or configuration file from external media, such as SD card, into Flash memory, providing there is enough free space available.

If there is not enough free space, the Autoboot feature will exit and booting will revert to what was previously set by the CLI. This feature is enabled only the first time the device is powered up in the field. Subsequently, the Autoboot feature is disabled by default.

The Autoboot feature minimizes network downtime by avoiding the need for manual configuration of a replacement device.

If you use prepared external media for the first time boot, the Autoboot feature gives you the ability to easily ensure the device boots with your desired release and configuration files. You must prepare the external media for this purpose using an initiation file, `autoboot.txt`, and accompanying release and configuration files.

Use the **create autoboot** command to create an `autoboot.txt` file on external media. This command will automatically ensure that the keys and values that are expected in this file are correct. After the file is created the command will copy the current release and configuration files across to the external media. The `autoboot.txt` file is read/writable by any desktop operating system currently supported by the AlliedWare Plus™ Operating System. Note that the external media file system is not case sensitive.

When the Autoboot feature is enabled, the device on boot-up:

- checks for a special file called `autoboot.txt` on external media, and if this file exists,
- checks in the file for the "key=value" pair "`Copy_from_external_media_enabled=yes`", and if this enable flag is set,
- loads the release file and/or configuration file from external media.

An example of a valid `autoboot.txt` file is shown in **Figure 6-1** below.

Figure 6-1: Example autoboot.txt file

```
; J Smith,  x610-24Ts/XP,  16 July 2012
[AlliedWare Plus]
Copy_from_external_media_enabled=yes
Boot_Release=x900-5.4.4-0.4.rel
Boot_Config=network1.cfg
```

If external media is not present, cannot be read, or the internal enable flag is not set to **yes** in the switch, the switch will boot as normal. Incompatible release files are prevented from loading onto the switch, even if the enable flag is set on the switch. If there is an incompatible release file then the configuration file referenced in the `autoboot.txt` file is also not loaded onto the switch.

We recommend that no directories are present on external media used to hold the `autoboot.txt` file. In addition, large numbers of files on external media may slow the booting process.

Note The Autoboot feature is not supported in a stacked configuration.

Do not remove external media part way through the copy process as this may leave the device in an unstable state.

Configuration files placed on external media reduce security. Therefore, ensure adequate security precautions are taken with external media holding configuration files.

Configuration commands that rely on the presence of a feature license will fail when executed in the replacement switch if the replacement switch does not have the same feature license present.

The bootloader version on the device must be 1.1.6 or greater to support external media. An `autoboot.txt` file on an SD card will not be detected on a device with a bootloader version less than 1.1.6.

Restoring a switch using Autoboot from external media

The example below describes the sequence of events when a switch in the field fails and is restored using this feature:

1. Using the **create autoboot** command, a network engineer has previously manually created a restore external media device, such as an SD card. The external media device contains the following components:
   - An `autoboot.txt` file with required contents
   - An appropriate release file
   - A configuration file
2. A switch fails in the field.
3. A replacement switch of same model is installed.

Note This replacement switch must already have a 5.4.2-2.6 or later release or bootloader version 1.1.6 or later pre-installed to be able to detect and interpret the `autoboot.txt` file.

4. The previously created external media device is placed into the replacement switch.
5. The switch powers up using its pre-installed release if present. It automatically checks the external media device for the `autoboot.txt` file.
6. The switch finds a valid `autoboot.txt` file on the external media device, with the value “Copy_from_external_media_enabled” set. The release file and configuration file both exist on the external media device.
7. The MD5sum of pre-installed Flash release file is compared to the MD5sum of the release file stored in the external media device. If they do not match, because the release file in the replacement switch is either missing or different, then the release is

restored from the external media device. If the release files already match, then the release file is not copied from the external media device.

8. The MD5sum of the Flash configuration file `default.cfg` (if pre-installed in the replacement switch) is compared to the MD5sum of the configuration file stored in the external media device. If they do not match, because the configuration file in the replacement switch is either missing or different, then the configuration file is restored from the external media device. If the configuration files already match, then the configuration file is not copied from the external media device.

9. The memory space available in the switch Flash is checked to ensure the release and configuration files stored in the external media device will fit. If there is not enough space the Autoboot feature will exit.

10. The release file and configuration files are automatically copied from the external media device to switch Flash memory. The switch release and configuration files are updated to contain the appropriate names.

11. The switch is automatically rebooted.

12. The replacement switch is now running the restored release and configuration files. Subsequent reboots are based on the restored release and configuration files stored in the switch Flash memory.

13. If you want to Autoboot from external media on this specific switch in the future, you must now manually enable the Autoboot feature in the configuration menu via the **autoboot enable** command. This command resets the enable flag stored internally in the switch NVS memory.

Configure Autoboot

This section describes the commands used to configure the Autoboot feature.

Table 6-1: Configuration procedures for the Autoboot feature

Create an Autoboot file (autoboot.txt)	
`awplus#`	
`create autoboot [card]`	Create an **autoboot.txt** file on external media.
Enable the Autoboot feature	
`awplus#`	
`configure terminal`	Enter Global Configuration mode.
`awplus(config)#`	
`autoboot enable`	The Autoboot feature is enabled by default the first time the device is powered up in the field. Use this command to enable the feature subsequently.

Table 6-1: Configuration procedures for the Autoboot feature

Disable the Autoboot feature	
`awplus(config)#`	
`no autoboot enable`	Use this command to disable the Autoboot feature.
Display Autoboot configuration and status	
`awplus#`	
`show autoboot`	Display detailed information about the current Autoboot configuration and status.
`awplus#`	
`show boot`	Display the status of the Autoboot feature; either enabled or disabled.

Introduction

This chapter provides an alphabetical reference of AlliedWare Plus™ OS file management commands.

URL Syntax and Keyword Usage

Many of the commands in this chapter use the placeholder "URL" to represent the name and location of the file that you want to act on. The following table explains the syntax of this URL for each different type of file location.

When you copy a file...	Use this syntax:
In local Flash memory	`flash:[/][<directory>/] <filename>`
To or from an SD (or SDHC) card	`card:[/][<directory>/] <filename>`
Copying with Hypertext Transfer Protocol (HTTP)	`http://[[<username>:<password>]@] {<hostname>|<host-ip>}[/<filepath>]/<filename>`
Copying with Trivial File Transfer Protocol (TFTP)	`tftp://[[<location>]/<directory>]/<filename>`
Copying with Secure Copy (SCP)	`scp://<username>@<location>[/<directory>][/<filename>]`
Copying with SSH File Transfer Protocol (SFTP)	`sftp://[[<location>]/<directory>]/<filename>`
To or from stack member Flash	`<hostname>-<stack_ID>/flash:[/][<directory>] <stack_member_filename>`

The URL can include characters from up to four categories. The URL categories are:

1. uppercase letters: A to Z
2. lowercase letters: a to z
3. digits: 0 to 9
4. special symbols: all printable ASCII characters not included in the previous three categories. Including the following characters:
   - « -
   - « /
   - « .
   - « _
   - « @
   - « "
   - « '
   - « *
   - « :
   - « ~
   - « ?

Do not use spaces or parentheses within filenames. Use hyphens or underlines instead.

In a stacked environment you can only access `flash` and `nvs` using the stack member filepath. To access an SD card on a backup stack member, use the **remote-login** command on page 112.10.

Note

When the Flash base directory is required for local filesystems you may use **flash** or **flash:** or **flash:/**. and similarly, when the SD (or SDHC) card base directory is required you may use **card** or **card:** or **card:/**.

The keywords **flash**, **nvs**, **card**, **tftp**, **scp**, **sftp** and **http** are reserved for tab completion when using the **copy**, **move**, **delete**, **cd**, and **dir** commands.

The keywords **flash**, **nvs**, **card**, **tftp**, **scp**, **sftp** and **http** cannot be applied as directory or subdirectory names when using a **mkdir** command.

A leading slash (/) indicates the root of the current filesystem location.

Command List

autoboot enable

This command enables the device to restore a release file and/or a configuration file from external media, such as an SD card.

When the Autoboot feature is enabled, the device looks for a special file called `autoboot.txt` on the external media. If this file exists, the device will check the key and values in the file and recover the device with a new release file and/or configuration file from the external media. An example of a valid `autoboot.txt` file is shown in Figure 7-1 below.

Figure 7-1: Example autoboot.txt file

```
[AlliedWare Plus]
Copy_from_external_media_enabled=yes
Boot_Release=x900-5.4.4-0.4.rel
Boot_Config=network1.cfg
```

Use the **no** variant of this command to disable the Autoboot feature.

Note This command is not supported in a stacked configuration.

Syntax

```
autoboot enable
no autoboot enable
```

Default The Autoboot feature operates the first time the device is powered up in the field, after which the feature is disabled by default.

Mode Global Configuration

Example To enable the Autoboot feature, use the command:

```
awplus# configure terminal
awplus(config)# autoboot enable
```

To disable the Autoboot feature, use the command:

```
awplus# configure terminal
awplus(config)# no autoboot enable
```

Related Commands

create autoboot
show autoboot
show boot

boot config-file

Use this command to set the configuration file to use during the next boot cycle.

Use the **no** variant of this command to remove the configuration file.

Note To ensure correct operation of the chassis and in particular of any cards inserted after issuing this command, the chassis should be rebooted.

Syntax

```
boot config-file <filepath-filename>
no boot config-file
```

Parameter	Description
<filepath-filename>	Filepath and name of a configuration file. The specified configuration file must exist in the Flash, SD card, or SDHC card filesystem. Valid configuration files must have a **.cfg** extension.

Mode Global Configuration

Usage You can only specify that the configuration file is on an SD card if there is a backup configuration file already specified in Flash. If you attempt to set the configuration file on an SD card and a backup configuration file is not specified in Flash, the following error message is displayed:

```
% Backup configuration files must be stored in the flash
filesystem
```

In addition, you can only specify that the configuration file is on an SD card if the card is writable. For example, if you attempt to set the configuration file on an SD card and stack member 2 has a write protected card inserted, the following error message is displayed:

```
% Stack member 2 has a write protected card inserted
```

In a VCStack configuration you can only specify that the configuration file is on an SD card if there is a card inserted in all stack members. If a stack member has a card removed an error message is displayed. For example, if stack member 2 does not have a card inserted the following message is displayed:

```
% Stack member 2 has no card inserted
```

A new stack member cannot join a stack if the stack has the configuration file on an SD card and the new member does not have a card inserted or the new member has a write protected card inserted.

Note

The read speeds of SD cards and SDHC cards varies significantly between different manufacturers and card capacities. Ensure the same brand and size of card is used in all stack members.

For an explanation of the configuration fallback order, see **"The configuration file fallback order" on page 6.10**.

Examples

To run the configuration file `branch.cfg` stored on the switch's Flash filesystem the next time the device boots up, use the commands:

```
awplus# configure terminal
awplus(config)# boot config-file flash:/branch.cfg
```

To remove the configuration file `branch.cfg` stored on the switch's Flash filesystem the next time the device boots up, use the commands:

```
awplus# configure terminal
awplus(config)# no boot config-file flash:/branch.cfg
```

To run the configuration file `branch.cfg` stored on the switch's SD card filesystem the next time the device boots up, use the commands:

```
awplus# configure terminal
awplus(config)# boot config-file card:/branch.cfg
```

To remove the configuration file `branch.cfg` stored on the switch's SD card filesystem the next time the device boots up, use the commands:

```
awplus# configure terminal
awplus(config)# no boot config-file card:/branch.cfg
```

Related Commands

boot config-file backup
boot system
boot system backup
show boot

boot config-file backup

Use this command to set a backup configuration file to use if the main configuration file cannot be accessed.

Use the **no** variant of this command to remove the backup configuration file.

Syntax

```
boot config-file backup <filepath-filename>
no boot config-file backup
```

Parameter	Description
<filepath-filename>	Filepath and name of a backup configuration file. Backup configuration files must be in the Flash filesystem. Valid backup configuration files must have a **.cfg** extension.
`backup`	The specified file is a backup configuration file.

Mode Global Configuration

Usage For an explanation of the configuration fallback order, see **"The configuration file fallback order" on page 6.10**.

Examples To set the configuration file `backup.cfg` as the backup to the main configuration file, use the commands:

```
awplus# configure terminal
awplus(config)# boot config-file backup flash:/backup.cfg
```

To remove the configuration file `backup.cfg` as the backup to the main configuration file, use the commands:

```
awplus# configure terminal
awplus(config)# no boot config-file backup flash:/backup.cfg
```

Related Commands

boot config-file
boot system
boot system backup
show boot

boot system

Use this command to set the release file to load during the next boot cycle.

Use the **no** variant of this command to remove the release file as the boot file.

Syntax

```
boot system <filepath-filename>
no boot system
```

Parameter	Description
<filepath-filename>	Filepath and name of a release file. The specified release file must exist and must be stored in the root directory of the Flash, SD card, or SDHC card filesystem. Valid release files must have a **.rel** extension.

Mode Global Configuration

Usage You can only specify that the release file is on an SD card if there is a backup release file already specified in Flash. If you attempt to set the release file on an SD card and a backup release file is not specified in Flash, the following error message is displayed:

```
% A backup boot image must be set before setting a current boot
image on card
```

In a VCStack configuration, a release file on an SD card is accepted only if a card is inserted in all stack members and all stack members have a bootloader version that supports booting from card. If a stack member has a card removed an error message is displayed. For example, if stack member 2 does not have a card inserted the following message is displayed:

```
% Stack member 2 has no card inserted
```

Note

The read speed of SD cards and SDHC cards varies significantly between different manufacturers and card capacities. Ensure the same brand and size of card is used in all stack members.

Examples To run the release file `x900-5.4.4-0.4.rel` stored on the switch's Flash filesystem the next time the device boots up, use the commands:

```
awplus# configure terminal
awplus(config)# boot system flash:/x900-5.4.4-0.4.rel
```

To remove the release file `x900-5.4.4-0.4.rel` stored on the switch's Flash filesystem

the next time the device boots up, use the commands:

```
awplus# configure terminal
awplus(config)# no boot system flash:/x900-5.4.4-0.4.rel
```

To run the release file `x900-5.4.4-0.4.rel` stored on the switch's SD card filesystem the next time the device boots up, use the commands:

```
awplus# configure terminal
awplus(config)# boot system card:/x900-5.4.4-0.4.rel
```

To remove the release file `x900-5.4.4-0.4.rel` stored on the switch's SD card filesystem the next time the device boots up, use the commands:

```
awplus# configure terminal
awplus(config)# no boot system card:/x900-5.4.4-0.4.rel
```

In a VCStack configuration, if there is not enough space to synchronize the new release across the stack, the boot system command has an interactive mode that prompts you to delete old releases.

```
awplus# configure terminal
awplus(config)# boot system x900-5.4.4-0.4.rel
```

```
Insufficient flash available on stack member-2 (11370496)
 to synchronize file x900-5.4.4-0.4.rel (14821895).

 List of release files on stack member-2
        x900-5.4.4-0.4.rel (14822400)

 Select files to free up space,
 Delete awplus-2/flash:/x900-5.4.4-0.4.rel? (y/n)[n]:y
```

```
awplus(config)# y
```

```
 Deleting selected files, please
wait.................................
 Successful operation
 VCS synchronizing file across the stack, please
wait.....................................
 File synchronization with stack member-2 successfully completed
 [DONE]
```

Related Commands

boot config-file
boot config-file backup
boot system backup
show boot

boot system backup

Use this command to set a backup release file to load if the main release file cannot be loaded.

Use the **no** variant of this command to remove the backup release file as the backup boot file.

Syntax

```
boot system backup <filepath-filename>
no boot system backup
```

Parameter	Description
<filepath-filename>	Filepath and name of a backup release file. Backup release files must be in the Flash filesystem. Valid release files must have a **.rel** extension.
`backup`	The specified file is a backup release file.

Mode Global Configuration

Examples To specify the file `x900-5.4.4-0.4.rel` as the backup to the main release file, use the commands:

```
awplus# configure terminal
awplus(config)# boot system backup flash:/x900-5.4.4-0.4.rel
```

To remove the file `x900-5.4.4-0.4.rel` as the backup to the main release file, use the commands:

```
awplus# configure terminal
awplus(config)# no boot system backup flash:/x900-5.4.4-
0.4.rel
```

Related Commands

boot config-file
boot config-file backup
boot system
show boot

cd

This command changes the current working directory.

Syntax `cd <directory-url>`

Parameter	Description
<directory-url>	URL of the directory.

Mode Privileged Exec

Example To change to the directory called `images`, use the command:

```
awplus# cd images
```

Related Commands **dir**
pwd
show file systems

copy current-software

This command copies the AlliedWare Plus™ OS software that the device has booted from to a destination file. Specify whether the destination is Flash or card when saving the software to the local filesystem.

This command copies the AlliedWare Plus™ OS software that the device has booted from to a destination file. Specify whether the destination is Flash or USB when saving the software to the local filesystem.

Syntax `copy current-software <destination-url>`

Parameter	Description
<destination-url>	The URL where you would like the current running-release saved. This command creates a file if no file exists with the specified filename. If a file already exists, then the CLI prompts you before overwriting the file. See **"URL Syntax and Keyword Usage" on page 7.3** for valid URL syntax.

Mode Privileged Exec

Example To copy the current software as installed in the working directory with the file name `my-release.rel`, use the command:

```
awplus# copy current-software my-release.rel
```

Related Commands **boot system backup**
show boot

copy debug

This command copies a specified debug file to a destination file. Specify whether the destination is Flash or Card when saving the software to the local filesystem.

This command copies a specified debug file to a destination file. Specify whether the destination is Flash or USB when saving the software to the local filesystem.

Syntax

```
copy debug {<destination-url>|card|debug|flash|nvs|scp|tftp|usb}
   {<source-url>|card|debug|flash|nvs|scp|tftp|usb}
```

Parameter	Description
<destination-url>	The URL where you would like the debug output saved. See **"URL Syntax and Keyword Usage" on page 7.3** for valid URL syntax.
<source-url>	The URL where the debug output originates. See **"URL Syntax and Keyword Usage" on page 7.3** for valid URL syntax.

Mode Privileged Exec

Example To copy debug output to an SD (or SDHC) card with a filename `my-debug`, use the following command:

```
awplus# copy debug card:mydebug
```

To copy debug output to a USB storage device with a filename `my-debug`, use the following command:

```
awplus# copy debug usb:mydebug
```

Output **Figure 7-2: CLI prompt after entering the copy debug command**

```
Enter source file name []:
```

Related Commands

delete debug
move debug

copy running-config

This command copies the running-config to a destination file, or copies a source file into the running-config. Commands entered in the running-config do not survive a device reboot unless they are saved in a configuration file.

Syntax

```
copy <source-url> running-config
copy running-config <destination-url>
copy running-config startup-config
```

Parameter	Description
<source-url>	The URL of a configuration file. This must be a valid configuration file with a **.cfg** filename extension. Specify this when you want the script in the file to become the new running-config. The URL can contain the following protocols or location words. See **"URL Syntax and Keyword Usage" on page 7.3** for valid URL syntax.
<destination-url>	The URL where you would like the current running-config saved. This command creates a file if no file exists with the specified filename. If a file already exists, then the CLI prompts you before overwriting the file. See **"URL Syntax and Keyword Usage" on page 7.3** for valid URL syntax.
`startup-config`	Copies the running-config into the file set as the current startup-config file.

Mode Privileged Exec

Examples To copy the `running-config` into the startup-config, use the command:

```
awplus# copy running-config startup-config
```

To copy the file `layer3.cfg` into the `running-config`, use the command:

```
awplus# copy layer3.cfg running-config
```

To use SCP to copy the running-config as `current.cfg` to the remote server listening on TCP port 2000, use the command:

```
awplus# copy running-config scp://user@server:2000/
       config_files/current.cfg
```

Related Commands

copy startup-config
write file
write memory

copy startup-config

This command copies the startup-config script into a destination file, or alternatively copies a configuration script from a source file into the startup-config file. Specify whether the destination is Flash or card when loading from the local filesystem.

Syntax

```
copy <source-url> startup-config
copy startup-config <destination-url>
```

Parameter	Description
<source-url>	The URL of a configuration file. This must be a valid configuration file with a **.cfg** filename extension. Specify this to copy the script in the file into the *startup-config* file. Note that this does not make the copied file the new startup file, so any further changes made in the configuration file are not added to the startup-config file unless you reuse this command. See **"URL Syntax and Keyword Usage" on page 7.3** for valid URL syntax.
<destination-url>	The destination and filename that you are saving the startup-config as. This command creates a file if no file exists with the specified filename. If a file already exists, then the CLI prompts you before overwriting the file. See **"URL Syntax and Keyword Usage" on page 7.3** for valid URL syntax.

Mode Privileged Exec

Examples To copy the file `Layer3.cfg` to the `startup-config`, use the command:

```
awplus# copy Layer3.cfg startup-config
```

To copy the `startup-config` as the file `oldconfig.cfg` in the current directory, use the command:

```
awplus# copy startup-config oldconfig.cfg
```

Related Commands **copy running-config**

copy (URL)

This command copies a file. This allows you to:

- copy files from your device to a remote device
- copy files from a remote device to your device
- copy files stored on Flash memory to or from a different memory type, such as an SD card
- create two copies of the same file on your device

Syntax `copy <source-url> <destination-url>`

Parameter	Description
<source-url>	The URL of the source file. See **"URL Syntax and Keyword Usage" on page 7.3** for valid URL syntax.
<destination-url>	The URL for the destination file. See **"URL Syntax and Keyword Usage" on page 7.3** for valid URL syntax.

Mode Privileged Exec

Usage The URL can include characters from up to four categories. The URL categories are:

1. uppercase letters: A to Z
2. lowercase letters: a to z
3. digits: 0 to 9
4. special symbols: all printable ASCII characters not included in the previous three categories. Including the following characters:

   « -
   « /
   « .
   « _
   « @
   « "
   « '
   « *
   « :
   « ~
   « ?

Do not use spaces or parentheses within filenames. Use hyphens or underlines instead.

Examples

To use TFTP to copy the file `bob.key` into the current directory from the remote server at `10.0.0.1`, use the command:

```
awplus# copy tftp://10.0.0.1/bob.key bob.key
```

To use SFTP to copy the file `new.cfg` into the current directory from a remote server at `10.0.1.2`, use the command:

```
awplus# copy sftp://10.0.1.2/new.cfg bob.key
```

To use SCP with the username `beth` to copy the file `old.cfg` into the directory `config_files` on a remote server that is listening on TCP port 2000, use the command:

```
awplus# copy scp://beth@serv:2000/config_files/old.cfg old.cfg
```

To copy the file `config.cfg` into the current directory from an SD (or SDHC) Card, and rename it to `configtest.cfg`, use the command:

```
awplus# copy card:/config.cfg configtest.cfg
```

To copy the file `test.txt` from the top level of Flash on stack member 4 to the current directory in the stack master, use the command:

```
awplus# copy awplus-4/flash:/test.txt test.txt
```

Note that you must specify either the NVS or Flash filesystem on the (backup) stack member (`flash:` in this example).

Related Commands

copy zmodem
edit (URL)
show file systems

copy zmodem

This command allows you to copy files using ZMODEM using Minicom. ZMODEM works over a serial connection and does not need any interfaces configured to do a file transfer.

Syntax

```
copy <source-url> zmodem
```

```
copy zmodem
```

Parameter	Description
<source-url>	The URL of the source file. See **"URL Syntax and Keyword Usage" on page 7.3** for valid URL syntax.

Mode Privileged Exec

Example To copy the local file `asuka.key` using ZMODEM, use the command:

```
awplus# copy asuka.key zmodem
```

Related Commands

copy (URL)
show file systems

create autoboot

Use this command to create an `autoboot.txt` file on external media. This command will automatically ensure that the keys and values that are expected in this file are correct. After the file is created the **create autoboot** command will copy the current release and configuration files across to the external media. The external media is then available to restore a release file and/or a configuration file to the device.

Syntax `create autoboot [card]`

Mode Privileged Exec

Example To create an `autoboot.txt` on external media, use the command:

```
awplus# create autoboot card
```

Related Commands
autoboot enable
show autoboot
show boot

delete

This command deletes files or directories.

Syntax `delete [force] [recursive] <url>`

Parameter	Description
`force`	Ignore nonexistent filenames and never prompt before deletion.
`recursive`	Remove the contents of directories recursively.
<url>	URL of the file to delete. See **"URL Syntax and Keyword Usage" on page 7.3** for valid URL syntax.

Mode Privileged Exec

Examples To delete the file `temp.cfg` from the current directory, use the command:

```
awplus# delete temp.cfg
```

To delete the read-only file `one.cfg` from the current directory, use the command:

```
awplus# delete force one.cfg
```

To delete the directory `old_configs`, which is not empty, use the command:

```
awplus# delete recursive old_configs
```

To delete the directory `new_configs`, which is not empty, without prompting if any read-only files are being deleted, use the command:

```
awplus# delete force recursive new_configs
```

Related Commands **erase startup-config**
rmdir

delete debug

Use this command to delete a specified debug output file.

Syntax `delete debug <source-url>`

Parameter	Description
<source-url>	The URL where the debug output originates. See **"URL Syntax and Keyword Usage" on page 7.3** for valid URL syntax.

Mode Privileged Exec

Example To delete debug output, use the following command:

```
awplus# delete debug
```

Output **Figure 7-3: CLI prompt after entering the delete debug command**

```
Enter source file name []:
```

Related Commands **copy debug**
move debug

dir

This command lists the files on a filesystem. If no directory or file is specified then this command lists the files in the current working directory.

Syntax `dir [all] [recursive] [sort [reverse] [name|size|time]] [<url>|card|debug|flash|nvs]`

Parameter	Description
`all`	List all files.
`recursive`	List the contents of directories recursively.
`sort`	Sort directory listing.
`reverse`	Sort using reverse order.
`name`	Sort by name.
`size`	Sort by size.
`time`	Sort by modification time (default).
<url>	URL of the directory or file. If no directory or file is specified, then this command lists the files in the current working directory.
`card`	SD (or SDHC) card root directory
`debug`	Debug root directory
`flash`	Flash memory root directory
`nvs`	NVS memory root directory

Mode Privileged Exec

Usage In a stacked environment you can use the CLI on a stack master to access filesystems that are located on another stack member. Refer to the **URL Syntax and Keyword Usage**.

Examples To list the files in the current working directory, use the command:

```
awplus# dir
```

To list the non-hidden files in the root of the Flash filesystem, use the command:

```
awplus# dir flash
```

To list all the files in the root of the Flash filesystem, use the command:

```
awplus# dir all flash:
```

To list recursively the files in the Flash filesystem, use the command:

```
awplus# dir recursive flash:
```

To list the files in alphabetical order, use the command:

```
awplus# dir sort name
```

To list the files by size, smallest to largest, use the command:

```
awplus# dir sort reverse size
```

To sort the files by modification time, oldest to newest, use the command:

```
awplus# dir sort reverse time
```

To list the files within the Flash filesystem for stack member 3, use the command:

```
awplus# dir awplus-3/flash:/
```

Note that you must specify the filesystem, on the stack member (`flash` in this example).

Related Commands **cd**
pwd

edit

This command opens a text file in the AlliedWare Plus™ text editor. Once opened you can use the editor to alter to the file.

If a filename is specified and it already exists, then the editor opens it in the text editor.

If no filename is specified, the editor prompts you for one when you exit it.

Before starting the editor make sure your terminal, terminal emulation program, or Telnet client is 100% compatible with a VT100 terminal. The editor uses VT100 control sequences to display text on the terminal.

For more information about using the editor, including control sequences, see **"Using the editor" on page 6.6**.

Syntax

```
edit [<filename>]
```

Parameter	Description
<filename>	Name of a file in the local Flash filesystem.

Mode Privileged Exec

Examples To create and edit a new text file, use the command:

```
awplus# edit
```

To edit the existing configuration file `myconfig.cfg` stored on your device's Flash memory, use the command:

```
awplus# edit myconfig.cfg
```

Related Commands

edit (URL)
show file

edit (URL)

This command opens a remote text file as read-only in the AlliedWare Plus™ text editor.

Before starting the editor make sure your terminal, terminal emulation program, or Telnet client is 100% compatible with a VT100 terminal. The editor uses VT100 control sequences to display text on the terminal.

Syntax `edit <url>`

Parameter	Description
<url>	The URL of the remote file. See **"URL Syntax and Keyword Usage" on page 7.3** for valid URL syntax.

Mode Privileged Exec

Usage The URL can include characters from up to four categories. The URL categories are:

1. uppercase letters: A to Z
2. lowercase letters: a to z
3. digits: 0 to 9
4. special symbols: all printable ASCII characters not included in the previous three categories. Including the following characters:
   - « -
   - « /
   - « .
   - « _
   - « @
   - « "
   - « '
   - « *
   - « :
   - « ~
   - « ?

Do not use spaces or parentheses within filenames. Use hyphens or underlines instead.

Example To view the file `bob.key` stored in the security directory of a TFTP server, use the command:

```
awplus# edit tftp://security/bob.key
```

Related Commands
copy (URL)
edit
show file

erase startup-config

This command deletes the file that is set as the startup-config file, which is the configuration file that the system runs when it boots up.

At the next restart, the device loads the default configuration file, default.cfg. If default.cfg no longer exists, then the device loads with the factory default configuration. This provides a mechanism for you to return the device to the factory default settings.

Syntax

```
erase startup-config
```

Mode

Privileged Exec

Example

To delete the file currently set as the startup-config, use the command:

```
awplus# erase startup-config
```

Related Commands

boot config-file backup
copy running-config
copy startup-config
show boot

mkdir

This command makes a new directory.

Syntax `mkdir <url>`

Parameter	Description
<url>	URL of the directory that you are creating.

Mode Privileged Exec

Usage The keywords **flash**, **nvs**, **card**, **tftp**, **scp**, **sftp** and **http** are reserved for tab completion when using the **copy**, **move**, **delete**, **cd** and **dir** command. Keywords **flash**, **nvs**, **card**, **tftp**, **scp**, **sftp** and **http** cannot be applied as directory or subdirectory names when using a **mkdir** command.

Example To make a new directory called `images` in the current directory, use the command:

```
awplus# mkdir images
```

Related Commands **cd**
dir
pwd

move

This command renames or moves a file.

Syntax `move <source-url> <destination-url>`

Parameter	Description
<source-url>	The URL of the source file. See **"URL Syntax and Keyword Usage" on page 7.3** for valid URL syntax.
<destination-url>	The URL of the destination file. See **"URL Syntax and Keyword Usage" on page 7.3** for valid URL syntax.

Mode Privileged Exec

Examples To rename the file `temp.cfg` to `startup.cfg`, use the command:

```
awplus# move temp.cfg startup.cfg
```

To move the file `temp.cfg` from the root of the Flash filesystem to the directory `myconfigs`, use the command:

```
awplus# move temp.cfg myconfigs/temp.cfg
```

Related Commands
delete
edit
show file
show file systems

move debug

This command moves a specified debug file to a destination debug file.

Specify whether the destination is Flash or Card when saving the software to the local filesystem.

Syntax

```
move debug {<destination-url>|card|debug|flash|nvs}
   {<source-url>|card|debug|flash|nvs}
```

Parameter	Description
<destination-url>	The URL where you would like the debug output moved to. See **"URL Syntax and Keyword Usage" on page 7.3** for valid URL syntax.
<source-url>	The URL where the debug output originates. See **"URL Syntax and Keyword Usage" on page 7.3** for valid URL syntax.

Mode Privileged Exec

Example To move debug output onto an SD (or SDHC) card with a filename `my-debug`, use the following command:

```
awplus# move debug card:my-debug
```

Output **Figure 7-4: CLI prompt after entering the move debug command**

```
Enter source file name []:
```

Related Commands

copy debug
delete debug

pwd

This command prints the current working directory.

Syntax `pwd`

Mode Privileged Exec

Example To print the current working directory, use the command:

```
awplus# pwd
```

Related Commands cd

rmdir

This command removes a directory. The directory must be empty for the command to work unless the optional **force** keyword is used to remove all subdirectories or files in a directory.

Syntax `rmdir [force] <url>`

Parameter	Description
`force`	Optional keyword that allows you to delete any directories that are not empty and may contain files or subdirectories.
`<url>`	The URL of the directory.

Mode Privileged Exec

Usage In a stacked environment you can use the CLI on a stack master to access filesystems that are located on another stack member. Refer to the **URL Syntax and Keyword Usage**.

Examples To remove the directory `images` from the top level of the Flash filesystem, use the command:

```
awplus# rmdir flash:/images
```

To force the removal of directory `level1` containing subdirectory `level2`, use the command:

```
awplus# mkdir level1
awplus# mkdir level1/level2
awplus# rmdir force level1
```

To remove a directory called `test` from the top level of the Flash filesystem, in stack member 3, use the command:

```
awplus# rmdir awplus-3/flash:/test
```

Note that you must specify the filesystem, ("flash:" in this example).

Related Commands
cd
dir
mkdir
pwd

show autoboot

This command displays the Autoboot configuration and status.

Syntax `show autoboot`

Mode Privileged Exec

Example To show the Autoboot configuration and status, use the command:

```
awplus# show autoboot
```

Output **Figure 7-5: Example output from the show autoboot command**

```
awplus#show autoboot
Autoboot configuration
------------------------------------------------------------------------------
Autoboot status                  : enabled
SD Card file autoboot.txt exists : yes

Restore information on SD card
Autoboot enable in autoboot.txt  : yes
Restore release file             : x900-5.4.4-0.4.rel (file exists)
Restore configuration file       : network_1.cfg (file exists)
```

Figure 7-6: Example output from the show autoboot command when an external media source is not present

```
awplus#show autoboot
Autoboot configuration
------------------------------------------------------------------------------
Autoboot status                  : enabled
External media source            : SD card not found.
```

Related Commands **autoboot enable**
create autoboot
show boot

show boot

This command displays the current boot configuration.

Syntax `show boot`

Mode Privileged Exec

Example To show the current boot configuration, use the command:

```
awplus# show boot
```

Output **Figure 7-7: Example output from the show boot command with current boot config set on an SD card**

```
awplus#show boot
Boot configuration
-----------------------------------------------------------------
Current software   : x900-5.4.4-0.4.rel
Current boot image : card:/x900-5.4.4-0.4.rel
Backup  boot image : flash:/x900-5.4.4-0.4.rel
Default boot config: flash:/default.cfg
Current boot config: card:/my.cfg (file exists)
Backup  boot config: flash:/backup.cfg (file not found)
Autoboot status    : enabled
```

Figure 7-8: Example output from the show boot command

```
awplus#show boot
Boot configuration
-----------------------------------------------------------------
Current software   : x900-5.4.4-0.4.rel
Current boot image : flash:/x900-5.4.4-0.4.rel
Backup  boot image : flash:/x900-5.4.4-0.4.rel
Default boot config: flash:/default.cfg
Current boot config: flash:/my.cfg (file exists)
Backup  boot config: flash:/backup.cfg (file not found)
Autoboot status    : enabled
```

Table 7-1: Parameters in the output of the show boot command

Parameter	Description
`Current software`	The current software release that the device is using.
`Current boot image`	The boot image currently configured for use during the next boot cycle.
`Backup boot image`	The boot image to use during the next boot cycle if the device cannot load the main image.
`Default boot config`	The default startup configuration file. The device loads this configuration script if no file is set as the startup-config file.
`Current boot config`	The configuration file currently configured as the startup-config file. The device loads this configuration file during the next boot cycle if this file exists.

Parameter	Description
`Backup boot config`	The configuration file to use during the next boot cycle if the main configuration file cannot be loaded.
`Autoboot status`	The status of the Autoboot feature; either enabled or disabled.

Related Commands

autoboot enable
boot config-file backup
boot system backup
show autoboot

show file

This command displays the contents of a specified file.

Syntax `show file {<filename>|<url>}`

Parameter	Description
<filename>	Name of a file on the local Flash filesystem.
<url>	URL of a file.

Mode Privileged Exec

Example To display the contents of the file `oldconfig.cfg`, which is in the current directory, use the command:

```
awplus# show file oldconfig.cfg
```

Related Commands **edit**
edit (URL)
show file systems

show file systems

This command lists the filesystems and their utilization information where appropriate.

If this command is entered on the stack master, it will list the filesystems for all the stack members. A stack member heading is displayed to distinguish the different lists shown for each stack member.

Syntax `show file systems`

Mode Privileged Exec

Examples To display the filesystems for either a standalone device, or a complete stack, use the command:

```
awplus# show file systems
```

Output **Figure 7-9: Example output from the show file systems command**

```
awplus#show file systems

Stack member 1:

Table 7-2: Parameters in the output of the show file systems command

Parameter	Description
`Size (B)` `Available`	The total memory available to this filesystem. The units are given after the value and are M for Megabytes or k for kilobytes.
`Free (B)`	The total memory free within this filesystem. The units are given after the value and are M for Megabytes or k for kilobytes.
`Type`	The memory type used for this filesystem: flash, system, nvs, sdcard, tftp, scp, sftp, or http.
`Flags`	The file setting options: rw (read write), ro (read only).
`Prefixes`	The prefixes used when entering commands to access the filesystems: flash, system, nvs, card, tftp, scp, sftp, or http.
`S/V/D`	The memory type: static, virtual, dynamic.
`Lcl / Ntwk`	Whether the memory is located locally or via a network connection.
`Avail`	Whether the memory is accessible: Y (yes), N (no), - (not appropriate)

show running-config

This command displays the current configuration of the device. The output includes all non-default configuration; default settings are not displayed.

You can control the output in any one of the following ways:

- To display only lines that contain a particular word, follow the command with **| include word**
- To start the display at the first line that contains a particular word, follow the command with **| begin word**
- To save the output to a file, follow the command with **> filename**

For more information, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show running-config`

Mode Privileged Exec and Global Configuration

Example To display the current dynamic configuration of your device, use the command:

```
awplus# show running-config
```

Output **Figure 7-10: Example output from the show running-config command**

```

Use this command to show the running system status and configuration details for community-lists.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show running-config community-list
```

Mode

Privileged Exec and Global Configuration

Example

To display the running system status and configuration details for community-lists use the command:

```
awplus# show running-config community-list
```

Output

Figure 7-14: Example output from the show running-config community list command

```
!
ip community-list standard aspd permit internet
ip community-list expanded cspd deny ljj
ip community-list expanded cspd permit dcv
ip community-list expanded wde permit njhd
ip community-list expanded wer deny sde
```

Related Commands

copy running-config
show running-config

show running-config dhcp

Use this command to display the running configuration for DHCP server, DHCP snooping, and DHCP relay.

Syntax `show running-config dhcp`

Mode Privileged Exec and Global Configuration

Example To display to display the running configuration for DHCP server, DHCP snooping, and DHCP relay:

```
awplus# show running-config dhcp
```

Output **Figure 7-15: Example output from the show running-config dhcp command**

```
!
#show running-config dhcp
no service dhcp-server
!
service dhcp-snooping
!
interface port1.0.1

Related Commands **copy running-config**
show running-config

show running-config full

Use this command to show the complete status and configuration of the running system.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show running-config full`

Mode Privileged Exec and Global Configuration

Example To display the complete status and configuration of the running system, use the command:

```
awplus# show running-config full
```

Output **Figure 7-16: Example output from the show running-config full command**

```
awplus#show running-config full

Related Commands **copy running-config**
show running-config

show running-config interface

This command displays the current configuration of one or more interfaces on the switch.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show running-config interface [<interface-list>]
   [dot1x|ip igmp|ip multicast|ip pim dense-mode|ip pim sparse-mode|
   ipv6 rip|lacp|mstp|ospf|rip|rstp|stp]
```

Parameter	Description
<interface-list>	The interfaces or ports to display information about. An interface-list can be: ■ an interface (e.g. `vlan2`), a switch port (e.g. `port1.0.12`), a static channel group (e.g. `sa3`) or a dynamic (LACP) channel group (e.g. `po4`) ■ a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. `vlan2-8`, or `port1.0.1-1.0.24`, or `sa2-4`, or `po1-3` ■ a comma-separated list of the above; e.g. `port1.0.1,port1.0.8-1.0.24`. Do not mix interface types in a list The specified interfaces must exist.
`dot1x`	Displays running configuration for 802.1X port authentication for the specified interfaces.
`lacp`	Displays running configuration for LACP (Link Aggregation Control Protocol) for the specified interfaces.
`ip igmp`	Displays running configuration for IGMP (Internet Group Management Protocol) for the specified interfaces.
`ip multicast`	Displays running configuration for general multicast settings for the specified interfaces.
`ip pim sparse-mode`	Displays running configuration for PIM-SM (Protocol Independent Multicast - Sparse Mode) for the specified interfaces.
`ip pim dense-mode`	Displays running configuration for PIM-DM (Protocol Independent Multicasting - Dense Mode) for the specified interfaces.
`mstp`	Displays running configuration for MSTP (Multiple Spanning Tree Protocol) for the specified interfaces.
`ospf`	Displays running configuration for OSPF (Open Shortest Path First) for the specified interfaces.
`rip`	Displays running configuration for RIP (Routing Information Protocol) for the specified interfaces.
`ipv6 rip`	Displays running configuration for RIPng (RIP for IPv6) for the specified interfaces.

Parameter	Description
rstp	Displays running configuration for RSTP (Rapid Spanning Tree Protocol) for the specified interfaces.
stp	Displays running configuration for STP (Spanning Tree Protocol) for the specified interfaces.

Mode Privileged Exec and Global Configuration

Examples To display the current running configuration of your switch for ports 1 to 24, use the command:

```
awplus# show running-config interface port1.0.1-port1.0.24
```

To display the current running configuration of a switch for VLAN 1, use the command:

```
awplus# show running-config interface vlan1
```

To display the current running configuration of a switch for VLANs 1 and 3-5, use the command:

```
awplus# show running-config interface vlan1,vlan3-vlan5
```

To display the current OSPF configuration of your switch for ports 1 to 24, use the command:

```
awplus# show running-config interface port1.0.1-port1.0.24
       ospf
```

To display current IGMP configuration for ports 1 to 12 on XEM 1 and 3, use the command:

```
awplus# show running-config interface
       port1.0.1-1.0.12,port1.3.1-1.3.12 ip igmp
```

Output **Figure 7-17: Example output from a show running-config interface port1.0.2 command**

```
awplus#sh running-config interface port1.0.2
!
interface port1.0.2
 switchport
 switchport mode access
!
```

Figure 7-18: Example output from the show running-config interface command

```
awplus#sh running-config interface
interface port1.0.1-1.0.24
 switchport
 switchport mode access
!
interface vlan1
 ip address 192.168.1.1/24
 ip rip authentication mode md5
 ip rip authentication string mykey
 ip irdp
!
interface vlan2
 ip address 192.168.2.2/24
 ip rip authentication mode md5
 ip rip authentication key-chain cars
!
```

Related Commands

copy running-config
show running-config

show running-config router

Use the show running-config router command to display the current running configuration for a given router.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show running-config router <protocol>`

Parameter	Description
<protocol>	bgp | ospf | rip |ipv6 rip | vrrp
`bgp`	Border Gateway Protocol (BGP)
`ospf`	Open Shortest Path First (OSPF)
`rip`	Routing Information Protocol (RIP)
`ipv6 rip`	IPv6 RIP
`vrrp`	Virtual Redundancy Routing Protocol (VRRP)

Mode Privileged Exec and Global Configuration

Example To display the current running configuration for a given router, use the command:

```
awplus# show running-config router ospf
```

Output **Figure 7-30: Example output from the show running-config router command**

```
!
router ospf
 network 192.168.1.0/24 area 0.0.0.0
 network 192.168.3.0/24 area 0.0.0.0
!

Related Commands **copy running-config**
show running-config

show running-config router-id

Use this command to show the running system global router ID configuration.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show running-config router-id`

Mode Privileged Exec and Global Configuration

Example To display the running system global router ID configuration, use the command:

```
awplus# show running-config router-id
```

Output **Figure 7-31: Example output from the show running-config router-id command**

```
!
router-id 3.3.3.3
!
```

Related Commands **copy running-config**
show running-config

show running-config security-password

This command displays the configuration settings for the various security-password rules. If a default parameter is used for a security-password rule, therefore disabling that rule, no output is displayed for that feature.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show running-config security-password`

Mode Privileged Exec and Global Configuration

Example To display the current security-password rule settings in the running-config, use the command:

```
awplus# show running-config security-password
```

Output **Figure 7-32: Example output from the show running-config security-password command**

```
security-password minimum-length 8
security-password minimum-categories 3
security-password history 4
security-password lifetime 30
security-password warning 3
security-password forced-change
```

Related Commands **show security-password configuration**
show security-password user

show startup-config

This command displays the contents of the start-up configuration file, which is the file that the device runs on start-up.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show startup-config`

Mode Privileged Exec

Example To display the contents of the current start-up configuration file, use the command:

```
awplus# show startup-config
```

Output **Figure 7-33: Example output from the show startup-config command**

```
awplus#show startup-config
!

Adding a new switch to a VCStack 8.10
Adding a new feature license to a VCStack 8.13
Upgrading release licensing on a switch 8.16

Introduction

Licensing Types

Allied Telesis devices running AlliedWare Plus software can have three types of software licensing. These licenses enable default software features, additional software features, and software versions.

Allied Telesis devices running AlliedWare Plus software can have base and feature software licensing. These licenses enable default and additional software features.

A base license enables default software features. The default features are determined by region. The region is shown as the OEM Territory in console output.

Feature license keys enable additional software features not included with a base license.

Release license keys are required to enable each major software version from release 5.4.4.

Release licenses are separate from feature licenses. Feature licenses are used to run advanced features, such as Layer 3 routing and IPv6 protocols. Release licenses are used to run new software release files. New software release files contain features and patches.

A license certificate is a file that is used to install release licenses in a convenient manner. It contains release licenses for multiple devices.

See **Licensing Terminology** for definitions of licensing terms used through this chapter.

Release Licenses added in 5.4.4

Prior to AlliedWare Plus software version 5.4.4, software feature licensing was available to enable Allied Telesis devices to run new features and networking protocols. Stack members must have an identical set of licensed features in order for a stack to form.

AlliedWare Plus software version 5.4.4 adds software release licensing keys to control new software release files on Allied Telesis devices. AlliedWare Plus version 5.4.4 has software feature licensing and software release licensing for Allied Telesis devices.

About licensing VCStack

In order for a stack to form, each switch in the stack needs to be running the same version of a software release. Then each SwitchBlade x908 switch must have its own separate valid release license for that software release. SwitchBlade x908 switches that do not have a valid release license for their software release will operate in an unlicensed mode, but will remain valid members of the stack.

Switches will not form a stack unless they have exactly the same features licensed and activated. Switches with different OEM Territories may not form a stack, because features may vary by OEM Territory.

For step-by-step instructions for licensing on stacked switches, see the section **VCStack Licensing Configuration**.

Release Licenses (SwitchBlade x908 only)

Release licenses are linked to MAC addresses. Each SwitchBlade x908 switch has a different release license.

To make it easier for you to apply licenses to devices, you can apply a single file called a license certificate file. The license certificate file contains multiple release licenses listed in Comma Separated Value (CSV) format. The software finds licenses within the file with a matching MAC address of the device, and then applies any matching license to the device.

How to obtain a Release License

Release licenses are either added to a device by a customer, or are installed by the factory. For example, if you purchase a SwitchBlade x908 that is running 5.4.4 release software, a 5.4.4 release license will have been loaded onto it at the factory. However, if you purchase a SwitchBlade x908 that is running 5.4.3 release software, and you wish to upgrade, you will need to load an appropriate release license onto the SwitchBlade x908 yourself.

Note Contact your authorized Allied Telesis support center to obtain a release license.

Unlicensed Operation

The device operates in an unlicensed mode if:

- it does not have a release license key for the currently running software release file, or
- you install a new software release file before installing an appropriate release license.

Unlicensed Restrictions

Unlicensed mode operation displays console messages and updates the log every hour to indicate the device is unlicensed. The **boot system** and **boot system backup** commands are rejected until a release license is applied. This prevents you from setting the device to boot with unlicensed software. Licensed mode operation enables unrestricted usage.

Devices without a valid release license will display a console message at startup and login:

Figure 8-1: Startup and login console output displaying the release license message:

```
11:04:56 awplus IMI[1696]: SFL: The current software is not licensed.

awplus login: manager
Password:
ERROR: No valid release license found for current software version.
This violates the End User License Agreement (EULA) for AlliedWare Plus.

continued support.
```

Software Versions

Each major software release file is specified by a three-digit, period-separated reference number, for example, 5.4.4. A 5.4.4 release license key enables a customer to use associated minor and maintenance releases, and earlier releases.

For example, to use a 5.4.4-0.3 maintenance release or a 5.4.4-1.4 minor release you only need a 5.4.4 major release license key. A 5.4.5 release license key will allow you to use a 5.4.5 software release file, and would also allow you to use a 5.4.4 software release file.

MAC addresses for Release Licenses

A release license is tied to the MAC address of a device. MAC addresses are viewed with the **show system mac** and **show system mac license (SwitchBlade x908 only)** commands. Devices may have several MAC addresses. The **show system mac license (SwitchBlade x908 only)** command is used to find which MAC addresses are used for release licensing.

License Certificate Files (SwitchBlade x908 only)

License Certificate Definition

A license certificate is a file that is used to install release license keys in a convenient manner and can contain release license keys for multiple devices.

The certificate file is accessed by the device using the **license certificate (SwitchBlade x908 only)** command. This makes a device search through the file to apply a license that matches its MAC address.

License certificates are a convenient way to apply release licenses to multiple devices, because the certificate file can store release licenses for multiple devices. The certificate file may be stored on a central TFTP server and each device in the network can be issued with an identical **license certificate (SwitchBlade x908 only)** command.

Figure 8-2: license certificate file showing feature and release license entries:

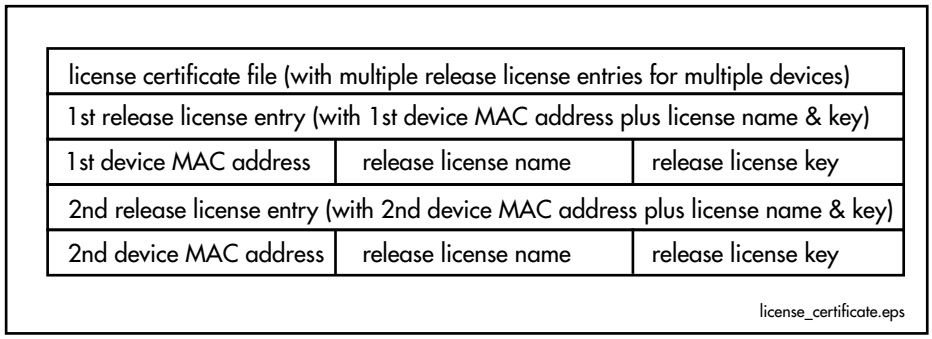

Table 8-1: license certificate file entries and fields:

Label	Description
license certificate file	A Comma Separated Value (CSV) format file that can contain feature license and release license entries for multiple devices.
release license entry	Comprises a device MAC address, a release license name, and a release license key. Multiple entries may be in one certificate file. The figure above shows multiple licenses for multiple devices.
device MAC address	Specifies a device MAC address for the release license.
release license name	Specifies a name of a software version for the device.
release license key	Specifies a key to to allow use of a software version on a device.

A license certificate file is an ASCII-encoded text file in a Comma Separated Value (CSV) format. The file consists of a number of lines of text. Each line is terminated by an end of line character. The file may contain comment lines indicated by the hash (#) character.

The first field of each line is a device's MAC address, encoded as a set of 12 hexadecimal characters (numerals 0 to 9 and characters A to F) with a dash (-) separating every four hexadecimal characters. An example of a MAC address in this format is 000C-25A4-00F0.

The second field of each line is a license label that describes the contents of the license. This field is a string of letters and numbers up to 15 alphanumeric characters in length.

The third field of each line is a license key. It can contain the following symbolic characters: underscore (_) characters, plus (+) signs, forward slash (/) characters, and equal (=) signs. You cannot change the license key. The license key is used to activate the release license.

See the **license certificate (SwitchBlade x908 only)** command that applies a license certificate file to devices.

Figure 8-3: Example license certificate file contents

```
# Release licenses for ABC Consulting
fedd-e557-3c18, 544-SBx908, f7AFZiAA4p9OROHNBjghPyxwThvaUYNdgN8RpCUaVbfk22nw==
```

Table 8-2: Fields in the example license certificate file contents

Parameter	Description
`fedd-e557-3c18`	An example MAC address of the device that a given license name and license key is applied to.
`544-SBx908`	An example license name for a release license. Note that this is only an example and is not a valid release license.
`f7AFZiAA4p9OROHNBjghPyxwThvaUYNdgN8RpCUaVbfk22nw==`	An example generated and encrypted license key. This example license key shown is not a valid encrypted license key.

Licensing Terminology

See the below table for descriptions of Licensing terms used through this chapter:

Term	Description
Activation	A process by which a feature is enabled for a particular release. A set of base features in the release is available on a given device. When a release is activated you are entitled to technical support. Activated devices do not show console or log messages requesting activation. Unlicensed devices display console messages requesting activation and are unsupported.
Feature	A software feature or protocol that is enabled with a valid software license. A software feature license key enables a feature on a device. A license is valid if it is appropriate for a software feature or protocol. For example, an IPv6 feature license will only enable IPv6 not ESPR.
License	A software object that enables features or releases on a device. A license is a combination of an identifying license label and a license key. License keys have internal fields such as an issue date, an expiration interval, a release identifier, a MAC address, and a customer name.
License Certificate (SwitchBlade x908 only)	A plain text file containing a table of license keys in Comma Separated Value (CSV) format. Each line of the file contains a MAC address, a license name, and a license key.
License Key	An encrypted string of characters associated with a particular license that when added to a device enable a feature or release on the device.
License Label	A descriptive name associated with a license. This name may be chosen by a user, though license generation provides a default label for each license. This may also be called a license name.
Release (SwitchBlade x908 only)	A version of the software that runs on a device. A release is typically identified by version numbers, which may include the following: a product number, a major release number, a minor release number, or a maintenance release number. For example, 5.4.4 is a major release, 5.4.4-0.3 is a maintenance release, and 5.4.4-1.4 is a minor release. The software release file will have the suffix .rel at the end of the filename. The product number is prefixed before the software version number. For example, SBx908-5.4.4.rel is the initial major 5.4.4 software release file for SBx908 series switches, where subsequent maintenance releases increment the last digit. Minor version files increment the second to last digit and the last digit. For example, SBx908-5.4.4-1.4.rel is the first minor release after the SBx908-5.4.4-0.3.rel maintenance release.

Applying a new feature license on a stand-alone switch

Feature licenses are applied with the **license** command and validated with the **show license** and **show license brief** commands. Follow these steps to apply feature licenses:

- **Purchase a feature license for a switch**
- **Apply a feature license on a switch**
- **Confirm feature license application on a switch**

Step 1: Purchase a feature license for a switch

Purchase a feature license from your authorized distributor or reseller.

See the AlliedWare Plus datasheet for a list of licenses available by device.

Step 2: Apply a feature license on a switch

Use the **license** command to apply a feature license to your switch.

Note that if the feature license contains a license for a protocol, then that protocol will restart. This action may result in the loss of network traffic. We advise that you should only install licenses during scheduled maintenance for devices operating in a live environment. When you add a feature license you are warned on the console before that feature restarts.

Step 3: Confirm feature license application on a switch

On a stand-alone switch, use the commands **show license** or **show license brief** to confirm feature license application.

AlliedWare Plus switches and chassis have a base feature license applied, which is shown in **show license** and **show license brief** command output.

Figure 8-4: Example show license brief command output showing a base feature license:

```
awplus#show license brief

OEM Territory : ATI USA
Software Release Licenses
-------------------------------------------------------------------------
1     Base License    1            Base License
      Full                         N/A

Current enabled features for displayed licenses:
 EPSR-MASTER, IPv6Basic, LAG-FULL, MLDSnoop, OSPF-64, RADIUS-100, RIP, VRRP
```

Applying a release license on a SwitchBlade x908 switch

Release licenses are applied with the **license certificate (SwitchBlade x908 only)** command, then validated with the **show license** or **show license brief** commands. Follow these steps to apply release licenses:

- **Obtain the MAC address for a SwitchBlade x908 switch**
- **Obtain a release license for a SwitchBlade x908 switch**
- **Apply a release license on a SwitchBlade x908 switch**
- **Confirm release license application**

Step 1: Obtain the MAC address for a SwitchBlade x908 switch

A release license is tied to the MAC address of the switch.

Switches may have several MAC addresses. Use the **show system mac license (SwitchBlade x908 only)** command to show the switch MAC address for release licensing.

Figure 8-5: Example show system mac license output showing a switch MAC address:

```
awplus#show system mac license

MAC address for licensing:

eccd.6d9d.4eed
```

Step 2: Obtain a release license for a SwitchBlade x908 switch

Contact your authorized Allied Telesis support center to obtain a release license.

Step 3: Apply a release license on a SwitchBlade x908 switch

Use the **license certificate (SwitchBlade x908 only)** command to apply a release license to your SwitchBlade x908 switch.

Note the license certificate file can be stored on internal flash memory, or an external SD card, or on a TFTP server accessible by SCP or accessible by HTTP protocols.

Entering a valid release license changes the console message displayed about licensing:

Figure 8-6: Example license certificate command entry changing console message:

```
11:04:56 awplus IMI[1696]: SFL: The current software is not licensed.
awplus#license certificate demo1.csv
A restart of affected modules may be required.
Would you like to continue? (y/n): y
11:58:14 awplus IMI[1696]: SFL: The current software is licensed. Exiting
unlicensed mode.

Stack member 1 installed 1 license

1 license installed.
```

Step 4: Confirm release license application

On a stand-alone SwitchBlade x908 switch, use the commands **show license** or **show license brief** to confirm release license application.

On a stacked SwitchBlade x908 switch, use the command **show license member** or **show license brief member** to confirm release license application.

From release 5.4.4, the **show license** command displays the base feature license and any other feature and release licenses installed on AlliedWare Plus SwitchBlade x908 switches.

Figure 8-7: Example show license brief command output showing a release license:

```
awplus#show license
OEM Territory : ATI USA

```

VCStack Licensing Configuration

This section describes licensing configuration for stacked switches. Stacking requires all switches that form a stack to have matching feature licenses. A stack that does not meet this requirement is an unbalanced stack, and an unbalanced stack will not form on reboot. Perform the following tasks to modify a stack:

- **Adding a new switch to a VCStack**
- **Adding a new feature license to a VCStack**
- **Upgrading release licensing on a switch**

See the **VCStack Introduction** chapter section **Stack Formation** for stack formation information, and see section **VCStack Introduction** for stacking overview information.

Note that to maintain consistent behavior across the stack, all member switches must have the same licenses enabled.

Adding a new switch to a VCStack

Follow this section to add a new switch to a VCStack. If you need to add a new feature to an existing VCStack then follow the section **Adding a new feature license to a VCStack**.

The same feature licenses that are applied to the existing stack members must be applied to a new switch. This section assumes a new switch is installed, but it is not licensed.

Perform the following tasks to add a new switch to a VCStack:

- **Apply a feature license to a VCStack**
- **Obtain license information from a new switch**
- **Apply the feature licenses to the new switch**
- **Connect the new switch to the stack and reboot the new switch**

Step 1: Obtain existing VCStack license information

Use the **show license member all** command to display full list output of all licenses per stack member. Use the **show license brief member all** command for brief table output per stack member.

Note that the **show license** command will display licenses applied to a stack master only. If there is an existing stack, then the master and the members will all have the same feature licenses.

Step 2: Obtain license information from a new switch

Use the **show license** command to display full output of licenses applied to the new switch. Use the **show license brief** command to display brief table output instead of full list output.

Step 3: Apply the feature licenses to the new switch

Use the **license** command to apply the required feature licenses to the new switch.

Figure 8-8: Example license command entry to add a feature license to a member:

```
awplus#license IPv6 Qd0NvZJ8DutyLAYbsM8pCpY1d8Ho9mzygweBp+paBqVu7By1bTZ+Jipo57
A restart of affected modules may be required.
Would you like to continue? (y/n): y

Stack member 1 installed 1 license

1 license installed.
```

Step 4: Connect the new switch to the stack and reboot the new switch

Use either the **reboot** command or the **reload** command to reboot the new switch. The stack will form on reboot with matching feature licenses on all stack members.

Figure 8-9: Example reboot entry output showing a valid license console message:

```
reboot system? (y/n): y

URGENT: broadcast message:
System going down IMMEDIATELY!

        ... Rebooting at user request ...

If feature licenses differ between stack members the stack will not form and the new switch will become a disabled master. See the **Disabled Master** section in the **VCStack Introduction** chapter for further information.

See console messages displayed at startup indicating disabled master and stack formation.

Figure 8-10: Example startup indicating the disabled master and no stack formation:

```
12:37:06 awplus-2 VCS[1869]: Stack Virtual MAC is 0000.cd37.01e0
12:37:16 awplus-2 VCS[1869]: Software feature licensing incompatible, Member 2
will boot as a standalone system.
12:37:16 awplus-2 VCS[1869]: Member 2 (eccd.6d5a.b85a) has become the Disabled
Master
12:37:16 awplus VCS[1869]: Member 1 (eccd.6d48.e560) has left the stack
12:37:16 awplus VCS[1869]: Member 3 (eccd.6d5e.2614) has left the stack
```

See the **show stack** output for the disabled master without stack formation

Figure 8-11: Example show stack output for disabled master without stack formation:

```
awplus#show stack
Virtual Chassis Stacking summary information

ID    Pending ID  MAC address         Priority  Status  Role
1     -           -                   -         -       Provisioned
2     -           eccd.6d5a.b85a      128       Ready   Disabled Master
3     -           -                   -         -       Provisioned

Operational Status                  Operating in failover mode
Stack MAC address                   eccd.6d5a.b85a
```

If there is a feature license mismatch then wait until the new switch boots and becomes a disabled master. Login to the disabled master and repeat this procedure to apply the feature license to it.

If there is a release license mismatch then wait until the new SwitchBlade x908 switch boots then login and follow the process **Apply a release license on a SwitchBlade x908 switch** to update the license. The SwitchBlade x908 switch will form a stack, but the SwitchBlade x908 switch will operate in the unsupported unlicensed mode.

After updating the release license on the existing stack, no **reboot** or **reload** is necessary. A message will display on the console to confirm the release is now licensed on the stack.

Adding a new feature license to a VCStack

Follow this section to add a new feature license to a VCStack. If you need to add a new switch to a VCStack then follow the section **Adding a new switch to a VCStack**.

Perform the following tasks to add a new feature license to a VCStack:

- **Apply a feature license to a VCStack**
- **Reboot the stack**

Step 1: Apply a feature license to a VCStack

Use the **license** command to apply the required feature license to the VCStack. In a stacked configuration, the **license** command will add a license to all stack members and the **no license** command will remove a license from all stack members.

Previously, feature licenses were applied to each stack member using the **license member** command. Since version 5.4.4, the **license** command applies feature licenses to all stack members. You do not need to use the **remote-login** command to login to stack members from a master.

Figure 8-12: Example license command entry to add a feature license to a member:

```
awplus#license IPv6 Qd0NvZJ8DutyLAYbsM8pCpY1d8Ho9mzygweBp+paBqVu7By1bTZ+Jipo57
A restart of affected modules may be required.
Would you like to continue? (y/n): y

Stack member 1 installed 1 license

1 license installed.
```

Step 2: Reboot the stack

Use either the **reboot** command or the **reload** command to reboot the stack after the feature has restarted on all stack members. The stack will form on reboot with matching feature licenses on all stack members. Note this is optional, but it is good practice to check the stack.

Figure 8-13: Example reboot entry output showing a valid license console message:

```
reboot system? (y/n): y

URGENT: broadcast message:
System going down IMMEDIATELY!

        ... Rebooting at user request ...

Flushing file system buffers...
Unmounting any remaining filesystems...
Restarting system.

Bootloader 2.0.13 loaded
Press <Ctrl+B> for the Boot Menu

Verifying release... OK
Booting...
Starting base/first...                                  [  OK  ]
Mounting virtual filesystems...                         [  OK  ]

          _________________  _____

```

See the **show stack** output for the disabled master without stack formation

Figure 8-15: Example show stack output for disabled master without stack formation:

```
awplus#show stack
Virtual Chassis Stacking summary information

ID    Pending ID  MAC address        Priority  Status  Role
1     -           -                  -         -       Provisioned
2     -           eccd.6d5a.b85a     128       Ready   Disabled Master
3     -           -                  -         -       Provisioned

Operational Status                 Operating in failover mode
Stack MAC address                  eccd.6d5a.b85a
```

Login to the disabled master and repeat this procedure to apply the feature license to it.

If there is a release license mismatch then wait until the switch boots then login and follow the process **Apply a release license on a SwitchBlade x908 switch** to update the license. The switch will form a stack, but the switch will operate in the unsupported unlicensed mode.

Upgrading release licensing on a switch

This process assumes that an existing stack has formed. Follow this process if you are adding a new switch to a stack, or if you are upgrading switches in a stack. Release licenses are tied to individual switches as stack members, not to stack members in a stack.

Before starting this process, confirm if a new release license is needed on the existing stack. Use the **show license member brief all** command to display release licenses.

If there is no release license on the stack that matches the release license on the new switch, then follow the section **Applying a release license on a SwitchBlade x908 switch**. The same procedure applies for both adding and upgrading release licenses on stand-alone and stacked switches.

The **license certificate (SwitchBlade x908 only)** command applies release licenses in the certificate file to any devices in the stack that match the MAC addresses shown in the license certificate file.

If the license certificate file contains all the required release licenses for all stack members, then you can run the **license certificate (SwitchBlade x908 only)** command once on the stack master to apply release licenses to all stack members automatically.

Chapter 9: Licensing Commands

Command List 9.2
license 9.2
license certificate (SwitchBlade x908 only) 9.4
license member (deleted) 9.4
show license 9.5
show license brief 9.7
show license member 9.9
show license brief member 9.11
show system mac license (SwitchBlade x908 only) 9.13

Command List

This chapter provides an alphabetical reference for each of the License commands.

license

This command activates the licensed software feature set on a standalone switch, or a stack of switches.

Use the **no** variant of this command to deactivate the licensed software feature set on a standalone switch, or a stack of switches.

For feature licenses, contact your authorized distributor or reseller. If a license key expires or is incorrect so the license key is invalid, then some software features will be unavailable.

Note

See the AlliedWare Plus™ datasheet for a list of current feature licenses available by product, and the AlliedWare Plus™ How To notes for information on obtaining them. Purchase licenses from your authorized dealer or reseller.

Only install feature licences during scheduled maintenance for any devices in a live environment. For example, if a feature license includes EPSR, EPSR is restarted with a temporary loss of EPSR network traffic.

Syntax

```
license <label> <key>
no license <label>
```

Parameter	Description
<label>	A name for the feature license. To determine names already in use, use the **show license** command. This can be the default name supplied for the feature, or a renamed feature name.
<key>	The encrypted license key to enable a set of software features.

Mode Privileged Exec

Usage You can change the license label using this command to make it specific to you when you initially add a license. Once a license is added, any change to the license label first requires removal of the license before adding a license again with a new license label .

The default feature license labels are issued along with encrypted license keys by e-mail for you to apply using this command to activate features. You can change default feature license labels, but they must be 15 characters or less to be accepted with the issued keys.

For example, you may want to change the label of the advanced L3 license to “adv-L3-license”. You can check your new license label by using the **show license** command.

In a stacked configuration, the **license** command will add a license to all stack members and the **no license** command will remove a license from all stack members.

You can add a license to a specified stack member after first using the **remote-login** command from the stack master. Adding or deleting licenses on individual switches can cause different members of the stack to have different features enabled, which may cause the stack to fail to operate correctly. Unbalanced stack members will not form a stack. Stack members require the same feature licenses to be balanced.

If you add a feature license you will be prompted at the console that the feature needs to restart. For example, if the feature license contains a license for the EPSR protocol, then that protocol will restart. This action may result in the loss of network traffic. Only install licenses in scheduled maintenance periods for devices in a live environment.

Examples To activate the license `name1` with the key `12345678ABCDE123456789ABCDE`, use the command:

```
awplus# license name1 12345678ABCDE123456789ABCDE
```

Output **Figure 9-1: Example license command entry to add a release license:**

```
awplus#license 544 Qd0NvZJ8DutyLAYbsM8pCpY1d8Ho9mzygweBp+paBqVu7By1bTZ+Jipo57
A restart of affected modules may be required.

Stack member 1 installed 1 license

1 license installed.

awplus#10:20:08 awplus IMI[1718]: SFL: The current software is licensed. Exiting
unlicensed mode.
```

To deactivate the license `name1`, use the command:

```
awplus# no license name1
```

Output **Figure 9-2: Example license command entry to remove a feature license:**

```
awplus#no license IPv6
Stack member 1: Removal of "IPv6" will disable the following features:
 IPv6

INFO: Uninstalling license key will disable the affected modules immediately.
Would you like to continue? (y/n): y

Stack member 1 removed 1 license

1 license removed.
```

Validation Command **show license**

Related Commands **license certificate (SwitchBlade x908 only)**
show license member

license certificate (SwitchBlade x908 only)

This command enables you to apply software release licenses from a license certificate file to a standalone SwitchBlade x908 switch, or a stack of SwitchBlade x908 switches.

See the **License Certificate Files (SwitchBlade x908 only)** section in this chapter for a description of the contents of a license certificate file.

Note Contact your authorized Allied Telesis support center to obtain a release license.

Syntax `license certificate <certificate-url>`

Parameter	Description
<certificate-url>	Specify the URL of the certificate file. This can be a file name of a certificate file stored on the device, or it can be a TFTP path specifying the address of the site plus the file name.

Mode Privileged Exec

Example To apply release licenses from the certificate file `certificate.txt` stored at the TFTP IP address `172.16.1.121`, use the following command:

```
awplus# license certificate tftp://172.16.1.121/
       certificate.txt
```

Output **Figure 9-3: Example output from the license certificate command showing the number of license keys applied to a device:**

```
awplus# license certificate tftp://172.16.1.121/certificate.txt

%% 2 licenses applied
```

Validation Command **show license**

Related Commands **license**
show system mac license (SwitchBlade x908 only)

license member (deleted)

This command has been deleted. Use the **license** command to apply licenses to members

In a stacked configuration, the **license** command will add a license to all stack members and the **no license** command will remove a license from all stack members.

show license

This command displays information about a specific software feature or release license, or all enabled software feature or release licenses on the device.

Syntax `show license [feature|release] [<label>|index <index-number>]`

Parameter	Description
`feature`	Only display license information for any applied feature licenses.
`release`	Only display license information for any applied release licenses. Note that this parameter is only for SwitchBlade x908 switches.
<label>	The license name of the software feature or software release to show information about. The release name or license name can be used instead of the index number to identify a specific license.
`index` *<index-number>*	The index number of the software feature or release license to show information about. The index number can be used instead of the license name to identify a specific license.

Mode User Exec and Privileged Exec

Usage In a stacked configuration, use the **show license member** command to display license information about either a specific licensed software feature or release, or all software feature and release licenses enabled on a specific stack member or on all stack members.

Note that the **show license** command will display licenses applied to a stack master only.

Examples To display full information about all enabled licenses, use the command:

```
awplus# show license
```

To display full information about the licenses with index number 1, use the command:

```
awplus# show license index 1
```

Output **Figure 9-4: Example output from the show license command showing a base license with index 1 followed by a release license with index 2:**

```
awplus#show license
OEM Territory : ATI Europe
Software Licenses
------------------------------------------------------------------------
Index                          : 1
License name                   : Base License

```

Table 9-1: Parameters in the output of the show license command:

Parameter	Description
OEM Territory	Name of the region for the Base License features.
Index	Index identifying entry. The index is assigned automatically by the software. It is not configured.
License name	Name of the license key bundle (case-sensitive).
Customer name	Customer name.
Quantity of licenses	Quantity of licensed installations.
Type of license	Full or Trial.
License issue date	Date the license was generated.
License expiry date	Expiry date for trial license.
Features included	List of features included in the feature license.
Release	Software version supported in the release license.

Related Commands

license
license certificate (SwitchBlade x908 only)
show license brief
show license member

show license brief

This command displays information about a specific software feature or release license, or all enabled software feature or release licenses on the device.

In a stacked configuration, use the **show license member** command to display license information about either a specific licensed software feature or release, or all software feature or release licenses enabled on a specific stack member or on all stack members.

Syntax `show license [feature|release] [<label>|index <index-number>] brief`

Parameter	Description
`feature`	Only display license information for any applied feature licenses.
`release`	Only display license information for any applied release licenses.
`<label>`	The license name of the software feature or software release to show information about. The release name or license name can be used instead of the index number to identify a specific license.
`index <index-number>`	The index number of the software feature or release license to show information about. The index number can be used instead of the license name to identify a specific license.
`brief`	Displays a brief summary of release and feature license information.

Mode User Exec and Privileged Exec

Examples To display a brief summary of information about all feature licenses, use the command:

```
awplus# show license feature brief
```

Output **Figure 9-5: Example output from the show license brief command:**

```
awplus#show license brief
OEM Territory : ATI Europe
Software Licenses
-------------------------------------------------------------------------
Index License name    Quantity     Customer name
      Type            Version      Period
-------------------------------------------------------------------------
1     Base License    1            Base License
      Full                         N/A

Current enabled features for displayed licenses:
 IPv6Basic, LAG-FULL, MLDSnoop, RADIUS-100, VCS, VRRP
```

To display a brief summary of information about all release licenses, use the command:

```
awplus# show license release brief
```

Figure 9-6: Example output from the show license release brief command:

```
awplus#show license release brief
OEM Territory : ATI USA
Software Release Licenses
-------------------------------------------------------------------------

show license member

show license member

Use this command to display information about either a specific software license, or all software feature licenses enabled on either a specific stack member or all stack members.

Syntax `show license [<label>] member [<1-8>|all]`

Parameter	Description
<label>	The name of the license to show information about.
<1-8>	The ID of the stack member to show information about.
`all`	Display information about all stack members.

Mode User Exec and Privileged Exec

Usage Use the **show license member all** command to display full list output of all licenses per stack member.

Examples To display full information about all enabled licenses on all stack members, use the command:

```
awplus# show license member all
```

To display full information about all enabled licenses on stack member 2, use the command:

```
awplus# show license member 2
```

To display full information about the license `name1` on all stack members, use the command:

```
awplus# show license name1 member all
```

Output **Figure 9-7: Example output from the show license member command:**

```
awplus#show license member all
OEM Territory : ATI Europe

show license brief member

show license brief member

Use this command to display information about either a specific software license, or all software feature licenses enabled on either a specific stack member or all stack members.

Syntax `show license [<label>] brief member [<1-8>|all]`

Parameter	Description
`<label>`	The name of the license to show information about.
`brief`	Display a brief summary of license information.
`<1-8>`	The ID of the stack member to show information about.
`all`	Display information about all stack members.

Mode User Exec and Privileged Exec

Usage Use the **show license brief member all** command for brief table output of all licenses per stack member.

Examples To display a brief summary of information about all enabled licenses on stack member 2, use the command:

```
awplus# show license brief member 2
```

To display a brief summary about all enabled licenses on all stack members, use the command:

```
awplus# show license brief member all
```

To display a brief summary about the license `name1` on all stack members, use the command:

```
awplus# show license name1 brief member all
```

Output **Figure 9-8: Example output from the show license brief member command:**

```

show system mac license (SwitchBlade x908 only)

This command displays the physical MAC address on a standalone switch, or a stack, required for applying release licenses with the **license certificate (SwitchBlade x908 only)** command.

Syntax

```
show system mac license
```

Mode

User Exec and Privileged Exec

Usage

See the related **license certificate (SwitchBlade x908 only)** command to apply a license certificate file containing release licenses per device MAC address.

Example

To display the physical MAC address on a standalone switch, or a stack, for release licensing, enter the following command:

```
awplus# show system mac license
```

Output

Figure 9-9: Example output from the show system mac license (SwitchBlade x908 only) command showing the MAC address required for release licensing:

```
awplus#show system mac license
MAC address for licensing:
eccd.6d9d.4eed
```

Command List

This chapter provides an alphabetical reference of commands for configuring and monitoring the system.

banner exec

This command configures the User Exec mode banner that is displayed on the console after you login. The **banner exec default** command restores the User Exec banner to the default banner. Use the **no banner exec** command to disable the User Exec banner and remove the default User Exec banner.

Syntax

```
banner exec <banner-text>
banner exec default
no banner exec
```

Default By default, the AlliedWare Plus™ version and build date is displayed at console login, such as:

```
AlliedWare Plus (TM) 5.4.1 07/27/10 00:44:25
```

Mode Global Configuration

Examples To configure a User Exec mode banner after login, enter the following commands:

```
awplus#configure terminal
awplus(config)#banner exec enable to move to Priv Exec mode
awplus(config)#exit
awplus#exit

awplus login: manager
Password:
enable to move to Priv Exec mode
awplus>
```

To restore the default User Exec mode banner after login, enter the following commands:

```
awplus#configure terminal
awplus(config)#banner exec default
awplus(config)#exit
awplus#exit

awplus login: manager
Password:

AlliedWare Plus (TM) 5.4.1 11/14/10 13:03:59

awplus>
```

To remove the User Exec mode banner after login, enter the following commands:

```
awplus#configure terminal
awplus(config)#no banner exec
awplus(config)#exit
awplus#exit

awplus login: manager
Password:
awplus>
```

Related Commands

banner login (system)
banner motd

banner login (system)

This command configures the login banner that is displayed on the console when you login. The login banner is displayed on all connected terminals. The login banner is displayed after the MOTD (Message-of-the-Day) banner and before the login username and password prompts.

Use the **no banner login** command to disable the login banner.

Syntax

```
banner login
no banner login
```

Default By default, no login banner is displayed at console login.

Mode Global Configuration

Examples To configure a login banner to be displayed when you login, enter the following commands:

```
awplus#configure terminal
awplus(config)#banner login
Type CNTL/D to finish.
authorised users only
awplus(config)#exit
awplus#exit

authorised users only
awplus login: manager
Password:

AlliedWare Plus (TM) 5.4.1 11/14/10 13:03:59

awplus>
```

To remove the login banner, enter the following commands:

```
awplus#configure terminal
awplus(config)#no banner login
awplus(config)#exit
awplus#exit

awplus login: manager
Password:

awplus>
```

Related Commands **banner exec**
banner motd

banner motd

Use this command to change the text MOTD (Message-of-the-Day) banner displayed before login. The MOTD banner is displayed on all connected terminals. The MOTD banner is useful for sending messages that affect all network users, for example, any imminent system shutdowns.

Use the **no** variant of this command to not display a text MOTD (Message-of-the-Day) banner on login.

Syntax

```
banner motd <motd-text>
no banner motd
```

Default By default, the switch displays the AlliedWare Plus™ OS version and build date before login.

Mode Global Configuration

Examples To configure a MOTD banner to be displayed when you login, enter the following commands:

```
awplus>enable
awplus#configure terminal
awplus(config)#banner motd system shutdown at 6pm
awplus(config)#exit
awplus#exit

system shutdown at 6pm
awplus login: manager
Password:

AlliedWare Plus (TM) 5.4.1 11/14/10 13:03:59
```

To remove the login banner, enter the following commands:

```
awplus>enable
awplus#configure terminal
awplus(config)#no banner motd
awplus(config)#exit
awplus#exit

awplus login: manager
Password:

AlliedWare Plus (TM) 5.4.1 11/14/10 13:03:59

awplus>
```

Related Commands banner exec
banner login (system)

clock set

This command sets the time and date for the system clock.

Syntax `clock set <hh:mm:ss> <day> <month> <year>`

Parameter	Description
<hh:mm:ss>	Local time in 24-hour format
<day>	Day of the current month <1-31>
<month>	The first three letters of the current month.
<year>	Current year <2000-2035>

Mode Privileged Exec

Usage Configure the timezone before setting the local time. Otherwise, when you change the timezone, the device applies the new offset to the local time.

Note If Network Time Protocol (NTP) is enabled, then you cannot change the time or date using this command. NTP maintains the clock automatically using an external time source. If you wish to manually alter the time or date, you must first disable NTP.

Example To set the time and date on your system to 2pm on the 2nd of April 2007, use the command:

```
awplus# clock set 14:00:00 2 apr 2007
```

Related Commands clock timezone

clock summer-time date

This command defines the start and end of summertime for a specific year only, and specifies summertime's offset value to Standard Time for that year.

The **no** variant of this command removes the device's summertime setting. This clears both specific summertime dates and recurring dates (set with the **clock summer-time recurring** command on page 10.10).

By default, the device has no summertime definitions set.

Syntax

```
clock summer-time <timezone-name> date <start-day> <start-month>
   <start-year> <start-time> <end-day> <end-month> <end-year>
   <end-time> <1-180>

no clock summer-time
```

Parameter	Description
<timezone-name>	A description of the summertime zone, up to 6 characters long.
date	Specifies that this is a date-based summertime setting for just the specified year.
<start-day>	Day that the summertime starts, in the range 1-31.
<start-month>	First three letters of the name of the month that the summertime starts.
<start-year>	Year that summertime starts, in the range 2000-2035.
<start-time>	Time of the day that summertime starts, in the 24-hour time format HH:MM.
<end-day>	Day that summertime ends, in the range 1-31.
<end-month>	First three letters of the name of the month that the summertime ends.
<end-year>	Year that summertime ends, in the range 2000-2035.
<end-time>	Time of the day that summertime ends, in the 24-hour time format HH:MM.
<1-180>	The offset in minutes.

Mode Global Configuration

Examples To set a summertime definition for New Zealand using NZST (UTC+12:00) as the standard time, and NZDT (UTC+13:00) as summertime, with the summertime set to begin on the 1st October 2007 and end on the 18th of March 2008:

```
awplus(config)# clock summer-time NZDT date 1 oct 2:00 2007 18
                mar 2:00 2008 60
```

To remove any summertime settings on the system, use the command:

```
awplus(config)# no clock summer-time
```

Related Commands **clock summer-time recurring**
clock timezone

clock summer-time recurring

This command defines the start and end of summertime for every year, and specifies summertime's offset value to Standard Time.

The **no** variant of this command removes the device's summertime setting. This clears both specific summertime dates (set with the **clock summer-time date** command on page 10.8) and recurring dates.

By default, the device has no summertime definitions set.

Syntax

```
clock summer-time <timezone-name> recurring <start-week> <start-day>
   <start-month> <start-time> <end-week> <end-day> <end-month>
   <end-time> <1-180>

no clock summer-time
```

Parameter	Description
<timezone-name>	A description of the summertime zone, up to 6 characters long.
`recurring`	Specifies that this summertime setting applies every year from now on.
<start-week>	Week of the month when summertime starts, in the range 1-5. The value 5 indicates the last week that has the specified day in it for the specified month. For example, to start summertime on the last Sunday of the month, enter **5** for *<start-week>* and **sun** for *<start-day>*.
<start-day>	Day of the week when summertime starts. Valid values are **mon**, **tue**, **wed**, **thu**, **fri**, **sat** or **sun**.
<start-month>	First three letters of the name of the month that summertime starts.
<start-time>	Time of the day that summertime starts, in the 24-hour time format HH:MM.
<end-week>	Week of the month when summertime ends, in the range 1-5. The value 5 indicates the last week that has the specified day in it for the specified month. For example, to end summertime on the last Sunday of the month, enter **5** for *<end-week>* and **sun** for *<end-day>*.
<end-day>	Day of the week when summertime ends. Valid values are **mon**, **tue**, **wed**, **thu**, **fri**, **sat** or **sun**.
<end-month>	First three letters of the name of the month that summertime ends.
<end-time>	Time of the day that summertime ends, in the 24-hour time format HH:MM.
<1-180>	The offset in minutes.

Mode Global Configuration

Examples To set a summertime definition for New Zealand using NZST (UTC+12:00) as the standard time, and NZDT (UTC+13:00) as summertime, with summertime set to start on the 1st Sunday in October, and end on the 3rd Sunday in March, use the command:

```
awplus(config)# clock summer-time NZDT recurring 1 sun oct 2:00
                3 sun mar 2:00 60
```

To remove any summertime settings on the system, use the command:

```
awplus(config)# no clock summer-time
```

Related Commands **clock summer-time date**
clock timezone

clock timezone

This command defines the device's clock timezone. The timezone is set as a offset to the UTC.

The **no** variant of this command resets the system time to UTC.

By default, the system time is set to UTC.

Syntax

```
clock timezone <timezone-name> {minus|plus} [<0-13>|<0-12>:<00-59>]
no clock timezone
```

Parameter	Description
<timezone-name>	A description of the timezone, up to 6 characters long.
`minus` or `plus`	The direction of offset from UTC. The **minus** option indicates that the timezone is behind UTC. The **plus** option indicates that the timezone is ahead of UTC.
<0-13>	The offset in hours or from UTC.
<0-12>:<00-59>	The offset in hours or from UTC.

Mode Global Configuration

Usage Configure the timezone before setting the local time. Otherwise, when you change the timezone, the device applies the new offset to the local time.

Examples To set the timezone to New Zealand Standard Time with an offset from UTC of +12 hours, use the command:

```
awplus(config)# clock timezone NZST plus 12
```

To set the timezone to Indian Standard Time with an offset from UTC of +5:30 hours, use the command:

```
awplus(config)# clock timezone IST plus 5:30
```

To set the timezone back to UTC with no offsets, use the command:

```
awplus(config)# no clock timezone
```

Related Commands
clock set
clock summer-time date
clock summer-time recurring

continuous-reboot-prevention

Use this command to enable and to configure the continuous reboot prevention feature. Continuous reboot prevention allows the user to configure the time period during which reboot events are counted, the maximum number of times the switch can reboot within the specified time period, referred to as the threshold, and the action to take if the threshold is exceeded.

Use the **no** variant of this command to disable the continuous reboot prevention feature or to return the **period**, **threshold** and **action** parameters to the defaults.

Syntax

```
continuous-reboot-prevention enable

continuous-reboot-prevention [period <0-604800>] [threshold <1-10>]
   [action [linkdown|logonly|stopreboot]]

no continuous-reboot-prevention enable

no continuous-reboot-prevention [period] [threshold] [action]}
```

Parameter	Description	
`enable`	Enable the continuous reboot prevention feature.	
`period`	Set the period of time in which reboot events are counted.	
	<0-604800>	Period value in seconds. The default is 600.
`threshold`	Set the maximum number of reboot events allowed in the specified period.	
	<1-10>	Threshold value. The default is 1.
`action`	Set the action taken if the threshold is exceeded.	
	`linkdown`	Reboot procedure continues and all switch ports and stack ports stay link-down. The reboot event is logged. This is the default action .
	`logonly`	Reboot procedure continues normally and the reboot event is logged.
	`stopreboot`	Reboot procedure stops until the user enters the key "c" via the CLI. Normal reboot procedure then continues and the reboot event is logged.

Default Continuous reboot prevention is disabled by default. The default `period` value is `600`, the default `threshold` value is `1` and the default `action` is `linkdown`.

Mode Global Configuration

Examples To enable continuous reboot prevention, use the commands:

```
awplus# configure terminal
awplus(config)# continuous-reboot-prevention enable
```

To set the `period` to `500` and `action` to `stopreboot`, use the commands:

```
awplus# configure terminal
awplus(config)# continuous-reboot-prevention period 500
action stopreboot
```

To return the `period` and `action` to the defaults and keep the continuous reboot prevention feature enabled, use the commands:

```
awplus# configure terminal
awplus(config)# no continuous-reboot-prevention period action
```

To disable continuous reboot prevention, use the commands:

```
awplus# configure terminal
awplus(config)# no continuous-reboot-prevention enable
```

diagnostic monitor pcsping

Use this command to disable or configure the background PCS (Physical Coding Sublayer) ping monitoring feature to either output a log message or to power off a XEM when a background PCS ping check fails.

Use the **no** variant of this command to re-enable the PCS ping monitoring feature, or restore default behavior to output a log message and not power off a XEM.

The background PCS ping feature is enabled by default to output log messages.

Syntax

```
diagnostic monitor pcsping {disable|power-off}
no diagnostic monitor pcsping {disable|power-off}
```

Parameter	Description
`disable`	Select this required parameter to disable the background PCS (Physical Coding Sublayer) ping monitoring feature (not recommended). Negate a **diagnostic monitor pcsping disable** command to re-enable the background PCS ping feature.
`power-off`	Select this required parameter to power off a XEM if a background PCS (Physical Coding Sublayer) ping is not received on a XEM. Negate a **diagnostic monitor pcsping power-off** command to output a log message instead of powering off a XEM, restoring default behavior.

Default This feature is enabled by default to log a message when a background PCS ping check fails. Default behavior is restored by negating a **diagnostic monitor pcsping power-off** command.

Mode Global Configuration

Usage The background PCS ping feature implements background hardware monitoring to ensure the connections between the switch and the XEMs are working correctly, which is done by this feature periodically sending PCS pings to connected XEMs on a switch, by default.

A PCS ping is a small message that is sent across a switch link at the PHY layer. The PCS ping message contains data that identifies the source at one end of the link. If a PCS ping message is delivered then a XEM to switch link works.

To re-enable background PCS ping monitoring negate a **diagnostic monitor pcsping disable** command. A **no diagnostic monitor pcsping disable** command will re-enable the feature.

To log a message and not power off a XEM, negate a **diagnostic monitor pcsping power-off** command. A **no diagnostic monitor pcsping power-off** command will not power off a XEM.

Note

We recommend that you do not disable the PCSping function, because this may conceal the existence of a faulty XEM module.

Examples To disable the background PCS ping monitoring feature, use the following commands:

```
awplus# configure terminal
awplus(config)# diagnostic monitor pcsping disable
```

Output **Figure 10-1: Example output from a show diagnostic monitor pcsping command after issuing a diagnostic monitor pcsping disable command to disable the feature**

```
awplus# configure terminal
awplus(config)# diagnostic monitor pcsping disable
awplus(config)# exit
awplus# show diagnostic monitor pcsping
Background PCS Ping Monitoring Information
Enabled: No
Power-off XEM if a PCS Ping fails: No
```

To re-enable the background PCS ping monitoring feature, use the following commands:

```
awplus# configure terminal
awplus(config)# no diagnostic monitor pcsping disable
```

Output **Figure 10-2: Example output from a show diagnostic monitor pcsping command after issuing a no diagnostic monitor pcsping disable command to re-enable the feature**

```
awplus# configure terminal
awplus(config)# no diagnostic monitor pcsping disable
awplus(config)# exit
awplus# show diagnostic monitor pcsping
Background PCS Ping Monitoring Information
Enabled: Yes
Power-off XEM if a PCS Ping fails: No
```

To power off a XEM when a background PCS ping check fails, use the following commands:

```
awplus# configure terminal
awplus(config)# diagnostic monitor pcsping power-off
```

Output **Figure 10-3: Example output from a show diagnostic monitor pcsping command after issuing a diagnostic monitor pcsping power-off command to configure XEM power-off**

```
awplus# configure terminal
awplus(config)# diagnostic monitor pcsping power-off
awplus(config)# exit
awplus# show diagnostic monitor pcsping
Background PCS Ping Monitoring Information
Enabled: Yes
Power-off XEM if a PCS Ping fails: Yes
```

To not power off a XEM, and only log a message, when a background PCS ping check fails, use the following commands:

```
awplus# configure terminal
awplus(config)# no diagnostic monitor pcsping power-off
```

Output **Figure 10-4: Example output from a show diagnostic monitor pcsping command after issuing a no diagnostic monitor pcsping power-off command to restore log output**

```
awplus# configure terminal
awplus(config)# no diagnostic monitor pcsping power-off
awplus(config)# exit
awplus# show diagnostic monitor pcsping
Background PCS Ping Monitoring Information
Enabled: Yes
Power-off XEM if a PCS Ping fails: No
```

Validation Commands **show diagnostic monitor pcsping**
show running-config

ecofriendly led

Use this command to enable the eco-friendly LED (Light Emitting Diode) feature which turns off power to the port LEDs on XEMs installed in the switch, the stack ID LED on the XEM-STK and all port LEDs on the switch, except the eth0 port. On the switch, power to the fault, SD and PSU LEDs is not disabled, and in addition, on the SwitchBlade® x908 power to the stacking status LED is not disabled. On the XEM-1XP and XEM-2XP power to the XFP LED is not disabled.

Use the **no** variant of this command to disable the eco-friendly LED feature.

Syntax

```
ecofriendly led
no ecofriendly led
```

Default The eco-friendly LED feature is disabled by default.

Mode Global Configuration

Usage When the eco-friendly LED feature is enabled, a change in port status will not affect the display of the associated LED. When the eco-friendly LED feature is disabled and power is returned to port LEDs, the LEDs will correctly show the current state of the ports.

In a stack environment, enabling the eco-friendly LED feature on the stack master will apply the feature to every member of the stack.

For an example of how to configure a trigger to enable the eco-friendly LED feature, see **"Turn Off Power to Port LEDs" on page 105.7**. See also the section **"Save Power With the Eco-Friendly Feature" on page 1.33**.

Examples To enable the eco-friendly LED feature which turns off power to all port LEDs, use the following commands:

```
awplus# configure terminal
awplus(config)# ecofriendly led
```

To disable the eco-friendly LED feature, use the following command:

```
awplus# configure terminal
awplus(config)# no ecofriendly led
```

Related Commands

ecofriendly lpi
show ecofriendly

ecofriendly lpi

Use this command to conserve power by enabling the eco-friendly LPI (Low Power Idle) feature. This feature reduces the power supplied to the ports on XEMs installed in the switch, except the eth0 port, whenever ports are idle and are connected to IEEE802.3az Energy Efficient Ethernet compliant host devices. See the section **"Save Power With the Eco-Friendly Feature" on page 1.33**.

LPI is a feature of the IEEE 802.3az Energy Efficient Ethernet (EEE) standard. LPI lowers power consumption of switch ports during periods of low link utilization when connected to IEEE 802.3az compliant host devices. If no data is sent then the switch port can enter a sleep state, called Low Power Idle (LPI), to conserve power used by the switch.

Use the **no** variant of this command to disable the eco-friendly LPI feature.

Syntax

```
ecofriendly lpi
no ecofriendly lpi
```

Default The eco-friendly LPI feature is disabled by default.

Mode Interface Configuration for a switch port, or Interface Configuration for a range of switch ports.

Usage For an example of how to configure a trigger to enable the eco-friendly LPI feature, see **"Reduce Power Supplied to Ports" on page 105.9**.

All ports configured for LPI must support LPI in hardware and must be configured to auto negotiate by default or by using the **speed** and **duplex** commands as needed.

Examples To enable the eco-friendly LPI feature on a switch port, `port1.0.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# ecofriendly lpi
```

To enable the eco-friendly LPI feature on a range of switch ports, `port1.0.2-port1.0.20`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2-port1.0.20
awplus(config-if)# ecofriendly lpi
```

To disable the eco-friendly feature on `port1.0.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no ecofriendly lpi
```

To disable the eco-friendly feature on a range of switch ports, `port1.0.2-port1.0.20`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2-port1.0.20
awplus(config-if)# no ecofriendly lpi
```

speed

findme

Use this command to physically locate a specific device from a group of similar devices. Activating the command causes a selected number of port LEDs to alternately flash green then amber (if that device has amber LEDs) at a rate of 1 Hz.

Use the **no** variant of this command to deactivate the Find Me feature prior to the timeout expiring.

Syntax

```
findme [interface <port-list>|member <stack-ID>] [timeout <duration>]
no findme
```

Parameter	Description
<port-list>	The ports to flash. The port list can be: ■ a switch port e.g. `port1.0.12` ■ a continuous range of ports separated by a hyphen, e.g. `port1.0.1-1.0.24` ■ a comma-separated list of ports and port ranges, e.g. `port1.0.1,port1.1.1-1.2.24`.
<stack-ID>	Stack member number, from 1 to 8.
<duration>	Specify the duration in seconds within the range of 5-3600 seconds.

Default Flashes all port LEDs for 60 seconds.

Mode Privileged Exec

Usage Running the **findme** command causes the device's port LEDs to flash. An optional **timeout** parameter specifies the flash behavior duration. Normal LED behavior is restored automatically after either the default time, or a specified time has elapsed, or a **no findme** command is used. You can specify which interface or interfaces are flashed with the optional **interface** parameter.

You can specify a particular stack member with the optional **member** parameter. All available interfaces are flashed by default.

Note The **interface** and **member** parameters are mutually exclusive.

Example To activate the Find Me feature for the default duration on all ports, use the following command:

```
awplus# findme
```

To activate the Find Me feature for 120 seconds on all ports, use the following command:

```
awplus# findme timeout 120
```

To activate the Find Me feature for the default duration on switch port interfaces `port1.0.2` through `port1.0.12`, use the following command:

```
awplus# findme interface port1.0.2-1.0.12
```

In the example above, ports 2 to 12 will flash 4 times and then all ports will flash twice. Each alternate flash will be amber (if that device has amber LEDs). This pattern will repeat until **timeout** or **no findme** commands are used.

To deactivate the Find Me feature, use the following command:

```
awplus# no findme
```

To activate the Find Me feature for the default duration on stack member 2, use the following command:

```
awplus# findme member 2
```

In the example above, all ports on member 2 will flash 4 times and then all ports in the stack will flash twice. Each alternate flash will be amber (if that device has amber LEDs). This pattern will repeat until the **timeout** expires or the **no findme** commands is used.

hostname

This command sets the name applied to the device as shown at the prompt. The hostname is:

- displayed in the output of the **show system** command
- displayed in the CLI prompt so you know which device you are configuring
- stored in the MIB object sysName

On a stack, after the stack master is elected, the master will have a host name: `awplus` by default, and this also becomes the name of the stack. Individual stack members (excluding the master) will have a host name that is the stack name hyphenated with a numeric suffix. For example, `awplus-1`, `awplus-2` and so on.

The hostname command can then be used to change the stack name and the stack master's host name. For example, for the hostname `Lab` the stack master's host name will be `Lab` and the other stack members will have host names `Lab-1`, `Lab-2` and so on.

In case of stack master fail-over, or stack split, the new stack will use the previous stack name as its host name and the stack name, unless it is changed by executing the hostname command on the new stack master.

Use the **no** variant of this command to revert the hostname setting to its default (`awplus`).

Syntax

```
hostname <hostname>
no hostname [<hostname>]
```

Parameter	Description
<hostname>	Specifies the name given to a specific switch. Also referred to as the Node Name in ATMF output screens.

Default `awplus`

Mode Global Configuration

Usage The name must also follow the rules for ARPANET host names. The name must start with a letter, end with a letter or digit, and use only letters, digits, and hyphens. Refer to RFC 1035.

Note

Within an ATMF network, any switch without a hostname applied will automatically be assigned a name based on its MAC address.

To efficiently manage your network using ATMF, we strongly advise that you devise a naming convention for your network switches and accordingly apply an appropriate hostname to each switch.

Example To set the system name to `HQ-Sales`, use the command:

```
awplus# configure terminal
awplus(config)# hostname HQ-Sales
```

This changes the prompt to:

```
HQ-Sales(config)#
```

To revert to the default hostname `awplus`, use the command:

```
HQ-Sales(config)#no hostname
```

This changes the prompt to:

```
awplus(config)#
```

Note

When ATMF is configured, running the **no hostname** command will apply a hostname that is based on the MAC address of the switch node. For example, **node_0016_76b1_7a5e**.

Related Commands **show system**

max-fib-routes

This command enables you to control the maximum number of FIB routes configured. It operates by providing parameters that enable you to configure preset maximums and warning message thresholds. The operation of these parameters is explained in the Parameter / Descriptions table shown below

Syntax (VRF Lite)

Note To set the max-fib-routes for either the Global Routing Instance or a specific VRF Instance, use the **max-fib-routes (VRF)** command on page 49.12.
To set static routes, use the **max-static-routes** command on page 10.26.

Use the **no** variant of this command to set the maximum number of fib routes to the default of 4294967294 fib routes.

Syntax

```
max-fib-routes <1-4294967294> [<1-100>|warning-only]

no max-fib-routes
```

Parameter	Description
`max-fib-routes`	This is a the maximum number of routes that can be stored in the switch's Forwarding Information dataBase. In practice, other practical system limits would prevent this maximum being reached.
<1-4294967294>	The allowable configurable range for setting the maximum number of FIB-routes.
<1-100>	This parameter enables you to optionally apply a percentage value. This percentage will be based on the maximum number of FIB routes you have specified. This will cause a warning message to appear when your routes reach your specified percentage value. Routes can continue to be added until your configured maximum value is reached.
`warning-only`	This parameter enables you to optionally apply a warning message. If you set this option a warning message will appear if your maximum configured value is reached. Routes can continue to be added until your switch reaches either the maximum capacity value of 4294967294, or a practical system limit.

Default The default number of fib routes is the maximum number of fib routes (4294967294).

Mode Global Configuration

Examples To set the maximum number of dynamic routes to 2000 and warning threshold of 75%, use the following commands:

```
awplus# config terminal
awplus(config)# max-fib-routes 2000 75
```

Related Commands **max-fib-routes (VRF)**

max-static-routes

Use this command to set the maximum number of static routes, excluding FIB (Forwarding Information Base) routes. Note that FIB routes are set and reset using **max-fib-routes**.

Use the **no** variant of this command to set the maximum number of static routes to the default of 1000 static route

VRF Lite .

Note To set the max-static-routes for a VRF Instance, use the **max-fib-routes (VRF)** command on page 49.12.
To set dynamic FIB routes, use the **max-fib-routes** command on page 10.25.

Syntax

```
max-static-routes <1-1000>

no max-static-routes
```

Default The default number of static routes is the maximum number of static routes (1000).

Mode Global Configuration

Example To reset the maximum number of static routes to the default maximum, use the command:

```
awplus# configure terminal
awplus(config)# no max-static-routes
```

Note Static routes are applied before adding routes to the RIB (Routing Information Base). Therefore, rejected static routes will not appear in the running config.

Related Commands **max-fib-routes**

no debug all

This command disables the debugging facility for all features on your device. This stops the device from generating any diagnostic debugging messages.

The debugging facility is disabled by default.

Syntax `no debug all [bgp|dot1x|ipv6|nsm|ospf|vrrp]`

Parameter	Description
`bgp`	Turns off all debugging for BGP (Border Gateway Protocol).
`dot1x`	Turns off all debugging for IEEE 802.1X port-based network access-control.
`ipv6`	Turns off all debugging for IPv6 (Internet Protocol version 6).
`nsm`	Turns off all debugging for the NSM (Network Services Module).
`ospf`	Turns off all debugging for OSPF (Open Path Shortest First).
`vrrp`	Turns off all debugging for VRRP (Virtual Router Redundancy Protocol).

Mode Global Configuration and Privileged Exec

Example To disable debugging for all features, use the command:

```
awplus# no debug all
```

To disable all bgp debugging, use the command:

```
awplus# no debug all
```

To disable all 802.1X debugging, use the command:

```
awplus# no debug all
```

To disable all IPv6 debugging, use the command:

```
awplus# no debug all
```

To disable all NSM debugging, use the command:

```
awplus# no debug all
```

To disable all OSPF debugging, use the command:

```
awplus# no debug all ospf
```

To disable all VRRP debugging, use the command:

```
awplus# no debug all vrrp
```

Related Commands **undebug all**

reboot

This command halts the device and performs a cold restart (also known as reload). It displays a confirmation request before restarting.

You can reboot a stand-alone device, a stack, or a specified stack member.

Syntax

```
reboot <stack-ID>
reload <stack-ID>
reboot
reload
```

Parameter	Description
<stack-ID>	Stack member number, from 1 to 8.

Mode Privileged Exec

Usage The **reboot** and **reload** commands perform the same action.

When restarting the whole stack, you can either use this reboot command to reboot all stack members immediately, or to minimize downtime, reboot the stack members in a rolling sequence by using the **reboot rolling** command on page 112.5.

Examples To restart the stand-alone device, use the command:

```
awplus# reboot
reboot system? (y/n): y
```

To restart all devices in the stack, use the command:

```
awplus# reboot
Are you sure you want to reboot the whole stack? (y/n): y
```

To restart stack member 3, use the command:

```
awplus# reboot stack-member 3
reboot stack-member 3 system? (y/n): y
```

If the specified stack member ID does not exist in the current stack, the command is rejected.

Related Commands

reboot rolling
reload rolling

reload

This command performs the same function as the **reboot** command on page 10.28.

show clock

This command displays the system's current configured local time and date. It also displays other clock related information such as timezone and summertime configuration.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show clock
```

Mode User Exec and Privileged Exec

Example To display the system's current local time, use the command:

```
awplus# show clock
```

Output **Figure 10-5: Example output from the show clock command for a switch using New Zealand time**

```
Local Time: Mon,  6 Aug 2007 13:56:06 +1200
UTC Time:   Mon,  6 Aug 2007 01:56:06 +0000
Timezone: NZST
Timezone Offset: +12:00
Summer time zone: NZDT
Summer time starts: Last Sunday in September at 02:00:00
Summer time ends: First Sunday in April at 02:00:00
Summer time offset: 60 mins
Summer time recurring: Yes
```

Table 10-1: Parameters in the output of the show clock command

Parameter	Description
`Local Time`	Current local time.
`UTC Time`	Current UTC time.
`Timezone`	The current configured timezone name.
`Timezone Offset`	Number of hours offset to UTC.
`Summer time zone`	The current configured summertime zone name.
`Summer time starts`	Date and time set as the start of summer time.
`Summer time ends`	Date and time set as the end of summer time.
`Summer time offset`	Number of minutes that summer time is offset from the system's timezone.
`Summer time recurring`	Whether the device will apply the summer time settings every year or only once.

Related Commands

clock set
clock summer-time date
clock summer-time recurring
clock timezone

show continuous-reboot-prevention

This command displays the current continuous reboot prevention configuration.

Syntax `show continuous-reboot-prevention`

Mode User Exec and Privileged Exec

Examples To show the current continuous reboot prevention configuration, use the command:

```
awplus# show continuous-reboot-prevention
```

Output **Figure 10-6: Example output from the show continuous-reboot-prevention**

```
-----------------------------------------
Continuous reboot prevention
-----------------------------------------
status=disabled
period=600
threshold=1
action=linkdown
-----------------------------------------
```

command

Related Commands **continuous-reboot-prevention**
show reboot history

show cpu

This command displays a list of running processes with their CPU utilization.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show cpu [<stack-ID>] [sort {thrds|pri|sleep|runtime}]`

Parameter	Description	
<stack-ID>	Stack member number, from 1 to 8.	
`sort`	Changes the sorting order using the following fields. If you do not specify a field, then the list is sorted by percentage CPU utilization.	
	`thrds`	Sort by the number of threads.
	`pri`	Sort by the process priority.
	`sleep`	Sort by the average time sleeping.
	`runtime`	Sort by the runtime of the process.

Mode User Exec and Privileged Exec

Usage Entering this command on the stack master will display the information for all the stack members. A stack member heading will distinguish the different information for every stack member device.

Examples To show the CPU utilization of current processes, sorting them by the number of threads the processes are using, use the command:

```
awplus# show cpu sort thrds
```

Note that in a stack environment, executing this command on the stack master will show CPU utilization for all stack members.

To show CPU utilization for a specific stack member (in this case stack member 2), use the following command:

```
awplus# show cpu 2
```

Output **Figure 10-7: Example output from the show cpu command**

```
Stack member 2:

CPU averages:
 1 second: 12%, 20 seconds: 2%, 60 seconds: 2%
System load averages:
 1 minute: 0.03, 5 minutes: 0.02, 15 minutes: 0.00
Current CPU load:
 userspace: 6%, kernel: 4%, interrupts: 1% iowaits: 0%

Table 10-2: Parameters in the output of the show cpu command

Parameter	Description
`Stack member`	Stack member number.
`CPU averages`	Average CPU utilization for the periods stated.
`System load averages`	The average number of processes waiting for CPU time for the periods stated.
`Current CPU load`	Current CPU utilization specified by load types.

Table 10-2: Parameters in the output of the show cpu command

Parameter	Description
`pid`	Identifier number of the process.
`name`	A shortened name for the process
`thrds`	Number of threads in the process.
`cpu%`	Percentage of CPU utilization that this process is consuming.
`pri`	Process priority state.
`state`	Process state; one of “run”, “sleep”, “zombie”, and “dead”.
`sleep%`	Percentage of time that the process is in the sleep state.
`runtime`	The time that the process has been running for, measured in jiffies. A jiffy is the duration of one tick of the system timer interrupt.

show cpu history

This command prints a graph showing the historical CPU utilization.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show [<stack-ID>]cpu history`

Parameter	Description
<stack-ID>	Stack member number, from 1 to 8.

Mode User Exec and Privileged Exec

Usage This command's output displays three graphs of the percentage CPU utilization:

- per second for the last minute, then
- per minute for the last hour, then
- per 30 minutes for the last 30 hours.

If this command is entered on the stack master, it will print graphs for all the stack members. A stack member heading will be displayed to distinguish the different graphs for every stack member.

Examples To display a graph showing the historical CPU utilization of the device, use the command:

```
awplus# show cpu history
```

To display the CPU utilization history graph for stack member 2, use the command:

```
awplus# show 2 cpu history
```

where 2 is the node id of the stack member.

Output **Figure 10-8: Example output from the show cpu history command**

```

show debugging

This command displays information for all debugging options.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show debugging`

Default This command runs all the **show debugging** commands in alphabetical order.

Mode User Exec and Privileged Exec

Usage This command displays all debugging information, similar to the way the **show tech-support** command displays all show output for use by Allied Telesis authorized service personnel only.

Example To display all debugging information, use the command:

```
awplus# show debugging
```

Output **Figure 10-9: Example output from the show debugging command**

```
awplus#show debugging
AAA debugging status:
  Authentication debugging is off
  Accounting debugging is off
% DHCP Snooping service is disabled
BGP debugging status:
  BGP debugging is off
  BGP nsm debugging is off
  BGP events debugging is off
  BGP keepalives debugging is off
  BGP updates debugging is off
  BGP fsm debugging is off
  BGP filter debugging is off
  BGP Route Flap Dampening debugging is off

802.1X debugging status:

EPSR debugging status:
 EPSR Info debugging is off
 EPSR Message debugging is off
 EPSR Packet debugging is off
 EPSR State debugging is off
IGMP Debugging status:
  IGMP Decoder debugging is off
  IGMP Encoder debugging is off

show diagnostic monitor pcsping

Use this command to show the status of the background PCS (Physical Coding Sublayer) ping feature used to check the link status between a XEM and the switch. See the **diagnostic monitor pcsping** command on page 10.15 for further information about the feature. The background PCS ping feature is enabled by default to output log messages.

Syntax `show diagnostic monitor pcsping`

Mode User Exec and Privileged Exec

Example To monitor the status of the background PCS ping feature, use the following command:

```
awplus# show diagnostic monitor pcsping
```

Output

Figure 10-10: Example output from a show diagnostic monitor pcsping command showing default behaviour (enabled with log message output) for the background PCS ping feature

```
awplus# show diagnostic monitor pcsping
Background PCS Ping Monitoring Information
Enabled: Yes
Power-off XEM if a PCS Ping fails: No
```

Figure 10-11: Example output from a show diagnostic monitor pcsping command showing the background PCS ping feature disabled

```
awplus# show diagnostic monitor pcsping
Background PCS Ping Monitoring Information
Enabled: No
Power-off XEM if a PCS Ping fails: No
```

Figure 10-12: Example output from a show diagnostic monitor pcsping command showing the background PCS ping feature configured to power off a XEM if PCS ping fails

```

show ecofriendly

This command displays the switch's eco-friendly configuration status. The **ecofriendly led** and **ecofriendly lpi** configuration status are shown in the **show ecofriendly** output.

Syntax `show ecofriendly`

Mode Privileged Exec and Global Configuration

Example To display the switch's eco-friendly configuration status, use the following command:

```
awplus# show ecofriendly
```

Output **Figure 10-13: Example output from the show ecofriendly command**

```
awplus#show ecofriendly
Front panel port LEDs          normal
Energy efficient ethernet
Port          Name             Configured  Status
port1.0.1     Port 1           lpi         lpi
port1.0.2                      lpi         lpi
port1.0.3                      lpi         lpi
port1.0.4                      off         off
port1.0.5                      lpi         off
port1.0.6     Port 6           off         off
port1.0.7                      off         -
port1.0.8                      off         -
port1.0.9                      off         -
port1.0.10                     off         -
```

Table 10-3: Parameters in the output of the show ecofriendly command

Parameter	Description
`normal`	The eco-friendly LED feature is disabled and port LEDs show the current state of the ports. This is the default setting.
`off`	The eco-friendly LED feature is enabled and power to the port LEDs is disabled.
`Port`	Displays the port number as assigned by the switch.
`Name`	Displays the port name if a name is configured for a port number.
`Configured`	The eco-friendly LPI feature is configured on the port. Either lpi or off is displayed.
`Status`	The eco-friendly LPI feature is active on the port. Either lpi or off is displayed. Ports that are not running show -

Related Commands **ecofriendly led**
ecofriendly lpi

show interface memory

This command displays the shared memory used by either all interfaces, or the specified interface or interfaces. The output is useful for diagnostic purposes by Allied Telesis authorized service personnel.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show interface memory
show interface <port-list> memory
```

Parameter	Description
<port-list>	The ports to display information about. The port list can be: ■ a switch port (e.g. `port1.0.12`) a static channel group (e.g. `sa3`) or a dynamic (LACP) channel group (e.g. `po3`) ■ a continuous range of ports separated by a hyphen, e.g. `port1.0.1-1.0.24`, or `sa1-2`, or `po1-4` ■ a comma-separated list of ports and port ranges, e.g. `port1.0.1,port1.0.4-1.2.24`. Do not mix switch ports, static channel groups, and dynamic (LACP) channel groups in the same list

Mode User Exec and Privileged Exec

Example To display the shared memory used by all interfaces, use the command:

```
awplus# show interface memory
```

To display the shared memory used by `port1.0.1` and `port1.0.5 to port1.0.8`, use the command:

```
awplus# show interface port1.0.1,port1.0.5-1.0.8 memory
```

Output **Figure 10-14: Example output from the show interface <port-list> memory**

```
awplus#show interface port1.0.1,port1.0.5-1.0.8 memory
Vlan blocking state shared memory usage
---------------------------------------------

show memory

This command displays the memory used by each process that is currently running

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show memory [<stack-ID>] [sort {size|peak|stk}]`

Parameter	Description	
`<stack-ID>`	Stack member number, from 1 to 8.	
`sort`	Changes the sorting order for the list of processes. If you do not specify this, then the list is sorted by percentage memory utilization.	
	`size`	Sort by the amount of memory the process is currently using.
	`peak`	Sort by the amount of memory the process is currently using.
	`stk`	Sort by the stack size of the process.

Mode User Exec and Privileged Exec

Usage If this command is entered on the stack master, it will display corresponding memory utilization information for all the stack members. A stack member heading will display the information for every stack member device.

Example To display the memory used by the current running processes, use the command:

```
awplus# show memory
```

Output **Figure 10-16: Example output from the show memory command**

```
awplus#show memory

Stack member 1:

RAM total: 514920 kB; free: 382716; buffers: 16368 kB

user processes
==============

.
.
.
```

Table 10-4: Parameters in the output of the show memory command

Parameter	Description
`Stack member`	Stack member number.
`RAM total`	Total amount of RAM memory free.
`free`	Available memory size.
`buffers`	Memory allocated kernel buffers.
`pid`	Identifier number for the process.
`name`	Short name used to describe the process.
`mem%`	Percentage of memory utilization the process is currently using.
`size`	Amount of memory currently used by the process.
`peak`	Greatest amount of memory ever used by the process.
`data`	Amount of memory used for data.
`stk`	The stack size.

show memory shared

This command displays shared memory allocation information. The output is useful for diagnostic purposes by Allied Telesis authorized service personnel.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show memory shared`

Mode User Exec and Privileged Exec

Example To display information about the shared memory allocation used on the switch, use the command:

```
awplus# show memory shared
```

Output **Figure 10-20: Example output from the show memory shared command**

```
awplus#show memory shared
Shared Memory Status
--------------------------
Segment allocated  = 39
Pages allocated    = 39
Pages resident     = 11

Shared Memory Limits
-------------------------
Maximum number of segments          = 4096
Maximum segment size (kbytes)       = 32768
Maximum total shared memory (pages) = 2097152
Minimum segment size (bytes)        = 1
```

Related Commands
show memory allocations
show memory history
show memory sort

show process

This command lists a summary of the current running processes.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show process [<stack-ID>] [sort {cpu|mem}]`

Parameter	Description	
`<stack-ID>`	Stack member number, from 1 to 8.	
`sort`	Changes the sorting order for the list of processes.	
	`cpu`	Sorts the list by the percentage of CPU utilization.
	`mem`	Sorts the list by the percentage of memory utilization.

Mode User Exec and Privileged Exec

Usage For a stacked configuration, if this command is entered on the stack master, it will display the information for all the stack members. A stack member heading will be displayed to distinguish the different information for every stack member.

Example To display a summary of the current running processes, use the command:

```
awplus# show process
```

To display a summary of the current running processes on stack member 3, use the command:

```
awplus# show process 3
```

Output **Figure 10-21: Example output from the show process command**

```
Stack member 3:

CPU load for 1 minute: 0%; 5 minutes: 3%; 15 minutes: 0%
RAM total: 514920 kB; free: 382600 kB; buffers: 16368 kB

user processes
==============
pid name          thrds  cpu%  mem%   pri  state  sleep%
962 pss              12     0     6    25  sleep       5
1   init              1     0     0    25  sleep       0
797 syslog-ng         1     0     0    16  sleep      88

kernel threads
==============
pid name          cpu%  pri  state  sleep%
71  aio/0         0     20   sleep  0
3   events/0      0     10   sleep  98
.
.
.
```

Table 10-5: Parameters in the output from the show process command

Parameter	Description
`Stack member`	Stack member number.
`CPU load`	Average CPU load for the given period.
`RAM total`	Total memory size.
`free`	Available memory.
`buffers`	Memory allocated to kernel buffers.
`pid`	Identifier for the process.
`name`	Short name to describe the process.
`thrds`	Number of threads in the process.
`cpu%`	Percentage of CPU utilization that this process is consuming.
`mem%`	Percentage of memory utilization that this process is consuming.
`pri`	Process priority.
`state`	Process state; one of “run”, “sleep”, “stop”, “zombie”, or “dead”.
`sleep%`	Percentage of time the process is in the sleep state.

Related Commands

show cpu
show cpu history

show reboot history

Use this command to display the switch's reboot history.

Syntax `show reboot history [<stack-ID>]`

Parameter	Description
<stack-ID>	Stack member number, from 1 to 8.

Mode User Exec and Privileged Exec

Example To show the reboot history of stack member 2, use the command:

```
awplus# show reboot history 2
```

Output **Figure 10-22: Example output from the show reboot history command**

```
awplus#show reboot history 2

Stack member 2:

<date>     <time>    <type>      <description>
------------------------
2014-01-10 01:42:04  Expected    User Request
2014-01-10 01:35:31  Expected    User Request
2014-01-10 01:16:25  Unexpected Rebooting due to critical process (network/nsm)
failure!
2014-01-10 01:11:04  Unexpected Rebooting due to critical process (network/nsm)
failure!
2014-01-09 20:46:40  Unexpected Rebooting due to VCS duplicate member-ID
2014-01-09 19:56:16  Expected    User Request
2010-01-09 20:36:06  Unexpected Rebooting due to VCS duplicate master (Continuous
reboot prevention)
2014-01-09 19:51:20  Expected    User Request
```

Table 10-6: Parameters in the output from the show reboot history command

Parameter	Description
`Unexpected`	Reboot is counted by the continuous reboot prevention feature if the reboot event occurs in the time period specified for continuous reboot prevention.
`Expected`	Reboot is not counted by continuous reboot prevention feature.
`Continuous reboot prevention`	A continuous reboot prevention event has occurred. The action taken is configured with the **continuous-reboot-prevention** command. The next time period during which reboot events are counted begins from this event.
`user request`	User initiated reboot via the CLI.

Related Commands **show continuous-reboot-prevention**
show tech-support

show router-id

Use this command to show the Router ID of the current system.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show router-id`

Mode User Exec and Privileged Exec

Example To display the Router ID of the current system, use the command:

```
awplus# show router-id
```

Output **Figure 10-23: Example output from the show router-id command**

```
awplus>show router-id
Router ID: 10.55.0.2 (automatic)
```

show system

This command displays general system information about the device, including the hardware installed, memory, and software versions loaded. It also displays location and contact details when these have been set.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show system`

Mode User Exec and Privileged Exec

Usage For a stacked configuration, if this command is entered on the stack master, it will display the information for all the stack members. A stack member heading will be displayed to distinguish the different information for every stack member.

Examples To display the system information, use the command:

```
awplus# show system
```

Output **Figure 10-24: Example output from the show system command**

```
awplus#show system

Related Commands show system

show system interrupts

Use this command to display the number of interrupts for each IRQ (Interrupt Request) used to interrupt input lines on a PIC (Programmable Interrupt Controller) on your switch.

For information on output options, see "Controlling "show" Command Output" on page 1.38.

Syntax `show system interrupts`

Mode User Exec and Privileged Exec

Example To display information about the number of interrupts for each IRQ in your device, use the command:

```
awplus# show system interrupts
```

Output **Example output from the show system interrupts command**

```
awplus>show system interrupts
           CPU0

Related Commands show system environment

show system mac

This command displays the physical MAC address available on a standalone switch, or a stack. This command also shows the virtual MAC address for a for a stack if the stack virtual MAC address feature is enabled with the **stack virtual-mac** or the **stack enable** command.

Syntax `show system mac`

Mode User Exec and Privileged Exec

Usage This command also displays the virtual MAC address, if the VCStack Plus virtual MAC address feature is enabled with the **stack virtual-mac** command.

For information about this VCStack Plus feature, see the section **Fixed or Virtual MAC Addressing** in the **VCStack Introduction** chapter.

Examples To display the physical MAC address on a standalone switch, enter the following command:

```
awplus# show system mac
```

Output **Figure 10-26: Example output from the show system mac command**

```
awplus#show system mac
eccd.6d9d.4eed
```

Output **Figure 10-27: Example output from show system mac, showing a stack virtual MAC address and the earlier stack virtual-mac command entry to enable this feature:**

```
awplus#configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
awplus(config)#stack virtual-mac
% Please check that the new MAC 0000.cd37.0065 is unique within
the network.
% Save the config and restart the system for this change to take
effect.

Related Commands **stack virtual-mac**

show system pci device

Use this command to display the PCI devices on your switch.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show system pci device Mode`

Mode User Exec and Privileged Exec

Example To display information about the PCI devices on your switch, use the command:

```
awplus# show system pci device
```

Output **Example output from the show system pci device command**

```
awplus>show system pci device
00:0c.0 Class 0200: 11ab:00d1 (rev 01)
        Flags: bus master, 66Mhz, medium devsel, latency 128, IRQ 113
        Memory at 5ffff000 (32-bit, non-prefetchable) [size=4K]
        Memory at 58000000 (32-bit, non-prefetchable) [size=64M]

00:0d.0 Class 0200: 11ab:00d1 (rev 01)
        Flags: bus master, 66Mhz, medium devsel, latency 128, IRQ 116
        Memory at 57fff000 (32-bit, non-prefetchable) [size=4K]
        Memory at 50000000 (32-bit, non-prefetchable) [size=64M]
```

Related Commands **show system environment**
show system pci tree

show system pci tree

Use this command to display the PCI tree on your switch.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show system pci tree`

Mode User Exec and Privileged Exec

Example To display information about the PCI tree on your switch, use the command:

```
awplus# show system pci tree
```

Output **Figure 10-28: Example output from the show system pci tree command**

```
awplus>show system pci tree
-[00]-+-0c.0  11ab:00d1
      \-0d.0  11ab:00d1
```

Related Commands **show system environment**
show system pci device

show system pluggable

This command displays brief pluggable transceiver information showing the pluggable type, the pluggable serial number, and the pluggable port on the switch. Different types of pluggable transceivers are supported in different models of switch. See your Allied Telesis dealer for more information about the models of pluggables that your switch supports.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show system pluggable [<port-list>]`

Parameter	Description
<port-list>	The ports to display information about. The port list can be: ■ a switch port (e.g. `port1.0.12`) ■ a continuous range of ports separated by a hyphen, e.g. `port1.0.1-1.0.24` ■ a comma-separated list of ports and port ranges, e.g. `port1.0.1,port1.0.4-1.2.24`.

Mode User Exec and Privileged Exec

Usage Entering this command will display the information for all pluggable transceivers in the system. In a stack, a separate heading will be displayed to distinguish each stack member's information.

Example To display brief information about pluggable transceivers installed in `port1.0.21` through `port1.0.24`, use the command:

```
awplus# show system pluggable port1.0.21-1.0.24
```

Output **Figure 10-30: Example output from the show system pluggable port1.0.21-1.0.24 command**

```
System Pluggable Information
Port   Manufacturer     Device           Serial Number    Datecode Type

```

Table 10-7: Parameters in the output from the show system pluggables command

Parameter	Description
`Stack member`	The stack member number.
`Port`	Specifies the vendor's name for the installed pluggable transceiver.
`Vendor Name:`	Specifies the vendor's name for the installed pluggable transceiver.
`Device Name:`	Specifies the device name for the installed pluggable transceiver.
`Device Type:`	Specifies the device type for the installed pluggable transceiver.
`Serial Number`	Specifies the serial number for the installed pluggable transceiver.
`Manufacturing Datecode`	Specifies the manufacturing datecode for the installed pluggable transceiver. Checking the manufacturing datecode with the vendor may be useful when determining Laser Diode aging issues. See the **Trouble-shoot fiber and pluggable issues** section in the **System Configuration and Monitoring Commands** chapter.
`SFP Laser Wavelength:`	Specifies the laser wavelength of the installed pluggable transceiver.
`Datecode`	Specifies the manufacturing datecode for the installed pluggable transceiver. Checking the manufacturing datecode with the vendor may be useful when determining Laser Diode aging issues. See the **Trouble-shoot fiber and pluggable issues** section in the **System Configuration and Monitoring Commands** chapter.
`Device Type:`	Specifies the device type for the installed pluggable transceiver.

show system pluggable detail

This command displays detailed pluggable transceiver information showing the pluggable type, the pluggable serial number, and the pluggable port on the switch. Different types of pluggable transceivers are supported in different models of switch. See your Allied Telesis dealer for more information about the models of pluggables that your switch supports.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show system pluggable [<port-list>] detail`

Parameter	Description
<port-list>	The ports to display information about. The port list can be: ■ a switch port (e.g. `port1.0.12`) ■ a continuous range of ports separated by a hyphen, e.g. `port1.0.1-1.0.24` ■ a comma-separated list of ports and port ranges, e.g. `port1.0.1,port1.0.4-1.2.24`.

Mode User Exec and Privileged Exec

Usage For a stacked configuration, if this command is entered on the stack master, it will display detailed information about the pluggable transceivers for all the stack members. A stack member heading will be displayed to distinguish the different pluggable transceiver information for every stack member.

In addition to the information about pluggable transceivers displayed using the **show system pluggable** command (port, manufacturer, serial number, manufacturing datecode, and type information), the **show system pluggable detail** command displays the following information:

- **SFP Laser Wavelength**: Specifies the laser wavelength of the installed pluggable transceiver
- **Single mode Fiber**: Specifies the link length supported by the pluggable transceiver using single mode fiber
- **OM1 (62.5µm) Fiber**: Specifies the link length (in µm - micron) supported by the pluggable transceiver using 62.5 micron multi-mode fiber.
- **OM2 (50 µm) Fiber**: Specifies the link length (in µm - micron) supported by the pluggable transceiver using 50 micron multi-mode fiber.
- **Diagnostic Calibration**: Specifies whether the pluggable transceiver supports DDM or DOM Internal or External Calibration.
  - « **Internal** is displayed if the pluggable transceiver supports DDM or DOM Internal Calibration.
  - « **External** is displayed if the pluggable transceiver supports DDM or DOM External Calibration.
  - « - is displayed if SFP DDM, SFP+ DDM or XFP DOM Internal Calibration or External Calibration is not supported.
- **Power Monitoring**: Displays the received power measurement type, which can be either **OMA** (Optical Module Amplitude) or **Avg** (Average Power) measured in µW.

- **FEC BER support**: Specifies whether FEC (Forward Error Correction) coder can generate a BER (Bit Error Rate) signal that is used as feedback to tune an XFP if DOM is supported

Note FEC BER support may be available on an XFP if the XFP supports DOM. FEC BER support is not available on an SFP or an SFP+ even if the SFP or the SFP+ supports DDM. FEC BER support is applicable to XFPs that support DOM only.

Note For parameters that are not supported or not specified, a hyphen is displayed instead.

Example To display detailed information about the pluggable transceivers installed on a switch, use the command:

```
awplus# show system pluggable port1.0.24 detail
```

To display detailed information about the pluggable transceivers installed on the switch, use the command:

```
awplus# show system pluggable detail
```

Output **Figure 10-32: Example output from the show system pluggable detail command on a switch**

```
awplus#show system pluggable port1.0.24 detail
System Pluggable Information Detail

Table 10-8: Parameters in the output from the show system pluggables detail command:

Parameter	Description
`Stack member`	The stack member number..
`Port`	Specifies the port the pluggable transceiver is installed in.
`Vendor Name:`	Specifies the vendor's name for the installed pluggable transceiver.
`Device Name:`	Specifies the device name for the installed pluggable transceiver.
`Device Type:`	Specifies the device type for the installed pluggable transceiver..
`Serial Number:`	Specifies the serial number for the installed pluggable transceiver.
`Manufacturing Datecode:`	Specifies the manufacturing datecode for the installed pluggable transceiver. Checking the manufacturing datecode with the vendor may be useful when determining Laser Diode aging issues. See the **Trouble-shoot fiber and pluggable issues** section in the **System Configuration and Monitoring Commands** chapter.
`SFP Laser Wavelength:`	Specifies the laser wavelength of the installed pluggable transceiver.
`Single Mode Fiber:`	Specifies the link length supported by the pluggable transceiver using single mode fiber.
`OM1 (62.5um) Fiber:`	Specifies the link length (in µm - micron) supported by the pluggable transceiver using 62.5 micron multi-mode fiber.
`OM2 (50um) Fiber:`	Specifies the link length (in µm - micron) supported by the pluggable transceiver using 50 micron multi-mode fiber.
`Diagnostic Calibration:`	Specifies whether the pluggable transceiver supports DDM or DOM Internal or External Calibration: **Internal** is displayed if the pluggable transceiver supports DDM or DOM Internal Calibration. **External** is displayed if the pluggable transceiver supports DDM or DOM External Calibration. - is displayed if SFP DDM, SFP+ DDM or XFP DOM Internal Calibration or External Calibration is not supported.
`Power Monitoring:`	Displays the received power measurement type, which can be either **OMA** (Optical Module Amplitude) or **Avg** (Average Power) measured in µW.
`FEC BER support:`	Specifies whether FEC (Forward Error Correction) coder can generate a BER (Bit Error Rate) signal that is used as feedback to tune an XFP if DOM is supported.

show system pluggable diagnostics

show system pluggable diagnostics

This command displays diagnostic information about SFP, SFP+ and XFP pluggable transceivers, which support Digital Diagnostic Monitoring (DDM) for SFPs and SFP+s, or Digital Optical Monitoring (DOM) for XFPs.

Different types of pluggable transceivers are supported in different models of switch. See your switch's Datasheet for more information about the models of pluggables that your switch supports.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show system pluggable [<port-list>] diagnostics`

Parameter	Description
<port-list>	The ports to display information about. The port list can be: ■ a switch port (e.g. `port1.0.12`) ■ a continuous range of ports separated by a hyphen, e.g. `port1.0.1-1.0.24` ■ a comma-separated list of ports and port ranges, e.g. `port1.0.1,port1.0.4-1.2.24`.

Mode User Exec and Privileged Exec

Usage For a stacked configuration, if this command is entered on the stack master, it will display information about the pluggable transceivers for all the stack members. A stack member heading will be displayed to distinguish different pluggable transceiver information for every stack member.

Modern optical XFP transceivers support Digital Optical Monitoring (DOM) functions.

Diagnostic monitoring features allow you to monitor real-time parameters of the pluggable transceiver, such as optical output power, optical input power, temperature, laser bias current, and transceiver supply voltage. Additionally, RX LOS (Loss of Signal) is shown when the received optical level is below a preset threshold. Monitor these parameters to check on the health of all transceivers, selected transceivers or a specific transceiver installed in a switch.

Example To display detailed information about all pluggable transceivers installed on a standalone switch, use the command:

```
awplus# show system pluggable diagnostics
```

Output **Figure 10-34: Example output from the show system pluggable diagnostics command on a switch**

```
awplus#show system pluggable diagnostics
System Pluggable Information Diagnostics

Rx Power: (mW)       1.739       -  18.000   0.000         -  10.000   0.200
Rx LOS:              Rx Up
```

Table 10-9: Parameters in the output from the show system pluggables diagnostics command:

Parameter	Description
`Temp: (Degrees C)`	Shows the temperature inside the transceiver.
`Vcc: (Volts)`	Shows voltage supplied to the transceiver.
`Tx Bias: (mA)`	Shows current to the Laser Diode in the transceiver.
`Tx Power: (mW)`	Shows the amount of light transmitted from the transceiver.
`Rx Power: (mW)`	Shows the amount of light received in the transceiver.
`Rx LOS:`	Shows when the received optical level falls below a preset threshold.

show system psu

This command shows the PSU (Power Supply Unit) status information for the x908 series PSUs only. This command returns a console error message when run on other x900 switches.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show system psu`

Mode User Exec and Privileged Exec

Usage Running this command on switches other than an SBx908 results in an error message as shown:

```
awplus#show system psu
% This command is not applicable to this device.
```

Example To display the PSU status information, use the command:

```
awplus# show system psu
```

Output **Figure 10-36: Example output from the show system psu command on an x908 switch**

```
awplus#show system psu
System PSU Status

Dynamic Data:
Dynamic data invalid. PSU may be powered off.
awplus#
```

show system serialnumber

This command shows the serial number information for the switch.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show system serialnumber`

Mode User Exec and Privileged Exec

Example To display the serial number information for the switch, use the command:

```
awplus# show system serialnumber
```

Output **Figure 10-37: Example output from the show system serialnumber command**

```
awplus#show system serialnumber
45AX5300X
```

show tech-support

This command generates system and debugging information for the switch and saves it to a file. You can optionally limit the command output to display only information for a given protocol or feature.

The command generates a large amount of output, which is saved to a file in compressed format. The output file name can be specified by outfile option. If the output file already exists, a new file name is generated with the current time stamp. If the output filename does not end with ".gz", then ".gz" is appended to the filename. Since output files may be too large for Flash on the switch we recommend saving files to either an SD card or a USB storage device whenever possible to avoid switch lockup. This method is not likely to be appropriate when running the working set option of ATMF across a range of physically separated switches.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

The output of this command may include the result of the following commands:

Syntax

```
show tech-support {all|[bgp|dhcpsn|epsr|igmp|ip|rp|ospf|pim|stack|
   stp|system|ipv6|rip|ripng|mld|tacacs+|ospf|atmf|]|[outfile
   <filename>]}
```

Parameter	Description
`all`	Output full troubleshooting information for all protocols and the device.
`bgp`	Displays troubleshooting information specific to BGP
`dhcpsn`	Displays troubleshooting information specific to DHCPSN
`epsr`	Displays troubleshooting information specific to EPSR
`igmp`	Displays troubleshooting information specific to IGMP
`ip`	Displays troubleshooting information specific to IP
`rip`	Displays troubleshooting information specific to RIP
`ospf`	Displays troubleshooting information specific to OSPF
`pim`	Displays troubleshooting information specific to PIM
`stack`	Displays troubleshooting information specific to VCStack
`stp`	Displays troubleshooting information specific to STP
`system`	Displays troubleshooting general system information (not protocol) troubleshooting information for the device
`ipv6`	Displays troubleshooting information specific to IPv6
`ripng`	Displays troubleshooting information specific to RIPNG
`mld`	Displays troubleshooting information specific to MLD
`tacacs+`	Displays troubleshooting information specific to TACACS PLUS
`ospf`	Displays troubleshooting information specific to OSPF
`atmf`	Displays information specific to ATMF

Parameter	Description
`outfile`	The output file that will be created. By default, this file is saved to the current directory.
`<filename>`	Specifies a name for the output file. If no name is specified, this file will be saved as: tech-support.txt.gz.

Default Captures **all** information for the switch.

By default the output is saved to the file '`tech-support.txt.gz`' in the current directory. If this file already exists in the current directory then a new file is generated with the time stamp appended to the file name, for example '`tech-support20080109.txt.gz`', so the last saved file is retained.

Usage This command is useful for collecting a large amount of information about all protocols or specific protocols on your switch so that it can then be analyzed for troubleshooting purposes. The output of this command can be provided to technical support staff when reporting a problem.

Mode Privileged Exec

Examples show tech-support

```
awplus# show tech-support
```

Note

You can manage your show output, or make it a more selective, by using a command modifier. For information on using show-command modifiers, see: **"Controlling "show" Command Output" on page 1.38**.

speed (asyn)

This command changes the console speed from the switch. Note that a change in console speed is applied for subsequent console sessions. Exit the current session to enable the console speed change using the **clear line console** command.

Syntax `speed <console-speed-in-bps>`

Parameter	Description
<console-speed-in-bps>	Console speed Baud rate in bps (bits per second).
1200	1200 Baud
2400	2400 Baud
9600	9600 Baud
19200	19200 Baud
38400	38400 Baud
57600	57600 Baud
115200	115200 Baud

Default The default console speed baud rate is 9600 bps.

Mode Line Configuration

Usage This command is used to change the console (asyn) port speed. Set the console speed to match the transmission rate of the device connected to the console (asyn) port on your switch.

Example To set the terminal console (asyn0) port speed from the switch to 57600 bps, then exit the session, and log in again to enable the change, use the commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# speed 57600
awplus(config-line)# exit
awplus(config)# exit
awplus# exit
```

The new console speed of 57600 bps is applied after exiting the session and before login.

```

system territory

This command sets the territory of the system.

Use the **no** variant of this command to return the territory to its default setting of `japan`.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
system territory {australia|nz|europe|japan|usa|china|korea}
no system territory
```

Parameter	Description
`australia`	Australia
`nz`	New Zealand
`europe`	Europe
`japan`	Japan
`usa`	USA
`china`	China
`korea`	Korea

Mode Global Configuration

Example To set the territory to USA, enter the command:

```
awplus(config)# system territory usa
```

Validation Commands **show system**

terminal monitor

Use this command to display debugging output on a terminal.

To display the cursor after a line of debugging output, press the Enter key.

Use the command **terminal no monitor** to stop displaying debugging output on the terminal, or use the timeout option to stop displaying debugging output on the terminal after a set time.

Syntax

```
terminal monitor [<1-60>]
terminal no monitor
```

Parameter	Description
<1-60>	Set a timeout between 1 and 60 seconds for terminal output.

Default Disabled

Mode User Exec and Privileged Exec

Examples To display debugging output on a terminal, enter the command:

```
awplus# terminal monitor
```

To specify timeout of debugging output after 60 seconds, enter the command:

```
awplus# terminal monitor 60
```

To stop displaying debugging output on the terminal, use the command:

```
awplus# terminal no monitor
```

Related Commands All debug commands

undebug all

This command applies the functionality of the **no debug all** command.

Chapter 11: Debugging and Logging

Introduction 11.2
Debugging 11.2
Logging to terminal 11.2
Turning off debugging 11.3
Logging 11.3
Log Outputs 11.4

Introduction

AlliedWare Plus™ has a comprehensive debugging and logging facility in various protocols and components. This chapter describes how to start/stop debugging and logging. For detailed descriptions of the commands used to configure logging, see **Chapter 12, Logging Commands**.

Debugging

Many protocols have debug commands. Debug commands, when used with the parameters, log protocol-specific information. For example, using the **debug mstp protocol** command, results in the device writing all debugging messages generated by the MSTP algorithm to the logging system.

On using a debug command, the protocol continues to generate output until the **no** parameter is used with the command. To specify where logging output is sent, and the level of events to log, use the **log** commands in **Chapter 12, Logging Commands**.

Logging to terminal

To start debugging to the terminal:

Step 1: Turn on the debug options by using the relevant debug command.

Step 2: Run the terminal monitor command.

```
awplus> enable
awplus# configure terminal
awplus(config)# debug <protocol> (parameter)
awplus(config)# exit
awplus# terminal monitor
```

Sample Output This is a sample output of the **debug rsvp events** command displayed on the terminal:

```
awplus#terminal monitor
Dec  2 16:41:49 localhost RSVP[6518]: RSVP: RSVP message sent to
10.10.23.60/32 via interface vlan2
Dec  2 16:41:57 localhost RSVP[6518]: RSVP: Received an RSVP message
of type RSVP Reservation from 192.168.0.60 via interface vlan2
Dec  2 16:41:57 localhost RSVP[6518]: RSVP: Received a RESV message
from 10.10.23.60/32
```

Turning off debugging

To turn off debugging, use the `no debug` or `undebug` command. When a protocol is specified with the `no debug` or `undebug` commands, debugging is stopped for the specified protocol. To stop all debugging, use the `all` parameter with these commands.

```
awplus(config)# no debug rstp
```

or

```
awplus#undebug all
```

Logging

Protocols generate important debugging messages by default, and send them to the logging system. Additional more detailed messages can be generated by enabling debugging (**"Debugging" on page 11.2**).

Messages can be filtered based on: the program that generated the message, the severity level of the message, the type of facility that generated the message, substrings within the message text. The severity levels in order are:

- emergencies
- alerts
- critical
- errors
- warnings
- notifications
- informational
- debugging

The facility categories are:

- auth Security/authorization messages
- authpriv Security/authorization messages (private)
- cron Clock daemon
- daemon System daemons
- ftp FTP daemon
- kern Kernel messages
- lpr Line printer subsystem
- mail Mail system
- news Network news subsystem
- syslog Messages generated internally by syslogd
- user Random user-level messages
- uucp UUCP subsystem

Log Outputs

The following types of logging output are available:

- buffered
- permanent
- terminal
- console
- host
- email

Buffered log

The buffered log is a file stored in RAM on the device. Because it is stored in RAM its content does not survive a reboot of the device. A device can only have one instance of the buffered log. The buffered log is enabled by default and has a filter to include messages with a severity level of 'notifications' and above. The buffered log can be enabled or disabled using the commands:

```
awplus# configure terminal
awplus(config)# log buffered
awplus(config)# no log buffered
```

Additional filters can be added and removed using the commands described in **log buffered (filter)** command on page 12.9:

```
awplus(config)# log buffered {facility|level|msgtext|program}
awplus(config)# no log buffered {facility|level|msgtext|
program}
```

The following log buffered commands are available:

`show log`	Displays the entire contents of the buffered log
`show log tail`	Displays the 10 most recent entries in the buffered log.
`show log tail <10-250>`	Displays a specified number of the most recent entries in the buffered log.
`show log config`	Displays the configuration of all log outputs
`log buffered size`	Specify the amount of memory the buffered log may use.
`clear log`	Remove the contents of the buffered log (and permanent log if it exists)
`clear log buffered`	Remove the contents of the buffered log only
`default log buffered`	Restore the buffered log to its default configuration

Permanent log

The permanent log is a file stored in NVS on the device. This output type is only available on devices that have NVS. The contents on the permanent log is retained over a reboot. A device can only have one instance of the permanent log. The permanent log is enabled by default and has a filter to include messages with a severity level of 'warning' and above. The permanent log can be disabled using the command:

```
awplus# configure terminal
awplus(config)# no log permanent
```

Additional filters can be added and removed using the commands described in **log permanent (filter)**:

```
awplus# configure terminal
awplus(config)# log permanent {facility|level|msgtext|
program}
awplus(config)# no log permanent {facility|level|msgtext|
program}
```

Table 11-1: Permanent log commands

Command	Description
`show log permanent`	Display the entire contents of the permanent log
`show log permanent tail`	Display the 10 most recent entries in the permanent log
`show log permanent tail <10-250>`	Display a specified number of the most recent entries in the permanent log
`show log config`	Display the configuration of all log outputs
`log permanent size`	Specify the amount of memory the permanent log may use
`clear log`	Remove the contents of the buffered log and permanent log
`clear log permanent`	Remove the contents of the permanent log only
`default log permanent`	Restore the permanent log to its default configuration

Host log

A host log sends log messages to a remote syslog server. A device may have many syslog hosts configured. To configure or remove a host use the commands:

```
awplus# configure terminal
awplus(config)# log host <ip-addr>9
awplus(config)# no log host <ip-addr>9
```

where `<ip-addr>` is the IP address of the remote syslog server.

There are no default filters associated with host outputs when they are created. Filters can be added and removed with the **log host (filter)** command on page 12.24.

It is not possible to view the log messages sent to this type of output as they are not retained on the device. They must be viewed on the remote device. The other host log commands are:

`show log config`	Displays the configuration of all log outputs
`log host time`	Adjust the time information in messages to a time zone other than the one configured on this device
`default log host <ip-address>`	Restores the device default settings for log sent to a remote syslog server.

Email log

An email log sends log messages to an email address. A device may have many email logs configured. To configure or remove an email log use the commands:

```
awplus# configure terminal
awplus(config)# log email <email-address>
awplus(config)# no log email <email-address>
```

where `<email-address>` is the destination email address.

There are no default filters associated with email outputs when they are created. Filters can be added and removed with the commands described in **log email (filter)**:

```
awplus# configure terminal
awplus(config)# log email <email-address> {facility|level|
msgtext|program}
awplus(config)# no log email <email-address> {facility|
level|msgtext|program}
```

It is not possible to view the log messages sent to this type of output as they are not retained on the device. They must be viewed by the email recipient.

The other email log commands are:

`show log config`	Displays the configuration of all log outputs
`log email time`	Adjust the time information in messages to a time zone other than the one configured on this device
`default log email`	Restores the device default settings for log messages sent to an email address.

Note

An email server and "from" address must be configured on the device in order for email logs to work:

- mail from <*email-address*>
- mail smtpserver <*ip-address*>

where the <*email-address*> is the 'From:' field on the sent email, and the <*ip-address*> is the email's destination SMTP server.

Email logs are sent in batches of approximately 20 messages and have the subject line "Log messages"

Chapter 12: Logging Commands

Command List 12.2
clear exception log 12.2
clear log 12.2
clear log buffered 12.3
clear log permanent 12.3
default log buffered 12.4
default log console 12.4
default log email 12.5
default log host 12.5
default log monitor 12.6
default log permanent 12.6
exception coredump size (deprecated) 12.7
log buffered 12.8
log buffered (filter) 12.9
log buffered size 12.12
log console 12.13
log console (filter) 12.14
log email 12.17
log email (filter) 12.18
log email time 12.21
log host 12.23
log host (filter) 12.24
log host time 12.27
log monitor (filter) 12.29
log permanent 12.32
log permanent (filter) 12.33
log permanent size 12.36
log-rate-limit nsm 12.37
show counter log 12.38
show exception log 12.39
show log 12.40
show log config 12.42
show log permanent 12.45
show running-config log 12.46

Command List

This chapter provides an alphabetical reference of commands used to configure logging.

clear exception log

This command resets the contents of the exception log, but does not remove the associated core files.

Note When this command is used within a stacked environment, it will remove the contents of the exception logs in all stack members.

Syntax `clear exception log`

Mode Privileged Exec

Example To reset the contents of the exception log, use the following command:

```
awplus# clear exception log
```

clear log

This command removes the contents of the buffered and permanent logs.

Note When this command is used within a stacked environment, it will remove the contents of the buffered and permanent logs in all stack members.

Syntax `clear log`

Mode Privileged Exec

Example To delete the contents of the buffered and permanent log use the command:

```
awplus# clear log
```

Validation Commands **show log**

Related Commands **clear log buffered**
clear log permanent

clear log buffered

This command removes the contents of the buffered log.

Note When this command is used within a stacked environment, it will remove the contents of the buffered logs in all stack members.

Syntax

```
clear log buffered
```

Mode Privileged Exec

Example To delete the contents of the buffered log use the following commands:

```
awplus# clear log buffered
```

Validation Commands show log

Related Commands clear log
clear log permanent

clear log permanent

This command removes the contents of the permanent log.

Note When this command is used within a stacked environment, it will remove the contents of the buffered logs in all stack members.

Syntax

```
clear log permanent
```

Mode Privileged Exec

Example To delete the contents of the permanent log use the following commands:

```
awplus# clear log permanent
```

Validation Commands show log

Related Commands clear log
clear log buffered

default log buffered

This command restores the default settings for the buffered log stored in RAM. By default the size of the buffered log is 50 kB and it accepts messages with the severity level of "warnings" and above.

Syntax `default log buffered`

Default The buffered log is enabled by default.

Mode Global Configuration

Example To restore the buffered log to its default settings use the following commands:

```
awplus# configure terminal
awplus(config)# default log buffered
```

Validation Commands **show log config**

Related Commands **log buffered**
log buffered size

default log console

This command restores the default settings for log messages sent to the terminal when a **log console** command is issued. By default all messages are sent to the console when a **log console** command is issued.

Syntax `default log console`

Mode Global Configuration

Example To restore the log console to its default settings use the following commands:

```
awplus# configure terminal
awplus(config)# default log console
```

Validation Commands **show log config**

Related Commands **log console**
log console (filter)

default log email

This command restores the default settings for log messages sent to an email address. By default no filters are defined for email addresses. Filters must be defined before messages will be sent. This command also restores the remote syslog server time offset value to local (no offset).

Syntax `default log email <email-address>`

Parameter	Description
<email-address>	The email address to send log messages to

Mode Global Configuration

Example To restore the default settings for log messages sent to the email address `admin@alliedtelesis.com` use the following commands:

```
awplus# configure terminal
awplus(config)# default log email admin@alliedtelesis.com
```

Related Commands **show log config**

default log host

This command restores the default settings for log sent to a remote syslog server. By default no filters are defined for remote syslog servers. Filters must be defined before messages will be sent. This command also restores the remote syslog server time offset value to local (no offset).

Syntax `default log host <ip-addr>`

Parameter	Description
<ip-addr>	The IP address of a remote syslog server

Mode Global Configuration

Example To restore the default settings for messages sent to the remote syslog server with IP address `10.32.16.21` use the following commands:

```
awplus# configure terminal
awplus(config)# default log host 10.32.16.21
```

Validation Commands **show log config**

Related Commands **log email**

default log monitor

This command restores the default settings for log messages sent to the terminal when a **terminal monitor** command is used.

Syntax `default log monitor`

Default All messages are sent to the terminal when a **terminal monitor** command is used.

Mode Global Configuration

Example To restore the log monitor to its default settings use the following commands:

```
awplus# configure terminal
awplus(config)# default log monitor
```

Related Commands
log monitor (filter)
show log config

default log permanent

This command restores the default settings for the permanent log stored in NVS. By default, the size of the permanent log is 50 kB and it accepts messages with the severity level of `warnings` and above.

Syntax `default log permanent`

Default The permanent log is enabled by default.

Mode Global Configuration

Example To restore the permanent log to its default settings use the following commands:

```
awplus# configure terminal
awplus(config)# default log permanent
```

Related Commands
log permanent
log permanent size
show log config

exception coredump size (deprecated)

This command has been deprecated in the 5.4.4 release, and will be removed in a later release. There are no alternative commands.

This command sets the size of core files, and can also be used to stop core files being created.

Use the **no** variant of this command to restore the core file size to its default (unlimited).

This setting only applies to processes created after this command has been executed, to ensure this is applied to all processes the system will need to be restarted.

Syntax

```
exception coredump size {none|small|medium|large|unlimited}
no exception coredump size
```

Parameter	Description
`none`	Don't create corefiles
`small`	Create small corefiles
`medium`	Create medium corefiles
`large`	Create large corefiles
`unlimited`	Create corefiles as large as necessary (default)

Default Unlimited

Mode Global Configuration

Usage Core files are generated when a process crashes. The size of a core file can vary, its upper limit is controlled by this command. Files larger than this limit will be truncated by reducing the amount of stack and variable information stored.

Truncated core files may make debugging the failure difficult if not impossible. Reducing the amount of data stored in a core file is not recommended, however the facility is provided to reduce the amount of flash used.

Examples To restrict the size of the core file created, use the command:

```
awplus# configure terminal
awplus(config)# exception coredump size small
```

To restore the size of the core files created to the default of `unlimited`, use the command:

```
awplus# configure terminal
awplus(config)# no exception coredump size
```

log buffered

This command configures the device to store log messages in RAM. Messages stored in RAM are not retained on the device over a restart. Once the buffered log reaches its configured maximum allowable size old messages will be deleted to make way for new ones.

Syntax

```
log buffered
no log buffered
```

Default The buffered log is configured by default.

Mode Global Configuration

Examples To configured the device to store log messages in RAM use the following commands:

```
awplus# configure terminal
awplus(config)# log buffered
```

To configure the device to not store log messages in a RAM buffer use the following commands:

```
awplus# configure terminal
awplus(config)# no log buffered
```

Validation Commands show log config

Related Commands default log buffered
log buffered (filter)
log buffered size

log buffered (filter)

Use this command to create a filter to select messages to be sent to the buffered log. Selection can be based on the priority/ severity of the message, the program that generated the message, the logging facility used, a sub-string within the message or a combination of some or all of these.

The **no** variant of this command removes the corresponding filter, so that the specified messages are no longer sent to the buffered log.

Syntax

```
log buffered [level <level>] [program <program-name>]
   [facility <facility>] [msgtext <text-string>]

no log buffered [level <level>] [program <program-name>]
   [facility <facility>] [msgtext <text-string>]
```

Parameter	Description
`level`	Filter messages to the buffered log by severity level.
<level>	The minimum severity of message to send to the buffered log. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity: 0 emergencies: System is unusable 1 alerts Action must be taken immediately 2 critical Critical conditions 3 errors Error conditions 4 warnings Warning conditions 5 notices Normal, but significant, conditions 6 informational Informational messages 7 debugging Debug-level messages
`program`	Filter messages to the buffered log by program. Include messages from a specified program in the buffered log.

Parameter	Description
<program-name>	The name of a program to log messages from, either one of the following predefined program names (not case-sensitive), or another program name (case-sensitive) that you find in the log output. rip — Routing Information Protocol (RIP) ripng — Routing Information Protocol - next generation (RIPng) ospf — Open Shortest Path First (OSPF) ospfv3 — Open Shortest Path First (OSPF) version 3 (OSPFv3) bgp — Border Gateway Protocol (BGP) rsvp — Resource Reservation Protocol (RSVP) pim-dm — Protocol Independent Multicast - Dense Mode (PIM-DM) pim-sm — Protocol Independent Multicast - Sparse Mode (PIM-SM) dot1x — IEEE 802.1X Port-Based Access Control lacp — Link Aggregation Control Protocol (LACP) stp — Spanning Tree Protocol (STP) rstp — Rapid Spanning Tree Protocol (RSTP) mstp — Multiple Spanning Tree Protocol (MSTP) imi — Integrated Management Interface (IMI) imish — Integrated Management Interface Shell (IMISH) epsr — Ethernet Protection Switched Rings (EPSR) irdp — ICMP Router Discovery Protocol (IRDP) rmon — Remote Monitoring loopprot — Loop Protection dhcpsn — DHCP snooping (DHCPSN)
`facility`	Filter messages to the buffered log by syslog facility.
<facility>	Specify one of the following syslog facilities to include messages from in the buffered log: kern — Kernel messages user — Random user-level messages mail — Mail system daemon — System daemons auth — Security/authorization messages syslog — Messages generated internally by syslogd lpr — Line printer subsystem news — Network news subsystem uucp — UUCP subsystem cron — Clock daemon authpriv — Security/authorization messages (private) ftp — FTP daemon
`msgtext`	Select messages containing a certain text string (maximum 128 characters).
<text-string>	A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line.

Default By default the buffered log has a filter to select messages whose severity level is "notices (5)" or higher. This filter may be removed using the **no** variant of this command.

Mode Global Configuration

Examples To add a filter to send all messages generated by EPSR that have a severity of `notices` or higher to the buffered log use the following commands:

```
awplus# configure terminal
awplus(config)# log buffered level notices program epsr
```

To add a filter to send all messages containing the text "`Bridging initialization`", to the buffered log use the following commands:

```
awplus# configure terminal
awplus(config)# log buffered msgtext Bridging initialization
```

To remove a filter that sends all messages generated by EPSR that have a severity of `notices` or higher to the buffered log use the following commands:

```
awplus# configure terminal
awplus(config)# no log buffered level notices program epsr
```

To remove a filter that sends all messages containing the text "`Bridging initialization`", to the buffered log use the following commands:

```
awplus# configure terminal
awplus(config)# no log buffered msgtext Bridging initialization
```

Validation Commands **show log config**

Related Commands **default log buffered**
log buffered
log buffered size

log buffered size

This command configures the amount of memory that the buffered log is permitted to use. Once this memory allocation has been filled old messages will be deleted to make room for new messages.

Syntax `log buffered size <50-250>`

Parameter	Description
<50-250>	Size of the RAM log in kilobytes

Mode Global Configuration

Example To allow the buffered log to use up to 100 kB of RAM use the following commands:

```
awplus# configure terminal
awplus(config)# log buffered size 100
```

Validation Commands **show log config**

Related Commands **default log buffered**
log buffered

log console

This command configures the device to send log messages to consoles. The console log is configured by default to send messages to the devices main console port.

Use the **no** variant of this command to configure the device not to send log messages to consoles.

Syntax

```
log console
no log console
```

Mode Global Configuration

Examples To configure the device to send log messages use the following commands:

```
awplus# configure terminal
awplus(config)# log console
```

To configure the device not to send log messages in all consoles use the following commands:

```
awplus# configure terminal
awplus(config)# no log console
```

Validation Commands show log config

Related Commands log console (filter)

log console (filter)

This command creates a filter to select messages to be sent to all consoles when the log console command is given. Selection can be based on the priority/severity of the message, the program that generated the message, the logging facility used, a sub-string within the message or a combination of some or all of these.

Syntax

```
log console [level <level>] [program <program-name>]
   [facility <facility>] [msgtext <text-string>]

no log console [level <level>] [program <program-name>]
   [facility <facility>] [msgtext <text-string>]
```

Parameter	Description
`level`	Filter messages by severity level.
<level>	The minimum severity of message to send. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity: 0 emergencies: System is unusable 1|alerts Action must be taken immediately 2|critical Critical conditions 3|errors Error conditions 4|warnings Warning conditions 5|notices Normal, but significant, conditions 6|informational Informational messages 7|debugging Debug-level messages
`program`	Filter messages by program. Include messages from a specified program.

Parameter	Description	
<program-name>	The name of a program to log messages from, either one of the following predefined program names (not case-sensitive), or another program name (case-sensitive) that you find in the log output.	
	rip	Routing Information Protocol (RIP)
	ripng	Routing Information Protocol - next generation (RIPng)
	ospf	Open Shortest Path First (OSPF)
	ospfv3	Open Shortest Path First (OSPF) version 3 (OSPFv3)
	bgp	Border Gateway Protocol (BGP)
	rsvp	Resource Reservation Protocol (RSVP)
	pim-dm	Protocol Independent Multicast - Dense Mode (PIM-DM)
	pim-sm	Protocol Independent Multicast - Sparse Mode (PIM-SM)
	dot1x	IEEE 802.1X Port-Based Access Control
	lacp	Link Aggregation Control Protocol (LACP)
	stp	Spanning Tree Protocol (STP)
	rstp	Rapid Spanning Tree Protocol (RSTP)
	mstp	Multiple Spanning Tree Protocol (MSTP)
	imi	Integrated Management Interface (IMI)
	imish	Integrated Management Interface Shell (IMISH)
	epsr	Ethernet Protection Switched Rings (EPSR)
	irdp	ICMP Router Discovery Protocol (IRDP)
	rmon	Remote Monitoring
	loopprot	Loop Protection
	dhcpsn	DHCP snooping (DHCPSN)
`facility`	Filter messages to the buffered log by syslog facility.	
<facility>	Specify one of the following syslog facilities to include messages from:	
	kern	Kernel messages
	user	Random user-level messages
	mail	Mail system
	daemon	System daemons
	auth	Security/authorization messages
	syslog	Messages generated internally by syslogd
	lpr	Line printer subsystem
	news	Network news subsystem
	uucp	UUCP subsystem
	cron	Clock daemon
	authpriv	Security/authorization messages (private)
	ftp	FTP daemon
`msgtext`	Select messages containing a certain text string	
<text-string>	A text string to match. This is case sensitive, and must be the last text on the command line.	

Default By default the buffered log has a filter to select messages whose severity level is `critical` or higher. This filter may be removed using the **no** variant of this command. This filter may be removed and replaced by filters that are more selective.

Mode Global Configuration

Examples To create a filter to send all messages generated by MSTP that have a severity of `info` or higher to console instances where the log console command has been given, remove the default filter that includes everything use the following commands:

```
awplus# configure terminal
awplus(config)# log console level info program mstp
```

and then use the command:

```
awplus(config)# log console level info program mstp
```

To create a filter to send all messages containing the text "`Bridging initialization`" to console instances where the log console command has been given use the following commands:

```
awplus# configure terminal
awplus(config)# log console msgtext "Bridging initialization"
```

To remove a filter that sends all messages generated by EPSR that have a severity of `notices` or higher to consoles use the following commands:

```
awplus# configure terminal
awplus(config)# no log console level notices program epsr
```

To remove a default filter that includes sending `critical`, `alert` and `emergency` level messages to the console use the following commands:

```
awplus# configure terminal
awplus(config)# no log console level critical
```

Validation Commands **show log config**

Related Commands **log console**

log email

This command configures the device to send log messages to an email address. The email address is specified in this command.

Syntax `log email <email-address>`

Parameter	Description
<email-address>	The email address to send log messages to

Default By default no filters are defined for email log targets. Filters must be defined before messages will be sent.

Mode Global Configuration

Example To have log messages emailed to the email address `admin@alliedtelesis.com` use the following commands:

```
awplus# configure terminal
awplus(config)# log email admin@alliedtelesis.com
```

Validation Commands **show log config**

Related Commands **default log email**
log email

log email (filter)

This command creates a filter to select messages to be sent to an email address. Selection can be based on the priority/ severity of the message, the program that generated the message, the logging facility used, a sub-string within the message or a combination of some or all of these.

The **no** variant of this command configures the device to no longer send log messages to a specified email address. All configuration relating to this log target will be removed.

Syntax

```
log email <email-address> [level <level>] [program <program-name>]
   [facility <facility>] [msgtext <text-string>]

no log email <email-address> [level <level>] [program <program-name>]
   [facility <facility>] [msgtext <text-string>]
```

Parameter	Description
<email-address>	The email address to send logging messages to
`level`	Filter messages by severity level.
<level>	The minimum severity of messages to send. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity: 0 emergencies: System is unusable 1 alerts Action must be taken immediately 2 critical Critical conditions 3 errors Error conditions 4 warnings Warning conditions 5 notices Normal, but significant, conditions 6 informational Informational messages 7 debugging Debug-level messages
`program`	Filter messages by program. Include messages from a specified program in the log.

Parameter	Description
<program-name>	The name of a program to log messages from, either one of the following predefined program names (not case-sensitive), or another program name (case -sensitive) that you find in the log output. rip — Routing Information Protocol (RIP) ripng — Routing Information Protocol - next generation (RIPng) ospf — Open Shortest Path First (OSPF) ospfv3 — Open Shortest Path First (OSPF) version 3 (OSPFv3) bgp — Border Gateway Protocol (BGP) rsvp — Resource Reservation Protocol (RSVP) pim-dm — Protocol Independent Multicast - Dense Mode (PIM-DM) pim-sm — Protocol Independent Multicast - Sparse Mode (PIM-SM) dot1x — IEEE 802.1X Port-Based Access Control lacp — Link Aggregation Control Protocol (LACP) stp — Spanning Tree Protocol (STP) rstp — Rapid Spanning Tree Protocol (RSTP) mstp — Multiple Spanning Tree Protocol (MSTP) imi — Integrated Management Interface (IMI) imish — Integrated Management Interface Shell (IMISH) epsr — Ethernet Protection Switched Rings (EPSR) irdp — ICMP Router Discovery Protocol (IRDP) rmon — Remote Monitoring loopprot — Loop Protection dhcpsn — DHCP snooping (DHCPSN)
`facility`	Filter messages to the log by syslog facility.
<facility>	Specify one of the following syslog facilities to include messages from in the log: kern — Kernel messages user — Random user-level messages mail — Mail system daemon — System daemons auth — Security/authorization messages syslog — Messages generated internally by syslogd lpr — Line printer subsystem news — Network news subsystem uucp — UUCP subsystem cron — Clock daemon authpriv — Security/authorization messages (private) ftp — FTP daemon
`msgtext`	Select messages containing a certain text string
<text-string>	A text string to match. This is case sensitive, and must be the last text on the command line.

Mode Global Configuration

Examples To create a filter to send all messages generated by EPSR that have a severity of `notices` or higher to the email address `admin@homebase.com` use the following commands:

```
awplus# configure terminal
awplus(config)# log email admin@homebase.com level notices
program epsr
```

To create a filter to send all messages containing the text "`Bridging initialization`", to the email address `admin@homebase.com` use the following commands:

```
awplus# configure terminal
awplus(config)# log email admin@homebase.com msgtext
"Bridging initialization"
```

To create a filter to send messages with a severity level of `informational` and above to the email address `admin@alliedtelesis.com` use the following commands:

```
awplus# configure terminal
awplus(config)# log email admin@alliedtelesis.com level
informational
```

To stop the device emailing log messages emailed to the email address `admin@alliedtelesis.com` use the following commands:

```
awplus# configure terminal
awplus(config)# no log email admin@homebase.com
```

To remove a filter that sends all messages generated by EPSR that have a severity of `notices` or higher to the email address `admin@homebase.com` use the following commands:

```
awplus# configure terminal
awplus(config)# no log email admin@homebase.com level
notices program epsr
```

To remove a filter that sends messages with a severity level of `informational` and above to the email address `admin@alliedtelesis.com` use the following commands:

```
awplus# configure terminal
awplus(config)# no log email admin@alliedtelesis.com level
informational
```

Related Commands **default log email**
log email
show log config

log email time

This command configures the time used in messages sent to an email address. If the syslog server is in a different time zone to your switch then the time offset can be configured using either the **utc-offset** parameter option keyword or the **local-offset** parameter option keyword, where **utc-offset** is the time difference from UTC (Universal Time, Coordinated) and **local-offset** is the difference from local time.

Syntax

```
log email <email-address> time {local|local-offset|utc-offset
   {plus|minus}<0-24>}
```

Parameter	Description
<email-address>	The email address to send log messages to
`time`	Specify the time difference between the email recipient and the switch you are configuring.
`local`	The switch is in the same time zone as the email recipient
`local-offset`	The switch is in a different time zone to the email recipient. Use the **plus** or **minus** keywords and specify the difference (offset) from local time of the switch to the email recipient in hours.
`utc-offset`	The switch is in a different time zone to the email recipient. Use the **plus** or **minus** keywords and specify the difference (offset) from UTC time of the switch to the email recipient in hours.
`plus`	Negative offset (difference) from the switch to the email recipient.
`minus`	Positive offset (difference) from the switch to the email recipient.
<0-24>	World Time zone offset in hours

Default The default is **local** time.

Mode Global Configuration

Usage Use the **local** option if the email recipient is in the same time zone as this device. Messages will display the time as on the local device when the message was generated.

Use the **offset** option if the email recipient is in a different time zone to this device. Specify the time offset of the email recipient in hours. Messages will display the time they were generated on this device but converted to the time zone of the email recipient.

Examples To send messages to the email address `test@home.com` in the same time zone as the switch's local time zone, use the following commands:

```
awplus# configure terminal
awplus(config)# log email admin@base.com time local 0
```

To send messages to the email address `admin@base.com` with the time information converted to the time zone of the email recipient, which is 3 hours ahead of the switch's local time zone, use the following commands:

```
awplus# configure terminal
awplus(config)# log email admin@base.com time local-offset
                plus 3
```

To send messages to the email address `user@remote.com` with the time information converted to the time zone of the email recipient, which is 3 hours behind the switch's UTC time zone, use the following commands:

```
awplus# configure terminal

awplus(config)# log email user@remote.com time utc-offset
minus 3
```

Validation Commands **show log config**

Related Commands **default log buffered**

log host

This command configures the device to send log messages to a remote syslog server via UDP port 514. The IP address of the remote server must be specified. By default no filters are defined for remote syslog servers. Filters must be defined before messages will be sent.

Syntax

```
log host <ip-addr>
no log host <ip-addr>
```

Parameter	Description
<ip-addr>	The IP address of a remote syslog server in dotted decimal format A.B.C.D

Mode Global Configuration

Examples To configure the device to send log messages to a remote syslog server with IP address `10.32.16.99` use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.99
```

To stop the device from sending log messages to the remote syslog server with IP address `10.32.16.99` use the following commands:

```
awplus# configure terminal
awplus(config)# no log host 10.32.16.99
```

Validation Commands **show log config**

Related Commands **default log host**

log host (filter)

This command creates a filter to select messages to be sent to a remote syslog server. Selection can be based on the priority/severity of the message, the program that generated the message, the logging facility used, a substring within the message or a combination of some or all of these.

The **no** variant of this command configures the device to no longer send log messages to a remote syslog server. The IP address of the syslog server must be specified. All configuration relating to this log target will be removed.

Syntax

```
log host <ip-addr> [level <level>] [program <program-name>]
    [facility <facility>] [msgtext <text-string>]

no log host <ip-addr> [level <level>] [program <program-name>]
    [facility <facility>] [msgtext <text-string>]
```

Parameter	Description
`<ip-addr>`	The IP address of a remote syslog server
`level`	Filter messages by severity level.
`<level>`	The minimum severity of messages to send. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity: 0|emergencies: System is unusable 1|alerts Action must be taken immediately 2|critical Critical conditions 3|errors Error conditions 4|warnings Warning conditions 5|notices Normal, but significant, conditions 6|informational Informational messages 7|debugging Debug-level messages
`program`	Filter messages by program. Include messages from a specified program in the log.
`<program-name>`	The name of a program to log messages from, either one of the following predefined program names (not case-sensitive), or another program name (case -sensitive) that you find in the log output. rip Routing Information Protocol (RIP) ripng Routing Information Protocol - next generation (RIPng) ospf Open Shortest Path First (OSPF) ospfv3 Open Shortest Path First (OSPF) version 3 (OSPFv3) bgp Border Gateway Protocol (BGP) rsvp Resource Reservation Protocol (RSVP) pim-dm Protocol Independent Multicast - Dense Mode (PIM-DM) pim-sm Protocol Independent Multicast - Sparse Mode (PIM-SM) dot1x IEEE 802.1X Port-Based Access Control

Parameter	Description	
`<program-name>` (cont.)	lacp	Link Aggregation Control Protocol (LACP)
	stp	Spanning Tree Protocol (STP)
	rstp	Rapid Spanning Tree Protocol (RSTP)
	mstp	Multiple Spanning Tree Protocol (MSTP)
	imi	Integrated Management Interface (IMI)
	imish	Integrated Management Interface Shell (IMISH)
	epsr	Ethernet Protection Switched Rings (EPSR)
	irdp	ICMP Router Discovery Protocol (IRDP)
	rmon	Remote Monitoring
	loopprot	Loop Protection
	dhcpsn	DHCP snooping (DHCPSN)
`facility`	Filter messages to the log by syslog facility.	
`<facility>`	Specify one of the following syslog facilities to include messages from in the log:	
	kern	Kernel messages
	user	Random user-level messages
	mail	Mail system
	daemon	System daemons
	auth	Security/authorization messages
	syslog	Messages generated internally by syslogd
	lpr	Line printer subsystem
	news	Network news subsystem
	uucp	UUCP subsystem
	cron	Clock daemon
	authpriv	Security/authorization messages (private)
	ftp	FTP daemon
`msgtext`	Select messages containing a certain text string	
`<text-string>`	A text string to match. This is case sensitive, and must be the last text on the command line.	

Mode Global Configuration

Examples To create a filter to send all messages generated by EPSR that have a severity of `notices` or higher to a remote syslog server with IP address `10.32.16.21` use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.21 level notices program epsr
```

To create a filter to send all messages containing the text "`Bridging initialization`", to a remote syslog server with IP address `10.32.16.21` use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.21 msgtext "Bridging
initialization"
```

To create a filter to send messages with a severity level of `informational` and above to the syslog server with IP address `10.32.16.21` use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.21 level informational
```

To remove a filter that sends all messages generated by EPSR that have a severity of `notices` or higher to a remote syslog server with IP address `10.32.16.21` use the following commands:

```
awplus# configure terminal
awplus(config)# no log host 10.32.16.21 level notices program
epsr
```

To remove a filter that sends all messages containing the text "`Bridging initialization`", to a remote syslog server with IP address `10.32.16.21` use the following commands:

```
awplus# configure terminal
awplus(config)# no log host 10.32.16.21 msgtext "Bridging
initialization"
```

To remove a filter that sends messages with a severity level of `informational` and above to the syslog server with IP address `10.32.16.21` use the following commands:

```
awplusawpluls# configure terminal
awplus(config)# no log host 10.32.16.21 level informational
```

Related Commands

log host time

This command configures the time used in messages sent to a remote syslog server. If the syslog server is in a different time zone to your switch then the time offset can be configured using either the **utc-offset** parameter option keyword or the **local-offset** parameter option keyword, where **utc-offset** is the time difference from UTC (Universal Time, Coordinated) and **local-offset** is the difference from local time.

Syntax

```
log host <email-address> time {local|local-offset|utc-offset
   {plus|minus} <0-24>}
```

Parameter	Description
<email-address>	The email address to send log messages to
`time`	Specify the time difference between the email recipient and the switch you are configuring.
`local`	The switch is in the same time zone as the email recipient
`local-offset`	The switch is in a different time zone to the email recipient. Use the **plus** or **minus** keywords and specify the difference (offset) from local time of the switch to the email recipient in hours.
`utc-offset`	The switch is in a different time zone to the email recipient. Use the **plus** or **minus** keywords and specify the difference (offset) from UTC time of the switch to the email recipient in hours.
`plus`	Negative offset (difference) from the switch to the syslog server.
`minus`	Positive offset (difference) from the switch to the syslog server.
<0-24>	World Time zone offset in hours

Default The default is **local** time.

Mode Global Configuration

Usage Use the **local** option if the remote syslog server is in the same time zone as the switch. Messages will display the time as on the local device when the message was generated.

Use the **offset** option if the email recipient is in a different time zone to this device. Specify the time offset of the remote syslog server in hours. Messages will display the time they were generated on this device but converted to the time zone of the remote syslog server.

Examples To send messages to the remote syslog server with the IP address `10.32.16.21` in the same time zone as the switch's local time zone, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.21 time local 0
```

To send messages to the remote syslog server with the IP address `10.32.16.12` with the time information converted to the time zone of the remote syslog server, which is 3 hours ahead of the switch's local time zone, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.12 time local-offset plus 3
```

To send messages to the remote syslog server with the IP address `10.32.16.02` with the time information converted to the time zone of the email recipient, which is 3 hours behind the switch's UTC time zone, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.02 time utc-offset minus 3
```

Validation Commands **show log config**

Related Commands **default log buffered**

log monitor (filter)

This command creates a filter to select messages to be sent to the terminal when the terminal monitor command is given. Selection can be based on the priority/severity of the message, the program that generated the message, the logging facility used, a sub-string within the message or a combination of some or all of these.

Syntax

```
log monitor [level <level>] [program <program-name>]
   [facility <facility>] [msgtext <text-string>]

no log monitor [level <level>] [program <program-name>]
   [facility <facility>] [msgtext <text-string>]
```

Parameter	Description
`level`	Filter messages to the permanent log by severity level.
<level>	The minimum severity of message to send to the log. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity: 0|emergencies: System is unusable 1|alerts Action must be taken immediately 2|critical Critical conditions 3|errors Error conditions 4|warnings Warning conditions 5|notices Normal, but significant, conditions 6|informational Informational messages 7|debugging Debug-level messages
`program`	Filter messages to the permanent log by program. Include messages from a specified program in the log.
<program-name>	The name of a program to log messages from, either one of the following predefined program names (not case-sensitive), or another program name (case -sensitive) that you find in the log output. rip Routing Information Protocol (RIP) ripng Routing Information Protocol - next generation (RIPng) ospf Open Shortest Path First (OSPF) ospfv3 Open Shortest Path First (OSPF) version 3 (OSPFv3) bgp Border Gateway Protocol (BGP) rsvp Resource Reservation Protocol (RSVP) pim-dm Protocol Independent Multicast - Dense Mode (PIM-DM) pim-sm Protocol Independent Multicast - Sparse Mode (PIM-SM) dot1x IEEE 802.1X Port-Based Access Control lacp Link Aggregation Control Protocol (LACP) stp Spanning Tree Protocol (STP) rstp Rapid Spanning Tree Protocol (RSTP) mstp Multiple Spanning Tree Protocol (MSTP) imi Integrated Management Interface (IMI)

Parameter	Description	
<program-name> (cont.)	imish	Integrated Management Interface Shell (IMISH)
	epsr	Ethernet Protection Switched Rings (EPSR)
	irdp	ICMP Router Discovery Protocol (IRDP)
	rmon	Remote Monitoring
	loopprot	Loop Protection
	dhcpsn	DHCP snooping (DHCPSN)
`facility`	Filter messages to the permanent log by syslog facility.	
<facility>	Specify one of the following syslog facilities to include messages from in the log:	
	kern	Kernel messages
	user	Random user-level messages
	mail	Mail system
	daemon	System daemons
	auth	Security/authorization messages
	syslog	Messages generated internally by syslogd
	lpr	Line printer subsystem
	news	Network news subsystem
	uucp	UUCP subsystem
	cron	Clock daemon
	authpriv	Security/authorization messages (private)
	ftp	FTP daemon
`msgtext`	Select messages containing a certain text string	
<text-string>	A text string to match. This is case sensitive, and must be the last text on the command line.	

Default By default there is a filter to select all messages. This filter may be removed and replaced by filters that are more selective.

Mode Global Configuration

Examples To create a filter to send all messages generated by MSTP that have a severity of `info` or higher to terminal instances where the terminal monitor command has been given use the following commands:

```
awplus# configure terminal
awplus(config)# log monitor level info program mstp
```

To remove a filter that sends all messages generated by EPSR that have a severity of `notices` or higher to the terminal use the following commands:

```
awplus# configure terminal
awplus(config)# no log monitor level notices program epsr
```

To remove a default filter that includes sending everything to the terminal use the following commands:

```
awplus# configure terminal
awplus(config)# no log monitor level debugging
```

Validation Commands **show log config**

Related Commands **terminal monitor**

log permanent

This command configures the device to send log messages to non-volatile storage (NVS) on the device. Log messages sent to NVS are retained on the device over a restart, that is they are permanent. Once the permanent log reaches its configured maximum allowable size old messages will be deleted to make way for new ones.

The **no** variant of this command configures the device not to send any messages to the permanent log. Log messages will not be retained over a restart.

Syntax

```
log permanent
no log permanent
```

Mode Global Configuration

Examples To enable permanent logging use the following commands:

```
awplus# configure terminal
awplus(config)# log permanent
```

To disable permanent logging use the following commands:

```
awplus# configure terminal
awplus(config)# no log permanent
```

Validation Commands **show log config**

Related Commands **default log permanent**
log permanent (filter)
log permanent size
show log permanent

log permanent (filter)

This command creates a filter to select messages to be sent to the permanent log. Selection can be based on the priority/ severity of the message, the program that generated the message, the logging facility used, a sub-string within the message or a combination of some or all of these.

The **no** variant of this command removes the corresponding filter, so that the specified messages are no longer sent to the permanent log.

Syntax

```
log permanent [level <level>] [program <program-name>]
   [facility <facility>] [msgtext <text-string>]

no log permanent [level <level>] [program <program-name>]
   [facility <facility>] [msgtext <text-string>]
```

Parameter	Description
`level`	Filter messages to the permanent log by severity level.
`<level>`	The minimum severity of message to send to the log. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity: 0|emergencies: System is unusable 1|alerts Action must be taken immediately 2|critical Critical conditions 3|errors Error conditions 4|warnings Warning conditions 5|notices Normal, but significant, conditions 6|informational Informational messages 7|debugging Debug-level messages
`program`	Filter messages to the permanent log by program. Include messages from a specified program in the log.

Parameter	Description	
<program-name>	The name of a program to log messages from, either one of the following predefined program names (not case-sensitive), or another program name (case -sensitive) that you find in the log output.	
	rip	Routing Information Protocol (RIP)
	ripng	Routing Information Protocol - next generation (RIPng)
	ospf	Open Shortest Path First (OSPF)
	ospfv3	Open Shortest Path First (OSPF) version 3 (OSPFv3)
	bgp	Border Gateway Protocol (BGP)
	rsvp	Resource Reservation Protocol (RSVP)
	pim-dm	Protocol Independent Multicast - Dense Mode (PIM-DM)
	pim-sm	Protocol Independent Multicast - Sparse Mode (PIM-SM)
	dot1x	IEEE 802.1X Port-Based Access Control
	lacp	Link Aggregation Control Protocol (LACP)
	stp	Spanning Tree Protocol (STP)
	rstp	Rapid Spanning Tree Protocol (RSTP)
	mstp	Multiple Spanning Tree Protocol (MSTP)
	imi	Integrated Management Interface (IMI)
	imish	Integrated Management Interface Shell (IMISH)
	epsr	Ethernet Protection Switched Rings (EPSR)
	irdp	ICMP Router Discovery Protocol (IRDP)
	rmon	Remote Monitoring
	loopprot	Loop Protection
	dhcpsn	DHCP snooping (DHCPSN)
`facility`	Filter messages to the permanent log by syslog facility.	
<facility>	Specify one of the following syslog facilities to include messages from in the log:	
	kern	Kernel messages
	user	Random user-level messages
	mail	Mail system
	daemon	System daemons
	auth	Security/authorization messages
	syslog	Messages generated internally by syslogd
	lpr	Line printer subsystem
	news	Network news subsystem
	uucp	UUCP subsystem
	cron	Clock daemon
	authpriv	Security/authorization messages (private)
	ftp	FTP daemon
`msgtext`	Select messages containing a certain text string	
<text-string>	A text string to match. This is case sensitive, and must be the last text on the command line.	

Default By default the buffered log has a filter to select messages whose severity level is `notices (5)` or higher. This filter may be removed using the **no** variant of this command.

Mode Global Configuration

Examples To create a filter to send all messages generated by EPSR that have a severity of `notices` or higher to the permanent log use the following commands:

```
awplus# configure terminal
awplus(config)# log permanent level notices program epsr
```

To create a filter to send all messages containing the text "`Bridging initialization`", to the permanent log use the following commands:

```
awplus# configure terminal
awplus(config)# log permanent msgtext Bridging initialization
```

Validation Commands **show log config**

Related Commands **default log permanent**
log permanent
log permanent size
show log permanent

log permanent size

This command configures the amount of memory that the permanent log is permitted to use. Once this memory allocation has been filled old messages will be deleted to make room for new messages.

Syntax `log permanent size <50-250>`

Parameter	Description
<50-250>	Size of the permanent log in kilobytes

Mode Global Configuration

Example To allow the permanent log to use up to 100 kB of NVS use the following commands:

```
awplus# configure terminal
awplus(config)# log permanent size 100
```

Validation Commands **show log config**

Related Commands **default log permanent**
log permanent

log-rate-limit nsm

This command limits the number of log messages generated by the switch for a given interval.

Use the **no** variant of this command to revert to the default number of log messages generated by the switch of up to 200 log messages per second.

Syntax

```
log-rate-limit nsm messages <message-limit> interval <time-interval>
no log-rate-limit nsm
```

Parameter	Description
<message-limit>	<1-65535> The number of log messages generated by the switch.
<time-interval>	<0-65535> The time period for log message generation in 1/100 seconds. If an interval of 0 is specified then no log message rate limiting is applied.

Default By default, the switch will allow 200 log messages to be generated per second.

Mode Global Configuration

Usage Previously, if the switch received a continuous stream of IGMP packets with errors, such as when a packet storm occurs because of a network loop, then the switch generates a lot of log messages using more and more memory, which may ultimately cause the switch to shutdown. This log rate limiting feature constrains the rate that log messages are generated by the switch.

Note that if within the given time interval, the number of log messages exceeds the limit, then any excess log messages are discarded. At the end of the time interval, a single log message is generated indicating that log messages were discarded due to the log rate limit being exceeded.

Thus if the expectation is that there will be a lot of discarded log messages due to log rate limiting, then it is advisable to set the time interval to no less than 100, which means that there would only be one log message, indicating log excessive log messages have been discarded.

Examples To limit the switch to generate up to 300 log messages per second, use the following commands:

```
awplus# configure terminal
awplus(config)# log-rate-limit nsm messages 300 interval 100
```

To return the switch the default setting, to generate up to 200 log messages per second, use the following commands:

```
awplus# configure terminal
awplus(config)# no log-rate-limit nsm
```

show counter log

This command displays log counter information.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show counter log`

Mode User Exec and Privileged Exec

Example To display the log counter information, use the command:

```
awplus# show counter log
```

Output **Figure 12-1: Example output from the show counter log command**

```
Log counters
Total Received          ......... 2328
Total Received P0       ......... 0
Total Received P1       ......... 0
Total Received P2       ......... 1
Total Received P3       ......... 9
Total Received P4       ......... 32
Total Received P5       ......... 312
Total Received P6       ......... 1602
Total Received P7       ......... 372
```

Table 12-1: Parameters in output of the show counter log command

Parameter	Description
`Total Received`	Total number of messages received by the log
`Total Received P0`	Total number of Priority 0 (Emergency) messages received
`Total Received P1`	Total number of Priority 1 (Alert) messages received
`Total Received P2`	Total number of Priority 2 (Critical) messages received
`Total Received P3`	Total number of Priority 3 (Error) messages received
`Total Received P4`	Total number of Priority 4 (Warning) messages received
`Total Received P5`	Total number of Priority 5 (Notice) messages received
`Total Received P6`	Total number of Priority 6 (Info) messages received
`Total Received P7`	Total number of Priority 7 (Debug) messages received

Related Commands **show log config**

show exception log

This command displays the contents of the exception log. When used within a stacked environment, this command will display the contents of the exception log for all the stack members.

Syntax `show exception log`

Mode User Exec and Privileged Exec

Example To display the exception log, use the command:

```
awplus# show exception log
```

Output **Figure 12-2: Example output from the show exception log command on a switch**

```
awplus#show exception log

show log

This command displays the contents of the buffered log.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show log [tail [<10-250>]]`

Parameter	Description
`tail`	Display only the latest log entries.
<10-250>	Specify the number of log entries to display.

Default By default the entire contents of the buffered log is displayed.

Mode User Exec, Privileged Exec and Global Configuration

Usage If the optional **tail** parameter is specified only the latest 10 messages in the buffered log are displayed. A numerical value can be specified after the **tail** parameter to select how many of the latest messages should be displayed.

Examples To display the contents of the buffered log use the command:

```
awplus# show log
```

To display the 10 latest entries in the buffered log use the command:

```
awplus# show log tail 10
```

Output **Figure 12-3: Example output from the show log command**

```
awplus#show log

Related Commands **show log config**
show log permanent

show log config

This command displays information about the logging system. This includes the configuration of the various log destinations, buffered, permanent, syslog servers (hosts) and email addresses. This also displays the latest status information for each of these destinations.

Syntax `show log config`

Mode User Exec, Privileged Exec and Global Configuration

Example To display the logging configuration use the command:

```
awplus# show log config
```

Output **Figure 12-5: Example output from the show log config command**

```
Buffered log:
Status ......... enabled
  Maximum size ... 100kb
  Filters:
 *1 Level ........ notices
    Program ...... any
    Facility ..... any
    Message text . any
  2 Level ........ informational
    Program ...... mstp
    Facility ..... daemon
    Message text . any
  Statistics ..... 1327 messages received, 821 accepted by filter (2006 Dec 11
10:36:16)
Permanent log:
  Status ......... enabled
  Maximum size ... 60kb
  Filters:
  1 Level ........ error
    Program ...... any
    Facility ..... any
    Message text . any
 *2 Level ........ warnings

10:36:16)
Email admin@alliedtelesis.com:
  Time offset .... +0:00
  Offset type .... Local
  Filters:
  1 Level ........ emergencies
    Program ...... any
    Facility ..... any
    Message text . any
  Statistics ..... 1327 messages received, 0 accepted by filter (2006 Dec 11
10:36:16)
Monitor log:
  Filters:
 *1   Level ...... debugging
      Program .... any
      Facility ... any
      Msg text ... any
  Statistics ..... Not available
Console log:
  Status ......... enabled
  List of consoles:
  1 .............. ttyS0
  Filters:
 *1   Level ...... critical
      Program .... any
      Facility ... any
      Msg text ... any
  Statistics ..... 1327 messages received, 1 accepted by filter (2006 Dec 11
10:36:16)
```

In the above example the '*' next to filter 1 in the buffered log configuration indicates that this is the default filter. The permanent log has had its default filter removed, so none of the filters are marked with "*'.

Note

Terminal log and console log cannot be set at the same time. If console logging is enabled then the terminal logging is turned off.

Related Commands

show counter log
show log
show log permanent

show log permanent

This command displays the contents of the permanent log.

When used within a stacked environment, this command will display the contents of the permanent log for all the stack members.

Syntax `show log permanent[<stack-ID>][tail [<10-250>]]`

Parameter	Description
<stack-ID>	Stack member number, from 1 to 8.
`tail`	Display only the latest log entries.
<10-250>	Specify the number of log entries to display.

Default If the optional `tail` parameter is specified only the latest 10 messages in the permanent log are displayed. A numerical value can be specified after the `tail` parameter to select how many of the latest messages should be displayed.

Mode User Exec, Privileged Exec and Global Configuration

Example To display the permanent log of stack member 2, use the command:

```
awplus# show log permanent 2
```

Output **Figure 12-6: Example output from the show log permanent command**

```
awplus#show log permanent 2

Stack member 2:

<date> <time> <facility>.<severity> <program[<pid>]>: <message>

Related Commands show log

show running-config log

This command displays the current running configuration of the Log utility.

Syntax `show running-config log`

Mode Privileged Exec and Global Configuration

Example To display the current configuration of the log utility, use the command:

```
awplus# show running-config log
```

Related Commands show log
show log config

Chapter 13: Scripting Commands

Command List 13.2
activate 13.2
echo 13.3
wait 13.4

Command List

This chapter provides commands used for command scripts.

activate

This command activates a script file.

Syntax `activate [background] <script>`

Parameter	Description
`background`	Activate a script to run in the background. A process that is running in the background will operate as a separate task, and will not interrupt foreground processing. Generally, we recommend running short, interactive scripts in the foreground and longer scripts in the background. The default is to run the script in the foreground.
<script>	The file name of the script to activate. The script is a command script consisting of commands documented in this software reference. Note that you must use either a **.scp** or a **.sh** filename extension for a valid script text file, as described below in the usage section for this command.

Mode Privileged Exec

Usage In a stacked environment you can use the CLI on a stack master to access file systems that are located on a stack backup member. In this case the command specifies a file on the backup member. The stack member's file system will be denoted by: *<hostname>-<member-id>* For example, **awplus-1** for member 1, **awplus-2** for member 2 etc.

When a script is activated, the privilege level is set to 1 enabling User Exec commands to run in the script. If you need to run Privileged Exec commands in your script you need to add an **enable (Privileged Exec mode)** command to the start of your script. If you need to run Global Configuration commands in your script you need to add a **configure terminal** command after the **enable** command at the start of your script.

The **activate** command executes the script in a new shell. A **terminal length** shell command, such as **terminal length 0** may also be required to disable a delay that would pause the display.

A script must be a text file with a filename extension of either **.sh** or **.scp** only for the AlliedWare Plus™ CLI to activate the script file. The **.sh** filename extension indicates the file is an ASH script, and the **.scp** filename extension indicates the file is an AlliedWare Plus™ script.

Examples To activate a command script to run as a background process, use the command:

```
awplus# activate background test.scp
```

To activate a script `/flash:/test.scp` in stack member 2, use the command:

```
awplus-2# activate awplus-2/flash:/test.scp
```

Related Commands
configure terminal
echo
enable (Privileged Exec mode)
wait

echo

This command echoes a string to the terminal, followed by a blank line.

Syntax

```
echo <line>
```

Parameter	Description
<line>	The string to echo

Mode User Exec and Privileged Exec

Usage This command may be useful in CLI scripts, to make the script print user-visible comments.

Example To echo the string `Hello World` to the console, use the command:

```
awplus# echo Hello World
```

```
Hello World
```

Related Commands
activate
wait

wait

This command pauses execution of the active script for the specified period of time.

Syntax `wait <delay>`

Parameter	Description
<delay>	<1-65335> Specify the time delay in seconds

Default No wait delay is specified by default to pause script execution.

Mode Privileged Exec (when executed from a script not directly from the command line)

Usage Use this command to pause script execution in an **.scp** (AlliedWare Plus™ script) or an **.sh** (ASH script) file executed by the **activate** command. The script must contain an **enable (Privileged Exec mode)** command since the **wait** command is only executed in the Privileged Exec mode.When a script is activated, the privilege level is set to 1 enabling User Exec commands to run in the script. If you need to run Privileged Exec commands in your script you need to add an **enable (Privileged Exec mode)** command to the start of your script.

Example See an example **.scp** script file extract below that will show port counters for interface `port1.0.1` over a 10 second interval:

```
enable
show interface port1.0.1
wait 10
show interface port1.0.1
```

Related Commands
activate
echo
enable (Privileged Exec mode)

Chapter 14: Interface Commands

Command List 14.2
description (interface) 14.2
interface (to configure) 14.3
mtu 14.5
show interface 14.7
show interface brief 14.10
show interface status 14.11
shutdown 14.13

Command List

This chapter provides an alphabetical reference of commands used to configure and display interfaces.

description (interface)

Use this command to add a description to a specific port or interface.

Syntax `description <description>`

Parameter	Description
<description>	Text describing the specific interface.

Mode Interface Configuration

Example The following example uses this command to describe the device that a switch port is connected to.

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# description Boardroom PC
```

interface (to configure)

Use this command to select one or more interfaces to configure.

Syntax

```
interface <interface-list>
interface lo
```

Parameter	Description
<interface-list>	The interfaces or ports to configure. An interface-list can be: ■ an interface (e.g. `vlan2`), a switch port (e.g. `port1.0.12`), a static channel group (e.g. `sa3`) or a dynamic (LACP) channel group (e.g. `po4`) ■ a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. `vlan2-8`, or `port1.0.1-1.0.24`, or `sa2-4`, or `po1-3` ■ a comma-separated list of the above; e.g. `port1.0.1,port1.0.8-1.0.24`. Do not mix interface types in a list The specified interfaces must exist.
`lo`	The local loopback interface.

Usage

A local loopback interface is one that is always available for higher layer protocols to use and advertise to the network. Although a local loopback interface is assigned an IP address, it does not have the usual requirement of connecting to a lower layer physical entity. This lack of physical attachment creates the perception of a local loopback interface always being accessible via the network.

Local loopback interfaces can be utilized by a number of protocols for various purposes. They can be used to improve access to the switch and also increase its reliability, security, scalability and protection. In addition, local loopback interfaces can add flexibility and simplify management, information gathering and filtering.

One example of this increased reliability is for OSPF to advertise a local loopback interface as an interface-route into the network irrespective of the physical links that may be “up” or “down” at the time. This provides a higher probability that the routing traffic will be received and subsequently forwarded.

Mode

Global Configuration

Example

The following example shows how to enter Interface mode to configure `vlan1`. Note how the prompt changes.

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)#
```

The following example shows how to enter Interface mode to configure the local loopback interface.

```
awplus# configure terminal
awplus(config)# interface lo
awplus(config-if)#
```

Related Commands

ip address
show interface
show interface brief

mtu

Use this command to set the Maximum Transmission Unit (MTU) size for VLANs, where MTU is the maximum packet size that VLANs can transmit. The MTU size setting is applied to both IPv4 and IPv6 packet transmission.

Use the **no** variant of this command to remove a previously specified Maximum Transmission Unit (MTU) size for VLANs, and restore the default MTU size (1500 bytes) for VLANs.

Syntax

```
mtu <mtu-size>
no mtu
```

Parameter	Description
<mtu-size>	<68-1500> Specifies the Maximum Transmission Unit (MTU) size in bytes, where 1500 bytes is the default Ethernet MTU size for an interface.

Default The default MTU size is 1500 bytes for VLAN interfaces.

Mode Interface Configuration for VLAN interfaces.

Usage If a switch receives an IPv4 packet for Layer 3 switching to another VLAN with an MTU size smaller than the packet size, and if the packet has the '**don't fragment**' bit set, then the switch will send an ICMP '**destination unreachable**' (3) packet type and a '**fragmentation needed and DF set**' (4) code back to the source. For IPv6 packets bigger than the MTU size of the transmitting VLAN interface, an ICMP '**packet too big**' (ICMP type 2 code 0) message is sent to the source.

Note that **show interface** output will only show MTU size for VLAN interfaces.

Examples To configure an MTU size of 1500 bytes on interface `vlan2`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# mtu 1500
```

To configure an MTU size of 1500 bytes on interfaces `vlan2` to `vlan4`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# mtu 1500
```

To restore the MTU size to the default MTU size of 1500 bytes on `vlan2`, use the commands

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no mtu
```

To restore the MTU size to the default MTU size of 1500 bytes on `vlan2` and `vlan4`, use the commands

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# no mtu
```

Related Commands **show interface**

show interface

Use this command to display interface configuration and status.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show interface [<interface-list>]
show interface lo
```

Parameter	Description
<interface-list>	The interfaces or ports to configure. An interface-list can be: ■ an interface (e.g. `vlan2`), a switch port (e.g. `port1.0.12`), a static channel group (e.g. `sa3`) or a dynamic (LACP) channel group (e.g. `po4`) ■ a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. `vlan2-8`, or `port1.0.1-1.0.24`, or `sa2-4`, or `po1-3` ■ a comma-separated list of the above; e.g. `port1.0.1,port1.0.8-1.0.24`. Do not mix interface types in a list The specified interfaces must exist.
`lo`	The local loopback interface.

Mode User Exec and Privileged Exec

Usage Note that the output displayed with this command will show MTU (Maximum Transmission Unit) size for VLAN interfaces, and MRU (Maximum Received Unit) size for switch ports.

Example To display configuration and status information for interfaces `port1.0.1` and `port1.0.4`, use the command:

```
awplus# show interface port1.0.1,port1.0.4
```

Figure 14-1: Example output from the show interface command

```
awplus#show interface
Interface port1.0.1
  Scope: both
  Link is UP, administrative state is UP

show interface brief

show interface brief

Use this command to display brief interface, configuration, and status information, including provisioning information.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show interface brief`

Mode User Exec and Privileged Exec

Output **Figure 14-4: Example output from the show interface brief command**

```
awplus#show int brief
Interface              Status          Protocol
port1.0.1              admin up        down
port1.0.2              admin up        down
port1.0.3              admin up        down
port1.0.4              admin up        down
.
.
port1.0.23             admin up        down
port1.0.24             admin up        running
lo                     admin up        running
vlan1                  admin up        down
vlan2                  admin up        down
```

Table 14-1: Parameters in the output of the show interface brief command

Parameter	Description
`Interface`	The name or type of interface.
`Status`	The administrative state. This can be either **admin up** or **admin down**
`Protocol`	The link state. This can be either **down**, **running**, or **provisioned**

Related Commands **show interface**
show interface memory

show interface status

Use this command to display the status of the specified interface or interfaces. Note that when no interface or interfaces are specified then the status of all interfaces on the switch are shown.

Syntax `show interface [<port-list>] status`

Parameter	Description
`<port-list>`	The ports to display information about. The port list can be: ■ a switch port (e.g. `port1.0.12`) a static channel group (e.g. `sa3`) or a dynamic (LACP) channel group (e.g. `po3`) ■ a continuous range of ports separated by a hyphen, e.g. `port1.0.1-1.0.24`, or `sa1-2`, or `po1-4` ■ a comma-separated list of ports and port ranges, e.g. `port1.0.1,port1.0.4-1.2.24`. Do not mix switch ports, static channel groups, and dynamic (LACP) channel groups in the same list

Examples To display the status of ports 1.0.1 to 1.0.5, use the commands:

```
awplus# show interface port1.0.1-1.0.5 status
```

Figure 14-5: Example output from the show interface <port-list> status command

```
awplus#show interface port1.0.1 -1.0.5 status
Port       Name               Status            Vlan Duplex   Speed Type
port1.0.1                     notconnect           1 auto      auto 1000BASE-T
port1.0.2                     notconnect           1 auto      auto 1000BASE-T
port1.0.3                     notconnect           1 auto      auto 1000BASE-T
port1.0.4                     notconnect           1 auto      auto 1000BASE-T
port1.0.5                     notconnect           1 auto      auto 1000BASE-T
```

To display the status of all ports, use the commands:

```
awplus# show interface status
```

Figure 14-6: Example output from the show interface status command

```
awplus#sho int status
Port      Name               Status             Vlan Duplex   Speed Type
port1.0.1 Trunk_Net          connected         trunk a-full  a-1000 1000BaseTX
port1.0.2 Access_Net1        connected             5 full     100 1000BaseTX
port1.0.3 Access_Net1        disabled              5 auto      auto 1000BaseTX
port1.0.4 Access_Net2        connected             6 a-half   a-100 1000BaseTX
port1.0.5 Private_Prom       connected            10 a-full   a-100 1000BaseTX
port1.0.6 Private_Net1       connected         10,11 a-full   a-100 1000BaseTX
port1.0.7 Private_Net2       connected         10,12 a-full   a-100 1000BaseTX
port1.0.8                    notconnect            1 auto      auto 1000BaseTX
.
.
port1.0.23                   disabled              1 auto      auto not present

Table 14-2: Parameters in the output from the show interface status command

Parameter	Description
`Port`	Name/Type of the interface.
`Name`	Description of the interface.
`Status`	The administrative and operational status of the interface; one of: ■ disabled: the interface is administratively down. ■ connect: the interface is operationally up. ■ notconnect: the interface is operationally down.
`Vlan`	VLAN type or VLAN IDs associated with the port: ■ When the VLAN mode is trunk, it displays **trunk** (it does not display the VLAN IDs). ■ When the VLAN mode is access, it displays the VLAN ID. ■ When the VLAN mode is private promiscuous, it displays the primary VLAN ID if it has one, and **promiscuous** if it does not have a VLAN ID. ■ When the VLAN mode is private host, it displays the primary and secondary VLAN IDs. ■ When the port is an Eth port, it displays **none**: there is no VLAN associated with it. ■ When the VLAN is dynamically assigned, it displays the current dynamically assigned VLAN ID (not the access VLAN ID), or **dynamic** if it has multiple VLANs dynamically assigned.
`Duplex`	The actual duplex mode of the interface, preceded by **a-** if it has autonegotiated this duplex mode. If the port is disabled or not connected, it displays the configured duplex setting.
`Speed`	The actual link speed of the interface, preceded by **a-** if it has autonegotiated this speed. If the port is disabled or not connected, it displays the configured speed setting.
`Type`	The type of interface, e.g., 1000BaseTX. For SFP bays, it displays **Unknown** if it does not recognize the type of SFP installed, or **Not present** if an SFP is not installed or is faulty.

Related Commands

show interface
show interface memory

shutdown

This command shuts down the selected interface. This administratively disables the link and takes the link down at the physical (electrical) layer.

Use the **no** variant of this command to disable this function and therefore to bring the link back up again.

Syntax

```
shutdown
no shutdown
```

Mode Interface Configuration

Example The following example shows the use of the `shutdown` command to shut down `port1.0.20`.

```
awplus# configure terminal
awplus(config)# interface port1.0.20
awplus(config-if)# shutdown
```

The following example shows the use of the `no shutdown` command to bring up `port1.0.12`.

```
awplus# configure terminal
awplus(config)# interface port1.0.12
awplus(config-if)# no shutdown
```

The following example shows the use of the `shutdown` command to shut down `vlan2`.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# shutdown
```

The following example shows the use of the `no shutdown` command to bring up `vlan2`.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no shutdown
```

Chapter 15: Interface Testing Commands

Command List 15.2
clear test interface 15.2
service test 15.3
test interface 15.4

Command List

This chapter provides an alphabetical reference of commands used for testing interfaces.

clear test interface

This command clears test results and counters after issuing a test interface command. Test results and counters must be cleared to issue subsequent test interface commands later on.

Syntax `clear test interface {<port-list>|all}`

Parameter	Description
`<port-list>`	The ports to test. A port-list can be: ■ a switch port (e.g. `port1.0.12`) ■ a continuous range of ports separated by a hyphen, e.g. `port1.0.1-port1.0.24` ■ a comma-separated list of the above, e.g. `port1.0.1,port1.0.5-1.0.24` The specified ports must exist.
`all`	All interfaces

Mode Privileged Exec

Examples To clear the counters for `port1.0.1` use the command:

```
awplus# clear test interface port1.0.1
```

To clear the counters for all interfaces use the command:

```
awplus# clear test interface all
```

To clear the counters for ports 1 to 12 on XEM 1 (`port1.1.1` through `port1.1.12`) apply:

```
awplus# clear test interface port1.1.1-port1.1.12
```

Related Commands test interface

service test

This command puts the device into the interface testing state, ready to begin testing. After entering this command, enter Interface Configuration mode for the desired interfaces and enter the command **test interface**.

Do not test interfaces on a device that is part of a live network—disconnect the device first.

Use the **no** variant of this command to stop the test service.

Syntax

```
service test
no service test
```

Mode Global Configuration

Example To put the device into a test state, use the command:

```
awplus(config)# service test
```

Related Commands **test interface**

test interface

This command starts a test on a port or all ports or a selected range or list of ports.

Use the **no** variant of this command to disable this function. The test duration can be configured by specifying the time in minutes after specifying a port or ports to test.

For an example of all the commands required to test switch ports, see the Examples section in this command. To test the Eth port, set its speed to 100 by using the command **speed 100.**

Note Do not run test interface on live networks because this will degrade network performance.

Syntax

```
test interface {<port-list>|all} [time{<1-60>|cont}]
no test interface {<port-list>|all}
```

Parameter	Description
<port-list>	The ports to test. A port-list can be: ■ a switch port (e.g. `port1.0.12`) ■ a continuous range of ports separated by a hyphen, e.g. `port1.0.1-port1.0.24` ■ a comma-separated list of the above, e.g. `port1.0.1,port1.0.5-1.0.24` The specified ports must exist.
`all`	All ports
`time`	Keyword entered prior to the value for the time duration of the interface test.
<1-60>	Specifies duration of time to test the interface or interfaces in minutes (from a minimum of 1 minute to a maximum of 60 minutes). The default is 4 minutes.
`cont`	Specifies continuous interface testing until cancelled with command negation.

Mode Privileged Exec

Example To test the switch ports in VLAN 1, install loopbacks in the ports, and enter the following commands:

```
awplus(config)# service test
awplus(config)# no spanning-tree rstp enable bridge-forward
awplus(config)# interface vlan1
awplus(config-if)# shutdown
awplus(config-if)# end
awplus# test interface all
```

To see the output, use the commands:

```
awplus# show test
```

```
awplus# show test count
```

To start the test on all interfaces for 1 minute use the command:

```
awplus# test interface all time 1
```

To start the test on ports 1 to 12 for XEM 1 (`port1.1.1` through `port1.1.12`) use the command:

```
awplus# test interface port1.1.1-port1.1.12
```

To stop testing ports 1 to 12 for XEM 1 (`port1.1.1` through `port1.1.12`) use the command:

```
awplus# no test interface port1.1.1-port1.1.12
```

Related Commands **clear test interface**

Introduction

This chapter gives an overview of Layer 1 and 2 switching.

Layer 2 switches are used to connect multiple Local Area Network (LAN) segments together to form an extended LAN. Stations connected to different LANs can be configured to communicate with one another as if they were on the same LAN. They can also divide one physical LAN into multiple Virtual LANs (VLANs). Stations connected to each other on the same extended LAN can be grouped in separate VLANs, so that a station in one VLAN can communicate directly with other stations in the same VLAN, but must go through higher layer routing protocols to communicate with those stations in other VLANs.

Layer 2 switches appear transparent to higher layer protocols, transferring frames between the data link layers of the networks to which they are attached. A Layer 2 switch accesses each physical link according to the rules for that particular network. Access may not always be instant, so the switch must be capable of storing and forwarding frames.

Storing and forwarding enables the switch to examine both the VLAN tag fields and Ethernet MAC address fields in order to forward the frames to their appropriate destination. In this way, the switch can act as an intelligent filtering device, redirecting or blocking the movement of frames between networks.

Because switch ports can sometimes receive frames faster than it can forward them, the switch has Quality of Service (QoS) queues in which frames await transmission according to their priority. Such a situation could occur where data enters a number of input ports all destined for the same output port.

The switch can be used to:

- Increase both the physical extent and the maximum number of stations on a LAN. LANs are limited in their physical extent by the signal distortion and propagation delay characteristics of the media. The switch overcomes this limitation by receiving a frame on one LAN and then retransmitting it to another. The physical characteristics of the LAN media also place a practical limit on the number of stations that can be connected to a single LAN segment. The switch overcomes this limitation by joining LAN segments to form an extended LAN capable of supporting more stations than either of the individual LAN segments.
- Connect LANs that have a common data link layer protocol but different physical media, for example, Ethernet 10BASET, 100BASET, and 10BASEF.
- Increase the availability of LANs by allowing multiple redundant paths to be physically configured and selected dynamically, using the Spanning Tree algorithm.
- Reduce the load on a LAN or increase the effective bandwidth of a LAN, by filtering traffic.
- Prioritize the transmission of data with high Quality of Service requirements.

By using Virtual LANs (VLANs), a single physical LAN can be separated into multiple Virtual LANs. VLANs can be used to:

- Further improve LAN performance, as broadcast traffic is limited to LAN segments serving members of the VLAN to which the sender belongs.
- Provide security, as frames are forwarded to those stations belonging to the sender's VLAN, and not to stations in other VLANs on the same physical LAN.
- Reduce the cost of moving or adding stations to function or security based LANs, as this generally requires only a change in the VLAN configuration.

Physical Layer Information

Switch Ports

A unique port number identifies each switch port. The software supports a number of features at the physical level that allow it to be connected in a variety of physical networks. This physical layer (Layer 1) versatility includes:

- Enabling and disabling of ports
- Auto negotiation of port speed and duplex mode for all 10/100 BASE ports
- Manual setting of port speed and duplex mode for all 10/100 BASE ports
- Link up and link down triggers
- Packet storm protection
- Port mirroring
- Support for SNMP management

Port Numbering

Ports are numbered using a 3 digit format `x.y.z` where `x` is the device number (within a stacked configuration), `y` is the module number within the device, and `z` is the port number within the module. Ports connected directly to the switch chassis or baseboard (rather than a pluggable module) are given the module number `0`. In an unstacked configuration all device numbers are `1`. For example, `port1.2.6` represents device `1`, module `2`, port `6`.

Adding a description

You can add a description to an interface to help identify its purpose or position. For example, to add the description "connected to Nerv" to `port1.0.3`, use the commands:

```
awplus(config)# interface port1.0.3
awplus(config-if)# description connected to Nerv
```

Port ranges

Continuous

To configure a continuous range of ports at the same time, enter the range in the format:

`portx.y.z-portx.y.z`

For example, to configure the same interface setting on `port1.0.10` to `port1.0.20`, enter the Global Configuration mode command:

```
awplus(config)# interface port1.0.10-port1.0.20
```

Non-continuous

To configure a non-continuous set of ports at the same time, enter a comma-separated list:

`portx.y.z,portx.y.z`

For example, to configure the same interface setting on `port1.0.1` and `port1.0.5`, enter the Global Configuration mode command:

```
awplus(config)# interface port1.0.1,port1.0.5
```

You can combine a hyphen-separated range and a comma-separated list. To configure the same setting on `port1.0.1` to `port1.0.3` and `port1.0.5`, enter the Global Configuration mode command:

```
awplus(config)# interface port1.0.1-port1.0.3,port1.0.5
```

Activating and Deactivating Switch Ports

An active switch port is one that is available for packet reception and transmission. Disabling a switch port does not affect the STP operation on the port. By default ports and VLANs are activated.

To shutdown a port or VLAN use the **shutdown** command on page 14.13. Use the **no** variant of this command to reactivate it.

Autonegotiation

Autonegotiation lets the port adjust its speed and duplex mode to accommodate the device connected to it. When the port connects to another autonegotiating device, they negotiate the highest possible speed and duplex mode for both of them.

By default, all ports autonegotiate. Setting the port to a fixed speed and duplex mode may be necessary when connecting to a device that cannot autonegotiate.

Duplex mode

Ports can operate in full duplex or half duplex mode depending on the type of port it is. When in full duplex mode, a port transmits and receives data simultaneously. When in half duplex mode, the port transmits or receives but not both at the same time.

You can set a port to use either of these options, or allow it to autonegotiate the duplex mode with the device at the other end of the link. To configure the duplex mode, use these commands:

`awplus#`	
`configure terminal`	Enter Global Configuration mode
`awplus(config)#`	
`interface port1.0.1`	Enter Interface Configuration mode for port 1.0.1
`awplus(config-if)#`	
`duplex {auto|full|half}`	Enter the Duplex mode for port 1.0.1

Speed options

Before configuring a port's speed, check the hardware limit for the particular port type. The following list can be used as a guide:

- non-SFP RJ-45 copper switch ports: 10, 100 or 1000 Mbps
- supported tri-speed copper SFPs: 10, 100 or 1000 Mbps
- fibre SFPs: 100 Mbps to 1000 Mbps, depending on the SFP type
- SFP+ / XFP modules: 10 Gbps

For the latest list of approved SFP transceivers either contact your authorized distributor or reseller, or visit **http://www.alliedtelesis.com**.

You can set a port to use one of these speed options, or allow it to autonegotiate the speed with the device at the other end of the link.

Most types of switch port can operate in either full duplex or half duplex mode. In full duplex mode a port can transmit and receive data simultaneously. In half duplex mode the port can either transmit or receive, but not at the same time.

Make sure that the configuration of the switch matches the configuration of the device at the far end of the link. In particular, avoid having one end autonegotiate duplex mode while the other end is fixed. For example, if you set one end of a link to autonegotiate and fix the other end at full duplex, the autonegotiating end cannot determine that the fixed end is full duplex capable. Therefore, the autonegotiating end selects half-duplex operation. This results in a duplex mismatch and packet loss. To avoid this, either fix the mode at both ends, or use autonegotiation at both ends.

Configuring the port speed

To set the port speed to 1000 kbps on port 1.0.1, use the commands:

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`interface port1.0.1`	Enter Interface Configuration mode for port 1.0.1
`awplus(config-if)#`	
`speed 1000`	Set the port speed for port 1.0.1 to 1000 Mbps.

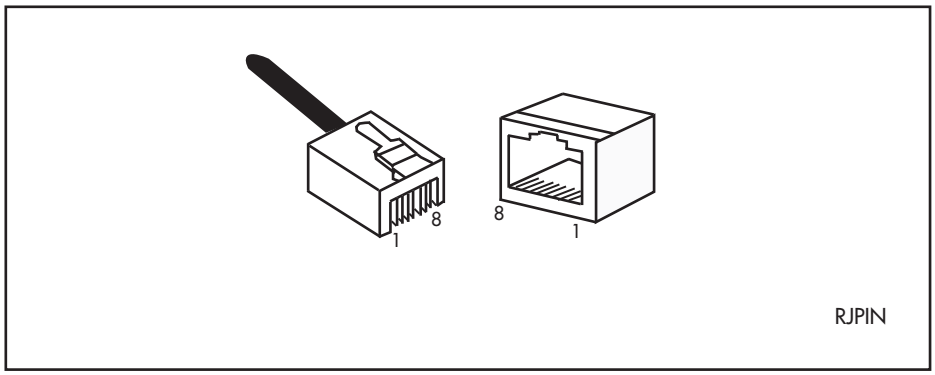
MDI/MDIX Connection Modes

By default, copper 10Base-T, 100Base-T, and 1000Base-T ports on the switch automatically set the Media Dependant Interface mode to MDI or MDIX for successful physical connections. We recommend using this default setting. However, you can configure them to have either fixed MDI mode or fixed MDIX mode by using the **polarity** command on page 17.39. MDI/MDIX mode polarity does not apply to fibre ports.

Connections to 10BASE-T, 100BASE-T, and 1000BASE-T networks may either be straight though (MDI) or crossover (MDIX). The crossover connection can be achieved by using either a crossover cable or by integrating the crossover function within the device. In the latter situation, the connector is referred to as an MDIX connection. Refer to your switch's Hardware Reference for more detailed information on physical connections cabling.

The IEEE 802.3 standard defines a series of Media Dependant Interface types and their physical connections. For twisted pair (10BASE-T) networking, the standard defines that connectors that conform to the IEC 60603-7 standard. The **Figure 16-1**f shows a connector of this type.

Figure 16-1: Connector used for 10BASE-T networks



Switch Bay Provisioning

Switch bay provisioning enables the pre-configuration of interfaces on hardware that is not yet physically present. This enables ports belonging to a XEM bay, or stack member, to be configured in advance, ready for device hot-insertion at a later time.

Provisioning enables a network administrator to pre-configure a vacant XEM bay on a switch, ready to be hot-swapped in at a later time. Later, when the XEM is physically added, its configuration is automatically applied with the minimum network disruption. Provisioning is ON by default, and cannot be disabled.

Provsioned capacity can be applied by either of the following actions:

- Applying the appropriate provisioning command
- Installing, then removing a provisionable XEM from its bay

Provisioned Board Classes

Provisioning introduces the concept of defined board classes. Each board class is assigned a **class** and an appropriate **port count.** Presently no further definitions have been made for additional features such as media type, or PoE capability. This structure simplifies configuration. For example:

- A single class is required to provision a XEM bay for either the XEM-12s, XEM12-T, or the XEM-12T/PoE modules.

The following Board Classes are defined:

Table 16-1: Provisioned Board Classes

Board Classes	
Class	**Port Count**
XEM-1	1
XEM-2	2
XEM-12	12

Applying Hardware Provisioning

As previously mentioned, provisioning is the pre-configuration of vacant XEM bay ready for device insertion at a later time.

Without provisioning

On software versions prior to version 5.3.4 - trying to configure port within a vacant XEM bay will result in the following error message:

```
awplus(config)# interface port4.0.1
% Can't find interface port4.0.1
```

With provisioning

With provisioning you can configure XEMs and their ports that are not presently installed, ready for future connection:

The following example sets the port speed of `port4.2.1` to be 1000 kbps.

```
awplus(config)# interface port4.2.1
awplus(config-if)# speed 1000
```

You can apply provisional configuration to all interface related commands. However, you cannot apply provisioning where it changes the network topology.

The following example creates a provisioned configuration that shows the association of ports with a VLAN:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 12 state enable
awplus(config-vlan)# exit
awplus(config)# interface port2.1.1
awplus(config-if)# switchport mode access
awplus(config-if)# switchport access vlan 12
awplus(config-if)# exit
awplus(config)# interface port2.1.2-port2.1.26
awplus(config-if)# switchport mode access
```

Removing or Changing XEM BAY Provisioning

You cannot un-provision currently installed hardware. Provisioning changes will only be retained if the configuration is saved prior to rebooting.

Displaying Provisioned Configurations

The major difference associated with provisioning is that interface configurations will still exist in the config files and will appear in show commands, even though a device itself may not be physically installed. Provisioning could result from device capability that has been preconfigured for future installation, or could result from the removal of an installed device.

The **show running-config command** includes switch commands for existing hardware, plus all non existent, but provisioned, hardware. The following example output of the **show running-config command** illustrates how provisioned and existing hardware is displayed.

Figure 16-2: Sample display of existing and provisioned show output

```
awplus#show running-config
.
.
switch 1 provision x908
switch 1 bay 1 provision xem-12
switch 1 bay 2 provision xem-12
switch 1 bay 3 provision xem-12
switch 1 bay 5 provision xem-12
switch 1 bay 7 provision xem-1
switch 1 bay 8 provision xem-1
switch 2 provision x908
switch 2 bay 1 provision xem-12
switch 2 bay 2 provision xem-12
switch 2 bay 3 provision xem-1
switch 2 bay 8 provision xem-1
!
interface port1.1.1-1.1.12
 switchport
 switchport mode access
!
interface port1.2.1-1.2.12
 switchport
 switchport mode access
!
interface port1.3.1-1.3.12
 switchport
 switchport mode access
.
.
.end
```

Displaying provisioned hardware status

The status, *present* or *provisioned*, appears in monitoring commands, such as the **show interface brief**. The following sample output from this command shows the provisioning status of two configured stack members.

Figure 16-3: Sample display showing hardware provisioning status

```
Interface            Status          Protocol   Status
port1.1.1            admin up        running    present
port1.1.2            admin up        down       present
.
.
port2.8.1            admin up        down       provisioned
```

A more detailed inspection of the provisioned port 2.8.1 is shown below. Note that the MAC address of 0000.0000.0000, which is a placeholder value for all provisioned ports. Also note that although the port is in the link DOWN state its administrative state of UP PROVISIONED means that it can be further configured. For example, it can be associated with a VLAN, or added to a link aggregation group etc.

Figure 16-4: Sample display showing provisioning status of a specific port

```
Interface port2.8.1
  Scope: both
  Link is DOWN, administrative state is UP PROVISIONED
  Thrash-limiting
    Status Unknown, Action learn-disable, Timeout 1(s)
  Hardware is Ethernet, address is 0000.0000.0000
  index 6801 metric 1 mtu 1500 mru 1522
  <BROADCAST,MULTICAST>
  SNMP link-status traps: Disabled
    input packets 0, bytes 0, dropped 0, multicast packets 0
    output packets 0, bytes 0, multicast packets 0 broadcast
pks0
```

Provisioning and Change Management

A benefit of provisioning is that configuration settings are no longer dependant on the existence of hardware devices. When a device is removed, all the interfaces for that device are shutdown and its provisioning status is set. This means that you can add or remove physical hardware without affecting your network configuration. Of course when ports go down (i.e. are physically removed) there will be other changes to network configuration, as protocols may re-converge or, for example, routes may be removed etc.

XEMs within a switch, can be hot-swapped without the need for re-configuration.

The configuration of a newly inserted device that matches the provisioned board-class is achieved on a best-effort basis. For example inserting a non-POE switch into a stack member location configured for PoE will result in the failure of the PoE configuration commands.

Take care that your provisioned configurations, match with the type of hardware that you plan to install. For example, the XEM-12 configuration shown below has the port speed set for one of its ports:

```
awplus(config)# switch 2 bay 4 provision xem-12
awplus(config)# interface port2.4.1
awplus(config-if)# speed 10
```

This will be fine if a XEM-12T is installed; however installing a XEM-12S (a device that cannot run its ports at 10 Mbps) would result in an error condition.

Possible Hardware Provisioning Conflicts

Conflicting provisioning configurations can occur where there is a mismatch between the XEM or switch type that is provisionally configured, and the device that is physically added.

For example, if a XEM-1XP is inserted into a bay provisioned for a XEM-12T, there would be a mismatch between the inserted and provisioned XEMs. In this situation, the provisioned configuration would not be applied. Instead the switch would apply its default configuration to the new XEM-1XP.

If this incorrect XEM-1XP is then replaced with a correct XEM-12T, the provisioned configuration is still not applied. Instead, the default configuration will still be applied and the user will have to reconfigure this XEM.

Provisioning and Software Version Aspects

When upgrading to version 5.3.4 or later, the provisioning commands will automatically be added to the running configuration of the switch—all other configuration will remain unchanged.

When downgrading from 5.3.4 (for example from 5.3.4 back to 5.3.3), error messages will result if the configuration has been saved using the 5.3.4 version software. This is because the provisioning commands in the configuration file will be unknown to the 5.3.3 version software.

If the configuration has not been saved with the version 5.3.4 software release, then downgrading will not result in error messages. This is because the saved configuration will not contain provisioning commands. All other commands will be unaffected, and the switch will operate as previously.

The Layer 2 Switching Process

The Layer 2 switching process comprises these related but separate processes:

- **The Ingress Rules**
- **The Learning Process**
- **The Forwarding Process**
- **The Egress Rules**

Ingress rules admit or discard frames based on their VLAN tagging.

The Learning process learns the MAC addresses and VLAN membership of frames admitted on each port.

The Forwarding process determines which ports the frames are forwarded to, and the Quality of Service priority with which they are transmitted.

Finally, Egress rules determine for each frame whether VLAN tags are included in the Ethernet frames that are transmitted.

These processes assume that each station on the extended LAN has a unique data link layer address, and that all data link layer frames have a header which includes the source (sender's) MAC address and destination (recipient's) MAC address.

The Ingress Rules

All frames, tagged and untagged, that a VLAN-aware switch receives must be classified into a VLAN. Each received frame is mapped to exactly one VLAN. If an incoming frame is tagged with a valid VLAN identifier (VID) then that VID is used. If an incoming frame is untagged or is priority tagged (a tagged frame with a VID of all zeros), then the switch uses internal VLAN association rules to determine the VLAN it belongs to. The default settings for the ingress rules are to Admit All Frames, and for Ingress Filtering to be on.

Every port belongs to one or more VLANs so every incoming frame has a VID to show which VLAN it belongs. The final part of the Ingress Rules depends on whether Ingress Filtering is enabled for the port. If Ingress Filtering is disabled, all frames are passed on to the Learning process, regardless of which VLAN they belong to. If Ingress Filtering is enabled (by default), frame are admitted only when they have the VID of a VLAN to which the port belongs. Frames are discarded when they do not have an associated VID matching the VLAN assigned to a port.

The possible association rules, in order of precedence, are:

- IP subnet/IPX network classification
- protocol classification
- port classification

The default VLAN classification is based upon the port on which the incoming frame (untagged, or priority tagged) was received. It is possible for an incoming untagged, or priority tagged, frame to match more than one of the association rules.

Each port on the switch can be configured to be one of two modes:

- only untagged frames - access mode
- only VLAN-tagged frames - trunk mode

Access Mode

This mode can be used to connect to VLAN unaware devices. Frames to and from access mode ports carry no VLAN tagging information.

Trunk Mode

This mode is used to connect VLAN capable devices. All devices that connect using trunk mode ports must be VLAN aware.

The Learning Process

The learning process uses an adaptive learning algorithm, sometimes called ***backward learning***, to discover the location of each station on the extended LAN.

All frames admitted by the ingress rules on any port are passed on to the forwarding process when they are for destinations in the same VLAN. Frames destined for other VLANs are passed to a Layer 3 protocol, such as IP. For every frame admitted, the frame's source MAC address and VID are compared with entries in the forwarding database for the VLAN (also known as a ***MAC Address table***) maintained by the switch. When the frame's source address is not in the forwarding database for the VLAN, the address is added and an ageing timer for that entry is started. When the frame's source address is already in the forwarding database, the ageing timer for that entry is restarted.

By default, switch learning is enabled. It can be disabled with the **no mac address-table acquire** command, and re-enabled using the **mac address-table acquire** command on page 17.17.

If the ageing timer for an entry in the forwarding database expires before another frame with the same source address is received, the entry is removed from the forwarding database. This prevents the forwarding database from being filled with information about stations that are inactive or have been disconnected from the network. It also ensures that entries for active stations are kept alive in the forwarding database.

By default, the ageing timer is enabled with a default ageing-time. The ageing timer can be reset to the default with the **no mac address-table ageing-time** command. The ageing timer can be increased or decreased using the **mac address-table ageing-time** command.

If switch learning is disabled and the ageing timer has aged out all dynamically learned filter entries, only statically entered MAC source addresses decide the packets to forward or discard. When the switch finds no matching entries in the forwarding database during the forwarding process, all switch ports in the VLAN are flooded with the packet, except the port that received it.

The default for the mac address-table ageing-time is 300 seconds (5 minutes) and can be modified by using the command **mac address-table ageing-time**. The **no mac address-table ageing-time** command will reset the ageing-time back to the default (5 minutes).

To set the mac address-table ageing-time to 1000 seconds:

`awplus#`	
`configure terminal`	Enter the config terminal mode
`awplus(config)#`	
`mac address-table ageing-time 1000`	Set the ageing time to 1000 seconds

To display general switch settings, including settings for switch learning and the switch ageing timer, use the **show system** command on page 10.54.

The Forwarding Process

After a VID is assigned to a frame using the ingress rules, the switch forwards it to the destination MAC address specified in the frame. To do this the switch must learn which MAC addresses are available on each port for each VLAN. When the destination MAC address is not found, the switch floods the frame on all ports that are members of the VLAN except the port on which the frame was received.

The forwarding database (also known as the ***MAC Address table***) determines the egress port on which the destination MAC address has been learned. MAC addresses are learned dynamically as part of the Layer 2 switching process.

The forwarding database is ordered according to MAC address and VLAN identifier. This means a MAC address can appear more than once in the forwarding database having been learned on the same port but for different VLANs. This could occur if the IP address of an end station is changed thereby moving the end station to a different IP subnet-based VLAN while still connected to the same switch port. When the forwarding database ageing process is enabled, old entries in the forwarding database are deleted after a user-configurable period.

If the destination address is found, the switch discards the frame when the port is not in the STP forwarding or disabled state if the destination address is on the same port as the source address, or if there is a static filter entry for the destination address set to **discard** (see **"Layer 2 Filtering" on page 16.15**). Otherwise, the frame is forwarded on the indicated port.

Forwarding occurs only when the port on which the frame was received is in the Spanning Tree forwarding or disabled state. The destination address is then looked up in the forwarding database for the VLAN.

The Egress Rules

After the forwarding process has determined from which ports and transmission queues to forward a frame, the egress rules for each port determine whether the outgoing frame is VLAN-tagged with its numerical VLAN identifier (VID).

A port must belong to a VLAN at all times unless the port has been set as the mirror port for the switch.

A port can transmit VLAN-tagged frames for any VLAN to which the port belongs. A port can transmit untagged frames for any VLAN for which the port is configured, e.g. IP subnet-based or protocol-based, unless prevented by the port-based VLAN egress rules. A port that belongs to a port-based VLAN can transmit untagged packets for only one VLAN. For more information about VLANs and VLAN tagging, see **Chapter 18, VLAN Introduction**.

For more information on port tagging see the following commands:
switchport mode access command on page 19.17
switchport mode trunk command on page 19.23

Layer 2 Filtering

The switch has a forwarding database (also known as the ***MAC address table***) whose entries determine whether frames are forwarded or discarded over each port. Entries in the forwarding database are created dynamically by the learning process. A dynamic entry is automatically deleted from the forwarding database when its ageing timer expires.

The forwarding database supports queries by the forwarding process as to whether frames with given values of the destination MAC address field should be forwarded to a given port.

For each VLAN, the destination MAC address of a frame to be forwarded is checked against the forwarding database. If there is no entry for the destination address and VLAN, the frame is transmitted on all ports in the VLAN that are in the forwarding or disabled state, except the port on which the frame was received. This process is referred to as ***flooding***. If an entry is found in the forwarding database but the entry is not marked ***forwarding*** or the entry points to the same port the frame was received on, the frame is discarded. Otherwise, the frame is transmitted on the port specified by the forwarding database.

Ingress Filtering

The **ingress-filter** parameter of the **switchport mode trunk** command on page 19.23 and the **switchport mode access** command on page 19.17, enables or disables ingress filtering of frames entering the specified port (or port range). Each port on the switch belongs to one or more VLANs. If ingress filtering is enabled, any frame received on the specified port is only admitted if its VID matches one for which the port is tagged. Any frame received on the port is discarded if its VID does not match one for which the port is tagged.

Untagged frames are admitted and are assigned the VLAN Identifier (VID) of the port's native VLAN. Ingress filtering can be turned off by setting the **disable** parameter of the above two commands. The default setting of the **enable** / **disable** parameter option is **enable**.

Note

Enabling the **vlan-disable** parameter of the **thrash-limiting** command on page 17.70 will also enable ingress filtering, and will override the setting of the switchport mode access, and trunk commands

Storm-control

The packet storm-control feature enables you to set limits on the reception rate of broadcast, multicast frames and destination lookup failures. You can set separate limits beyond which each of the different packet types are discarded.

Note A destination lookup failure (DLF) is the event of receiving a unicast Ethernet frame with an unknown destination address.

For more information on applying storm-control, see the **storm-control level** command on page 17.65.

To apply storm-control by limiting broadcasts to 30% on `port1.0.4`

`awplus(config-if)#` `configure terminal`	Enter Global Configuration mode.
`awplus(config-if)#` `interface port1.0.4`	Enter the Interface Configuration mode for the selected port.
`awplus(config-if)#` `storm-control broadcast level 30`	Configure the interface.

To turn off storm protection on `port1.0.4`

`awplus(config-if)#` `configure terminal`	Enter Global Configuration mode.
`awplus(config-if)#` `interface port1.0.4`	Enter the Interface Configuration mode for the selected port.
`awplus(config-if)#` `no storm-control broadcast level`	Configure the interface.

Loop Protection

Loop protection is a general term that embraces several different methods you can apply to protect your network from effects such as broadcast storms that can result from data loops or equipment malfunction. Presently two methods of loop protection are available:

- **Loop Detection**
- **Thrash Limiting**

Loop Detection

Introduction

This feature is used to detect loops with a network segment. If a loop is detected then a selected protection mechanism is applied to limit the effect of the loop. The loop protection actions can be applied either to the port at which the loop is detected or to the VLAN within which the loop was detected.

Limiting Actions

You can configure loop detection to apply one of the following mechanisms when a loop condition is detected:

- Block all traffic on the port (or aggregated link) that detected the loop, and take **down** the link.
- Block all traffic on the port (or aggregated link) that detected the loop, but keep the link in the **up** state.
- Block all traffic on a vlan. Note that setting this parameter will also enable ingress filtering. This is the default action.
- Take no action, but log the details.
- Take no action.

Operation

To detect loops this feature operates by transmitting a series of Loop Detection Frames (LDFs) from each switch port out into the network. If no loops exist, then none of these frame should ever return. If a frame returns to its original port, the detection mechanism assumes that there is a loop somewhere in the network and offers a number of protective options.

Each LDF is a Layer 2 LLC frame that contains the following components:

- the source MAC address of the originating switch
- the destination MAC address of the non-existent end station 00-00-F4-27-71-01
- VLAN ID (where the port is a tagged member of a VLAN).
- a randomly generated LDF ID number.

You can set the detection mechanism to remember the LDF ID of up to 5 of the most recently transmitted LDF frames. Each of the 5 most recently transmitted frames is compared with every frame that arrives at that same port.

Configuration

To enable loop protection and configure its basic parameters, you use the **loop-protection** command on page 17.14.

Example To enable the loop-detect mechanism, and generate loop-detect frames once every 5 seconds, use the command:

```
awplus(config)# loop-protection loop-detect ldf-interval 5
```

Note LDFs are sent sequentially for each VLAN defined to a particular port. For example, if a particular port in this example is a member of 4 VLANs, then the LDFs will be sent from this port at the rate of 4 frames every 5 seconds.

You can now use the **loop-protection action** command on page 17.15 configure the action that the switch will take if a loop is detected.

Example To disable an interface, and bring the link down, when a network loop is detected, use the command:

```
awplus(config-if)# loop-protection action link-down
```

Now decide how long you want the protective action to apply for. You configure this function by using the **loop-protection timeout** command on page 17.16.

Example To configure a loop protection action timeout of 10 seconds, use the command:

```
awplus(config-if)# loop-protection timeout 10
```

Thrash Limiting

MAC address thrashing occurs when MAC addresses move rapidly between one or more ports or trunks, for example, due to a network loop.

Thrash limiting enables you to apply actions to a port when thrashing is detected. It is supported on all port types and also on aggregated ports.

Limiting Actions There are several different thrash actions that you can apply to a port when thrashing is detected. These actions are:

- learnDisable
  MAC address learning is temporarily disabled on the port.
- portDisable
  The port is logically disabled. Traffic flow is prevented, but the link remains up. The device at the other end does not notice that the port has changed status, and the link LEDs at both ends stay on.
- linkDown
  The port is physically disabled and the link is down. This is equivalent to entering the **shutdown** command on page 14.13.
- vlanDisable
  The port is disabled only for the VLAN on which thrashing has occurred. It can still receive and transmit traffic for any other VLANs of which it is a member.

When a MAC address is thrashing between two ports, one of these ports (the first to cross its thrashing threshold) is disabled. All other ports on the device will then have their threshold counters reset.

To set a thrash action for a port, use the **thrash-limiting** command on page 17.70:

To view the thrash action that is set for a port, use the **show interface switchport** command on page 17.42:

Re-enabling a port

When a port is disabled, either completely or for a specific VLAN, it remains disabled until it is manually re-enabled in any of the following ways:

- by using SNMP
- by rebooting the switch or stack
- by specifying a thrash timeout value along with the thrash action
- via the CLI

Support for Jumbo Frames

Jumbo frames are frames with more than 1500 bytes of payload. You can enable jumbo frame support on the switch to improve throughput and network utilization. Jumbo frame support allows you to put more data in each packet that the switch has to process. You can increase the received packet size for the switch to receive jumbo frames.

When jumbo frames support is enabled, the maximum received packet size is 10240 bytes for ports that work at speeds of 10 Mbps, 100 Mbps or 1000 Mbps.

Jumbo frame support is enabled or disabled on the entire switch, not on a per port basis. To enable them, use the **platform jumboframe** command on page 17.29; to see whether they are enabled, use the **show platform** command on page 17.48. Jumbo frame support is disabled by default.

Note

Jumbo packet switching is supported for L2 and L3 traffic flows that have established traffic paths. Jumbo frames cannot be used for establishing these network paths. Please use frames less than 1518 bytes to establish the path, for example by pinging the destination.

Port Mirroring

Port mirroring enables traffic being received and transmitted on a switch port to be sent to another switch port, the mirror port, usually for the purposes of capturing the data with a protocol analyzer.

The mirror port is the only switch port that does not belong to a VLAN, and therefore does not participate in any other switching. Before the mirror port can be set, it must be removed from all trunk groups and all VLANs except the default VLAN.

The following example sets mirroring on ports 1.0.2 and 1.0.5 for both incoming and outgoing data.

Note

Due to the internal hardware properties of the switch, frames that are destined to leave the mirrored port untagged (i.e. will have their VLAN tag removed on egress) will be received by the mirror port with the tag retained. Consequently, if frames were being transmitted by the mirror port (into the network) at wire speed, then the mirror port might be unable to accept all the frames supplied to it.

To configure port 1. 0. 2 to mirror port 1. 0. 5

`awplus#`	
`configure terminal`	Enter Global Configuration mode.
`awplus(config)#`	
`interface port1.0.2`	Enter the Interface Configuration mode for port1.0.2.
`awplus(config-if)#`	
`mirror interface port1.0.5 direction both`	Configure this port to mirror port 1. 0. 5.

Port Security

The port security features provide control over the stations connected to each switch port. These comprise:

- MAC address learn limits
- IEEE 802.1X

MAC Address Learn Limits

MAC address limiting is applied using the **switchport port-security** command on page 17.67. If enabled on a port, the switch will learn MAC addresses up to a user-defined limit from 1 to 256, then lock out all other MAC addresses. One of the following options can be specified for the action taken when an unknown MAC address is detected on a locked port:

- Discard the packet and take no further action.
- Discard the packet and notify management with an SNMP trap.
- Discard the packet, notify management with an SNMP trap and disable the port.

IEEE 802.1X

IEEE 802.1X restricts unauthenticated devices from connecting to the switch. After authentication is successful, traffic is allowed through the switch. For more information see **Chapter 67, 802.1X Introduction and Configuration**.

Quality of Service

Quality of Service (QoS) enables you to both prioritize traffic and limit its available bandwidth. The concept of QoS is a departure from the original networking protocols, in which all traffic on the Internet or within a LAN had the same available bandwidth. Without QoS, all traffic types are equally likely to be dropped if a link becomes oversubscribed. This approach is now inadequate in many networks, because traffic levels have increased and networks often carry time-critical applications such as streams of real-time video data. QoS also enables service providers to easily supply different customers with different amounts of bandwidth.

Configuring Quality of Service involves two separate stages:

1. Classifying traffic into flows, according to a wide range of criteria. Classification is performed by the switch's class maps.

2. Acting on these traffic flows.

The switch's QoS functionality includes the following:

- policies, to provide a QoS configuration for a port or ports
- traffic classes, for bandwidth limiting and user prioritization
- maximum bandwidth limiting on a traffic class
- flow groups within traffic classes, for user prioritization
- control of the egress scheduling algorithm
- priority relabelling of frames, at Layer 2, by replacing the VLAN tag User Priority field
- class of service relabelling of frames, at Layer 3, by replacing the DSCP (DiffServ Code Point) or the TOS precedence value in the IP header's Type of Service (TOS) field.

For more information on QoS see **Chapter 65, Quality of Service (QoS) Introduction** and **Chapter 66, QoS Commands**.

IGMP Snooping

IGMP (Internet Group Management Protocol) is used by IP hosts to report their multicast group memberships to routers and switches. IP hosts join a multicast group to receive broadcast messages directed to the multicast group address. IGMP is an IP-based protocol and uses IP addresses to identify both the multicast groups and the host members. For a VLAN-aware devices, this means multicast group membership is on a per-VLAN basis. If at least one port in the VLAN is a member of a multicast group, by default multicast packets will be flooded onto all ports in the VLAN.

IGMP snooping enables the switch to forward multicast traffic intelligently on the switch. The switch listens to IGMP membership reports, queries and leave messages to identify the switch ports that are members of multicast groups. Multicast traffic will only be forwarded to ports identified as members of the specific multicast group.

IGMP snooping is performed at Layer 2 on VLAN interfaces automatically. By default, the switch will forward traffic only from those ports with multicast listeners, therefore it will not act as a simple hub and flood all multicast traffic out all ports. IGMP snooping is independent of the IGMP and Layer 3 configuration, so an IP interface does not have to be attached to the VLAN, and IGMP does not have to be enabled or configured.

IGMP snooping is enabled by default.

For more information on IGMP see **Chapter 51, IGMP and IGMP Snooping Introduction** and **Chapter 52, IGMP and IGMP Snooping Commands**.

Command List

This chapter provides an alphabetical reference of commands used to configure switching. For more information see Chapter 16, Switching Introduction.

clear loop-protection counters

Use this command to clear the counters for the Loop Protection counters.

Syntax `clear loop-protection [interface <port-list>] counters`

Parameters	Description
`interface`	The interface whose counters are to be cleared.
`<port-list>`	A port, a port range, or an aggregated link.

Mode Privileged Exec

Examples To clear the counter information:

```
awplus# clear loop-protection counters
awplus# clear loop-protection interface port1.0.1 counters
```

clear mac address-table static

Use this command to clear the filtering database of all statically configured entries for a selected MAC address, interface, or VLAN.

Syntax

```
clear mac address-table static
   [address <mac-address>|interface <port>|vlan <vid>]
```

Parameter	Description
`address`	Specify a MAC (Media Access Control) address to be cleared from the filtering database.
<mac-address>	Enter a MAC address to be cleared from the database in the format HHHH.HHHH.HHHH.
`interface`	Specify a switch port to be cleared from the filtering database.
<port>	Specify the switch port from which address entries will be cleared. This can be a single switch port, (e.g. `port1.0.4`), a static channel group (e.g. `sa3`), or a dynamic (LACP) channel group (e.g. `po4`).
`vlan`	Specify a VLAN to be cleared from the filtering database.
<vid>	Enter a VID (VLAN ID) in the range `<1-4094>` to be cleared from the filtering database.

Mode Privileged Exec

Usage Use this command with options to clear the filtering database of all entries made from the CLI for a given MAC address, interface or VLAN. Use this command without options to clear any entries made from the CLI.

Compare this usage with **clear mac address-table dynamic** command on page 17.5.

Examples This example shows how to clear all filtering database entries configured through the CLI.

```
awplus# clear mac address-table static
```

This example shows how to clear all filtering database entries for a given interface configured through the CLI.

```
awplus# clear mac address-table static interface port1.0.3
```

This example shows how to clear filtering database entries filtering database entries configured through the CLI for a given mac address.

```
awplus# clear mac address-table static address 0202.0202.0202
```

Related Commands
clear mac address-table dynamic
mac address-table static
show mac address-table

clear mac address-table dynamic

Use this command to clear the filtering database of all entries learned for a selected MAC address, an MSTP instance, a switch port interface or a VLAN interface.

Syntax

```
clear mac address-table dynamic
   [address <mac-address>|interface <port> [instance <inst>]|
   vlan <vid>]
```

Parameter	Description
`interface`	Specify a switch port to be cleared from the filtering database.
<port>	Specify the switch port from which address entries will be cleared. This can be a single switch port, (e.g. `port1.0.4`), a static channel group (e.g. `sa3`), or a dynamic (LACP) channel group (e.g. `po4`).
`address`	Specify a MAC (Media Access Control) address to be cleared from the filtering database.
<mac-address>	Enter a MAC address to be cleared from the database in the format HHHH.HHHH.HHHH.
`instance`	Specify an MSTP (Multiple Spanning Tree) instance to be cleared from the filtering database.
<inst>	Enter an MSTP instance in the range `<1-63>` to be cleared from the filtering database.
`vlan`	Specify a VLAN to be cleared from the filtering database.
<vid>	Enter a VID (VLAN ID) in the range `<1-4094>` to be cleared from the filtering database.

Mode Privileged Exec

Usage Use this command with options to clear the filtering database of all entries learned for a given MAC address, interface or VLAN. Use this command without options to clear any learned entries.

Use the optional `instance` parameter to clear the filtering database entries associated with a specified MSTP instance Note that you must first specify a switch port interface before you can specify an MSTP instance.

Compare this usage and operation with the **clear mac address-table static** command on page 17.4. Note that an MSTP instance cannot be specified with **clear mac address-table static**.

Examples This example shows how to clear all dynamically learned filtering database entries for all interfaces, addresses, VLANs.

```
awplus# clear mac address-table dynamic
```

This example shows how to clear all dynamically learned filtering database entries when

learned through switch operation for a given MAC address.

```
awplus# clear mac address-table dynamic address 0202.0202.0202
```

This example shows how to clear all dynamically learned filtering database entries when learned through switch operation for a given MSTP instance `1` on switch port interface `port1.0.2`.

```
awplus# clear mac address-table dynamic interface port1.0.2
       instance 1
```

Related Commands

clear mac address-table static
show mac address-table

clear port counter

Use this command to clear the packet counters of the port.

Syntax `clear port counter [<port>]`

Parameter	Description
<port>	The port number or range

Mode Privileged Exec

Example To clear the packet counter for `port1.0.1`, use the command:

```
awplus#  clear port counter port1.0.1
```

Related Commands show platform port

debug loopprot

This command enables Loop Protection debugging.

The **no** variant of this command disables Loop Protection debugging.

Syntax `debug loopprot {info|msg|pkt|state|nsm|all}`

`no debug loopprot {info|msg|pkt|state|nsm|all}`

Parameter	Description
`info`	General Loop Protection information.
`msg`	Received and transmitted Loop Detection Frames (LDFs).
`pkt`	Echo raw ASCII display of received and transmitted LDF packets to the console.
`state`	Loop Protection states transitions.
`nsm`	Network Service Module information.
`all`	All debugging information.

Mode Privileged Exec and Global Configuration

Example To enable debug for all state transitions, use the command:

```
awplus#  debug loopprot state
```

Related Commands **show debugging loopprot**
undebug loopprot

debug platform packet

This command enables platform to CPU level packet debug functionality on the switch.

Use the **no** variant of this command to disable platform to CPU level packet debug. If the result means both send and receive packet debug are disabled, then any active timeout will be cancelled.

Syntax

```
debug platform packet [recv] [send] [sflow] [timeout <timeout>]
    [vlan <vlan-id>|all]

no debug platform packet [recv] [send]
```

Parameter	Description
`recv`	Debug packets received.
`send`	Debug packets sent.
`sflow`	Debug sFlow packets.
`timeout`	Stop debug after a specified time.
<timeout>	<0-3600>The timeout period, specified in seconds.
`vlan`	Limit debug to a single VLAN ID specified.
<vlan-id>	<1-4094> The VLAN ID to limit the debug output on.
`all`	Debug all VLANs (default setting).

Default A 5 minute timeout is configured by default if no other timeout duration is specified.

Mode Privileged Exec and Global Configuration

Usage This command can be used to trace packets sent and received by the CPU. If a timeout is not specified, then a default 5 minute timeout will be applied.

If a timeout of 0 is specified, packet debug will be generated until the **no** variant of this command is used or another timeout value is specified. The timeout value applies to both send and receive debug and is updated whenever the **debug platform packet** command is used.

Examples To enable both receive and send packet debug for the default timeout of 5 minutes, enter:

```
awplus# debug platform packet
```

To enable receive packet debug for 10 seconds, enter:

```
awplus# debug platform packet recv timeout 10
```

To enable packet debug for sFlow packets only for the default timeout of 5 minutes, enter:

```
awplus# debug platform packet sflow
```

To enable send packet debug with no timeout, enter:

```
awplus# debug platform packet send timeout 0
```

To enable VLAN packet debug for VLAN 2 with a timeout duration of 3 minutes, enter:

```
awplus# debug platform packet vlan 2 timeout 150
```

To disable receive packet debug, enter:

```
awplus# no debug platform packet recv
```

Related Commands

show debugging platform packet
undebug platform packet

duplex

This command changes the duplex mode for the specified port.

To see the currently-negotiated duplex mode for ports whose links are up, use the command **show interface**. To see the configured duplex mode (when different from the default), use the command **show running-config**.

Syntax `duplex {auto|full|half}`

Parameter	Description
`auto`	Auto-negotiate duplex mode.
`full`	Operate in full duplex mode only.
`half`	Operate in half duplex mode only.

Default By default, ports auto-negotiate duplex mode (except for 100Base-FX ports which do not support auto-negotiation, so default to full duplex mode).

Mode Interface Configuration

Usage Switch ports in a static or dynamic (LACP) channel group must have the same port speed and be in full duplex mode. Once switch ports have been aggregated into a channel group, you can set the duplex mode of all the switch ports in the channel group by applying this command to the channel group.

Examples To specify full duplex for `port1.0.4`, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# duplex full
```

To specify half duplex for `port1.0.4`, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# duplex half
```

To auto-negotiate duplex mode for `port1.0.4`, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# duplex auto
```

Related Commands
ecofriendly lpi
polarity
speed
show interface

flowcontrol (switch port)

Use this command to enable flow control, and configure the flow control mode for the switch port.

Use the **no** variant of this command to disable flow control for the specified switch port.

Syntax

```
flowcontrol both
no flowcontrol
```

Parameter	Description
`both`	Use this parameter to specify send and receive flow control for the port.

Default By default, flow control is disabled.

Mode Interface Configuration

Usage The flow control mechanism specified by 802.3x is only for full duplex links. It operates by sending PAUSE frames to the link partner to temporarily suspend transmission on the link

Flow control enables connected Ethernet ports to control traffic rates during congestion by allowing congested nodes to pause link operation at the other end. If one port experiences congestion, and cannot receive any more traffic, it notifies the other port to stop sending until the condition clears. When the local device detects congestion at its end, it notifies the remote device by sending a pause frame. On receiving a pause frame, the remote device stops sending data packets, which prevents loss of data packets during the congestion period.

Flow control is not recommended when running QoS or ACLs, because the complex queuing, scheduling, and filtering configured by QoS or ACLs may be slowed by applying flow control.

For flow control on async serial (console) ports, see **flowcontrol hardware (asyn/console)** command on page 5.11.

Examples To enable flow control on port 1.0.2 use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# flowcontrol both

awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no flowcontrol
```

Validation Commands **show running-config**

linkflap action

Use this command to detect flapping on all ports. If more than 15 flaps occur in less than 15 seconds the flapping port will shut down.

Use the **no** variant of this command to disable flapping detection at this rate.

Syntax

```
linkflap action [shutdown]
no linkflap action
```

Parameter	Description
`linkflap`	Global setting for link flapping.
`action`	Specify the action for port.
`shutdown`	Shutdown the port.

Default Linkflap action is disabled by default.

Mode Global Configuration

Example To enable the linkflap action command on the switch, use the following commands:

```
awplus# configure terminal
awplus(config)# linkflap action shutdown
```

loop-protection

Use this command to enable the loop-protection loop-detection feature, and configure the detection mechanism parameters.

Use the **no** variant of this command to disable the loop-protection loop-detection feature.

Syntax

```
loop-protection loop-detect [ldf-interval <period>]
   [ldf-rx-window <frames>]

no loop-protection [loop-detect]
```

Parameter	Description
`loop-detect`	Enables loop detection when used with loop-protection keywords. Disables loop detection when used with no loop-protection keywords.
`ldf-interval`	The time (in seconds) between successive loop-detect frames being sent.
<period>	Specify a period between 1 and 600 seconds. The default is 10 seconds.
`ldf-rx-window`	The number of transmitted loop detection frames whose details are held for comparing with frames arriving at the same port.
<frames>	Specify a value for the window size between 1 and 5 frames. The default is 3 frames.

Default The loop-protection loop-detection feature is disabled by default.
The default interval is 10 seconds, and the default window size is 3 frames.

Mode Global Configuration

Usage See the **Loop Protection** section in **Chapter 16, Switching Introduction** for relevant conceptual, configuration, and overview information prior to applying this command.

Example To enable the loop-detect mechanism on the switch, and generate loop-detect frames once every 5 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# loop-protection loop-detect ldf-interval 5
```

Related Commands
loop-protection action
loop-protection timeout
show loop-protection
thrash-limiting

loop-protection action

Use this command to specify the protective action to apply when a network loop is detected on an interface.

Use the **no** variant of this command to reset the loop protection actions to the default action, vlan-disable, on an interface.

Syntax

```
loop-protection action {link-down|log-only|port-disable|vlan-disable|
   none}
no loop-protection action
```

Parameter	Description
`link-down`	Block all traffic on a port (or aggregated link) that detected the loop, and take **down** the link.
`log-only`	Details of loop conditions are logged. No action is applied to the port (or aggregated link).
`port-disable`	Block all traffic on interface for which the loop occurred, but keep the link in the **up** state.
`vlan-disable`	Block all traffic for the VLAN on which the loop traffic was detected. Note that setting this parameter will also enable ingress filtering. This is the default action.
`none`	Applies no protective action.

Default loop-protection action vlan-disable

Mode Interface Configuration

Usage See the **Loop Protection** section in **Chapter 16, Switching Introduction** for relevant conceptual, configuration, and overview information prior to applying this command.

Example To disable an interface (`port1.0.4`), and bring the link down, when a network loop is detected, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# loop-protection action link-down
```

Related Commands

loop-protection
loop-protection timeout
show loop-protection
thrash-limiting

loop-protection timeout

Use this command to specify the Loop Protection recovery action duration on an interface.

Use the **no** variant of this command to set the loop protection timeout to the default.

Syntax

```
loop-protection timeout <duration>
no loop-protection timeout
```

Parameter	Description
<duration>	The time (in seconds) for which the configured action will apply before being disabled. This duration can be set between 0 and 86400 seconds (24 hours). The set of 0 means infinity so timeout does not expire.

Default The default is 7 seconds.

Mode Interface Configuration

Usage See the **Loop Protection** section in **Chapter 16, Switching Introduction** for relevant conceptual, configuration, and overview information prior to applying this command.

Example To configure a loop protection action timeout of 10 seconds for `port1.0.4`, use the command:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# loop-protection timeout 10
```

Related Commands

loop-protection
loop-protection action
show loop-protection
thrash-limiting

mac address-table acquire

Use this command to enable MAC address learning on the device.

Use the **no** variant of this command to disable learning.

Syntax

```
mac address-table acquire
no mac address-table acquire
```

Default Learning is enabled by default for all instances.

Mode Global Configuration

Example Use the following commands to enable MAC address learning on the switch:

```
awplus# configure terminal
awplus(config)# mac address-table acquire
```

mac address-table ageing-time

Use this command to specify an ageing-out time for all learned MAC address. Learned MAC addresses will persist for at least the specified time.

The **no** variant of this command will reset the ageing-out time back to the default of 300 seconds (5 minutes).

Syntax

```
mac address-table ageing-time <ageing-timer> none
no mac address-table ageing-time
```

Parameter	Description
<ageing-timer>	*<10-1000000>* The number of seconds of persistence.
none	Disable learned MAC address timeout.

Default The default ageing time is 300 seconds.

Mode Global Configuration

Examples The following commands specify various ageing timeouts on the switch.

```
awplus# configure terminal
awplus(config)# mac address-table ageing-time 1000

awplus# configure terminal
awplus(config)# mac address-table ageing-time none

awplus# configure terminal
awplus(config)# no mac address-table ageing-time
```

mac address-table static

Use this command to statically configure the MAC address-table to forward or discard frames with a matching destination MAC address.

Syntax

```
mac address-table static <mac-addr> {forward|discard} interface
   <port> [vlan <vid>]

no mac address-table static <mac-addr> {forward|discard} interface
   <port> [vlan <vid>]
```

Parameter	Description
<mac-addr>	The destination MAC address in `HHHH.HHHH.HHHH` format.
<port>	The port to display information about. The port may be a switch port (e.g. `port1.0.4`), a static channel group (e.g. `sa3`), or a dynamic (LACP) channel group (e.g. `po4`).
<vid>	The VLAN ID. If you do not specify a VLAN, its value defaults to vlan 1.

Mode Global Configuration

Usage The **mac address-table static** command is only applicable to Layer 2 switched traffic within a single VLAN. Do not apply the **mac address-table static** command to Layer 3 switched traffic passing from one VLAN to another VLAN. Frames will not be discarded across VLANs because packets are routed across VLANs. This command only works on Layer 2 traffic.

Example The following commands will configure the MAC address-table to "forward" frames with the MAC addresss `2222.2222.2222 on VLAN 3, port 1.0.4`

```
awplus# configure terminal
awplus(config)# mac address-table static 2222.2222.2222 forward
                interface port1.0.4 vlan 3
```

Related Commands **clear mac address-table static**
show mac address-table

mac address-table thrash-limit

Use this command to set the thrash limit on the switch or stack. Thrashing occurs when a MAC address table rapidly "flips" its mapping of a single MAC address between two subnets, usually as a result of a network loop.

Use the **no** variant of this command to disable thrash limiting.

Syntax

```
mac address-table thrash-limit <rate>
no mac address-table thrash-limit
```

Parameter	Description
<rate>	sets the maximum thrash rate at which limiting is applied. This rate can be set between 5 and 255 MAC thrashing flips per second. Once the thrash limit rate is reached, the port is considered to be thrashing.

Default No thrash limiting

Mode Global Configuration

Usage Use this command to limit thrashing on the selected port range.

Example To apply a thrash limit of 100 MAC address flips per second:

```
awplus# configure terminal
awplus(config)# mac address-table thrash-limit 100
```

Related Commands **show mac address-table thrash-limit**

mirror interface

Use this command to define a mirror port and mirrored (monitored) ports and direction of traffic to be mirrored. The port for which you enter interface mode will be the mirror port.

The destination port is removed from all VLANs, and no longer participates in other switching.

Use the **no** variant of this command to disable port mirroring by the destination port on the specified source port.

Use the **none** variant of this command when using copy-to-mirror ACL and QoS commands.

Syntax

```
mirror interface <source-port-list> direction {both|receive|transmit}
mirror interface none
no mirror interface <source-port-list>
no mirror interface none
```

Parameter	Description
<source-port-list>	The source switch ports to mirror. A port-list can be: ■ a port (e.g. `port1.0.12`) ■ a continuous range of ports separated by a hyphen, e.g. `port1.0.1-1.0.24` ■ a comma-separated list of ports and port ranges, e.g. `port1.0.1,port1.0.8-1.0.24` The source port list cannot include dynamic or static channel groups (link aggregators).
`direction`	Specifies whether to mirror traffic that the source port receives, transmits, or both.
`both`	Mirroring traffic both received and transmitted by the source port.
`receive`	Mirroring traffic received by the source port.
`transmit`	Mirroring traffic transmitted by the source port.
`none`	Specify this parameter for use with the ACL (Access Control List) **access-list** and QoS (Quality of Service) default action commands when used with the **copy-to-mirror** parameter option, so you can specify the destination port (the analyzer port) for the traffic without specifying a source mirror port. See the ACL commands **access-list (hardware IP numbered)** and **access-list (hardware MAC numbered)**, and the QoS command **default-action** for further information.

Mode Interface Configuration

Usage Use this command to send traffic to another device connected to the mirror port for monitoring.

See **"Port Mirroring" on page 16.20**.

A mirror port cannot be associated with a VLAN. If a switch port is configured to be a mirror port, it is automatically removed from any VLAN it was associated with.

This command can only be applied to a single mirror (destination) port, not to a range of ports, nor to a static or dynamic channel group. Do not apply multiple interfaces with an interface command before issuing the mirror interface command. One interface may have multiple mirror interfaces.

Note A port cannot be configured as a mirror or mirrored port, if it is already configured for sFlow monitoring.

Example To mirror traffic received and transmitted on `port1.0.4` and `port1.0.5` to destination `port1.0.3`, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.3
awplus(config-if)# mirror interface port1.0.4,port1.0.5
direction both
```

To enable use with the **access-list (hardware IP numbered)** ACL and **default-action** QoS commands to destination `port1.0.3` without specifying a source port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.3
awplus(config-if)# mirror interface none
```

To mirror all TCP traffic, received or transmitted to analyzer `port1.0.1`, see the sample config below:

```
awplus#show running-config

!
mls qos enable
access-list 3000 copy-to-mirror tcp any any
access-group 3000
!
interface port1.0.1
 mirror interface none
 switchport
!
```

Related Commands
access-list (hardware IP numbered)
access-list (hardware MAC numbered)
default-action

platform buffer-drop-mode

You can use this command to configure how to deal with congestion in the switch. There are two sets of traffic buffering memory on each XEM ingress port and egress port. The egress memory is divided up equally for each egress port.

The default mode is **tail-drop**. When one egress port gets congested, it signals the ingress port that it is congested. Then the switch drops packets at that ingress port destined for the congested egress port.

The **tail-drop** mode allows you to drop packets based on low priority level first and provides QoS. Congested egress ports do not affect traffic to any other egress ports.

In **lossless** mode, ingress packets are not dropped if the ingress port's corresponding egress port (the output port the ingress port destined for) is congested. The traffic buffering memory of the ingress port will be filled up, which allows congestion to build up. 802.3x flow control then sends information to adjacent switches to stop them sending packets if the ingress ports are congested.

By using the **lossless** mode you can provide optimized throughput for certain applications.

Use the **no** variant of this command to restore buffer drop mode to the default **tail-drop** mode.

Syntax

```
platform buffer-drop-mode {tail-drop|lossless}
no platform buffer-drop-mode
```

Parameter	Description
`tail-drop`	Packet tail-drop mode
`lossless`	Lossless mode

Default **tail-drop** mode is the default mode.

Mode Global Configuration

Usage Use **tail-drop** mode to drop packets to avoid congestion building up. When buffers get congested, if you don't want to drop packets and you want to allow feedback congestion to ingress ports, use **lossless** mode.

To confirm the default setting, use **show running-config** command.

```
awplus# show running-config
```

```
!
platform buffer-drop-mode lossless
```

Example To enable **lossless** mode, use the following command:

```
awplus(config)# platform buffer-drop-mode lossless
```

Related Commands **show running-config**

platform control-plane-prioritization rate

The feature ensures that different traffic types can share the CPU effectively.

Use this command to set the maximum traffic rate on the CPU port to limit the data rate to the CPU. This is to prevent the CPU becoming overloaded with unnecessary data packets, which in turn could result in poor performance in situations such as a CLI console lock up, or control packet loss following a broadcast storm.

Use the **no** variant of this command to restore the rate limiting on the CPU port to the default.

Note that only integer values are accepted for rate limits.

Set the rate to 0 using **platform control-plane prioritization rate** to disable CPU protection.

Syntax

```
platform control-plane-prioritization rate <rate-limit>
no platform control-plane-prioritization rate
```

Parameter	Description
<rate-limit>	<1-1000> 1 Mbps to 1000 Mbps.

Default 60 Mbps

Mode Global Configuration

Usage Confirming default settings:

Use **show platform** to confirm the default rate limit settings displayed with platform information:

```
awplus# show platform
```

```
Load Balancing                  srt-dst-mac, src-dst-ip
Control-plane-prioritization    Max 60 Mbps
Jumboframe support              off
Enhanced mode                   qos counters
Vlan-stacking TPID              0x8100
```

Disabling CPU protection:

To disable the CPU protection feature you can set the control plane prioritization rate to 0:

```
awplus# platform control-plane-prioritization 0
```

Then you can confirm the CPU protection feature has been disabled using **show platform**:

```
awplus# show platform
```

```
Load Balancing                  srt-dst-mac, src-dst-ip
Control-plane-prioritization    Max 0 Mbps
Jumboframe support              off
Enhanced mode                   qos counters
Vlan-stacking TPID              0x8100
```

Examples To set the maximum traffic rate on the CPU port to 10 Mbps enter the following command:

```
awplus# configure terminal
awplus(config)# platform control-plane-prioritization 10
```

Confirm the maximum traffic rate has been configured using the following **show** command:

```
awplus#show platform
Load Balancing                  srt-dst-mac, src-dst-ip
Control-plane-prioritization    Max 10 Mbps
Jumboframe support              off
Enhanced mode                   qos counters
Vlan-stacking TPID              0x8100
```

To reset the maximum traffic rate on the CPU port to the default enter the following command:

```
awplus# configure terminal
awplus(config)# no platform control-plane-prioritization
```

Related Commands **show platform**
show running-config

platform delay-locked-loop-monitoring

This command should only be used when directed by Allied Telesis support personnel. This command allows you to configure the DLL (Delayed Locked Loop) monitoring parameters used for hardware environmental monitoring functionality.

Syntax `platform delay-locked-loop-monitoring <poll-interval> <temp-delta>`

Parameter	Description
<poll-interval>	<1-4294967295> Time interval in seconds between two successive temperature readings.
<temp-delta>	<1-200> Maximum rise in temperature in degrees Celsius after which the Delay Locked Loop is reset.

Default The default poll interval is 10 seconds, and the default temperature delta is 30 degrees Celsius.

Mode Global Configuration

Usage In field resetting of the Delayed Locked Loop (DLL) may be used under some extreme thermal conditions, such as a reboot at a very low temperature with a ramp-up to a high temperature.

The two integer parameters configured by this command are the values for the time interval in seconds to poll for temperature variations (which is the poll interval), and the temperature limit in degrees Celsius (which is the maximum temperature delta).

Example To set the poll interval to 20 seconds and the temperature delta to 35 degrees Celsius, enter:

```
awplus# configure terminal
awplus(config)# platform delay-locked-loop-monitoring 20 35
```

platform hwfilter-size

You can use this command to control the configuration of hardware Access Control Lists (ACLs), which determines the total available number and functionality of hardware ACLs.

For this command to take effect, you need to reboot the affected device.

The **ipv6 access-list (named)** command is available only if this command is set to **ipv4-full-ipv6**.

Syntax `platform hwfilter-size {basic|ipv4-full-ipv6}`

Parameter	Description
`hwfilter-size`	Configure hardware ACLs command.
`basic`	Configure hardware ACLs to filter IPv4 traffic and MAC addresses.
`ipv4-full-ipv6`	Configure hardware ACLs to filter IPv4 traffic, MAC addresses and IPv6 traffic; however, this will reduce the total number of filters available in the hardware table.

Default The default mode is **ipv4-full-ipv6**. When the mode is **ipv4-full-ipv6,** it is printed in the output of the **show running-config** command, even though it is the default setting.

Mode Global Configuration

Usage The maximum number of individual hardware ACLs depends on the hardware type of the port you apply the ACLs to.

Two hardware types exist: **Hardware Version 1** and **Hardware Version 2**. The following table shows the hardware modules and the version to which each belongs.

Hardware Version 1	Hardware Version 2
Baseboard	AT-XEM-12Sv2
AT-XEM-12T	AT-XEM-12Tv2
AT-XEM-12XS	AT-XEM-2XP
AT-XEM-1XP	AT-XEM-2XS
	AT-XEM-2XT
	AT-XEM-24T

The following table shows the maximum number of filters for each hardware type and **platform hwfilter-size**option.

Hardware Type	Setting of platform hwfilter-size	Maximum
Hardware Type 1	ipv4-full-ipv6 (Default. Can filter on MAC addresses and IPv4 and IPv6 settings)	1024
Hardware Type 1	basic (Can only filter on MAC addresses and IPv4 settings)	2048
Hardware Type 2	ipv4-full-ipv6	4096
Hardware Type 2	basic	8192

Example To configure hardware ACLs to filter IPv4 and IPv6 traffic, use the following commands:

```
awplus# configure terminal
awplus(config)# platform hwfilter-size ipv4-full-ipv6
```

Related Commands

platform jumboframe

This command enables the device to forward jumbo frames. For more information, see **"Support for Jumbo Frames" on page 16.19.**

When jumbo frame support is enabled, the maximum size of packets that the device can forward is 10240 bytes for ports that work at speeds of 10 Mbps, 100 Mbps or 1000 Mbps.

The **no** variant of this command disables the device from forwarding jumbo frames. This stops the ports from forwarding packets larger than VLAN tagged frames (1522 bytes).

Syntax

```
platform jumboframe
no platform jumboframe
```

Default By default, jumbo frames is off.

Mode Global Configuration

Usage You must restart the device after entering this command for it to take effect. You can use the **reboot** command on page 10.28 to restart the device.

Example To enable the device to forward jumbo frames, use the following commands:

```
awplus# configure terminal
awplus(config)# platform jumboframe
```

Related Commands

show platform
show running-config

platform l2mc-overlap

Use this command to enable checking for overlapping (shared) multicast entries, so that shared entries are not deleted if they are still in use.

Use the **no** version of this command to disable checking for overlapping entries before deletion.

Syntax

```
platform l2mc-overlap
no platform l2mc-overlap
```

Mode Global Configuration

Default By default, Layer 2 multicast overlap checking is disabled.

Example To prevent the deletion of overlapping (shared) Layer 2 multicast entries, use the command:

```
awplus# configure terminal
awplus(config)# platform l2mc-overlap
```

Related Commands show platform

platform load-balancing

This command selects which address fields are used as inputs into the load balancing algorithm. The output from this algorithm is used to select which individual path a given packet will traverse within an aggregated link.

The **no** variant of this command applies its default setting.

Syntax

```
platform load-balancing {src-dst-mac|src-dst-ip}
no platform load-balancing
```

Parameter	Description
src-dst-mac	Include the source and destination MAC addresses (Layer 2)
src-dst-ip	Include the source and destination IP addresses (Layer 3)

Default Includes the **src-dst-mac** and **src-dst-ip** addresses as inputs into the platform load balancing algorithm.

Mode Global configuration

Examples To set the load balancing algorithm to include only Layer 2 MAC addresses, enter:

```
awplus# configure terminal
awplus(config)# platform load-balancing src-dst-mac
```

To set the load balancing algorithm to include only Layer 3 IP addresses, enter:

```
awplus# configure terminal
awplus(config)# platform load-balancing src-dst-ip
```

Related Commands show platform

platform routingratio

This command changes the amount of memory allocated to IPv4 routing tables relative to IPv6 routing tables.

Use the **no** variant of this command to restore to the default setting.

The switching hardware contains memory that it uses to store tables of routes and nexthop addresses. IPv4 and IPv6 addresses have separate tables. This command adjusts the amount of memory allocated to the tables depending on whether they are for IPv4 or IPv6 addresses.

Syntax

```
platform routingratio {ipv4only|ipv4andipv6}

no platform routingratio
```

Parameter	Description
`ipv4only`	All memory resources are allocated to the IPv4 address tables.
`ipv4andipv6`	50% of memory resources are allocated to the IPv4 address tables, and 50% to IPv6 address tables.

Default The routing ratio is set to `ipv4andipv6` by default to store both IPv4 and IPv6 addresses.

Mode Global Configuration

Usage The default routing memory ratio is set to `ipv4andipv6` allowing both IPv4 and IPv6 to run concurrently. Use the negated form of this command to restore to the default. If you need to maximize routing memory capacity for IPv4, then set the routing memory ratio to `ipv4only`.

Note For this command to take effect, you must copy it to the startup configuration using the **copy running-config startup-config** command and then reboot the switch.

Examples To set the route and nexthop tables to store IPv4 addresses only, use the following commands:

```
awplus# configure terminal
awplus(config)# platform routingratio ipv4only
% The device needs to be restarted for this
change to take effect.
```

To reset the route and nexthop tables to store both IPv4 and IPv6 addresses, use the following commands:

```
awplus# configure terminal
awplus(config)# platform routingratio ipv4andipv6
% The device needs to be restarted for this
change to take effect.
```

To reset the route and nexthop tables to the default setting, use the following commands:

```
awplus# configure terminal
awplus(config)# no platform routingratio
% The device needs to be restarted for this
change to take effect.
```

Related Commands

platform silicon-profile
show platform
show running-config
show startup-config

platform silicon-profile

Use this command to rearrange memory in the switch's silicon hardware, to provide differing numbers of table entries for different uses. For a new silicon profile setting to take effect, it must be in the startup configuration when the switch starts up. For more details about the limits that are modified by this command, see **Table 17-1**.

The **no** variant of this command restores the memory to the default state: no silicon profile set. For the default silicon profile setting to take effect, you must restart the switch with the **no** version of the command in the startup config.

This command replaces the **platform enhancedmode** command.

Syntax x900

```
platform silicon-profile {nexthop|qoscounters|qospolicers}
no platform silicon-profile
```

Syntax SBx908

```
platform silicon-profile {nexthop|qoscounters|qospolicers|extended}
no platform silicon-profile
```

Parameter	Description
nexthop	Increases the number of individual routes that can be stored in the nexthop table. The maximum number of multicast groups and traffic classes is reduced. This profile is only useful on: ■ x900 Series switches, or ■ SwitchBlade x908 switches with one or more of these XEMs present: XEM-1XP, XEM-12T, XEM-12S. On a SwitchBlade x908 that only has XEM-2XP, XEM-2XT, and XEM-2XS XEMs installed, more nexthops are available with the **extended** profile.
qoscounters	Enables the QoS counters profile so that the hardware monitors QoS counters for traffic classes (policers). The maximum number of traffic classes is reduced. This profile is only useful on: ■ x900 Series switches, or ■ SwitchBlade x908 switches with one or more of these XEMs present: XEM-1XP, XEM-12T, XEM-12S. Before you configure QoS storm protection, you must set either this profile or the **extended** profile. On a SwitchBlade x908 that only has XEM-2XP, XEM-2XT, and XEM-2XS XEMs installed, QoS counters are available in the **extended** profile.
qospolicers	Enables the QoS policers profile. The internal memory for the switch is rearranged to allow more QoS policers at the expense of a reduced multicast route capacity. This profile is only useful on: ■ x900 Series switches, or ■ SwitchBlade x908 switches with one or more of these XEMs present: XEM-1XP, XEM-12T, XEM-12S. On a SwitchBlade x908 that only has XEM-2XP, XEM-2XT, and XEM-2XS XEMs installed, more QoS policers are available in the **extended** profile.

Parameter	Description
extended	SBx908 with only XEM-2XP, XEM-2XT, and XEM-2XS XEMs installed: This profile increases silicon hardware table sizes to make use of the larger capacity of these XEMs when installed in a SwitchBlade x908. This profile increases the maximum number of: ■ static channel groups ■ LACP channel groups ■ Forwarding Database (FDB) entries ■ Unicast nexthop entries ■ Layer 3 multicast entries

Default By default, no silicon profile is set.

Mode Global Configuration

Usage Memory in the switch hardware silicon can be allocated in various ways when the switch starts up. The memory allocations that can be made depend on the hardware (which switch model and which XEMs are installed). On some hardware platforms, using this command to increase the allocation for one use reduces the memory available for other uses.

Before you configure QoS storm protection (**storm-protection** command on page 66.81.), you must set the silicon profile to either **extended** or **qoscounters.**

The silicon profile setting in the startup configuration takes effect when the switch starts up. Once you have entered this **platform silicon-profile** command (or the **no** version), you can copy the running-config to the startup-config (**copy running-config** command on page 7.14) and reboot the switch (**reboot** command on page 10.28):

```
awplus# copy running-config startup-config
awplus# reboot
```

SBx908 only: The switch will only start up with the platform silicon-profile set to **extended** if all the XEMs installed are XEM-2XP, XEM-2XT, and XEM-2XS XEMs. When the switch is running with the extended profile, you cannot install any of the other XEMs (XEM-1XP, XEM-12T, or XEM-12S)—if you insert one of these XEMs, the XEM will not start up. To install one of these XEMs, you must remove the extended profile setting from the startup config, and restart the switch. This results in the table sizes being reduced to the default settings.

Before connecting switches into a stack, all stack members must be operating in the same mode (enhanced or default/none).

Table 17-1: Memory allocation for silicon profiles with routing ratio IPv4 and IPv6

	Silicon profile options				
	None (default)	nexthop	qoscounters	qospolicers	extended
Route Entry/Policer Limits					
Unicast nexthop entries	2500	5060	2500	2500	8192
Multicast nexthop entries	2048	256	2048	1280	8192
QoS policers (traffic classes)	713	329	475	1097	4096
FDB Limits					
Forwarding Database entries (MAC addresses)	16384	16384	16384	16384	65536
Link Aggregation Limits					
Link aggregators: total	31	31	31	31	128
Link aggregators: LACP (dynamic)	31	31	31	31	32
Link aggregators: static	31	31	31	31	96
QoS Counters Enabled					
QoS counters	No	No	Yes	No	Yes

Examples To enable monitoring of QoS traffic class counters, use the following commands:

```
awplus# configure terminal
awplus(config)# platform silicon-profile qoscounters
```

To increase the size of the nexthop table, use the following commands:

```
awplus# configure terminal
awplus(config)# platform silicon-profile nexthop
```

To allow more QoS policers at the expense of multicast routes, use the commands:

```
awplus# configure terminal
awplus(config)# platform silicon-profile qospolicers
```

SBx908 only: On a SwitchBlade x908 with XEM-2XP, XEM-2XT, and XEM-2XS XEMs installed (and no XEM-1XP, XEM-12T, or XEM-12S XEMs present), to increase table sizes, use the commands:

```
awplus# configure terminal
awplus(config)# platform silicon-profile extended
```

To restore the silicon profile to its default setting (no profile), use the commands:

```
awplus# configure terminal
awplus(config)# no platform silicon-profile
```

storm-protection

platform vlan-stacking-tpid

This command specifies the Tag Protocol Identifier (TPID) value that applies to all frames that are carrying double tagged VLANs. All nested VLANs must use the same TPID value. (This feature is sometimes referred to as VLAN stacking or VLAN double-tagging.)

Use the **no** variant of this command to revert to the default TPID value (0x8100).

Note Because the additional tag increases the frame size beyond 1522 bytes, you must turn on Jumbo frames to activate VLAN-stacking.

Syntax

```
platform vlan-stacking-tpid <tpid>
no platform vlan-stacking-tpid
```

Parameter	Description
<tpid>	The Ethernet type of the tagged packet, as a two byte hexadecimal number.

Default The default TPID value of 0x8100 is restored using a **no platform vlan-stacking-tpid** command.

Mode Global Configuration

Examples To set the VLAN stacking TPID value to 0x9100, use the following commands:

```
awplus# configure terminal
awplus(config)# platform vlan-stacking-tpid 9100
```

To reset the VLAN stacking TPID value to the default (0x8100), use the following commands:

```
awplus# configure terminal
awplus(config)# no platform vlan-stacking-tpid
```

Related Commands
switchport vlan-stacking (double tagging)
show platform
show running-config

polarity

This command sets the MDI/MDIX polarity on a copper-based switch port.

Syntax `polarity {auto|mdi|mdix}`

Parameter	Description
`mdi`	Sets the polarity to MDI (medium dependent interface).
`mdix`	Sets the polarity to MDI-X (medium dependent interface crossover).
`auto`	The switch port sets the polarity automatically. This is the default option.

Default By default, switch ports set the polarity automatically (**auto**).

Mode Interface Configuration

Usage We recommend the default **auto** setting for MDI/MDIX polarity. Polarity applies to copper 10BASE-T, 100BASE-T, and 1000BASE-T switch ports; It does not apply to fibre ports. For more information, see **"MDI/MDIX Connection Modes" on page 16.5**.

Example To set the polarity for `port1.0.7` to fixed MDI mode, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.7
awplus(config-if)# polarity mdi
```

show debugging loopprot

This command shows Loop Protection debugging information.

Syntax `show debugging loopprot`

Mode User Exec and Privileged Exec

Example To display the enabled Loop Protection debugging modes, use the command:

```
awplus# show debugging loopprot
```

Related Commands **debug loopprot**

show debugging platform packet

This command shows platform to CPU level packet debugging information.

Syntax `show debugging platform packet`

Mode User Exec and Privileged Exec

Example To display the platform packet debugging information, use the command:

```
awplus# show debugging platform packet
```

Related Commands **debug platform packet**
undebug platform packet

show flowcontrol interface

Use this command to display flow control information.

Syntax `show flowcontrol interface <port>`

Parameter	Description
<port>	Specifies the name of the port to be displayed.

Mode User Exec and Privileged Exec

Example To display the flow control for the `port1.0.5`, use the command:

```
awplus# show flowcontrol interface port1.0.5
```

Output **Figure 17-1: Example output from the show flowcontrol interface command for a specific interface**

```
Port     Send  FlowControl    Receive  FlowControl  RxPause TxPause
          admin    oper        admin    oper
-----     ------- --------    ------- --------     ------- -------
port1.0.5 on       on           on       on           0       0
```

show interface switchport

Use this command to show VLAN information about each switch port.

Syntax `show interface switchport`

Mode User Exec and Privileged Exec

Example To display VLAN information about each switch port, enter the command:

```
awplus# show interface switchport
```

Output **Figure 17-2: Example output from the show interface switchport command**

```
 Interface name          : port1.0.1
 Switchport mode         : access
 Ingress filter          : enable
 Acceptable frame types  : all
 Default Vlan            :  2
 Configured Vlans        : 2

 Interface name          : port1.0.2
 Switchport mode         : trunk
 Ingress filter          : enable
 Acceptable frame types  : all
 Default Vlan            :  1
 Configured Vlans        : 1 4 5 6 7 8
...
```

Related Commands show interface memory

show loop-protection

Use this command to display the current loop protection setup for the device.

Syntax `show loop-protection [interface <port-list>] [counters]`

Parameter	Description
`interface`	The interface selected for display.
`<port-list>`	A port, a port range, or an aggregated link.
`counters`	Displays counter information for loop protection.

Mode User Exec and Privileged Exec

Usage This command is used to display the current configuration and operation of the Loop Protection feature

Examples To display the current configuration status for `port1.0.1`, use the command:

```
awplus# show loop-protection interface port1.0.1
```

Figure 17-3: Example output from the show loop-protection command

```
Loop-Detection:          Enabled
LDF Interval:            10 [sec]
Interface:               port1.0.1
 Action:                 port-disable
 Timeout:                300 [sec]
 Vlan:                   1
  Status:                Blocking
  Timeout Remaining:     115 [sec]
 Vlan:                   2
  Status:                Normal
  Timeout Remaining:     0 [sec]
```

To display the counter information for `port1.0.1`, use the command:

```
awplus# show loop-protection interface port1.0.1 counters
```

Figure 17-4: Example output from the show loop-protection interface counters command for port1.0.1

```
Interface:               port1.0.1
 Vlan:                   1
  LDF Tx:                3
  LDF Rx:                1
  Invalid LDF Rx:        1
  Action:                1
Vlan:                    2
  LDF Tx:                3
  LDF Rx:                0
  Invalid LDF Rx:        0
  Action:                0
```

show mac address-table

Use this command to display the mac address-table for all configured VLANs.

Syntax `show mac address-table`

Mode User Exec and Privileged Exec

Usage The **show mac address-table** command is only applicable to view a mac address-table for Layer 2 switched traffic within VLANs.

Example To display the mac address-table, use the following command:

```
awplus# show mac address-table
```

Output See the below sample output captured when there was no traffic being switched:

```
awplus#show mac address-table

VLAN port          mac               type
1    unknown       0000.cd28.0752    forward   static
ARP  -             0000.cd00.0000    forward   static
```

See the sample output captured when packets were switched and mac addresses were learnt:

```
awplus#show mac address-table

VLAN port          mac               type
1    unknown       0000.cd28.0752    forward   static
1    port1.0.11    0030.846e.9bf4    forward   dynamic
1    port1.0.9     0030.846e.bac7    forward   dynamic
ARP  -             0000.cd00.0000    forward   static
```

Note the new mac addresses learnt for `port1.0.9` and `port1.0.11` added as dynamic entries.

Note the first column of the output below shows VLAN IDs if multiple VLANs are configured:

```
awplus#show mac address-table

VLAN port          mac               type
1    unknown       0000.cd28.0752    forward   static
1    port1.0.9     0030.846e.bac7    forward   dynamic
2    unknown       0000.cd28.0752    forward   static
2    port1.0.11    0030.846e.9bf4    forward   dynamic
ARP  -             0000.cd00.0000    forward   static
```

Also note manually configured static mac-addresses are shown to the right of the type column:

```
awplus(config)#mac address-table static 0000.1111.2222 for int
port1.0.11 vlan 2
awplus(config)#end
awplus#
awplus#show mac address-table

VLAN port          mac               type
1    unknown       0000.cd28.0752    forward   static
1    port1.0.9     0030.846e.bac7    forward   dynamic
2    port1.0.11    0000.1111.2222    forward   static
2    unknown       0000.cd28.0752    forward   static
2    port1.0.11    0030.846e.9bf4    forward   dynamic
ARP  -             0000.cd00.0000    forward   statics
```

Related Commands

clear mac address-table dynamic
clear mac address-table static
mac address-table static

show mac address-table thrash-limit

Use this command to display the current thrash limit set for all interfaces on the device.

Syntax

```
show mac address-table thrash-limit
```

Mode

User Exec and Privileged Exec

Example

To display the current, use the following command:

```
awplus# show mac address-table thrash-limit
```

Output

Figure 17-5: Example output from the show mac address-table thrash-limit command

```
% Thrash-limit  7 movements per second
```

Related Commands

mac address-table thrash-limit

show mirror

Use this command to display the status of all mirrored ports.

Syntax `show mirror`

Mode User Exec and Privileged Exec

Example To display the status of all mirrored ports, use the following command:

```
awplus# show mirror
```

Output **Figure 17-6: Example output from the show mirror command**

```
Mirror Test Port Name: port1.0.1
Mirror option: Enabled
Mirror direction: both
Monitored Port Name: port1.0.2
Mirror Test Port Name: port1.0.3
Mirror option: Enabled
Mirror direction: receive
Monitored Port Name: port1.0.4
Mirror Test Port Name: port1.0.3
Mirror option: Enabled
Mirror direction: receive
Monitored Port Name: port1.0.1
Mirror Test Port Name: port1.0.1
Mirror option: Enabled
Mirror direction: receive
Monitored Port Name: port1.0.3
Mirror Test Port Name: port1.0.1
Mirror option: Enabled
Mirror direction: transmit
Monitored Port Name: port1.0.4
```

show mirror interface

Use this command to display port mirroring configuration for a mirrored (monitored) switch port.

Syntax `show mirror interface <port>`

Parameter	Description
<port>	The monitored switch port to display information about.

Mode User Exec, Privileged Exec and Interface Configuration

Example To display port mirroring configuration for the `port1.0.4`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# show mirror interface port1.0.4
```

Output **Figure 17-7: Example output from the show mirror interface command**

```
Mirror Test Port Name: port1.0.3
Mirror option: Enabled
Mirror direction: both
Monitored Port Name: port1.0.4
```

show platform

This command displays the settings configured by using the **platform** commands.

Syntax `show platform`

Mode Privileged Exec

Usage This command displays the settings in the running config. For changes in some of these settings to take effect, the switch must be rebooted with the new settings in the startup config.

Example To check the settings configured with **platform** commands on the switch, use the following command:

```
awplus# show platform
```

Output **Figure 17-8: Example output from the show platform command**

```
awplus# show platform

Load Balancing                  src-dst-mac, scr-dst-ip
Control-plane-prioritization    Max 60 Mbps
L2MC overlapped group check     off
silicon-profile                 extended
Jumboframe support              off
Vlan-stacking TPID              0x8100
Routing ratio                   IPv4 and IPv6
```

Table 17-2: Parameters in the output of the show platform command

Parameter	Description
Load Balancing	Which packet fields are used in the channel load balancing algorithm (**platform load-balancing** command on page 17.31).
Control-plane-prioritization	Maximum traffic rate on the CPU port, set using the **platform control-plane-prioritization rate** command on page 17.24.
L2MC overlapped group check	Whether Layer 2 multicast entries are checked before deletion (**platform l2mc-overlap** command on page 17.30).

Parameter	Description
silicon-profile	The silicon profile setting (**platform silicon-profile** command on page 17.34) for the switch hardware; one of: ■ nexthop ■ qoscounters ■ qospolicers ■ extended (SBx908 only) ■ None (default)
Jumboframe support	Whether the jumbo frames setting is enabled or disabled.
Vlan-stacking TPID	The value of the TPID set in the Ethernet type field when a frame has a double VLAN tag (**platform vlan-stacking-tpid** command on page 17.38).
Routing Ratio	Whether all memory is allocated to IPv4 address tables (**ipv4only**), or whether it is allocated evenly to both IPv4 and IPv6 address tables (**ipv4andipv6**) (**platform routingratio** command on page 17.32).

Related Commands

platform control-plane-prioritization rate

show platform classifier statistics utilization brief

This command displays the total memory space, and free memory space of CAM (Content-Addressable Memory). Utilization statistics for various platform functions, such as ACLs and QoS are also shown.

Syntax `show platform classifier statistics utilization brief`

Mode Privileged Exec

Example To display the platform classifier utilization statistics, use the following command:

```
awplus# show platform classifier statistics utilization brief
```

Figure 17-9: Output from the show platform classifier statistics utilization brief command

```
awplus#show platform classifier statistics utilization brief

Table 17-3: Parameters in the output from the show platform classifier statistics utilization brief command

Parameter	Description
`IPv6 Multicast`	Reserved hardware space for use by IPv6 multicast, when the ipv6 multicast routing command is used.
`System`	Fixed system entries, which may differ between types of XEMs. Resiliency links make use of system ACLs.
`MLD Snooping`	Entries to trap various packets that MLD Snooping is interested in.
`DHCP Snooping`	Entries used to DHCP and ARP packets to the CPU. User-added DHCP Snooping filter under ACLs are counted under the ACL or QoS categories.
`Loop Detection`	Entries uses to trap the special loop detection frame to the CPU.
`EPSR`	Entries used to trap the EPSR VLAN to the CPU.
`Global ACLs`	Entries for ACLs appear here if the ACLs are applied globally instead of per switchport.
`ACL`	Entries for ACL filters that have been applied directly to ports using the access-group command.
`QoS`	Entries for ALC filters and other class-map configurations, such as policers, applied through policy maps using the service input command.
`RA Guard`	Entries used to block IPv6 router advertisements, configured with the ipv6 nd raguard command.
`UDB`	User Defined Bytes (UDB), which are a limited resource of bytes that can be used to implement additional arbitrary matching on packet bytes. The software manages the use and allocation of these bytes automatically. The output of this table is intended for use by Allied Telesis Customer Support only.

Related Commands

show platform
ipv6 access-list (named)
platform hwfilter-size

show platform port

This command displays the various port registers or platform counters for specified switchports.

Syntax `show platform port [<port-list>|counters]`

Parameter	Description
<port-list>	The ports to display information about. A port-list can be: ■ a continuous range of ports separated by a hyphen, e.g. `port1.0.1-1.0.24` ■ a comma-separated list of ports and port ranges, e.g. `port1.0.1,port1.0.7-1.0.24`.
`counters`	Show the platform counters.

Mode Privileged Exec

Examples To display port registers for `port1.0.1` and `port1.0.2` use the following command:

```
awplus# show platform port port1.0.1-port1.0.2
```

To display platform counters for `port1.0.1` and `port1.0.2` use the following command:

```
awplus# show platform port port1.0.1-port1.0.2 counters
```

Table 17-4: Parameters in the output from the show platform port command

Parameter	Description
Ethernet MAC counters	
Combined receive/ transmit packets by size (octets) counters	Number of packets in each size range received and transmitted.
64	Number of 64 octet packets received and transmitted.
65 - 127	Number of 65 - 127 octet packets received and transmitted.
128 - 255	Number of 128 - 255 octet packets received and transmitted.
256 - 511	Number of 256 - 511 octet packets received and transmitted.
512 - 1023	Number of 512 - 1023 octet packets received and transmitted.
1024 - MaxPktSz	Number of packets received and transmitted with size 1024 octets to the maximum packet length.
1519 - 1522	Number of 1519 - 1522 octet packets received and transmitted.
1519 - 2047	Number of 1519 - 2047 octet packets received and transmitted.
2048 - 4095	Number of 2048 - 4095 octet packets received and transmitted.
4096 - 9216	Number of 4096 - 9216 octet packets received and transmitted.
General Counters	
Receive	Counters for traffic received.
Octets	Number of octets received.
Pkts	Number of packets received.
FCSErrors	Number of FCS (Frame Check Sequence) error events received.
UnicastPkts	Number of unicast packets received.
MulticastPkts	Number of multicast packets received.
BroadcastPkts	Number of broadcast packets received.
PauseMACCtlFrms	Number of Pause MAC Control Frames received.
OversizePkts	Number of oversize packets received.
Fragments	Number of fragments received.
Jabbers	Number of jabber frames received.
UnsupportOpcode	Number of MAC Control frames with unsupported opcode received.
AlignmentErrors	Receive Alignment Error Frame Counter.
SysErDurCarrier	Receive Code Error Counter.
CarrierSenseErr	Receive False Carrier Counter.
UndersizePkts	Number of undersized packets received.
Transmit	Counters for traffic transmitted.
Octets	Number of octets transmitted.

Table 17-4: Parameters in the output from the show platform port command(cont.)

Parameter	Description
Pkts	Number of packets transmitted.
UnicastPkts	Number of unicast packets transmitted.
MulticastPkts	Number of multicast packets transmitted.
BroadcastPkts	Number of broadcast packets transmitted.
PauseMACCtlFrms	Number of Pause MAC Control Frames transmitted.
OversizePkts	Number of oversize packets transmitted.
FrameWDeferrdTx	Transmit Single Deferral Frame counter.
FrmWExcesDefer	Transmit Multiple Deferral Frame counter.
SingleCollsnFrm	Transmit Single Collision Frame counter.
MultCollsnFrm	Transmit Multiple Collision Frame counter.
LateCollisions	Transmit Late Collision Frame counter.
ExcessivCollsns	Transmit Excessive Collision Frame counter.
Collisions	Transmit Total Collision counter
Layer 3 Counters:	
ifInUcastPkts	Inbound interface Unicast counter.
ifInDiscards	Inbound interface Discarded Packets counter.
ipInHdrErrors	Inbound interface Header Errors counter.
ifOutUcastPkts	Outbound interface Unicast counter.
ifOutErrors	Outbound interface Error counter.
Miscellaneous Counters	
DropEvents	Drop Event counter
ifOutDiscards	Outbound interface Discarded Packets counter.
MTUExcdDiscard	Receive MTU Check Error Frame Counter

Table 17-5: Output parameters from the show platform port counters command

Parameter	Description
`Ethernet MAC counters`	
`Combined receive/transmit packets by size (octets) counters`	Number of packets in each size range received and transmitted.
`64`	Number of 64 octet packets received and transmitted.
`65 - 127`	Number of 65 - 127 octet packets received and transmitted.
`128 - 255`	Number of 128 - 255 octet packets received and transmitted.
`256 - 511`	Number of 256 - 511 octet packets received and transmitted.
`512 - 1023`	Number of 512 - 1023 octet packets received and transmitted.
`1024 - MaxPktSz`	Number of packets received and transmitted with size 1024 octets to the maximum packet length.

Table 17-5: Output parameters from the show platform port counters

Parameter	Description
`General Counters`	
`Receive`	Counters for traffic received.
`Octets`	Number of octets received.
`Pkts`	Number of packets received.
`CRCErrors`	Number of CRC (Cyclic Redundancy Check) error events received.
`UnicastPkts`	Number of unicast packets received.
`MulticastPkts`	Number of multicast packets received.
`BroadcastPkts`	Number of broadcast packets received.
`FlowCtrlFrms`	Number of good Flow Control frames received.
`OversizePkts`	Number of oversize packets received.
`Fragments`	Number of fragments received.
`Jabbers`	Number of jabber frames received.
`UnsupportOpcode`	Number of MAC Control frames with unsupported opcode received.
`UndersizePkts`	Number of undersized packets received.
`Transmit`	Counters for traffic transmitted.
`Octets`	Number of octets transmitted.
`Pkts`	Number of packets transmitted.
`UnicastPkts`	Number of unicast packets transmitted.
`MulticastPkts`	Number of multicast packets transmitted.
`BroadcastPkts`	Number of broadcast packets transmitted.
`FlowCtrlFrms`	Number of good Flow Control frames transmitted.
`OversizePkts`	Number of oversize packets transmitted.
`FlowCtrlFrms`	The number of Flow Control frames transmitted.
`Collisions`	Total number of collisions seen by the MAC.
`LateCollisions`	Total number of late collisions seen by the MAC.
`ExcessivCollsns`	Number of frames dropped in the transmit MAC due to excessive collisions. This is applicable for Half-Duplex mode only.
`Miscellaneous Counters`	
`Mac TxErr`	Number of frames not transmitted correctly or dropped due to internal MAC transmit error.
`Mac RxErr`	Number of Receive Error events seen by the receive side of the MAC.
`DropEvents`	Number of instances that the port was unable to receive packets due to insufficient bandwidth to one of the PP internal resources, such as the DRAM or buffer allocation.

show port-security interface

Use this command to show the current port-security configuration and the switch port status.

Syntax `show port-security interface <port>`

Parameter	Description
`<port>`	The port to display information about. The port may be a switch port (e.g. `port1.0.4`), a static channel group (e.g. `sa3`), or a dynamic (LACP) channel group (e.g. `po4`).

Mode Privileged Exec

Example To see the port-security status on `port1.0.1`, use the following command:

```
awplus# show port-security interface port1.0.1
```

Output **Figure 17-12: Example output from the show port-security interface command**

```
Port Security configuration
Security Enabled               : YES
Port Status                    : ENABLED
Violation Mode                 : TRAP
Aging                          : OFF
Maximum MAC Addresses          : 3
Total MAC ddresses             : 1
Lock Status                    : UNLOCKED
Security Violation Count       : 0
Last Violation Source Address : None
```

show port-security intrusion

Shows the intrusion list. If the port is not give, entire intrusion table is shown.

Syntax `show port-security intrusion [interface <port>]`

Parameter	Description
`interface`	Specify a port
<port>	The port to display information about. The port may be a switch port (e.g. `port1.0.4`), a static channel group (e.g. `sa3`), or a dynamic (LACP) channel group (e.g. `po4`).

Mode Privileged Exec

Example To see the intrusion list on `port1.0.1`, use the following command:

```
awplus# show port-security intrusion interface port1.0.1
```

Output **Figure 17-13: Example output from the show port-security intrusion command for port 1.0.1**

```
Port Security Intrusion List
Interface: port1.0.1 -3 intrusion(s) detected
11-22-33-44-55-04 11-22-33-44-55-06 11-22-33-44-55-08
```

show provisioning (xem)

This command shows the provisioning status of all installed or provisioned hardware. Provisioning is the preconfiguration necessary to accommodate future connection of hardware items such as a XEM bay.

Syntax `show provisioning`

Mode User Exec and Privileged Exec

Example To show provisioning, use the following command:

```
awplus# show provisioning
```

Output **Figure 17-14: Example output from the show provisioning command**

```
awplus#show provisioning
Switch provisioning summary information

ID  Board class Status
1.0 x908        Hardware present
1.1 xem-12      Provisioned
1.4 xem-2       Hardware present
1.5 xem-1       Provisioned
```

Table 17-6: Output parameters from the show provisioning command

Parameter	Meaning
ID	The unit.bay-location of the hardware provision.
Board class	The hardware type.
Status	The provisioned state: ■ Hardware Present means that the hardware is currently installed in the stack or switch. ■ Provisioned means that although the hardware is not currently installed; the stack, or bay, is preconfigured ready to accept the hardware installation.

Related Commands **show stack**
switch bay provision (xem)

show storm-control

Use this command to display storm-control information for all interfaces or a particular interface.

Syntax `show storm-control [<port>]`

Parameter	Description
<port>	The port to display information about. The port may be a switch port (e.g. `port1.0.4`), a static channel group (e.g. `sa3`), or a dynamic (LACP) channel group (e.g. `po4`).

Mode User Exec and Privileged Exec

Example To display storm-control information for `port1.0.2`, use the following command:

```
awplus# show storm-control port1.0.2
```

Output **Figure 17-15: Example output from the show storm-control command for port1.0.2**

```
Port       BcastLevel  McastLevel  DlfLevel
port1.0.2      40. 0%     100. 0%   100. 0%
```

Example To display storm-control information for all ports, use the following command:

```
awplus# show storm-control
```

Output **Figure 17-16: Example output from the show storm-control command for all ports**

```
awplus#show storm-control
Port       BcastLevel  McastLevel  DlfLevel
port1.0.1      100.0%      100.0%    100.0%

port1.0.22     100.0%      100.0%    100.0%
port1.0.23     100.0%      100.0%    100.0%
port1.0.24     100.0%      100.0%    100.0%
```

Related Commands **storm-control level**

speed

This command changes the speed of the specified port. You can optionally specify the speed or speeds that get autonegotiated, so autonegotiation is only attempted at the specified speeds.

To see the currently-negotiated speed for ports whose links are up, use the **show interface** command. To see the configured speed (when different from the default), use the **show running-config** command.

Syntax

```
speed {10|100|1000|10000|auto [10][100][1000][10000]}
```

The following table shows the speed options for each type of port.

Port type	Speed Options (units are Mbps)
RJ-45 and RJ.5copper ports	auto (default) 10 100 1000
supported tri-speed copper SFPs	auto (default) 10 100 1000
100Mb fibre SFPs	100
1000Mb fibre SFPs	auto (default) 1000
10000Mb fibre SFP+	auto (default) 10000
XFP modules	auto (default) 10000 Note that XFG is fixed speed and runs at 10G. For example, XFG cannot be stepped down to run at the same port speed as a 1G SFP.

Mode Interface Configuration

Default By default, ports autonegotiate speed (except for 100Base-FX ports which do not support auto-negotiation, so default to 100Mbps).

Usage Switch ports in a static or dynamic (LACP) channel group must have the same port speed and be in full duplex mode. Once switch ports have been aggregated into a channel group, you can set the speed of all the switch ports in the channel group by applying this command to the channel group.

Note Note that if multiple speeds are specified after the auto option to autonegotiate speeds, then only those speeds specified are attempted for autonegotiation.

Examples

To set the speed of a tri-speed port to 100Mbps, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# speed 100
```

To return the port to auto-negotiating its speed, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# speed auto
```

To set a port to auto-negotiate its speed at 100Mbps and 1000Mbps, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# speed auto 100 1000
```

To set a port to auto-negotiate its speed at 1000Mbps only, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# speed auto 1000
```

Related Commands

duplex
ecofriendly lpi
polarity
show interface
speed (asyn)

storm-control level

Use this command to specify the threshold level for broadcasting, multicast, or destination lookup failure (DLF) traffic for the port. Storm-control limits the specified traffic type to the specified threshold.

Use the **no** variant of this command to disable storm-control for broadcast, multicast or DLF traffic.

Syntax

```
storm-control {broadcast|multicast|dlf} level <level>
no storm-control {broadcast|multicast|dlf} level
```

Parameter	Description
<level>	<0-100> Specifies the threshold as a percentage of the maximum port speed.
broadcast	Applies the storm-control to broadcast frames.
multicast	Applies the storm-control to multicast frames.
dlf	Applies the storm-control to destination lookup failure traffic.

Default By default, storm-control is disabled.

Mode Interface Configuration

Usage Flooding techniques are used to block the forwarding of unnecessary flooded traffic. A packet storm occurs when a large number of broadcast packets are received on a port. Forwarding these packets can cause the network to slow down or time out.

Example To limit broadcast traffic on `port1.0.2` to 30% of the maximum port speed, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# storm-control broadcast level 30
```

Related Commands show storm-control

switch bay provision (xem)

This command enables you to pre-configure a specific empty bay within a switch ready for inserting a particular XEM type. To run this command, the bay position must be vacant and the selected XEM type must be one that is currently supported.

Use the **no** variant of this command to remove an existing switch provision.

Syntax

```
switch <chassis-ID> bay <1-8> {provision|reprovision}{xem-1|xem-2|
   xem-12}

no switch <chassis-ID> bay <1-8> provision
```

Parameter	Description
`switch <chassis-ID>`	For a stack, the chassis member switch to be either provisioned or reprovisioned, from 1 to 8. For a standalone switch this setting should be 1.
`bay <1-8>`	The switch bay to be either provisioned or reprovisioned.
`provision`	Provides settings within the switch configuration ready for a specific XEM to be inserted into a specific bay.
`reprovision`	Reconfigure an existing provision switch bay configuration.

Mode Global Configuration

Examples To provision a 12 port XEM in bay 1 of stack member 2, use the following commands:

```
awplus# configure terminal
awplus(config)# switch 2 bay 1 provision xem-12
```

To change the provisioning of the XEM bay to accommodate a 2 port XEM, use the following commands:

```
awplus# configure terminal
awplus(config)# switch 2 bay 1 reprovision xem-2
```

To remove the above provisioning, use the following commands:

```
awplus# configure terminal
awplus(config)# no switch 2 bay 1 provision
```

Related Commands

show stack
show provisioning (stack)
show provisioning (xem)
switch provision (stack)

switchport port-security

Enables the port-security feature. This feature is also known as the port-based learn limit. It allows the user to set the maximum number of MAC addresses that each port can learn.

Use the **no** variant of this command to disable the port-security feature.

Syntax

```
switchport port-security
no switchport port-security
```

Mode Interface Configuration

Examples To enable the port-security feature on `port1.0.4`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# switchport port-security
```

To disable port-security feature on `port1.0.4`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# no switchport port-security
```

switchport port-security aging

Sets the port-security MAC to time out.

Use the **no** variant of this command to set the port-security to not time out.

Syntax

```
switchport port-security aging
no switchport port-security aging
```

Mode Interface Configuration

Examples To set the MAC to time out, use the following command:

```
awplus# switchport port-security aging
```

To unset the MAC time out, use the following command:

```
awplus# no switchport port-security aging
```

switchport port-security maximum

Sets the maximum MAC address that each port can learn.

Use the **no** variant of this command to unset the maximum number of MAC addresses that each port can learn. This is same as setting the maximum number to 0. This command also resets the intrusion list table.

Syntax

```
switchport port-security maximum <0-256>
no switchport port-security maximum
```

Parameter	Description
`maximum`	Maximum number of address to learn.
<0-256>	Maximum number of address to learn.

Mode Interface Configuration

Examples To learn 3 MAC addresses on `port1.0.4`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# switchport port-security maximum 3
```

To remove the MAC learning limit on `port1.0.4`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# no switchport port-security maximum
```

switchport port-security violation

Sets the violation action for a switch port when the port exceeds the learning limits. The port action can be either **shutdown**, **restrict** or **protect**. If **shutdown** is set, the physical link will be disabled and "shutdown" will be shown in the config. If **restrict** is set, the packet from the un-authorized MAC will be discarded and SNMP TRAP will be generated to alert management. If **protect** is set, the packet will simply be discarded by the packet processor silently.

The **no** variant of this command sets the violation action to default. The default violation action is protect.

Syntax

```
switchport port-security violation {shutdown|restrict|protect}
no switchport port-security violation
```

Parameter	Description
`shutdown`	Disable the port.
`restrict`	Alert the network administrator.
`protect`	Discard the packet.

Mode Interface Configuration

Examples To set the action to be shutdown on `port1.0.4`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# switchport port-security violation shutdown
```

To set the port-security action to the default (protect) on `port1.0.4`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# no switchport port-security violation
```

thrash-limiting

Sets and configures the thrash limit action that will be applied to any port on the switch when a thrashing condition is detected. The thrash-limiting timeout specifies the time, in seconds, for which the thrash action is employed.

Syntax

```
thrash-limiting {[action {learn-disable|link-down|port-disable|
   vlan-disable|none}] [timeout <0-86400>]}

no thrash-limiting {action|timeout}
```

Parameter	Description
`action`	The mac thrashing detected action. The default is vlan-disable.
`learn-disable`	Disable mac address learning
`link-down`	Block all traffic on an interface - link down
`port-disable`	Block all traffic on an interface - link remains up
`vlan-disable`	Block all traffic on a vlan Note that setting this parameter will also enable ingress filtering.
`none`	No thrash action
`timeout`	Set the duration for the thrash action
<0-86400>	The duration of the applied thrash action in seconds. The default is 1 seconds.

Default The default action is learn-disable.

Mode Interface Configuration

Usage See the **Thrash Limiting** section in **Chapter 16, Switching Introduction** for relevant conceptual, configuration, and overview information prior to applying this command.

Examples To set the action to learn disable for `port1.0.4`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# thrash-limiting action learn-disable
```

To block all traffic on a vlan, use the following command:

```
awplus# configure terminal
awplus(config)# thrash-limiting action vlan-disable
```

To set the thrash limiting timeout to 5 seconds, use the following command:

```
awplus(config-if)# thrash-limiting timeout 5
```

To set the thrash limiting action to its default, use the following command:

```
awplus(config-if)# no thrash-limiting action
```

To set the thrash limiting timeout to its default, use the following command:

```
awplus(config-if)# no thrash-limiting timeout
```

Introduction

This chapter describes Virtual LANs (VLAN), VLAN features and configuration on the switch. For detailed descriptions of commands used to configure VLANs, see **Chapter 19, VLAN Commands**. For information about Voice VLAN and LLDP-MED, see **Chapter 99, LLDP Introduction and Configuration**.

Virtual LANs (VLANs)

A Virtual LAN (VLAN) is a logical, software-defined subnetwork. It allows similar devices on the network to be grouped together into one broadcast domain, irrespective of their physical position in the network. Multiple VLANs can be used to group workstations, servers, and other network equipment connected to the switch, according to similar data and security requirements.

Decoupling logical broadcast domains from the physical wiring topology offers several advantages, including the ability to:

- Move devices and people with minimal, or no, reconfiguration
- Change a device's broadcast domain and access to resources without physically moving the device, by software reconfiguration or by moving its cable from one switch port to another
- Isolate parts of the network from other parts, by placing them in different VLANs
- Share servers and other network resources without losing data isolation or security
- Direct broadcast traffic to only those devices which need to receive it, to reduce traffic across the network
- Connect 802.1Q-compatible switches together through one port on each switch

Devices that are members of the same VLAN only exchange data with each other through the switch's Layer 2 switching capabilities. To exchange data between devices that are located in different VLANs, the switch's Layer 3 (routing) capabilities are used.

Different IP subnets are associated with different VLANs. The switch's IP router table will be populated by the routes to the subnets on any active VLANs, and by routes statically configured over active VLAN interfaces, or learnt via routing protocols operating over these interfaces.

The device supports up to 4094 VLANs (the maximum allowed by the VID field in the 802.1Q tag). On some devices a few of these VLANs may be reserved for management purposes.

When the switch is first powered up (and therefore unconfigured), it creates a default VLAN with a VID of 1 and an interface name of *vlan1*. In this initial condition, the switch attaches all its ports to this default VLAN.

The default VLAN cannot be deleted, and ports can only be removed from it if they also belong to at least one other VLAN. If all the devices on the physical LAN belong to the same logical LAN, that is, the same broadcast domain, then the default settings will be acceptable, and no additional VLAN configuration is required.

Configuring VLANs

Defaults

By default, all switch ports are in access mode, are associated with the default VLAN (**vlan1**), and have ingress filtering on. You cannot delete **vlan1**.

VLAN names

When you create a VLAN (using the **vlan** command), you give it a numerical VLAN Identifier (VID) - a number from 2 to 4094. If tagged frames are transmitted from this VLAN, they will contain this VID in their tag. You may also give it an arbitrary alphanumeric name containing a meaningful description, which is not transmitted to other devices.

When referring to a VLAN, some commands require the VLAN to be specified by its VID while some commands require it to be specified by its interface name: vlan<VID>. In command output, the VLAN may be referred to by its VID, its interface name (vlan<VID>), or its VLAN name (the arbitrary alphanumeric string).

You can name a VLAN with a string containing “vlan” and its VLAN Identifier (VID). To avoid confusion, we recommend not naming it “vlan” followed by any number different from its VID.

Access mode

A switch port in access mode sends untagged Ethernet frames, that is, frames without a VLAN tag. Each port is associated with one VLAN (the port-based VLAN, by default, *vlan1*), and when it receives untagged frames, it associates them with the VID of this VLAN. You can associate the port with another VLAN (using the **switchport access vlan** command). This removes it from the default VLAN.

Use access mode for any ports connected to devices that do not use VLAN tagging, for instance PC workstations.

Trunk mode

A switch port in trunk mode is associated with one or more VLANs for which it transmits VLAN-tagged frames, and for which it identifies incoming tagged frames with these VIDs.

To allow a switch port to distinguish and identify traffic from different VLANs, put it in trunk mode (using the **switchport mode trunk** command), and add the VLANs (using the **switchport trunk allowed vlan** command). Use trunk mode for ports connected to other switches which send VLAN-tagged traffic from one or more VLANs.

A trunk mode port may also have a native VLAN (by default vlan1), for which it transmits untagged frames, and with which it associates incoming untagged frames (using the **switchport trunk native vlan** command).

Ports in trunk mode can be enabled as promiscuous ports for private VLANs (using the **switchport mode private-vlan trunk promiscuous**) and secondary ports for private VLANs (using the **switchport mode private-vlan trunk secondary**).

Mirror ports

A mirror port cannot be associated with a VLAN. If a switch port is configured to be a mirror port (using the **mirror interface** command), it is automatically removed from any VLAN it was associated with.

VLANs and channel groups

All the ports in a channel group must have the same VLAN configuration: they must belong to the same VLANs and have the same tagging status, and can only be operated on as a group.

Table 18-1: Configuration procedure for VLANs

Create VLANs	
`awplus#` **`configure terminal`**	Enter Configuration mode.
`awplus(config)#` `vlan database`	Enter VLAN Configuration mode.

`awplus(config-vlan)#`
`vlan <vid> [name <vlan-name>] [state {enable|disable}]`
or
`vlan <vid-range> [state {enable|disable}]`
	Create VLANs.

Associate switch ports with VLANs	
`awplus(config-vlan)#` `interface <port-list>`	Associate switch ports in access mode with VLANs:
`awplus(config-if)#` `switchport access vlan <vlan-id>`	Enter Interface Configuration mode for the switch ports that will be in access mode for a particular VLAN. Associate the VLAN with these ports in access mode. Repeat for other VLANs and ports in access mode.
`awplus(config-if)#` `interface <port-list>`	Associate switch ports in trunk mode with VLANs. Enter Interface Configuration mode for all the switch ports that will be in trunk mode for a particular set of VLANs.
`awplus(config-if)#` `switchport mode trunk [ingress-filter {enable|disable}]`	Set these switch ports to trunk mode.

`awplus(config-if)#`
`switchport trunk allowed vlan all`
or
`switchport trunk allowed vlan add <vid-list>`
	Allow these switch ports to trunk this set of VLANs.

`awplus(config-if)#` `switchport trunk native vlan {<vid>|none}`	By default, a trunk mode switch port's native VLAN, the VLAN that the port uses for untagged packet, is VLAN 1. If required, change the native VLAN from the default.
`awplus(config-if)#` `exit`	Return to Global Configuration mode.
`awplus(config)#` `exit`	Return to Privileged Exec mode.
`awplus#` `show vlan {all|brief|dynamic|static|auto|static-ports<1-4094>}`	Confirm VLAN configuration.

VLAN Double Tagging (VLAN Stacking)

VLAN double tagging, also known as VLAN Stacking, Nested VLANs, or Q-in-Q VLANs, is used to operate a number of private Layer 2 networks within a single public Layer 2 network. This feature provides simple access infrastructure for network service providers to operate Metropolitan Area Networks (MANs) as commercial value added networks. Customers can connect to a service provider's network at multiple locations and use their own VLAN IDs, without requiring the service provider's equipment between to know about those VLANs.

A nested VLAN implementation consists of the following port types:

- Provider ports - these connect to a service provider's Layer 2 network
- Customer edge ports - these connect to a customer's private Layer 2 network

How double-tagged VLANs work

In a nested VLAN environment VLAN tagging exists at two levels:

- client tagging (C-tag)
- service provider tagging (S-tag)

When nested VLAN functionality is enabled, the service provider assigns to each of its clients an individual 12 bit customer VID called an S-Tag. The S-Tag field has an identical structure to a conventional VLAN tag field.

The S-Tag is attached to a packet as it enters the service provider network at the customer edge port. From this point on, the S-Tag is used for transmission within the service provider, or public Layer 2, network. The S-Tag is then removed as it leaves the destination customer edge port. This process is shown in **Figure 18-1 on page 18.7**.

The VID that is used within the client's own network, the C-Tag, is ignored by the service provider network and bridging is based on the value of the S-Tag. The ethertype of the S-Tag is set by changing the Tag Protocol Identifier (TPID). Once the S-Tag is removed from the packet, it is forwarded "as is" out of the customer-edge port. The tagged status of the Customer port is ignored on egress.

VLAN Rules for double tagging

When double-tagged VLANs are created on the switch:

- a nested VLAN belongs to only one customer and can have multiple customer-edge ports
- a port must be either a customer-edge port or a provider port, but cannot be both

A service provider port:

- accepts only tagged packets
- transmits only tagged packets
- can be in many double-tagged VLANs

A customer edge port:

- accepts both tagged and untagged packets
- transmits both tagged and untagged packets
- can be a member of only one nested VLAN

Restrictions when using double-tagged VLANs

Restrictions when double-tagged VLANs are implemented are:

- Ethernet bridging is based on the S-Tag VID instead of the packet C-Tag VID. The packets C-Tag VID does not change
- ARP packet trapping is restricted
- hardware filtering does not work above MAC address level

Configuring double-tagged VLANs

You need a special feature license to use double-tagged VLANs. Contact your authorized Allied Telesis distributor or reseller for more information.

Set the Tag Protocol Identifier (TPID)

If required, you can change the Tag Protocol Identifier (TPID) from its default (for VLAN stacking) of 0x8100 (specified as hex notation), with the **platform vlan-stacking-tpid** command on page 17.38. Note that this command specifies the TPID value that applies to all VLANs used for double-tagged VLANs. You cannot set individual TPID values for different VLANs within a multi double-tagged VLAN network

Turn on Jumbo frame support

Adding the S-Tag can result in frame sizes that exceed the maximum of 1522 bytes. In order to cope with these larger than normal frames, you should turn on Jumbo packet support on all devices running within the service provider network. For more information, see the **platform jumboframe** command on page 17.29.

Double-tagged VLAN configuration example

Figure 18-1: VLAN double tagging

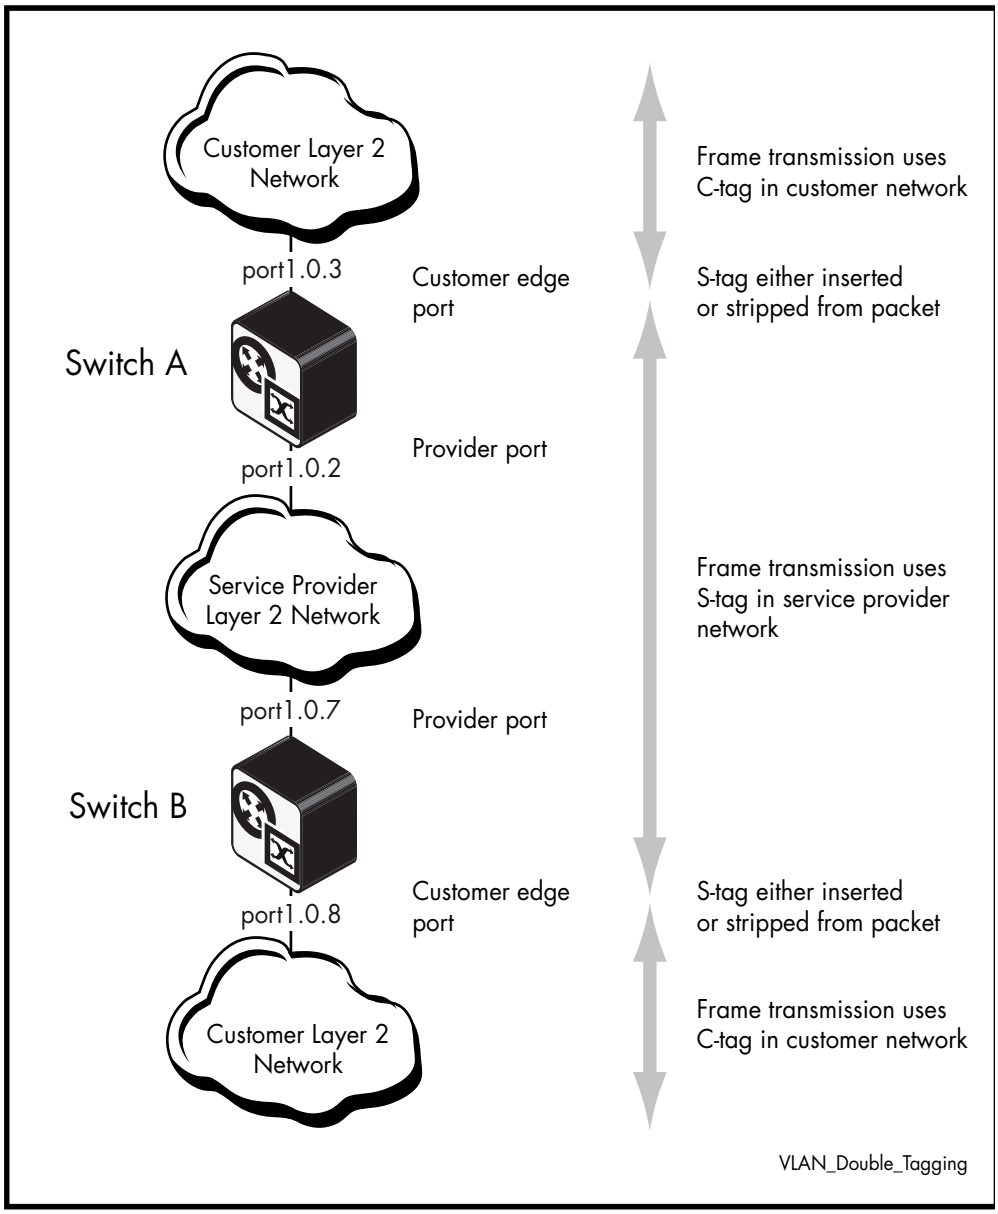

Table 18-2: Switch A Configuration

Turn on Jumbo frame support	
`awplus#`	
`configure terminal`	Enter Global Configuration mode.
`awplus(config)#`	
`platform jumboframe`	Configure the switch to forward Jumbo frames.
`awplus(config)#`	
`exit`	Return to Global Configuration mode.

Table 18-2: Switch A Configuration(cont.)

`awplus#`	
`reboot`	Reboot the switch to enable Jumbo frame support
`awplus#`	
`exit`	Return to Global Configuration mode.
Create and enable the service provider VLAN 2 (the VLAN that will be used in the outer-tag)	
`awplus#`	
`configure terminal`	Enter Global Configuration mode.
`awplus(config)#`	
`vlan database`	Enter VLAN database mode.
`awplus(config-vlan)#`	
`vlan 2 state enable`	Create and enable VLAN 2.
`awplus(config-vlan)#`	
`exit`	Return to Global Configuration mode.
Configure port 1.0.2 as a provider-port member of VLAN 2	
`awplus#`	
`configure terminal`	Enter Global Configuration mode.
`awplus(config)#`	
`interface port1.0.2`	Select `port1.0.2` for configuring.
`awplus(config-if)#`	
`switchport mode trunk`	Set the port to trunk mode.
`awplus(config-if)#`	
`switchport trunk allowed vlan add 2`	Add the VLAN to be trunked over the port.
`awplus(config-if)#`	
`switchport vlan-stacking provider-port`	Enable VLAN stacking and set the port to be a provider port.
`awplus(config-if)#`	
`exit`	Return to Global Configuration mode.
Configure port 1.0.3 as a customer edge port member of VLAN 10	
`awplus#`	
`configure terminal`	Enter Global Configuration mode.
`awplus(config)#`	
`interface port1.0.3`	Select `port1.0.3` for configuring.
`awplus(config-if)#`	
`switchport mode access`	Set the port to access mode.

Table 18-2: Switch A Configuration(cont.)

`awplus(config-if)#`	
`switchport access vlan 2`	Associate the port with VLAN 2.
`awplus(config-if)#`	
`switchport vlan-stacking customer-edge-port`	Enable VLAN stacking and set the port to be a customer edge port.
`awplus(config-if)#`	
`exit`	Return to Global Configuration mode.

Table 18-3: Switch B Configuration

Turn on Jumbo frame support	
`awplus#`	
`configure terminal`	Enter Global Configuration mode.
`awplus(config)#`	
`platform jumboframe`	Configure the switch to forward Jumbo frames.
`awplus(config)#`	
`exit`	Return to Global Configuration mode.
`awplus#`	
`reboot`	Reboot the switch to enable Jumbo frame support
`awplus#`	
`exit`	Return to Global Configuration mode.
Create and enable the service provider VLAN 2 (the VLAN that will be used in the outer-tag)	
`awplus#`	
`configure terminal`	Enter Global Configuration mode.
`awplus(config)#`	
`vlan database`	Enter VLAN database mode.
`awplus(config-vlan)#`	
`vlan 2 state enable`	Create and enable VLAN 2.
`awplus(config-vlan)#`	
`exit`	Return to Global Configuration mode.
Configure port 1.0.7 as a provider-port member of VLAN 2	
`awplus#`	
`configure terminal`	Enter Global Configuration mode.
`awplus(config)#`	
`interface port1.0.7`	Select `port1.0.7` for configuring.
`awplus(config-if)#`	
`switchport mode trunk`	Set the port to trunk mode.

Table 18-3: Switch B Configuration(cont.)

`awplus(config-if)#`	
`switchport trunk allowed vlan add 2`	Add the VLAN to be trunked over the port.
`awplus(config-if)#`	
`switchport vlan-stacking provider-port`	Enable VLAN stacking and set the port to be provider port.
`awplus(config-if)#`	
`exit`	Return to Global Configuration mode.
Configure port 1.0.8 as a customer edge port member of VLAN 10	
`awplus#`	
`configure terminal`	Enter Global Configuration mode.
`awplus(config)#`	
`interface port1.0.8`	Select `port1.0.8` for configuring.
`awplus(config-if)#`	
`switchport mode access`	Set the port to access mode.
`awplus(config-if)#`	
`switchport access vlan 2`	Associate the port with VLAN 2.
`awplus(config-if)#`	
`switchport vlan-stacking customer-edge-port`	Enable VLAN stacking and set the port to be a customer edge port.
`awplus(config-if)#`	
`exit`	Return to Global Configuration mode.

Private VLANs

Private VLANs combine the network advantages of conventional VLANs, with an added degree of privacy obtained by limiting the connectivity between selected ports.

This section provides an introduction to:

- Private VLANs for ports in access mode
- **Private VLANs for trunked ports**

Private VLANs for ports in access mode

An example application of a private VLAN would be a library in which user booths each have a PC with Internet access. In this situation it would usually be undesirable to allow communication between these individual PCs. Connecting the PC to ports within a private isolated VLAN would enable each PC to access the Internet or a library server via a single connection, whilst preventing access between the PCs in the booths.

Another application might be to use private VLANs to simplify IP address assignment. Ports can be isolated from each other whilst still belonging to the same subnet.

A private VLAN comprises the following components:

- **a single promiscuous port**
- **one or more host ports**
  There are two types of host ports:
  - **isolated ports**
    These can only communicate with the promiscuous port that is associated with the isolated VLAN.
  - **community ports**
    These can communicate with their associated promiscuous port and other community ports within the community VLAN.
- **a single primary VLAN**
- **one or more secondary VLANS**
  There are two types of secondary VLANs:
  - **isolated VLANs**
    In this VLAN type, communication can only take place between each host port and its associated promiscuous port.
  - **community VLANs**
    In this VLAN type, communication can take place between host ports and between each host port and its associated promiscuous port.

Membership rules for private VLANs in access mode

The following membership rules apply when creating and operating private VLANs in access mode.

Each private VLAN:

- must contain one promiscuous port (or aggregated link)
- may contain multiple host ports
- can be configured to span switch instances
- can only contain promiscuous and host ports
- cannot use the default VLAN (vlan1)
- a private *isolated* VLAN can only contain a single promiscuous port
- a private *community* VLAN can contain more than one promiscuous port

A promiscuous port:

- is a member of the primary VLAN and all its associated secondary VLANs
- cannot be a member of both private and non-private VLANs

A host port:

- can be a member of multiple private (community) VLANs, but all these VLANs must share the same promiscuous port
- cannot be a host port in some VLANs and a non-host port in others
- cannot be a promiscuous port in another VLAN

Promiscuous ports

A promiscuous port can communicate with all ports that are members of its associated secondary VLANs. Multiple promiscuous ports can exist in a primary VLAN, but only if the primary VLAN is only associated with community VLANS (that is, that there are no isolated VLANs associated with this port).

A promiscuous port is a member of the primary VLAN and all associated secondary VLANs. Its Port VID is set to the VLAN ID of the primary VLAN.

Host ports

Host ports have two levels of connectivity depending on whether they exist in an isolated or a community VLAN.

1. Host ports within an isolated VLAN

These ports are only allowed to communicate with their VLAN's promiscuous port, even though they share their secondary (isolated) VLAN with other hosts. The host ports receive their data from the promiscuous port via the primary VLAN, and individually transmit their data to the promiscuous port via their common secondary VLAN.

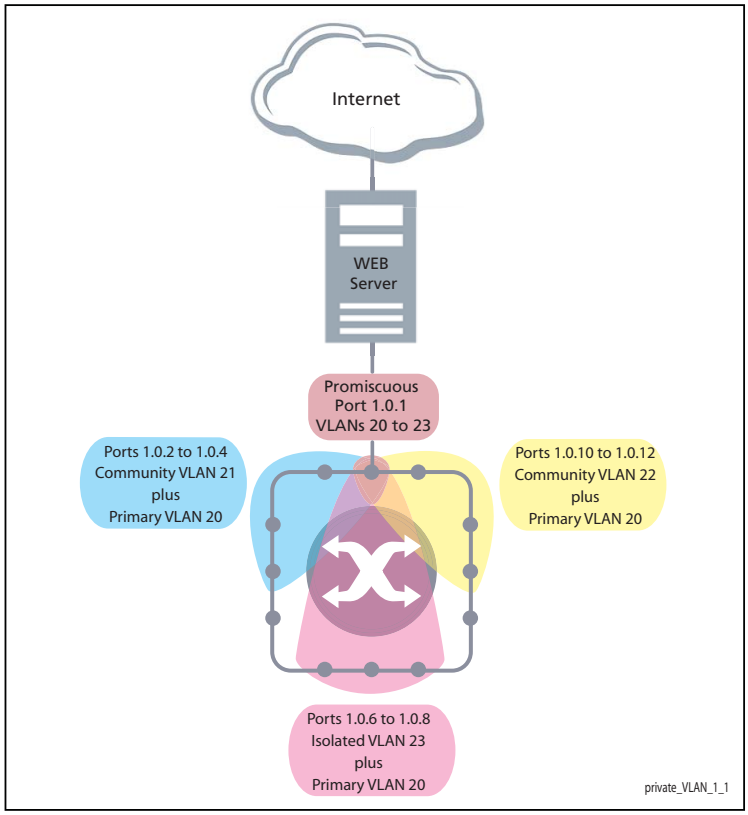
2. Host ports within a community VLAN

These ports are able to communicate with both the promiscuous port and the other ports within the community VLAN that they are associated with. They receive their data from the promiscuous port via the primary VLAN, and transmit their data to both the promiscuous port and the other host ports (within their community VLAN) via their common secondary VLAN. However, the only external path from a community VLAN is from its promiscuous port.

Private VLAN operation with ports in access mode

A basic private VLAN operation is shown in **Figure 18-2**.It comprises primary VLAN 20 plus three secondary VLANS, two community VLANs 21 and 22, and an isolated VLAN 23.

Figure 18-2: Private VLAN



The ports on this switch have the following configuration:

- Port 1.0.1 is the promiscuous port and is a member of the primary VLAN 20 and all its associated secondary VLANs.
- Ports 1.0.2 to 1.0.4 are members of the community VLAN 21 and are able to communicate with both the promiscuous port and all other ports in VLAN 21.
- Ports 1.0.10 to 1.0.12 are members of the community VLAN 22 and are able to communicate with both the promiscuous port and all other ports in VLAN 22.
- Ports 1.0.6 to 1.0.8 are members of the isolated VLAN 23. Each of these ports can only communicate with the promiscuous port.

Table 18-4: Private VLANs - Port Tagging

Port	Mode	Untagged VLAN Membership	PVID
1.0.1	Promiscuous	20, 21, 22, 23	20
1.0.2 to 1.0.4	Host	20, 21	21
1.0.10 to 1.0.12	Host	20, 22	22
1.0.6 to 1.0.8	Host	20, 23	23
1.0.5	Not members of the private VLAN		-
1.0.9	Not members of the private VLAN		-

Private VLANs operate within a single switch and comprise one primary VLAN plus a number of secondary VLANS. All data enters the private VLAN ports untagged. Using the example of **Figure 18-2**, data enters the switch via the promiscuous `port1.0.1` and is forwarded to the host ports using VLAN 20, the primary VLAN. Data returning from the host ports to the promiscuous port (and exiting the switch) use the secondary VLAN associated with its particular host port, VLAN 21, 22, or 23 in the example. Thus the data flows into the switch via the primary VLAN and out of the switch via the secondary VLANs. This situation is not detected outside of the switch, because all its private ports are untagged. Note however, that data flowing between ports within the same community VLAN will do so using the VID of the community VLAN.

Portfast on private VLANS

Within private VLANs, we recommend that you place all host ports into spanning-tree portfast mode and enable BPDU guard. Portfast assumes that because host ports will also be edge ports, they will have no alternative paths (loops) via other bridges. These ports are therefore allowed to move directly from the spanning-tree blocking state into the forwarding state, thus bypassing the intermediate states.

Applying BPDU guard is an extra precaution. This feature disables an edge port if it receives a BPDU frame, because receiving such a frame would indicate that the port has a connection to another network bridge.

For more information on BPDU guard and portfast, see their following commands:

- **spanning-tree portfast bpdu-guard** command on page 21.62
- **spanning-tree portfast (STP)** command on page 21.58

Access mode private VLAN configuration example

Table 18-5: Configuration procedure for access mode private VLANs

Command	Description
Create the VLANs	
`awplus#` `configure terminal`	Enter Global Configuration mode.
`awplus(config)#` `vlan database`	Enter VLAN Configuration mode.
`awplus(config-vlan)#` `vlan 20-23`	Create the VLANs.
Create the private VLANs and set the type	
`awplus(config-vlan)#` `private-vlan 20 primary`	Create primary VLAN 20.
`awplus(config-vlan)#` `private-vlan 21 community`	Create community VLAN 21.
`awplus(config-vlan)#` `private-vlan 22 community`	Create community VLAN 22.
`awplus(config-vlan)#` `private-vlan 23 isolated`	Create isolated VLAN 23.

Table 18-5: Configuration procedure for access mode private VLANs(cont.)

Associate the secondary VLANs with the primary VLAN	
`awplus(config-vlan)#` `private-vlan 20 association add 21`	Associate secondary VLAN 21 with the primary VLAN 20.
`awplus(config-vlan)#` `private-vlan 20 association add 22`	Associate secondary VLAN 22 with the primary VLAN 20.
`awplus(config-vlan)#` `private-vlan 20 association add 23`	Associate secondary VLAN 23 with the primary VLAN 20.
Set port 1.0.1 to be the promiscuous port	
`awplus(config-if)#` `exit`	Return to Global Configuration mode.
`awplus(config)#` `interface port1.0.1`	Enter Interface Configuration mode for `port1.0.1`.
`awplus(config-if)#` `switchport mode private-vlan promiscuous`	Set the port as a promiscuous ports.
Set the other ports to be host ports	
`awplus(config-if)#` `exit`	Return to Global Configuration mode.
`awplus(config)#` `interface port1.0.2-1.0.4, port1.0.6-1.0.8, port1.0.10-1.0.12`	Enter Interface Configuration mode for the ports.
`awplus(config-if)#` `switchport mode private-vlan host`	Set the ports as host ports.
On the promiscuous port, map the primary VLAN to each of the secondary VLANs	
`awplus(config-if)#` `exit`	Return to Global Configuration mode.
`awplus(config)#` `interface port1.0.1`	Enter Interface Configuration mode for `port1.0.1`.
`awplus(config-if)#` `switchport private-vlan mapping 20 add 21-23`	Associate primary VLAN 20 and the secondary VLANs 21 to 23 to the promiscuous port.

Table 18-5: Configuration procedure for access mode private VLANs(cont.)

Associate the community host ports with the community VLANs	
`awplus(config-if)#`	
`exit`	Return to Global Configuration mode.
`awplus(config)#`	
`interface port1.0.2-1.0.4`	Enter Interface Configuration mode for ports 1.0.2 to 1.0.4.
`awplus(config-if)#`	
`switchport private-vlan host-association 20 add 21`	Associate primary VLAN 20 and secondary VLAN 21 to the host ports.
`awplus(config-if)#`	
`exit`	Return to Global Configuration mode.
`awplus(config)#`	
`interface port1.0.10-1.0.12`	Enter Interface Configuration mode for ports 1.0.10 to 1.0.12.
`awplus(config-if)#`	
`switchport private-vlan host-association 20 add 22`	Associate primary VLAN 20 and secondary VLAN 22 to the host ports.
Associate the isolated host ports with the isolated VLAN 23	
`awplus(config-if)#`	
`exit`	Return to Global Configuration mode.
`awplus(config)#`	
`interface port1.0.6-1.0.8`	Enter Interface Configuration mode for ports 1.0.6 to 1.0.8.
`awplus(config-if)#`	
`switchport private-vlan host-association 20 add 23`	Associate primary VLAN 20 and secondary VLAN 23 to the host ports.

Private VLANs for trunked ports

Private VLAN trunk ports allow you to combine traffic for private isolated VLANs over a trunk. A port in trunk mode enabled as a promiscuous port with the **switchport mode private-vlan trunk promiscuous** command can carry both multiple isolated private VLANs and non-private VLANs. A promiscuous port in trunk mode allows you to combine multiple isolated VLANs on a single trunk port. A port in trunk mode enabled as a secondary port with the **switchport mode private-vlan trunk secondary** command can combine traffic for multiple isolated VLANs over a trunk.

Note Private VLAN trunk ports are not supported by the current AlliedWare Plus GVRP implementation. Private VLAN trunk ports and GVRP are mutually exclusive.

A private VLAN group for trunked ports comprises the following components:

- **a single promiscuous port**
- **one or more isolated secondary ports**
  These can only communicate with the associated promiscuous port.
- **isolated VLANs**
  In this VLAN type, communication can only take place between each secondary port and its associated promiscuous port. Membership rules for private VLANs for trunked ports

The following membership rules apply when creating and operating private VLANs for trunked ports.

A promiscuous trunk port:

- must be in trunk mode
- can be a member of both isolated VLANs and non-isolated VLANs
- has a group ID that is solely used to associate the promiscuous port with secondary ports

A secondary trunk port:

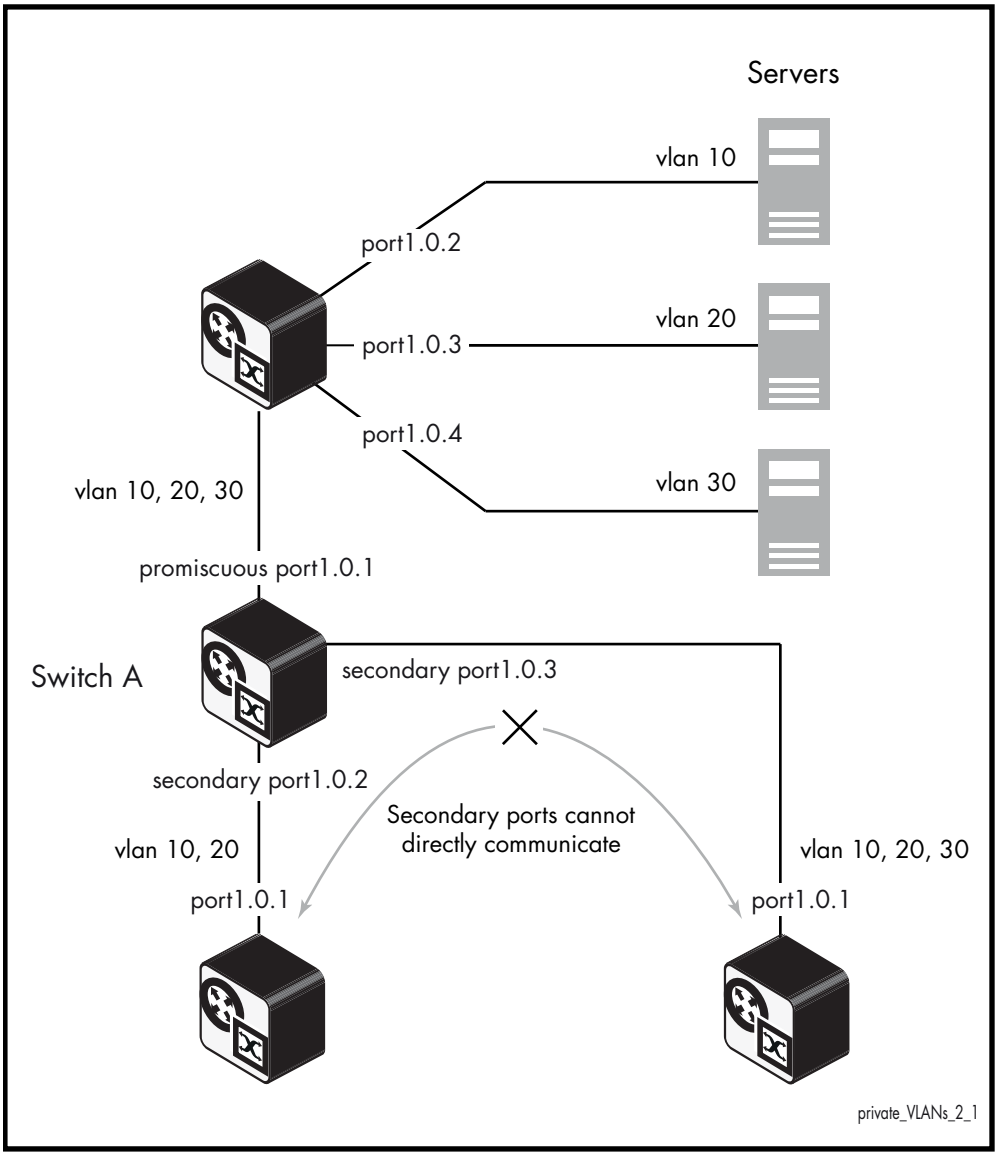
- must be in trunk mode
- can only be a member of isolated VLANs
- cannot be a promiscuous port in another VLAN
- has a group ID that is solely used to associate the secondary port with its promiscuous port

Unlike private VLANs for ports in access mode, private VLANs for trunked ports have no secondary to primary VLAN mappings.

Trunked port private VLAN configuration example

A basic trunked port private VLAN operation is shown in **Figure 18-3**.

Figure 18-3: Trunked port private VLAN



The ports on **Switch A** have the following configuration:

- Port 1.0.1 is the promiscuous port, and has a group ID of 1
- Port 1.0.2 is a secondary port for isolated private VLANs 10 and 20, and has a group ID of 1
- Port 1.0.3 is a secondary port for isolated private VLANs 10, 20 and 30, and has a group ID of 1

The configuration procedure in **Table 18-6** show the steps to configure **Switch A**.

Table 18-6: Configuration procedure for Switch A

Command	Description
Create the VLANs	
`awplus#`	
`configure terminal`	Enter Global Configuration mode.
`awplus(config)#`	
`vlan database`	Enter VLAN Configuration mode.
`awplus(config-vlan)#`	
`vlan 10,20,30`	Create the VLANs.
Create the private VLANs and set the type	
`awplus(config-vlan)#`	
`private-vlan 10 isolated`	Create isolated VLAN 10.
`awplus(config-vlan)#`	
`private-vlan 20 isolated`	Create isolated VLAN 20.
`awplus(config-vlan)#`	
`private-vlan 30 isolated`	Create isolated VLAN 30.
Set port 1.0.1 to trunk mode and add the VLANs to be trunked over the port	
`awplus(config-vlan)#`	
`interface port1.0.1`	Enter Interface Configuration mode for `port1.0.1`.
`awplus(config-if)#`	
`switchport mode trunk`	Set the switching characteristics of the port to trunk.
`awplus(config-if)#`	
`switchport trunk allowed vlan add 10,20,30`	Add the VLANs to be trunked over this port.
Set port 1.0.2 to trunk mode and add the VLANs to be trunked over the port	
`awplus(config-if)#`	
`exit`	Return to Global Configuration mode.
`awplus(config)#`	
`interface port1.0.2`	Enter Interface Configuration mode for `port1.0.2`.
`awplus(config-if)#`	
`switchport mode trunk`	Set the switching characteristics of the port to trunk.
`awplus(config-if)#`	
`switchport trunk allowed vlan add 10,20`	Add the VLANs to be trunked over this port.

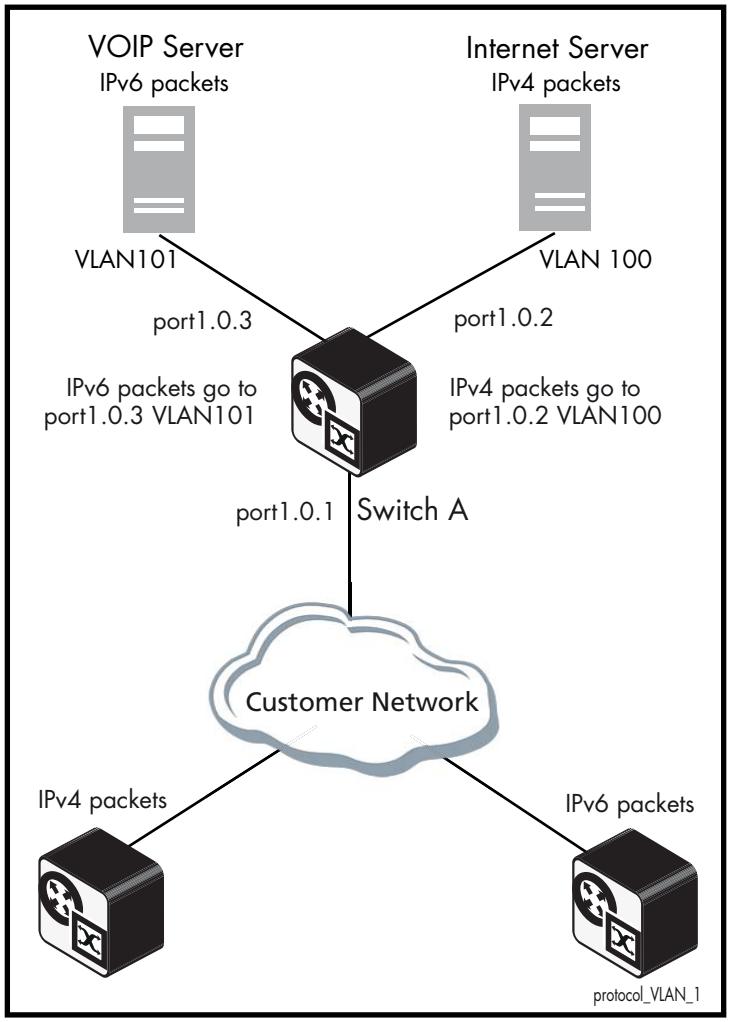
Table 18-6: Configuration procedure for Switch A(cont.)

Set port 1.0.3 to trunk mode and add the VLANs to be trunked over the port	
`awplus(config-if)#`	
`exit`	Return to Global Configuration mode.
`awplus(config)#`	
`interface port1.0.3`	Enter Interface Configuration mode for port 1.0.3.
`awplus(config-if)#`	
`switchport mode trunk`	Set the switching characteristics of the port to trunk.
`awplus(config-if)#`	
`switchport trunk allowed vlan add 10,20,30`	Add the VLANs to be trunked over this port.
Set port 1.0.1 to be the promiscuous port	
`awplus(config-if)#`	
`exit`	Return to Global Configuration mode.
`awplus(config)#`	
`interface port1.0.1`	Enter Interface Configuration mode for port 1.0.1.
`awplus(config-if)#`	
`switchport mode private-vlan trunk promiscuous group 1`	Enable the port in trunk mode to be promiscuous port for isolated VLANs 10, 20 and 30 with a group ID of 1.
Set port 1.0.2 to be a secondary port	
`awplus(config-if)#`	
`exit`	Return to Global Configuration mode.
`awplus(config)#`	
`interface port1.0.2`	Enter Interface Configuration mode for `port1.0.2`.
`awplus(config-if)#`	
`switchport mode private-vlan trunk secondary group 1`	Enable the port in trunk mode to be a secondary port for isolated VLANs 10 and 20 with a group ID of 1.
Set port 1.0.3 to be a secondary port	
`awplus(config-if)#`	
`exit`	Return to Global Configuration mode.
`awplus(config)#`	
`interface port1.0.3`	Enter Interface Configuration mode for `port1.0.3`.
`awplus(config-if)#`	
`switchport mode private-vlan trunk secondary group 1`	Enable the port in trunk mode to be a secondary port for isolated VLANs 10, 20 and 30 with a group ID of 1.

Protocol based VLAN configuration example

A protocol based VLAN topology is shown below in **Figure 18-4**.
See the configuration procedure to configure **Switch A** in **Table 18-6** on the next page.

Figure 18-4: Protocol based VLAN configuration



Switch A has the following configuration to enable protocol based VLAN classification:

- VLAN 100 and VLAN 101 created and applied to port1.0.2 and port1.0.3 respectively
- IPv4 and IPv6 VLAN classifier rules created and mapped to VLAN 100 and VLAN 101
- VLAN classifier group created and mapped to port1.0.1
- VLAN 100 and VLAN 101 are trunked over port1.0.2 and port1.0.3 respectively
- IPv4 packets received on port1.0.1 go to port1.0.2 VLAN 100
- IPv6 packets received on port1.0.1 go to port1.0.3 VLAN 101

The configuration procedure in **Table 18-6** show the steps to configure **Switch A**.

Table 18-7: Configuration procedure for Switch A

Command	Description
Create the VLANs 100 and 101	
`awplus#` `configure terminal`	Enter Global Configuration mode.
`awplus(config)#` `vlan database`	Enter VLAN Configuration mode.
`awplus(config-vlan)#` `vlan 100,101`	Create the VLANs.
`awplus(config-vlan)#` `exit`	Exit VLAN Configuration mode.
Create two protocol type based VLAN classifier rules for IPv4 and IPv6 mapped to VLAN 100 and 101	
`awplus(config)#` `vlan classifier rule 1 proto ip encap ethv2 vlan 100`	Create a VLAN classifier rule `1` for IPv4 packets on VLAN `100`.
`awplus(config)#` `vlan classifier rule 2 proto ipv6 encap ethv2 vlan 101`	Create a VLAN classifier rule `2` for IPv6 packets on VLAN `101`.
Create a group of VLAN classifier rules and map the defined VLAN classifier rules 1 and 2 to the group	
`awplus(config)#` `vlan classifier group 1 add rule 1`	Add VLAN classifier rule `1` to VLAN classifier group `1`.
`awplus(config)#` `vlan classifier group 1 add rule 2`	Add VLAN classifier rule `2` to VLAN classifier group `1`.
Associate the created VLAN classifier group 1 with port1.0.1	
`awplus(config)#` `interface port1.0.1`	Enter Interface Configuration mode for `port1.0.1`.
`awplus(config-if)#` `vlan classifier activate 1`	Associate VLAN classifier group `1` with `port1.0.1`.
`awplus(config-if)#` `exit`	Exit Interface Configuration mode.
Add VLAN 100 to be trunked over port1.0.2	
`awplus(config)#` `interface port1.0.2`	Enter Interface Configuration mode for `port1.0.2`.
`awplus(config-if)#` `switchport mode trunk`	Enable switchport trunking on `port1.0.2`.

Table 18-7: Configuration procedure for Switch A(cont.)

`awplus(config-if)#`	
`switchport trunk allowed vlan add 100`	Add VLAN 100 to be trunked over `port1.0.2`.
`awplus(config-if)#`	
`exit`	Exit Interface Configuration mode.
Add VLAN 101 to be trunked over port1.0.3	
`awplus(config)#`	
`interface port1.0.3`	Enter Interface Configuration mode for `port1.0.3`.
`awplus(config-if)#`	
`switchport mode trunk`	Enable switchport trunking on `port1.0.3`.
`awplus(config-if)#`	
`switchport trunk allowed vlan add 101`	Add VLAN 101 to be trunked over `port1.0.3`.
`awplus(config-if)#`	
`exit`	Exit Interface Configuration mode.

Chapter 19: VLAN Commands

Command List 19.2
private-vlan 19.3
private-vlan association 19.4
port-vlan-forwarding-priority 19.5
show port-vlan-forwarding-priority 19.8
show vlan 19.9
show vlan classifier group 19.10
show vlan classifier group interface 19.11
show vlan classifier interface group 19.12
show vlan classifier rule 19.13
show vlan private-vlan 19.14
switchport access vlan 19.15
switchport enable vlan 19.16
switchport mode access 19.17
switchport mode private-vlan 19.18

Command List

This chapter provides an alphabetical reference of commands used to configure VLANs. For more information see **Chapter 18, VLAN Introduction**.

private-vlan

Use this command to a create a private VLAN. Private VLANs can be either primary or secondary. Secondary VLANs can be ether community or isolated.

Use the **no** variant of this command to remove the specified private VLAN.

For more information, see the section **"Private VLANs" on page 18.11**.

Syntax

```
private-vlan <vlan-id> {community|isolated|primary}
no private-vlan <vlan-id> {community|isolated|primary}
```

Parameter	Description
<vlan-id>	VLAN ID in the range <2-4094> for the VLAN which is to be made a private VLAN.
`community`	Community VLAN.
`isolated`	Isolated VLAN.
`primary`	Primary VLAN.

Mode VLAN Configuration

Examples

```
                awplus# configure terminal
           awplus(config)# vlan database
     awplus(config-vlan)# vlan 2 name vlan2 state enable
     awplus(config-vlan)# vlan 3 name vlan3 state enable
     awplus(config-vlan)# vlan 4 name vlan4 state enable
     awplus(config-vlan)# private-vlan 2 primary
     awplus(config-vlan)# private-vlan 3 isolated
     awplus(config-vlan)# private-vlan 4 community

                awplus# configure terminal
           awplus(config)# vlan database
     awplus(config-vlan)# no private-vlan 2 primary
     awplus(config-vlan)# no private-vlan 3 isolated
     awplus(config-vlan)# no private-vlan 4 community
```

private-vlan association

Use this command to associate a secondary VLAN to a primary VLAN. Only one isolated VLAN can be associated to a primary VLAN. Multiple community VLANs can be associated to a primary VLAN.

Use the **no** variant of this command to remove association of all the secondary VLANs to a primary VLAN.

For more information, see the section **"Private VLANs" on page 18.11**.

Syntax

```
private-vlan <primary-vlan-id> association
    {add <secondary-vlan-id> | remove <secondary-vlan-id>}

no private-vlan <primary-vlan-id> association
```

Parameter	Description
<primary-vlan-id>	VLAN ID of the primary VLAN.
<secondary-vlan-id>	VLAN ID of the secondary VLAN (either isolated or community).

Mode VLAN Configuration

Examples The following commands associates primary VLAN 2 with secondary VLAN 3

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# private-vlan 2 association add 3
```

Examples The following commands remove the association of primary VLAN 2 with secondary VLAN 3

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# private-vlan 2 association remove 3
```

Examples The following commands removes all secondary VLAN associations of primary VLAN 2

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# no private-vlan 2 association
```

port-vlan-forwarding-priority

Use this command to set the highest priority protocol to control transitions from blocking to forwarding traffic. This command prioritizes switch port forwarding mode control, when more than one of EPSR, Loop Protection, and MAC thrashing protection protocols are used on the switch.

EPSR, Loop Protection and MAC Thrashing use the same mechanism to block or forward traffic. This command sets the highest priority protocol to control transitions from blocking to forwarding traffic. Setting the priority stops contention between protocols.

For example, If EPSR is set to the highest priority protocol to block traffic on vlan10 on port1.0.2 then this stops MAC Thrashing from forwarding traffic on vlan10 on port1.0.2.

Caution **loop-protection** and **none** parameter options must not be set on an EPSR master node. Use the **epsr** parameter option on an EPSR master node instead. Setting this command incorrectly on an EPSR master node could cause unexpected broadcast storms.

Use the **no** variant of this command to restore the default highest priority protocol back to the default of EPSR.

For more information about EPSR, see the section **"EPSR Introduction and Configuration" on page 86.1**.

Syntax

```
port-vlan-forwarding-priority {epsr|loop-protection|none}

no port-vlan-forwarding-priority
```

Parameter	Description
`epsr`	Sets EPSR as the highest priority protocol. Use this parameter on an EPSR master node to avoid unexpected broadcast storms.
`loop-protection`	Sets Loop Protection as the highest priority protocol. Note that this option must not be set on an EPSR master node. Use the **epsr** parameter option on an EPSR master node to avoid unexpected broadcast storms.
`none`	Sets the protocols to have equal priority. This was the previous behavior before this command was added, and allows protocols to override each other to set a port to forwarding a VLAN. Note that this option must not be set on a EPSR master node. Use the **epsr** parameter option on an EPSR master node to avoid unexpected broadcast storms.

Default By default, the highest priority protocol is EPSR

Mode Global Configuration

Usage EPSR, Loop Protection and MAC Thrashing protection do not usually need to be configured on a switch, because they perform similar functions—each prevents network loops by blocking a selected port for each (loop containing) VLAN.

However, if more than one of these three features is configured on a switch, you can use this command to prioritize either EPSR or Loop Protection when their effects on a port would conflict and override each other. Previously, each protocol could set a port to forwarding for a VLAN, sometimes overriding the previous setting by another protocol to block the port. This could sometimes lead to unexpected broadcast storms.

Now, when a protocol is set to have the highest priority over a data VLAN on a port, it will not allow other protocols to put that port-vlan into a forwarding state if the highest priority protocol blocked it.

The priority mechanism is only used for blocking-to-forwarding transitions; protocols remain independent on the forwarding-to-blocking transitions.

For example, with an EPSR master node in a two-node ESPR ring with the below settings:

- The EPSR master node primary port is configured to switchport interface **port1.0.1**
- The EPSR master node secondary port is configured to switchport interface **port1.0.2**
- The EPSR master node control VLAN is configured to VLAN interface **vlan10**
- The EPSR master node has a first data VLAN configured to VLAN interface **vlan20**
- The EPSR master node has a second data VLAN configured to VLAN interface **vlan30**.

Initially, the EPSR ring is complete, with **port1.0.2** blocking data VLANs **vlan20** and **vlan30** and some broadcast traffic flowing through. If the user removes **vlan30** from EPSR, a storm is created on **vlan30**. MAC thrashing protection detects it and blocks **vlan30**.

Then after the storm has stopped, MAC thrashing protection sets it to forwarding again and it keeps oscillating between forwarding and blocking. In the meantime, the user adds back **vlan30** to EPSR as a data VLAN and EPSR blocks it on **port1.0.2**.

If the priority is set to none (**port-vlan-forwarding-priority none**), MAC thrashing protection notices that the storm has stopped again and decides to put **vlan30** on **port1.0.2** into forwarding state. This overrides what EPSR requires for this port-VLAN and creates a storm. This matches the old behavior before this feature was implemented.

If the priority is set to EPSR or default (**port-vlan-forwarding-priority epsr**), MAC thrashing protection notices that the storm has stopped again and attempts to put **vlan30** on **port1.0.2** into forwarding state. The higher priority protocol (EPSR) is blocking the VLAN on this port, so it stays blocking and no storm occurs.

Example To prioritize EPSR over Loop Protection or MAC Thrashing protection settings, so that Loop Protection or MAC Thrashing protection cannot set a port to the forwarding state a VLAN if EPSR has set it to the blocking state, use the commands:

```
awplus# configure terminal
awplus(config)# port-vlan-forwarding-priority epsr
```

To prioritize Loop Protection over EPSR or MAC Thrashing protection settings, so that EPSR or MAC Thrashing protection cannot set a port to the forwarding state a VLAN if Loop Protection has set it to the blocking state, use the commands:

```
awplus# configure terminal
awplus(config)# port-vlan-forwarding-priority loop-
protection
```

To set EPSR, Loop Protection, and MAC Thrashing protection protocols to have equal priority for port forwarding and blocking, which allows the protocols to override each other to set a port to the forwarding or blocking states, use the commands:

```
awplus# configure terminal
awplus(config)# port-vlan-forwarding-priority none
```

To restore the default highest priority protocol back to the default of EPSR, use the commands:

```
awplus# configure terminal
awplus(config)# no port-vlan-forwarding-priority
```

Related Commands **show port-vlan-forwarding-priority**

show port-vlan-forwarding-priority

Use this command to display the highest priority protocol that controls port-vlan forwarding or blocking traffic. This command displays whether EPSR or Loop Protection is set as the highest priority for determining whether a port forwards a VLAN, as set by the **port-vlan-forwarding-priority** command.

For more information about EPSR, see the section **"EPSR Introduction and Configuration" on page 86.1**.

Syntax

```
show port-vlan-forwarding-priority
```

Mode

Privileged Exec

Example

To display the highest priority protocol, use the command:

```
awplus# show port-vlan-forwarding-priority
```

Output

Figure 19-1: Example output from the show port-vlan-forwarding-priority command

```
Port-vlan Forwarding Priority: EPSR
```

Related Commands

port-vlan-forwarding-priority

show vlan

Use this command to display information about a particular VLAN by specifying the VLAN ID. It displays information for all the VLANs configured.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show vlan {all|brief|dynamic|static|auto|static-ports<1-4094>}`

Parameter	Description
<1-4094>	Display information about the VLAN specified by the VLAN ID.
`all`	Display information about all VLANs on the device.
`brief`	Display information about all VLANs on the device.
`dynamic`	Display information about all VLANs learned dynamically.
`static`	Display information about all statically configured VLANs.
`auto`	Display information about all auto-configured VLANs.
`static-ports`	Display static egress/forbidden ports.

Mode User Exec and Privileged Exec

Example To display information about VLAN 2, use the command:

```
awplus# show vlan 2
```

Output **Figure 19-2: Example output from the show vlan command**

```
VLAN ID  Name            Type    State   Member ports
                                         (u)-Untagged, (t)-Tagged
======= ================ ======= ======= ===================================
2       VLAN0002         STATIC  ACTIVE  port1.0.5(u) port1.0.6(u) port1.0.7(u)
                                         port1.0.8(u)
.
.
```

Related Commands **vlan**

show vlan classifier group

Use this command to display information about all configured VLAN classifier groups or a specific group.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show vlan classifier group [<1-16>]`

Parameter	Description
<1-16>	VLAN classifier group identifier

Mode User Exec and Privileged Exec

Usage If a group ID is not specified, all configured VLAN classifier groups are shown. If a group ID is specified, a specific configured VLAN classifier group is shown.

Example To display information about VLAN classifier group 1, enter the command:

```
awplus# show vlan classifier group 1
```

Related Commands **vlan classifier group**

show vlan classifier group interface

Use this command to display information about a single switch port interface for all configured VLAN classifier groups.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show vlan classifier group interface <switch-port>`

Parameter	Description
<switch-port>	Specify the switch port interface classifier group identifier

Mode User Exec and Privileged Exec

Usage All configured VLAN classifier groups are shown for a single interface.

Example To display VLAN classifier group information for switch port interface `port1.0.2`, enter the command:

```
awplus# show vlan classifier group interface port1.0.2
```

Output **Figure 19-3: Example output from the show vlan classifier group interface port1.0.1 command:**

```
vlan classifier group 1 interface port1.0.1
```

Related Commands **vlan classifier group**
show vlan classifier interface group

show vlan classifier interface group

Use this command to display information about all interfaces configured for a VLAN group or all the groups.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show vlan classifier interface group [<1-16>]`

Parameter	Description
<1-16>	VLAN classifier interface group identifier

Mode User Exec and Privileged Exec

Usage If a group ID is not specified, all interfaces configured for all VLAN classifier groups are shown. If a group ID is specified, the interfaces configured for this VLAN classifier group are shown.

Example To display information about all interfaces configured for all VLAN groups, enter the command:

```
awplus# show vlan classifier interface group
```

To display information about all interfaces configured for VLAN group 1, enter the command:

```
awplus# show vlan classifier interface group 1
```

Output **Figure 19-4: Example output from the show vlan classifier interface group command**

```
vlan classifier group 1 interface port1.0.1
vlan classifier group 1 interface port1.0.2
vlan classifier group 2 interface port1.0.3
vlan classifier group 2 interface port1.0.4
```

Output **Figure 19-5: Example output from the show vlan classifier interface group 1 command**

```
vlan classifier group 1 interface port1.0.1
vlan classifier group 1 interface port1.0.2
```

Related Commands **vlan classifier group**
show vlan classifier group interface

show vlan classifier rule

Use this command to display information about all configured VLAN classifier rules or a specific rule.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show vlan classifier rule [<1-256>]
```

Parameter	Description
<1-256>	VLAN classifier rule identifier

Mode User Exec and Privileged Exec

Usage If a rule ID is not specified, all configured VLAN classifier rules are shown. If a rule ID is specified, a specific configured VLAN classifier rule is shown.

Example To display information about VLAN classifier rule 1, enter the command:

```
awplus# show vlan classifier rule 1
```

Output **Figure 19-6: Example output from the show vlan classifier rule 1 command**

```
vlan classifier group 1 add rule 1
```

Related Commands

vlan classifier activate
vlan classifier rule ipv4
vlan classifier rule proto

show vlan private-vlan

Use this command to display the private VLAN configuration and associations.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show vlan private-vlan
```

Mode

User Exec and Privileged Exec

Example

To display the private VLAN configuration and associations, enter the command:

```
awplus# show vlan private-vlan
```

Output

Figure 19-7: Example output from the show vlan private-vlan command

```
awplus#show vlan private-vlan
 PRIMARY       SECONDARY          TYPE          INTERFACES
 -------       ---------        ----------      ----------
       2               3          isolated
       2               4         community
                       8          isolated
```

Related Commands

private-vlan
private-vlan association

switchport access vlan

Use this command to change the port-based VLAN of the current port.

Use the **no** variant of this command to change the port-based VLAN of this port to the default VLAN, *vlan1*.

Syntax

```
switchport access vlan <vlan-id>
no switchport access vlan
```

Parameter	Description
<vlan-id>	<1-4094> The port-based VLAN ID for the port.

Default Reset the default VLAN 1 to specified switchports using the negated form of this command.

Mode Interface Configuration

Usage Any untagged frame received on this port will be associated with the specified VLAN.

Examples To change the port-based VLAN to VLAN 3 for `port1.0.2`, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport access vlan 3
```

To reset the port-based VLAN to the default VLAN 1 for `port1.0.2`, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no switchport access vlan
```

Validation Command **show interface switchport**

Related Commands **show vlan**

switchport enable vlan

This command enables the VLAN on the port manually once disabled by certain actions, such as QSP (QoS Storm Protection) or EPSR (Ethernet Protection Switching Ring). Note that if the VID is not given, all disabled VLANs are re-enabled.

Syntax `switchport enable vlan [<1-4094>]`

Parameter	Description
`vlan`	Re-enables the VLAN on the port.
<1-4094>	VLAN ID.

Mode Interface Configuration

Example To re-enable the `port1.0.1` from VLAN 1:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# switchport enable vlan 1
```

Related Commands **show mls qos interface storm-status**
storm-window

switchport mode access

Use this command to set the switching characteristics of the port to access mode. Received frames are classified based on the VLAN characteristics, then accepted or discarded based on the specified filtering criteria.

Syntax

```
switchport mode access [ingress-filter {enable|disable}]
```

Parameter	Description
`ingress-filter`	Set the ingress filtering for the received frames.
`enable`	Turn on ingress filtering for received frames. This is the default.
`disable`	Turn off ingress filtering to accept frames that do not meet the classification criteria.

Default By default, ports are in access mode with ingress filtering on.

Usage Use access mode to send untagged frames only.

Mode Interface Configuration

Example

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode access ingress-filter
enable
```

Validation Command **show interface switchport**

switchport mode private-vlan

Use this command to make a Layer 2 port a private VLAN host port or a promiscuous port.

Use the **no** variant of this command to remove the configuration.

Syntax

```
switchport mode private-vlan {host|promiscuous}
no switchport mode private-vlan {host|promiscuous}
```

Parameter	Description
`host`	This port type can communicate with all other host ports assigned to the same community VLAN, but it cannot communicate with the ports in the same isolated VLAN. All communications outside of this VLAN must pass through a promiscuous port in the associated primary VLAN.
`promiscuous`	A promiscuous port can communicate with all interfaces, including the community and isolated ports within a private VLAN.

Mode Interface Configuration

Examples

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode private-vlan host
awplus(config)# interface port1.0.3
awplus(config-if)# switchport mode private-vlan promiscuous
awplus(config)# interface port1.0.4
awplus(config-if)# no switchport mode private-vlan promiscuous
```

Related Commands switchport private-vlan mapping

switchport mode private-vlan trunk secondary

Use this command to enable a port in trunk mode to be a secondary port for isolated VLANs.

Note Private VLAN trunk ports are not supported by the current AlliedWare Plus GVRP implementation. Private VLAN trunk ports and GVRP are mutually exclusive.

Use the **no** variant of this command to remove a port in trunk mode as a secondary port for isolated VLANs.

Syntax

```
switchport mode private-vlan trunk secondary group <group-id>
no switchport mode private-vlan trunk secondary
```

Parameter	Description
<group-id>	The group ID is a numeric value in the range 1 to 32 that is used to associate a secondary port with its promiscuous port.

Default By default, a port in trunk mode is disabled as a secondary port.

When a port in trunk mode is enabled to be a secondary port for isolated VLANs, by default it will have a native VLAN of **none** (no native VLAN specified).

Mode Interface Configuration

Usage A port must be put in trunk mode with **switchport mode trunk** command before the port is enabled as a secondary port in trunk mode.

To add VLANs to be trunked over the secondary port use the **switchport trunk allowed vlan** command. These must be isolated VLANs and must exist on the associated promiscuous port.

To configure the native VLAN for the secondary port, use the **switchport trunk native vlan** command. The native VLAN must be an isolated VLAN and must exist on the associated promiscuous port.

For further information, see **"Private VLANs for trunked ports" on page 18.17**.

Examples To create isolated private VLAN 2 and then enable `port1.0.3` in trunk mode as a secondary port for the this VLAN with the group ID of `3`, use the following commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 2
awplus(config-vlan)# private-vlan 2 isolated
```

```
awplus(config-vlan)# exit
awplus(config)# interface port1.0.3
awplus(config-if)# switchport mode trunk
awplus(config-if)# switchport trunk allowed vlan add 2
awplus(config-if)# switchport mode private-vlan trunk
secondary group 3
```

To remove `port1.0.3` in trunk mode as a secondary port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.3
awplus(config-if)# no switchport mode private-vlan trunk
secondary
```

Related Commands

switchport mode private-vlan trunk promiscuous
switchport mode trunk
switchport trunk allowed vlan
switchport trunk native vlan
show vlan private-vlan

switchport mode private-vlan trunk promiscuous

Use this command to enable a port in trunk mode to be promiscuous port for isolated VLANs.

Note Private VLAN trunk ports are not supported by the current AlliedWare Plus GVRP implementation. Private VLAN trunk ports and GVRP are mutually exclusive.

Use the **no** variant of this command to remove a port in trunk mode as a promiscuous port for isolated VLANs. You must first remove the secondary port, or ports, in trunk mode associated with the promiscuous port with the **no switchport mode private-vlan trunk secondary** command.

Syntax

```
switchport mode private-vlan trunk promiscuous group <group-id>
no switchport mode private-vlan trunk promiscuous
```

Parameter	Description
<group-id>	The group ID is a numeric value in the range 1 to 32 that is used to associate the promiscuous port with secondary ports.

Default By default, a port in trunk mode is disabled as a promiscuous port.

Mode Interface Configuration

Usage A port must be put in trunk mode with **switchport mode trunk** command before it can be enabled as a promiscuous port.

To add VLANs to be trunked over the promiscuous port, use the **switchport trunk allowed vlan** command. These VLANs can be isolated VLANs, or non-private VLANs.

To configure the native VLAN for the promiscuous port, use the **switchport trunk native vlan** command. The native VLAN can be an isolated VLAN, or a non-private VLAN.

When you enable a promiscuous port, all of the secondary port VLANs associated with the promiscuous port via the group ID number must be added to the promiscuous port. In other words, the set of VLANs on the promiscuous port must be a superset of all the VLANs on the secondary ports within the group.

For further information, see **"Private VLANs for trunked ports" on page 18.17**.

Examples To create the isolated VLANs 2, 3 and 4 and then enable `port1.0.2` in trunk mode as a promiscuous port for these VLANs with the group ID of 3, use the following commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 2-4
awplus(config-vlan)# private-vlan 2 isolated
awplus(config-vlan)# private-vlan 3 isolated
awplus(config-vlan)# private-vlan 4 isolated
```

```
awplus(config-vlan)# exit
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode trunk
awplus(config-if)# switchport trunk allowed vlan add 2-4
awplus(config-if)# switchport mode private-vlan trunk
promiscuous group 3
```

To remove `port1.0.2` in trunk mode as a promiscuous port for a private VLAN, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no switchport mode private-vlan trunk
promiscuous
```

Note that you must remove the secondary port or ports enabled as trunk ports that are associated with the promiscuous port before removing the promiscuous port.

Related Commands

switchport mode private-vlan trunk secondary
switchport mode trunk
switchport trunk allowed vlan
switchport trunk native vlan
show vlan private-vlan

switchport mode trunk

Use this command to set the switching characteristics of the port to trunk. Received frames are classified based on the VLAN characteristics, then accepted or discarded based on the specified filtering criteria.

Syntax

```
switchport mode trunk [ingress-filter {enable|disable}]
```

Parameter	Description
`ingress-filter`	Set the ingress filtering for the frames received.
`enable`	Turn on ingress filtering for received frames. This is the default.
`disable`	Turn off ingress filtering to accept frames that do not meet the classification criteria.

Default By default, ports are in access mode, are untagged members of the default VLAN (vlan1), and have ingress filtering on.

Mode Interface Configuration

Usage A port in trunk mode can be a tagged member of multiple VLANs, and an untagged member of one native VLAN.

To configure which VLANs this port will trunk for, use the **switchport trunk allowed vlan** command.

Example

```
awplus# configure terminal
awplus(config)# interface port1.0.3
awplus(config-if)# switchport mode trunk ingress-filter enable
```

Validation Command **show interface switchport**

switchport private-vlan host-association

Use this command to associate a primary VLAN and a secondary VLAN to a host port. Only one primary and secondary VLAN can be associated to a host port.

Use the **no** variant of this command to remove the association.

Syntax

```
switchport private-vlan host-association <primary-vlan-id> add
   <secondary-vlan-id>
no switchport private-vlan host-association
```

Parameter	Description
<primary-vlan-id>	VLAN ID of the primary VLAN.
<secondary-vlan-id>	VLAN ID of the secondary VLAN (either isolated or community).

Mode Interface Configuration

Examples

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport private-vlan host-association 2
add 3

awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no switchport private-vlan host-association
```

switchport private-vlan mapping

Use this command to associate a primary VLAN and a set of secondary VLANs to a promiscuous port.

Use the **no** variant of this to remove all the association of secondary VLANs to primary VLANs for a promiscuous port.

Syntax

```
switchport private-vlan mapping <primary-vlan-id> add
   <secondary-vid-list>

switchport private-vlan mapping <primary-vlan-id> remove
   <secondary-vid-list>

no switchport private-vlan mapping
```

Parameter	Description
<primary-vlan-id>	VLAN ID of the primary VLAN.
<secondary-vid-list>	VLAN ID of the secondary VLAN (either isolated or community), or a range of VLANs, or a comma-separated list of VLANs and ranges.

Mode Interface Configuration

Usage This command can be applied to a switch port or a static channel group, but not a dynamic (LACP) channel group. LACP channel groups (dynamic/LACP aggregators) cannot be promiscuous ports in private VLANs.

Examples

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport private-vlan mapping 2 add 3-4
awplus(config-if)# switchport private-vlan mapping 2 remove 3-4
awplus(config-if)# no switchport private-vlan mapping
```

Related Commands switchport mode private-vlan

switchport trunk allowed vlan

Use this command to add VLANs to be trunked over this switch port. Traffic for these VLANs can be sent and received on the port.

Use the **no** variant of this command to reset switching characteristics of a specified interface to negate a trunked configuration specified with **switchport trunk allowed vlan** command.

Syntax

```
switchport trunk allowed vlan all
switchport trunk allowed vlan none
switchport trunk allowed vlan add <vid-list>
switchport trunk allowed vlan remove <vid-list>
switchport trunk allowed vlan except <vid-list>
no switchport trunk
```

Parameter	Description
`all`	Allow all VLANs to transmit and receive through the port.
`none`	Allow no VLANs to transmit and receive through the port.
`add`	Add a VLAN to transmit and receive through the port. Only use this parameter if a list of VLANs are already configured on a port.
`remove`	Remove a VLAN from transmit and receive through the port. Only use this parameter if a list of VLANs are already configured on a port.
`except`	All VLANs, except the VLAN for which the VID is specified, are part of its port member set. Only use this parameter to remove VLANs after either this parameter or the **all** parameter have added VLANs to a port.
`<vid-list>`	<2-4094> The ID of the VLAN or VLANs that will be added to, or removed from, the port. A single VLAN, VLAN range, or comma-separated VLAN list can be set. For a VLAN range, specify two VLAN numbers: lowest, then highest number in the range, separated by a hyphen. For a VLAN list, specify the VLAN numbers separated by commas. Do not enter spaces between hyphens or commas when setting parameters for VLAN ranges or lists.

Default By default, ports are untagged members of the default VLAN (vlan1).

Mode Interface Configuration

Usage The **all** parameter sets the port to be a tagged member of all the VLANs configured on the device. The **none** parameter removes all VLANs from the port's tagged member set. The **add** and **remove** parameters will add and remove VLANs to and from the port's member set. See the note below about restrictions when using the **add**, **remove**, **except**, and **all** parameters.

Note: Only use the **add** or the **remove** parameters with this command if a list of VLANs are configured on a port. Only use the **except** parameter to remove VLANs after either the **except** or the **all** parameters have first been used to add a list of VLANs to a port.

To remove a VLAN, where the configuration for `port1.0.18` shows the below output:

```
awplus#show running-config
!
interface port1.0.18
switchport
switchport mode trunk
switchport trunk allowed vlan except 4
```

Remove VLAN `3` by re-entering the **except** parameter with the list of VLANs to remove, instead of using the **remove** parameter, as shown in the command example below:

```
awplus# configure terminal
awplus(config)# interface port1.0.18
awplus(config-if)# switchport trunk allowed vlan except 3,4
```

Then the configuration is changed after entering the above commands to remove VLAN 3:

```
awplus#show running-config
!
interface port1.0.18
switchport
switchport mode trunk
switchport trunk allowed vlan except 3-4
```

To add a VLAN, where the configuration for `port1.0.18` shows the below output:

```
awplus#show running-config
!
interface port1.0.18
switchport
switchport mode trunk
switchport trunk allowed vlan except 3-5
```

Add VLAN `4` by re-entering the **except** parameter with a list of VLANs to exclude, instead of using the **add** parameter to include VLAN 4, as shown in the command example below:

```
awplus# configure terminal
awplus(config)# interface port1.0.18
awplus(config-if)# switchport trunk allowed vlan except 3,5
```

The configuration is changed after entering the above commands to add VLAN 4:

```
awplus#show running-config
!
interface port1.0.18
switchport
switchport mode trunk
switchport trunk allowed vlan except 3,5
```

Examples The following shows adding a single VLAN to the port's member set.

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport trunk allowed vlan add 2
```

The following shows adding a range of VLANs to the port's member set.

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport trunk allowed vlan add 2-4
```

The following shows adding a list of VLANs to the port's member set.

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport trunk allowed vlan add 2,3,4
```

switchport trunk native vlan

Use this command to configure the native VLAN for this port. The native VLAN is used for classifying the incoming untagged packets. Use the **none** parameter with this command to remove the native VLAN from the port and set the acceptable frame types to vlan-tagged only.

Use the **no** variant of this command to revert the native VLAN to the default VLAN ID 1. Command negation removes tagged VLANs, and sets the native VLAN to the default VLAN.

Syntax

```
switchport trunk native vlan {<vid>|none}
no switchport trunk native vlan
```

Parameter	Description
`<vid>`	`<2-4094>` The ID of the VLAN that will be used to classify the incoming untagged packets. The VLAN ID must be a part of the VLAN member set of the port.
`none`	No native VLAN specified. This option removes the native VLAN from the port and sets the acceptable frame types to vlan-tagged only. Note: Use the **no** variant of this command to revert to the default VLAN 1 as the native VLAN for the specified interface switchport - not **none**.

Default VLAN 1 (the default VLAN), which is reverted to using the **no** form of this command.

Mode Interface Configuration

Examples The following commands show configuration of VLAN 2 as the native VLAN for interface `port1.0.2`:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport trunk native vlan 2
```

The following commands show the removal of the native VLAN for interface `port1.0.2`:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport trunk native vlan none
```

The following commands revert the native VLAN to the default VLAN 1 for interface `port1.0.2`:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no switchport trunk native vlan
```

switchport vlan-stacking (double tagging)

Use this command to enable VLAN stacking on a port and set it to be a customer-edge-port or provider-port. This is sometimes referred to as VLAN double-tagging, nested VLANs, or QinQ.

Use **no** parameter with this command to disable VLAN stacking on an interface.

Syntax

```
switchport vlan-stacking {customer-edge-port|provider-port}
no switchport vlan-stacking
```

Parameter	Description
`customer-edge-port`	Set the port to be a customer edge port. This port must already be in access mode.
`provider-port`	Set the port to be a provider port. This port must already be in trunk mode.

Default By default, ports are not VLAN stacking ports.

Mode Interface Configuration

Usage Use VLAN stacking to separate traffic from different customers to that they can be managed over a provider network

Traffic with an extra VLAN header added by VLAN stacking cannot be routed.

Example

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport vlan-stacking customer-edge-port
```

switchport voice dscp

Use this command to configure the Layer 3 DSCP value advertised when the transmission of LLDP-MED Network Policy TLVs for voice devices is enabled. When LLDP-MED capable IP phones receive this network policy information, they transmit voice data with the specified DSCP value.

Use the **no** variant of this command to reset the DSCP value to the default, 0.

Syntax

```
switchport voice dscp <0-63>
no switchport voice dscp
```

Parameter	Description
`dscp`	Specify a DSCP value for voice data.
<0-63>	DSCP value.

Default A DSCP value of 0 will be advertised.

Mode Interface Configuration

Usage LLDP-MED advertisements including Network Policy TLVs are transmitted via a port if:

- LLDP is enabled (**lldp run** command on page 100.16)
- Voice VLAN is configured for the port (**switchport voice vlan** command on page 19.32)
- The port is configured to transmit LLDP advertisements—enabled by default (**lldp transmit receive** command on page 100.20)
- The port is configured to transmit Network Policy TLVs—enabled by default (**lldp med-tlv-select** command on page 100.9)
- There is an LLDP-MED device connected to the port

Example To tell IP phones connected to `port1.0.5` to send voice data with DSCP value 27, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.5
awplus(config-if)# switchport voice dscp 27
```

Related Commands

lldp med-tlv-select
show lldp
switchport voice vlan

switchport voice vlan

Use this command to configure the Voice VLAN tagging advertised when the transmission of LLDP-MED Network Policy TLVs for voice endpoint devices is enabled. When LLDP-MED capable IP phones receive this network policy information, they transmit voice data with the specified tagging. This command also sets the ports to be spanning tree edge ports, that is, it enables spanning tree portfast on the ports.

Use the **no** variant of this command to remove LLDP-MED network policy configuration for voice devices connected to these ports. This does not change the spanning tree edge port status.

Syntax

```
switchport voice vlan [<vid>|dot1p|dynamic|untagged]
no switchport voice vlan
```

Parameter	Description
`<vid>`	VLAN identifier, in the range 1 to 4094.
`dot1p`	The IP phone should send User Priority tagged packets, that is, packets in which the tag contains a User Priority value, and a VID of 0. (The User Priority tag is also known as the 802.1p priority tag, or the Class of Service (CoS) tag.)
`dynamic`	The VLAN ID with which the IP phone should send tagged packets will be assigned by RADIUS authentication.
`untagged`	The IP phone should send untagged packets.

Default By default, no Voice VLAN is configured, and therefore no network policy is advertised for voice devices.

Mode Interface Configuration

Usage LLDP-MED advertisements including Network Policy TLVs are transmitted via a port if:

- LLDP is enabled (**lldp run** command on page 100.16)
- Voice VLAN is configured for the port using this command (**switchport voice vlan**)
- The port is configured to transmit LLDP advertisements—enabled by default (**lldp transmit receive** command on page 100.20)
- The port is configured to transmit Network Policy TLVs—enabled by default (**lldp med-tlv-select** command on page 100.9)
- There is an LLDP-MED device connected to the port.

To set the priority value to be advertised for tagged frames, use the **switchport voice vlan priority** command on page 19.34.

If the Voice VLAN details are to be assigned by RADIUS, then the RADIUS server must be configured to send the attribute “Egress-VLANID (56)” or “Egress-VLAN-Name (58)” in the RADIUS Accept message when authenticating a phone attached to this port. To set these attributes on the local RADIUS server, use the **egress-vlan-id** command on page 78.19 or the **egress-vlan-name** command on page 78.20.

For more information about configuring authentication for Voice VLAN, **“Configuring LLDP” on page 99.11**.

If the ports have been set to be edge ports by the **switchport voice vlan** command, the **no** variant of this command will leave them unchanged as edge ports. To set them back to their default non-edge port configuration, use the **spanning-tree edgeport (RSTP and MSTP)** command on page 21.37.

Examples To tell IP phones connected to `port1.0.5` to send voice data tagged for VLAN 10, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.5
awplus(config-if)# switchport voice vlan 10
```

To tell IP phones connected to ports 1.0.8-1.0.12 to send priority tagged packets (802.1p priority tagged with VID 0, so that they will be assigned to the port VLAN) use the following commands. The priority value is 5 by default, but can be configured with the **switchport voice vlan priority** command.

```
awplus# configure terminal
awplus(config)# interface port1.0.8-port1.0.12
awplus(config-if)# switchport voice vlan dot1p
```

To dynamically configure the VLAN ID advertised to IP phones connected to `port1.0.1` based on the VLAN assigned by RADIUS authentication (with RADIUS attribute “Egress-VLANID” or “Egress-VLAN-Name” in the RADIUS accept packet), use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# switchport voice vlan dynamic
```

To remove the Voice VLAN, and therefore disable the transmission of LLDP-MED network policy information for voice devices on `port1.0.24`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.24
awplus(config-if)# no switchport voice vlan
```

Related Commands
egress-vlan-id
egress-vlan-name
lldp med-tlv-select
spanning-tree edgeport (RSTP and MSTP)
switchport voice dscp
switchport voice vlan priority
show lldp

switchport voice vlan priority

Use this command to configure the Layer 2 user priority advertised when the transmission of LLDP-MED Network Policy TLVs for voice devices is enabled. This is the priority in the User Priority field of the IEEE 802.1Q VLAN tag, also known as the Class of Service (CoS), or 802.1p priority. When LLDP-MED capable IP phones receive this network policy information, they transmit voice data with the specified priority.

Syntax

```
switchport voice vlan priority <0-7>
no switchport voice vlan priority
```

Parameter	Description
`priority`	Specify a user priority value for voice data.
<0-7>	Priority value.

Default By default, the Voice VLAN user priority value is 5.

Mode Interface Configuration

Usage LLDP-MED advertisements including Network Policy TLVs are transmitted via a port if:

- LLDP is enabled (**lldp run** command on page 100.16)
- Voice VLAN is configured for the port (**switchport voice vlan** command on page 19.32)
- The port is configured to transmit LLDP advertisements—enabled by default (**lldp transmit receive** command on page 100.20)
- The port is configured to transmit Network Policy TLVs—enabled by default (**lldp med-tlv-select** command on page 100.9)
- There is an LLDP-MED device connected to the port.

To set the Voice VLAN tagging to be advertised, use the **switchport voice vlan** command on page 19.32.

Example To remove the Voice VLAN, and therefore disable the transmission of LLDP-MED network policy information for voice devices on `port1.0.24`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.24
awplus(config-if)# no switchport voice vlan
```

Related Commands

lldp med-tlv-select
show lldp
switchport voice vlan

vlan

This command creates VLANs, assigns names to them, and enables or disables them. Specifying the `disable` state causes all forwarding over the specified VLAN ID to cease. Specifying the `enable` state allows forwarding of frames on the specified VLAN.

The **no** variant of this command destroys the specified VLANs.

Syntax

```
vlan <vid> [name <vlan-name>] [state {enable|disable}]
vlan <vid-range> [state {enable|disable}]
vlan {<vid>|<vlan-name>} [mtu <mtu-value>]
no vlan {<vid>|<vid-range>} [mtu]
```

Parameter	Description
<vid>	The VID of the VLAN to enable or disable in the range <**1-4094**>.
<vlan-name>	The ASCII name of the VLAN. Maximum length: **32** characters.
<vid-range>	Specifies a range of VLAN identifiers.
<mtu-value>	Specifies the Maximum Transmission Unit (MTU) size in bytes, in the range 68 to1500 bytes, for the VLAN.
`enable`	Sets VLAN into an `enable` state.
`disable`	Sets VLAN into a `disable` state.

Default By default, VLANs are enabled when they are created.

Mode VLAN Configuration

Examples

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 45 name accounts state enable

awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# no vlan 45
```

Related Commands

mtu
vlan database
show vlan

vlan classifier activate

Use this command in Interface Configuration mode to associate a VLAN classifier group with the switch port.

Use the **no** variant of this command to remove the VLAN classifier group from the switch port.

Syntax

```
vlan classifier activate <vlan-class-group-id>
no vlan classifier activate <vlan-class-group-id>
```

Parameter	Description
<vlan-class-group-id>	Specify a VLAN classifier group identifier in the range <1-16>.

Mode Interface Configuration mode for a switch port.

Usage See the **Protocol based VLAN configuration example** section in **Chapter 18, VLAN Introduction** for a configuration example and network topology using this command.

Example To associate VLAN classifier group 3 with switch `port1.0.3`, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.3
awplus(config-if)# vlan classifier activate 3
```

To remove VLAN classifier group 3 from switch `port1.0.3`, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.3
awplus(config-if)# no vlan classifier activate 3
```

Related Commands
show vlan classifier rule
vlan classifier group
vlan classifier rule ipv4
vlan classifier rule proto

vlan classifier group

Use this command to create a group of VLAN classifier rules. The rules must already have been created.

Use the **no** variant of this command to delete a group of VLAN classifier rules.

Syntax

```
vlan classifier group <1-16> {add|delete} rule <vlan-class-rule-id>
no vlan classifier group <1-16>
```

Parameter	Description
<1-16>	VLAN classifier group identifier
add	Add the rule to the group.
delete	Delete the rule from the group.
<vlan-class-rule-id>	The VLAN classifier rule identifier.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# vlan classifier group 3 add rule 5
```

Related Commands

show vlan classifier rule
vlan classifier activate
vlan classifier rule ipv4
vlan classifier rule proto

vlan classifier rule ipv4

Use this command to create an IPv4 subnet-based VLAN classifier rule and map it to a specific VLAN. Use the **no** variant of this command to delete the VLAN classifier rule.

Syntax

```
vlan classifier rule <1-256> ipv4 <ip-addr/prefix-length>  vlan
   <1-4094>

no vlan classifier rule <1-256>
```

Parameter	Description
<1-256>	Specify the VLAN Classifier Rule identifier.
<ip-addr/prefix-length>	Specify the IP address and prefix length.
<1-4094>	Specify a VLAN ID to which an untagged packet is mapped in the range *<1-4094>*.

Mode Global Configuration

Usage If the source IP address matches the IP subnet specified in the VLAN classifier rule, the received packets are mapped to the specified VLAN.

You can set up to twelve IPv4 subnet-based VLAN classifier rules. If you attempt to set more than twelve rules, the following error message is displayed:

```
%% Maximum number (12) of ipv4 classifier rules already reached
```

Note

The subnet VLAN classifier only matches IPv4 packets. It does not match ARP packets. To ensure ARP traffic is classified into the correct subnet VLAN, you can use a hardware based policy map that sends ARP packets to the CPU, which will then process them appropriately. This means that if you use subnet-based VLANs, you should also configure the following:

```
!
vlan database
 vlan 10 state enable
!
vlan classifier rule 1 ipv4 192.168.10.0/24 vlan 10
vlan classifier group 1 add rule 1
!
mls qos enable
access-list 4000 send-to-cpu any any
!
class-map 1
 match access-group 4000
 match eth-format ethii-untagged protocol 0806
!
policy-map 1
 class default
 class 1
```

Note

The policy map should be applied to each port that uses a subnet based VLAN using the service-policy input command:

```
!
interface port2.0.1
 switchport
 switchport mode access
 vlan classifier activate 1
 service-policy input 1
```

Example

```
awplus# configure terminal
awplus(config)# vlan classifier rule 3 ipv4 3.3.3.3/8 vlan 5
```

Related Commands

show vlan classifier rule
vlan classifier activate
vlan classifier rule proto

vlan classifier rule proto

Use this command to create a protocol type-based VLAN classifier rule, and map it to a specific VLAN. See the published IANA EtherType IEEE 802 numbers here: **http://www.iana.org/assignments/ieee-802-numbers/ieee-802-numbers.txt**.

The decimal value that you can enter instead of a protocol name is also a hexadecimal value for the EtherType field. The EtherType field is a two-octet field in an Ethernet frame. It is used to show which protocol is encapsulated in the payload of the Ethernet frame.

The **no** variant of this command removes a previously set rule.

Syntax

```
vlan classifier rule <1-256> proto <protocol>
   encap {ethv2|nosnapllc|snapllc} vlan <1-4094>

no vlan classifier rule <1-256>
```

Parameter	Description	
<1-256>	VLAN Classifier identifier	
proto	Protocol type	
<protocol>	Specify a protocol either by its decimal number (0-65535) or by one of the following protocol names:	
	[arp|2054]	Address Resolution protocol
	[atalkaarp|33011]	Appletalk AARP protocol
	[atalkddp|32923]	Appletalk DDP protocol
	[atmmulti|34892]	MultiProtocol Over ATM protocol
	[atmtransport|34948]	Frame-based ATM Transport protocol
	[dec|24576]	DEC Assigned protocol
	[deccustom|24582]	DEC Customer use protocol
	[decdiagnostics|24581]	DEC Systems Comms Arch protocol
	[decdnadumpload|24577]	DEC DNA Dump/Load protocol
	[decdnaremoteconsole|24578]	DEC DNA Remote Console protocol
	[decdnarouting|24579]	DEC DNA Routing protocol
	[declat|24580]	DEC LAT protocol
	[decsyscomm|24583]	DEC Systems Comms Arch protocol
	[g8bpqx25|2303]	G8BPQ AX.25 protocol

Parameter(cont	Description(cont.)	
	`[ieeeaddrtrans|2561]`	Xerox IEEE802.3 PUP Address
	`[ieeepup|2560]`	Xerox IEEE802.3 PUP protocol
	`[ip|2048]`	IP protocol
	`[ipv6|34525]`	IPv6 protocol
	`[ipx|33079]`	IPX protocol
	`[netbeui|61680]`	IBM NETBIOS/NETBEUI protocol
	`[netbeui|61681]`	IBM NETBIOS/NETBEUI protocol
	`[pppdiscovery|34915]`	PPPoE discovery protocol
	`[pppsession|34916]`	PPPoE session protocol
	`[rarp|32821]`	Reverse Address Resolution protocol
	`[x25|2056]`	CCITT.25 protocol
	`[xeroxaddrtrans|513]`	Xerox PUP Address Translation protocol
	`[xeroxpup|512]`	Xerox PUP protocol
`ethv2`	Ethernet Version 2 encapsulation	
`nosnapllc`	LLC without SNAP encapsulation	
`snapllc`	LLC SNAP encapsulation	
`<1-4094>`	Specify a VLAN ID to which an untagged packet is mapped in the range *`<1-4094>`*	

Mode Global Configuration

Usage If the protocol type matches the protocol specified in the VLAN classifier rule, the received packets are mapped to the specified VLAN. Ethernet Frame Numbers may be entered in place of the protocol names listed. For a full list please refer to the IANA list online: **http://www.iana.org/assignments/ieee-802-numbers/ieee-802-numbers.txt**

Examples

```
awplus# configure terminal
awplus(config)# vlan classifier rule 1 proto x25 encap ethv2
vlan 2
awplus(config)# vlan classifier rule 2 proto 512 encap ethv2
vlan 2
awplus(config)# vlan classifier rule 3 proto 2056 encap ethv2
vlan 2
awplus(config)# vlan classifier rule 4 proto 2054 encap ethv2
vlan 2
awplus(config)# vlan classifier rule 4 proto 34525 encap ethv2
vlan 2
awplus(config)# vlan classifier rule 4 proto ipv6 encap ethv2
vlan 2
awplus(config)# vlan classifier rule 4 proto 2048 encap ethv2
vlan 2
awplus(config)# vlan classifier rule 4 proto ip encap ethv2
vlan 2
```

Validation Output

```
awplus# show vlan classifier rule
```

```
vlan classifier rule 16 proto rarp encap ethv2 vlan 2
vlan classifier rule 8 proto encap ethv2 vlan 2
vlan classifier rule 4 proto arp encap ethv2 vlan 2
vlan classifier rule 2 proto xeroxpup encap ethv2 vlan 2
vlan classifier rule 2 proto ip encap ethv2 vlan 2
vlan classifier rule 2 proto ipv6 encap ethv2 vlan 2
```

Related Commands

show vlan classifier rule
vlan classifier activate
vlan classifier group

vlan database

Use this command to enter the VLAN Configuration mode.

Syntax `vlan database`

Mode Global Configuration

Usage Use this command to enter the VLAN configuration mode. You can then add or delete a VLAN, or modify its values.

Example In the following example, note the change to VLAN configuration mode from Configure mode:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)#
```

Introduction

This chapter describes and provides configuration procedures for:

- Spanning Tree Protocol (STP)
- Rapid Spanning Tree Protocol (RSTP)
- Multiple Spanning Tree Protocol (MSTP)

For detailed information about the commands used to configure spanning trees, see **Chapter 21, Spanning Tree Commands**.

Overview of Spanning Trees

The concept of the spanning tree protocol was devised to address broadcast storming. The spanning tree algorithm itself is defined by the IEEE standard 802.1D and its later revisions.

The IEEE Standard 802.1 uses the term “bridge” to define the spanning tree operation and uses terms such as Bridge Protocol Data Units, Root Bridge etc., when defining spanning tree protocol functions.

When a bridge receives a frame, it reads the source and destination address fields. The bridge then enters the frame’s source address in its forwarding database. In doing this the bridge associates the frame’s source address with the network attached to the port on which the frame was received. The bridge also reads the destination address and if it can find this address in its forwarding database, it forwards the frame to the appropriate port. If the bridge does not recognize the destination address, it forwards the frame out from all its ports except for the one on which the frame was received, and then waits for a reply. This process is known as “flooding”.

A significant problem arises where bridges connect via multiple paths. A frame that arrives with an unknown destination address is flooded over all available paths. The arrival of these frames at another network via different paths and bridges produces major problems. The bridges can become confused about the location of the send and receive devices and begin sending frames in the wrong directions. This process feeds on itself and produces a condition known as a broadcast storm, where the increase of circulating frames can eventually overload the network.

Spanning tree operation

Where a LAN’s topology results in more than one path existing between bridges, frames transmitted onto the extended LAN circulate in increasing numbers around the loop, decreasing performance and potentially overloading the network. However, multiple paths through the extended LAN are often required in order to provide redundancy and backup in the event of a bridge or link failure.

The spanning tree is created through the exchange of Bridge Protocol Data Units (BPDUs) between the bridges in the LAN. The spanning tree algorithm operates by:

- Automatically computing a loop-free portion of the topology, called a *spanning tree*. The topology is dynamically pruned to the spanning tree by declaring certain ports on a switch to be redundant, and placing them into a ‘Blocking’ state.
- Automatically recovering from a switch failure that would partition the extended LAN by reconfiguring the spanning tree to use redundant paths, if available.

The logical tree computed by the spanning tree algorithm has the following properties:

- A single bridge is selected to become the spanning tree's unique *root bridge*. This is the device that advertises the lowest Bridge ID. Each bridge is uniquely identified by its Bridge ID, which comprises the bridge's *root priority* (a spanning tree parameter) followed by its MAC address.
- Each bridge or LAN in the tree, except the root bridge, has a unique parent, known as the *designated bridge*. Each LAN has a single bridge, called the *designated bridge*, that connects it to the next LAN on the path towards the root bridge.
- Each port connecting a bridge to a LAN has an associated *cost*, called the *root path cost*. This is the sum of the costs for each path between the particular bridge port and the root bridge. The designated bridge for a LAN is the one that advertises the lowest *root path cost*. If two bridges on the same LAN have the same lowest root path cost, then the switch with the lowest bridge ID becomes the designated bridge.

The spanning tree computation is a continuous, distributed process to establish and maintain a spanning tree (**Table 20-1**). The basic algorithm is similar for STP, RSTP and MSTP modes.

Table 20-1: Spanning tree process

The spanning tree algorithm ...	By ...
Selects a root bridge	It selects as the root bridge for the spanning tree the device with the (numerically) lowest bridge identifier (that is, the device with lowest root bridge priority value, or if they have the same priority, the bridge with the lowest MAC address).
Selects root ports	On each device, it selects the root port according to: ■ the port with the lowest path cost to the root bridge ■ the port connected to the bridge with the lowest root identifier ■ MSTP and RSTP only: the port with the lowest port priority value ■ the port with the lowest port number[1]
Blocks alternate ports	In order to prevent loops, it blocks alternate ports (Discarding state) that provide higher cost paths to the root bridge.
Blocks backup ports	Where a second port connects one switch back to itself, it blocks the backup port that has the highest path cost or port number.
Selects designated ports	All other ports that are not disabled are selected as designated ports and are eventually made active (Forwarding state).
Maintains the spanning tree	If a switch or port fails, the spanning tree configures a new active topology, changing some port states, to reestablish connectivity and block loops. Depending on where the failure occurs, the changes may be widespread (e.g., if the root bridge fails), or local (e.g., if a designated port fails).

1. **The whole three part port number (D.M.P) is used to find the lowest port number, where D is the device number within a stack (1 for a non stacked device), M is the module number (XEM number) within the device (note that 0 is used for all base-board connected ports), and P is the number of the port within the XEM or base-board.**

The logical spanning tree, sometimes called the *active topology*, includes the root bridge and all designated bridges, meaning all ports that are to be used for communication within the spanning tree. These ports are in the forwarding state. Ports removed from the logical spanning tree are not in the forwarding state. To implement the spanning tree algorithm, devices communicate with one another using the Spanning Tree Protocol.

Spanning tree modes

STP can run in one of three modes: STP, RSTP or MSTP. A device running RSTP is compatible with other devices running STP; a device running MSTP is compatible with other devices running RSTP or STP. By default, on a device in MSTP mode each port automatically detects the mode of the device connected to it (MSTP, RSTP or STP), and responds in the appropriate mode by sending messages (BPDUs) in the corresponding format. Ports on a device in RSTP mode can automatically detect and respond to connected devices in RSTP and STP mode. Particular ports can also be forced to only operate in a particular mode (**spanning-tree force-version** command on page 21.42).

STP The Spanning Tree Protocol (STP) is the original protocol defined by IEEE standard 802.1D-1988. It creates a single spanning tree over a network.

STP mode may be useful for supporting applications and protocols whose frames may arrive out of sequence or duplicated, for example NetBeui.

RSTP Rapid Spanning Tree Protocol (RSTP) also creates a single spanning tree over a network. Compared with STP, RSTP provides for more rapid convergence to an active spanning tree topology. RSTP is defined in IEEE standard 802.1D-2004.

By default, the device operates in RSTP mode.

MSTP The Multiple Spanning Tree Protocol (MSTP) addresses the limitations in the previous spanning tree protocols, STP and RSTP, within networks that use multiple VLANs with topologies that employ alternative physical links. It supports multiple spanning tree instances on any given link within a network, and supports large networks by grouping bridges into regions that appear as a single bridge to other devices.

MSTP is defined in IEEE standard 802.1Q-2005. The protocol builds on, and remains compatible with, the previous IEEE standards defining STP and RSTP.

Spanning Tree Protocol (STP)

STP uses the process described in **Table 20-1** to avoid loops.

STP port states

In STP mode, each switch port can be in one of five spanning tree states, and one of two switch states. The state of a switch port is taken into account by STP. The STP port states (**Table 20-2**) affect the behavior of ports whose switch state is enabled.

Table 20-2: STP port states

State	Meaning
DISABLED	STP operations are disabled on the port. The port does not participate in the operation of the Spanning Tree Algorithm and Protocol. The port can still switch if its switch state is enabled.
BLOCKING	The forwarding process discards received frames and does not submit forwarded frames for transmission. This is the “standby” mode.The port does not participate in frame relay.
LISTENING	The port is enabled for receiving frames only. The port is preparing to participate in frame relay. The forwarding process discards received frames and does not submit forwarded frames for transmission.
LEARNING	The port is enabled for receiving frames only, and the Learning Process can add new source address information to the Forwarding Database.
FORWARDING	The normal state for a switch port. The forwarding process and the Spanning Tree entity are enabled for transmit and receive operations on the port.

Configuring STP

By default, RSTP is enabled on all switch ports. This section provides a procedure for configuring STP (**Table 20-3**).

To configure other modes, see **"Configuring RSTP" on page 20.9** or **"Configuring MSTP" on page 20.19**.

Table 20-3: Configuration procedure for STP

Command	Description
Configure STP	
RSTP is enabled by default with default settings on all switch ports to prevent Layer 2 loops in your network.	
`awplus#`	
`configure terminal`	Enter Global Configuration mode.
`awplus(config)#`	
`spanning-tree mode stp`	By default, the device is in RSTP mode. Change to STP mode.
`awplus(config)#`	
`spanning-tree enable`	By default, spanning tree is enabled on all switch ports. If it has been disabled, enable it for STP.
`awplus(config)#`	
`spanning-tree priority <priority>`	By default, all devices have the same root bridge priority, 32768 (8000 in hexadecimal), so the device with the lowest MAC address becomes the root bridge. If you want the device to be the root bridge, set the root bridge priority to a value lower than 32768. Enter a value in the range 0 to 61440. If you enter a number that is not a multiple of 4096, the switch rounds the number down.
Configure Root Guard	
The Root Guard feature makes sure that the port on which it is enabled is a designated port. If the Root Guard enabled port receives a superior BPDU, it goes to a Listening state (for STP) or discarding state (for RSTP and MSTP).	
`awplus(config)#`	
`interface <port-list>`	Enter Interface Configuration mode for the switch ports you want to enable Root Guard for.
`awplus(config-if)#`	
`spanning-tree guard root`	Enable the Guard Root feature for these ports.
`awplus(config-if)#`	
`exit`	Return to Global Configuration mode.
`awplus(config)#`	
`exit`	Return to Privileged Exec mode.

Table 20-3: Configuration procedure for STP(cont.)

Check STP configuration	
`awplus#` `show spanning-tree [interface <port-list>]`	Display the spanning tree configuration for the device, and confirm the new root bridge priority (Bridge Priority). Note that the Bridge ID is in a form like this: 80000000cd240331, and that other IDs follow the same pattern. This is made up of: 8000—the devices' root bridge priority in hexadecimal 0000cd240331—the devices' MAC address.

Advanced configuration: For most networks the default settings for path costs will be suitable, however, you can configure them if required (**spanning-tree path-cost**).

Rapid Spanning Tree Protocol (RSTP)

RSTP uses the process described in **Table 20-1** to avoid loops.

A spanning tree running in STP mode can take up to one minute to rebuild after a topology or configuration change. The RSTP algorithm provides for a faster recovery of connectivity following the failure of a bridge, bridge port, or a LAN. RSTP provides rapid recovery by including port roles in the computation of port states, and by allowing neighboring bridges to explicitly acknowledge signals on a point-to-point link that indicate that a port wants to enter the forwarding mode.

In rapid mode, the rapid transition of a port to the forwarding state is possible when the port is considered to be part of a point-to-point link, or when the port is considered to be an *edge* port. An edge port is one that attaches to a LAN that has no other bridges attached.

Table 20-4: RSTP port states

State	Meaning
DISABLED	STP operations are disabled on the port.
DISCARDING	The port does not participate in frame relay. The forwarding process discards received frames and does not submit forwarded frames for transmission.
LEARNING	The port is enabled for receiving frames only, and the learning process can add new source address information to the forwarding database. The port does not forward any frames.
FORWARDING	The normal state for a switch port. The forwarding process and the Spanning Tree entity are enabled for transmit and receive operations on the port.

Configuring RSTP

RSTP is enabled by default with default settings on all switch ports to prevent Layer 2 loops in your network. No further configuration is required if you want to use RSTP with these default settings. For further RSTP configuration, see **Table 20-5** below.

To configure other modes, see **"Configuring MSTP" on page 20.19** or **"Configuring STP" on page 20.6**.

For detailed configuration examples, see the How To Note *How To Configure Basic Switching Functionality*, available from **http://www.alliedtelesis.com**.

Table 20-5: Configuration procedure for RSTP

Command	Description
Configure RSTP	
RSTP is enabled by default with default settings on all switch ports to prevent Layer 2 loops in your network. No further configuration is required if you want to use RSTP with these default settings. If you need to restore the device to RSTP after it has been set to another mode, or modify the default RSTP settings, follow the procedure below.	
`awplus#`	
`configure terminal`	Enter Global Configuration mode.
`awplus(config)#`	
`spanning-tree mode rstp`	By default, the device is in RSTP mode. If it has been changed to STP or MSTP mode, change it back to RSTP.
`awplus(config)#`	
`spanning-tree enable`	By default, spanning tree is enabled on all switch ports. If it has been disabled, enable it for RSTP.
`awplus(config)#`	
`spanning-tree priority <priority>`	By default, all devices have the same root bridge priority, 32768 (8000 in hexadecimal), so the device with the lowest MAC address becomes the root bridge. If you want the device to be the root bridge, set the root bridge priority to a value lower than 32768. Enter a value in the range 0 to 61440. If you enter a number that is not a multiple of 4096, the switch rounds the number down.
Configure edge ports	
If some switch ports are connected to devices that cannot generate BPDUs (such as workstations), you can set particular switch ports as edge ports, or set them to automatically detect whether they are edge ports.	
`awplus(config)#`	
`interface <port-list>`	Enter Interface Configuration mode for these switch ports.
`awplus(config-if)#`	
`spanning-tree edgeport (RSTP and MSTP)`	Set these ports to be edge ports,
or	
`awplus(config-if)#`	
`spanning-tree autoedge (RSTP and MSTP)`	or set these ports to automatically detect whether they are edge ports.

Table 20-5: Configuration procedure for RSTP(cont.)

Configure Root Guard	
`awplus(config-if)#`	
`exit`	Return to Global Configuration mode.
`awplus(config)#`	
`interface <port-list>`	Enter Interface Configuration mode for the switch ports you want to enable Root Guard for.
`awplus(config-if)#`	
`spanning-tree guard root`	The Root Guard feature makes sure that the port on which it is enabled is a designated port. If the Root Guard enabled port receives a superior BPDU, it goes to a Listening state (for STP) or discarding state (for RSTP and MSTP). Enable the Guard Root feature if required.
Configure BPDU Guard	
`awplus(config-if)#`	
`exit`	Return to Global Configuration mode.
`awplus(config)#`	
`spanning-tree portfast bpdu-guard`	If required, enable the BPDU Guard feature.
`awplus(config)#`	
`spanning-tree errdisable-timeout enable`	Set a timeout for ports that are disabled due to the BPDU guard feature.
`awplus(config)#`	
`spanning-tree errdisable-timeout interval`	Specify the time interval after which a port is brought back up when it has been disabled by the BPDU guard feature.
Check RSTP configuration	
`awplus(config)#`	
`exit`	Return to Privileged Exec mode.
`awplus#`	
`show spanning-tree [interface <port-list>]`	Display the spanning tree configuration for the device, and confirm the new root bridge priority (Bridge Priority). Note that the Bridge ID is in a form like this: 80000000cd240331, and that other IDs follow the same pattern. This is made up of: 8000—the devices' root bridge priority in hexadecimal 0000cd240331—the devices' MAC address.

Advanced configuration: For most networks the default settings for path costs will be suitable, however, you can configure them if required (**spanning-tree path-cost**).

Multiple Spanning Tree Protocol (MSTP)

Conceptually, MSTP views the total bridged network as one that comprises a number of *Multiple Spanning Tree Regions* (MSTRs), where each region can contain up to 64 spanning trees, which operate locally, called *Multiple Spanning Tree Instances* (MSTIs). AlliedWare Plus™ supports up to 15 MSTIs. The regions are linked by the *Common Internal Spanning Tree* (CIST).

MSTP uses BPDUs to exchange information between spanning-tree compatible devices, to prevent loops in each MSTI and also in the CIST, by selecting active and blocked paths. This process is described in **Table 20-1**.

If multiple ports are aggregated together into a dynamic (LACP) or static channel group, then the spanning-tree process is aware of the link aggregation and treats the aggregated ports as a single logical path.

Advantage of MSTP over RSTP

MSTP is similar to RSTP, in that it provides loop resolution and rapid convergence. However, RSTP can keep track of only one spanning-tree. MSTP can track many spanning-trees, referred to as *instances*. MSTP makes it possible to have different forwarding paths for different MST instances. This enables load balancing of network traffic across redundant links, so that all the links in a network can be used by at least one MSTI, and no link is left completely idle. That is to say that no link is unnecessarily shut down by spanning-tree.

Essentially, MSTP is VLAN aware and RSTP is not VLAN aware. MSTP BPDUs and RSTP BPDUs are compatible, so a network can have a mixture of MSTP and RSTP areas.

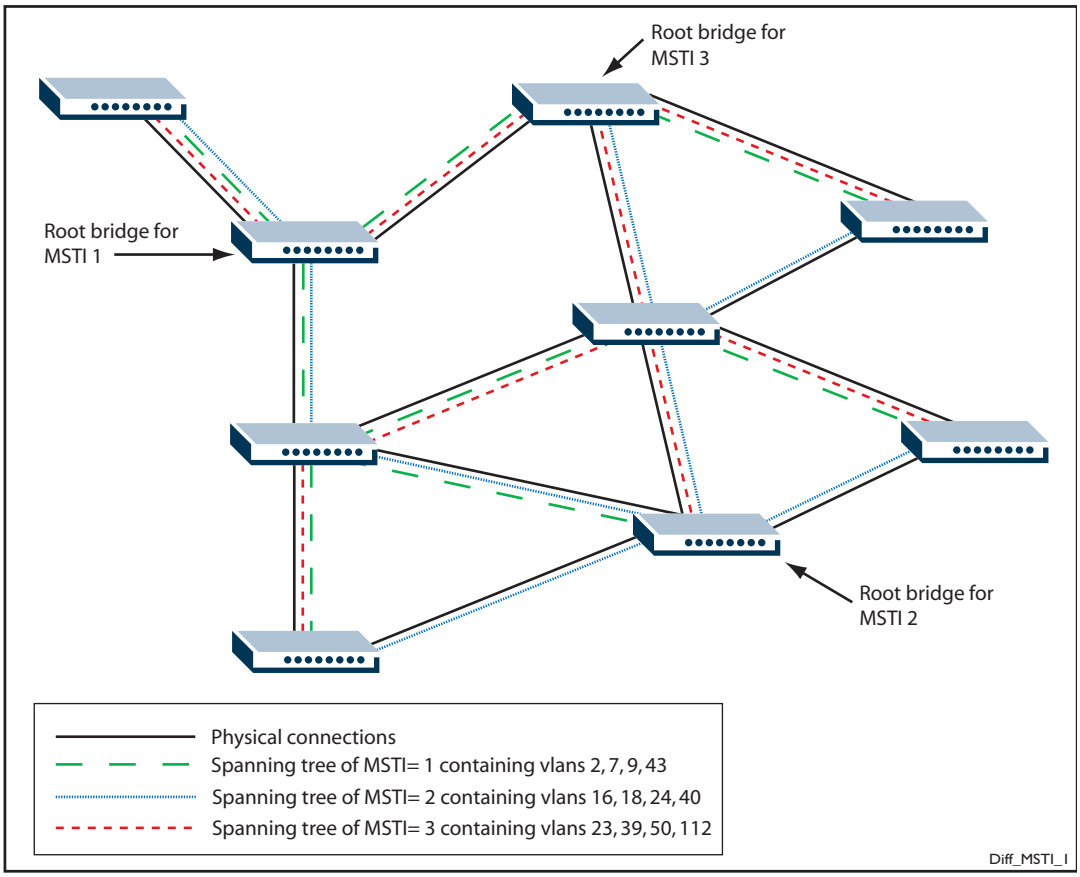
Multiple Spanning Tree Instances (MSTI)

MSTP enables the grouping and mapping of VLANs to different spanning tree instances. So, an MST Instance (MSTI) is a particular set of VLANs that are all using the same spanning tree.

In a network where all VLANs span all links of the network, judicious choice of bridge priorities for different MSTIs can result in different switches becoming root bridges for different MSTIs. That will result in the different MSTIs choosing different active topologies on the network. An example of how different MSTIs can choose different active topologies on the same physical set of links is illustrated in **Figure 20-1**.

MSTP is compatible with RSTP and STP—see **"Common and Internal Spanning Tree (CIST)" on page 20.15**.

Figure 20-1: Different spanning trees created by different MSTIs on the same physical layout



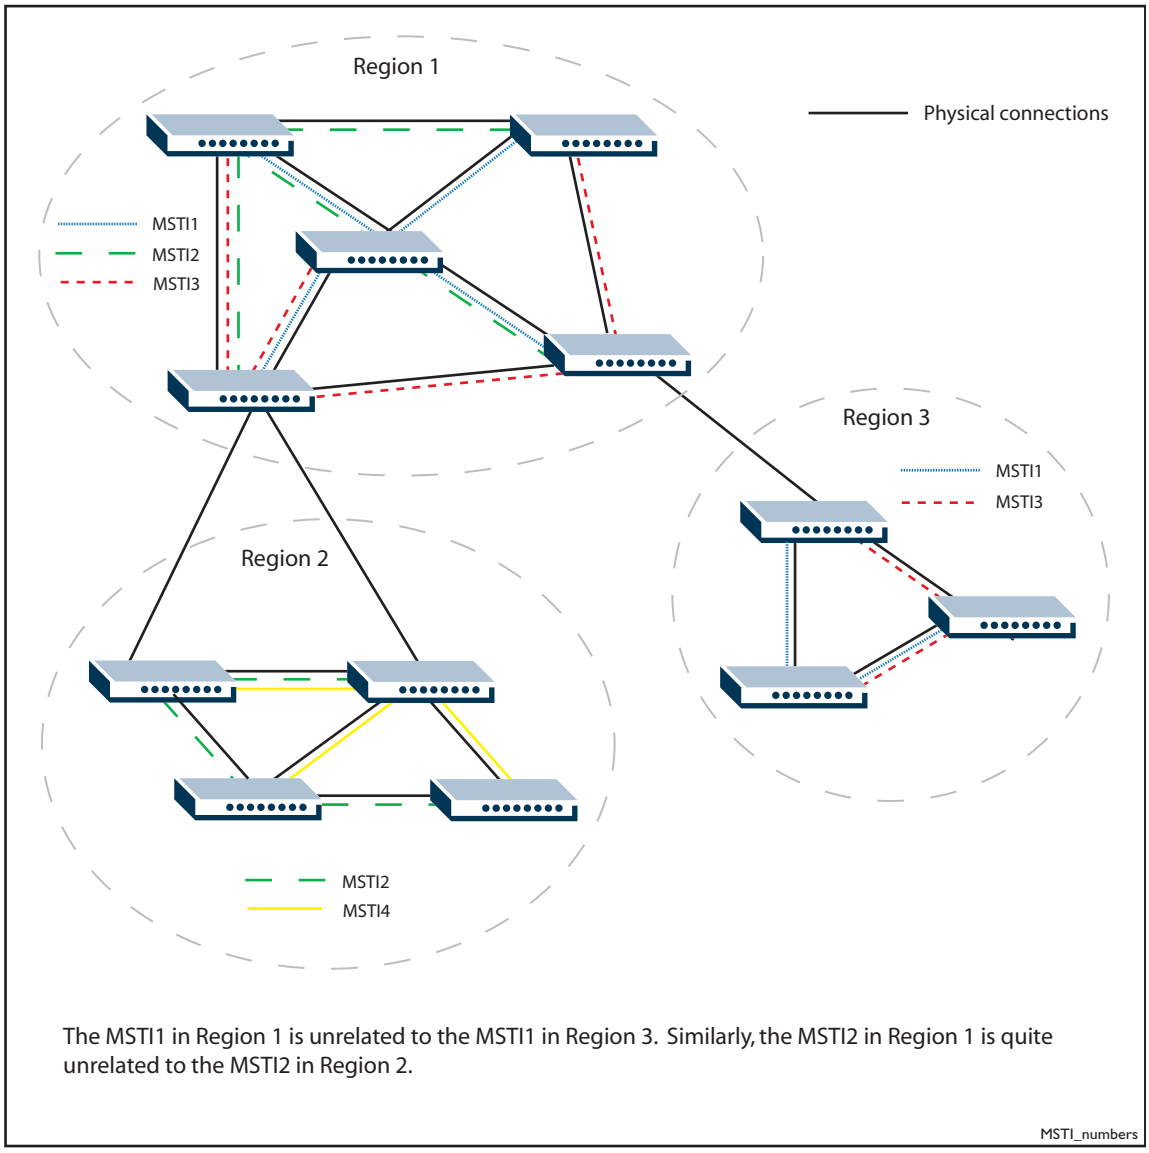
MSTP Regions

An MST region is a set of interconnected switches that all have the same values for the following MST configuration identification elements:

- MST configuration name - the name of the MST region
- Revision level - the revision number of configuration
- Configuration Digest - the mapping of which VLANs are mapped to which MST instances

Each of the MST instances created are identified by an MSTI number. This number is locally significant within the MST region. Therefore, an MSTI will not span across MST regions.

Figure 20-2: MSTIs in different regions



The task of assigning each bridge to a particular region is achieved by the member bridges each comparing their *MST Configuration Identifiers*. More information on configuration identifiers is provided in **Table 20-6**, but for the moment an *MST Configuration Identifier* can simply be thought of as an identifier that represents the mapping of VLANs to MSTIs within each bridge. Therefore, bridges with identical *MST Configuration Identifiers*, must have identical MSTI mapping tables.

While each MSTI can have multiple VLANs, each VLAN can be associated with only one MSTI. Once these associations have been made, the bridges in each region can transmit their spanning tree BPDUs and advertise their MSTIs. This in turn establishes the active data paths between the bridges for each group of VLANs (that is, for each MSTI) and block any duplicate paths within each instance. A particular advantage of this enhancement applies where a large number of VLANs share a few internetwork paths. In this situation there need only be as many Multiple Spanning Tree Instances (MSTIs) as there are source and destination bridge pairs, remembering that a pair of bridges probably has multiple paths between them.

In order to ensure that each bridge within a region maintains the same configuration information (particularly their VID to MSTI mappings) and to ensure each bridge's membership of a particular region, the bridges exchange configuration information in the form of *MST Configuration Identifiers*. **Table 20-6** provides a breakdown of an *MST Configuration Identifier*. A detailed explanation of bridge configuration identifiers can be found in Section 13.7 of the IEEE 802.1Q-2003 standard.

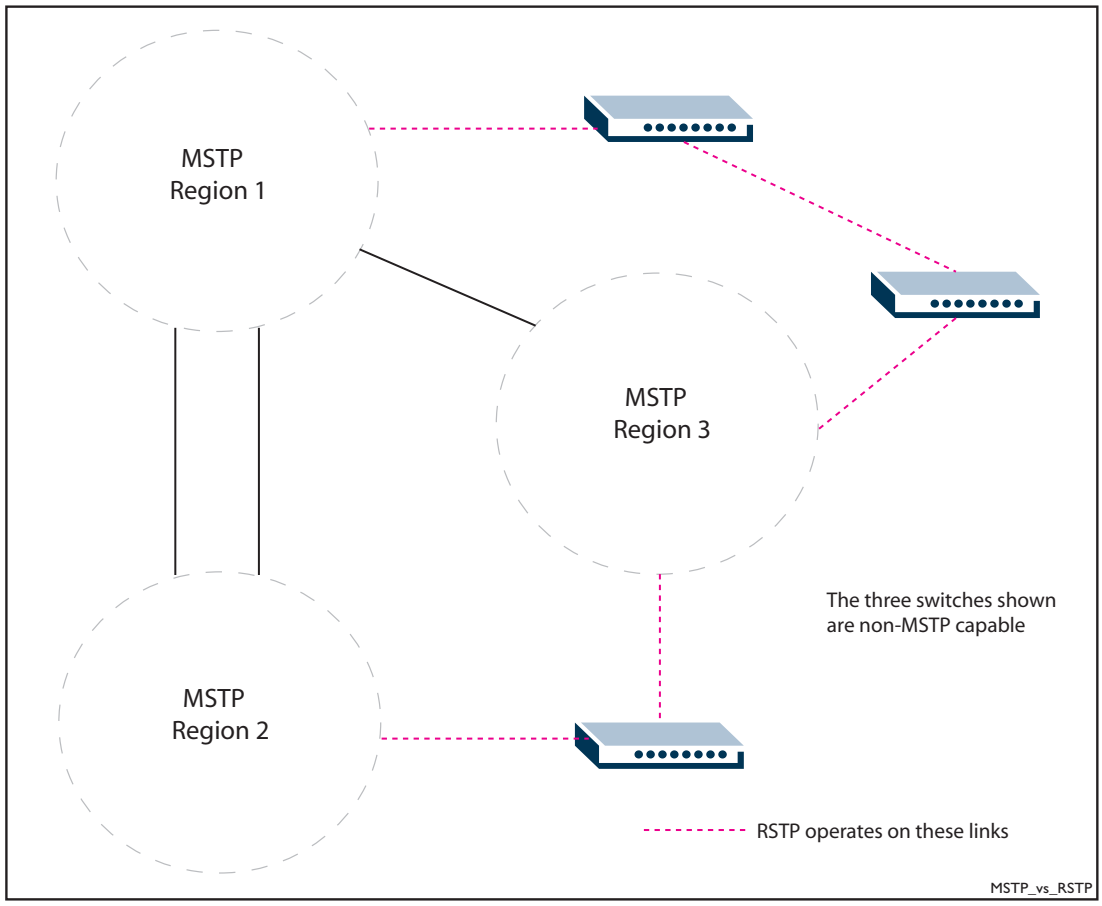
Table 20-6: MST Configuration Identifier

Field Name	Description
Format Selector	A single octet field whose value of 0 indicates MSTP operation
Region Name	A name (up to 32 characters long) that identifies a particular MST region, defined using the **region (MSTP)** command on page 21.11
Revision Level	A number representing the region's revision level, defined using the **revision (MSTP)** command on page 21.12.
Configuration Digest	A 16 octet (HMAC-MD5 based) signature created from the MST configuration table.

Common and Internal Spanning Tree (CIST)

The CIST is the default spanning tree instance of MSTP, i.e. all VLANs that are not members of particular MSTIs are members of the CIST. Also, an individual MST region can be regarded as a single virtual bridge by other MST regions. The spanning tree that runs between regions is the CIST. The CIST is also the spanning tree that runs between MST regions and Single Spanning Tree (SST) entities. So, in **Figure 20-3**, the STP that is running between the regions, and to the SST bridges, is the CIST.

Figure 20-3: The CIST operates on links between regions and to SST devices



Compatibility with Previous Spanning Tree Protocols

MSTP provides for compatibility with older spanning tree protocols in several ways. In addition to the MST region described in the previous section, the protocol provides for single spanning tree systems by employing a Common and Internal Spanning Tree (CIST). The CIST applies a common and internal spanning tree protocol to the whole of the bridged network and is a direct equivalent to the internal spanning tree (IST) protocol of earlier versions.

In common with legacy spanning tree systems, the CIST protocol first determines its root bridge from all the bridges on the network. This is the bridge that contains the lowest bridge identifier. The protocol then selects a regional root bridge for each MSTR. This is the bridge that provides the best path to the CIST root. After the MSTR root bridges have been chosen, they then act on the region's behalf in such a way that the region appears to the Common Spanning Tree (CST) as a virtual bridge. So in addition to having multiple MSTIs, each region operates as a bridge in a CST.

CIST In addition to the individual MSTIs within each MSTP region, the MSTP region is a member of a network-wide spanning tree called the Common and Internal Spanning Tree (CIST). Conceptually, each region represents a virtual bridge. Internal and external bridge connectivity are two independent functions.

Frames with VIDs allocated to the CIST are subject to the rules and path costs of the complete bridged LAN as determined by the CIST's vectors. Frames other than these are subject to the CIST when travelling outside their region, and subject to its particular MSTI inside the region.

The following operational rules apply:

- Each bridge can be a member of only one region.
- A data frame is associated with a single VID.
- Data frames with a given VID are associated with either the CIST or their particular MSTI, but not both.

The role of the Common Spanning Tree (CST) in a network, and the Common and Internal Spanning Tree (CIST) configured on each device, is to prevent loops within a wider network that may span more than one MSTP region and parts of the network running in legacy STP or RSTP mode.

CIST first allocates root and designated bridges by selecting the bridge with the lowest identifier as the root. MSTP then deals with any loops between the regions in the CST. It does this by considering the CIST "vectors" in the following order:

1. CIST External Root Path Cost
2. CIST Regional Root Identifier
3. CIST Internal Root Path Cost
4. CIST Designated Bridge Identifier
5. CIST Designated Port Identifier
6. CIST Receiving Port Identifier

MSTP Bridge Protocol Data Units (BPDUs)

The main function of bridge protocol data units is to enable MSTP to select its root bridges for the CIST (**"Common and Internal Spanning Tree (CIST)" on page 20.15**) and each MSTI. MSTP is compatible with earlier spanning tree versions; its Bridge Protocol Data Unit (BPDU) formats build on earlier versions (**"Compatibility with Previous Spanning Tree Protocols" on page 20.15**).

Table 20-7 shows the standardized format for MSTP BPDU messages. The general format of the BPDUs comprise a common generic portion—octets 1 to 36—that are based on those defined in IEEE Standard 802.1D, 1998, followed by components that are specific to CIST—octets 37 to 102. Components specific to each MSTI are added to this BPDU data block.

Table 20-7: MSTP Bridge Protocol Data Units (BPDUs)

Field Name	Octets	Description
Protocol Identifier	1–2	Protocol being used. The value 0000 0000 0000 0000 identifies the spanning tree algorithm and protocol.
Protocol Version Identifier	3	Identifies the protocol version used.
BPDU Type	4	Value 0000 0000 specifies a configuration BPDU.
CIST Flags	5	Bit 1 is the topology change flag. Bit 2 conveys the CIST proposal flag in RST and MST BPDUs - unused in STP. Bits 3 & 4 convey the CIST port role in RST, and MST BPDUs - unused in STP. Bit 5 conveys the CIST learning flag in RST and MST BPDUs - unused in STP. Bit 6 conveys the CIST forwarding flag in RST and MST BPDUs - unused in STP. Bit 7 conveys the CIST agreement flag in RST and MST BPDUs - unused in STP. Bit 8 conveys the topology change acknowledge flag in STP configuration BPDUs - unused in RSTP and MSTP BPDUs.
CIST Root Identifier	6–13	The Bridge identifier of the CIST Root
CIST External Path Cost	14–17	The path cost between MST regions from the transmitting bridge to the CIST root.
CIST Regional Root Identifier	18–25	ID of the current CIST regional root bridge.
CIST Port Identifier	26–27	CIST port identifier of the transmitting bridge port.
Message Age	28–29	Message age timer value.
Max Age	30–31	Timeout value to be used by all bridges in the bridged network. This value is set by the root. Some implementations of MSTP may choose not to use this value.
Hello Time	32–33	Time interval between the generation of configuration BPDUs by the root bridge.
Forward Delay	34–35	A timeout value used to ensure forward delay timer consistency when transferring a port to the forwarding state. It is also used for ageing filtering database dynamic entries following changes in the active topology.
Version 1 Length	36	Used to convey the Version 1 length. It is always transmitted as 0.

Table 20-7: MSTP Bridge Protocol Data Units (BPDUs)(cont.)

Field Name	Octets	Description
Version 3 Length	37–38	Used to convey the Version 3 length. It is the number of octets taken by the parameters that follow in the BPDU.
MST Configuration Identifier	39–89	An identifier comprising elements of the following: Format Selector Configuration Name Revision Level Configuration Digest.
CIST Internal Root Path Cost	90–93	Path cost to the CIST regional root.
CIST Bridge Identifier	94–101	CIST bridge identifier of the transmitting bridge.
CIST Remaining Hops	102	Remaining hops which limits the propagation and longevity of received spanning tree information for the CIST.
MSTI Configuration Messages (may be absent)	103–39 plus Version 3 Length	See **Table 20-8**.

Table 20-8: MSTI configuration messages

Field Name	Octets	Description
MSTI Flags	1	Bits 1 through 8, convey the topology change flag, proposal flag, port role (two bits), Learning flag, forwarding flag, agreement flag, and master flag for this MSTI.
MSTI Regional Root Identifier	2–9	This includes the value of the MSTID for this configuration message encoded in bits 4 through 1 of octet 1, and bits 8 through 1 of octet 2.
MSTI Internal Root Path Cost	10-13	Internal Root Path Cost.
MSTI Bridge Priority	14	Bits 5 through 8 convey the value of the bridge identifier priority for this MSTI. Bits 1 through 4 of Octet 14 are transmitted as 0, and ignored on receipt.
MSTI Port Priority	15	Bits 5 through 8 are used to convey the value of the port identifier priority for this MSTI. Bits 1 through 4 are transmitted as 0, and ignored on receipt.
MSTI Remaining Hops	16	Value of remaining hops for this MSTI.

Configuring MSTP

By default, RSTP is enabled with default settings on all switch ports. To configure MSTP, see the configuration procedure in **Table 20-9**.

To configure other modes, see **"Configuring RSTP" on page 20.9** or **"Configuring STP" on page 20.6**.

For detailed configuration examples, see the How To Note *How To Configure Basic Switching Functionality*, available from website at **http://www.alliedtelesis.com**.

Configuration guidelines for MSTP

- Switches must have the same MST configuration identification elements (region name, revision level and VLAN to MSTI mapping) to be in the same MST region. When configuring multiple MST regions for MSTP, MSTIs are locally significant within an MST region. MSTIs will not span from one region to another region.
- Common and Internal Spanning Tree (CIST) is the default spanning tree instance for MSTP. This means that all VLANs that are not explicitly configured into another MSTI are members of the CIST.
- The software supports a single instance of the MSTP Algorithm consisting of the CIST and up to 15 MSTIs.
- A VLAN can only be mapped to one MSTI or to the CIST. One VLAN mapped to multiple spanning trees is not allowed. All the VLANs are mapped to the CIST by default. Once a VLAN is mapped to a specified MSTI, it is removed from the CIST.
- An MSTI is locally significant within an MST region. An MSTI cannot span across multiple MST regions. The CIST is the spanning tree instance for connecting different MST regions and single spanning tree entities, such as RSTP and STP switches.
- MSTP is compatible with RSTP and STP. An MST region appears as a virtual bridge connecting to single spanning tree entities.
- To avoid unnecessary STP processing, a port that attaches to a LAN that is known to have no other bridges/switches attached can be configured as an edge port.

Before configuring MSTP

Before configuring MSTP, configure VLANs and associate them with switch ports (**Chapter 18, VLAN Introduction** and **Chapter 19, VLAN Commands**), and determine for your network:

- which MSTP regions, revision level and instances are required
- which VLANs and switch ports will belong to which MSTIs,
- which devices you want to be root bridges for each MSTI

Table 20-9: Configuration procedure for MSTP

Command	Description
`awplus#` `configure terminal`	Enter Global Configuration mode.
`awplus(config)#` `spanning-tree mode mstp`	By default, the device is in RSTP mode. Change to MSTP mode.
`awplus(config)#` `spanning-tree enable`	By default, spanning tree is enabled on all switch ports. If it has been disabled, enable it for MSTP.

Table 20-9: Configuration procedure for MSTP(cont.)

Configure MSTP region, revision, and instances	
All MSTP devices in this region of the network must have the same region name, revision number, and VLAN to MSTI mappings.	
`awplus(config)#`	
`spanning-tree mst configuration`	Enter MST Configuration mode.
`awplus(config-mst)#`	
`region <region-name>`	Specify the MSTP region. The **region-name** parameter is an arbitrary string that specifies the name you want to assign to the MST region for identification.
`awplus(config-mst)#`	
`revision <revision-number>`	The **revision-number** parameter specifies the revision of the current MST configuration. The revision is an arbitrary number that you assign to an MST region. It can be used to keep track of the number of times that MST configuration has been updated for the network. Specify the MST revision number in the range 0 to 255.
`awplus(config-mst)#`	
`instance <msti-id> vlan {<vid>|<vid-list>}`	To allow MSTP to block traffic for different VLANs in different places in a loop, create multiple MSTP instances and associate VLANs with them. Each VLAN can only be in one instance. Specify the MST instance ID in the range 1 to 15.
Advanced configuration	
The commands above are the minimum required to configure MSTP. The following commands allow more advanced configuration.	
Assign root bridge priorities	
MSTP lets you distribute traffic more efficiently across a network by blocking different links for different VLANs. You do this by making different devices into the root bridge for each MSTP instance, and for the CIST, so that each instance blocks a different link. By default, all devices have the same root bridge priority, 32768 (8000 in hexadecimal), so the device with the lowest MAC address becomes the root bridge. If you want the device to be the root bridge for an instance or for the CIST, set the priority to a lower value (a higher priority) than other devices for this instance. (If you enter a number that is not a multiple of 4096, the device rounds the number down.)	
`awplus(config)#`	
`spanning-tree mst configuration`	Enter MST Configuration mode.
`awplus(config-mst)#`	
`instance <msti-id> priority <priority>`	Set the priority for the device to become the root bridge for each instance. Specify the MST instance ID in the range 1 to 15. Specify the root bridge priority in the range 0 to 61440. If you enter a number that is not a multiple of 4096, the switch rounds the number down.
`awplus(config-mst)#`	
`exit`	Return to Global Configuration mode.

Table 20-9: Configuration procedure for MSTP(cont.)

`awplus(config)#`	
`spanning-tree priority <priority>`	Set the priority for the device to become the root bridge for the CIST. Specify the bridge priority in the range 0 to 61440. If you enter a number that is not a multiple of 4096, the switch rounds the number down.
Configure edge ports	
If some switch ports are connected to devices that cannot generate BPDUs (such as workstations), you can set particular switch ports as edge ports, or set them to automatically detect whether they are edge ports.	
`awplus(config)#`	
`interface <port-list>`	Enter Interface Configuration mode for these switch ports.
`awplus(config-if)#`	
`spanning-tree edgeport (RSTP and MSTP)`	Set these ports to be edge ports,
or	or
`awplus(config-if)#`	
`spanning-tree autoedge (RSTP and MSTP)`	set these ports to automatically detect whether they are edge ports.
Configure Root Guard	
`awplus(config-if)#`	
`spanning-tree guard root`	The Root Guard feature makes sure that the port on which it is enabled is a designated port. If the Root Guard enabled port receives a superior BPDU, it goes to a Listening state (for STP) or discarding state (for RSTP and MSTP). Enable the Guard Root feature if required.
`awplus(config-if)#`	
`exit`	Return to Global Configuration mode.
Configure BPDU Guard	
`awplus(config)#`	
`spanning-tree portfast bpdu-guard`	If required, enable the BPDU Guard feature.
`awplus(config)#`	
`spanning-tree errdisable-timeout enable`	Set a timeout for ports that are disabled due to the BPDU guard feature.
`awplus(config)#`	
`spanning-tree errdisable-timeout interval <10-1000000>`	Specify the time interval after which a port is brought back up when it has been disabled by the BPDU guard feature.

Table 20-9: Configuration procedure for MSTP(cont.)

Check MSTP configuration	
`awplus(config)#`	
`exit`	Return to Privileged Exec mode.
`awplus#`	
`show spanning-tree mst config`	Check that the digest is the same on this device as for all other devices in the same region.
`awplus#`	
`show spanning-tree mst`	Check the MST to VLAN and port mapping.
`awplus#`	
`show spanning-tree mst instance <instance>`	Check the detailed information for a particular instance, and all switch ports associated with that instance. Specify the MST instance ID in the range 1 to 15.
`awplus#`	
`show spanning-tree mst interface <port>`	Check general information about MSTP, and the CIST settings.

Advanced configuration: For most networks, the default settings of the following will be suitable. However, you can also configure them.

- path costs for ports in an MSTI (**spanning-tree mst instance path-cost**) or for the CIST (**spanning-tree path-cost**)
- port priority for ports in an MSTI (**spanning-tree mst instance priority**) or for the CIST (**spanning-tree priority (port priority)**)

Command List

This chapter provides an alphabetical reference for commands used to configure RSTP, STP or MSTP. For information about spanning trees, including configuration procedures, see **Chapter 20, Spanning Tree Introduction: STP, RSTP, and MSTP**

clear spanning-tree statistics

Use this command to clear all the STP BPDU (Bridge Protocol Data Unit) statistics.

Syntax

```
clear spanning-tree statistics

clear spanning-tree statistics [instance <mstp-instance>]

clear spanning-tree statistics
   [interface <port> [instance <mstp-instance>]]
```

Parameter	Description
<port>	The port to clear STP BPDU statistics for. The port may be a switch port (e.g. `port1.0.4`), a static channel group (e.g. `sa3`), or a dynamic (LACP) channel group (e.g. `po4`).
<mstp-instance>	The MSTP instance (MSTI - Multiple Spanning Tree Instance) to clear MSTP BPDU statistics.

Mode User Exec and Privileged Exec

Usage Use this command with the **instance** parameter in MSTP mode. Specifying this command with the **interface** parameter only not the instance parameter will work in STP and RSTP mode.

Examples

```
awplus# clear spanning-tree statistics

awplus# clear spanning-tree statistics instance 1

awplus# clear spanning-tree statistics interface port1.0.2

awplus# clear spanning-tree statistics interface port1.0.2
       instance 1
```

clear spanning-tree detected protocols (RSTP and MSTP)

Use this command to clear the detected protocols for a specific port, or all ports.

Use this command in RSTP or MSTP mode only.

Syntax `clear spanning-tree detected protocols [interface <port>]`

Parameter	Description
<port>	The port to clear detected protocols for. The port may be a switch port (e.g. `port1.0.4`), a static channel group (e.g. `sa3`), or a dynamic (LACP) channel group (e.g. `po4`).

Mode Privileged Exec

Example

```
awplus# clear spanning-tree detected protocols
```

debug mstp (RSTP and STP)

Use this command to enable debugging for the configured spanning tree mode, and echo data to the console, at various levels. Note that although this command uses the keyword **mstp** it displays debugging output for RSTP and STP protocols as well the MSTP protocol.

Use the **no** variant of this command to disable spanning tree debugging.

Syntax

```
debug mstp {all|cli|protocol [detail]|timer [detail]}
debug mstp {packet {rx|tx} [decode] [interface <interface>]}
debug mstp {topology-change [interface <interface>]}
no debug mstp {all|cli|protocol [detail]|timer [detail]}
no debug mstp {packet {rx|tx} [decode] [interface <interface>]}
no debug mstp {topology-change [interface <interface>]}
```

Parameter	Description
`all`	Echoes all spanning tree debugging levels to the console.
`cli`	Echoes spanning tree commands to the console.
`packet`	Echoes spanning tree packets to the console.
`rx`	Received packets.
`tx`	Transmitted packets.
`protocol`	Echoes protocol changes to the console.
`timer`	Echoes timer information to the console.
`detail`	Detailed output.
`decode`	Interprets packet contents
`topology-change`	Interprets topology change messages
`interface`	Keyword before <*interface*> placeholder to specify an interface to debug
<*interface*>	Placeholder used to specify the name of the interface to debug.

Mode Privileged Exec and Global Configuration mode

Usage 1 Use the **debug mstp topology-change interface** command to generate debugging messages when the switch receives an indication of a topology change in a BPDU from another device. The debugging can be activated on a per-port basis. Although this command uses the keyword **mstp**, it displays debugging output for RSTP and STP protocols as well as the MSTP protocol.

Due to the likely volume of output, these debug messages are best viewed using the **terminal monitor** command on page 10.77 before issuing the relevant **debug mstp** command. The default terminal monitor filter will select and display these messages. Alternatively, the messages can be directed to any of the other log outputs by adding a filter for the MSTP application using **log buffered (filter)** command on page 12.9:

```
awplus# configure terminal
awplus(config)# log buffered program mstp
```

Output 1

```
awplus#terminal monitor
awplus#debug mstp topology-change interface port1.0.19
10:09:09 awplus MSTP[1409]: Topology change rcvd on port1.0.19 (internal)
10:09:09 awplus MSTP[1409]: Topology change rcvd on MSTI 1 port1.0.19
aawplus#debug mstp topology-change interface port1.0.21
10:09:29 awplus MSTP[1409]: Topology change rcvd on port1.0.21 (external)
10:09:29 awplus MSTP[1409]: Topology change rcvd on MSTI 1 port1.0.21
```

Usage 2 Use the **debug mstp packet rx|tx decode interface** command to generate debugging messages containing the entire contents of a BPDU displayed in readable text for transmitted and received xSTP BPDUs. The debugging can be activated on a per-port basis and transmit and receive debugging is controlled independently. Although this command uses the keyword **mstp**, it displays debugging output for RSTP and STP protocols as well as the MSTP protocol.

Due to the likely volume of output, these debug messages are best viewed using the **terminal monitor** command on page 10.77 before issuing the relevant **debug mstp** command. The default terminal monitor filter will select and display these messages. Alternatively, the messages can be directed to any of the other log outputs by adding a filter for the MSTP application using the **log buffered (filter)** command on page 12.9:

```
awplus(config)# log buffered program mstp
```

Output 2 In MSTP mode - an MSTP BPDU with 1 MSTI:

```
awplus#terminal monitor
awplus#debug mstp packet rx decode interface port1.0.19
17:23:42 awplus MSTP[1417]: port1.0.19 xSTP BPDU rx - start
17:23:42 awplus MSTP[1417]: Protocol version: MSTP, BPDU type: RST
17:23:42 awplus MSTP[1417]: CIST Flags:  Agree Forward Learn role=Desig
17:23:42 awplus MSTP[1417]: CIST root id      : 0000:0000cd1000fe
17:23:42 awplus MSTP[1417]: CIST ext pathcost : 0
17:23:42 awplus MSTP[1417]: CIST reg root id  : 0000:0000cd1000fe
17:23:42 awplus MSTP[1417]: CIST port id      : 8001 (128:1)
17:23:42 awplus MSTP[1417]: msg age: 0 max age: 20 hellotime: 2 fwd delay: 15
17:23:42 awplus MSTP[1417]: Version 3 length : 80
17:23:42 awplus MSTP[1417]: Format id      : 0
17:23:42 awplus MSTP[1417]: Config name    : test
17:23:42 awplus MSTP[1417]: Revision level : 0
17:23:42 awplus MSTP[1417]: Config digest  : 3ab68794d602fdf43b21c0b37ac3bca8
17:23:42 awplus MSTP[1417]: CIST int pathcost : 0
17:23:42 awplus MSTP[1417]: CIST bridge id    : 0000:0000cd1000fe
17:23:42 awplus MSTP[1417]: CIST hops remaining : 20
17:23:42 awplus MSTP[1417]: MSTI flags           : Agree Forward Learn role=Desig
17:23:42 awplus MSTP[1417]: MSTI reg root id     : 8001:0000cd1000fe
17:23:42 awplus MSTP[1417]: MSTI pathcost        : 0
17:23:42 awplus MSTP[1417]: MSTI bridge priority : 32768 port priority : 128
17:23:42 awplus MSTP[1417]: MSTI hops remaining  : 20
17:23:42 awplus MSTP[1417]: port1.0.19 xSTP BPDU rx - finish
```

In STP mode transmitting a TCN BPDU:

```
awplus#terminal monitor
awplus#debug mstp packet tx decode interface port1.0.19
17:28:09 awplus MSTP[1417]: port1.0.19 xSTP BPDU tx - start
17:28:09 awplus MSTP[1417]: Protocol version: STP, BPDU type: TCN
17:28:09 awplus MSTP[1417]: port1.0.19 xSTP BPDU tx - finish
```

In STP mode receiving an STP BPDU:

```
awplus#terminal monitor
awplus#debug mstp packet rx decode interface port1.0.19
17:31:36 awplus MSTP[1417]: port1.0.19 xSTP BPDU rx - start
17:31:36 awplus MSTP[1417]: Protocol version: STP, BPDU type: Config
17:31:36 awplus MSTP[1417]: Flags:  role=none
17:31:36 awplus MSTP[1417]: Root id      : 8000:0000cd1000fe
17:31:36 awplus MSTP[1417]: Root pathcost : 0
17:31:36 awplus MSTP[1417]: Bridge id  : 8000:0000cd1000fe
17:31:36 awplus MSTP[1417]: Port id      : 8001 (128:1)
17:31:36 awplus MSTP[1417]: msg age: 0 max age: 20 hellotime: 2 fwd delay: 15
17:31:36 awplus MSTP[1417]: ort1.0.19 xSTP BPDU rx - finish
```

In RSTP mode receiving an RSTP BPDU:

```
awplus#terminal monitor
awplus#debug mstp packet rx decode interface port1.0.19
awplus#17:30:17 awplus MSTP[1417]: port1.0.19 xSTP BPDU rx - start
17:30:17 awplus MSTP[1417]: Protocol version: RSTP, BPDU type: RST
17:30:17 awplus MSTP[1417]: CIST Flags:  Forward Learn role=Desig
17:30:17 awplus MSTP[1417]: CIST root id      : 8000:0000cd1000fe
17:30:17 awplus MSTP[1417]: CIST ext pathcost : 0
17:30:17 awplus MSTP[1417]: CIST reg root id  : 8000:0000cd1000fe
17:30:17 awplus MSTP[1417]: CIST port id      : 8001 (128:1)
17:30:17 awplus MSTP[1417]: msg age: 0 max age: 20 hellotime: 2 fwd delay: 15
17:30:17 awplus MSTP[1417]: port1.0.19 xSTP BPDU rx - finish
```

Examples

```
awplus# debug mstp all

awplus# debug mstp cli

awplus# debug mstp packet rx

awplus# debug mstp protocol detail

awplus# debug mstp timer

awplus# debug mstp packet rx decode interface port1.0.2

awplus# debug mstp packet tx decode interface port1.0.12
```

Related commands

log buffered (filter)
show debugging mstp
terminal monitor
undebug mstp

instance priority (MSTP)

Use this command to set the priority for this device to become the root bridge for the specified MSTI (Multiple Spanning Tree Instance).

Use this command for MSTP only.

Use the **no** variant of this command to restore the root bridge priority of the device for the instance to the default.

Syntax

```
instance <msti-id> priority <priority>
no instance <msti-id> priority
```

Parameter	Description
<msti-id>	Specify the The MST instance ID in the range <1-15>.
<priority>	Specify the root bridge priority for the device for the MSTI in the range <0-61440>. Note that a lower priority number indicates a greater likelihood of the device becoming the root bridge. The priority values can be set only in increments of 4096. If you specify a number that is not a multiple of 4096, it will be rounded down. The default priority is 32768.

Default The default priority value for all instances is 32768.

Mode MST Configuration

Usage MSTP lets you distribute traffic more efficiently across a network by blocking different links for different VLANs. You do this by making different devices into the root bridge for each MSTP instance, so that each instance blocks a different link.

If all devices have the same root bridge priority for the instance, MSTP selects the device with the lowest MAC address to be the root bridge. Give the device a higher priority for becoming the root bridge for a particular instance by assigning it a lower priority number, or vice versa.

Examples To set the root bridge priority for MSTP instance 2 to be the highest (0), so that it will be the root bridge for this instance when available, use the commands:

```
awplus# configure terminal
awplus(config)# spanning-tree mst configuration
awplus(config-mst)# instance 2 priority 0
```

To reset the root bridge priority for instance 2 to the default (32768), use the commands:

```
awplus# configure terminal
awplus(config)# spanning-tree mst configuration
awplus(config-mst)# no instance 2 priority
```

Related Commands

region (MSTP)
revision (MSTP)
show spanning-tree mst config
spanning-tree mst instance
spanning-tree mst instance priority

instance vlan (MSTP)

Use this command to create an MST Instance (MSTI), and associate the specified VLANs with it. An MSTI is a spanning tree instance that exists within an MST region (MSTR). An MSTR can contain up to 15 MSTIs.

When a VLAN is associated with an MSTI the member ports of the VLAN are automatically configured to send and receive spanning-tree information for the associated MSTI. You can disable this automatic configuration of member ports of the VLAN to the associated MSTI by using a **no spanning-tree mst instance** command to remove the member port from the MSTI.

Use the **instance vlan** command for MSTP only.

Use the **no** variant of this command to remove the specified VLANs from the MSTI.

Syntax

```
instance <msti-id> vlan {<vid>|<vid-list>}
no instance <msti-id> vlan {<vid>|<vid-list>}
```

Parameter	Description
<msti-id>	Specify the MST instance ID <1-15>.
<vid>	Specify a VLAN identifier (VID) in the range <1-4094> to be associated with the MSTI specified.
<vid-list>	A hyphen-separated range or a comma-separated list of VLAN IDs

Mode MST Configuration

Usage The VLANs must be created before being associated with an MST instance (MSTI). If the VLAN range is not specified, the MSTI will not be created.

This command removes the specified VLANs from the CIST and adds them to the specified MSTI. If you use the **no** variant of this command to remove the VLAN from the MSTI, it returns it to the CIST. To move a VLAN from one MSTI to another, you must first use the **no** variant of this command to return it to the CIST.

Ports in these VLANs will remain in the control of the CIST until you associate the ports with the MSTI using the **spanning-tree mst instance** command.

Example

```
awplus# configure terminal
awplus(config)# spanning-tree mode mstp
awplus(config)# spanning-tree mst configuration
awplus(config-mst)# instance 2 vlan 30
```

Related Commands

region (MSTP)
revision (MSTP)
show spanning-tree mst config
spanning-tree mst instance
vlan

region (MSTP)

Use this command to assign a name to the device's MST Region. MST Instances (MSTI) of a region form different spanning trees for different VLANs.

Use this command for MSTP only.

Use the **no** variant of this command to remove this region name and reset it to the default.

Syntax

```
region <region-name>
no region
```

Parameter	Description
<region-name>	Specify the name of the region, up to 32 characters. Valid characters are upper-case, lower-case, digits, underscore.

Default By default, the region name is My Name.

Mode MST Configuration

Usage The region name, the revision number, and the digest of the VLAN to MSTI configuration table must be the same on all devices that are intended to be in the same MST region.

Example

```
awplus# configure terminal
awplus(config)# spanning-tree mst configuration
awplus(config-mst)# region ATL
```

Related Commands revision (MSTP)
show spanning-tree mst config

revision (MSTP)

Use this command to specify the MST revision number to be used in the configuration identifier.

Use this command for MSTP only.

Syntax `revision <revision-number>`

Parameter	Description
<revision-number>	<0-65535> Revision number.

Default The default of revision number is 0.

Mode MST Configuration

Usage The region name, the revision number, and the digest of the VLAN to MSTI configuration table must be the same on all devices that are intended to be in the same MST region.

Example

```
awplus# configure terminal
awplus(config)# spanning-tree mst configuration
awplus(config-mst)# revision 25
```

Related Commands **region (MSTP)**
show spanning-tree mst config
instance vlan (MSTP)

show debugging mstp

Use this command to show the MSTP debugging options set.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show debugging mstp
```

Mode

User Exec and Privileged Exec mode

Example

To display the MSTP debugging options set, enter the command:

```
awplus# show debugging mstp
```

Output

Figure 21-1: Example output from the show debugging mstp command

```
MSTP debugging status:
  MSTP receiving packet debugging is on
```

Related Commands

debug mstp (RSTP and STP)

show spanning-tree

Use this command to display detailed spanning tree information on the specified port or on all ports. Use this command for RSTP, MSTP or STP.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show spanning-tree [interface <port-list>]`

Parameter	Description
`interface`	Display information about the following port only.
`<port-list>`	The ports to display information about. A port-list can be: ■ a switch port (e.g. `port1.0.12`) a static channel group (e.g. `sa3`) or a dynamic (LACP) channel group (e.g. `po3`) ■ a continuous range of ports separated by a hyphen, e.g. `port1.0.1-1.0.24`, or `sa1-2`, or `po1-4` ■ a comma-separated list of ports and port ranges, e.g. `port1.0.1,port1.0.4-1.2.24`. Do not mix switch ports, static channel groups, and dynamic (LACP) channel groups in the same list

Mode User Exec and Privileged Exec

Usage Note that any list of interfaces specified must not span any interfaces that are not installed.

A topology change counter has been included for RSTP and MSTP. You can see the topology change counter for RSTP by using the **show spanning-tree** command. You can see the topology change counter for MSTP by using the **show spanning-tree mst instance** command.

Example To display spanning tree information about `port1.0.23`, use the command:

```
awplus# show spanning-tree interface port1.0.23
```

Output **Figure 21-2: Example output from the show spanning-tree command**

```

show spanning-tree brief

Use this command to display a summary of spanning tree status information on all ports. Use this command for RSTP, MSTP or STP.

Syntax `show spanning-tree brief`

Parameter	Description
`brief`	A brief summary of spanning tree information.

Mode User Exec and Privileged Exec

Usage Note that any list of interfaces specified must not span any interfaces that are not installed.

A topology change counter has been included for RSTP and MSTP. You can see the topology change counter for RSTP by using the **show spanning-tree** command. You can see the topology change counter for MSTP by using the **show spanning-tree mst instance** command.

Example To display a summary of spanning tree status information, use the command:

```
awplus# show spanning-tree brief
```

Output **Figure 21-4: Example output from the show spanning-tree brief command**

```
Default: Bridge up - Spanning Tree Enabled

show spanning-tree mst detail interface

This command prints detailed information about the specified switch port, and the MST instances associated with it.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show spanning-tree mst detail interface <port>`

Parameter	Description
<port>	The port to display information about. The port may be a switch port (e.g. `port1.0.4`), a static channel group (e.g. `sa3`), or a dynamic (LACP) channel group (e.g. `po4`).

Mode User Exec, Privileged Exec and Interface Configuration

Example To display detailed information about `port1.0.3` and the instances associated with it, enter the command:

```
awplus# show spanning-tree mst detail interface port1.0.3
```

Output **Figure 21-8: Example output from the show spanning-tree mst detail interface command**

show spanning-tree mst instance

This command displays detailed information for the specified instance, and all switch ports associated with that instance.

A topology change counter has been included for RSTP and MSTP. You can see the topology change counter for RSTP by using the **show spanning-tree** command. You can see the topology change counter for MSTP by using the **show spanning-tree mst instance** command.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show spanning-tree mst instance <instance>
```

Parameter	Description
<instance>	Specify an MSTP instance in the range <1-15>.

Mode User Exec, Privileged Exec, and Interface Configuration

Usage To display detailed information for **instance 2**, and all switch ports associated with that instance, use the command:

```
awplus# show spanning-tree mst instance 2
```

Output **Figure 21-9: Example output from the show spanning-tree mst instance command**

```
% 1: MSTI Root Path Cost 0 - MSTI Root Port 0 - MSTI Bridge Priority 32768
% 1: MSTI Root Id 80020000cd24ff2d
% 1: MSTI Bridge Id 80020000cd24ff2d

show spanning-tree mst instance interface

This command displays detailed information for the specified MST (Multiple Spanning Tree) instance, and the specified switch port associated with that MST instance.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show spanning-tree mst instance <instance> interface <port>`

Parameter	Description
<instance>	Specify an MSTP instance in the range `<1-15>`.
<port>	The port to display information about. The port may be a switch port (e.g. `port1.0.4`), a static channel group (e.g. `sa3`), or a dynamic (LACP) channel group (e.g. `po4`).

Mode User Exec, Privileged Exec, and Interface Configuration

Example To display detailed information for `instance 2`, interface `port1.0.2`, use the command

```
awplus# show spanning-tree mst instance 2 interface port1.0.2
```

Output **Figure 21-10: Example output from the show spanning-tree mst instance command**

```
% 1: MSTI Root Path Cost 0 - MSTI Root Port 0 - MSTI Bridge Priority 32768
% 1: MSTI Root Id 80020000cd24ff2d
% 1: MSTI Bridge Id 80020000cd24ff2d
%   port1.0.2: Port 5002 - Id 838a - Role Disabled - State Discarding
%   port1.0.2: Designated Internal Path Cost 0  - Designated Port Id 838a
%   port1.0.2: Configured Internal Path Cost 20000000
%   port1.0.2: Configured CST External Path cost 20000000

%   port1.0.2: Designated Root 80020000cd24ff2d
%   port1.0.2: Designated Bridge 80020000cd24ff2d
%   port1.0.2: Message Age 0 - Max Age 0
%   port1.0.2: Hello Time 2 - Forward Delay 15
%   port1.0.2: Forward Timer 0 - Msg Age Timer 0 - Hello Timer 0
%
```

show spanning-tree mst interface

This command displays the number of instances created, and VLANs associated with it for the specified switch port.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show spanning-tree mst interface <port>`

Parameter	Description
<port>	The port to display information about. The port may be a switch port (e.g. `port1.0.4`), a static channel group (e.g. `sa3`), or a dynamic (LACP) channel group (e.g. `po4`).

Mode User Exec, Privileged Exec, and Interface Configuration

Example To display detailed information about each instance, and all interfaces associated with them, for `port1.0.4`, use the command:

```
awplus# show spanning-tree mst interface port1.0.4
```

Output **Figure 21-11: Example output from the show spanning-tree mst interface command**

```
% 1: Bridge up - Spanning Tree Enabled
% 1: CIST Root Path Cost 0 - CIST Root Port 0 - CIST Bridge Priority 32768

```

show spanning-tree mst detail interface

This command displays detailed information about the specified switch port, and the MST instances associated with it.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show spanning-tree mst detail interface <port>`

Parameter	Description
<port>	The port to display information about. The port may be a switch port (e.g. `port1.0.4`), a static channel group (e.g. `sa3`), or a dynamic (LACP) channel group (e.g. `po4`).

Mode User Exec, Privileged Exec and Interface Configuration

Example To display detailed information about `port1.0.3` and the instances associated with it, enter the command:

```
awplus# show spanning-tree mst detail interface port1.0.3
```

Output **Figure 21-12: Example output from the show spanning-tree mst detail interface command**

```

show spanning-tree statistics

This command displays BPDU (Bridge Protocol Data Unit) statistics for all spanning-tree instances, and all switch ports associated with all spanning-tree instances. For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show spanning-tree statistics`

Mode Privileged Exec

Usage To display BPDU statistics for all spanning-tree instances, and all switch ports associated with all spanning-tree instances, use the command:

```
awplus# show spanning-tree statistics
```

Output **Figure 21-13: Example output from the show spanning-tree statistics command**

```
Port number = 915 Interface = port1.0.11

show spanning-tree statistics instance

This command displays BPDU (Bridge Protocol Data Unit) statistics for the specified MST (Multiple Spanning Tree) instance, and all switch ports associated with that MST instance. For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show spanning-tree statistics instance <instance>`

Parameter	Description
<instance>	Specify an MSTP instance in the range <1-15>.

Mode Privileged Exec

Usage To display BPDU statistics information for MST instance 2, and all switch ports associated with that MST instance, use the command:

```
awplus# show spanning-tree statistics instance 2
```

Output **Figure 21-14: Example output from the show spanning-tree statistics instance command:**

Related commands **show spanning-tree statistics**

show spanning-tree statistics instance interface

This command displays BPDU (Bridge Protocol Data Unit) statistics for the specified MST (Multiple Spanning Tree) instance and the specified switch port associated with that MST instance.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show spanning-tree statistics instance <instance> interface <port>`

Parameter	Description
`<instance>`	Specify an MSTP instance in the range `<1-15>`.
`<port>`	The port to display information about. The port may be a switch port (e.g. `port1.0.4`), a static channel group (e.g. `sa3`), or a dynamic (LACP) channel group (e.g. `po4`).

Mode Privileged Exec

Example To display BPDU statistics for MST `instance 2`, interface `port1.0.2`, use the command

```
awplus# show spanning-tree statistics instance 2 interface
       port1.0.2
```

Output **Figure 21-15: Example output from the show spanning-tree statistics instance interface command**

```
awplus#sh spanning-tree statistics interface port1.0.2 instance 1
        Spanning Tree Enabled for Instance : 1

Related commands **show spanning-tree statistics**

show spanning-tree vlan range-index

Use this command to display information about MST (Multiple Spanning Tree) instances and the VLANs associated with them including the VLAN range-index value for the switch.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show spanning-tree vlan range-index`

Mode Privileged Exec

Example To display information about MST instances and the VLANs associated with them for the switch, including the VLAN range-index value, use the following command:

```
awplus# show spanning-tree vlan range-index
```

Output **Figure 21-17: Example output from the show spanning-tree vlan range-index command**

```
awplus#show spanning-tree vlan range-index
% MST Instance  VLAN       RangeIdx
%      1        1          1
%
```

Related commands **show spanning-tree statistics**

spanning-tree autoedge (RSTP and MSTP)

Use this command to enable the autoedge feature on the port.

The autoedge feature allows the port to automatically detect that it is an edge port. If it does not receive any BPDUs in the first three seconds after linkup, enabling, or entering RSTP or MSTP mode, it sets itself to be an edgeport and enters the forwarding state.

Use this command for RSTP or MSTP.

Use the **no** variant of this command to disable this feature.

Syntax

```
spanning-tree autoedge
no spanning-tree autoedge
```

Default Disabled

Mode Interface Configuration

Example

```
awplus# configure terminal
awplus(config)# interface port1.0.3
awplus(config-if)# spanning-tree autoedge
```

Related commands spanning-tree edgeport (RSTP and MSTP)

spanning-tree cisco-interoperability (MSTP)

Use this command to enable/disable Cisco-interoperability for MSTP.

Use this command for MSTP only.

Syntax `spanning-tree cisco-interoperability {enable|disable}`

Parameter	Description
`enable`	Enable Cisco interoperability for MSTP.
`disable`	Disable Cisco interoperability for MSTP.

Default If this command is not used, Cisco interoperability is disabled.

Mode Global Configuration

Usage For compatibility with certain Cisco devices, all devices in the switched LAN running the AlliedWare Plus™ Operating System must have Cisco-interoperability enabled. When the AlliedWare Plus™ Operating System is interoperating with Cisco, the only criteria used to classify a region are the region name and revision level. VLAN to instance mapping is not used to classify regions when interoperating with Cisco.

Examples To enable Cisco interoperability on a Layer 2 switch:

```
awplus# configure terminal
awplus(config)# spanning-tree cisco-interoperability enable
```

To disable Cisco interoperability on a Layer 2 switch:

```
awplus# configure terminal
awplus(config)# spanning-tree cisco-interoperability disable
```

spanning-tree edgeport (RSTP and MSTP)

Use this command to set a port as an edge-port.

Use this command for RSTP or MSTP.

This command has the same effect as the **spanning-tree portfast (STP)** command, but the configuration displays differently in the output of some show commands.

Use the **no** variant of this command to set a port to its default state (not an edge-port).

Syntax

```
spanning-tree edgeport
no spanning-tree edgeport
```

Default Not an edge port.

Mode Interface Configuration

Usage Use this command on a switch port connected to a LAN that has no other bridges attached. If a BPDU is received on the port that indicates that another bridge is connected to the LAN, then the port is no longer treated as an edge port.

Example

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree edgeport
```

Related commands **spanning-tree autoedge (RSTP and MSTP)**

spanning-tree enable

Use this command in Global Configuration mode to enable the specified spanning tree protocol for all switch ports. Note that this must be the spanning tree protocol that is configured on the switch by the **spanning-tree mode** command.

Use the **no** variant of this command to disable the configured spanning tree protocol. This places all switch ports in the forwarding state.

Syntax

```
spanning-tree {mstp|rstp|stp} enable
no spanning-tree {mstp|rstp|stp} enable
```

Parameter	Description
mstp	Enables or disables MSTP (Multiple Spanning Tree Protocol).
rstp	Enables or disables RSTP (Rapid Spanning Tree Protocol).
stp	Enables or disables STP (Spanning Tree Protocol).

Default RSTP is enabled by default for all switch ports.

Mode Global Configuration

Usage With no configuration, spanning tree is enabled, and the spanning tree mode is set to RSTP. To change the mode, see **spanning-tree mode** command on page 21.49.

Examples To enable STP in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# spanning-tree stp enable
```

To disable STP in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# no spanning-tree stp enable
```

To enable MSTP in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# spanning-tree mstp enable
```

To disable MSTP in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# no spanning-tree mstp enable
```

To enable RSTP in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# spanning-tree rstp enable
```

To disable RSTP in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# no spanning-tree rstp enable
```

Related commands **spanning-tree mode**

spanning-tree errdisable-timeout enable

Use this command to enable the errdisable-timeout facility, which sets a timeout for ports that are disabled due to the BPDU guard feature.

Use this command for RSTP or MSTP.

Use the **no** variant of this command to disable the errdisable-timeout facility.

Syntax

```
spanning-tree errdisable-timeout enable
no spanning-tree errdisable-timeout enable
```

Default By default, the errdisable-timeout is disabled.

Mode Global Configuration

Usage The BPDU guard feature shuts down the port on receiving a BPDU on a BPDU-guard enabled port. This command associates a timer with the feature such that the port is re-enabled without manual intervention after a set interval. This interval can be configured by the user using the **spanning-tree errdisable-timeout interval** command.

Example

```
awplus# configure terminal
awplus(config)# spanning-tree errdisable-timeout enable
```

Related Commands

show spanning-tree
spanning-tree errdisable-timeout interval
spanning-tree portfast bpdu-guard

spanning-tree errdisable-timeout interval

Use this command to specify the time interval after which a port is brought back up when it has been disabled by the BPDU guard feature.

Use this command for RSTP or MSTP.

Syntax

```
spanning-tree errdisable-timeout interval <10-1000000>
no spanning-tree errdisable-timeout interval
```

Parameter	Description
<10-1000000>	Specify the errdisable-timeout interval in seconds.

Default By default, the port is re-enabled after 300 seconds.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# spanning-tree errdisable-timeout interval 34
```

Related Commands

show spanning-tree
spanning-tree errdisable-timeout enable
spanning-tree portfast bpdu-guard

spanning-tree force-version

Use this command in Interface Configuration mode for a switch port interface only to force the protocol version for the switch port. Use this command for RSTP or MSTP only.

Syntax

```
spanning-tree force-version <version>
no spanning-tree force-version
```

Parameter	Description	
<version>	<0-3> Version identifier.	
	0	Forces the port to operate in STP mode.
	1	Not supported.
	2	Forces the port to operate in RSTP mode. If it receives STP BPDUs, it can automatically revert to STP mode.
	3	Forces the port to operate in MSTP mode (this option is only available if MSTP mode is configured). If it receives RSTP or STP BPDUs, it can automatically revert to RSTP or STP mode.

Default By default, no version is forced for the port. The port is in the spanning tree mode configured for the device, or a lower version if it automatically detects one.

Mode Interface Configuration mode for a switch port interface only.

Examples Set the value to enforce the spanning tree protocol (STP):

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree force-version 0
```

Set the default protocol version:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no spanning-tree force-version
```

Related Commands show spanning-tree

spanning-tree forward-time

Use this command to set the forward delay value. Use the **no** variant of this command to reset the forward delay value to the default setting of 15 seconds.

The **forward delay** sets the time (in seconds) to control how fast a port changes its spanning tree state when moving towards the forwarding state. If the mode is set to STP, the value determines how long the port stays in each of the listening and learning states which precede the forwarding state. If the mode is set to RSTP or MSTP, this value determines the maximum time taken to transition from discarding to learning and from learning to forwarding.

This value is used only when the switch is acting as the root bridge. Switches not acting as the Root Bridge use a dynamic value for the **forward delay** set by the root bridge. The **forward delay**, **max-age**, and **hello time** parameters are interrelated.

Syntax

```
spanning-tree forward-time <forward-delay>
no spanning-tree forward-time
```

Parameter	Description
<forward-delay	<4-30> The forwarding time delay in seconds.

Default The default is 15 seconds.

Mode Global Configuration

Usage The allowable range for forward-time is 4-30 seconds.

The **forward delay**, **max-age**, and **hello time** parameters should be set according to the following formulae, as specified in IEEE Standard 802.1d:

2 x (forward delay - 1.0 seconds) >= max-age

max-age >= 2 x (hello time + 1.0 seconds)

Example

```
awplus# configure terminal
awplus(config)# spanning-tree forward-time 6
```

Related Commands

show spanning-tree
spanning-tree forward-time <forward-delay>
spanning-tree hello-time <hello-time>
spanning-tree mode

spanning-tree guard root

Use this command in Interface Configuration mode for a switch port only to enable the Root Guard feature for the switch port. The root guard feature disables reception of superior BPDUs. You can use this command for RSTP, STP or MSTP.

Use the **no** variant of this command to disable the root guard feature for the port.

Syntax

```
spanning-tree guard root
no spanning-tree guard root
```

Mode Interface Configuration mode for a switch port interface only.

Usage The Root Guard feature makes sure that the port on which it is enabled is a designated port. If the Root Guard enabled port receives a superior BPDU, it goes to a Listening state (for STP) or discarding state (for RSTP and MSTP).

Example

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree guard root
```

spanning-tree hello-time

Use this command to set the hello-time. This sets the time in seconds between the transmission of switch spanning tree configuration information when the switch is the Root Bridge of the spanning tree or is trying to become the Root Bridge.

Use this command for RSTP, STP or MSTP.

Use the **no** variant of this command to restore the default of the hello time.

Syntax

```
spanning-tree hello-time <hello-time>
no spanning-tree hello-time
```

Parameter	Description
<hello-time>	<1-10> The hello BPDU interval in seconds.

Default Default is 2 seconds.

Mode Global Configuration and Interface Configuration for switch ports.

Usage The allowable range of values is 1-10 seconds.

The **forward delay**, **max-age**, and **hello time** parameters should be set according to the following formulae, as specified in IEEE Standard 802.1d:

2 x (**forward delay** - 1.0 seconds) >= **max-age**

max-age >= 2 x (**hello time** + 1.0 seconds)

Example

```
awplus# configure terminal
awplus(config)# spanning-tree hello-time 3
```

Related Commands

spanning-tree forward-time <forward-delay>
spanning-tree max-age <max-age>
show spanning-tree

spanning-tree link-type

Use this command in Interface Configuration mode for a switch port interface only to enable or disable point-to-point or shared link types on the switch port.

Use this command for RSTP or MSTP only.

Use the **no** variant of this command to return the port to the default link type.

Syntax

```
spanning-tree link-type {point-to-point|shared}
no spanning-tree link-type
```

Parameter	Description
`shared`	Disable rapid transition.
`point-to-point`	Enable rapid transition.

Default The default link type is point-to-point.

Mode Interface Configuration mode for a switch port interface only.

Usage You may want to set link type to shared if the port is connected to a hub with multiple switches connected to it.

Examples

```
awplus# configure terminal
awplus(config)# interface port1.0.3
awplus(config-if)# spanning-tree link-type point-to-point
```

spanning-tree max-age

Use this command to set the max-age. This sets the maximum age, in seconds, that dynamic spanning tree configuration information is stored in the switch before it is discarded.

Use this command for RSTP, STP or MSTP.

Use the **no** variant of this command to restore the default of max-age.

Syntax

```
spanning-tree max-age <max-age>
no spanning-tree max-age
```

Parameter	Description
<max-age>	<6-40> The maximum time, in seconds.

Default The default of spanning-tree max-age is 20 seconds.

Mode Global Configuration

Usage Max-age is the maximum time in seconds for which a message is considered valid.

Configure this value sufficiently high, so that a frame generated by the root bridge can be propagated to the leaf nodes without exceeding the max-age.

The **forward delay**, **max-age**, and **hello time** parameters should be set according to the following formulae, as specified in IEEE Standard 802.1d:

2 x (forward delay - 1.0 seconds) >= max-age

max-age >= 2 x (hello time + 1.0 seconds)

Example

```
awplus# configure terminal
awplus(config)# spanning-tree max-age 12
```

Related Commands

show spanning-tree
spanning-tree forward-time <forward-delay>
spanning-tree hello-time <hello-time>

spanning-tree max-hops (MSTP)

Use this command to specify the maximum allowed hops for a BPDU in an MST region. This parameter is used by all the instances of the MST region.

Use the **no** variant of this command to restore the default.

Use this command for MSTP only.

Syntax

```
spanning-tree max-hops <hop-count>
no spanning-tree max-hops <hop-count>
```

Parameter	Description
<hop-count>	Specify the maximum hops the BPDU will be valid for in the range <1-40>.

Default The default max-hops in a MST region is 20.

Mode Global Configuration

Usage Specifying the max hops for a BPDU prevents the messages from looping indefinitely in the network. The hop count is decremented by each receiving port. When a switch receives an MST BPDU that has a hop count of zero, it discards the BPDU.

Examples

```
awplus# configure terminal
awplus(config)# spanning-tree max-hops 25

awplus# configure terminal
awplus(config)# no spanning-tree max-hops
```

spanning-tree mode

Use this command to change the spanning tree protocol mode on the switch. The spanning tree protocol mode on the switch can be configured to either STP, RSTP or MSTP.

Syntax `spanning-tree mode {stp|rstp|mstp}`

Default The default spanning tree protocol mode on the switch is RSTP.

Mode Global Configuration

Usage With no configuration, the switch will have spanning tree enabled, and the spanning tree mode will be set to RSTP. Use this command to change the spanning tree protocol mode on the device. MSTP is VLAN aware, but RSTP and STP are not VLAN aware. To enable or disable spanning tree operation, see the **spanning-tree enable** command on page 21.38.

Examples To change the spanning tree mode from the default of RSTP to MSTP, use the following commands:

```
awplus# configure terminal
awplus(config)# spanning-tree mode mstp
```

Related commands **spanning-tree enable**

spanning-tree mst configuration

Use this command to enter the MST Configuration mode to configure the Multiple Spanning-Tree Protocol.

Syntax `spanning-tree mst configuration`

Mode Global Configuration

Examples The following example uses this command to enter MST Configuration mode. Note the change in the command prompt.

```
awplus# configure terminal
awplus(config)# spanning-tree mst configuration
awplus(config-mst)#
```

spanning-tree mst instance

Use this command in Interface Configuration mode to assign a Multiple Spanning Tree instance (MSTI) to a switch port or channel group.

Note that ports are automatically configured to send and receive spanning-tree information for the associated MSTI when VLANs are assigned to MSTIs using the **instance vlan (MSTP)** command.

Use the **no** variant of this command in Interface Configuration mode to remove the MSTI from the specified switch port or channel group.

Syntax

```
spanning-tree mst instance <instance-id>
no spanning-tree mst instance <instance-id>
```

Parameter	Description
<instance-id>	<1-15> Specify the MST instance ID. The MST instance must have already been created using the **instance vlan (MSTP)** command.

Default A port automatically becomes a member of an MSTI when it is assigned to a VLAN.

Mode Interface Configuration mode for a switch port or channel group.

Usage You can disable automatic configuration of member ports of a VLAN to an associated MSTI by using a **no spanning-tree mst instance** command to remove the member port from the MSTI. Use the **spanning-tree mst instance** command to add a VLAN member port back to the MSTI.

Examples

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree mst instance 3

awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no spanning-tree mst instance 3
```

Related Commands

instance vlan (MSTP)
spanning-tree mst instance path-cost
spanning-tree mst instance priority
spanning-tree mst instance restricted-role
spanning-tree mst instance restricted-tcn

spanning-tree mst instance path-cost

Use this command in Interface Configuration mode for a switch port interface only to set the cost of a path associated with a switch port, for the specified MSTI (Multiple Spanning Tree Instance) identifier.

This specifies the switch port's contribution to the cost of a path to the MSTI regional root via that port. This applies when the port is the root port for the MSTI.

Use the **no** variant of this command to restore the default cost value of the path.

Syntax

```
spanning-tree mst instance <instance-id> path-cost <path-cost>
no spanning-tree mst instance <instance-id> path-cost
```

Parameter	Description
<instance-id>	Specify the MSTI identifier in the range <1-15>.
<path-cost>	Specify the cost of path in the range of <1-200000000>, where a lower path-cost indicates a greater likelihood of the specific interface becoming a root.

Default

The default path cost values and the range of recommended path cost values depend on the port speed, as shown in the following table from the IEEE 802.1q-2003 standard.

Port speed	Default path cost	Recommended path cost range
Less than 100 Kb/s	200,000,000	20,000,000-200,000,000
1Mbps	20,000,000	2,000,000-20,000,000
10Mbps	2,000,000	200,000-2,000,000
100 Mbps	200,000	20,000-200,000
1 Gbps	20,000	2,000-20,000
10 Gbps	2,000	200-2, 000
100 Gbps	200	20-200
1Tbps	20	2-200
10 Tbps	2	2-20

Mode

Interface Configuration mode for a switch port interface only.

Usage

Before you can use this command to set a path-cost in a VLAN configuration, you must explicitly add an MST instance to a port using the `spanning-tree instance` command.

Examples

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree mst instance 3 path-cost 1000
```

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no spanning-tree mst instance 3 path-cost
```

Related Commands

instance vlan (MSTP)
spanning-tree mst instance
spanning-tree mst instance priority
spanning-tree mst instance restricted-role
spanning-tree mst instance restricted-tcn

spanning-tree mst instance priority

Use this command in Interface Configuration mode for a switch port interface only to set the port priority for an MST instance (MSTI).

Use the **no** variant of this command to restore the default priority value (128).

Syntax

```
spanning-tree mst instance <instance-id> priority <priority>
no spanning-tree mst instance <instance-id> [priority]
```

Parameter	Description
<instance-id>	Specify the MSTI identifier in the range <1-15>.
<priority>	This must be a multiple of 16 and within the range <0-240>. A lower priority indicates greater likelihood of the port becoming the root port.

Default The default is 128.

Mode Interface Configuration mode for a switch port interface.

Usage This command sets the value of the priority field contained in the port identifier. The MST algorithm uses the port priority when determining the root port for the switch in the MSTI. The port with the lowest value is considered to have the highest priority and will be chosen as root port over a port - equivalent in all other aspects - but with a higher priority value.

Examples

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree mst instance 3 priority 112

awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no spanning-tree mst instance 3 priority
```

Related Commands

instance vlan (MSTP)
spanning-tree priority (port priority)
spanning-tree mst instance
spanning-tree mst instance path-cost
spanning-tree mst instance restricted-role
spanning-tree mst instance restricted-tcn

spanning-tree mst instance restricted-role

Use this command in Interface Configuration mode for a switch port interface only to enable the restricted role for an MSTI (Multiple Spanning Tree Instance) on a switch port. Configuring the restricted role for an MSTI on a switch port prevents the switch port from becoming the root port in a spanning tree topology.

Use the **no** variant of this command to disable the restricted role for an MSTI on a switch port. Removing the restricted role for an MSTI on a switch port allows the switch port to become the root port in a spanning tree topology.

Syntax

```
spanning-tree mst instance <instance-id> restricted-role
no spanning-tree mst instance <instance-id> restricted-role
```

Parameter	Description
<instance-id>	<1-15> Specify the MST instance ID. The MST instance must have already been created using the **instance vlan (MSTP)** command.

Default The restricted role for an MSTI instance on a switch port is disabled by default.

Mode Interface Configuration mode for a switch port interface only.

Usage The root port is the port providing the best path from the bridge to the root bridge. Use this command to disable a port from becoming a root port. Use the **no** variant of this command to enable a port to become a root port. See **Spanning tree operation** for root port information.

Examples

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree mst instance 3
restricted-role

awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no spanning-tree mst instance 3
restricted-role
```

Related Commands

instance vlan (MSTP)
spanning-tree priority (port priority)
spanning-tree mst instance
spanning-tree mst instance path-cost
spanning-tree mst instance restricted-tcn

spanning-tree mst instance restricted-tcn

Use this command in Interface Configuration mode for a switch port interface only to set the restricted TCN (Topology Change Notification) value to TRUE for the specified MSTI (Multiple Spanning Tree Instance).

Use the **no** variant of this command in Interface Configuration mode to reset the restricted TCN for the specified MSTI to the default value of FALSE.

Syntax

```
spanning-tree mst instance <instance-id> restricted-tcn
no spanning-tree mst instance <instance-id> restricted-tcn
```

Parameter	Description
<instance-id>	<1-15> Specify the MST instance ID. The MST instance must have already been created using the **instance vlan (MSTP)** command.

Default The default value for restricted TCNs is FALSE, as reset with the **no** variant of this command.

Mode Interface Configuration mode for a switch port interface only.

Usage A Topology Change Notification (TCN) is a simple Bridge Protocol Data Unit (BPDU) that a bridge sends out to its root port to signal a topology change. You can configure restricted TCN between TRUE and FALSE values with this command and the **no** variant of this command.

If you configure restricted TCN to TRUE with this command then this stops the switch port from propagating received topology change notifications and topology changes to other switch ports.

If you configure restricted TCN to FALSE with the **no** variant of this command then this enables the switch port to propagate received topology change notifications and topology changes to other switch ports.

Examples

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree mst instance 3 restricted-tcn

awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no spanning-tree mst instance 3
restricted-tcn
```

Related Commands

instance vlan (MSTP)
spanning-tree priority (port priority)
spanning-tree mst instance
spanning-tree mst instance path-cost
spanning-tree mst instance restricted-role

spanning-tree path-cost

Use this command in Interface Configuration mode for a switch port interface only to set the cost of a path for the specified port. This value then combines with others along the path to the root bridge in order to determine the total cost path value from the particular port, to the root bridge. The lower the numeric value, the higher the priority of the path. This applies when the port is the root port.

Use this command for RSTP, STP or MSTP. When MSTP mode is configured, this will apply to the port's path cost for the CIST.

Syntax

```
spanning-tree path-cost <pathcost>
no spanning-tree path-cost
```

Parameter	Description
<pathcost>	<1-200000000> The cost to be assigned to the port.

Default The default path cost values and the range of recommended path cost values depend on the port speed, as shown in the following table from the IEEE 802.1q-2003 and IEEE 802.1d-2004 standards.

Port speed	Default path cost	Recommended path cost range
Less than 100 Kb/s	200,000,000	20,000,000-200,000,000
1Mbps	20,000,000	2,000,000-20,000,000
10Mbps	2,000,000	200,000-2,000,000
100 Mbps	200,000	20,000-200,000
1 Gbps	20,000	2,000-20,000
10 Gbps	2,000	200-2, 000
100 Gbps	200	20-200
1Tbps	20	2-200
10 Tbps	2	2-20

Mode Interface Configuration mode for switch port interface only.

Example

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree path-cost 123
```

spanning-tree portfast (STP)

Use this command in Interface Configuration mode for a switch port interface only to set a port as an edge-port. The portfast feature enables a port to rapidly move to the forwarding state, without having first to pass through the intermediate spanning tree states. This command has the same effect as the **spanning-tree edgeport (RSTP and MSTP)** command, but the configuration displays differently in the output of some show commands.

Note

You can run either of two additional parameters with this command. To simplify the syntax these are documented as separate commands. See the following additional portfast commands:

- **spanning-tree portfast bpdu-filter** command on page 21.60
- **spanning-tree portfast bpdu-guard** command on page 21.62.

You can obtain the same effect by running the **spanning-tree edgeport (RSTP and MSTP)** command. However, the configuration output may display differently in some show commands.

Use the **no** variant of this command to set a port to its default state (not an edge-port).

Syntax

```
spanning-tree portfast

no spanning-tree portfast
```

Default Not an edge port.

Mode Interface Configuration mode for a switch port interface only.

Usage Portfast makes a port move from a blocking state to a forwarding state, bypassing both listening and learning states. The portfast feature is meant to be used for ports connected to end-user devices not switches. Enabling portfast on ports that are connected to a workstation or server allows devices to connect to the network without waiting for spanning-tree to converge.

For example, you may need hosts to receive a DHCP address quickly and waiting for STP to converge would cause the DHCP request to time out. Ensure you do not use portfast on any ports connected to another switch to avoid creating a spanning-tree loop on the network.

Use this command on a switch port that connects to a LAN with no other bridges attached. An edge port should never receive BPDUs. Therefore if an edge port receives a BPDU, the portfast feature takes one of three actions.

- Cease to act as an edge port and pass BPDUs as a member of a spanning tree network (**spanning-tree portfast (STP)** command disabled).
- Filter out the BPDUs and pass only the data and continue to act as a edge port (**spanning-tree portfast bpdu-filter** command enabled)
- Block the port to all BPDUs and data (**spanning-tree portfast bpdu-guard** command enabled).

Example

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree portfast
```

Related Commands

spanning-tree edgeport (RSTP and MSTP)
show spanning-tree
spanning-tree portfast bpdu-filter
spanning-tree portfast bpdu-guard

spanning-tree portfast bpdu-filter

This command sets the bpdu-filter feature and applies a filter to any BPDUs (Bridge Protocol Data Units) received. Enabling this feature ensures that configured ports will not transmit any BPDUs and will ignore (filter out) any BPDUs received. BPDU Filter is not enabled on a port by default.

Using the **no** variant of this command to turn off the bpdu-filter, but retain the port's status as an enabled port. If the port then receives a BPDU it will change its role from an **edge-port** to a **non edge-port**.

Syntax (Global Configuration)

```
spanning-tree portfast bpdu-filter

no spanning-tree portfast bpdu-filter
```

Syntax (Interface Configuration)

```
spanning-tree portfast bpdu-filter {default|disable|enable}

no spanning-tree portfast bpdu-filter
```

Parameter	Description	
`bpdu-filter`	A port that has bpdu-filter enabled will not transmit any BPDUs and will ignore any BPDUs received. This port type has one of the following parameters (in Interface Configuration mode):	
	`default`	Takes the setting that has been configured for the whole switch, i.e. the setting made from the Global configuration mode.
	`disable`	Turns off BPDU filter.
	`enable`	Turns on BPDU filter.

Default BPDU Filter is not enabled on any ports by default.

Mode Global Configuration and Interface Configuration

Usage This command filters the BPDUs and passes only data to continue to act as an edge port. Using this command in Global Configuration mode applies the portfast bpdu-filter feature to all ports on the switch. Using it in Interface mode applies the feature to a specific port, or range of ports.The command will operate in both RSTP and MSTP networks.

Use the **show spanning-tree** command to display status of the bpdu-filter parameter for the switch ports.

Example To enable STP BPDU filtering in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# spanning-tree portfast bpdu-filter
```

To enable STP BPDU filtering in Interface Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree portfast bpdu-filter enable
```

Related Commands
spanning-tree edgeport (RSTP and MSTP)
show spanning-tree

spanning-tree portfast bpdu-guard

spanning-tree portfast bpdu-guard

This command applies a BPDU (Bridge Protocol Data Unit) guard to the port. A port with the bpdu-guard feature enabled will block all traffic (BPDUs and user data), if it starts receiving BPDUs.

Use this command in Global Configuration mode to apply BPDU guard to all ports on the switch. Use this command in Interface mode for an individual interface or a range of interfaces specified. BPDU Guard is not enabled on a port by default.

Use the **no** variant of this command to disable the BPDU Guard feature on a switch in Global Configuration mode or to disable the BPDU Guard feature on a port in Interface mode.

Syntax (Global Configuration)

```
spanning-tree portfast bpdu-guard

no spanning-tree portfast bpdu-guard
```

Syntax (Interface Configuration)

```
spanning-tree portfast bpdu-guard {default|disable|enable}

no spanning-tree portfast bpdu-guard
```

Parameter	Description	
`bpdu-guard`	A port that has bpdu-guard turned on will enter the STP blocking state if it receives a BPDU. This port type has one of the following parameters (in Interface Configuration mode):	
	`default`	Takes the setting that has been configured for the whole switch, i.e. the setting made from the Global configuration mode.
	`disable`	Turns off BPDU guard.
	`enable`	Turns on BPDU guard and will also set the port as an edge port.

Default BPDU Guard is not enabled on any ports by default.

Mode Global Configuration or Interface Configuration

Usage This command blocks the port(s) to all BPDUs and data when enabled. BPDU Guard is a port-security feature that changes how a portfast-enabled port behaves if it receives a BPDU. When **bpdu-guard** is set, then the port shuts down if it receives a BPDU. It does not process the BPDU as it is considered suspicious. When **bpdu-guard** is not set, then the port will negotiate spanning-tree with the device sending the BPDUs. By default, bpdu-guard is not enabled on a port.

You can configure a port disabled by the bpdu-guard to re-enable itself after a specific time interval. This interval is set with the **spanning-tree errdisable-timeout interval** command on page 21.41. If you do not use the **errdisable-timeout** feature, then you will need to manually re-enable the port by using the **no shutdown** command.

Use the **show spanning-tree** command on page 21.14 to display the switch and port configurations for the BPDU Guard feature. It shows both the administratively configured and currently running values of bpdu-guard.

Example To enable STP BPDU guard in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# spanning-tree portfast bpdu-guard
```

To enable STP BPDU guard in Interface Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree portfast bpdu-guard enable
```

Related Commands
spanning-tree edgeport (RSTP and MSTP)
show spanning-tree
spanning-tree portfast (STP)
spanning-tree portfast bpdu-filter

spanning-tree priority (bridge priority)

Use this command to set the bridge priority for the switch. A lower priority value indicates a greater likelihood of the switch becoming the root bridge.

Use this command for RSTP, STP or MSTP. When MSTP mode is configured, this will apply to the CIST.

Use the **no** variant of this command to reset it to the default.

Syntax

```
spanning-tree priority <priority>
no spanning-tree priority
```

Parameter	Description
<priority>	<0-61440> The bridge priority, which will be rounded to a multiple of 4096.

Default The default priority is 32678.

Mode Global Configuration

Usage To force a particular switch to become the root bridge use a lower value than other switches in the spanning tree.

Example

```
awplus# configure terminal
awplus(config)# spanning-tree priority 4096
```

Related Commands **spanning-tree mst instance priority**
show spanning-tree

spanning-tree priority (port priority)

Use this command in Interface Configuration mode for a switch port interface only to set the port priority for port. A lower priority value indicates a greater likelihood of the port becoming part of the active topology.

Use this command for RSTP, STP, or MSTP. When the device is in MSTP mode, this will apply to the CIST.

Use the **no** variant of this command to reset it to the default.

Syntax

```
spanning-tree priority <priority>
no spanning-tree priority
```

Parameter	Description
<priority>	<0-240>, in increments of 16. The port priority, which will be rounded down to a multiple of 16.

Default The default priority is 128.

Mode Interface Configuration mode for a switch port interface only.

Usage To force a port to be part of the active topology (for instance, become the root port or a designated port) use a lower value than other ports on the device. (This behavior is subject to network topology, and more significant factors, such as bridge ID.)

Example

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree priority 16
```

Related Commands

spanning-tree mst instance priority
spanning-tree priority (bridge priority)
show spanning-tree

spanning-tree restricted-role

Use this command in Interface Configuration mode for a switch port interface only to restrict the port from becoming a root port.

Use the **no** variant of this command to disable the restricted role functionality.

Syntax

```
spanning-tree restricted-role
no spanning-tree restricted-role
```

Default The restricted role is disabled.

Mode Interface Configuration mode for a switch port interface only.

Example

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree restricted-role
```

spanning-tree restricted-tcn

Use this command in Interface Configuration mode for a switch port interface only to prevent TCN (Topology Change Notification) BPDUs (Bridge Protocol Data Units) from being sent on a port. If this command is enabled, after a topology change a bridge is prevented from sending a TCN to its designated bridge.

Use the **no** variant of this command to disable the restricted TCN functionality.

Syntax

```
spanning-tree restricted-tcn
no spanning-tree restricted-tcn
```

Default The restricted TCN is disabled.

Mode Interface Configuration mode for a switch port interface only.

Example

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree restricted-tcn
```

spanning-tree transmit-holdcount

Use this command to set the maximum number of BPDU transmissions that are held back.

Use the **no** variant of this command to restore the default transmit hold-count value.

Syntax

```
spanning-tree transmit-holdcount
no spanning-tree transmit-holdcount
```

Default Transmit hold-count default is 3.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# spanning-tree transmit-holdcount
```

undebug mstp

This command applies the functionality of the **no debug mstp (RSTP and STP)** command.

Chapter 22: Link Aggregation Introduction and Configuration

Introduction and Overview 22.2
Static and Dynamic (LACP) Link Aggregation 22.3
Static Channel Groups 22.3
Dynamic (LACP) Channel Groups 22.3
Link Aggregation Control Protocol (LACP) 22.3
Configuring an LACP Channel Group 22.5
Minimal LACP Group Configuration 22.8
Configuring a Static Channel Group 22.9

Introduction and Overview

This chapter contains two sample Link Aggregation Control Protocol (LACP), or dynamic channel group, configurations and a sample static channel group configuration.

Link aggregation is the process where two or more ports in an Ethernet switch are combined together to operate as a single virtual port.

Link aggregation is a key component in resilient network design, since it increases the available bandwidth between network devices and it provides continuity of connectivity if one link is broken between network devices.

By aggregating two or more links together, you can increase the bandwidth between neighboring devices since this is effectively additive, where two links give up to twice the bandwidth of one link. Having more than one link to a neighboring device provides connectivity if one of the links break, where a feature of this resiliency is the speed at which link aggregation reacts to the change of link status in a matter of millisecond.

A link aggregation can only exist between a pair of neighboring switches, where the switch ports that are aggregated on one switch cannot be connected to switch ports that are not aggregated on the other switch. A switch can have multiple link aggregations to different neighbors, even to the same neighbor if the network is loop protected.

To see details about the commands used to configure dynamic (LACP) and static Link aggregation, see **Chapter 23, Link Aggregation Commands**.

For a brief overview of static and dynamic link aggregation (LACP), see **Static and Dynamic (LACP) Link Aggregation**.

Static and Dynamic (LACP) Link Aggregation

Channels, either static or dynamic LACP, increase reliability by distributing the data path over more than one physical link. Channels must be configured on both ends of a link or network loops may result. Ports in a channel group need not be contiguous. A mirror port cannot be a member of either a static or a dynamic channel group.

Aggregation criteria

For individual links to be aggregated into a channel group they must:

- originate on the same device or stack
- terminate on the same device or stack
- be members of the same VLANs (**vlan** command on page 19.35)
- have the same data rate (**speed** command on page 17.63)
- share the same admin port key (assigned by using the **channel-group** command on page 23.4 command)
- be operating in full duplex mode (**duplex** command on page 17.11)

The hardware must also be capable and have the capacity to handle the number of links to be aggregated.

Static Channel Groups

A static channel group, also known as a static aggregator, enables a number of ports to be manually configured to form a single logical connection of higher bandwidth. By using static channel groups you increase channel reliability by distributing the data path over more than one physical link. Static channel groups are best used in simpler environments, usually where neighbor switches are close together, situated within the same rack, so that you can easily ensure that the correct statically aggregated ports are connected together.

For a static channel group configuration example see the **Configuring a Static Channel Group** section in this chapter. For details of static channel group commands, such as the **static-channel-group** command, see **Chapter 23, Link Aggregation Commands**.

Dynamic (LACP) Channel Groups

A LACP channel group, also known as an etherchannel, a LACP aggregator, or a dynamic channel group, enables a number of ports to be dynamically combined to form a single higher bandwidth logical connection. LACP channel groups are best used for complex environments, typically long-distance links, to detect failure between neighbor switches.

For LACP configuration examples see **Configuring an LACP Channel Group** and **Minimal LACP Group Configuration** sections in this chapter. For details of LACP channel group commands, such as the **channel-group** command, see **Chapter 23, Link Aggregation Commands**.

Link Aggregation Control Protocol (LACP)

LACP is based on the IEEE Standard 802.3ad. It allows bundling of several physical ports to form a single logical channel providing enhanced performance and resiliency. The aggregated channel is viewed as a single link by each switch. Spanning tree also views the channel as one interface and not as multiple interfaces. When there is a failure in one physical port, the other ports stay up and there is no disruption.

This device supports the aggregation of a maximum of eight physical ports into a single channel group.

Note

AlliedWare Plus™ supports IEEE 802.3ad link aggregation and uses the Link Aggregation Control Protocol (LACP). LACP does not interoperate with devices that use Port Aggregation Protocol (PAgP).

Note

Link aggregation does not necessarily achieve exact load balancing across the links. The load sharing algorithm is designed to ensure that any given data flow always goes down the same link. It also aims to spread data flows across the links as evenly as possible.

Link aggregation hashes the source and destination MAC address, IP address and UDP/TCP ports to select a link on which to send a packet. So packet flow between a pair of hosts always takes the same link inside the Link Aggregation Group (LAG). The net effect is that the bandwidth for a given packet stream is restricted to the speed of one link in the LAG.

For example, for a 2 Gbps LAG that is a combination of two 1 Gbps ports, one flow of traffic can only ever reach a maximum throughput of 1 Gbps. However, the hashing algorithm should spread the flows across the links so that when many flows are operating, the full 2 Gbps can be utilized.

For information about load balancing see the **platform load-balancing** command.

LACP operates where systems are connected over multiple communications links. Once LACP has been initially configured and enabled, it automatically aggregates the ports that have been assigned to a channel group, if possible. LACP continues to monitor these groups and dynamically adds or removes links to them as network changes occur.

LACP achieves this by determining:

- which ports are under LACP control (**channel-group** command on page 23.4)
- whether each port is in LACP active or LACP passive mode (**channel-group** command on page 23.4)
- which system has the highest LACP priority (**lacp system-priority** command on page 23.8)
- the LACP priority of ports (**lacp port-priority** command on page 23.7)
- whether the LACP timeout is short or long (**lacp timeout** command on page 23.9)

Channel group identification

In order to identify particular channel groups, each group is assigned a link aggregation identifier called a **lag ID**. The lag ID comprises the following components for both the local system (called the Actor) followed by their equivalent components for the remote system (called the Partner):

- system identifier - the MAC address of the system
- port key - An identifier - created by the LACP software
- port priority - set by the **lacp port-priority** command on page 23.7
- port number - determined by the device connection

The lag ID can be displayed for each aggregated link by entering the **show etherchannel** command on page 23.13.

Configuring an LACP Channel Group

The following example shows how to configure three links between two Allied Telesis managed Layer 3 Switches. The three links are assigned the same administrative key (1), so that they aggregate to form a single channel (1). They are viewed by the STP as one interface.

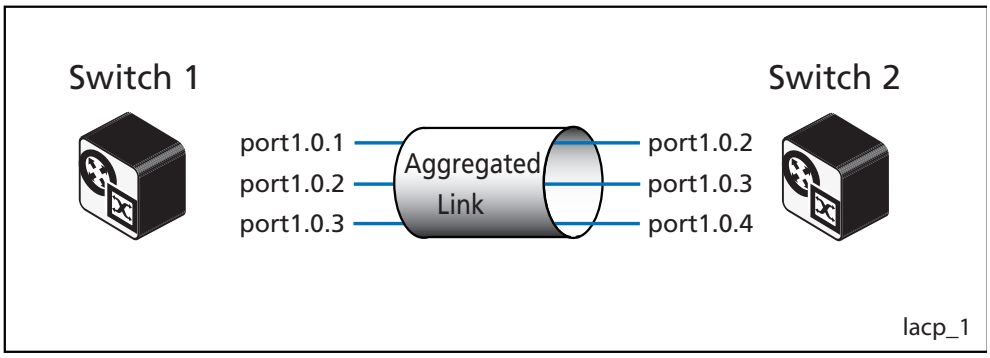

Table 22-1: Switch 1 configuration

`awplus#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config)#` `lacp system-priority 20000`	Set the system priority of this switch. This priority is used to determine which switch in the system is responsible for resolving conflicts in the choice of aggregation groups. A lower numerical value has a higher priority. Switch 1 has a higher priority than Switch 2 in this configuration.
`awplus(config)#` `interface port1.0.1`	Enter the Interface Configuration mode to configure port `1.0.1`.
`awplus(config-if)#` `channel-group 1 mode active`	Add this interface to a channel group `1` and enable link aggregation so that it may be selected for aggregation by the local system.
`awplus(config-if)#` `exit`	Exit the Interface Configuration mode and return to the Global Configure mode.
`awplus(config)#` `interface port1.0.2`	Enter the Interface Configuration mode to configure port `1.0.2`.
`awplus(config-if)#` `channel-group 1 mode active`	Add this interface to a channel group `1` and enable link aggregation so that it may be selected for aggregation by the local system.

Table 22-1: Switch 1 configuration (cont.)

`awplus(config-if)#` `exit`	Exit the Interface Configuration mode and return to the Global Configure mode.
`awplus(config)#` `interface port1.0.3`	Enter the Interface Configuration mode to configure port `1.0.3`.
`awplus(config-if)#` `channel-group 1 mode active`	Add this interface to a channel group `1` and enable link aggregation so that it may be selected for aggregation by the local system.
`awplus(config-if)#` `interface po1`	Select the dynamic aggregator logical interface created for channel-group 1 named `po1`.

Table 22-2: Switch 2 configuration

`awplus#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config)#` `lacp system-priority 3000`	Set the system priority of this switch. This priority is used to determine which switch in the system is responsible for resolving conflicts in the choice of aggregation groups. A lower numerical value has a higher priority. Switch 2 has a lower priority than Switch 1 in this configuration.
`awplus(config)#` `interface port1.0.2`	Enter the Interface Configuration mode to configure port `1.0.2`.
`awplus(config-if)#` `channel-group 1 mode active`	Add this interface to a channel group `1` and enable link aggregation so that it may be selected for aggregation by the local system.
`awplus(config-if)#` `exit`	Exit the Interface mode and return to the Configure mode.
`awplus(config)#` `interface port1.0.3`	Enter the Interface mode to configure port `1.0.3`.
`awplus(config-if)#` `channel-group 1 mode active`	Add this interface to a channel group `1` and enable link aggregation so that it may be selected for aggregation by the local system.

Table 22-2: Switch 2 configuration

`awplus(config-if)#`	
`exit`	Exit the Interface Configuration mode and return to the Global Configuration mode.
`awplus(config)#`	
`interface port1.0.4`	Enter the Interface Configuration mode to configure port `1.0.4`.
`awplus(config-if)#`	
`channel-group 1 mode active`	Add this interface to a channel group `1` and enable link aggregation so that it may be selected for aggregation by the local system.
`awplus(config-if)#`	
`interface po1`	Select the dynamic aggregator logical interface created for channel-group 1 named `po1`.

Commands Used

lacp system-priority
channel-group

Validation Commands

show lacp sys-id
show port etherchannel
show etherchannel
show etherchannel detail

Minimal LACP Group Configuration

For details of LACP channel group commands, see **Chapter 23, Link Aggregation Commands**.

The following minimal LACP group configuration example creates LACP channel group 2 and enables link aggregation on switch ports `1.0.1` and `1.0.2` within this channel group. Note that all aggregated ports must belong to the same VLAN.

`awplus#` `configure terminal`	Enter Global Configuration mode.
`awplus(config)#` `interface port1.0.1-port1.0.2`	Enter the Interface Configuration mode for the switch ports to aggregate into the channel group.
`awplus(config-if)#` `channel-group 2 mode active`	Assign the switch ports to channel group `2` in active mode. This creates the channel group.
`awplus(config-if)#` `interface po2`	Select the dynamic aggregator logical interface created for channel-group 2 named `po2`.

Commands Used **channel-group**

Validation Commands **show static-channel-group**

Configuring a Static Channel Group

For details of LACP channel group commands, see **Chapter 23, Link Aggregation Commands**.

The following example creates a static channel group and adds switch ports `1.0.1` and `1.0.2`.

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`interface port1.0.1`	Enter the Interface Configuration mode to configure port `1.0.1`.
`awplus(config-if)#`	
`static-channel-group 2`	Add port `1.0.1` to static-channel-group `2`.
`awplus(config-if)#`	
`exit`	Exit the Interface Configuration mode and return to the Global Configuration mode.
`awplus(config)#`	
`interface port1.0.2`	Enter the Interface Configuration mode to configure port `1.0.2`.
`awplus(config-if)#`	
`static-channel-group 2`	Add port `1.0.2` to static-channel-group `2`.
`awplus(config-if)#`	
`interface sa2`	Select the static aggregator logical interface created for static-channel-group 2 named `sa2`.

Commands Used **static-channel-group**

Validation Commands **show static-channel-group**

Introduction

This chapter provides an alphabetical reference of commands used to configure a static channel group (static aggregator) and dynamic channel group (LACP channel group, etherchannel or LACP aggregator). Link aggregation is also sometimes referred to as channelling.

Note

AlliedWare Plus™ supports IEEE 802.3ad link aggregation and uses the Link Aggregation Control Protocol (LACP). LACP does not interoperate with devices that use Port Aggregation Protocol (PAgP).

Note

LACP does not perform load balancing. The LACP algorithm is based on the packet flow. Link aggregation (LAG) hashes the source and destination MAC address, IP address and UDP/TCP ports to select a port on which to send a packet. So packet flow between a pair of hosts always takes the same port inside the LAG. The net effect is that the bandwidth for one packet stream is restricted to the speed of one link in the LAG. For example, for a 2 Gbps LAG that is a combination of two 1 Gbps ports, one flow of traffic can only ever reach a maximum throughput of 1 Gbps.

For information about load balancing see the **platform load-balancing** command on page 17.31 command.

For a description of static and dynamic link aggregation (LACP), see **"Configuring an LACP Channel Group" on page 22.5**. For an LACP configuration example, see **Chapter 22, Link Aggregation Introduction and Configuration**.

Command List

clear lacp counters

Use this command to clear all counters of all present LACP aggregators (channel groups) or a given LACP aggregator.

Syntax `clear lacp [<1-32>] counters`

Parameter	Description
<1-32>	Channel-group number.

Mode Privileged Exec

Example

```
awplus# clear lacp 2 counters
```

channel-group

Use this command to create an dynamic channel group containing the port, or add a port to an existing LACP channel group, to enable LACP link aggregation on the port so that it can be selected for aggregation by the local system, and to set the mode.

Use the **no** variant of this command to turn off link aggregation on the switch port. You will be returned to Global Configuration mode from Interface Configuration mode.

Syntax

```
channel-group <dynamic-channel-group-number> mode {active|passive}
no channel-group
```

Parameter	Description
<dynamic-channel-group-number>	<1-32> Specify a dynamic channel group number for an LACP link. If the switch silicon profile is not set to **extended**, you can create up to 31 channel groups (dynamic and/or static channel groups). SBx908 only: If the switch's silicon profile is set to **extended**, you can create up to 32 dynamic (LACP) channel groups (as well as up to 96 static channel groups). Each channel group can include up to 8 ports. The silicon profiles are hardware dependent—see the **platform silicon-profile** command on page 17.34
`active`	Enables initiation of LACP negotiation on a port. The port will transmit LACP dialogue messages whether or not it receives them from the partner system.
`passive`	Disables initiation of LACP negotiation on a port. The port will only transmit LACP dialogue messages if the partner systems is transmitting them, i.e. the partner is in the active mode.

Mode Interface Configuration

Usage All the switch ports in a channel-group must belong to the same VLANs, have the same tagging status, and can only be operated on as a group. All switch ports within a channel group must have the same port speed and be in full duplex mode.

Once the LACP channel group has been created, it is treated as a switch port, and can be referred to in most other commands that apply to switch ports.

To refer to an LACP channel group in other LACP commands, use the channel group number. To specify an LACP channel group (LACP aggregator) in other commands, prefix the channel group number with **po**. For example, '`po4`' refers to the LACP channel group with channel group number `4`.

For more on LACP, see **"Dynamic (LACP) Channel Groups" on page 22.3** and **Chapter 22, Link Aggregation Introduction and Configuration**.

Examples

To add switch `port1.0.10` to a newly created LACP channel group 4 use the commands below:

```
awplus# configure terminal
awplus(config)# interface port1.0.10
awplus(config-if)# channel-group 4 mode active
```

To remove switch `port1.0.8` from any created LACP channel groups use the command below:

```
awplus# configure terminal
awplus(config)# interface port1.0.8
awplus(config-if)# no channel-group
awplus(config)#
```

To reference the pre-defined LACP channel group 2 as an interface, apply commands as below:

```
awplus# configure terminal
awplus(config)# interface port1.0.8
awplus(config-if)# channel-group 2 mode active
awplus(config-if)# exit
awplus(config)# interface port.1.0.10
awplus(config-if)# channel-group 2 mode active
awplus(config-if)# exit
awplus(config)# interface po2
awplus(config-if)#
```

Related Commands

platform silicon-profile
show etherchannel
show etherchannel detail
show etherchannel summary
show port etherchannel

debug lacp

Use this command to enable all LACP troubleshooting functions.

Use the **no** variant of this command to disable this function.

Syntax

```
debug lacp {all|cli|event|ha|packet|sync|timer[detail]}
no debug lacp {all|cli|event|ha|packet|sync|timer[detail]}
```

Parameter	Description
`all`	Turn on all debugging for LACP.
`cli`	Specifies debugging for CLI messages. Echoes commands to the console.
`event`	Specifies debugging for LACP events. Echoes events to the console.
`ha`	Specifies debugging for HA (High Availability) events. Echoes High Availability events to the console.
`packet`	Specifies debugging for LACP packets. Echoes packet contents to the console.
`sync`	Specified debugging for LACP synchronization. Echoes synchronization to the console.
`timer`	Specifies debugging for LACP timer. Echoes timer expiry to the console.
`detail`	Optional parameter for LACP timer-detail. Echoes timer start/stop details to the console.

Mode Privileged Exec and Global Configuration

Examples

```
awplus# debug lacp timer detail
awplus# debug lacp all
```

Related Commands **show debugging lacp**
undebug lacp

lacp port-priority

Use this command to set the priority of a switch port. Ports are selected for aggregation based on their priority, with the higher priority (numerically lower) ports selected first.

Use the **no** variant of this command to reset the priority of port to the default.

Syntax

```
lacp port-priority <1-65535>
no lacp port-priority
```

Parameter	Description
<1-65535>	Specify the LACP port priority.

Default The default is 32768.

Mode Interface Configuration

Example

```
awplus# configure terminal
awplus(config)# interface port1.0.5
awplus(config-if)# lacp port-priority 34
```

lacp system-priority

Use this command to set the system priority of a local system. This is used in determining the system responsible for resolving conflicts in the choice of aggregation groups.

Use the **no** variant of this command to reset the system priority of the local system to the default.

Syntax

```
lacp system-priority <1-65535>
no lacp system-priority
```

Parameter	Description
<1-65535>	LACP system priority. Lower numerical values have higher priorities.

Default The default is 32768.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# lacp system-priority 6700
```

lacp timeout

Use this command to set the short or long timeout on a port. Ports will time out of the aggregation if three consecutive updates are lost.

Syntax `lacp timeout {short|long}`

Parameter	Description
`timeout`	Number of seconds before invalidating a received LACP data unit (DU).
`short`	LACP short timeout. The **short** timeout value is **1** second.
`long`	LACP long timeout. The **long** timeout value is **30** seconds.

Default The default is **long** timeout (30 seconds).

Mode Interface Configuration

Usage This command enables the switch to indicate the rate at which it expects to receive LACPDUs from its neighbor.

If the timeout is set to **long**, then the switch expects to receive an update every **30** seconds, and this will time a port out of the aggregation if no updates are seen for 90 seconds (i.e. 3 consecutive updates are lost).

If the timeout is set to **short**, then the switch expects to receive an update every second, and this will time a port a port out of the aggregation if no updates are seen for 3 seconds (i.e. 3 consecutive updates are lost).

The switch indicates its preference by means of the '`Timeout`' field in the '`Actor`' section of its LACPDUs. If the '`Timeout`' field is set to 1, then the switch has set the **short** timeout. If the '`Timeout`' field is set to 0, then the switch has set the **long** timeout.

Setting the **short** timeout enables the switch to be more responsive to communication failure on a link, and does not add too much processing overhead to the switch (1 packet per second).

Note It is not possible to configure the rate that the switch sends LACPDUs; the switch must send at the rate which the neighbor indicates it expects to receive LACPDUs.

Examples The following commands set the LACP long timeout period for 30 seconds on `port1.0.2`.

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# lacp timeout long
```

The following commands set the LACP short timeout for 1 second on `port1.0.2`.

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# lacp timeout short
```

show debugging lacp

Use this command to display the LACP debugging option set.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show debugging lacp
```

Mode

User Exec and Privileged Exec

Example

```
awplus# show debugging lacp
```

Output

Figure 23-1: Example output from the show debugging lacp command

```
LACP debugging status:
 LACP timer debugging is on
 LACP timer-detail debugging is on
 LACP cli debugging is on
 LACP packet debugging is on
 LACP event debugging is on
 LACP sync debugging is on
```

Related Commands

debug lacp

show diagnostic channel-group

This command displays dynamic and static channel group interface status information. The output of this command is useful for Allied Telesis authorized service personnel for diagnostic purposes.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show diagnostic channel-group`

Mode User Exec and Privileged Exec

Example

```
awplus# show diagnostic channel-group
```

Output **Figure 23-2: Example output from the show diagnostic channel-group command**

```
awplus#show diagnostic channel-group

Channel Group Info based on NSM:
Note: Pos - position in hardware table
-------------------------------------------------------------
Dev  Interface  IfIndex  Member port  IfIndex  Active  Pos
-------------------------------------------------------------
     sa3        4503     port1.0.15   5015     No
     sa3        4503     port1.0.18   5018     No
     po1        4601     port1.0.7    5007     No

```

Related Commands **show tech-support**

show etherchannel

Use this command to display information about a LACP channel specified by the channel group number.

The command output also shows the thrash limiting status. If thrash limiting is detected and the **thrash limiting** parameter of the **thrash-limiting** command on page 17.70 is set to **vlan disable**, the output will also show the VLANs on which thrashing is detected.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show etherchannel [<1-32>]`

Parameter	Description
<1-32>	Channel-group number.

Mode User Exec and Privileged Exec

Example

```
awplus# show etherchannel 5
```

Output **Figure 23-3: Example output from the show etherchannel command**

```
% Lacp Aggregator: po1
 Thrash-limiting
 Status Vlan Thrashing Detected, Action vlan-disable 60(s)
 Thrashing Vlans 1 2 3 4 5
% Member:
   port1.0.4
   port1.0.8
```

show etherchannel detail

Use this command to display detailed information about all LACP channels.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show etherchannel detail`

Mode User Exec and Privileged Exec

Example

```
awplus# show etherchannel detail
```

Output **Figure 23-4: Example output from the show etherchannel detail command**

```
% Aggregator po1 (4501)
%  Mac address: 00:00:cd:24:fd:29
%  Admin Key: 0001 - Oper Key 0001
%  Receive link count: 1 - Transmit link count: 0
%  Individual: 0 - Ready: 1
%  Partner LAG: 0x8000,00-00-cd-24-da-a7
%   Link: port1.0.1 (5001) disabled
%   Link: port1.0.2 (5002) sync: 1
% Aggregator po2 (4502)
%  Mac address: 00:00:cd:24:fd:29
%  Admin Key: 0002 - Oper Key 0002
%  Receive link count: 1 - Transmit link count: 0
%  Individual: 0 - Ready: 1
%  Partner LAG: 0x8000,00-00-cd-24-da-a7
%   Link: port1.0.7 (5007) disabled
```

show etherchannel summary

Use this command to display a summary of all LACP channels.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show etherchannel summary`

Mode User Exec and Privileged Exec

Example

```
awplus# show etherchannel summary
```

Output **Figure 23-5: Example output from the show etherchannel summary command**

```
% Aggregator po1
%  Admin Key: 0001 - Oper Key 0001
%   Link: port1.0.1 (5001) disabled
%   Link: port1.0.2 (5002) sync: 1
% Aggregator po2
%  Admin Key: 0002 - Oper Key 0002
%   Link: port1.0.7 (5007) disabled
```

show lacp-counter

Use this command to display the packet traffic on all ports of all present LACP aggregators, or a given LACP aggregator.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show lacp-counter [<1-32>]`

Parameter	Description
<1-32>	Channel-group number.

Mode User Exec and Privileged Exec

Example

```
awplus# show lacp-counter 2
```

Output **Figure 23-6: Example output from the show lacp-counter command**

```
% Traffic statistics
Port          LACPDUs          Marker          Pckt err

% Aggregator po4 (4604)
port1.0.2   0       0        0       0        0       0
```

show lacp sys-id

Use this command to display the LACP system ID and priority.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show lacp sys-id`

Mode User Exec and Privileged Exec

Example

```
awplus# show lacp sys-id
```

Output **Figure 23-7: Example output from the show lacp sys-id command**

```
% System Priority: 0x8000 (32768)
% MAC Address: 00-00-cd-24-fd-29
```

show port etherchannel

Use this command to show LACP details of the switch port specified.

For information on output options, see "Controlling "show" Command Output" on page 1.38.

Syntax `show port etherchannel <port>`

Parameter	Description
<port>	Name of the switch port to display LACP information about.

Mode User Exec and Privileged Exec

Example

```
awplus# show port etherchannel port1.0.1
```

Output **Figure 23-8: Example output from the show port etherchannel command**

```
% Link: port1.0.1 (5001)
% Aggregator: po1 (4501)
% Receive machine state: Current
% Periodic Transmission machine state: Fast periodic

%   Expired ................ No           Expired ......................... No
```

show static-channel-group

Use this command to display all configured static channel groups and their corresponding member ports. Note that a static channel group is the same as a static aggregator.

The command output also shows the thrash limiting status. If thrash limiting is detected and the **thrash limiting** parameter of the **thrash-limiting** command on page 17.70 is set to **vlan disable**, the output will also show the VLANs on which thrashing is detected.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show static-channel-group
```

Mode

User Exec and Privileged Exec

Example

```
awplus#  show static-channel-group
```

Output

Figure 23-9: Example output from the show static-channel-group command

```
% LAG Maximum        : 128
% LAG Static  Maximum: 96
% LAG Dynamic Maximum: 32
% LAG Static  Count  : 2
% LAG Dynamic Count  : 2
% LAG Total   Count  : 4
% Static Aggregator: sa2
% Member:
   port1.0.1
% Static Aggregator: sa3
% Member:
   port1.0.2
```

Related Commands

static-channel-group

static-channel-group

Use this command to create a static channel group, also known as a static aggregator, or add a member port to an existing static channel group.

Use the **no** variant of this command to remove the switch port from the static channel group.

Syntax

```
static-channel-group <static-channel-group-number>

no static-channel-group
```

Parameter	Description
<static-channel-group-number>	<1-96> Static channel group number. If the switch silicon profile is not set to **extended**, you can create up to 31 channel groups (dynamic and/or static channel groups). If the switch's silicon profile is set to **extended**, you can create up to 96 static channel groups (as well as up to 32 dynamic (LACP) channel groups). Each channel group can include up to 8 ports. The silicon profiles are hardware dependent—see the **platform silicon-profile** command on page 17.34

Mode Interface Configuration

Usage This command adds the switch port to the static channel group with the specified channel group number. If the channel group does not exist, it is created, and the port is added to it. The **no** prefix detaches the port from the static channel group. If the port is the last member to be removed, the static channel group is deleted.

All the ports in a channel group must have the same VLAN configuration: they must belong to the same VLANs and have the same tagging status, and can only be operated on as a group.

Once the static channel group has been created, it is treated as a switch port, and can be referred to in other commands that apply to switch ports.

To refer to a static channel group in other static channel group commands, use the channel group number. To specify a static channel group in other commands, prefix the channel group number with **sa**. For example, 'sa3' refers to the static channel group with channel group number 3.

For more on static channel groups, see **"Static Channel Groups" on page 22.3** and **Chapter 22, Link Aggregation Introduction and Configuration**.

Examples To define a static channel group on a switch port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.6
awplus(config-if)# static-channel-group 3
```

To reference the pre-defined static channel group 2 as an interface apply the example commands as below:

```
awplus# configure terminal
awplus(config)# interface port1.0.8
awplus(config-if)# static-channel-group 2
awplus(config-if)# exit
awplus(config)# interface port.1.0.10
awplus(config-if)# static-channel-group 2
awplus(config-if)# exit
awplus(config)# interface sa2
awplus(config-if)#
```

Related Commands **platform silicon-profile**
show static-channel-group

undebug lacp

This command applies the functionality of the **no debug lacp** command on page 23.6.

Chapter 24: GVRP Introduction and Configuration

Introduction 24.2
GVRP Example 24.3
GVRP Guidelines 24.4
GVRP and Network Security 24.5
GVRP-inactive Intermediate Switches 24.5
Enabling GVRP on the Switch 24.5
Enabling GVRP on the Ports 24.6
Setting the GVRP Timers 24.6
Disabling GVRP on the Ports 24.7
Disabling GVRP on the Switch 24.7
Configuring and validating GVRP 24.8

Introduction

GVRP enables the automatic VLAN configuration of switches in a network by allowing GVRP enabled switches to dynamically exchange VLAN configuration information with each other. GVRP is based on GARP, which defines how attributes, like VIDs, are registered and deregistered. This makes it easier to manage VLANs that span more than one switch. Without GVRP, you have to manually configure your switches to ensure that the various parts of the VLANs can communicate with each other across the different switches. With GVRP this is done for you automatically.

The switch uses GVRP protocol data units (PDUs) to share VLAN information among GVRP-active devices. The PDUs contain the VID numbers of all the VLANs on the switch. When the switch receives a GVRP PDU on a port, it examines the PDU to determine the VIDs of the VLANs on the device that sent it. It then does the following:

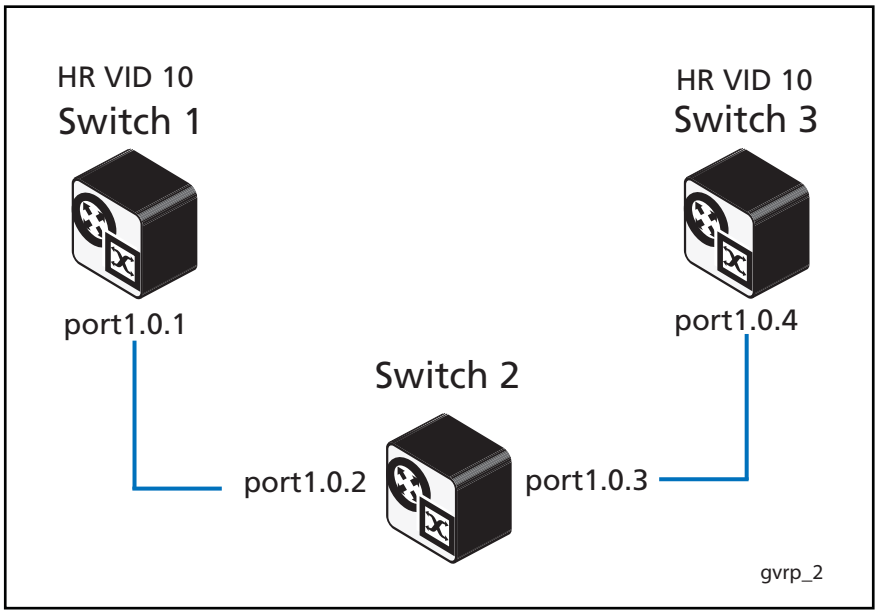
- If the PDU contains a VID of a VLAN that does not exist on the switch, it creates this VLAN and adds the port that received the PDU as a tagged member of the VLAN. A VLAN created by GVRP is called a dynamic GVRP VLAN.
- If the PDU contains a VID of a VLAN that already exists on the switch but the receiving port is not a member of it, the switch adds the port as a tagged member of the VLAN. A port that has been added by GVRP to a static VLAN (that is a user-created VLAN) is called a dynamic GVRP port.

Only GVRP can modify or delete dynamic GVRP VLANs. Dynamic GVRP VLANs exist only so long as the switch continues to receive GVRP PDUs that contain the VID of that VLAN. If there are no more relevant GVRP PDUs arriving, or there are no active links in the VLAN, GVRP deletes it from the switch.

A dynamic GVRP port in a static VLAN remains a member of the VLAN as long as the switch continues to receive GVRP PDUs that contain the VID of that VLAN. If the relevant GVRP PDUs are no longer being received on the port, then GVRP removes the dynamic port from the VLAN, but does not delete the VLAN if the VLAN is a static VLAN.

GVRP Example

The example consists of three switches. Switch 1 and Switch 3 have the HR VLAN 10, but Switch 2 is not configured with the HR VLAN 10. Consequently, the end nodes of the two parts of the HR VLAN 10 cannot communicate with each other because Switch 2 does not have VLAN 10.



Without GVRP, you would have to manually add the HR VLAN 10 to Switch 2. But with GVRP, the VLAN is added automatically. Here is how GVRP resolves this example.

1. Interface `port1.0.1` on Switch 1 sends a PDU (Protocol Data Unit) to interface `port1.0.2` on Switch 2 that contains the VIDs of all the VLANs on Switch 1, including VID 10 for the HR VLAN.

2. Switch 2 examines the PDU it receives on interface `port1.0.2` and finds that it does not have a VLAN with a VID 10. In response, it creates the VLAN as a dynamic GVRP VLAN, assigning it VID 10. Switch 2 then adds interface `port1.0.2`, the switch port that received the PDU, as a tagged member of HR VLAN 10.

3. Switch 2 sends a PDU from interface `port1.0.3` containing all the VIDs of the VLANs on the switch, including the new VID 10. Note at this point interface `port1.0.3` is not a member of VLAN 10. Ports are added to VLANs when they receive PDUs from other switches in the network, not when they transmit PDUs.

4. Switch 3 receives the PDU on interface port1.0.4 and, after examining it, finds that one of the VLANs on Switch 2 has the VID 10, which matches the VID of an already existing VLAN on the switch. So it does not create the VLAN because it already exists. It then determines whether the port that received the PDU, in this case interface `port1.0.4`, is a member of the VLAN. If it is not a member, it adds the port to the VLAN as a tagged dynamic GVRP port. If the port is already a member of the VLAN, then no change is made.

5. Switch 3 sends a PDU out interface `port1.0.4` to interface `port1.0.3` on Switch 2.

6. Switch 2 receives the PDU on interface `port1.0.3` and then adds the port as a tagged dynamic GVRP port to the dynamic GVRP VLAN 10.

There is now a communications path for the end nodes of the HR VLAN 10 on Switch 1 and Switch 3. GVRP created the new dynamic GVRP VLAN with a VID of 10 on Switch 2 and added interfaces `port1.0.2` and `port1.0.3` to HR VLAN 10 as tagged dynamic GVRP ports.

GVRP Guidelines

Here are the guidelines for configuring GVRP on your switch:

- All ports the constitute a network link between the switch and the other switches must be running GVRP.
- You cannot modify or delete dynamic GVRP VLANs.
- You cannot remove dynamic GVRP ports from static or dynamic VLANs.
- There is limit of 400 VLANs supported by the AlliedWare Plus GVRP implementation. VLANs may be numbered 1-4094, but a limit of 400 of these VLANs are supported.
- MSTP is not supported by the current AlliedWare Plus GVRP implementation. GVRP and MSTP are mutually exclusive. STP and RSTP are supported by GVRP.
- VCStack is not supported by the current AlliedWare Plus GVRP implementation.
- To be detected by GVRP, a VLAN must have at least one active port. GVRP cannot detect a VLAN that does not have any active nodes or valid port links.
- Rebooting the switch erases all dynamic GVRP VLANs and dynamic GVRP port assignments. The dynamic assignments are relearned by the switch as PDUs arrive on the ports from other switches.
- GVRP has three timers: join timer, leave timer, and leave all timer. The values for these timers must be set the same on all switches running GVRP. Timers with different values on different switches can result in GVRP compatibility problems.
- You can convert dynamic GVRP VLANs and dynamic GVRP port assignments to static VLANs and static port assignments.
- The default port settings on the switch for GVRP is inactive, meaning that the ports will not participate in GVRP until enabled on the switch globally and on the interface locally.
- Allied Telesis recommends disabling GVRP on those ports that are connected to GVRP-inactive devices, meaning any switches that do not have the GVRP feature enabled.
- PDUs are transmitted from only those switch ports where GVRP is enabled.
- Private VLAN trunk ports are not supported by the current AlliedWare Plus GVRP implementation. GVRP and private VLAN trunk ports are mutually exclusive.

GVRP and Network Security

GVRP should be used with caution because it can expose your network to unauthorized access. If a network intruder were to connect to a switch port running GVRP and transmit a bogus GVRP PDU containing VIDs of restricted VLANs, GVRP would make the port a member of the VLANs, giving the intruder access to restricted areas of your network.

Here are a few suggestions to protect against this type of unauthorized network intrusion:

- Activating GVRP only on those switch ports connected to other GVRP devices. Do not activate GVRP on ports that are connected to GVRP inactive devices.
- Converting all dynamic GVRP VLANs and dynamic GVRP ports to static assignments, and then turning off GVRP on all the switches. This preserves the new VLAN assignments while protecting against unauthorized network intrusion.

GVRP-inactive Intermediate Switches

If two GVRP-active devices are separated by a GVRP-inactive switch, the GVRP-active devices may not be able to share VLAN information. There are two issues involved.

The first is whether the intermediate switch forwards the GVRP PDUs that it receives from the GVRP-active switches. GVRP PDUs are management frames, intended for the switch's CPU. In all likelihood, a GVRP-inactive switch will discard the PDUs because it will not recognize them.

The second issue is that even if a GVRP-inactive switch forwards GVRP PDUs, it will not automatically create the VLANs. Consequently, even if GVRP-active switches receive the PDUs and create the necessary VLANs, an intermediate switch may block the VLAN traffic, unless you modify its VLANs and port assignments manually.

Enabling GVRP on the Switch

The command for enabling GVRP on the switch is found in the Global Configuration mode. It is the **gvrp enable (global)** command. After the command is entered, the switch immediately begins to transmit PDUs from those ports where GVRP is enabled.

Further, to enable the switch to create dynamic VLANs if it receives GVRP PDUs that contain VIDs for VLANs it does not currently have, use the command **gvrp dynamic-vlan-creation**.

Here are the commands to enable GVRP on the switch and enable to switch to create dynamic VLANs if it receives GVRP PDUs that contain VIDs for VLANs it does not currently have:

```
awplus>enable
awplus#configure terminal
awplus(config)#gvrp enable
awplus(config)#gvrp dynamic-vlan-creation
```

For reference information, refer to the **gvrp enable (global)** command and the **gvrp dynamic-vlan-creation** command in the **GVRP Commands** chapter.

Enabling GVRP on the Ports

To activate GVRP on the ports so that they transmit GVRP PDUs, use the **gvrp registration** and the **gvrp (interface)** commands in the Interface Configuration mode. Because the default setting for GVRP on the ports is disabled, you need to use these commands if you want to re-enable GVRP after disabling it on a port.

This example of these commands activates GVRP on interface `port1.0.12`, `port1.0.13`, and `port1.0.17`:

```
awplus>enable
awplus#configure terminal
awplus(config)#interface port1.0.12,port1.0.13,port1.0.17
awplus(config-if)#gvrp registration normal
awplus(config-if)#gvrp
```

For reference information, refer to the **gvrp registration** and **gvrp (interface)** commands in the **GVRP Commands** chapter.

Setting the GVRP Timers

The switch has a join timer, a leave timer, and a leave all timer. You should not change the timers unless you understand their functions. (Refer to the IEEE 802.1p standard for the timer definitions.) The timers have to be set the same on all GARP-active network devices and the join timer and the leave timer have to be set according to the following rule:

leave timer >= (3 x (join timer))

When configuring the leave timer, set it to more than or equal to three times the join timer value. The settings for the leave and join timers must be the same for all GVRP enabled switches.

The commands for setting the timers are in the Interface Configuration mode. They are:

gvrp timer join
gvrp timer leave
gvrp timer leaveall

The timers are set in one hundredths of a second. This example sets the join timer to 0.2 seconds, the leave timer to 0.8 seconds and the leave all timer to 10 seconds for port1.0.2:

```
awplus>enable
awplus#configure terminal
awplus(config)#interface port1.0.2
awplus(config-if)#gvrp timer join 20
awplus(config-if)#gvrp timer leave 80
awplus(config-if)#gvrp timer leaveall 1000
```

For reference information, refer to **gvrp timer** command in the **GVRP Commands** chapter.

Disabling GVRP on the Ports

To disable GVRP on the ports, use the **gvrp registration none** and **no gvrp (interface)** commands in the Interface Configuration mode.

This example of the command deactivates GVRP on interfaces `port1.0.4` and `port1.0.5`:

```
awplus>enable
awplus#configure terminal
awplus(config)#interface port1.0.4,port1.0.5
awplus(config-if)#gvrp registration none
awplus(config-if)#no gvrp
```

For reference information, refer to **gvrp registration** and **gvrp (interface)** command in the **GVRP Commands** chapter.

Disabling GVRP on the Switch

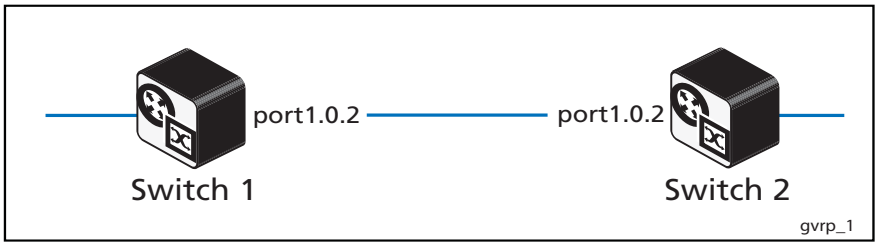
To disable GVRP to stop the switch from learning any further dynamic VLANs or GVRP ports, use the **no gvrp (interface) enable** command in the Global Configuration mode. Here is the command.

```
awplus>enable
awplus#configure terminal
awplus(config)#no gvrp enable
```

For reference information, refer to the **gvrp (interface)** command in the **GVRP Commands** chapter.

Configuring and validating GVRP

GVRP (GARP VLAN Registration Protocol) allows the exchange of VLAN information between switches in a network. If one switch is manually configured with multiple VLANs, other switches in the network learn about these VLANs dynamically through GVRP.



Switch 1: Configuring GVRP to receive VLANs from Switch 1

`awplus#` `configure terminal`	Enter the Global Configuration mode from the Privileged Exec mode.
`awplus(config)#` `gvrp enable`	Enter GVRP on **Switch 1**.
`awplus(config)#` `gvrp dynamic-vlan-creation`	Enable dynamic VLAN creation for GVRP. Note that GVRP is now enabled globally for **Switch 1**.
`awplus(config)#` `interface port1.0.2`	Specify an interface (`port1.0.2`) to be configured and enter Interface Configuration mode.
`awplus(config-if)#` `switchport mode trunk`	Set the switching characteristics of the interface as trunk and specify tagged frames only. Any frames not tagged as trunk frames are discarded.

`awplus(config-if)#` `switchport trunk allowed vlan all`	Apply to all VLANs on this interface.
`awplus(config-if)#` `gvrp`	Enable GVRP on switch port `port1.0.2`. Note that GVRP is now set up on interface `port1.0.2` as GVRP is also enabled globally for **Switch 1**.
`awplus(config-if)#` `exit`	Exit Interface Configuration mode and enter Global Configuration mode.
`awplus(config)#` `exit`	Exit Global Configuration mode and enter Privileged Exec mode.
`awplus#` `show gvrp configuration`	Show GVRP configuration on **Switch 1** to confirm GVRP is ready to propagate VLANs.

Switch 2: Configuring GVRP & creating VLANs to propagate:

`awplus#` `enable`	Enter the Privileged Exec mode.
`awplus#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config)#` `gvrp enable`	Enter GVRP on **Switch 2**.
`awplus(config)#` `vlan database`	Create VLANs to propagate between **Switch 1** and **Switch 2** with GVRP enabled on the Switches and on the interfaces on each Switch.
`awplus(config-vlan)#` `vlan 20-30`	Create 11 VLANs with VIDs 20 through 30 to propagate between interface `port1.0.2` on **Switch 1** and **Switch 2**.
`awplus(config)#` `gvrp dynamic-vlan-creation`	Enable dynamic VLAN creation for GVRP. Note that GVRP is now enabled globally for **Switch 2**.
`awplus(config)#` `interface port1.0.2`	Specify an interface (`port1.0.2`) to be configured and enter Interface Configuration mode.
`awplus(config-if)#` `switchport mode trunk`	Set the switching characteristics of the interface as trunk and specify tagged frames only. Any frames not tagged as trunk frames are discarded.
`awplus(config-if)#` `switchport trunk allowed vlan all`	Set this interface to be a tagged member of all VLANs.
`awplus(config-if)#` `gvrp`	Enable GVRP on switch port `port1.0.2`.
`awplus(config-if)#` `exit`	Exit Interface Configuration mode and enter Global Configuration mode.
`awplus(config)#` `exit`	Exit Global Configuration mode and enter Privileged Exec mode.
`awplus#` `show gvrp configuration`	Show GVRP configuration on **Switch 2** to confirm GVRP is ready to propagate VLANs.

Switch 1: Validating VLANs have propagated from Switch 2:

`awplus#`	
`show vlan`	Confirm the VLANs are available from **Switch 2** on **Switch 1** by examining show output to confirm VLANs from **Switch 2** are on **Switch 1**.

Names of Commands Used

gvrp (interface)
gvrp dynamic-vlan-creation
switchport mode trunk
vlan database
vlan

Validation Commands

show vlan

Chapter 25: GVRP Commands

Command List 25.2
clear gvrp statistics 25.2
debug gvrp 25.3
gvrp (interface) 25.5
gvrp dynamic-vlan-creation 25.6
gvrp enable (global) 25.8
gvrp registration 25.9
gvrp timer 25.10
show debugging gvrp 25.12
show gvrp configuration 25.13
show gvrp machine 25.14
show gvrp statistics 25.15
show gvrp timer 25.16

Command List

With GVRP enabled the switch can exchange VLAN configuration information with other GVRP enabled switches. VLANs can be dynamically created and managed through trunk ports.

- There is limit of 400 VLANs supported by the AlliedWare Plus GVRP implementation. VLANs may be numbered 1-4094, but a limit of 400 of these VLANs are supported.
- MSTP is not supported by the AlliedWare Plus GVRP implementation. GVRP and MSTP are mutually exclusive. STP and RSTP are supported by GVRP.
- VCStack is not supported by the current AlliedWare Plus GVRP implementation.

This chapter provides an alphabetical reference for commands used to configure GVRP. For information about GVRP, including configuration, see **Chapter 24, GVRP Introduction and Configuration**.

clear gvrp statistics

Use this command to clear the GVRP statistics for all switchports, or for a specific switchport.

Syntax `clear gvrp statistics {all|<interface>}`

Parameter	Description
`all`	Specify all switchports to clear GVRP statistics.
<interface>	Specify the switchport to clear GVRP statistics.

Mode Privileged Exec

Usage Use this command together with the **show gvrp statistics** command to troubleshoot GVRP.

Examples To clear all GVRP statistics for all switchport on the switch, enter the command:

```
awplus#clear gvrp statistics all
```

To clear GVRP statistics for switchport interface `port1.0.3`, enter the command:

```
awplus#clear gvrp statistics port1.0.3
```

Related Commands **show gvrp statistics**

debug gvrp

Use this command to debug GVRP packets and commands, sending output to the console.

Use the **no** variant of this command to turn off debugging for GVRP packets and commands.

Syntax

```
debug gvrp {all|cli|event|packet}
no debug gvrp {all|cli|event|packet}
```

Parameter	Description
`all`	Specifies debugging for all levels.
`cli`	Specifies debugging for commands.
`event`	Specified debugging for events.
`packet`	Specifies debugging for packets.

Mode Privileged Exec and Global Configuration

Examples To send debug output to the console for GVRP packets and GVRP commands, and to enable the display of debug output on the console first, enter the commands:

```
awplus#terminal monitor
awplus#configure terminal
awplus(config)#debug gvrp all
```

To send debug output for GVRP packets to the console, enter the commands:

```
awplus#terminal monitor
awplus#configure terminal
awplus(config)#debug gvrp packets
```

To send debug output for GVRP commands to the console, enter the commands:

```
awplus#terminal monitor
awplus#configure terminal
awplus(config)#debug gvrp cli
```

To stop sending debug output for GVRP packets and GVRP commands to the console, and to stop the display of any debug output on the console, enter the commands:

```
awplus#terminal no monitor
awplus#configure terminal
awplus(config)#no debug gvrp all
```

Related Commands

show debugging gvrp
terminal monitor

gvrp (interface)

Use this command to enable GVRP for switchport interfaces.

Use the **no** variant of this command to disable GVRP for switchport interfaces.

Syntax

```
gvrp
no gvrp
```

Mode Interface Configuration (for switchport interfaces).

Default Disabled by default.

Usage Use this command to enable GVRP on switchport interfaces. Note this command does not enable GVRP for the switch. To enable GVRP on switchports use this command in Interface Configuration mode. You must issue a **gvrp enable (global)** command before issuing a **gvrp (interface)** command.

You must enable GVRP on both ends of a link for GVRP to propagate VLANs between links.

Note

MSTP is not supported by the current AlliedWare Plus GVRP implementation. GVRP and MSTP are mutually exclusive. STP and RSTP are supported by GVRP.

Private VLAN trunk ports are not supported by the current AlliedWare Plus GVRP implementation. GVRP and private VLAN trunk ports are mutually exclusive.

Examples To enable GVRP on interfaces `port1.0.1-port1.0.2`, enter the commands:

```
awplus#configure terminal
awplus(config)#gvrp enable
awplus(config)#interface port1.0.1-port1.0.2
awplus(config-if)#gvrp
```

To disable GVRP on interfaces `port1.0.1-port1.0.2`, enter the commands:

```
awplus#configure terminal
awplus(config)#interface port1.0.1-port1.0.2
awplus(config-if)#no gvrp
```

Validation Commands **show gvrp configuration**

Related Commands **gvrp dynamic-vlan-creation**
gvrp enable (global)

gvrp dynamic-vlan-creation

Use this command to enable dynamic VLAN creation globally for the switch.

Use the **no** variant of this command to disable dynamic VLAN creation globally for the switch.

Syntax `gvrp dynamic-vlan-creation`

`no gvrp dynamic-vlan-creation`

Mode Global Configuration

Default Disabled by default.

Usage You must enable GVRP on both ends of a link for GVRP to propagate VLANs between links.

You must also enable GVRP globally in Global Configuration mode before enabling GVRP on an interface in Interface Configuration mode. Both of these tasks must occur to create VLANs.

Note

There is limit of 400 VLANs supported by the AlliedWare Plus GVRP implementation. VLANs may be numbered 1-4094, but a limit of 400 of these VLANs are supported.

.Examples To enable GVRP dynamic VLAN creation on the switch, enter the commands:

```
awplus#configure terminal
awplus(config)#gvrp enable
awplus(config)#gvrp dynamic-vlan-creation
```

Enter the following commands for switches with hostnames `awplus_switch1` and `awplus_switch2` respectively, so `awplus_switch1` propagates VLANs to `awplus_switch2` and `awplus_switch2` propagates VLANs to `awplus_switch1`:

```
awplus_switch1#configure terminal
awplus_switch1(config)#gvrp enable
awplus_switch1(config)#gvrp dynamic-vlan-creation

awplus_switch2#configure terminal
awplus_switch2(config)#gvrp enable
awplus_switch2(config)#gvrp dynamic-vlan-creation
```

To disable GVRP dynamic VLAN creation on the switch, enter the commands:

```
awplus#configure terminal
awplus(config)#no gvrp dynamic-vlan-creation
```

Validation Commands **show gvrp configuration**

Related Commands **gvrp enable (global)**

gvrp enable (global)

Use this command to enable GVRP globally for the switch.

Use the **no** variant of this command to disable GVRP globally for the switch.

Syntax

```
gvrp enable
no gvrp enable
```

Mode Global Configuration

Default Disabled by default.

Usage Use this command to enable GVRP on the switch. Note that this command does not enable GVRP on switchports. To enable GVRP on switchports use the **gvrp (interface)** command in Interface Configuration mode. You must issue a **gvrp enable (global)** command before issuing a **gvrp (interface)** command.

You must enable GVRP on both ends of a link for GVRP to propagate VLANs between links.

Note

MSTP is not supported by the current AlliedWare Plus GVRP implementation. GVRP and MSTP are mutually exclusive. STP and RSTP are supported by GVRP.

Private VLAN trunk ports are not supported by the current AlliedWare Plus GVRP implementation. GVRP and private VLAN trunk ports are mutually exclusive.

Examples To enable GVRP for the switch, before enabling GVRP on switchports, enter the commands:

```
awplus#configure terminal
awplus(config)#gvrp enable
```

To disable GVRP on the switch, which will also disable GVRP enabled on switchports, enter the commands:

```
awplus#configure terminal
awplus(config)#no gvrp enable
```

Validation Commands **show gvrp configuration**

Related Commands **gvrp (interface)**
gvrp dynamic-vlan-creation

gvrp registration

Use this command to set GVRP registration to normal, fixed, and forbidden registration modes.

Syntax `gvrp registration {normal|fixed|forbidden}`

Parameter	Description
`normal`	Specify dynamic GVRP registration and deregistration of VLANs.
`fixed`	Specify fixed GVRP registration and deregistration of VLANs.
`forbidden`	Specify no GVRP registration of VLANs. VLANs are deregistered.

Mode Interface Configuration

Default Normal registration is the default.

Usage Configuring a trunk port in normal registration mode allows dynamic creation of VLANs. Normal mode is the default mode. Validate using the **show gvrp configuration** command.

Configuring a trunk port in fixed registration mode allows manual creation of VLANs.

Configuring a trunk port in forbidden registration mode prevents VLAN creation on the port.

Examples To disable GVRP on interfaces `port1.0.1-port1.0.2`, enter the commands:

```
awplus#configure terminal
awplus(config)#interface port1.0.1-port1.0.2
awplus(config-if)#no gvrp
```

To disable GVRP on interfaces `port1.0.1-port1.0.2`, enter the commands:

```
awplus#configure terminal
awplus(config)#interface port1.0.1-port1.0.2
awplus(config-if)#no gvrp
```

To disable GVRP on interfaces `port1.0.1-port1.0.2`, enter the commands:

```
awplus#configure terminal
awplus(config)#interface port1.0.1-port1.0.2
awplus(config-if)#no gvrp
```

Validation Commands **show gvrp configuration**

gvrp timer

Use this command to set GVRP timers in Interface Configuration mode for a given interface.

Use the **no** variant of this command to reset the GVRP timers to the defaults specified in the table below.

Syntax

```
gvrp timer
    {join <timer-value>|leave <timer-value>|leaveall <timer-value>}

no gvrp timer {join|leave|leaveall}
```

Parameter	Description
`join`	Specifies the timer for joining the group (default is 20 centiseconds / hundredths of a second, or 200 milliseconds).
`leave`	Specifies the timer for leaving a group (default is 60 centiseconds / hundredths of a second, or 600 milliseconds).
`leaveall`	Specifies the timer for leaving all groups (default is 1000 centiseconds / hundredths of a second, or 10,000 milliseconds).
<timer-value>	<1-65535> The timer value in hundredths of a second (centiseconds).

Mode Interface Configuration

Defaults The default join time value is 20 centiseconds (200 milliseconds), the default leave timer value is 60 centiseconds (600 milliseconds), and the default leaveall timer value is 1000 centiseconds (10,000 milliseconds).

Usage When configuring the `leave` timer, set it to more than or equal to three times the `join` timer value. The settings for the `leave` and `join` timers must be the same for all GVRP enabled switches. See also the section **"Setting the GVRP Timers" on page 24.6**.

Use the **show gvrp timer** command to confirm GVRP timers set with this command.

Examples To set the GVRP `join` timer to 300 hundredths of a second for interface `port1.0.1`, enter the commands:

```
awplus#configure terminal
awplus(config)#interface port1.0.1
awplus(config-if)#gvrp timer join 20
```

To set the GVRP `leave` timer to 600 hundredths of a second for interface `port1.0.2`, enter the commands:

```
awplus#configure terminal
awplus(config)#interface port1.0.2
awplus(config-if)#gvrp timer leave 60
```

To set the GVRP `leaveall` timer to 1000 hundredths of a second for interface `port1.0.1`, enter the commands:

```
awplus#configure terminal
awplus(config)#interface port1.0.1
awplus(config-if)#gvrp timer leaveall 1000
```

To reset the GVRP `join` timer to its default (200 milliseconds) for interface `port1.0.1`, enter the commands:

```
awplus#configure terminal
awplus(config)#interface port1.0.1
awplus(config-if)#no gvrp timer join
```

To reset the GVRP `leave` timer to its default (600 milliseconds) for interface `port1.0.2`, enter the commands:

```
awplus#configure terminal
awplus(config)#interface port1.0.2
awplus(config-if)#no gvrp timer leave
```

To disable GVRP on interfaces `port1.0.1-port1.0.2`, enter the commands:

```
awplus#configure terminal
awplus(config)#interface port1.0.1-port1.0.2
awplus(config-if)#no gvrp
```

Related Commands **show gvrp timer**

show debugging gvrp

Use this command to display the GVRP debugging option set.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show debugging gvrp`

Mode User Exec and Privileged Exec

Example Enter the following commands to display GVRP debugging output on the console:

```
        awplus#configure terminal
awplus(config)#debug gvrp all
awplus(config)#exit
        awplus#show debugging gvrp
```

Output See sample output from the `show debugging gvrp` after entering `debug gvrp all`:

```
GVRP debugging status:
  GVRP Event debugging is on
  GVRP CLI debugging is on
  GVRP Timer debugging is on
  GVRP Packet debugging is on
```

Related Commands **debug gvrp**

show gvrp configuration

Use this command to display GVRP configuration data for a switch.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show gvrp configuration`

Mode User Exec and Privileged Exec

Example To show GVRP configuration for the switch, enter the command:

```
awplus#show gvrp configuration
```

Output The following is an output of this command displaying the GVRP configuration for a switch:

```
awplus#show gvrp configuration
Global GVRP Configuration:
GVRP Feature: Enabled
Dynamic Vlan Creation: Disabled
Port based GVRP Configuration:
                                                    Timers(centiseconds)
Port    GVRP Status Registration  Applicant   Join    Leave
LeaveAll
---------------------------------------------------------------------
port1.0.1 Enabled   Normal        Normal      20       60     1000
port1.0.2 Enabled   Normal        Normal      200     600    10000
```

show gvrp machine

Use this command to display the state machine for GVRP.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show gvrp machine`

Mode User Exec and Privileged Exec

Example To show the GVRP state machine for the switch, enter the command:

```
awplus#show gvrp machine
```

Output See the following output of this command displaying the GVRP state machine.

```
awplus show gvrp machine
  port = 1.0.1  applicant state = QA   registrar state = INN
  port = 1.0.2  applicant state = QA   registrar state = INN
```

show gvrp statistics

Use this command to display a statistical summary of GVRP information for the switch.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show gvrp statistics [<interface>]`

Parameter	Description
<interface>	The name of the switchport interface.

Mode User Exec and Privileged Exec

Usage Use this command together with the **clear gvrp statistics** command to troubleshoot GVRP.

Examples To show the GVRP statistics for all switchport interfaces, enter the command:

```
awplus#show gvrp statistics
```

To show the GVRP statistics for switchport interfaces `port1.0.1` and `port1.0.2`, enter the command:

```
awplus#show gvrp statistics port1.0.1-port1.0.2
```

Output The following is an output of this command displaying a statistical summary for `port1.0.1-port1.0.2`

```
awplus# show gvrp statistics port1.0.1-port1.0.2
Port     JoinEmpty    JoinIn   LeaveEmpty     LeaveIn      Empty
-----------------------------------------------------------------
1.0.1    RX           0          2          0         0        0
         TX           0          0          0         0        0
1.0.2    RX           0          1          0         0        1
         TX           0          0          0         0        0
```

Related Commands **clear gvrp statistics**

show gvrp timer

Use this command to display data for the GVRP timers set with the **gvrp timer** command.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show gvrp timer <interface>`

Parameter	Description
<interface>	The name of the switchport interface.

Mode User Exec and Privileged Exec

Examples To show the GVRP timers for all switchport interfaces, enter the command:

```
awplus#show gvrp timer
```

To show the GVRP timers for switchport interface `port1.0.1`, enter the command:

```
awplus#show gvrp timer port1.0.1
```

Output The following show output displays data for timers on the switchport interface `port1.0.1`

```
awplus# show gvrp timer port1.0.1
Timer           Timer Value (centiseconds)
----------------------------------------
Join                  20
Leave                 60
Leave All             1000
```

Introduction

This chapter describes how to configure IPv4 addressing and the protocols used to help IP function on your network.

As well as the familiar Internet, with uppercase "I", the term internet (with lowercase "i") can refer to any network (usually a wide area network) that uses the Internet Protocol. This chapter concentrates on this definition—a generalized network that uses IP as its network protocol.

Assigning an IP Address

To configure your device to perform IP routing (for example, to access the Internet) you need to configure IP. You also need to configure IP if you want to manage your device from any IP-based management process (such as SSH, Telnet, or SNMP).

Add an IP address to each of the interfaces that you want to process IP traffic.

You can configure an interface on your device with a static IP address, or with a dynamic IP address assigned using your device's DHCP client.

Static IP addresses

To add a static IP address to an interface, enter interface mode for the interface that you want to configure, then use the command:

```
awplus(config-if)# ip address <ip-addr/prefix-length>
                   [secondary [label <label>]]
```

where `<ip-address/m>` the IP address followed by a slash then the prefix length. Note that you cannot specify the mask in dotted decimal notation in this command.

For example, to give the interface vlan1 an address of 192.168.10.10, with a class C subnet mask, use the command:

```
awplus(config-if)# ip address 192.168.10.10/24
```

The **secondary** parameter allows you to add multiple IP addresses to an interface using this command. Each interface must have a primary IP address before you can add a secondary address. Your device treats secondary addresses the same as primary addresses in most instances, such as responding for ARP requests for the IP address. However, the only packets generated that have a secondary address as source address are routing updates. You can define up to 32 secondary addresses on a single interface.

DHCP dynamic addresses

When you use the DHCP client, it obtains the IP address and subnet mask for the interface, and other IP configuration parameters, from a DHCP server. To configure an interface to gain its IP configuration using the DHCP client, use the command:

```
awplus(config-if)# ip address dhcp [client-id <interface>]
                   [hostname <hostname>]
```

If an IP interface is configured to get its IP address and subnet mask from DHCP, the interface does not take part in IP routing until the IP address and subnet mask have been set by DHCP.

If you need to make a static entry in your DHCP server for the device, you need your device's MAC address, which you can display by using the command:

```
awplus# show interface
```

See **Chapter 92, Dynamic Host Configuration Protocol (DHCP) Introduction** for more information about DHCP.

Address Resolution Protocol (ARP)

Address Resolution Protocol (ARP) is used by your device to dynamically learn the Layer 2 address of devices in its networks. Most hosts also have a MAC physical address in addition to the assigned IP address. For Ethernet, this is a 6-byte, globally unique number. ARP enables your device to learn the physical address of the host that has a given IP address.

When your device needs to forward packets to a destination that it does not know the Layer 2 address of, it broadcasts an ARP request to determine where to send the packet. The ARP request is a broadcast packet and includes the target IP address. All stations on the LAN receive this broadcast but only one host recognizes its own IP address. It replies, thereby giving your device its physical address.

Your device creates a dynamic ARP entry in its ARP cache, to record the IP address to physical address mapping (also called a binding). It uses that ARP entry to forward further packets to that address.

The ARP protocol is described in RFC 826, ***An Ethernet Address Resolution Protocol—or—Converting Network Protocol Addresses to 48 bit Ethernet Address for Transmission on Ethernet Hardware***.

Static ARP Entries

If your LAN includes hosts that do not support ARP, you can add a static ARP entry to the cache. However, it is rarely necessary to add an ARP entry this way. To add a static ARP entry, use the command:

```
awplus(config)# arp <ip-addr> <mac-address> [<port-number>]
                [alias]
```

or, if you have VRF Lite enabled

```
awplus(config)# arp [vrf <vrf-name>] <ip-addr> <mac-address>
                [<port-number>] [alias]
```

Timing Out ARP Entries

Your device times out dynamic ARP entries to ensure that the cache does not fill with entries for hosts that are no longer active. If your device stops receiving traffic for a device specified in a dynamic ARP entry, it deletes the ARP entry after a configurable timeout period. Static ARP entries are not aged or automatically deleted.

Increasing the ARP timeout reduces the amount of network traffic. Decreasing the timeout makes your device more responsive to changes in network topology.

To set a timeout period, enter the interface mode, then use the command:

```
awplus(config-if)# arp-aging-timeout <0-432000>
```

Deleting ARP Entries

To remove a static ARP entry, use the command:

```
awplus(config)# no arp <ip-addr>
```

or, if you have enabled VRF Lite:

```
awplus(config)# no arp [vrf <vrf-name>] <ip-addr>
```

To clear the ARP cache of dynamic entries, use the command:

```
awplus# clear arp-cache
```

This removes the dynamic ARP entries for all interfaces.

To display the entries in the ARP cache, use the command:

```
awplus)# show arp
```

The ARP cache will be repopulated by the normal ARP learning mechanism. As long as the entries are relearned quickly enough, deleting dynamic ARP entries does not affect:

- routes
- OSPF neighbor status
- BGP peer status
- the TCP/UDP connection status
- VRRP status

Proxy ARP

Proxy ARP (defined in RFC 1027) allows hosts that do not support routing (i.e. they have no knowledge of the network structure) to determine the physical addresses of hosts on other networks. Your device intercepts ARP broadcast packets and substitutes its own physical address for that of the remote host. This occurs only if your device has the best route to the remote host. By responding to the ARP request, your device ensures that subsequent packets from the local host are directed to its physical address, and it can then forward these to the remote host. The process is symmetrical.

Proxy ARP is disabled by default. To enable proxy ARP on an interface, use the commands:

```
awplus(config)# interface <interface>
awplus(config-if)# ip proxy-arp
```

To disable Proxy ARP on an interface, use the command:

```
awplus(config-if)# no ip proxy-arp
```

To check Proxy ARP is enabled on an interface, use the **show running-config** command. If Proxy ARP has been enabled an entry shows **ip proxy-arp** below the interface it is enabled on. No **ip proxy-arp** entry below an interface in the config indicates Proxy ARP is disabled on it.

See the sample configuration commands and validation command with resulting output showing proxy ARP **enabled** on VLAN 2 below:

```
awplus#configure terminal
awplus(config)#interface vlan2
awplus(config-if)#ip proxy-arp
awplus(config-if)#end
awplus(config)#exit
awplus#show running-config
!
interface vlan2
 ip proxy-arp
 ip address 192.168.2.2/24
!
```

See the sample configuration commands and validation command with resulting output showing proxy ARP **disabled** on VLAN 2 below:

```
awplus#configure terminal
awplus(config)#interface vlan2
awplus(config-if)#no ip proxy-arp
awplus(config-if)#end
awplus(config)#exit
awplus#show running-config
!
interface vlan2
 ip address 192.168.2.2/24
!
```

Local Proxy ARP

Local Proxy ARP lets you stop MAC address resolution between hosts within an interface's subnet. This ensures that devices within a subnet cannot send traffic that bypasses Layer 3 routing on your device. This lets you monitor, filter, and control traffic between devices in the same subnet.

Local Proxy ARP extends proxy ARP by intercepting and responding to ARP requests between hosts within a subnet. Local proxy ARP responds to ARP requests with your device's own MAC address details instead of those from the destination host. This stops hosts from learning the MAC address of other hosts within its subnet.

When Local Proxy ARP is operating on an interface, your device does not generate or forward any ICMP-Redirect messages on that interface.

Local Proxy ARP is disabled by default. To enable local proxy ARP on an interface, use the commands:

```
awplus(config)# interface <interface>
awplus(config-if)# ip local-proxy-arp
```

To disable local proxy ARP on an interface, use the command:

```
awplus(config-if)# no ip local-proxy-arp
```

To check Local Proxy ARP is enabled on an interface, use the **show running-config** command. If Local Proxy ARP has been enabled an entry shows **ip local-proxy-arp** below the interface it is enabled on. No **ip local-proxy-arp** entry below an interface in the config indicates Local Proxy ARP is disabled on it.

See the sample configuration commands and validation command with resulting output showing local proxy ARP **enabled** on VLAN 1 below:

```
awplus#configure terminal
awplus(config)#interface vlan1
awplus(config-if)#ip local-proxy-arp
awplus(config-if)#end
awplus(config)#exit
awplus#show running-config
!
interface vlan1
 ip local-proxy-arp
 ip address 192.168.1.2/24
!
```

See the sample configuration commands and validation command with resulting output showing Local Proxy ARP **disabled** on VLAN 1 below:

```
awplus#configure terminal
awplus(config)#interface vlan1
awplus(config-if)#no ip local-proxy-arp
awplus(config-if)#end
awplus(config)#exit
awplus#show running-config
!
interface vlan1
 ip address 192.168.1.2/24
!
```

ARP Logging

You can enable your device to log static and dynamic ARP entries, and you can select either default hexadecimal notation (HHHH.HHHH.HHHH) or standard IEEE format hexadecimal notation (HH-HH-HH-HH-HH-HH) for the MAC addresses displayed in the ARP log output.

If this feature is enabled, ARP log messages are stored on the device in RAM. If the device is rebooted the ARP log messages are lost. ARP logging is disabled by default.

To enable ARP logging, use the command:

```
awplus(config)# arp log [mac-address-format ieee]
```

You can specify whether the MAC address is displayed in the default hexadecimal notation HHHH.HHHH.HHHH or in the standard IEEE format HH-HH-HH-HH-HH-HH.

To disable ARP logging, use the command:

```
awplus(config)# no arp log [mac-address-format ieee]
```

To display the ARP log messages, use the command:

```
awplus(config)# show log | include ARP_LOG
```

See the sample ARP log output and descriptions of the fields displayed in the sample ARP log output in the **arp log** command on page 27.8.

Domain Name System (DNS)

The Domain Name System allows you to access remote systems by entering human-readable device host names rather than IP addresses. DNS works by creating a mapping between a domain name, such as “www.alliedtelesis.com”, and its IP address. These mappings are held on DNS servers. DNS translates meaningful domain names into IP addresses for networking equipment to locate and address these devices. The benefits of DNS are that domain names:

- can map to a new IP address if the host’s IP address changes
- are easier to remember than an IP address
- allow organizations to use a domain name hierarchy that is independent of any IP address assignment

Your AlliedWare Plus™ device has a the ability to resolve domain names for internally generated commands (DNS Client) as well as providing the DNS information to connected hosts (via DNS Relay, DHCP Server or DHCP Relay).

The DNS Client is enabled automatically when at least one DNS server is present on the interface. This client allows you to use domain names instead of IP addresses when using commands on your device from this interface.

The DNS Relay provides the presence of a local virtual DNS server which can service DNS lookup requests sent to it from local hosts. The DHCP Server can be configured to provide domain names information to DHCP clients during the lease process.

Domain name parts

Domain names are made up of a hierarchy of two or more name segments. Each segment is separated by a period. The format of domain names is the same as the host portion of a URL (Uniform Resource Locator). The first segment from the left is unique to the host, with each following segment mapping the host in the domain name hierarchy. The segment on the far right is a top-level domain name shared by many hosts.

Server hierarchy

A network of domain name servers maintains the mappings between domain names and their IP addresses. This network operates in a hierarchy that is similar to the structure of the domain names. When a local DNS server cannot resolve your request it sends the request to a higher level DNS server.

For example, to access the site “alliedtelesis.com”, your PC sends a DNS enquiry to its local DNS server asking for the IP address matching alliedtelesis.com. If this address is already locally cached (following its recent use), the DNS server returns the IP address that matches alliedtelesis.com. If the DNS server does not have this address cached, it forwards the request upwards through the hierarchy of DNS servers until a DNS server can resolve the mapping. This means an often-used domain name is resolved quickly, while an uncommon or nonexistent domain may take longer to resolve or fail.

As well as the hierarchy of domain name servers accessible through the Internet, you can operate your own DNS server to map to private IP addresses within your network.

The DHCP server IP address can be either statically defined, or can be dynamically assigned via DHCPv4 option 6 using **"ip name-server" on page 27.50** and DHCP option 15 using **"ip domain-name" on page 27.30** if DHCP client is configured. See **Chapter 92, Dynamic Host Configuration Protocol (DHCP) Introduction** for more information about DHCP and DHCP options.

DNS Client

Your AlliedWare Plus™ device has a DNS Client that is enabled automatically when you add a DNS server to your device. This client allows you to use domain names instead of IP addresses when using commands on your device.

To add a DNS server to the list of servers that the device sends DNS queries to, use the command:

```
awplus(config)# ip name-server <ip-addr>
```

To check the list of servers that the device sends DNS queries to, use the command:

```
awplus# show ip name-server
```

To add a default domain name used to append to DNS requests, use the command:

```
awplus(config)# ip domain-name <domain-name>
```

For example, to use DNS to match hostnames to your internal network "example.net", use the command:

```
awplus(config)# ip domain-name example.net
```

If you then use the command **ping host2**, your device sends a DNS request for host2.example.net. To check the domain name configured with this command, use the command:

```
awplus# show ip domain-name
```

Alternatively you can create a list of domain names that your device will try in turn by using the command:

```
awplus(config)# ip domain-list <domain-name>
```

For example, to use DNS to match incomplete hostnames to the top level domains ".com", and ".net", use the commands:

```
awplus(config)# ip domain-list .com
awplus(config)# ip domain-list .net
```

If you then use the command **ping alliedtelesis**, your device sends a DNS request for alliedtelesis.com and if no match was found your device would then try alliedtelesis.net. To check the entries in the domain list, use the command:

```
awplus# show ip domain-list
```

To disable the DNS client on your device, use the command:

```
awplus(config)# no ip domain-lookup
```

To check the status of the DNS Client on your device, and the configured servers and domain names, use the command:

```
awplus# show hosts
```

DNS Relay

Enabling DNS Relay your switch provides the capability for it act as a local virtual DNS server. It can then service DNS lookup repetitive requests sent to it from local hosts. Acting as a DNS Relay the switch will usually relay the requests to an external, or upstream, DNS server. By default, DNS Relay is disabled.

Note When running VRF_Lite, the DNS Relay functions will apply separately within each VRF Instance.

Optionally, DNS name resolver caching may be enabled on the DNS Relay, which can provide some lookup speed advantage and avoid unnecessary repeated requests to external DNS servers. By default, DNS caching is disabled.

When the DNS Relay name resolver cache is enabled on your switch, the switch will maintain a cache of recently used mappings between domain names and IP addresses so that other identical requests can be responded to without further reference to an external, or upstream DNS server. When the switch receives a DNS query from a client the switch will attempt to match the request with entries in this cache. If the switch does not have this address cached, it forwards the request upwards through the hierarchy of DNS servers for resolution. The DNS cache has a limited size, and times out entries after a specified period of up to 60 minutes.

The relaying of DNS queries is required for use in networks where the DNS server and the clients connected to the switch are on different subnets and do not know how to reach each other.

DNS Relay uses the DNS server list configured by the **ip name-server** command to forward DNS query packets. To enable DNS Relay you need to configure the list of servers that the device sends DNS queries to and then enable DNS forwarding, as shown in the following example for a DNS server with an IPv4 address:

```
awplus# configure terminal
awplus(config)# ip name-server 192.168.1.1
awplus(config)# ip name-server 192.168.1.2
awplus(config)# ip dns forwarding
```

Note both IPv4 and IPv6 support DNS record types. IPv4 and IPv6 are supported in DNS name-to-address and DNS address-to-name lookup processes. Specifying a name server and enabling DNS forwarding maps both IPv4 and IPv6 addresses. You can configure DNS Relay to use IPv6 addresses using the same commands used to configure DNS Relay to use IPv4 addresses, as shown in the following example:

```
awplus# configure terminal
awplus(config)# ip name-server 2001:0db8:010d::1
awplus(config)# ip name-server 2001:0db8:010d::2
awplus(config)# ip dns forwarding
```

You can then configure DNS Relay behavior with the following commands:

To set the number of times the switch will retry to forward DNS queries, use the command:

```
awplus(config)# ip dns forwarding retry <0-100>
```

To set the number of seconds to wait for a response, use the command:

```
awplus(config)# ip dns forwarding timeout <0-3600>
```

To set the DNS forwarding dead-time period in seconds, use the command:

```
awplus(config)# ip dns forwarding dead-time <60-43200>
```

At the dead-time period set, the switch stops sending requests to an unresponsive server.

To set the interface to use for forwarding and receiving DNS queries, use the command:

```
awplus(config)# ip dns forwarding source-interface
                <interface-name>
```

To specify the DNS Relay name resolver cache size and lifetime, use the command:

```
awplus(config)# ip dns forwarding cache [size <0-1000>]
                [timeout <60-3600>]
```

To remove entries from the DNS Relay name resolver cache, use the command:

```
awplus(config)# clear ip dns forwarding cache
```

Information which may be useful for troubleshooting DNS Relay is available using the DNS Relay debugging function. To enable DNS Relay debugging, use the command:

```
awplus# debug ip dns forwarding
```

To display the status of DNS Relay, use the command:

```
awplus# show ip dns forwarding
```

To display the status of DNS Relay name servers, use the command:

```
awplus# show ip dns forwarding server
```

To display the DNS Relay name resolver cache, use the command:

```
awplus# show ip dns forwarding cache
```

DNS Operation With VRF Lite

When running VRF Lite, you can configure DNS Relay functionality to be VRF aware. In this mode DNS Relay messages can be forwarded within specified VRF instances. VRF aware DNS services to remotely connected DNS clients is also supported. These VRF aware services include: ping, traceroute, telnet client, SSH client, and tcpdump.

Configuring DNS Operation with VRF Lite

The **ip name-server [vrf <name>] <ip-addr>** command on page 27.50, configures a name-server for the specified VRF. This command assigns the address of one or more name servers to a VRF table to be used for name and address resolution. If no VRF Lite instance (vrf<name>) is specified, the name-server is configured for the global VRF. A name-server that is configured on the global VRF will apply to both the DNS relay and DNS client. Note that the DNS client is not VRF aware. A VRF specific name-cache is created within the DNS relay for every VRF instance that has a name-server configured.

A maximum of 3 name-servers may be defined for each DNS-relay instance.

The configuration command, **ip dns forwarding** command on page 27.21 will apply to all VRF instances configured on the device and not on a per VRF basis.

The configuration commands listed below apply to all VRF instances configured on the device and not on a per VRF basis. Timeouts are in seconds as per existing commands:

- **ip dns forwarding retry** command on page 27.25
- **ip dns forwarding timeout** command on page 27.27,
- **ip dns forwarding dead-time** command on page 27.24,
- **ip dns forwarding source-interface** command on page 27.26,
- **ip dns forwarding cache** command on page 27.22,

The following show commands provide output information for the VRF instance specified. If a VRF instance is not specified, output is shown for all VRF instances including the global instance and the output will be formatted in a way that distinguishes the information for each VRF

- **show ip dns [vrf <name>|global]forwarding server** command on page 27.66,
- **show ip dns [vrf <name>|global] forwarding cache** command on page 27.64
- **show ip name-server [vrf <name>|global]** command on page 27.74

The DNS cache can also be cleared on a per VRF instance basis by using the

clear ip dns [vrf <name>|global] forwarding cache command on page 27.14.
The following commands show how to configure a DNS relay name-server for both the specified VRF instance VRF red, and the global VRF instance.

To configure a DNS relay name-server for the VRF Lite instance red:

```
awplus# configure terminal
awplus(config)# ip name-server vrf red 192.168.0.1
awplus# ip domain-lookup
```

To configure a DNS relay name-server for the global VRF instance:

```
awplus# configure terminal
awplus(config)# ip name-server vrf red 192.168.1.1
awplus# ip domain-lookup
```

DHCP options

When your device is using its DHCP client for an interface, it can receive the following DHCP options from the DHCP server:

- Option 6 - a list of DNS servers. This list appends to the DNS servers set on your device with the **ip name-server** command.
- Option 15 - a domain name used to resolve host names. This option replaces the domain name set with the **ip domain-name** command.

See **Chapter 92, Dynamic Host Configuration Protocol (DHCP) Introduction** for more information about DHCP and DHCP options.

DHCP Operation With VRF Lite

You can configure DHCP Relay to forward packets within a VRF Lite instance.

DHCP messages between DHCP Clients and a DHCP Server are then able to be relayed between VLAN interfaces within a VRF Lite instance.

When an DHCP Relay instance is enabled on a VLAN interface using the command 'ip dhcp-relay <server>' command, the relay will be placed within the same VRF Lite instance that the VLAN belongs to. If the VLAN does not belong to a VRF Lite instance, then the DHCP Relay will be placed in the default (global) VRF.

Note that DHCP option 82 is still supported on a DHCP Relay operating within a VRF Lite instance.

The following commands can be used to monitor DHCP relay functions:

"show counter dhcp-relay [vrf <vrf-name>|global]" on page 93.41

"show ip dhcp-relay [interface <interface-name>]" on page 93.51]The following example shows how to configure DHCP relay for a VLAN interface that is associated with named VRF Lite instance VRF red:

Example The following example shows how to configure DHCP relay for a VLAN interface that is associated with named VRF Lite instance VRF red:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config if)# ip vrf red
awplus(config-if)# ip address 192.168.0.1/24
awplus(config-if)# ip dhcp-relay server-address
192.168.1.1
```

Internet Control Message Protocol (ICMP)

The Internet Control Message Protocol (ICMP) allows networking devices to send information and control messages to other devices or hosts. Your device implements all non-obsolete ICMP functions.

The following table lists the ICMP messages implemented by your device.

ICMP Message Type	Device Response
Echo reply (0)	This is used to implement the ping command. Your device sends out an echo reply in response to an echo request.
Destination unreachable (3)	This message is sent when your device drops a packet because it did not have a route to the destination.
Redirect (5)	Your device issues this message to inform a local host that its target is located on the same LAN (no routing is required) or when it detects a host using a non-optimal route (usually because a link has failed or changed its status). For example, if your device receives a packet destined to its own MAC address, but with a destination IP address of another host in the local subnet, it returns an ICMP redirect to the originating host. ICMP redirects are disabled on interfaces on which local proxy ARP is enabled.
Echo request (8)	This is related to echo replies. If your device receives an echo request, it sends an echo reply. If you enter the ping command, your device generates echo requests.
Router Advertisements (10)	These are Router Discovery Protocol messages. If Router Discovery is enabled, your device sends these to announce the IP addresses of the sending interface.
Time to Live Exceeded (11)	If the TTL field in a packet falls to zero, your device sends this message.This occurs when there are too many hops in the path that a packet is traversing.

ICMP messages are enabled on all interfaces by default. You can control the flow of ICMP messages across different interfaces using the **access-list** commands. See **Chapter 61, IPv4 Hardware Access Control List (ACL) Commands** and **Chapter 62, IPv4 Software Access Control List (ACL) Commands**.

ICMP Router Discovery Protocol (IRDP)

Router discovery

Your device supports the router specification sections of RFC 1256, ***ICMP Router Discovery Messages***. If this feature is configured, your device sends router advertisements periodically and in response to router solicitations. It does not support the Host Specification section of this RFC.

Benefits

Before an IP host can send an IP packet, the host has to know the IP address of a neighboring router that can forward the packet to its destination. ICMP Router Discovery messages let routers automatically advertise themselves to hosts. Other methods either require someone to manually keep these addresses current, or require DHCP to send router addresses.

Router discovery process

The following table summarizes what happens when Router Discovery advertisements are enabled on an interface.

When...	Then...
Router Discovery advertising starts on an interface because: ■ your device starts up, or ■ you enable advertisements on your device or on an interface	your device multicasts a router advertisement and continues to multicast them periodically until router advertising is disabled.
a host starts up	the host may send a router solicitation message.
your device receives a router solicitation	your device multicasts an early router advertisement from the interface on which it received the router solicitation.
a host receives a router advertisement	the host stores the IP address and preference level for the advertisement lifetime.
the lifetimes of all existing router advertisements on a host expire	the host sends a router solicitation.
a host does not receive a router advertisement after sending a small number of router solicitations	the host waits for the next unsolicited router advertisement.
a host needs a default router address	the host uses the IP address of the router or L3 switch with the highest preference level.

When...(cont.)	Then...(cont.)
Router Discovery advertising is deleted from the interface	your device multicasts a router advertisement with the IP address(es) that stopped advertising, and a lifetime of zero. It continues to periodically multicast router advertisements for other interfaces, if configured to.
the router receives a router advertisement from another router	the router does nothing but silently discards the message

Advertisement messages

A router advertisement is an ICMP (type 10) message that contains the following:

- in the destination address field of the IP header, the interface's configured advertisement address, either 224.0.0.1 or 255.255.255.255.
- in the lifetime field, the interface's configured advertisement lifetime.
- in the Router Address and Preference Level fields, the addresses and preference levels of all the logical interfaces that are set to advertise.

Your device does not send router advertisements by default.

Solicitation message

A router solicitation is an ICMP (type 10) message containing:

- source Address: an IP address belonging to the interface from which the message is sent
- destination Address: the configured Solicitation Address, and
- Time-to-Live: 1 if the Destination Address is an IP multicast address; at least 1 otherwise.

Advertisement interval

The router advertisement interval is the time between router advertisements. For the first few advertisements sent from an interface (up to 3), your device sends the router advertisements at intervals of at most 16 seconds. After these initial transmissions, it sends router advertisements at random intervals between the minimum and maximum intervals that the user configures, to reduce the probability of synchronization with the advertisements from other routers on the same link. By default, the minimum is 450 seconds (7.5 minutes), and the maximum is 600 seconds (10 minutes).

Preference level

The preference level is the preference of the advertised address as a default router address relative to other router addresses on the same subnet. By default, all routers and Layer 3 switches have the same preference level, zero. While it is entered as a decimal from 0 to 2147483647, it is encoded in router advertisements as a twos-complement hex integer from 0x8000000 to 0x7fffffff. A higher preference level is preferred over a lower value.

Lifetime

The lifetime of a router advertisement is how long the information in the advertisement is valid. By default, the lifetime of all advertisements is 1800 seconds (30 minutes).

Address type

Your device can send its router advertisements using either a broadcast or multicast destination address. By default, your device sends router advertisements using the all-systems multicast address (224.0.0.1). However, on networks where the hosts do not support IP multicast you must use the broadcast address (255.255.255.255). To change the address type to broadcast on an interface, use the command:

```
awplus(config-if)# ip irdp broadcast
```

To change the address type back to multicast, use the **no** variant of the above command, or use the command:

```
awplus(config-if)# ip irdp multicast
```

Configuration procedure

Do the following to configure your device to send router advertisements.

Step 1: Enter the interface to advertise.

Enter the configuration mode for the interface, using the command:

```
awplus(config)# interface <interface>
```

Step 2: Change the address type.

By default, your device sends router advertisements using a multicast destination address. If hosts on your network do not support this, change the address type to broadcast, using the command:

```
awplus(config-if)# ip irdp broadcast
```

Step 3: Configure the advertisement interval and lifetime.

By default, your device sends router advertisements every 7.5 to 10 minutes, with a lifetime of 30 minutes. These settings are likely to work well in most situations, and will not cause a large amount of extra traffic, even if there are several routers on the LAN. If you change these settings, keep the following proportions:

```
lifetime=3 x maxadvertisementinterval
minadvertisementinverval=0.75 x maxadvertisementinterval
```

You cannot set the maximum advertisement interval below the minimum interval. If you are lowering the maximum interval to a value below the current minimum interval, you must change the minimum value first. This also applies to changing the minimum interval above the current maximum interval.

To change the maximum advertisement interval, use the command:

```
awplus(config-if)# no ip irdp maxadvertinterval
```

To change the minimum advertisement interval, use the command:

```
awplus(config-if)# ip irdp minadvertinterval <3-1800>
```

To change the lifetime for your device's router advertisements, use the command:

```
awplus(config-if)# ip irdp lifetime <0-9000>
```

Step 4: Set preference levels.

By default, every interface has the same preference for becoming a default router. To give the interface a higher preference, increase the preference level. To give it a lower preference, decrease this value.

To set the preference level for all addresses on this interface, use the command:

```
awplus(config-if)# ip irdp preference <0-2147483647>
```

To set the preference for a specific address on the interface, use the command:

```
awplus(config-if)# ip irdp address <ip-address> preference
                   <0-2147483647>
```

Step 5: Enable advertising on the interface.

To enable router advertisements on an interface, enter the interface mode and use the command:

```
awplus(config-if)# ip irdp
```

Step 6: Enable advertising on your device.

To globally enable router advertisements on your device, enter the configure mode and use the command:

```
awplus(config)# router ip irdp
```

Step 7: Check advertise settings.

To view the IRDP configuration on the interface, use the command:

```
awplus# show ip irdp interface [<interface-name>]
```

To view the global IRDP configuration for your device, use the command:

```
awplus# show ip irdp
```

Debugging IRDP

Information which may be useful for troubleshooting IRDP is available using the IRDP debugging function. To enable IRDP debugging, use the command:

```
awplus# debug ip irdp {event|nsm|receive|send|both|
       detail|all}
```

Checking IP Connections

To verify connections between networks and network devices, use the ping (Packet Internet Groper) and trace route functions on your device.

Ping

Ping tests the connectivity between two network devices to determine whether each network device can “see” the other device. Echo request packets are sent to the destination addresses and responses are displayed on the console.

If you can ping the end destination, then the physical, Layer 2 and Layer 3 links are functioning, and any difficulties are in the network or higher layers.

If pinging the end destination fails, use traceroute to discover the point of failure in the route to the destination.

To ping a device, use the command:

```
awplus# ping {<hostname>|<ipaddr>}
```

Traceroute

You can use traceroute to discover the route that packets pass between two systems running the IP protocol. Traceroute sends an initial UDP packets with the Time To Live (TTL) field in the IP header set starting at 1. The TTL field is increased by one for every subsequent packet sent until the destination is reached. Each hop along the path between two systems responds with a TTL exceeded packet (ICMP type 11) and from this the path is determined.

To use traceroute, use the command:

```
awplus# traceroute {<ip-addr>|<hostname>}
```

or, if you have enabled VRF Lite:

```
awplus# traceroute [vrf <vrf-name>] {<ip-addr>|<hostname>}
```

Enter either the hostname or the IP address of the device you are trying to reach.

IP Helper

The IP Helper feature allows the switch to receive UDP broadcasts on one subnet, and forward them as broadcasts or unicasts into another subnet, so a client can use an application which uses UDP broadcast (such as Net-BIOS) when the client and server are located in different subnets. The IP Helper feature forwards UDP broadcast network traffic to specific hosts on another subnet and/or to the broadcast address of another subnet.

When the IP Helper feature is enabled on a VLAN interface, the UDP broadcast packets received on the interface are processed for forwarding out through another interface into another subnet. Depending on the nature of the ip-helper addresses configured, the UDP broadcasts will be unicast forwarded to a single host in the destination subnet, or unicast forwarded to multiple hosts in the destination subnet, or broadcast to the broadcast address of the destination subnet. Not all UDP broadcasts will be forwarded when IP Helper is configured. The set of broadcasts to be forwarded can be defined by specifying the destination UDP port(s) of the packets you wish to forward.

The command to enable the forwarding of UDP broadcasts received on a given interface is **ip helper-address** (entered in interface configuration mode). The **ip forward-protocol udp** command specifies types of broadcast packets to forward.

Multiple different destination addresses can be specified by using multiple instances of the **ip helper-address** command under the same interface. If a destination address is specified that is actually the broadcast address of one of the subnets directly connected to the switch, then the UDP packets will be forwarded as broadcasts onto that subnet.

Likewise, multiple different types of UDP packet can be specified for forwarding by specifying multiple different destination ports using the **ip forward-protocol udp** command.

Note

The types of UDP broadcast packets that the switch will forward are **only** those specified by the **ip forward-protocol** command(s). The IP Helper process does not forward any other UDP packet types by default.

IP Directed Broadcast

IP directed-broadcast is enabled and disabled per VLAN interface. When enabled a directed broadcast packet is forwarded to an enabled VLAN interface if received on another subnet.

An IP directed broadcast is an IP packet whose destination address is a broadcast address for some IP subnet, but originates from a node that is not itself part of that destination subnet. When a directed broadcast packet reaches a switch that is directly connected to its destination subnet, the packet is flooded as a broadcast on the destination subnet.

The **ip directed-broadcast** command controls the flooding of directed broadcasts when they reach target subnets. The command affects the final transmission of the directed broadcast on its destination subnet. It does not affect the transit unicast routing of IP directed broadcasts. If directed broadcast is enabled for an interface, incoming directed broadcast IP packets intended for the subnet assigned to interface will be flooded as broadcasts on that subnet.

If the **no ip directed-broadcast** command is configured for an interface, directed broadcasts destined for the subnet where the interface is attached will be dropped instead of broadcast.

Chapter 27: IP Addressing and Protocol Commands

Introduction 27.3
Command List 27.4
arp-mac-disparity 27.4
arp-aging-timeout 27.5
arp (IP address MAC) 27.6
arp log 27.8
arp opportunistic-nd 27.11
clear arp-cache 27.13
clear ip dns forwarding cache 27.14
debug ip dns forwarding 27.15
debug ip packet interface 27.16
debug ip irdp 27.18
ip address 27.19
ip dns forwarding 27.21
ip dns forwarding cache 27.22
ip dns forwarding dead-time 27.24
ip dns forwarding retry 27.25
ip dns forwarding source-interface 27.26
ip dns forwarding timeout 27.27
ip domain-list 27.28
ip domain-lookup 27.29
ip domain-name 27.30

Introduction

This chapter provides an alphabetical reference of commands used to configure the following protocols:

- Address Resolution Protocol (ARP)
- Domain Name Service (DNS)
- ICMP Router Discovery Advertisements (IRDP)

For more information see **Chapter 26, Internet Protocol (IP) Addressing and Protocols**.

Command List

arp-mac-disparity

Use this command in Interface Configuration mode for a VLAN interface to enable the reception of ARP packets that contain a multicast MAC address in the sender field.

By default, ARP packets that contain a multicast MAC address in the sender field are dropped. The **no** variant of this command reverts to the default behavior.

Syntax

```
arp-mac-disparity
no arp-mac-disparity
```

Default ARP disparity is disabled. ARP packets with a multicast MAC address in the sender field are dropped.

Mode Interface Configuration for a VLAN interface.

Usage Normally, it is invalid for an ARP request to resolve a multicast MAC address. By default, ARP replies with a multicast MAC addresses are not learnt. This command allows control over the learning of dynamic ARPs that resolve to a multicast MAC address.

ARP-MAC disparity may need to be enabled to support multicast network load balancing. The **arp-mac-disparity** command allows ARP replies quoting multicast MAC addresses to be accepted and learnt. No **no arp-mac-disparity** command reverts to default behavior.

If the ARP-MAC disparity feature is enabled, then ARP entries that resolve to a multicast MAC address are flooded to the VLAN regardless of the port associated with the ARP entry.

Example To enable ARP MAC disparity on interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# arp-mac-disparity
```

To disable ARP MAC disparity on interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no arp-mac-disparity
```

Related Commands **clear arp-cache**
show arp

arp-aging-timeout

This command sets a timeout period on dynamic ARP entries associated with a specific interface. If your device stops receiving traffic for the host specified in a dynamic ARP entry, it deletes the ARP entry from the ARP cache after this timeout is reached.

Your device times out dynamic ARP entries to ensure that the cache does not fill with entries for hosts that are no longer active. Static ARP entries are not aged or automatically deleted.

By default the time limit for dynamic ARP entries is 300 seconds on all interfaces.

The **no** variant of this command sets the time limit to the default of 300 seconds.

Syntax

```
arp-aging-timeout <0-432000>
no arp-aging timeout
```

Parameter	Description
<0-432000>	The timeout period in seconds.

Default 300 seconds (5 minutes)

Mode Interface Configuration for a VLAN interface.

Example To set the ARP entries on interface `vlan30` to time out after two minutes, use the commands:

```
awplus(config)# interface vlan30
awplus(config-if)# arp-aging-timeout 120
```

Related Commands

clear arp-cache
show arp

arp (IP address MAC)

This command adds a static ARP entry to the ARP cache. This is typically used to add entries for hosts that do not support ARP or to speed up the address resolution function for a host. The ARP entry must not already exist. Use the **alias** parameter to allow your device to respond to ARP requests for this IP address.

If VRF Lite is configured, you can add ARP entries to either the global cache or for a specific VRF Lite instance.

The **no** variant of this command removes the static ARP entry. Use the **clear arp-cache** command on page 27.13 to remove the dynamic ARP entries in the ARP cache.

Syntax

```
arp <ip-addr> <mac-address> [<port-number>] [alias]
no arp <ip-addr>
```

Syntax (VRF Lite)

```
arp [vrf <vrf-name>] <ip-addr> <mac-address> [<port-number>] [alias]
no arp [vrf <vrf-name>] <ip-addr>
```

Parameter	Description
<ip-addr>	IPv4 address of the device you are adding as a static ARP entry.
<mac-address>	MAC address of the device you are adding as a static ARP entry, in hexadecimal notation with the format HHHH.HHHH.HHHH.
<port-number>	The port number associated with the IP address. Specify this when the IP address is part of a VLAN.
`alias`	Allows your device to respond to ARP requests for the IP address. Proxy ARP must be enabled on the interface before using this parameter.
`vrf`	Apply this command to a VRF Lite instance.
<vrf-name>	The name of the VRF Lite instance.

Mode Global Configuration

Examples To add the IP address 10.10.10.9 with the MAC address 0010.2533.4655 into the ARP cache, and have your device respond to ARP requests for this address, use the commands:

```
awplus# configure terminal
awplus(config)# arp 10.10.10.9 0010.2355.4566 alias
```

Example (VRF Lite) To apply the above example within VRF Lite instance called `red` use the following commands:

```
awplus# configure terminal
awplus(config)# arp vrf red 10.10.10.9 0010.2355.4566 alias
```

Related Commands

clear arp-cache
ip proxy-arp
show arp

arp log

This command enables the logging of dynamic and static ARP entries in the ARP cache. The ARP cache contains mappings of switch ports, VLAN IDs, and IP addresses to physical MAC addresses for hosts.

This command can display the MAC addresses in the ARP log either using the default hexadecimal notation (HHHH.HHHH.HHHH), or using the IEEE standard hexadecimal notation (HH-HH-HH-HH-HH-HH).

Use the **no** variant of this command to disable the logging of dynamic and static ARP entries in the ARP cache.

Syntax

```
arp log [mac-address-format ieee]

no arp log [mac-address-format ieee]
```

Parameter	Description
`mac-address-format ieee`	Display the MAC address in hexadecimal notation with the standard IEEE format (HH-HH-HH-HH-HH-HH), instead of displaying the MAC address with the default hexadecimal format (HHHH.HHHH.HHHH).

Default The ARP logging feature is disabled by default.

Mode Global Configuration

Usage You have the option to change how the MAC address is displayed in the ARP log message, to use the default hexadecimal notation (HHHH.HHHH.HHHH), or the IEEE format hexadecimal notation (HH-HH-HH-HH-HH-HH) when you apply the **mac-address-format ieee** parameter.

Enter the **arp log** command without the optional **mac-address-format ieee** parameter specified for MAC addresses in the ARP log output to use the default hexadecimal notation (HHHH.HHHH.HHHH).

Enter the **arp log mac-address-format ieee** command for MAC addresses in the ARP log output to use the IEEE standard format hexadecimal notation (HH-HH-HH-HH-HH-HH).

Use the **no** variant of this command (**no arp log**) without the optional **mac-address-format ieee** parameter specified to disable ARP logging on the switch

Use the **no** variant of this command with the optional **mac-address-format ieee** parameter specified (**no arp log mac-address-format ieee**) to disable IEEE standard format hexadecimal notation (HH-HH-HH-HH-HH-HH) and revert to the default hexadecimal notation (HHHH.HHHH.HHHH) for MAC addresses in the ARP log output.

To display ARP log messages use the **show log | include ARP_LOG** command.

Examples To enable ARP logging and use the default hexadecimal notation (HHHH.HHHH.HHHH), use the following commands:

```
awplus# configure terminal
awplus(config)# arp log
```

To disable ARP logging on the switch of MAC addresses displayed using the default hexadecimal notation (HHHH.HHHH.HHHH), use the following commands:

```
awplus# configure terminal
awplus(config)# no arp log
```

To enable ARP logging and to specify that the MAC address in the log message is displayed in the standard IEEE format hexadecimal notation (HH-HH-HH-HH-HH-HH), use the following commands:

```
awplus# configure terminal
awplus(config)# arp log mac-address-format ieee
```

To disable ARP logging on the switch of MAC addresses displayed using the standard IEEE format hexadecimal notation (HH-HH-HH-HH-HH-HH), and revert to the use of the default hexadecimal notation (HHHH.HHHH.HHHH) instead, use the following commands:

```
awplus# configure terminal
awplus(config)# no arp log mac-address-format ieee
```

To display ARP log messages, use following command:

```
awplus# show log | include ARP_LOG
```

Output Below is example output from the **show log | include ARP_LOG** command after enabling ARP logging displaying default hexadecimal notation MAC addresses (HHHH.HHHH.HHHH) using the **arp log** command.

```
awplus#configure terminal
awplus(config)#arp log
awplus(config)#exit
awplus#show log | include ARP_LOG
2010 Apr  6 06:21:01 user.notice awplus HSL[1007]: ARP_LOG port1.0.7 vlan1 add
0013.4078.3b98 (192.168.2.4)
2010 Apr  6 06:22:30 user.notice awplus HSL[1007]: ARP_LOG port1.0.7 vlan1 del

2010 Apr  6 06:28:14 user.notice awplus IMISH[1830]: show log | include ARP_LOG
```

Below are the parameters in output of the **show log | include ARP_LOG** command with an ARP log message format of <*ARP_LOG*> <*port number*> <*VLAN ID*> <*Operation*> <*MAC*> <*IP*> after <*date*> <*time*> <*severity*> <*hostname*> <*program name*> information.

Table 27-1: Parameters in output of the show log | include ARP_LOG command

Parameter	Description
<*ARP_LOG*>	Indicates ARP log entry information follows <*date*> <*time*> <*severity*> <*hostname*> <*program name*> log information.
<*port number*>	Indicates switch port number for the ARP log entry.
<*VLAN ID*>	Indicates the VLAN ID for the ARP log entry.
<*Operation*>	Indicates 'add' if the ARP log entry displays an ARP addition. Indicates 'del' if the ARP log entry displays an ARP deletion.
<*MAC*>	Indicates the MAC address for the ARP log entry, either in the default hexadecimal notation (HHHH.HHHH.HHHH) or in the IEEE standard format hexadecimal notation (HH-HH-HH-HH-HH-HH) as specified with the **arp log** or the **arp log mac-address-format ieee** command.
<*IP*>	Indicates the IP address for the ARP log entry.

Validation Commands **show running-config**

Related Commands **show log**

arp opportunistic-nd

changes the behavior for unsolicited ARP packet forwarding on the switch.

Use this command to enable opportunistic neighbor discovery for the global ARP cache.

When using VRF Lite you can use this command to enable opportunistic neighbor discovery for a named VRF Lite instance.

Use the **no** variant of this command to disable opportunistic neighbor discovery for the global ARP cache.

Syntax

```
arp opportunistic-nd
```

Syntax (VRF Lite)

```
arp opportunistic-nd [vrf <vrf-name>]
```

Syntax

```
no arp opportunistic-nd
```

Syntax (VRF Lite)

Parameter	Description
`vrf`	Apply this command to a VRF Lite instance.
<vrf-name>	The name of the VRF Lite instance.

Default Opportunistic neighbor discovery is disabled by default.

Mode Global Configuration

Usage When opportunistic neighbor discovery is enabled, the switch will reply to any received unsolicited ARP packets (but not gratuitous ARP packets). The source MAC address for the unsolicited ARP packet is added to the ARP cache, so the switch forwards the ARP packet. When opportunistic neighbor discovery is disabled, the source MAC address for the ARP packet is not added to the ARP cache, so the ARP packet is not forwarded by the switch.

Note this command enables or disables opportunistic neighbor discovery for a VRF Lite instance if the **VRF Lite** parameter and an instance name are applied. If a VRF Lite instance is not specified, then opportunistic neighbor discovery is enabled or disabled for switch ports configured for IPv4.

Example To enable opportunistic neighbor discovery for the global ARP cache, enter:

```
awplus# configure terminal
awplus(config)# arp opportunistic-nd
```

To disable opportunistic neighbor discovery for the global ARP cache, enter:

```
awplus# configure terminal
awplus(config)# no arp opportunistic-nd
```

Syntax (VRF Lite)

To enable opportunistic neighbor discovery for the VRF Lite instance `vrf_blue`, enter:

```
awplus# configure terminal
awplus(config)# arp opportunistic-nd VRF Lite instance_blue
```

To disable opportunistic neighbor discovery for the VRF Lite instance_`blue`, enter:

```
awplus# configure terminal
awplus(config)# no arp opportunistic-nd VRF Lite instance_blue
```

Related Commands

ipv6 opportunistic-nd
show arp

Validation Commands

show running-config interface

clear arp-cache

This command deletes dynamic ARP entries from the ARP cache. You can optionally specify the IPv4 address of an ARP entry to be cleared from the ARP cache.

When running VRF Lite, this command deletes dynamic ARP entries from either the whole switch, the global instance, or a selected VRF instance. By using this command with no specific VRF Lite parameters. You can optionally specify the IPv4 address for the ARP entries across the whole switch.

To delete all ARP entries from both the Global VRF Lite instance and all VRF Lite instances, use the command with no parameters. You can optionally specify the IPv4 address for the VRF Lite instance to clear an ARP entry from the ARP cache.

Syntax

```
clear arp-cache [<ip-address>]
```

Parameter	Description
<ip-address>	Optionally specify an IPv4 address of an ARP entry to be cleared from the ARP cache.

Syntax (VRF Lite)

```
clear arp-cache [vrf <vrf-name>|global] [<ip-address>]
```

Parameter	Description
`global`	When VRF Lite is configured, apply this command to the global routing and forwarding table
`vrf`	Apply this command to the specified VRF Lite instance.
<vrf-name>	The VRF Lite instance name

Mode Privileged Exec

Usage To display the entries in the ARP cache, use the **show arp** command. To remove static ARP entries, use the no variant of the **arp (IP address MAC)** command on page 27.6.

Examples To clear all dynamic ARP entries, use the command:

```
awplus# clear arp-cache
```

To clear all dynamic ARP entries associated with the IPv4 address 192.168.1.1, use the command:

```
awplus# clear arp-cache 192.168.1.1
```

Example (VRF Lite) To clear the dynamic ARP entries from the VRF Lite instance named blue, use the commands:

```
awplus# clear arp-cache vrf blue
```

To clear the dynamic ARP entries from the VRF Lite instance named blue with the IPv4

address 192.168.1.1, use the commands:

```
awplus# clear arp-cache vrf blue 192.168.1.1
```

When running VRF Lite, to clear the dynamic ARP entries from the global VRF Lite and all VRF Lite instances, use the command:

```
awplus# clear arp-cache
```

Related Commands **arp-mac-disparity**
arp (IP address MAC)
show arp

clear ip dns forwarding cache

Use this command to clear the DNS Relay name resolver cache.

When using VRF Lite, Use this command to clear the DNS Relay name resolver cache for either the whole switch or for a specific VRF Lite instance.

Syntax

```
clear ip dns forwarding cache
```

Syntax (VRF Lite)

```
clear ip dns [vrf <name>|global] forwarding cache
```

Mode Privileged Exec

Examples To clear all cached data, use the command:

```
awplus# clear ip dns forwarding cache
```

Example (VRF Lite) To clear the cached data for VRF Lite instance red, use the command:

```
awplus# clear ip dns vrf red forwarding cache
```

To clear the cached data for the default global VRF Lite instance only, use the command:

```
awplus# clear ip dns global forwarding cache
```

Related Commands **ip dns forwarding cache**

debug ip dns forwarding

Use this command to enable DNS Relay debugging.

Use the **no** variant of this command to disable DNS Relay debugging.

Syntax

```
debug ip dns forwarding
no debug ip dns forwarding
```

Default DNS Relay debugging is disabled by default.

Mode Privileged Exec

Examples To enable DNS forwarding debugging, use the commands:

```
awplus# debug ip dns forwarding
```

To disable DNS forwarding debugging, use the commands:

```
awplus# no debug ip dns forwarding
```

Related Commands

ip dns forwarding
show debugging ip dns forwarding

debug ip packet interface

The **debug ip packet interface** command enables IP packet debug and is controlled by the **terminal monitor** command.

If the optional **icmp** keyword is specified then ICMP packets are shown in the output.

The **no** variant of this command disables the **debug ip interface** command.

Syntax

```
debug ip packet interface {<interface-name>|all}
   [address <ip-address>|verbose|hex|arp|udp|tcp|icmp]

no debug ip packet interface [<interface-name>]
```

Parameter	Description
<interface>	Specify a single Layer 3 interface name (not a range of interfaces) This keyword can be specified as either all or as a single Layer 3 interface to show debugging for either all interfaces or a single interface.
`all`	Specify all Layer 3 interfaces on the switch.
<ip-address>	Specify an IPv4 address. If this keyword is specified, then only packets with the specified IP address as specified in the ip-address placeholder are shown in the output.
`verbose`	Specify **verbose** to output more of the IP packet. If this keyword is specified then more of the packet is shown in the output.
`hex`	Specify **hex** to output the IP packet in hexadecimal. If this keyword is specified, then the output for the packet is shown in hex.
`arp`	Specify **arp** to output ARP protocol packets. If this keyword is specified, then ARP packets are shown in the output.
`udp`	Specify **udp** to output UDP protocol packets. If this keyword is specified then UDP packets are shown in the output.
`tcp`	Specify **tcp** to output TCP protocol packets. If this keyword is specified, then TCP packets are shown in the output.
`icmp`	Specify **icmp** to output ICMP protocol packets. If this keyword is specified, then ICMP packets are shown in the output.

Mode Privileged Exec and Global Configuration

Examples To turn on ARP packet debugging on `vlan1`, use the command:

```
awplus# debug ip packet interface vlan1 arp
```

To turn on all packet debugging on all interfaces on the switch, use the command:

```
awplus# debug ip packet interface all
```

To turn on TCP packet debugging on `vlan1` and IP address `192.168.2.4`, use the command:

```
awplus# debug ip packet interface vlan1 address 192.168.2.4
       tcp
```

To turn off IP packet interface debugging on all interfaces, use the command:

```
awplus# no debug ip packet interface
```

To turn off IP packet interface debugging on interface `vlan2`, use the command:

```
awplus# no debug ip packet interface vlan2
```

Related Commands

no debug all
show debugging ip dns forwarding
tcpdump
terminal monitor
undebug ip packet interface

debug ip irdp

This command enables debugging of ICMP Router Discovery Protocol (IRDP) events and messages on your device. IRDP debugging is disabled by default.

The **no** variant of this command disables IRDP debugging. Negating any packet debug mode will switch detail off.

Syntax

```
debug ip irdp {event|nsm|receive|send|both|detail|all}
no debug ip irdp {event|nsm|receive|send|both|detail|all}
```

Parameter	Description
`event`	Enables debugging of IRDP events.
`nsm`	Enables debugging of IRDP processing of NSM messages.
`receive`	Enables debugging of IRDP input packet processing.
`send`	Enables debugging of IRDP output packet processing.
`both`	Enables debugging of both IRDP input and output packet processing.
`detail`	Enables detailed debugging of both IRDP input and output packet processing. Note that setting detail also sets both, so if you set **detail**, the output will show "packet debugging mode is all". Negating any packet debug mode will switch detail off.
`all`	Enables all IRDP debugging types.

Default IRDP protocol debugging is disabled by default.

Mode Privileged Exec and Global Configuration

Examples To enable IRDP input packet process debugging, use the following command:

```
awplus# debug ip irdp receive
```

To disable all IRDP debugging, use the following command:

```
awplus# no debug ip irdp all
```

Related Commands

ip irdp
router ip irdp
show ip irdp
undebug ip irdp

ip address

This command sets a static IP address on an interface. To set the primary IP address on the interface, specify only **ip address *<ip-address/m>***. This overwrites any configured primary IP address. To add additional IP addresses on this interface, use the **secondary** parameter. You must configure a primary address on the interface before configuring a secondary address.

Note

Use **show running-config** interface not **show ip interface brief** when you need to view a secondary address configured on an interface. **show ip interface brief** will only show the primary address not a secondary address for an interface.

The **no** variant of this command removes the IP address from the interface. You cannot remove the primary address when a secondary address is present.

Syntax

```
ip address <ip-addr/prefix-length> [secondary [label <label>]]
no ip address <ip-addr/prefix-length> [secondary]
no ip address
```

Parameter	Description
<ip-addr/prefix-length>	The IPv4 address and prefix length you are assigning to the interface.
`label`	Adds a user-defined description of the secondary IP address.
<label>	A user-defined description of the secondary IP address. Valid characters are any printable character and spaces.

Mode Interface Configuration for a VLAN interface or a local loopback interface.

Examples To add the primary IP address `10.10.10.50/24` to the interface `vlan3`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# ip address 10.10.10.50/24
```

To add the secondary IP address `10.10.11.50/24` to the same interface, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# ip address 10.10.11.50/24 secondary
```

To add the IP address `10.10.11.50/24` to the local loopback interface `lo`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface lo
awplus(config-if)# ip address 10.10.11.50/24
```

Related Commands

interface (to configure)
show ip interface
show running-config interface

ip dns forwarding

Use this command to enable DNS Relay, the forwarding of incoming DNS queries for IP hostname-to-address translation.

Use the **no** variant of this command to disable the forwarding of incoming DNS queries for IP hostname-to-address translation.

Syntax

```
ip dns forwarding
no ip dns forwarding
```

Default The forwarding of incoming DNS query packets is disabled by default.

Mode Global Configuration

Usage See **"DNS Relay" on page 26.10** for more information about DNS Relay to map IPv4 and IPv6 addresses to name servers to maintain a a database of hostname-to-address mappings

Syntax (VRF Lite)

Note When running VRF Lite, the DNS Relay functions will apply separately within each VRF Lite Instance.

Examples To enable the forwarding of incoming DNS query packets, use the commands:

```
awplus# configure terminal
awplus(config)# ip dns forwarding
```

To disable the forwarding of incoming DNS query packets, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dns forwarding
```

show ip dns forwarding server

ip dns forwarding cache

Use this command to set the DNS Relay name resolver cache size and cache entry lifetime period. The DNS Relay name resolver cache stores the mappings between domain names and IP addresses.

Use the **no** variant of this command to set the default DNS Relay name resolver cache size and cache entry lifetime period.

Note that the lifetime period of the cache entry can be overwritten by the time-out period of the DNS reply from the DNS server if the time-out period of the DNS reply from the DNS server is smaller than the configured time-out period. The time-out period of the cache entry will only be used when the time-out period of the DNS reply from the DNS server is bigger than the time-out period configured on the device.

Syntax

```
ip dns forwarding cache [size <0-1000>] [timeout <60-3600>]
no ip dns forwarding cache [size|timeout]
```

Parameter	Description
<0-1000>	Number of entries in the DNS Relay name resolver cache. Note that when running VRF Lite the number of entries configured will apply to each VRF Lite instance.
<60-3600>	Timeout value in seconds. Note that when running VRF Lite the number of entries configured will apply to each VRF Lite instance.

Note that when running VRF Lite the number of entries configured will apply to each VRF Lite instance.
Also note that when running VRF Lite the number of entries configured will apply to each VRF Lite instance

Default The default cache size is 0 (no entries) and the default lifetime is 1800 seconds.

Mode Global Configuration

Usage See **"DNS Relay" on page 26.10** for more information about DNS Relay to map IPv4 and IPv6 addresses to name servers to maintain a a database of hostname-to-address mappings.

Examples To set the cache size to `10` entries and the lifetime to `500` seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip dns forwarding cache size 10 time 500
```

To set the cache size to the default, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dns forwarding cache size
```

Related Commands

clear ip dns forwarding cache
debug ip dns forwarding
ip dns forwarding
show ip dns forwarding
show ip dns forwarding cache

ip dns forwarding dead-time

Use this command to set the time period in seconds when the switch stops sending any DNS requests to an unresponsive server and all retries set using **ip dns forwarding retry** are used. This time period is the DNS forwarding dead-time. The switch stops sending DNS requests at the DNS forwarding dead-time configured and when all of the retries are used.

Use the **no** variant of this command to restore the default DNS forwarding dead-time value of 3600 seconds.

Syntax

```
ip dns forwarding dead-time <60-43200>
no ip dns forwarding retry
```

Parameter	Description
<60-43200>	Set the DNS forwarding dead-time period in seconds. At the dead-time set, the switch stops sending DNS requests to an unresponsive server.

Default The default time to stop sending DNS requests to an unresponsive server is 3600 seconds.

Mode Global Configuration

Usage See **"DNS Relay" on page 26.10** for more information about DNS Relay to map IPv4 and IPv6 addresses to name servers to maintain a a database of hostname-to-address mappings. See the **ip dns forwarding retry** command used with this command.

Examples To set the DNS forwarding retry count to `50` and to set the DNS forwarding dead-time to `1800` seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip dns forwarding dead-time 1800
awplus(config)# ip dns forwarding retry 50
```

To reset the DNS retry count to the default of `2` and the DNS forwarding dead-time to the default of 3600, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dns forwarding dead-time
awplus(config)# no ip dns forwarding retry
```

Related Commands

debug ip dns forwarding
ip dns forwarding
ip dns forwarding retry

show ip dns forwarding server

ip dns forwarding retry

Use this command to set the number of times DNS Relay will retry to forward DNS queries. The switch stops sending DNS requests to an unresponsive server at the time set using the **ip dns forwarding dead-time** command and when all of the retries are used.

Use the **no** variant of this command to set the number of retries to the default of 2.

Syntax

```
ip dns forwarding retry <0-100>
no ip dns forwarding retry
```

Parameter	Description
<0-100>	Set the number of times DNS Relay will retry to forward a DNS query.

Default The default number of retries is 2 DNS requests to an unresponsive server.

Mode Global Configuration

Usage See **"DNS Relay" on page 26.10** for more information about DNS Relay to map IPv4 and IPv6 addresses to name servers to maintain a a database of hostname-to-address mappings. See the **ip dns forwarding dead-time** command used with this command.

Examples To set the DNS forwarding retry count to `50` and to set the DNS forwarding dead-time to `1800` seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip dns forwarding retry 50
awplus(config)# ip dns forwarding dead-time 1800
```

To reset the DNS retry count to the default of `2` and the DNS forwarding dead-time to the default of `3600` seconds, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dns forwarding retry
awplus(config)# no ip dns forwarding dead-time
```

Related Commands

debug ip dns forwarding
ip dns forwarding
ip dns forwarding dead-time
show ip dns forwarding

ip dns forwarding source-interface

Use this command to set the interface to use for forwarding and receiving DNS queries.

Use the **no** variant of this command to unset the interface used for forwarding and receiving DNS queries.

Syntax

```
ip dns forwarding source-interface <interface-name>
no ip dns forwarding source-interface
```

Parameter	Description
<interface-name>	An alphanumeric string that is the interface name.

Default The default is that no interface is set and the switch selects the appropriate source IP address automatically.

Mode Global Configuration

Usage See **"DNS Relay" on page 26.10** for more information about DNS Relay to map IPv4 and IPv6 addresses to name servers to maintain a a database of hostname-to-address mappings.

Examples To set `vlan1` as the source interface for relayed DNS queries, use the commands:

```
awplus# configure terminal
awplus(config)# ip dns forwarding source-interface vlan1
```

To clear the source interface for relayed DNS queries, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dns forwarding source-interface
```

Related Commands

debug ip dns forwarding
ip dns forwarding
show ip dns forwarding

ip dns forwarding timeout

Use this command to set the time period for the DNS Relay to wait for a DNS response.

Use the **no** variant of this command to set the time period to wait for a DNS response to the default of 3 seconds.

Syntax

```
ip dns forwarding timeout <0-3600>
no ip dns forwarding timeout
```

Parameter	Description
<0-3600>	Timeout value in seconds.

Default The default timeout value is 3 seconds.

Mode Global Configuration

Usage See **"DNS Relay" on page 26.10** for more information about DNS Relay to map IPv4 and IPv6 addresses to name servers to maintain a a database of hostname-to-address mappings.

Examples To set the timeout value to `12` seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip dns forwarding timeout 12
```

To set the timeout value to the default of `3` seconds, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dns forwarding timeout
```

Related Commands

debug ip dns forwarding
ip dns forwarding
show ip dns forwarding

ip domain-list

This command adds a domain to the DNS list. Domain are appended to incomplete host names in DNS requests. Each domain in this list is tried in turn in DNS lookups. This list is ordered so that the first entry you create is checked first.

The **no** variant of this command deletes a domain from the list.

Syntax

```
ip domain-list <domain-name>
no ip domain-list <domain-name>
```

Parameter	Description
<domain-name>	Domain string, for example “company.com”.

Mode Global Configuration

Usage If there are no domains in the DNS list, then your device uses the domain specified with the **ip domain-name** command. If any domain exists in the DNS list, then the device does not use the domain set using the **ip domain-name** command.

See **“Domain Name System (DNS)” on page 26.8** for introductory information about DNS.
See **“DNS Client” on page 26.9** for information about DNS Client configuration commands.

Example To add the domain `example.net` to the DNS list, use the following commands:

```
awplus# configure terminal
awplus(config)# ip domain-list example.net
```

Related Commands

ip domain-lookup
ip domain-name
show ip domain-list

ip domain-lookup

This command enables the DNS client on your device. This allows you to use domain names instead of IP addresses in commands. The DNS client resolves the domain name into an IP address by sending a DNS enquiry to a DNS server, specified with the **ip name-server** command.

The **no** variant of this command disables the DNS client. The client will not attempt to resolve domain names. You must use IP addresses to specify hosts in commands.

Syntax

```
ip domain-lookup
no ip domain-lookup
```

Mode Global Configuration

Usage The client is enabled by default. However, it does not attempt DNS enquiries unless there is a DNS server configured.

See **"DNS Client" on page 26.9** for information about DNS Client configuration commands.

Examples To enable the DNS client on your device, use the following commands:

```
awplus# configure terminal
awplus(config)# ip domain-lookup
```

To disable the DNS client on your device, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip domain-lookup
```

Related Commands

ip domain-list
ip domain-name
ip name-server
show hosts
show ip name-server

ip domain-name

This command sets a default domain for the DNS. The DNS client appends this domain to incomplete host-names in DNS requests.

The **no** variant of this command removes the domain-name previously set by this command.

Syntax

```
ip domain-name <domain-name>
no ip domain-name <domain-name>
```

Parameter	Description
<domain-name>	Domain string, for example “company.com”.

Mode Global Configuration

Usage If there are no domains in the DNS list (created using the **ip domain-list** command) then your device uses the domain specified with this command. If any domain exists in the DNS list, then the device does not use the domain configured with this command.

See **“DNS Client” on page 26.9** for information about DNS Client configuration commands.

When your device is using its DHCP client for an interface, it can receive Option 15 from the DHCP server. This option replaces the domain name set with this command. See **Chapter 92, Dynamic Host Configuration Protocol (DHCP) Introduction** for more information about DHCP and DHCP options.

Example To configure the domain name, enter the following commands:

```
awplus# configure terminal
awplus(config)# ip domain-name company.com
```

Related Commands

ip domain-list
show ip domain-list
show ip domain-name

ip directed-broadcast

Use this command to enable flooding of directed broadcast packets into a directly connected subnet. If this command is configured on a VLAN interface, then directed broadcasts received on other VLAN interfaces, destined for the subnet on this VLAN, will be flooded to the subnet broadcast address of this VLAN.

Use the **no** variant of this command to disable **ip directed-broadcast**. When this feature is disabled using the **no** variant of this command, directed broadcasts are not forwarded.

Syntax

```
ip directed-broadcast
no ip directed-broadcast
```

Default The **ip directed-broadcast** command is disabled by default.

Mode Interface Configuration for a VLAN interface or a local loopback interface.

Usage IP directed-broadcast is enabled and disabled per VLAN interface. When enabled a directed broadcast packet is forwarded to an enabled VLAN interface if received on another subnet.

An IP directed broadcast is an IP packet whose destination address is a broadcast address for some IP subnet, but originates from a node that is not itself part of that destination subnet. When a directed broadcast packet reaches a switch that is directly connected to its destination subnet, that packet is flooded as a broadcast on the destination subnet.

The **ip directed-broadcast c**ommand controls the flooding of directed broadcasts when they reach target subnets. The command affects the final transmission of the directed broadcast on its destination subnet. It does not affect the transit unicast routing of IP directed broadcasts. If directed broadcast is enabled for an interface, incoming directed broadcast IP packets intended for the subnet assigned to interface will be flooded as broadcasts on that subnet.

If the **no ip directed-broadcast** command is configured for an interface, directed broadcasts destined for the subnet where the interface is attached will be dropped instead of broadcast.

Examples To enable **ip directed-broadcast**, to flood broadcast packets out via the `vlan2` interface, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip directed-broadcast
```

To disable **ip directed-broadcast,** disabling the flooding of broadcast packets via `vlan2`, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip directed-broadcast
```

Related Commands

ip forward-protocol udp
ip helper-address
show running-config

ip forwarding

This command enables IP forwarding on your device. When enabled, your device routes IP packets.

The **no** variant of this command disables IP forwarding on your device. Even when IP forwarding is not enabled, the device can still work as an IP host; in particular, it can be managed by IP-based applications, such as SNMP, Telnet and SSH.

Syntax

```
ip forwarding
no ip forwarding
```

Default IP forwarding is enabled by default.

Mode Global Configuration

Examples To enable your device to route IP packets, use the commands:

```
awplus# configure terminal
awplus(config)# ip forwarding
```

To stop your device from routing IP packets, use the commands

```
awplus# configure terminal
awplus(config)# no ip forwarding
```

Related Commands show ip forwarding

ip forward-protocol udp

This command enables you to control which UDP broadcasts will be forwarded to the helper address(es). A UDP broadcast will only be forwarded if the destination UDP port number in the packet matches one of the port numbers specified using this command.

Refer to the IANA site (**www.iana.org**) for a list of assigned UDP port numbers for protocols to forward using **ip forward-protocol udp**.

Use the **no** variant of this command to remove a port number from the list of destination port numbers that are used as the criterion for deciding if a given UDP broadcast should be forwarded to the IP helper address(es).

Syntax

```
ip forward-protocol udp <port>
no ip forward-protocol udp <port>
```

Parameter	Description
<port>	UDP Port Number.

Default The **ip forward-protocol udp** command is not enabled by default.

Mode Global Configuration

Usage Combined with the **ip helper-address** command on page 27.38 in interface mode, the **ip forward-protocol udp** command in Global Configuration mode allows control of which protocols (destination port numbers) are forwarded. The **ip forward-protocol udp** command configures protocols for forwarding, and the **ip helper-address** command configures the destination address(es).

Note The types of UDP broadcast packets that the switch will forward are ONLY those specified by the **ip forward-protocol** command(s). There are no other UDP packet types that the IP helper process forwards by default.

Note The **ip forward-protocol udp** command does not support BOOTP / DHCP Relay. The **ip dhcp-relay** command must be used instead. For this reason, you may not configure UDP ports 67 and 68 with the **ip forward-protocol udp** command.
See **"DHCP Relay Agent Introduction" on page 92.9** for information about DHCP Relay.

Examples To configure forwarding of packets on a UDP port, use the following commands:

```
awplus# configure terminal
awplus(config)# ip forward-protocol udp <port>
```

To delete a UDP port from the UDP ports that the switch forwards, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip forward-protocol udp <port>
```

Validation Commands **show running-config**

Related Commands **ip helper-address**
ip directed-broadcast

ip gratuitous-arp-link

This command sets the Gratuitous ARP time limit for all switchports. The time limit restricts the sending of Gratuitous ARP packets to one Gratuitous ARP packet within the time in seconds.

Note

This command specifies time between sequences of Gratuitous ARP packets, and time between individual Gratuitous ARP packets occurring in a sequence, to allow legacy support for older devices and interoperation between other devices that are not ready to receive and forward data until several seconds after linkup.

Additionally, jitter has been applied to the delay following linkup, so Gratuitous ARP packets applicable to a given port are spread over a period of 1 second so are not all sent at once. Remaining Gratuitous ARP packets in the sequence occur after a fixed delay from the first one.

Syntax

```
ip gratuitous-arp-link <0-300>

no ip gratuitous-arp-link
```

Parameter	Description
<0-300>	Specify the minimum time between sequences of Gratuitous ARPs and the fixed time between Gratuitous ARPs occurring in a sequence, in seconds. 0 disables the sending of Gratuitous ARP packets. The default is 8 seconds.

Default The default Gratuitous ARP time limit for all switchports is 8 seconds.

Mode Global Configuration

Usage Every switchport will send a sequence of 3 Gratuitous ARP packets to each VLAN that the switchport is a member of, whenever the switchport moves to the forwarding state. The first Gratuitous ARP packet is sent 1 second after the switchport becomes a forwarding switchport. The second and third Gratuitous ARP packets are each sent after the time period specified by the Gratuitous ARP time limit.

Additionally, the Gratuitous ARP time limit specifies the minimum time between the end of one Gratuitous ARP sequence and the start of another Gratuitous ARP sequence. When a link is flapping, the switchport's state is set to forwarding several times. The Gratuitous ARP time limit is imposed to prevent Gratuitous ARP packets from being sent undesirably often.

Examples To disable the sending of Gratuitous ARP packets, use the commands:

```
awplus# configure terminal
awplus(config)# ip gratuitous-arp-link 0
```

To restrict the sending of Gratuitous ARP packets to one every 20 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip gratuitous-arp-link 20
```

Validation Commands **show running-config**

ip helper-address

This command adds a forwarding destination address for IP Helper to enable forwarding of User Datagram Protocol (UDP) broadcasts on an interface.

Use the **no** variant of this command to disable the forwarding of broadcast packets to specific addresses.

Syntax

```
ip helper-address <ip-addr>
no ip helper-address <ip-addr>
```

Parameter	Description
<ip-addr>	Forwarding destination IP address for IP Helper.

Default The destination address for the **ip helper-address** command is not configured by default.

Mode Interface Configuration for a VLAN interface or a local loopback interface.

Usage Combined with the **ip forward-protocol udp** command in global configuration mode, the **ip helper-address** command in interface mode allows control of which protocols (destination port numbers) are forwarded. The **ip forward-protocol udp** command configures protocols for forwarding, and the **ip helper-address** command configures the destination address(es).

The destination address can be a unicast address or a subnet broadcast address. The UDP destination port is configured separately with the **ip forward-protocol udp** command. If multiple destination addresses are registered then UDP packets are forwarded to each IP address added to an IP Helper. Up to 32 destination addresses may be added using IP Helper.

Note

The types of UDP broadcast packets that the switch will forward are ONLY those specified by the **ip forward-protocol** command(s). There are no other UDP packet types that the IP helper process forwards by default.

Note

The **ip helper-address** command does not support BOOTP / DHCP Relay. The **ip dhcp-relay** command must be used instead. For this reason, you may not configure UDP ports 67 and 68 with the **ip forward-protocol** command. For information about DHCP Relay, see **"DHCP Relay Agent Introduction" on page 92.9**.

Examples The following example defines IPv4 address `192.168.1.100` as an IP Helper destination address to which to forward UDP broadcasts received on `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip helper-address 192.168.1.100
```

The following example removes IPv4 address `192.168.1.100` as an IP Helper destination address to which to forward UDP broadcasts received on `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip helper-address 192.168.1.100
```

Validation Commands **show running-config**

Related Commands **ip forward-protocol udp**
ip directed-broadcast

ip irdp

This command enables ICMP Router Discovery advertising on an interface. However, the interface does not send or process Router Discovery messages until at least one IP address is configured on the interface with the **ip address** command.

The **no** variant of this command disables ICMP Router Discovery advertisements on an IP interface. All transmitting and processing of Router Discovery messages ceases immediately on the interface.

Syntax

```
ip irdp

no ip irdp
```

Mode Interface Configuration for a VLAN interface or a local loopback interface.

Examples To enable Router Discovery advertisements on `vlan4`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ip irdp
```

To disable Router Discovery advertisements on `vlan4`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# no ip irdp
```

Related Commands

ip address
show ip irdp
show ip irdp interface

ip irdp address preference

When multiple routers connected to a LAN are all sending Router Discovery advertisements, hosts need to be able to choose the best router to use. Therefore the IRDP defines a preference value to place in the Router Discovery advertisements. Hosts choose the router with the highest preference value.

This command sets the preference value to include in Router Discovery advertisements sent for the specified IP address.

The **no** variant of this command sets the preference for a specific address to the default of **0**.

Syntax

```
ip irdp address <ip-address> preference <0-2147483647>
no ip irdp address <ip-address> preference
```

Parameter	Description
<ip-address>	The IP address to be advertised with the specified preference value.
<0-2147483647>	The preference value advertised. A higher number increases the preference level for this address.

Default The default preference value is 0.

Mode Interface Configuration for a VLAN interface or a local loopback interface.

Examples To set the preference value to `3000` for the address `192.168.1.1` advertised on `vlan5`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan5
awplus(config-if)# ip irdp address 192.168.1.1 preference 3000
```

To set the preference value to the default of `0` for the address `192.168.1.1` advertised on `vlan5`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan5
awplus(config-if)# no ip irdp address 192.168.1.1 preference
```

Related Commands

ip irdp
ip irdp preference
show ip irdp interface

ip irdp broadcast

This command configures broadcast Router Discovery advertisements on an interface. The interface sends IRDP advertisements with the broadcast address (255.255.255.255) as the IP destination address.

The **no** variant of this command configures multicast Router Discovery advertisements on an interface. The interface sends IRDP advertisements with the all-system multicast address (224.0.0.1) as the IP destination address.

Syntax

```
ip irdp broadcast
no ip irdp broadcast
```

Mode Interface Configuration for a VLAN interface or a local loopback interface.

Examples To enable broadcast Router Discovery advertisements on `vlan13`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan13
awplus(config-if)# ip irdp broadcast
```

To enable multicast Router Discovery advertisements on `vlan13`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan13
awplus(config-if)# no ip irdp broadcast
```

Related Commands

ip irdp
ip irdp multicast
show ip irdp interface

ip irdp holdtime

This command sets the maximum length of time that the advertised addresses are to be considered as valid router addresses by hosts.

The **no** variant of this command resets the holdtime back to the default of 1800 seconds.

Syntax

```
ip irdp holdtime <0-9000>
no ip irdp holdtime
```

Parameter	Description
<0-9000>	The holdtime value in seconds of addresses advertised.

Default The IRDP holdtime is set to 1800 seconds (30 minutes) by default.

Mode Interface Configuration for a VLAN interface or a local loopback interface.

Examples To set the holdtime value of addresses advertised on `vlan2` to 4000 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip irdp holdtime 4000
```

To set the holdtime value of addresses advertised on `vlan2` back to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip irdp holdtime
```

Related Commands **show ip irdp interface**

ip irdp lifetime

This command sets the maximum length of time that hosts should consider the Router Discovery advertised addresses as valid router addresses. If you change the lifetime value, also change the **maxadvertisementinterval** and the **minadvertisementinterval** to maintain the following ratios:

```
lifetime=3 x maxadvertisementinterval
minadvertisementinterval=0.75 x maxadvertisementinterval
```

This command is synonymous with the **ip irdp hostname <*0-9000*>** command.

The **no** variant of this command sets the lifetime back to the default of 1800 seconds.

Syntax

```
ip irdp lifetime <0-9000>
no ip irdp lifetime
```

Parameter	Description
<0-9000>	Lifetime value in seconds of the advertised addresses.

Default The lifetime value is 1800 seconds.

Mode Interface Configuration for a VLAN interface or a local loopback interface.

Examples To set the lifetime value to 4000 seconds for addresses advertised on `vlan6`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan6
awplus(config-if)# ip irdp lifetime 4000
```

To set the lifetime value to the default of 1800 seconds for addresses advertised on `vlan6`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan6
awplus(config-if)# no ip irdp lifetime
```

Related Commands

ip irdp
ip irdp maxadvertinterval
ip irdp minadvertinterval
show ip irdp interface

ip irdp maxadvertinterval

This command sets the maximum time allowed between sending router advertisements from the interface. If you change the **maxadvertisementinterval** value, also change the **lifetime** and the **minadvertisementinterval** to maintain the following ratios:

```
lifetime=3 x maxadvertisementinterval
minadvertisementinterval=0.75 x maxadvertisementinterval
```

You cannot set the maximum advertisement interval below the minimum interval. If you are lowering the maximum interval to a value below the current minimum interval, you must change the minimum value first.

The **no** variant of this command sets the **maxadvertinterval** back to the default of 600 seconds.

Syntax

```
ip irdp maxadvertinterval <4-1800>
no ip irdp maxadvertinterval
```

Parameter	Description
<4-1800>	The maximum time, in seconds, between Router Discovery advertisements.

Default The IRDP maximum advertisement interval is set to 600 seconds (10 minutes) by default.

Mode Interface Configuration for a VLAN interface or a local loopback interface.

Examples To set the maximum interval between Router Discovery advertisements on `vlan7` to 950 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan7
awplus(config-if)# ip irdp maxadvertinterval 950
```

To set the maximum interval between advertisements on `vlan7` back to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan7
awplus(config-if)# no ip irdp maxadvertinterval
```

Related Commands

ip irdp
ip irdp lifetime
ip irdp minadvertinterval
show ip irdp interface

ip irdp minadvertinterval

This command sets the minimum time allowed between sending router advertisements from the interface. If you change the **minadvertisementinterval** value, also change the **lifetime** and the **maxadvertisementinterval** to maintain the following ratios:

```
lifetime=3 x maxadvertisementinterval
minadvertisementinterval=0.75 x maxadvertisementinterval
```

You cannot set the minimum advertisement interval above the maximum interval. If you are raising the minimum interval to a value above the current maximum interval, you must change the maximum value first.

The **no** variant of this command sets the **minadvertinterval** back to the default of 450 seconds.

Syntax

```
ip irdp minadvertinterval <3-1800>
no ip irdp minadvertinterval
```

Parameter	Description
<3-1800>	The minimum time between advertisements in seconds.

Default The IRDP minimum advertisement interval is set to 450 seconds (7.5 minutes) by default.

Mode Interface Configuration for a VLAN interface or a local loopback interface.

Examples To set the minimum interval between advertisements on `vlan4` to 900 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ip irdp minadvertinterval 900
```

To set the minimum interval between advertisements on `vlan4` back to the default of 450 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# no ip irdp minadvertinterval
```

Related Commands

ip irdp
ip irdp lifetime
ip irdp maxadvertinterval

ip irdp multicast

This command configures multicast Router Discovery advertisements on an interface. The interface sends IRDP advertisements with the all-system multicast address (224.0.0.1) as the IP destination address.

The **no** variant of this command configures broadcast Router Discovery advertisements on an interface. The interface sends IRDP advertisements with the broadcast address (255.255.255.255) as the IP destination address.

The multicast address is the default IP destination address for Router Discovery advertisements.

Syntax

```
ip irdp multicast
no ip irdp multicast
```

Mode Interface Configuration for a VLAN interface or a local loopback interface.

Examples To enable multicast Router Discovery advertisements on `vlan5`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan5
awplus(config-if)# ip irdp multicast
```

To enable broadcast Router Discovery advertisements on `vlan5`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan5
awplus(config-if)# no ip irdp multicast
```

Related Commands

ip irdp

ip irdp preference

When multiple routers connected to a LAN are all sending Router Discovery advertisements, hosts need to be able to choose the best router to use. Therefore the IRDP defines a preference value to place in the Router Discovery advertisements. Hosts choose the router with the highest preference value.

This command sets the preference value to include in Router Discovery advertisements sent for the specified interface.

When this command is used, all IP addresses on the interface are assigned the same preference value, except the addresses that have specific preference value assignment using the command **ip irdp address preference**.

The **no** variant of this command sets the preference value to the default of 0.

Syntax

```
ip irdp preference <0-2147483647>
no ip irdp preference
```

Parameter	Description
<0-2147483647>	The preference value for the interface. A higher number increases the preference level for addresses on the specific interface.

Default The default preference value is 0.

Mode Interface Configuration for a VLAN interface or a local loopback interface.

Examples To set the preference of addresses advertised on `vlan6` to `500`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan6
awplus(config-if)# ip irdp preference 500
```

To set the preference value for addresses on `vlan6` back to the default of `0`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan6
awplus(config-if)# no ip irdp preference
```

Related Commands

ip irdp
ip irdp address preference

ip local-proxy-arp

This command allows you to stop MAC address resolution between hosts within a private VLAN edge interface. Local Proxy ARP works by intercepting ARP requests between hosts within a subnet and responding with your device's own MAC address details instead of the destination host's details. This stops hosts from learning the MAC address of other hosts within its subnet through ARP requests.

Local Proxy ARP ensures that devices within a subnet cannot send traffic that bypasses Layer 3 routing on your device. This lets you monitor and filter traffic between hosts in the same subnet, and enables you to have control over which hosts may communicate with one another.

When Local Proxy ARP is operating on an interface, your device does not generate or forward any ICMP-Redirect messages on that interface. This command does not enable proxy ARP on the interface; see the **ip proxy-arp** command for more information on enabling proxy ARP.

The **no** variant of this command disables Local Proxy ARP to stop your device from intercepting and responding to ARP requests between hosts within a subnet. This allows the hosts to use MAC address resolution to communicate directly with one another. Local Proxy ARP is disabled by default.

Syntax

```
ip local-proxy-arp
no ip local-proxy-arp
```

Default Local proxy ARP is disabled by default

Mode Interface Configuration for a VLAN interface or a local loopback interface.

Examples To enable your device to apply Local Proxy ARP on the interface `vlan7`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan7
awplus(config-if)# ip local-proxy-arp
```

To disable your device to apply Local Proxy ARP on the interface `vlan7`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan7
awplus(config-if)# no ip local-proxy-arp
```

Related Commands

ip proxy-arp
show arp
show running-config

ip name-server

This command adds IPv4 or IPv6 DNS server addresses. The DNS client on your device sends DNS queries to IP addresses in this list when trying to resolve a host name. Host names cannot be resolved until you have added at least one server to this list. A maximum of three name servers can be added to this list.

The **no** variant of this command removes the specified DNS name-server address.

Syntax

```
ip name-server <ip-addr>
no ip name-server <ip-addr>
```

Syntax (VRF Lite)

```
When running VRF
ip name-server [vrf <name>] <ip-addr>
no ip name-server [vrf <name>] <ip-addr>
```

Parameter	Description
ip	The Internet protocol, either IPv4 or IPv6.
<ip-addr>	The IP address to be advertised with the specified preference value, entered in the form `A.B.C.D` for an IPv4 address, or in the form `X:X::X:X` for an IPv6 address.
vrf	A VRF Lite instance
<name>	The name of the specific VRF Lite instance

Mode Global Configuration

Usage When your device is using its DHCP client for an interface, it can receive Option 6 messages from the DHCP server. This option appends the name server list with more DNS servers. See **Chapter 92, Dynamic Host Configuration Protocol (DHCP) Introduction** for more information about DHCP and DHCP options.

See **"DNS Relay" on page 26.10** for more information about DNS Relay to map IPv4 and IPv6 addresses to name servers to maintain a database of hostname-to-address mappings. Also see **"DNS Client" on page 26.9** for information about DNS Client configuration commands.

Examples To allow a device to send DNS queries to a DNS server with the IPv4 address `10.10.10.5`, use the commands:

```
awplus# configure terminal
awplus(config)# ip name-server 10.10.10.5
```

To enable your switch to send DNS queries to a DNS server with the IPv6 address `2001:0db8:010d::1`, use the commands:

```
awplus# configure terminal
awplus(config)# ip name-server 2001:0db8:010d::1
```

Syntax (VRF Lite)

To enable your switch to send DNS queries (on VRF Lite instance red) to a DNS server with the IPv4 address `10.10.10.5` use the commands:

```
awplus# configure terminal
awplus(config)# ip name-server vrf red 10.10.10.5
```

Related Commands

ip domain-list
ip domain-lookup
ip domain-name
show ip name-server

ip proxy-arp

This command enables Proxy ARP responses to ARP requests on an interface. When enabled, your device intercepts ARP broadcast packets and substitutes its own physical address for that of the remote host. By responding to the ARP request, your device ensures that subsequent packets from the local host are directed to its physical address, and it can then forward these to the remote host.

Your device responds only when it has a specific route to the address being requested, excluding the interface route that the ARP request arrived from. It ignores all other ARP requests. See the **ip local-proxy-arp** command about enabling your device to respond to other ARP messages.

The **no** variant of this command disables Proxy ARP responses on an interface. Proxy ARP is disabled by default.

Syntax

```
ip proxy-arp
no ip proxy-arp
```

Default Proxy ARP is disabled by default.

Mode Interface Configuration for a VLAN interface or a local loopback interface.

Examples To enable your device to Proxy ARP on the interface `vlan13`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan13
awplus(config-if)# ip proxy-arp
```

To disable your device to Proxy ARP on the interface `vlan13`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan13
awplus(config-if)# no ip proxy-arp
```

Related Commands

arp (IP address MAC)
ip local-proxy-arp
show arp
show running-config

ip redirects

This command enables ICMP redirects for an interface.

Use the **no** variant of this command to disable the sending of ICMP redirects for an interface.

Syntax

```
ip redirects
no ip redirects
```

Default ICMP redirects are disabled by default.

Mode Interface Configuration for a VLAN interface.

Usage ICMP redirect messages are used to notify hosts that a better route is available to a destination. ICMP redirects are used when a packet is routed into the switch on the same interface that the packet is routed out of the switch. ICMP redirects are also used when the subnet or network of the source address is on the same subnet or network as the next-hop address for a packet.

Use the **ip redirects** command to allow the sending of ICMP redirects whenever the switch receives a packet that is routed on the same interface that the packet was sent on.

Use the **no** variant of this command to disallow the sending of ICMP redirects whenever the switch receives a packet that is routed on the same interface that the packet was sent on.

Examples To enable ICMP redirects on interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip redirects
```

To disable ICMP redirects on interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip redirects
```

optimistic-nd

Use this command to enable the optimistic neighbor discovery feature for both IPv4 and IPv6.

Use the **no** variant of this command to disable the optimistic neighbor discovery feature.

Syntax

```
optimistic-nd
no optimistic-nd
```

Default The optimistic neighbor discovery feature is enabled by default.

Mode Interface Configuration for a VLAN interface.

Usage The optimistic neighbor discovery feature allows the switch, after learning an IPv4 or IPv6 neighbor, to refresh the neighbor before the neighbor is deleted from the hardware L3 switching table. The neighbor is put into the 'stale' state in the software switching table if is it not refreshed, then the 'stale' neighbors are deleted from the hardware L3 switching table.

The optimistic neighbor discovery feature enables the switch to sustain L3 traffic switching to a neighbor without interruption. Without the optimistic neighbor discovery feature enabled L3 traffic is interrupted when a neighbor is 'stale' and is then deleted from the L3 switching table.

If a neighbor receiving optimistic neighbor solicitations does not answer optimistic neighbor solicitations with neighbor advertisements, then the neighbor will be put into the 'stale' state, and subsequently deleted from both the software and the hardware L3 switching tables.

Examples To enable the optimistic neighbor discovery feature on `vlan100`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan100
awplus(config-if)# optimistic-nd
```

To disable the optimistic neighbor discovery feature on `vlan100`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan100
awplus(config-if)# no optimistic-nd
```

Validation Commands **show running-config**

ping

This command sends a query to another IPv4 host (send Echo Request messages).

Syntax

```
ping [ip] <host> [broadcast] [df-bit {yes|no}] [interval <0-128>]
   [pattern <hex-data-pattern>] [repeat {<1-2147483647>|continuous}]
   [size <36-18024>] [source <ip-addr>] [timeout <1-65535>] [tos <0-
   255>]
```

Syntax (VRF Lite)

```
ping [vrf <vrf-name>] [ip] <host> [broadcast] [df-bit {yes|no}]
   [interval <0-128>] [pattern <hex-data-pattern>] [repeat {<1-
   2147483647>|continuous}] [size <36-18024>] [source <ip-addr>]
   [timeout <1-65535>] [tos <0-255>]
```

Parameter	Description
<host>	The destination IP address or hostname.
broadcast	Allow pinging of a broadcast address.
df-bit	Enable or disable the do-not-fragment bit in the IP header.
interval *<0-128>*	Specify the time interval in seconds between sending ping packets. The default is 1.
pattern *<hex-data-pattern>*	Specify the hex data pattern.
repeat	Specify the number of ping packets to send.
<1-2147483647>	Specify repeat count. The default is 5.
continuous	Continuous ping
size *<36-18024>*	The number of data bytes to send, excluding the 8 byte ICMP header. The default is 56 (64 ICMP data bytes).
source *<ip-addr>*	The IP address of a configured IP interface to use as the source in the IP header of the ping packet.
timeout *<1-65535>*	The time in seconds to wait for echo replies if the ARP entry is present, before reporting that no reply was received. If no ARP entry is present, it does not wait.
tos *<0-255>*	The value of the type of service in the IP header.
vrf	Apply the command to the specified VRF Lite instance.
<vrf-name>	The name of the VRF Lite instance.

Mode User Exec and Privileged Exec

Example To ping the IP address `10.10.0.5` use the following command:

```
awplus# ping 10.10.0.5
```

Example (VRF Lite) To ping the IP address `10.10.0.5` from VRF Lite instance `red`, use the following command:

```
awplus# ping vrf red 10.10.0.5
```

router ip irdp

Note that unless a cross-domain static or leaked route exists to the destination IP address, you must run this command from within the same routing domain as the address being pinged.

This command globally enables ICMP Router Discovery (IRDP) advertisements on your device. However, your device does not send or process IRDP messages until at least one interface is configured to use IP and has had IRDP enabled on the interface with the **ip irdp** command.

The **no** variant of this command globally disables IRDP advertisements on the device. All interfaces immediately stop transmitting and processing Router Discovery messages.

Syntax

```
router ip irdp
no router ip irdp
```

Mode Global Configuration

Examples To enable Router Discovery advertisements on your device, use the following commands:

```
awplus# configure terminal
awplus(config)# router ip irdp
```

To disable Router Discovery advertisements on your device, use the following commands:

```
awplus# configure terminal
awplus(config)# no router ip irdp
```

Related Commands

ip irdp
show ip irdp

show arp

Use this command to display entries in the ARP routing and forwarding table. The ARP cache contains mappings of IP addresses to physical addresses for hosts. To have a dynamic entry in the ARP cache, a host must have used the ARP protocol to access another host.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show arp [security [interface [<interface-list>]]
show arp [statistics [detail][interface [<interface-list>]]
```

Syntax (VRF Lite)

```
show arp [global|security|vrf <vrf-name>]
```

Parameter	Description
`security`	Specify the DHCP Snooping ARP security output option.
`interface`	Specify an interface list for DHCP Snooping ARP security output.
<interface-list>	Specify a single Layer 3 interface name, or a a range of interfaces.
`statistics`	Specify brief DHCP Snooping ARP security statistics.
`detail`	Specify detailed DHCP Snooping ARP security statistics.
`global`	When VRF Lite is configured, apply this command to the global routing and forwarding table
`vrf`	Apply this command to the specified VRF Lite instance.
<vrf-name>	The VRF Lite instance name

Mode User Exec and Privileged Exec

Usage Running this command with no additional parameters will display all entries in the ARP routing and forwarding table.

With VRF Lite configured, and no additional parameters entered, the command output displays all entries, listed by their VRF Lite instance. By adding either a specific VRF Lite instance or global parameter entry, you can selectively list ARP entries by their membership of a specific VRF Lite instance.

Example To display all ARP entries in the ARP cache, use the following command:

```
awplus# show arp
```

Output **Figure 27-2: Example output from the show arp command**

```
awplus#show arp

  IP Address       MAC Address     Interface    Port         Type
192.168.10.2     0015.77ad.fad8  vlan1        port1.0.1    dynamic
192.168.20.2     0015.77ad.fa48  vlan2        port1.0.2    dynamic
192.168.1.100    00d0.6b04.2a42  vlan2        port1.0.8    static

[VRF: red]
  IP Address       MAC Address     Interface    Port         Type
10.1.1.1         0015.77ad.1234  vlan11       port1.0.11   dynamic
```

Example (VRF Lite) To display the dynamic ARP entries in the global routing instance, use the command:

```
awplus# show arp global
```

Output (VRF Lite) **Figure 27-3: Example output from the show arp global command**

```
awplus#show arp global

IP Address       MAC Address     Interface    Port         Type
192.168.10.2     0015.77ad.fad8  vlan1        port1.0.1    dynamic
192.168.20.2     0015.77ad.fa48  vlan2        port1.0.2    dynamic
192.168.1.100    00d0.6b04.2a42  vlan2        port1.0.8    static
```

Example (VRF Lite) To display the dynamic ARP entries for a VRF Lite instance `red`, use the command:

```
awplus# show arp vrf red
```

Output (VRF Lite)

Table 27-2: Parameters in the output of the show arp command

Parameter	Meaning
`IP Address`	IP address of the network device this entry maps to.
`MAC Address`	Hardware address of the network device.
`Interface`	Interface over which the network device is accessed.
`Port`	Physical port that the network device is attached to.
`Type`	Whether the entry is a static or dynamic entry. Static entries are added using the **arp (IP address MAC)** command. Dynamic entries are learned from ARP request/reply message exchanges.
`VRF`	The name of the VRF Lite instance. The VRF Lite components only display when VRF Lite is configured on the switch.

Related Commands

show debugging ip dns forwarding

Use this command to display the DNS Relay debugging status. DNS Relay debugging is set using the **debug ip dns forwarding** command.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show debugging ip dns forwarding`

Mode User Exec and Privileged Exec

Example To display the DNS Relay debugging status, use the command:

```
awplus# show debugging ip dns forwarding
```

Output **Figure 27-4: Example output from the show debugging ip dns forwarding command**

```
awplus#show debugging ip dns forwarding
DNS Relay debugging status:
  debugging is on
```

Related Commands **debug ip dns forwarding**

show debugging ip packet

Use this command to show the IP interface debugging status. IP interface debugging is set using the **debug ip packet interface** command.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show debugging ip packet`

Mode User Exec and Privileged Exec

Example To display the IP interface debugging status when the terminal monitor off, use the command:

```
awplus# terminal no monitor
awplus# show debug ip packet
```

Output **Figure 27-5: Example output from the show debugging ip packet command with terminal monitor off**

```
awplus#terminal no monitor
awplus#show debug ip packet
IP debugging status:
interface all tcp (stopped)
interface vlan1 arp verbose (stopped)
```

Example To display the IP interface debugging status when the terminal monitor is on, use the command:

```
awplus# terminal monitor
awplus# show debug ip packet
```

Output **Figure 27-6: Example output from the show debugging ip packet command with terminal monitor on**

```
awplus#terminal monitor
awplus#show debug ip packet
IP debugging status:
interface all tcp (running)
interface vlan1 arp verbose (running)
```

Related Commands **debug ip packet interface**
terminal monitor

show hosts

This command shows the default domain, domain list, and name servers configured on your device.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show hosts
```

Mode

User Exec and Privileged Exec

Example

To display the default domain, use the command:

```
awplus# show hosts
```

Output

Figure 27-7: Example output from the show hosts command

```
awplus#show hosts
Default domain is mycompany.com
Domain list: company.com
Name/address lookup uses domain service
Name servers are 10.10.0.2 10.10.0.88
```

Related Commands

ip domain-list
ip domain-lookup

show ip dns forwarding

Use this command to display the DNS Relay status.

Syntax `show ip dns forwarding`

Mode User Exec and Privileged Exec

Examples To display the DNS Relay status, use the command:

```
awplus# show ip dns forwarding
```

Output **Figure 27-8: Example output from the show ip dns forwarding command**

```
awplus#show ip dns forwarding
Max-Retry        : 2
Timeout          : 3 second(s)
Dead-Time        : 3600 second(s)
Source-Interface: not specified
DNS Cache        : disabled
```

Related Commands ip dns forwarding

show ip dns forwarding cache

Use this command to display the DNS Relay name resolver cache.

Syntax `show ip dns forwarding cache`

Syntax (VRF Lite) `show ip dns [vrf <name>|global] forwarding cache`

Parameter	Description
ip	The Internet protocol, either IPv4 or IPv6.
dns	Domain Name Server
<ip-addr>	The IP address to be advertised with the specified preference value, entered in the form `A.B.C.D` for an IPv4 address, or in the form `X:X::X:X` for an IPv6 address.
vrf	VRF Lite
<name>	The name of the specific VRF Lite instance

Mode User Exec and Privileged Exec

Examples To display the DNS Relay name resolver cache, use the command:

```
awplus# show ip dns forwarding cache
```

Output **Figure 27-9: Example output from the show ip dns forwarding cache command**

```
awplus#show ip dns forwarding cache
Host                                    Address                 Expires Flags

```

Related Commands **ip dns forwarding cache**

show ip dns forwarding server

Use this command to display the status of DNS forwarding name servers.

Use this command to display the status for DNS forwarding name servers operating on a specific VRF Lite instance.

Syntax `show ip dns forwarding server`

Syntax (VRF Lite) `show ip dns [vrf <name>|global]forwarding server`

Parameter	Description
`show ip dns`	Display ip dns properties.
vrf	VRF Lite
<name>	The name of the specific VRF Lite instance
`forwarding server`	The DNS forwarding name server for either the switch (when not using VRF_Lite) or for a specific VRF Lite instance (when using VRF_Lite).

Mode User Exec and Privileged Exec

Examples To display the status of DNS Relay name servers, use the command:

```
awplus# show ip dns forwarding server
```

Output **Figure 27-11: Example output from the show ip dns forwarding server command**

```
awplus#show ip dns forwarding server
Servers           Forwards      Fails    Dead-Time
172.16.1.1              12          0       active
172.16.1.2               6          3         3900
```

Example (VRF Lite) To display the status of DNS Relay name-servers for VRF Lite instance red, use the command:

```
awplus# show ip dns vrf red forwarding server
```

Output (VRF Lite) Example output from the **show ip dns forwarding** server command

```
awplus#show ip dns forwarding server
[VRF: red]
Servers           Forwards      Fails    Dead-Time
172.16.1.1              12          0       active
172.16.1.2               6          3         3900
```

Related Commands **ip dns forwarding**
ip dns forwarding dead-time

show ip domain-list

This command shows the domains configured in the domain list. The DNS client uses the domains in this list to append incomplete hostnames when sending a DNS enquiry to a DNS server.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show ip domain-list`

Mode User Exec and Privileged Exec

Example To display the list of domains in the domain list, use the command:

```
awplus# show ip domain-list
```

Output **Figure 27-12: Example output from the show ip domain-list command**

```
awplus#show ip domain-list
alliedtelesis.com
mycompany.com
```

Related Commands **ip domain-list**
ip domain-lookup

show ip domain-name

This command shows the default domain configured on your device. When there are no entries in the DNS list, the DNS client appends this domain to incomplete hostnames when sending a DNS enquiry to a DNS server.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show ip domain-name`

Mode User Exec and Privileged Exec

Example To display the default domain configured on your device, use the command:

```
awplus# show ip domain-name
```

Output **Figure 27-13: Example output from the show ip domain-name command**

```
awplus#show ip domain-name
alliedtelesis.com
```

Related Commands **ip domain-name**
ip domain-lookup

show ip forwarding

Use this command to display the IP forwarding status.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show ip forwarding`

Mode User Exec and Privileged Exec

Example

```
awplus# show ip forwarding
```

Output **Figure 27-14: Example output from the show ip forwarding command**

```
awplus#show ip forwarding
IP forwarding is on
```

Related Commands **ip forwarding**

show ip interface

Use this command to display information about interfaces and the IP addresses assigned to them. To display information about a specific interface, specify the interface name with the command.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show ip interface [<interface-list>] [brief]
```

Parameter	Description
<interface-list>	The interfaces to display information about. An interface-list can be: ■ an interface, e.g. `vlan2` ■ a continuous range of interfaces separated by a hyphen, e.g. `vlan2-8` or `vlan2-vlan5` ■ a comma-separated list of interfaces or interface ranges, e.g. `vlan2,vlan5,vlan8-10` The specified interfaces must exist.

Mode User Exec and Privileged Exec

Examples To show brief information for the assigned IP address for interface port1.0.2 use the command:

```
awplus# show ip interface port1.0.2 brief
```

To show the IP addresses assigned to vlan2 and vlan3, use the command:

```
awplus# show ip interface vlan2-3 brief
```

Output **Figure 27-15: Example output from the show ip interface brief command**

```
Interface              IP-Address      Status          Protocol
port1.0.2              unassigned      admin up        down
vlan1                  192.168.1.1     admin up        running
vlan2                  192.168.2.1     admin up        running
vlan3                  192.168.3.1     admin up        running
vlan8                  unassigned      admin up        down
```

show ip interface vrf

Syntax (VRF Lite)

Use this command to display protocol and status information about configured interfaces and their assigned IP addresses in VRF Lite instances.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show ip interface [vrf <vrf-name>|global]
```

Parameter	Description
`vrf`	A VRF Lite instance.
<vrf-name>	The name of a specific VRF Lite instance.
`global`	The global routing and forwarding table.

Mode

User Exec and Privileged Exec

Examples

To display all interfaces and IP addresses associated with a VRF Lite instance `red`, use the command:

```
awplus# show ip interface vrf red
```

Output

Figure 27-16: Example output from the show ip interface VRF Lite instance red command

```
[VRF: red]
Interface            IP-Address          Status       Protocol
lo1                  unassigned          admin up     running
vlan1                192.168.10.1/24     admin up     running
```

Example

To display all interfaces and IP addresses associated with all VRF Lite instances, use the command:

```
awplus# show ip interface
```

Output

Figure 27-17: Example output from the show ip interface with VRF Lite configured

```
Interface            IP-Address          Status       Protocol
eth0                 unassigned          admin up     down
lo                   unassigned          admin up     running
vlan1                192.168.1.1/24      admin up     running
vlan4                172.30.4.43/24      admin up     down

[VRF: red]
Interface            IP-Address          Status
Protocol
lo1                  unassigned          admin up     running

[VRF: blue]
Interface            IP-Address          Status
Protocol
lo2                  unassigned          admin up     running
```

show ip irdp

This command displays whether IRDP is globally enabled on your device, and the status of the debugging modes.

If the **debug ip irdp** command has been set with the **detail** parameter then the **both** parameter is also set and the output will show "packet debugging mode is all".

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show ip irdp
```

Mode User Exec and Privileged Exec

Example To display global IRDP configuration, use the command:

```
awplus# show ip irdp
```

Output

Figure 27-18: Example output from the show ip irdp command

```
IRDP is enabled
  event debugging is disabled
  nsm debugging is disabled
  packet debugging mode is disabled
```

Figure 27-19: Example output from the show ip irdp command with debug ip irdp detail set

```
IRDP is enabled
  event debugging is disabled
  nsm debugging is disabled
  packet debugging mode is all
```

Figure 27-20: Example output from the show ip irdp command with debug ip irdp both set

```
IRDP is enabled
  event debugging is disabled
  nsm debugging is disabled
  packet debugging mode is both
```

Related Commands

debug ip irdp
router ip irdp

show ip irdp interface

This command displays the configuration of IRDP on all interfaces, or for a specified interface.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show ip irdp interface [<interface-name>]`

Parameter	Description
<interface-name>	Displays the interface status and configuration details of the specified interface.

Mode User Exec and Privileged Exec

Example To display the IRDP configuration for `vlan4`, use the command:

```
awplus# show ip irdp interface vlan4
```

Output **Figure 27-21: Example output from the show ip irdp interface command**

```
vlan13 is up, line protocol is up
ICMP Router Discovery Protocol
  Sending mode           multicast
  Router Lifetime        1350 seconds
  Default Preference     0
  Min Adv Interval       450 seconds
  Max Adv Interval       600 seconds
  Next advertisement in 551 seconds
  Non default prefix preferences
     192.168.1.1         preference     25000

  In packets                    0                Out packets                   3
  In bad packets                0                Out bad packets               0
  In good packets               0                Out good packets              3
  In ignored packets            0
```

Table 27-3: Parameters in the output of the show ip irdp interface command

Parameter	Description
`Sending mode`	Whether this interface is sending broadcast or multicast router advertisements. This means the destination IP address of router advertisements will be either the multicast address 224.0.0.1, or the broadcast address 255.255.255.255.
`Router Lifetime`	The lifetime value set for router advertisements sent from this interface. This is the maximum time that other devices should treat the advertised address as valid.
`Default Preference`	The preference value for IP addresses as default router addresses, relative to other router addresses on the same subnet. This preference value is used for all IP addresses on this interface, except for those listed under the heading "non default prefix preferences".
`Min Adv Interval`	Minimum time allowed between sending router advertisements from this interface.

Table 27-3: Parameters in the output of the show ip irdp interface command

Parameter	Description
`Max Adv Interval`	Maximum time allowed between sending router advertisements from this interface.
`Non default prefix preferences`	List of the IP addresses on this interface that have been set with a specific router preference value. These addresses use the preference value listed beside them, rather than the interface's default preference value.
`In packets`	The total number of packets received by IRDP on this interface. IRDP processes all ICMP packets received on this interface.
`Out packets`	The number of packets sent by IRDP on this interface.
`In bad packets`	The number of packets received by IRDP that it has discarded because they do not conform or corrupted.
`Out bad packets`	The number of packets that IRDP generated but failed to send to the network layer.
`In good packets`	The number of packets received and processed by IRDP.
`Out good packets`	The number of packets generated and successfully sent by IRDP.
`In ignored packets`	The number of incoming packets ignored, like ICMP packets other than IRDP.

Related Commands

ip irdp
show ip irdp

show ip name-server

This command displays a list of IPv4 and IPv6 DNS server addresses that your switch will send DNS requests to. This is a static list configured using the **ip name-server** command.

When running VRF Lite, this command displays a list of IPv4 and IPv6 addresses of DNS servers that your switch will send DNS requests to for either the global VRF Lite instance or a selected VRF Lite Instance.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show ip name-server
```

Syntax (VRF Lite)

```
show ip name-server [vrf <name>|global]
```

Parameter	Description
vrf	A VRF Lite instance
<name>	The name of the specific VRF Lite instance
<name>	The global VRF Lite instance

Mode User Exec and Privileged Exec

Example To display the list of DNS servers that your device sends DNS requests to, use the command:

```
awplus# show ip name-server
```

Output **Figure 27-22: Example output from the show ip name-server command**

```
awplus# show ip name-server
 10.10.0.123
 10.10.0.124
 2001:0db8:010d::1
```

Output (VRF Lite) **Figure 27-23: Example output from the show ip name-server command for the VRF Lite instance "red"**

```
awplus# show ip name-server vrf red
[VRF: red]
 10.10.0.123
 10.10.0.124
 2001:0db8:010d::1
```

Related Commands

ip domain-lookup
ip name-server

show ip sockets

Use this command to display information about the IP or TCP sockets that are present on the switch. It includes TCP, UDP listen sockets, displaying associated IP address and port.

The information displayed for established TCP sessions includes the remote IP address, port, and session state. Raw IP protocol listen socket information is also displayed for protocols such as VRRP and ICMP6, which are configured to receive IP packets with the associated protocol number.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show ip sockets`

Mode Privileged Exec

Usage Use this command to verify that the socket being used is opening correctly. If there is a local and remote endpoint, a connection is established with the ports indicated.

Note that this command does not display sockets that are used internally for exchanging data between the various processes that exist on the device and are involved in its operation and management. It only displays sockets that are present for the purposes of communicating with other external devices.

Example To display ip sockets currently present on the device, use the command:

```
awplus# show ip sockets
```

Output **Figure 27-24: Example output from the show ip sockets command**

```
Socket information

Not showing 40 local connections
Not showing 7 local listening ports

Typ Local Address            Remote Address          State
tcp 0.0.0.0:111              0.0.0.0:*               LISTEN
tcp 0.0.0.0:80               0.0.0.0:*               LISTEN
tcp 0.0.0.0:23               0.0.0.0:*               LISTEN
tcp 0.0.0.0:443              0.0.0.0:*               LISTEN
tcp 0.0.0.0:4743             0.0.0.0:*               LISTEN
tcp 0.0.0.0:873              0.0.0.0:*               LISTEN
tcp :::23                    :::*                    LISTEN
udp 0.0.0.0:111              0.0.0.0:*
udp 226.94.1.1:5405          0.0.0.0:*
udp 0.0.0.0:161              0.0.0.0:*
udp :::161                   :::*
raw 0.0.0.0:112              0.0.0.0:*               112
raw :::58                    :::*                    58
raw :::112                   :::*                    112
```

Table 27-4: Parameters in the output of the show ip sockets command

Parameter	Description
`Not showing <number> local connections`	This field refers to established sessions between processes internal to the device, that are used in its operation and management. These sessions are not displayed as they are not useful to the user. <number> is some positive integer.
`Not showing <number> local listening ports`	This field refers to listening sockets belonging to processes internal to the device, that are used in its operation and management. They are not available to receive data from other devices. These sessions are not displayed as they are not useful to the user. <number> is some positive integer.
`Typ`	This column displays the type of the socket. Possible values for this column are: `tcp` : IP Protocol 6. `udp` : IP Protocol 17. `raw` : Indicates that socket is for a non port-orientated protocol (i.e. a protocol other than TCP or UDP) where all packets of a specified IP protocol type are accepted. For raw socket entries the protocol type is indicated in subsequent columns.
`Local Address`	For TCP and UDP listening sockets this shows the destination IP address (either IPv4 or IPv6) and destination TCP or UDP port number for which the socket will receive packets. The address and port are separated by ':'. If the socket will accept packets addressed to any of the switch's IP addresses, the IP address will be 0.0.0.0 for IPv4 or :: for IPv6. For active TCP sessions the IP address will display which of the switches addresses the session was established with. For raw sockets this displays the IP address and IP protocol for which the socket will accept IP packets. The address and protocol are separated by ':'. If the socket will accept packets addressed to any of the switch's IP addresses, the IP address will be 0.0.0.0 for IPv4 and ::. IP Protocol assignments are described at: **http://www.iana.org/assignments/protocol-numbers**
`Remote Address`	For TCP and UDP listening sockets this shows the source IP address (either IPv4 or IPv6) and source TCP or UDP port number for which the socket will accept packets. The address and port are separated by ':'. If the socket will accept packets addressed from any IP address, the IP address will be 0.0.0.0 for IPv4 or :: for IPv6. This is the usual case for a listening socket. Normally for a listen socket any source port will be accepted. This is indicated by ". For active TCP sessions the IP address will display the remote address and port the session was established with. For raw sockets the entry in this column will be 0.0.0.0: or ::: for IPv4 and IPv6, respectively.

`State`	This column shows the state of the socket. For TCP sockets this shows the state of the TCP state machine. For UDP sockets this column is blank. For raw sockets it contains the IP protocol number. The possible TCP states are:
	`LISTEN`
	`SYN-SENT`
	`SYN-RECEIVED`
	`ESTABLISHED`
	`FIN-WAIT-1`
	`FIN-WAIT-2`
	`CLOSE-WAIT`
	`CLOSING`
	`LAST-ACK`
	`TIME-WAIT`
	`CLOSED`
	RFC793 contains the TCP state machine diagram with Section 3.2 describing each of the states.

show ip traffic

Use this command to display statistics regarding IP traffic sent and received by all interfaces on the switch, showing totals for IP and IPv6 and then broken down into sub-categories such as TCP, UDP, ICMP and their IPv6 equivalents when appropriate.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show ip traffic`

Mode Privileged Exec

Example To display IP traffic statistics, use the command:

```
awplus# show ip traffic
```

Output **Figure 27-25: Example output from the show ip traffic command**

```
IP:
     261998 packets received
     261998 delivered
     261998 sent
     69721 multicast packets received
     69721 multicast packets sent
     23202841 bytes received
     23202841 bytes sent
     7669296 multicast bytes received
     7669296 multicast bytes sent

Table 27-5: Parameters in the output of the show ip traffic command(cont.):

Parameter	Description
`received packets with no route`	Received packets with no route
`truncated packets received`	Truncated packets received
`multicast packets received`	Multicast packets received
`multicast packets sent`	Multicast packets sent
`broadcast packets received`	Broadcast packets received
`broadcast packets sent`	Broadcast packets sent
`bytes received`	Bytes received
`bytes sent`	Bytes sent
`multicast bytes received`	Multicast bytes received
`multicast bytes sent`	Multicast bytes sent
`broadcast bytes received`	Broadcast bytes received
`broadcast bytes sent`	Broadcast bytes sent
`packets received`	Packets received
`packets received with invalid headers`	Packets received with invalid headers
`oversize packets received`	Oversize packets received
`packets received with no route`	Packets received with no route
`packets received with invalid address`	Packets received with invalid address
`packets received with unknown protocol`	Packets received with unknown protocol
`truncated packets received`	Truncated packets received
`received packets discarded`	Received packets discarded
`received packets delivered`	Received packets delivered
`forwarded packets transmitted`	Forwarded packets transmitted
`packets transmitted`	Packets transmitted
`packets discarded on transmit`	Packets discarded on transmit
`packets discarded on transmit due to no route`	Packets discarded on transmit due to no route
`fragment reassembly timeouts`	Fragment reassembly timeouts
`fragment reassembly required`	Fragment reassembly required
`fragment reassembly OK`	Fragment reassembly OK
`fragment reassembly failures`	Fragment reassembly failures
`fragmentations succeeded`	Fragmentations succeeded

Table 27-5: Parameters in the output of the show ip traffic command(cont.):

Parameter	Description
`fragmentations failed`	Fragmentations failed
`fragments created`	Fragments created
`ICMP6`	ICMPv6 counters
`messages received`	Messages received
`errors received`	Errors received
`messages sent`	Messages sent
`TCP`	TCP counters
`remote connections established`	Remote connections established
`local connections established`	Local connections established
`remote listening ports`	Remote listening ports
`local listening ports`	Local listening ports
`active connection openings`	Active connection openings
`passive connection openings`	Passive connection openings
`connection attempts failed`	Connection attempts failed
`connection resets received`	Connection resets received
`segments received`	Segments received
`segments transmitted`	Segments transmitted
`retransmits`	Retransmits
`bad segments received`	Bad segments received
`resets transmitted`	Resets transmitted
`datagrams received`	Datagrams received
`received for unknown port`	Received for unknown port
`datagrams sent`	Datagrams sent
`syncookies sent`	Syncookies sent
`syncookies received`	Syncookies received
`syncookies failed`	Syncookies failed
`embryonic resets`	Embryonic resets
`sockets pruned`	Sockets pruned
`ICMPs out of window`	ICMPs out of window
`ICMPs dropped due to lock`	ICMPs dropped due to lock
`ARPs filtered`	ARPs filtered

Table 27-5: Parameters in the output of the show ip traffic command(cont.):

Parameter	Description
`TCP sockets finished time wait in fast timer`	TCP sockets finished time wait in fast timer
`time wait sockets recycled by time stamp`	Time wait sockets recycled by time stamp
`time wait sockets killed`	Time wait sockets killed
`delayed acks sent`	Delayed acks sent delayed acks further delayed because of locked socket
`delayed acks lost`	Delayed acks lost
`listening socket overflows`	Listening socket overflows
`listening socket drops`	Listening socket drops
`headers predicted`	Headers predicted
`pure ACKs`	Pure ACKs
`pure ACKs predicted`	Pure ACKs predicted
`losses recovered by TCP Reno`	Losses recovered by TCP Reno
`losses recovered by SACK`	Losses recovered by SACK
`SACKs renegged`	SACKs renegged
`detected reordering by FACK`	Detected reordering by FACK
`detected reordering by SACK`	Detected reordering by SACK
`detected reordering by TCP Reno`	Detected reordering by TCP Reno
`detected reordering by sequence`	Detected reordering by sequence
`full undos`	Full undos
`partial undos`	Partial undos
`SACK undos`	SACK undos
`loss undos`	Loss undos
`segments lost`	Segments lost
`lost retransmits`	Lost retransmits
`TCP Reno failures`	TCP Reno failures
`SACK failures`	SACK failures
`loss failures`	Loss failures
`fast retransmits`	Fast retransmits
`forward retransmits`	Forward retransmits
`retransmits in slow start`	Retransmits in slow start

Table 27-5: Parameters in the output of the show ip traffic command(cont.):

Parameter	Description
`timeouts`	Timeouts
`TCP Reno recovery failures`	TCP Reno recovery failures
`SACK recovery failures`	SACK recovery failures
`collapsed segments received`	Collapsed segments received
`DSACKs sent for old packets`	DSACKs sent for old packets
`DSACKs sent for out of order segments`	DSACKs sent for out of order segments
`DSACKs received`	DSACKs received
`DSACKs received for out of order segments`	DSACKs received for out of order segments
`connections reset due to unexpected SYN`	Connections reset due to unexpected SYN
`connections reset due to unexpected data`	Connections reset due to unexpected data
`connections reset due to early user close`	Connections reset due to early user close
`connections aborted due to lack of memory`	Connections aborted due to lack of memory
`connections aborted due to timeout`	Connections aborted due to timeout
`connections aborted due to lingering`	Connections aborted due to lingering
`connection aborts due to connection failure`	Connection aborts due to connection failure
`TCP memory pressure events`	TCP memory pressure events
`SACKs discarded`	SACKs discarded
`Old DSACKs ignored`	Old DSACKs ignored
`DSACKs ignored without undo`	DSACKs ignored without undo
`Spurious RTOs`	Spurious RTOs
`TCP MD5 Not Found`	TCP MD5 Not Found
`TCP MD5 Unexpected`	TCP MD5 Unexpected
`TCP SACKs shifted`	TCP SACKs shifted
`TCP SACKs merged`	TCP SACKs merged
`TCP SACK shift fallback`	TCP SACK shift fallback
`UDP`	UDP Counters
`UDPLite`	UDPLite Counters

Table 27-5: Parameters in the output of the show ip traffic command(cont.):

Parameter	Description
UDP6	UDPv6 Counters
UDPLite6	UDPLitev6 Counters
datagrams received	Datagrams received
datagrams received for unknown port	Datagrams received for unknown port
datagram receive errors	Datagram receive errors

datagrams received	Datagrams received
datagrams received for unknown port	Datagrams received for unknown port
datagram receive errors	Datagram receive errors
datagrams transmitted	Datagrams transmitted

tcpdump

Use this command to start a tcpdump, which gives the same output as the Unix-like **tcpdump** command to display TCP/IP traffic. Press `<ctrl> + c` to stop a running tcpdump.

Syntax (without VRF Lite)

```
tcpdump <line>
```

Syntax (VRF Lite)

```
tcpdump [vrf <vrf-name>] <line>
```

Parameter	Description
<line>	Specify the dump options. For more information on the options for this placeholder see URL **http://www.tcpdump.org/tcpdump_man.html**
`vrf`	Apply the command to the specified VRF Lite instance.
<vrf-name>	The name of the VRF Lite instance.

Mode Privileged Exec

Example To start a tcpdump running to capture IP packets, enter the command:

```
awplus# tcpdump ip
```

Example (VRF Lite) To start a tcpdump on interface `vlan2` associated with a VRF Lite instance `red`, enter the command:

```
awplus# tcpdump vrf red vlan2
```

Output **Figure 27-26: Example output from the tcpdump command**

```
03:40:33.221337 IP 192.168.1.1 > 224.0.0.13: PIMv2, Hello,
length: 34
1 packets captured
2 packets received by filter
0 packets dropped by kernel
```

Related Commands **debug ip packet interface**

traceroute

Use this command to trace the route to the specified IPv4 host.

Syntax (without VRF Lite)

```
traceroute {<ip-addr>|<hostname>}
```

Parameter	Description
<ip-addr>	The destination IPv4 address. The IPv4 address uses the format A.B.C.D.
<hostname>	The destination hostname.

Syntax (VRF Lite)

```
traceroute [vrf <vrf-name>] {<ip-addr>|<hostname>}
```

Parameter	Description
`vrf`	Apply the command to the specified VRF Lite instance.
<vrf-name>	The name of the VRF Lite instance.

Mode User Exec and Privileged Exec

Example

```
awplus# traceroute 10.10.0.5
```

Example (VRF Lite)

```
awplus# traceroute 10.10.0.5
awplus# traceroute vrf red 192.168.0.1
```

undebug ip packet interface

This command applies the functionality of the **no debug ip packet interface** command on page 27.16.

undebug ip irdp

This command applies the functionality of the **no debug ip irdp** command on page 27.18.

Introduction

This chapter describes the main features of IPv6, the switch's implementation of IPv6 and how to configure and operate IPv6 on the switch.

This chapter describes the following IPv6 features:

- linking together networks that run IPv6.
- allowing address autoconfiguration of hosts connected to the switch.

Overview

IPv6 is the next generation of the Internet Protocol (IP). It has primarily been developed to solve the problem of the eventual exhaustion of the IPv4 address space, but also offers other enhancements. IPv6 addresses are 16 bytes long, in contrast to IPv4's 4 byte addresses. Other features of IPv6 include:

- Address structure improvements:
  - « globally unique addresses with more levels of addressing hierarchy to reduce the size of routing tables
  - « autoconfiguration of addresses by hosts
  - « improved scalability of multicast routing by adding a "scope" field to multicast addresses
  - « a new type of address, the "anycast address", which sends packets to any one of a group of devices
- Removes the need for packet fragmentation en-route, by dynamic determination of the largest packet size that is supported by every link in the path. A link's MTU (Maximum Transmission Unit) must be at least 1280 bytes, compared with 576 bytes for IPv4.
- Includes a Traffic Class that allow packets to be labelled with an appropriate priority. If the network becomes congested, the lowest priority packets are dropped.
- Includes Flow labels that indicate to intermediate switches and routers that packets are part of a flow, and that a particular flow requires a particular type of service. This feature enables, for example, real-time processing of data streams. It also increases routing speed because the forwarding router or switch needs only to check the flow label, not the rest of the header. The handling indicated by the flow label can be done by the IPv6 Hop-by-Hop header, or by a separate protocol such as RSVP.
- Mandatory authentication and data integrity protocols through IPsec. IPsec is optional in IPv4.

IPv6 Addresses and Prefixes

IPv6 addresses are hexadecimal, and are made up of eight pairs of octets separated by colons. An example of a valid address is **2001:0db8:0000:0000:0260:0000:97ff:64aa**. In the interests of brevity, addresses can be abbreviated in two ways:

- Leading zeros can be omitted, so this address can be written as **2001:db8:0:0:260:0:97ff:64aa**.
- Consecutive zeros can be replaced with a double colon, so this address can be written as **2001:db8::260:0:97ff:64a**. Note that a double colon can replace any number of consecutive zeros, but an address can contain only one double colon.

Like IPv4 addresses, a proportion of the leftmost bits of the IPv6 address can be used to indicate the subnet, rather than a single node. This part of the address is called the *prefix*. Prefixes provide the equivalent functionality to a subnet mask in IPv4, allowing a subnet to be addressed, rather than a single node. If a prefix is specified, the IPv6 address is followed by a slash and the number of bits that represent the prefix. For example, **2001::/16** indicates that the first 16 bits (**2001**) of the address **2001:0:0:0:0:0:0:0** represent the prefix.

Like IPv4 addresses, IPv6 addresses are attached to interfaces.

Address types

IPv6 supports the following address types:

- Unicast
- Multicast
- Anycast

Unicast addresses

A unicast address is attached to a single interface and delivers packets only to that interface. The following special addresses have been defined:

- IPv4-compatible and IPv4-mapped addresses. IPv4-compatible addresses are used to tunnel IPv6 packets across an IPv4 network. IPv4-mapped addresses are used by an IPv6 host to communicate with an IPv4 host. The IPv6 host addresses the packet to the mapped address.
- Link-local addresses can be used on the local network on which the interface is attached. The link-local prefix is **fe80::/10**. Different interfaces on a device may have the same link-local address. The switch will automatically generate a link-local address for all interfaces that are using IPv6. Commands entered to configure link-local addresses that match any automatically generated link-local addresses by the switch will not be executed.
  Enter the **show ipv6 interface** command to display automatically generated link-local addresses not shown in the **running-config**. Automatically generated link-local addresses contain the last six hexadecimal numbers of the MAC address for a given interface.

- The Loopback address, consisting of **::1**, which is the equivalent of the IPv4 loopback address, and allows a host to send packets to itself.
- The Unspecified address, consisting of **::**, which is the equivalent of the IPv4 unspecified address, and is used as a source address by hosts during the autoconfiguration process.

Multicast addresses

IPv6 multicast addresses provide the equivalent functionality to broadcast addresses in IPv4. Broadcast addresses are not supported in IPv6. A multicast address identifies a group of interfaces, and packets are sent to all interfaces in that group.

Among the special addresses that have been defined are addresses that allow multicasting to:

- All interfaces on a particular host (**ff01::1**)
- All nodes on a local network (**ff01::2**)
- All routers on the local link (**ff02::2**)
- All routers on the local site (**ff05::2**).

Anycast addresses

An *anycast* address is a unicast address that is attached to more than one interface. If a packet is sent to an anycast address it is delivered to the nearest interface with that address, with the definition of "nearest" depending on the protocol used for routing. If the protocol is RIPv6, the nearest interface is the one that is the shortest number of hops away.

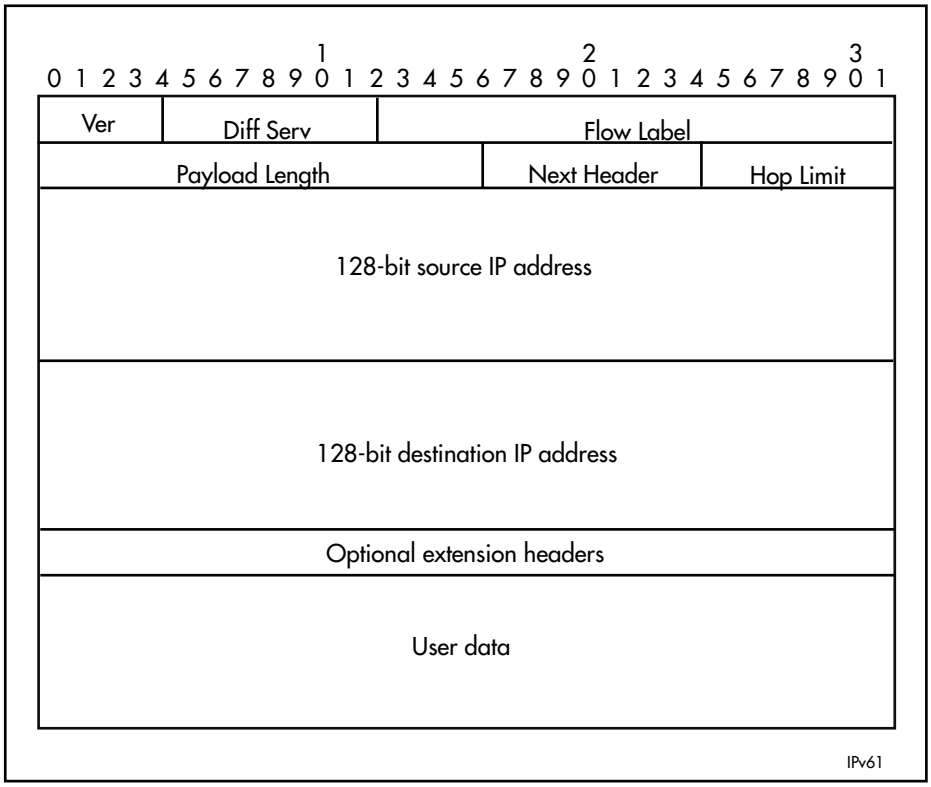
Anycast addresses can be assigned to routers only, and packets cannot originate from an anycast address. A router must be configured to know that it is using an anycast address because the address format cannot be distinguished from that of a unicast address.

Only one anycast address has been predefined: the subnet-router address. The subnet-router address sends messages to the nearest router on a subnet and consists of the subnet's prefix followed by zeros.

IPv6 Headers

The basic unit of data sent through an internet is called a *packet* in IPv6. A packet consists of a *header* followed by the *data*. The following figure shows the IPv6 packet.

Figure 28-1: IPv6 packet



.

Table 28-1: IPv6 packet - Field Description

Field	Function
Ver	Version of the IP protocol that created the packet. For IPv6, this field has a value of 6.
Differentiated Services	8-bit value that contains the 6-bit DSCP and is used to prioritize traffic as part of a Quality of Service system. For more information, see **"Differentiated Services Architecture" on page 65.4**. Additional information can be found in RFC 2474, *Definition of the Differentiated Services Field (DS Field) in the IPv4 and IPv6 Headers*.
Flow Label	20-bit value that indicates the data flow to which this packet belongs.This flow may be handled in a particular way.
Payload Length	Length of the user data portion of the packet. If the data payload is larger than 64 kB, the length is given in the optional "Jumbo Payload" header and the Payload Length header is given a value of zero.

Table 28-1: IPv6 packet - Field Description(cont.)

Field	Function
Next Header	Number that indicates the type of header that immediately follows the basic IP header. This header type may be an optional IPv6 extension header, a relevant IPv4 option header, or another protocol, such as TCP or ICMPv6. The IPv6 extension header values are: **0** (Hop-by-Hop Options Header) **43** (IPv6 Routing Header) **44** (IPv6 Fragment Header) **50** (Encapsulating Security Payload) **51** (IPv6 Authentication Header) **59** (No Next Header) **60** (Destination Options Header)
Hop Limit	Field that is the equivalent of the IPv4 Time To Live field, measured in hops.
Source IP address	128-bit IPv6 address of the sender.
Destination IP address	128-bit IPv6 address of the recipient.
Optional extension headers	Headers for less-frequently used information.
User data	Payload.

Basic IPv6 header structure

The headers contain information necessary to move the packet across the internet. They must be able to cope with missing and duplicated packets as well as possible fragmentation (and reassembly) of the original packet.

IPv6 headers are twice as long as IPv4 headers (40 bytes instead of 20 bytes) and contain four times the address space size (128 bits instead of 32 bits).

They no longer contain the header length, identification, flags, fragment offset, and header checksum fields. Some of these options are placed in extension headers. The Time To Live field is replaced with a hop limit, and the IPv4 Type of Service field is replaced with a Differentiated Services field. The Differentiated Services field contains the DSCP bits, used in a Quality of Service (QoS) regime. The following table explains IPv4 header fields that changed in IPv6.

Changed Field	Description
Type of Service	The type of service that a connection should receive is indicated in IPv6 by the Flow Label field in the IPv6 header.
Fragmentation information (the Identification field, the Flags field and the Fragment Offset field)	In most cases fragmentation does not occur in IPv6. If it does, packets are fragmented at their source and not en route. Therefore, the fragmentation information is contained in an extension header to reduce the size of the basic IPv6 header.
Header Checksum	This option has not been provided in IPv6. This is because transport protocols implement checksums and because of the availability of the IPsec authentication header (AH) in IPv6.
Options	Extension headers handle all the optional values associated with IPv6 packets. The biggest advantage of this scheme is that the size of the basic IP header is a constant.

Extension headers

IPv6 implements many of the less commonly used fields in the IPv4 header (or their equivalents) as extension headers, which are placed after the basic IPv6 header. The length of each header must be a multiple of 8 bytes.

The first extension header is identified by the Next Header field in the basic IPv6 header. Any subsequent extension headers are identified by an 8-bit "Next Header" value at the beginning of the preceding extension header.

IPv6 nodes that originate packets are required to place extension headers in a specific order:

1. The basic IPv6 header. This must come immediately before the extension headers.
2. The Hop-by-Hop header. This specifies options that must be examined by every node in the routing path.
3. A Destination Options header. This is used to specify options to be processed by the first destination or final destination. The destination options header is the only extension header that may be present more than once in the IPv6 packet.
4. The Routing header. This enables a static path to be specified for the packet, if the dynamically-determined path is undesirable.
5. The Fragment header. This indicates that the source node has fragmented the packet, and contains information about the fragmentation.
6. The Authentication header (AH). This verifies the integrity of the packet and its headers.
7. The Encapsulating Security Payload (ESP) header. This encrypts a packet and verifies the integrity of its contents.
8. The Upper Layer Protocol header. This indicates which protocol a higher layer (such as the transport layer) is to process the packet with (for example, TCP).

The Internet Control Message Protocol (ICMPv6)

The Internet Control Message Protocol, ICMPv6, provides a mechanism for error reporting and route discovery and diagnostics. It also conveys information about multicast group membership, a function that is carried out by the Internet Group Management Protocol (IGMP) in IPv4, and performs address resolution, which the Address Resolution Protocol (ARP) performs in IPv4.

Significant aspects of ICMPv6 include neighbor discovery, which enables one device in a network to find out about other nearby devices; and stateless address autoconfiguration, which allows a device to dynamically determine its own IPv6 address.

ICMPv6 is also used to support the Ping v6 (*Packet Internet Groper*) and Trace route v6 functions that are used to verify the connections between networks and network devices. Ping is used to test the connectivity between two network devices to determine whether each network device can "see" the other device. Trace route is used to discover the route used to pass packets between two systems running the IP protocol.

Both of these functions operate almost identically in IPv4 and IPv6. For more information, see **"Ping" on page 26.20**.

Neighbor Discovery

Neighbor discovery is an ICMPv6 function that enables a router or a host to identify other devices on its links. This information is then used in address autoconfiguration, to redirect a node to use a more appropriate router if necessary, and to maintain reachability information with its neighbors.

The IPv6 Neighbor Discovery protocol is similar to a combination of the IPv4 protocols ARP, ICMP Router Discovery and ICMP Redirect.

The following table describes packet types involved with neighbor discovery.

Packet Type	Description
router solicitation	Packet in which a host sends out a request for routers to generate advertisements.
router advertisement	Allows routers to advertise their presence and other network parameters. A router sends an advertisement packet in response to a solicitation packet from a host.
neighbor solicitation	Packet in which a node sends a packet to determine the link layer address of a neighbor or to verify that a neighbor is still active.
neighbor advertisement	A response to a neighbor solicitation packet. These packets are also used to notify neighbors of link layer address changes.
redirect	Informs hosts of a better first hop.

To comply with Section 6.2.1 of RFC 2461, *IPv6 Neighbor Discovery*, the router does not generate router advertisements by default. See **"Neighbor Discovery" on page 28.8** for instructions about enabling advertisements.

The following table explains packet types and services.

Packet Type	Description
address resolution	A method for carrying out address autoconfiguration, and is achieved using the Neighbor Solicitation Message and the Neighbor Advertisement Message.
router and prefix discovery	On connection to a link, a node needs to know the address of a router that the node can use to reach the rest of the world. The node also needs to know the prefix (or prefixes) that define the range of IP addresses on its link that it can reach without going through a router. Routers use ICMP to convey this information to hosts, by means of router advertisements. The message may have an option attached (the *source link address* option), which enables the receiving node to respond directly to the router, without performing a neighbor solicitation.
immediate information	The configuration of a router includes a defined frequency at which unsolicited advertisements are sent. If a node wants to obtain information about the nearest router immediately, rather than waiting for the next unsolicited advertisement, the node can send a router solicitation message. Each router that receives the solicitation message sends a router advertisement specifically to the node that sent the solicitation.

Packet Type	Description
redirection	If a node is aware of more than one router that it can use to connect to wider networks, the router to which it sends packets by default does not always represent the most desirable route. ICMPv6 uses the redirect packet to communicate a more effective path to the node.
Neighbor Unreachability Detection (NUD)	A node may issue solicitation requests to determine whether a path is still viable, or may listen in on acknowledgement packets of higher layer protocols, such as TCP. If the node determines that a path is no longer viable, it attempts to establish a new link to the neighbor, or to re-establish the previous link. NUD can be used between any two devices in the network, independent of whether the devices are acting as hosts or routers.

Stateless address autoconfiguration

Stateless address autoconfiguration allows an IPv6-aware device to be plugged into a network without manual configuration with an IP address. This plug and play functionality results in networks that are easier to set up and modify, and simplifies the process of shifting to use a new Internet Service Provider (ISP).

Stateless address autoconfiguration is achieved in a series of steps. Routers and hosts perform the first three steps, which autoconfigure a link-local address. A global address is autoconfigured in the last three steps, which only hosts perform.

On the router or host

1. During system start-up, the node begins autoconfiguration by generating a link-local address for the interface. A link-local address is formed by adding the interface ID to the link-local prefix **fe80::/10** (reference RFC 3513).

> **Note** Different interfaces on a device may have the same link-local address. The switch will automatically generate a link-local address for all interfaces that are using IPv6. Commands entered to configure link-local addresses that match any automatically generated link-local addresses by the switch will not be executed. Enter the show ipv6 interface command to display automatically generated link-local addresses not shown in the running-config. Automatically generated link-local addresses contain the last six hexadecimal numbers of the MAC address for a given interface.

2. The node then transmits a neighbor solicitation message to this address. If the address is already in use, the node that the address belongs to replies with a neighbor advertisement message. The autoconfiguration process stops and manual configuration of the node is then required.

3. If no neighbor advertisement is received, the node concludes that the address is available and assigns it to the chosen interface.

On the host

1. The node then sends one or more router solicitations to detect if any routers are present. Any routers present responds with a router advertisement.

   If no router advertisement is received, the node tries to use DHCP to obtain an address and other configuration information. If no DHCP server responds, the node continues using the link-level address

   If a router advertisement is received, this message informs the node how to proceed with the auto configuration process. The prefix from the router advertisement, if received, is added to the link-level address to form the global unicast IP address.

2. This address is then assigned to the network interface.

   If routers are present, the node continues to receive router advertisements. The node updates its configuration when there are changes in the router advertisements.

IPv6 Routing

Routing in IPv6 is almost identical to IPv4 routing under CIDR, except that the addresses are 128-bit IPv6 addresses instead of 32-bit IPv4 addresses.

Routing Information Protocol (RIPv6)

RIP is a simple distance vector protocol that defines networks based on how many hops they are from the router. When a network is more than 15 hops away (one hop is one link), it is not included in the routing table.

RIPv6, also referred to as RIPng (for "next generation") is similar to RIPv2. Extensions to RIPv2 to support IPv6 are:

- the address field of a routing entry is expanded to 128 bits to allow IPv6 prefixes
- the 32-bit RIPv2 subnet mask field is replaced by an 8-bit prefix length field
- authentication is removed in RIPv6
- the size of a routing packet is no longer arbitrarily limited
- RIPv6 specifies the next hop instead of simply allowing the recipient of the update to set the next hop to the sender of the update.

In RIPv6, each router uses a routing table to keep track of every destination that is reachable throughout the system. Each entry in the routing table contains:

- the IPv6 prefix of the destination
- a metric, which represents the total cost of getting a packet from the router to that destination
- the IPv6 address of the next router along the path to the destination
- a flag to indicate that information about the route has changed recently
- various timers associated with the route.

Integration of IPv4 and IPv6

IPv6 has been designed in such a way that a smooth transition from IPv4 is possible. The most effective way to ensure this is to use a *dual IP stack*. A node configured as a dual stack system has both a 128-bit IPv6 address and a 32-bit IPv4 address, and so can communicate with nodes running IPv4 and those running IPv6.

Another aspect of the transition is to *tunnel* IPv6 packets through an IPv4 network. IPv6 packets are tunnelled simply by encapsulating the IPv6 packet within an IPv4 datagram, and identifying that this datagram is an encapsulated IPv6 packet by giving the datagram a protocol value of 41.

IPv6 on your Switch

This section describes the switch's support for IPv6, and how to configure IPv6 on the switch.

Enabling IPv6

The switch's implementation of IPv6 is disabled by default. To enable IPv6 forwarding, use the **ipv6 forwarding** command on page 29.8.

To display information about IPv6 settings, use the **show ipv6 interface brief** command on page 29.27.

Because the switch implements IPv6 as a dual stack, implementing IPv6 does not affect IPv4 functionality.

IPv6 Stateless Address Autoconfiguration (SLAAC)

The switch's implementation of IPv6 supports SLAAC on an interface. To enable IPv6 SLAAC on an interface, use the **ipv6 address autoconfig** command on page 29.5. SLAAC automatically applies the MAC address of the interface to an IPv6 address for the interface specified.
ipv6 address autoconfig enables automatic configuration of IPv6 addresses on an interface using stateless autoconfiguration, and enables IPv6 processing on an interface.

IPv6 EUI-64 Addressing

The switch's implementation of IPv6 supports EUI-64 addressing. EUI-64 applies an IPv6 address that is based on the MAC address of the interface. The EUI-64 identifiers from the MAC address are used as the least significant 64 bits of a unicast address.

To enable IPv6 EUI-64, use the **ipv6 address** command on page 29.3 specifying the optional **eui64** parameter for an interface.

When configuring SLAAC you must ensure that you set the prefix length to 64 bits on the switch that is advertising the RAs used for address configuration via SLAAC.

Prefix information received in an RA (Router Advertisement) will not be applied to form an IPv6 address via SLAAC unless the prefix length is 64. Since the EUI is 64 bits long, the IPv6 prefix of the advertising device must also be 64 bits. This prefix length setting and behavior is in accordance with RFC 4864, section 5.5.3.

IPv6 Link-local Addresses

The switch's implementation of IPv6 supports IPv6 link-local addresses without global addresses for communications within the local subnetwork. Switches do not forward packets to link-local addresses. To enable IPv6 link-local addresses, use the **ipv6 enable** command on page 29.7. **ipv6 enable** automatically configures an IPv6 link-local address on the interface and enables IPv6 processing on the interface.

Note that link-local addresses are retained in the system until they are negated by using the no variant of the command that established them. See the **Link-local addresses** glossary entry, and the **ipv6 enable** command for more information. Also note that the link-local address is retained in the system if the global address is removed using another command, which was not used to establish the link-local address. For example, if a link local address is established with the **ipv6 enable** command then it will not be removed using a **no ipv6 address** command.

IPv6 RA Guard

This section describes the switch's support for IPv6 RA Guard, and how to configure IPv6 RA Guard on the switch.

RA Guard Introduction

Router Advertisements (RAs) and Router Redirects are used to manage IPv6 networks. RA messages advertise a router's presence and specify network parameters that are used by hosts as part of address auto-configuration and setting next-hop routes for particular destinations.

RAs are periodically transmitted by switches allowing networks to be reconfigured by changes to the routers only. Switches can also send redirects to hosts suggesting that they use a different next-hop route for a particular traffic stream. But because the entire network configuration can be modified by what is contained in RAs and redirects, the network is vulnerable to rogue messages that are generated either through misconfiguration or due to a malicious attack.

RA Guard on the switch simply considers each of its ports as either trusted or untrusted. Any host connected to a port is considered trusted or untrusted depending on the port status. A trusted port will accept RAs and redirects and will forward RAs and redirects on trusted ports. An untrusted port will block and discard all RAs and redirects received from the untrusted host.

Enabling IPv6 RA Guard

The switch's implementation of IPv6 RA Guard is disabled by default. To enable IPv6 RA Guard on a port to block RAs from an untrusted host, use the **ipv6 nd raguard** command on page 29.17. Disable IPv6 RA Guard to allow RAs on a port using the **no ipv6 nd raguard** command.

Chapter 29: IPv6 Commands

Command List 29.2
clear ipv6 neighbors 29.2
ipv6 address 29.3
ipv6 address autoconfig 29.5
ipv6 enable 29.7
ipv6 forwarding 29.8
ipv6 nd current-hoplimit 29.9
ipv6 nd managed-config-flag 29.10
ipv6 nd minimum-ra-interval 29.11
ipv6 nd other-config-flag 29.12
ipv6 nd prefix 29.13
ipv6 nd ra-interval 29.15
ipv6 nd ra-lifetime 29.16
ipv6 nd raguard 29.17

traceroute ipv6 ..... 29.32

Command List

This chapter provides an alphabetical reference of commands used to configure IPv6. For more information, see **Chapter 28, IPv6 Introduction**.

clear ipv6 neighbors

Use this command to clear all dynamic IPv6 neighbor entries.

Syntax `clear ipv6 neighbors`

Mode Privileged Exec

Example

```
awplus# clear ipv6 neighbors
```

ipv6 address

Use this command to set the IPv6 address of a VLAN interface and enable IPv6.

Use the optional eui64 parameter to derive the interface identifier of the IPv6 address from the MAC address of the interface. Note that the MAC address of the default VLAN is applied if the interface does not have a MAC address of its own when specifying the eui64 parameter.

Use the no variant of this command to remove the IPv6 address assigned and disable IPv6. Note that if no global addresses are left after removing the IPv6 address then IPv6 is disabled.

Syntax

```
ipv6 address <ipv6-addr/prefix-length> [eui64]
no ipv6 address <ipv6-addr/prefix-length> [eui64]
```

Parameter	Description
<ipv6-addr/prefix-length>	Specifies the IPv6 address to be set. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.
`[eui64]`	EUI-64 is a method of automatically deriving the lower 64 bits of an IPv6 address, based on the switch's MAC address.

Mode Interface Configuration for a VLAN interface.

Usage If the **eui64** parameter is specified then the lower 64 bits of the IPv6 address are appended with the same address that would be acquired through stateless address autoconfiguration (SLAAC) if the device received an RA (Router Advertisement) specifying this prefix. See **ipv6 address autoconfig** for a detailed command description and examples to enable and disable SLAAC. See also the **IPv6 EUI-64 Addressing** section in **Chapter 28, IPv6 Introduction** for further EUI-64 implementation information.

Note that link-local addresses are retained in the system until they are negated by using the no variant of the command that established them. See the **Link-local addresses** glossary entry, and the **ipv6 enable** command for more information.

Also note that the link-local address is retained in the system if the global address is removed using another command, which was not used to establish the link-local address. For example, if a link local address is established with the **ipv6 enable** command then it will not be removed using a **no ipv6 address** command.

Example To assign the IPv6 address `2001:0db8::a2/64` to the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 address 2001:0db8::a2/64
```

To remove the IPv6 address `2001:0db8::a2/64` from the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 address 2001:0db8::a2/64
```

To assign the **eui64** derived address in the prefix `2001:db8::/48` to VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-fr-subif)# ipv6 address 2001:0db8::/48 eui64
```

To remove the **eui64** derived address in the prefix `2001:db8::/48` from VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-fr-subif)# no ipv6 address 2001:0db8::/48 eui64
```

Validation Commands

show running-config
show ipv6 interface brief
show ipv6 route

Related Commands

ipv6 address autoconfig

ipv6 address autoconfig

Use this command to enable IPv6 stateless address autoconfiguration (SLAAC) for an interface. This configures an IPv6 address on an interface derived from the MAC address on the interface.

Use the **no** variant of this command to disable IPv6 SLAAC on an interface. Note that if no global addresses are left after removing all IPv6 autoconfigured addresses then IPv6 is disabled.

Syntax

```
ipv6 address autoconfig

no ipv6 address autoconfig
```

Mode Interface Configuration for a VLAN interface.

Usage The **ipv6 address autoconfig** command enables automatic configuration of IPv6 addresses using stateless autoconfiguration on an interface and enables IPv6, but does not enable IPv6 forwarding. See **ipv6 forwarding** command on page 29.8 for further description and examples.

IPv6 hosts can configure themselves when connected to an IPv6 network using ICMPv6 (Internet Control Message Protocol version 6) router discovery messages. Configured routers respond with a Router Advertisement (RA) containing configuration parameters for IPv6 hosts.

The SLAAC process derives the interface identifier of the IPv6 address from the MAC address of the interface. When applying SLAAC to an interface, note that the MAC address of the default VLAN is applied to the interface if the interface does not have its own MAC address.

If SLAAC is not suitable then a network can use stateful configuration with DHCPv6 (Dynamic Host Configuration Protocol version 6) Relay, or hosts can be configured statically. See **ip dhcp-relay server-address** for the DHCPv6 Relay server command description and examples. For introduction and configuration information about DHCPv6 Relay agent see **"DHCP Relay Agent Introduction" on page 92.9** and **"Configuring the DHCP Relay Agent" on page 92.9**.

Note that link-local addresses are retained in the system until they are negated by using the no variant of the command that established them. See the **Link-local addresses** glossary entry, and the **ipv6 enable** command for more information.

Also note that the link-local address is retained in the system if the global address is removed using another command, which was not used to establish the link-local address. For example, if a link local address is established with the **ipv6 enable** command then it will not be removed using a **no ipv6 address** command.

Example To enable SLAAC on the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 address autoconfig
```

To disable SLAAC on the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 address autoconfig
```

Validation Commands
show running-config
show ipv6 interface brief
show ipv6 route

Related Commands
ipv6 address
ipv6 enable

ipv6 enable

Use this command to enable IPv6 on an interface without an IPv6 global address for the interface. This enables IPv6 with a IPv6 link-local address, not an IPv6 global address.

Use the no variant of this command to disable IPv6 on an interface without a global address. Note the no variant of this command does not operate on an interface with an IPv6 global address or an interface configured for IPv6 stateless address autoconfiguration (SLAAC),

Syntax

```
ipv6 enable
no ipv6 enable
```

Mode Interface Configuration for a VLAN interface.

Usage The **ipv6 enable** command automatically configures an IPv6 link-local address on the interface and enables the interface for IPv6 processing. Note that link-local addresses are retained in the system until they are negated by using the no variant of the command that established them. See the **Link-local addresses** glossary entry for more information.

Also note that the link-local address is retained in the system if the global address is removed using another command, which was not used to establish the link-local address. For example, if a link local address is established with the **ipv6 enable** command then it will not be removed using a **no ipv6 address** command.

Example To enable IPv6 with only a link-local IPv6 address on the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
```

To disable IPv6 with only a link-local IPv6 address on the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 enable
```

Validation Commands
show running-config
show ipv6 interface brief
show ipv6 route

Related Commands
ipv6 address
ipv6 address autoconfig

ipv6 forwarding

Use this command to turn on IPv6 unicast routing for IPv6 packet forwarding. Issue this command globally on your switch prior to issuing **ipv6 enable** on individual interfaces.

Use this **no** variant of this command to turn off IPv6 unicast routing for IPv6 packet forwarding. Note IPv6 unicast routing for IPv6 packet forwarding is disabled by default.

Note Use this command to enable IPv6 unicast routing before configuring either RIPng or OSPFv3 IPv6 routing protocols and static or multicast IPv6 routing. IPv6 must be enabled on an interface with the **ipv6 enable** command, IPv6 forwarding must be enabled globally for routing IPv6 with the **ipv6 forwarding** command, and IPv6 multicasting must be enabled globally with the **ipv6 multicast-routing** command before using PIM-SMv6 commands.

Note The switch will not apply any IPv6 functionality unless you have allocated it memory resource by using the **platform routingratio** command on page 17.32.

Syntax

```
ipv6 forwarding
no ipv6 forwarding
```

Mode Global Configuration

Default IPv6 unicast forwarding is disabled by default.

Usage Enable IPv6 unicast forwarding globally for all interface on your switch with this command. Use the **no** variant of this command to disable IPv6 unicast forwarding globally for all interfaces on your switch.

IPv6 unicast forwarding allows switches to communicate with devices that are more than one hop away, providing that there is a route to the destination address. If IPv6 forwarding is not enabled then pings to addresses on devices that are more than one hop away will fail, even if there is a route to the destination address.

Examples To enable IPv6 unicast routing, use this command as shown below:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
```

To disable IPv6 unicast routing, use the **no** variant of this command as shown below:

```
awplus# configure terminal
awplus(config)# no ipv6 forwarding
```

Related Commands
ipv6 enable
ipv6 multicast-routing
platform routingratio

ipv6 nd current-hoplimit

Use this command to specify the advertised current hop limit used between IPv6 Routers.

Use the **no** variant of this command to reset the current advertised hop limit to its default (0).

Syntax

```
ipv6 nd current-hoplimit <hoplimit>
no ipv6 nd current-hoplimit [<hoplimit>]
```

Parameter	Description
<hoplimit>	Specifies the advertised current hop limit value. Valid values are from 0 to 255 hops.

Default 0 (No advertised current hop limit specified)

Mode Interface Configuration for a VLAN interface.

Example To set the advertised current hop limit to 2 between IPv6 Routers on the VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 nd current-hoplimit 2
```

To reset the advertised current hop limit to the default (0) on the VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 nd current-hoplimit
```

Related Commands

ipv6 nd managed-config-flag
ipv6 nd prefix
ipv6 nd suppress-ra

ipv6 nd managed-config-flag

Use this command to set the managed address configuration flag, contained within the router advertisement field.

Setting this flag indicates the operation of a stateful autoconfiguration protocol such as DHCPv6 for address autoconfiguration, and that address information (i.e. the network prefix) and other (non-address) information can be requested from the switch.

An unset flag enables hosts receiving the advertisements to use a stateless autoconfiguration mechanism to establish their IPv6 addresses. The default is flag unset.

Use the **no** variant of this command to reset this command to its default of, *flag unset*.

Syntax

```
ipv6 nd managed-config-flag
no ipv6 nd managed-config-flag
```

Default Unset

Mode Interface Configuration for a VLAN interface.

Usage Advertisement flags will not be transmitted unless you have applied the **no ipv6 nd suppress-ra** command on page 29.21. This step is included in the example below.

Example To set the managed address configuration flag on the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 nd managed-config-flag
awplus(config-if)# no ipv6 nd suppress-ra
```

Related Commands

ipv6 nd suppress-ra
ipv6 nd prefix
ipv6 nd other-config-flag

ipv6 nd minimum-ra-interval

Use this command in Interface Configuration mode to set a minimum Router Advertisement (RA) interval for a VLAN interface.

Use the **no** variant of this command in Interface Configuration mode to remove the minimum RA interval for a VLAN interface.

Syntax

```
ipv6 nd minimum-ra-interval <seconds>

no ipv6 nd minimum-ra-interval [<seconds>]
```

Parameter	Description
<seconds>	Specifies the number of seconds between IPv6 Router Advertisements (RAs). Valid values are from 3 to 1350 seconds.

Default The RA interval for a VLAN interface is unset by default.

Mode Interface Configuration for a VLAN interface.

Examples To set the minimum RA interval for the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 nd minimum-ra-interval 60
```

To remove the minimum RA interval for the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 nd minimum-ra-interval 60
```

Related Commands

ipv6 nd ra-interval
ipv6 nd suppress-ra
ipv6 nd prefix
ipv6 nd other-config-flag

ipv6 nd other-config-flag

Use this command to set the **other** stateful configuration flag (contained within the router advertisement field) to be used for IPv6 address auto-configuration. This flag is used to request the router to provide information in addition to providing addresses.

Note

Setting the **ipv6 nd managed-config-flag** command on page 29.10 implies that the **ipv6 nd other-config-flag** will also be set.

Use **no** variant of this command to reset the value to the default.

Syntax

```
ipv6 nd other-config-flag
no ipv6 nd other-config-flag
```

Default Unset

Mode Interface Configuration for a VLAN interface.

Usage Advertisement flags will not be transmitted unless you have applied the **no ipv6 nd suppress-ra** command on page 29.21. This step is included in the example below.

Example To set the IPv6 other-config-flag on the VLAN interface `vlan4`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ipv6 nd other-config-flag
awplus(config-if)# no ipv6 nd suppress-ra
```

Related Commands

ipv6 nd suppress-ra
ipv6 nd prefix
ipv6 nd managed-config-flag

ipv6 nd prefix

Use this command in Interface Configuration mode for a VLAN interface to specify the IPv6 prefix information that is advertised by the router advertisement for IPv6 address auto-configuration.

Use the **no** parameter with this command to reset the IPv6 prefix for a VLAN interface in Interface Configuration mode.

Syntax

```
ipv6 nd prefix <ipv6-prefix/length>

ipv6 nd prefix <ipv6-prefix/length> [<valid-lifetime>]

ipv6 nd prefix <ipv6-prefix/length> <valid-lifetime>
   <preferred-lifetime> [no-autoconfig]

ipv6 nd prefix <ipv6-prefix/length> <valid-lifetime>
   <preferred-lifetime> off-link [no-autoconfig]

no ipv6 nd prefix [<ipv6-addr/prefix-length>|all]
```

Parameter	Description
<ipv6-prefix/length>	The prefix to be advertised by the router advertisement message. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.The default is X:X::/64.
<valid-lifetime>	The the period during which the specified IPv6 address prefix is valid. This can be set to a value between 0 and 4294967295 seconds. The default is 2592000 (30 days). Note that this period should be set to a value greater than that set for the prefix preferred-lifetime.
<preferred-lifetime>	Specifies theIPv6 prefix preferred lifetime. This is the period during which the IPv6 address prefix is considered a current (undeprecated) value. After this period, the command is still valid but should not be used in new communications. Set to a value between 0 and 4294967295 seconds. The default is 604800 seconds (7 days). Note that this period should be set to a value less than that set for the prefix valid-lifetime.
`off-link`	Specify the IPv6 prefix off-link flag. The default is *flag set*.
`no-autoconfig`	Specify the IPv6 prefix no autoconfiguration flag. Setting this flag indicates that the prefix is not to be used for autoconfiguration. The default is *flag set*.
`all`	Specify all IPv6 prefixes associated with the VLAN interface.

Default Valid-lifetime default is 2592000 seconds (30 days). Preferred-lifetime default is 604800 seconds (7 days).

Usage This command specifies the IPv6 prefix flags that are advertised by the router advertisement message.

Examples The following example configures the switch to issue router advertisements on the VLAN interface `vlan4`, and advertises the address prefix of `2001:0db8::/64`.

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ipv6 nd prefix 2001:0db8::/64
```

The following example configures the switch to issue router advertisements on the VLAN interface `vlan4`, and advertises the address prefix of `2001:0db8::/64` with a valid lifetime of 10 days and a preferred lifetime of 5 days.

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ipv6 nd prefix 2001:0db8::/64 864000 432000
```

The following example configures the switch to issue router advertisements on the VLAN interface `vlan4`, and advertises the address prefix of `2001:0db8::/64` with a valid lifetime of 10 days, a preferred lifetime of 5 days and no prefix used for autoconfiguration.

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ipv6 nd prefix 2001:0db8::/64 864000 43200
no-autoconfig
```

The following example resets router advertisements on the VLAN interface `vlan4`, so the address prefix of `2001:0db8::/64` is not advertised from the switch.

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# no ipv6 nd prefix 2001:0db8::/64
```

The following example resets all router advertisements on the VLAN interface `vlan4`:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# no ipv6 nd prefix all
```

Related Commands **ipv6 nd suppress-ra**

ipv6 nd ra-interval

Use this command to specify the interval between IPv6 Router Advertisements (RA) transmissions.

Use **no** parameter with this command to reset the value to the default value (600 seconds).

Syntax

```
ipv6 nd ra-interval <seconds>

no ipv6 nd ra-interval
```

Parameter	Description
<*seconds*>	Specifies the number of seconds between IPv6 Router Advertisements (RAs). Valid values are from 4 to 1800 seconds.

Default 600 seconds.

Mode Interface Configuration for a VLAN interface.

Usage Advertisement flags will not be transmitted unless you have applied the **no ipv6 nd suppress-ra** command on page 29.21 as shown in the example below.

Example To set the advertisements interval on the VLAN interface `vlan4` to be 60 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ipv6 nd ra-interval 60
awplus(config-if)# no ipv6 nd suppress-ra
```

Related Commands

ipv6 nd minimum-ra-interval
ipv6 nd suppress-ra
ipv6 nd prefix

ipv6 nd ra-lifetime

Use this command to specify the time period that this router can usefully act as a default gateway for the network. Each router advertisement resets this time period.

Use **no** parameter with this command to reset the value to default.

Syntax

```
ipv6 nd ra-lifetime <seconds>
no ipv6 nd ra-lifetime
```

Parameter	Description
<seconds>	Time period in seconds. Valid values are from 0 to 9000. Note that you should set this time period to a value greater than the value you have set using the **ipv6 nd ra-interval** command.

Default 1800 seconds

Mode Interface Configuration for a VLAN interface.

Usage This command specifies the lifetime of the current router to be announced in IPv6 Router Advertisements.

Advertisement flags will not be transmitted unless you have applied the **no ipv6 nd suppress-ra** command. This instruction is included in the example shown below.

Examples To set the advertisement lifetime of 8000 seconds on the VLAN interface `vlan4`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ipv6 nd ra-lifetime 8000
awplus(config-if)# no ipv6 nd suppress-ra
```

Related Commands

ipv6 nd suppress-ra
ipv6 nd prefix

ipv6 nd raguard

Use this command to apply the Router Advertisements (RA) Guard feature from the Interface Configuration mode for a switch port. This blocks all RA messages received on a switch port. For introductory information about RA Guard see **"RA Guard Introduction" on page 28.13**.

Use the **no** parameter with this command to disable RA Guard for a specified switch port.

Syntax

```
ipv6 nd raguard
no ipv6 nd raguard
```

Default RA Guard is not enabled by default.

Mode Interface Configuration for a switch port interface.

Usage Router Advertisements (RAs) are used by Routers to announce themselves on the link. Applying RA Guard to a switch port disallows Router Advertisements and redirect messages. RA Guard blocks RAs from untrusted hosts. Blocking RAs stops untrusted hosts from flooding malicious RAs and stops any misconfigured hosts from disrupting traffic on the local network.

Enabling RA Guard on a port blocks RAs from a connected host and indicates the port and host are untrusted. Disabling RA Guard on a port allows RAs from a connected host and indicates the port and host are trusted. Ports and hosts are trusted by default to allow RAs.

Example To enable RA Guard on switch ports `port1.0.2-1.0.12`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2-1.0.12
awplus(config-if)# ipv6 nd raguard
```

To verify RA Guard is enabled on switch port interface `port1.0.2`, use the command:

```
awplus# show running-config interface port1.0.2
```

To disable RA Guard on switch ports `port1.0.2-1.0.12`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2-port1.0.12
awplus(config-if)# no ipv6 nd raguard
```

When RA Guard is disabled on a switch port it is not displayed in **show running-config** output.

Output **Example output from a show running-config interface port1.0.2 to verify RA Guard:**

```
!
interface port1.0.2
 switchport mode access
 ipv6 nd raguard
!
```

Related Commands **show running-config interface**

ipv6 nd reachable-time

Use this command to specify the reachable time in the router advertisement to be used for detecting reachability of the IPv6 neighbor.

Use the **no** variant of this command to reset the value to default.

Syntax

```
ipv6 nd reachable-time <milliseconds>
no ipv6 nd reachable-time
```

Parameter	Description
<milliseconds>	Time period in milliseconds. Valid values are from 1000 to 3600000. Setting this value to 0 indicates an unspecified reachable-time.

Default 0 milliseconds

Mode Interface Configuration for a VLAN interface.

Usage This command specifies the reachable time of the current router to be announced in IPv6 Router Advertisements.

Advertisement flags will not be transmitted unless you have applied the **no ipv6 nd suppress-ra** command. This instruction is included in the example shown below.

Example To set the reachable-time in router advertisements on the VLAN interface `vlan4` to be 1800000 milliseconds, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ipv6 nd reachable-time 1800000
awplus(config-if)# no ipv6 nd suppress-ra
```

To reset the reachable-time in router advertisements on the VLAN interface `vlan4` to an unspecified reachable-time (0 milliseconds), enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# no ipv6 nd reachable-time
```

Related Commands **ipv6 nd suppress-ra**
ipv6 nd prefix

ipv6 nd retransmission-time

Use this command to specify the advertised retransmission interval for Neighbor Solicitation in milliseconds between IPv6 Routers.

Use the **no** variant of this command to reset the retransmission time to the default (1 second).

Syntax

```
ipv6 nd retransmission-time <milliseconds>
no ipv6 nd retransmission-time [<milliseconds>]
```

Parameter	Description
<milliseconds>	Time period in milliseconds. Valid values are from 1000 to 3600000.

Default 1000 milliseconds (1 second)

Mode Interface Configuration for a VLAN interface.

Example To set the retransmission-time of Neighbor Solicitation on the VLAN interface `vlan2` to be 800000 milliseconds, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 nd retransmission-time 800000
```

To reset the retransmission-time of Neighbor Solicitation on the VLAN interface `vlan2` to the default 1000 milliseconds (1 second), enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 nd retransmission-time
```

Related Commands **ipv6 nd suppress-ra**
ipv6 nd prefix

ipv6 nd suppress-ra

Use this command to inhibit IPv6 Router Advertisement (RA) transmission for the current interface. Router advertisements are used when applying IPv6 stateless auto-configuration.

Use **no** parameter with this command to enable Router Advertisement transmission.

Syntax

```
ipv6 nd suppress-ra
no ipv6 nd suppress-ra
```

Default Router Advertisement (RA) transmission is suppressed by default.

Mode Interface Configuration for a VLAN interface.

Example To enable the transmission of router advertisements from the VLAN interface `vlan4` on the switch, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# no ipv6 nd suppress-ra
```

Related Commands **ipv6 nd ra-interval**
ipv6 nd prefix

ipv6 neighbor

Use this command to add a static IPv6 neighbor entry.

Use the **no** variant of this command to remove a specific IPv6 neighbor entry.

Syntax

```
ipv6 neighbor <ipv6-address> <vlan-name> <mac-address> <port-list>
no ipv6 neighbor <ipv6-address> <vlan-name> <port-list>
```

Parameter	Description
<ipv6-address>	Specify the neighbor's IPv6 address in format `X:X::X:X`.
<vlan-name>	Specify the neighbor's VLAN name.
<mac-address>	Specify the MAC hardware address in hexadecimal notation with the format `HHHH.HHHH.HHHH`.
<port-list>	Specify the port number, or port range.

Mode Global Configuration

Usage Use this command to clear a specific IPv6 neighbor entry. To clear all dynamic address entries, use the **clear ipv6 neighbors** command.

Example To create a static neighbor entry for IPv6 address `2001:0db8::a2`, on `vlan 4`, MAC address `0000.cd28.0880`, on `port1.0.19`, use the command:

```
awplus# configure terminal
awplus(config)# ipv6 neighbor 2001:0db8::a2 vlan4
0000.cd28.0880 port1.0.19
```

Related Commands **clear ipv6 neighbors**

ipv6 opportunistic-nd

Use this command to enable opportunistic neighbor discovery for the global IPv6 ND cache. Opportunistic neighbor discovery changes the behavior for unsolicited ICMPv6 ND packet forwarding on the switch.

Use the **no** variant of this command to disable opportunistic neighbor discovery for the global IPv6 ND cache.

Syntax

```
ipv6 opportunistic-nd
no ipv6 opportunistic-nd
```

Default Opportunistic neighbor discovery is disabled by default.

Mode Global Configuration

Usage When opportunistic neighbor discovery is enabled, the switch will reply to any received unsolicited ICMPv6 ND packets. The source MAC address for the unsolicited ICMPv6 ND packet is added to the IPv6 ND cache, so the switch forwards the ICMPv6 ND packet. When opportunistic neighbor discovery is disabled, the source MAC address for the ICMPv6 packet is not added to the IPv6 ND cache, so the ICMPv6 ND packet is not forwarded by the switch.

Example To enable opportunistic neighbor discovery for the IPv6 ND cache, enter:

```
awplus# configure terminal
awplus(config)# ipv6 opportunistic-nd
```

To disable opportunistic neighbor discovery for the IPv6 ND cache, enter:

```
awplus# configure terminal
awplus(config)# no ipv6 opportunistic-nd
```

Related Commands **arp opportunistic-nd**
show ipv6 neighbors

Validation Commands **show running-config interface**

ipv6 route

Use this command to establish the distance for static routes of a network prefix.

Use the **no** variant of this command to disable the distance for static routes of the network prefix.

Syntax

```
ipv6 route <dest-prefix> <dest-prefix/length>
   {<gateway-ip>|<gateway-name>} [<distvalue>]

no ipv6 route <dest-prefix> <dest-prefix/length>
   {<gateway-ip>|<gateway-name>} [<distvalue>]
```

Parameter	Description
<dest-prefix/length>	Specifies the IP destination prefix. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.
<gateway-ip>	Specifies the IP gateway (or next hop) address. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.
<distvalue>	Specifies the administrative distance for the route. Valid values are from 1 to 255.
<gateway-name>	Specifies the name of the gateway (or next hop) interface.

Mode Global Configuration

Example To set a distance value of 32 for the static route `2001:0db8::1/128 use the following commands`

```
awplus# configure terminal
awplus(config)# ipv6 route 2001:0db8::1/128 myintname 32
```

Validation Commands **show running-config**
show ipv6 route

ping ipv6

This command sends a query to another IPv6 host (send Echo Request messages).

Note Use of the `interface` parameter keyword, plus an interface or an interface range, with this command is only valid when pinging an IPv6 link local address.

Syntax

```
ping ipv6 {<host>|<ipv6-address>} [repeat {<1-2147483647>|
   continuous}] [size <10-1452>] [interface <interface-list>]
   [timeout <1-65535>]
```

Parameter	Description
<ipv6-addr>	The destination IPv6 address. The IPv6 address uses the format X:X::X:X.
<hostname>	The destination hostname.
`repeat`	Specify the number of ping packets to send.
<1-2147483647>	Specify repeat count. The default is 5.
`size` *<10-1452>*	The number of data bytes to send, excluding the 8 byte ICMP header. The default is 56 (64 ICMP data bytes).
`interface` *<interface-list>*	The interface or range of configured IP interfaces to use as the source in the IP header of the ping packet.
`timeout` *<1-65535>*	The time in seconds to wait for echo replies if the ARP entry is present, before reporting that no reply was received. If no ARP entry is present, it does not wait.
`repeat`	Specify the number of ping packets to send.
<1-2147483647>	Specify repeat count. The default is 5.
`continuous`	Continuous ping.
`size` *<10-1452>*	The number of data bytes to send, excluding the 8 byte ICMP header. The default is 56 (64 ICMP data bytes).
`timeout` *<1-65535>*	The time in seconds to wait for echo replies if the ARP entry is present, before reporting that no reply was received. If no ARP entry is present, it does not wait.

Mode User Exec and Privileged Exec

Example To issue an echo request message to the host `2001:0db8::a2`

```
awplus# ping ipv6 2001:0db8::a2
```

Related Commands traceroute ipv6

show ipv6 forwarding

Use this command to display IPv6 forwarding status.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show ipv6 forwarding
```

Mode

User Exec and Privileged Exec

Example

```
awplus# show ipv6 forwarding
```

Output

Figure 29-1: Example output from the show ipv6 forwarding command

```
ipv6 forwarding is on
```

show ipv6 interface brief

Use this command to display brief information about interfaces and the IPv6 address assigned to them.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show ipv6 interface [brief]
```

Parameter	Description
`brief`	Specify this optional parameter to display brief IPv6 interface information.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ipv6 interface brief
```

Output **Figure 29-2: Example output from the show ipv6 interface brief command**

```
awplus#show ipv6 interface brief
Interface     IPv6-Address                                  Status      Protocol
lo            unassigned                                    admin up    running
vlan1         2001:db8::1/48                                admin up    down
              fe80::215:77ff:fee9:5c50/64
```

Related Commands **show interface brief**

show ipv6 neighbors

Use this command to display all IPv6 neighbors.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show ipv6 neighbors`

Mode User Exec and Privileged Exec

show ipv6 route

Use this command to display the IPv6 routing table for a protocol or from a particular table.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show ipv6 route
   [connected|database|ospf|rip|static|summary|
   <ipv6-address>|<ipv6-addr/prefix-length>)]
```

Parameter	Description
`connected`	Displays only the routes learned from connected interfaces.
`database`	Displays only the IPv6 routing information extracted from the database.
`ospf`	Displays only the routes learned from IPv6 Open Shortest Path First (OSPFv3).
`rip`	Displays only the routes learned from IPv6 Routing Information Protocol (RIPng).
`static`	Displays only the IPv6 static routes you have configured.
`summary`	Displays summary information from the IPv6 routing table.
`<ipv6-address>`	Displays the routes for the specified address in the IP routing table. The IPv6 address uses the format X:X::X:X/ Prefix-Length. The prefix-length is usually set between 0 and 64.
`<ipv6-prefix/length>`	Displays only the routes for the specified IP prefix. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.

Mode User Exec and Privileged Exec

Example 1 To display an IP route with all parameters turned on, use the following command:

```
awplus# show ipv6 route
```

Output **Figure 29-3: Example output of the show ipv6 route command**

```
IPv6 Routing Table
Codes: C - connected, S - static, R - RIP, O - OSPF, B - BGP
S    ::/0 [1/0] via 2001::a:0:0:c0a8:a6, vlan10
C    2001:db8::a:0:0:0:0/64 via ::, vlan10
C    2001:db8::14:0:0:0:0/64 via ::, vlan20
C    2001:db8::0:0:0:0/64 via ::, vlan30
C    2001:db8::28:0:0:0:0/64 via ::, vlan40
C    2001:db8::fa:0:0:0:0/64 via ::, vlan250
C    2001:db8::/64 via ::, vlan250
C    2001:db8::/64 via ::, vlan40
C    2001:db8::/64 via ::, vlan20
C    2001:db8::/64 via ::, vlan10
```

Example 2 To display all database entries for an IP route, use the following command:

```
awplus# show ipv6 route database
```

Output **Figure 29-4: Example output of the show ipv6 route database command**

```
IPv6 Routing Table
Codes: C - connected, S - static, R - RIP, O - OSPF, B - BGP
       > - selected route, * - FIB route, p - stale info
Timers: Uptime

S    ::/0 [1/0] via 2001::a:0:0:c0a8:a01 inactive, 6d22h12m
          [1/0] via 2001::fa:0:0:c0a8:fa01 inactive, 6d22h12m
```

show ipv6 route summary

Use this command to display the summary of the current NSM RIB entries.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show ipv6 route summary`

Mode User Exec and Privileged Exec

Example To display IP route summary, use the following command:

```
awplus# show ipv6 route summary
```

Output **Figure 29-5: Example output from the show ipv6 route summary command**

```
IPv6 routing table name is Default-IPv6-Routing-Table(0)
IPv6 routing table maximum-paths is 4
RouteSource     Networks
connected       4
ospf            5
Total           9
FIB             5
```

Related Commands **show ip route**
show ip route database

traceroute ipv6

Use this command to trace the route to the specified IPv6 host.

Syntax `traceroute ipv6 {<ipv6-addr>|<hostname>}`

Parameter	Description
<ipv6-addr>	The destination IPv6 address. The IPv6 address uses the format X:X::X:X.
<hostname>	The destination hostname.

Mode User Exec and Privileged Exec

Example To run a traceroute for the IPv6 address 2001:0db8::a2, use the following command:

```
awplus# traceroute ipv6 2001:0db8::a2
```

Related Commands ping ipv6

Chapter 30: IPv6to4 Tunneling Configuration

Introduction 30.2
6to4 Automatic Tunnel Configuration 30.2
Tunneling Operation 30.2
6to4 tunnels operation and configuration summary 30.3
Example 6to4 configuration 30.4

Introduction

This chapter contains a basic IPv6to4 automatic tunneling configuration example for reference.

To see details on the Tunneling commands used in this sample configuration, or to see the outputs of the Validation commands, refer to **Chapter 31, IPv6to4 Tunneling Commands**. Links to the Tunneling commands used in the examples are also provided below the examples.

6to4 Automatic Tunnel Configuration

IPv6 transition is required to migrate from IPv4 to IPv6. One method to connect to the global IPv6 network over the existing IPv4 network is called 6to4 automatic tunneling.

Although this method is called '6to4 tunneling', it does not involve discrete point-to-point tunnels. The 'tunneling' in '6to4 tunneling' refers to the fact that the IPv6 packets are encapsulated in IPv4 packets to be 'tunneled' across the IPv4 domain. Hence, '6to4 tunneling' is primarily a scheme for encapsulating IPv6 packets inside IPv4 headers.

Using 6to4 tunneling, you are not required to specify tunnel destination addresses. You only choose the interface that connects the switch to the IPv4 domain, and designate that interface to be the tunnel entry-point. As will be explained below, the IPv4 address that represents the point at which any given IPv6 packet will eventually exit the IPv4 domain is derived from the IPv6 packet itself. Note that the packet's destination IPv6 address itself contains the destination IPv4 address that is used for tunnel encapsulation.

The 6to4 tunneling implementation in AlliedWare Plus™ is used for routing only between IPv6 addresses that are of the form:

`2002: <valid-IPv4-unicast-address> : XX:XX:XX:XX:XX`

6to4 tunneling makes use of the fact that for every valid IPv4 unicast address `A.B.C.D`, there is always a corresponding valid IPv6 subnet `2002:<A.B.C.D>::/48`. So, for every global IP v4 address that has been allocated to an organization, there is immediately a global IPv6 subnet `2002:<ipv4-address>::/48` available to that organization.

Tunneling Operation

When an IPv4 interface on the switch is designated as a tunnel entry point, using the **tunnel source** command on page 31.5 command, an IPv6 tunnel interface is created. The interface is automatically allocated the IPv6 address: `2002:<ipv4-address>::1/128`.

Note

Other implementations of 6to4 tunneling might have a different scheme for deriving the IPv6 address of the tunnel interface, as there is no standardized scheme. This does not cause any interoperability problems, however, as the IPv6 address of the tunnel interface is not actually involved in the routing process.

This tunnel interface is the gateway used by the IPv6 packets to enter the IPv4 domain. As IPv6 packets enter the IPv4 domain, the switch must encapsulate them by pre-pending IPv6 packets with an IPv4 header. The source address of the encapsulating header is the IPv4 address that has been specified by the tunnel source command. The process for determining the destination IP address is explained in more detail below.

The key to routing across the IPv4 domain is that there is a connection between the IPv4 address of a tunnel endpoint and the IPv6 subnets which can be reached via that endpoint. The connection is that the tunnel interface with IP address `<ipv4-address>` is considered to be the gateway to **all** IPv6 subnets within the range `2002:<ipv4-address>::/48`.

When a switch is required to deliver packets, via a tunnel interface, to IPv6 addresses in the range `2002:<ipv4-address>::/48`, the switch knows that the IPv4 address to which the switch must deliver that packet is given by the 17th through 48th bits of the IPv6 destination address. So, the encapsulation process extracts those bits from the IPv6 destination address, and uses them as the IPv4 destination address in the encapsulating header.

For example, if `192.0.2.1` is the IPv4 address of a tunnel endpoint, then the IPv6 subnets in the range `2002:c000:201::/48` are automatically known to be reachable via that tunnel endpoint. If another tunnel endpoint has an IPv6 packet to deliver to `2002:c000:201:6::04:8d`, via the tunnel, then that switch will encapsulate the packet in an IPv4 header with a destination address of `192.0.2.1`

The corollary to this is the requirement that, to be reachable from other 6to4 networks, the IPv6 VLAN interfaces on the IPv6 side a tunneling switch will need to be configured with IPv6 addresses that are subnetted from the `2002:<ipv4-address>::/48` address.

For example, `2002:<ipv4-address>:1::/64`, `2002:<ipv4-address>:2::/64`, `2002:<ipv4-address>:3::/64`, etc.

Note `2002:<ipv4-address>::/64` cannot be used here, because it conflicts with the automatically configured tunnel address.

6to4 tunnels operation and configuration summary

1. When an IPv4 address is designated as the source address of a tunnel, that tunnel interface is automatically given the IPv6 address `2002:<ipv4-address>::1/128`

2. The switch does not automatically create any IPv6 routes via that tunnel interface, so you do need to explicitly create a route to direct traffic over the tunnel interface. Typically, you will create a route to `2002::/16` via the tunnel interface. There might be occasions, though, when you want to just create some more restricted routes, within the `2002::/16` range, over the tunnel interface.

3. Once routes have been created that direct traffic over the tunnel interface, it is not necessary to specify nexthop addresses for the individual remote IPv6 subnets that are reachable via the tunnel. The switch will automatically know the IPv4 nexthop via which to reach any IPv6 subnet in the range `2002:<ipv4-address>::/48`.

4. The only IPv6 addresses that can be routed to via the 6to4 tunnels on switches running AlliedWare Plus™ are IPv6 addresses of the form:

   `2002:<valid-IPv4-unicast-address>:xx:xx:xx:xx:xx`

Example 6to4 configuration

The following example shows the minimum configuration required for 6to4 automatic tunnel configuration. Follow the commands and descriptions in the tables below the sample network:

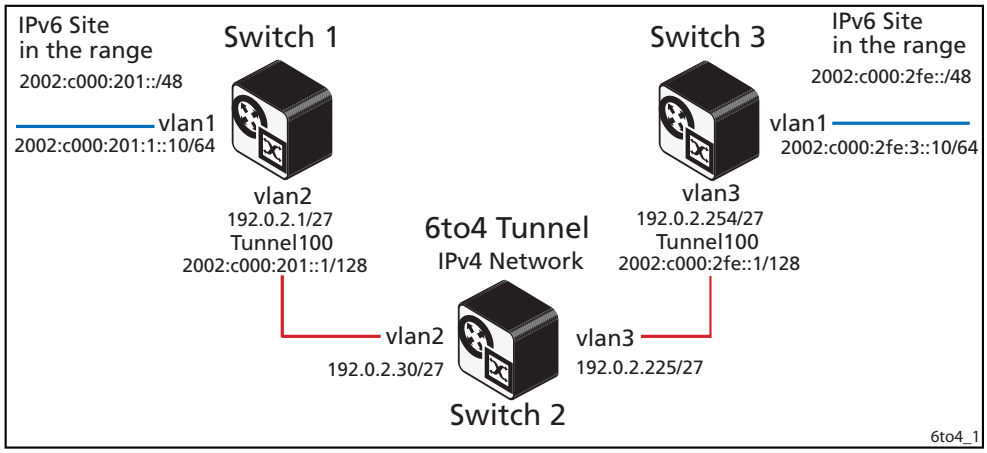

Table 30-1: Example configuration for 6to4 automatic tunneling: Switch 1

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`interface vlan2`	Specify the interface (`vlan2`) and enter the Interface Configuration mode.
`awplusa(config-if)#`	
`ip address 192.0.2.1/27`	Set the IPv4 address for the interface (`vlan2`).
`awplus(config-if)#`	
`exit`	Exit Interface Configuration mode and enter Global Configuration mode.
`awplus(config)#`	
`interface vlan1`	Specify the interface (`vlan1`) and enter the Interface Configuration mode.
`awplus(config-if)#`	
`ipv6 address 2002:c000:201:1::10/64`	Set the IPv6 address for the interface (`vlan1`).
`awplus(config-if)#`	
`exit`	Exit Interface Configuration mode and enter Global Configuration mode.
`awplus(config)#`	
`ipv6 forwarding`	Enable IPv6 routing.

Table 30-1: Example configuration for 6to4 automatic tunneling: Switch 1 (cont.)

`awplus(config)#` `interface tunnel 100`	Create a tunnel interface.
`awplus(config-if)#` `tunnel mode ipv6ip 6to4`	Set the tunnel mode.
`awplus(config-if)#` `tunnel source 192.0.2.1`	Define the IPv4 address to be used as the source address for the tunnel interface.
`awplus(config-if)#` `exit`	Exit Interface Configuration mode and enter Global Configuration mode.
`awplus(config)#` `ipv6 route 2002::/16 tunnel100`	Add a route to send traffic for other 6to4 subnets via the tunnel interface.

Table 30-2: Example configuration for 6to4 automatic tunneling: Switch 2

`awplus#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config)#` `interface vlan2`	Specify the interface (`vlan2`) and enter the Interface Configuration mode.
`awplus(config-if)#` `ip address 192.0.2.30/27`	Set the IPv4 address of the interface (`vlan2`).
`awplus(config-if)#` `exit`	Exit Interface mode and enter the Global Configuration mode.
`awplus(config)#` `interface vlan3`	Specify the interface (`vlan3`) and enter the Interface Configuration mode.
`awplus(config-if)#` `ip address 192.0.2.225/27`	Set the IPv4 address of the interface (`vlan3`).
`awplus(config-if)#` `exit`	Exit the Interface Configuration mode and enter the Global Configuration mode.

Table 30-3: Example configuration for 6to4 automatic tunneling: Switch 3

`awplus(config)#` `interface vlan3`	Specify interface (`vlan3`) and enter the Interface Configuration mode.
`awplus(config-if)#` `ip address 192.0.2.254/27`	Set the IPv4 address for the interface (`vlan3`).
`awplus(config-if)#` `exit`	Exit the Interface Configuration mode and enter the Global Configuration mode.
`awplus(config)#` `interface vlan1`	Specify the interface (`vlan1`) and enter the Interface Configuration mode.
`awplus(config-if)#` `ipv6 address 2002:c000:2fe:3::10/64`	Set the IPv6 address for the interface (`vlan1`).
`awplus(config-if)#` `exit`	Exit Interface mode and enter Global Configuration mode.
`awplus(config)#` `ipv6 forwarding`	Enable IPv6 routing.
`awplus(config)#` `interface tunnel 100`	Create a tunnel interface.
`awplus(config-if)#` `tunnel mode ipv6ip 6to4`	Set the tunnel mode.
`awplus(config-if)#` `tunnel source 192.0.2.254`	Define the IPv4 address to be used as the source address for the tunnel interface.

Table 30-3: Example configuration for 6to4 automatic tunneling: Switch 3 (cont.)

`awplus(config-if)#` `exit`	Exit Interface Configuration mode and enter Global Configuration mode.
`awplus(config)#` `ipv6 route 2002::/16 tunnel100`	Add a route to send traffic for other 6to4 subnets via the tunnel interface.
`awplus(config)#` `router ospf`	Create an OSPF routing instance.
`awplus(config-router)#` `router-id 10.70.0.76`	Specify a Router ID for the OSPF routing process.
`awplus(config-router)#` `network 192.0.2.224/27 area 0`	Enable OSPF routing with a specified Area ID on interfaces with IP addresses within the specified network address. The Area ID used in this case is 0, which specifies the backbone area.

Note

The IPv6 address which is automatically assigned to the tunnel interface in this example for **Switch 1** is **2002:<IPv4 address in hex>::1/128**, where <**IPv4 address in hex**> represents the IPv4 address of the tunnel source, converted to hexadecimal.

So, the tunnel interface is the gateway from the IPv4 network to the IPv6 subnet
2002:<IPv4 address in hex>::/48

Hence, the IPv6 address configured on **vlan1** must be in the subnet **2002:<IPv4 address in hex>::/48**. However, if the address on **vlan1** is given a /**64** prefix-length it must differ from the tunnel address somewhere in the 49-64th bits.

For example, in this scenario: **vlan2** IP address (which the tunnel will go over): **192.0.2.1 = c0000201 hex (shown as c000:201without leading zeros in the example).** Tunnel 100 IPv6 address will automatically use **2002:c000:0201:0000::1/128** as its IPv6 address.

So, configure the following address on **vlan1: 2002:c000:0201:<xxxx>::x/6** where <**xxxx**> is anything other than **0000** e.g. **2002:c000:0201:1::10/64**

Names of Commands Used

interface tunnel
ip address
ipv6 address
tunnel mode ipv6ip
tunnel source

Chapter 31: IPv6to4 Tunneling Commands

Command List 31.2
interface tunnel 31.2
tunnel dscp (6to4) 31.3
tunnel mode ipv6ip 31.4
tunnel source 31.5
tunnel ttl 31.6

Command List

This chapter provides an alphabetical reference of commands used to configure automatic IPv6 tunneling over IPv4. For more information, see **Chapter 30, IPv6to4 Tunneling Configuration**.

interface tunnel

Use this command to create a new tunnel interface, which is identified by an integer (1-145).

This command is also used to enter interface configuration mode for existing tunnel interfaces.

Use the **no** variant of this command to destroy a previously created tunnel interface.

Note

This command will function on your switch in the stand-alone mode. but is not supported when the switch forms part of a VCStack.

Syntax

```
interface tunnel <1-145>
no interface tunnel <1-145>
```

Default Disabled

Mode Global Configuration

Usage This command creates a new tunnel interface to configure in Interface mode.

Examples

```
awplus# configure terminal
awplus(config)# interface tunnel 100
awplus(config-if)#

awplus# configure terminal
awplus(config)# no interface tunnel 100
awplus(config)#
```

Related Commands **tunnel dscp (6to4)**
tunnel source

tunnel dscp (6to4)

Use this command to configure the value (0-63) to use for the IPv4 DSCP (Differentiated Services Code Point) field in the IPv4 header that encapsulates the tunneled IPv6 packets. By default the IPv4 DSCP field value is 0.

Use the **no** variant of this command to reset the IPv4 DSCP field to the default (0).

Note This command will function on your switch in the stand-alone mode. but is not supported when the switch forms part of a VCStack.

Syntax

```
tunnel dscp <0-63>
no tunnel dscp
```

Default The default IPv4 DSCP field value is 0.

Mode Interface Configuration for 6to4 tunnel interfaces.

Usage This command controls the IPv4 DSCP field in the IPv4 headers that are prepended (or prefixed) to the tunneled IPv6 packets.

Examples

```
awplus# configure terminal
awplus(config)# interface tunnel 100
awplus(config-if)# tunnel source 192.0.2.1
awplus(config-if)# tunnel dscp 10

awplus# configure terminal
awplus(config)# interface tunnel 100
awplus(config-if)# tunnel source 192.0.2.1
awplus(config-if)# no tunnel dscp
```

Related Commands interface tunnel
tunnel mode ipv6ip
tunnel source

tunnel mode ipv6ip

Use this command to specify the IPv6 transition tunnel mode. In AlliedWare Plus™ 6to4 automatic tunneling is the only tunnel mode supported.

Use the **no** variant of this command to return the mode of the IPv6 transition tunnel to an undefined state.

Note

This command will function on your switch in the stand-alone mode. but is not supported when the switch forms part of a VCStack.

Syntax

```
tunnel mode ipv6ip 6to4

no tunnel mode
```

Parameter	Description
`6to4`	`6to4` automatic tunnel mode.

Mode Interface Configuration for 6to4 tunnel interfaces.

Usage This command specifies a tunnel encapsulation mode for IPv6 in IPv4. Currently only 6to4 automatic tunneling is supported. Future releases may support alternative tunneling modes.

It is a requirement that the mode is set on a tunnel. The tunnel will not be operational until the tunnel mode has been set using the **tunnel mode ipv6ip 6to4** command.

Example

```
awplus# configure terminal
awplus(config)# interface tunnel 100
awplus(config-if)# tunnel source 192.0.2.1
awplus(config-if)# tunnel mode ipv6ip

awplus# configure terminal
awplus(config)# interface tunnel 100
awplus(config-if)# tunnel source 192.0.2.1
awplus(config-if)# no tunnel mode
```

Related Commands

interface tunnel
tunnel dscp (6to4)
tunnel source

tunnel source

Use this command to specify the IPv4 source address for packets being encapsulated in the tunnel. It should be the IPv4 address on the interface that attaches the switch for the IPv4 domain through which the IPv6 packets are to be tunneled.

Use the **no** variant of this command to remove a tunnel source address for a tunnel interface.

Note
This command will function on your switch in the stand-alone mode. but is not supported when the switch forms part of a VCStack.

Syntax

```
tunnel source <ipv4-addr>
no tunnel source
```

Parameter	Description
<ipv4-addr>	IPv4 tunnel source address.

Mode Interface Configuration for 6to4 tunnel interfaces.

Usage This command specifies an IPv4 source address for the tunnel.

Note
There are constraints on the IPv4 source address specified for the tunnel. The IPv4 source address for the tunnel must be the IPv4 address of an interface on the switch, and it must be the interface for carrying the tunnel traffic.

Example

```
awplus# configure terminal
awplus(config)# interface tunnel 100
awplus(config-if)# tunnel source 192.0.2.1

awplus# configure terminal
awplus(config)# interface tunnel 100
awplus(config-if)# no tunnel source
```

Related Commands interface tunnel
tunnel dscp (6to4)

tunnel ttl

Use this command to configure the value to use for the Time to Live (TTL) field in the IPv4 header that encapsulates the tunneled IPv6 packets.

Use the **no** variant of this command to inherit the TTL value from the encapsulated packet.

Note This command will function on your switch in the stand-alone mode. but is not supported when the switch forms part of a VCStack.

Syntax

```
tunnel ttl <1-255>
no tunnel ttl
```

Default By default the TTL value is inherited from the encapsulated packet.

Mode Interface Configuration for 6to4 tunnel interfaces.

Usage This command specifies a value of Time to Live (TTL) in the tunnel IPv4 encapsulation header.

Example

```
awplus# configure terminal
awplus(config)# interface tunnel 100
awplus(config-if)# tunnel source 192.0.2.1
awplus(config-if)# tunnel ttl 255

awplus# configure terminal
awplus(config)# interface tunnel 100
awplus(config-if)# tunnel source 192.0.2.1
awplus(config-if)# no tunnel ttl
```

Related Commands interface tunnel
tunnel dscp (6to4)

Chapter 32: Routing Protocol Overview

Introduction 32.2
RIP 32.2
OSPF 32.2
BGP 32.3
PIM-SM 32.4
VRRP 32.4

Introduction

This chapter introduces the basic routing protocols supported within the AlliedWare Plus™ Operating System.

RIP

A distance-vector protocol, Routing Information Protocol (RIP) is an Interior Gateway Protocol (IGP) that uses hop counts as its metrics. The AlliedWare Plus™ RIP module supports RFCs 1058 and 1723; the RIPv2 module supports more fields in the RIP packets, and supports security authentication features.

At regular intervals of the routing update timer (which has a default value of 30 seconds), and at the time of change in the topology, the RIP router sends update messages to other routers. The listening routers update their route table with the new route, and increase the metric value of the path by one (referred to as a hop count). The router recognizes the IP address advertising router as the next hop, then sends the routing updates to other routers. A maximum allowable hop count is 15. If a router reaches a metric value of 16 or more (referred to as infinity), the destination is identified as unreachable. This avoids the indefinite routing loops. The split-horizon and hold-down features are used to avoid propagation incorrect routing information. The route becomes not valid when the route time-out timer expires; it remains in the table until the route-flush timer expires.

OSPF

A link-state routing protocol, Open Shortest Path First (OSPF) is an interior gateway protocol (IGP) that uses the Shortest Path First (SPF) Dijsktra algorithm.

OSPF sends link-state advertisements (LSAs) to all other routers within the same hierarchical area. Data on attached interfaces, metrics used, and other variables, are included in OSPF LSAs. As OSPF routers accumulate link-state data, they use the SPF algorithm to calculate the shortest path to each node.

An Autonomous System (AS) or Domain is defined as a group of networks with common routing infrastructure. OSPF can work in one AS; or receive or send routes from or to different AS systems. Autonomous systems consist of areas. An area is a group of neighboring networks or attached hosts. A router attached to multiple areas with its interfaces is called an Area Border Router (ABR). It creates a distinct topological database: a group of LSAs received from all routers in the same area, for each area. All the routers in the same area have an identical topological database. OSPF routing traffic is restricted in the area because areas are unknown to each other. The routing information is distributed between areas, area border routers, networks, and connected routers by the OSPF backbone.

All backbone OSPF area routers use the same procedures and algorithms to maintain routing information within the backbone that any area router would. The backbone topology is invisible to all routers within an area. The individual area topologies are invisible to the backbone. Sometimes the backbone is not a contiguous area. Virtual links function as if they were direct links, and are configured between backbone routers that share a link to a non-backbone area.

AS border routers running OSPF learn about exterior routes through exterior gateway protocols (EGPs) such as the Border Gateway Protocol (BGP).

During boot-up, an OSPF router initializes its routing-protocol-specific data structures and tables. When the lower layer protocols with which it interfaces are functional, it sends the OSPF Hello protocol packets to find neighboring routers. A router sends Hello packets as keep-alive packets, informing other routers about its continuing functionality. Two routers are adjacent when their link state databases are synchronized.

Multi-access networks have more than two routers. On multi-access networks, the hello protocol chooses a designated router and a designated backup-router. The designated router generates LSAs for the entire multi-access network, and reduces network traffic and the size of the topological database. The designated router also determines the adjacency of routers and the synchronization of their topological databases. The data on a router's adjacencies or state changes are provided by periodic transmission of an LSA. Failed routers are detected, and topology is changed quickly by comparison of adjacencies to link states. Each router calculates a shortest path tree, with itself as a root, from the topological database generated from these LSAs. This shortest path tree creates a routing table.

BGP

Border Gateway Protocol (BGP) is an exterior gateway protocol (EGP) that determines the best path in networks, performs optimal routing between multiple autonomous systems or domains, and exchanges routing information with other BGP systems. The RFCs 1771 (BGP4), 1654 (first BGP4 specification), and 1105, 1163, 1267 (older version of BGP) describe BGP and BGP4.

Multiple-peer BGP routers in different autonomous systems, or administrative domains on the same physical network, support consistent internetwork topology using inter-autonomous system routing. Multiple-peer BGP routers within the same AS support consistent system topology using inter-autonomous system routing. BGP determines the router to serve as the connection point for specific external autonomous system routing services. Multiple-peer BGP routers transport traffic across an autonomous system that does not run BGP using pass-through autonomous-systems routing. In this case, if the traffic does not originate, or is destined for an autonomous system under consideration, the AS is used only to transport (pass-through) the traffic using another intra-autonomous system routing protocol.

BGP exchanges information about the list of autonomous system paths with other BGP systems. A connectivity mapping between autonomous systems is created, routing loops are pruned, and other autonomous systems-level policy decisions are taken. Each BGP router maintains a routing table of all feasible and optimal paths to other networks and incrementally updates the routing information received from other peer BGP routers.

The BGP routing metric describes the preference of the path, and is assigned to each link by the network administrator. The network administrator assigns this value to a link depending on path criteria such as:

- the number of autonomous systems through which the path passes
- the history of stability
- the line speed
- any delays
- cost per packet

PIM-SM

The AlliedWare Plus™ Protocol Independent Multicast–Sparse Mode (PIM-SM) module is a multicast routing protocol module that uses the underlying unicast Routing Information Base (RIB) to determine the best next-hop neighbor to reach the root of the multicast data distribution tree, the Rendezvous Point (RP), or the source. It builds unidirectional-shared trees per group, and optionally creates shortest-path trees per source.

VRRP

Mission-critical applications running on fault-tolerant networking equipment, such as routers and switches, require redundancy and high availability. This section provides an architectural overview of Virtual Router Redundancy Protocol (VRRP) implementation in the AlliedWare Plus™ OS.

Typically, end hosts are connected to the enterprise network through a single router (first-hop router) that is in the same Local Area Network (LAN) segment. The most popular method of configuration is for the end hosts to statically configure this router as their default gateway. This minimizes configuration and processing overhead. The main problem with this configuration method is that it produces a single point of failure if the enterprise network's first-hop router fails.

VRRP attempts to solve this problem by introducing the concept of a virtual router, composed of two or more VRRP routers on the same subnet. The concept of a virtual IP address is also introduced, which is the address that end hosts configure as their default gateway. Only one of the routers (called the Master) forwards packets on behalf of this IP address. In the event that the Master fails, one of the other routers (Backups) assumes forwarding responsibility for it.

Introduction

This chapter describes the route selection process used by the AlliedWare Plus™ Operating System. Understanding the route selection process helps in analyzing and troubleshooting route-related problems.

The process of routing packets consists of selectively forwarding data packets from one network to another. Your device must determine which network to send each packet to, and over which interface to send the packet in order to reach the desired network. This information is contained in your device routes. For each packet, your device chooses the best route it has for that packet and uses that route to forward the packet. In addition, you can define filters to restrict the way packets are sent.

Types of Routes

Your device learns routes from static information entered as part of the configuration process and by listening to any configured routing protocols. The following types of routes are available on your device:

Interface Routes

Your device creates an interface route when you create the interface. This route tells your device to send packets over that interface when the packets are addressed to the interface's subnet.

Static Routes

You can manually enter routes, which are then called static routes. You can use static routes to:

- specify the default route (to 0.0.0.0). If your device does not have a route to the packet's destination, it sends it out the default route. The default route normally points to an external network such as the Internet.
- set up multiple networks or subnets. In this case you define multiple routes for a particular interface, usually a LAN port. This is a method of supporting multiple subnets on a single physical media.

To create a static route, use the command:

```
awplus(config)# ip route <subnet&mask> {<gateway-ip>|
                <interface>} [<distance>]
```

or

```
awplus(config)# ip route [vrf <vrf-name>] <subnet&mask>
                [<gateway-ip>] [<interface>] [<distance>]
```

Dynamic Routes

Your device learns dynamic routes from one or more routing protocols such as RIP, BGP, or OSPF. The routing protocol updates these routes as the network topology changes.

In all but the most simple networks, we recommend that you configure at least one dynamic routing protocol. Routing protocols enables your device to learn routes from other routers and switches on the network, and to respond automatically to changes in network topology.

Routing protocols use different metrics to calculate the best path for a destination. However, when two paths have an equal cost/metric and Equal Cost Multipath (ECMP) is enabled on a system, AlliedWare Plus™ may receive two paths from the same protocol.

- Routing Information Protocol (RIP)

  Routing Information Protocol (RIP) is a simple distance vector IPv4 routing protocol. It determines the number of hops between the destination and your device, where one hop is one link. Given a choice of routes, RIP uses the route that takes the lowest number of hops. If multiple routes have the same hop count, RIP chooses the first route it finds.

  See **Chapter 35, RIP Configuration** for further information about RIP Configuration.

- Routing Information Protocol next generation (RIPng)

  Routing Information Protocol next generation (RIPng) is a simple distance vector IPv6 routing protocol. It determines the number of hops between the destination and your device, where one hop is one link. Given a choice of routes, RIPng uses the route that takes the lowest number of hops. If multiple routes have the same hop count, RIPng chooses the first route it finds.

  RIPng (Routing Information Protocol next generation) is an extension of RIPv2 to support IPv6. RFC 2080 specifies RIPng. The differences between RIPv2 and RIPng are:

  « RIPng does not support RIP updates authentication

  « RIPng does not allow the attachment of arbitrary tags to routes

  « RIPng requires the encoding of the next-hop for a set of routes

  See **Chapter 37, RIPng for IPv6 Configuration** for further information about RIPng Configuration.

- Open Shortest Path First (OSPF)

  The Open Shortest Path First (OSPF) protocol is documented in RFC 1247. It has a number of significant benefits over RIP, including:

  « OSPF supports the concept of areas to allow networks to be administratively partitioned as they grow in size.

  « Load balancing, in which multiple routes exist to a destination, is also supported. OSPF distributes traffic over these links.

  See **Chapter 39, OSPF Introduction and Configuration** for further information about OSPF Configuration.

- Border Gateway Protocol (BGP)

  The Border Gateway Protocol (BGP) allows routers in different routing domains to exchange routing information. This facilitates the forwarding of data across the borders of the routing domains. BGP-4 is based on distance vector (DV) protocol algorithms.

  See **Chapter 44, BGP and BGP4+ Configuration** for further information about BGP Configuration.

RIB and FIB Routing Tables

Your device maintains its routing information in routing tables that tell your device how to find a remote network or host. Each route is uniquely identified in a table by its IP address, network mask, next hop, interface, protocol, and policy. There are two routing tables populated by your device: the **Routing Information Base** (RIB) and the **Forwarding Information Base** (FIB).

Note Routes in the FIB are used locally but are not advertised to neighbors if they are not also in the RIB.

Routing Information Base

The RIB records **all** the routes that your device has learnt. Your device uses the RIB to advertise routes to its neighbor devices and to populate the FIB. It adds routes to this table when:

- you add a static route using the **ip route** command
- one or more routing protocols, such as RIP or OSPF, exchange routing information with other routers or hosts
- your device receives route information from a connected interface
- your device gathers route information from an ICMP redirect message or DHCP message

Understanding the Routing Information Base (RIB)

Use the **show ipv6 route database** command to view the IPv6 RIB.

Use the **show ip route database** command to view the IPv4 RIB.

The RIB in AlliedWare Plus displays all the routes sent to the RIB by the routing protocols, plus all the static and connected routes.

The angle bracket > character in show output indicates which route has been selected as the best route. The best routes are installed in the Forwarding Information Base (FIB).

Routes which have been installed in the software FIB are marked with a star * symbol in show output.

The Administrative Distance and the Metric are seen in the square brackets with **AD** on the left of the backslash and **Metric** to the right of **AD**, so this is shown as: **[AD / Metric]**

See the below list of other information displayed in the RIB:

- Route type
- Prefix and Prefix Length
- Administrative Distance
- Metric
- Next-Hop
- Exit interface
- Uptime

Example RIB Output

See the sample output below for example RIB output, and note that all routes (including the non-best routes) are displayed in the RIB, but note only the best routes are selected:

Figure 33-1: Example RIB output after entering the show ipv6 route database command

```
awplus#show ipv6 route database
IPv6 Routing Table
Codes: C - connected, S - static, R - RIP, O - OSPF, B - BGP, D - DHCP
IA - OSPF inter area E1 - OSPF ext. type 1, E2 - OSPF ext. type 2
> - selected route, * - FIB route, p - stale info
Timers: Uptime
R *> 2001:db8:10::/64 [120/2] via fe80::eecd:6dff:fe20:c26b, vlan20, 20:42:47
R 2001:db8:20::/64 [0/1] via ::, vlan20, 21:18:42
C *> 2001:db8:20::/64 via ::, vlan20, 21:18:42

C *> 2001:db8:40::/64 via ::, vlan40, 21:18:22
O *> 2001:db8:50::/64 [110/2] via fe80::eecd:6dff:fe20:c073, vlan40, 21:17:29
O *> 2001:db8:60::/64 [110/2] via fe80::eecd:6dff:fe20:c073, vlan40, 20:31:06
```

Forwarding Information Base

The RIB populates the **Forwarding Information Base** (FIB) with the best route to each destination. When your device receives an IP packet, and no filters are active that would exclude the packet, it uses the FIB to find the most specific route to the destination. If your device does not find a direct route to the destination, and no default route exists, it discards the packet and sends an ICMP message to that effect back to the source.

A route is only deleted in the FIB if the corresponding prefix is removed from the RIB.

Changes to the software FIB are propagated to the hardware FIB, so the software and hardware FIB tables mirror each other.

The number of FIB table entries also mirror the best selected routes in the RIB.

Example FIB Output

See the sample output below for example FIB output, and note that only the best selected routes from the RIB are installed in the FIB:

Figure 33-2: Example FIB output after entering the show ipv6 route command

```
awplus#show ipv6 route
IPv6 Routing Table
Codes: C - connected, S - static, R - RIP, O - OSPF, B - BGP, D - DHCP
IA - OSPF inter area E1 - OSPF ext. type 1, E2 - OSPF ext. type 2
Timers: Uptime
R 2001:db8:10::/64 [120/2] via fe80::eecd:6dff:fe20:c26b, vlan20, 21:28:22
C 2001:db8:20::/64 via ::, vlan20, 22:04:17
C 2001:db8:40::/64 via ::, vlan40, 22:03:57
O 2001:db8:50::/64 [110/2] via fe80::eecd:6dff:fe20:c073, vlan40, 22:03:04
O 2001:db8:60::/64 [110/2] via fe80::eecd:6dff:fe20:c073, vlan40, 21:16:41
```

Viewing table entries

To view the routes in the RIB, use the commands:

```
awplus# show ip route {vrf <vrf-name>|global} [bgp|connected|
        ospf|rip|static]
```

To view the routes in the FIB, use the command:

```
awplus# show ip route [bgp|connected|ospf|rip|static|<ip-
        addr>|<ip-addr/prefix-length>]
```

Administrative Distance

When multiple routes are available for the same prefix, the AlliedWare Plus™ Operating System adds the routes with the lowest **administrative distance** to the FIB. The administrative distance is a rank given to a route based on the protocol that the route was received from. The lower the administrative distance, the higher the route preference. For example, if the RIB has these routes

Route	Prefix	Protocol	Distance
1	192.168.1.0/24	Static	1
2	192.168.2.0/24	eBGP	20
3	192.168.2.0/24	OSPF	110
4	192.168.3.0/24	OSPF	110

then the AlliedWare Plus™ Operating System adds routes 1, 2, and 4 to the FIB. It does not add route 3, as this has a higher administrative distance than a route with the same prefix.

Note Administrative distance indicates a level of trustworthiness of a route where the lower the administrative distance the higher the integrity of a route.

The following table lists the default administrative distances for routing protocols.

Protocols	Distance	Preference
Connected Routes directly connected to an interface.	-	1 (highest)
Static Routes added using the **ip route** command or learnt through DHCP options on interfaces using DHCP to obtain an IP address.	1	2
eBGP Routes learnt from BGP that are external to your network.	20	3
OSPF Routes learnt from OSPF.	110	4
RIP Routes learnt from RIP.	120	5
iBGP Routes learnt from BGP that are internal to your network.	200	6 (lowest)
Unknown No traffic will be passed to neighbors via this route.	255	(route is not advertised to neighbors)

For static routes, specify the distance when adding the route, use the command:

```
awplus(config)# ip route [vrf <vrf-name>] <subnet&mask>
                [<gateway-ip>] [<interface>] [<distance>]
```

For eBGP and iBGP routes, enter the Router Configuration mode and use the command to enter a separate administrative distance value for each BGP route type.:

```
awplus(config-router)# distance bgp <ebgp> <ibgp> <local>
```

To set the administrative distance for a specific BGP route, use the command:

```
awplus(config-router)# distance <1-255> <ip-address/m>
                       [<listname>]
```

To enter a separate administrative distance value for each OSPF route type, enter the Router Configuration mode and use the command:

```
awplus(config-router)# distance ospf {external <1-255>|
                       inter-area <1-255>|intra-area <1-255>}
```

To set the same value for all OSPF route types, use the command:

```
awplus(config-router)# distance <1-255>
```

For RIP routes, enter the Router Configuration mode, and use the command:

```
awplus(config-router)# distance <1-255> [<ip-addr/prefix-
                       length> [<access-list>]]
```

This sets the administrative distance for all RIP routes.

You cannot set an administrative distance for connected routes.

Note

AlliedWare Plus™ does not populate routes with an administrative distance of 255 in the FIB (Forwarding Information Base). But AlliedWare Plus™ does populate routes with an administrative distance of 255 in the RIB (Routing Information Base).
See the below examples showing the behavior of a static route with an administrative distance of 255, which is only added to the RIB, as seen from the below show output.

Output **Figure 33-3: Static route with an administrative distance of 255 that is added to the RIB**

```
awplus(config)#ip route 100.0.0.0/24 192.168.1.100 255
awplus(config)#end
awplus#show ip route database

Codes: C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       > - selected route, * - FIB route, p - stale info

S       100.0.0.0/24 [255/0] via 192.168.1.100, vlan1
C    *> 192.168.1.0/24 is directly connected, vlan1
```

Output **Figure 33-4: Static route with an administrative distance of 255 that is not added to the FIB**

```
awplus(config)#ip route 100.0.0.0/24 192.168.1.100 255
awplus(config)#end
awplus#show ip route

Codes: C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       * - candidate default

C       192.168.1.0/24 is directly connected, vlan1
```

Metric

The Metric is used to find the best route from one routing source. In the routing table it is used as the next tie breaker if the Administrative Distance (AD) is equal for the routes in it.

Metrics Used by AlliedWare Plus Routing Protocols

The following metrics are used by AlliedWare IPv4 and IPv6 routing protocols:

IPv4 and IPv6 Routing Protocol	Metric
RIP for IPv4 / RIPng for IPv6	Hop-Count
OSPFv2 for IPv4 / OSPFv3 for IPv6	Cost
BGP for IPv4 / BGP4+ for IPv6	MULTI_EXIT-DISC / IGMP metric to Next-Hop

Equal Cost Multipath Routing

When multiple routes are available for the same prefix within the FIB, then your device uses Equal Cost Multipath Routing (ECMP) to determine how to forward packets.

ECMP allows the AlliedWare Plus™ Operating System to distribute traffic over multiple equal-cost routes to a destination. The software determines that two or more routes are equal cost if they have the same destination IP address and mask. When the software learns such multiple routes, it puts them in an ECMP route group. When it sends traffic to that destination, it distributes the traffic across all routes in the group.

The AlliedWare Plus™ Operating System distributes traffic over the routes one flow at a time, so all packets in a session take the same route. Each equal-cost route group can contain up to eight individual routes. ECMP is only used to select between routes already in the FIB.

By default, each equal-cost route group can contain four routes. You can change this setting by using the command:

```
awplus(config)# maximum-paths <1-8>
```

The maximum path setting determines how many routes with the same prefix value and the same administrative distance that the FIB can contain. Once an equal-cost route group has the maximum number of routes, then the RIB cannot add any further routes to the route group. The device only adds to the group if a route is deleted from the FIB.

To disable ECMP, set the maximum paths value to one.

How AlliedWare Plus Deletes Routes

When the AlliedWare Plus™ Operating System receives a route delete request from a routing protocol, it first deletes the specified route from its RIB. Then it checks if the specified route is in the FIB.

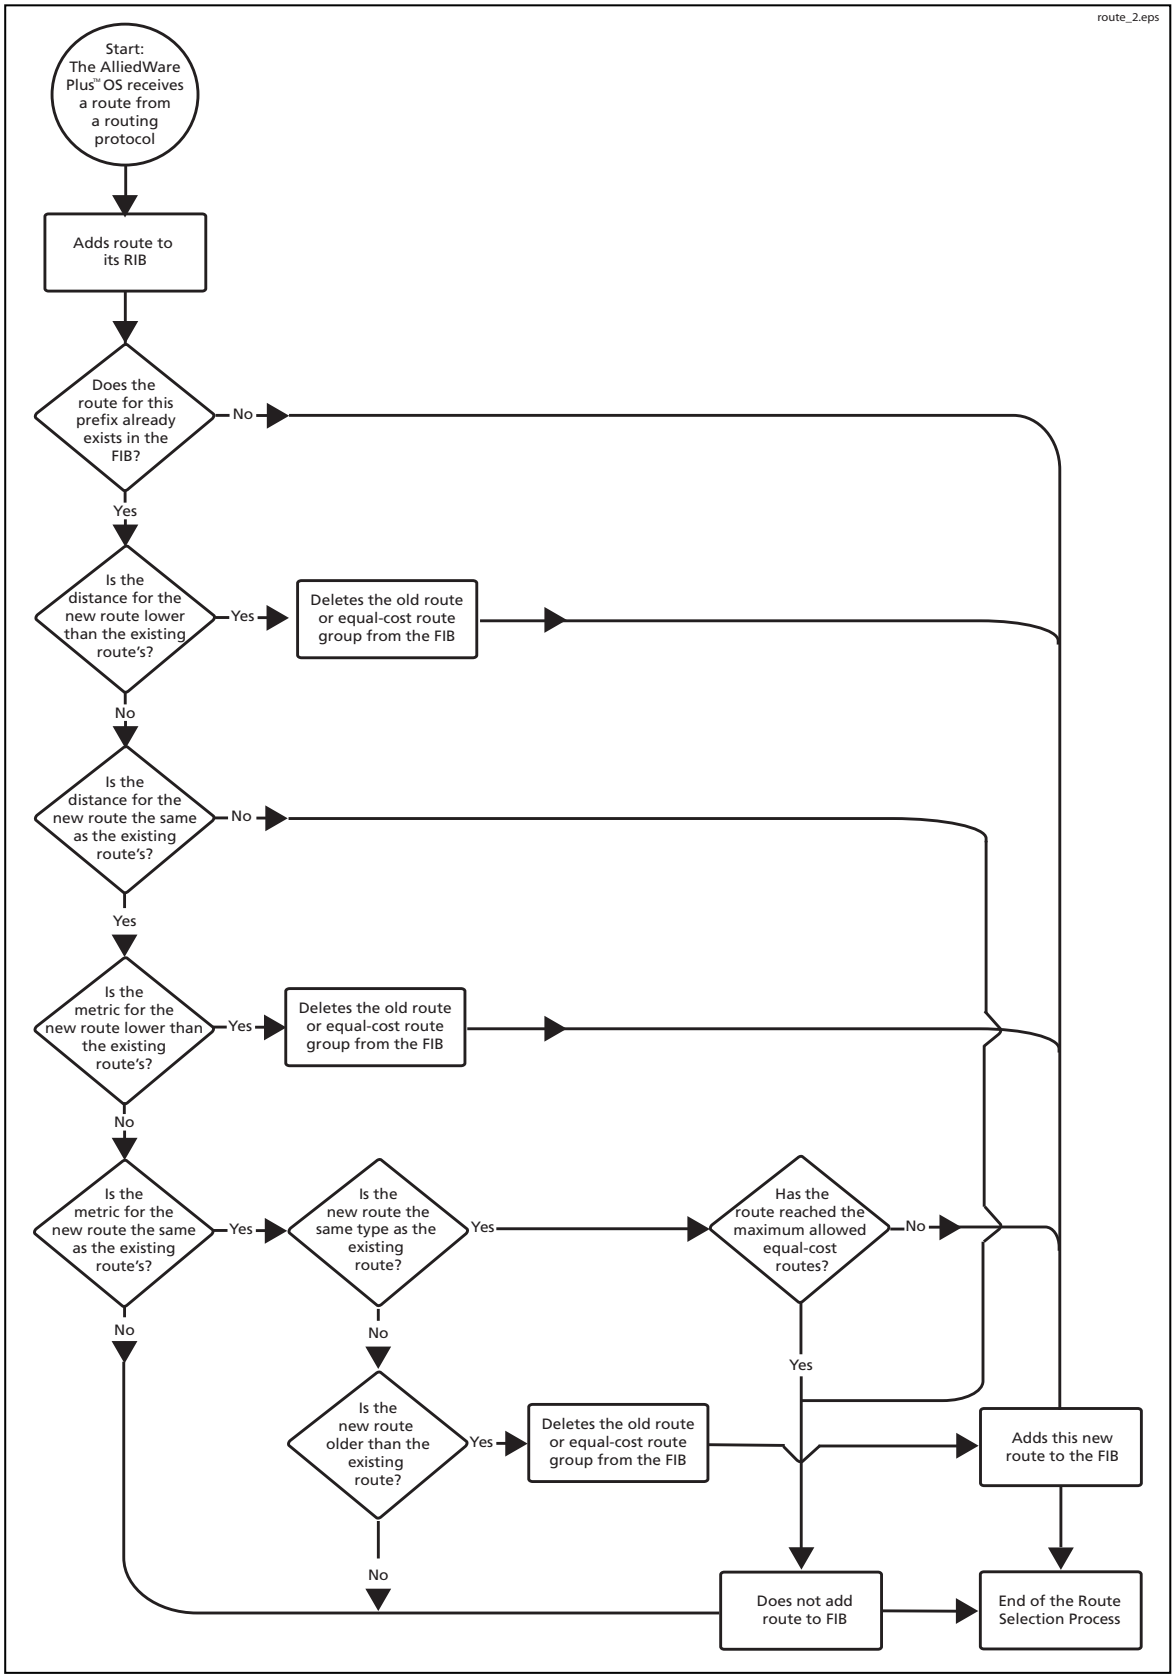
If the route is in the FIB, it deletes it from the FIB and checks if another route is available in its database for the same prefix.

If there is another route in the database, the software installs this route in the FIB. When multiple such routes exist, the software uses the route selection mechanism to choose the best route before adding it to the FIB.

How AlliedWare Plus Adds Routes

The following flow chart shows how the software adds a route to the FIB.

Figure 33-5: How AlliedWare Plus™ adds a route to the FIB



Troubleshooting routes not installed to the RIB

Possible reasons why a route is not installed in the RIB are:

- The layer 3 interface is not in the Up state.
- Route oscillation (route flap) is occurring with the route being added and removed frequently.
- The routing process from which the route is learned, has deleted the route.
- A routing protocol has learned the maximum number of routes allowed by the license, so the routes are not installed to the RIB.

See the **max-static-routes** command in the **System Configuration and Monitoring Commands** chapter for detailed command description and command example information, where static routes are applied before adding routes to the RIB.

Troubleshooting routes not installed to the FIB

Possible reasons why a route is not installed in the FIB are:

- The maximum-paths limit may have been reached (currently supports up to eight equal cost paths being installed).
- The maximum-paths command may be set to a lower value preventing more paths being selected as best.
- The desired route type has a higher AD over another route entry in the RIB, so is not preferred.
- The max-fib-routes command is configured and the maximum number of installed software FIB routes has been reached.

See the **max-fib-routes** command in the **System Configuration and Monitoring Commands** chapter for detailed command description and command example information to control the maximum number of FIB routes configured.

Chapter 34: Routing Commands

Introduction 34.2
Command List 34.2
ip route 34.2
maximum-paths 34.5
show ip route 34.6
show ip route database 34.9
show ip route summary 34.12

Introduction

This chapter provides an alphabetical reference of routing commands that are common across the routing IP protocols. For more information see **Chapter 32, Routing Protocol Overview** and **Chapter 33, Route Selection**.

Command List

ip route

This command adds a static route to the Routing Information Base (RIB). If this route is the best route for the destination, then your device adds it to the Forwarding Information Base (FIB). Your device uses the FIB to advertise routes to neighbors and forward packets.

When using VRF (Virtual Routing and Forwarding), you can use this command to configure a static inter-VRF route to a destination network that is reachable by a remote gateway located in a different VRF instance. Note that to apply the command in this way, the **ip route static inter-vrf** command must be in enabled (its default condition). For more information about VRF see, **Chapter 48, VRF-Lite Introduction and Configuration** and **Chapter 49, VRF-Lite Commands**.

The **no** variant of this command removes the static route from the RIB and FIB.

Syntax

```
ip route <subnet&mask> {<gateway-ip>|<interface>} [<distance>]
no ip route <subnet&mask> {<gateway-ip>|<interface>} [<distance>]
```

Syntax (VRF Lite)

```
ip route [vrf <vrf-name>] <subnet&mask> [<gateway-ip>] [<interface>]
    [<distance>]
no ip route [vrf <vrf-name>] <subnet&mask> [<gateway-ip>]
    [<interface>] [<distance>]
```

Parameter	Description
<subnet&mask>	The IPv4 address of the destination subnet defined using either a prefix length or a separate mask specified in one of the following formats:
	The IPv4 subnet address in dotted decimal notation followed by the subnet mask, also in dotted decimal notation.
	The IPv4 subnet address in dotted decimal notation, followed by a forward slash, then the prefix length.
<gateway-ip>	The IPv4 address of the gateway device.

Parameter(cont.)	Description(cont.)
<interface>	The interface that connects your device to the network. Enter the name of the VLAN or its VID. You can also enter 'null' as an interface. Specify a 'null' interface to add a null or blackhole route to the switch. The gateway IP address or the interface is required, if VRF-Lite is not configured. If VRF-Lite is configured. When adding a static intra-VRF route, you must specify either the gateway IP address or the interface. When adding a static inter-VRF route, you must specify both the gateway IP address and the interface.
<distance>	The administrative distance for the static route in the range <1-255>. Static routes by default have an administrative distance of 1.
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance to enter IPv4 Address-Family mode for.

Mode Global Configuration

Default The default administrative distance for a static route is 1 for priority over non-static routes.

Usage Administrative distance can be modified so static routes do not take priority over other routes.

Specify a 'Null' interface to add a null or blackhole route to the switch. A null or blackhole route is a routing table entry that does not forward packets, so any packets sent to it are dropped.

Examples To add the destination 192.168.3.0 with the mask 255.255.255.0 as a static route available through the device at "10.10.0.2" with the default administrative distance, use the commands:

```
awplus# configure terminal
awplus(config)# ip route 192.168.3.0 255.255.255.0 10.10.0.2
```

To remove the destination 192.168.3.0 with the mask 255.255.255.0 as a static route available through the device at "10.10.0.2" with the default administrative distance, use the commands:

```
awplus# configure terminal
awplus(config)# no ip route 192.168.3.0 255.255.255.0 10.10.0.2
```

To specify a null or blackhole route 192.168.4.0/24, so packets forwarded to this route are dropped, use the commands:

```
awplus# configure terminal
awplus(config)# ip route 192.168.4.0/24 null
```

To add the destination 192.168.3.0 with the mask 255.255.255.0 as a static route available through the device at "10.10.0.2" with an administrative distance of 128, use the commands:

```
awplus# configure terminal
awplus(config)# ip route 192.168.3.0 255.255.255.0 10.10.0.2 128
```

Example (VRF Lite) To create a static route from source VRF instance red, to the subnet 192.168.50.0/24 with a next hop of 192.168.20.6, use the following commands for static intra-VRF routing configuration:

```
awplus# configure terminal
awplus(config)# ip route vrf red 192.168.50.0/24 192.168.20.6
```

Example (VRF Lite) To remove a static route from source vrf red, to the subnet 192.168.50.0/24 with a next hop of 192.168.20.6, use the following commands for static intra-VRF routing configuration:

```
awplus# configure terminal
awplus(config)# no ip route vrf red 192.168.50.0/24 192.168.20.6
```

Example (VRF Lite) To create a static route from source vrf red, to the subnet 192.168.50.0/24 with a next hop of 192.168.20.6 via vlan-10, use the following commands for static inter-VRF routing configuration:

```
awplus# configure terminal
awplus(config)# ip route vrf red 192.168.50.0/24 192.168.20.6
vlan10
```

Example (VRF Lite) To remove a static route from source vrf red, to the subnet 192.168.50.0/24 with a next hop of 192.168.20.6 via vlan-10, use the following commands for static inter-VRF routing configuration:

```
awplus# configure terminal
awplus(config)# no ip route vrf red 192.168.50.0/24
192.168.20.6 vlan10
```

Example (VRF Lite) To create a static route from source vrf red, to the subnet 192.168.50.0/24 with a next hop of 192.168.20.6 via vlan-10, with an administrative distance of 225, use the following commands:

```
awplus# configure terminal
awplus(config)# ip route vrf red 192.168.50.0/24 192.168.20.6
vlan10 225
```

Example (VRF Lite) This example is shown as part of a larger VRF configuration, in **"Static Inter-VRF Routing" on page 48.14**.

Related Commands **show ip route**

maximum-paths

This command enables ECMP on your device, and sets the maximum number of paths that each route has in the Forwarding Information Base (FIB). ECMP is enabled by default.

The **no** variant of this command sets the maximum paths to the default of 4.

Syntax

```
maximum-paths <1-8>
no maximum-paths
```

Parameter	Description
<1-8>	The maximum number of paths that a route can have in the FIB.

Default By default the maximum number of paths is 4.

Mode Global Configuration

Examples To set the maximum number of paths for each route in the FIB to 5, use the command:

```
awplus# configure terminal
awplus(config)# maximum-paths 5
```

To set the maximum paths for a route to the default of 4, use the command:

```
awplus# configure terminal
awplus(config)# no maximum-paths
```

show ip route

Use this command to display routing entries in the FIB (Forwarding Information Base). The FIB contains the best routes to a destination, and your device uses these routes when forwarding traffic. You can display a subset of the entries in the FIB based on protocol.

VRF Lite If VRF-Lite is configured, you can display routing entries in the FIB associated with either the global routing domain or a named VRF.

To modify the lines displayed, use the | (output modifier token); to save the output to a file, use the > output redirection token.

Syntax
```
show ip route [bgp|connected|ospf|rip|static|<ip-addr>|<ip-addr/
    prefix-length>]
```

VRF Lite
```
show ip route {vrf <vrf-name>|global} [bgp|connected|ospf|rip|static]
```

Parameter	Description
`global`	If VRF-Lite is configured, apply the command to the global routing and forwarding table.
`vrf`	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
`bgp`	Displays only the routes learned from BGP.
`connected`	Displays only the routes learned from connected interfaces.
`ospf`	Displays only the routes learned from OSPF.
`rip`	Displays only the routes learned from RIP.
`static`	Displays only the static routes you have configured.
<ip-addr>	Displays the routes for the specified address. Enter an IPv4 address.
<ip-addr/prefix-length>	Displays the routes for the specified network. Enter an IPv4 address and prefix length.

Mode User Exec and Privileged Exec

Example To display the OSPF routes in the FIB, use the command:

```
awplus# show ip route ospf
```

Example (VRF Lite) To display all routing entries in the FIB associated with a VRF instance `red`, use the command:

```
awplus# show ip route vrf red
```

Output Each entry in the output from this command has a code preceding it, indicating the source of the routing entry. For example, O indicates OSPF as the origin of the route. The first few lines of the output list the possible codes that may be seen with the route entries.

Typically, route entries are composed of the following elements:

- code
- a second label indicating the sub-type of the route
- network or host ip address
- administrative distance and metric
- nexthop ip address
- outgoing interface name
- time since route entry was added

Figure 34-1: Example output from the show ip route command

```
Codes: C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       * - candidate default

O       10.10.37.0/24 [110/11] via 10.10.31.16, vlan2, 00:20:54
C       3.3.3.0/24 is directly connected, vlan1
C       10.10.31.0/24 is directly connected, vlan2
C       10.70.0.0/24 is directly connected, vlan4
O E2    14.5.1.0/24 [110/20] via 10.10.31.16, vlan2, 00:18:56
C       33.33.33.33/32 is directly connected, lo
```

To avoid repetition, only selected route entries comprised of different elements are described here:

OSPF Route `O 10.10.37.0/24 [110/11] via 10.10.31.16, vlan2, 00:20:54`

This route entry denotes:

- This route in the network `10.10.37.0/24` was added by OSPF.
- This route has an administrative distance of 110 and metric/cost of 11.
- This route is reachable via nexthop `10.10.31.16`.
- The outgoing local interface for this route is `vlan2`.
- This route was added 20 minutes and 54 seconds ago.

Connected Route `C 10.10.31.0/24 is directly connected, vlan2`

This route entry denotes:

- Route entries for network `10.10.31.0/24` are derived from the IP address of local interface `vlan2`.
- These routes are marked as Connected routes `(C)` and always preferred over routes for the same network learned from other routing protocols.

OSPF External Route `O E2 14.5.1.0/24 [110/20] via 10.10.31.16, vlan2, 00:18:56`

This route entry denotes:

- This route is the same as the other OSPF route explained above; the main difference is that it is a Type 2 External OSPF route.

Related Commands **maximum-paths**
show ip route database

show ip route database

This command displays the routing entries in the RIB (Routing Information Base).

When multiple entries are available for the same prefix, RIB uses the routes' administrative distances to choose the best route. All best routes are entered into the FIB (Forwarding Information Base). To view the routes in the FIB, use the **show ip route** command.

To modify the lines displayed, use the | (output modifier token); to save the output to a file, use the > output redirection token.

Syntax

```
show ip route database [bgp|connected|ospf|rip|static]
```

Syntax (VRF Lite)

```
show ip route [vrf <vrf-name>|global] database [bgp|connected|ospf|
   rip|static]
```

Parameter	Description
`global`	If VRF-Lite is configured, apply the command to the global routing and forwarding table.
`vrf`	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
`bgp`	Displays only the routes learned from BGP.
`connected`	Displays only the routes learned from connected interfaces.
`ospf`	Displays only the routes learned from OSPF.
`rip`	Displays only the routes learned from RIP.
`static`	Displays only the static routes you have configured.

Mode User Exec and Privileged Exec

Example To display the static routes in the RIB, use the command:

```
awplus# show ip route database static
```

Output **Figure 34-2: Example output from the show ip route database command**

```
Codes: C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
              > - selected route, * - FIB route, p - stale info

O    *> 9.9.9.9/32 [110/31] via 10.10.31.16, vlan2, 00:19:21
O       10.10.31.0/24 [110/1] is directly connected, vlan2, 00:28:20
C    *> 10.10.31.0/24 is directly connected, vlan2
S    *> 10.10.34.0/24 [1/0] via 10.10.31.16, vlan2
O       10.10.34.0/24 [110/31] via 10.10.31.16, vlan2, 00:21:19
O    *> 10.10.37.0/24 [110/11] via 10.10.31.16, vlan2, 00:21:19
C    *> 10.30.0.0/24 is directly connected, vlan6
S    *> 11.22.11.0/24 [1/0] via 10.10.31.16, vlan2
O E2 *> 14.5.1.0/24 [110/20] via 10.10.31.16, vlan2, 00:19:21
O       16.16.16.16/32 [110/11] via 10.10.31.16, vlan2, 00:21:19
S    *> 16.16.16.16/32 [1/0] via 10.10.31.16, vlan2
O    *> 17.17.17.17/32 [110/31] via 10.10.31.16, vlan2, 00:21:19
C    *> 45.45.45.45/32 is directly connected, lo
O    *> 55.55.55.55/32 [110/21] via 10.10.31.16, vlan2, 00:21:19
C    *> 127.0.0.0/8 is directly connected, lo
```

Example (VRF Lite) To display all routing entries in the RIB associated with a VRF instance `red`, use the command:

```
awplus# show ip route vrf red database
```

Output **Figure 34-3: Example output from the show ip route vrf red database command**

```
[VRF: red]
Codes: C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
              > - selected route, * - FIB route, p - stale info

O       192.168.10.0/24 [110/1] is directly connected, vlan1, 06:45:51
C    *> 192.168.10.0/24 is directly connected, vlan1
B     > 192.168.33.0/24 [20/0] via 192.168.30.3, 06:45:52
O E2 *> 192.168.110.0/24 [110/20] via 192.168.10.2, vlan1, 06:45:00
O E2 *> 192.168.111.0/24 [110/20] via 192.168.10.2, vlan1, 06:45:00
```

The routes added to the FIB are marked with a `*`. When multiple routes are available for the same prefix, the best route is indicated with the > symbol. All unselected routes have neither the * nor the > symbol.

```
S    *> 10.10.34.0/24 [1/0] via 10.10.31.16, vlan2
O       10.10.34.0/24 [110/31] via 10.10.31.16, vlan2, 00:21:19
```

These route entries denote:

- The same prefix was learned from OSPF and from static route configuration.
- Since this static route has a lower administrative distance than the OSPF route (110), the static route (1) is selected and installed in the FIB.

If the static route becomes unavailable, then the device automatically selects the OSPF route and installs it in the FIB.

Related Commands

maximum-paths
show ip route

show ip route summary

This command displays a summary of the current RIB (Routing Information Base) entries.

To modify the lines displayed, use the | (output modifier token); to save the output to a file, use the > output redirection token.

Syntax `show ip route summary`

VRF Lite `show ip route summary [vrf <vrf-name>|global]`

Parameter	Description
`vrf`	Specific VRF instance.
<vrf-name>	The name of the VRF instance.
`global`	The global routing and forwarding table.

Mode User Exec and Privileged Exec

Example To display a summary of the current RIB entries, use the command:

```
awplus# show ip route summary
```

Output **Figure 34-4: Example output from the show ip route summary command**

```
IP routing table name is Default-IP-Routing-Table(0)
IP routing table maximum-paths is 4
Route Source    Networks
connected       5
ospf            2
Total           8
```

Example (VRF Lite) **Figure 34-5: Example output from the show ip route summary vrf red command**

```
IP routing table name is Default-IP-Routing-Table(0)
IP routing table maximum-paths is 4
Route Source    Networks
connected       1
Total           1
FIB             0

[VRF: red]
Route Source    Networks
connected       1
ospf            2
Total           3
```

Chapter 35: RIP Configuration

Introduction 35.2
Enabling RIP 35.2
Specifying the RIP Version 35.4
RIPv2 Authentication (Single Key) 35.6
RIPv2 Text Authentication (Multiple Keys) 35.8
RIPv2 md5 authentication (Multiple Keys) 35.12

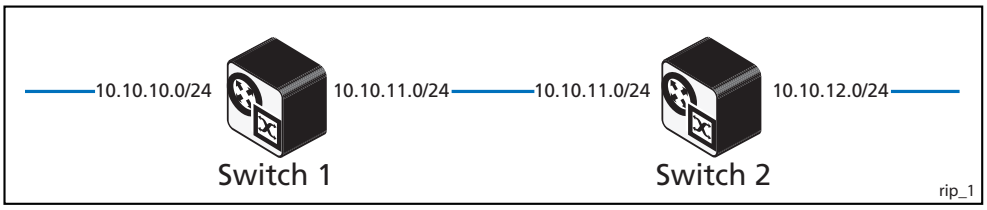
Introduction

This chapter contains basic RIP configuration examples. To see details on the RIP commands used in these examples, or to see the outputs of the Validation commands, refer to the **Chapter 36, RIP Commands**.

Enabling RIP

This example shows the minimum configuration required for enabling two devices to exchange routing information using RIP. The routing devices in this example are Allied Telesis managed Layer 3 Switches. `Switch 1` and `Switch 2` are two neighbors connecting to network 10.10.11.0/24. Switch 1 and Switch 2 are also connected to networks 10.10.10.0/24 and 10.10.12.0/24 respectively. This example assumes that the devices have already been configured with IP interfaces in those subnets.

To enable RIP, first define the RIP routing process and then associate a network with the routing process.



Switch 1

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`router rip`	Define a RIP routing process and enter the Router Configuration mode.
`awplus(config-router)#`	
`network 10.10.10.0/24`	Associate network 10.10.10.0/24 with the RIP process.
`awplus#`	
`network 10.10.11.0/24`	Associate network 10.10.11.0/24 with the RIP process.

Switch 2

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`router rip`	Define a RIP routing process and enter the Router Configuration mode.
`awplus(config-router)#`	
`network 10.10.11.0/24`	Associate networks with the RIP process
`awplus(config-router)#`	
`network 10.10.12.0/24`	Associate networks with the RIP process

Names of Commands Used

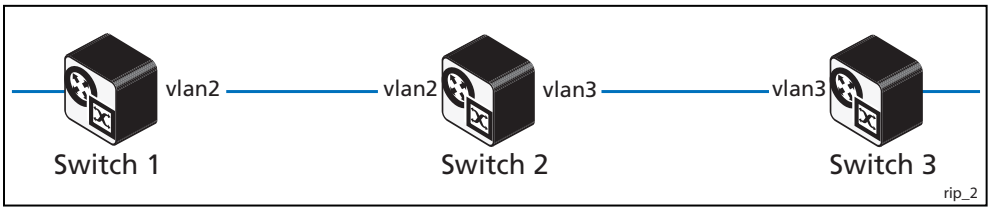
router rip
network (RIP)

Validation Commands

show ip rip
show running-config
show ip protocols rip
show ip rip interface
show ip route

Specifying the RIP Version

Configure a router to receive and send specific versions of RIP packets on a VLAN interface. The routing devices in this example are Allied Telesis managed Layer 3 Switches. In this example, Switch 2 is configured to receive and send RIP version 1 and version 2 information on both `vlan2` and `vlan3` interfaces.



Switch 2

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`router rip`	Enable the RIP routing process.
`awplus(config-router)#`	
`exit`	Return to the Global Configuration mode
`awplus(config)#`	
`interface vlan2`	Specify vlan2 as an interface you want to configure.
`awplus(config-if)#`	
`ip rip send version 1 2`	Allow sending RIP version 1 and version 2 packets out of this interface.
`awplus(config-if)#`	
`ip rip receive version 1 2`	Allow receiving of RIP version 1 and version 2 packets from the vlan2 interface.
`awplus(config-if)#`	
`exit`	Exit the Interface mode and return to Global Configuration mode to configure the next interface.
`awplus(config)#`	
`interface vlan3`	Specify interface vlan3 as the interface you want to configure.
`awplus(config-if)#`	
`ip rip send version 1 2`	Allow sending RIP version 1 and version 2 packets out of this interface.
`awplus(config-if)#`	
`ip rip receive version 1 2`	Allow receiving of RIP version 1 and version 2 packets from the vlan3 interface.

Names of Commands Used

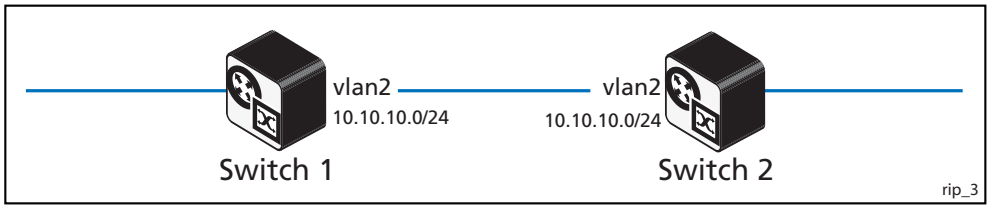
ip rip send version
ip rip receive version

Validation Commands

show ip rip
show running-config
show ip protocols rip
show ip rip interface
show ip route

RIPv2 Authentication (Single Key)

AlliedWare Plus™ RIP implementation provides the choice of configuring authentication for a single key or for multiple keys. This example illustrates authentication of the routing information exchange process for RIP using a single key. The routing devices in this example are Allied Telesis managed Layer 3 Switches. Switch 1 and Switch 2 are running RIP and exchange routing updates. To configure single key authentication on Switch 1, specify an interface and then define a key or password for that interface. Next, specify an authentication mode. Any receiving RIP packet on this specified interface should have the same string as password. For an exchange of updates between Switch 1 and Switch 2, define the same password and authentication mode on Switch 2.



Switch 1

`awplus#` `configure terminal`	Enter the Configure mode.
`awplus(config)#` `router rip`	Define a RIP routing process and enter the Router Configuration mode.
`awplus(config-router)#` `network 10.10.10.0/24`	Associate network 10.10.10.0/24 with the RIP process.
`awplus(config-router)#` `redistribute connected`	Enable redistributing from connected routes.
`awplus(config-router)#` `exit`	Exit the Router Configuration mode and return to the Configure mode.
`awplus(config)#` `interface vlan2`	Specify the VLAN interface (vlan2) for authentication.
`awplus(config-if)#` `ip rip authentication string Secret`	Specify the authentication string (Secret) for this interface.
`awplus(config-if)#` `ip rip authentication mode md5`	Specify the authentication mode to be MD5.

Switch 2

`awplus#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config)#` `router rip`	Define a RIP routing process and enter the Router Configuration mode.
`awplus(config-router)#` `network 10.10.10.0/24`	Associate network 10.10.10.0/24 with the RIP process.
`awplus(config-router)#` `redistribute connected`	Enable redistributing from connected routes.
`awplus(config-router)#` `exit`	Exit the Router Configuration mode and return to the Global Configuration mode.
`awplus(config)#` `interface vlan2`	Specify the VLAN interface (vlan2) for authentication.
`awplus(config-if)#` `ip rip authentication string Secret`	Specify the authentication string (Secret) on this interface.
`awplus(config-if)#` `ip rip authentication mode md5`	Specify the authentication mode to be MD5.

Names of Commands Used

ip rip authentication string
ip rip authentication mode
redistribute (RIP)
network (RIP)

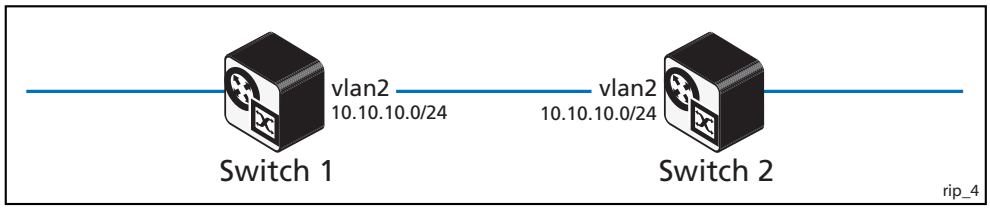
Validation Commands

show ip rip
show running-config
show ip protocols rip
show ip rip interface
show ip route

RIPv2 Text Authentication (Multiple Keys)

This example illustrates text authentication of the routing information exchange process for RIP using multiple keys. The routing devices in this example are Allied Telesis managed Layer 3 Switches. Switch 1 and Switch 2 are running RIP and exchanging routing updates. To configure authentication on Switch 1, define a key chain, specify keys in the key chain and then define the authentication string or passwords to be used by the keys. Set the time period during which it is valid to receive or send the authentication key by specifying the accept and send lifetimes. After defining the key string, specify the key chain (or the set of keys) that will be used for authentication on each interface and also the authentication mode to be used.

Switch 1 accepts all packets that contain any key string that matches one of the key strings included in the specified key chain (within the accept lifetime) on that interface. The key ID is not considered for matching. For additional security, the accept lifetime and send lifetime are configured such that every fifth day the key ID and key string changes. To maintain continuity, the accept lifetimes should be configured to overlap. This will accommodate different time-setup on machines. However, the send lifetime does not need to overlap and we recommend not configuring overlapping send lifetimes.



Switch 1

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`router rip`	Define a RIP routing process and enter the Router Configuration mode.
`awplus(config-router)#`	
`network 10.10.10.0/24`	Associate network 10.10.10.0/24 with the RIP process.
`awplus(config-router)#`	
`redistribute connected`	Enable redistributing of connected routes.
`awplus(config-router)#`	
`exit`	Exit the Router Configuration mode and return to the Global Configuration mode.
`awplus(config)#`	
`key chain SUN`	Enter the key chain management mode to add keys to the key chain SUN.
`awplus(config-keychain)#`	
`key 10`	Add authentication key ID (10) to the key chain SUN.
`awplus(config-keychain-key)#`	
`key-string Secret`	Specify a password (Secret) to be used by the specified key.

Switch 1(cont.)

`awplus(config-keychain-key)#`	
`accept-lifetime 12:00:00 Mar 2 2007 14:00:00 Mar 7 2007`	Specify the time period during which authentication key string `Secret` can be received. In this case, key string `Secret` can be received from noon of March 2 to 2 pm March 7, 2007.
`awplus(config-keychain-key)#`	
`send-lifetime 12:00:00 Mar 2 2007 12:00:00 Mar 7 2007`	Specify the time period during which authentication key string `Secret` can be send. In this case, key string `Secret` can be received from noon of March 2 to noon of March 7, 2007.
`awplus(config-keychain-key)#`	
`exit`	Exit the keychain-key mode and return to keychain mode.
`awplus(config-keychain)#`	
`key 20`	Add another authentication key (`20`) to the key chain `SUN`.
`awplus(config-keychain-key)#`	
`key-string Earth`	Specify a password (`Earth`) to be used by the specified key.
`awplus(config-keychain-key)#`	
`accept-lifetime 12:00:00 Mar 7 2007 14:00:00 Mar 12 2007`	Specify the time period during which authentication key string `Earth` can be received. In this case, key string `Earth` can be received from noon of March 7 to 2 pm March 12, 2007.
`awplus(config-keychain-key)#`	
`send-lifetime 12:00:00 Mar 7 2007 12:00:00 Mar 12 2007`	Specify the time period during which authentication key string `Earth` can be sent. In this case, key string `Secret` can be received from noon of March 7 to noon of March 12, 2007.
`awplus(config-keychain-key)#`	
`end`	Enter Privileged Exec mode.
`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`interface vlan2`	Specify VLAN interface (vlan2) as the interface you want to configure on Switch 1.
`awplus(config-if)#`	
`ip rip authentication key-chain SUN`	Enable RIPv2 authentication on the `vlan2` interface and specify the key chain `SUN` to be used for authentication.
`awplus(config-if)#`	
`ip rip authentication mode text`	Specify text authentication mode to be used for RIP packets. This step is optional, as text is the default mode.

Switch 2

awplus# configure terminal	Enter the Global Configuration mode.
awplus(config)# router rip	Define a RIP routing process and enter the Router Configuration mode.
awplus(config-router)# network 10.10.10.0/24	Associate network 10.10.10.0/24 with the RIP process.
awplus(config-router)# redistribute connected	Enable redistributing from connected routes.
awplus(config-router)# exit	Exit the Router Configuration mode and return to the Global Configuration mode.
awplus(config)# key chain MOON	Enter the key chain management mode to add keys to the key chain MOON.
awplus(config-keychain)# key 30	Add authentication key ID (30) to the key chain MOON.
awplus(config-keychain-key)# key-string Secret	Specify a password (Secret) to be used by the specified key.
awplus(config-keychain-key)# accept-lifetime 12:00:00 Mar 2 2007 14:00:00 Mar 7 2007	Specify the time period during which authentication key string Secret can be received. In this case, key string Secret can be received from noon of March 2 to 2 pm March 7, 2007.
awplus(config-keychain-key)# send-lifetime 12:00:00 Mar 2 2007 12:00:00 Mar 7 2007	Specify the time period during which authentication key string Secret can be send. In this case, key string Secret can be received from noon of March 2 to noon of March 7, 2007.
awplus(config-keychain)# key 40	Add another authentication key (40) to the key chain MOON.
awplus(config-keychain-key)# key-string Earth	Specify a password (Earth) to be used by the specified key.
awplus(config-keychain-key)# accept-lifetime 12:00:00 Mar 7 2007 14:00:00 Mar 12 2007	Specify the time period during which authentication key string Earth can be received. In this case, key string Earth can be received from noon of March 7 to 2 pm March 12, 2007.

Switch 2(cont.)

`awplus(config-keychain-key)#`	
`send-lifetime 12:00:00 Mar 7 2007 12:00:00 Mar 12 2007`	Specify the time period during which authentication key string `Earth` can be sent. In this case, key string `Secret` can be received from noon of March 7 to noon of March 12, 2007.
`awplus(config-keychain-key)#`	
`end`	Enter Privileged Exec mode.
`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`interface vlan2`	Specify the VLAN interface that you want to configure on Switch 2.
`awplus(config-if)#`	
`ip rip authentication key-chain MOON`	Enable RIPv2 authentication on the vlan2 interface, and specify the key chain MOON to be used for authentication.
`awplus(config-if)#`	
`ip rip authentication mode text`	Specify authentication mode to be used for RIP packets. This step is optional, as text is the default mode.

Names of Commands Used

key chain, **key-string**
accept-lifetime
send-lifetime
ip rip authentication key-chain
ip rip authentication mode

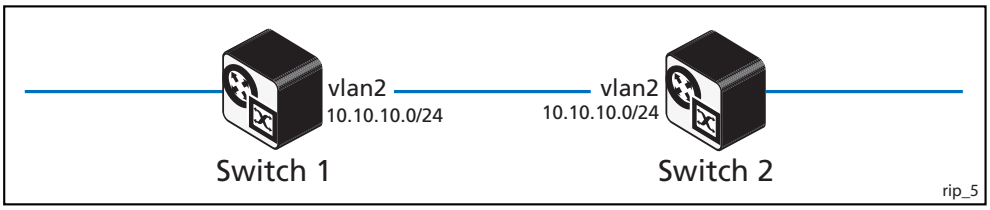
Validation Commands

show ip rip
show running-config
show ip protocols rip
show ip rip interface
show ip route

RIPv2 md5 authentication (Multiple Keys)

This example illustrates the md5 authentication of the routing information exchange process for RIP using multiple keys. The routing devices in this example are Allied Telesis managed Layer 3 Switches. Switch 1 and Switch 2 are running RIP and exchange routing updates. To configure authentication on Switch 1, define a key chain, specify keys in the key chain and then define the authentication string or passwords to be used by the keys. Then set the time period during which it is valid to receive or send the authentication key by specifying the accept and send lifetimes. After defining the key string, specify the key chain (or the set of keys) that will be used for authentication on the interface and the authentication mode to be used. Configure Switch 2 and Switch 3 to have the same key ID and key string as Switch 1 for the time that updates need to be exchanged.

In `md5` authentication, both the key ID and key string are matched for authentication. Switch 1 will receive only packets that match both the key ID and the key string in the specified key chain (within the accept lifetime) on that interface. In the following example, Switch 2 has the same key ID and key string as Switch 1. For additional security, the accept lifetime and send lifetime are configured such that every fifth day the key ID and key string changes. To maintain continuity, the accept lifetimes should be configured to overlap; however, the send lifetime should not be overlapping.



Switch 1

awplus# `configure terminal`	Enter the Global Configuration mode.
awplus(config)# `router rip`	Define a RIP routing process and enter the Router Configuration mode.
awplus(config-router)# `network 10.10.10.0/24`	Associate network `10.10.10.0/24` with the RIP process.
awplus(config-router)# `redistribute connected`	Enable redistributing from connected routes.
awplus(config-router)# `exit`	Exit the Router Configuration mode and return to the Global Configuration mode.
awplus(config)# `key chain SUN`	Enter the key chain management mode to add keys to the key chain `SUN`.
awplus(config-keychain)# `key 1`	Add authentication key ID (`1`) to the key chain `SUN`.

Switch 1(cont.)

`awplus(config-keychain-key)#`	
`key-string Secret`	Specify a password (`Secret`) to be used by the specified key.
`awplus(config-keychain-key)#`	
`accept-lifetime 12:00:00 Mar 2 2007 14:00:00 Mar 7 2007`	Specify the time period during which authentication key string `Secret` can be received. In this case, key string `Secret` can be received from noon of March 2 to 2 pm March 7, 2007.
`awplus(config-keychain-key)#`	
`send-lifetime 12:00:00 Mar 2 2007 12:00:00 Mar 7 2007`	Specify the time period during which authentication key string `Secret` can be send. In this case, key string `Secret` can be received from noon of March 2 to noon of March 7, 2007.
`awplus(config-keychain-key)#`	
`exit`	Exit the `keychain-key` mode and return to `keychain` mode.
`awplus(config-keychain)#`	
`key 2`	Add another authentication key (`2`) to the key chain `SUN`.
`awplus(config-keychain-key)#`	
`key-string Earth`	Specify a password (`Earth`) to be used by the specified key.
`awplus(config-keychain-key)#`	
`accept-lifetime 12:00:00 Mar 7 2007 14:00:00 Mar 12 2007`	Specify the time period during which authentication key string `Earth` can be received. In this case, key string `Earth` can be received from noon of March 7 to 2 pm March 12, 2007.
`awplus(config-keychain-key)#`	
`send-lifetime 12:00:00 Mar 7 2007 12:00:00 Mar 12 2007`	Specify the time period during which authentication key string `Earth` can be send. In this case, key string `Secret` can be received from noon of March 7 to noon of March 12, 2007.
`awplus(config-keychain-key)#`	
`end`	Enter Privileged Exec mode.
`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`interface vlan2`	Specify interface `vlan2` as the VLAN interface you want to configure on Switch 1.
`awplus(config-if)#`	
`ip rip authentication key-chain SUN`	Enable RIPv2 authentication on the `vlan2` interface and specify the key chain `SUN` to be used for authentication.
`awplus(config-if)#`	
`ip rip authentication mode md5`	Specify the `md5` authentication mode to be used for RIP packets.

Switch 2

`awplus#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config)#` `router rip`	Define a RIP routing process and enter the Router Configuration mode.
`awplus(config-router)#` `network 10.10.10.0/24`	Associate network 10.10.10.0/24 with the RIP process.
`awplus(config-router)#` `redistribute connected`	Enable redistributing from connected routes.
`awplus(config-router)#` `exit`	Exit the Router Configuration mode and return to the Global Configuration mode.
`awplus(config)#` `key chain MOON`	Enter the key chain management mode to add keys to the key chain `MOON`.
`awplus(config-keychain)#` `key 1`	Add authentication key ID (`1`) to the key chain `MOON`.
`awplus(config-keychain-key)#` `key-string Secret`	Specify a password (`Secret`) to be used by the specified key.
`awplus(config-keychain-key)#` `accept-lifetime 12:00:00 Mar 2 2007 14:00:00 Mar 7 2007`	Specify the time period during which authentication key string `Secret` can be received. In this case, key string `Secret` can be received from noon of March 2 to 2 pm March 7, 2007.
`awplus(config-keychain-key)#` `send-lifetime 12:00:00 Mar 2 2007 12:00:00 Mar 7 2007`	Specify the time period during which authentication key string `Secret` can be send. In this case, key string `Secret` can be received from noon of March 2 to noon of March 7, 2007.
`awplus(config-keychain)#` `key 2`	Add another authentication key (`2`) to the key chain `MOON`.
`awplus(config-keychain-key)#` `key-string Earth`	Specify a password (`Earth`) to be used by the specified key.
`awplus(config-keychain-key)#` `accept-lifetime 12:00:00 Mar 7 2007 14:00:00 Mar 12 2007`	Specify the time period during which authentication key string `Earth` can be received. In this case, key string `Earth` can be received from noon of March 7 to 2 pm March 12, 2007.

Switch 2(cont.)

`awplus(config-keychain-key)#`	
`send-lifetime 12:00:00 Mar 7 2007 12:00:00 Mar 12 2007`	Specify the time period during which authentication key string `Earth` can be send. In this case, key string `Secret` can be received from noon of March 7 to noon of March 12, 2007.
`awplus(config-keychain-key)#`	
`end`	Enter Privileged Exec mode.
`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`interface vlan2`	Specify vlan2 as the VLAN interface you want to configure on Switch 2.
`awplus(config-if)#`	
`ip rip authentication key-chain MOON`	Enable RIPv2 authentication on the `vlan2` interface and specify the key chain `MOON` to be used for authentication.
`awplus(config-if)#`	
`ip rip authentication mode md5`	Specify the md5 authentication mode to be used for RIP packets.

Introduction

This chapter provides an alphabetical reference of commands used to configure RIP. For more information, see **Chapter 35, RIP Configuration**.

Command List

accept-lifetime

Use this command to specify the time period during which the authentication key on a key chain is received as valid.

Use the **no** variant of this command to remove a specified time period for an authentication key on a key chain as set previously with the **accept-lifetime** command.

Syntax

```
accept-lifetime <start-date>{<end-date>|duration <seconds>|infinite}
no accept-lifetime
```

Parameter	Description	
<start-date>	Specifies the start period - time and date in the format DD MMM YYYY or MMM DD YYYY: *<hh:mm:ss>* {*<day> <month> <year>* | *<month> <day> <year>*}	
	<hh:mm:ss>	Time of the day when accept-lifetime starts, in hours, minutes and seconds
	<day>	<1-31> Specifies the day of the month to start.
	<month>	Specifies the month of the year to start (the first three letters of the month, for example, Jan).
	<year>	<1993-2035> Specifies the year to start.
<end-date>	Specifies the end period - time and date in the format DD MMM YYYY or MMM DD YYYY: *<hh:mm:ss>* {*<day> <month> <year>* | *<month> <day> <year>*}	
	<hh:mm:ss>	Time of the day when lifetime expires, in hours, minutes and seconds.
	<day>	<1-31> Specifies the day of the month to expire.
	<month>	Specifies the month of the year to expire (the first three letters of the month, for example, Feb).
	<year>	<1993-2035> Specifies the year to expire.
<seconds>	<1-2147483646> Duration of the key in seconds.	
infinite	Never expires.	

Mode Keychain-key Configuration

Examples The following examples show the setting of accept-lifetime for `key1` on the key chain named `mychain`.

```
awplus# configure terminal
awplus(config)# key chain mychain
awplus(config-keychain)# key 1
awplus(config-keychain-key)# accept-lifetime 03:03:01 Dec 3
2007 04:04:02 Oct 6 2008
```

or:

```
awplus# configure terminal
awplus(config)# key chain mychain
awplus(config-keychain)# key 1
awplus(config-keychain-key)# accept-lifetime 03:03:01 3 Dec
2007 04:04:02 6 Oct 2008
```

Related Commands
key
key-string
key chain
send-lifetime

address-family ipv4 (RIP)

Syntax (VRF Lite) This command enters the IPv4 address-family command mode. In this mode you can configure address-family specific parameters for a specific VRF (RIP) instance.

Syntax

```
address-family ipv4 vrf <vrf-name>
no address-family ipv4 vrf <vrf-name>
```

Parameter	Description
`ipv4`	Configure parameters relating to the RIP exchange of IPv4 prefixes.
`vrf`	Apply this command to a VRF instance.
`<vrf-name>`	The name of the VRF instance.

Mode Router Configuration

Usage To leave Address Family mode and return to Router Configuration mode, use the **exit-address-family (BGP and BGP4+)** command on page 45.65.

Example In this example the address family “green” is entered, and then exited by using the exit-address-family command. I

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf green
awplus(config-router-af)#
awplus(config-router-af)# exit-address-family
awplus(config-router)# exit
```

Related Commands **exit-address-family (BGP and BGP4+)**

cisco-metric-behavior (RIP)

Use this command to enable or disable the RIP routing metric update to conform to Cisco's implementation. This command is provided to allow inter-operation with older Cisco devices that do not conform to the RFC standard for RIP route metrics.

Use the **no** variant of this command to disable this feature.

Syntax

```
cisco-metric-behavior {enable|disable}
no cisco-metric-behavior
```

Parameter	Description
`enable`	Enables updating the metric consistent with Cisco.
`disable`	Disables updating the metric consistent with Cisco.

Default By default, the Cisco metric-behavior is disabled.

Mode Router Configuration

Examples To enable the routing metric update to behave as per the Cisco implementation, enter the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# cisco-metric-behavior enable
```

To disable the routing metric update to behave as per the default setting, enter the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# no cisco-metric-behavior
```

Validation Commands **show running-config**

Related Commands **cisco-metric-behavior (IPv6 RIPng)**

clear ip rip route

Use this command to clear specific data from the RIP routing table.

Syntax

```
clear ip rip route {<ip-dest-network/prefix-length>|static|connected|
   rip|ospf|bgp|all}
```

Syntax (VRF Lite)

```
clear ip rip [vrf <vrf-name>] route {<ip-dest-network/prefix-length>
   |static|connected|rip|ospf|bgp|all}
```

Parameter	Description
`vrf`	Apply this command to a VRF instance.
<vrf-name>	The name of the VRF instance.
<ip-dest-network/prefix-length>	Removes entries which exactly match this destination address from RIP routing table. Enter the IP address and prefix length of the destination network.
`static`	Removes static entries from the RIP routing table.
`connected`	Removes entries for connected routes from the RIP routing table.
`rip`	Removes only RIP routes from the RIP routing table.
`ospf`	Removes only OSPF routes from the RIP routing table.
`bgp`	Removes only BGP routes from the RIP routing table.
`all`	Clears the entire RIP routing table.

Mode Privileged Exec

Usage Using this command with the `all` parameter, clears the RIP table of all the routes.

Examples To clear the route `10.0.0.0/8` from the RIP routing table, use the following command:

```
awplus# clear ip rip route 10.0.0.0/8
```

Examples (VRF Lite) To clear RIP routes associated with the VRF instance `red` for OSPF routes, use the following command:

```
awplus# clear ip rip vrf red route ospf
```

To clear the route 10.0.0.0/8 from the RIP routing table for the VRF instance `red`, use the following command:

```
awplus# clear ip rip vrf red route 10.0.0.0/8
```

debug rip

Use this command to specify the options for the displayed debugging information for RIP events and RIP packets.

Use the **no** variant of this command to disable the specified debug option.

Syntax

```
debug rip {events|nsm|<packet>|all}
no debug rip {events|nsm|<packet>|all}
```

Parameter	Description
`events`	RIP events debug information is displayed.
`nsm`	RIP and NSM communication is displayed.
<packet>	`packet [recv|send] [detail]` Specifies RIP packets only.
`recv`	Specifies that information for received packets be displayed.
`send`	Specifies that information for sent packets be displayed.
`detail`	Displays detailed information for the sent or received packet.
`all`	Displays all RIP debug information.

Default Disabled

Mode Privileged Exec and Global Configuration

Example The following example displays information about the RIP packets that are received and sent out from the device.

```
awplus# debug rip packet
```

Related Commands undebug rip

default-information originate (RIP)

Use this command to generate a default route into the Routing Information Protocol (RIP).

Use the **no** variant of this command to disable this feature.

Syntax

```
default-information originate
no default-information originate
```

Default Disabled

Mode Router Configuration

Usage If routes are being redistributed into RIP and the router's route table contains a default route, within one of the route categories that are being redistributed, the RIP protocol will advertise this default route, irrespective of whether the **default-information originate** command has been configured or not. However, if the router has not redistributed any default route into RIP, but you want RIP to advertise a default route anyway, then use this command.

This will cause RIP to create a default route entry in the RIP database. The entry will be of type RS (Rip Static). Unless actively filtered out, this default route will be advertised out every interface that is sending RIP. Split horizon does not apply to this route, as it is internally generated. This operates quite similarly to the OSPF **default-information originate always** command.

Example

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# default-information originate
```

default-metric (RIP)

Use this command to specify the metrics to be assigned to redistributed RIP routes.

Use the **no** variant of this command to reset the RIP metric back to its default (1).

Syntax

```
default-metric <metric>
no default-metric [<metric>]
```

Parameter	Diagnostic
<metric>	<1-16> Specifies the value of the default metric.

Default By default, the RIP metric value is set to 1.

Mode RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance

Usage This command is used with the **redistribute (RIP)** command to make the routing protocol use the specified metric value for all redistributed routes, regardless of the original protocol that the route has been redistributed from.

Examples This example assigns the cost of 10 to the routes that are redistributed into RIP.

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# default-metric 10
awplus(config-router)# redistribute ospf
awplus(config-router)# redistribute connected
```

Syntax (VRF Lite) This example assigns the cost of 10 to the routes which are redistributed into RIP for the VRF instance blue.

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address family ipv4 vrf blue
awplus(config-router-af)# default-metric 10
awplus(config-router-af)# redistribute ospf
awplus(config-router-af)# redistribute connected
```

Related Commands **redistribute (RIP)**

distance (RIP)

This command sets the administrative distance for RIP routes. Your device uses this value to select between two or more routes to the same destination obtained from two different routing protocols. The route with the smallest administrative distance value is added to the Forwarding Information Base (FIB). See **"Administrative Distance" on page 33.6** for more information.

The **no** variant of this command sets the administrative distance for the RIP route to the default of 120.

Syntax

```
distance <1-255> [<ip-addr/prefix-length> [<access-list>]]
no distance [<1-255>] [<ip-addr/prefix-length> [<access-list>]]
```

Parameter	Description
<1-255>	The administrative distance value you are setting for this RIP route.
<ip-addr/ prefix-length>	The network IP address and prefix-length that you are changing the administrative distance for.
<access-list>	Specifies the access-list name. This access list specifies which routes within the network *<ip-address/m>* this command applies to.

Mode RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance

Examples To set the administrative distance to `8` for the RIP routes within the `10.0.0.0/8` network that match the access-list `mylist`, use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# distance 8 10.0.0.0/8 mylist
```

To set the administrative distance to the default of `120` for the RIP routes within the `10.0.0.0/8` network that match the access-list `mylist`, use the commands:

```
awplus# configure terminal
awplus (config)# router rip
awplus(config-router)# no distance 8 10.0.0.0/8 mylist
```

Example (VRF Lite) This example assigns a cost of 10 to the routes for the VRF instance blue, when redistributed into RIP.

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address family ipv4 blue
awplus(config-router-af)# distance 10
```

distribute-list (RIP)

Use this command to filter incoming or outgoing route updates using the access-list or the prefix-list.

Syntax (VRF Lite) When running VRF-Lite, this command can be applied to a specific VRF instance.

Use the **no** variant of this command to disable this feature.

Syntax

```
distribute-list {<access-list> |prefix <prefix-list>} {in|out}
   [<interface>]

no distribute-list {<access-list> |prefix <prefix-list>} {in|out}
   [<interface>]
```

Parameter	Description
`prefix`	Filter prefixes in routing updates.
<access-list>	Specifies the IPv4 access-list number or name to use.
<prefix-list>	Specifies the name of the IPv4 prefix-list to use.
`in`	Filter incoming routing updates.
`out`	Filter outgoing routing updates.
<interface>	The interface on which distribute-list applies. For instance: vlan2

Default Disabled

Mode RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance

Usage Filter out incoming or outgoing route updates using access-list or prefix-list. If you do not specify the name of the interface, the filter will be applied to all interfaces.

Examples In this example the following commands are used to apply an access list called myfilter to filter incoming routing updates in VLAN2

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# distribute-list prefix myfilter in
vlan2
```

Example (VRF Lite)

This example applies the commands of the previous example, but to a specific VRF named blue:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# distribute-list prefix myfilter in
vlan2
```

Related Commands

access-list extended (named)
ip prefix-list

fullupdate (RIP)

Use this command to specify which routes RIP should advertise when performing a triggered update. By default, when a triggered update is sent, RIP will only advertise those routes that have changed since the last update. When **fullupdate** is configured, the switch advertises the full RIP route table in outgoing triggered updates, including routes that have not changed. This enables faster convergence times, or allow inter-operation with legacy network equipment, but at the expense of larger update messages.

Use the **no** variant of this command to disable this feature.

Syntax

```
fullupdate
no fullupdate
```

Default By default this feature is disabled.

Mode RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance

Usage (VRF Lite) If VRF-Lite is configured, you can apply this command for either the global routing environment, or to a specific VRF instance.

Examples Use the following commands to enable the fullupdate (RIP) function:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# fullupdate
```

Syntax (VRF Lite) Use the following commands to enable the full update (RIP) function on a the VRF instance named `blue`:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# fullupdate
```

ip rip authentication key-chain

Use this command to enable RIPv2 authentication on an interface and specify the name of the key chain to be used.

Use the **no** variant of this command to disable this function.

Syntax

```
ip rip authentication key-chain <key-chain-name>
no ip rip authentication key-chain
```

Parameter	Description
<key-chain-name>	Specify the name of the key chain. This is an alpha-numeric string, but it cannot include spaces.

Mode Interface Configuration for a VLAN interface.

Usage This command can only be used on VLAN interfaces. Use this command to perform authentication on the interface. Not configuring the key chain results in no authentication at all.

The AlliedWare Plus™ implementation provides the choice of configuring authentication for single key or multiple keys at different times. Use the **ip rip authentication string** command for single key authentication. Use the **ip rip authentication key-chain** command for multiple keys authentication. See **Chapter 35, RIP Configuration** for illustrated RIP configuration examples.

For multiple key authentication, use the following steps to configure a route to enable RIPv2 authentication using multiple keys at different times:

Step 1: Define a key chain:

In the Configure mode, identify a key chain with a key chain name using the following command:

```
awplus# configure terminal
awplus(config)# key chain <key-chain-name>
```

where *<key-chain-name>* is the name of the chain to manage, and should not include spaces.

Step 2: Define the key or keys:

In the Keychain mode, specify a key on this key chain using the following command:

```
awplus(config-keychain)# key <keyid>
```

where *<keyid>* (a decimal number in the range 1 to 2147483647) is the Key Identifier number.

Step 3: Define the authentication string or password:

In the Keychain-key mode, define the password used by a key, using the following command:

```
awplus(config-keychain-key)# key-string <key-password>
```

where *<key-password>* is a string of characters that can contain spaces, to be used as a password by the key.

Step 4: Set key management options:

This step can be performed at this stage or later when multiple keys are used.
The options are configured in the keychain-key command mode.

Set the time period during which the authentication key on a key chain is received as valid, using the **accept-lifetime** command:

```
awplus(config-keychain-key)# accept-lifetime <START> <END>
```

where <*START*> and <*END*> are the beginning and end of the time period.

Set the time period during which the authentication key on a key chain can be sent, using the **send-lifetime** command:

```
awplus(config-keychain-key)# send-lifetime <START> <END>
```

where <*START*> and <*END*> are the beginning and end of the time period.

Step 5: Enable authentication on an interface:

In the Interface Configuration mode, enable authentication on the VLAN interface `vlan3` and specify the key chain to be used, using the following commands:

```
awplusawpluls# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# ip rip authentication key-chain <key-chain-name>
```

where *<key-chain-name>* is a set of valid authentication keys.

Step 6: Specify the mode of authentication for the given interface:

In the Interface Configuration mode for a VLAN interface, specify whether the interface uses text or MD5 authentication using:

```
awplus(config-if)# ip rip authentication mode {md5|text}
```

Example In the following sample multiple keys authentication RIP configuration, a password `toyota` is set for key 1 in key chain `cars`. Authentication is enabled on `vlan2` and the authentication mode is set to MD5:

```
                    awplus# configure terminal
             awplus(config)# key chain cars
         awplus(config-keychain)# key 1
      awplus(config-keychain-key)# key-string toyota
      awplus(config-keychain-key)# accept-lifetime 10:00:00 Apr 08
                                   2008 duration 43200
      awplus(config-keychain-key)# send-lifetime 10:00:00 Apr 08
                                   2008 duration 43200
      awplus(config-keychain-key)# exit
         awplus(config-keychain)# exit
             awplus(config)# interface vlan2
           awplus(config-if)# ip rip authentication key-chain
                               cars
           awplus(config-if)# ip rip authentication mode md5
           awplus(confi-if)# exit
             awplus(config)# exit
                    awplus#
```

Example In the following example, the VLAN interface `vlan23` is configured to use key-chain authentication with the keychain `mykey`. See the **key** command for a description of how a key chain is created.

```
             awplus# configure terminal
        awplus(config)# interface vlan23
     awplus(config-if)# ip rip authentication key-chain mykey
```

Related Commands

accept-lifetime
send-lifetime
ip rip authentication mode
ip rip authentication string
key
key chain

ip rip authentication mode

Use this command to specify the type of authentication mode used for RIP v2 packets.

Use the **no** variant of this command to restore clear text authentication.

Syntax

```
ip rip authentication mode {md5|text}
no ip rip authentication mode
```

Parameter	Description
`md5`	Uses the keyed MD5 authentication algorithm.
`text`	Specifies clear text or simple password authentication.

Default Text authentication is enabled

Mode Interface Configuration for a VLAN interface.

Usage This command can only be configured on VLAN interfaces. The AlliedWare Plus™ implementation provides the choice of configuring authentication for single key or multiple keys at different times. Use the **ip rip authentication string** command for single key authentication. Use the **ip rip authentication key-chain** command for multiple keys authentication. See **Chapter 35, RIP Configuration** for illustrated RIP configuration examples.

Use the following steps to configure a route to enable RIPv2 authentication using a single key or password:

Step 1: Define the authentication string or password

In the Interface Configuration mode for the VLAN interface `vlan2`, specify the authentication string or password used by the key, using the following command:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip rip authentication string <auth-string>
```

where *<auth-string>* is the authentication string or password and it can include spaces.

Step 2: Specify the mode of authentication for the given interface:

In the Interface Configuration mode for VLAN interface `vlan2`, specify if the interface will use text or MD5 authentication, using the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip rip authentication mode {md5|text}
```

See the sample below to specify `mykey` as the authentication string with MD5

authentication, for the VLAN interface vlan2:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip rip authentication string mykey
awplus(config-if)# ip rip authentication mode md5
```

For multiple keys authentication, use the following steps to configure a route to enable RIPv2 authentication using multiple keys at different times:

Step 1: Define a key chain:

In the Global Configuration mode, identify a key chain with a key chain name using the following command:

```
awplus# configure terminal
awplus(config)# key chain <key-chain-name>
```

where *<key-chain-name>* is the name of the chain to manage, a text string with no spaces.

Step 2: Define the key or keys:

In the Keychain Configuration mode, specify a key on this key chain using the following command:

```
awplus(config-keychain)# key <keyid>
```

where *<keyid>* (a decimal number in the range 1 to 2147483647) is the Key Identifier number.

Step 3: Define the authentication string or password:

In the Keychain-key Configuration mode, define the password used by a key, using the following command:

```
awplus(config-keychain-key)# key-string <key-password>
```

where *<key-password>* is a string of characters that can include spaces, to be used as a password by the key.

Step 4: Set key management options:

This step can be performed at this stage or later when multiple keys are used.
The options are configured in the Keychain-key Configuration mode.

Set the time period during which the authentication key on a key chain is received as valid, using the **accept-lifetime** command:

```
awplus(config-keychain-key)# accept-lifetime <start> <end>
```

where *<start>* and *<end>* are the beginning and end of the time period.

Set the time period during which the authentication key on a key chain can be sent, using

the **send-lifetime** command:

```
awplus(config-keychain-key)# send-lifetime <start> <end>
```

where <*start*> and <*end*> are the beginning and end of the time period.

Step 5: Enable authentication on an interface:

In the Interface Configuration mode, enable authentication on an interface and specify the key chain to be used, using the following command:

```
awplus(config-if)# ip rip authentication key-chain <key-
                   chain-name>
```

where <*key-chain-name*> is a set of valid authentication keys, as defined in Step 1.

Step 6: Specify the mode of authentication for the given interface:

In the Interface Configuration mode, specify whether the interface uses text or MD5 authentication using:

```
awplus(config-if)# ip rip authentication mode {md5|text}
```

Example In the following sample multiple keys authentication RIP configuration, a password `toyota` is set for key 1 in key chain `cars`. Authentication is enabled on `vlan2` and the authentication mode is set to MD5:

```
                    awplus# configure terminal
             awplus(config)# key chain cars
      awplus(config-keychain)# key 1
awplus(config-keychain-key)# key-string toyota
awplus(config-keychain-key)# accept-lifetime 10:00:00 Apr 08
                            2008 duration 43200
awplus(config-keychain-key)# send-lifetime 10:00:00 Apr 08 2008
                            duration 43200
awplus(config-keychain-key)# exit
      awplus(config-keychain)# exit
             awplus(config)# interface vlan2
           awplus(config-if)# ip rip authentication key-chain
                            cars
           awplus(config-if)# ip rip authentication mode md5
            awplus(confi-if)# exit
             awplus(config)# exit
                    awplus#
```

Example The following example shows md5 authentication configured on VLAN interface `vlan2`,

ensuring authentication of rip packets received on this interface.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip rip authentication mode md5
```

Related Commands **ip rip authentication string**
ip rip authentication key-chain

ip rip authentication string

Use this command to specify the authentication string or password used by a key.

Use the **no** variant of this command to remove the authentication string.

Syntax

```
ip rip authentication string <auth-string>
no ip rip authentication string
```

Parameter	Description
<auth-string>	The authentication string or password used by a key. It is an alpha-numeric string and can include spaces.

Mode Interface Configuration for a VLAN interface.

Usage This command can only be configured on VLAN interfaces. The AlliedWare Plus™ implementation provides the choice of configuring authentication for single key or multiple keys at different times. Use this command to specify the password for a single key on an interface. Use the **ip rip authentication key-chain** command for multiple keys authentication. See **Chapter 35, RIP Configuration** for further RIP configuration examples.

Use the following steps to configure a route to enable RIPv2 authentication using a single key or password:

Step 1: Define the authentication string or password:

In the Interface Configuration mode, specify the authentication string or password used by the key, using the following commands to configure the authentication string on the VLAN interface `vlan3`:

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# ip rip authentication string <auth-string>
```

where *<auth-string>* is the authentication string or password.

Step 2: Specify the mode of authentication for the given interface:

In the Interface Configuration mode for a VLAN, specify if the interface will use text or MD5 authentication, using the following command:

```
awplus(config-if)# ip rip authentication mode {md5|text}
```

Example See the example below to specify `mykey` as the authentication string with MD5

authentication for the VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip rip authentication string mykey
awplus(config-if)# ip rip authentication mode md5
```

Example In the following example, the VLAN interface `vlan2` is configured to have an authentication string as `guest`. Any received RIP packet in that interface should have the same string as password.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip rip authentication string guest
```

Related commands **ip rip authentication key-chain**
ip rip authentication mode

ip rip receive-packet

Use this command to configure the interface to enable the reception of RIP packets.

Use the **no** variant of this command to disable this feature.

Syntax

```
ip rip receive-packet
no ip rip receive-packet
```

Default Receive-packet is enabled

Mode Interface Configuration for a VLAN interface.

Usage This command can only be configured on VLAN interfaces.

Example This example shows packet receiving being turned on for the VLAN interface `vlan3`:

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# ip rip receive-packet
```

Related Commands ip rip send-packet

ip rip receive version

Use this command to specify the version of RIP packets accepted on an interface and override the setting of the version command.

Use the **no** variant of this command to use the setting specified by the **version** command on page 36.54.

Syntax

```
ip rip receive version {[1][2]}
no ip rip receive version
```

Parameter	Description
1	Specifies acceptance of RIP version 1 packets on the interface.
2	Specifies acceptance of RIP version 2 packets on the interface.

Default Version 2

Mode Interface Configuration for a VLAN interface.

Usage This command can only be configured on VLAN interfaces. This command applies to a specific VLAN interface and overrides any the version specified by the **version** command.

RIP can be run in version 1 or version 2 mode. Version 2 has more features than version 1; in particular RIP version 2 supports authentication and classless routing. Once the RIP version is set, RIP packets of that version will be received and sent on all the RIP-enabled interfaces.

Example In the following example, the VLAN interface `vlan3` is configured to receive both RIP version 1 and 2 packets:

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# ip rip receive version 1 2
```

Related Commands **version**

ip rip send-packet

Use this command to enable sending RIP packets through the current interface.

Use the **no** variant of this command to disable this feature.

Syntax

```
ip rip send-packet
no ip rip send-packet
```

Default Send packet is enabled

Mode Interface Configuration for a VLAN interface.

Usage This command can only be configured on VLAN interfaces.

Example This example shows packet sending being turned on for the VLAN interface `vlan4`:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ip rip send-packet
```

Related Commands ip rip receive-packet

ip rip send version

Use this command in Interface Configuration mode to specify the version of RIP packets sent on an interface and override the setting of the **version** command. This mechanism causes RIP version 2 interfaces to send multicast packets instead of broadcasting packets.

Use the **no** variant of this command to use the setting specified by the **version** command.

Syntax

```
ip rip send version {1|2|1 2|2 1}
no ip rip send version
```

Parameter	Description
1	Specifies the sending of RIP version 1 packets out of an interface.
2	Specifies the sending of RIP version 2 packets out of an interface.
1 2	Specifies the sending of both RIP version 1 and RIP version 2 packets out of an interface.
2 1	Specifies the sending of both RIP version 2 and RIP version 1 packets out of an interface.

Default RIP version 2 is enabled by default.

Mode Interface Configuration for a VLAN interface.

Usage This command applies to a specific interface and overrides the version specified by the **version** command.

RIP can be run in version 1 or version 2 mode. Version 2 has more features than version 1; in particular RIP version 2 supports authentication and classless routing. Once the RIP version is set, RIP packets of that version will be received and sent on all the RIP-enabled interfaces. Selecting version parameters `1 2` or `2 1` sends RIP version 1 and 2 packets.

Use the **ip rip send version 1-compatible** command in an environment where you cannot send multicast packets. For example, in environments where multicast is not enabled and where hosts do not listen to multicast.

Examples In the following example, the VLAN interface `vlan4` is configured to send both RIP version 1 and 2 packets.

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ip rip send version 1 2
```

In the following example, the VLAN interface `vlan4` is configured to send both RIP version 2 and 1 packets.

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ip rip send version 2 1
```

In the following example, the VLAN interface `vlan4` is configured to send RIP version 1 packets only.

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ip rip send version 1
```

In the following example, the VLAN interface `vlan4` is configured to send RIP version 2 packets only.

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ip rip send version 2
```

In the following example, the VLAN interface `vlan3` is configured to use the RIP version specified by the **version** command.

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# no ip rip send version
```

Related Commands **ip rip send version 1-compatible**
version

ip rip send version 1-compatible

Use this command in Interface Configuration mode to send RIP version 1 compatible packets from a RIP version 2 interfaces to other RIP Interfaces. This mechanism causes RIP version 2 interfaces to send broadcast packets instead of multicasting packets, and is used in environments where multicast is not enabled or where hosts do not listen to multicast.

Use the **no** variant of this command to use the setting specified by the **version** command, and disable the broadcast of RIP version 2 packets that are sent as broadcast packets.

Syntax

```
ip rip send version 1-compatible

no ip rip send version
```

Parameter	Description
`1-compatible`	Specify this parameter to send RIP version 1 compatible packets from a version 2 RIP interface to other RIP interfaces. This mechanism causes version 2 RIP interfaces to broadcast packets instead of multicasting packets.

Default RIP version 2 is enabled by default.

Mode Interface Configuration for a VLAN interface.

Usage This command applies to a specific interface and overrides the version specified by the **version** command.

RIP can be run in version 1 compatible mode. Version 2 has more features than version 1; in particular RIP version 2 supports authentication and classless routing. Once the RIP version is set, RIP packets of that version will be received and sent on all the RIP-enabled interfaces.

Use the **ip rip send version** command in an environment where you can send multicast packets. For example, in environments where multicast is enabled and where hosts listen to multicast.

Examples In the following example, the VLAN interface `vlan2` is configured to send RIP version 1-compatible packets.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip rip send version 1-compatible
```

In the following example, the VLAN interface `vlan3` is configured to use the RIP version specified by the **version** command.

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# no ip rip send version
```

Related Commands **ip rip send version**
version

ip rip split-horizon

Use this command to perform the split-horizon action on the interface. The default is split-horizon poisoned.

Use the **no** variant of this command to disable this function.

Syntax

```
ip rip split-horizon [poisoned]
no ip rip split-horizon
```

Parameter	Description
`poisoned`	Performs split-horizon with poisoned reverse.

Default Split horizon poisoned is the default.

Mode Interface Configuration for a VLAN interface.

Usage This command can only be configured on VLAN interfaces. Use this command to avoid including routes in updates sent to the same gateway from which they were learned. Using the **split horizon** command omits routes learned from one neighbor, in updates sent to that neighbor. Using the **poisoned** parameter with this command includes such routes in updates, but sets their metrics to infinity. Thus, advertising that these routes are not reachable.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip rip split-horizon poisoned
```

key

Use this command to manage, add and delete authentication keys in a key-chain.

Use the **no** variant of this command to delete the authentication key.

Syntax

```
key <keyid>
no key <keyid>
```

Parameter	Description
<keyid>	<0-2147483647> Key identifier number.

Mode Keychain Configuration

Usage This command allows you to enter the keychain-key mode where a password can be set for the key.

Example The following example configures a key number 1 and shows the change into a **keychain-key** command mode prompt.

```
awplus# configure terminal
awplus(config)# key chain mychain
awplus(config-keychain)# key 1
awplus(config-keychain-key)#
```

Related Commands

key chain
key-string
accept-lifetime
send-lifetime

key chain

Use this command to enter the key chain management mode and to configure a key chain with a key chain name.

Use the **no** variant of this command to remove the key chain and all configured keys.

Syntax

```
key chain <key-chain-name>
no key chain <key-chain-name>
```

Parameter	Description
<key-chain-name>	Specify the name of the key chain to manage.

Mode Global Configuration

Usage This command allows you to enter the keychain mode from which you can specify keys on this key chain.

Example The following example shows the creation of a key chain named `mychain` and the change into **keychain** mode prompt.

```
awplus# configure terminal
awplus(config)# key chain mychain
awplus(config-keychain)#
```

Related Commands

key
key-string
accept-lifetime
send-lifetime

key-string

Use this command to define the password to be used by a key.

Use the **no** variant of this command to remove a password.

Syntax

```
key-string <key-password>
no key-string
```

Parameter	Description
<key-password>	A string of characters to be used as a password by the key.

Mode Keychain-key Configuration

Usage Use this command to specify passwords for different keys.

Examples In the following example, the password for `key1` in the key chain named `mychain` is set to password **prime**:

```
awplus# configure terminal
awplus(config)# key chain mychain
awplus(config-keychain)# key 1
awplus(config-keychain-key)# key-string prime
```

In the following example, the password for `key1` in the key chain named `mychain` is removed:

```
awplus# configure terminal
awplus(config)# key chain mychain
awplus(config-keychain)# key 1
awplus(config-keychain-key)# no key-string
```

Related Commands

key
key chain
accept-lifetime
send-lifetime

maximum-prefix

Use this command to configure the maximum number of RIP routes stored in the routing table.

Use the **no** variant of this command to disable all limiting of the number of RIP routes stored in the routing table.

Syntax

```
maximum-prefix <maxprefix> [<threshold>]
no maximum-prefix
```

Parameter	Description
<maxprefix>	<1-65535> The maximum number of RIP routes allowed.
<threshold>	<1-100> Percentage of maximum routes to generate a warning. The default threshold is 75%.

Mode Router Configuration

Example

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# maximum-prefix 150
```

neighbor (RIP)

Use this command to specify a neighbor router. It is used for each router to which you wish to send unicast RIP updates.

Use the **no** variant of this command to stop sending unicast updates to the specific router.

Syntax

```
neighbor <ip-address>
no neighbor <ip-address>
```

Parameter	Description
<ip-address>	The IP address of a neighboring router with which the routing information will be exchanged.

Default Disabled

Mode Router Configuration

Usage Use this command to exchange nonbroadcast routing information. It can be used multiple times for additional neighbors.

The **passive-interface (RIP)** command disables sending routing updates on an interface. Use the `neighbor` command in conjunction with the **passive-interface (RIP)** to send routing updates to specific neighbors.

Example

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# passive-interface vlan1
awplus(config-router)# neighbor 1.1.1.1
```

Related Commands **passive-interface (RIP)**

network (RIP)

Use this command to activate the transmission of RIP routing information on the defined network.

Use the **no** variant of this command to remove the specified network or VLAN as one that runs RIP.

Syntax

```
network {<network-address>[/<subnet-prefix-length>]|<vlan-name>}
no network {<network-address>[/<subnet-mask>]|<vlan-name>}
```

Parameter	Description
<network-address> [/<subnet-prefix-length>]	Specifies the network address to run RIP. Entering a subnet mask (or prefix length) for the network address is optional. Where no mask is entered, the switch will attempt to apply a mask that is appropriate to the class (A, B, or C) of the address entered, i.e. an IP address of 10.0.0.0 will have a prefix length of 8 applied to it.
<vlan-name>	Specify a VLAN name with up to 32 alphanumeric characters to run RIP.

Default Disabled

Mode RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance

Usage Use this command to specify networks, or VLANs, to which routing updates will be sent and received. The connected routes corresponding to the specified network, or VLANs, will be automatically advertised in RIP updates. RIP updates will be sent and received within the specified network or VLAN.

Note (VRF Lite) When running VRF-Lite, this command can be applied to a VRF instance.

Example Use the following commands to activate RIP routing updates on network 172.16.20.0/24:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# network 172.16.20.0/24
```

(VRF Lite) Wo activate RIP routing updates on `vlan3` for VRF instance `blue`.

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# network vlan3
```

Related Commands

show ip rip
show running-config
clear ip rip route

offset-list (RIP)

Use this command to add an offset to the **in** and **out** metrics of routes learned through RIP.

Use the **no** variant of this command to remove the offset list.

Syntax

```
offset-list <access-list> {in|out} <offset> [<interface>]
no offset-list <access-list> {in|out} <offset> [<interface>]
```

Parameter	Description
<access-list>	Specifies the access-list number or names to apply.
`in`	Indicates the access list will be used for metrics of incoming advertised routes.
`out`	Indicates the access list will be used for metrics of outgoing advertised routes.
<offset>	`<0-16>` Specifies that the offset is used for metrics of networks matching the access list.
<interface>	An alphanumeric string that specifies the interface to match.

Default The default `offset value` is the metric value of the interface over which the updates are being exchanged.

Mode RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance

Usage Use this command to specify the offset value that is added to the routing metric. When the networks match the access list the offset is applied to the metrics. No change occurs if the offset value is zero.

Examples In this example the router examines the RIP updates being sent out from interface `vlan2` and adds `5` hops to the routes matching the ip addresses specified in the access list `8`.

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# offset-list 8 in 5 vlan2
```

To apply this same command within the specific VRF instance named `blue`, use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# offset-list 8 in 5 vlan2
```

Related Commands **access-list (extended numbered)**
access-list (standard numbered)

passive-interface (RIP)

Use this command to block RIP broadcasts on the VLAN interface.

Use the **no** variant of this command to disable this function.

Syntax

```
passive-interface <interface>
no passive-interface <interface>
```

Parameter	Description
<interface>	Specifies the interface name.

Default Disabled

Mode RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance

Usage This command can only be configured for VLAN interfaces.

Examples Use the following commands to block RIP broadcasts on vlan20:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# passive-interface vlan20
```

Example (VRF Lite) To apply this above example to a specific VRF instance named `green`, use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf green
awplus(config-router-af)# passive-interface vlan20
```

Related Commands show ip rip

recv-buffer-size (RIP)

Use this command to run-time configure the RIP UDP (User Datagram Protocol) receive-buffer size to improve UDP reliability by avoiding UDP receive buffer overrun.

Use the **no** variant of this command to reset the configured RIP UDP receive-buffer size to the system default (196608 bits).

Syntax

```
recv-buffer-size <8192-2147483647>

no recv-buffer-size [<8192-2147483647>]
```

Parameter	Description
<8192-2147483647>	Specify the RIP UDP (User Datagram Protocol) buffer size value in bits.

Default 196608 bits is the system default when reset using the **no** variant of this command.

Mode Router Configuration

Examples

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# recv-buffer-size 23456789

awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# no recv-buffer-size 23456789
```

redistribute (RIP)

Use this command to redistribute information from other routing protocols into RIP.

Example (VRF Lite) When using VRF-Lite, you can apply this command to a specific VRF instance.

Use the **no** variant of this command to disable the specified redistribution. The parameters **metric** and **routemap** may be used on this command, but have no effect.

Syntax

```
redistribute {connected|static|ospf|bgp} [metric <0-16>] [routemap
   <routemap>]
no redistribute {connected|static|ospf|bgp} [metric] [routemap]
```

Parameter	Description
`routemap`	Optional. Specifies route-map that controls how routes are redistributed.
<routemap>	Optional. The name of the route map.
`connected`	Redistribute from connected routes.
`static`	Redistribute from static routes.
`ospf`	Redistribute from Open Shortest Path First (OSPF).
`bgp`	Redistribute from Border Gateway Protocol (BGP).
`metric <0-16>`	Optional. Sets the value of the metric that will be applied to routes redistributed into RIP from other protocols. If a value is not specified, and no value is specified using the **default-metric (RIP)** command, the default is one.

Default By default, the RIP metric value is set to 1.

Mode RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance

Examples To apply the metric value 15 to static routes being redistributed into RIP, use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# redistribute static metric 15
```

Example (VRF Lite) To apply the metric value 15 to static routes in address-family ipv4 VRF instance `blue` being redistributed into RIP, use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# redistribute static metric 15
```

Related Commands **default-metric (RIP)**

restart rip graceful

Use this command to force the RIP process to restart, and optionally set the grace-period.

Syntax `restart rip graceful [grace-period <1-65535>]`

Mode Privileged Exec

Default The default RIP grace-period is 60 seconds.

Usage After this command is executed, the RIP process immediately shuts down. It notifies the system that RIP has performed a graceful shutdown. Routes that have been installed into the route table by RIP are preserved until the specified grace-period expires.

When a **restart rip graceful** command is issued, the RIP configuration is reloaded from the last saved configuration. Ensure you first enter the command **copy running-config startup-config**.

When a master failover happens on a VCStack, the RIP grace-period will apply the larger value of either, the setting's configured value, or its default of 60 seconds.

Example To apply a restart rip graceful setting, grace-period to 100 seconds use the following commands:

```
awplus# copy running-config startup-config
awplus# restart rip graceful grace-period 100
```

rip restart grace-period

Use this command to change the grace period of RIP graceful restart.

Use the **no** variant of this command to disable this function.

Syntax

```
rip restart grace-period <1-65535>
no rip restart grace-period <1-65535>
```

Mode Global Configuration

Default The default RIP grace-period is 60 seconds.

Usage Use this command to enable the **Graceful Restart** feature on the RIP process. Entering this command configures a grace period for RIP.

When a master failover happens on a VCStack, the RIP grace-period will be the longest period between the default value (60 seconds is the default RIP grace-period) and the configured RIP grace-period value from this command. So the configured RIP grace-period value will not be used for a VCStack master failover if it is shorter than the default RIP grace-period value.

Example

```
awplus# configure terminal
awplus(config)# rip restart grace-period 200
```

route (RIP)

Use this command to configure static RIP routes.

Use the **no** variant of this command to disable this function.

Syntax

```
route <ip-addr/prefix-length>
no route <ip-addr/prefix-length>
```

Parameter	Description
<ip-addr/prefix-length>	The IPv4 address and prefix length.

Default No static RIP route is added by default.

Mode RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance

Usage Use this command to add a static RIP route. After adding the RIP route, the route can be checked in the RIP routing table.

Example To create a static RIP route to IP subnet `192.168.1.0/24`, use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# route 192.168.1.0/24
```

Example (VRF Lite) To create a static RIP route to IP subnet `192.168.1.0/24`, for the VRF instance `red`, use the following commands

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf red
awplus(config-router-af)# route 192.168.1.0/24
```

Related Commands

show ip rip
clear ip rip route

router rip

Use this global command to enter Router Configuration mode to enable the RIP routing process.

Use the **no** variant of this command to disable the RIP routing process.

Syntax

```
router rip
no router rip
```

Mode Global Configuration

Example This command is used to begin the RIP routing process:

```
                awplus# configure terminal
        awplus(config)# router rip
  awplus(config-router)# version 1
  awplus(config-router)# network 10.10.10.0/24
  awplus(config-router)# network 10.10.11.0/24
  awplus(config-router)# neighbor 10.10.10.10
```

Related Commands network (RIP)
version

send-lifetime

Use this command to specify the time period during which the authentication key on a key chain can be sent.

Syntax

```
send-lifetime <start-date>{<end-date>|duration <seconds>|infinite}
no send-lifetime
```

Parameter	Description	
<start-date>	Specifies the start period - time and date in the format DD MMM YYYY or MMM DD YYYY: *<hh:mm:ss> {<day> <month> <year> | <month> <day> <year>}*	
	<hh:mm:ss>	Time of the day when send-lifetime starts, in hours, minutes and seconds
	<day>	<1-31> Specifies the day of the month to start.
	<month>	Specifies the month of the year to start (the first three letters of the month, for example, Jan).
	<year>	<1993-2035> Specifies the year to start.
<end-date>	Specifies the end period - time and date in the format DD MMM YYYY or MMM DD YYYY: *<hh:mm:ss> {<day> <month> <year> | <month> <day> <year>}*	
	<hh:mm:ss>	Time of the day when lifetime expires, in hours, minutes and seconds.
	<day>	<1-31> Specifies the day of the month to expire.
	<month>	Specifies the month of the year to expire (the first three letters of the month, for example, Feb).
	<year>	<1993-2035> Specifies the year to expire.
<seconds>	<1-2147483646> Duration of the key in seconds.	
infinite	Never expires.	

Mode Keychain-key Configuration

Example The following example shows the setting of send-lifetime for key1 on the key chain named mychain.

```
awplus# configure terminal
awplus(config)# key chain mychain
awplus(config-keychain)# key 1
awplus(config-keychain-key)# send-lifetime 03:03:01 Jan 3 2004
04:04:02 Dec 6 2006
```

show debugging rip

Use this command to display the RIP debugging status for these debugging options: nsm debugging, RIP event debugging, RIP packet debugging and RIP nsm debugging.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show debugging rip
```

Mode

User Exec and Privileged Exec

Usage

Use this command to display the debug status of RIP.

Example

```
awplus# show debugging rip
```

show ip protocols rip

Use this command to display RIP process parameters and statistics.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show ip protocols rip`

Mode User Exec and Privileged Exec

Example

```
awplus# show ip protocols rip
```

Output **Figure 36-1: Example output from the show ip protocols rip command:**

```
Routing Protocol is "rip"
Sending updates every 30 seconds with +/-50%, next due in 12
seconds
Timeout after 180 seconds, garbage collect after 120 seconds
Outgoing update filter list for all interface is not set
Incoming update filter list for all interface is not set
Default redistribution metric is 1
Redistributing: connected static
Default version control: send version 2, receive version 2
Interface         Send  Recv   Key-chain
   vlan25           2     2
Routing for Networks:
  10.10.0.0/24
Routing Information Sources:
  Gateway          BadPackets BadRoutes  Distance Last Update
Distance: (default is 120
```

show ip rip

Use this command to show RIP routes.

For information on output options, see "Controlling "show" Command Output" on page 1.38.

Syntax `show ip rip`

Mode User Exec and Privileged Exec

Example

```
awplus# show ip rip
```

Output **Figure 36-2: Example output from the show up rip command**

```
awplus#show ip rip
Codes: R - RIP, Rc - RIP connected, Rs - RIP static
       C - Connected, S - Static, O - OSPF, B - BGP
Network        Next Hop Metric From If   Time
C 10.0.1.0/24             1      vlan20
S 10.10.10.0/24           1      vlan20
C 10.10.11.0/24           1      vlan20
S 192.168.101.0/24        1      vlan20
R 192.192.192.0/24        1      --
```

Related Commands route (RIP)
network (RIP)
clear ip rip route

For VRF Lite show ip rip vrf interface

show ip rip database

Use this command to display information about the RIP database.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show ip rip database [full]`

Parameter	Description
`full`	Specify the full RIP database including sub-optimal RIP routes.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip rip database
awplus# show ip rip database full
```

Related Commands **show ip rip**

show ip rip interface

Use this command to display information about the RIP interfaces. You can specify an interface name to display information about a specific interface.

Syntax `show ip rip interface [<interface>]`

Parameter	Description
<interface>	The interface to display information about. For instance: `vlan2`.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip rip interface
```

show ip rip vrf database

VRF Lite Only Use this command to display information about the RIP database that is associated with a specific VRF instance.

Entering this command with the **full** option included, will display information about the full RIP database (including sub-optimal routes) associated with a specific VRF instance.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show ip rip {vrf <vrf-name>|global} database [full]
```

Parameter	Description
`vrf`	Specific VRF instance.
`<vrf-name>`	The name of the VRF instance.
`global`	The global routing and forwarding table.
`full`	Specify the full RIP database including sub-optimal RIP routes.

Mode User Exec and Privileged Exec

Example To display information about the RIP database associated with a VRF instance `blue`, use the command:.

```
awplus# show ip rip vrf blue database
```

Output **Figure 36-3: Example output from the show ip rip vrf blue database command**

```
Codes: R - RIP, Rc - RIP connected, Rs - RIP static
       C - Connected, S - Static, O - OSPF, B - BGP

   Network            Next Hop         Metric From            If       Time
Rc 192.168.30.0/24                          1                 vlan3
R  192.168.45.0/24    192.168.30.1          2 192.168.30.1    vlan3    02:46
```

Related Commands **show ip rip**

show ip rip vrf interface

Use this command to display information about the RIP interfaces that are associated with a specific VRF instance.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show ip rip {vrf <vrf-name>|global} interface [<interface-name>]`

Parameter	Description
`vrf`	Specific VRF instance.
`<vrf-name>`	The name of the VRF instance.
`global`	The global routing and forwarding table.
`<interface-name>`	The IP RIP interface (VLAN).

Mode User Exec and Privileged Exec

Example To display information about the RIP database associated with a VRF instance `blue`, use the command:.

```
awplus# show ip rip vrf blue interface
```

Output **Figure 36-4: Example output from the show ip rip vrf blue interface vlan3 command**

```
Codes: R - RIP, Rc - RIP connected, Rs - RIP static
       C - Connected, S - Static, O - OSPF, B - BGP

   Network            Next Hop         Metric From            If       Time
Rc 192.168.30.0/24                          1                 vlan3
R  192.168.45.0/24    192.168.30.1 2    192.168.30.1          vlan3    02:46
```

Note

The Time parameter operates as follows:
- RIP updates occur approximately every 30 seconds.
- Each update resets a count-down timer to 180 seconds (3 minutes).
- The Time parameter displays the count-down from the last reset.

Related Commands **show ip rip**

timers (RIP)

Use this command to adjust routing network timers.

Use the **no** variant of this command to restore the defaults.

Syntax

```
timers basic <update> <timeout> <garbage>
no timers basic
```

Parameter	Description
<update>	<5-2147483647> Specifies the period at which RIP route update packets are transmitted. The default is 30 seconds.
<timeout>	<5-2147483647> Specifies the routing information timeout timer in seconds. The default is 180 seconds. After this interval has elapsed and no updates for a route are received, the route is declared invalid.
<garbage>	<5-2147483647> Specifies the routing garbage collection timer in seconds. The default is 120 seconds.

Default Enabled

Mode RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance

Usage This command adjusts the RIP timing parameters.

The update timer is the time between sending out updates, that contain the complete routing table, to every neighboring router.

If an update for a given route has not been seen for the time specified by the timeout parameter, that route is no longer valid. However, it is retained in the routing table for a short time, with metric 16, so that neighbors are notified that the route has been dropped.

When the time specified by the garbage parameter expires the metric 16 route is finally removed from the routing table. Until the garbage time expires, the route is included in all updates sent by the router.

All the routers in the network must have the same timers to ensure the smooth operation of RIP throughout the network.

Examples

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# timers basic 30 180 120
```

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# timers basic 30 180 120
```

undebug rip

Use this command to disable the options set for debugging information of RIP events, packets and communication between RIP and NSM.

This command has the same effect as the **no debug rip** command.

Syntax `undebug rip {all|events|nsm|<packet>}`

Parameter	Description
`all`	Disables all RIP debugging.
`events`	Disables the logging of RIP events.
`nsm`	Disables the logging of RIP and NSM communication.
<packet>	`packet [recv|send] [detail]` Disables the debugging of RIP packets.
`recv`	Disables the logging of received packet information.
`send`	Disables the logging of sent packet information.
`detail`	Disables the logging of sent or received RIP packets.

Mode Privileged Exec

Example

```
awplus# undebug rip packet
```

Related Commands **debug rip**

version

Use this command to specify a RIP version used globally by the router. If VRF- Lite is configured, you can specify a RIP version either globally, or for a particular VRF instance.

Use the **no** variant of this command to restore the default version.

Syntax

```
version {1|2}
no version
```

Parameter	Description
1|2	Specifies the version of RIP processing.

Default Version 2

Mode RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance

Usage RIP can be run in version 1 or version 2 mode. Version 2 has more features than version 1; in particular RIP version 2 supports authentication and classless routing. Once the RIP version is set, RIP packets of that version will be received and sent on all the RIP-enabled interfaces.

Setting the version command has no impact on receiving updates, only on sending them. The **ip rip send version** command overrides the value set by the **version** command on an interface-specific basis. The **ip rip receive version** command allows you to configure a specific interface to accept only packets of the specified RIP version. The **ip rip receive version** command and the **ip rip send version** command override the value set by this command.

Examples

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# version 1
```

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# version 1
```

Validation Commands **show running-config**

```
awplus#show running-config
!
router rip
 version 1
!
```

Related Commands **ip rip receive version**
ip rip send version

Chapter 37: RIPng for IPv6 Configuration

Introduction 37.2
Enabling RIPng 37.2
Troubleshooting RIPng Adjacency 37.5

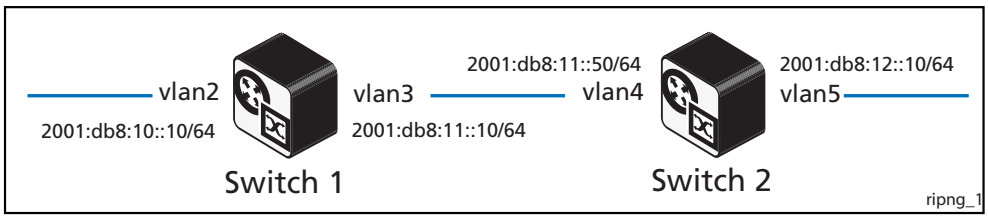
Introduction

This chapter contains a basic RIPng configuration example. To see details on the RIPng commands used in these examples, or to see the outputs of the Validation commands, refer to **Chapter 38, RIPng for IPv6 Commands**.

Enabling RIPng

This example shows the minimum configuration required for enabling RIPng on an interface. Switch 1 and Switch 2 are two switches connected via network **2001:db8:11::/64**.

To enable RIPng, first add IPv6 addresses to interfaces and then enable RIPng on each interface.



Switch 1

`awplus#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config)#` `router ipv6 rip`	Globally enable RIPng routing on `Switch 1` and enter Router Configuration mode.
`awplus(config-router)#` `exit`	Exit Router Configuration mode and return to Global Configuration mode.
`awplus(config)#` `interface vlan2`	Specify the interface (`vlan2`) and enter the Interface Configuration mode.
`awplus(config-if)#` `ipv6 address 2001db8:10::10/64`	Configure the IPv6 address on interface `vlan2`.
`awplus(config-if)#` `ipv6 router rip`	Enable RIPng routing on interface `vlan2`.
`awplus(config-if)#` `exit`	Exit Interface mode and enter Global Configuration mode.
`awplus(config)#` `interface vlan3`	Specify the interface (`vlan3`) and enter the Interface Configuration mode.

Switch 1(cont.)

`awplus(config-if)#`	
`ipv6 address 2001db8:11::10/64`	Configure the IPv6 address on interface `vlan3`.
`awplus(config-if)#`	
`ipv6 router rip`	Enable RIPng routing on interface `vlan3`.
`awplus(config-if)#`	
`exit`	Exit Interface mode and enter Global Configuration mode.
`awplus(config)#`	
`router ipv6 rip`	Define a RIPng routing process and enter Router Configuration mode.
`awplus(config-router)#`	
`exit`	Exit Router Configuration mode and return to Global Configuration mode.
`awplus(config)#`	
`exit`	Exit Global Configuration mode and return to Privileged Exec mode.

Switch 2

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`router ipv6 rip`	Globally enable RIPng routing on `Switch 2` and enter Router Configuration mode.
`awplus(config-router)#`	
`exit`	Exit Router Configuration mode and return to Global Configuration mode.
`awplus(config)#`	
`interface vlan5`	Specify the interface (`vlan5`) and enter the Interface Configuration mode.
`awplus(config-if)#`	
`ipv6 address 2001db8:12::10/64`	Configure the IPv6 address on interface `vlan5`.
`awplus(config-if)#`	
`ipv6 router rip`	Enable RIPng routing on interface `vlan5`
`awplus(config-if)#`	
`exit`	Exit Interface mode and enter Global Configuration mode.
`awplus(config)#`	
`interface vlan4`	Specify the interface (`vlan4`) and enter the Interface Configuration mode.

Switch 2 (cont.)

`awplus(config-if)#`	
`ipv6 address 2001db8:11::50/64`	Configure the IPv6 address on interface `vlan4`.
`awplus(config-if)#`	
`ipv6 router rip`	Enable RIPng routing on interface `vlan4`.
`awplus(config-if)#`	
`exit`	Exit Interface mode and enter Global Configuration mode.
`awplus(config)#`	
`router ipv6 rip`	Define a RIPng routing process and enter Router Configuration mode.
`awplus(config-router)#`	
`exit`	Exit Router Configuration mode and return to Global Configuration mode.
`awplus(config)#`	
`exit`	Exit Global Configuration mode and return to Privileged Exec mode.

Names of Commands Used

router ipv6 rip
ipv6 router rip

Validation Commands

show ipv6 rip

Troubleshooting RIPng Adjacency

Follow the steps below to troubleshoot RIPng adjacency:

Step 1. Confirm the Interface is not shutdown

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`router ipv6 rip`	Globally enable RIPng routing on the Switch and enter Router Configuration mode.
`awplus(config-router)#`	
`exit`	Exit Router Configuration mode and return to Global Configuration mode.
`awplus(config)#`	
`interface vlan2`	Specify the interface (`vlan2`) and enter the Interface mode.
`awplus(config-if)#`	
`no shutdown`	Ensure the interface is not administratively shutdown.
`awplus(config-if)#`	
`exit`	Exit Interface Configuration mode and enter Global Configuration mode.
`awplus(config)#`	
`exit`	Exit Global Configuration mode and return to Privileged Exec mode.
`awplus#`	
`show ipv6 interface brief`	Use the `show interface` command to make sure that the interface is not administratively shutdown.

Step 2. Confirm RIPng is enabled on the interface

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`router ipv6 rip`	Globally enable RIPng routing on the Switch.
`awplus(config-router)#`	
`exit`	Exit Router Configuration mode and return to Global Configuration mode.
`awplus(config)#`	
`interface vlan2`	Specify the interface (`vlan2`) and enter the Interface Configuration mode.

Step 2. Confirm RIPng is enabled on the interface(cont.)

`awplus(config)#`	
`interface vlan2`	Specify the interface (`vlan2`) and enter the Interface Configuration mode.
`awplus(config-if)#`	
`ipv6 router rip`	Enable RIPng routing on interface `vlan2`.
`awplus(config-if)#`	
`exit`	Exit Interface Configuration mode and enter Global Configuration mode.
`awplus(config)#`	
`router ipv6 rip`	Define a RIPng routing process and enter Router Configuration mode.
`awplus(config-router)#`	
`exit`	Exit Router Configuration mode and return to Global Configuration mode.
`awplus(config)#`	
`exit`	Exit Global Configuration mode and return to Privileged Exec mode.
`awplus#`	

`show ipv6 rip interface vlan2`	Check the configuration. E.g.:
	`vlan2 is up, line protocol is up`
	`  Routing Protocol: RIPng`
	`  Passive interface: Disabled`
	`  Split horizon: Enabled with Poisoned Reversed`
	`  IPv6 interface address:`
	`  2001:db8:1::10/64`
	`  2001:db8:204:76ff:fec8::/10`

Step 3. Check the Interface is not a Passive Interface

`awplus#`	

`show running-config`	Check that the interface is not configured as a passive interface.
	If it is configured to be passive, this is displayed in the output from the **show running config** command, e.g.:
	`!`
	`router ipv6 rip`
	`passive interface vlan2`
	`!`

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`router ipv6 rip`	Enter the Router Configuration mode.
`awplus(config-router)#`	
`no passive interface port1.0.1`	Remove the passive interface.

Step 4. Ensure RIPng Advertisements get exchanged

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`router ipv6 rip`	Globally enable RIPng routing on the Switch and enter Router Configuration mode.
`awplus(config-router)#`	
`exit`	Exit Router Configuration mode and return to Global Configuration mode.
`awplus(config)#`	
`debug ipv6 rip event`	Check on the interface to make sure that RIPng advertisements are being sent and received.
`awplus(config)#`	
`debug ipv6 rip packet detail`	Check on the interface to make sure that RIPng advertisements are being sent and received.
`awplus(config)#`	
`exit`	Exit Global Configuration mode to enter Privileged Exec mode.
`awplus#`	
`terminal monitor`	View log messages, or use a packet sniffer such as Ethereal or Wireshark, to verify RIPng advertisements.

Introduction

This chapter contains RIPng commands. RIPng (Routing Information Protocol next generation) is an extension of RIPv2 to support IPv6. RFC 2080 specifies RIPng. The differences between RIPv2 and RIPng are:

- RIPng does not support RIP updates authentication
- RIPng does not allow the attachment of arbitrary tags to routes
- RIPng requires the encoding of the next-hop for a set of routes

For more information, see **Chapter 37, RIPng for IPv6 Configuration**.

Command List

This section provides an alphabetical reference of commands used to configure RIPng for IPv6.

aggregate-address (IPv6 RIPng)

Use this command to add an aggregate route to RIPng.

Use the **no** variant of this command to remove the aggregate route from RIPng.

Syntax

```
aggregate-address <ipv6-addr/prefix-length>
no aggregate-address <ipv6-addr/prefix-length>
```

Parameter	Description
<ipv6-addr/prefix-length>	Specify the IPv6 Address in the format *X:X::X:X/Prefix-Length*. The prefix-length is a decimal integer between 1 and 128.

Mode Router Configuration

Usage The route will not be added to the RIPng database unless the database contains at least one route which is contained within the address range covered by the aggregate route. As soon as there are any such component routes in the RIPng database, then the following occurs:

- the aggregate route is added to the RIPng database
- all the component routes that are within the address range covered by the aggregate route are retained in the RIPng database, but are marked as suppressed routes. The aggregate route will be advertised in RIPng updates, and the component route will no longer be advertised.

Note that simply having a component route in the IPv6 route database is not a sufficient condition for the aggregate route to be included into the RIPng database. The component route(s) must be in the RIPng database before the aggregate route will be included in the RIPng database. There is no restriction on the method by which the component routes have arrived into the RIPng database, it can be by being connected RIP interfaces, by redistribution or by direct inclusion using the **route** command in router IPv6 RIP configuration mode.

Example

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# aggregate-address 2001:db8::/32
```

cisco-metric-behavior (IPv6 RIPng)

Use this command to enable or disable the RIPng routing metric update to conform to Cisco's implementation. This command is provided to allow inter-operation with older Cisco devices that do not conform to the RFC standard for RIP route metrics.

Use the **no** variant of this command to disable this feature.

Syntax

```
cisco-metric-behavior {enable|disable}
no cisco-metric-behavior
```

Parameter	Description
`enable`	Enables updating the metric consistent with Cisco.
`disable`	Disables updating the metric consistent with Cisco.

Default By default, the Cisco metric-behavior is disabled.

Mode Router Configuration

Examples To enable the routing metric update to behave as per the Cisco implementation, enter the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# cisco-metric-behavior enable
```

To disable the routing metric update to behave as per the default setting, enter the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# no cisco-metric-behavior
```

Validation Commands **show running-config**

Related Commands **cisco-metric-behavior (RIP)**

clear ipv6 rip route

Use this command to clear specific data from the RIPng routing table.

Syntax

```
clear ipv6 rip route {<ipv6-addr/prefix-length>|all|connected|rip|
   static|ospf}
```

Parameter	Description
<ipv6-addr/prefix-length>	Specify the IPv6 Address in format *X:X::X:X/Prefix-Length*. The prefix-length is a decimal integer between 1 and 128. Removes entries which exactly match this destination address from the RIPng routing table.
`connected`	Removes redistributed connected entries from RIPng routing table.
`static`	Removes redistributed static entries from the RIPng routing table.
`rip`	Removes RIPng routes from the RIPng routing table.
`ospf`	Removes redistributed OSPFv3 routes from the RIPng routing table.
`all`	Clears the entire RIPng routing table.

Mode Privileged Exec

Example

```
awplus# clear ipv6 rip route all
awplus# clear ipv6 rip route 2001:db8::/32
```

debug ipv6 rip

Use this command to enable RIPng debugging and specify debugging for RIPng events, RIPng packets, or RIPng communication with NSM processes.

Use the **no** variant of this command to disable RIPng debugging.

Syntax

```
debug ipv6 rip [all|events|nsm|packet [detail]|recv [detail]|
    send [detail]]

no debug ipv6 rip [all|events|nsm|packet [detail]|recv [detail]|
    send [detail]]
```

Parameter	Description
`all`	Displays all RIPng debugging showing RIPng events debug information, RIPng received packets information, and RIPng sent packets information.
`events`	Displays RIPng events debug information.
`nsm`	Displays RIPng and NSM communication.
`packet`	Displays RIPng packets only.
`recv`	Displays information for received packets.
`send`	Displays information for sent packets.
`detail`	Displays detailed information for the sent or received packet.

Default RIPng debugging is disabled by default.

Mode Privileged Exec and Global Configuration

Example

```
awplus# debug ipv6 rip events
awplus# debug ipv6 rip packet send detail
awplus# debug ipv6 rip nsm
```

Related Commands undebug ipv6 rip

default-information originate (IPv6 RIPng)

Use this command to generate a default route into RIPng.

Use the **no** variant of this command to disable this feature.

Syntax

```
default-information originate
no default-information originate
```

Default Disabled

Mode Router Configuration

Example

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# default-information originate
```

default-metric (IPv6 RIPng)

Use this command to specify the metrics to be assigned to redistributed RIPng routes.

Use the **no** variant of this command to reset the RIPng metric back to its default (1).

Syntax

```
default-metric <1-16>
no default-metric [<1-16>]
```

Parameter	Description
<1-16>	Metric value.

Default By default, the RIPng metric value is set to 1.

Mode Router Configuration

Usage This command is used with the **redistribute (IPv6 RIPng)** command to make the routing protocol use the specified metric value for all redistributed RIPng routes, regardless of the original protocol that the route has been redistributed from.

Note, this metric is not applied to routes that are brought into RIPng by using the **route** command in router IPv6 RIP configuration mode. This metric is, though, applied to any RIPng aggregate routes that have been brought into the RIPng database due to the presence of a component route that was redistributed into RIPng.

Also note that the default-metric is applied to routes redistributed into RIPng with no metric assignment in the routemap associated with redistribution.

Example

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# default-metric 8
```

Related Commands **ipv6 rip metric-offset**
redistribute (IPv6 RIPng)

distribute-list (IPv6 RIPng)

Use this command to filter incoming or outgoing route updates using the access-list or the prefix-list.

Use the **no** variant of this command to disable this feature.

Syntax

```
distribute-list [<access-list>|prefix <prefix-list-name>] [in|out]
    [<interface>]
no distribute-list [<access-list>|prefix <prefix-list-name>] [in|out]
    [<interface>]
```

Parameter	Description
<access-list>	Specifies the IPv6 access-list number or name to use.
<prefix-list-name>	Filter prefixes in routing updates. Specify the name of the IPv6 prefix-list to use.
<interface>	The interface for which distribute-list applies. For instance: `vlan2`.
`in`	Filter incoming routing updates.
`out`	Filter outgoing routing updates.

Default Disabled

Mode Router Configuration

Usage Filter out incoming or outgoing route updates using the access-list or the prefix-list. If you do not specify the name of the interface, the filter is applied to all the interfaces.

Example

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# distribute-list prefix myfilter in vlan2
```

Related Commands **ipv6 access-list extended (named)**
ipv6 nd prefix

ipv6 rip metric-offset

Use this command to increment the metric value on incoming routes for a specified interface. This command can be used to artificially inflate the metric value for routes learnt on the specified interface. Routes learnt on the specified interface are only used if the routes to the same destination with a lower metric value in the routing table are down.

Use the **no** variant of this command to reset the metric value on incoming routes to the default value (1). You can set the metric value for redistributed routes with **default-metric (IPv6 RIPng)** and **redistribute (IPv6 RIPng)** commands in Router Configuration mode.

Syntax

```
ipv6 rip metric-offset <1-16>
no ipv6 rip metric-offset <1-16>
```

Parameter	Description
<1-16>	Specify an increment to the metric value on an incoming route. The metric value for RIPng routes is the hop count for the route.

Default The default RIPng metric value is 1.

Mode Interface Configuration for a VLAN interface only.

Usage When a RIPng route is received on a VLAN interface, the metric value for the interface set by this command is added to the metric value of the route in the routing table. Note this command only increments the metric for incoming routes on a specified interface. Increasing the metric value for a VLAN interface increases the metric value of routes received on that VLAN interface. This changes the route selected from the routing table.

The RIPng metric is the hop count. At regular intervals of the routing update timer (which has a default value of 30 seconds), and at the time of change in the topology, the RIPng router sends update messages to other routers. The listening routers update their route table with the new route, and increase the metric value of the path by one (referred to as a hop count). The router recognizes the IPv6 address advertising router as the next hop, then sends the routing updates to other routers. A maximum allowable hop count is 15. If a router reaches a metric value of 16 or more, the destination is identified as unreachable.

See how AlliedWare Plus adds routes in the **Chapter 33, How AlliedWare Plus Adds Routes** in **Chapter 33, Route Selection**. See also the **default-metric (IPv6 RIPng)** and **redistribute (IPv6 RIPng)** commands to specify the metric for redistributed RIPng routes.

Examples To increment the metric-offset on the VLAN interface vlan2, enter the below commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# exit
awplus(config)# interface vlan2
awplus(config-if)# ipv6 rip metric-offset 1
```

To reset the metric-offset on the VLAN interface `vlan2` to the default value, enter the below commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 rip metric-offset 1
```

Validation Commands **show running-config**

Related Commands **default-metric (IPv6 RIPng)**

ipv6 rip split-horizon

Use this command to perform the split-horizon action on the interface. The default is split-horizon with poisoned reverse.

Use the **no** variant of this command to disable this function.

Syntax

```
ipv6 rip split-horizon [poisoned]
no ipv6 rip split-horizon
```

Parameter	Description
`split-horizon`	Perform split-horizon without poisoned reverse
`poisoned`	Performs split-horizon with poisoned reverse.

Default Split-horizon with poisoned reverse is the default.

Mode Interface Configuration for a VLAN interface.

Usage Use this command to avoid including routes in updates sent to the same gateway from which they were learned. Using the **split horizon** command omits routes learned from one neighbor, in updates sent to that neighbor. Using the **poisoned** parameter with this command includes such routes in updates, but sets their metrics to infinity. Thus, advertising that these routes are not reachable.

Examples To perform split-horizon with poisoned reverse on the VLAN interface `vlan2`, enter the below commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# exit
awplus(config)# interface vlan2
awplus(config-if)# ipv6 rip split-horizon poisoned
```

To disable split-horizon on the VLAN interface `vlan2`, enter the below commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 rip split-horizon
```

Validation Commands **show running-config**

ipv6 router rip

Use this command to enable RIPng routing on an interface.

Use the **no** variant of this command to disable RIPng routing on an interface.

Syntax

```
ipv6 router rip
no ipv6 router rip
```

Default RIPng routing is disabled by default.

Mode Interface Configuration for a VLAN interface.

Usage This command can only be configured on VLAN interfaces.

Examples To enable RIPng routing on the VLAN interface `vlan2`, enter the below commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# exit
awplus(config)# interface vlan2
awplus(config-if)# ipv6 router rip
```

To disable RIPng routing on the VLAN interface `vlan2`, enter the below commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 router rip
```

neighbor (IPv6 RIPng)

Use this command to specify a neighbor router.

Use the **no** variant of this command to disable the specific router.

Syntax

```
neighbor <ipv6-link-local-addr> <interface>
no neighbor <ipv6-link-local-addr> <interface>
```

Parameter	Description
<ipv6-link-local-addr>	Specify the link-local IPv6 address (in the format *X:X::X:X*) of a neighboring router to exchange routing information with.
<interface>	The interface. For instance: `vlan2`.

Mode Router Configuration

Usage Use this command to exchange non broadcast routing information. It can be used multiple times for additional neighbors.

The **passive-interface (IPv6 RIPng)** command disables sending routing updates on an interface. Use the `neighbor` command in conjunction with the **passive-interface (IPv6 RIPng)** command to send routing updates to specific neighbors.

Examples

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# neighbor 2001:db8:1::1 vlan2

awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# no neighbor 2001:db8:1::1 vlan2
```

Related Commands **passive-interface (IPv6 RIPng)**

offset-list (IPv6 RIPng)

Use this command to add an offset to in and out metrics to routes learned through RIPng.

Use the **no** variant of this command to remove an offset list.

Syntax

```
offset-list {<access-list-number>|<access-list-name>} {in|out}
    <offset> [<interface>]

no offset-list {<access-list-number>|<access-list-name>} {in|out}
    <offset> [<interface>]
```

Parameter	Description
<access-list-number>	Specify an access-list number to apply to an offset-list.
<access-list-name>	Specify and access-list name to apply to an offset-list.
`in`	Indicates the access-list will be used for metrics of incoming advertised routes
`out`	Indicates the access-list will be used for metrics of outgoing advertised routes
<offset>	`<0-16>` Specifies that the offset is used for metrics of networks matching the access-list
<interface>	The interface to match. For instance: `vlan2`.

Default The default offset value is the metric value of the interface over which the updates are being exchanged.

Mode Router Configuration

Usage Use this command to specify the offset value that is added to the routing metric. When the networks match the access list the offset is applied to the metrics. No change occurs if the offset value is zero.

Example In this example the router examines the RIPng updates being sent out from interface `vlan2` and adds `8` hops to the routes matching the ip addresses specified in the access list `2`.

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# offset-list mylist in 8 vlan2
```

passive-interface (IPv6 RIPng)

Use this command to enable suppression of routing updates on an interface.

Use the **no** variant of this command to disable this function.

Syntax

```
passive-interface <interface>
no passive-interface <interface>
```

Parameter	Description
<interface>	The interface. For instance: `vlan2`.

Default Disabled

Mode Router Configuration

Examples

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# passive-interface vlan2

awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# no passive-interface vlan2
```

recv-buffer-size (IPv6 RIPng)

Use this command to configure the RIPng UDP (User Datagram Protocol) receive-buffer size. This should improve UDP reliability by avoiding UDP receive buffer overruns.

Use the **no** variant of this command to unset the configured RIPng UDP receive-buffer size and set it back to the system default of 196608 bits.

Syntax

```
recv-buffer-size <8192-2147483647>
no recv-buffer-size [<8192-2147483647>]
```

Default The RIPng UDP receive-buffer-size is 196608 bits by default, and is reset to the default using the **no** variant of this command.

Mode Router Configuration

Examples

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# recv-buffer-size 23456789

awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# no recv-buffer-size 23456789

awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# no recv-buffer-size
```

redistribute (IPv6 RIPng)

Use this command to redistribute information from other routing protocols into RIPng.

Use the **no** variant of this command to disable the specified redistribution. The parameters **metric** and **routemap** may be used on this command, but have no effect.

Syntax

```
redistribute {connected|static|ospf} [metric <0-16>]
    [route-map <route-map>]

no redistribute {connected|static|ospf} [metric <0-16>]
    [route-map <route-map>]
```

Parameter	Description
<0-16>	Optional. Specifies the metric value to be used when redistributing information. If a value is not specified, and no value is specified using the **default-metric (IPv6 RIPng)** command, the default is one.
<route-map>	Optional. Specifies route-map to be used to redistribute information.
`connected`	Redistribute from connected routes.
`static`	Redistribute from static routes.
`ospf`	Redistribute from Open Shortest Path First (OSPF).

Default By default, the RIPng metric value is set to 1.

Mode Router Configuration

Example

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# redistribute static route-map mymap
awplus(config-router)# redistribute static metric 8
```

Related Commands **default-metric (IPv6 RIPng)**

route (IPv6 RIPng)

Use this command to configure static RIPng routes.

Use the **no** variant of this command to disable this function.

Syntax

```
route <ipv6-addr/prefix-length>
no route <ipv6-addr/prefix-length>
```

Parameter	Description
<ipv6-addr/prefix-length>	Specify the IPv6 Address in format *X:X::X:X/Prefix-Length*. The prefix-length is a decimal integer between 1 and 128.

Mode Router Configuration

Usage Use this command to add a static RIPng route. After adding the RIPng route, the route can be checked in the RIPng routing table.

Example

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# route 2001:db8::1/64
```

Related Commands **show ipv6 rip**
clear ipv6 rip route

router ipv6 rip

Use this global command to enter Router Configuration mode to enable a RIPng routing process.

Use the **no** variant of this command to disable the RIPng routing process.

Syntax

```
router ipv6 rip
no router ipv6 rip
```

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)#
```

show debugging ipv6 rip

Use this command to display the RIPng debugging status for the debugging options of: nsm debugging, RIPng event debugging, RIPng packet debugging, and RIPng nsm debugging.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show debugging ipv6 rip`

Mode User Exec and Privileged Exec

Usage Use this command to display the debug status of RIPng.

Example

```
awplus# show debugging ipv6 rip
```

show ipv6 protocols rip

Use this command to display RIPng process parameters and statistics.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**

Syntax `show ipv6 protocols rip`

Mode User Exec and Privileged Exec

Example

```
awplus# show ipv6 protocols rip
```

Output

```
awplus#show ipv6 protocols rip
Routing Protocol is "RIPng"
  Sending updates every 30 seconds with +/-5 seconds, next due
in 6 seconds
  Timeout after 180 seconds, garbage collect after 120 seconds
  Outgoing update filter list for all interface is not set
  Incoming update filter list for all interface is not set
  Default redistribute metric is 1
  Redistributing:
  Interface
    vlan3
  Routing for Networks:
    fe80::200:cdff:fe27:c086 vlan1
```

show ipv6 rip

Use this command to show RIPng routes.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show ipv6 rip
```

Mode

User Exec and Privileged Exec

Example

```
awplus# show ipv6 rip
```

Output

```
Codes: R - RIP, Rc - RIP connected, Rs - RIP static, Ra - RIP
aggregated, Rcx - RIP connect suppressed, Rsx - RIP static
suppressed, C - Connected, S - Static, O - OSPF, B - BGP

   Network           Next Hop          If     Met Tag   Time

R  2001:db8:1::/48   2001:db8:2::/48   vlan3   3   0    02:28
C  2001:db8:3::/48   ::                vlan2   1   0
Ra 2001:db8:4::/48                     --      1   0
Rs 2001:db8:5::/48   2001:db8:1::/48   vlan3   3   0    02:32
Cs 2001:db8:6::/48   ::                vlan3   1   0
```

Related Commands

show ipv6 rip database

show ipv6 rip database

Use this command to display information about the RIPng database.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show ipv6 rip database [full]`

Parameter	Description
`full`	Display all IPv6 RIPng full database entries including sub-optimal routes.

Mode User Exec and Privileged Exec

Example

```
awplus# show ipv6 rip database
```

Output

```
Codes: R - RIP, Rc - RIP connected, Rs - RIP static, Ra - RIP
aggregated, Rcx - RIP connect suppressed, Rsx - RIP static
suppressed, C - Connected, S - Static, O - OSPF, B - BGP

   Network            Next Hop          If      Met Tag   Time

R  2001:db8:1::/48    2001:db8:2::/48   vlan3    3   0    02:28
C  2001:db8:3::/48    ::                vlan2    1   0
Ra 2001:db8:4::/48                      --       1   0
Rs 2001:db8:5::/48    2001:db8:1::/48   vlan3    3   0    02:32
Cs 2001:db8:6::/48    ::                vlan3    1   0
```

Related Commands **show ipv6 rip**

show ipv6 rip interface

Use this command to display information about the RIPng interfaces. You can specify an interface name to display information about a specific interface.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show ipv6 rip interface [<interface>]`

Parameter	Description
<interface>	The interface to display information about. For instance: `vlan2`.

Mode User Exec and Privileged Exec

Example

```
awplus# show ipv6 rip interface
```

Output

```
lo is up, line protocol is up
RIPng is not enabled on this interface
vlan1 is up, line protocol is up
RIPng is not enabled on this interface
vlan2 is down, line protocol is down
RIPng is not enabled on this interface
vlan3 is up, line protocol is up
Routing Protocol: RIPng
Passive interface: Disabled
Split horizon: Enabled with Poisoned Reversed
IP interface address:
2001:db8:1::1/64
2001:db8:1::2/64
```

timers (IPv6 RIPng)

Use this command to adjust the RIPng routing network timers.

Use the **no** variant of this command to restore the defaults.

Syntax

```
timers basic <update> <timeout> <garbage>
no timers basic
```

Parameter	Description
<update>	<5-2147483647> Specifies the RIPng routing table update timer in seconds. The default is 30 seconds.
<timeout>	<5-2147483647> Specifies the RIPng routing information timeout timer in seconds. The default is 180 seconds. After this interval has elapsed and no updates for a route are received, the route is declared invalid.
<garbage>	<5-2147483647> Specifies the RIPng routing garbage collection timer in seconds. The default is 120 seconds.

Default The default RIPng routing table update timer default is 30 seconds, the default RIPng routing information timeout timer is 180 seconds, and the default RIPng routing garbage collection timer is 120 seconds. The **no** variant of this command restores the default RIPng routing timers.

Mode Router Configuration

Example

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# timers basic 30 180 120
```

undebug ipv6 rip

Use this command to disable debugging options of RIPng events, RIPng packets, and communication between RIPng and NSM processes.

Syntax `undebug ipv6 rip [all|events|nsm|packet [recv|send][detail]]`

Parameter	Description
`all`	Disables all RIPng debugging.
`events`	Disable the display of RIPng events information.
`nsm`	Disable the display of RIPng and NSM communication.
`packet`	Disable debugging of specified RIPng packets only.
`recv`	Disable the display of information for received packets.
`send`	Disable the display of information for sent packets.
`detail`	Disable the display of detailed information for sent or received packets.

Mode Privileged Exec and Global Configuration

Example

```
awplus# undebug ipv6 rip events

awplus# undebug ipv6 rip all

awplus# undebug ipv6 rip packet send

awplus# undebug ipv6 rip packet recv detail
```

Related Commands **debug ipv6 rip**

OSPF Introduction

This chapter introduces OSPF followed by basic configuration examples. To see details on the OSPF commands used in these examples, or to see the outputs of the validation commands, refer to **Chapter 40, OSPF Commands**.

Features

Open Shortest Path First (OSPF) is an Interior Gateway Routing Protocol, based on Shortest Path First (SPF) or link-state technology. OSPF is defined in RFCs 1245–1247, 1253 and 1583. OSPF was designed specifically for the TCP/IP Internet environment, and supports the following features:

- Authentication of routing updates.
- Tagging of externally-derived routes.
- Fast response to topology changes with low overhead.
- Load sharing over meshed links.

OSPF Components

Autonomous Systems

In SPF-based routing protocols, routers combine to form an Autonomous Systems (AS). These are router systems which operate under a common administration and usually share common routing protocols. Each router maintains a database describing the AS's topology. Each router has an identical database, each component of which describes a particular router and its current state. This includes the state of the interfaces, reachable neighbors, and other information. Information about the AS is distributed between the routers by a process known as "flooding".

Each router runs a routing algorithm, and from the information exchanged about the other AS routers, creates an internal tree-like database of shortest paths with itself as the root. The tree contains a route to each destination in the AS. External routes are added to the tree as "leaves".

Another feature of OSPF is that it enables IP subnets to be configured in a very flexible way. Each route distributed by OSPF has a destination and a mask. During the routing process, routes with the longest mask to a destination are used in preference to those with shorter masks. Host routes are also supported by OSPF; these are considered to be subnets with masks of all ones.

All OSPF protocol exchanges can be authenticated so that only trusted routers participate in the creation of the topology database, and hence the AS's routing. Authentication is disabled by default.

Externally derived routing data can be passed into the AS transparently. The externally derived routing information is kept separate from the OSPF protocol's link state data.

Routing Areas

OSPF allows the grouping of networks into a set, called an **Area**. The internal topology of an area is hidden from the rest of the AS. This technique minimizes the routing traffic required for the protocol. When multiple areas are used, each area has its own copy of the topological database.

Routing can be between areas (inter-area routing) or within areas (intra-area routing). To link together multiple areas, OSPF uses the concept of a **backbone area**. The backbone area forms a central network that links to the other areas within the AS. The backbone must have contiguous connectivity with the its other areas. Virtual links can be used to make the backbone contiguous.

At the junction of each area and its backbone is a **border router**. Packets travelling between areas will do so via the backbone area. Packets are first sent to the area's border router where they will be routed onto the backbone. They will then travel through the backbone to another area border router at the connection to the destination area. The packets are then routed through the destination area to their specific destination.

Adjacencies and Designated Routers

OSPF creates adjacencies between neighboring routers. The reason for forming adjacencies is to exchange topological information. Not every router needs to become adjacent to every other router. Adjacencies are established and maintained with **hello packets**. These packets are sent periodically on all router interfaces. Bidirectional communication is determined by a router seeing itself listed in hello packets from its neighbors. On broadcast multi-access networks, one of the routers becomes a designated router.

The designated router maintains adjacencies with all the routers within the area by issuing link state advertisements for its area and subnet.

The designated router becomes adjacent to all other routers within the area. Since the topological database is spread over adjacencies, the designated router coordinates the synchronization of the topological database on all the routers within its area.

Selecting the Designated Router

The designated router for a broadcast network is determined dynamically via hello packets. Each router is configured with a priority number, which is advertised in the hello packet. The routers compare their priority numbers, and the router with the highest priority number is elected the designated router. Where routers share the same priority number, as could happen with a common default setting, then the designated router is the router with the highest router ID. On non-broadcast multi-access networks, static configuration information is used to initiate the search for a designated router.

To help in dynamic fallover, OSPF also determines a backup designated router for a network via hello packets. The backup designated router, like the designated router maintains an adjacency to all other routers on the network. If the designated router fails for any reason, the backup designated router takes over.

Link State Advertisements

Link state advertisements are records in the topological database. Routers may generate five different types of link state advertisements **Table 39-1 on page 39.4**. Each type of link state advertisement describes a different set of features of the Autonomous System (AS).

Link state advertisements age to a maximum age called MaxAge (3600 seconds) while stored in the topological database. When a link state advertisement reaches MaxAge, the router tries to flush it from the routing domain by reflooding the advertisement. A link state advertisement that has reached MaxAge is not used in further routing table calculations. The MaxAge link state advertisement is removed totally from the topological database when it is no longer contained on a neighbor link state retransmission list or none of the neighbors are in exchange or loading state. It is relatively rare for a link state advertisement to reach MaxAge because advertisements are usually replaced by more recent instances by normal refresh processes.

Table 39-1: OSPF link state advertisement type

LSA Type	Meaning
Router Links	The router originates a router links advertisement for each area to which it belongs. The advertisement describes the collected states of the router's links to the area. This advertisement also indicates whether the router is an area border router or an AS boundary router.
Network Links	A network link advertisement is originated for every transit multi-access network. This advertisement is originated by the designated router for the transit network, and describes all the OSPF routers fully adjacent to the designated router.
Summary Links	Summary Link advertisements describe a single route to a destination. The destinations described are external to the area, but internal to the AS. Some condensing of routing information occurs when creating these summary link state advertisements.
AS Summary Links	These are like summary link advertisements, but they describe routes to AS boundary routers.
AS External Links	AS external advertisements describe routes external to the AS.

OSPF Packet Types

The OSPF protocol runs directly over IP, using the assigned number 89. The following table describes OSPF packet types.

Table 39-2: OSPF Packet Types

Packet Type	Purpose
Hello	Used to discover and maintain neighbors.
Link State Request	Used to form adjacencies. The router summarizes all its link state advertisements and passes this information, via database description packets, to the router it is forming an adjacency with.
Link State Update	Used for transmission of link state advertisements between routers. This could be in response to a link state request packet or to flood a new or more recent link state advertisement.
Link State Acknowledgement	Used to make the flooding of link state advertisements reliable. Each link state advertisement received is explicitly acknowledged.

OSPF States

The following table describes the states that neighbors can be in:

Table 39-3: OSPF States

Packet Type	Purpose
Down	This is the initial state. No hello packets have been received from the neighbor recently or at all.
Attempt	This state applies to non-broadcast multi-access networks. The router is making a determined attempt to contact a statically configured neighbor. Hello packets are sent every hello interval.
Init	A hello packet has been seen from the neighbor. However, the hello packet does not list the router as known.
2-Way	This state is entered when the communication between to neighbors is bidirectional (the hello packet from the neighbor lists this router as a neighbor).
ExStart	This is the first step in creating an adjacency between two routers. The two routers decide which is going to control the exchange between them.
Exchange	In this state, the neighbors exchange database description packets. Each packet summarizes the link state advertisements held by that router.
Loading	After all the database description information has been exchanged, the routers exchange link state advertisements required to update or complete each router's topological database thereby synchronizing the two router's databases.
Full	This is the final state and the adjacency is complete. Reaching this state in itself may cause new instances of some link state advertisements, such as the network and router advertisements related to the two routers.

The following table describes the interface states that the router can be in.

Table 39-4: OSPF Interface States

Packet Type	Purpose
Down	The initial state. No traffic can be routed with the interface in this state.
Loopback	The router's interface to the network is looped back.
Waiting	Interfaces to broadcast and non-broadcast multi-access networks enter this state when they are started. In this state the router tries to determine the designated or backup designated router. The router is not allowed to elect a backup or designated router while in the waiting state. This stops unnecessary changes in the designated router.
Point-to-Point	The interface is operational and is connected to a point-to-point network.
DROther	The interface to a broadcast or a non-broadcast multi-access network has not been selected as either the designated router or backup designated router for the network.
Backup	The interface to a broadcast or a non-broadcast multi-access network has been selected as the backup designated router for the network.
DR	The interface to a broadcast or a non-broadcast multi-access network has been selected as the designated router for the network.

OSPF Metrics

The metrics used by OSPF are not simple distance metrics, such as used by RIP for example, but are measurements of the path bandwidth. Interface metrics are normally set using the formula 10^8 / interface speed (in bps). This gives metrics such as 1 for a 100 Mbps Ethernet interface, and 1562 for a 64 kbps serial line.

When no metric is defined, the default metric for routes redistributed into OSPF is 20. You can define the metric using the **redistribute (OSPF)** command.

You can also define the metric using the **set metric** command for a route map. If a route map is configured, but no OSPF metric is defined using a **redistribute (OSPF)** command, then a default metric of 20 is used. If a route map is configured and the metric is defined using the **set metric** command, this supersedes a metric defined using the **redistribute (OSPF)** command.

How to set the OSPF metric when redistributing routes

You can determine the OSPF metric using the following methods:

- use the default OSPF metric, which is 20.
- change it using the **metric** parameter of the **redistribute (OSPF)** command

The following example sets the metric to `5` for `connected` redistributed routes:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# redistribute connected metric 5
```

- change it using the **metric-value** parameter of the **set metric** command for a route map

Note that changing the metric using a route map supersedes the metric defined using the **redistribute (OSPF)** command. The following example for entry `3` of the route map called `rmap1` give matching routes a metric of `5`::

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set metric 5
```

Automatic Cost Calculation

OSPF interfaces can automatically set the OSPF metric of an IP interface based on its bandwidth, instead of the system administrator having to manually set the OSPF metric. Automatic setting takes into account that the speed of an interface can change over time, when ports change link state or change speed via auto-negotiation or manual setting. If metrics are manually set, some interfaces are preferred when they should be changing to match dynamically changing network configurations.

Routing with OSPF

To route an IP packet, the router looks up the routing table for the entry that best matches the destination of the packet. This entry contains the interface and nexthop router required to forward the IP packet to its destination. The entry that best matches the destination is determined first by the path type, then the longest (most specific) network mask. At this point there may still be multiple routing entries to the destination; if so, then equi-cost multi-path routes exist to the destination. Table **Table 39-5 on page 39.7** shows the available path types used when routing packets.

Table 39-5: OSPF Path Types

Path Type	Description
Intra	Route to the destination is within a single OSPF area.
Inter	Route to the destination is within the AS, but spans more than one OSPF area.
Ext1	Route to the destination is via an AS router within the AS. This is an OSPF external route of Type 1. Type 1 external routes add the external metric (as received by the AS router), and the internal OSPF metric to reach the AS router, to determine the final metric to the destination.
Ext2	Route to the destination is via an AS router within the AS. This is an OSPF external route of Type 2. Type 2 external routes use only the external path cost to determine the preferred route. Internal metrics are only used where two or more interfaces present the same external path cost.

Network Types

OSPF treats the networks attached to OSPF interfaces as one of the following network types, depending on the physical media:

- broadcast
- non-broadcast multi-access (nbma)
- point-to-point
- point-to-multipoint
- virtual

By default, VLAN and Ethernet networks are treated as broadcast networks. You can use the **ip ospf network** command to configure a VLAN interface to be other network types. Configure a VLAN or Ethernet interface as an NBMA interface when:

- Some devices on the network do not support multicast addressing.
- You want to select which devices on the network are to become OSPF neighbors, rather than allow all the devices on the network to become OSPF neighbors.

Passive Interfaces

A passive interface does not take part in normal OSPF interface operations:

- OSPF does not transmit or receive Hello messages via the interface.
- The interface does not experience interface state transitions.
- OSPF does not associate neighbors with the interface.

If the interface is up, OSPF adds the network attached to the interface as a stub network to the router LSA of the area in which the interface resides.

Usage Configure an interface to be passive if you wish its connected route to be treated as an OSPF route (rather than an AS-external route), but do not wish to actually exchange any OSPF packets via this interface.

Examples To configure passive interface mode on interface **vlan2**, enter the following commands:

```
awplus(config)# router ospf 100
awplus(config-router)# passive-interface vlan2
```

To configure passive interface mode on **all** interfaces, enter the following commands:

```
awplus(config)# router ospf 100
awplus(config-router)# passive-interface
```

Authenticating OSPF

OSPF packet authentication is described in Appendix D of RFC 2328, and in RFC 1583. RFC 2328 describes authentication set for an interface, whilst RFC 1583 describes authentication set per area. Refer to the RFCs for a detailed description of these methods of authentication.

There are two ways to authenticate an OSPF packet:

- password authentication
- cryptographic authentication

Use the following commands to configure authentication on a specific VLAN interface:

- **ip ospf authentication**
- **ip ospf authentication-key**
- **ip ospf message-digest-key**

Use the following commands to configure authentication for a specific OSPF area.

- **area authentication**
- **ip ospf message-digest-key**

Redistributing External Routes

OSPF can import and redistribute BGP, RIP, non-OSPF interface, and statically configured routes. It can also optionally assign any of the following settings to all routes it imports:

- a route metric
- the External metric type
- a tag—a number to label the route

Alternatively, you can assign a route map to select particular routes and set their route parameters. A route map can also filter out a subset of routes, so you do not have to import all routes.

The import settings also allow you to select whether to redistribute subnets (classless network routes), or only classful network routes.

To import and redistribute external routes into OSPF, create a route redistribution definition for the source routing protocol, using the **redistribute (OSPF)** command.

Summarizing Routes for Redistribution

OSPF can summaries external routes to be redistributed using a list of administratively defined summary addresses specified as network/mask pairs. The summary addresses replace the original routes in AS external LSAs. Use summary addresses to reduce the number of AS external routes advertised by the router.

You can set the following attributes for summary addresses:

- Whether the summary address is advertised.
- The tag to be inserted in the AS external LSA. The tag overrides tags set by the original route used to select the original routes for redistribution.

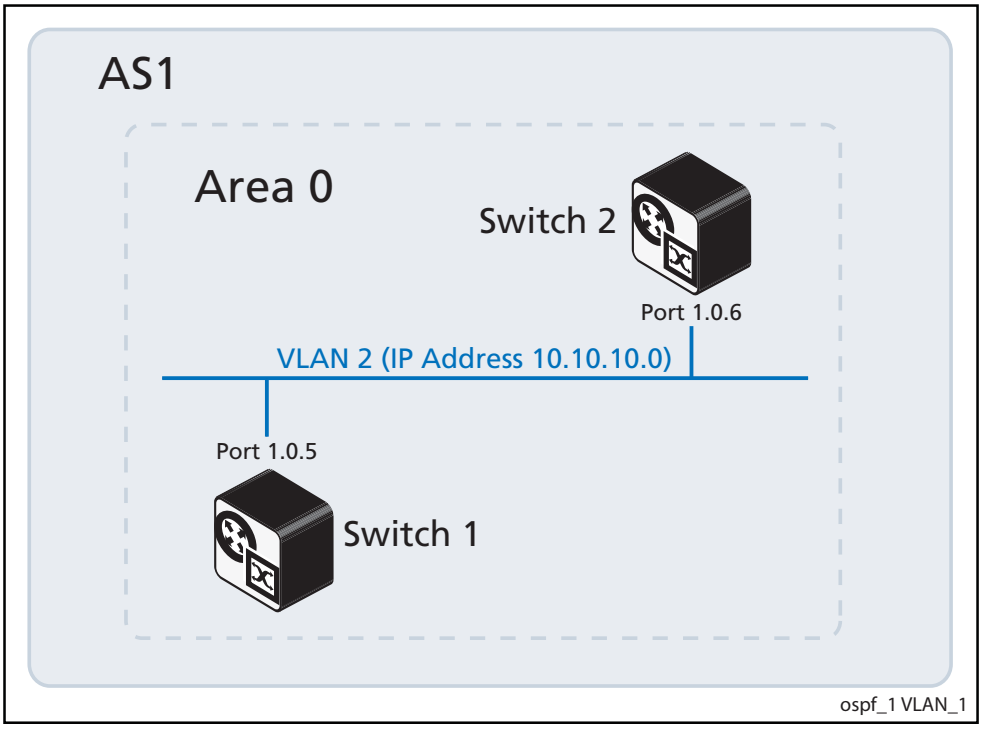
To create summary addresses for route redistribution, use the **summary-address** command.

Enabling OSPF on an Interface

This example shows the minimum configuration required for enabling OSPF on an interface. In this example, the OSPF routers are Allied Telesis managed Layer 3 switches. `Switch 1` and `Switch 2` are two OSPF routers in `Area 0` connecting to network 10.10.10.0/24.

Note

Configure one interface so that it belongs to only one area. However, you can configure different interfaces on an OSPF router to belong to different areas.



Switch 1

`awplus#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config)#` `interface port1.0.5`	Set the switchport mode to **access**
`awplus#` `switchport access vlan2`	Assign port 1.0.5 to VLAN 2
`awplus(config)#` `router ospf 100`	Configure the Routing process and specify the Process ID (`100`)
`awplus(config-router)#` `network 10.10.10.0/24 area 0`	Define the interface (`10.10.10.0/24`) on which OSPF runs and associate the area ID (`0`) with the interface (area ID `0` specifies the backbone area).

Switch 2

`awplus#` `configure terminal`	Enter the Global Configuration mode
`awplus(config)#` `interface port1.0.6`	Set the switchport mode to **access**
`awplus#` `switchport access vlan2`	Assign port 1.0.6 to VLAN 2
`awplus(config)#` `router ospf 200`	Configure the Routing process and specify the Process ID `(200)`. The Process ID should be a unique positive integer identifying the routing process. Note that the process ID used on this switch is different to that used on Switch 1. This is correct configuration as the process ID is a value that is only used within a single OSPF router. Therefore there is no requirement for the process IDs used on one OSPF router to have any relationship with the process IDs used on the other OSPF routers that it interacts with.
`awplus(config-router)#` `network 10.10.10.0/24 area 0`	Define the interface (`10.10.10.0/24`) on which OSPF runs and associate the area ID (`0`) with the interface.

Names of Commands Used

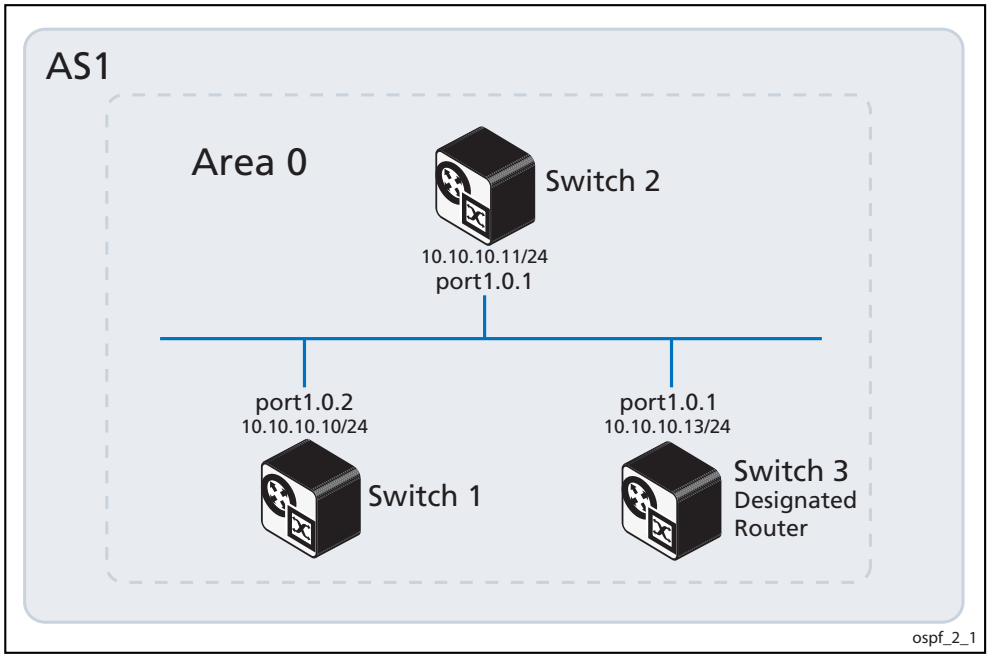
network area
router ospf

Validation Commands

show ip ospf
show ip ospf interface
show ip ospf neighbor
show ip ospf route

Setting priority

This example shows the configuration for setting the priority for an interface. You can set a high priority for an OSPF router to make it the Designated Router (DR). In this example, the OSPF routers are Allied Telesis managed Layer 3 switches. Switch 3 is configured to have a priority of 10, which is higher than the default priority (default priority is 1) of Switch 1 and Switch 2; making it the DR. In this example network the back-up DR would be Switch 2 as it has a higher router ID than Switch 1.



Switch 3

`awplus(config)#` `interface vlan2`	Specify the interface (`vlan2`) to be configured.
`awplus(config-if)#` `ip ospf priority 10`	Specify the router priority to a higher priority (`10`) to make Switch 3 the Designated Router (DR).
`awplus(config-if)#` `exit`	Exit the Interface Configuration mode and return to the Global Configuration mode.
`awplus(config)#` `router ospf 100`	Configure the Routing process and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.
`awplus(config-router)#` `network 10.10.10.0/24 area 0`	Define the interface (`10.10.10.0/24`) on which OSPF runs and associate the area ID (`0`) with the interface.

Switch 1

`awplus#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config)#` `router ospf 100`	Configure the Routing process and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.
`awplus(config-router)#` `network 10.10.10.0/24 area 0`	Define the interface (`10.10.10.0/24`) on which OSPF runs and associate the area ID (`0`) with the interface (area ID 0 specifies the backbone area).

Switch 2

`awplus#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config)#` `router ospf 200`	Configure the Routing process and specify the Process ID (200). The Process ID should be a unique positive integer identifying the routing process.
`awplus(config-router)#` `network 10.10.10.0/24 area 0`	Define the interface (`10.10.10.0/24`) on which OSPF runs and associate the area ID (`0`) with the interface.

Names of Commands Used

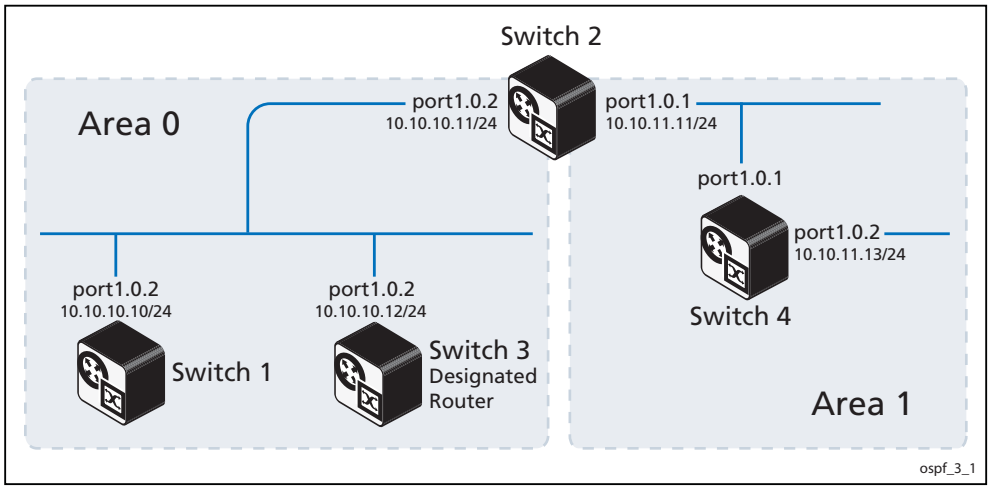
network area
ip ospf priority

Validation Commands

show ip ospf neighbor
show ip ospf interface

Configuring an Area Border Router

This example shows configuration for an Area Border Router (ABR). In this example, the OSPF routers are Allied Telesis managed Layer 3 switches. `Switch 2` is an ABR, where interface `vlan2` is in `Area 0` and interface `vlan3` is in `Area 1`.



Switch 2

`awplus#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config)#` `router ospf 100`	Configure the Routing process and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.
`awplus(config-router)#` `network 10.10.10.0/24 area 0`	Define one interface (`10.10.10.0/24`) on which OSPF runs and associate the area ID (`0`) with the interface.
`awplus(config-router)#` `network 10.10.11.0/24 area 1`	Define the other interface `(10.10.11.0/24)` on which OSPF runs and associate the area ID `(1)` with the interface.

Names of Commands Used

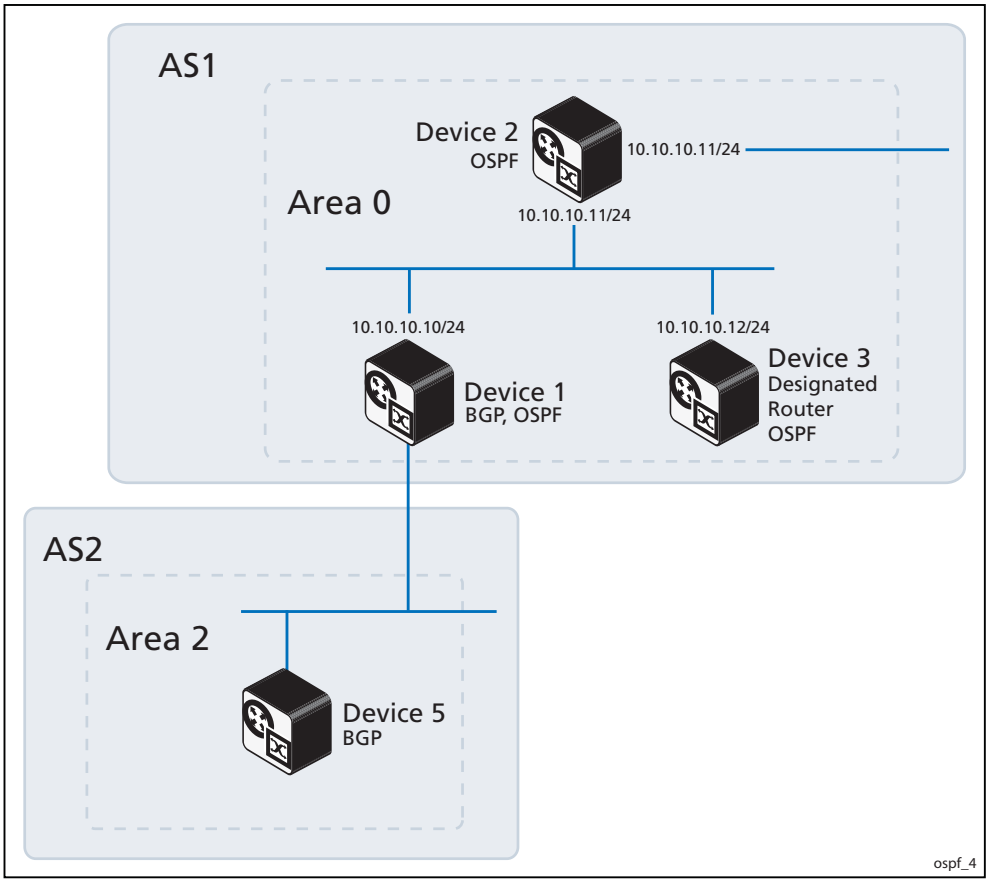
network area

Validation Commands

show ip ospf
show ip ospf interface

Redistributing Routes Into OSPF

In this example the configuration causes BGP routes to be imported into the OSPF routing table and advertised as `Type 5` External LSAs into `Area 0`. In this example, the OSPF routers, labelled "Device 1-5", represent any Allied Telesis managed Layer 3 switches or Allied Telesis routers.



Device 1

`awplus#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config)#` `router ospf 100`	Configure the Routing process and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.
`awplus(config-router)#` `network 10.10.10.0/24 area 0`	Define one interface (`10.10.10.0/24`) on which OSPF runs and associate the area ID (`0`) with the interface (area ID 0 specifies the backbone area).
`awplus(config-router)#` `redistribute bgp`	Specify redistributing routes from other routing protocol (BGP) into OSPF.

Names of Commands Used

redistribute (OSPF)
network area

Validation Commands

show ip ospf database external

OSPF Cost

You can make a route the preferred route by changing its cost. In this example, the OSPF routers are Allied Telesis managed Layer 3 switches. The cost has been configured to make `Switch 2` the next hop for `Switch 1`.

The default cost on each interface is 10. Interface `vlan2` on `Switch 2` has a cost of 100 and interface `vlan3` on Switch 3 has a cost of 150. The total cost for Switch 1 to reach 10.10.14.0/24 (Switch 4) `Switch 2` or via `Switch 3` is:

Switch 2: 10+100 = 110

Switch 3: 10+150 = 160

Therefore, `Switch 1` chooses `Switch 2` as its next hop for destination 10.10.14.0/24, as that path has the lower cost.

Switch 1

`awplus#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config)#` `router ospf 100`	Configure the Routing process and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.

`awplus(config-router)#`
`network 10.10.9.0/24 area 0`
`awplus(config-router)#`
`network 10.10.10.0/24 area 0`
`awplus(config-router)#`
`network 10.10.12.0/24 area 0`
	Define interfaces on which OSPF runs and associate the area ID `(0)` with the interface (area ID 0 specifies the backbone area).

Switch 2

`awplus#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config)#` `interface vlan2`	Specify the interface (`vlan2`) to be configured.

`awplus(config-if)#` `ip ospf cost 100`	Set the OSPF cost of this link to `100`.
`awplus(config-if)#` `exit`	Exit the Interface Configuration mode and return to the Global Configuration mode.
`awplus(config)#` `router ospf 100`	Configure the Routing process and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.
`awplus(config-router)#` `network 10.10.10.0/24 area 0`	Define interfaces on which OSPF runs and associate the area ID `(0)` with the interface.
`awplus(config-router)#` `network 10.10.11.0/24 area 0`	Define interfaces on which OSPF runs and associate the area ID `(0)` with the interface.

Switch 3

`awplus(config)#` `interface vlan3`	Specify the interface (`vlan3`) to be configured.
`awplus(config-if)#` `ip ospf cost 150`	Set the OSPF cost of this link to `100`.
`awplus(config-if)#` `exit`	Exit the Interface Configuration mode and return to the Global Configuration mode.
`awplus(config)#` `router ospf 100`	Configure the Routing process and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.
`awplus(config-router)#` `network 10.10.12.0/24 area 0`	Define interfaces on which OSPF runs and associate the area ID `(0)` with the interface.
`awplus(config-router)#` `network 10.10.13.0/24 area 0`	

Switch 4

`awplus(config)#`	
`router ospf 100`	Configure the Routing process and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.
`awplus(config-router)#`	
`network 10.10.11.0/24 area 0`	Define interfaces on which OSPF runs and associate the area ID `(0)` with the interface.
`awplus(config-router)#`	
`network 10.10.13.0/24 area 0`	
`awplus(config-router)#`	
`network 10.10.14.0/24 area 0`	

Names of Commands Used

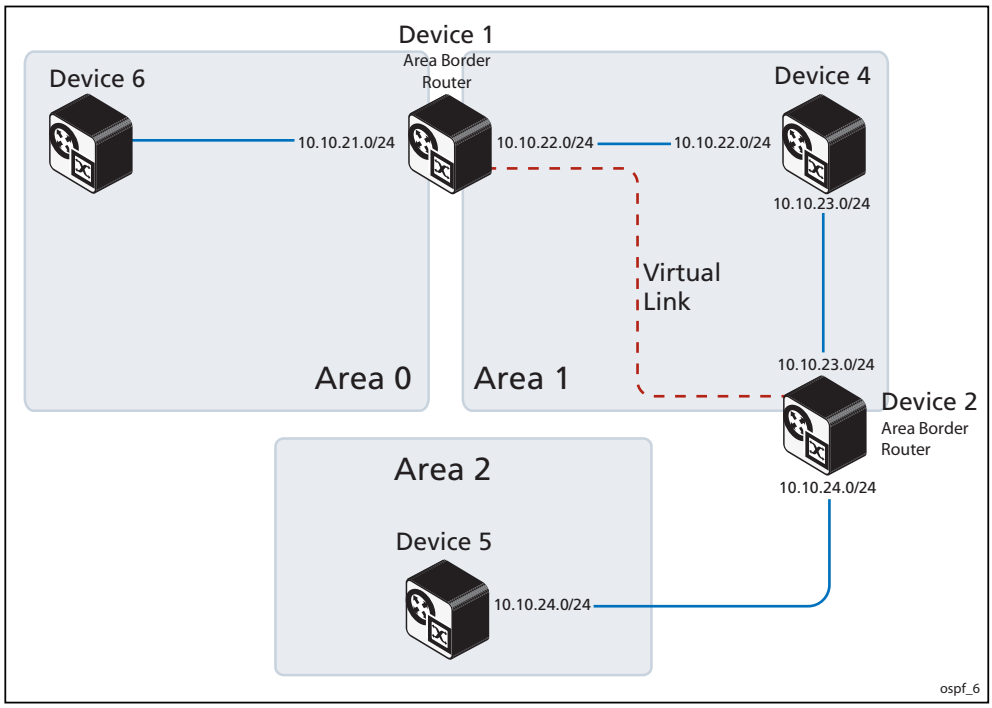
Validation Commands

show ip ospf route

Configuring Virtual Links

Virtual links are used to connect a disjointed non-backbone area to the backbone area, or to repair a non-contiguous backbone area. In this example, the OSPF routers shown represent any Allied Telesis managed Layer 3 switches or Allied Telesis routers.

In the network below, there is no area border router that connects Area2 to the backbone. So a virtual link needs to be created between ABR Device 1 and ABR Device 2 to connect `Area 2` to `Area 0`. Area 1 is used as a transit area.



Device 1

`awplus#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config)#` `router ospf 100`	Configure the Routing process and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.
`awplus(config-router)#` `ospf router-id 10.10.21.1`	Configure OSPF Router ID (`10.10.21.1`) for this router.

`awplus(config-router)#`
`network 10.10.21.0/24 area 0`
`awplus(config-router)#`
`network 10.10.22.0/24 area 1`
	Define interfaces on which OSPF runs and associate the area IDs (`0` and `1`) with the interface.

`awplus(config-router)#` `area 1 virtual-link 10.10.23.2`	Configure a virtual link between Device 1 and Device 2 (`10.10.23.2`) through transit area 1.

Device 2

`awplus(config)#` `router ospf 100`	Configure the Routing process and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.
`awplus(config-router)#` `ospf router-id 10.10.23.2`	Configure OSPF Router ID (`10.10.23.2`) for this router.

`awplus(config-router)#`
`network 10.10.23.0/24 area 1`
`awplus(config-router)#`
`network 10.10.24.0/24 area 2`
	Define interfaces on which OSPF runs and associate the area IDs (`1` and `2`) with the interface.

`awplus(config-router)#` `area 1 virtual-link 10.10.21.1`	Configure a virtual link between Device 2 and Device 1 (`10.10.21.1`) through transit area 1.

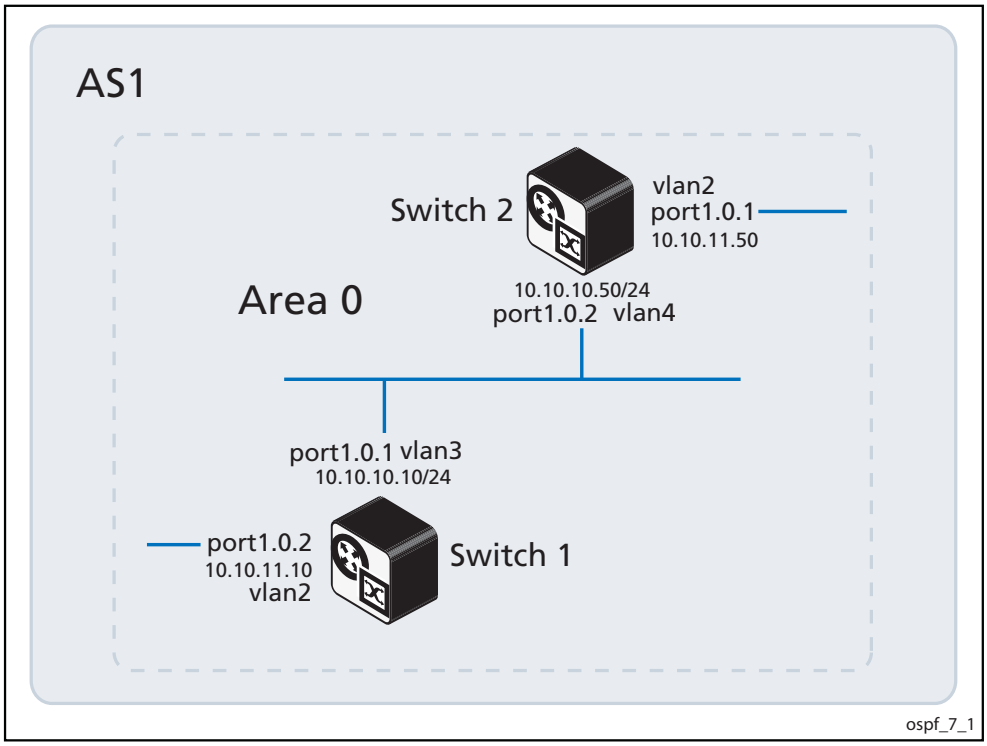
show ip ospf route

OSPF Authentication

In the AlliedWare Plus™ implementation there are three types of OSPF authentications--Null authentication (Type 0), Simple Text (Type 1) authentication and MD5 (Type 2) authentication. With null authentication, routing exchanges over the network are not authenticated. In Simple Text authentication, the authentication type is the same for all OSPF routers that communicate using OSPF in a network. For MD5 authentication, you configure a key and a key-id on each OSPF router. The OSPF router generates a message digest on the basis of the key, key ID and the OSPF packet and adds it to the OSPF packet.

The Authentication type can be configured on a per-interface basis or a per-area basis. Additionally, Interface and Area authentication can be used together. Area authentication is used for an area and interface authentication is used for a specific interface in the area. If the Interface authentication type is different from Area authentication type, Interface authentication type overrides the Area authentication type. If the Authentication type is not specified for an interface, the Authentication type for the area is used. The authentication command descriptions contain details of each type of authentication. Refer to **Chapter 40, OSPF Commands** for OSPF authentication commands.

In this example, the OSPF routers are Allied Telesis managed Layer 3 switches. Switch 1 and Switch 2 are configured for both the interface and area authentications. The authentication type of interface `vlan2` on Switch 1 and interface `vlan2` on Switch 2 is md5 mode and is defined by the **area authentication** command on page 40.3; however, the authentication type of interface vlan3 on Switch 1 and interface vlan4 on Switch 2 is plain text mode and is defined by the **ip ospf authentication** command on page 40.34. This interface command overrides the area authentication command.



Switch 1

`awplus#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config)#` `router ospf 100`	Configure the Routing process and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.

`awplus(config-router)#`
`network 10.10.10.0/24 area 0`
`awplus(config-router)#`
`network 10.10.11.0/24 area 0`
	Define interfaces on which OSPF runs and associate the area ID `(0)` with the interface (area ID 0 specifies the backbone area).

`awplus(config-router)#` `area 0 authentication message-digest`	Enable MD5 authentication on area 0.
`awplus(config-router)#` `exit`	Exit the Router Configuration mode and return to the Global Configuration mode.
`awplus(config)#` `interface vlan2`	Specify the interface (`vlan2`) you are configuring.
`awplus(config-if)#` `ip ospf message-digest-key 1 md5 test`	Register MD5 key `test` for OSPF authentication. The Key ID is 1.
`awplus(config-if)#` `exit`	Exit the Interface Configuration mode and return to Global Configuration mode
`awplus(config)#` `interface vlan3`	Specify the interface (`vlan3`) you are configuring.
`awplus(config-if)#` `ip ospf authentication`	Enable OSPF packet to use text authentication on the current interface (`vlan3`).
`awplus(config-if)#` `ip ospf authentication-key test`	Specify an OSPF authentication password test for the neighboring OSPF routers.

Switch 2

`awplus#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config)#` `router ospf 100`	Configure the Routing process and specify the Process ID (100). The Process ID should be a unique positive integer identifying the routing process.

`awplus(config-router)#`
`network 10.10.10.0/24 area 0`
`awplus(config-router)#`
`network 10.10.11.0/24 area 0`
	Define interfaces on which OSPF runs and associate the area ID `(0)` with the interface (area ID 0 specifies the backbone area).

`awplus(config-router)#` `area 0 authentication message-digest`	Enable MD5 authentication on area 0.
`awplus(config-router)#` `exit`	Exit the Router Configuration mode and return to the Global Configuration mode.
`awplus(config)#` `interface vlan2`	Specify the interface (`vlan2`) you are configuring.
`awplus(config-if)#` `ip ospf message-digest-key 1 md5 test`	Register MD5 key `test` for OSPF authentication. The Key ID is 1.
`awplus(config-if)#` `exit`	Exit the Interface Configuration mode and return to Global Configuration mode
`awplus(config)#` `interface vlan4`	Specify the interface (`vlan4`) you are configuring.
`awplus(config-if)#` `ip ospf authentication`	Enable OSPF packet to use text authentication on the current interface (`vlan4`).
`awplus(config-if)#` `ip ospf authentication-key test`	Specify an OSPF authentication password `test` for the neighboring OSPF routers.

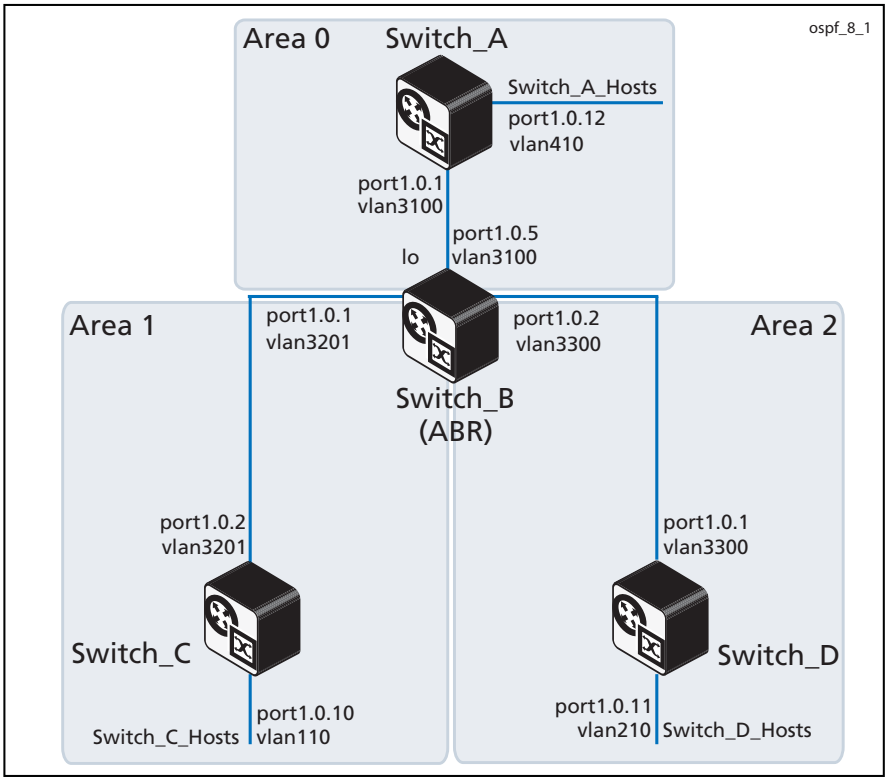
OSPF Multi-Area Loopback Configuration

When a switch is connected to more than two areas, and area 0 interfaces go down, then all routing between the remaining areas will stop. This is due to how OSPF processes inter-area routes as they pass through area 0, even if they are destined for another area. This is a globally recognized issue. Configuring a loopback interface on area 0 resolves this issue.

This example OSPF multiple area configuration applies the best practice of configuring a loopback interface in area 0. This is done so that the ABR (Area Border Router), which in this example is Switch_B, remains available to help connected areas exchange traffic. If the physical link fails between Switch_A and Switch_B, area 0 remains available on Switch_B.

An ABR is a member of both the OSPF backbone and the attached areas. ABRs maintain routing tables describing both the backbone topology and the topology of other areas.



Switch_A Configuration

Introduction

This chapter provides an alphabetical reference of commands used to configure OSPF. For more information, see **Chapter 39, OSPF Introduction and Configuration**.

Command List

area authentication

Use this command to enable authentication for an OSPF area. Specifying the area authentication sets the authentication to Type 1 authentication or the Simple Text password authentication (details in RFC 2328).

The **no** variant of this command removes the authentication specification for an area.

Syntax

```
area <area-id> authentication [message-digest]
no area <area-id> authentication
```

Parameter	Description	
<area-id>	The OSPF area that you are enabling authentication for. This can be entered in either dotted decimal format or normal decimal format.	
	<ip-addr>	OSPF Area ID expressed in IPv4 address, entered in the form A.B.C.D.
	<0-4294967295>	OSPF Area ID expressed as a decimal number within the range shown.
	For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area OSPF Area ID.	
`message-digest`	Enables MD5 authentication in the OSPF area.	

Default By default, no authentication occurs.

Mode Router Configuration

Usage All OSPF packets transmitted in this **area** must have the same password in their OSPF header. This ensures that only routers that have the correct password may join the routing domain.

Give all routers that are to communicate with each other through OSPF the same authentication password.

Use the **ip ospf authentication-key** command to specify a Simple Text password. Use the **ip ospf message-digest-key** command to specify MD5 password.

Example

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# area 1 authentication
```

Related Commands

ip ospf authentication
ip ospf message-digest-key

area default-cost

This command specifies a cost for the default summary route sent into a stub or NSSA area.

The **no** variant of this command removes the assigned default-route cost.

Syntax

```
area <area-id> default-cost <0-16777215>
no area <area-id> default-cost
```

Parameter	Description	
<area-id>	The OSPF area that you are specifying the default summary route cost for. Use one of the following formats: This can be entered in either dotted decimal format or normal decimal format.	
	<ip-addr>	OSPF Area ID expressed in IPv4 address format A.B.C.D.
	<0-4294967295>	OSPF Area ID expressed as a decimal number within the range shown.
	For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area ID.	
`default-cost`	Indicates the cost for the default summary route used for a stub or NSSA area. Default: **1**	

Mode Router Configuration

Usage The default-cost option provides the metric for the summary default route, generated by the area border router, into the NSSA or stub area. Use this option only on an area border router that is attached to the NSSA or stub area. Refer to the RFC 3101 for information on NSSA.

Example To set the default cost to 10 in area 1 for the OSPF instance 100, use the commands:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# area 1 default-cost 10
```

Related Commands **area nssa**
area stub

area filter-list

This command configures filters to advertise summary routes on Area Border Routers (ABR).

This command is used to suppress particular intra-area routes from/to an area to/from the other areas. You can use this command in conjunction with either the access-list or prefix-list command.

The **no** variant of this command removes the filter configuration.

Syntax

```
area <area-id> filter-list {access <access-list>|prefix <prefix-
    list>} {in|out}

no area <area-id> filter-list {access <access-list>|prefix <prefix-
    list>} {in|out}
```

Parameter	Description	
<area-id>	The OSPF area that you are configuring the filter for. Use one of the following formats: This can be entered in either dotted decimal format or normal decimal format.	
	<ip-addr>	OSPF Area ID expressed in IPv4 address format `A.B.C.D`.
	<0-4294967295>	OSPF Area ID expressed as a decimal number within the range shown.
	For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area ID.	
`access`	Use access-list to filter summary.	
`prefix`	Use prefix-list to filter summary.	
<access-list>	Name of an access-list.	
<prefix-list>	Name of a prefix-list.	
`in`	Filter routes from the other areas to this area.	
`out`	Filter routes from this area to the other areas.	

Mode Router Configuration

Examples

```
awplus# configure terminal
awplus(config)# access-list 1 deny 172.22.0.0
awplus(config)# router ospf 100
awplus(config-router)# area 1 filter-list access 1 in
```

```
awplus# configure terminal
awplus(config)# access-list 1 deny 172.22.0.0
awplus(config)# router ospf 100
awplus(config-router)# no area 1 filter-list access 1 in
```

area nssa

This command sets an area as a Not-So-Stubby-Area (NSSA). By default, no NSSA area is defined.

Use this command to simplify administration if you are connecting a central site using OSPF to a remote site that is using a different routing protocol. You can extend OSPF to cover the remote connection by defining the area between the central router and the remote router as an NSSA.

There are no external routes in an OSPF stub area, so you cannot redistribute from another protocol into a stub area. A NSSA allows external routes to be flooded within the area. These routes are then leaked into other areas. Although, the external routes from other areas still do not enter the NSSA. You can either configure an area to be a stub area or an NSSA, not both.

The **no** variant of this command removes this designation.

Syntax

```
area <area-id> nssa [default-information-originate <metric> |
   no-redistribution | no-summary | translator-role <role> ]

no area <area-id> nssa [default-information-originate |
   no-redistribution | no-summary | translator-role ]
```

Parameter	Description	
<area-id>	The OSPF area that you are configuring as an NSSA. Use one of the following formats: This can be entered in either dotted decimal format or normal decimal format.	
	<ip-addr>	OSPF Area ID expressed in IPv4 address format `A.B.C.D`.
	<0-4294967295>	OSPF Area ID expressed as a decimal number within the range shown.
	For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area ID.	
`default-information-originate`	Originate Type-7 default LSA into NSSA.	
<metric>	The external or internal metric. Specify the following:	
	`metric` *<0-16777214>*	The metric value.
	`metric-type` *<1-2>*	External metric type.
`no-redistribution`	Do not redistribute external route into NSSA.	
`no-summary`	Do not inject inter-area route into NSSA.	
`translator-role`	Specify NSSA-ABR translator-role.	

Parameter(cont.)	Description(cont.)	
<role>	The role type. Specify one of the following keywords:	
	`always`	Router always translate NSSA-LSA to Type-5 LSA.
	`candidate`	Router may translate NSSA-LSA to Type-5 LSA if it is elected.
	`never`	Router never translate NSSA-LSA.

Mode Router Configuration

Example

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# area 0.0.0.51 nssa
awplus(config-router)# area 3 nssa translator-role candidate
no-redistribution default-information-
originate metric 34 metric-type 2
```

Related Commands **area default-cost**

area range

Use this command to summarize OSPF routes at an area boundary, configuring an IPv4 address range which consolidates OSPF routes. By default, this feature is not enabled.

A summary route created by this command is then advertised to other areas by the Area Border Routers (ABRs). In this way, routing information is condensed at area boundaries and outside the area so that routes are exchanged between areas in an efficient manner.

If the network numbers in an area are arranged into sets of contiguous routes, the ABRs can be configured to advertise a summary route that covers all the individual networks within the area that fall into the specified range.

The **no** variant of this command disables this function and restores default behavior.

Syntax

```
area <area-id> range <ip-addr/prefix-length> [advertise|not-
    advertise]

no area <area-id> range <ip-addr/prefix-length>
```

Parameter	Description	
<area-id>	The OSPF area that you summarizing the routes for. Use one of the following formats: This can be entered in either dotted decimal format or normal decimal format.	
	<ip-addr>	OSPF Area ID expressed in IPv4 address format `A.B.C.D`.
	<0-4294967295>	OSPF Area ID expressed as a decimal number within the range shown.
	For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area ID.	
<ip-addr/prefix-length>	The area range prefix and length.	
`advertise`	Advertise this range as a summary route into other areas.	
`not-advertise`	Does not advertise this range.	

Default The area range is not configured by default. The area range is advertised if it is configured.

Mode Router Configuration

Usage You can configure multiple ranges on a single area with multiple instances of this command, so OSPF summarizes addresses for different sets of IPv4 address ranges.

Ensure OSPF IPv4 routes exist in the area range for advertisement before using this command.

Example

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# area 1 range 192.16.0.0/16
awplus(config-router)# area 1 range 203.18.0.0/16
```

area stub

This command defines an OSPF area as a stub area. By default, no stub area is defined.

Use this command when routers in the area do not require learning about summary LSAs from other areas. You can define the area as a totally stubby area by configuring the Area Border Router of that area using the **area stub no-summary** command.

There are two stub area router configuration commands: the **area stub** and **area default-cost** commands. In all routers attached to the stub area, configure the area by using the **area stub** command. For an area border router (ABR) attached to the stub area, also use the **area default-cost** command.

The **no** variant of this command removes this definition.

Syntax

```
area <area-id>  stub [no-summary]
no area <area-id> stub [no-summary]
```

Parameter	Description	
<area-id>	The OSPF area that you are configuring as a stub area. Use one of the following formats: This can be entered in either dotted decimal format or normal decimal format. For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area ID.	
	<ip-addr>	OSPF Area ID expressed in IPv4 address in the format `A.B.C.D`.
	<0-4294967295>	OSPF Area ID expressed as a decimal number within the range shown.
	For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area ID.	
`no-summary`	Stops an ABR from sending summary link advertisements into the stub area.	

Mode Router Configuration

Example

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# area 1 stub
```

Related Commands area default-cost

area virtual-link

This command configures a link between two backbone areas that are physically separated through other non-backbone areas.

In OSPF, all non-backbone areas must be connected to a backbone area. If the connection to the backbone is lost, the virtual link repairs the connection.

The **no** variant of this command removes the virtual link.

Syntax

```
area <area-id> virtual-link <ip-addr> [<auth-key>|<msg-key>]

no area <area-id>  virtual-link <ip-addr>[<auth-key>|<msg-key>]

area <area-id>  virtual-link <ip-addr> authentication
    [message-digest|null] [<auth-key>|<msg-key>]

no area <area-id>  virtual-link <ip-addr> authentication
    [message-digest|null] [<auth-key>|<msg-key>]

area <area-id>  virtual-link <ip-addr> [authentication]
    [dead-interval <1-65535>] [hello-interval <1-65535>]
    [retransmit-interval <1-3600>] [transmit-delay <1-3600>]

no area <area-id>  virtual-link <ip-addr>[authentication]
    [dead-interval] [hello-interval] [retransmit-interval] [transmit-
    delay]
```

Parameter	Description	
<area-id>	The area ID of the transit area that the virtual link passes through. Use one of the following formats: This can be entered in either dotted decimal format or normal decimal format.	
	<ip-addr>	OSPF Area ID expressed in IPv4 address format `A.B.C.D`.
	<0-4294967295>	OSPF Area ID expressed as a decimal number within the range shown.
	For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area ID.	
<ip-address>	The OSPF router ID of the virtual link neighbor.	
<auth-key>	Specifies the password used for this virtual link. Use the format: **authentication-key** *<pswd-short>*	
	<pswd-short>	An 8 character password.
<msg-key>	Specifies a message digest key using the MD5 encryption algorithm. Use the following format: **message-digest-key** *<1-255>* md5 *<pswd-long>*	
	<1-255>	The key ID.
	<pswd-long>	Authentication password of 16 characters.
`authentication`	Enables authentication on this virtual link.	
`message-digest`	Use message-digest authentication.	

Parameter(cont.)	Description(cont.)	
null	Use null authentication to override password or message digest.	
dead-interval	If no packets are received from a particular neighbor for dead-interval seconds, the router considers that neighboring router as being off-line. Default: 40 seconds	
	<1-65535>	The number of seconds in the interval.
hello-interval	The interval the router waits before it sends a hello packet. Default: 10 seconds	
	<1-65535>	The number of seconds in the interval.
retransmit-interval	The interval the router waits before it retransmits a packet. Default: 5 seconds	
	<1-3600>	The number of seconds in the interval.
transmit-delay	The interval the router waits before it transmits a packet. Default: 1 seconds	
	<1-3600>	The number of seconds in the interval.

Mode Router Configuration

Usage You can configure virtual links between any two backbone routers that have an interface to a common non-backbone area. The protocol treats these two routers, joined by a virtual link, as if they were connected by an unnumbered point-to-point network. To configure a virtual link, you require:

- The transit area ID, i.e. the area ID of the non backbone area that the two backbone routers are both connected to.
- The corresponding virtual link neighbor's router ID. To see the router ID use the **show ip ospf** command.

Configure the **hello-interval** to be the same for all routers attached to a common network. A short **hello-interval** results in the router detecting topological changes faster but also an increase in the routing traffic.

The **retransmit-interval** is the expected round-trip delay between any two routers in a network. Set the value to be greater than the expected round-trip delay to avoid needless retransmissions.

The **transmit-delay** is the time taken to transmit a link state update packet on the interface. Before transmission, the link state advertisements in the update packet, are incremented by this amount. Set the **transmit-delay** to be greater than zero. Also, take into account the transmission and propagation delays for the interface.

Example

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# area 1 virtual-link 10.10.11.50 hello 5
dead 10
```

Related Commands
area authentication
show ip ospf
show ip ospf virtual-links

auto-cost reference bandwidth

This command controls how OSPF calculates default metrics for the interface.

Use the **no** variant of this command to assign cost based only on the interface bandwidth.

Syntax

```
auto-cost reference-bandwidth <1-4294967>
no auto-cost reference-bandwidth
```

Parameter	Description
<1-4294967>	The reference bandwidth in terms of Mbits per second (Mbps).

Default 1000 Mbps

Usage By default, OSPF calculates the OSPF metric for an interface by dividing the reference bandwidth by the interface bandwidth. The default for the reference bandwidth is 1000 Mbps. As a result, if this default is used, there is very little difference between the metrics applied to interfaces of increasing bandwidth beyond 1000 Mbps.

The auto-cost command is used to alter this reference bandwidth in order to give a real difference between the metrics of high bandwidth links of differing bandwidths. In a network that has multiple links with high bandwidths, specify a larger reference bandwidth value to differentiate the costs on those links.

Mode Router Configuration

Example

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# auto-cost reference-bandwidth 1000
```

Related Commands ip ospf cost

bandwidth

Use this command to specify the maximum bandwidth to be used for each VLAN interface.
The bandwidth value is in bits. OSPF uses this to calculate metrics for the VLAN interface.

Use the **no** variant of this command to remove the maximum bandwidth.

Syntax

```
bandwidth  <bandwidth-setting>

no bandwidth
```

Parameter	Description
<bandwidth-setting>	Sets to bandwidth for the interface. Enter a value in the range 1 to 10000000000 bits.

Mode Interface Configuration for a VLAN interface.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# bandwidth 1000000
```

Related Commands

show running-config
show running-config access-list
show interface

capability opaque

This command enables opaque-LSAs. Opaque-LSAs are Type 9, 10 and 11 LSAs that deliver information used by external applications.

By default, opaque-LSAs are enabled.

Use the **no** variant of this command to disables opaque-LSAs.

Syntax

```
capability opaque
no capability opaque
```

Mode Router Configuration

Example

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# no capability opaque
```

capability restart

This command enables OSPF Graceful Restart or restart signaling features. By default, this is enabled.

Use the **no** variant of this command to disable OSPF Graceful Restart and restart signalling features.

Syntax

```
capability restart [graceful|signaling]
no capability restart
```

Parameter	Description
`graceful`	Enable graceful OSPF restart.
`signaling`	Enable OSPF restart signaling.

Default Graceful restart

Mode Router Configuration

Example

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# capability restart graceful
```

clear ip ospf process

This command clears and restarts the OSPF routing process. Specify the Process ID to clear one particular OSPF process. When no Process ID is specified, this command clears all running OSPF processes.

Syntax `clear ip ospf [<0-65535>] process`

Parameter	Description
<0-65535>	The Routing Process ID.

Mode Privileged Exec

Example

```
awplus# clear ip ospf process
```

compatible rfc1583

This command changes the method used to calculate summary route to the that specified in RFC 1583. By default, OSPF uses the method specified in RFC 2328.

RFC 1583 specifies a method for calculating the metric for summary routes based on the minimum metric of the component paths available. RFC 2328 specifies a method for calculating metrics based on maximum cost.

It is possible that some ABRs in an area might conform to RFC 1583 and others support RFC 2328, which could lead to incompatibility in their interoperation. This command addresses this issue by allowing you to selectively disable compatibility with RFC 2328.

Use the **no** variant of this command to disable RFC 1583 compatibility.

Syntax `compatible rfc1583`

`no compatible rfc1583`

Mode Router Configuration

Example

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# compatible rfc1583
```

debug ospf events

This command enables OSPF debugging for OSPF event troubleshooting.

To enable all debugging options, specify **debug ospf event** with no additional parameters.

The **no** and **undebug** variant of this command disable OSPF debugging. Use this command without parameters to disable all the options.

Syntax

```
debug ospf events [abr] [asbr] [lsa] [nssa] [os] [router] [vlink]
no debug ospf events [abr] [asbr] [lsa] [nssa] [os] [router] [vlink]
```

Parameter	Description
`abr`	Shows ABR events.
`asbr`	Shows ASBR events.
`lsa`	Shows LSA events.
`nssa`	Shows NSSA events.
`os`	Shows OS interaction events.
`router`	Shows other router events.
`vlink`	Shows virtual link events.

Mode Privileged Exec and Global Configuration

Example

```
awplus# debug ospf events asbr lsa
```

Related Commands terminal monitor
undebug ospf events

debug ospf ifsm

This command specifies debugging options for OSPF Interface Finite State Machine (IFSM) troubleshooting.

To enable all debugging options, specify **debug ospf ifsm** with no additional parameters.

The **no** and **undebug** variant of this command disable OSPF IFSM debugging. Use this command without parameters to disable all the options.

Syntax

```
debug ospf ifsm [status] [events] [timers]
no debug ospf ifsm [status] [events] [timers]
```

Parameter	Description
`events`	Displays IFSM event information.
`status`	Displays IFSM status information.
`timers`	Displays IFSM timer information.

Mode Privileged Exec and Global Configuration

Example

```
awplus# no debug ospf ifsm events status
awplus# debug ospf ifsm status
awplus# debug ospf ifsm timers
```

Related Commands terminal monitor
undebug ospf ifsm

debug ospf lsa

This command enables debugging options for OSPF Link State Advertisements (LSA) troubleshooting. This displays information related to internal operations of LSAs.

To enable all debugging options, specify **debug ospf lsa** with no additional parameters.

The **no** and **undebug** variant of this command disable OSPF LSA debugging. Use this command without parameters to disable all the options.

Syntax

```
debug ospf lsa [flooding] [generate] [install] [maxage] [refresh]
no debug ospf lsa [flooding] [generate] [install] [maxage] [refresh]
```

Parameter	Description
`flooding`	Displays LSA flooding.
`generate`	Displays LSA generation.
`install`	Show LSA installation.
`maxage`	Shows maximum age of the LSA in seconds.
`refresh`	Displays LSA refresh.

Mode Privileged Exec and Global Configuration

Examples

```
awplus# undebug ospf lsa refresh
```

Output **Figure 40-1: Example output from the debug ospf lsa command**

```
2002/05/09 14:08:11 OSPF: LSA[10.10.10.10:10.10.10.70]: instance(0x8139cd0)
created with Link State Update
2002/05/09 14:08:11 OSPF: RECV[LS-Upd]: From 10.10.10.70 via vlan5:10.10.10.50
(10.10.10.10 -> 224.0.0.5)
2002/05/09 14:12:33 OSPF: SEND[LS-Upd]: Begin send queue
2002/05/09 14:12:33 OSPF: SEND[LS-Upd]: # of LSAs 1, destination 224.0.0.5
2002/05/09 14:12:33 OSPF: SEND[LS-Upd]: End send queue
2002/05/09 14:12:33 OSPF: SEND[LS-Upd]: To 224.0.0.5 via vlan5:10.10.10.50
```

Related Commands terminal monitor
undebug ospf lsa

debug ospf nfsm

This command enables debugging options for OSPF Neighbor Finite State Machines (NFSMs).

To enable all debugging options, specify **debug ospf nfsm** with no additional parameters.

The **no** and **undebug** variant of this command disable OSPF NFSM debugging. Use this command without parameters to disable all the options.

Syntax

```
debug ospf nfsm [events] [status] [timers]
no debug ospf nfsm [events] [status] [timers]
```

Parameter	Description
`events`	Displays NFSM event information.
`status`	Displays NSFM status information.
`timers`	Displays NFSM timer information.

Mode Privileged Exec and Global Configuration

Examples

```
awplus# debug ospf nfsm events
awplus# no debug ospf nfsm timers
awplus# undebug ospf nfsm events
```

Related Commands terminal monitor
undebug ospf nfsm

debug ospf nsm

This command enables debugging options for the OSPF Network Service Module.

To enable both debugging options, specify **debug ospf nsm** with no additional parameters.

The **no** and **undebug** variant of this command disable OSPF NSM debugging. Use this command without parameters to disable both options.

Syntax

```
debug ospf nsm [interface] [redistribute]
no debug ospf nsm [interface] [redistribute]
```

Parameter	Description
`interface`	Specify NSM interface information.
`redistribute`	Specify NSM redistribute information.

Mode Priviledged Exec and Global Configuration

Examples

```
awplus# debug ospf nsm interface
awplus# no debug ospf nsm redistribute
awplus# undebug ospf nsm interface
```

Related Commands **terminal monitor**
undebug ospf nsm

debug ospf packet

This command enables debugging options for OSPF packets.

To enable all debugging options, specify **debug ospf packet** with no additional parameters.

The **no** and **undebug** variant of this command disable OSPF packet debugging. Use this command without parameters to disable all options.

Syntax

```
debug ospf packet [dd] [detail] [hello] [ls-ack] [ls-request]
    [ls-update] [recv] [send]
```

```
no debug ospf packet [dd] [detail] [hello] [ls-ack] [ls-request]
    [ls-update] [recv] [send]
```

Parameter	Description
`dd`	Specifies debugging for OSPF database descriptions.
`detail`	Sets the debug option to detailed information.
`hello`	Specifies debugging for OSPF hello packets.
`ls-ack`	Specifies debugging for OSPF link state acknowledgments.
`ls-request`	Specifies debugging for OSPF link state requests.
`ls-update`	Specifies debugging for OSPF link state updates.
`recv`	Specifies the debug option set for received packets.
`send`	Specifies the debug option set for sent packets.

Mode Privileged Exec and Global Configuration

Examples

```
awplus# debug ospf packet detail
awplus# debug ospf packet dd send detail
awplus# no debug ospf packet ls-request recv detail
awplus# undebug ospf packet ls-request recv detail
```

Related Commands **terminal monitor**
undebug ospf packet

debug ospf route

This command enables debugging of route calculation. Use this command without parameters to turn on all the options.

To enable all debugging options, specify **debug ospf route** with no additional parameters.

The **no** and **undebug** variant of this command disable OSPF route debugging. Use this command without parameters to disable all options.

Syntax

```
debug ospf route [ase] [ia] [install] [spf]
no debug ospf route [ase] [ia] [install] [spf]
```

Parameter	Description
`ia`	Specifies the debugging of Inter-Area route calculation.
`ase`	Specifies the debugging of external route calculation.
`install`	Specifies the debugging of route installation.
`spf`	Specifies the debugging of SPF calculation.

Mode Privileged Exec and Global Configuration

Examples

```
awplus# debug ospf route
awplus# no debug ospf route ia
awplus# debug ospf route install
awplus# undebug ospf route install
```

Related Commands terminal monitor
undebug ospf route

default-information originate (OSPF)

This command creates a default external route into an OSPF routing domain.

When you use the **default-information originate** command to redistribute routes into an OSPF routing domain, then the system acts like an Autonomous System Boundary Router (ASBR). An ASBR does not by default, generate a default route into the OSPF routing domain.

When using this command, also specify the **route-map <*route-map*>** option to avoid a dependency on the default network in the routing table.

The **metric-type** is an external link type associated with the default route advertised into the OSPF routing domain. The value of the external route could be either Type 1 or 2. The default is Type 2.

The **no** variant of this command disables this feature.

Syntax

```
default-information originate [always] [metric <metric>]
    [metric-type <1-2>] [route-map <route-map>]

no default-information originate [always] [metric] [metric-type]
    [route-map]
```

Parameter	Description
`always`	Used to advertise the default route regardless of whether there is a default route.
`metric <metric>`	The metric value used in creating the default route. Enter a value in the range 0 to 16777214. The default metric value is 10. The value used is specific to the protocol.
`metric-type <1-2>`	External metric type for default routes, either OSPF External Type 1 or Type 2 metrics. Enter the value 1 or 2.
`route-map`	Specifies to use a specific route-map.
`<route-map>`	The route-map name. It is a string comprised of any characters, numbers or symbols.

Mode Router Configuration

Example

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# default-information originate
always metric 23 metric-type 2
route-map myinfo
```

Related Commands route-map

default-metric (OSPF)

This command sets default metric values for the OSPF routing protocol.

The **no** variant of this command returns OSPF to using built-in, automatic metric translations, as appropriate for each routing protocol.

Syntax

```
default-metric <1-16777214>
no default-metric [<1-16777214>]
```

Parameter	Description
<1-16777214>	Default metric value appropriate for the specified routing protocol.

Mode Router Configuration

Usage A default metric facilitates redistributing routes even with incompatible metrics. If the metrics do not convert, the default metric provides an alternative and enables the redistribution to continue. The effect of this command is that OSPF will use the same metric value for **all** redistributed routes. Use this command in conjunction with the **redistribute (OSPF)** command.

Examples

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# default-metric 100

awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# no default-metric
```

Related commands **redistribute (OSPF)**

distance (OSPF)

This command sets the administrative distance for OSPF routes based on the route type. Your switch uses this value to select between two or more routes to the same destination from two different routing protocols. The route with the smallest administrative distance value is added to the Forwarding Information Base (FIB). See **"Administrative Distance" on page 33.6** for more information.

Use the command **distance ospf** to set the distance for an entire category of OSPF routes, rather than the specific routes that pass an access list.

Use the command **distance <1-255>**, with no other parameter, to set the same distance for all OSPF route types.

The **no** variant of this command sets the administrative distance for all OSPF routes to the default of 110.

Syntax

```
distance <1-255>

distance ospf
   {external <1-255>|inter-area <1-255>|intra-area <1-255>}

no distance {ospf|<1-255>}
```

Parameter	Description
`<1-255>`	Specify the Administrative Distance value for OSPF routes.
`external`	Sets the distance for routes from other routing domains, learned by redistribution. Specify an OSPF external distance in the range `<1-255>`.
`inter-area`	Sets the distance for all routes from one area to another area. Specify an OSPF inter-area distance in the range `<1-255>`.
`intra-area`	Sets the distance for all routes within an area. Specify an OSPF intra-area distance in the range `<1-255>`.

Default The default OSPF administrative distance is 110. The default Administrative Distance for each type of route (intra, inter, or external) is 110.

Mode Router Configuration

Usage The administrative distance rates the trustworthiness of a routing information source. The distance could be any integer from 0 to 255. A higher distance value indicates a lower trust rating. For example, an administrative distance of 255 indicates that the routing information source cannot be trusted and should be ignored.

Use this command to set the distance for an entire group of routes, rather than a specific route that passes an access list.

Examples To set the following administrative distances for route types in OSPF 100:

- 20 for inter-area routes
- 10 for intra-area routes
- 40 for external routes

use the commands:

```
awplus(config)# router ospf 100
awplus(config-router)# distance ospf inter-area 20 intra-area
10 external 40
```

To set the administrative distance for all routes in OSPF 100 back to the default of 110, use the commands:

```
awplus(config)# router ospf 100
awplus(config-router)# no distance ospf
```

distribute-list (OSPF)

Use this command to apply filtering to the transfer of routing information between OSPF and the IP route table. You can apply filtering in either direction, from OSPF to the IP route table using an **in** distribute-list, or from the IP route table to OSPF using an **out** distribute-list.

The effect of an **in** filter is that some route information that OSPF has learnt from LSA updates will not be installed into the IP route table. The effect of an **out** filter is that some route information that could be redistributed to OSPF will not be redistributed to OSPF. See the **Usage** section below for the distinction between the **in** and **out** distribute-lists.

The entities that are used to perform filtering are ACLs or route-maps, which match on certain attributes in the routes that are being transferred. See **Access Control Lists Introduction** and **Route Map Configuration** chapters to define ACLs and route-maps.

The **no** variant of this command removes the configured distribute-list command entry.

Syntax

```
distribute-list {<access-list-name>|route-map <route-map-name>} in
distribute-list <access-list-name> out {bgp|connected|rip|static}
no distribute-list <access-list-name> in
no distribute-list <access-list-name> out {bgp|connected|rip|static}
```

Parameter	Description
<access-list-name>	Specifies the name of the access list. The access list defines which networks are received and which are suppressed.
`in`	Indicates that this applies to incoming advertised routes.
`out`	Indicates that this applies to outgoing advertised routes.
<route-map-name>	The name of the route-map that the distribute-list applies. This defines which networks are installed in the IP route table and which networks are filtered from the IP route table.
`bgp`	Specify the redistribution of BGP routes.
`connected`	Specify the redistribution of connected routes.
`rip`	Specify the redistribution of RIP routes.
`static`	Specify the redistribution of static routes.

Mode Router Configuration

Usage There are **in** and **out** distribute-lists, which carry out different route filtering activities:

- The **in** distribute list is applied to the process of installing OSPF routes into the IP route table. The SPF calculation generate a set of routes calculated from the LSA database. By default, all of these routes become OSPF's candidate routes for inclusion into the IP route table.

- An **in** distribute-list can be used to control whether or not certain routes generated by the SPF calculation are included into the set of candidates for inclusion into the IP route table. Those routes that match **deny** entries in the distribute-list will not be considered for inclusion into the IP route table.
- The **out** distribute-list applies the process of redistributing non-OSPF routes into OSPF. If OSPF redistribution is configured, and an **out** distribute-list is also configured, then routes that match deny entries in the distribute-list will not be redistributed into OSPF.

Examples The following example shows the distribution of BGP routing updates into OSPF, based on the access list `myacl1` that is defined to permit network `172.10.0.0`:

```
awplus# configure terminal
awplus(config)# access-list standard myacl1 permit
172.10.0.0/16
awplus(config)# router ospf 100
awplus(config-router)# distribute-list myacl1 out bgp
awplus(config-router)# redistribute bgp
```

The following example shows the installation of OSPF routes into the IP route table with route map `mymap1` applied, which will process routes that have been tagged `100`:

```
awplus# configure terminal
awplus(config)# route-map mymap1 permit 10
awplus(config-route-map)# match tag 100
awplus(config-route-map)# exit
awplus(config)# router ospf 100
awplus(config-router)# distribute-list route-map mymap1 in
```

Use the following commands to configure a route-map to specifically prevent OSPF from offering `192.168.1.0/24` as a candidate for inclusion into the IP route table:

```
awplus# configure terminal
awplus(config)# ip prefix-list 100 seq 5 permit
192.168.1.0/24
awplus(config)# route-map 100 deny 10
awplus(config-route-map)# match ip address prefix-list 100
awplus(config-route-map)# exit
awplus(config)# route-map 100 permit 20
awplus(config-router)# router ospf 1
awplus(config-router)# distribute-list route-map 100 in
```

Related Commands **match interface**
redistribute (OSPF)
route-map

enable db-summary-opt

This command enables OSPF database summary list optimization.

The **no** variant of this command disables database summary list optimization.

Syntax

```
enable db-summary-opt
no enable db-summary-opt
```

Default The default setting is disabled.

Mode Router Configuration

Usage When this feature is enabled, the database exchange process is optimized by removing the LSA from the database summary list for the neighbor, if the LSA instance in the database summary list is the same as, or less recent than, the listed LSA in the database description packet received from the neighbor.

Examples To enable OSPF database summary list optimization, use the commands:

```
awplus# configure terminal
awplus(config)# router ospf
awplus(config-router)# enable db-summary-opt
```

To disable OSPF database summary list optimization, use the commands:

```
awplus# configure terminal
awplus(config)# router ospf
awplus(config-router)# no enable db-summary-opt
```

Validation Commands **show running-config**

host area

This command configures a stub host entry belonging to a particular area. You can use this command to advertise specific host routes in the router-LSA as stub link. Since stub host belongs to the specified router, specifying cost is optional.

The **no** variant of this command removes the host area configuration.

Syntax

```
host <ip-address> area <area-id> [cost <0-65535>]
no host <ip-address> area <area-id> [cost <0-65535>]
```

Parameter	Description
<ip-address>	The IPv4 address of the host, in dotted decimal notation.
<area-id>	The OSPF area ID of the transit area that configuring the stub host entry for. Use one of the following formats: ■ dotted decimal format, e.g., 0.0.1.2. ■ normal decimal format in the range <0-4294967295>, e.g., 258.
`cost <0-65535>`	The cost for the stub host entry.

Default By default, no host entry is configured.

Mode Router Configuration

Example

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# host 172.16.10.100 area 1
awplus(config-router)# host 172.16.10.101 area 2 cost 10
```

ip ospf authentication

This command sets the authentication method used when sending and receiving OSPF packets on the current VLAN interface. The default is to use no authentication. If no authentication method is specified in this command, then plain text authentication will be used.

The **no** variant of this command disables the authentication.

Syntax

```
ip ospf [<ip-address>] authentication [message-digest|null]
no ip ospf [<ip-address>] authentication
```

Parameter	Description
<ip-address>	The IP address of the interface.
`message-digest`	Use the message digest authentication.
`null`	Use no authentication. It overrides password or message-digest authentication of the interface.

Mode Interface Configuration for a VLAN interface.

Usage Use the **ip ospf authentication** command on page 40.34 to specify a Simple Text password. Use the **ip ospf message-digest-key** command on page 40.41 to specify MD5 password.

Example In this example, VLAN interface `vlan2` is configured to have no authentication. This will override any text or MD5 authentication configured on this interface.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf authentication null
```

Related Commands
ip ospf authentication-key
area authentication
ip ospf message-digest-key

ip ospf authentication-key

This command specifies an OSPF authentication password for the neighboring routers.

The **no** variant of this command removes the OSPF authentication password.

Syntax

```
ip ospf [<ip-address>] authentication-key <pswd-long>
no ip ospf [<ip-address>] authentication-key
```

Parameter	Description
<ip-address>	The IPv4 address of the interface, in dotted decimal notation.
<pswd-long>	Specifies the authentication password. The string by the end of line will be used.

Default By default, an authentication password is not specified.

Mode Interface Configuration for a VLAN interface.

Usage This command creates a password (key) that is inserted into the OSPF header when AlliedWare Plus™ software originates routing protocol packets. Assign a separate password to each network for different VLAN interfaces. All neighboring routers on the same network with the same password exchange OSPF routing data.

The key can be used only when authentication is enabled for an area. Use the **area authentication** command to enable authentication.

Simple password authentication allows a password to be configured for each area. Configure the routers in the same routing domain with the same password.

Example In the following example, an authentication key test is created on VLAN interface `vlan2` in area 0. Note that first authentication is enabled for area 0.

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# network 10.10.10.0/24 area 0
awplus(config-router)# area 0 authentication
awplus(config-router)# exit
awplus(config)# interface vlan2
awplus(config-if)# ip ospf 3.3.3.3 authentication-key test
```

Related Commands area authentication
ip ospf authentication

ip ospf cost

This command explicitly specifies the cost of the link-state metric in a router-LSA.

The **no** variant of this command resets the VLAN interface cost to the default.

Syntax

```
ip ospf [<ip-address>] cost <1-65535>
no ip ospf [<ip-address>] cost
```

Parameter	Description
<ip-address>	The IPv4 address of the interface, in dotted decimal notation.
<1-65535>	The link-state metric.

Default By default the reference bandwidth is 1000 Mbps, but can be set to a different value by the command, **auto-cost reference bandwidth** command on page 40.15.

Mode Interface Configuration for a VLAN interface.

Usage The interface cost indicates the overhead required to send packets across a certain VLAN interface. This cost is stated in the Router-LSA's link. Typically, the cost is inversely proportional to the bandwidth of an interface. By default, the cost of a VLAN interface is calculated according to the following formula:

reference bandwidth/interface bandwidth

To set the VLAN interface cost manually, use this command.

Example The following example shows setting ospf cost to 10 on VLAN interface `vlan25` for IP address 10.10.10.50

```
awplus# configure terminal
awplus(config)# interface vlan25
awplus(config-if)# ip ospf 10.10.10.50 cost 10
```

Related Commands

show ip ospf interface
auto-cost reference bandwidth

ip ospf database-filter

This command turns on the LSA database-filter for a particular VLAN interface.

The **no** variant of this command turns off the LSA database-filter.

Syntax

```
ip ospf [<ip-address>] database-filter all out
no ip ospf [<ip-address>] database-filter
```

Parameter	Description
<ip-address>	The IPv4 address of the interface, in dotted decimal notation.

Default By default, all outgoing LSAs are flooded to the interface.

Mode Interface Configuration for a VLAN interface.

Usage OSPF floods new LSAs over all interfaces in an area, except the interface on which the LSA arrives. This redundancy ensures robust flooding. However, too much redundancy can waste bandwidth and might lead to excessive link and CPU usage in certain topologies, resulting in destabilizing the network. To avoid this, use the **ip ospf database-filter** command to block flooding of LSAs over specified interfaces.

Example

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if# ip ospf database-filter all out
```

ip ospf dead-interval

This command sets the interval during which no hello packets are received and after which a neighbor is declared dead.

The dead-interval is the amount of time that OSPF waits to receive an OSPF hello packet from the neighbor before declaring the neighbor is down. This value is advertised in the router's hello packets. It must be a multiple of the hello-interval and be the same for all routers on a specific network.

The **no** variant of this command returns the interval to the default of 40 seconds. If you have configured this command specifying the IP address of the interface and want to remove the configuration, specify the IP address (**no ip ospf** `<ip-address>` **dead-interval**).

Syntax

```
ip ospf [<ip-address>] dead-interval <1-65535>
no ip ospf [<ip-address>] dead-interval
```

Parameter	Description
`<ip-address>`	The IPv4 address of the interface, in dotted decimal notation.
`<1-65545>`	The interval in seconds. Default: **40**

Mode Interface Configuration for a VLAN interface.

Example The following example shows configuring the dead-interval to 10 seconds on the VLAN interface `vlan2`.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf dead-interval 10
```

Related Commands

ip ospf hello-interval
show ip ospf interface

ip ospf disable all

This command completely disables OSPF packet processing on a VLAN interface. It overrides the **network area** command and disables the processing of packets on the specific interface.

Use the **no** variant of this command to restore OSPF packet processing on a selected interface.

Syntax

```
ip ospf disable all
no ip ospf disable all
```

Mode Interface Configuration for a VLAN interface.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf disable all
```

ip ospf hello-interval

This command specifies the interval between hello packets.

The hello-interval is advertised in the hello packets. Configure the same hello-interval for all routers on a specific network. A shorter hello interval ensures faster detection of topological changes, but results in more routing traffic.

The **no** variant of this command returns the interval to the default of 10 seconds.

Syntax

```
ip ospf [<ip-address>] hello-interval <1-65535>
no ip ospf [<ip-address>] hello-interval
```

Parameter	Description
<ip-address>	The IP address of the interface, in dotted decimal notation.
<1-65535>	The interval in seconds. Default: **10**

Default The default interval is 10 seconds.

Mode Interface Configuration for a VLAN interface.

Example The following example shows setting the hello-interval to 3 seconds on VLAN interface `vlan2`.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf hello-interval 3
```

Related Commands

ip ospf dead-interval
show ip ospf interface

ip ospf message-digest-key

This command registers an MD5 key for OSPF MD5 authentication.

Message Digest Authentication is a cryptographic authentication. A key (password) and key-id are configured on each router. The router uses an algorithm based on the OSPF packet, the key, and the key-id to generate a **message digest** that gets appended to the packet.

The **no** variant of this command removes the MD5 key.

Syntax

```
ip ospf [<ip-address>] message-digest-key <key-id> md5 <pswd-long>
no ip ospf [<ip-address>] message-digest-key <key-id>
```

Parameter	Description
<ip-address>	The IPv4 address of the interface, in dotted decimal notation.
<key-id>	A key ID number specified as an integer between 1 and 255.
md5	Use the MD5 algorithm.
<pswd-long>	The OSPF password. This is a string of 1 to 16 characters including spaces.

Default By default, there is no MD5 key registered.

Mode Interface Configuration for a VLAN interface.

Usage Use this command for uninterrupted transitions between passwords. It allows you to add a new key without having to delete the existing key. While multiple keys exist, all OSPF packets will be transmitted in duplicate; one copy of the packet will be transmitted for each of the current keys. This is helpful for administrators who want to change the OSPF password without disrupting communication. The system begins a rollover process until all the neighbors have adopted the new password. This allows neighboring routers to continue communication while the network administrator is updating them with a new password. The router will stop sending duplicate packets once it detects that all of its neighbors have adopted the new password.

Maintain only one password per interface, removing the old password whenever you add a new one. This will prevent the local system from continuing to communicate with the system that is using the old password. Removing the old password also reduces overhead during rollover. All neighboring routers on the same network must have the same password value to enable exchange of OSPF routing data.

Examples The following example shows OSPF authentication on the VLAN interface `vlan5` when IP address has not been specified.

```
awplus# configure terminal
awplus(config)# interface vlan5
awplus(config-if)# ip ospf authentication message-digest
awplus(config-if)# ip ospf message-digest-key 1 md5 yourpass
```

The following example shows configuring OSPF authentication on the VLAN interface `vlan2` for the IP address `1.1.1.1`. (If the interface has two IP addresses assigned--`1.1.1.1` & `2.2.2.2`, OSPF authentication will be enabled only for the IP address `1.1.1.1`).

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf 1.1.1.1 authentication message-
digest
awplus(config-if)# ip ospf 1.1.1.1 message-digest-key 2 md5
yourpass
```

ip ospf mtu

This command sets the MTU size for OSPF. Whenever OSPF constructs packets, it uses VLAN interface MTU size as Maximum IP packet size. This command forces OSPF to use the specified value, overriding the actual VLAN interface MTU size.

Use the **no** variant of this command to return the MTU size to the default.

Syntax

```
ip ospf mtu <576-65535>
no ip ospf mtu
```

Default By default, OSPF uses interface MTU derived from the VLAN interface.

Mode Interface Configuration for a VLAN interface.

Usage This command allows an administrator to configure the MTU size recognized by the OSPF protocol. It does not configure the MTU settings on the VLAN interface. OSPF will not recognize MTU size configuration changes made to the kernel until the MTU size is updated through the CLI.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf mtu 1480
```

ip ospf mtu-ignore

Use this command to configure OSPF so that OSPF does not check the MTU size during DD (Database Description) exchange.

Use the **no** variant of this command to make sure that OSPF checks the MTU size during DD exchange.

Syntax

```
ip ospf [<ip-address>] mtu-ignore
no ip ospf [<ip-address>] mtu-ignore
```

Parameter	Description
<ip-address>	IPv4 address of the interface, in dotted decimal notation.

Mode Interface Configuration for a VLAN interface.

Usage By default, during the DD exchange process, OSPF checks the MTU size described in the DD packets received from the neighbor. If the MTU size does not match the interface MTU, the neighbor adjacency is not established. Using this command makes OSPF ignore this check and allows establishing of adjacency regardless of MTU size in the DD packet.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf mtu-ignore
```

ip ospf network

This command configures the OSPF network type to a type different from the default for the particular VLAN interface.

The **no** variant of this command returns the network type to the default for the particular VLAN interface.

Syntax

```
ip ospf network [broadcast|non-broadcast|point-to-point|
   point-to-multipoint]

no ip ospf network
```

Parameter	Description
`broadcast`	Sets the network type to broadcast.
`non-broadcast`	Sets the network type to NBMA.
`point-to-multipoint`	Sets the network type to point-to-multipoint.
`point-to-point`	Sets the network type to point-to-point.

Default The default is the `broadcast` OSPF network type for a VLAN interface.

Mode Interface Configuration for a VLAN interface.

Usage This command forces the interface network type to the specified type. Depending on the network type, OSPF changes the behavior of the packet transmission and the link description in LSAs.

Example The following example shows setting the network type to `point-to-point` on the VLAN interface `vlan2`.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf network point-to-point
```

ip ospf priority

This command sets the router priority, which is a parameter used in the election of the designated router for the network.

The **no** variant of this command returns the router priority to the default of 1.

Syntax

```
ip ospf [<ip-address>] priority <priority>
no ip ospf [<ip-address>] priority
```

Parameter	Description
<ip-address>	The IP address of the interface.
<priority>	*<0-255>* Specifies the Router Priority of the interface.

Default The router priority for an interface is set to 1 by default.

Mode Interface Configuration for a VLAN interface.

Usage Set the priority to help determine the OSPF Designated Router (DR) for a network. If two routers attempt to become the DR, the router with the higher router priority becomes the DR. If the router priority is the same for two routers, the router with the higher router ID takes precedence.

Only routers with nonzero router priority values are eligible to become the designated or backup designated router.

Configure router priority for multiaccess networks only and not for point-to-point networks.

Example The following example shows setting the OSPF priority value to 3 on the VLAN interface `vlan2`.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf priority 3
```

Related Commands ip ospf network

ip ospf resync-timeout

Use this command to set the interval after which adjacency is reset if out-of-band resynchronization has not occurred. The interval period starts from the time a restart signal is received from a neighbor.

Use the **no** variant of this command to return to the default.

Syntax

```
ip ospf [<ip-address>] resync-timeout <1-65535>
no ip ospf [<ip-address>] resync-timeout
```

Parameter	Description
<ip-address>	The IP address of the interface.
<1-65535>	Specifies the resynchronization timeout value of the interface in seconds.

Mode Interface Configuration for a VLAN interface.

Example The following example shows setting the OSPF resynchronization timeout value to 65 seconds on the VLAN interface `vlan2`.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf resync-timeout 65
```

ip ospf retransmit-interval

Use this command to specify the time between link-state advertisement (LSA) retransmissions for adjacencies belonging to the interface.

Use the **no** variant of this command to return to the default of 5 seconds.

Syntax

```
ip ospf [<ip-address>] retransmit-interval <1-65535>
no ip ospf [<ip-address>] retransmit-interval
```

Parameter	Description
<ip-address>	The IP address of the interface.
<1-65535>	Specifies the interval in seconds.

Default The default interval is 5 seconds.

Mode Interface Configuration for a VLAN interface.

Usage After sending an LSA to a neighbor, the router keeps the LSA until it receives an acknowledgement. In case the router does not receive an acknowledgement during the set time (the retransmit interval value) it retransmits the LSA. Set the retransmission interval value conservatively to avoid needless retransmission. The interval should be greater than the expected round-trip delay between two routers.

Example The following example shows setting the `ospf retransmit interval` to 6 seconds on the VLAN interface `vlan2`.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf retransmit-interval 6
```

ip ospf transmit-delay

Use this command to set the estimated time it takes to transmit a link-state-update packet on the VLAN interface.

Use the **no** variant of this command to return to the default of 1 second.

Syntax

```
ip ospf [<ip-address>] transmit-delay <1-65535>
no ip ospf [<ip-address>] transmit-delay
```

Parameter	Description
<ip-address>	The IP address of the VLAN interface.
<1-65535>	Specifies the time, in seconds, to transmit a link-state update.

Default The default interval is 1 second.

Mode Interface Configuration for a VLAN interface.

Usage The transmit delay value adds a specified time to the age field of an update. If the delay is not added, the time in which the LSA transmits over the link is not considered. This command is especially useful for low speed links. Add transmission and propagation delays when setting the transmit delay value.

Example The following example shows setting the OSPF transmit delay time to 3 seconds on the VLAN interface `vlan2`.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf transmit-delay 3
```

max-concurrent-dd

Use this command to set the limit for the number of Database Descriptors (DD) that can be processed concurrently.

Use the **no** variant of this command to reset the limit for the number of Database Descriptors (DD) that can be processed concurrently.

Syntax

```
max-concurrent-dd <1-65535>
no max-concurrent-dd
```

Parameter	Description
<1-65535>	Specify the number of DD processes.

Mode Router Configuration

Usage This command is useful when a router's performance is affected from simultaneously bringing up several OSPF adjacencies. This command limits the maximum number of DD exchanges that can occur concurrently per OSPF instance, thus allowing for all of the adjacencies to come up.

Example The following example sets the max-concurrent-dd value to 4, so that only 4 DD exchanges will be processed at a time.

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router# max-concurrent-dd 4
```

maximum-area

Use this command to set the maximum number of OSPF areas.

Use the **no** variant of this command to set the maximum number of OSPF areas to the default.

Syntax

```
maximum-area <1-4294967294>
no maximum-area
```

Parameter	Description
<1-4294967294>	Specify the maximum number of OSPF areas.

Default The default for the maximum number of OSPF areas is 4294967294.

Mode Router Configuration

Usage Use this command in router OSPF mode to specify the maximum number of OSPF areas.

Examples The following example sets the maximum number of OSPF areas to 2:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# maximum-area 2
```

The following example removes the maximum number of OSPF areas and resets to default:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# no maximum-area
```

neighbor (OSPF)

Use this command to inform the router of other neighboring routers that are connected to the same NBMA network.

Use the **no** variant of this command to remove a configuration.

Syntax

```
neighbor <ip-address> [<cost>]{<priority>|<poll-interval>}
no neighbor <ip-address> [<cost>]{<priority>|<poll-interval>}
```

Parameter	Description
<ip-address>	Specifies the interface IP address of the neighbor.
<priority>	`priority` *<0-255>* Specifies the router priority value of the non-broadcast neighbor associated with the specified IP address. The default is 0. This keyword does not apply to point-to-multipoint interfaces.
<poll-interval>	`poll-interval` *<1-2147483647>* Dead neighbor polling interval in seconds. It is recommended to set this value much higher than the hello interval. The default is 120 seconds.
<cost>	`cost` *<1-65535>* Specifies the link-state metric to this neighbor.

Mode Router Configuration

Usage To configure a neighbor on an NBMA network manually, use the `neighbor` command and include one neighbor entry for each known nonbroadcast network neighbor. The IP address used in this command is the neighbor's primary IP address on the interface where that neighbor connects to the NBMA network.

The poll interval is the reduced rate at which routers continue to send hello packets, when a neighboring router has become inactive. Set the poll interval to be much larger than hello interval.

Examples This example shows a neighbor configured with a priority value, poll interval time, and cost.

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# neighbor 1.2.3.4 priority 1 poll-
interval 90
awplus(config-router)# neighbor 1.2.3.4 cost 15
```

network area

Use this command to enable OSPF routing with a specified Area ID on any interfaces with IP addresses that match the specified network address.

Use the **no** variant of this command to disable OSPF routing on the interfaces.

Syntax

```
network <network-address> area <area-id>
no network <network-address> area <area-id>
```

Parameter	Description
<network-address>	{*<ip-network/m>*|*<ip-addr>* *<reverse-mask>*}
<ip-network/m>	IP address of the network, entered in the form A.B.C.D/M. Dotted decimal notation followed by a forward slash, and then the subnet mask length.
<ip-addr>	IPv4 network address, entered in the form A.B.C.D.
<reverse-mask>	Reverse mask in dotted decimal format. Note that the term reverse-mask is sometimes referred to as a Wildcard mask.
<area-id>	{*<ip-addr>*|*<0-4294967295>*}
<ip-addr>	OSPF Area ID in IPv4 address format, in the form A.B.C.D.
<0-4294967295>	OSPF Area ID as 4 octets unsigned integer value.

Default No **network area** is configured by default.

Mode Router Configuration

Usage OSPF routing can be enabled per IPv4 subnet. The network address can be defined using either the prefix length or a wild card mask. A wild card mask is comprised of consecutive `0's` as network bits and consecutive `1's` as host bits.

Examples The following commands show the use of the **network area** command with OSPF multiple instance support disabled:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# network 10.0.0.0/8 area  3
awplus(config-router)# network 10.0.0.0/8 area 1.1.1.1
```

The following commands disable OSPF routing with Area ID 3 on all interfaces:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# no network 10.0.0.0/8 area3
```

ospf abr-type

Use this command to set an OSPF Area Border Router (ABR) type.

Use the **no** variant of this command to revert the ABR type to the default setting (Cisco).

Syntax

```
ospf abr-type {cisco|ibm|standard}
no ospf abr-type {cisco|ibm|standard}
```

Parameter	Description
`cisco`	Specifies an alternative ABR using Cisco implementation (RFC 3509). This is the default ABR type.
`ibm`	Specifies an alternative ABR using IBM implementation (RFC 3509).
`standard`	Specifies a standard behavior ABR (RFC 2328).

Default ABR type `Cisco`

Mode Router Configuration

Usage Specifying the ABR type allows better interoperation between different implementations. This command is specially useful in a multi-vendor environment. The different ABR types are:

- Cisco ABR Type: By this definition, a router is considered an ABR if it has more than one area actively attached and one of them is the backbone area.
- IBM ABR Type: By this definition, a router is considered an ABR if it has more than one area actively attached and the backbone area is configured. In this case the configured backbone need not be actively connected.
- Standard ABR Type: By this definition, a router is considered an ABR if it has more than one area actively attached to it.

Example

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# ospf abr-type ibm
```

ospf restart grace-period

Use this command to configure the grace-period for restarting OSPF routing.

Use the **no** variant of this command to revert to the default grace-period.

Syntax

```
ospf restart grace-period <1-1800>
no ospf restart grace-period
```

Parameter	Description
<1-1800>	Specifies the grace period in seconds.

Default In the AlliedWare Plus™ OSPF implementation, the default OSPF grace-period is 180 seconds.

Mode Global Configuration

Usage Use this command to enable the OSPF Graceful Restart feature and set the restart grace-period. Changes from the default restart grace-period are displayed in the running-config. The restart grace-period is not displayed in the running-config if it has been reset to the default using the **no** variant of this command.

When a master failover happens on a VCStack, the OSPF grace-period will be the longest period between the default value (180 seconds is the default OSPF grace-period) and the configured OSPF grace-period value from this command. So the configured OSPF grace-period value will not be used for a VCStack master failover if it is shorter than the default OSPF grace-period.

Example To set the OSPF restart grace-period to 250 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ospf restart grace-period 250
```

To reset the OSPF restart grace-period to the default (180 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# no ospf restart grace-period
```

Validation Commands **show running-config**

Related Commands **ospf restart helper**
restart ospf graceful

ospf restart helper

Use this command to configure the **helper** behavior for the OSPF Graceful Restart feature.

Use the **no** variant of this command to revert to the default grace-period.

Syntax

```
ospf restart helper
   {max-grace-period <grace-period>|only-reload|only-upgrade}

ospf restart helper {never router-id <router-id>}

no ospf restart helper [max-grace-period]
```

Parameter	Description
`max-grace-period`	Specify help if received grace-period is less than a specified value.
<grace-period>	Maximum grace period accepted in seconds in range *<1-1800>*.
`never`	Specify the local policy to never to act as a helper for this feature.
`only-reload`	Specify help only on software reloads not software upgrades.
`only-upgrade`	Specify help only on software upgrades not software reloads.
`router-id`	Enter the router-id keyword to specify the OSPF Router ID that is never to act as a helper for the OSPF Graceful Restart feature.
<router-id>	*<A.B.C.D>* Specify the OSPF Router ID in dotted decimal format A.B.C.D

Default In the AlliedWare Plus™ OSPF implementation, the default OSPF grace-period is 180 seconds.

Mode Global Configuration

Usage The **ospf restart helper** command requires at least one parameter, but you may use more than one in the same command (excluding parameter **never**).

The **no** version of this command turns off the OSPF restart helper, while the **no ospf restart helper max-grace-period** command resets the max-grace-period, rather than the helper policy itself.

Example

```
awplus# configure terminal
awplus(config)# ospf restart helper only-reload

awplus# configure terminal
awplus(config)# ospf restart helper never router-id 10.10.10.1
```

```
awplus# configure terminal
awplus(config)# no ospf restart helper max-grace-period
```

Related Commands **ospf restart grace-period**
restart ospf graceful

ospf router-id

Use this command to specify a router ID for the OSPF process.

Use the **no** variant of this command to disable this function.

Syntax

```
ospf router-id <ip-address>
no ospf router-id
```

Parameter	Description
<ip-address>	Specifies the router ID in IPv4 address format.

Mode Router Configuration

Usage Configure each router with a unique router-id. In an OSPF router process that has active neighbors, a new router-id takes effect at the next reload or when you restart OSPF manually.

Example The following example shows a specified router ID 2.3.4.5.

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# ospf router-id 2.3.4.5
```

Related Commands show ip ospf

overflow database

Use this command to limit the maximum number of Link State Advertisements (LSAs) that can be supported by the current OSPF instance.

Use the **no** variant of this command to have no limit on the maximum number of LSAs.

Syntax

```
overflow database <0-4294967294> {hard|soft}
no overflow database
```

Parameter	Description
<0-4294967294>	The maximum number of LSAs.
`hard`	Shutdown occurs if the number of LSAs exceeds the specified value.
`soft`	Warning message appears if the number of LSAs exceeds the specified value.

Mode Router Configuration

Usage Use **hard** with this command if a shutdown is required if the number of LSAs exceeds the specified number. Use **soft** with this command if a shutdown is not required, but a warning message is required, if the number of LSAs exceeds the specified number.

Example The following example shows setting the database overflow to 500, and a shutdown to occur, if the number of LSAs exceeds 500.

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# overflow database 500 hard
```

overflow database external

Use this command to configure the size of the external database and the time the router waits before it tries to exit the overflow state.

Use the **no** variant of this command to revert to default.

Syntax

```
overflow database external <max-lsas> <recover-time>
no overflow database external
```

Parameter	Description
<max-lsas>	*<0-2147483647>* The maximum number of Link State Advertisements (LSAs). Note that this value should be the same on all routers in the AS.
<recover-time>	*<0-65535>* the number of seconds the router waits before trying to exit the database overflow state. If this parameter is 0, router exits the overflow state only after an explicit administrator command.

Mode Router Configuration

Usage Use this command to limit the number of AS-external-LSAs a router can receive, once it is in the wait state. It takes the number of seconds specified as the *<recover-time>* to recover from this state.

Example The following example shows setting the maximum number of LSAs to 5 and the time to recover from overflow state to be 3:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# overflow database external 50 3
```

passive-interface (OSPF)

Use this command to suppress the sending of Hello packets on all interfaces, or on a specified interface. If you use the **passive-interface** command without the optional parameters then **all** interfaces are put into passive mode.

Use the **no** variant of this command to allow the sending of Hello packets on all interfaces, or on the specified interface. If you use the **no** variant of this command without the optional parameters then **all** interfaces are removed from passive mode.

Syntax

```
passive-interface [<interface>][<ip-address>]
no passive-interface [<interface>][<ip-address>]
```

Parameter	Description
<interface>	The name of the interface.
<ip-address>	IP address of the interface, entered in the form A.B.C.D.

Mode Router Configuration

Usage Configure an interface to be passive if you wish its connected route to be treated as an OSPF route (rather than an AS-external route), but do not wish to actually exchange any OSPF packets via this interface.

Examples To configure passive interface mode on interface **vlan2**, enter the following commands:

```
awplus(config)# router ospf 100
awplus(config-router)# passive-interface vlan2
```

To configure passive interface mode on **all** interfaces, enter the following commands:

```
awplus(config)# router ospf 100
awplus(config-router)# passive-interface
```

To remove passive interface mode on interface **vlan2**, enter the following commands:

```
awplus(config)# router ospf 100
awplus(config-router)# no passive-interface vlan2
```

To remove passive interface mode on **all** interfaces, enter the following commands:

```
awplus(config)# router ospf 100
awplus(config-router)# no passive-interface
```

redistribute (OSPF)

Use this command to redistribute routes from other routing protocols, static routes and connected routes into an ospf routing table.

Use the **no** variant of this command to disable this function.

Syntax

```
redistribute {bgp|connected|rip|static} {metric|metric-type|
   route-map|tag}

no redistribute {bgp|connected|rip|static} {metric|metric-type|
   route-map|tag}
```

Parameter	Description
`bgp`	Specifies that this applies to the redistribution of BGP routes.
`connected`	Specifies that this applies to the redistribution of connected routes.
`rip`	Specifies that this applies to the redistribution of RIP routes.
`static`	Specifies that this applies to the redistribution of static routes.
`metric`	`metric <0-16777214>` Specifies the external metric.
`metric-type`	`metric-type {1|2}` Specifies the external metric-type.
`route-map`	`route-map WORD` Specifies name of the route-map.
`tag`	`tag <0-4294967295>` Specifies the external route tag.

Default The default metric value for routes redistributed into OSPF is 20. The metric can also be defined using the **set metric** command for a route map. Note that a metric defined using the **set metric** command for a route map overrides a metric defined with this command.

Mode Router Configuration

Usage You use this command to inject routes, learnt from other routing protocols, into the OSPF domain to generate AS-external-LSAs. If a route-map is configured by this command, then that route-map is used to control which routes are redistributed and can set metric and tag values on particular routes.

The metric, metric-type, and tag values specified on this command are applied to any redistributed routes that are not explicitly given a different metric, metric-type, or tag value by the route map.

See the section **OSPF Metrics** in the **OSPF Introduction and Configuration** chapter for more information about metrics, and about behavior when configured in route maps.

Example The following example shows redistribution of bgp routes into ospf routing table `100`, with metric `12`.

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# redistribute bgp metric 12
```

The following example shows the configuration of a route-map named `rmap2`, which is then applied using the **redistribute route-map** command, so routes learnt via interface vlan1 can be redistributed as type-1 external LSAs:

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 3
awplus(config-route-map)# match interface vlan1
awplus(config-route-map)# set metric-type 1
awplus(config-route-map)# exit
awplus(config)# router ospf 100
awplus(config-router)# redistribute bgp route-map rmap2
```

Note that configuring a route-map and applying it with the **redistribute route-map** command allows you to filter which routes are distributed from another routing protocol (such as RIP). A route-map can also set the metric, tag, and metric-type of the redistributed routes.

Validation Commands **show ip ospf database external**

Related Commands **distribute-list (OSPF)**
match interface
route-map

restart ospf graceful

Use this command to force the OSPF process to restart, and optionally set the grace-period.

Syntax `restart ospf graceful [grace-period <1-1800>]`

Parameter	Description
`grace-period`	Specify the grace period.
<1-1800>	The grace period in seconds.

Default In the AlliedWare Plus™ OSPF implementation, the default OSPF grace-period is 180 seconds.

Mode Privileged Exec

Usage After this command is executed, the OSPF process immediately shuts down. It notifies the system that OSPF has performed a graceful shutdown. Routes installed by OSPF are preserved until the grace-period expires.

When a **restart ospf graceful** command is issued, the OSPF configuration is reloaded from the last saved configuration. Ensure you first enter the command **copy running-config startup-config**.

When a master failover happens on a VCStack, the OSPF grace-period will be the longest period between the default value (180 seconds is the default OSPF grace-period) and the configured OSPF grace-period value from this command. So the configured OSPF grace-period value will not be used for a VCStack master failover if it is shorter than the default OSPF grace-period.

Example

```
awplus# copy running-config startup-config
awplus# restart ospf graceful grace-period 200
```

Related Commands **ospf restart grace-period**
ospf restart helper

router ospf

Use this command to enter Router Configuration mode to configure an OSPF routing process. You must specify the process ID with this command for multiple OSPF routing processes on the switch.

Use the **no** variant of this command to terminate an OSPF routing process.

Use the **no** parameter with the **process-id** parameter, to terminate and delete a specific OSPF routing process. If no **process-id** is specified on the **no** variant of this command, then all OSPF routing processes are terminated, and all OSPF configuration is removed.

Syntax

```
router ospf [<process-id>]
no router ospf [<process-id>]
```

Syntax (VRF Lite)

```
router ospf [<process-id>] [<vrf-instance>]
no router ospf [<process-id>]
```

Parameter	Description
<process-id>	A positive number from 1 to 65535, that is used to define a routing process.
<vrf-instance>	The VRF instance to be associated with the OSPF routing process.

Default No routing process is defined by default.

Mode Global Configuration

Usage The process ID of OSPF is an optional parameter for the **no** variant of this command only. When removing all instances of OSPF, you do not need to specify each Process ID, but when removing particular instances of OSPF you must specify each Process ID to be removed.

Note (VRF Lite) When using VRF-Lite, this command can be used to associate a process-id with a VRF instance that has been created using the **ip vrf** command on page 49.10.

Example To enter Router Configuration mode to configure an existing OSPF routing process `100`, use the commands:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)#
```

Syntax (VRF Lite) To enter Router Configuration mode to configure an existing OSPF routing process `100` for VRF instance `red`, use the commands:

```
awplus# configure terminal
awplus(config)# router ospf 100 red
awplus(config-router)#
```

router-id

Use this command to specify a router ID for the OSPF process.

Use the **no** variant of this command to force OSPF to use the previous OSPF router-id behavior.

Syntax

```
router-id <ip-address>
no router-id
```

Parameter	Description
<ip-address>	Specifies the router ID in IPv4 address format.

Mode Router Configuration

Usage Configure each router with a unique router-id. In an OSPF router process that has active neighbors, a new router-id is used at the next reload or when you restart OSPF manually.

Example The following example shows a fixed router ID 10.10.10.60

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# router-id 10.10.10.60
```

Related Commands show ip ospf

show debugging ospf

Use this command to display which OSPF debugging options are currently enabled.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show debugging ospf
```

Mode

User Exec and Privileged Exec

Example

```
awplus# show debugging ospf
```

Output

Figure 40-2: Example output from the show debugging ospf command

```
OSPF debugging status:
  OSPF packet Link State Update debugging is on
  OSPF all events debugging is on
```

show ip ospf

Use this command to display general information about all OSPF routing processes. Include the process ID parameter with this command to display information about specified instances.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show ip ospf
show ip ospf <process-id>
```

Parameter	Description
<process-id>	*<0-65535>* The ID of the router process for which information will be displayed. If this parameter is included, only the information for the specified routing process is displayed.

Mode User Exec and Privileged Exec

Examples To display general information about all OSPF routing processes, use the command:

```
awplus# show ip ospf
```

To display general information about OSPF routing process `100`, use the command:

```
awplus# show ip ospf 100
```

Table 40-1: Example output from the show ip ospf command

```
Route Licence: Route : Limit=0, Allocated=0, Visible=0, Internal=0
Route Licence: Breach: Current=0, Watermark=0
Routing Process "ospf 10" with ID 192.168.1.1
Process uptime is 10 hours 24 minutes
Process bound to VRF default
Conforms to RFC2328, and RFC1583 Compatibility flag is disabled
Supports only single TOS(TOS0) routes
Supports opaque LSA
Supports Graceful Restart
SPF schedule delay min 0.500 secs, SPF schedule delay max 50.0 secs
Refresh timer 10 secs
Number of incomming current DD exchange neighbors 0/5
Number of outgoing current DD exchange neighbors 0/5
Number of external LSA 0. Checksum 0x000000
Number of opaque AS LSA 0. Checksum 0x000000
Number of non-default external LSA 0
External LSA database is unlimited.
Number of LSA originated 0
Number of LSA received 0
Number of areas attached to this router: 2
   Area 0 (BACKBONE) (Inactive)
        Number of interfaces in this area is 0(0)
        Number of fully adjacent neighbors in this area is 0
        Area has no authentication
        SPF algorithm executed 0 times
        Number of LSA 0. Checksum 0x000000
```

Table 40-1: Example output from the show ip ospf command (cont.)

```
    Area 1 (Inactive)
        Number of interfaces in this area is 0(0)
        Number of fully adjacent neighbors in this area is 0
        Number of fully adjacent virtual neighbors through this area is 0
        Area has no authentication
        SPF algorithm executed 0 times
        Number of LSA 0. Checksum 0x000000
```

Table 40-2: Example output from the show ip ospf <process-id> command

```
Routing Process "ospf 100" with ID 10.10.11.146
Process uptime is 0 minute
Conforms to RFC2328, and RFC1583Compatibility flag is disabled
Supports only single TOS(TOS0) routes
Supports opaque LSA
SPF schedule delay 5 secs, Hold time between two SPFs 10 secs
Refresh timer 10 secs
Number of external LSA 0. Checksum Sum 0x0
Number of non-default external LSA 0
External LSA database is unlimited.
Number of areas attached to this router: 1
   Area 1
        Number of interfaces in this area is 1(1)
        Number of fully adjacent neighbors in this area is 0
        Number of fully adjacent virtual neighbors through this area is 0
        Area has no authentication
        SPF algorithm executed 0 times
        Number of LSA 1. Checksum Sum 0x00e3e2
```

Table 40-3: Parameters in the output of the show ip ospf command

Output Parameter		Meaning
`Route Licence: Route:`	`Limit`	The maximum number of OSPF routes which may be used for forwarding.
	`Allocated`	The current total number of OSPF routes allocated in the OSPF module.
	`Visible`	The current number of OSPF routes which may be used for forwarding.
	`Internal`	The number of OSPF internal routes used for calculating paths to ASBRs.
`Number of external LSA`		The number of external link-state advertisements
`Number of opaque AS LSA`		Number of opaque link-state advertisements

Related Commands router ospf

show ip ospf border-routers

Use this command to display the ABRs and ASBRs for all OSPF instances. Include the process ID parameter with this command to view data about specified instances.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show ip ospf border-routers

show ip ospf <process-id> border-routers
```

Parameter	Description
<process-id>	*<0-65535>* The ID of the router process for which information will be displayed.

Mode User Exec and Privileged Exec

Output **Figure 40-3: Example output from the show ip ospf border-routers command**

```
OSPF process 1 internal Routing Table
Codes: i - Intra-area route, I - Inter-area route
i 10.15.0.1 [10] via 10.10.0.1, vlan2, ASBR, Area 0.0.0.0
i 172.16.10.1 [10] via 10.10.11.50, vlan3, ABR, ASBR, Area
0.0.0.0
```

show ip ospf database

Use this command to display a database summary for OSPF information. Include the process ID parameter with this command to display information about specified instances.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show ip ospf [<process-id>] database [self-originate|max-age|adv router <adv-router-id>]`

Parameter	Description
<process-id>	*<0-65535>* The ID of the router process for which information will be displayed.
`self-originate`	Displays self-originated link states.
`max-age`	Displays LSAs in MaxAge list. It maintains the list of the all LSAs in the database which have reached the max-age which is 3600 seconds.
`adv-router`	Advertising Router LSA.
<adv-router-id>	The Advertising Router ID (usually entered in IPv4 address format A.B.C.D). Note that this ID component no longer represents an address; it is simply a character string that has an IPv4 address format.

Mode User Exec and Privileged Exec

Examples To display the ABRs and ASBRs for all OSPF instances, use the command:

```
awplus# show ip ospf border-routers
```

To display the ABRs and ASBRs for the specific OSPF instance `721`, use the command:

```
awplus# show ip ospf 721 border-routers
```

Output **Figure 40-4: Example output from the show ip ospf database command**

```
       OSPF Router process 1 with ID (10.10.11.60)
                Router Link States (Area 0.0.0.1)
Link ID         ADV Router      Age  Seq#       CkSum  Link
count
10.10.11.60     10.10.11.60       32 0x80000002 0x472b 1
       OSPF Router process 100 with ID (10.10.11.60)
                Router Link States (Area 0.0.0.0)
Link ID         ADV Router      Age  Seq#       CkSum  Link
count
10.10.11.60     10.10.11.60      219 0x80000001 0x4f5d 0
```

Example

```
awplus# show ip ospf database external 1.2.3.4 self-originate

awplus# show ip ospf database self-originate
```

Figure 40-5: Example output from the show ip ospf database self-originate command

```
       OSPF Router process 100 with ID (10.10.11.50)
                Router Link States (Area 0.0.0.1 [NSSA])
Link ID         ADV Router      Age  Seq#       CkSum  Link
count
10.10.11.50     10.10.11.50     20  0x80000007  0x65c3 2
                Area-Local Opaque-LSA (Area 0.0.0.1 [NSSA])
Link ID         ADV Router      Age  Seq#       CkSum Opaque ID

                AS-Global Opaque-LSA
Link ID         ADV Router      Age  Seq#       CkSum Opaque ID
67.1.4.217      10.10.11.50     37 0x80000001  0x2daa 66777
```

show ip ospf database asbr-summary

Use this command to display information about the Autonomous System Boundary Router (ASBR) summary LSAs.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show ip ospf database asbr-summary [<ip-addr>]
   [self-originate|<advrouter>]
```

Parameter	Description
<advrouter>	adv-router **<***ip-address***>**
adv-router	Displays all the LSAs of the specified router.
<ip-addr>	A link state ID, as an IP address.
self-originate	Displays self-originated link states.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ip ospf database asbr-summary 1.2.3.4 self-
originate

awplus# show ip ospf database asbr-summary self-originate

awplus# show ip ospf database asbr-summary 1.2.3.4 adv-router
2.3.4.5
```

show ip ospf database external

Use this command to display information about the external LSAs.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show ip ospf database external adv-router[<adv-router-id>]
   [self-originate|adv-router<adv-router-id>]
```

Parameter	Description
`adv-router`	Displays all the LSAs of the specified router.
`self-originate`	Displays self-originated link states.
`<adv-router-id>`	The Advertising Router ID (usually entered in IPv4 address format A.B.C.D). Note that this ID component no longer represents an address; it is simply a character string that has an IPv4 address format.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ip ospf database external 1.2.3.4 self-originate

awplus# show ip ospf database external self-originate

awplus# show ip ospf database external 1.2.3.4 adv-router
        2.3.4.5
```

Output **Figure 40-6: Example output from the show ip ospf database external self-originate command**

```
      OSPF Router process 100 with ID (10.10.11.50)
                AS External Link States
LS age: 298
Options: 0x2 (*|-|-|-|-|-|E|-)
LS Type: AS-external-LSA
Link State ID: 10.10.100.0 (External Network Number)
Advertising Router: 10.10.11.50
LS Seq Number: 80000001
Checksum: 0x7033
Length: 36
Network Mask: /24
      Metric Type: 2 (Larger than any link state path)
      TOS: 0
      Metric: 20
      Forward Address: 10.10.11.50
      External Route Tag: 0
```

Output

Figure 40-7: Example output from the show ip ospf database external adv-router command

```
awplus#show ip ospf database external adv-router 1.1.1.1

                 AS External Link States
LS age: 273
Options: 0x2 (-|-|-|-|-|-|E|-)
LS Type: AS-external-LSA
Link State ID: 172.16.0.0 (External Network Number)
Advertising Router: 1.1.1.1
LS Seq Number: 80000004
Checksum: 0x02f8
Length: 36
Network Mask: /24
      Metric Type: 2 (Larger than any link state path)
      TOS: 0
      Metric: 20
      Forward Address: 0.0.0.0
      External Route Tag: 0
```

show ip ospf database network

Use this command to display information about the network LSAs.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show ip ospf database network [<adv-router-id>]
   [self-originate|<adv-router-id>]
```

Parameter	Description
<adv-router-id>	The router ID of the advertising router, in IPv4 address format. Note however, that this no longer represents a real address.
`self-originate`	Displays self-originated link states.
`adv-router`	Displays all the LSAs of the specified router.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ip ospf database network 1.2.3.4 self-originate

awplus# show ip ospf database network self-originate

awplus# show ip ospf database network 1.2.3.4 adv-router
        2.3.4.5
```

Output **Figure 40-8: Example output from the show ip ospf database network command**

```
       OSPF Router process 200 with ID (192.30.30.2)
                Net Link States (Area 0.0.0.0)

```

show ip ospf database nssa-external

Use this command to display information about the NSSA external LSAs.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show ip ospf database nssa-external [<ip-address>]
   [self-originate|<advrouter>]
```

Parameter	Description
<advrouter>	`adv-router` **<***ip-address***>**
`adv-router`	Displays all the LSAs of the specified router.
<ip-address>	A link state ID, as an IP address.
`self-originate`	Displays self-originated link states.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ip ospf database nssa-external 1.2.3.4
       self-originate

awplus# show ip ospf database nssa-external self-originate

awplus# show ip ospf database nssa-external 1.2.3.4
       adv-router 2.3.4.5
```

Output **Figure 40-10: Example output from the show ip ospf database nssa-external adv-router command**

```
      OSPF Router process 100 with ID (10.10.11.50)
               NSSA-external Link States (Area 0.0.0.0)

```

show ip ospf database opaque-area

Use this command to display information about the area-local (link state type 10) scope LSAs. Type-10 Opaque LSAs are not flooded beyond the borders of their associated area.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show ip ospf database opaque-area [<ip-address>]
   [self-originate|<advrouter>]
```

Parameter	Description
<advrouter>	adv-router **<***ip-address***>**
adv-router	Displays all the LSAs of the specified router.
<ip-address>	A link state ID, as an IP address.
self-originate	Displays self-originated link states.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ip ospf database opaque-area 1.2.3.4 self-
originate

awplus# show ip ospf database opaque-area self-originate

awplus# show ip ospf database opaque-area 1.2.3.4 adv-router
2.3.4.5
```

Output **Figure 40-11: Example output from the show ip ospf database opaque-area command**

```
      OSPF Router process 100 with ID (10.10.11.50)
                Area-Local Opaque-LSA (Area 0.0.0.0)
LS age: 262
Options: 0x2 (*|-|-|-|-|-|E|-)
LS Type: Area-Local Opaque-LSA
Link State ID: 10.0.25.176 (Area-Local Opaque-Type/ID)
Opaque Type: 10
Opaque ID: 6576
Advertising Router: 10.10.11.50
LS Seq Number: 80000001
Checksum: 0xb413
Length: 26
```

show ip ospf database opaque-as

Use this command to display information about the link-state type 11 LSAs. This type of link-state denotes that the LSA is flooded throughout the Autonomous System (AS).

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show ip ospf database opaque-as [<ip-address>]
   [self-originate|<advrouter>]
```

Parameter	Description
<advrouter>	adv-router **<***ip-address***>**
adv-router	Displays all the LSAs of the specified router.
<ip-address>	A link state ID, as an IP address.
self-originate	Displays self-originated link states.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ip ospf database opaque-as 1.2.3.4 self-
        originate

awplus# show ip ospf database opaque-as self-originate

awplus# show ip ospf database opaque-as 1.2.3.4 adv-router
        2.3.4.5
```

Output **Figure 40-12: Example output from the show ip ospf database opaque-as command**

```
       OSPF Router process 100 with ID (10.10.11.50)
              AS-Global Opaque-LSA
  LS age: 325
  Options: 0x2 (*|-|-|-|-|-|E|-)
  LS Type: AS-external Opaque-LSA
  Link State ID: 11.10.9.23 (AS-external Opaque-Type/ID)
  Opaque Type: 11
  Opaque ID: 657687
  Advertising Router: 10.10.11.50
  LS Seq Number: 80000001
  Checksum: 0xb018
  Length: 25
```

show ip ospf database opaque-link

Use this command to display information about the link-state type 9 LSAs. This type denotes a link-local scope. The LSAs are not flooded beyond the local network.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show ip ospf database opaque-link [<ip-address>]
   [self-originate|<advrouter>]
```

Parameter	Description
<advrouter>	adv-router **<***ip-address***>**
adv-router	Displays all the LSAs of the specified router.
<ip-address>	A link state ID, as an IP address.
self-originate	Displays self-originated link states.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ip ospf database opaque-link 1.2.3.4 self-
        originate

awplus# show ip ospf database opaque-link self-originate

awplus# show ip ospf database opaque-link 1.2.3.4 adv-router
        2.3.4.5
```

Output **Figure 40-13: Example output from the show ip ospf database opaque-link command**

```
       OSPF Router process 100 with ID (10.10.11.50)
                Link-Local Opaque-LSA (Link hme0:10.10.10.50)
  LS age: 276
  Options: 0x2 (*|-|-|-|-|-|E|-)
  LS Type: Link-Local Opaque-LSA
  Link State ID: 10.0.220.247 (Link-Local Opaque-Type/ID)
  Opaque Type: 10
  Opaque ID: 56567
  Advertising Router: 10.10.11.50
  LS Seq Number: 80000001
  Checksum: 0x744e
  Length: 26
                Link-Local Opaque-LSA (Link hme1:10.10.11.50)
```

show ip ospf database router

Use this command to display information only about the router LSAs.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show ip ospf database router [<adv-router-id> self-originate|<adv-router-id>]`

Parameter	Description
`adv-router`	Displays all the LSAs of the specified router.
`self-originate`	Displays self-originated link states.
`<adv-router-id>`	The router ID of the advertising router, in IPv4 address format. Note however, that this no longer represents a real address.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ip ospf database router 1.2.3.4 self-originate
awplus# show ip ospf database router self-originate
awplus# show ip ospf database router 1.2.3.4 adv-router
        2.3.4.5
```

Output **Figure 40-14: Example output from the show ip ospf database router command**

```
      OSPF Router process 100 with ID (10.10.11.50)

```

show ip ospf database summary

Use this command to display information about the summary LSAs.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show ip ospf database summary [<ip-address>]
   [self-originate|<advrouter>]
```

Parameter	Description
<advrouter>	adv-router **<***ip-address***>**
adv-router	Displays all the LSAs of the specified router.
<ip-address>	A link state ID, as an IP address.
self-originate	Displays self-originated link states.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ip ospf database summary 1.2.3.4 self-originate

awplus# show ip ospf database summary self-originate

awplus# show ip ospf database summary 1.2.3.4 adv-router
        2.3.4.5
```

Output **Figure 40-15: Example output from the show ip ospf database summary command**

```

```

show ip ospf interface

Use this command to display interface information for OSPF.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show ip ospf interface [<interface-name>]`

Parameter	Description
<interface-name>	The VLAN name, for example vlan3.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ip ospf interface vlan2
```

Output **Figure 40-18: Example output from the show ip ospf interface command**

```
vlan2 is up, line protocol is up
  Internet Address 1.1.1.1/24, Area 0.0.0.0, MTU 1500
  Process ID 0, Router ID 33.33.33.33, Network Type BROADCAST,
Cost: 10
  Transmit Delay is 1 sec, State Waiting, Priority 1, TE Metric
0
  No designated router on this network
  No backup designated router on this network
  Timer intervals configured, Hello 10, Dead 40, Wait 40,
Retransmit 5
    Hello due in 00:00:02
  Neighbor Count is 0, Adjacent neighbor count is 0
  Crypt Sequence Number is 1106347721
  Hello received 0 sent 1, DD received 0 sent 0
  LS-Req received 0 sent 0, LS-Upd received 0 sent 0
  LS-Ack received 0 sent 0, Discarded 0
```

show ip ospf neighbor

Use this command to display information on OSPF neighbors. Include the **ospf-id** parameter with this command to display information about specified instances.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show ip ospf [<ospf-id>] neighbor <neighbor-ip-addr> [detail]
show ip ospf [<ospf-id>] neighbor detail [all]
show ip ospf [<ospf-id>] neighbor [all]
show ip ospf [<ospf-id>] neighbor interface <ip-addr>
```

Parameter	Description
<ospf-id>	<0-65535> The ID of the router process for which information will be displayed.
<neighbor-ip-addr>	The Neighbor ID, entered as an IP address.
all	Include downstatus neighbor.
detail	Detail of all neighbors.
<ip-addr>	IP address of the interface.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ip ospf neighbor detail
awplus# show ip ospf neighbor 1.2.3.4
awplus# show ip ospf neighbor interface 10.10.10.50 detail
       all
```

Output Note that before a device enters OSPF Graceful Restart it first informs its OSPF neighbors. In the **show** output, the * symbol beside the **Dead Time** parameter indicates that the switch has been notified of a neighbor entering the graceful restart state, as shown in **Figure 40-20**.

Figure 40-19: Example output from the show ip ospf neighbor command

```
OSPF process 1:

   Thread Link State Request Retransmission off
   Thread Link State Update Retransmission on
```

show ip ospf route

Use this command to display the OSPF routing table. Include the `process ID` parameter with this command to display the OSPF routing table for specified instances.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show ip ospf [<ospf-id>] route`

Parameter	Description
<ospf-id>	<0-65535> The ID of the router process for which information will be displayed. If this parameter is included, only the information for this specified routing process is displayed.

Mode User Exec and Privileged Exec

Examples To display the OSPF routing table, use the command:

```
awplus# show ip ospf route
```

Output **Figure 40-22: Example output from the show ip ospf route command for a specific process**

```
OSPF process 1:
Codes: C - connected, D - Discard, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
O  10.10.0.0/24 [10] is directly connected, vlan1, Area 0.0.0.0
O  10.10.11.0/24 [10] is directly connected, vlan2, Area 0.0.0.0
O  10.10.11.100/32 [10] is directly connected, lo, Area 0.0.0.0
E2 10.15.0.0/24 [10/50] via 10.10.0.1, vlan1
IA 172.16.10.0/24 [30] via 10.10.11.50, vlan2, Area 0.0.0.0
E2 192.168.0.0/16 [10/20] via 10.10.11.50, vlan2
```

show ip ospf virtual-links

Use this command to display virtual link information.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show ip ospf virtual-links`

Mode User Exec and Privileged Exec

Examples To display virtual link information, use the command:

```
awplus# show ip ospf virtual-links
```

Output **Figure 40-23: Example output from the show ip ospf virtual-links command**

```
Virtual Link VLINK0 to router 10.10.0.9 is up
  Transit area 0.0.0.1 via interface vlan5
  Transmit Delay is 1 sec, State Point-To-Point,
  Timer intervals configured, Hello 10, Dead 40, Wait 40,
Retransmit 5
    Hello due in 00:00:02
    Adjacency state Full
Virtual Link VLINK1 to router 10.10.0.123 is down
  Transit area 0.0.0.1 via interface *
  Transmit Delay is 1 sec, State Down,
  Timer intervals configured, Hello 10, Dead 40, Wait 40,
Retransmit 5
    Hello due in inactive
    Adjacency state Down
```

show ip protocols ospf

Use this command to display OSPF process parameters and statistics.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show ip protocols ospf`

Mode User Exec and Privileged Exec

Examples To display OSPF process parameters and statistics, use the command:

```
awplus# show ip protocols ospf
```

Output **Figure 40-24: Example output from the show ip protocols ospf command**

```
Routing Protocol is "ospf 200"
  Invalid after 0 seconds, hold down 0, flushed after 0
  Outgoing update filter list for all interfaces is
    Redistributed kernel filtered by filter1
  Incoming update filter list for all interfaces is
  Redistributing: kernel
  Routing for Networks:
    192.30.30.0/24
    192.40.40.0/24
  Routing Information Sources:
    Gateway         Distance      Last Update
  Distance: (default is 110)
    Address         Mask            Distance List
```

summary-address

Use this command to summarize, or possibly suppress, external routes that have the specified address range.

Use the **no** variant of this command to stop summarizing, or suppressing, external routes that have the specified address range.

Syntax

```
summary-address <ip-addr/prefix-length> [not-advertise]
    [tag <0-4294967295>]

no summary-address <ip-addr/prefix-length> [not-advertise]
    [tag <0-4294967295>]
```

Parameter	Description
<ip-addr/prefix-length>	Specifies the base IP address of the summary address.The range of addresses given as IPv4 starting address and a prefix length.
`not-advertise`	Set the **not-advertise** option if you do not want OSPF to advertise either the summary address or the individual networks within the range of the summary address.
`tag <0-4294967295>`	The tag parameter specifies the tag value that OSPF places in the AS external LSAs created as a result of redistributing the summary route. The tag overrides tags set by the original route.

Default The default tag value for a summary address is 0.

Mode Router Configuration

Usage An address range is a pairing of an address and a mask that is almost the same as IP network number. For example, if the specified address range is 192.168.0.0/255.255.240.0, it matches: 192.168.1.0/24, 192.168.4.0/22, 192.168.8.128/25 and so on.

Redistributing routes from other protocols into OSPF requires the router to advertise each route individually in an external LSA. Use the `summary address` command to advertise one summary route for all redistributed routes covered by a specified network address and mask. This helps decrease the size of the OSPF link state database.

Ensure OSPF routes exist in the summary address range for advertisement before using this command.

Example The following example uses the `summary-address` command to aggregate external LSAs that match the network 172.16.0.0/16 and assign a Tag value of 3.

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# summary-address 172.16.0.0/16 tag 3
```

timers spf exp

Use this command to adjust route calculation timers using exponential back-off delays.

Use **no** form of this command to return to the default exponential back-off timer values.

Syntax

```
timers spf exp <min-holdtime> <max-holdtime>
no timers spf exp
```

Parameter	Description
<min-holdtime>	*<0-2147483647>* Specifies the minimum delay between receiving a change to the SPF calculation in milliseconds. The default SPF min-holdtime value is 50 milliseconds.
<max-holdtime>	*<0-2147483647>* Specifies the maximum delay between receiving a change to the SPF calculation in milliseconds. The default SPF max-holdtime value is 50 seconds.

Mode Router Configuration

Default The default SPF min-holdtime is 50 milliseconds. The default SPF max-holdtime is 40 seconds.

Usage This command configures the minimum and maximum delay time between the receipt of a topology change and the calculation of the Shortest Path First (SPF).

Examples To set the minimum delay time to 5 milliseconds and maximum delay time to 10 milliseconds, use the commands:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# timers spf exp 5 10
```

To reset the minimum and maximum delay times to the default values, use the commands:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# no timers spf exp
```

Related Commands timers spf exp

- Example 2: Two-Area Network Configuration 41.28
- Setting Up the Metrics 41.30

Configuring OSPFv3 Authentication and Encryption 41.35
- Configuring OSPFv3 Authentication on a VLAN 41.36
- Configuring OSPFv3 Encryption on a VLAN 41.37
- Configuring OSPFv3 Authentication in an OSPFv3 Area 41.38
- Configuring OSPFv3 Encryption in an OSPFv3 Area 41.39
- Configuring OSPFv3 Authentication and Encryption for a Virtual Link 41.40
- OSPFv3 Authentication in an OSPFv3 Area 41.41
- OSPFv3 Encryption in an OSPFv3 Area 41.43
- OSPFv3 Authentication on a VLAN 41.45
- OSPFv3 Encryption on a VLAN 41.47
- OSPFv3 Authentication with two VLANs 41.49
- OSPFv3 Encryption with two VLANs 41.51
- OSPFv3 Authentication for a Virtual Link 41.53
- OSPFv3 Encryption for a Virtual Link 41.55

OSPFv3 Introduction

This chapter introduces OSPFv3 followed by basic configuration examples. OSPFv3 is documented in RFC 2740 and is in essence OSPFv2 with changes and additions necessary for OSPF's operation within an IPv6 network. This introduction focuses on the differences between the two protocol versions, rather than to re-introduce OSPF as a routing method. See the chapter, **Chapter 39, OSPF Introduction and Configuration** for an introductory overview of OSPF on AlliedWare Plus™ switches.

To see details on the OSPF commands used in the examples, refer to the chapter, **Chapter 42, OSPFv3 for IPv6 Commands**.

Features

Not version-specific

Open Shortest Path First (OSPF) is an Interior Gateway Routing Protocol, based on Shortest Path First (SPF) or link-state technology. OSPF is defined in RFCs 1245–1247, 1253 and 1583. The protocol was designed specifically for the TCP/IP Internet environment, and supports the following features:

- Authentication of routing updates - authentication for OSPFv3 is achieved using IPsec AH and IPsec ESP header capabilities available in the IPv6 protocol.
- Tagging of externally-derived routes.
- Fast response to topology changes with low overhead.
- Load sharing over meshed links.

Specific to OSPFv3

The specific features and enhancements of OSPFv3 are introduced to enable OSPF to run over IPv6 networks. These aspects are covered later in this chapter.

Licensing

OSPF is a licensed feature, and can be obtained either with a "**Base License**" or a "**Full License.**" The table below shows the basic licensing structure for running OSPFv3. Note that licensing structures can vary with sales regions. We therefore recommend that you discuss your licensing options with your local Allied Telesis distributor or reseller.

OSPF Version	Base License	Full License
OSPFv3	Not bundled as part of the AlliedWare Plus release, but is separately available as a basic license pack that will support up to 64 routes.	Purchased separately. There is no licensed route limit, but route numbers are limited by switch specifications. See your switch's Datasheet for details.

Routing Overview

The basic function of a routing protocol is to establish the best path for packets to travel in order to reach their destination. The method of establishing the best path can be based on various different network measurements, such as the hop-count, bandwidth, or delay that a particular path may present, or could be based on static routes that are manually entered. This information is then fed into a mathematical algorithm such as those invented by Belman-Ford (for RIP), or Dijkstra (for OSPF), in order to calculate a best path to the destination.

A very brief overview of OSPF's general principles and components is presented in this chapter. For a further explanation refer to **Chapter 39, OSPF Introduction and Configuration**.

OSPF Components

Autonomous Systems

Routers combine to form Autonomous Systems (AS) that share a common management and protocol suite. Each router within an area has an identical database, which contains components that describe other routers, their paths and states.

Routing Areas

OSPF allows the grouping of networks into a set, called an **Area**. The internal topology of an area is hidden from the rest of the AS. This technique minimizes the routing traffic required for the protocol. When multiple areas are used, each area has its own copy of the topological database. Routing can be between areas (inter-area routing) or within areas (intra-area routing). A backbone area forms the central path between all other areas. A router that forms a connection between an area and the backbone is known as an area border router.

Relationships Between Routers

Neighbors and Adjacencies

By transmitting hello messages, routers that share a common physical connection initially form neighbor relationships. Neighbors that meet a common set of configuration factors can then form adjacent relationships through which they can exchange topological information.

Designated Router

On broadcast multi-access networks, one of the routers becomes a **designated router**. By issuing its link state advertisements, the designated router maintains adjacencies with all the routers within a broadcast domain. The designated router therefore coordinates and synchronizes the topological databases for all routers on the link.

The designated router is selected through the exchange of hello packets. The router transmitting the highest priority number will be elected the designated router. Where a tie exists, selection will be based on the highest transmitted router ID.

Backup Designated Router

For network efficiency and resiliency, the routers also elect a backup designated router, which is able to act as the designated router in the event of failure of the designated router.

OSPFv3 Packet Types

The OSPF protocol contains five basic packet types for its messages. The OSPFv3 protocol retains these basic types, although the structure of some of them has changed slightly. The basic message packet types are:

- hello packet
- database description packet
- link state request packet
- link state update packet
- link state acknowledgment packet

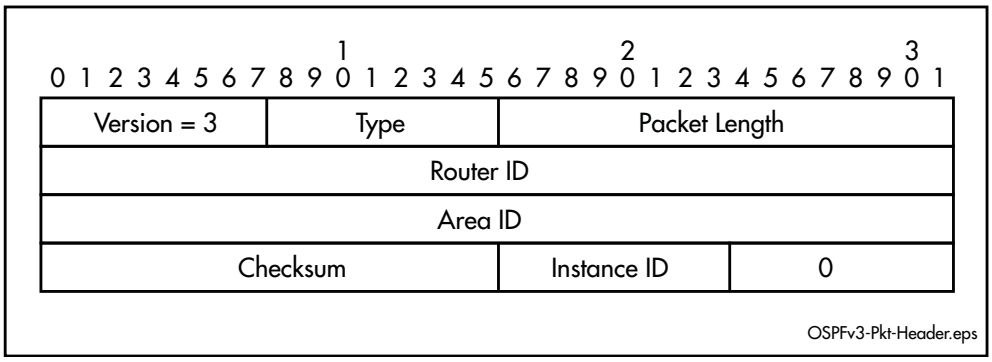
Also note that at the IP packet level, protocol number 89, previously assigned to OSPFv2 is now shared by both OSPFv2 and OSPFv3. These are the values contained within the protocol field of the IPv4 packets, and the Next Header field of IPv6 packets.

The five OSPFv3 message types are now described in greater detail.

OSPFv3 packet header

All OSPFv3 packets carry the common header component shown in **Figure 41-1**.

Figure 41-1: OSPFv3 common packet header



Because this packet component forms a common prefix for all the OSPFv3 packets, its components are expanded in greater detail than for the specific packet types that follow. **Table 41-1** shows the meaning of each field within the common header component.

Table 41-1: OSPFv3 common packet header components

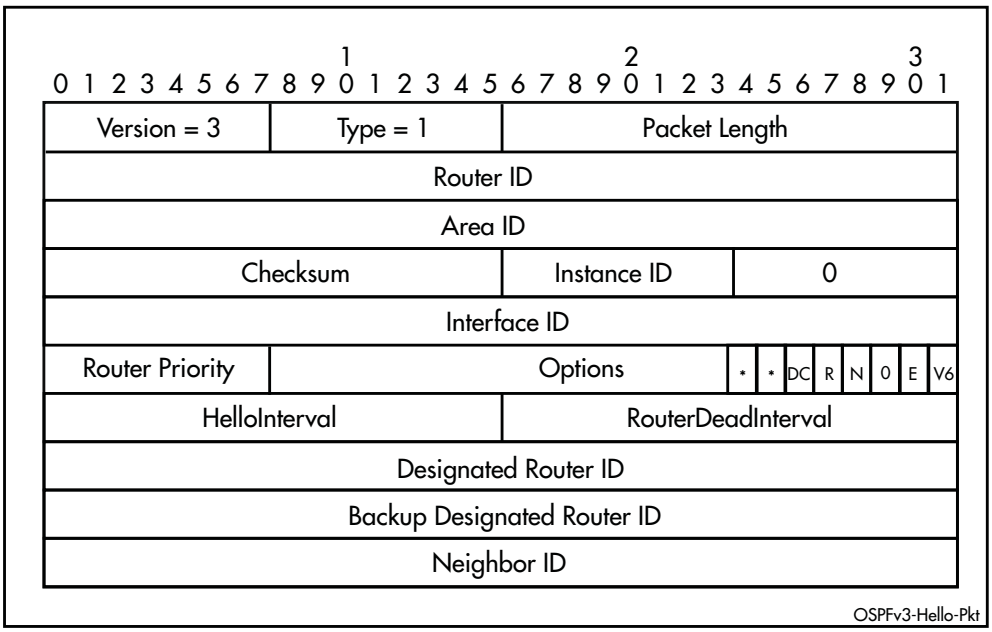
Packet Field	Purpose
Version	Denotes the OSPF version, i.e. 2 for OSPFv2, and 3 for OSPFv3.
Type	Denotes the packet type: « 1 = Hello packet « 2 = Database Description packet « 3 = Link State Request « 4 = Link State Update « 5 = Link State Acknowledgment
Packet Length	The packet length, in bytes, including the standard OSPFv3 header.
Router ID	The ID of the transmitting router.
Area ID	A 32 bit number that identifies the (single) area to which the packet belongs.
Checksum	The standard IPv6 packet checksum.
Instance ID	OSPFv3 is capable of running multiple OSPF instances over a single link. Each Instance is identified by its Instance ID. Note that the Instance ID is only of local (link) significance. Also note that the term “instance” is sometimes used in a totally different context in referring to specific LSA element components.
0	Reserved and normally set to 0.

Hello message packet

These messages are sent on all links. Their function is to establish and maintain neighbor relationships between routers.

Figure 41-2 shows the structure and content of the Hello packet. It follows the same basic format as the OSPFv2 hello packet, but without the Authentication or Network Mask fields, and with an additional field for the Instance ID.

Figure 41-2: OSPFv3 hello message type

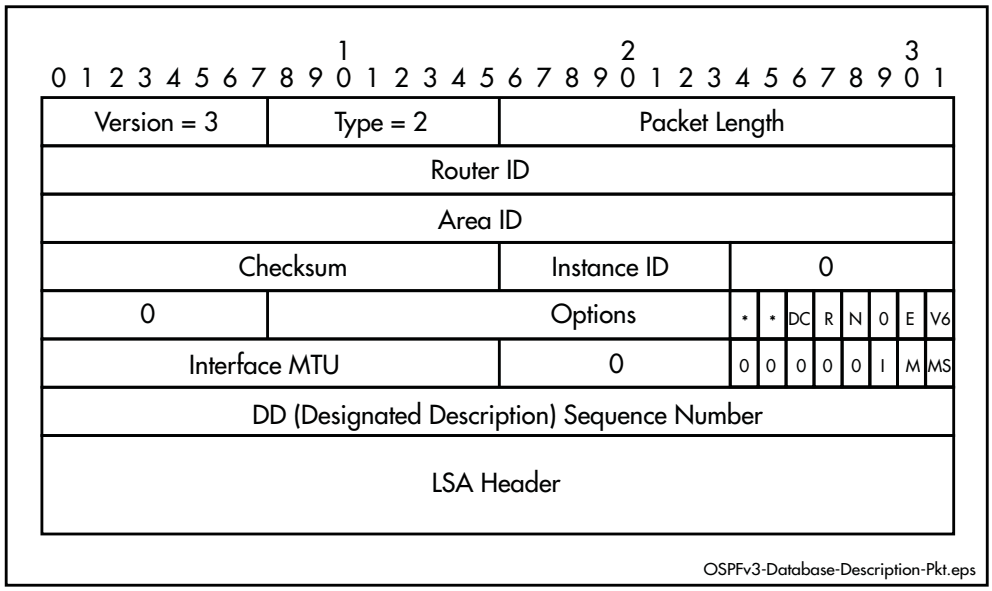


Database description packet

These packet types are exchanged as router adjacencies are established. They contain descriptions that define the link-state.

Figure 41-3 shows the structure and content of the database description packet. It follows the same basic format as that used for OSPFv2, but without the Authentication or Network Mask fields, and with an additional field for the Instance ID.

Figure 41-3: OSPFv3 database description packet

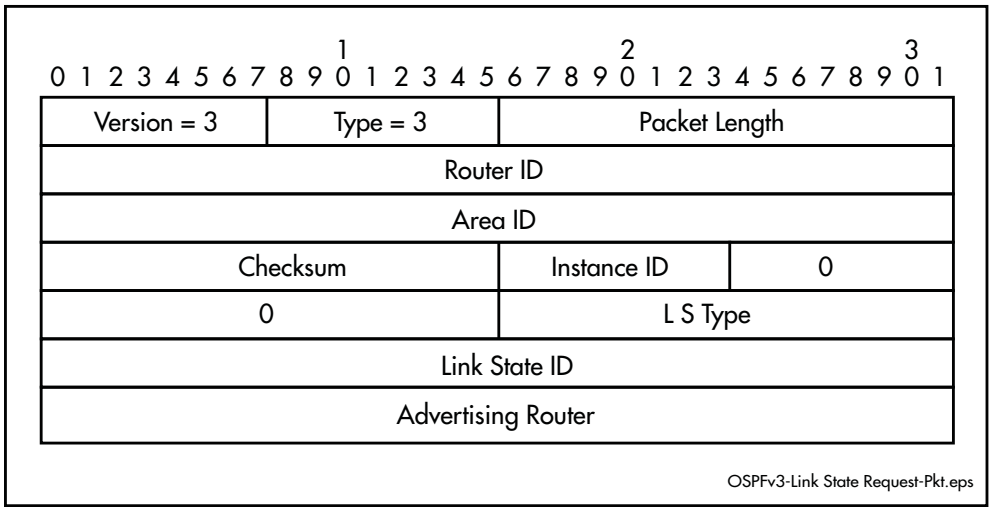


Link state request packet

Routers use these packets to request transmissions of specific portions (instances) of the Link State database, usually to replace out-of-date components. The requesting router knows exactly which database components it requires, based on their link state ID, sequence number, age, and checksum.

Figure 41-4 shows the structure and content of the a link state request packet. It follows the same basic format as that used for OSPFv2, but without the AuType, Authentication and network-mask fields, and with an additional field for the Instance ID.

Figure 41-4: OSPFv3 link-state request packet

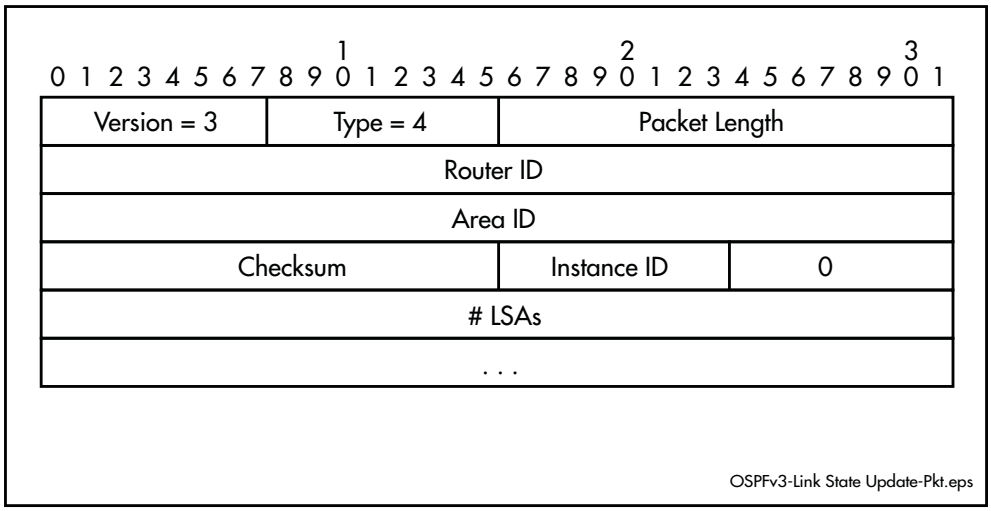


Link state update packet

These packet types are used to implement LSA flooding. They carry LSA information between a router and its immediate neighbors, often in response to link state requests.

Figure 41-5 shows the structure and content of the link state update packet. It follows the same basic format as that used for OSPFv2, but without the Authentication or Network-Mask fields, and with an additional field for the Instance ID.

Figure 41-5: OSPFv3 link-state update packet

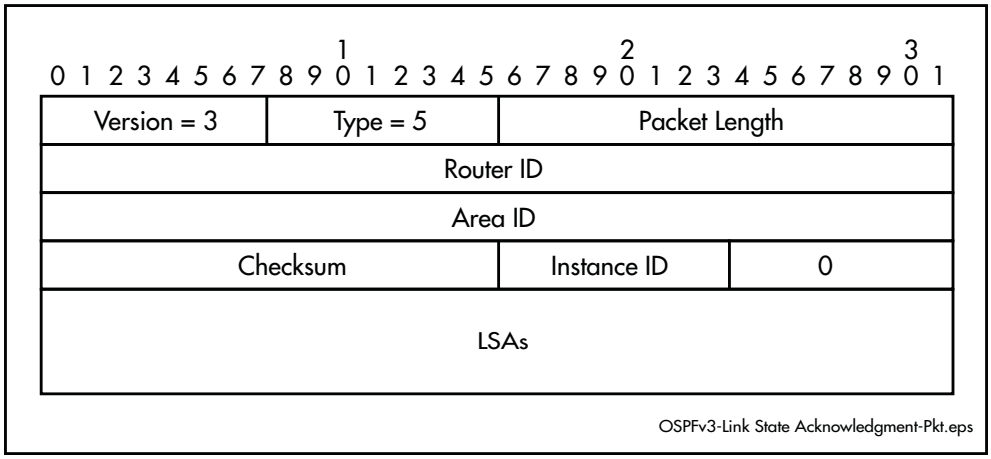


Link state acknowledgment packet

These multicast packet types are used to provide explicit acknowledgment of flooded LSAs. If a router transmits a link-state update, but does not receive acknowledgments from all neighbors, it will continue to retransmit the link state update until all neighbors have acknowledged it. This constitutes the guaranteed delivery mechanism within OSPF. A single packet can acknowledge multiple LSAs.

Figure 41-6 shows the structure and content of the link state acknowledgment packet. It follows the same basic format as that used for OSPFv2, but without the Authentication or Network Mask fields, and with an additional field for the Instance ID.

Figure 41-6: OSPFv3 link state acknowledgment packet



Link State Advertisements (LSAs)

Link state advertisements (LSAs) are records in the topological database. Nine different types of link state advertisements exist, see **Table 41-2**. Only the common header components are documented. A description of the LSAs themselves is outside the scope of this document.

Link state advertisements age to a maximum (MaxAge) of 3600 seconds, which limits their storage period in the topological database. When a link state advertisement reaches MaxAge, the router tries to flush it from the routing domain by reflooding the advertisement. A link state advertisement that has reached MaxAge is not used in further routing table calculations.

LSA types

Table 41-2 shows the LSA types supported by OSPFv3. Each type of link state advertisement describes a different set of features of the Autonomous System (AS).

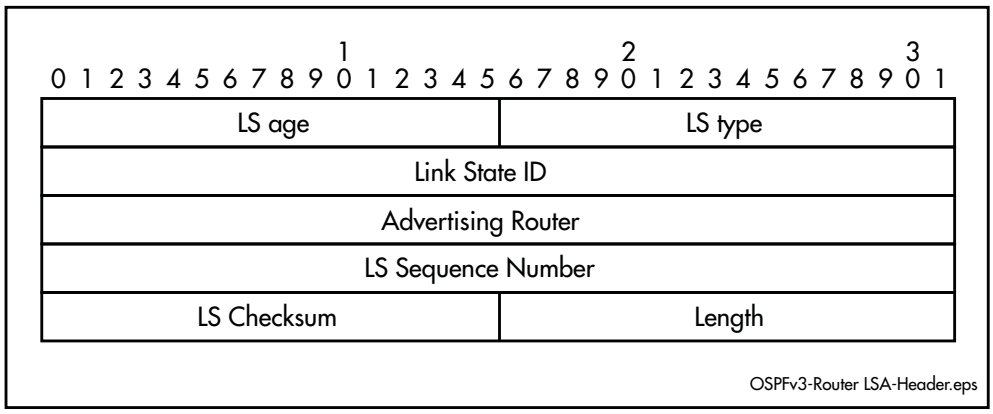
Table 41-2: OSPFv3 LSA header types

LSA Function Code	LS Type	Description
1	0x2001	Router LSA
2	0x2002	Network LSA
3	0x2003	Inter-Area-Prefix-LSA
4	0x2004	Inter-Area-Router-LSA
5	0x4005	AS-External-LSA
6	0x2006	Deprecated (may be reassigned)
7	0x2007	NSSA-LSA
8	0x0008	Link-LSA
9	0x2009	Intra-Area-Prefix-LSA
11	0x000b	Grace-LSA

LSA Header

Figure 41-7 shows the structure and content of the 20 byte header that is common to all OSPFv3 Link State Advertisements (LSAs). This header provides sufficient information to identify the link state type, its ID, and its advertising router.

Figure 41-7: OSPFv3 LSA header



OSPFv3 States

The following table describes the eight states that routers can pass through as they establish their neighbor relationships.

Table 41-3: OSPF states

Packet Type	Purpose
Down	This is the initial state. No hello packets have been received from the neighbor recently, or at all.
Attempt	This state applies to non-broadcast multi-access networks. The router is making a determined attempt to contact a statically configured neighbor. Hello packets are sent every hello interval.
Init	A hello packet has been seen from the neighbor, however the hello packet does not list the router as known.
2-Way	This state is entered when the communication between two neighbors is bidirectional (the hello packet from the neighbor lists this router as a neighbor).
ExStart	This is the first step in creating an adjacency between two routers. The two routers decide which is going to control the exchange between them.
Exchange	In this state, the neighbors exchange database description packets. Each packet summarizes the link state advertisements held by that router.
Loading	After all the database description information has been exchanged, the routers exchange link state advertisements required to update or complete each router's topological database, thereby synchronizing the two routers' databases.
Full	This is the final state, and the adjacency is complete. Reaching this state in itself may cause new instances of some link state advertisements, such as the network and router advertisements related to the two routers.

OSPFv3 Metrics

The metrics used by OSPF are not simple distance metrics, such as used by RIP for example, but are measurements of the path bandwidth. Interface metrics are normally set using the formula 10^8 / interface speed (in bps). This gives metrics such as 1 for a 100 Mbps Ethernet interface, and 1562 for a 64 kbps serial line.

When no metric is defined, the default metric for routes redistributed into OSPF is 20. You can define the metric using the **redistribute (IPv6 OSPF)** command.

You can also define the metric using the **set metric** command for a route map. If a route map is configured, but no OSPF metric is defined using a **redistribute (IPv6 OSPF)** command, then a default metric of 20 is used. If a route map is configured and the metric is defined using the **set metric** command, this supersedes a metric defined using the **redistribute (IPv6 OSPF)** command.

How to set the OSPFv3 metric when redistributing routes

You can determine the OSPFv3 metric using the following methods:

- use the default OSPFv3 metric, which is 20.
- change it using the **metric** parameter of the **redistribute (IPv6 OSPF)** command

The following example sets the metric to `5` for `connected` redistributed routes:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# redistribute connected metric 5
```

- change it using the **metric-value** parameter of the **set metric** command for a route map

Note that changing the metric using a route map supersedes the metric defined using the **redistribute (IPv6 OSPF)** command. The following example for entry `3` of the route map called `rmap1` give matching routes a metric of `5`::

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set metric 5
```

Automatic Cost Calculation

OSPF interfaces can automatically set the OSPF metric of an IP interface based on its bandwidth, instead of the system administrator having to manually set the OSPF metric. Automatic setting takes into account that the speed of an interface can change over time, when ports change link state or change speed via auto-negotiation or manual setting. If metrics are manually set, some interfaces are preferred when they should be changing to match dynamically changing network configurations.

Network Types

OSPF treats the networks attached to OSPF interfaces as one of the following network types, depending on the physical media:

- broadcast
- non-broadcast multi-access (NBMA)
- point-to-point
- point-to-multipoint
- virtual

By default, Ethernet networks are treated as broadcast networks. You can use the **ip ospf network** command on page 40.44 to configure a VLAN interface to be a different network type. Configure a VLAN or Ethernet interface as an Non-Broadcast Multi-Access (NBMA) interface when:

- some devices on the network do not support multicast addressing.
- you want to select which devices on the network are to become OSPF neighbors, rather than allow all the devices on the network to become OSPF neighbors.

Passive Interfaces

A passive interface does not take part in normal OSPF interface operations:

- OSPF does not transmit or receive Hello messages via the interface.
- The interface does not experience interface state transitions.
- OSPF does not associate neighbors with the interface.

If the interface is up, OSPF adds the network that is attached to the interface, as a stub network to the router LSA of the area in which the interface resides.

Examples To configure the passive interface mode on interface vlan2, enter the following commands:

```
awplus(config)# router ipv6 ospf
awplus(config-router)# passive-interface vlan2
```

To configure the passive interface mode on **all** interfaces, enter the following commands:

```
awplus(config)# router ipv6 ospf
awplus(config-router)# passive-interface
```

Redistributing External Routes

OSPFv3 can import and redistribute BGP, RIP, non-OSPF interface, and statically configured routes. It can also optionally assign the following settings to all routes it imports:

- a route metric
- the External metric type

Alternatively, you can assign a route map to select particular routes and set their route parameters. A route map can also filter out a subset of routes, so you do not have to import all routes.

The import settings also allow you to select whether to redistribute subnets (classless network routes), or only classful network routes.

To import and redistribute external routes into OSPF, create a route redistribution definition for the source routing protocol, using the **redistribute (IPv6 OSPF)** command on page 42.49.

Differences between OSPFv2 and OSPFv3

Whilst the fundamental principles of OSPFv2 are maintained from those standardized for OSPF with IPv6 (OSPFv3), the following items, listed below, represent the major areas that are applied differently for OSPFv3. For more detail refer to RFC 2740 (OSPF for IPv6).

- Protocol processing applied per-link rather than per-subnet
- Removed address semantics
- Neighbors are identified by Router ID
- New link-local flooding scope for link state advertisements
- Uses link-local addresses
- Support provided for multiple instances per link
- OSPF-specific authentication has been removed
- Unknown LSAs are handled more effectively
- Authentication relies on IPsec features within the IPv6 protocol, rather than integrate authorization within the OSPF protocol itself (as is done for OSPFv2).
- Modified packet types
- Modified LSA types

The following sections expand on these points.

Protocol processing applied per-link rather than per-subnet

OSPFv3 nodes use links to communicate at the link layer. You can also assign multiple subnets, and multiple IPv6 addresses, to a single link. In addition, two nodes can be assigned to and communicate over the same link without having to share the same subnet.

Thus the term **link** can be compared with the OSPFv2 terms **network** and **subnet.** This change has resulted in changes within the Hello packets and Network Link State Advertisements (LSAs).

Removed address semantics

Address semantics have been removed from OSPFv3 protocol packets and network Link State Advertisements (LSAs).

The intention of this change is to enable the core features to be protocol independent. The major changes in this respect are described below:

Note Although the 32 bit Router and ID fields still exist in IPv6 packets, and can still be entered in dotted decimal format, for OSPFv3, they are simply 32-bit-long labels, which no longer represent IP addresses.

Neighbors are identified by Router ID

OSPFv2 neighbors were identified by IPv4 addresses on multipoint networks and by router ID on point-to-point networks. OSPFv3 removes this inconsistency by identifying all neighbors by their router ID.

New link-local flooding scope for link state advertisements

OSPFv3 contains the following flooding scopes:

- Area scope flooding (in OSPFv2)
- Autonomous System (AS) flooding (in OSPFv2)
- Link-local flooding (new in OSPFv3)

Uses link-local unicast addresses

On all OSPF interfaces except virtual links, OSPF packets are sent using the interface's associated link-local unicast address as the source address.

Support provided for multiple OSPF instances per link

An Instance field has been added to OSPFv3 hello and LSA packets. By assigning separate **instances**, multiple routers to be attached to a single broadcast link in such a way that separate adjacencies may be configured for selected router groups. See **"Configuring Instances and Processes" on page 41.33**.

Unknown LSAs are handled more effectively

In OSPFv2 routers discarded unknown LSA types. In OSPFv3 unknown LSA types are given either link-local flooding scope, or are stored and flooded as if being understood. The options determining which action to take, and flooding scope, is contained in components within the LSA type field.

OSPFv3 Authentication and Encryption Overview

To ensure that OSPFv3 packets are not modified, and are not being spoofed, configure OSPFv3 Authentication and Encryption on your devices, if they are running Version 5.4.3 or later AlliedWare Plus software.

OSPFv2 defines the AuType and Authentication fields in its protocol header to provide security. In OSPFv3, these OSPFv2 authentication fields were removed from OSPF headers. OSPFv3 requires the IPv6 AH (Authentication Header) header to provide authentication of routing information exchanges, and OSPFv3 requires the IPv6 ESP (Encapsulating Security Payload) header to provide encryption of routing information exchanges.

OSPFv3 Authentication and Encryption is specified in RFC 4552 'Authentication/ Confidentiality for OSPFv3'. RFC 4552 describes the AH/ESP extension headers.

See the section **Configuring OSPFv3 Authentication and Encryption** for OSPFv3 Authentication and Encryption configurations and topologies.

Also refer to **Chapter 42, OSPFv3 for IPv6 Commands** for OSPFv3 Authentication and Encryption command syntaxes, parameters, descriptions, and command examples.

OSPFv3 Authentication and Encryption Support

The IPv6 ESP header may be applied alone or in combination with the IPv6 AH header. When IPv6 ESP is used, both encryption and authentication are provided.

- Apply the IPsec AH header for OSPFv3 authentication using the **ipv6 ospf authentication spi** command.
- Apply the IPsec ESP header for OSPFv3 encryption using the **ipv6 ospf encryption spi esp** command.
- Confirm OSPFv3 authentication and encryption configuration using the **show ipv6 ospf** and **show debugging ipv6 ospf** commands.

When you only configure the IPv6 ESP header alone with the **ipv6 ospf encryption spi esp** command, note that both encryption and authentication are provided in IPsec ESP headers. You can apply IPv6 ESP headers alone or in combination with IPv6 AH headers.

If you configure IPv6 AH or IPv6 ESP headers for an OSPFv3 area, note that authentication or encryption is applied to all of the interfaces in the OSPFv3 area, except for any interfaces which had direct configuration of OSPFv3 authentication and/or encryption.

The below Authentication algorithms are supported in AlliedWare Plus OSPFv3 Authentication as parameter options in the **ipv6 ospf authentication spi** command:

- **MD5** (Message Digest Algorithm 5)
- **SHA-1** (Secure Hash Algorithm 1)

The below Encryption algorithms are supported in the AlliedWare Plus OSPFv3 Encryption as parameter options the **ipv6 ospf encryption spi esp** command:

- **AES** (Advanced Encryption Standard)
- **3DES** (Triple Data Encryption Standard)
- **NULL** (ESP without encryption)

See the sections listed below when configuring OSPFv3 Authentication and Encryption:

- **Configuring OSPFv3 Authentication on a VLAN**
- **Configuring OSPFv3 Encryption on a VLAN**
- **Configuring OSPFv3 Authentication in an OSPFv3 Area**
- **Configuring OSPFv3 Encryption in an OSPFv3 Area**

See sample configurations listed below with topologies that accompany these sections:

- **OSPFv3 Authentication in an OSPFv3 Area**
- **OSPFv3 Encryption in an OSPFv3 Area**
- **OSPFv3 Authentication on a VLAN**
- **OSPFv3 Encryption on a VLAN**
- **OSPFv3 Authentication with two VLANs**
- **OSPFv3 Encryption with two VLANs**

OSPFv3 Virtual Links

OSPFv3 Authentication and Encryption on virtual links requires some restriction on how the source IPv6 address that is used on packets sent over the virtual link is chosen.

For non-virtual links, IPv6 link-local addresses are used in packet headers. For virtual links, OSPFv3 uses non-link-local addresses, since packets are routed over intermediate routers.

A router does not necessarily have just one IPv6 address to choose from when deciding the source IPv6 address to use. A router may have more than one IPv6 address on the interfaces that connect it to the virtual link's transit area.

Without OSPFv3 Authentication and Encryption, multiple IPv6 addresses are not a problem. But multiple IPv6 addresses are a problem with OSPFv3 Authentication and Encryption, because the calculation of security parameters depends on knowing the addresses being used on both ends of the link.

Before IPv6 packets are exchanged over an OSPFv3 virtual link, the security parameters for the virtual link must be calculated. To calculate the security parameters, the router must know the source and destination addresses that will be used for OSPFv3 packets sent over the link.

A router knows what source IPv6 address it will use, and it knows the destination IPv6 address that it will send the packets to, since RFC 2740 (OSPF for IPv6) defines which of a virtual neighbor's addresses to use. However, a router cannot be sure what IPv6 address its virtual neighbor will use, since RFC 2740 does not specify the choice of source IPv6 address.

So to remove any uncertainty, routers that implement OSPFv3 Authentication and Encryption over virtual links ensure that the source IPv6 address of the packets they send over the virtual link is the same IPv6 address that their neighbor will use as a destination IPv6 address for its packets. Then IPv6 addresses that will be used over the virtual link are predictable. So, the security parameters can be calculated before the packet exchange begins.

If the IPv6 address at either end of the OSPFv3 virtual link changes, then the existing security parameters are discarded, before new security parameters are calculated.

- Apply the OSPFv3 authentication virtual link authentication using the **area virtual-link authentication ipsec spi** command.
- Apply the OSPFv3 virtual link encryption using the **area virtual-link encryption ipsec spi** command.
- Confirm OSPFv3 virtual link authentication and encryption configuration using the **show ipv6 ospf virtual-links** command.

See the section listed below when configuring OSPFv3 Virtual Links:

- **Configuring OSPFv3 Authentication and Encryption for a Virtual Link**

See sample configurations listed below with topologies that accompany this section:

- **OSPFv3 Authentication for a Virtual Link**
- **OSPFv3 Encryption for a Virtual Link**

Configuring OSPFv3

The following examples show firstly the configuration for a basic three-switch single-area OSPFv3 network. This network is then modified to become a two-area network.

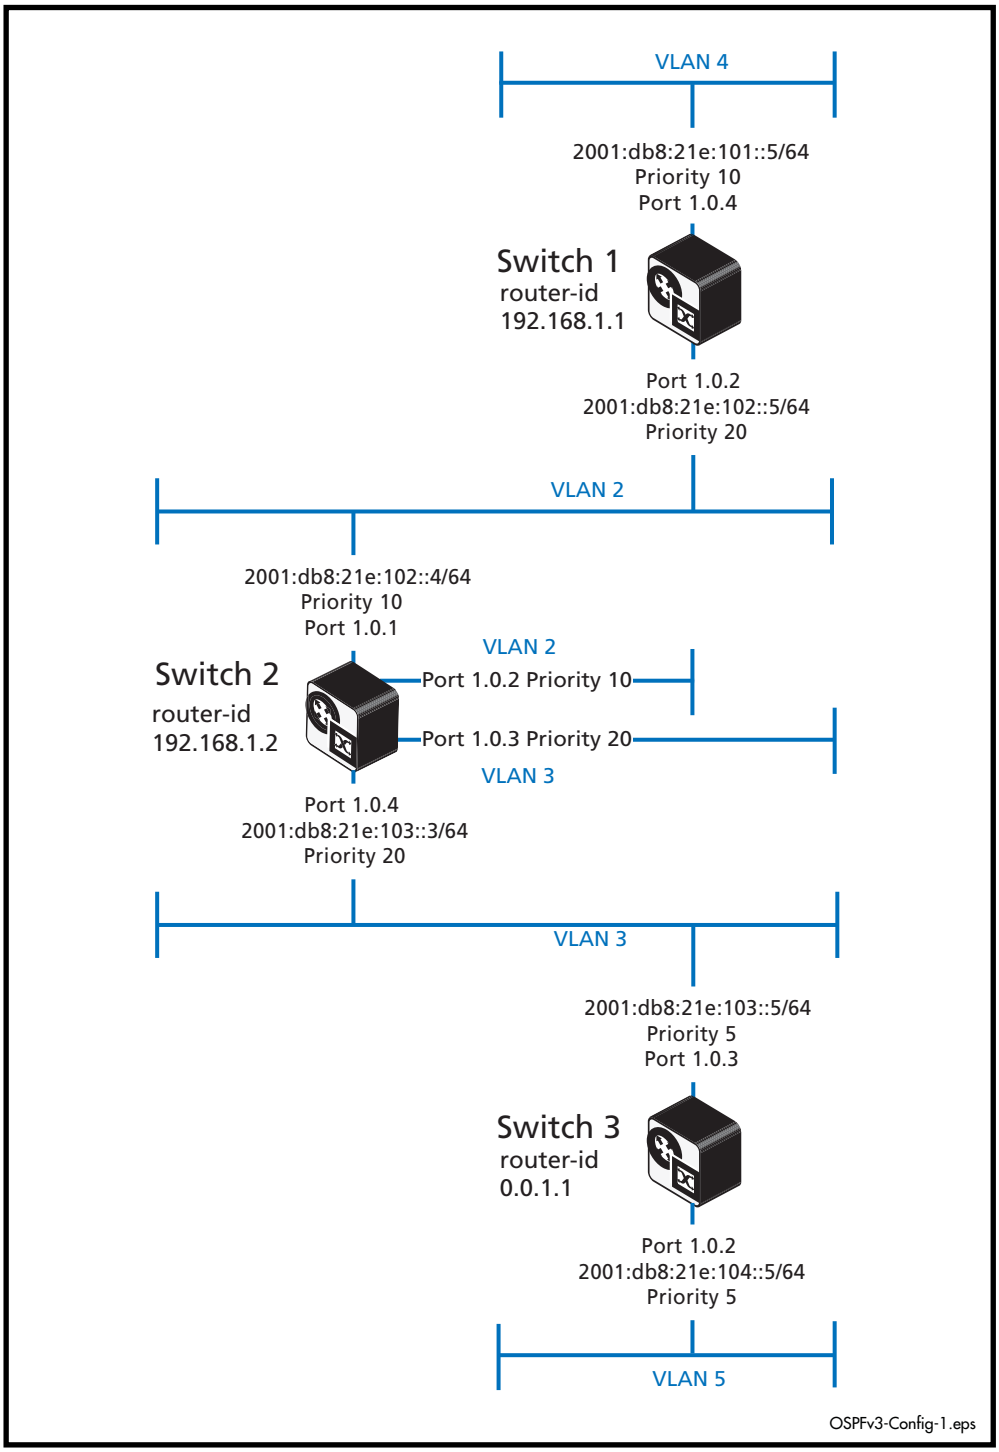
The configuration command sequences shown are presented for understanding, and do not necessarily represent the most efficient configuration method.

The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical networks (other than for testing purposes) nor should they appear on any public network.

Example 1: Single-Area Network Configuration

Figure 41-8 shows a basic three-switch, single-area configuration. Setting the priority value of 20 to VLAN 2 on switch 1 and to the value 10 on switch 2 will ensure that switch 1 will become the designated router for this VLAN. Similarly, the priority settings on VLAN 3, of 20 on switch 2, and 5 on switch 3, will ensure that switch 2 becomes the designated router for VLAN 3.

Figure 41-8: Basic single-area OSPFv3 configuration



Switch 1 Configuration (Single-Area Network)

Table 41-4: Example 1—single-area network configuration—Switch 1

Create and enable VLANs	
awplus# configure terminal	Enter Global Configuration mode.
awplus(config)# vlan database	Enter VLAN database mode.
awplus(config-vlan)# vlan 2,4 state enable	Create and enable VLANs 2 and 4.
awplus(config-vlan)# exit	Return to Global Configuration mode.
For VLAN 4, assign IPv6 addresses and configure OSPF	
awplus(config)# interface vlan4	Select VLAN 4 for configuring.
awplus(config-if)# ipv6 address 2001:db8:21e:101::5/64	Assign an IPv6 address to VLAN 4.
awplus(config-if)# ipv6 router ospf area 0 tag process1	Assign VLAN 4 to OSPF area 0. In this configuration, any address within the subnet 2001:db8:21e:101::/64 will be part of OSPF area 0.
Note that the tag named "process1" denotes a separate router process. Its name can comprise any string of alphanumeric characters. Also note that this tag is local to the router on which it is set and does not appear in any OSPF packets or LSAs. For more information on processes and instances, see **"Configuring Instances and Processes" on page 41.33**.	
awplus(config-if)# ipv6 ospf priority 10	Set the priority for the router to become the designated router for a particular VLAN. The router with the highest priority becomes the designated router for that VLAN. Defaults to 1.
awplus(config-if)# exit	Return to Global Configuration mode.
For VLAN 2, assign IPv6 addresses and configure OSPF	
awplus(config)# interface vlan2	Select VLAN 2 for configuring.
awplus(config-if)# ipv6 address 2001:db8:21e:102::5/64	Assign an IPv6 address to VLAN 2.
awplus(config-if)# ipv6 router ospf area 0 tag process1	Assign VLAN 2 to OSPF area 0. In this configuration, any address within the subnet 2001:db8:21e:102::/64 will be part of OSPF area 0.

Table 41-4: Example 1—single-area network configuration—Switch 1(cont.)

`awplus(config-if)#`	
`ipv6 ospf priority 20`	Set the priority for the router to become the designated router for a particular VLAN. The router with the highest priority becomes the designated router for that VLAN. Defaults to 1.
Configure switch ports and assign them to their VLANs	
`awplus(config)#`	
`interface port1.0.4`	Select port 1.0.4 for configuring.
`awplus(config-if)#`	
`switchport access vlan 4`	Assign port 1.0.4 to VLAN 4.
`awplus(config-if)#`	
`exit`	Return to Global Configuration mode.
`awplus(config)#`	
`interface port1.0.2`	Select port1.0.2 for configuring.
`awplus(config-if)#`	
`switchport access vlan 2`	Assign port 1.0.2 to VLAN 2.
`awplus(config-if)#`	
`exit`	Return to Global Configuration mode.
Set router ID and allocate memory to IPv6	
`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`platform routingratio ipv4andipv6`	Allocate memory resources to IPv6. Note that `ipv4andipv6` is the default platform routing ratio.
`awplus(config)#`	
`router ipv6 ospf process1`	Configure an IPv6 OSPF routing process.
`awplus(config-router)#`	
`router-id 192.168.1.1`	Set the router ID.
`awplus(config-router)#`	
`passive-interface vlan4`	Configure VLAN 4 as a passive interface to suppress IPv6 OSPF routing updates.
`awplus(config-router)#`	
`exit`	Return to Global Configuration mode.
`awplus(config)#`	
`ipv6 forwarding`	Turn on IPv6 forwarding.
`awplus(config)#`	
`exit`	Return to Privileged Exec mode.

Switch 2 Configuration (Single-Area Network)

Table 41-5: Example 1—single-area network configuration—Switch 2

Create and enable VLANs 2 and 3	
`awplus#` `configure terminal`	Enter Global Configuration mode.
`awplus(config)#` `vlan database`	Enter VLAN database mode.
`awplus(config-vlan)#` `vlan 2,3 state enable`	Create and enable VLANs 2 and 3.
`awplus(config-vlan)#` `exit`	Return to Global Configuration mode.
For VLAN 2, assign IPv6 addresses and configure OSPF	
`awplus(config)#` `interface vlan2`	Select VLAN 2 for configuring.
`awplus(config-if)#` `ipv6 address 2001:db8:21e:102::4/64`	Assign an IPv6 address to VLAN 2.
`awplus(config-if)#` `ipv6 router ospf area 0 tag process1`	Assign VLAN 2 to OSPF area 0. In this configuration, any address within the subnet 2001:db8:21e:102 will be part of OSPF area 0.
`awplus(config-if)#` `ipv6 ospf priority 10`	Set the priority for the router to become the designated router for a particular VLAN. The router with the highest priority becomes the designated router for that VLAN. Defaults to 1.
`awplus(config-if)#` `exit`	Return to Global Configuration mode.
For VLAN 3, assign IPv6 addresses and configure OSPF	
`awplus(config)#` `interface vlan3`	Select VLAN 3 for configuring.
`awplus(config-if)#` `ipv6 address 2001:db8:21e:103::3/64`	Assign an IPv6 address to VLAN 3.
`awplus(config-if)#` `ipv6 router ospf area 0 tag process1`	Assign VLAN 3 to OSPF area 0. In this configuration, any address within the subnet 2001:db8:21e:103 will be part of OSPF area 0.

Table 41-5: Example 1—single-area network configuration—Switch 2(cont.)

`awplus(config-if)#`	
`ipv6 ospf priority 20`	Set the priority for the router to become the designated router for a particular VLAN. The router with the highest priority becomes the designated router for that VLAN. Defaults to 1.
Configure switch ports and assign them to their VLANs	
`awplus(config)#`	
`interface port1.0.1`	Select port 1.0.1 for configuring.
`awplus(config-if)#`	
`switchport access vlan 2`	Assign port 1.0.1 to VLAN 2.
`awplus(config-if)#`	
`exit`	Return to Global Config mode.
`awplus(config)#`	
`interface port1.0.2`	Select port1.0.2 for configuring.
`awplus(config-if)#`	
`switchport access vlan 2`	Assign port 1.0.2 to VLAN 2.
`awplus(config-if)#`	
`exit`	Return to Global Configuration mode.
`awplus(config)#`	
`interface port1.0.3`	Select port1.0.3 for configuring.
`awplus(config-if)#`	
`switchport access vlan 3`	Assign port 1.0.3 to VLAN 3.
`awplus(config-if)#`	
`exit`	Return to Global Configuration mode.
`awplus(config)#`	
`interface port1.0.4`	Select port1.0.4 for configuring.
`awplus(config-if)#`	
`switchport access vlan 3`	Assign port 1.0.4 to VLAN 3.
Set router ID and allocate memory to IPv6	
`awplus#`	
`configure terminal`	Enter Global Configuration mode.
`awplus(config)#`	
`platform routingratio ipv4andipv6`	Allocate memory resources to IPv6. Note that `ipv4andipv6` is the default platform routing ratio.
`awplus(config)#`	
`router ipv6 ospf process1`	Configure an IPv6 routing process.
`awplus(config-router)#`	Set the router ID. Note that:
`router-id 192.168.1.2`	■ In this configuration, the router-id value 192.168.1.2 makes this switch most likely to be selected as the designated router.

Table 41-5: Example 1—single-area network configuration—Switch 2(cont.)

`awplus(config)#`	
`ipv6 forwarding`	Turn on IPv6 forwarding.
`awplus(config)#`	
`exit`	Return to Privileged Exec mode.

Switch 3 Configuration (Single-Area Network)

Table 41-6: Example 1—single-area network configuration—Switch 3

Create and enable VLANs 3 and 5	
`awplus#`	
`configure terminal`	Enter Global Configuration mode.
`awplus(config)#`	
`vlan database`	Enter VLAN database mode.
`awplus(config-vlan)#`	
`vlan 3,5 state enable`	Create and enable VLANs 3 and 5.
`awplus(config-vlan)#`	
`exit`	Return to Global Configuration mode.
For VLAN 3, assign IPv6 addresses and configure OSPF	
`awplus(config)#`	
`interface vlan 3`	Select VLAN 3 for configuring.
`awplus(config-if)#`	
`ipv6 address 2001:db8:21e:103::5/64`	Assign an IPv6 address to VLAN 3.
`awplus(config-if)#`	
`ipv6 router ospf area 0 tag process1`	Assign VLAN 3 to OSPF area 0. In this configuration, any address within the subnet 2001:db8:21e:103::/64 will be part of OSPF area 0.
`awplus(config-if)#`	
`ipv6 ospf priority 5`	Set the priority for the router to become the designated router for a particular VLAN. The router with the highest priority becomes the designated router for that VLAN. Defaults to 1.
`awplus(config-if)#`	
`exit`	Return to Global Configuration mode.
For VLAN 5, assign IPv6 addresses and configure OSPF	
`awplus(config)#`	
`interface vlan5`	Select VLAN 5 for configuring.
`awplus(config-if)#`	
`ipv6 address 2001:db8:21e:104::5/64`	Assign an IPv6 address to VLAN 5.

Table 41-6: Example 1—single-area network configuration—Switch 3(cont.)

`awplus(config-if)#`	
`ipv6 router ospf area 0 tag process1`	Assign VLAN 5 to OSPF area 0. In this configuration, any address within the subnet 2001:db8:21e:104::/64 will be part of OSPF area 0.
`awplus(config-if)#`	
`ipv6 ospf priority 5`	Set the priority for the router to become the designated router for a particular VLAN. The router with the highest priority becomes the designated router for that VLAN. Defaults to 1.
Configure switch ports and assign them to their VLANs	
`awplus(config)#`	
`interface port1.0.3`	Select port 1.0.3 for configuring.
`awplus(config-if)#`	
`switchport access vlan 3`	Assign port 1.0.3 to VLAN 3
`awplus(config-if)#`	
`exit`	Return to Global Configuration mode.
`awplus(config)#`	
`interface port1.0.2`	Select port1.0.2 for configuring.
`awplus(config-if)#`	
`switchport access vlan 5`	Assign port 1.0.2 to VLAN 5.
`awplus(config-if)#`	
`exit`	Return to Global Configuration mode.
Set router ID and allocate memory to IPv6	
`awplus#`	
`configure terminal`	Enter Global Configuration mode.
`awplus(config)#`	
`platform routingratio ipv4andipv6`	Allocate memory resources to IPv6. Note that `ipv4andipv6` is the default platform routing ratio.
`awplus(config)#`	
`router ipv6 ospf process1`	Configure an IPV6 routing process.
`awplus(config-router)#`	
`router-id 0.0.1.1`	Set the router ID. Note that the router-id value 0.0.1.1 has been selected for the following reasons: ■ so that it is unlikely to be selected as a designated router. ■ to illustrate that it, although it has an IPv4 address format, it is not an IPv4 address.
`awplus(config-router)#`	
`passive-interface vlan5`	Configure VLAN 5 as a passive interface to suppress IPv6 OSPF routing updates.
`awplus(config-router)#`	
`exit`	Return to Global Configuration mode.

Table 41-6: Example 1—single-area network configuration—Switch 3(cont.)

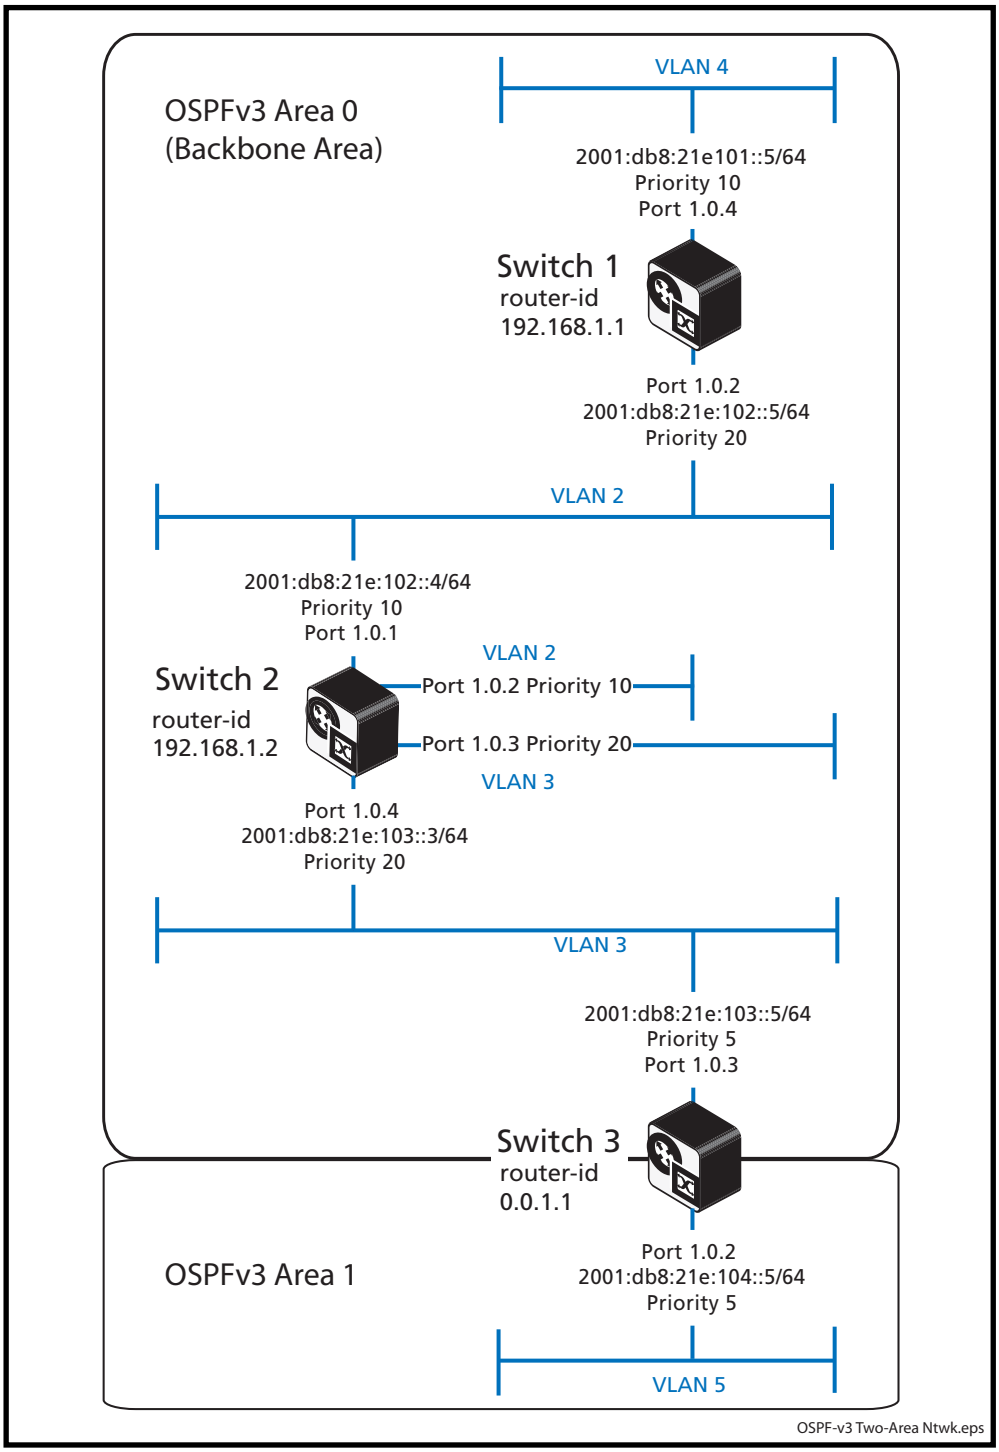
`awplus(config)#`	
`ipv6 forwarding`	Turn on IPv6 forwarding.
`awplus(config)#`	
`exit`	Return to Privileged Exec mode.

Example 2: Two-Area Network Configuration

Figure 41-9shows a basic three-switch, two-area configuration. Setting the priority value of 20 to VLAN 2 on Switch 1 and to the value 10 on Switch 2 will ensure that Switch 1 will become the designated router for this VLAN. Similarly the priority settings on VLAN 3 of 20 on Switch 2, and 5 on Switch 3 will ensure that Switch 2 will become the designated router for VLAN 3.

Note that Switch 3 now becomes the area border router for areas 0 and 1.

Figure 41-9: Basic two-area OSPFv3 configuration



The commands used to configure this two-area network are the same as those used in the previous example, except for the configuration of VLAN 5 on switch 3, which now becomes part of Area 1. The revised configuration for switch 3 and VLAN 5 is shown in below.

Table 41-7: Example 2—two-area network—revised configuration for Switch 3

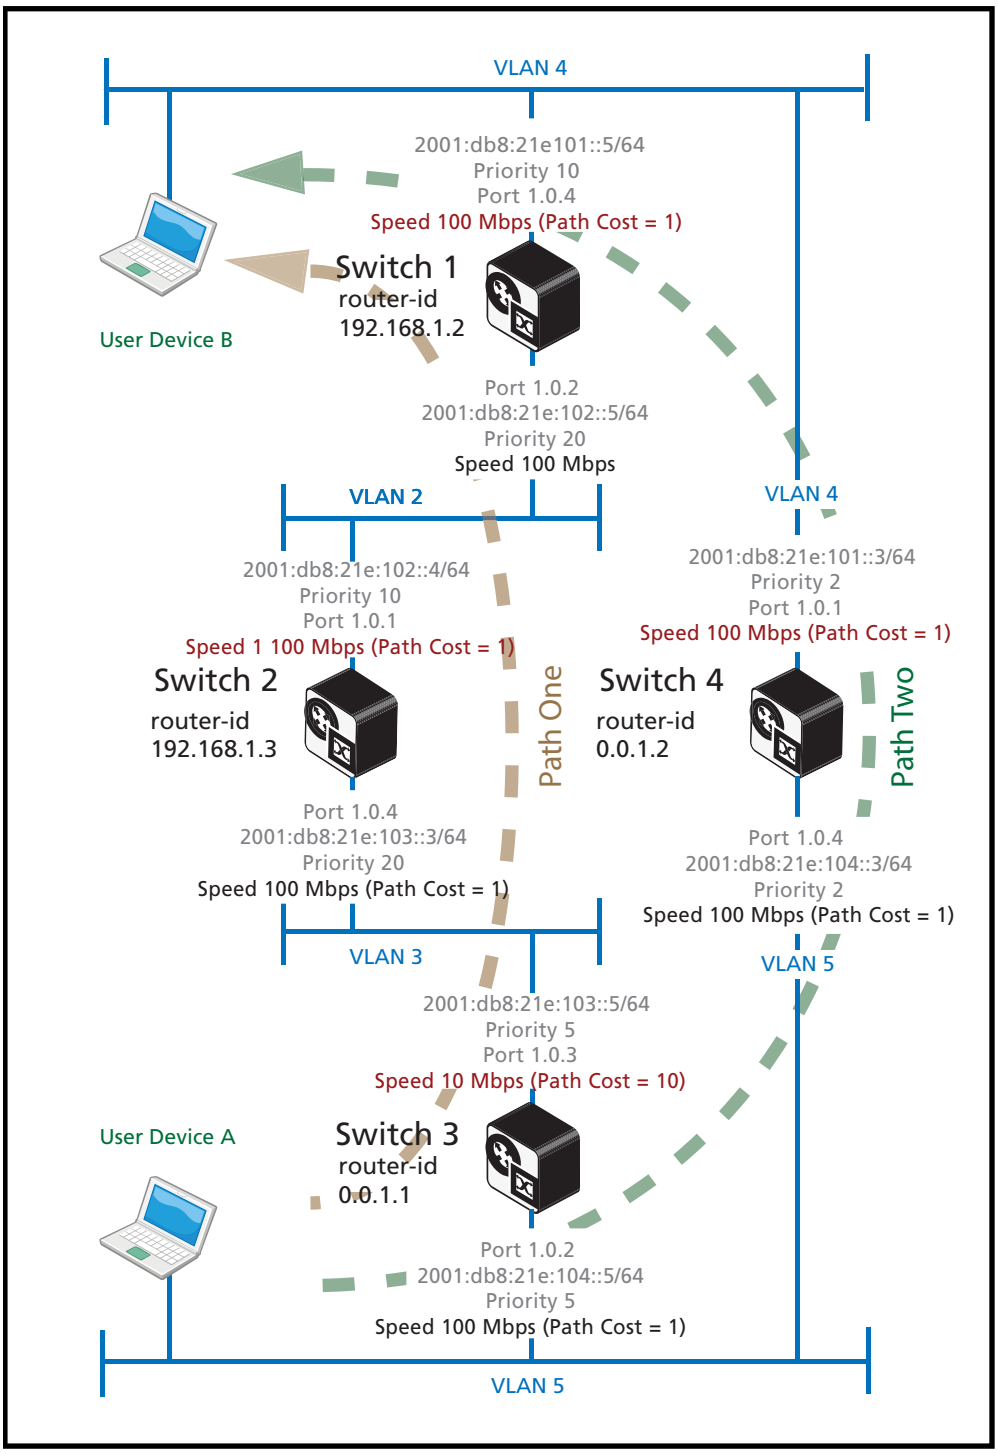
Set VLANs 3 and 5 to be part of area 1	
`awplus(config)#`	
`interface vlan5`	Select VLAN 5 for configuring.
`awplus(config-if#`	
`ipv6 address 2001:db8:21e:104::5/64`	Assign IPv6 address to VLAN 5.
`awplus(config-if)#`	
`ipv6 router ospf area 1`	Assign VLAN 5 to OSPF area 1. In this configuration, any address within the subnet 2001:db8:21e:104 will be part of OSPF area 1.

Setting Up the Metrics

OSPF selects its preferred routes by measuring the cost of each path to a given destination. Each path (or link) has a metric value applied, which by default is 100 000 000 divided by the link bandwidth. The preferred route will be the one that presents the lowest total path cost.

Figure 41-10 shows the previously configured single-area network of **Figure 41-8**, but with an additional path provided by Switch 4. The diagram also shows port speeds and their resultant path costs.

Figure 41-10: OSPFv3 multipath metrics example



Using the procedure shown in **"Switch 1 Configuration (Single-Area Network)" on page 41.21**, add Switch 4 to the configuration, applying the port numbers, VLANs, and settings shown in **Figure 41-10 on page 41.30**.

Setting the metric values

The metric values shown are derived from the data rate configured for each port and (unless manually changed) use the formula 10^8 / port bandwidth in bps.

Example To set the speed of a tri-speed port to 100 Mbps, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# speed 100
```

The above example will produce a path cost of 100 000 000 / port speed (in bps), or 100 000 000 /100 000 000 = 1

If the port speed and its resultant metric value does not produce the required best paths and you do not want to change the port speed, you can change the metric by using the **ipv6 ospf cost** command on page 42.35. The following section explains how to do this.

Best path selection

Figure 41-10 on page 41.30 shows two paths from User Device A to User Device B, labeled Path One and Path Two. The metric cost for each of these paths is found by adding the individual output path costs: For traffic flowing from User Device A, to User Device B, these are:

Path Cost for Path One = 10 + 1 + 1 = 12

Path Cost for Path Two = 1

The preferred route will be via the paths that offer the lowest total path cost. Traffic will therefore travel from User Device A, to User Device B via Path Two.

However, you can manually adjust the cost metrics to favour one path over another. For example, you can apply the **ipv6 ospf cost** command on page 42.35 to manually force the preference for a particular path.

Example Using the configuration shown in **Figure 41-10 on page 41.30** use the **ipv6 ospf cost** command on page 42.35 set Path One to be the preferred path.

Existing path cost for Path One is, 10 + 1 + 1 = 12

Existing path cost for Path Two = 1

Setting the cost of Path Two to be greater than 12, will force OSPF's path selection algorithm to select Path One as the preferred path between User Device A and User Device B.

Use the following commands on switch 4 to force the path cost on switchport 1.0.1 to have the metric value of 20:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ipv6 ospf 2001:0db8:21e:101::5/64 cost 20
```

This has set a higher metric cost for data traveling from Device A to Device B, via Path Two. You now need to set the same metric cost for data traveling in the direction from Device B, to Device A.

```
awplus# configure terminal
awplus(config)# interface vlan5
awplus(config-if)# ipv6 ospf 2001:0db8:21e:104::5/64 cost 20
```

Traffic traveling from devices A to B, and B to A, will now use Path One in preference to Path Two.

Configuring Instances and Processes

OSPFv3 introduces the capability of sharing physical links (or VLANs) with multiple OSPF routing instances. This is achieved by inserting an Instance ID field in the OSPFv3 **Hello**, and **Link State** packets, see **"OSPFv3 packet header" on page 41.5**. In a multi-instance network, the OSPF hello and LSA frames belonging to different instances can coexist alongside each other, each sharing a physical link and each establishing its own set of metric values and path preferences. New instances are created using the **ipv6 router ospf area** command on page 42.46.

There are solutions where multiple OSPF routers are attached to a single link, but should not form an adjacency between OSPF routers. For example, four OSPF routers are attached to an Ethernet link. OSPF routers 1 and 2 belong to one OSPF domain, and OSPF routers 3 and 4 belong to a different OSPF domain. There should be adjacencies between OSPF routers 1 and 2, and between OSPF routers 3 and 4. But there should not be adjacencies between OSPF routers 1 and 3 or between OSPF routers 2 and 4 in this example.

This type of separation of adjacencies is often accomplished in the case of OSPFv2 by the use of manipulated OSPF authentication. However, this is not ideal since OSPF routers may log authentication failures of any rejected hello packets associated with the OSPF domain.

OSPFv3 allows for multiple OSPF routing instances per link by adding the new Instance ID field to the OSPF packet header to distinguish OSPF routing instances. An interface assigned to a given interface ID will drop OSPF packets whose Instance IDs do not match.

Some OSPFv2 (and OSPFv3) switches and routers also have a similar (and older) function called processes. Processes enable more than one OSPF environment to be configured on the same switch (or router), but not the same VLAN. Processes exist only within the switch or router on which they are created. Although their existence is not explicitly conveyed between OSPF routers, the packets from each process contains its own router ID and will thus appear as if generated by a different OSPF router. New processes are created also using the **ipv6 router ospf area** command on page 42.46.

Although instances and processes apply a similar function and each can be individually created, there are interactions between them that require you to apply some specific rules when creating multi-instance networks. The following table shows those combinations of instances and processes that are workable, and those that are not.

Table 41-8: Functional combinations of OSPFv3 instances and processes

VLAN	Instances	Processes	Workable Combination
VLAN 5	Instance 1	Process A	Yes
VLAN 5 & VLAN 7	Instance 1	Process D	Yes
VLAN 5	Instance 1	Process D	Yes
If you now add a second instance so that VLAN 5 shares both instances using Process D			
VLAN 5	Instance 2	Process D	No
To make the above configuration work requires adding a new process.			
VLAN 5	Instance 1	Process D	Yes
VLAN 5	Instance 2	Process E	Yes

Example 1 To apply the settings shown in the last two rows of **Table 41-8**, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan5
awplus(config-if)# ipv6 router ospf area 1 tag D instance-id 1
awplus(config-if)# ipv6 router ospf area 2 tag E instance-id 2
```

Example 2 See the below entries for another supported combination of OSPFv3 instances and processes:

```
awplus# configure terminal
awplus(config)# interface vlan5
awplus(config-if)# ipv6 router ospf area 1 tag D instance-id 1
awplus(config-if)# ipv6 router ospf area 1 tag E instance-id 2
awplus(config-if)# ipv6 router ospf area 2 tag F instance-id 3
awplus(config-if)# exit
awplus(config)# interface vlan7
awplus(config-if)# ipv6 router ospf area 1 tag D instance-id 1
```

Example 3 See the below entries for an unsupported combination of OSPFv3 instances and processes. Note the console error message shown after completing the entries with the same instance ID (**1**) on different processes (**D** and **E**) on the same interface (**vlan5**):

```
awplus# configure terminal
awplus(config)# interface vlan5
awplus(config-if)# ipv6 router ospf area 1 tag D instance-id 1
awplus(config-if)# ipv6 router ospf area 1 tag E instance-id 1
% Interface enabled in another process with
the same instance ID
```

Example 4 See the below entries for an unsupported combination of OSPFv3 instances and processes. Note the console error message shown after completing the entries with different instances IDs (**1** and **2**) on the same process (**A**) on the same interface (**vlan5**):

```
awplus# configure terminal
awplus(config)# interface vlan5
awplus(config-if)# ipv6 router ospf area 1 tag A instance-id 1
awplus(config-if)# ipv6 router ospf area 2 tag A instance-id 2
% Interface enabled in the same process with
a different instance ID
```

Configuring OSPFv3 Authentication and Encryption

See the section **OSPFv3 Authentication and Encryption Overview** earlier in this chapter for introductory OSPFv3 Authentication and OSPFv3 Encryption information.

Also refer to **Chapter 42, OSPFv3 for IPv6 Commands** for detailed OSPFv3 Authentication and OSPFv3 Encryption command syntaxes, parameters, descriptions, and command examples.

Once you configure OSPFv3 and decide on using authentication or encryption, you need to define a security policy on each OSPFv3 interface of each device in the network.

A security policy consists of:

- An SPI (Security Parameter Index), the identification number for the security policy
- An authentication algorithm, either MD5 (Message Digest 5) or SHA-1 (Secure Hash Algorithm 1) authentication, if the security policy is to perform authentication
- An authentication key, which is a 32 or 40 bit hexadecimal value used with the authentication algorithm, if the security policy is to perform authentication
- An encryption algorithm, either AES-CBC (Advanced Encryption Standard-Cipher Block Chaining) or 3DES (Triple Data Encryption Standard) encryption, if the security policy is to perform encryption.
- An encryption key, which is a 32 to 64 bit hexadecimal value used with the encryption algorithm, if the security policy is to perform encryption

You can configure authentication and encryption on virtual links, on VLAN interfaces, and on OSPFv3 areas. When you configure authentication or encryption for an area, the security policy is applied to all of the VLAN interfaces in the OSPFv3 area. Note that you should use a different security policy on each VLAN interface to improve the security.

See the sections listed below when configuring OSPFv3 Authentication:

- **Configuring OSPFv3 Authentication on a VLAN**
- **Configuring OSPFv3 Encryption on a VLAN**
- **Configuring OSPFv3 Authentication in an OSPFv3 Area**
- **Configuring OSPFv3 Encryption in an OSPFv3 Area**
- **Configuring OSPFv3 Authentication and Encryption for a Virtual Link**

See sample configurations listed below with topologies that accompany these sections:

- **OSPFv3 Authentication in an OSPFv3 Area**
- **OSPFv3 Encryption in an OSPFv3 Area**
- **OSPFv3 Authentication on a VLAN**
- **OSPFv3 Encryption on a VLAN**
- **OSPFv3 Authentication with two VLANs**
- **OSPFv3 Encryption with two VLANs**
- **OSPFv3 Authentication for a Virtual Link**
- **OSPFv3 Encryption for a Virtual Link**

Configuring OSPFv3 Authentication on a VLAN

Enter the below commands to configure OSPFv3 Authentication on a VLAN interface. Note you need to configure OSPFv3 on a VLAN before configuring OSPFv3 Authentication.

Note the links in the list are for the command name in the relevant command chapter. The links in the table below the list take you to the command syntax of the relevant command.

Commands Applied

1. **enable (Privileged Exec mode)**
2. **configure terminal**
3. **interface (to configure)**
4. **ipv6 ospf authentication spi**
5. **exit**
6. **exit**

Table 41-9: Configuring the DHCPv6 Configuration Pool

1.	`awplus>enable [<privilege-level>]`	Enter Privileged Exec mode.
2.	`awplus#configure terminal`	Enter Global Configuration mode.
3.	`awplus(config)# interface <interface-list>`	Specify a VLAN interface, and enter Interface Configuration mode.
4.	`awplus(config-if)#ipv6 ospf authentication ipsec spi <256-4294967295> {md5 <MD5-key>|sha1 <SHA1-key>}`	Specifies an OSPFv3 Authentication type (MD5 or SHA-1) for a specified VLAN interface.
5.	`awplus(config-if)# exit`	Return to Global Configuration mode.
6.	`awplus(config)# exit`	Return to Privileged Exec mode.

Configuring OSPFv3 Encryption on a VLAN

Enter the below commands to configure OSPFv3 Encryption on a VLAN interface. Note you need to configure OSPFv3 on a VLAN before configuring OSPFv3 Encryption.

Note the links in the list are for the command name in the relevant command chapter. The links in the table below the list take you to the command syntax of the relevant command.

Commands Applied

1. **enable (Privileged Exec mode)**
2. **configure terminal**
3. **interface (to configure)**
4. **ipv6 ospf encryption spi esp**
5. **exit**
6. **exit**

Table 41-10: Configuring the DHCPv6 Configuration Pool

1.	`awplus>enable (Privileged Exec mode)`	Enter Privileged Exec mode.
2.	`awplus#configure terminal`	Enter Global Configuration mode.
3.	`awplus(config)# interface <interface-list>`	Specify a VLAN interface, and enter Interface Configuration mode.
4.	`awplus(config-if)#ipv6 ospf encryption ipsec spi <256-4294967295> esp {aes-cbc <AES-CBC-key>|3des <3DES-key>|null} {md5 <MD5-key>|sha1 <SHA1-key>}`	Specifies an OSPFv3 Encryption type (AES-CBC or 3DES) and an OSPFv3 Authentication type (MD5 or SHA-1) for a specified VLAN interface.
5.	`awplus(config-if)# exit`	Return to Global Configuration mode.
6.	`awplus(config)# exit`	Return to Privileged Exec mode.

Configuring OSPFv3 Authentication in an OSPFv3 Area

Enter the below commands to configure OSPFv3 Authentication in an OSPFv3 Area. Note you need to configure an OSPFv3 Area before configuring OSPFv3 Authentication.

Note the links in the list are for the command name in the relevant command chapter. The links in the table below the list take you to the command syntax of the relevant command.

Commands Applied

1. **enable (Privileged Exec mode)**
2. **configure terminal**
3. **interface (to configure)**
4. **ipv6 router ospf area**
5. **area authentication ipsec spi**
6. **exit**
7. **exit**
8. **exit**

Table 41-11: Configuring the DHCPv6 Configuration Pool

1.	`awplus>enable (Privileged Exec mode)`	Enter Privileged Exec mode.
2.	`awplus#configure terminal`	Enter Global Configuration mode.
3.	`awplus(config)# interface <interface-list>`	Specify a VLAN interface, and enter Interface Configuration mode.
4.	`awplus(config-if)# ipv6 router ospf area <area-id> [tag <process-id>] [instance <inst-id>]`	Specify an OSPFv3 Area and, and enter Router Configuration mode.
5.	`awplus(config-router)# area <area-id> authentication ipsec spi <256-4294967295> {md5 <MD5-key>|sha1 <SHA1-key>}`	Specifies an OSPFv3 Authentication type (MD5 or SHA-1) for a specified OSPFv3 Area.
6.	`awplus(config-router)# exit`	Return to Interface Configuration mode.
7.	`awplus(config-if)# exit`	Return to Global Configuration mode.
8.	`awplus(config)# exit`	Return to Privileged Exec mode.

Configuring OSPFv3 Encryption in an OSPFv3 Area

Enter the below commands to configure OSPFv3 Encryption in an OSPFv3 Area. Note you need to configure an OSPFv3 Area before configuring OSPFv3 Encryption.

Note the links in the list are for the command name in the relevant command chapter. The links in the table below the list take you to the command syntax of the relevant command.

Commands Applied

1. **enable (Privileged Exec mode)**
2. **configure terminal**
3. **interface (to configure)**
4. **ipv6 router ospf area**
5. **area encryption ipsec spi esp**
6. **exit**
7. **exit**
8. **exit**

Table 41-12: Configuring the DHCPv6 Configuration Pool

1.	`awplus>enable (Privileged Exec mode)`	Enter Privileged Exec mode.
2.	`awplus#configure terminal`	Enter Global Configuration mode.
3.	`awplus(config)# interface <interface-list>`	Specify a VLAN interface, and enter Interface Configuration mode.
4.	`awplus(config-if)# ipv6 router ospf area <area-id> [tag <process-id>] [instance <inst-id>]`	Specify an OSPFv3 Area and, and enter Router Configuration mode.
5.	`awplus(config-router)# area <area-id> encryption ipsec spi <256-4294967295> esp {aes-cbc <AES-CBC-key>|3des <3DES-key>|null} {md5 <MD5-key>|sha1 <SHA1-key>}`	Specifies an OSPFv3 Encryption type (AES-CBC or 3DES) and an OSPFv3 Authentication type (MD5 or SHA-1) for a specified OSPFv3 Area.
6.	`awplus(config-router)# exit`	Return to Interface Configuration mode.
7.	`awplus(config-if)# exit`	Return to Global Configuration mode.
8.	`awplus(config)# exit`	Return to Privileged Exec mode.

Configuring OSPFv3 Authentication and Encryption for a Virtual Link

Enter the below commands to configure OSPFv3 Authentication and OSPFv3 Encryption for a OSPFv3 Area Virtual Link. Note you need to configure an OSPFv3 Area and an OSPFv3 Area Virtual Link before configuring OSPFv3 Authentication and OSPFv3 Encryption for an OSPFv3 Area Virtual Link.

Note the links in the list are for the command name in the relevant command chapter. The links in the table below the list take you to the command syntax of the relevant command.

Commands Applied

1. **enable (Privileged Exec mode)**
2. **configure terminal**
3. **interface (to configure)**
4. **ipv6 router ospf area**
5. **area virtual-link (IPv6 OSPF)**
6. **area virtual-link authentication ipsec spi**
7. **area virtual-link encryption ipsec spi**
8. **exit**
9. **exit**
10. **exit**

Table 41-13: Configuring the DHCPv6 Configuration Pool

1.	`awplus>enable (Privileged Exec mode)`	Enter Privileged Exec mode.
2.	`awplus#configure terminal`	Enter Global Configuration mode.
3.	`awplus(config)# interface <interface-list>`	Specify a VLAN interface, and enter Interface Configuration mode.
4.	`awplus(config-if)# ipv6 router ospf area <area-id> [tag <process-id>] [instance <inst-id>]`	Specify an OSPFv3 Area and, and enter Router Configuration mode.
5.	`awplus(config-router)# area <area-id> virtual-link <router-id>`	Specifies an OSPFv3 Area Virtual Link.
6.	`awplus(config-router)# area <area-id> virtual-link <router-ID> authentication ipsec spi <256-4294967295> {md5 <MD5-key>|sha1 <SHA1-key>}`	Specifies an OSPFv3 Encryption type (AES-CBC or 3DES) and an OSPFv3 Authentication type (MD5 or SHA-1) for a specified OSPFv3 Area.
7.	`awplus(config-router)# area <area-id> virtual-link <router-ID> encryption ipsec spi <256-4294967295> esp {aes-cbc <AES-CBC-key>|3des <3DES-key>|null} {md5 <MD5-key>|sha1 <SHA1-key>}`	Specifies an OSPFv3 Encryption type (AES-CBC or 3DES) and an OSPFv3 Authentication type (MD5 or SHA-1) for a specified OSPFv3 Area.
8.	`awplus(config-router)# exit`	Return to Interface Configuration mode.
9.	`awplus(config-if)# exit`	Return to Global Configuration mode.
10.	`awplus(config)# exit`	Return to Privileged Exec mode.

OSPFv3 Authentication in an OSPFv3 Area

This example shows how to configure two devices to form an adjacency to each other with OSPFv3 authentication in an OSPFv3 backbone area 0. Both devices are configured to use the same process name test1, which is not advertised between peers.

See section **Configuring OSPFv3 Authentication in an OSPFv3 Area** for the sequence of console command entries. For command information, see the **area authentication ipsec spi** command.

Note that **bold** command entries in configuration output show hostnames and interfaces.

Figure 41-11: OSPFv3 Authentication in an OSPFv3 Area topology:

OSPFv3 Encryption in an OSPFv3 Area

This example shows how to configure two devices to form an adjacency to each other with OSPFv3 encryption in an OSPFv3 backbone area 0. Both devices are also configured to use the same internal process name test1. Additionally, both devices insert instance-id 1 into their advertised hello messages to control adjacency between the two devices.

See section **Configuring OSPFv3 Encryption in an OSPFv3 Area** for the sequence of console command entries. For command information, see the **area encryption ipsec spi esp** command.

Note that **bold** command entries in configuration output show hostnames and interfaces.

OSPFv3 Encryption with two VLANs

This example shows how to configure three devices with OSPFv3 encryption on a per VLAN basis. Note that to increase security, rather than using a single SPI for the entire area, this example uses a different security profile for each VLAN in the topology shown.

See section **Configuring OSPFv3 Encryption on a VLAN** for the sequence of console command entries. For detailed command information, see the **ipv6 ospf encryption spi esp** command.

Note that **bold** command entries in configuration output show hostnames and interfaces.

Figure 41-16: OSPFv3 Encryption with two VLANs topology:

OSPFv3 Authentication for a Virtual Link

In this example, there is an OSPFv3 virtual link configured from area 2.2.2.2 to the OSPFv3 backbone area 0, via transit area 1.1.1.1, with OSPFv3 authentication configured.

See section **Configuring OSPFv3 Authentication and Encryption for a Virtual Link** for the sequence of console command entries. For detailed command information, see the **area virtual-link authentication ipsec spi** command.

Note that **bold** command entries in configuration output show hostnames and interfaces.

Command List

This chapter provides an alphabetical reference of commands used to configure OSPFv3 for IPv6. For more information on this topic, see **Chapter 41, OSPFv3 for IPv6 Introduction and Configuration**.

abr-type

Use this command to set an OSPF Area Border Router (ABR) type.

Use the **no** variant of this command to revert the ABR type to the default setting (Cisco).

Syntax

```
abr-type {cisco|ibm|standard}
no abr-type {cisco|ibm|standard}
```

Parameter	Description
`cisco`	Specifies an alternative ABR using Cisco implementation (RFC 3509). This is the default ABR type.
`ibm`	Specifies an alternative ABR using IBM implementation (RFC 3509).
`standard`	Specifies a standard behavior ABR (RFC 2328).

Default ABR type `cisco`

Mode Router Configuration

Usage Specifying the ABR type allows better interoperation between different implementations. This command is specially useful in a multi-vendor environment. The different ABR types are:

- Cisco ABR Type: By this definition, a router is considered an ABR if it has more than one area actively attached and one of them is the backbone area.
- IBM ABR Type: By this definition, a router is considered an ABR if it has more than one area actively attached and the backbone area is configured. In this case the configured backbone need not be actively connected.
- Standard ABR Type: By this definition, a router is considered an ABR if it has more than one area actively attached to it.

Example

```
awplus# configure terminal
awplus(config)# router ipv6 ospf 100
awplus(config-router)# abr-type ibm
```

area authentication ipsec spi

Use this command in Router Configuration mode to enable either MD5 (Message-Digest 5) or SHA1 (Secure Hash Algorithm 1) authentication for a specified OSPF area.

Use the **no** variant of this command in Router Configuration mode to disable the authentication configured for a specified OSPF area.

Syntax

```
area <area-id> authentication ipsec spi <256-4294967295>
    {md5 <MD5-key>|sha1 <SHA1-key>}

no area <area-id> authentication ipsec spi <256-4294967295>
```

Parameter	Description	
<area-id>	The OSPF area that you are specifying the summary route default-cost for. This can be entered in either dotted decimal format or normal decimal format. Use one of the following formats:	
	<ip-addr>	OSPF area-ID expressed in IPv4 address format A.B.C.D.
	<0-4294967295>	OSPF area-ID expressed as a decimal number within the range shown.
	For example, the values 0.0.1.2 and decimal 258 would both define the same area-ID.	
<256-4294967295>	Specify an SPI (Security Parameters Index) value in the range 256 to 4294967295, entered as a decimal integer.	
md5	Specify the MD5 (Message-Digest 5) hashing algorithm.	
<MD5-key>	Enter an MD5 key containing up to 32 hexadecimal characters.	
sha1	Specify the SHA-1 (Secure Hash Algorithm 1) hashing algorithm.	
<SHA1-key>	Enter an SHA-1 key containing up to 40 hexadecimal characters.	

Mode Router Configuration

Usage Use this command on an OSPFv3 area, use the **area virtual-link authentication ipsec spi** command on an OSPFv3 area virtual link. Configure the same SPI (Security Parameters Index) value on all interfaces that connect to the same link. SPI values are used by link interfaces. Use a different SPI value for a different link interface when using OSPFv3 with link interfaces.

Use the **sha1** keyword to choose SHA-1 authentication instead of entering the **md5** keyword to use MD5 authentication. The SHA-1 algorithm is more secure than the MD5 algorithm. SHA-1 uses a 40 hexadecimal character key instead of a 32 hexadecimal character key as used for MD5 authentication.

See the section **OSPFv3 Authentication and Encryption Overview** in **Chapter 41, OSPFv3 for IPv6 Introduction and Configuration** for introductory OSPFv3 Authentication and Encryption information.

Also see the section **Configuring OSPFv3 Authentication and Encryption** in **Chapter 41, OSPFv3 for IPv6 Introduction and Configuration** for configuration examples and topologies.

Note

You can configure an authentication security policy (SPI) on an OSPFv3 area with this command, or on a VLAN interface with the **ipv6 ospf authentication spi** command.

When you configure authentication for an area, the security policy is applied to all VLAN interfaces in the area. However, Allied Telesis recommends a different authentication security policy is applied to each interface for higher security.

If you apply the `ipv6 ospf authentication null` command this affects authentication configured on both the VLAN interface and the OSPFv3 area.

This is due to OSPFv3 hello messages ingressing VLAN interfaces, which are part of area authentication, not being authenticated. So neighbors time out.

Example To enable MD5 authentication with a 32 hexadecimal character key for OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 authentication ipsec spi 1000 md5
1234567890ABCDEF1234567890ABCDEF
```

To enable SHA-1 authentication with a 40 hexadecimal character key for OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 authentication ipsec spi 1000 sha1
1234567890ABCDEF1234567890ABCDEF12345678
```

To disable authentication for OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# no area 1 authentication ipsec spi 1000
```

Related Commands

area encryption ipsec spi esp
area virtual-link authentication ipsec spi
area virtual-link encryption ipsec spi
ipv6 ospf authentication spi
ipv6 ospf encryption spi esp
show ipv6 ospf

area default-cost (IPv6 OSPF)

This command specifies a cost for the default summary route sent into a stub area.

The **no** variant of this command removes the assigned default-route cost.

Syntax

```
area <area-id> default-cost <0-16777215>
no area <area-id> default-cost
```

Parameter	Description	
<area-id>	The OSPF area that you are specifying the summary route default-cost for. This can be entered in either dotted decimal format or normal decimal format. Use one of the following formats:	
	<ip-addr>	OSPF area-ID expressed in IPv4 address format A.B.C.D.
	<0-4294967295>	OSPF area-ID expressed as a decimal number within the range shown.
	For example, the values 0.0.1.2 and decimal 258 would both define the same area-ID.	
`default-cost`	Indicates the cost for the default summary route used for a stub area. Default: **1**	

Mode Router Configuration

Usage The default-cost option provides the metric for the summary default route, generated by the area border router, into the stub area. Use this option only on an area border router that is attached to the stub area.

Example To set the default cost to 10 in area 1 for the OSPF process P2, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf P2
awplus(config-router)# area 1 default-cost 10
```

Related Commands area stub (IPv6 OSPF)

area encryption ipsec spi esp

Use this command in Router Configuration mode to enable either AES-CBC (Advanced Encryption Standard-Cipher Block Chaining) or 3DES (Triple Data Encryption Standard) ESP (Encapsulating Security Payload) encryption for a specified OSPF area.

Use the **no** variant of this command in Router Configuration mode to disable the encryption configured for a specified OSPF area.

Syntax

```
area <area-id> encryption ipsec spi <256-4294967295>
    esp {aes-cbc <AES-CBC-key>|3des <3DES-key>|null}
    {md5 <MD5-key>|sha1 <SHA1-key>}

no area <area-id> encryption ipsec spi <256-4294967295>
```

Parameter	Description	
<area-id>	The OSPF area that you are specifying the summary route default-cost for. This can be entered in either dotted decimal format or normal decimal format. Use one of the following formats:	
	<ip-addr>	OSPF area-ID expressed in IPv4 address format A.B.C.D.
	<0-4294967295>	OSPF area-ID expressed as a decimal number within the range shown.
	For example, the values 0.0.1.2 and decimal 258 would both define the same area-ID.	
<256-4294967295>	Specify an SPI (Security Parameters Index) value in the range 256 to 4294967295, entered as a decimal integer.	
esp	Specify the esp keyword (Encapsulating Security Payload) to then apply either AES-CBC or 3DES encryption.	
aes-cbc	Specify this keyword to enable AES-CBC (Advanced Encryption Standard-Cipher Block Chaining) encryption.	
<AES-CBC-key>	Enter an AES-CBC key containing either 32, 48, or 64 hexadecimal characters.	
3des	Specify 3DES (Triple Data Encryption Standard) encryption.	
<3DES-key>	Enter a 3DES key containing 48 hexadecimal characters.	
null	Specify ESP without AES-CBC or 3DES encryption applied.	
md5	Specify the MD5 (Message-Digest 5) encryption algorithm.	
<MD5-key>	Enter an MD5 key containing 32 hexadecimal characters.	
sha1	Specify the SHA-1 (Secure Hash Algorithm 1) encryption algorithm.	
<SHA1-key>	Enter an SHA-1 key containing 40 hexadecimal characters.	

Mode Router Configuration

Usage When you issue this command, authentication and encryption are both enabled.

Use this command on an OSPFv3 area, use the **area virtual-link encryption ipsec spi** command on an OSPFv3 area virtual link. Configure the same SPI (Security Parameters Index) value on all interfaces that connect to the same link. SPI values are used by link interfaces. Use a different SPI value for a different link interface when using OSPFv3 with link interfaces.

Security is achieved using the IPv6 ESP extension header. The IPv6 ESP extension header is used to provide confidentiality, integrity, authentication, and confidentiality. Authentication fields are removed from OSPF for IPv6 packet headers, so applying IPv6 ESP extension headers are required for integrity, authentication, and confidentiality.

Use the **sha1** keyword to choose SHA-1 authentication instead of entering the **md5** keyword to use MD5 authentication. The SHA-1 algorithm is more secure than the MD5 algorithm. SHA-1 uses a 40 hexadecimal character key instead of a 32 hexadecimal character key as used for MD5 authentication.

See the section **OSPFv3 Authentication and Encryption Overview** in **Chapter 41, OSPFv3 for IPv6 Introduction and Configuration** for introductory OSPFv3 Authentication and Encryption information.

Also see the section **Configuring OSPFv3 Authentication and Encryption** in **Chapter 41, OSPFv3 for IPv6 Introduction and Configuration** for configuration examples and topologies.

Note

You can configure an encryption security policy (SPI) on an OSPFv3 area with this command, or on a VLAN interface with the **ipv6 ospf encryption spi esp** command.

When you configure encryption for an area, the security policy is applied to all VLAN interfaces in the area. However, Allied Telesis recommends a different encryption security policy is applied to each interface for higher security.

If you apply the `ipv6 ospf encryption null` command this affects encryption configured on both the VLAN interface and the OSPFv3 area.

This is due to OSPFv3 hello messages ingressing VLAN interfaces, which are part of area encryption, not being being encrypted. So neighbors time out.

Example To enable ESP encryption, but not apply an AES-CBC key or an 3DES key, and MD5 authentication with a 32 hexadecimal character key for OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 encryption ipsec spi 1000 esp null
md5 1234567890ABCDEF1234567890ABCDEF
```

To enable ESP encryption, but not apply an AES-CBC key or an 3DES key, and SHA-1 authentication with a 40 hexadecimal character key for OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 encryption ipsec spi 1000 esp null
sha1
1234567890ABCDEF1234567890ABCDEF12345678
```

To enable ESP encryption with a 48 hexadecimal character 3DES key and a 32 hexadecimal

character MD5 authentication for OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 encryption ipsec spi 1000 esp 3des
1234567890ABCDEF1234567890ABCDEF12345678
90ABCDEF md5
1234567890ABCDEF1234567890ABCDEF
```

To enable ESP encryption with a 32 hexadecimal character AES-CBC key, and a 40 hexadecimal character SHA-1 authentication key for OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 encryption ipsec spi 1000 esp aes-
cbc 1234567890ABCDEF1234567890ABCDEF
sha1
1234567890ABCDEF1234567890ABCDEF12345678
```

To disable ESP encryption for OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# no area 1 encryption ipsec spi 1000
```

Related Commands

area authentication ipsec spi

area virtual-link encryption ipsec spi
ipv6 ospf authentication spi
ipv6 ospf encryption spi esp
show ipv6 ospf

area range (IPv6 OSPF)

Use this command to summarize OSPFv3 routes at an area boundary, configuring an IPv6 address range which consolidates OSPFv3 routes. By default, this feature is not enabled.

A summary route created by this command is then advertised to other areas by the Area Border Routers (ABRs). In this way, routing information is condensed at area boundaries and outside the area so that routes are exchanged between areas in an efficient manner.

If the network numbers in an area are arranged into sets of contiguous routes, the ABRs can be configured to advertise a summary route that covers all the individual networks within the area that fall into the specified range.

The **no** variant of this command disables this function and restores default behavior.

Syntax

```
area <area-id> range <ipv6address/prefix-length> [advertise|not-
    advertise]

no area <area-id> range <ipv6address/prefix-length>
```

Parameter	Description	
<area-id>	The OSPFv3 area that you summarizing the routes for. Use one of the following formats: This can be entered in either dotted decimal format or normal decimal format.	
	<A.B.C.D>	OSPF area-ID expressed in IPv4 address format A.B.C.D.
	<0-4294967295>	OSPF area-ID expressed as a decimal number within the range shown.
	For example the values 0.0.1.2 and decimal 258 would both define the same area-ID.	
<ip-addr/ prefix-length>	The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.	
`advertise`	Advertise this range as a summary route into other areas.	
`not-advertise`	Do not advertise this range.	

Default The area range is not configured by default. The area range is advertised if it is configured.

Mode Router Configuration

Usage You can configure multiple ranges on a single area with multiple instances of this command, so OSPFv3 summarizes addresses for different sets of IPv6 address ranges.

Ensure OSPFv3 IPv6 routes exist in the area range for advertisement before using this command.

Example

```
awplus# configure terminal
awplus(config)# router ipv6 ospf P2
awplus(config-router)# area 1 range 2000::/3
```

area stub (IPv6 OSPF)

This command defines an OSPF area as a stub area. By default, no stub area is defined.

Use this command when routers in the area do not require learning about external LSAs. You can define the area as a totally stubby area by configuring the Area Border Router of that area using the **area stub no-summary** command.

The **no** variant of this command removes this definition.

Syntax

```
area <area-id> stub [no-summary]
no area <area-id> stub [no-summary]
```

Parameter	Description	
<area-id>	The OSPF area that you are configuring as a stub area. Use one of the following formats: This can be entered in either dotted decimal format or normal decimal format. For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area-ID.	
	<A.B.C.D>	OSPF area-ID, expressed in the IPv4 address format *<A.B.C.D>*.
	<0-4294967295>	OSPF area-ID expressed as a decimal number within the range shown.
	For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area-ID.	
no-summary	Stops an ABR from sending summary link advertisements into the stub area.	

Mode Router Configuration

Usage There are two stub area router configuration commands: the **area stub** and **area default-cost** commands. In all routers attached to the stub area, configure the area by using the **area stub** command. For an area border router (ABR) attached to the stub area, also use the **area default-cost** command.

Example

```
awplus# configure terminal
awplus(config)# router ipv6 ospf 100
awplus(config-router)# area 100 stub
```

Related Commands area default-cost (IPv6 OSPF)

area virtual-link (IPv6 OSPF)

This command configures a link between a non-backbone area and the backbone, through other non-backbone areas.

In OSPF, all non-backbone areas must be connected to a backbone area. If the connection to the backbone is lost, the virtual link repairs the connection.

The **no** variant of this command removes the virtual link.

Syntax

```
area <area-id> virtual-link <router-id>

no area <area-id>  virtual-link <router-id>

area <area-id>  virtual-link <router-id>

no area <area-id>  virtual-link <router-id>

area <area-id>  virtual-link <router-id> [hello-interval <1-65535>]
   [retransmit-interval <1-65535>] [transmit-delay <1-65535>]

no area <area-id>  virtual-link <router-id> [hello-interval]
   [retransmit-interval] [transmit-delay]
```

Parameter	Description	
<area-id>	The area-ID of the transit area that the virtual link passes through. This can be entered in either dotted decimal format or normal decimal format as shown below.	
	<A.B.C.D>	OSPF area-ID, expressed in the IPv4 address format *<A.B.C.D>*.
	<0-4294967295>	OSPF area-ID expressed as a decimal number within the range shown.
	For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area-ID.	
<router-id>	The OSPF router ID of the virtual link neighbor.	
dead-interval	If no packets are received from a particular neighbor for dead-interval seconds, the router considers the neighbor router to be off-line. Default: 40 seconds	
	<1-65535>	The number of seconds in the interval.
hello-interval	The interval the router waits before it sends a hello packet. Default: 10 seconds	
	<1-65535>	The number of seconds in the interval.
retransmit-interval	The interval the router waits before it retransmits a packet. Default: 5 seconds	
	<1-65535>	The number of seconds in the interval.
transmit-delay	The interval the router waits before it transmits a packet. Default: 1 seconds	
	<1-65535>	The number of seconds in the interval.

Mode Router Configuration

Usage

You can configure virtual links between any two backbone routers that have an interface to a common non-backbone area. The protocol treats these two routers, joined by a virtual link, as if they were connected by an unnumbered point-to-point network. To configure a virtual link, you require:

- The transit area-ID, i.e. the area-ID of the non-backbone area that the two backbone routers are both connected to.
- The corresponding virtual link neighbor's router ID. To see the router ID use the **show ipv6 ospf** command.

Configure the **hello-interval** to be the same for all routers attached to a common network. A short **hello-interval** results in the router detecting topological changes faster but also an increase in the routing traffic.

The **retransmit-interval** is the expected round-trip delay between any two routers in a network. Set the value to be greater than the expected round-trip delay to avoid needless retransmissions.

The **transmit-delay** is the time taken to transmit a link state update packet on the interface. Before transmission, the link state advertisements in the update packet, are incremented by this amount. Set the **transmit-delay** to be greater than zero. Also, take into account the transmission and propagation delays for the interface.

Example

To configure a virtual link through area 1to the router with router-ID 10.10.11.50, use the following commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf 100
awplus(config-router)# area 1 virtual-link 10.10.11.50 hello 5
dead 10
```

Related Commands

show ipv6 ospf

area virtual-link authentication ipsec spi

Use this command in Router Configuration mode to enable authentication for virtual links in a specified OSPF area.

Use the **no** variant of this command in Router Configuration mode to disable authentication for virtual links in a specified OSPF area.

Syntax

```
area <area-id> virtual-link <router-ID> authentication ipsec
    spi <256-4294967295> {md5 <MD5-key>|sha1 <SHA1-key>}

no area <area-id> virtual-link <router-ID> authentication ipsec
    spi <256-4294967295>
```

Parameter	Description	
<area-id>	The OSPF area that you are specifying the summary route default-cost for. This can be entered in either dotted decimal format or normal decimal format. Use one of the following formats:	
	<ip-addr>	OSPF area-ID expressed in IPv4 address format A.B.C.D.
	<0-4294967295>	OSPF area-ID expressed as a decimal number within the range shown.
	For example, the values 0.0.1.2 and decimal 258 would both define the same area-ID.	
`virtual-link`	Specify a virtual link and its parameters.	
<router-ID>	Enter a router ID associated with a virtual link neighbor in IPv4 address format A.B.C.D.	
`authentication`	Specify this keyword to enable authentication.	
`ipsec`	Specify this keyword to use IPsec authentication.	
`spi`	Specify this keyword to set the SPI (Security Parameters Index).	
<256-4294967295>	Specify an SPI (Security Parameters Index) value in the range 256 to 4294967295, entered as a decimal integer.	
`md5`	Specify the MD5 (Message-Digest 5) encryption algorithm.	
<MD5-key>	Enter an MD5 key containing 32 hexadecimal characters.	
`sha1`	Specify the SHA-1 (Secure Hash Algorithm 1) encryption algorithm.	
<SHA1-key>	Enter an SHA-1 key containing 40 hexadecimal characters.	

Mode Router Configuration

Usage Use this command on an OSPFv3 area virtual link, use the **area authentication ipsec spi** command on an OSPFv3 area. Configure the same SPI (Security Parameters Index) value on all interfaces that connect to the same link. SPI values are used by link interfaces. Use a different SPI value for a different link interface when using OSPFv3 with link interfaces.

OSPFv3 areas are connected to a backbone area. Virtual links can be configured to repair lost connections to a backbone area for OSPFv3 areas. To configure an OSPFv3 virtual link, use a router ID instead of the IPv6 prefix of the router.

Use the **sha1** keyword to choose SHA-1 authentication instead of entering the **md5** keyword to use MD5 authentication. The SHA-1 algorithm is more secure than the MD5 algorithm. SHA-1 uses a 40 hexadecimal character key instead of a 32 hexadecimal character key as used for MD5 authentication.

See the section **OSPFv3 Virtual Links** in **Chapter 41, OSPFv3 for IPv6 Introduction and Configuration** for introductory OSPFv3 Authentication and Encryption information.

Also see the section **Configuring OSPFv3 Authentication and Encryption for a Virtual Link** in **Chapter 41, OSPFv3 for IPv6 Introduction and Configuration** for configuration examples and topologies.

Example To enable MD5 authentication with a 32 hexadecimal character key for virtual links in OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 virtual-link 10.0.0.1
                       authentication ipsec spi 1000 md5
                       1234567890ABCDEF1234567890ABCDEF
```

To enable SHA-1 authentication with a 40 hexadecimal character key for virtual links in OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 virtual-link 10.0.0.1
                       authentication ipsec spi 1000 sha1
                       1234567890ABCDEF1234567890ABCDEF12345678
```

To disable authentication for virtual links in OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# no area 1 virtual-link ipsec spi 1000
```

Related Commands
area authentication ipsec spi
area encryption ipsec spi esp
area virtual-link encryption ipsec spi
show ipv6 ospf virtual-links

area virtual-link encryption ipsec spi

Use this command in Router Configuration mode to enable either AES-CBC (Advanced Encryption Standard-Cipher Block Chaining) or 3DES (Triple Data Encryption Standard) ESP (Encapsulating Security Payload) encryption for virtual links in a specified OSPF area.

Use the **no** variant of this command in Router Configuration mode to disable encryption configured for virtual links in a specified OSPF area.

Syntax

```
area <area-id> virtual-link <router-ID> encryption ipsec
    spi <256-4294967295>
    esp {aes-cbc <AES-CBC-key>|3des <3DES-key>|null}
    {md5 <MD5-key>|sha1 <SHA1-key>}

no area <area-id> encryption ipsec spi <256-4294967295>
```

Parameter	Description	
<area-id>	The OSPF area that you are specifying the summary route default-cost for. This can be entered in either dotted decimal format or normal decimal format. Use one of the following formats:	
	<ip-addr>	OSPF area-ID expressed in IPv4 address format A.B.C.D.
	<0-4294967295>	OSPF area-ID expressed as a decimal number within the range shown.
	For example, the values 0.0.1.2 and decimal 258 would both define the same area-ID.	
`virtual-link`	Specify a virtual link and its parameters.	
<router-ID>	Enter a router ID associated with a virtual link neighbor in IPv4 address format A.B.C.D.	
`encryption`	Specify this keyword to enable encryption.	
`ipsec`	Specify this keyword to use IPsec authentication.	
`spi`	Specify this keyword to set the SPI (Security Parameters Index).	
<256-4294967295>	Specify an SPI (Security Parameters Index) value in the range 256 to 4294967295, entered as a decimal integer.	
`esp`	Specify the esp keyword (Encapsulating Security Payload) to then apply either AES-CBC or 3DES encryption.	
`aes-cbc`	Specify this keyword to enable AES-CBC (Advanced Encryption Standard-Cipher Block Chaining) encryption.	
<AES-CBC-key>	Enter an AES-CBC key containing either 32, 48, or 64 hexadecimal characters.	
`3des`	Specify 3DES (Triple Data Encryption Standard) encryption.	
<3DES-key>	Enter a 3DES key containing 48 hexadecimal characters.	
`null`	Specify ESP without AES-CBC or 3DES encryption applied.	
`md5`	Specify the MD5 (Message-Digest 5) encryption algorithm.	
<MD5-key>	Enter an MD5 key containing 32 hexadecimal characters.	
`sha1`	Specify the SHA-1 (Secure Hash Algorithm 1) encryption algorithm.	
<SHA1-key>	Enter an SHA-1 key containing 40 hexadecimal characters.	

Mode Router Configuration

Usage When you issue this command, authentication and encryption are both enabled.

Use this command on an OSPFv3 area virtual link, use the **area encryption ipsec spi esp** command on an OSPFv3 area. Configure the same SPI (Security Parameters Index) value on all interfaces that connect to the same link. SPI values are used by link interfaces. Use a different SPI value for a different link interface when using OSPFv3 with link interfaces.

Security is achieved using the IPv6 ESP extension header. ESP is used to provide confidentiality, integrity, authentication, and confidentiality. Authentication fields are removed from OSPF for IPv6 packet headers. The IPv6 ESP extension header is required for integrity, authentication, and confidentiality.

Note that interface configuration takes priority over area configuration. If an interface configuration is removed then an area configuration is applied to an interface instead.

Use the **sha1** keyword to choose SHA-1 authentication instead of entering the **md5** keyword to use MD5 authentication. The SHA-1 algorithm is more secure than the MD5 algorithm. SHA-1 uses a 40 hexadecimal character key instead of a 32 hexadecimal character key as used for MD5 authentication.

See the section **OSPFv3 Virtual Links** in **Chapter 41, OSPFv3 for IPv6 Introduction and Configuration** for introductory OSPFv3 Authentication and Encryption information.

Also see the section **Configuring OSPFv3 Authentication and Encryption for a Virtual Link** in **Chapter 41, OSPFv3 for IPv6 Introduction and Configuration** for configuration examples and topologies.

Example To enable ESP encryption, but not apply an AES-CBC key or a 3DES key, and MD5 authentication with a 32 hexadecimal character key for virtual links in OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 virtual-link 10.0.0.1 encryption
ipsec spi 1000 esp null md5
1234567890ABCDEF1234567890ABCDEF
```

To enable ESP encryption, but not apply an AES-CBC key or a 3DES key, and SHA-1 authentication with a 40 hexadecimal character key for virtual links in OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 virtual-link 10.0.0.1 encryption
ipsec spi 1000 esp null sha1
1234567890ABCDEF1234567890ABCDEF12345678
```

To enable ESP encryption with a 32 hexadecimal character AES-CBC key and a 40 hexadecimal character SHA-1 authentication key for virtual links in OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 virtual-link 10.0.0.1 encryption
ipsec spi 1000 esp aes-cbc
1234567890ABCDEF1234567890ABCDEF sha1
1234567890ABCDEF1234567890ABCDEF12345678
```

To enable ESP encryption with a 48 hexadecimal character 3DES key and a 40 hexadecimal character SHA-1 authentication key for virtual links in OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 virtual-link 10.0.0.1 encryption
ipsec spi 1000 esp 3des
1234567890ABCDEF1234567890ABCDEF12345678
90ABCDEF sha1
1234567890ABCDEF1234567890ABCDEF12345678
```

To disable authentication for virtual links in OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# no area 1 virtual-link 10.0.0.1
authentication ipsec spi 1000
```

Related Commands

area virtual-link authentication ipsec spi
show ipv6 ospf virtual-links

auto-cost reference bandwidth (IPv6 OSPF)

This command controls how OSPF calculates default metrics for the interface.

Use the **no** variant of this command to assign cost based only on the interface bandwidth.

Syntax

```
auto-cost reference-bandwidth <1-4294967>
no auto-cost reference-bandwidth
```

Parameter	Description
<1-4294967>	The reference bandwidth, measured in Mbits per second (Mbps).

Default 1000 Mbps

Usage By default, OSPF calculates the OSPF metric for an interface by dividing the reference bandwidth by the interface bandwidth. The default for the reference bandwidth is 1000 Mbps. As a result, if this default is used, there is very little difference between the metrics applied to interfaces of increasing bandwidth beyond 1000 Mbps.

The auto-cost command is used to alter this reference bandwidth in order to give a real difference between the metrics of high bandwidth links of differing bandwidths. In a network that has multiple links with high bandwidths, specify a larger reference bandwidth value to differentiate the costs on those links.

Mode Router Configuration

Example

```
awplus# configure terminal
awplus(config)# router ipv6 ospf 20
awplus(config-router)# auto-cost reference-bandwidth 1000
```

Related Commands ipv6 ospf cost

bandwidth (duplicate)

This command is a copy of the **bandwidth** command on page 40.16. It specifies the maximum bandwidth to be used for each VLAN interface.

Use the **no** variant of this command to remove the maximum bandwidth.

Syntax

```
bandwidth  <bandwidth-setting>
no bandwidth
```

Parameter	Description
<bandwidth-setting>	Sets to bandwidth for the interface. Enter a value in the range 1 to 10000000000. The bandwidth value is in bits.

Default 100000000 (for OSPF configuration this is often considered as 100 Mbps)

Mode Interface Configuration for a VLAN interface.

Usage This value is used when calculating the metrics for the VLAN interface.

Example To set the bandwidth command for VLAN2 to be 1 Mbps, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# bandwidth 1000000
```

Related Commands

show interface

clear ipv6 ospf process

This command clears and restarts the IPv6 OSPF routing process. Specify the Process ID to clear one particular OSPF process. When no Process ID is specified, this command clears all running OSPF processes.

Syntax `clear ipv6 ospf [<0-65535>] process`

Parameter	Description
`<0-65535>`	The routing process ID.

Mode Privileged Exec

Example

```
awplus# clear ipv6 ospf process
```

debug ipv6 ospf events

This command enables IPv6 OSPF debugging for event troubleshooting.

To enable all debugging options, specify **debug ipv6 ospf event** with no additional parameters.

The **no** and **undebug** variants of this command disable OSPF debugging. Using this command with no parameters entered, will disable debugging for all parameter options.

Syntax `debug ipv6 ospf events [abr] [asbr] [os][router] [vlink]`

`no debug ipv6 ospf events [abr] [asbr] [os] [router] [vlink]`

Parameter	Description
`abr`	Shows ABR events.
`asbr`	Shows ASBR events.
`router`	Shows other router events.
`os`	Shows OS events.
`vlink`	Shows virtual link events.

Mode Privileged Exec and Global Configuration

Example To enable IPv6 event debugging and show ABR events, use the following command:

```
awplus# debug ipv6 ospf events asbr
```

debug ipv6 ospf ifsm

This command specifies debugging options for IPv6 OSPF Interface Finite State Machine (IFSM) troubleshooting.

To enable all debugging options, specify **debug ipv6 ospf ifsm** with no additional parameters.

The **no** and **undebug** variants of this command disable IPv6 OSPF IFSM debugging. Use these commands without parameters to disable all the options.

Syntax

```
debug ipv6 ospf ifsm [events] [status] [timers]
no debug ipv6 ospf ifsm [events] [status] [timers]
```

Parameter	Description
`events`	Displays IFSM event information.
`status`	Displays IFSM status information.
`timers`	Displays IFSM timer information.

Mode Privileged Exec and Global Configuration

Example To specify IPv6 OSPF debugging options to display IPv6 OSPF IFSM events information, use the following commands:

```
awplus# debug ipv6 ospf ifsm events
```

Related Commands **terminal monitor**
undebug ipv6 ospf ifsm

debug ipv6 ospf lsa

This command enables debugging options for IPv6 OSPF Link State Advertisements (LSA) troubleshooting. This displays information related to internal operations of LSAs.

To enable all debugging options, specify **debug ipv6 ospf lsa** with no additional parameters.

The **no** and **undebug** variants of this command disable IPv6 OSPF LSA debugging. Use this command without parameters to disable all the options.

Syntax

```
debug ipv6 ospf lsa [flooding] [generate] [install] [maxage]
    [refresh]

no debug ipv6 ospf lsa [flooding] [generate] [install] [maxage]
    [refresh]
```

Parameter	Description
`flooding`	Displays LSA flooding.
`generate`	Displays LSA generation.
`install`	Show LSA installation.
`maxage`	Shows maximum age of the LSA in seconds.
`refresh`	Displays LSA refresh.

Mode Privileged Exec and Global Configuration

Examples To enable debugging for IPv6 OSPF refresh LSA, use the following commands:

```
awplus# debug ipv6 ospf lsa refresh
```

Related Commands

terminal monitor
undebug ipv6 ospf lsa

debug ipv6 ospf nfsm

This command enables debugging options for IPv6 OSPF Neighbor Finite State Machines (NFSMs).

To enable all debugging options, specify **debug ipv6 ospf nfsm** with no additional parameters.

The **no** and **undebug** variants of this command disable IPv6 OSPF NFSM debugging. Use this command without parameters to disable all the options.

Syntax

```
debug ipv6 ospf nfsm [events] [status] [timers]
no debug ipv6 ospf nfsm [events] [status] [timers]
```

Parameter	Description
`events`	Displays NFSM event information.
`status`	Displays NSFM status information.
`timers`	Displays NFSM timer information.

Mode Privileged Exec and Global Configuration

Examples To enable IPv6 debugging option to display timer information, use the following command:

```
awplus# debug ipv6 ospf nfsm timers
```

Related Commands **terminal monitor**
undebug ipv6 ospf nfsm

debug ipv6 ospf packet

This command enables debugging options for IPv6 OSPF packets.

To enable all debugging options, specify **debug ipv6 ospf packet** with no additional parameters.

The **no** and **undebug** variants of this command disable IPv6 OSPF packet debugging. Use this command without parameters to disable all options.

Syntax

```
debug ipv6 ospf packet [dd] [detail] [hello] [ls-ack] [ls-request]
    [ls-update] [recv] [send]

no debug ipv6 ospf packet [dd] [detail] [hello] [ls-ack] [ls-request]
    [ls-update] [recv] [send]
```

Parameter	Description
`dd`	Specifies debugging for IPv6 OSPF database descriptions.
`detail`	Sets the debug option to detailed information.
`hello`	Specifies debugging for IPv6 OSPF hello packets.
`ls-ack`	Specifies debugging for IPv6 OSPF link state acknowledgments.
`ls-request`	Specifies debugging for IPv6 OSPF link state requests.
`ls-update`	Specifies debugging for IPv6 OSPF link state updates.
`recv`	Specifies the debug option set for received packets.
`send`	Specifies the debug option set for sent packets.

Mode Privileged Exec and Global Configuration

Examples To enable debugging for hello packets, use the following command:

```
awplus# debug ipv6 ospf packet hello
```

Related Commands **terminal monitor**
undebug ipv6 ospf packet

debug ipv6 ospf route

This command enables debugging of route calculation. Use this command without parameters to turn on all the options.

The **no** and **undebug** variants of this command disable IPv6 OSPF route debugging. Use this command without parameters to disable all options.

Syntax

```
debug ipv6 ospf route [ase] [ia] [install] [spf]
no debug ipv6 ospf route [ase] [ia] [install] [spf]
```

Parameter	Description
`ase`	Specifies the debugging of external route calculation.
`ia`	Specifies the debugging of inter-area route calculation.
`install`	Specifies the debugging of route installation.
`spf`	Specifies the debugging of SPF calculation.

Mode Privileged Exec and Global Configuration

Examples To enable IPv6 route debugging of inter-area route calculations, use the following command:

```
awplus# debug ipv6 ospf route ia
```

Related Commands terminal monitor
undebug ipv6 ospf route

default-metric (IPv6 OSPF)

This command sets default metric value for routes redistributed into the IPv6 OSPF routing protocol.

The **no** variant of this command returns IPv6 OSPF to using built-in, automatic metric translations, as appropriate for each routing protocol.

Syntax

```
default-metric <0-16777214>
no default-metric [<0-16777214>]
```

Parameter	Description
<1-16777214>	Default metric value appropriate for the specified routing protocol.

Mode Router Configuration

Usage A default metric facilitates redistributing routes even with incompatible metrics. If the metrics do not convert, the default metric provides an alternative and enables the redistribution to continue. The effect of this command is that IPv6 OSPF will use the same metric value for **all** redistributed routes. Use this command in conjunction with the **redistribute (IPv6 OSPF)** command.

Examples

```
awplus# configure terminal
awplus(config)# router ipv6 ospf 100
awplus(config-router)# default-metric 100

awplus# configure terminal
awplus(config)# router ipv6 ospf 100
awplus(config-router)# no default-metric
```

Related commands **redistribute (IPv6 OSPF)**

distance (IPv6 OSPF)

This command sets the administrative distance for OSPFv3 routes based on the route type. Your switch uses this value to select between two or more routes to the same destination from two different routing protocols. The route with the smallest administrative distance value is added to the Forwarding Information Base (FIB). See **"Administrative Distance" on page 33.6** for more information.

Use the command **distance ospfv3** to set the distance for an entire category of OSPFv3 routes, rather than the specific routes that pass an access list.

Use the command **distance <1-254>**, with no other parameter, to set the same distance for all OSPFv3 route types.

The **no** variant of this command sets the administrative distance for OSPFv3 routes to the default of 110.

Syntax

```
distance <1-254>

distance ospfv3
   {external <1-254>|inter-area <1-254>|intra-area <1-254>}

no distance {ospfv3|<1-254>}
```

Parameter	Description
<1-254>	Specify the Administrative Distance value for OSPFv3 routes.
`external`	Sets the distance for routes from other routing domains, learned by redistribution. Specify an OSPFv3 external distance in the range *<1-254>*.
`inter-area`	Sets the distance for all routes from one area to another area. Specify an OSPFv3 inter-area distance in the range *<1-254>*.
`intra-area`	Sets the distance for all routes within an area. Specify an OSPFv3 intra-area distance in the range *<1-254>*.

Default The default OSPFv3 administrative distance is 110. The default Administrative Distance for each type of route (intra, inter, or external) is 110.

Mode Router Configuration

Usage The administrative distance rates the trustworthiness of a routing information source. The distance could be any integer from 0 to 254. A higher distance value indicates a lower trust rating. For example, an administrative distance of 254 indicates that the routing information source cannot be trusted and should be ignored.

Use this command to set the distance for an entire group of routes, rather than a specific route that passes an access list.

Examples To set the following administrative distances for route types in OSPF 100:

- 20 for inter-area routes
- 10 for intra-area routes
- 40 for external routes

use the commands:

```
awplus(config)# router ipv6 ospf 100
awplus(config-router)# distance ospfv3 inter-area 20 intra-area 10
external 40
```

To set the administrative distance for all routes in OSPFv3 100 back to the default of 110, use the commands:

```
awplus(config)# router ipv6 ospf 100
awplus(config-router)# no distance ospfv3
```

distribute-list (IPv6 OSPF)

Use this command in Router Configuration mode to filter incoming or outgoing OSPFv3 route updates from the networks as defined in an associated access-list.

See **Usage** for detailed information about the **in** and **out** distribution list parameters.

The entities that are used to perform filtering are ACLs (Access Control Lists), which match on certain attributes in the routes that are being transferred. See **Chapter 60, Access Control Lists Introduction** for further access list overview and configuration information.

Use the **no** variant of this command in Router Configuration mode to disable this feature for networks as defined in an associated access-list.

Syntax

```
distribute-list <access-list> in

no distribute-list [<access-list>] in

distribute-list <access-list> out
   {connected|ospf [<process-tag>]|rip|static}

no distribute-list <access-list> out
    {connected|ospf [<process-tag>]|rip|static}
```

Parameter	Description
<access-list>	Specifies the IPv6 access-list number or name to use. The specified access list defines which networks are received and which are suppressed.
`in`	Indicates that this applies to incoming advertised routes.
`out`	Indicates that this applies to outgoing advertised routes.
`connected`	Specify the redistribution of connected routes.
`ospf`	Specify the redistribution of OSPFv3 routes.
<process-tag>	Optionally specify an OSPFv3 process tag for OSPFv3 routes.
`rip`	Specify the redistribution of RIPng routes.
`static`	Specify the redistribution of connected routes.

Default Disabled

Mode Router Configuration

Usage This command applies filtering to the transfer of routing information between OSPFv3 and the IPv6 route table. You can apply filtering in either direction, from OSPFv3 to the IPv6 route table using an **in** distribute-list, or from the IPv6 route table to OSPFv3 using an **out** distribute-list.

The effect of an **in** filter is that some route information that OSPFv3 has learnt from LSA updates will not be installed into the IPv6 route table. The effect of an **out** filter is that some route information that could be redistributed to OSPFv3 will not be redistributed to OSPFv3.

There are **in** and **out** distribute-lists, which carry out different route filtering activities:

- The **in** distribute list is applied to the process of installing OSPFv3 routes into the IPv6 route table. The SPF calculation generate a set of routes calculated from the LSA database. By default, all of these routes become OSPFv3 candidate routes for inclusion into the IPv6 route table.
- An **in** distribute-list can be used to control whether or not certain routes generated by the SPF calculation are included into the set of candidates for inclusion into the IP route table. Those routes that match **deny** entries in the distribute-list will not be considered for inclusion into the IPv6 route table.
- The **out** distribute-list applies the process of redistributing non-OSPFv3 routes into OSPFv3. If OSPFv3 redistribution is configured, and an **out** distribute-list is also configured, then routes that match deny entries in the distribute-list will not be redistributed into OSPFv3.

Example The below commands redistribute incoming route updates from networks defined with the standard named access-list called `myacl`:

```
awplus# configure terminal
awplus(config)# ipv6 access-list standard myacl permit
2001:db8:1::/64
awplus(config)# router ipv6 ospf
awplus(config-router)# distribute-list myacl in
```

The below commands redistribute outgoing connected route updates from networks defined with the standard named access-list called `myacl`:

```
awplus# configure terminal
awplus(config)# ipv6 access-list standard myacl permit
2001:db8:1::/64
awplus(config)# router ipv6 ospf
awplus(config-router)# distribute-list myacl out connected
```

The below commands disable incoming route updates from networks defined with the standard named access-list called `myacl`:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# no distribute-list myacl in
```

The below commands disable outgoing connected route updates from networks defined with the standard named access-list called `myacl`:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# no distribute-list myacl out connected
```

Related Commands **ipv6 access-list extended (named)**
ipv6 access-list standard (named)

ipv6 ospf authentication spi

Use this command in Interface Configuration mode to enable either MD5 (Message-Digest 5) or SHA1 (Secure Hash Algorithm 1) authentication for a specified interface.

Use the **no** variant of this command in Interface Configuration mode to disable the authentication configured for a specified interface.

Syntax

```
ipv6 ospf authentication ipsec spi <256-4294967295>
   {md5 <MD5-key>|sha1 <SHA1-key>}

ipv6 ospf authentication null

no ipv6 ospf authentication ipsec spi <256-4294967295>
```

Parameter	Description
`authentication`	Specify this keyword to enable authentication.
`ipsec`	Specify this keyword to use IPsec authentication.
`spi`	Specify this keyword to set the SPI (Security Parameters Index).
`<256-4294967295>`	Specify an SPI (Security Parameters Index) value in the range 256 to 4294967295, entered as a decimal integer.
`md5`	Specify the MD5 (Message-Digest 5) hashing algorithm.
`<MD5-key>`	Enter an MD5 key containing up to 32 hexadecimal characters.
`sha1`	Specify the SHA-1 (Secure Hash Algorithm 1) hashing algorithm.
`<SHA1-key>`	Enter an SHA-1 key containing up to 40 hexadecimal characters.
`null`	Specify no authentication is applied when no other parameters are applied after this keyword (`ipv6 ospf authentication null`). Note this overrides any existing area authentication configured.

Mode Interface Configuration

Default Authentication is not configured on an interface by default.

Usage Configure the same SPI (Security Parameters Index) value on all interfaces that connect to the same link. SPI values are used by link interfaces. Use a different SPI value for a different link interface when using OSPFv3 with link interfaces.

Use the **sha1** keyword to choose SHA-1 authentication instead of entering the **md5** keyword to use MD5 authentication. The SHA-1 algorithm is more secure than the MD5 algorithm. SHA-1 uses a 40 hexadecimal character key instead of a 32 hexadecimal character key as used for MD5 authentication.

Use the **null** keyword to override existing area authentication. Apply the null keyword if area authentication is already configured to configure authentication on an interface.

Use the **null** keyword to override existing area authentication. Apply the **null** keyword if area authentication is already configured to configure authentication on an interface.

See the section **OSPFv3 Authentication and Encryption Overview** in **Chapter 41, OSPFv3 for IPv6 Introduction and Configuration** for introductory OSPFv3 Authentication and Encryption information.

Also see the section **Configuring OSPFv3 Authentication and Encryption** in **Chapter 41, OSPFv3 for IPv6 Introduction and Configuration** for configuration examples and topologies.

Note

You can configure an authentication security policy (SPI) on a VLAN interface with this command, or an OSPFv3 area with the **area authentication ipsec spi** command.

When you configure authentication for an area, the security policy is applied to all VLAN interfaces in the area. Allied Telesis recommends a different authentication security policy is applied to each interface for higher security.

If you apply the `ipv6 ospf authentication null` command this affects authentication configured on both the VLAN interface and the OSPFv3 area.

This is due to OSPFv3 hello messages ingressing VLAN interfaces, which are part of area authentication, not being authenticated. So neighbors time out.

Example To enable MD5 authentication with a 32 hexadecimal character key for interface VLAN 2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# area 1 authentication ipsec spi 1000 md5
1234567890ABCDEF1234567890ABCDEF
```

To enable SHA-1 authentication with a 32 hexadecimal character key for interface VLAN 2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf authentication ipsec spi 1000
sha1
1234567890ABCDEF1234567890ABCDEF12345678
```

To specify no authentication is applied to interface VLAN 2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf authentication null
```

To disable authentication for interface VLAN 2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 ospf authentication ipsec spi 1000
```

Related Commands **area authentication ipsec spi**

area encryption ipsec spi esp
ipv6 ospf encryption spi esp
show ipv6 ospf interface

ipv6 ospf cost

This command explicitly specifies the cost of the link-state metric in a router-LSA.

The interface cost indicates the overhead required to send packets across a certain VLAN interface. Use this command to set the VLAN interface cost manually.

The **no** variant of this command resets the VLAN interface cost to the default.

Syntax

```
ipv6 ospf cost <1-65535>
no ipv6 ospf cost
```

Parameter	Description
<1-65535>	The link-state metric.

Default By default the reference bandwidth is 1000 Mbps, but can be set to a different value by the command, **auto-cost reference bandwidth (IPv6 OSPF)** command on page 42.19.

Mode Interface Configuration for a VLAN interface.

Usage The link-state metric cost is stated in the Router-LSA's link. Typically, the cost is inversely proportional to the bandwidth of an interface. By default, the cost of a VLAN interface is calculated according to the following formula:

reference bandwidth / interface bandwidth

The reference bandwidth is set by default at 1000000000 (or 1000 Mbps), but can be changed by the **auto-cost reference bandwidth (IPv6 OSPF)** command on page 42.19.

The interface bandwidth is set by default to 1000000000 (or 1000 Mbps), but can be changed by the **bandwidth (duplicate)** command on page 42.20.

Example To set the IPv6 OSPF cost to 10 on the VLAN interface `vlan25`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan25
awplus(config-if)# ipv6 ospf cost 10
```

Related Commands

show ipv6 ospf interface
auto-cost reference bandwidth (IPv6 OSPF)
bandwidth (duplicate)

ipv6 ospf dead-interval

This command sets the interval during which no hello packets are received and after which a neighbor is declared dead.

The dead-interval is the amount of time that OSPF waits to receive an OSPF hello packet from the neighbor before declaring the neighbor is down. This value is advertised in the router's hello packets. It must be a multiple of the hello-interval and be the same for all routers on a specific network.

The **no** variant of this command returns the interval to the default of 40 seconds.

Syntax

```
ipv6 ospf dead-interval <1-65535> [<inst-id>]
no ipv6 ospf  dead-interval
```

Parameter	Description
<1-65535>	The interval in seconds. Default: `40`
<inst-id>	The instance ID Default: `0`

Mode Interface Configuration for a VLAN interface.

Example The following example shows configuring the dead-interval to 10 seconds on the VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf dead-interval 10
```

Related Commands

ipv6 ospf hello-interval
show ipv6 ospf interface

ipv6 ospf display route single-line

Use this command to change the result of the **show ipv6 route** command to display each route entry on a single line.

Syntax

```
ipv6 ospf display route single-line
no ipv6 ospf display route single-line
```

Mode Global Configuration

Example To display each route entry on a single line.

```
awplus# configure terminal
awplus(config)# ipv6 ospf display route single-line
```

Related Commands show ipv6 ospf route

ipv6 ospf encryption spi esp

Use this command in Interface Configuration mode to enable either AES-CBC (Advanced Encryption Standard-Cipher Block Chaining) or 3DES (Triple Data Encryption Standard) ESP (Encapsulating Security Payload) encryption for a specified interface.

Use the **no** variant of this command in Interface Configuration mode to disable the encryption configured for a specified interface.

Syntax

```
ipv6 ospf encryption ipsec spi <256-4294967295>
   esp {aes-cbc <AES-CBC-key>|3des <3DES-key>|null}
   {md5 <MD5-key>|sha1 <SHA1-key>}

ipv6 ospf encryption null

no ipv6 ospf encryption ipsec spi <256-4294967295>
```

Parameter	Description
<256-4294967295>	Specify an SPI (Security Parameters Index) value in the range 256 to 4294967295, entered as a decimal integer.
`esp`	Specify the esp keyword (Encapsulating Security Payload) to then apply either AES-CBC or 3DES encryption.
`aes-cbc`	Specify this keyword to enable AES-CBC (Advanced Encryption Standard-Cipher Block Chaining) encryption.
<AES-CBC-key>	Enter an AES-CBC key containing either 32, 48, or 64 hexadecimal characters.
`3des`	Specify 3DES (Triple Data Encryption Standard) encryption.
<3DES-key>	Enter a 3DES key containing 48 hexadecimal characters.
`null`	Specify ESP without AES-CBC or 3DES encryption applied.
`md5`	Specify the MD5 (Message-Digest 5) encryption algorithm.
<MD5-key>	Enter an MD5 key containing 32 hexadecimal characters.
`sha1`	Specify the SHA-1 (Secure Hash Algorithm 1) encryption algorithm.
<SHA1-key>	Enter an SHA-1 key containing 40 hexadecimal characters.
`null`	Specify no encryption is applied when no other parameters are applied after this keyword (`ipv6 ospf encryption null`).

Default Authentication is not configured on an interface by default.

Mode Interface Configuration

Usage When you issue this command, authentication and encryption are both enabled. Configure the same SPI (Security Parameters Index) value on all interfaces that connect to the same link. SPI values are used by link interfaces. Use a different SPI value for a different link interface when using OSPFv3 with link interfaces.

Security is achieved using the IPv6 ESP extension header. The IPv6 ESP extension header is used to provide confidentiality, integrity, authentication, and confidentiality. Authentication fields are removed from OSPF for IPv6 packet headers, so applying IPv6 ESP extension headers are required for integrity, authentication, and confidentiality.

Use the **null** keyword to override existing area encryption. Apply the **null** keyword if area encryption is already configured to then configure encryption on an interface instead.

Use the **sha1** keyword to choose SHA-1 authentication instead of entering the **md5** keyword to use MD5 authentication. The SHA-1 algorithm is more secure than the MD5 algorithm. SHA-1 uses a 40 hexadecimal character key instead of a 32 hexadecimal character key as used for MD5 authentication.

See the section **OSPFv3 Authentication and Encryption Overview** in **Chapter 41, OSPFv3 for IPv6 Introduction and Configuration** for introductory OSPFv3 Authentication and Encryption information.

Also see the section **Configuring OSPFv3 Authentication and Encryption** in **Chapter 41, OSPFv3 for IPv6 Introduction and Configuration** for configuration examples and topologies.

Note

You can configure an encryption security policy (SPI) on a VLAN interface with this command, or an OSPFv3 area with the **area encryption ipsec spi esp** command.

When you configure encryption for an area, the security policy is applied to all VLAN interfaces in the area. Allied Telesis recommends a different encryption security policy is applied for each interface for higher security.

If you apply the `ipv6 ospf encryption null` command this affects encryption configured on both the VLAN interface and the OSPFv3 area.

This is due to OSPFv3 hello messages ingressing VLAN interfaces, which are part of area encryption, not being being encrypted. So neighbors time out.

Example To enable ESP encryption, but not apply an AES-CBC key or a 3DES key, for interface VLAN 2 and MD5 authentication with a 32 hexadecimal character key, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf encryption ipsec spi 1000 esp
null md5
1234567890ABCDEF1234567890ABCDEF
```

To enable ESP encryption, but not apply an AES-CBC key or a 3DES key, for interface VLAN 2 and SHA-1 authentication with a 40 hexadecimal character key, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf encryption ipsec spi 1000 esp
null sha1
1234567890ABCDEF1234567890ABCDEF12345678
```

To enable ESP encryption with an 3DES key with a 48 hexadecimal character key and MD5 authentication with a 32 hexadecimal character key for interface VLAN 2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf encryption ipsec spi 1000 esp
3des
1234567890ABCDEF1234567890ABCDEF12345678
90ABCDEF md5
1234567890ABCDEF1234567890ABCDEF
```

To enable ESP encryption with an AES-CBC key with a 32 hexadecimal character key and SHA-1 authentication with a 40 hexadecimal character key for interface VLAN 2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf encryption ipsec spi 1000 esp
aes-cbc 1234567890ABCDEF1234567890ABCDEF
sha1
1234567890ABCDEF1234567890ABCDEF12345678
```

To specify no ESP encryption is applied to interface VLAN 2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf encryption null
```

To disable ESP encryption for interface VLAN 2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 ospf encryption ipsec spi 1000
```

Related Commands

area authentication ipsec spi
area encryption ipsec spi esp
ipv6 ospf authentication spi
show ipv6 ospf interface

ipv6 ospf hello-interval

This command specifies the interval between hello packets.

The hello-interval is advertised in the hello packets. Configure the same hello-interval for all routers on a specific network. A shorter interval ensures faster detection of topological changes, but results in more routing traffic.

The **no** variant of this command returns the interval to the default of 10 seconds.

Syntax

```
ipv6 ospf hello-interval <1-65535>
no ipv6 ospf hello-interval
```

Parameter	Description
<1-65535>	The hello-interval in seconds. Default: `10`

Default The default interval is 10 seconds.

Mode Interface Configuration for a VLAN interface.

Example The following example shows setting the `hello-interval` to 3 seconds on the VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf hello-interval 3
```

Related Commands **ipv6 ospf dead-interval**
show ipv6 ospf interface

ipv6 ospf network

This command configures the OSPF network type to a type different from the default for the particular VLAN interface.

The **no** variant of this command returns the network type to the default for the particular VLAN interface.

Syntax

```
ipv6 ospf network [broadcast | non-broadcast | point-to-point |
   point-to-multipoint]

no ipv6 ospf network
```

Parameter	Description
`broadcast`	Sets the network type to broadcast.
`non-broadcast`	Sets the network type to NBMA.
`point-to-multipoint`	Sets the network type to point-to-multipoint.
`point-to-point`	Sets the network type to point-to-point.

Default The default is the `broadcast` OSPF network type for a VLAN interface.

Mode Interface Configuration for a VLAN interface.

Usage This command forces the interface network type to the specified type. Depending on the network type, OSPF changes the behavior of the packet transmission and the link description in LSAs.

Example The following example shows setting the network type to `point-to-point` on the VLAN interface `vlan1`:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ipv6 ospf network point-to-point
```

ipv6 ospf priority

This command sets the router priority, which is a parameter used in the election of the designated router for the link.

The **no** variant of this command returns the router priority to the default of 1.

Syntax

```
ipv6 ospf priority <priority>
no ipv6 ospf priority
```

Parameter	Description
<priority>	*<0-255>* Specifies the router priority of the interface. The larger the value, the greater the priority level. The value 0 defines that the switch cannot become either the DR, or backup DR for the link.

Default The default priority is 1.

Mode Interface Configuration for a VLAN interface.

Usage Set the priority to help determine the OSPF Designated Router (DR) for a link. If two routers attempt to become the DR, the router with the higher router priority becomes the DR. If the router priority is the same for two routers, the router with the higher router ID takes precedence.

Routers with zero router priority values cannot become the designated or backup designated router.

Example The following example shows setting the OSPFv3 priority value to 3 on the VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf priority 3
```

ipv6 ospf retransmit-interval

Use this command to specify the time between link-state advertisement (LSA) retransmissions for adjacencies belonging to the interface.

Use the **no** variant of this command to return to the default of 5 seconds.

Syntax

```
ipv6 ospf retransmit-interval <1-65535>
no ipv6 ospf retransmit-interval
```

Parameter	Description
<1-65535>	Specifies the interval in seconds.

Default The default interval is 5 seconds.

Mode Interface Configuration for a VLAN interface.

Usage After sending an LSA to a neighbor, the router keeps the LSA until it receives an acknowledgement. In case the router does not receive an acknowledgement during the set time (the retransmit interval value) it retransmits the LSA. Set the retransmission interval value conservatively to avoid needless retransmission. The interval should be greater than the expected round-trip delay between two routers.

Example The following example shows setting the `ospf retransmit interval` to 6 seconds on the VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf retransmit-interval 6
```

ipv6 ospf transmit-delay

Use this command to set the estimated time it takes to transmit a link-state-update packet on the VLAN interface.

Use the **no** variant of this command to return to the default of 1 second.

Syntax

```
ipv6 ospf transmit-delay <1-65535>
no ipv6 ospf transmit-delay
```

Parameter	Description
<1-65535>	Specifies the time, in seconds, to transmit a link-state update.

Default The default interval is 1 second.

Mode Interface Configuration for a VLAN interface.

Usage The transmit delay value adds a specified time to the age field of an update. If the delay is not added, the time in which the LSA transmits over the link is not considered. This command is especially useful for low speed links. Add transmission and propagation delays when setting the transmit delay value.

Example To set the IPv6 OSPF transmit delay time to 3 seconds on the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf transmit-delay 3
```

ipv6 router ospf area

Use this command to enable IPv6 OSPF routing on an interface.

Use the **no** variant of this command to disable IPv6 OSPF routing on an interface.

Syntax

```
ipv6 router ospf area <area-id> [tag <process-id>]
   [instance <inst-id>]

no ipv6 router ospf area <area-id>
```

Parameter	Description
<area-id>	The ID of the IPv6 OSPF routing area. Can be entered as either an IPv4 A.B.C.D address format, or as an unsigned integer in the range, 0 to 4294967295. Use either of the following forms when entering an area-ID: ■ area-id <*A.B.C.D*> Where A.B.C.D is a number entered in IPv4 address format. ■ area-id <0 to 4294967295>.
<process-id>	The process tag denotes a separate router process. It can comprise any string of alphanumeric characters. Note that this tag is local to the router on which it is set and does not appear in any OSPF packets or LSA.
<instance-id>	The OSPF instance ID, entered as an integer between 0 and 255. This is the value that will appear in the instance field of the IPv6 OSPF hello packet, see **Figure 41-2 on page 41.6**.

Defaults IPv6 OSPF routing is disabled by default.

When enabling IPv6 OSPF routing:

- the process-tag will default to a null value if not set.
- the Instance ID defaults to 0 if not set.

Mode Interface Configuration for a VLAN interface.

Usage When enabling IPv6 OSPF routing on an interface, specifying the area-ID is mandatory, but the Process tag and Instance are optional.

For more information see **"Configuring Instances and Processes" on page 41.33**.

Examples The following commands enable IPv6 OSPF on VLAN interface `vlan2`, OSPF area 1, tag PT2, and instance 2.:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 router ospf area 1 tag PT2 instance-id 2
```

The following commands disable IPv6 OSPF on VLAN interface `vlan2` and OSPF area 1:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 router ospf area 1
```

max-concurrent-dd (IPv6 OSPF)

Use this command to limit the number of neighbors that can be concurrently processed in the database exchange. The specified value limits the number of neighbors from all interfaces, not per interface.

Use the **no** variant of this command to have no limit on the maximum number of LSAs.

Syntax

```
max-concurrent-dd <max-neighbors>
no max-concurrent-dd
```

Parameter	Description
<max-neighbors>	<1-65535> The maximum number of neighbors.

Mode Router Configuration

Usage This command is useful where bringing up several adjacencies on a router is affecting performance. In this situation, you can often enhance the system performance by limiting the number of neighbors that can be processed concurrently.

Example The following example sets the max-concurrent-dd value to allow only 4 neighbors to be processed at a time.

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# max-concurrent-dd 4
```

Related Commands **router ipv6 ospf**

passive-interface (IPv6 OSPF)

Use this command to suppress the sending of Hello packets on a specified interface. If you use the **passive-interface** command without the optional parameters then **all** interfaces are put into passive mode.

Use the **no** variant of this command to allow the sending of Hello packets on all interfaces, or on the specified interface. If you use the **no** variant of this command without the optional parameters then **all** interfaces are removed from passive mode.

Syntax

```
passive-interface [<interface>]
no passive-interface [<interface>]
```

Parameter	Description
<interface>	The name or the VID of the VLAN interface.

Mode Router Configuration

Usage Configure an interface to be passive if you wish its connected route to be treated as an OSPF route (rather than an AS-external route), but do not wish to actually exchange any OSPF packets via this interface.

Examples To configure passive interface mode on interface **vlan2**, enter the following commands:

```
awplus(config)# router ipv6 ospf
awplus(config-router)# passive-interface vlan2
```

To configure passive interface mode on **all** interfaces, enter the following commands:

```
awplus(config)# router ipv6 ospf
awplus(config-router)# passive-interface
```

To remove passive interface mode on interface **vlan2**, enter the following commands:

```
awplus(config)# router ipv6 ospf
awplus(config-router)# no passive-interface vlan2
```

To remove passive interface mode on **all** interfaces, enter the following commands:

```
awplus(config)# router ipv6 ospf
awplus(config-router)# no passive-interface
```

redistribute (IPv6 OSPF)

Use this command to redistribute routes from other routing protocols, static routes and connected routes into an IPv6 OSPF routing table.

Use the **no** variant of this command to disable this function.

Syntax

```
redistribute <protocol>} [metric <0-16777214>] [metric-type {1|2}]
   [route-map <route-map-entry>]

no redistribute <protocol>
```

Parameter	Description	
<protocol>	The routing protocol to be redistributed, can be one of:	
	`connected`	Connected routes
	`rip`	Routing Internet Protocol
	`static`	Static Routes
`metric`	*<0-16777214>* Specifies the external metric.	
`metric-type`	Specifies the external metric-type, either type 1 or type 2. ■ For Metric Type 1 The best route is based on the external redistributed path cost plus the internal path cost presented by the native routing protocol. ■ For Metric Type 2 The best route is based only on the external redistributed path cost. The internal path cost is only used to break a “tie” situation between two identical external path costs.	
`route-map`	*<route-map-entry>* Where the route-map-entry specifies the pointer to the specific route-map.	

Default The default metric value for routes redistributed into OSPFv3 is 20. The metric can also be defined using the **set metric** command for a route map. Note that a metric defined using the **set metric** command for a route map overrides a metric defined with this command.

Mode Router Configuration

Usage IPv6 OSPF advertises routes learnt from the RIP routing protocol including static or connected routes. Each injected prefix is put into the AS-external-LSA with a specified metric and metric type.

See the section **OSPFv3 Metrics** in the **OSPFv3 for IPv6 Introduction and Configuration** chapter for more information about metrics, and about behavior when configured in route maps.

Example The following example shows the redistribution of RIP routes into the IPv6 OSPF routing table, with a metric of 10 and a metric type of 1.

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# redistribute rip metric 10 metric-type 1
```

restart ipv6 ospf graceful

Use this command to force the OSPFv3 process to restart. You may optionally specify a grace-period value. If a grace-period is not specified then a default value of 120 seconds is applied.

You should specify a grace-period value of 120 seconds or more. Low grace-period values may cause the graceful restart process on neighboring routers to terminate with routes missing.

Syntax `restart ipv6 ospf graceful [grace-period <1-1800>]`

Parameter	Description
`grace-period`	Specify the grace period.
<1-1800>	The grace period in seconds.

Default The default OSPF grace-period is 120 seconds.

Mode Privileged Exec

Usage After this command is executed, the OSPFv3 process immediately shuts down. It notifies the system that OSPF has performed a graceful shutdown. Routes installed by OSPF are preserved until the grace-period expires.

When a **restart ospf graceful** command is issued, the OSPF configuration is reloaded from the last saved configuration. Ensure you first enter the **copy running-config startup-config** command.

Example To restart OSPFv3, use the following commands:

```
awplus# copy running-config startup-config
awplus# restart ipv6 ospf graceful grace-period 200
```

To apply the default grace-period (120 seconds), use the following commands:

```
awplus# copy running-config startup-config
awplus# restart ipv6 ospf graceful
```

router ipv6 ospf

Use this command to create or remove an IPv6 OSPF routing process, or to enter the Router Configuration mode to configure a specific IPv6 OSPF routing process. Use the **no** variant of this command to terminate an IPv6 OSPF routing process.

Use the **no** parameter with the **process-id** parameter, to terminate and delete a specific IPv6 OSPF routing process.

Syntax

```
router ipv6 ospf [<process-id>]
no router ipv6 ospf [<process-id>]
```

Parameter	Description
<process-id>	A character string that identifies a routing process. If you do not specify the process-id a "null" process ID will be applied. Note that this will appear in show output as *null* However you cannot select the null process by using the character string *null* as command entry characters.

Default No routing process is defined by default.

Mode Global Configuration

Usage The process ID enables you to run more than one OSPF session within the same router, then configure each session to a different router port. Note that this function is internal to the router, other routers (neighbors etc.) have no knowledge of these different processes. The hello and LSAs issued from each process will appear as if coming from a separate physical router.

To a large extent the requirement for multiple processes has been replaced by the ability within IPv6 OSPF of running simultaneous router instances.

The process ID of IPv6 OSPF is an optional parameter for the **no** variant of this command only. When removing all IPv6 OSPF processes on the switch, you do not need to specify each Process ID, but when removing particular IPv6 OSPF processes, you must specify each Process ID to be removed.

For a description of processes and instances and their configuration relationships, see **"Configuring Instances and Processes" on page 41.33**.

Example This example shows the use of this command to enter Router Configuration mode.

```
awplus# configure terminal
awplus(config)# router ipv6 ospf P100
awplus(config-router)#
```

router-id (IPv6 OSPF)

Use this command to specify a router ID for the IPv6 OSPF process.

Use the **no** variant of this command to disable this function.

Syntax

```
router-id <router-id>
no router-id
```

Parameter	Description
<router-id>	Specifies the router ID in IPv4 address format.

Mode Router Configuration

Usage Configure each router with a unique router-id. In an IPv6 OSPF router process that has active neighbors, a new router-id takes effect at the next reload or when you restart OSPF manually.

Example The following example shows a specified router ID 0.0.4.5.

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# router-id 0.0.4.5
```

Related Commands show ipv6 ospf

show debugging ipv6 ospf

Use this command in User Exec or Privileged Exec modesto display which OSPFv3 debugging options are currently enabled.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show debugging ipv6 ospf
```

Mode

User Exec and Privileged Exec

Example

```
awplus# show debugging ipv6 ospf
```

Output

Figure 42-1: Example output from the show debugging ipv6 ospf command

```
OSPFv3 debugging status:
  OSPFv3 all packet detail debugging is on
  OSPFv3 all IFSM debugging is on
  OSPFv3 all NFSM debugging is on
  OSPFv3 all LSA debugging is on
  OSPFv3 all NSM debugging is on
  OSPFv3 all route calculation debugging is on
  OSPFv3 all event debugging is on
```

show ipv6 ospf

Use this command in User Exec or Privileged Exec modes to display general information about all IPv6 OSPF routing processes, including OSPFv3 Authentication configuration and status information.

Include the process ID parameter with this command to display information about specified processes.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show ipv6 ospf
show ipv6 ospf <process-id>
```

Parameter	Description
<process-id>	*<0-65535>* The ID of the router process for which information will be displayed. If this parameter is included, only the information for the specified routing process is displayed.

Mode User Exec and Privileged Exec

Examples To display general information about all IPv6 OSPF routing processes, use the command:

```
awplus# show ipv6 ospf
```

To display general information about IPv6 OSPF (OSPFv3) routing process `P10`, use the command:

```
awplus# show ipv6 ospf P10
```

Output **Figure 42-2: Example output from the show ipv6 ospf command for process P10 showing OSPFv3 Authentication configuration information highlighted in bold**

```
 awplus#show ipv6 ospf
  Routing Process "OSPFv3 (10)" with ID 192.168.1.2
  Route Licence: Route : Limit=Unlimited, Allocated=0, Visible=0,
Internal=0
  Route Licence: Breach: Current=0, Watermark=0
  Process uptime is 6 minutes
  Current grace period is 120 secs (default)
  SPF schedule delay min 0.500 secs, SPF schedule delay max 50.0
secs
  Minimum LSA interval 5 secs, Minimum LSA arrival 1 secs
  Number of incoming current DD exchange neighbors 0/5
  Number of outgoing current DD exchange neighbors 0/5
  Number of external LSA 0. Checksum Sum 0x0000
  Number of AS-Scoped Unknown LSA 0
  Number of LSA originated 4
  Number of LSA received 10
  Number of areas in this router is 1
     Area BACKBONE(0)
          Number of interfaces in this area is 1(1)
          MD5 Authentication SPI 1000
          NULL Encryption SHA-1 Auth, SPI 1001
          SPF algorithm executed 9 times
          Number of LSA 3.  Checksum Sum 0xF9CC
          Number of Unknown LSA 0
```

show ipv6 ospf database

Use this command in User Exec or Privileged Exec modes to display a database summary for IPv6 OSPF information. Include the process ID parameter with this command to display information about specified processes.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show ipv6 ospf <process-id> database [self-originate|max-age|adv router <adv-router-id>]`

Parameter	Description
<process-id>	*<0-65535>* The ID of the router process for which information will be displayed.
`self-originate`	Displays self-originated link states.
`max-age`	Displays LSAs in MaxAge list. It maintains the list of the all LSAs in the database which have reached the max-age which is 3600 seconds.
`adv-router`	Advertising Router LSA.
<adv-router-id>	The Advertising Router ID (usually entered in IPv4 address format A.B.C.D). Note that this ID component no longer represents an address; it is simply a character string that has an IPv4 address format.

Mode User Exec and Privileged Exec

Example To display the database summary for IPv6 OSPF information on process `P10`, use the command:

```
awplus# show ipv6 ospf P10 database
```

Figure 42-3: Example output from the show ipv6 ospf P10 database command

```

show ipv6 ospf database external

Use this command in User Exec or Privileged Exec modes to display information about the external LSAs.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show ipv6 ospf database external <adv-router-id>
   [self-originate|adv-router<adv-router-id>]
```

Parameter	Description
<adv-router-id>	The Advertising Router ID (usually entered in IPv4 address format A.B.C.D). Note that this ID component no longer represents an address; it is simply a character string that has an IPv4 address format.
`self originate`	Self-originated link states.
`adv-router`	Displays all the LSAs of the specified router.

Mode User Exec and Privileged Exec

Examples To display information about the external LSAs, use the following command:

```
awplus# show ipv6 ospf database external adv-router 10.10.10.1
```

```
LS age: 1087

show ipv6 ospf database grace

Use this command in User Exec or Privileged Exec modes to display information about the grace LSAs.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show ipv6 ospf database grace <adv-router-id>
   [self-originate|adv-router<adv-router-id>]
```

Parameter	Description
<adv-router-id>	The Advertising Router ID (usually entered in IPv4 address format A.B.C.D). Note that this ID component no longer represents an address; it is simply a character string that has an IPv4 address format.
`adv-router`	Displays all the LSAs of the specified router.
`self originate`	Self-originated link states.

Mode User Exec and Privileged Exec

Examples To display information about the grace LSAs, use the following command:

```
awplus# show ipv6 ospf database grace adv-router 10.10.10.1

```

show ipv6 ospf database inter-router

Use this command in User Exec or Privileged Exec modes to display information about the inter-router LSAs.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show ipv6 ospf database inter-router <adv-router-id>
   [self-originate| adv-router<adv-router-id>]
```

Parameter	Description
<adv-router-id>	The Advertising Router ID (usually entered in IPv4 address format A.B.C.D). Note that this ID component no longer represents an address; it is simply a character string that has an IPv4 address format.
`adv-router`	Displays all the LSAs of the specified router.
`self originate`	Self-originated link states.

Mode User Exec and Privileged Exec

Examples To display information about the inter-router LSAs, use the following command:

```
awplus# show ipv6 ospf database inter-router adv-router
       10.10.10.1
```

```
LS age: 1087
  LS Type: AS-External-LSA
  Link State ID: 0.0.0.13
  Advertising Router: 0.0.1.1
  LS Seq Number: 0x8000000C
  Checksum: 0xCE9D
  Length: 52
    Metric Type: 2 (Larger than any link state path)
    Metric: 20
    Prefix: 2010:2222::/64
    Prefix Options: 0 (-|-|-|-)
    Forwarding Address: 2003:1111::1
```

```
LS age: 1087
  LS Type: AS-External-LSA
  Link State ID: 0.0.0.14
  Advertising Router: 0.0.1.1
  LS Seq Number: 0x8000000C
  Checksum: 0xD099
  Length: 52
    Metric Type: 2 (Larger than any link state path)
    Metric: 20
    Prefix: 2011:2222::/64
    Prefix Options: 0 (-|-|-|-)
    Forwarding Address: 2003:1111::1
```

```

```

show ipv6 ospf database intra-prefix

Use this command in User Exec or Privileged Exec modes to display information about the intra-prefix LSAs.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show ipv6 ospf database intra-prefix <adv-router-id> [self-originate|
   adv-router<adv-router-id>]
```

Parameter	Description
<adv-router-id>	The Advertising Router ID (usually entered in IPv4 address format A.B.C.D). Note that this ID component no longer represents an address; it is simply a character string that has an IPv4 address format.
adv-router	Displays all the LSAs of the specified router.
self originate	Self-originated link states.

Mode User Exec and Privileged Exec

Examples To display information about the intra-prefix LSAs, use the following command:

```
awplus# show ipv6 ospf database intra-prefix adv-router
       10.10.10.1
```

```

    Forwarding Address: 2003:1111::1
```

show ipv6 ospf database link

Use this command in User Exec or Privileged Exec modes to display information about the link LSAs.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show ipv6 ospf database link <adv-router-id> [self-originate|adv-
   router<adv-router-id>]
```

Parameter	Description
<adv-router-id>	The Advertising Router ID (usually entered in IPv4 address format A.B.C.D). Note that this ID component no longer represents an address; it is simply a character string that has an IPv4 address format.
`adv-router`	Displays all the LSAs of the specified router.
`self originate`	Self-originated link states.

Mode User Exec and Privileged Exec

Examples To display information about the link LSAs, use the following command:

```
awplus# show ipv6 ospf database link adv-router 10.10.10.1
```

```
LS age: 1087
  LS Type: AS-External-LSA
  Link State ID: 0.0.0.13
  Advertising Router: 0.0.1.1

```

show ipv6 ospf database network

Use this command in User Exec or Privileged Exec modes to display information about the network LSAs.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show ipv6 ospf database network <adv-router-id>
   [self-originate|adv-router<adv-router-id>]
```

Parameter	Description
<adv-router-id>	The router ID of the advertising router, in IPv4 address format. Note however, that this no longer represents a real address.
`self-originate`	Self-originated link states.
`adv-router`	The advertising router selected.

Mode User Exec and Privileged Exec

Examples To display information about the OSPFv3 network LSAs, use the following command:

```
awplus# show ipv6 ospf database network
```

Output **Figure 42-4: Example output from the show ipv6 ospf database network command**

```
OSPFv3 Router with ID (0.0.1.1) (Process P10)

                Network-LSA (Area 0.0.0.0)

  LS age: 97
  LS Type: Network-LSA

    Attached Router: 0.0.1.1
```

show ipv6 ospf database router

Use this command in User Exec or Privileged Exec modes to display information only about the router LSAs.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show ipv6 ospf database router <adv-router-id>
   [self-originate|adv-router<adv-router-id>]
```

Parameter	Description
<adv-router-id>	The router ID of the advertising router, in IPv4 address format. Note however, that this no longer represents a real address.
`self-originate`	Self-originated link states.
`adv-router`	The advertising router selected.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ipv6 ospf database router
```

```
           OSPFv3 Router with ID (0.0.1.3) (Process P10)

show ipv6 ospf interface

Use this command in User Exec or Privileged Exec modes to display interface information for OSPF for all interfaces or a specified interface, including OSPFv3 Authentication status for all interfaces or for a specified interface.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show ipv6 ospf interface [<interface-name>]
```

Parameter	Description
<interface-name>	An alphanumeric string that is the interface name. Omit the optional interface to display OSPF

Mode User Exec and Privileged Exec

Examples

```
awplus# show ipv6 ospf interface vlan2
```

Output **Figure 42-5: Example output from the show ipv6 ospf interface command showing OSPFv3 Authentication configuration information highlighted in bold**

```
awplus#show ipv6 ospf interface
 vlan2 is up, line protocol is up
   Interface ID 302
   IPv6 Prefixes
     fe80::215:77ff:fead:f87e/64 (Link-Local Address)
   Security Policy
     MD5 Authentication SPI 1000
     NULL Encryption SHA-1 Auth, SPI 1001

   OSPFv3 Process (10), Area 0.0.0.0, Instance ID 0
     Router ID 192.168.1.2, Network Type BROADCAST, Cost: 1
     Transmit Delay is 1 sec, State Backup, Priority 1
     Interface state Backup
     Designated Router (ID) 192.168.1.1
       Interface Address fe80::21d:e5ff:fec9:cfbe
     Backup Designated Router (ID) 192.168.1.2
       Interface Address fe80::215:77ff:fead:f87e
     Timer interval configured, Hello 10, Dead 40, Wait 40,
Retransmit 5
       Hello due in 00:00:07
     Neighbor Count is 1, Adjacent neighbor count is 1
```

Figure 42-6: Example output from the show ipv6 ospf interface vlan3 command

```
awplus#show ipv6 ospf interface vlan3
vlan3 is up, line protocol is up
  Interface ID 203
  IPv6 Prefixes

show ipv6 ospf neighbor

Use this command in User Exec or Privileged Exec modes to display information on OSPF neighbors. Include the process ID parameter with this command to display information about specified processes.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show ipv6 ospf [<process-id>] neighbor <neighbor-id>
show ipv6 ospf [<process-id>] neighbor detail
show ipv6 ospf [<process-id>] neighbor <interface> [detail]
```

Parameter	Description
<process-id>	*<character string>* The ID of the OSPF process for which information will be displayed.
<neighbor-id>	The Neighbor ID, entered in IP address (A.B.C.D) format.
detail	Detail of all neighbors.
<interface>	IP address of the interface.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ipv6 ospf neighbor
```

Output **Figure 42-7: Example output from the show ipv6 ospf neighbor command**

```
awplus#show ipv6 ospf P1 neighbor 2.2.2.2
OSPFv3 Process (P1)
Neighbor ID     Pri       State                 Dead Time   Interface Instance ID
2.2.2.2         5         2-Way/DROther         00:00:33    vlan3              0
```

Figure 42-8: Example output from the show ipv6 ospf neighbor detail command

```
awplus#show ipv6 ospf neighbor detail
Neighbor 0.0.1.2, interface address fe80::215:77ff:fec9:7472
   In the area 0.0.0.0 via interface vlan2
   Neighbor priority is 1, State is Full, 6 state changes
   DR is 0.0.1.2     BDR is 0.0.1.1
   Options is 0x000013 (-|R|-|-|E|V6)
   Dead timer due in 00:00:33
   Database Summary List 0
   Link State Request List 0
   Link State Retransmission List 0
```

show ipv6 ospf route

Use this command in User Exec or Privileged Exec modes to display the OSPF routing table. Include the process ID parameter with this command to display the OSPF routing table for specified processes.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show ipv6 ospf [<process-id>] route`

Parameter	Description
<process-id>	A character string that specifies the router process. If this parameter is included, only the information for this specified routing process is displayed.

Mode User Exec and Privileged Exec

Examples To display the OSPF routing table, use the command:

```
awplus# show ipv6 ospf route
```

Output **Figure 42-9: Example output from the show ipv6 ospf P10 route command for a specific process**

```
OSPFv3 Process (P1)

```

show ipv6 ospf virtual-links

Use this command in User Exec or Privileged Exec modes to display virtual link information, including OSPFv3 Authentication status for virtual links.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show ipv6 ospf virtual-links
```

Mode

User Exec and Privileged Exec

Usage

See the section **OSPFv3 Virtual Links** in **Chapter 41, OSPFv3 for IPv6 Introduction and Configuration** for introductory OSPFv3 Authentication and Encryption information.

Also see the section **Configuring OSPFv3 Authentication and Encryption for a Virtual Link** in **Chapter 41, OSPFv3 for IPv6 Introduction and Configuration** for configuration examples and topologies.

Examples

To display virtual link information, use the command:

```
awplus# show ipv6 ospf virtual-links
```

Output

Figure 42-10: Example output from the show ipv6 ospf virtual-links command showing OSPFv3 Authentication configuration information highlighted in bold

```
awplus#show ipv6 ospf virtual-links
 Virtual Link VLINK1 to router 192.168.1.10 is down
   Transit area 0.0.0.1 via interface *, instance ID 0
   Local address
   Remote address
   MD5 Authentication SPI 1000
   NULL encryption SHA-1 auth SPI 1001
   Transmit Delay is 1 sec, State Down,
   Timer intervals configured, Hello 10, Dead 40, Wait 40,
Retransmit 5
     Hello due in inactive

summary-address (IPv6 OSPF)

Use this command in Router Configuration mode to summarize, or possibly suppress, external redistributed OSPFv3 routes within the specified address range.

Use the **no** variant of this command in Router Configuration mode to stop summarizing, or suppressing, external redistributed OSPFv3 routes within the specified address range.

Syntax

```
summary-address <ipv6-addr/prefix-length>
   [not-advertise] [tag <0-4294967295>]

no summary-address <ipv6-addr/prefix-length>
   [not-advertise] [tag <0-4294967295>]
```

Parameter	Description
<ipv6-addr/prefix-length>	Specifies the base IPv6 address of the IPv6 summary address. The range of addresses given as IPv6 starting address and an IPv6 prefix length.
`not-advertise`	Set the **not-advertise** option if you do not want OSPFv3 to advertise either the summary address or the individual networks within the range of the summary address.
`tag <0-4294967295>`	The tag parameter specifies the tag value that OSPFv3 places in the AS external LSAs created as a result of redistributing the summary route. The tag overrides tags set by the original route.

Default The default tag value for a summary address is 0.

Mode Router Configuration

Usage An address range is a pairing of an address and a prefix length. Redistributing routes from other protocols into OSPFv3 requires the router to advertise each route individually in an external LSA. Use this command to advertise one summary route for all redistributed routes covered by a specified prefix to decrease the size of the OSPFv3 link state database.

For example, if the specified address range is 2001:0db8:44::/48, then summary-address functionality will match 2001:0db8:4400:0000::1/128 through 2001:0db8:44ff:ffff::1/128.

Ensure OSPFv3 routes exist in the summary address range for advertisement before using this command.

Example The following example uses the `summary-address` command to aggregate external LSAs that match the IPv6 prefix `2001:0db8::/32` and assigns a tag value of `3`.

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# summary-address 2001:0db8::/32 tag 3
```

The following example uses the `no summary-address` command to stop summarizing IPv6 addresses in the address range covered within the IPv6 prefix `2001:0db8::/32`.

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# no summary-address 2001:0db8::/32
```

timers spf (IPv6 OSPF) (deprecated)

Use this command to adjust route calculation timers.

Use the **no** variant of this command to return to the default timer values.

Syntax

```
timers spf <spf-delay> <spf-holdtime>
no timers spf
```

Parameter	Description
<spf-delay>	*<0-2147483647>* Specifies the delay between receiving changed routing information and embarking on an SPF calculation.
<spf-holdtime>	*<0-2147483647>* Specifies the hold time between consecutive SPF calculations.

Default The default spf-delay value is 5 seconds. The default spf-holdtime value is 10 seconds.

Mode Router Configuration

Usage This command configures the delay time between the receipt of a topology change and the calculation of the Shortest Path First (SPF). This command also configures the hold time between two consecutive SPF calculations.

Examples

```
awplus# configure terminal
awplus(config)# router ipv6 ospf 100
awplus(config-router)# timers spf 7 12
```

Related Commands timers spf exp (IPv6 OSPF)

timers spf exp (IPv6 OSPF)

Use this command to adjust route calculation timers using exponential back-off delays.

Use **no** form of this command to return to the default exponential back-off timer values.

Syntax

```
timers spf exp <min-holdtime> <max-holdtime>
no timers spf exp <min-holdtime> <max-holdtime>
```

Parameter	Description
<min-holdtime>	*<0-2147483647>* Specifies the minimum delay between receiving a change to the SPF calculation in milliseconds. The default SPF min-holdtime value is 50 milliseconds.
<max-holdtime>	*<0-2147483647>* Specifies the maximum delay between receiving a change to the SPF calculation in milliseconds. The default SPF max-holdtime value is 50 seconds.

Mode Router Configuration

Usage This command configures the minimum and maximum delay time between the receipt of a topology change and the calculation of the Shortest Path First (SPF).

Examples To set the minimum delay time to 5 milliseconds and maximum delay time to 10 milliseconds, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf 100
awplus(config-router)# timers spf exp 5 20
```

Introduction

This chapter introduces terminology and concepts about BGP for IPv4 and BGP4+ for IPv6, including the concepts of autonomous system numbers (ASN), path attributes (PA), and both internal and external BGP and BGP4+.

For basic BGP and BGP4+ configuration examples, see **Chapter 44, BGP and BGP4+ Configuration.**

For details about the commands used in these examples, or the outputs from validation commands, see **Chapter 45, BGP and BGP4+ Commands**. This chapter provides an alphabetical reference of commands used to configure the Border Gateway Protocol for IPv4 (BGP) and for IPv6 (BGP4+).

BGP and BGP4+ Overview

Border Gateway Protocol (BGP for IPv4 and BGP4+ for IPv6) is an exterior gateway protocol (EGP). The purpose of BGP is to advertise, learn, and choose the best paths inside the Internet.

ISPs (Internet Service Providers) use BGP to exchange the Internet routing table with each other. Enterprises also use BGP to exchange routing information with ISPs, allowing the Enterprise routers to learn Internet routes.

RFCs 1771 (BGP4), 1654 (first BGP4 specification), 1105, 1163, 1267 (older version of BGP) describe BGP and BGP4. RFC 2283 Multiprotocol Extensions for BGP-4 describes BGP4+.

BGP not only enables ISPs to exchange routes with each other, but also to control what data passed through their networks. ISPs need to keep fine control over the routes that they advertise out of their network, and who they advertise those networks to. They have commercial reasons for sending different traffic through different paths. In particular, ISPs whose main service is to provide bulk Internet backbone transport need to be very sure whose data they are transporting, as they do not want to be transporting data on behalf of people who have not paid for the service.

Since the paths via which Internet data is directed are subject to commercial agreements, network providers need to be able to implement policies that control the content of their route tables, and control the routes that they advertise to which neighbors. Internal routing protocols like OSPF and RIP do not have facilities for the types of policies that BGP needs. Although some filtering can be performed in OSPF and RIP, the sets of parameters that can be filtered on are rather limited.

So, instead of just using metric as the criterion for choosing the best route to a destination, BGP uses a process with path attributes, where path attributes are a variety of parameters that are associated with routes and exchanged in routing updates. BGP has an elaborate best path algorithm that is controlled by these path attributes, and allows network engineers flexibility in how routers choose the best BGP routes.

Moreover, the routing protocols used between ISPs are advertising huge numbers of routes (potentially hundreds of thousands of routes), so the routing protocol they use needs to be efficient, not a protocol that requires regular updates of all the routes (as the 30 minute refresh OSPF requires). BGP was developed to operate quite differently from OSPF or RIP.

BGP does not send route updates to multiple neighbors in the local subnet (as is typical with IGPs), but uses TCP (port 179) to establish connections to just a specific set of peer routers with which it will exchange routing information. BGP peer routers can be in the same subnet, or can be separated by several routers.

BGP does not send any more route updates than it absolutely has to. When routers first peer up, they exchange the route table data that they wish to inform each other of. Thereafter, they only send each other route information if anything changes.

BGP and BGP4+ ASNs and AS_Path Attributes

BGP and BGP4+ uses BGP path attributes (PAs). PAs define information about a path, or route, through a network. Some BGP and BGP4+ PAs describe information that is used to choose the best BGP or BGP4+ route. PAs are also used for other purposes, such as preventing routing loops.

If no BGP or BGP4+ PAs have been explicitly set, BGP and BGP4+ routers use the BGP and BGP4+ AS_Path (autonomous system path) PA when choosing the best route among competing routes. The AS_Path PA itself has many subcomponents, one of which is the autonomous system number (ASN)

The integer ASN identifies one organization that considers itself autonomous from other organizations. Each company with a network that connects to the Internet can be considered to be an autonomous system and can be assigned an ASN. (IANA assigns unique ASNs.) Each ISP has an ASN. Some large ISPs have multiple ASNs.

When a router uses BGP or BGP4+ to advertise a route, the prefix/ length is associated with a set of PAs, including the AS_Path. The AS_Path PA associated with a prefix/ length lists the ASNs that would be part of an end-to-end route for that prefix as learned using BGP or BGP4+.

BGP and BGP4+ use the AS_Path for two key functions:

- Choose the best route for a prefix based on the shortest AS_Path.
- Prevent routing loops.

Internal and External BGP Concepts

BGP defines two classes of neighbors (peers): internal BGP (iBGP) and external BGP (eBGP). These terms use the perspective of a single router, with the terms referring to whether a BGP neighbor is in the same ASN (iBGP) or a different ASN (eBGP).

A BGP router behaves differently in several ways depending on whether the peer (neighbor) is an iBGP or eBGP peer. The differences include different rules about what must be true before the two routers can become neighbors, different rules about which routes the BGP best path algorithm chooses as best, and even some different rules about how the routers update the BGP AS_Path PA.

When advertising to an eBGP peer, a BGP router updates the AS_Path PA, but it does not do so when advertising to an iBGP peer.

Public and Private ASNs

IANA administers the assignment of ASNs as it does with IP address prefixes. ASNs must be assigned as unique values since if ASNs are duplicated, the BGP loop prevention process may prevent parts of the Internet learning about a route.

IANA controls the ASN numbering space. Using the same process as for IPv4 addresses, ASNs are assigned to different organizations. The previous 16-bit BGP ASN has a decimal range of 0 through 65,535. The 32-bit BGP ASN has a decimal range of 1 through 4,294,967,295.

Like the public IPv4 address space, the public BGP ASN space has similar issues. To help overcome this issue, the ASN assignment process requires that each AS justify whether it truly needs a publicly unique ASN or whether it can just as easily use a private ASN. RFC 5398 reserves a small range of ASNs for use in documentation so that documentation avoids the use of ASNs assigned to organizations.

Private ASNs allow routers inside an AS to participate with BGP, using the same ASN as other organizations. An AS can use a private AS where the AS connects to only one other ASN. Loops cannot occur at that point in the BGP topology, so unique ASNs in that network do not exist. Loops cannot occur with BGP advertising the best path for a prefix.

Outbound Routing Toward the Internet

The main reason to use BGP between an Enterprise and an ISP is to influence the choice of best path (or best route). However, since the majority of the end-to-end routes exist inside the Internet, it is hard to determine which exit point from the Enterprise is a better route.

Enterprises typically have two major classes of options for outbound routing toward the Internet: default routing and BGP. Using default routes is reasonable. This section discusses default routes toward the Internet, and outbound routes toward the Internet.

BGP is useful when you have at least two Internet connections. BGP is most useful when you want to choose one outbound path over another path for particular destinations in the Internet. Consider BGP when you have multiple Internet connections, where you want to make some packets take one path and you want other packets to take another path.

External BGP (eBGP) Concepts

This section describes the basics of eBGP to configure, verify, and advertise eBGP routes:

- **External BGP (eBGP)**: describes connections, configuration and commands to verify eBGP.
- **Verifying BGP**: describes the contents of the BGP table, and routes learned with eBGP.
- **Advertising eBGP routes to ISPs**: shows how to configure eBGP to advertise routes.

External BGP (eBGP)

BGP first forms a neighbor relationship with peers. BGP then learns information from its neighbors, placing information in a table named the BGP table. BGP analyzes the BGP table to choose the best route for each prefix in the BGP table, placing those routes into the IP routing table.

This section discusses the configuration of eBGP peers (called neighbors), with settings that may be needed for eBGP connections to result in working BGP neighborships, then discusses the BGP table, listing the learned prefix/ length and path attributes (PA).

eBGP Neighbor Configuration

At a minimum, a router participating in BGP needs to configure the following settings:

- The ASN for the router configured from a **router bgp (BGP and BGP4+)** command from Global Configuration mode on the router to enter Router Configuration mode.
- The IP address and ASN of each neighbor from a **neighbor remote-as (BGP and BGP4+)** command from Router Configuration mode, once the ASN is configured with the **router bgp (BGP and BGP4+)** command in the Global Configuration mode.

How Routers become eBGP Neighbors

Routers must meet several requirements to become BGP neighbors:

- A local router's ASN must match the reference from the neighboring router to that ASN as specified from the **router bgp (BGP and BGP4+)** command.
- The BGP router IDs of the two routers must not be the same.
- Each router must establish a TCP connection with the other router.

  The remote router's IP address specified from the **neighbor remote-as (BGP and BGP4+)** command and used in that TCP connection must match what the local router configures from a **router bgp (BGP and BGP4+)** command.

How to verify eBGP Neighbor Status

The two most common commands to display a BGP neighbor's status are: **show ip bgp summary (BGP)** and **show ip bgp neighbors (BGP)**.

The **show ip bgp neighbors (BGP)** command shows detailed output per neighbor.

The **show ip bgp summary (BGP)** command shows summary output per neighbor.

Administratively Controlling Neighbor Status

To administratively disable any BGP neighbor, enter BGP configuration mode with the router bgp command and issue the **neighbor <neighborid> shutdown** command to set an idle state.

To administratively enable any BGP neighbor, enter BGP configuration mode with the router bgp command and issue the **no neighbor <neighborid> shutdown** command to set an idle state.

Use the **debug bgp (BGP)** command to see the BGP messages.

Verifying BGP

When a BGP router has established its eBGP neighbor relationships, that router can advertise and learn routes using BGP. To learn routes, a BGP router does not need additional configuration beyond the configuration of eBGP neighbor.

To advertise routes to eBGP peers, particularly the public IP address prefix(es) used by that Enterprise, the Enterprise BGP router needs some additional configuration.

The BGP table is important in the process of learning and using routing information with BGP. A router stores all learned BGP prefixes and PAs in its BGP table. The BGP router chooses which route for each prefix is the best BGP route. The BGP router advertises its BGP table to its neighbors, so the best route for each prefix is advertised to neighbors.

BGP Update Messages

When a BGP neighborship reaches the established state, those neighbors begin sending BGP Update messages to each other. The router receiving an Update places those learned prefixes into its BGP table, regardless of whether the route appears to be the best route. BGP puts all learned routing information into its table, and then BGP processes all such potential routes to choose the best route for each prefix.

The format of the Update message tells us about BGP as a Path Vector algorithm. The message lists a set of PAs and then a long list of prefixes that use that set of PAs. So, you might view the BGP Update message as focusing on advertising paths, or a set of PAs, along with the associated list of prefixes that use the advertised path. BGP uses the information in the combined set of PAs to make a decision of which path is best.

Verify the BGP Table

Verify BGP to check the prefixes in the BGP table and confirm that the right prefixes have been learned from the expected neighbors. The BGP table should hold all learned prefixes, from each neighbor, except for any prefixes filtered by an inbound BGP filter.

For a router configured with a **neighbor route-map (BGP and BGP4+)** command, the local router would first filter the routes and then add the allowed routes into the BGP table. The **show ip bgp (BGP)** command lists the entire BGP routing table.

Viewing a subset of the BGP Table

When accepting full BGP updates, the number of BGP table entries may be too large for the **show ip bgp (BGP)** command listing thousands of prefixes. So instead use the **show ip bgp summary (BGP)** command that only lists the number of prefixes received from each neighbor.

Advertising eBGP routes to ISPs

Outbound routes let the Enterprise routers forward packets toward the Internet. At the same time, the ISPs need to learn routes for the Enterprise's public IP address space. This section of this chapter examines the options for advertising these routes. In particular, this section looks at two options:

- BGP **network (BGP and BGP4+)** command
- Redistribute from an IGP (RIP/RIPng/OSPF/OSPFv3)

Advertising eBGP routes with the network command

The BGP **network (BGP and BGP4+)** command installs the prefix defined in the BGP table to be advertised to peers. The route does not have to exist in the routing table. BGP does not use this command to enable BGP on interfaces. This command compares the command's parameters and the contents of that router's IP routing table, as follows:

Look for a route in the router's current IP routing table that exactly matches the parameters of the **network (BGP and BGP4+)** command. If a route for that exact prefix/ length exists, then put the equivalent prefix/ length into the local BGP table.

This assumes a BGP default setting of **no auto-summary**. With **auto-summary** configured, the router adds a route for that classful network to the BGP table:

- If the exact classful route is in the IP routing table
- If any subset routes of that classful network are in the routing table

Advertising eBGP routes with the redistribute command

Instead of using the **network (BGP and BGP4+)** command to add routes to the BGP table, BGP routers can use a **redistribute** command for OSPF, OSPFv3, RIPng, and RIP to redistribute routes from an IGP into BGP.

- Advertise the public address range, not the private IP address range, to the BGP table.
- Advertise one route for the public address range, not individual subnets of the range.

Routers that run BGP may already run an IGP and have learned routes for either the entire public range either as one route or with subset routes. If a single route exists for the entire public range, then you need to add a **redistribute** command for OSPF, OSPFv3, RIPng, and RIP to the BGP configuration to redistribute only that single route into BGP.

Internal BGP (iBGP) Concepts

Routers that run BGP often run an IGP, such as OSPF, and have learned routes for the public range either as one route or with subset routes. If a single route exists for the public range, then you can add a **redistribute (into BGP or BGP4+) (BGP and BGP4+)** command to the BGP configuration to redistribute that route, and only that route, into BGP.

IGPs do not handle the public routing table. Internally peered BGP routers are capable of exchanging routing information without redistributing into an IGP. But an IGP can be used to connect two or more distant iBGP peers, and redistribution into an IGP may be used.

iBGP between Internet connected routers

When an organization uses more than one router to connect to the Internet, and those routers use BGP to exchange routing information with their ISPs, those same routers need to exchange BGP routes with each other as well. The BGP neighbor relationships occur inside that organization, making these routers iBGP peers.

iBGP with two Internet connected routers

Two Internet-connected routers in an Enterprise need to communicate BGP routes to each other because these routers may want to forward IP packets to the other Internet-connected router, which in turn would forward the packets into the Internet.

With an iBGP peer connection, each Internet-connected router can learn routes from the other router and decide if that other router has a better route to reach some destinations in the Internet. Without that iBGP connection, the routers have no way to know if the other router has a better BGP path.

Configuring iBGP

The most basic iBGP configuration differs only slightly compared to eBGP configuration. The configuration does not explicitly identify an eBGP versus an iBGP peer. Instead, for iBGP, the neighbor's ASN listed on the **neighbor remote-as (BGP and BGP4+)** command lists the same ASN as the local router's **router bgp (BGP and BGP4+)** command. This is because the local router and the neighbor are in the same ASN.

For eBGP, the **neighbor remote-as (BGP and BGP4+)** command lists a different ASN.

The configuration to use loopback interfaces as the update source mirrors configuration for eBGP peers, except that iBGP peers do not need to configure the **neighbor ebgp-multihop (BGP and BGP4+)** command.

For iBGP connections, only the following steps are required to make two iBGP peers use a loopback interface:

1. Configure an IP address on a loopback interface on each router.

2. Configure each router to use the loopback IP address as the source IP address, for the neighborship with the other router, using the **neighbor update-source (BGP and BGP4+)** command.

3. Configure the BGP **neighbor remote-as (BGP and BGP4+)** command on each router to refer to the other router's loopback IP address as the neighbor IP address in the **neighbor remote-as (BGP and BGP4+)** command.

4. Make sure each router has IP routes so that they can forward packets to the loopback interface IP address of the other router.

Verifying iBGP

iBGP neighbors use the same messages and neighbor states as eBGP peers. The same commands for BGP neighbor verification can be used to verify iBGP peers. The **show ip bgp summary (BGP)** command lists neighbors. The **show ip bgp neighbors (BGP)** and **show bgp ipv6 neighbors (BGP4+)** commands list many details specifically for the neighbor for BGP and BGP4+ respectively.

Understanding Next-Hop Reachability Issues with iBGP

With IGPs, the IP routes added to the IP routing table list a next-hop IP address. With few exceptions, the next-hop IP address routes exist in a connected subnet.

BGP advertises these particular IP addresses as the next-hop IP addresses because of a default behavior for BGP. By default, when a router advertises a route using eBGP, the advertising router lists its own update-source IP address as the next-hop address of the route. In other words, the next-hop IP address is the IP address of the eBGP neighbor, as listed on the **neighbor remote-as (BGP and BGP4+)** command. However, when advertising a route to an iBGP peer, the advertising router (by default) does not change the next-hop address.

The IP routing process can use routes whose next-hop addresses are not in connected subnets as long as each router has an IP route that matches the next-hop IP address. Two main options exist to ensure reachability to these next-hop addresses:

- Create IP routes so that each router can reach these next-hop addresses that exist in other ASNs.
- Change the default iBGP behavior with the **neighbor next-hop-self (BGP and BGP4+)** command.

Using neighbor next-hop-self to change Next-Hop Address

The second option for dealing with these unconnected next-hop IP addresses changes the iBGP configuration, so that a router changes the next-hop IP address on iBGP-advertised routes. This option requires the **neighbor next-hop-self (BGP and BGP4+)** command to be configured for the iBGP neighbor relationship.

With this command configured, the router advertises iBGP routes with its own update-source IP address as the next-hop IP address. Because the iBGP neighborship already relies on a working route for these update source IP addresses, if the neighborship is up, then IP routes already exist for these next-hop addresses.

IGP Redistribution and BGP Synchronization

Redistributing BGP routes into the IGP can solve routing loop problems. Redistributing BGP routes into the IGP prevents routing loops by giving routers the best exit point for each destination.

Redistributing eBGP-learned Internet routes into the IGP is the BGP feature started with the **synchronization (BGP and BGP4+)** command, where iBGP learned routes must be synchronized with IGP-learned routes for the same prefix before they can be used. If an iBGP learned route is to be considered to be a usable route, then that same prefix must be in the IP routing table and learned locally or via an IGP, such as OSPF.

The synchronization feature tells a BGP router not to consider an iBGP-learned route as best unless the prefix is learned locally or via an IGP and is currently in the IP routing table.

BGP synchronization prevents reachability issues by preventing a BGP router advertising routes learned from an iBGP peer unless the route is learned locally, or via an IGP.

If the route does not exist in the routing table, because an IGP has not learned the route, then BGP will not use or advertise the learned prefix. If BGP advertised the route to an external peer, then the external peer would consider that path valid. This is the resulting problem if synchronization is not enabled and there are non-BGP routers in the transit AS.

The eBGP peer would send traffic to the BGP router advertising the prefix and that router would be able to pass the traffic on since the IGP routers between the two iBGP routers do not know the prefix.

How to configure BGP and BGP4+

This section describes BGP and BGP4+ configuration tasks and the commands required. For example configurations with sample topologies, see **Chapter 44, BGP and BGP4+ Configuration**.

Initial BGP and BGP4+ Configuration Tasks

There are two initial BGP and BGP4+ configuration tasks described in the below sections. More advanced BGP and BGP4+ configuration tasks are described later in this chapter and are also available separately in the How to Configure BGP and BGP4+ Technical Guide:

- **How to enable BGP and BGP4+ Routing**
- **How to configure BGP and BGP4+ Neighbors**

How to enable BGP and BGP4+ Routing

To enable BGP or BGP4+ routing and establish a BGP or BGP4+ routing process, use the following commands starting in Global Configuration mode:

`awplus(config)#`	
`router bgp <asn>`	This command enables a BGP or BGP4+ routing process, which places the router in Router Configuration mode.
`awplus(config-router)#`	
`network {<ip-prefix/length>| <ip-network-addr>} [mask <network-mask>] [route-map <route-map-name>] [backdoor]`	This command flags an IPv4 network as local to this autonomous system and enters it to the BGP table.
`awplus(config-router)#`	This command flags an IPv6 network as local to this autonomous system and enters it to the BGP4+ table.
`network {<ipv6-prefix/length>| <ipv6-network-addr>} [route-map <route-map-name>]`	

How to configure BGP and BGP4+ Neighbors

Like other EGPs, BGP must completely understand the relationships it has with its neighbors. Therefore, this task is required.

BGP supports two kinds of neighbors: internal and external. Internal neighbors are in the same autonomous system; external neighbors are in different autonomous systems. Normally, external neighbors are adjacent to each other and share a subnet, while internal neighbors may be anywhere in the same autonomous system.

To configure BGP neighbors, use the following command in Router Configuration mode:

`awplus(config-router)#`	
`neighbor <neighborid> remote-as <as-number>`	This command specifies a BGP neighbor.

BGP and BGP4+ Neighbor Route Filtering

You can filter BGP and BGP4+ advertisements in two ways with neighbors:

- Use autonomous system path filters, as with the **ip as-path access-list (BGP and BGP4+)** Global Configuration mode command and the **neighbor filter-list (BGP and BGP4+)** Router Configuration mode command
- Use access or prefix lists, as with the **neighbor distribute-list (BGP and BGP4+)** Router Configuration mode command.

If you want to restrict routing information that is learned or advertised, you can filter BGP routing updates to and from neighbors. You can define an access list or a prefix list and apply it to the updates.

To filter BGP routing updates for IPv4 routes, use the command below in Router Configuration mode:

`awplus(config-router)#`	
`neighbor <neighborid> distribute-list <access-list> {in|out}`	This command filters BGP routing updates to and from neighbors as specified in an access list for IPv4 routers in Router Configuration mode.

To filter BGP4+ routing updates for IPv6 routes, use the command below in Address Family Configuration mode:

`awplus(config-router-af)#`	
`neighbor <neighborid> distribute-list <access-list> {in|out}`	This command filters BGP routing updates to and from neighbors as specified in an access list for IPv6 routes in Address Family Configuration mode.

BGP and BGP4+ Path Filtering by Neighbor

You can specify an access list filter on both incoming and outbound updates based on the BGP autonomous system paths. Each filter is an access list based on regular expressions. To specify the access list filter, define an autonomous system path access list and apply it to updates to and from particular neighbors.

To configure BGP path filtering, use the following commands starting in Global Configuration mode:

`awplus(config)#`	
`ip as-path access-list (BGP and BGP4+)`	This command defines a BGP-related access list.
`awplus(config)#`	
`router bgp <asn>`	This command enters Router configuration mode
`awplus(config-router)#`	
`neighbor <neighborid> filter-list <listname> {in|out}`	This command establishes a BGP filter for an IPv4 path in the Router Configuration mode.

To configure BGP4+ path filtering, use the following commands starting in Global Configuration mode:

`awplus(config)#` `ip as-path access-list (BGP and BGP4+)`	This command defines a BGP-related access list.
`awplus(config)#` `router bgp <asn>`	This command enters Router Configuration mode
`awplus(config-router)#` `address-family ipv6 [unicast]`	This command enters Address Family Configuration mode
`awplus(config-router-af)#` `neighbor <neighborid> filter-list <listname> {in|out}`	This command establishes a BGP4+ filter for an IPv6 path in the Address Family Configuration mode.

How to disable next hop processing for BGP or BGP4+ updates

You can configure the software to disable next hop processing for BGP and BGP4+ updates to a neighbor.

For BGP, to disable next hop processing and provide a specific address to be used instead of the next hop address, use the command below in Router Configuration mode:

`awplus(config-router)#` `neighbor <neighborid> next-hop-self`	This command disables next hop processing on BGP updates to an IPv4 neighbor in Router Configuration mode.

For BGP4+, to disable next hop processing and provide a specific address to be used instead of the next hop address, use the command below in Address Family Configuration mode:

`awplus(config-router-af)#` `neighbor <neighborid> next-hop-self`	This command disables next hop processing on BGP4+ updates to an IPv6 neighbor in Address Family Configuration mode.

Configuring this command causes the current router to advertise its peering address as the next hop for the specified neighbor. Therefore, other BGP neighbors will forward to it packets for that address.

How to use Route Maps for BGP or BGP4+ updates

You can use a route map on a per-neighbor basis to filter updates and modify various attributes. A route map can be applied to either inbound or outbound updates. Only the routes that pass the route map are sent or accepted in updates.

Note that community based matching requires the **ip community-list (BGP and BGP4+)** Global Configuration command.

See the section **BGP Community Filtering** for more information. See also the related route-map commands that are included in the **BGP and BGP4+ Commands** chapter of this Supplement: **set community (Route Map)** and **match community (Route Map)**.

For BGP, to apply a route map to incoming and outgoing IPv4 routes, use the command below in the Router Configuration mode:

`awplus(config-router)#`	
`neighbor <neighborid> route-map <mapname> {in|out}`	This command applies a route map to incoming or outgoing IPv4 routes in the Router Configuration mode.

For BGP4+, to apply a route map to incoming and outgoing IPv6 routes, use the following command in Address Family Configuration mode:

`awplus(config-router-af)#`	
`neighbor <neighborid> route-map <mapname> {in|out}`	This command applies a route map to incoming or outgoing IPv6 routes in the Address Family Configuration mode.

BGP and BGP4+ Peer Groups

Often, in a BGP speaker, many neighbors are configured with the same update policies. Neighbors with the same update policies can be grouped into peer groups to simplify configuration and, more importantly, to make updating more efficient.

Three steps to configure a BGP peer group, described in following sections, are as below:

1. **How to create a Peer Group for BGP**
2. **How to assign options to the created Peer Group**
3. **How to make neighbors members of a Peer Group**

You can disable a BGP peer or peer group without removing all the configuration information using the **neighbor shutdown (BGP and BGP4+)** Router Configuration mode command.

Note the steps differ slightly for BGP4+ peer groups. First you create a peer group in Global Configuration mode. Next you activate the peer group in Address Family Configuration mode, not Router Configuration mode. Then you assign options to the created peer group in Address Family Configuration mode, not Router Configuration mode as used for BGP.

How to create a Peer Group for BGP

To create a BGP peer group, use the following command in Router Configuration mode:

`awplus(config-router)#`	
`neighbor peer-group (create a peer-group) (BGP and BGP4+)`	This command creates a BGP peer group.

How to assign options to the created Peer Group

After you create a peer group, you configure the peer group with neighbor commands. By default, members of the peer group inherit all the configuration options of the peer group. Members can also be configured to override the options that do not affect outbound updates.

Peer group members will always inherit the following attributes: minimum-advertisement-interval, next-hop-self, out-route-map, out-filter-list, out-dist-list, remote-as (if configured), version, and update-source. All the peer group members will inherit changes made to the peer group.

To assign configuration options to an individual neighbor, specify any of the following commands using the IP address as the `<neighborid>`. To assign the options to a peer group, specify any of the commands using the peer group name as the `<neighborid>`. Use the following commands in Router Configuration mode as needed.

`awplus(config-router)#` `neighbor <neighborid> remote-as <as-number>`	This command specifies a BGP neighbor.
`awplus(config-router)#` `neighbor <neighborid> description <description>`	This command associates a description with a neighbor.
`awplus(config-router)#` `neighbor {<neighborid>} default-originate [route-map <routemap-name>]`	This command allows a BGP speaker (the local router) to send the default route 0.0.0.0 to a neighbor for use as a default route.
`awplus(config-router)#` `neighbor <neighborid> send-community {both|extended|standard}`	This command specifies that the community attribute be sent to the neighbor at this IP address.
`awplus(config-router)#` `neighbor <neighborid> update-source <interface>`	This command allows iBGP sessions to use any operational interface for TCP connections.
`awplus(config-router)#` `neighbor <neighborid> ebgp-multihop [<count>]`	This command allows BGP sessions, even when the neighbor is not on a directly connected segment. The multihop session is not established if the only route to the address of the multihop peer is the default route (0.0.0.0).
`awplus(config-router)#` `neighbor <neighborid> advertisement-interval <time>`	This command sets the minimum interval between sending BGP routing updates.
`awplus(config-router)#` `neighbor <neighborid> maximum-prefix <maximum>`	This command limits the number of prefixes allowed from a neighbor.
`awplus(config-router)#` `neighbor <neighborid> weight <weight>`	This command specifies a weight for all routes from a neighbor.
`awplus(config-router)#` `neighbor <neighborid> distribute-list <access-list> {in|out}`	This command filters BGP routing updates to and from neighbors, as specified in an access list..
`awplus(config-router)#` `neighbor <neighborid> filter-list <listname> {in|out}`	This command establishes a BGP filter.

`awplus(config-router)#`	
`neighbor <neighborid> next-hop-self`	This command disables next hop processing on the BGP updates to a neighbor.
`awplus(config-router)#`	
`neighbor <neighborid> version <version>`	This command specifies the BGP version to use when communicating with a neighbor.
`awplus(config-router)#`	
`neighbor {<ip-address>|<peer-group-name>} password <password>`	This command starts MD5 authentication on a TCP connection to a BGP peer. You can enter a case-sensitive password of up to 25 characters. The string can contain any alphanumeric characters.
`awplus(config-router)#`	
`neighbor <neighborid> route-map <mapname> {in|out}`	This command applies a route map to incoming or outgoing routes.
`awplus(config-router)#`	
`neighbor <neighborid> soft-reconfiguration inbound`	This command configures the software to start storing received updates.

If a peer group is not configured with a remote-as attribute, the members can be configured with the **neighbor remote-as (BGP and BGP4+)** command in Router Configuration mode. This command allows you to create peer groups containing external BGP (eBGP) neighbors.

You can customize inbound policies for peer group members (using a distribute list, a route map, or a filter list) because one identical copy of an update is sent to every member of a group. Neighbor options for outgoing updates cannot be customized for peer groups.

External BGP (eBGP) peers must reside on a directly connected network. But you may want to change this to test BGP or BGP4+. You can do this by specifying the **neighbor ebgp-multihop (BGP and BGP4+)** command in Router Configuration mode. Members of a peer group can pass routes from one member of the peer group to another. For example, if router B is peering with routers A and C, router B can pass routes from router A to router C.

For Internal BGP (iBGP) peers, you may want to allow BGP or BGP4+ connections to stay up if any interface is used. To enable this configuration, configure a loopback interface and assign it an IPv4 or an IPv6 address. Next, configure the BGP or BGP4+ update source to be the loopback interface. Then configure your neighbor to use the address on the loopback interface. Now the iBGP session will be up as long as there is a route on any interface.

How to configure authentication for BGP Peering Sessions

You can configure authentication between two BGP peers, meaning that each segment sent on the TCP connection between the peers is verified. Authentication must be configured with the same password on both BGP peers; otherwise, the connection between them will not be made. Configuring authentication causes the software to generate and check the MD5 digest of every segment sent on the TCP connection. If authentication is invoked and a segment fails authentication, then an error message will be displayed in the console.

`awplus(config-router)#`	
`neighbor {<ip-address>|<peer-group-name>} password <password>`	This command starts MD5 authentication on a TCP connection to a BGP peer. You can enter a case-sensitive password of up to 25 characters.

When configuring authentication, you can enter a case-sensitive password of up to 25 characters.The string can contain any alphanumeric characters, including spaces. A password cannot be configured in the number-space-anything format. The space after the number can cause authentication to fail.

How to make neighbors members of a Peer Group

To configure a BGP neighbor to be a member of a BGP peer group, use the following command in Router Configuration mode, using the same peer group name:

`awplus(config-router)#`	
`neighbor <ipv6-addr> peer-group <peer-group>`	This command makes a BGP neighbor a member of the peer group.

How to disable a Peer or Peer Group

To disable an existing BGP neighbor or neighbor peer group, use the following command in Router Configuration mode:

`awplus(config-router)#`	
`neighbor <neighborid> shutdown`	This command shuts down or disables a BGP neighbor or peer group.

To enable a previously existing neighbor or neighbor peer group that had been disabled using the **neighbor shutdown (BGP and BGP4+)** command in Router Configuration mode, use the following command in Router Configuration mode:

`awplus(config-router)#`	
`no neighbor <neighborid> shutdown`	This command enables a BGP neighbor or peer group.

BGP and BGP4+ Prefix Lists

Prefix lists can be used as an alternative to access lists in many BGP or BGP4+ route filtering commands. The advantages of using IPv4 or IPv6 prefix lists are as follows:

- More of a performance improvement in loading and route lookup of large lists.
- Support for updates. Filtering using access lists does not support updates.
- The command-line interface to use access lists to filter BGP updates is more difficult.
- More flexibility

Before using a prefix list in a BGP or BGP4+ command, first set up the prefix list, and assign sequence numbers to entries in the prefix list.

BGP and BGP4+ filtering by prefix lists involves matching the prefixes of IPv4 or IPv6 routes with those listed in the prefix list. When there is a match, the route is used. Whether a prefix is permitted or denied is based upon these rules:

- An empty prefix list permits all prefixes.
- An implicit deny is assumed if a given prefix does not match any entries of a prefix list.

The router begins the search at the top of the prefix list, with the sequence number 1. Once a match or deny occurs, the router need not go through the rest of the prefix list.

For efficiency, add the most common matches or denies near the top of the list, using the **seq** parameter in the **ip prefix-list (IPv4 Prefix List)** and **ipv6 prefix-list (IPv6 Prefix List)** Global Configuration mode commands. The **show ip prefix-list (IPv4 Prefix List)** command and the **show ipv6 prefix-list (IPv6 Prefix List)** command output includes sequence numbers.

Sequence numbers are generated automatically unless you disable automatic generation. If you disable the automatic generation of sequence numbers, you need to specify the sequence number for each entry with the **seq** parameter of the **ip prefix-list (IPv4 Prefix List)** and **ipv6 prefix-list (IPv6 Prefix List)** Global Configuration mode commands.

How to create and configure a Prefix List for BGP or BGP4+

To create a prefix list for BGP, use the following command in Global Configuration mode. Note you can add individual prefix list entries to a defined prefix list as well.

awplus(config)#	
`ip prefix-list <list-name> [seq <1-429496725>] {deny|permit} {any|<ip-prefix>} [ge <0-32>] [le <0-32>]`	This command creates an IPv4 prefix list with the name specified for the `<list-name>` parameter. To create a prefix list you must enter at least one **permit** or **deny** clause. Once an IPv4 prefix list is created, this command creates a prefix list entry, and assigns a sequence number to the IPv4 prefix list entry.
awplus(config)#	
`ipv6 prefix-list <list-name> [seq <1-429496725>] {deny|permit} {any|<ipv6-prefix>} [ge <0-128>] [le <0-128>]`	This command creates an IPv6 prefix list with the name specified for the `<list-name>` parameter. To create a prefix list you must enter at least one **permit** or **deny** clause. Once an IPv6 prefix list is created, this command creates a prefix list entry and assigns a sequence number to the IPv6 prefix list entry.

The optional **ge** and **le** keywords can be used to specify the range of the prefix length to be matched for prefixes that are more specific than the network/length parameter. An exact match is assumed when neither **ge** nor **le** is specified.

You can specify sequence values for prefix list entries in any increments you want. If you specify the sequence values in increments of 1, you cannot insert additional entries into the prefix list. If you choose very large increments, you could run out of sequence values.

How to delete Prefix List Entries

To remove a prefix list, and optionally specific entries, use the following commands as appropriate in Global Configuration mode:

awplus(config)#	
`no ip prefix-list <list-name> [seq <1-429496725>]`	This command removes an IPv4 prefix list with the name specified for the required <list-name> parameter and the sequence number specified in the range <1-429496725>.
awplus(config)#	
`no ipv6 prefix-list <list-name> [seq <1-429496725>]`	This command removes an IPv6 prefix list with the name specified for the <list-name> parameter and the sequence number specified in the range <1-429496725>.

The sequence number of an entry is optional when you delete the prefix list entry. If you omit the sequence number then all entries are deleted for the prefix list.

How to display IPv4 and IPv6 Prefix Entries

To display information about IPv4 and IPv6 prefix tables, prefix table entries, the policy associated with a node, or specific information about an entry, use the following commands in Privileged Exec mode as appropriate:

`awplus#` `show ip prefix-list [<name>| detail|summary]`	This command displays information about IPv4 prefix lists.
`awplus#` `show ipv6 prefix-list [<name>| detail|summary]`	This command displays information about IPv6 prefix lists.

BGP and BGP4+ Route Dampening

Route dampening is a BGP and BGP4+ feature designed to minimize the propagation of flapping routes across a network. A route is considered to be flapping when it is repeatedly available, then unavailable, then available, then unavailable, etc.

Consider a network with three BGP autonomous systems: autonomous system 1, autonomous system 2, and autonomous system 3. If the route to network A in autonomous system 1 flaps, and is unavailable without route dampening, the eBGP neighbor of autonomous system 2 sends a withdraw message to autonomous system 2.

The router in autonomous system 2 sends the withdraw message to autonomous system 3. When a route to network A appears, autonomous system 1 sends an advertisement message to autonomous system 2, which sends it to autonomous system 3.

If the route to network A repeatedly becomes unavailable, then available, many withdrawal and advertisement messages are sent. This is a problem in a network connected to the Internet since route flapping in the Internet often involves many routes.

The route dampening feature minimizes the flapping problem as follows. If the route to network A flaps, then the router in autonomous system 2, with route dampening enabled, assigns network A a penalty of 1000 and moves it to the history state.

The router in autonomous system 2 continues to advertise the status of the route to neighbors. When the route flaps so the penalty exceeds the limit, the router stops advertising the route to network A, so the route becomes dampened.

The penalty placed on network A is reduced until the limit is reached, when the route is advertised. At half the limit, dampening information for a route to network A is removed.

The below terms are used for BGP and BGP4+ route dampening:

- **Flap**—A route is available, then unavailable, or vice versa.
- **History state**—After a route flaps once, it is assigned a penalty and put into history state, meaning the router does not have the best path, based on historical information.
- **Penalty**—Each time a route flaps, the router configured for route dampening in another autonomous system assigns the route a penalty of 1000. Penalties are cumulative. The penalty for the route is stored in the BGP routing table until the penalty exceeds the suppress limit. At that point, the route state changes from history to damp.
- **Damp state**—In this state, the route has flapped so often that the router will not advertise this route to BGP neighbors.
- **Suppress limit**—A route is suppressed when its penalty exceeds this limit. The default value is 2000.
- **Half-life**—Once the route has been assigned a penalty, the penalty is decreased by half after the half-life period (which is 15 minutes by default). The process of reducing the penalty happens every 5 seconds.

How to enable BGP and BGP4+ Route Dampening

To enable BGP route dampening, use the command below in Router Configuration mode:

`awplus(config)#` `router bgp <asn>`	This command enters Router Configuration mode
`awplus(config-router)#` `bgp dampening`	This command enables BGP route dampening in Router Configuration mode.

To enable BGP4+ route dampening, use the command below in Address Family Configuration mode:

`awplus(config)#` `router bgp <asn>`	This command enters Router Configuration mode
`awplus(config-router)#` `address-family ipv6 [unicast]`	This command enters Address Family Configuration mode
`awplus(config-router-af)#` `bgp dampening`	This command enables BGP4+ route dampening in Address Family Configuration mode.

How to monitor BGP and BGP4+ Route Dampening

You can monitor the flaps of all the paths that are flapping. The statistics will be deleted once the route is not suppressed and is stable for at least one half-life. To display flap statistics, use the following show commands in Privileged Exec mode as needed:

`awplus#` `show ip bgp dampening {dampened-paths| flap-statistics|parameters}`	This command displays BGP flap statistics for all IPv4 paths when you apply the **flap-statistics** parameter.
`awplus#` `show bgp ipv6 dampening {dampened-paths| flap-statistics|parameters}`	This command displays BGP4+ flap statistics for all IPv6 paths when you apply the **flap-statistics** parameter.

Once a route is dampened, you can display BGP route dampening information, including the time remaining before the dampened routes will be unsuppressed. To display the information, use the following command in Privileged Exec mode:

awplus#	
show ip bgp dampening {dampened-paths| flap-statistics|parameters}	This command displays BGP route dampening information for all IPv4 paths when you apply the **dampened-paths** parameter.
awplus#	
show bgp ipv6 dampening {dampened-paths| flap-statistics|parameters}	This command displays BGP4+ route dampening information for all IPv6 paths when you apply the **dampened-paths** parameter.

To clear BGP flap statistics (thus making it less likely that the IPv4 route will be dampened), use the following command in Privileged Exec mode :

awplus#	
clear ip bgp flap-statistics [<ip-address>|<ip-address/m>]	This command clears BGP flap statistics for all IPv4 routes.

To clear BGP dampening statistics for IPv4 routes, use the following command in Privileged Exec mode:

awplus#	
clear ip bgp dampening [<ip-address>|<ip-address/m>]	This command clears BGP dampening statistics for all IPv4 routes.

To clear BGP4+ flap statistics (thus making it less likely that the IPv6 route will be dampened), use the following command in Privileged Exec mode :

awplus#	
clear bgp ipv6 flap-statistics [<ipv6-addr>|<ipv6-addr/prefix-length>]	This command clears BGP4+ flap statistics for all IPv6 routes.

To clear BGP4+ dampening statistics for IPv6 routes, use the following command in Privileged Exec mode:

awplus#	
clear bgp ipv6 dampening [<ipv6-addr>|<ipv6-addr/prefix-length>]	This command clears BGP4+ dampening statistics for all IPv6 routes.

The flap statistics for a route are also cleared when a BGP or BGP4+ peer is reset. Although the reset withdraws the route, there is no penalty applied, even if route flap dampening is enabled.

BGP and BGP4+ Synchronization

IGP synchronisation is a feature that is specifically required in the case where routing information is 'transiting' through an AS. That is, when:

- A BGP router on one side of the AS learns routes from external ASs by eBGP.
- This router passes the routes across the AS by iBGP to a BGP router on the other side of the network (passing through several IGP routers on the way, which simply pass on the iBGP updates).
- The BGP router on the other side of the network then sends the routes by eBGP to other external ASs.

The problem that can arise in this situation comes about because the iBGP session effectively tunnels route information across the AS, but packets destined to any of those routes have to cross the AS hop by hop.

If iBGP tunnels route information across the AS faster than the AS's IGP can pass the route information to all routers in between, then we end up with a situation where the BGP routers (and other ASs) know about routes that some of the IGP routers in the middle of the transit AS have not learnt yet. So, packets that are routed from an external AS into the transit AS may end up being dropped or misdirected somewhere in the middle of the AS when they arrive at an IGP router that has not yet learnt all the transiting routes.

To avoid this problem, we need to tell iBGP routers that even if they receive routes via the iBGP 'express tunnel', they must wait until the routes have also been received via the more pedestrian iBGP hop-by-hop method before the routes can be passed on to eBGP neighbors in other ASs.

This process of forcing a router to wait until a route has been learnt by IGP as well as iBGP is call IGP synchronisation. In other words, the routes that the router has learnt by iBGP must match up with the routes that it has learnt by IGP. Once a route has achieved this sync-up, it is then OK to advertise it on to eBGP neighbors.

IGP synchronization is disabled by default. It does not need to be enabled in an AS where there are no iBGP connections, or in an AS where all the internal route advertising is done by iBGP (i.e., when there is no other IGP in use in the AS).

To enable BGP synchronization for IPv4 routes, use the command below in the Router Configuration mode:

`awplus(config-router)#`	
`synchronization`	This command enables synchronization between BGP and an IGP for IPv4 routes in Router Configuration mode.

To enable BGP4+ synchronization for IPv6 routes, use the command below in the Address Family Configuration mode:

`awplus(config-router-af)#`	
`synchronization`	This command enables synchronization between BGP4+ and an IGP for IPv6 routes in Address Family Configuration mode.

BGP and BGP4+ Weights

A weight is a number that you can assign to a route so that you can control the route selection process. The administrative weight is local to the router. A weight can be a number from 0 to 65535. If you have particular neighbors that you want to prefer for most of your traffic, you can assign a higher weight to all routes learned from that neighbor.

To assign a weight to a BGP route, use the following commands in Router Configuration mode:

`awplus(config)#` `router bgp <asn>`	This command enters Router Configuration mode
`awplus(router-config)#` `neighbor <neighborid> weight <weight>`	This command adds a weight to a BGP route specified in the required <neighborid> parameter.

To assign a weight to a BGP4+ route, use the following commands in Address Family Configuration mode:

`awplus(config)#` `router bgp <asn>`	This command enters Router Configuration mode
`awplus(config-router)#` `address-family ipv6 [unicast]`	This command enters Address Family Configuration mode
`awplus(router-config-af)#` `neighbor <neighborid> weight <weight>`	This command adds a weight to a BGP4+ route specified in the required <neighborid> parameter.

BGP and BGP4+ Aggregate Addresses

CIDR (Classless Inter-Domain Routing) enables you to create aggregate routes to minimize the size of routing tables. CIDR is a routing method supported by BGP and BGP4+ that is based on route aggregation. CIDR allows a router to group routes together to minimize the amount of routing information carried. Several IP networks appear as a single network to networks outside of those grouped together

You can configure aggregate routes in BGP or BGP4+ either by redistributing an aggregate route into BGP or BGP4+ or by using the BGP and BGP4+ Aggregation feature. An aggregate address is added to the BGP table if at least one entry is in the BGP table.

To create an IPv4 aggregate address in the BGP routing table, use the following command in the Router Configuration mode:

awplus(config-router)#	
aggregate-address <ip-addr/m> {summary-only|as-set}	This command creates an aggregate IPv4 route entry in the BGP routing table. This entry will cause BGP to advertise IPv4 summary addresses only, if the **summary-only** parameter is applied. This entry will cause BGP to generate autonomous system set path information, if the the **as-set** parameter is applied.

To create an IPv6 aggregate address in the BGP4+ routing table, use the following command in the Address Family Configuration mode:

awplus(config-router-af)#	
aggregate-address <ipv6-addr/prefix-length> {summary-only|as-set}	This command creates an aggregate IPv6 route entry in the BGP4+ routing table. This entry will cause BGP4+ to advertise IPv6 summary addresses only, if the **summary-only** parameter is applied. This entry will cause BGP4+ to generate autonomous system set path information, if the the **as-set** parameter is applied.

How to enable and disable Automatic Summarization

When a subnet is redistributed from an IGP to BGP, network routes are added to routing tables. By default, automatic summarization is disabled. To enable automatic network number summarization, use the following command in Router Configuration mode:

awplus(config-router)#	
auto-summary	This command enables automatic network summarization.

To disable automatic network number summarization, use the following command in Router Configuration mode:

awplus(config-router)#	
no auto-summary	This command disables automatic network summarization.

BGP and BGP4+ monitoring

You can remove all contents of a particular cache, table, or database. You also can display specific statistics. The following sections describe each of these tasks.

How to clear BGP and BGP4+ tables

You can remove all contents of a particular table. Clearing a table may be needed when the contents of the table have become invalid. To clear tables for BGP and BGP4+, use the following commands in Privileged Exec mode, as needed:

awplus#	
clear ip bgp <ipv4-addr> [in [prefix-filter]|out|soft [in|out]]	This command resets a specified BGP IPv4 connection.

This command resets all BGP IPv4 connections by clearing all BGP peers:

awplus#	
clear ip bgp *	This command resets all BGP IPv4 connections.

This command resets all BGP IPv4 and BGP4+ IPv6 connections by clearing all BGP and BGP4+ peers:

awplus#	
clear bgp *	This command resets all BGP IPv4 and BGP4+ IPv6 connections.

These commands remove all members of a BGP or BGP4+ peer group respectively:

awplus#	
clear bgp peer-group <peer-group> [in [prefix-filter]|out|soft [in|out]]	This command removes all members of a BGP peer group.
awplus#	
clear ip bgp peer-group <peer-name>	This command removes all members of a BGP peer group.
awplus#	
clear bgp ipv6 peer-group <peer-name>	This command removes all members of a BGP4+ peer group.

How to display BGP and BGP4+ statistics

You can display specific statistics such as the contents of BGP routing tables.

Information provided can be used to determine resource utilization and solve network problems. You can also display information about node reachability and discover the routing path that the packets of your device are taking through the network.

To display various routing statistics, use the following commands in Privileged Exec mode, as needed:

awplus# show ip bgp prefix-list <list>	This command displays peer groups and peers not in peer groups to which the prefix has been advertised for BGP. It also displays prefix attributes, like next hop and local prefix.
awplus# show bgp ipv6 prefix-list <list>	This command displays peer groups and peers not in peer groups to which the prefix has been advertised for BGP4+. It also displays prefix attributes, like next hop and local prefix.
awplus# show ip bgp cidr-only	This command displays all BGP routes that contain subnet and supernet network masks.
awplus# show ip bgp community [<type>] [exact-match]	This command displays routes that belong to the specified communities for BGP.
awplus# show ip bgp community-list <listname> [exact-match]	This command displays routes that are permitted by the community list for BGP.
awplus# show bgp ipv6 community [<type>] [exact-match]	This command displays routes that belong to the specified communities for BGP4+.
awplus# show bgp ipv6 community-list <listname> [exact-match]	This command displays routes that are permitted by the community list for BGP4+.
awplus# show ip bgp filter-list <listname>	This command displays BGP IPv4 routes that are matched by the specified autonomous system path access list.
awplus# show bgp ipv6 filter-list <listname>	This command displays BGP4+ IPv6 routes that are matched by the specified autonomous system path access list.
awplus# show ip bgp inconsistent-as	This command displays the BGP IPv4 routes with inconsistent originating autonomous systems.
awplus# show bgp ipv6 inconsistent-as	This command displays the BGP4+ IPv6 routes with inconsistent originating autonomous systems.

awplus#	
show ip bgp regexp <expression>	This command displays the routes that have an autonomous system path that matches the specified regular expression entered on the command line.
awplus#	
show ip bgp [<ip-addr>|<ip-addr/m>]	This command displays the contents of the IPv4 routes in the BGP routing table.
awplus#	
show bgp ipv6 <ipv6-addr>	This command displays the contents of the IPv6 routes in the BGP4+ routing table.
awplus#	
show ip bgp neighbors [<ipv4-addr> [advertised-routes|received prefix-filter|received-routes|routes]]	This command displays detailed information on connections to individual BGP neighbors. Note this command does not display IPv4 routes learned from a specified BGP neighbor. It shows BGP session information and the number of announced and accepted prefixes. A counter shows how many routes have been announced and accepted, but not learned.
awplus#	
show bgp ipv6 neighbors [<ipv6-addr> [advertised-routes|received prefix-filter|received-routes|routes]]	This command displays detailed information on connections to individual BGP4+ neighbors. Note this command does not display IPv6 routes learned from a specified BGP4+ neighbor. It shows BGP4+ session information and the number of announced and accepted prefixes. A counter shows how many routes have been announced and accepted, but not learned.
awplus#	
show ip bgp paths	This command displays all BGP paths for IPv4 routes in the table.
awplus#	
show bgp ipv6 paths	This command displays all BGP4+ paths for IPv6 routes in the table.
awplus#	
show ip bgp summary	This command displays the status of all BGP connections.
awplus#	
show bgp ipv6 summary	This command displays the status of all BGP4+ connections.

BGP Neighbor status logging

To enable the logging of messages generated when a BGP neighbor resets, use the following command in Router Configuration mode:

awplus(config-router)#	
bgp log-neighbor-changes	This command generates log messages whenever a BGP neighbor resets.

BGP Connections Reset

When a link between external neighbors drops, a BGP session does not reset immediately. To reset a BGP session when an interface goes down, use this command in Router Configuration mode

`awplus(config-router)#`	
`bgp fast-external-failover`	This command resets BGP sessions automatically.

BGP Versions

By default, BGP sessions begin using BGP Version 4 and negotiate downward to earlier versions as needed. To prevent negotiation and force the BGP version used to communicate with a neighbor, use the command below in Router Configuration mode:

`awplus(config-router)#`	
`neighbor <neighborid> version <version>`	This command specifies the BGP version to use when communicating with a neighbor.

BGP Confederations

One way to reduce the iBGP mesh is to divide an autonomous system into multiple sub-autonomous systems and group them into a single confederation. To the outside world, the confederation looks like a single autonomous system.

Each autonomous system is fully meshed within itself, and has few connections to other autonomous systems in the same confederation. Though peers in different autonomous systems have eBGP sessions, they exchange routing information as iBGP peers.

To configure a BGP confederation, you must specify a confederation identifier. To the outside world, the group of autonomous systems will look like a single autonomous system with the confederation identifier as the autonomous system number. To configure a BGP confederation identifier, use the following command in Router Configuration mode:

`awplus(router-config)#`	
`bgp confederation identifier <1-4294967295>`	This command configures a BGP confederation.

In order to treat the neighbors from other autonomous systems within the confederation as special eBGP peers, use the following command in Router Configuration mode:

`awplus(router-config)#`	
`bgp confederation peers <1-4294967295>`	This command specifies the autonomous systems that belong to the confederation.

BGP Route Reflectors

BGP requires that all iBGP speakers be fully meshed. Another way to reduce the iBGP mesh is to configure a BGP route reflector, instead of configuring a BGP confederation.

With route reflectors, all iBGP speakers need not be fully meshed because there is a method to pass learned routes to neighbors. In this model, an iBGP peer is configured to be a route reflector responsible for passing iBGP learned routes to a set of iBGP neighbors.

The internal peers of the route reflector are divided into two groups: client peers and all the other routers in the autonomous system (non-client peers). A route reflector reflects routes between these two groups.

The route reflector and its client peers form a cluster. The non-client peers must be fully meshed with each other, but the client peers need not be fully meshed. The clients in the cluster do not communicate with iBGP speakers outside their cluster.

When the route reflector receives an advertised route, depending on the neighbor, it takes the following actions:

- A route from an external BGP speaker is advertised to all clients and non-client peers.
- A route from a non-client peer is advertised to all clients.
- A route from a client is advertised to all clients and non-client peers. Hence, the clients need not be fully meshed.

To configure a route reflector and its clients, use the command below in Router Configuration mode:

`awplus(router-config)#`	
`neighbor <neighborid> route-reflector-client`	This command configures the local router as a BGP route reflector and the specified neighbor as a client.

Along with route reflector-aware BGP speakers, you can have BGP speakers that do not understand the concept of route reflectors. They can be members of client or non-client groups allowing a gradual migration from the old BGP model to the route reflector model.

An autonomous system can have multiple route reflectors. A route reflector treats other route reflectors just like other iBGP speakers. A route reflector can be configured to have other route reflectors in a client group or non-client group.

Each route reflector would be configured with other route reflectors as non-client peers, so the route reflectors will be fully meshed. The clients are configured to maintain iBGP sessions with only the route reflector in their cluster.

If the cluster has more than one route reflector, configure the cluster ID by using the following command in Router Configuration mode:

`awplus(router-config)#`	
`bgp cluster-id {<ip-address>| <cluster-id>}`	This command configures the cluster-id if the BGP cluster has more than one route reflector. A cluster includes one or more route reflectors and their clients. Usually, each cluster is identified by the router-id of its single route reflector. .

Use the **show ip bgp (BGP)** command in Privileged Exec mode to display the originator ID and the cluster-list attributes.

BGP Community Filtering

BGP supports transit policies via controlled distribution of routing information. The distribution of routing information is based on one of the following three values:

- IP address.
- The value of the autonomous system path attribute.
- The value of the communities attribute (as described in this section).

The communities attribute is a way to group destinations into communities and apply routing decisions based on the communities. This method simplifies the configuration of a BGP speaker that controls distribution of routing information.

A community is a group of destinations that share some common attribute. Each destination can belong to multiple communities.

The communities attribute is an optional, transitive, global attribute in the numerical range from 1 to 4,294,967,200. Along with Internet community, there are a few predefined, well-known communities, as follows:

- **internet**—Advertise this route to the Internet community. All routers belong to it.
- **no-export**—Do not advertise this route to eBGP peers.
- **no-advertise**—Do not advertise this route to any peer (internal or external).
- **local-as**—Do not advertise this route to peers outside the local autonomous system. This route will not be advertised to other autonomous systems or sub-autonomous systems when confederations are configured.

Based on the community, you can control which routing information to accept, prefer, or distribute to other neighbors. When routes are aggregated, the resulting aggregate has a communities attribute that contains all communities from all the initial routes.

You can use community lists to create groups of communities to use in a match clause of a route map, and a series of community lists can be created. Statements are checked until a match is found. As soon as one statement is satisfied, the test is concluded.

To create a community list, use the following command in Global Configuration mode:

`awplus(config)#`	
`ip community-list <listname> {deny|permit} .<community>`	This command creates a community-list. To set communities attributes and match clauses based on communities, see the **match community (Route Map)** command and the **set community (Route Map)** command for further information.

By default, the communities attribute is sent to a neighbor. To specify that the communities attribute are not sent to the neighbor, use the command below in Router Configuration mode:

`awplus(config-router)#`	
`no neighbor <neighborid> send-community {both|extended|standard}`	This command specifies that the communities attribute be sent to the neighbor at this IP address. Both standard and extended communities can be specified with the both keyword. Only standard or only extended can be specified with the standard and extended keywords

BGP Optimization

How to determine Backdoor Routes

You can determine which networks are reachable by using a backdoor route that the border router should use. A backdoor network is treated as a local network, except that it is not advertised. To configure backdoor routes, use the network backdoor command, beginning in Router Configuration mode:

`awplus(config-router)#`	
`network {<ip-prefix/length>| <ip-network-addr>} [mask <network-mask>] [route-map <route-map-name>] [backdoor]`	This command determines reachable networks through backdoor routes when you apply the optional **backdoor** parameter.

How to set the BGP Administrative Distance

Administrative Distance is a measure of the preference of different routing protocols. BGP uses three different administrative distances: external, internal, and local. Routes learned through external BGP are given the external distance, routes learned with iBGP are given the internal distance, and routes that are part of this autonomous system are given the local distance. To assign a BGP administrative distance, use the following command in Router Configuration mode:

`awplus(config-router)#`	
`distance bgp <ebgp> <ibgp> <local>`	This command assigns a BGP administrative distance.

Changing administrative distance of BGP routes may cause issues so is not recommended. The external distance should be lower than any other dynamic routing protocol, and the internal and local distances should be higher than any other dynamic routing protocol.

How to change BGP default local preference value

You can define a particular path as more preferable or less preferable than other paths by changing the default local preference value of 100. To assign a different default local preference value, use the following command in Router Configuration mode:

`awplus(config-router)#`	
`bgp default local-preference <pref-value>`	This command changes the default local preference value. You can use route maps to change the default local preference of specific paths.

How to redistribute the default network 0.0.0.0

By default, you are not allowed to redistribute network 0.0.0.0. To permit the redistribution of network 0.0.0.0, use the following command in Router Configuration or Address Family Configuration modes:

awplus(config-router)#	
neighbor {<neighborid>} default-originate [route-map <routemap-name>]	This command allows the redistribution of the default network 0.0.0.0 into BGP from the Router Configuration mode.

awplus(config-router-af)#	
neighbor {<neighborid>} default-originate [route-map <routemap-name>]	This command allows the redistribution of the default network 0.0.0.0 into BGP from the Address Family Configuration mode.

How to adjust BGP Timers

BGP uses certain timers to control periodic activities such as the sending of keepalive messages and the interval after not receiving a keepalive message after which software declares a peer dead.

By default, the keepalive timer is 60 seconds, and the hold-time timer is 180 seconds.You can adjust these timers. When a connection is started, BGP will negotiate the hold time with the neighbor. The smaller of the two hold times will be chosen. The keepalive timer is then set based on the negotiated hold time and the configured keepalive time.

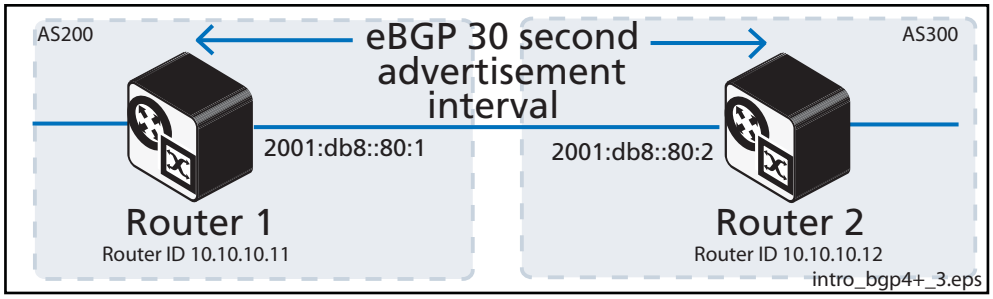
To adjust BGP timers for all neighbors, use the following command in Router Configuration mode:

awplus(config-router)#	
timers bgp <keepalive> <holdtime>	This command adjusts BGP timers for all neighbors.

To adjust BGP keepalive and hold-time timers for a specific neighbor, use the following command in Router Configuration mode:

awplus(config-router)#	
neighbor <neighborid> timers {<keepalive> <holdtime>|connect <connect>}	This command sets the keepalive and hold-time timers (in seconds) for the specified peer or peer group. To clear the timers for a BGP neighbor or peer group, use the negated form of the neighbor timers command.

How to adjust the eBGP advertisement interval



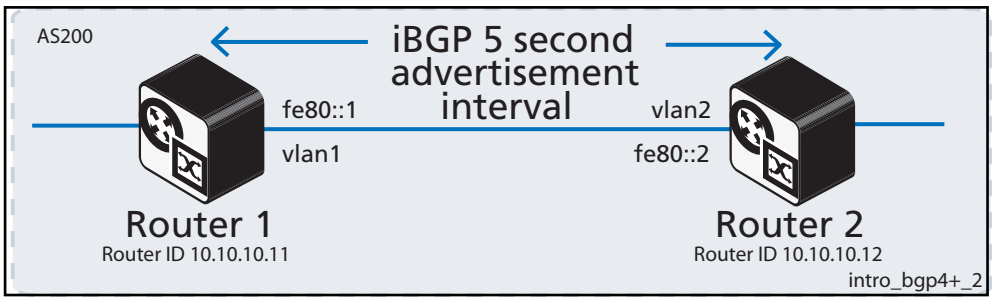
When a route advertised by BGP changes, BGP sends an Update message. If an advertised route is flapping, and becomes unavailable. Route flapping is often caused when an interface is unstable, and a flood of Update messages will occur. One approach to control the flooding of BGP messages is to configure the advertisement interval. With the default interval value of 30 seconds for eBGP neighbors, BGP routing updates are sent only every 30 seconds, even if a route is flapping many times during this 30 second interval.

To assign a different **advertisement-interval** value for eBGP peers, use the following command in Router Configuration mode::

`awplus(config-router)#`	
`neighbor <neighborid> advertisement-interval <time>`	This command sets the minimum interval between sending eBGP routing updates with a 30 second eBGP default interval.

Use this command instead of the **neighbor as-origination-interval (BGP and BGP4+)** command for eBGP peers with prefixes not in the same AS for updates not in a local AS.

How to adjust the iBGP advertisement interval



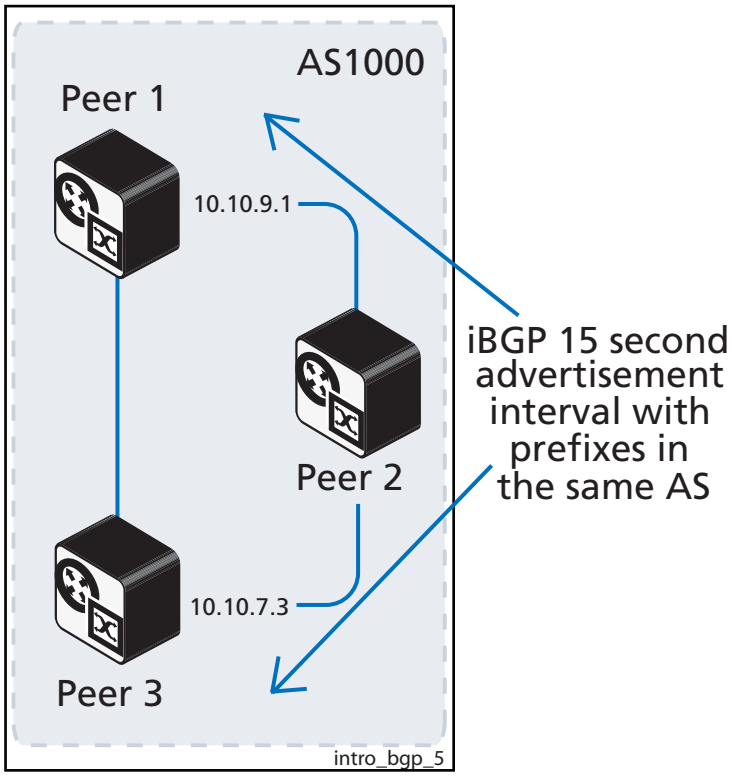
With the default value of 5 seconds for iBGP neighbors, BGP routing updates are sent only every 5 seconds, even if a route is flapping many times during this 5 second interval.

To assign a different **advertisement-interval** value for iBGP peers, use the following command in Router Configuration mode: :

`awplus(config-router)#`	
`neighbor <neighborid> advertisement-interval <time>`	This command sets the minimum interval between sending eBGP routing updates with a 5 second iBGP default interval.

BGP dampening can also be used to control the effects of flapping routes. See the **BGP and BGP4+ Route Dampening** section in this chapter, and the **bgp dampening (BGP and BGP4+)** command in the **BGP and BGP4+ Commands** chapter for more information.

How to adjust the AS origination interval



With the default value of 15 seconds for iBGP neighbors with a prefix in the same AS, BGP routing updates are sent only every 15 seconds, even if a route is flapping many times during this 15 second interval.

To assign a different **as-origination-interval** value for iBGP peers with a prefix in the same AS, use the following command in Router Configuration mode: :

`awplus(config-router)#`	
`neighbor <neighbor_address> as-origination-interval <time>`	This command sets the minimum interval between sending iBGP routing updates with a 15 second iBGP default interval to report changes in the local AS for iBGP peers with prefixes in the same local AS.

Use this command instead of the **neighbor advertisement-interval (BGP and BGP4+)** command for iBGP peers with prefixes in the same AS for updates only within a local AS.

BGP dampening can also be used to control the effects of flapping routes. See the **BGP and BGP4+ Route Dampening** section in this chapter, and the **bgp dampening (BGP and BGP4+)** command in the **BGP and BGP4+ Commands** chapter for more information.

How to remove private AS numbers for BGP

There are public and private AS numbers, in the same way there are public and private IP addresses. Like the private IP addresses that you cannot send to the Internet, you cannot send private AS numbers to the Internet. This functionality enables you to remove them.

Public AS numbers range from 1 to 64,511. Private AS numbers range for 64,512 and 65,535. Private AS numbers are used to divide large ASs into smaller multiple ASs for eBGP.

ISPs may assign private AS numbers to save public AS number usage. When you receive private AS numbers, you need to remove them before you send updates to the Internet. To remove private AS numbers for BGP, use this command in the Router Configuration mode:

`awplus(config-router)#`	
`neighbor <neighborid> remove-private-AS`	This command removes private AS numbers for BGP in Router Configuration mode. This command is not supported for BGP4+ in IPv6 Address Family Configuration mode. This command removes a private AS number and makes an update packet with a public AS number as the AS path attribute. So only public AS numbers are entered in Internet BGP routing tables, and private AS numbers are not entered in Internet BGP tables.

For the filtering to apply, both peering devices must be set to use either 2-byte or extended 4- byte ASN (with the same ASN type set on both peers). For example, if a device (which defaults to use a 4-byte ASN), is peered with a device that defaults to a 2-byte ASN, then the device using a 2-byte ASN device also needs to be configured with the command **bgp extended-asn-cap** for the filtering to apply.

The **neighbor remove-private-AS (BGP)** command is not available in IPv6 Address Family Configuration mode for BGP4+. This command is only available in Router Configuration mode for BGP.

Verify the application of this command with the **show running-config** and **show ip bgp** commands. See sample verification output in the following sections:

- **How to remove BGP filtering for private AS numbers**
- **How to apply BGP filtering for private AS numbers**.

How to remove BGP filtering for private AS numbers

Remove BGP filtering for private AS numbers using the `no neighbor <neighborid> remove-private-AS` command. See this example from Router Configuration mode:

```
awplus# configure terminal
awplus(config)# router bgp 5
awplus(config-router)# no neighbor 192.168.0.2 remove-private-AS
```

If the AS path attribute command is removed from the Router 2 BGP configuration, then the private AS is correctly not filtered. See the sample console command entries below:

```
Router 2#configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Router 2(config)#router bgp 5
Router 2(config-router)#no neighbor 192.168.0.2 remove-private-AS
Router 2(config-router)#exit
Router 2(config)#exit
Router 2#clear ip bgp *
```

The **show ip bgp** command output below on Router 1 shows an update for the network 10.0.0.0/24 received from Router 2 (192.68.0.1) has an AS path attribute 5, which is the AS number of Router 2, and contains private AS path 65000.

```
Router 1#show running-config router bgp
!
router bgp 1
neighbor 192.168.0.1 remote-as 5
!
Router 1#show ip bgp
BGP table version is 1017, local router ID is 192.168.0.2
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal
              l - labeled, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

   Network          Next Hop            Metric LocPrf Weight Path
*> 10.0.0.0/24      192.168.0.1              0             0 5 65000 i
*> 172.30.0.0       192.168.0.1              0             0 5 i
*> 192.168.0.0      192.168.0.1              0             0 5 i
```

How to apply BGP filtering for private AS numbers

Apply BGP filtering for private AS numbers using the `neighbor <neighborid> remove-private-AS` command. See this example from Router Configuration mode:

```
awplus# configure terminal
awplus(config)# router bgp 5
awplus(config-router)# neighbor 192.168.0.2 remove-private-AS
```

If the non-default AS path attribute command is applied to the Router 2 BGP configuration then the private AS is correctly filtered. See the sample console command entries below:

```
Router 2#configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Router 2(config)#router bgp 5
Router 2(config-router)#neighbor 192.168.0.2 remove-private-AS
Router 2(config-router)#exit
Router 2(config)#exit
Router 2#clear ip bgp *
```

The **show ip bgp** command output on ISP Router 1 shows that the update for the network 10.0.0.0/24 received from Router 2 (192.68.0.1) has an AS path attribute 5. This is the AS number of Router 2, without private AS path 65000.

In the ISP router BGP prefix table below, the only AS path attribute for the 10.0.0.0/24 network is '5', and the AS 65000 has been correctly filtered out from the update sent by Router 2 received into ISP Router 1. This is displayed in the **show ip bgp** output below:

```
Router 1#show running-config router bgp
!
router bgp 1
neighbor 192.168.0.1 remote-as 5
neighbor 192.168.0.2 remove-private-as
!
Router 1#show ip bgp
BGP table version is 1041, local router ID is 192.168.0.2
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal
              l - labeled, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

   Network          Next Hop            Metric LocPrf Weight Path
*> 10.0.0.0/24      192.168.0.1              0             0 5 i
*> 172.30.0.0       192.168.0.1              0             0 5 i

```

BGP and BGP4+ Terminology

See the below table for descriptions of BGP and BGP4+ terms used through this chapter:

Term	Description
AS number (ASN)	A number that identifies an Autonomous System. Previously, an ASN was a 16-bit number between 1 and 64,511 (public) and 64,512 and 65,535 (private) assigned to an AS for the purpose of BGP operation. Since RFC 6793, an ASN is now 32-bit with a range of decimal values between 1 and 4,294,967,295 .
AS_Path	A BGP path attribute that lists ASNs through which the route has been advertised.
AS_Sequence	A type of AS_Path segment consisting of an ordered list of ASNs through which the route has been advertised.
auto summary	A routing protocol feature in which a router that connects to more than one classful network advertises summarized routes for each entire classful network when sending updates out interfaces connected to other classful networks.
Autonomous System (AS)	A set of routers inside a single administrative authority, grouped together for the purpose of controlling routing policies for the routes advertised by that group to the Internet.
BGP best path algorithm	The process that BGP uses to examine competing BGP paths (routes) in its BGP table, for a single prefix, choosing one route as the best route. The best path algorithm results in a choice of a single route for each prefix as that router's best BGP path. BGP compares the current best path against the next path in the list.
BGP peer	A BGP neighbor. A BGP neighbor is a router running BGP that formed a BGP neighbor relationship to exchange BGP Updates.
BGP peer group	A configuration construct in which multiple neighbors' parameters can be configured as a group to reduce the length of the configuration. BGP performs routing policy logic against one set of Updates for the peer group, improving convergence time and reducing the CPU load.
BGP synchronization	A feature in which BGP routes cannot be considered to be a best route to reach a prefix unless that same prefix exists in the router's IP routing table as learned via some IGP. When synchronization is enabled, BGP does not advertise a route learned via an iBGP peer to external peers, until the route is learned locally, or via an IGP and is present in the routing table. When synchronization is disabled, BGP can use and advertise routes from an iBGP peer to external peers, which are not present in the routing table.
BGP table	A table inside a router that holds the path attributes known by BGP on that router.
Border Gateway Protocol (BGP)	An exterior routing protocol designed to exchange prefix information between different autonomous systems. The information includes characteristics called path attributes, which allow for great flexibility regarding routing choices.

Term	Description
CIDR	Classless Inter-Domain Routing. A routing method supported by BGP that is based on route aggregation. CIDR allows router to group routes together to cut down on the amount of routing information carried by routers. Several IP networks appear as a single network to networks outside of those grouped together.
External BGP (eBGP)	Refers to how a router views a BGP peer relationship, where the peer is in another AS (Autonomous System). See also Internal BGP (iBGP), where the peer is in the same AS.
Interior Gateway Protocol (IGP)	A routing protocol designed to be used to exchange routing information inside a single autonomous system.
Internal BGP (iBGP)	A characteristic of a BGP neighbor relationship, specifically when the two routers are internal to the same BGP ASN.
neighbor	Another router with which a router decides to exchange routing information.
Neighbor Type	Either external BGP (eBGP), confederation eBGP, or internal BGP (iBGP). The term refers to a peer connection and whether the peers are in different ASs (eBGP), different confederation systems (confederation eBGP), or in the same AS (iBGP).
Next Hop field	With a routing update, or routing table entry, the portion of a route that defines the next router to which a packet should be sent to reach the destination subnet. With routing protocols, the Next Hop field may define a router other than the router sending the routing update.
Next-hop self	A BGP configuration setting that tells the local router to change the NEXT_HOP path attribute to refer to its own BGP Update Source when advertising routes to BGP neighbors.
path control	A general term, that refers to any function that impacts how routers forward packets. These functions include routing protocols and any other feature that impacts the IP routing table, plus any feature that impacts the packet forwarding process.
private AS	BGP ASN whose value is between 64,512 and 65,535. These values are not assigned for use on the Internet and can be used for private purposes, typically either within confederations or by ISPs to hide the ASN used by some customers.
A private ASN	An Autonomous System Number (ASN) that falls inside the Private AS range.
public ASN	An ASN that fits below the private ASN range, specifically from 1 through 54,511 with a 16-bit ASN. With a 32-bit ASN the range is 1 through 4,294,967,295.
redistribution	The process on a router of taking the routes from the IP routing table, as learned by one routing protocol, and injecting routes for those same subnets into another routing protocol.
regular expression	A list of interspersed alphanumeric literals and metacharacters used to apply complex matching logic to alphanumeric strings. Often used for matching AS_Paths.

Term	Description
route map	Enables logic to be applied to a set of items. Often used for decisions about what routes to redistribute and for setting characteristics of those routes, for instance, metric values.
route redistribution	The process of taking routes known through one routing protocol and advertising those routes with another routing protocol.
route summarization	A consolidation of advertised addresses that causes a single summary route to be advertised.
summary route	A route that is created to represent one or more smaller component routes, typically to reduce the size of routing and topology tables.

BGP Attributes

See the below table for descriptions of BGP attributes:

Attribute	Description
Origin	How the prefix came to be routed by BGP at the origin AS. The can learn prefixes from various sources and then put them into BGP. Source include directly connected interfaces, manually configured static routes, and dynamic internal or external routing protocols. Values are IGP (internal protocols such as RIP and OSPF), EGP (other EGPs) and INCOMPLETE (static routes or other means). Every update message has this attribute.
AS_path	A list of the autonomous systems through which the announcement for the prefix has passed. As prefixes pass between autonomous systems, each autonomous system adds its Autonomous System Number (ASN) to the beginning of the list. This means the AS_path can be used to make routing decisions. Every update message has this attribute, although it may be empty.
Next_hop	The address of the next node to which the switch should send packets to get the packets closer to the destination. Every update message has this attribute.
Multi_Exit_Discriminator (MED)	A metric expressing the optimal path by which to reach a particular prefix in or behind a particular AS. One AS sets the value and a different AS uses that value when deciding which path to choose..
Local_preference	A metric used in iBGP so each host knows which path inside the AS it should use to reach the advertised prefix. eBGP peers do not send this value, and ignore it on receipt.
Atomic_aggregate	An attribute that allows BGP peers to inform each other about decisions they have made about overlapping routes. If Switch A receives overlapping routes, and selects the less specific (more general route) only, then it attaches the atomic_aggregate attribute. When one of its neighbors receives a prefix with the atomic_aggregate attribute set, then that neighbor must not take the prefix and de-aggregate it into any more specific entries in BGP.
Aggregator	An attribute that can be attached to an aggregated prefix to specify the AS and Router ID of the switch that performed the aggregation.

Attribute	Description
Community	Where the prefix is relevant to and where it should be advertised. By default, all prefixes below to the Internet community, which is the community of all BGP peers. Other communities have been globally defined that limit the scope of prefix advertisement or export. You can identify a community by a community number.
Originator_ID	The router ID of the iBGP peer that first learned this route, either via an eBGP peer or by some other means, such as importing it. This attribute is used by route reflection to prevent routing loops. eBGP peers do not send this value, and ignore it on receipt.
Cluster_list	A list of the cluster IDs of route reflectors who have reflected the corresponding routes(s) with this AS. This attribute is used by route reflection to prevent routing loops. eBGP peers do not send this value, and ignore it on receipt.

Chapter 44: BGP and BGP4+ Configuration

Introduction 44.2
BGP Configurations 44.3
- Enabling BGP Peers In The Same Autonomous System 44.3
- Enabling BGP Between Different Autonomous Systems 44.5
- Configuring a BGP Route Reflector 44.6
- Configuring a BGP Confederation 44.8
- Configuring BGP Authentication 44.11
- Configuring BGP Graceful Reset 44.13
- Configuring BGP Distance 44.15
- Configuring BGP Graceful Restart 44.18
- Configuring BGP Weight per Peer 44.20

BGP4+ Configurations 44.23
- Enabling iBGP Peering using a Global Address 44.23
- Enabling iBGP Peering using a Link-local Address 44.26
- Enabling eBGP Peering between different Autonomous Systems 44.29
- Configuring Route-Maps with BGP4+ 44.31
- Configuring BGP4+ Graceful Restart 44.35
- Configuring BGP4+ Distance 44.39
- Configuring BGP4+ Graceful Reset 44.43

Introduction

This chapter contains basic BGP and BGP4+ configuration examples.

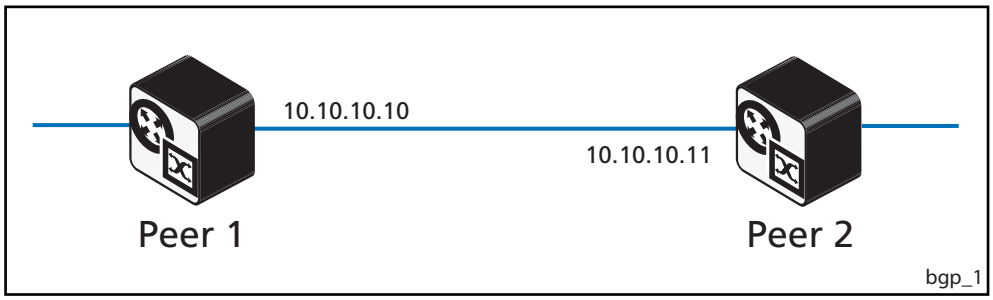
For details about the commands used in these examples, or the outputs from validation commands, see **Chapter 45, BGP and BGP4+ Commands**. This chapter provides an alphabetical reference of commands used to configure the Border Gateway Protocol for IPv4 (BGP) and for IPv6 (BGP4+).

For basic BGP and BGP4+ introduction information, including terminology and concepts about BGP and BGP4+, including the concept of autonomous system numbers (ASN), path attributes (PA), and both internal and external BGP/BGP4+, see **Chapter 43, BGP and BGP4+ Introduction**.

BGP Configurations

Enabling BGP Peers In The Same Autonomous System

This example shows the minimum configuration required for enabling BGP on an interface. **Peer 1** and **Peer 2** are two BGP Peers belonging to the same Autonomous System (AS), AS200, connecting to network 10.10.10.0/24. First, define the routing process and the AS number to which the peers belong. Then, define BGP neighbors to start exchanging routing updates.



Peer 1

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`router bgp 200`	Define the BGP routing process. The number 200 specifies the AS number of **Peer 1**.
`awplus(config-router)#`	
`neighbor 10.10.10.11 remote-as 200`	Define BGP neighbors. 10.10.10.11 is the IP address of the neighbor (**Peer 2**) and 200 is the neighbor's AS number.

Peer 2

`awplus#`	
`configure terminal`	Enter the Global Configuration mode
`awplus(config)#`	
`router bgp 200`	Define the BGP routing process. The number 200 specifies the AS number of **Peer 2**.
`awplus(config-router)#`	
`neighbor 10.10.10.10 remote-as 200`	Define BGP neighbors. 10.10.10.10 is the IP address of the neighbor (**Peer 1**) and 200 is the neighbor's AS number.

Names of Commands Used

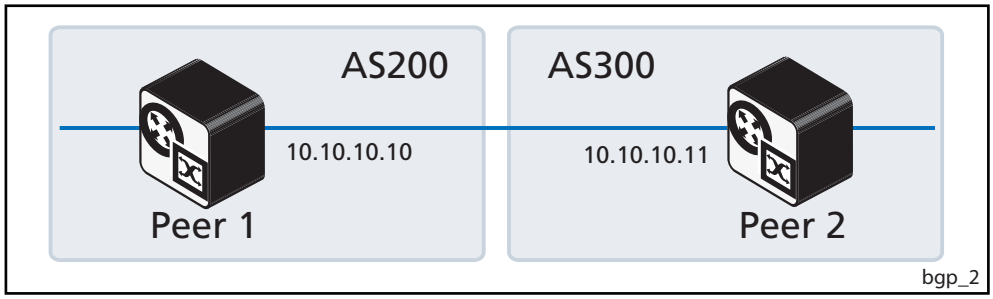
router bgp (BGP and BGP4+)
neighbor remote-as (BGP and BGP4+)

Validation Commands

show ip bgp summary (BGP)
show ip bgp neighbors (BGP)

Enabling BGP Between Different Autonomous Systems

This example shows the minimum configuration required for enabling BGP on an interface when the BGP peers belong to different Autonomous Systems (ASs). **Peer 1** and **Peer 2** are two BGP peers in different ASs, AS200 and AS300 connecting to network 10.10.10.0/24.



Peer 1

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`router bgp 200`	Define the BGP routing process. The number 200 specifies the AS number of Peer 1.
`awplus(config-router)#`	
`neighbor 10.10.10.11 remote-as 300`	Define BGP neighbors. 10.10.10.11 is the IP address of the neighbor (Peer 2) and 300 is the neighbor's AS number.

Peer 2

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`router bgp 300`	Define the BGP routing process. The number 300 specifies the AS number of Peer 2.
`awplus(config-router)#`	
`neighbor 10.10.10.10 remote-as 200`	Define BGP neighbors. 10.10.10.10 is the IP address of the neighbor (Peer 1) and 200 is the neighbor's AS number.

Names of Commands Used

router bgp (BGP and BGP4+)
neighbor remote-as (BGP and BGP4+)

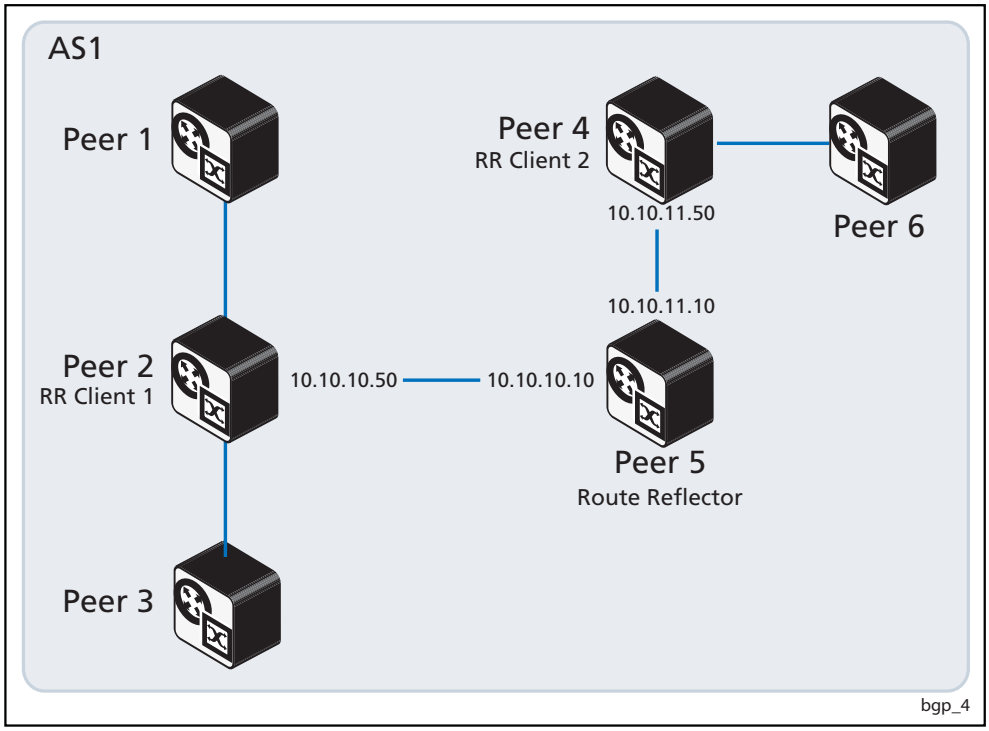
Validation Commands

show ip bgp summary (BGP)
show ip bgp neighbors (BGP)

Configuring a BGP Route Reflector

Use a BGP Route Reflector to reduce the iBGP mesh inside an AS. In this example, Peer 2, Peer 5 and Peer 4 would have to maintain a full mesh among themselves but by making Peer 5 the Route Reflector, Peer 2 (Client1) has an iBGP session with the Route Reflector only and not with Peer 4 (Client 2).

The routes learned from Peer 2 are advertised to the other clients and to iBGP peers outside the cluster; the iBGP routes learned from iBGP peers outside the cluster are advertised to Peer 2. This reduces the iBGP peer connections in AS1.



Route Reflector (Peer 5)

`awplus#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config)#` `router bgp 1`	Define the BGP routing process. The number `1` specifies the AS number of **Peer 5**.
`awplus(config-router)#` `neighbor 10.10.10.50 remote-as 1`	Define BGP neighbors. `10.10.10.50` is the IP address of one of the neighbors (**Peer 2**) and `1` is the neighbor's AS number.
`awplus(config-router)#` `neighbor 10.10.10.50 route-reflector client`	Configure **Peer 5** as the Route-Reflector (RR) and neighbor **Peer 2** as its client.
`awplus(config-router)#` `neighbor 10.10.11.50 remote-as 1`	Define BGP neighbor. `10.10.11.50` is the IP address of one of the neighbors (**Peer 4**) and 1 is the neighbor's AS number.

`awplus(config-router)#`	
`neighbor 10.10.11.50 route-reflector client`	Configure **Peer 5** as the Route-Reflector (RR) and neighbor **Peer 4** as its client.

Route Reflector Client 1 (Peer 2)

`awplus(config)#`	
`router bgp 1`	Define the BGP routing process. The number `1` specifies the AS number of **Peer 2**.
`awplus(config-router)#`	
`neighbor 10.10.10.10 remote-as 1`	Define BGP neighbors. `10.10.10.10` is the IP address of the neighbor (**Peer 5**) and `1` is the neighbor's AS number.

Route Reflector Client 2 (Peer 4)

`awplus(config)#`	
`router bgp 1`	Define the BGP routing process. The number `1` specifies the AS number of **Peer 4**.
`awplus(config-router)#`	
`neighbor 10.10.11.10 remote-as 1`	Define BGP neighbors. `10.10.11.10` is the IP address of the neighbor (**Peer 5**) and `1` is the neighbor's AS number.

Names of Commands Used

neighbor remote-as (BGP and BGP4+)
neighbor route-reflector-client (BGP)

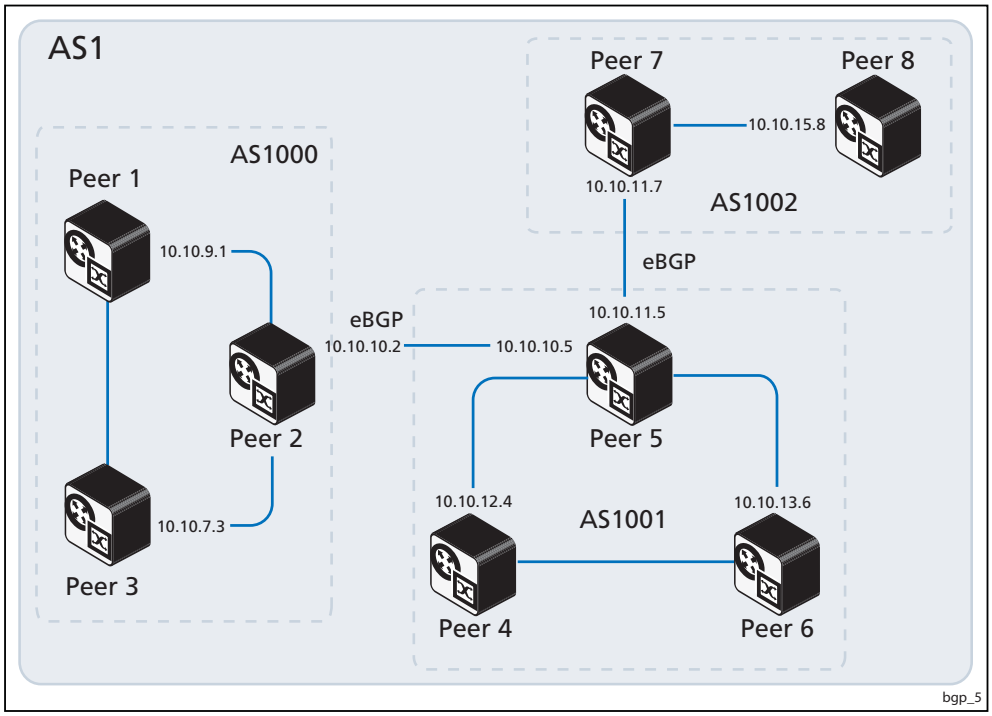
Validation Commands

show ip bgp (BGP)
show ip bgp neighbors (BGP)

Configuring a BGP Confederation

In this example, AS1 contains three Confederation Autonomous Systems - AS 1000, AS 1001 and AS 1002. To any outside AS, the Confederation is a single AS. AS1 Confederation eBGP is run between Peer 2 and Peer 5, and between Peer 5 and Peer 7. Peer 2 is configured so that its local AS is 1000. Its peer connection to Peer 5 is set up like any other eBGP session.

The **bgp confederation identifier (BGP and BGP4+)** command on page 45.21 tells the peer that it is a member of a Confederation and the Confederation ID. The **bgp confederation peers (BGP and BGP4+)** command on page 45.22 lists the member AS to which Peer 2 is connected. The command tells the BGP process that the eBGP connection is a Confederation eBGP rather than a normal eBGP.



Peer 2

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`router bgp 1000`	Define the BGP routing process. The number `1000` specifies the AS number of **Peer 2**.
`awplus(config-router)#`	
`bgp confederation identifier 1`	Specify a BGP Confederation Identifier. To routers outside the confederation, the whole confederation will appear as a single AS, and the identifier will appear as its AS number.
`awplus(config-router)#`	
`bgp confederation peers 1001 1002`	Specify `1001` (**AS1001**) and `1002` (**AS1002**) to become members of the Confederation.

Peer 2(cont.)

```
awplus(config-router)#
neighbor 10.10.10.5 remote-as 1001
awplus(config-router)#
neighbor 10.10.9.1 remote-as 1000
awplus(config-router)#
neighbor 10.10.7.3 remote-as 1000
```

Define BGP neighbors for **Peer 2** by specifying the IP addresses and the AS numbers of neighbors.

Peer 5

```
awplus(config)#
router bgp 1001
```

Define the BGP routing process. The number `1001` specifies the AS number of **Peer 5**.

```
awplus(config-router)#
bgp confederation identifier 1
```

Specify a BGP Confederation Identifier. To routers outside the confederation, the whole confederation will appear as a single AS, and the identifier will appear as its AS number.

```
awplus(config-router)#
bgp confederation peers 1000 1002
```

Specify `1000` (**AS1000**) and `1002` (**AS1002**) to become members of the Confederation.

```
awplus(config-router)#
neighbor 10.10.10.2 remote-as 1000
awplus(config-router)#
neighbor 10.10.11.7 remote-as 1002
awplus(config-router)#
neighbor 10.10.13.6 remote-as 1001
awplus(config-router)#
neighbor 10.10.12.4 remote-as 1001
```

Define BGP neighbors for **Peer 5** by specifying the IP addresses and the AS numbers of neighbors.

Peer 7

`awplus(config)#` `router bgp 1002`	Define the BGP routing process. The number `1001` specifies the AS number of **Peer 5**.
`awplus(config-router)#` `bgp confederation identifier 1`	Specify a BGP Confederation Identifier. To routers outside the confederation, the whole confederation will appear as a single AS, and the identifier will appear as its AS number.
`awplus(config-router)#` `bgp confederation peers 1000 1001`	Specify `1000` (**AS1000**) and `1001` (**AS1001**) to become members of the Confederation.

`awplus(config-router)#`
`neighbor 10.10.11.5 remote-as 1001`
`awplus(config-router)#`
`neighbor 10.10.15.8 remote-as 1002`
	Define BGP neighbors for **Peer 7** by specifying the IP addresses and the AS numbers of neighbors.

Names of Commands Used

neighbor remote-as (BGP and BGP4+)
bgp confederation peers (BGP and BGP4+)
bgp confederation identifier (BGP and BGP4+)

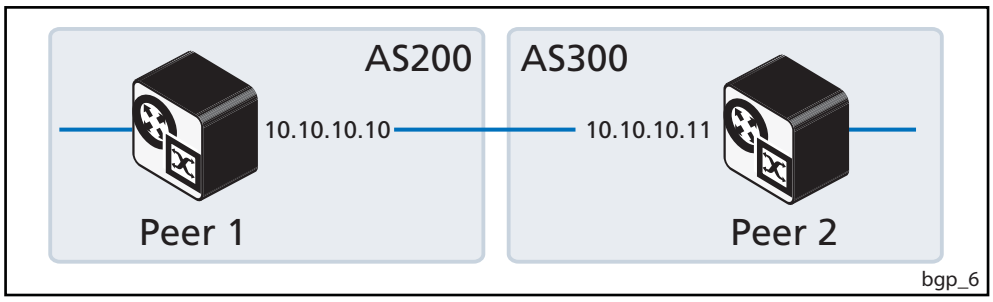
Validation Commands

show ip bgp (BGP)
show ip bgp neighbors (BGP)

Configuring BGP Authentication

BGP authentication allows users to receive selected routing information, enhancing security of their network traffic. When BGP authentication is enabled on a peer, the peer verifies routing packet it receives by exchanging a password that is configured on both the sending and the receiving peers.

In this example, both **Peer 1** and **Peer 2** have `manager` as the password. Configure the same password on all routers that are to communicate using BGP in a network.



Peer 1

`awplus(config)#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config-router)#` `router bgp 200`	Define the BGP routing process. The number `200` specifies the AS number of **Peer 1**.
`awplus(config-router)#` `neighbor 10.10.10.11 remote-as 200`	Define BGP neighbors and establish a TCP session. `10.10.10.11` is the IP address of the neighbor (**Peer 2**) and `200` is the neighbor's AS number.
`awplus(config-router)#` `neighbor 10.10.10.11 password 1 manager`	Specify the encryption type and the password.

Peer 2

`awplus(config)#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config-router)#` `router bgp 200`	Define the BGP routing process. The number `200` specifies the AS number of **Peer 2**.
`awplus(config-router)#` `neighbor 10.10.10.10 remote-as 200`	Define BGP neighbors and establish a TCP session. `10.10.10.10` is the IP address of the neighbor (**Peer 1**) and `200` is the neighbor's AS number.
`awplus(config-router)#` `neighbor 10.10.10.10 password 1 manager`	Specify the encryption type and the password.

Names of Commands Used

neighbor remote-as (BGP and BGP4+)
neighbor password (BGP and BGP4+)

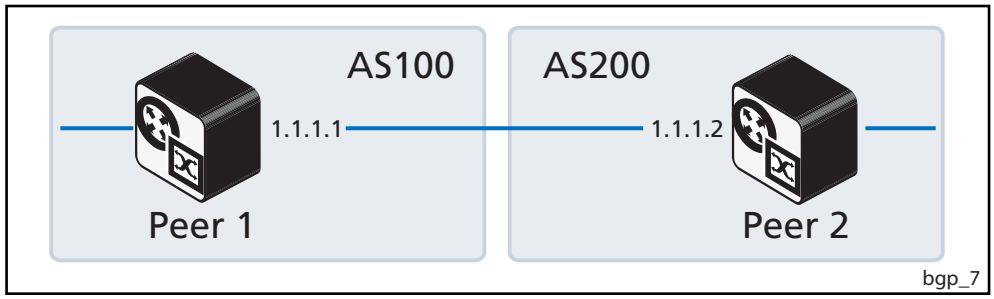
Validation Commands

show ip bgp (BGP)
show ip bgp neighbors (BGP)

Configuring BGP Graceful Reset

The graceful restart feature for BGP session reset is used so that any changes in network configuration do not affect packet forwarding. The **bgp graceful-restart graceful-reset (BGP and BGP4+)** command on page 45.33 invokes graceful restart only when a configuration change forces a peer reset.

This example shows configuring BGP graceful reset.



Peer 1

`awplus(config)#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config-router)#` `router bgp 100`	Define the BGP routing process. The number `100` specifies the AS number of **Peer 1**.
`awplus(config-router)#` `bgp graceful-restart`	Enable BGP graceful restart support.
`awplus(config-router)#` `bgp graceful-restart graceful-reset`	Configure to invoke graceful restart when a configuration change forces a peer reset.
`awplus(config-router)#` `neighbor 1.1.1.2 remote-as 200`	Specify the neighbor's IP address (1.1.1.2) and the AS number of the neighbor (200).
`awplus(config-router)#` `neighbor 1.1.1.2 capability graceful-restart`	Specify the neighbor's IP address (1.1.1.2) for which the graceful restart capability is supported.

Peer 2

`awplus(config)#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config-router)#` `router bgp 200`	Define the BGP routing process. The number `200` specifies the AS number of **Peer 2**.
`awplus(config-router)#` `bgp graceful-restart`	Enable BGP graceful restart support.
`awplus(config-router)#` `bgp graceful-restart graceful-reset`	Configure to invoke graceful restart when a configuration change forces a peer reset.
`awplus(config-router)#` `neighbor 1.1.1.1 remote-as 100`	Specify the neighbor's IP address (1.1.1.1) and the AS number of the neighbor (100).
`awplus(config-router)#` `neighbor 1.1.1.1 capability graceful-restart`	Specify the neighbor's IP address (1.1.1.1) for which the graceful restart capability is supported

Names of Commands Used

bgp graceful-restart (BGP and BGP4+)
bgp graceful-restart graceful-reset (BGP and BGP4+)
neighbor capability graceful-restart (BGP and BGP4+)
neighbor remote-as (BGP and BGP4+)
neighbor restart-time (BGP and BGP4+)
router bgp (BGP and BGP4+)

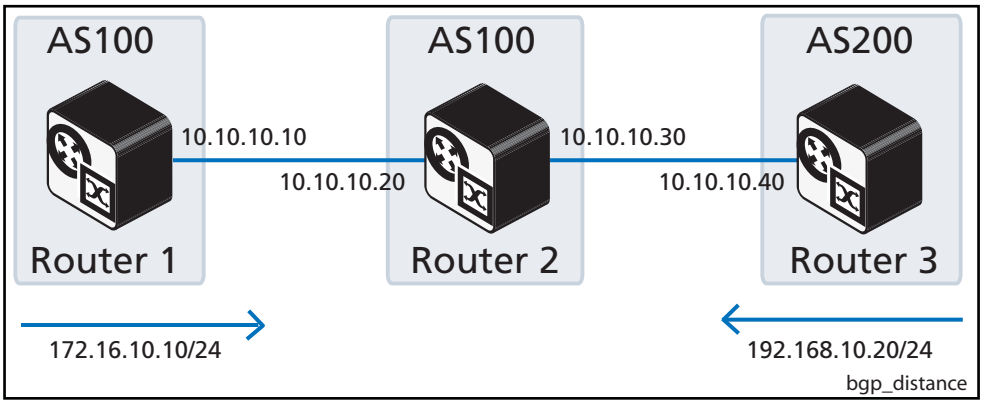
Validation Commands

show ip bgp (BGP)
show ip bgp neighbors (BGP)
show ip bgp summary (BGP)

Configuring BGP Distance

You can configure administrative distance in BGP for a specific address family.

This example shows configuring the BGP distance for the IPv4 Address Family.



Router 1

`awplus(config)#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config-router)#` `router bgp 100`	Define the BGP routing process. The number `100` specifies the AS number of **Router 1**.
`awplus(config-router)#` `network 172.16.10.10/24`	Specify the network `172.16.10.10/24` to be advertised by the BGP routing process from **Router 1** to **Router 2**.
`awplus(config-router)#` `neighbor 10.10.10.20 remote-as 100`	Specify the neighbor's IPv4 address (`10.10.10.20`) and Autonomous System (AS) number (`100`). **Router 2** is the neighbor of **Router 1**.
`awplus(config-router)#` `address-family ipv4 unicast`	Enter the IPv4 Address Family Configuration mode from the Global Configuration mode.
`awplus(config-router-af)#` `neighbor 10.10.10.20 activate`	Activate the exchange of information to the peer (neighbor) with the IPv4 address `10.10.10.20` for **Router 2**. Note that other information apart from prefixes is sent in updates. This command activates the exchange of information for the peer defined.
`awplus(config-router-af)#` `exit-address-family`	Exit IPv4 Address Family Configuration mode, and return to the Router Configuration mode.
`awplus(config-router)#` `exit`	Exit the Router Configuration mode, and return to the Global Configuration mode.

Router 2

`awplus(config)#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config-router)#` `router bgp 100`	Define the BGP routing process. The number `100` specifies the AS number of **Router 2**.
`awplus(config-router)#` `neighbor 10.10.10.40 remote-as 200`	Specify the neighbor's IPv4 address (`10.10.10.40`) and Autonomous System (AS) number (`200`). **Router 3** is a neighbor of **Router 2**.
`awplus(config-router)#` `neighbor 10.10.10.10 remote-as 100`	Specify the neighbor's IPv4 address (`10.10.10.10`) (and Autonomous System (AS) number (`100`). **Router 1** is a neighbor of **Router 2**.
`awplus(config-router)#` `address-family ipv4 unicast`	Enter the IPv4 Address Family Configuration mode from the Global Configuration mode.
`awplus(config-router-af)#` `aggregate-address 172.31.10.10/24 summary-only`	Configure an IPv4 non-AS-set aggregate route on **Router 2**. Note that the local distance gets applied to this route.
`awplus(config-router-af)#` `neighbor 10.10.10.10 activate`	Activate the exchange of information to the peer (neighbor) with the IPv4 address `10.10.10.10` (**Router 1**). Note that other information apart from prefixes is sent in updates. This command activates the exchange of information for the peer defined.
`awplus(config-router-af)#` `neighbor 10.10.10.40 activate`	Activate the exchange of information to the peer (neighbor) with the IPv4 address `10.10.10.40` (**Router 3**). Note that other information apart from prefixes is sent in updates. This command activates the exchange of information for the peer defined.
`awplus(config-router-af)#` `distance 12 13 11`	Configure the administrative distance for external, internal, and local routes received in IPv6 Address Family Configuration mode.
`awplus(config-router-af)#` `exit-address-family`	Exit IPv4 Address Family Configuration mode, and return to the Router Configuration mode.
`awplus(config-router)#` `exit`	Exit the Router Configuration mode, and return to the Global Configuration mode.

Router 3

`awplus(config)#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config-router)#` `router bgp 200`	Define the BGP routing process. The number `200` specifies the AS number of **Router 3**.
`awplus(config-router)#` `network 192.168.10.20/24`	Specify the network `192.168.10.20/24` to be advertised by the BGP4+ routing process from **Router 3** to **Router 2**.
`awplus(config-router)#` `neighbor 10.10.10.30 remote-as 100`	Specify the neighbor's IPv4 address (`10.10.10.30`) (and Autonomous System (AS) number (`100`). **Router 2** is a neighbor of **Router 3**.
`awplus(config-router)#` `address-family ipv4 unicast`	Enter the IPv6 Address Family Configuration mode from the Global Configuration mode.
`awplus(config-router-af)#` `neighbor 10.10.10.30 activate`	Activate the exchange of information to the peer (neighbor) with the IPv4 address `10.10.10.30` for **Router 2**. Note that other information apart from prefixes is sent in updates. This command activates the exchange of information for the peer defined.
`awplus(config-router-af)#` `exit-address-family`	Exit IPv4 Address Family Configuration mode, and return to the Router Configuration mode.
`awplus(config-router)#` `exit`	Exit the Router Configuration mode, and return to the Global Configuration mode.

Names of Commands Used

address-family (BGP and BGP4+)
aggregate-address (BGP and BGP4+)
exit-address-family (BGP and BGP4+)
neighbor remote-as (BGP and BGP4+)
network (BGP and BGP4+)
router bgp (BGP and BGP4+)

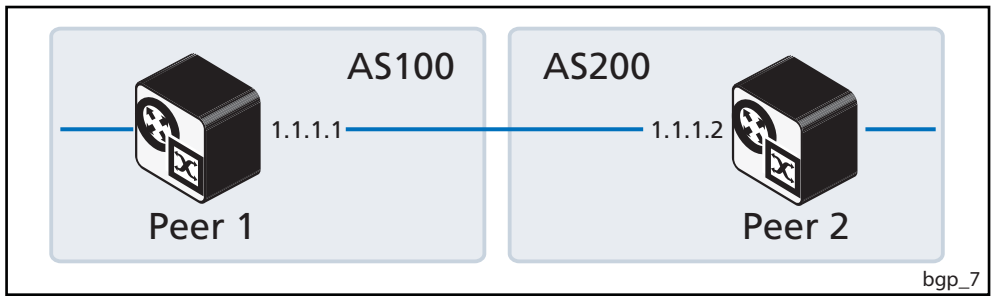
Validation Commands (re-link to BGP commands)

show ip bgp (BGP)
show ip bgp neighbors (BGP)
show ip bgp summary (BGP)

Configuring BGP Graceful Restart

Using BGP graceful restart, the data forwarding plane of the device can continue to process and forward packets even if the control plane, which is responsible for determining best paths, fails. The **bgp graceful-restart (BGP and BGP4+)** command on page 45.32 sets the maximum time that a graceful-restart neighbor waits to come back up after a restart. This value is applied to all neighbors unless you explicitly override it by configuring the corresponding value on the neighbor.

This example shows configuring BGP graceful restart.



Peer 1

`awplus(config)#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config-router)#` `router bgp 100`	Define the BGP routing process. The number `100` specifies the AS number of **Peer 1**.
`awplus(config-router)#` `bgp graceful-restart restart-time 180`	Configure the maximum time in seconds (180) required for neighbor(s) to restart.
`awplus(config-router)#` `bgp graceful-restart stalepath-time 150`	Configure the maximum time in seconds (150) to retain stale paths from the restarting neighbor(s).
`awplus(config-router)#` `bgp update-delay 120`	Configure the maximum time in seconds (120) to defer initial route selection.
`awplus(config-router)#` `neighbor 1.1.1.2 remote-as 200`	Specify the neighbor's IP address (1.1.1.2) and the AS number of the neighbor (200).
`awplus(config-router)#` `neighbor 1.1.1.2 capability graceful-restart`	Specify the neighbor's IP address (1.1.1.2) for which the graceful restart capability is supported.

Peer 2

`awplus(config)#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config-router)#` `router bgp 200`	Define the routing process. The number `200` specifies the AS number of **Peer 2**.
`awplus(config-router)#` `bgp graceful-restart`	Enable BGP graceful restart support. If the restart and stale-path timers are not configured, the defaults are 90 seconds and 360 seconds, respectively.
`awplus(config-router)#` `neighbor 1.1.1.1 remote-as 100`	Specify the neighbor's IP address (1.1.1.1) and the AS number of the neighbor (100).
`awplus(config-router)#` `neighbor 1.1.1.1 capability graceful-restart`	Specify the neighbor's IP address (1.1.1.1) for which the graceful restart capability is supported
`awplus(config-router)#` `neighbor 1.1.1.1 restart-time 160`	Configure the maximum time in seconds (160) required for the neighbor to restart. This overwrites the configured restart time for that neighbor. For example: the above configured restart-time for all neighbors is 90 seconds (the default). With this command, the neighbor, 1.1.1.1, will have a 160 second restart-time.

Names of Commands Used

bgp graceful-restart (BGP and BGP4+)
bgp graceful-restart graceful-reset (BGP and BGP4+)
bgp update-delay (BGP and BGP4+)
neighbor capability graceful-restart (BGP and BGP4+)
neighbor remote-as (BGP and BGP4+)
neighbor restart-time (BGP and BGP4+)
router bgp (BGP and BGP4+)

Validation Commands

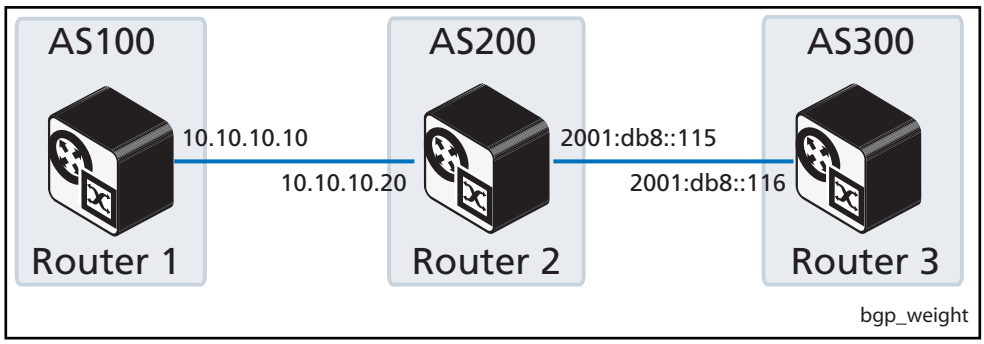
show ip bgp (BGP)
show ip bgp neighbors (BGP)
show ip bgp summary (BGP)

Configuring BGP Weight per Peer

You can assign a different weight per address family of a peer. For example, a network can be configured to prefer IPv6 routes from one peer and IPv4 routes from another peer.

If the neighbor weight command is given under a specific address family mode, then the peer weight is set for that specific address family. If the address family is not specifically set first, then the weight is updated for the default address family instead.

This example shows configuring the BGP Weight per Peer both for IPv4 Address Family and for IPv6 Address Family. Router 1 (AS100) uses IPv4 Address Family, Router 2 (AS200) uses both IPv4 and IPv6 Address Family, Router 3 (AS300) uses IPv6 Address Family.



Router 11

`awplus(config)#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config-router)#` `router bgp 100`	Define the BGP routing process. The number `100` specifies the AS number of **Router 1**.
`awplus(config-router)#` `address-family ipv4 unicast`	Enter the IPv4 Address Family Configuration mode from the Global Configuration mode.
`awplus(config-router-af)#` `neighbor 10.10.10.20 remote-as 200`	Specify the neighbor's IPv4 address (`10.10.10.20`) and Autonomous System (AS) number (`200`). **Router 2** is the neighbor of **Router 1**.
`awplus(config-router-af)#` `neighbor 10.10.10.20 activate`	Activate the exchange of information to the peer (neighbor) with the IPv4 address `10.10.10.20` for **Router 2** in IPv4 Address Family Configuration mode. Note that other information apart from prefixes is sent in updates. This command activates the exchange of information for the peer defined.
`awplus(config-router-af)#` `exit-address-family`	Exit IPv4 Address Family Configuration mode, and return to the Router Configuration mode.
`awplus(config-router)#` `exit`	Exit the Router Configuration mode, and return to the Global Configuration mode.

Router 21

`awplus(config)#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config-router)#` `router bgp 200`	Define the BGP routing process. The number `200` specifies the AS number of **Router 2**.
`awplus(config-router)#` `address-family ipv4 unicast`	Enter the IPv4 Address Family Configuration mode from the Global Configuration mode.
`awplus(config-router-af)#` `neighbor 10.10.10.10 remote-as 100`	Specify the neighbor's IPv4 address (`10.10.10.10`) and Autonomous System (AS) number (`100`). **Router 1** is a neighbor of **Router 2**.
`awplus(config-router-af)#` `neighbor 10.10.10.10 activate`	Activate the exchange of information to the peer (neighbor) with the IPv4 address `10.10.10.10` (**Router 1**) in IPv4 Address Family Configuration mode.
`awplus(config-router-af)#` `neighbor 10.10.10.10 weight 500`	Add a weight of `500` to all IPv4 routes coming from the neighbor with IPv4 address `10.10.10.10` (**Router 1**).
`awplus(config-router-af)#` `exit-address-family`	Exit IPv4 Address Family Configuration mode, and return to the Router Configuration mode.
`awplus(config-router)#` `address-family ipv6 unicast`	Enter the IPv6 Address Family Configuration mode from the Router Configuration mode.
`awplus(config-router-af)#` `neighbor 2001:db8::116 remote-as 300`	Specify the neighbor's IPv4 address (`2001:db8::116`) (and Autonomous System (AS) number (`300`). **Router 3** is a neighbor of **Router 2**.
`awplus(config-router-af)#` `neighbor 2001:db8::116 activate`	Activate the exchange of information to the peer (neighbor) with the IPv6 address `2001:db8::116` (**Router 3**) in IPv6 Address Family Configuration mode. Note that other information apart from prefixes is sent in updates. This command activates the exchange of information for the peer defined.
`awplus(config-router-af)#` `neighbor 2001:db8::116 weight 700`	Add a weight of `500` to all IPv6 routes coming from the neighbor with IPv6 address `2001:db8::116` (**Router 3**).
`awplus(config-router-af)#` `exit-address-family`	Exit IPv6 Address Family Configuration mode, and return to the Router Configuration mode.
`awplus(config-router)#` `exit`	Exit the Router Configuration mode, and return to the Global Configuration mode.

Router 31

`awplus(config)#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config-router)#` `router bgp 300`	Define the BGP routing process. The number `300` specifies the AS number of **Router 3**.
`awplus(config-router)#` `address-family ipv4 unicast`	Enter the IPv4 Address Family Configuration mode from the Global Configuration mode.
`awplus(config-router-af)#` `neighbor 2001:db8::115 remote-as 200`	Specify the neighbor's IPv6 address (`2001:db8::115`) and Autonomous System (AS) number (`200`). **Router 2** is the neighbor of **Router 1**.
`awplus(config-router-af)#` `neighbor 2001:db8::115 activate`	Activate the exchange of information to the peer (neighbor) with the IPv6 address `2001:db8::115` for **Router 2** in IPv6 Address Family Configuration mode. Note that other information apart from prefixes is sent in updates. This command activates the exchange of information for the peer defined.
`awplus(config-router-af)#` `exit-address-family`	Exit IPv6 Address Family Configuration mode, and return to the Router Configuration mode.
`awplus(config-router)#` `exit`	Exit the Router Configuration mode, and return to the Global Configuration mode.

Names of Commands Used

address-family (BGP and BGP4+)
exit-address-family (BGP and BGP4+)
neighbor activate (BGP and BGP4+)
neighbor remote-as (BGP and BGP4+)
neighbor weight (BGP and BGP4+)
router bgp (BGP and BGP4+)

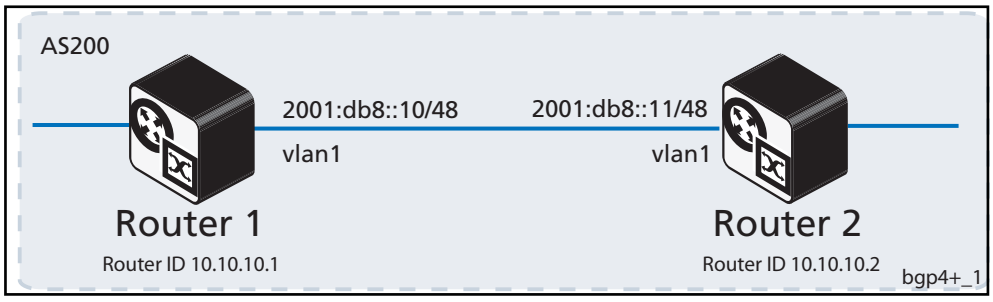
Validation Commands

show ip bgp (BGP)
show ip bgp neighbors (BGP)
show ip bgp summary (BGP)

BGP4+ Configurations

Enabling iBGP Peering using a Global Address

This example shows the minimum configuration required for enabling iBGP on a VLAN interface. **Router 1** and **Router 2** are BGP4+ Peers in in the same Autonomous System (AS), `200`, connected to network `2001:db8::/48`. First, specify an IPv6 global address, then define the AS number for the routers. Next, configure a Router ID, then define BGP4+ neighbors to start exchanging routing updates.



Router 1

`awplus#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config)#` `interface vlan1`	Specify the interface (`vlan1`) to configure an IPv6 global address.
`awplus(config-if)#` `ipv6 address 2001:db8::10/48`	Specify the IPv6 global address `2001:db8::10/48` on interface `vlan1`.
`awplus(config-if)#` `exit`	Leave Interface Configuration mode and enter Global Configuration mode.
`awplus(config)#` `router bgp 200`	Define the BGP4+ routing process. The number `200` specifies the AS number of **Router 1**.
`awplus(config-router)#` `bgp router-id 10.10.10.1`	Configure a fixed Router ID (`10.10.10.1`) for the BGP4+ routing process.

awplus(config-router)#	
neighbor 2001:db8::11 remote-as 200	Define BGP4+ neighbor **Router 2**, and establish a TCP session by specifying the global unicast IPv6 address (2001:db8::11) and the AS number (200) of neighbor **Router 2**.
awplus(config-router)#	
address-family ipv6	Enter IPv6 Address Family Configuration mode for configuring routing sessions that use IPv6 address prefixes.
awplus(config-router-af)#	
neighbor 2001:db8::11 activate	Activate the exchange of information to the peer (neighbor) **Router 2** (2001:db8::11) and enable the exchange of IPv6 address prefix types with this neighbor. Note that other information apart from prefixes is sent in updates. This command activates the exchange of information for the peer defined.
awplus(config-router-af)#	
exit-address-family	Exit IPv6 Address Family Configuration mode, and return to the Router Configuration mode.
awplus(config-router)#	
exit	Exit the Router Configuration mode, and return to the Global Configuration mode.

Router 2

awplus#	
configure terminal	Enter the Global Configuration mode.
awplus(config)#	
interface vlan1	Specify the interface (vlan1) to configure an IPv6 global address.
awplus(config-if)#	
ipv6 address 2001:db8::11/48	Specify the IPv6 global unicast address 2001:db8::10/48 on interface vlan1.
awplus(config-if)#	
exit	Leave Interface Configuration mode and enter Global Configuration mode.
awplus(config)#	
router bgp 200	Define the BGP4+ routing process. The number 200 specifies the AS number of **Router 2**.
awplus(config-router)#	
bgp router-id 10.10.10.2	Configure a fixed Router ID (2001:db8::10) for the BGP4+ routing process.

`awplus(config-router#`	
`neighbor 2001:db8::10 remote-as 200`	Define BGP4+ neighbor **Router 1**, and establish a TCP session by specifying the global IPv6 address (`2001:db8::10`) and the AS number (`200`) of neighbor **Router 1**.
`awplus(config-router)#`	
`address-family ipv6`	Enter IPv6 Address Family Configuration mode for configuring routing sessions that use IPv6 address prefixes.
`awplus(config-router-af)#`	
`neighbor 2001:db8::10 activate`	Activate the exchange of information to the peer (neighbor) **Router 1** (`2001:db8::10`) and enable the exchange of IPv6 address prefix types with this neighbor. Note that other information apart from prefixes is sent in updates. This command activates the exchange of information for the peer defined.
`awplus(config-router-af)#`	
`exit-address-family`	Exit IPv6 Address Family Configuration mode, and return to the Router Configuration mode.
`awplus(config-router)#`	
`exit`	Exit the Router Configuration mode, and return to the Global Configuration mode.

Names of Commands Used

address-family (BGP and BGP4+)
bgp router-id (BGP and BGP4+)
exit-address-family (BGP and BGP4+)
neighbor remote-as (BGP and BGP4+)
router bgp (BGP and BGP4+)

Validation Commands

show bgp ipv6 (BGP4+)
show bgp ipv6 neighbors (BGP4+)
show bgp ipv6 summary (BGP4+)

Enabling iBGP Peering using a Link-local Address

This example shows the minimum configuration required for enabling iBGP on a VLAN interface. **Router 1** and **Router 2** are BGP4+ Peers in in the same Autonomous System (AS), `200`, connected to link local network `fe80::/10`.

First, define the BGP4+ routing process, then define the AS number for the routers. Next, configure a Router ID for the BGP4+ routing process, then define BGP4+ neighbors to start exchanging routing updates.

Router 1

awplus# `configure terminal`	Enter the Global Configuration mode.
awplus(config)# `router bgp 200`	Define the BGP4+ routing process. The number `200` specifies the AS number of **Router 1**.
awplus(config-router)# `bgp router-id 10.10.10.11`	Configure a fixed Router ID (`10.10.10.11`) for the BGP4+ routing process.
awplus(config-router# `neighbor fe80::2 remote-as 200`	Define BGP4+ neighbor **Router 2**, and establish a TCP session by specifying the link-local IPv6 address (`fe80::2`) and the AS number (`200`) of neighbor **Router 2**.

`awplus(config-router)#`	
`neighbor fe80::2 interface vlan1`	Specify a link-local neighbor, and configure the interface name of the neighbor (`fe80::2`).
`awplus(config-router)#`	
`address-family ipv6`	Enter IPv6 Address Family Configuration mode for configuring routing sessions that use IPv6 address prefixes.
`awplus(config-router-af)#`	
`neighbor fe80:2 activate`	Activate the exchange of information to the peer (neighbor) **Router 2** (`fe80::2`) and enable the exchange of IPv6 address prefix types with this neighbor. Note that other information apart from prefixes is sent in updates. This command activates the exchange of information for the peer defined.
`awplus(config-router-af)#`	
`exit-address-family`	Exit IPv6 Address Family Configuration mode, and return to the Router Configuration mode.
`awplus(config-router)#`	
`exit`	Exit the Router Configuration mode, and return to the Global Configuration mode.

Router 2

`awplus#`	
`configure terminal`	Enter the Global Configuration mode.
`awplus(config)#`	
`router bgp 200`	Define the BGP4+ routing process. The number `200` specifies the AS number of **Router 2**.
`awplus(config-router)#`	
`bgp router-id 10.10.10.12`	Configure a fixed Router ID (`10.10.10.12`) for the BGP4+ routing process.
`awplus(config-router#`	
`neighbor fe80::1 remote-as 200`	Define BGP4+ neighbor **Router 1**, and establish a TCP session by specifying the link-local IPv6 address (`fe80::1`) and the AS number (`200`) of neighbor **Router 1**.

`awplus(config-router#` `neighbor fe80::1 interface vlan2`	Specify a link-local neighbor, and configure the interface name of the neighbor (`fe80::1`).
`awplus(config-router)#` `address-family ipv6`	Enter IPv6 Address Family Configuration mode for configuring routing sessions that use IPv6 address prefixes.
`awplus(config-router-af)#` `neighbor fe80::1 activate`	Activate the exchange of information to the peer (neighbor) **Router 1** (`fe80::1`) and enable the exchange of IPv6 address prefix types with this neighbor. Note that other information apart from prefixes is sent in updates. This command activates the exchange of information for the peer defined.
`awplus(config-router-af)#` `exit-address-family`	Exit IPv6 Address Family Configuration mode, and return to the Router Configuration mode.
`awplus(config-router)#` `exit`	Exit the Router Configuration mode, and return to the Global Configuration mode.

Names of Commands Used

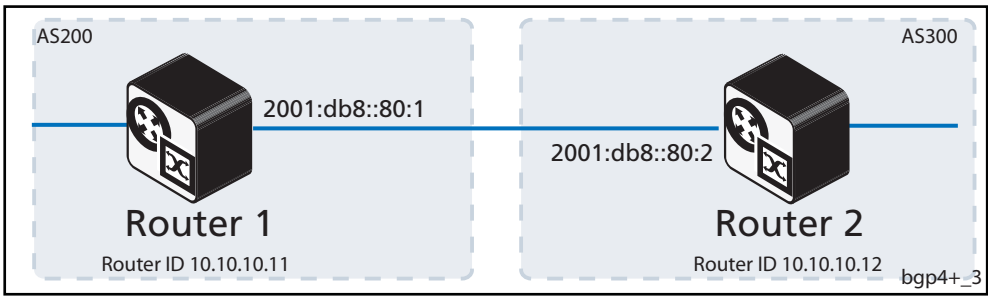
address-family (BGP and BGP4+)
bgp router-id (BGP and BGP4+)
exit-address-family (BGP and BGP4+)
neighbor activate (BGP and BGP4+)
neighbor remote-as (BGP and BGP4+)
router bgp (BGP and BGP4+)

Validation Commands

show bgp ipv6 (BGP4+)
show bgp ipv6 neighbors (BGP4+)
show bgp ipv6 summary (BGP4+)

Enabling eBGP Peering between different Autonomous Systems

This example shows the minimum configuration required to enable eBGP on a VLAN interface, when the routers belong to different Autonomous Systems. **Router 1** and **Router 2** are two routers in different Autonomous Systems, `200` and `300`, connecting to network `2001:db8::/64`.



Router 1

`awplus#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config)#` `router bgp 200`	Define the BGP4+ routing process. The number `200` specifies the AS number of **Router 1**.
`awplus(config-router)#` `bgp router-id 10.10.10.11`	Configure a fixed Router ID (`10.10.10.11`) for the BGP4+ routing process.
`awplus(config-router#` `neighbor 2001:db8::80:2 remote-as 300`	Define BGP4+ neighbor **Router 2**, and establish a TCP session by specifying the global unicast IPv6 address (`2001:db8::80:2`) and the AS number (`300`) of neighbor **Router 2**.
`awplus(config-router)#` `address-family ipv6`	Enter IPv6 Address Family Configuration mode for configuring routing sessions that use IPv6 address prefixes.
`awplus(config-router-af)#` `neighbor 2001:db8::80:2 activate`	Activate the exchange of information to the peer (neighbor) **Router 2** (`2001:db8::80:2`) and enable the exchange of IPv6 address prefix types with this neighbor. Note that other information apart from prefixes is sent in updates. This command activates the exchange of information for the peer defined.
`awplus(config-router-af)#` `exit-address-family`	Exit IPv6 Address Family Configuration mode, and return to the Router Configuration mode.
`awplus(config-router)#` `exit`	Exit the Router Configuration mode, and return to the Global Configuration mode.

Router 2

`awplus#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config)#` `router bgp 300`	Define the BGP4+ routing process. The number `300` specifies the AS number of **Router 2**.
`awplus(config-router)#` `bgp router-id 10.10.10.12`	Configure a fixed Router ID (`10.10.10.12`) for the BGP4+ routing process.
`awplus(config-router#` `neighbor 2001:db8::80:1 remote-as 200`	Define BGP4+ neighbor **Router 1**, and establish a TCP session by specifying the global unicast IPv6 address (`2001:db8::80:1`) and the AS number (`200`) of neighbor **Router 1**.
`awplus(config-router)#` `address-family ipv6`	Enter IPv6 Address Family Configuration mode for configuring routing sessions that use IPv6 address prefixes.
`awplus(config-router-af)#` `neighbor 2001:db8::80:1 activate`	Activate the exchange of information to the peer (neighbor) **Router 1** (`2001:db8::80:1`) and enable the exchange of IPv6 address prefix types with this neighbor. Note that other information apart from prefixes is sent in updates. This command activates the exchange of information for the peer defined.
`awplus(config-router-af)#` `exit-address-family`	Exit IPv6 Address Family Configuration mode, and return to the Router Configuration mode.
`awplus(config-router)#` `exit`	Exit the Router Configuration mode, and return to the Global Configuration mode.

Names of Commands Used

address-family (BGP and BGP4+)
bgp router-id (BGP and BGP4+)
exit-address-family (BGP and BGP4+)
neighbor activate (BGP and BGP4+)
neighbor remote-as (BGP and BGP4+)
router bgp (BGP and BGP4+)

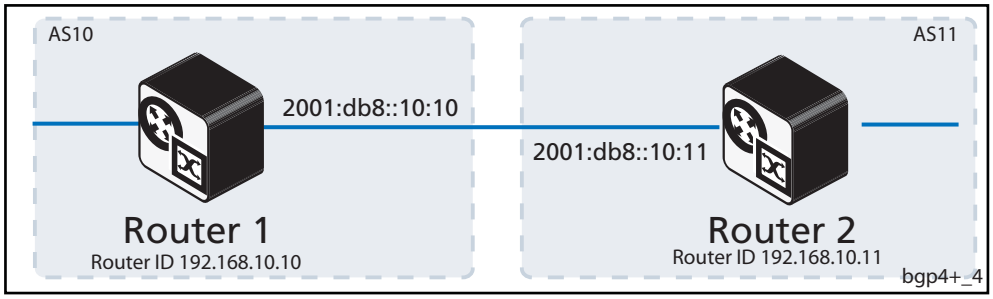
Validation Commands

show bgp ipv6 (BGP4+)
show bgp ipv6 neighbors (BGP4+)
show bgp ipv6 summary (BGP4+)

Configuring Route-Maps with BGP4+

Use route-maps to filter incoming updates from a BGP4+ peer. In this example, a prefix-list named `list1` on **Router 1** is configured to deny entry of any routes with the IPv6 address `2001::db8:12::/48`. To test the route-map filter , **Router 2** is configured to advertise IPv6 network prefixes `2001:db8:11::/48` and `2001:db8:12::/48`.

Use the `show bgp ipv6` command on **Router 1** to verify only the `2001:db8:11::/48` network prefix has been installed in the BGP table.



Router 1

`awplus#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config)#` `ipv6 prefix-list FILTER_LIST_IN seq 5 deny 2001:db8:12::/48`	Create an entry in the prefix-list named `FILTER_LIST_IN` for the route-map. `5` specifies the sequence number or position of this specific route-map. `deny` specifies that prefixes will be rejected. `permit` specifies that prefixes will be allowed. `48` and `64` are the minimum and maximum prefix lengths, respectively, to be matched for this route-map. The prefix-list permits or denies selected prefixes from being installed in the BGP table, when used in a route map with the route map applied to the peering.
`awplus(config)#` `ipv6 prefix-list FILTER_LIST_IN seq 10 permit any`	Create another entry in the prefix-list named `FILTER_LIST_IN` for the route-map. `10` specifies the sequence number or position of this specific route-map. `permit any` specifies prefix-list `FILTER_LIST_IN` to accept all prefixes of any length. The prefix-list permits or denies selected prefixes from being installed in the BGP table, when used in a route map with the route map applied to the peering.
`awplus(config#` `route-map FILTER_BGP_IN_MAP permit 1`	Enter the Route-map Configuration mode from the Global Configuration mode and creates the route-map named `FILTER_BGP_IN_MAP`. The route-map matches on the prefix-list.
`awplus(config-route-map)#` `match ipv6 address prefix-list FILTER_LIST_IN`	Set the match criteria for the route-map. In this case, if the route-map name matches `FILTER_LIST_IN`, then the first sequence `5` denies prefixes and the second sequence `10` accepts prefixes.

`awplus(config-router-map)#` `exit`	Exit the Route-map Configuration mode and return to the Global Configuration mode.
`awplus(config)#` `router bgp 10`	Define the routing process, where `10` is the Autonomous System (AS) number for **Router 1**.
`awplus(config-router)#` `bgp router-id 192.168.10.10`	Configure a fixed Router ID (`192.168.10.10`) for the BGP4+ routing process.
`awplus(config-router#` `neighbor 2001:db8::10:11 remote-as 11`	Define BGP neighbor **Router 2**, and establish a TCP session by specifying the global unicast IPv6 address (`2001:db8::10:11`) and the AS number (`11`) of neighbor **Router 2**.
`awplus(config-router)#` `address-family ipv6`	Enter IPv6 Address Family Configuration mode for configuring routing sessions that use IPv6 address prefixes.
`awplus(config-router-af)#` `neighbor 2001:db8::10:11 route-map list1 in`	Apply the route-map `list1` to all incoming routes.
`awplus(config-router-af)#` `neighbor 2001:db8::10:11 activate`	Activate the neighbor **Router 2** (`2001:db8::10:11`), and enable the exchange of IPv6 address prefix types with this neighbor. Note that other information apart from prefixes is sent in updates. This command activates the exchange of information for the peer defined.
`awplus(config-router-af)#` `exit-address-family`	Exit IPv6 Address Family Configuration mode, and return to the Router Configuration mode.
`awplus(config-router)#` `exit`	Exit the Router Configuration mode, and return to the Global Configuration mode.

Router 2

`awplus#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config)#` `router bgp 11`	Define the BGP4+ routing process. The number `11` specifies the Autonomous System (AS) number of **Router 2**.
`awplus(config-router)#` `bgp router-id 192.168.10.11`	Configure a fixed Router ID (`192.168.10.11`) for the BGP4+ routing process.
`awplus(config-router#` `neighbor 2001:db8::10:10 remote-as 10`	Define BGP4+ neighbor **Router 1**, and establish a TCP session by specifying the global unicast IPv6 address (`2001:db8::10:10`) and the AS number (`10`) of neighbor **Router 1**.
`awplus(config-router)#` `address-family ipv6`	Enter IPv6 Address Family Configuration mode for configuring routing sessions that use IPv6 address prefixes.
`awplus(config-router-af)#` `network 2001:db8:11::/48`	Announces IPv6 network prefix `2001:db8:11::/48`. Running `show ipv6 bgp` command on **Router 1** displays **Router 1** receiving `2001:db8:11::/48` packets.
`awplus(config-router-af)#` `network 2001:db8:12::/48`	Announces IPv6 network prefix `2001:db8:12::/48`. Running `show ipv6 bgp` command on **Router 1** displays **Router 1** rejecting `2001:db8:12::/48` packets.
`awplus(config-router-af)#` `neighbor 2001:db8::10:10 activate`	Activate the exchange of information to the peer (neighbor) **Router 1** (`2001:db8::10:10`) and enable the exchange of IPv6 address prefix types with this neighbor. Note that other information apart from prefixes is sent in updates. This command activates the exchange of information for the peer defined.
`awplus(config-router-af)#` `exit-address-family`	Exit IPv6 Address Family Configuration mode, and return to the Router Configuration mode.
`awplus(config-router)#` `exit`	Exit the Router Configuration mode, and return to the Global Configuration mode.

Names of Commands Used

address-family (BGP and BGP4+)
bgp router-id (BGP and BGP4+)
exit-address-family (BGP and BGP4+)
network (BGP and BGP4+)
neighbor activate (BGP and BGP4+)
neighbor remote-as (BGP and BGP4+)
neighbor route-map (BGP and BGP4+)
router bgp (BGP and BGP4+)

Validation Commands

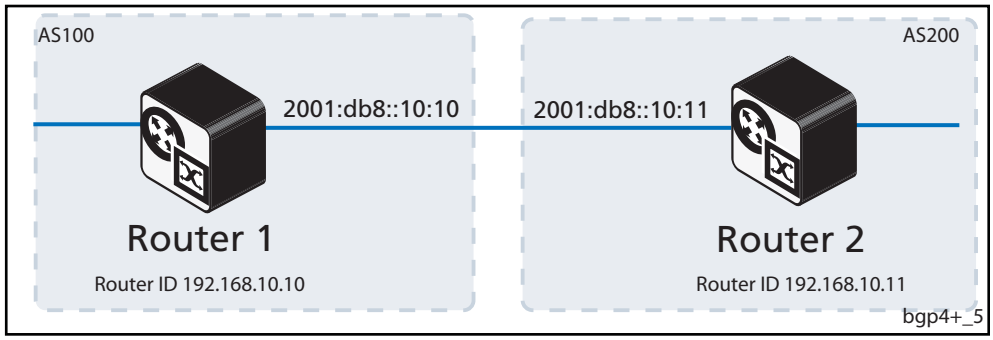
show bgp ipv6 (BGP4+)
show bgp ipv6 neighbors (BGP4+)
show bgp ipv6 summary (BGP4+)

Configuring BGP4+ Graceful Restart

Using BGP4+ graceful restart, the data forwarding plane of the device can continue to process and forward packets even if the control plane, which is responsible for determining best paths, fails.

The **bgp graceful-restart (BGP and BGP4+)** command on page 45.32 sets the maximum time that a graceful-restart neighbor waits to come back up after a restart. This value is applied to all neighbors unless you explicitly override it by configuring the corresponding value on the neighbor.

This example shows configuring BGP4+ graceful restart.



Router 1

`awplus(config)#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config-router)#` `router bgp 100`	Define the BGP4+ routing process. The number `100` specifies the AS number of **Router 1**.
`awplus(config-router)#` `bgp router-id 192.168.10.10`	Configure a fixed Router ID (`192.168.10.10`) for the BGP4+ routing process.
`awplus(config-router)#` `bgp graceful-restart`	Enable BGP4+ graceful restart support. If the restart and stale-path timers are not configured, the defaults are 90 seconds and 360 seconds, respectively.
`awplus(config-router)#` `neighbor 2001:db8::10:11 remote-as 200`	Specify the neighbor's IPv6 address (`2001:db8::10:11`) and the Autonomous System (AS) number of the neighbor (`200`) **Router 2**. **Router 2** is the neighbor of **Router 1**. This command defines BGP neighbor **Router 2**, and establishes a TCP session by specifying the global unicast IPv6 address and AS number of the neighbor.
`awplus(config-router)#` `address-family ipv6 unicast`	Exchange the IPv6 capabilities, and move from Router Configuration mode to IPv6 Address Family Configuration mode.
`awplus(config-router-af)#` `neighbor 2001:db8::10:11 activate`	Activate the exchange of information to the peer (neighbor) with the IPv6 address (`2001:db8::10:11`) (**Router 2**). Note that other information apart from prefixes is sent in updates. This command activates the exchange of information for the peer defined.
`awplus(config-router-af)#` `neighbor 2001:db8::10:11 capability graceful-restart`	Specify the neighbor's IPv6 address (`2001:db8::10:11`), for which the graceful restart capability function is supported. This command advertises the graceful restart capability to the peer.
`awplus(config-router-af)#` `exit-address-family`	Exit IPv6 Address Family Configuration mode, and return to the Router Configuration mode.
`awplus(config-router)#` `exit`	Exit the Router Configuration mode, and return to the Global Configuration mode.

Router 2

`awplus(config)#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config-router)#` `router bgp 200`	Define the BGP4+ routing process. The number `200` specifies the AS number of **Router 2**.
`awplus(config-router)#` `bgp router-id 192.168.10.11`	Configure a fixed Router ID (`192.168.10.11`) for the BGP4+ routing process.
`awplus(config-router)#` `bgp graceful-restart`	Enable BGP4+ graceful restart support.
`awplus(config-router)#` `bgp graceful-restart restart-time 120`	Configure the maximum time in seconds (`120`) required for neighbor(s) to restart.
`awplus(config-router)#` `bgp graceful-restart stalepath-time 120`	Configure the maximum time in seconds (`120`) to retain stale paths from the restarting neighbor(s).
`awplus(config-router)#` `bgp update-delay 120`	Configure the maximum time in seconds (120) to defer initial route selection.
`awplus(config-router)#` `neighbor 2001:db8::10:10 remote-as 100`	Specify the neighbor's global unicast IPv6 address (`2001:db8::10:10`) and the AS number of the neighbor (`100`) **Router 1**. **Router 1** is the neighbor of **Router 2**. This command defines BGP neighbor **Router 1**, and establishes a TCP session by specifying the global unicast IPv6 address and AS number of the neighbor.

`awplus(config-router)#` `address-family ipv6 unicast`	Exchange the IPv6 capabilities, and move from Router Configuration mode to IPv6 Address Family Configuration mode.
`awplus(config-router-af)#` `neighbor 2001:db8::10:10 activate`	Activate the exchange of information to the peer (neighbor) with the global unicast IPv6 address (`2001:db8::10:10`) (**Router 1**). Note that other information apart from prefixes is sent in updates. This command activates the exchange of information for the peer defined.
`awplus(config-router-af)#` `neighbor 2001:db8::10:10 capability graceful-restart`	Specify the neighbor's global unicast IPv6 address (`2001:db8::10:10`), for which the graceful restart capability function is supported. This command advertises the graceful restart capability to the peer.
`awplus(config-router-af)#` `exit-address-family`	Exit IPv6 Address Family Configuration mode, and return to the Router Configuration mode.
`awplus(config-router)#` `exit`	Exit the Router Configuration mode, and return to the Global Configuration mode.

Names of Commands Used

address-family (BGP and BGP4+)
bgp graceful-restart (BGP and BGP4+)
bgp graceful-restart graceful-reset (BGP and BGP4+)
bgp update-delay (BGP and BGP4+)
exit-address-family (BGP and BGP4+)
neighbor capability graceful-restart (BGP and BGP4+)
neighbor remote-as (BGP and BGP4+)
router bgp (BGP and BGP4+)

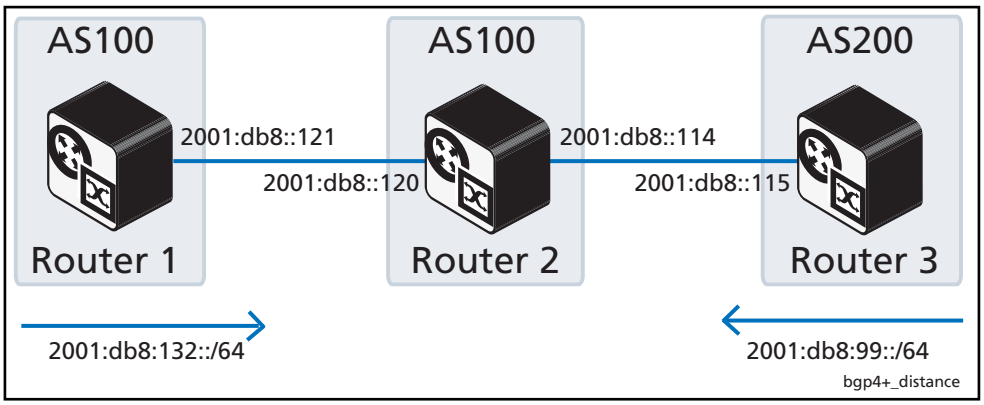
Validation Commands

show bgp ipv6 (BGP4+)
show bgp ipv6 neighbors (BGP4+)
show bgp ipv6 summary (BGP4+)

Configuring BGP4+ Distance

You can configure administrative distance in BGP4+ for a specific address family.

This example shows configuring the BGP4+ distance for the IPv6 Address Family.



Router 1

`awplus(config)#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config-router)#` `router bgp 100`	Define the BGP4+ routing process. The number `100` specifies the AS number of **Router 1**.
`awplus(config-router)#` `network 2001:db8:132::/64`	Specify the network `2001:db8:132::/64` to be advertised by the BGP4+ routing process from **Router 1** to **Router 2**.

awplus(config-router)# neighbor 2001:db8::120 remote-as 100	Specify the neighbor's IPv6 address (2001:db::120) and Autonomous System (AS) number (100). **Router 2** is the neighbor of **Router 1**. This command defines BGP neighbor **Router 2**, and establishes a TCP session by specifying the global unicast IPv6 address and the AS number of the neighbor.
awplus(config-router)# address-family ipv6 unicast	Enter the IPv6 Address Family Configuration mode from the Global Configuration mode.
awplus(config-router-af)# neighbor 2001:db8::120 activate	Activate the exchange of information to the peer (neighbor) with the global unicast IPv6 address 2001:db::120 for **Router 2**. Note that other information apart from prefixes is sent in updates. This command activates the exchange of information for the peer defined.
awplus(config-router-af)# exit-address-family	Exit IPv6 Address Family Configuration mode, and return to the Router Configuration mode.
awplus(config-router)# exit	Exit the Router Configuration mode, and return to the Global Configuration mode.

Router 2

awplus(config)# configure terminal	Enter the Global Configuration mode.
awplus(config-router)# router bgp 100	Define the BGP4+ routing process. The number 100 specifies the AS number of **Router 2**.
awplus(config-router)# neighbor 2001:db8::121 remote-as 100	Specify the neighbor's global unicast IPv6 address (2001:db8::121) and Autonomous System (AS) number (100). **Router 1** is a neighbor of **Router 2**. This command defines BGP4+ neighbor **Router 1**, and establishes a TCP session by specifying the global unicast IPv6 address and the AS number of the neighbor.
awplus(config-router)# neighbor 2001:db8::115 remote-as 200	Specify the neighbor's global unicast IPv6 address (2001:db8::115) (and Autonomous System (AS) number (200). **Router 3** is a neighbor of **Router 2**. This command defines BGP4+ neighbor **Router 3**, and establishes a TCP session by specifying the global unicast IPv6 address and the AS number of the neighbor.
awplus(config-router)# address-family ipv6 unicast	Enter the IPv6 Address Family Configuration mode from the Global Configuration mode.

`awplus(config-router-af)#` `aggregate-address 2001:db8::102/64 summary-only`	Configure an IPv6 non-AS-set aggregate route on **Router 2**. Note that the local distance gets applied to this route.
`awplus(config-router-af)#` `neighbor 2001:db8::121 activate`	Activate the exchange of information to the peer (neighbor) with the global unicast IPv6 address `2001:db::121` for **Router 1**. Note that other information apart from prefixes is sent in updates. This command activates the exchange of information for the peer defined.
`awplus(config-router-af)#` `neighbor 2001:db8::115 activate`	Activate the exchange of information to the peer (neighbor) with the global unicast IPv6 address `2001:db8::115` for **Router 3**. Note that other information apart from prefixes is sent in updates. This command activates the exchange of information for the peer defined.
`awplus(config-router-af)#` `distance 12 13 11`	Configure the administrative distance for external, internal, and local routes received in IPv6 Address Family Configuration mode.
`awplus(config-router-af)#` `exit-address-family`	Exit IPv6 Address Family Configuration mode, and return to the Router Configuration mode.
`awplus(config-router)#` `exit`	Exit the Router Configuration mode, and return to the Global Configuration mode.

Router 3

`awplus(config)#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config-router)#` `router bgp 200`	Define the BGP4+ routing process. The number `100` specifies the AS number of **Router 3**.
`awplus(config-router)#` `network 2001:db8:99::/64`	Specify the network `2001:db8:99::/64` to be advertised by the BGP4+ routing process from **Router 3** to **Router 2**.
`awplus(config-router)#` `neighbor 2001:db8::114 remote-as 100`	Specify the neighbor's global unicast IPv6 address (`2001:db8::114`) (and Autonomous System (AS) number (`100`). **Router 2** is a neighbor of **Router 3**. This command defines BGP4+ neighbor **Router 2**, and establishes a TCP session by specifying the global unicast IPv6 address and the AS number of the neighbor.
`awplus(config-router)#` `address-family ipv6 unicast`	Enter the IPv6 Address Family Configuration mode from the Global Configuration mode.
`awplus(config-router-af)#` `neighbor 2001:db8::114 activate`	Activate the exchange of information to the peer (neighbor) with the global unicast IPv6 address `2001:db::114` for **Router 2**. Note that other information apart from prefixes is sent in updates. This command activates the exchange of information for the peer defined.
`awplus(config-router-af)#` `exit-address-family`	Exit IPv6 Address Family Configuration mode, and return to the Router Configuration mode.
`awplus(config-router)#` `exit`	Exit the Router Configuration mode, and return to the Global Configuration mode.

Names of Commands Used

address-family (BGP and BGP4+)
aggregate-address (BGP and BGP4+)
exit-address-family (BGP and BGP4+)
network (BGP and BGP4+)
neighbor activate (BGP and BGP4+)
neighbor remote-as (BGP and BGP4+)
router bgp (BGP and BGP4+)

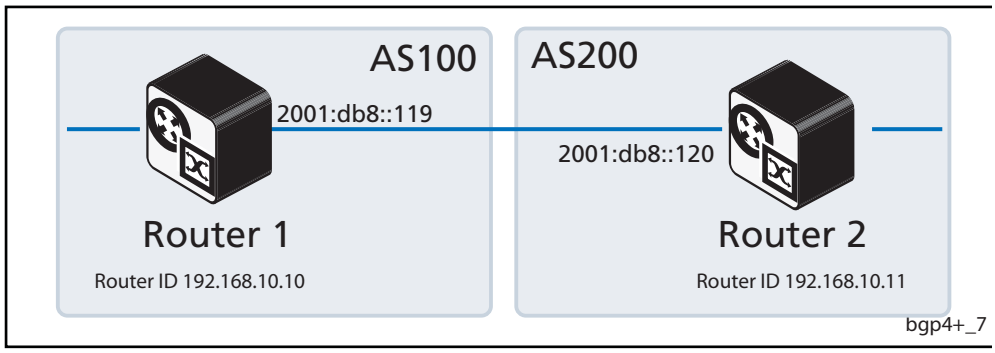
Validation Commands

show bgp ipv6 (BGP4+)
show bgp ipv6 neighbors (BGP4+)
show bgp ipv6 summary (BGP4+)

Configuring BGP4+ Graceful Reset

The graceful restart feature for BGP4+ session reset is used so that any changes in network configuration do not affect packet forwarding. The **bgp graceful-restart graceful-reset (BGP and BGP4+)** command on page 45.33 invokes graceful restart only when a configuration change forces a peer reset.

This example shows configuring BGP4+ graceful reset.



Router 1

`awplus(config)#` `configure terminal`	Enter the Global Configuration mode.
`awplus(config-router)#` `router bgp 100`	Define the BGP4+ routing process. The number `100` specifies the AS number of **Router 1**.
`awplus(config-router)#` `bgp router-id 192.168.10.10`	Configure a fixed Router ID (`192.168.10.10`) for the BGP4+ routing process.
`awplus(config-router)#` `bgp graceful-restart`	Enable BGP4+ graceful restart support.
`awplus(config-router)#` `bgp graceful-restart graceful-reset`	Configure to invoke graceful restart when a configuration change forces a peer reset.
`awplus(config-router)#` `neighbor 2001:db8::120 remote-as 200`	Specify the neighbor's IPv6 address (`2001:db::120`) and the AS number of the neighbor (`200`).

awplus(config-router)# address-family ipv6 unicast	Enter the IPv6 Address Family Configuration mode from the Global Configuration mode.
awplus(config-router-af)# neighbor 2001:db8::120 activate	Activate the exchange of information to the peer (neighbor) with the IPv6 address 2001:db::120 for **Router 2**. Note that other information apart from prefixes is sent in updates. This command activates the exchange of information for the peer defined.
awplus(config-router-af)# neighbor 2001:db8::120 capability graceful-restart	Specify the neighbor's global unicast IPv6 address (2001:db::120) for which the graceful restart capability is supported. This command advertises the graceful restart capability to the peer.
awplus(config-router-af)# exit-address-family	Exit IPv6 Address Family Configuration mode, and return to the Router Configuration mode.
awplus(config-router)# exit	Exit the Router Configuration mode, and return to the Global Configuration mode.

Router 2

awplus(config)# configure terminal	Enter the Global Configuration mode.
awplus(config-router)# router bgp 200	Define the BGP4+ routing process. The number 200 specifies the AS number of **Router 2**.
awplus(config-router)# bgp router-id 192.168.10.10	Configure a fixed Router ID (192.168.10.10) for the BGP4+ routing process.
awplus(config-router)# bgp graceful-restart	Enable BGP4+ graceful restart support.
awplus(config-router)# bgp graceful-restart graceful-reset	Configure to invoke graceful restart when a configuration change forces a peer reset.
awplus(config-router)# neighbor 2001:db8::119 remote-as 100	Specify the neighbor's IPv6 address (2001:db::119) and the AS number of the neighbor (100).

`awplus(config-router)#` `address-family ipv6 unicast`	Enter the IPv6 Address Family Configuration mode from the Global Configuration mode.
`awplus(config-router-af)#` `neighbor 2001:db8::119 activate`	Activate the exchange of information to the peer (neighbor) with the global unicast IPv6 address `2001:db::119` for **Router 1**. Note that other information apart from prefixes is sent in updates. This command activates the exchange of information for the peer defined.
`awplus(config-router-af)#` `neighbor 2001:db8::119 capability graceful-restart`	Specify the neighbor's global unicast IPv6 address (`2001:db::119`) for which the graceful restart capability is supported. This command advertises the graceful restart capability to the peer.
`awplus(config-router-af)#` `exit-address-family`	Exit IPv6 Address Family Configuration mode, and return to the Router Configuration mode.
`awplus(config-router)#` `exit`	Exit the Router Configuration mode, and return to the Global Configuration mode.

Introduction

This chapter provides an alphabetical reference of commands used to configure the Border Gateway Protocol for IPv4 (BGP) and for IPv6 (BGP4+).

For basic BGP and BGP4+ introduction information, including terminology and concepts about BGP and BGP4+, including the concept of autonomous system numbers (ASN), path attributes (PA), and both internal and external BGP/BGP4+, see **Chapter 43, BGP and BGP4+ Introduction**.

For basic BGP and BGP4+ configuration examples, see **Chapter 44, BGP and BGP4+ Configuration**.

Controlling “show” Command Output

You can control the output of **show** commands by using the | and > or >> tokens in the following ways:

- To display only part of the output, follow the command with **|** and then other keywords (see **Output Modifiers** below)
- To save the output to a file, follow the command with **> *filename***
- To append the output to an existing file, follow the command with **>> *filename***

Using the ? after typing the **show** command displays the following information about these tokens:

```
awplus#  show users
```

```
| Output modifiers
> Output redirection
>> Output redirection (append)
```

Output Modifiers

Type the | (vertical bar) to use **Output modifiers**.

```
append    Append output
begin     Begin with the first line that contains
          matching output
exclude   Exclude lines that contain matching output
include   Include lines that contain matching output
redirect  Redirect output
```

Begin

The **begin** parameter causes the display to begin at the first line that contains the input string.

```
awplus#  show run | begin vlan1
```

```
...skipping
interface vlan1
 ip address 192.168.14.1
!!
line con 0
 login
line vty 0 4
 login
!
end
```

Exclude The **exclude** parameter excludes all lines of output that contain the input string. In the following output all lines containing the word "input" are excluded:

```
awplus#  show interface vlan1 | exclude input
```

```
Interface vlan1
  Scope: both
  Hardware is Ethernet, address is 192.168.14.1
  index 3 metric 1 mtu 1500 <UP,BROADCAST,RUNNING,MULTICAST>
  Label switching is disabled
  No Virtual Circuit configured
  Administrative Group(s): None
  DSTE Bandwidth Constraint Mode is MAM
    output packets 4438, bytes 394940, dropped 0
    output errors 0, aborted 0, carrier 0, fifo 0, heartbeat 0,
window 0
    collisions 0
```

Include The include parameter includes only those lines of output that contain the input string. In the output below, all lines containing the word "input" are included:

```
awplus#  show interface vlan1 | include input
```

```
 input packets 80434552, bytes 2147483647, dropped 0, multicast
packets 0
 input errors 0, length 0, overrun 0, CRC 0, frame 0, fifo 1,
missed 0
```

Redirect The **redirect** parameter puts the lines of output into the specified file. If the file already exists, the new output overwrites the file's contents; the new output is not appended to the existing file contents.

| **redirect** and > are synonyms.

```
awplus#  show history | redirect history.txt
```

Output Redirection The output redirection token > puts the lines of output into the specified file. If the file already exists, the new output overwrites the file's contents; the new output is not appended to the existing file contents.

| **redirect** and > are synonyms.

```
awplus#  show history > history.txt
```

Append Output The append output token >> adds the lines of output into the specified file. The file must already exist, for the new output to be added to the end of the file's contents; the new output is appended to the existing file contents.

| **append** and >> are synonyms.

```
awplus#  show history >> history.txt
```

Command List

address-family (BGP and BGP4+)

This command enters the IPv4 or IPv6 Address-Family Configuration command mode. In this mode you can configure address-family specific parameters.

When using VRF-Lite, you can enter IPv4 Address Family Configuration mode for a specified VRF instance before configuring that instance.

Syntax [BGP]

```
address-family ipv4 [unicast]
no address-family ipv4 [unicast]
```

Syntax (VRF Lite)

```
address-family ipv4 [unicast|vrf <vrf-name>]
no address-family ipv4 [unicast|vrf <vrf-name>]
```

Syntax [BGP4+]

```
address-family ipv6 [unicast]
no address-family ipv6 [unicast]
```

Parameter	Description
ipv4	Configure parameters relating to the exchange of IPv4 prefixes.
ipv6	Configure parameters relating to the exchange of IPv6 prefixes.
unicast	Configure parameters relating to the exchange of routes to unicast destinations.
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance to enter IPv4 Address-Family mode for.

Mode [BGP] Router Configuration or IPv4 Address Family Configuration mode for a VRF instance

Mode [BGP4+] Router Configuration

Usage [BGP/BGP4+] To leave the IPv4 or IPv6 Address Family Configuration mode, and return to the Router Configuration mode, use the **exit-address-family (BGP and BGP4+)** command.

Example [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# neighbor 192.168.0.1 remote-as 100
awplus(config-router)# address-family ipv4 vrf green
awplus(config-router-af)# neighbor 192.168.0.1 activate
awplus(config-router-af)# exit-address-family
awplus(config-router)#
```

Example [BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as
100
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 activate
awplus(config-router-af)# exit-address-family
awplus(config-router)#
```

Related Commands exit-address-family (BGP and BGP4+)

aggregate-address (BGP and BGP4+)

This command adds an aggregate route that can be advertised to BGP or BGP4+ neighbors. This command creates an aggregate entry in the BGP or BGP4+ routing table if the switch learns, by any means, any routes that are within the range configured by the aggregate address/mask.

When this command is used with the **summary-only** option, the more-specific routes of the aggregate are suppressed to all neighbors. Use the **neighbor unsuppress-map (BGP and BGP4+)** command instead to selectively leak more-specific routes to a particular neighbor.

The **no** variant of this command removes the aggregate configured by the **aggregate-address** command.

Syntax [BGP]

```
aggregate-address <ip-addr/m> {summary-only|as-set}
no aggregate-address <ip-addr/m> {summary-only|as-set}
```

Syntax [BGP4+]

```
aggregate-address <ipv6-addr/prefix-length> {summary-only|as-set}
no aggregate-address <ipv6-addr/prefix-length> {summary-only|as-set}
```

Parameter	Description
<ip-addr/m>	Specifies the aggregate IPv4 address and mask.
<ipv6-addr/ prefix-length>	Specifies the aggregate IPv6 address. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.
`summary-only`	Filters more specific routes from updates. Only the aggregate address/mask will be advertised, and none of the component addresses that fall within the range of the aggregate address/mask.
`as-set`	Generates AS set path information. The AS-path advertised with the aggregate is an unordered list of all the AS-numbers that appear in any of the AS-paths of the component routes, with each AS-number appearing just once in the list.

Mode [BGP] Router Configuration or IPv4 Address Family Configuration for a VRF instance

Mode [BGP4+] IPv6 Address Family Configuration

Usage [BGP] If the `summary-only` parameter is specified, then only the aggregate address/mask will be advertised, and none of the component addresses that fall within the range of the aggregate address/mask. For example, if you configure:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# aggregate-address 172.0.0.0/8 summary-only
```

then the switch will advertise the prefix `172.0.0.0/8`, but no component routes like `172.10.0.0/16`

The `as-set` parameter controls the AS-path attribute that is advertised with the aggregate route. If the switch has learnt multiple routes that are within the range of the aggregate address/mask, and the AS-paths associated with those routes contain different sets of AS-numbers, then it is not possible to create a single AS-path that accurately represents the AS-paths of all those component routes. In this case, the switch will, by default, advertise a NULL AS-path with the aggregate.

Usage [BGP4+] If the `summary-only` parameter is specified, then only the aggregate address/mask will be advertised, and none of the component addresses that fall within the range of the aggregate address/mask. For example, if you configure:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)#address-family ipv6
awplus(config-router-af)# aggregate-address 2001:0db8::/64
summary-only
```

then the switch will advertise the prefix `2001:0db8::/64`, but no component routes like `2001:0db8:010d::1/128`

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# aggregate-address 192.0.0.0/8 as-set
summary-only

awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# no aggregate-address 192.0.0.0/8 as-set
summary-only
```

Examples [BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# address family ipv6
awplus(config-router-af)# aggregate-address 2001:0db8::/64
as-set summary-only

awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# address family ipv6
awplus(config-router-af)# no aggregate-address 2001:0db8::/64
as-set summary-only
```

Related Commands **aggregate-address (BGP and BGP4+)**
match as-path (Route Map)

auto-summary (BGP)

Use this command to enable sending summarized routes by a BGP speaker to its peers in the Router Configuration mode or in the Address-Family Configuration mode. BGP uses auto-summary to advertise summarized routes.

Use the **no** variant of this command to disable BGP auto-summary.

Syntax

```
auto-summary
no auto-summary
```

Default The auto-summary function is disabled by default.

Mode Router Configuration and Address Family IPv4 mode

Usage If certain routes have already been advertised, enabling auto-summary results in non-summarized routes being withdrawn and only summarized routes are advertised. Summarized routes are advertised before non-summarized routes are withdrawn from all connected peers.

If certain routes have already been advertised, disabling auto-summary results in summarized routes being withdrawn and only non-summarized routes are advertised. Non-summarized routes are advertised before summarized routes are withdrawn from all connected peers.

Examples The following example enables auto-summary in Router Configuration mode:

```
awplus# configure
awplus(config)# router bgp 100
awplus(config-router)# auto-summary
```

The following example disables auto-summary in Router Configuration mode:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# no auto-summary
```

The following example enables auto-summary in Address Family IPv4 mode:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# address-family ipv4
awplus(config-router-af)# auto-summary
```

The following example disables auto-summary in Address Family IPv4 mode:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no auto-summary
```

bgp aggregate-nexthop-check (BGP and BGP4+)

This command affects the operation of the summary-only option on the aggregate-address command.

This command enables a mode whereby the summary-only option will only suppress the component routes if those component routes all have the same nexthop. If the routes have different nexthops, then they will continue to be advertised to peers even if the summary-only option is configured. By default this is disabled.

The **no** variant of this command disables this function.

Syntax

```
bgp aggregate-nexthop-check
no bgp aggregate-nexthop-check
```

Default Disabled by default.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# bgp aggregate-nexthop-check
```

bgp always-compare-med (BGP and BGP4+)

This command enables BGP to compare the Multi Exit Discriminator (MED) for paths from neighbors in different autonomous systems.

Multi Exit Discriminator (MED) is used in best path selection by BGP. MED is compared after BGP attributes weight, local preference, AS-path and origin have been compared and are equal.

By default, MED comparison is done only among routes from the same autonomous system (AS). Use the **bgp always-compare-mode** command to allow comparison of MEDs from different ASs.

A path with a lower MED value is preferred. For example, if the bgp table contains the following entries, and the **bgp always-compare-med** command has been issued to enable this feature:

```
Route1: as-path 400, med 300
Route2: as-path 200, med 200
Route3: as-path 400, med 250
```

Route1 is compared to Route2. Route2 is best of the two (lower MED). Next, Route2 is compared to Route3 and Route2 is chosen best path again (lower MED). If **always-compare-med** was disabled, MED is not taken into account when Route1 and Route2 are compared, because of different ASs and MED is compared for only Route1 and Route3. In this case, Route3 would be the best path. The selected route is also affected by the **bgp deterministic-med** command. See the **bgp deterministic-med (BGP and BGP4+)** command on page 45.29 for details.

If this command is used to compare MEDs for all paths, it should be configured on every BGP router in the AS.

The **no** variant of this command disallows the comparison.

Syntax

```
bgp always-compare-med
no bgp always-compare-med
```

Default By default this feature is disabled.

Mode Router Configuration

Example

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp always-compare-med
```

Related Commands

bgp bestpath med (BGP and BGP4+)
bgp bestpath as-path ignore (BGP and BGP4+)
bgp bestpath compare-routerid (BGP and BGP4+)
bgp deterministic-med (BGP and BGP4+)

bgp bestpath as-path ignore (BGP and BGP4+)

This command prevents the router from considering as-path as a factor in the algorithm for choosing a route.

The **no** variant of this command allows the router to consider as-path in choosing a route.

Syntax

```
bgp bestpath as-path ignore
no bgp bestpath as-path ignore
```

Mode Router Configuration

Example

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp bestpath as-path ignore
```

Related Commands **bgp always-compare-med (BGP and BGP4+)**
bgp bestpath med (BGP and BGP4+)
bgp bestpath compare-routerid (BGP and BGP4+)

bgp bestpath compare-confed-aspath (BGP and BGP4+)

This command specifies that the AS confederation path length must be used, when available, in the BGP best path decision process. It is effective only when **bgp bestpath as-path ignore (BGP and BGP4+)** command has not been specified.

By default, if BGP receives routes with identical eBGP paths from eBGP peers, BGP does not continue to consider any AS confederation path length attributes that may be associated with the routes.

The **no** variant of this command returns the switch to the default state, where the switch ignores AS confederation path length in the BGP best path selection process.

Syntax

```
bgp bestpath compare-confed-aspath
no bgp bestpath compare-confed-aspath
```

Mode Router Configuration

Example

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp bestpath compare-confed-aspath
```

Related Commands **bgp bestpath as-path ignore (BGP and BGP4+)**

bgp bestpath compare-routerid (BGP and BGP4+)

By default, when comparing similar routes from peers, BGP does not consider the router ID of neighbors advertising the routes - BGP simply selects the first received route. Use this command to include router ID in the selection process; similar routes are compared and the route with the lowest router ID is selected.

The **no** variant of this command disables this feature, and returns the switch to the default state, where the switch ignores the router ID in the BGP best path selection process.

Syntax

```
bgp bestpath compare-routerid
no bgp bestpath compare-routerid
```

Mode Router Configuration

Example

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp bestpath compare-routerid
```

Related Commands show ip bgp (BGP)
show bgp ipv6 neighbors (BGP4+)

bgp bestpath med (BGP and BGP4+)

This command controls how the Multi Exit Discriminator (MED) attribute comparison is performed.

Use the **no** variant of this command to prevent BGP from considering the MED attribute when comparing paths.

Syntax

```
bgp bestpath med {[confed] [missing-as-worst]}
```

Parameter	Description
`confed`	Compares MED among confederation paths.
`missing-as-worst`	Treats missing MED as the least preferred one.

Mode Router Configuration

Usage The **confed** parameter enables MED comparison among paths learned from confederation peers. The MED attributes are compared only if there is no external AS (Autonomous System), where an external AS is one that is not within the confederation. If there is an external AS in the path, then the MED comparison is not made.

For example, in the following paths the MED value is not compared with `Path3` since it is not in the confederation. MED is compared for `Path1` and `Path2` only.

```
Path1 = 32000 32004, med=4
Path2 = 32001 32004, med=2
Path3 = 32003 1, med=1
```

The effect of the **missing-as-worst** parameter is to treat a missing MED attribute in a path as having a value of infinity, making the path without a MED value the least desirable path. If the **missing-as-worst** parameter is not configured, the missing MED attribute is assigned the value of 0, making the path with the missing MED attribute the best path.

Examples

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp bestpath med missing-as-worst

awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp bestpath med confed

awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp bestpath med confed missing-as-worst
```

Related Commands

bgp always-compare-med (BGP and BGP4+)
bgp bestpath as-path ignore (BGP and BGP4+)
bgp deterministic-med (BGP and BGP4+)

bgp bestpath med remove-recv-med (BGP and BGP4+)

This command removes the Multi Exit Discriminator (MED) attribute from the update messages received by the BGP speaker from its peers. However, the local BGP speaker will send MED attributes in the update messages to its peers, unless specified not to by the **bgp bestpath med remove-send-med** command.

Use the **no** variant of this command to disable this feature.

Syntax

```
bgp bestpath med remove-recv-med
no bgp bestpath med remove-recv-med
```

Mode Router Configuration

Example To enable the **remove-recv-med** feature on the BGP speaker belonging to the Autonomous System (AS) 100, enter the command:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp bestpath med remove-recv-med
```

Related Commands bgp bestpath med remove-send-med (BGP and BGP4+)

bgp bestpath med remove-send-med (BGP and BGP4+)

This command removes the Multi Exit Discriminator (MED) attribute from the update messages sent by the BGP speaker to its peers. However, the local BGP speaker will consider the MED attribute received from other peers during the decision and route selection process, unless specified not to by the **bgp bestpath med remove-recv-med** command.

Use the **no** variant of this command to disable this feature.

Syntax

```
bgp bestpath med remove-send-med
no bgp bestpath med remove-send-med
```

Mode Router Configuration

Example To enable the **remove-send-med** feature on the BGP speaker belonging to the Autonomous System (AS) 100, enter the command:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp bestpath med remove-send-med
```

Related Commands bgp bestpath med remove-recv-med (BGP and BGP4+)

bgp client-to-client reflection (BGP and BGP4+)

This command restores route reflection from a BGP route reflector to clients, and is used to configure routers as route reflectors. Route reflectors are used when all Interior Border Gateway Protocol (iBGP) speakers are not fully meshed.

If the clients are fully meshed the route reflector is not required, use the **no** variant of this command to disable the client-to-client route reflection.

When a router is configured as a route reflector, client-to-client reflection is enabled by default.

The **no** variant of this command turns off client-to-client reflection.

Syntax

```
bgp client-to-client reflection
no bgp client-to-client reflection
```

Default This command is enabled by default.

Mode Router Configuration

Example

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# no bgp client-to-client reflection
```

Related Commands

bgp cluster-id (BGP and BGP4+)
neighbor route-reflector-client (BGP)
show bgp ipv6 (BGP4+)
show ip bgp (BGP)

bgp cluster-id (BGP and BGP4+)

This command configures the cluster-id if the BGP cluster has more than one route reflector. A cluster includes one or more route reflectors and their clients. Usually, each cluster is identified by the router-id of its single route reflector. However, to increase redundancy, a cluster may sometimes have more than one route reflector. All router reflectors in such a cluster are then identified by a cluster-id.

The **bgp cluster-id** command is used to configure the 4 byte cluster ID for clusters with more than one route reflector.

The **no** variant of this command removes the cluster ID.

Syntax

```
bgp cluster-id {<ip-address>|<cluster-id>}
no bgp cluster-id
```

Parameter	Description	
<cluster-id>	<1-4294967295>	Route Reflector cluster-id as a 32 bit quantity.
<ip-address>	*A.B.C.D*	Route Reflector Cluster-id in IP address format.

Mode Router Configuration

Usage The following configuration creates `cluster-id 5` including two route-reflector-clients.

```
awplus(config)# router bgp 200
awplus(config-router)# neighbor 2.2.2.2 remote-as 200
awplus(config-router)# neighbor 3.3.3.3 remote-as 200
awplus(config-router)# neighbor 3.3.3.3 route-reflector-client
awplus(config-router)# neighbor 5.5.5.5 remote-as 200
awplus(config-router)# neighbor 5.5.5.5 route-reflector-client
awplus(config-router)# neighbor 6.6.6.6 remote-as 200
awplus(config-router)# bgp cluster-id 5
```

Examples To add a **bgp cluster-id**, apply the example commands as shown below:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp cluster-id 10.10.1.1
```

To remove a **bgp cluster-id** apply the example commands as shown below:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# no bgp cluster-id 10.10.1.1
```

Related Commands

bgp client-to-client reflection (BGP and BGP4+)
neighbor route-reflector-client (BGP)
show bgp ipv6 (BGP4+)
show ip bgp (BGP)

bgp confederation identifier (BGP and BGP4+)

This command specifies a BGP confederation identifier.

The **no** variant of this command removes all BGP confederation identifiers.

Syntax

```
bgp confederation identifier <1-4294967295>
no bgp confederation identifier
```

Parameter	Description
<1-4294967295>	Set routing domain confederation AS number.

Mode

Router Configuration

Examples

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp confederation identifier 1
```

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# no bgp confederation identifier
```

Related Commands

bgp confederation peers (BGP and BGP4+)

bgp confederation peers (BGP and BGP4+)

This command configures the Autonomous Systems (AS) that belong to the same confederation as the current switch.

A confederation allows an AS to be divided into several sub-ASs. The overall AS is given a confederation identifier. External routers view only the whole confederation as one AS, whose AS number is the confederation identifier. Each sub-AS is fully meshed within itself and is visible internally to the confederation.

Use the **bgp confederation peer** command to define the list of AS numbers of the sub-ASs in the confederation containing the current switch.

The **no** variant of this command removes an autonomous system from the confederation.

Syntax

```
bgp confederation peers <1-4294967295>
no bgp confederation peers <1-4294967295>
```

Parameter	Description
<1-4294967295>	AS numbers of eBGP peers that are under same confederation but in a different sub-AS.

Mode Router Configuration

Usage In the following configuration of **Router 1** the neighbor `172.210.30.2` and `172.210.20.1` have iBGP connection within AS `100`. The neighbor `173.213.30.1` has an BGP connection, but it is within AS `200`, which is part of the same confederation. The neighbor `6.6.6.6` has an eBGP connection to external AS `500`.

In the configuration of **Router 2**, neighbor `5.5.5.4` has an eBGP connection to confederation `300`. `Router2` does not know about the ASs `100` and `200`, it only knows about confederation `300`.

Router 1

```
awplus(config)# router bgp 100
awplus(config-router)# bgp confederation identifier 300
awplus(config-router)# bgp confederation peers 200
awplus(config-router)# neighbor 172.210.30.2 remote-as 100
awplus(config-router)# neighbor 172.210.20.1 remote-as 100
awplus(config-router)# neighbor 173.213.30.1 remote-as 200
awplus(config-router)# neighbor 6.6.6.6 remote-as 300
```

Router 2

```
awplus(config)# router bgp 500
awplus(config-router)# neighbor 5.5.5.4 remote-as 300
```

Example

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp confederation peers 1234
```

Related Commands **bgp confederation identifier (BGP and BGP4+)**

bgp config-type (BGP and BGP4+)

Use this command to set the BGP configuration type to either **standard** or **enhanced** types. When you configure the **enhanced** type, then BGP and BGP4+ communities are allowed to be sent and received by default. The **enhanced** type is configured by default.

Use the **no** variant of this command to restore the default BGP configuration type (**enhanced**).

Syntax

```
bgp config-type {standard|enhanced}
no bgp config-type
```

Parameter	Description
`standard`	Specifies the industry standard style configuration. After setting the configuration to **standard**, make sure to use the **neighbor send-community (BGP and BGP4+)** command to send out BGP community attributes. The **no synchronization** command is enabled in the Global Configuration mode and is shown in the configuration.
`enhanced`	Specifies the enhanced style configuration. The **enhanced** configuration type requires no specific configuration for sending out BGP standard community and extended community attributes. The **no synchronization** command is enabled by default in the Global Configuration mode and is not shown in configuration output.

Default By default, the BGP configuration type is **enhanced**.

Mode Global Configuration

Usage Note that the **enhanced** type default configuration may cause issues in some networks if unauthorized BGP peers are advertising BGP communities to adjust routing decisions.

Changing modes requires you to **reload** your device for the change to take effect:

```
awplus(config)#bgp config-type standard
awplus(config)#exit
awplus#reload
reboot system? (y/n): y
```

When your device reloads, it will load with the standard BGP settings commonly used by most vendors. Apply the **standard** type configuration if you have interoperability issues.

Examples To specify the `standard` BGP configuration type, enter the following commands:

```
awplus# configure terminal
awplus(config)# bgp config-type standard
```

To specify the `enhanced` BGP configuration type, enter the following commands:

```
awplus# configure terminal
awplus(config)# bgp config-type enhanced
```

To restore the default BGP configuration type (`enhanced`), enter the following commands:

```
awplus# configure terminal
awplus(config)# no bgp config-type
```

Related Commands **neighbor send-community (BGP and BGP4+)**
synchronization (BGP and BGP4+)

bgp dampening (BGP and BGP4+)

This command enables BGP and BGP4+ dampening and sets BGP and BGP4+ dampening parameters. BGP4+ dampening is available from the IPv6 Address Family Configuration mode. BGP dampening is available from the Router Configuration mode.

The **no** variant of this command disables BGP dampening or unsets the BGP dampening parameters.

Syntax [BGP/BGP4+]

```
bgp dampening
no bgp dampening
bgp dampening <reachtime>
no bgp dampening <reachtime>
bgp dampening <reachtime> <reuse> <suppress> <maxsuppress>
   <unreachtime>
no bgp dampening <reachtime> <reuse> <suppress> <maxsuppress>
   <unreachtime>
bgp dampening route-map <routemap-name>
no bgp dampening route-map <routemap-name>
```

Parameter	Description
<reachtime>	<1-45> Specifies the reachability half-life time in minutes. The time for the penalty to decrease to one-half of its current value. The default is 15 minutes.
<reuse>	<1-20000> Specifies the reuse limit value. When the penalty for a suppressed route decays below the reuse value, the routes become unsuppressed. The default reuse limit is 750
<suppress>	<1-20000> Specifies the suppress limit value. When the penalty for a route exceeds the suppress value, the route is suppressed. The default suppress limit is 2000.
<maxsuppress>	<1-255> Specifies the max-suppress-time. Maximum time that a dampened route is suppressed. The default max-suppress value is 4 times the half-life time (60 minutes).
<unreachtime>	<1-45> Specifies the un-reachability half-life time for penalty, in minutes.
route-map	Route-map to specify criteria for dampening.
<routemap-name>	Specify the name of the route-map.

Mode [BGP] Router Configuration

Mode [BGP4+] IPv6 Address Family Configuration

Usage [BGP/BGP4+]

Route dampening minimizes the instability caused by route flapping. A penalty is added for every flap in a flapping route. As soon as the total penalty reaches the **suppress** limit the advertisement of the route is suppressed. This penalty is decayed according to the configured **half time** value. Once the penalty is lower than the **reuse** limit, the route advertisement is un-suppressed.

The dampening information is purged from the router once the penalty becomes less than half of the **reuse** limit.

Example [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# bgp dampening 20 800 2500 80 25
```

Example [BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# address-family ipv6
awplus(config-router-af)# bgp dampening 20 800 2500 80 25
```

bgp default ipv4-unicast (BGP and BGP4+)

This command configures BGP defaults and activates IPv4-unicast for a peer by default. This affects BGP global configuration. By default, BGP exchanges IPv4 prefixes with a peer.

The **no** variant of this command disables this function. The BGP routing process will no longer exchange IPv4 addressing information with BGP neighbor routers. Note that disabling the exchange of IPv4 prefixes will also enable an IPv6 only BGP4+ network.

Syntax

```
bgp default ipv4-unicast
no bgp default ipv4-unicast
```

Default

This is enabled by default.

Mode

Router Configuration

Usage

Use the negated form of this command to enable an IPv6 only BGP4+ network.

Examples

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp default ipv4-unicast
```

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# no bgp default ipv4-unicast
```

bgp default local-preference (BGP)

This command changes the default local preference value.

The local preference indicates the preferred path when there are multiple paths to the same destination. The path with the higher preference is preferred.

Use this command to define the default local preference value that the switch will advertise for the routes it sends. The preference is sent to all routers and access servers in the local autonomous system.

The **no** variant of this command reverts to the default local preference value of 100.

Syntax

```
bgp default local-preference <pref-value>
no bgp default local-preference [<pref-value>]
```

Parameter	Description
<pref-value>	<0-4294967295> Configure default local preference value. The default local preference value is 100.

Default By default the local-preference value is 100.

Mode Router Configuration

Examples

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp default local-preference 2345555

awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# no bgp default local-preference
```

bgp deterministic-med (BGP and BGP4+)

Use this command to allow or disallow the switch to compare the Multi Exit Discriminator (MED) variable when choosing among routes advertised by different peers in the same autonomous system (AS).

Use the **bgp deterministic-med** command to enable this feature to allow the comparison of MED variables when choosing among routes advertised by different peers in the same AS.

Use the **no** variant of this command to disable this feature to disallow the comparison of the MED variable when choosing among routes advertised by different peers in the same AS.

Syntax [BGP/BGP4+]

```
bgp deterministic-med
no bgp deterministic-med
```

Default [BGP/BGP4+] Disabled

Mode [BGP/BGP4+] Router Configuration

Usage [BGP/BGP4+] When the **bgp deterministic-med** command is enabled, routes from the same AS are grouped together and ordered according to their MED values, and the best routes of each group are compared.

The main benefit of this is that the choice of best route then does not depend on the order in which the routes happened to be received, which is rather random and arbitrary.

To see how this works, consider the following set of bgp table entries, all for the same route:

```
1: ASPATH 234, MED 120, internal, IGP metric to NEXT_HOP 40
2: ASPATH 389, MED 190, internal, IGP metric to NEXT_HOP 35
3: ASPATH 234, MED 245, external
```

If **bgp deterministic-med** is not enabled, then entry `3:` will be chosen, because it is an external route.

But if BGP deterministic-MED is enabled, the entries will be grouped as follows:

```
Group 1:  1: ASPATH 234, MED 120, internal, IGP metric to NEXT_HOP 40
          3: ASPATH 234, MED 245, external
```

Group 2: 2: ASPATH 389, MED 190, internal, IGP metric to NEXT_HOP 35

Note Routes from the same AS are grouped together and ordered by MED.

Entry `1:` is chosen as the best route from `Group 1`, since this route has the lowest MED value. Entry 2 has to be the best route in `Group 2`, since this is the only route in that group. These two group winners are compared against each other, and Entry `2:` is chosen as the best route because Entry `2:` has the lower metric to next-hop.

All routers in an AS should have the same setting for BGP deterministic-MED. All routers in an AS should have BGP deterministic-MED enabled with **bgp deterministic-med**, or all routers in an AS should have BGP deterministic-MED disabled with **no bgp-deterministic-med**.

In the example above, the MED values were not considered when comparing the winners of the two groups (the best routes from the different ASs). To use MED in the comparison of routes from different ASs, use the **bgp always-compare-med (BGP and BGP4+)** command on page 45.14.

Examples [BGP/BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp deterministic-med

awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# no bgp deterministic-med
```

Related Commands

show ip bgp (BGP)
show bgp ipv6 neighbors (BGP4+)
show ip bgp neighbors (BGP)

bgp enforce-first-as (BGP and BGP4+)

Use this command to enforce the denying of eBGP updates in which the neighbor's AS number is not the first AS in the AS-path attribute.

Use the **no** variant of this command to disable this feature.

Syntax [BGP/BGP4+]

```
bgp enforce-first-as
no bgp enforce-first-as
```

Mode [BGP/BGP4+]

Router Configuration

Usage [BGP/BGP4+]

This command specifies that any updates received from an external neighbor that do not have the neighbor's configured Autonomous System (AS) at the beginning of the AS_PATH in the received update must be denied. Enabling this feature adds to the security of the BGP network by not allowing traffic from unauthorized systems.

Example [BGP/BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router# bgp enforce-first-as
```

bgp fast-external-failover (BGP and BGP4+)

Use this command to reset a BGP session immediately if the interface used for BGP connection goes down.

Use the **no** variant of this command to disable this feature.

Syntax [BGP/BGP4+]

```
bgp fast-external-failover
no bgp fast-external-failover
```

Default [BGP/BGP4+] Enabled

Mode [BGP/BGP4+] Router Configuration

Example [BGP/BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp fast-external-failover
```

bgp graceful-restart (BGP and BGP4+)

Use this command to enable BGP and BGP4+ graceful-restart capabilities for restart and stalepath times.

Use the **no** variant of this command to restore restart timers to their default settings.

Syntax

```
bgp graceful-restart
   [restart-time <delay-value>|stalepath-time <delay-value>]

no bgp graceful-restart [restart-time|stalepath-time]
```

Parameter	Description
`restart-time`	The maximum time needed for neighbors to restart, in seconds. The default restart-time is 120 seconds.
`stalepath-time`	The maximum time to retain stale paths from restarting neighbors, in seconds. The default stalepath-time is 120 seconds.
`<delay-value>`	`<1-3600>` Maximum time in seconds. Default is 120 seconds.

Default The default BGP and BGP4+ graceful restart time is 120 seconds without restart-time or stalepath-time parameters specified. The default restart-time and stalepath-times are also 120 seconds.

Mode Router Configuration

Usage This command is used to set the maximum time that a graceful-restart neighbor waits to come back up after a restart. This value is applied to all neighbors unless you explicitly override it by configuring the corresponding value on the neighbor.

The **restart-time** parameter is used for setting the maximum time that a graceful-restart neighbor waits to come back up after a restart. This **restart-time** value is applied to neighbors unless you explicitly override it by configuring the corresponding value on the neighbor.

The **stalepath-time** parameter is used to set the maximum time to preserve stale paths from a gracefully restarted neighbor. All stalepaths, unless reinstated by the neighbor after a re-establishment, will be deleted when time, as specified by the **stalepath-time** parameter, expires.

Examples

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# bgp graceful-restart 150
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no bgp graceful-restart
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# bgp graceful-restart restart-time 150

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no bgp graceful-restart restart-time 150
```

Related Commands **bgp graceful-restart graceful-reset (BGP and BGP4+)**
restart bgp graceful (BGP)

bgp graceful-restart graceful-reset (BGP and BGP4+)

This command enables BGP and BGP4+ graceful-restart when a configuration change forces a peer restart.

Use the **no** variant of this command to restore the device to its default state.

Syntax

```
bgp graceful-restart graceful-reset
no bgp graceful-restart graceful-reset
```

Default Disabled

Mode Router Configuration

Usage The **bgp graceful-restart (BGP and BGP4+)** command on page 45.32 must be enabled before this command is enabled. All events that cause BGP peer reset, including all session reset commands, can trigger graceful-restart.

Example To enable the graceful-restart graceful-reset feature on the BGP or BGP4+ peer belonging to Autonomous System (AS) 10, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# bgp graceful-restart graceful-reset
```

To disable the graceful-restart graceful-reset feature on the BGP or BGP4+ peer belonging to Autonomous System (AS) 10, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no bgp graceful-restart graceful-reset
```

Related Commands **bgp graceful-restart (BGP and BGP4+)**

bgp log-neighbor-changes (BGP and BGP4+)

Use this command to enable logging of status change messages without turning on **debug bgp** commands.

Use the **no** variant of this command to disable this feature.

Syntax [BGP/BGP4+]

```
bgp log-neighbor-changes
no bgp log-neighbor-changes
```

Default [BGP/BGP4+] Disabled

Mode [BGP/BGP4+] Router Configuration

Usage [BGP/BGP4+] AlliedWare Plus™ provides other kinds of logging services for neighbor status, for example, **debug bgp fsm, debug bgp events**, etc.

However, these commands create a significant hit in the logging performance. If you need to log neighbor status changes only, we recommend turning off all the debug commands, and then use this command.

To see BGP neighbor changes in the log you must also set the log level to informational using the **log buffered** command.

A sample output of this log is:

```
%Protocol-Severity-Events: Message-text
```

A sample output of the log for an `interface down` event is:

```
%BGP-5-ADJCHANGE: neighbor 10.10.0.24 Down Interface flap
```

The **bgp log-neighbor-changes** command logs the following events:

- BGP Notification Received
- Erroneous BGP Update Received
- User reset request
- Peer time-out
- Peer Closing down the session
- Interface flap
- Router ID changed
- Neighbor deleted
- Member added to peer group
- Administrative shutdown
- Remote AS changed
- RR client configuration modification
- Soft reconfiguration modification

Example [BGP/BGP4+] To enable the logging of BGP status changes without using the **debug bgp** command:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp log-neighbor-changes
```

bgp memory maxallocation (BGP and BGP4+)

This command allocates a maximum percentage of the RAM (Random Access Memory) available on the switch for BGP processes.

When this percentage is exceeded, BGP peering terminates and an **out of resources** error displays. The default setting for **bgp memory maxallocation** is 100% memory allocation.

Use the **no** variant of this command to reset memory allocation to the default.

Syntax [BGP/BGP4+]

```
bgp memory maxallocation <1-100>
no bgp memory maxallocation
```

Parameter	Description
<1-100>	Percentage of switch memory allocated to BGP processes. Note this is RAM (Random Access Memory), not switch flash memory.

Default [BGP/BGP4+] BGP processes are allocated the maximum percentage of 100% of the switch's available RAM memory by default. Note only non-default BGP memory allocation values are shown in the running or startup configuration files:

```
awplus#show running-config
!
bgp memory maxallocation 50
!
```

Mode [BGP/BGP4+] Global Configuration

Examples [BGP/BGP4+] To limit the maximum amount of memory used by BGP processes to 65% of the total RAM memory available on the switch, use the commands:

```
awplus# configure terminal
awplus(config)# bgp memory maxallocation 65
```

To return to the default 100% maximum RAM memory allocation available on the switch for BGP processes, use the commands:

```
awplus# configure terminal
awplus(config)# no bgp memory maxallocation
```

bgp nexthop-trigger-count (BGP and BGP4+)

Use this command to configure the display of BGP nexthop-tracking status.

Use the **no** variant of this command to disable this function.

Syntax [BGP/BGP4+]

```
bgp nexthop-trigger-count <0-127>
no bgp nexthop-trigger-count
```

Parameter	Description
<0-127>	BGP nexthop-tracking status.

Mode [BGP/BGP4+] Router Configuration

Example [BGP/BGP4+] To enable nexthop-tracking status on the BGP peer belonging to the Autonomous System (AS) 100, enter the following commands:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp nexthop-trigger-count 10
```

To disable nexthop-tracking status, enter the following commands:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# no bgp nexthop-trigger-count
```

Related Commands

bgp nexthop-trigger delay (BGP and BGP4+)
bgp nexthop-trigger enable (BGP and BGP4+)
show bgp nexthop-tracking (BGP)

bgp nexthop-trigger delay (BGP and BGP4+)

Use this command to set the delay interval for nexthop address tracking.

Use the **no** variant of this command to reset the timer value to the default.

Syntax [BGP/BGP4+]

```
bgp nexthop-trigger delay <1-100>
no bgp nexthop-trigger delay
```

Parameter	Description
<1-100>	Nexthop trigger delay interval in seconds.

Default [BGP/BGP4+] The default nexthop delay interval is 5 seconds.

Mode [BGP/BGP4+] Global Configuration

Usage [BGP/BGP4+] This command configures the delay interval between routing table waits for nexthop delay tracking. The delay interval determines how long BGP waits after it receives the trigger from the system about one or more nexthop changes before it walks the full BGP table to determine which prefixes are affected by the nexthop changes.

Example To set the nexthop delay interval to 6 seconds, enter the command:

```
awplus# configure terminal
awplus(config)# bgp nexthop-trigger delay 6
```

Related Commands
bgp nexthop-trigger-count (BGP and BGP4+)
bgp nexthop-trigger enable (BGP and BGP4+)

bgp nexthop-trigger enable (BGP and BGP4+)

Use this command to enable nexthop address tracking. If nexthop address tracking is enabled and a nexthop trigger delay interval has not been explicitly set with the **bgp nexthop-trigger delay (BGP and BGP4+)** command on page 45.38, the default delay interval of 5 seconds is used.

Use the **no** variant of this command to disable this feature.

Syntax [BGP/BGP4+]

```
bgp nexthop-trigger enable

no bgp nexthop-trigger enable
```

Default [BGP/BGP4+] Disabled.

Mode [BGP/BGP4+] Global Configuration

Usage [BGP/BGP4+] Nexthop address tracking is an event driven notification system that monitors the status of routes installed in the Routing Information Base (RIB) and reports nexthop changes that affect internal BGP (iBGP) or external BGP (eBGP) prefixes directly to the BGP process. This improves the overall BGP convergence time, by allowing BGP to respond rapidly to nexthop changes for routes installed in the RIB.

If nexthop tracking is enabled after certain routes are learnt, the registration of all the nexthops of selected BGP routes are done immediately after the nexthop tracking feature is enabled.

If nexthop tracking is disabled, and if there are still some selected BGP routes, BGP deregisters the nexthops of all of the selected BGP routes from the system.

If nexthop tracking is disabled when nexthop tracking is in the process of execution, an error appears, and nexthop tracking is not disabled. However, if the nexthop tracking timer is running at the time of negation, the nexthop tracking timer is stopped, and nexthop tracking is disabled.

Example [BGP/BGP4+] To enable nexthop address tracking, enter the command:

```
awplus# configure terminal
awplus(config)# bgp nexthop-trigger enable
```

Related Commands

bgp nexthop-trigger-count (BGP and BGP4+)
bgp nexthop-trigger delay (BGP and BGP4+)
show bgp nexthop-tracking (BGP)

bgp rfc1771-path-select (BGP)

Use this command to set the RFC1771 compatible path selection mechanism.

Use the **no** variant of this command to revert this setting.

Syntax

```
bgp rfc1771-path-select
no bgp rfc1771-path-select
```

Default Industry standard compatible path selection mechanism.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# bgp rfc1771-path-select
```

bgp rfc1771-strict (BGP)

Use this command to set the Strict RFC1771 setting.

Use the **no** variant of this command to revert this setting.

Syntax

```
bgp rfc1771-strict
no bgp rfc1771-strict
```

Default Disabled

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# bgp rfc1771-strict
```

bgp router-id (BGP and BGP4+)

Use this command to configure the router identifier. The IPv4 address specified in this command does not have to be an IPv4 address that is configured on any of the interfaces on the switch. Note that you must specify an IPv4 address with this when used for BGP4+.

Use the **no** variant of this command to return the router-id to its default value (as described in **Default** below).

Syntax [BGP/BGP4+]

```
bgp router-id <routerid>
no bgp router-id [<routerid>]
```

Parameter	Description
<routerid>	Specify the IPv4 address without mask for a manually configured router ID, in the format `A.B.C.D`.

Default [BGP/BGP4+] If the local loopback interface (`lo`) is configured the router-id is set to the IP address of this interface. If not, the highest IP address is the router-id.

Mode [BGP] Router Configuration or IPv4 Address Family Configuration for a VRF instance

Mode [BGP4+] Router Configuration

Usage [BGP/BGP4+] Use the **bgp router-id** command to manually configure a fixed router ID as a BGP or BGP4+ router identifier. The router-id configured using this command takes precedence over all other router-id sources

Examples [BGP/BGP4+] To configure a router ID with an IPv4 address for a BGP or BGP4+ router identifier, enter the commands listed below:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp router-id 1.1.2.3
```

To disable the router ID for a BGP or BGP4+ router identifier enter the commands listed below:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# no bgp router-id
```

bgp scan-time (BGP)

Use this command to set the interval for BGP route next-hop scanning.

Use the **no** variant of this command to disable this function.

Syntax

```
bgp scan-time <time>
no bgp scan-time [<time>]
```

Parameter	Description
<time>	<0-60> Scanning interval in seconds.

Default The default scanning interval is 60 seconds.

Mode Router Configuration

Usage Use this command to configure scanning intervals of BGP routers. This interval is the period after which router checks the validity of the routes in its database.

To disable BGP scanning, set the scan time interval to 0 seconds.

Example

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp scan-time 10
```

bgp update-delay (BGP and BGP4+)

Use this command to specify the update-delay value for a graceful-restart capable router.

Use the **no** variant of this command to revert to the default update-delay value.

Syntax [BGP/BGP4+]

```
bgp update-delay <1-3600>
no bgp update-delay [<1-3600>]
```

Parameter	Description
<1-3600>	Delay value in seconds.

Default [BGP/BGP4+] The default update-delay value is 120 seconds.

Mode [BGP/BGP4+] Router Configuration

Usage [BGP/BGP4+] The update-delay value is the maximum time a graceful-restart capable router which is restarting will defer route-selection and advertisements to all its graceful-restart capable neighbors. This maximum time starts from the instance the first neighbor attains established state after restart. The restarting router prematurely terminates this timer when end-of-rib markers are received from all its graceful-restart capable neighbors.

Example [BGP/BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# bgp update-delay 345
```

clear bgp * (BGP and BGP4+)

Use this command to reset the BGP and BGP4+ connections for all peers.

Syntax

```
clear bgp *
clear bgp * in [prefix-filter]
clear bgp * out
clear bgp * soft [in|out]
```

Parameter	Description
*	Clears all BGP and BGP4+ peers.
in	Indicates that incoming advertised routes will be cleared.
prefix-filter	Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration.
out	Indicates that outgoing advertised routes will be cleared.
soft in	Soft inbound reset causes the neighbors to resend all their updates to the local switch, without resetting the connection or clearing the entries in the local switch. So, the local switch stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory.
soft out	Soft outbound reset causes the switch to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries.

Mode Privileged Exec

Examples

```
awplus# clear bgp * soft in
awplus# clear bgp * in prefix-filter
```

clear bgp (IPv4 or IPv6 address) (BGP and BGP4+)

Use this command to reset the BGP and BGP4+ connections for specified peers.

When VRF-Lite is configured, you can apply this command to a specific VRF instance. This command resets all BGP connections from any address family (from either IPv4 or IPv6 Address Families).

Syntax [BGP]

```
clear bgp <ip-addr>
clear bgp <ip-addr> in [prefix-filter]
clear bgp <ip-addr> out
clear bgp <ip-addr> soft [in|out]
```

Syntax (VRF Lite)

```
clear ip bgp <ip-addr> [vrf <vrf-name>] [in|out|soft [in|out]]
```

Syntax [BGP4+]

```
clear bgp <ipv6-addr>
clear bgp <ipv6-addr> in [prefix-filter]
clear bgp <ipv6-addr> out
clear bgp <ipv6-addr> soft [in|out]
```

Parameter	Description
<ip-addr>	Specifies the IPv4 address of the neighbor whose connection is to be reset, entered in the form A.B.C.D.
<ipv6-addr>	Specifies the IPv6 address of the neighbor whose connection is to be reset, entered in hexadecimal in the format X:X::X:X.
`in`	Indicates that incoming advertised routes will be cleared.
`prefix-filter`	Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration.
`out`	Indicates that outgoing advertised routes will be cleared.
`soft in`	Soft inbound reset causes the neighbors to resend all their updates to the local switch, without resetting the connection or clearing the entries in the local switch. So, the local switch stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory.
`soft out`	Soft outbound reset causes the switch to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries.
`vrf`	Applies the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.

Mode [BGP/BGP4+] Privileged Exec

Examples [BGP]

```
awplus# clear bgp 3.3.3.3 soft in prefix-filter
awplus# clear bgp 2.2.2.2 out
```

Example (VRF Lite) To apply the above example to clear the BGP connection to peer at IP address 192.0.2.11for the VRF instance blue, use the following commands:

```
awplus# clear bgp 192.0.2.11 vrf blue in
```

Examples [BGP4+]

```
awplus# clear bgp 2001:0db8:010d::1 soft in prefix-filter
awplus# clear bgp 2001:0db8:010d::1 out
```

Related Commands **clear bgp (IPv4 or IPv6 address) (BGP and BGP4+)**

clear bgp (ASN) (BGP and BGP4+)

Use this command to reset the BGP and BGP4+ connections for peers in the specified Autonomous System Number (ASN).

Syntax [BGP/BGP4+]

```
clear bgp <asn> [in [prefix-filter]|out|soft [in|out]]
```

Parameter	Description
<*asn*>	<1-4294967295> The AS Number for which all routes will be cleared.
in	Indicates that incoming advertised routes will be cleared.
prefix-filter	Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration.
out	Indicates that outgoing advertised routes will be cleared.
soft in	Soft inbound reset causes the neighbors to resend all their updates to the local switch, without resetting the connection or clearing the entries in the local switch. So, the local switch stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory.
soft out	Soft outbound reset causes the switch to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries.

Mode [BGP/BGP4+]

Privileged Exec

Examples [BGP/BGP4+]

```
awplus# clear bgp 300 soft in prefix-filter
awplus# clear bgp 500 soft out
awplus# clear bgp 300 soft in
awplus# clear bgp 1 in prefix-filter
```

clear bgp external (BGP and BGP4+)

Use this command to reset the BGP and BGP4+ connections for all external peers.

Syntax [BGP/BGP4+]

```
clear bgp external [in [prefix-filter]|out|soft [in|out]]
```

Parameter	Description
`external`	Clears all external peers.
`in`	Indicates that incoming advertised routes will be cleared.
`prefix-filter`	Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration.
`out`	Indicates that outgoing advertised routes will be cleared.
`soft in`	Soft inbound reset causes the neighbors to resend all their updates to the local switch, without resetting the connection or clearing the entries in the local switch. So, the local switch stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory.
`soft out`	Soft outbound reset causes the switch to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries.

Mode [BGP/BGP4+]

Privileged Exec

Examples [BGP/BGP4+]

```
awplus# clear bgp external soft in
awplus# clear bgp external in prefix-filter
```

clear bgp peer-group (BGP and BGP4+)

Use this command to reset the BGP and BGP4+ connections for all members of a peer group.

Syntax [BGP/BGP4+]

```
clear bgp peer-group <peer-group>
   [in [prefix-filter]|out|soft [in|out]]
```

Parameter	Description
`peer-group`	Clears all members of a peer group.
<peer-group>	Name of the BGP peer group
`in`	Indicates that incoming advertised routes will be cleared.
`prefix-filter`	Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration.
`out`	Indicates that outgoing advertised routes will be cleared.
`soft in`	Soft inbound reset causes the neighbors to resend all their updates to the local switch, without resetting the connection or clearing the entries in the local switch. So, the local switch stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory.
`soft out`	Soft outbound reset causes the switch to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries.

Mode [BGP/BGP4+]

Privileged Exec

Examples [BGP/BGP4+]

```
awplus# clear bgp peer-group P1 soft in
awplus# clear bgp peer-group P2 in
```

clear ip bgp * (BGP)

Use this command to reset all BGP connections, either by fully resetting sessions or by performing soft resets.

If VRF-Lite is configured, you can reset BGP connections for all VRF instances or for a specified VRF instance.

Syntax

```
clear ip bgp *
clear ip bgp * in
clear ip bgp * out
clear ip bgp * soft [in|out]
clear ip bgp * in [prefix-filter]
```

Syntax (VRF Lite)

```
clear ip bgp * [vrf <vrf-name>]
clear ip bgp * [vrf <vrf-name>] in
clear ip bgp * [vrf <vrf-name>] out
clear ip bgp * [vrf <vrf-name>] soft [in|out]
clear ip bgp * in [prefix-filter]
```

Parameter	Description
`*`	Clears all bgp peers.
`in`	Indicates that incoming advertised routes will be cleared.
`prefix-filter`	Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration.
`out`	Indicates that outgoing advertised routes will be cleared.
`soft in`	Soft inbound reset causes the neighbors to resend all their updates to the local switch, without resetting the connection or clearing the entries in the local switch. So, the local switch stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory.
`soft out`	Soft outbound reset causes the switch to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries.
`vrf`	Applies the command to the specified VRF instance.
`<vrf-name>`	The name of the VRF instance.

Mode Privileged Exec

Examples To clear all BGP peers, use the command:

```
awplus# clear ip bgp *
```

Example (VRF Lite) To clear all BGP peers in VRF instance red, use the command:

```
awplus# clear ip bgp * vrf red
```

To clear all outbound BGP peers in VRF instance red, use the command:

```
awplus# clear ip bgp * out vrf red
```

clear ip bgp (IPv4) (BGP)

Use this command to reset the IPv4 BGP connection to the peer specified by the IP address. When VRF-Lite is configured, you can apply this command to a specific VRF instance.

Syntax [BGP]

```
clear ip bgp <ipv4-addr> [in [prefix-filter]|out|soft [in|out]]
```

Syntax (VRF Lite)

```
clear ip bgp <ipv4-address> [vrf <vrf-name>] [in|out|soft [in|out]]
```

Parameter	Description
<ipv4-addr>	Specifies the IPv4 address of the neighbor whose connection is to be reset, entered in the form A.B.C.D.
`in`	Indicates that incoming advertised routes will be cleared.
`prefix-filter`	Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration.
`out`	Indicates that outgoing advertised routes will be cleared.
`soft in`	Soft inbound reset causes the neighbors to resend all their updates to the local switch, without resetting the connection or clearing the entries in the local switch. So, the local switch stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory.
`soft out`	Soft outbound reset causes the switch to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries.
`vrf`	Applies the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.

Mode [BGP] Privileged Exec

Examples [BGP] Use the following command to clear the BGP connection to peer at IPv4 address 192.168.1.1, and clearing all incoming routes.

```
awplus# clear ip bgp 192.168.1.1 in
```

To apply the above example to clear the BGP connection to peer at IP address 192.0.2.11for the VRF instance blue, use the following commands:

```
awplus# clear ip bgp 192.0.2.11 vrf blue in
```

clear ip bgp dampening (BGP)

Use this command to clear route dampening information and unsuppress routes that have been suppressed.

Syntax `clear ip bgp dampening [<ip-address>|<ip-address/m>]`

Parameter	Description
<ip-address>	Specifies the IPv4 address for which BGP dampening is to be cleared, in dotted decimal format.
<ip-address/m>	Specifies the IPv4 address with mask for which BGP dampening is to be cleared, entered in the form A.B.C.D/M. Where M is the subnet mask
ipv4	Clears all IPv4 address family peers. Configure parameters relating to the BGP exchange of IPv4 prefixes.

Mode Privileged Exec

Examples

```
awplus# clear ip bgp dampening 10.10.0.121
```

clear ip bgp flap-statistics (BGP)

Use this command to clear the flap count and history duration for the specified prefixes.

Syntax `clear ip bgp flap-statistics [<ip-address>|<ip-address/m>]`

Parameter	Description
<ip-address>	Specifies the IPv4 address for which BGP flap count and history duration are to be cleared.
<ip-address/m>	Specifies the IPv4 address with mask for which BGP flap count and history duration are to be cleared.
ipv4	Clears all IPv4 address family peers. Configure parameters relating to the BGP exchange of IPv4 prefixes.

Mode Privileged Exec

Examples

```
awplus# clear ip bgp flap-statistics 10.10.0.121
```

clear ip bgp (ASN) (BGP)

Use this command to reset the BGP connections to all peers in a specified Autonomous System Number (ASN).

Syntax

```
clear ip bgp <asn> [in [prefix-filter]|out|soft [in|out]]
clear ip bgp <asn> ipv4
clear ip bgp <asn> ipv4 in [prefix-filter]
clear ip bgp <asn> ipv4 out
clear ip bgp <asn> ipv4 soft [in|out]
```

Parameter	Description
<asn>	<1-4294967295> Specifies the ASN for which all routes will be cleared.
ipv4	Clears all IPv4 address family peers. Configure parameters relating to the BGP exchange of IPv4 prefixes.
in	Indicates that incoming advertised routes will be cleared.
prefix-filter	Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration.
out	Indicates that outgoing advertised routes will be cleared.
soft in	Soft inbound reset causes the neighbors to resend all their updates to the local switch, without resetting the connection or clearing the entries in the local switch. So, the local switch stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory.
soft out	Soft outbound reset causes the switch to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries.

Mode Privileged Exec

Examples

```
awplus# clear ip bgp 100
```

clear ip bgp external (BGP)

Use this command to reset the BGP connections to all external peers.

Syntax

```
clear ip bgp external [in [prefix-filter]|out|soft [in|out]]
clear ip bgp external
clear ip bgp external in [prefix-filter]
clear ip bgp external out
clear ip bgp external soft [in|out]
```

Parameter	Description
`external`	Clears all external peers.
`ipv4`	Clears all IPv4 address family peers. Configure parameters relating to the BGP exchange of IPv4 prefixes.
`in`	Indicates that incoming advertised routes will be cleared.
`prefix-filter`	Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration.
`out`	Indicates that outgoing advertised routes will be cleared.
`soft in`	Soft inbound reset causes the neighbors to resend all their updates to the local switch, without resetting the connection or clearing the entries in the local switch. So, the local switch stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory.
`soft out`	Soft outbound reset causes the switch to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries.

Mode Privileged Exec

Examples

```
awplus# clear ip bgp external out
```

clear ip bgp peer-group (BGP)

Use this command to reset the BGP connections to all members of a peer group.

Syntax

```
clear ip bgp peer-group <peer-name>
clear ip bgp peer-group <peer-name> in [prefix-filter]
clear ip bgp peer-group <peer-name> out
clear ip bgp peer-group <peer-name> soft [in|out]
clear ip bgp peer-group <peer-name> out
clear ip bgp peer-group <peer-name> soft [in|out]
```

Parameter	Description
`peer-group`	Clears all members of a peer group.
<peer-name>	Specifies the name of the peer group for which all members will be cleared.
`ipv4`	Clears all IPv4 address family peers. Configure parameters relating to the BGP exchange of IPv4 prefixes.
`in`	Indicates that incoming advertised routes will be cleared.
`prefix-filter`	Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration.
`out`	Indicates that outgoing advertised routes will be cleared.
`soft in`	Soft inbound reset causes the neighbors to resend all their updates to the local switch, without resetting the connection or clearing the entries in the local switch. So, the local switch stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory.
`soft out`	Soft outbound reset causes the switch to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries.

Mode Privileged Exec

Examples

```
awplus# clear ip bgp peer-group Peer1 out
```

clear bgp ipv6 (ipv6 address) (BGP4+)

Use this command to reset the IPv6 BGP4+ connection to the peer specified by the IP address.

Syntax `clear bgp ipv6 <ipv6-addr> [in [prefix-filter]|out|soft [in|out]]`

Parameter	Description
<ipv6-addr>	Specifies the IPv6 address of the neighbor whose connection is to be reset, entered in hexadecimal in the format X:X::X:X.
`ipv6`	Clears all IPv6 address family peers. Configure parameters relating to the BGP4+ exchange of IPv6 prefixes.
`in`	Indicates that incoming advertised routes will be cleared.
`prefix-filter`	Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration.
`out`	Indicates that outgoing advertised routes will be cleared.
`soft in`	Soft inbound reset causes the neighbors to resend all their updates to the local switch, without resetting the connection or clearing the entries in the local switch. So, the local switch stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory.
`soft out`	Soft outbound reset causes the switch to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries.

Mode Privileged Exec

Examples Use the following command to clear the BGP4+ connection to peer at IPv6 address 2001:0db8:010d::1, and clearing all incoming routes.

```
awplus# clear ip bgp 2001:0db8:010d::1 in
```

clear bgp ipv6 dampening (BGP4+)

Use this command to clear route dampening information and unsuppress routes that have been suppressed routes.

Syntax `clear bgp ipv6 dampening [<ipv6-addr>|<ipv6-addr/prefix-length>]`

Parameter	Description
<ipv6-addr>	Specifies the IPv6 address for which BGP4+ dampening is to be cleared, entered in hexadecimal in the format X:X::X:X.
<ipv6-addr/prefix-length>	Specifies the IPv6 address and prefix-length for which BGP4+ dampening is to be cleared. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.

Mode Privileged Exec

Examples

```
awplus# clear bgp ipv6 dampening 2001:0db8:010d::1
awplus# clear bgp ipv6 dampening 2001:0db8::/64
```

clear bgp ipv6 flap-statistics (BGP4+)

Use this command to clear the flap count and history duration for the specified prefixes.

Syntax

```
clear bgp ipv6 flap-statistics
   [<ipv6-addr>|<ipv6-addr/prefix-length>]
```

Parameter	Description
<ipv6-addr>	Specifies the IPv6 address for which BGP4+ flap count and history duration are to be cleared, entered in hexadecimal in the format X:X::X:X.
<ipv6-addr/prefix-length>	Specifies the IPv6 address with prefix length for which BGP4+ flap count and history duration are to be cleared. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.

Mode Privileged Exec

Examples

```
awplus# clear bgp ipv6 flap-statistics 2001:0db8:010d::1
awplus# clear bgp ipv6 flap-statistics 2001:0db8::/64
```

clear bgp ipv6 (ASN) (BGP4+)

Use this command to reset the BGP4+ connections to all peers in a specified Autonomous System Number (ASN).

Syntax

```
clear bgp ipv6 <asn> [in [prefix-filter]|out|soft [in|out]]
clear bgp ipv6 <asn>
clear bgp ipv6 <asn> in [prefix-filter]
clear bgp ipv6 <asn> out
clear bgp ipv6 <asn> soft [in|out]
```

Parameter	Description
<asn>	<1-4294967295> Specifies the ASN for which all routes will be cleared.
`in`	Indicates that incoming advertised routes will be cleared.
`prefix-filter`	Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration.
`out`	Indicates that outgoing advertised routes will be cleared.
`soft in`	Soft inbound reset causes the neighbors to resend all their updates to the local switch, without resetting the connection or clearing the entries in the local switch. So, the local switch stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory.
`soft out`	Soft outbound reset causes the switch to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries.

Mode Privileged Exec

Examples

```
awplus# clear bgp ipv6 100
awplus# clear bgp ipv6 100 in
awplus# clear bgp ipv6 100 in prefix-filter
awplus# clear bgp ipv6 100 out
awplus# clear bgp ipv6 100 soft out
awplus# clear bgp ipv6 100 soft in
```

clear bgp ipv6 external (BGP4+)

Use this command to reset the BGP4+ connections to all external peers.

Syntax

```
clear bgp ipv6 external [in [prefix-filter]|out|soft [in|out]]
clear bgp ipv6 external
clear bgp ipv6 external in [prefix-filter]
clear bgp ipv6 external out
clear bgp ipv6 external soft [in|out]
```

Parameter	Description
`external`	Clears all external peers.
`in`	Indicates that incoming advertised routes will be cleared.
`prefix-filter`	Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration.
`out`	Indicates that outgoing advertised routes will be cleared.
`soft in`	Soft inbound reset causes the neighbors to resend all their updates to the local switch, without resetting the connection or clearing the entries in the local switch. So, the local switch stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory.
`soft out`	Soft outbound reset causes the switch to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries.

Mode Privileged Exec

Examples

```
awplus# clear bgp ipv6 external in
awplus# clear bgp ipv6 external in prefix
awplus# clear bgp ipv6 external out
awplus# clear bgp ipv6 external soft out
awplus# clear bgp ipv6 external soft in
```

clear bgp ipv6 peer-group (BGP4+)

Use this command to reset the BGP4+ connections to all members of a peer group.

Syntax

```
clear bgp ipv6 peer-group <peer-name>
clear bgp ipv6 peer-group <peer-name> in [prefix-filter]
clear bgp ipv6 peer-group <peer-name> out
clear bgp ipv6 peer-group <peer-name> soft [in|out]
```

Parameter	Description
`peer-group`	Clears all members of a peer group.
<peer-name>	Specifies the name of the peer group for which all members will be cleared.
`ipv6`	Clears all IPv6 address family peers. Configure parameters relating to the BGP4+ exchange of IPv6 prefixes.
`in`	Indicates that incoming advertised routes will be cleared.
`prefix-filter`	Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration.
`out`	Indicates that outgoing advertised routes will be cleared.
`soft in`	Soft inbound reset causes the neighbors to resend all their updates to the local switch, without resetting the connection or clearing the entries in the local switch. So, the local switch stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory.
`soft out`	Soft outbound reset causes the switch to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries.

Mode Privileged Exec

Example

```
awplus# clear bgp ipv6 peer-group Peer1 out
```

debug bgp (BGP)

Use this command to turn on one or more BGP debug options.

Use the **no** variant of this command to disable one or more BGP debug options.

Syntax

```
debug bgp [all|dampening|events|filters|fsm|keepalives|nht|nsm|
   updates [in|out]]

no debug all bgp

no debug bgp [all|dampening|events|filters|fsm|keepalives|nht|nsm|
   updates [in|out]]
```

Parameter	Description
`all`	Turns on all debugging for BGP.
`dampening`	Specifies debugging for BGP dampening.
`events`	Specifies debugging for BGP events.
`filters`	Specifies debugging for BGP filters.
`fsm`	Specifies debugging for BGP Finite State Machine (FSM).
`keepalives`	Specifies debugging for BGP keepalives.
`nht`	Specifies debugging for BGP NHT (Next Hop Tracking) messages.
`nsm`	Specifies debugging for NSM messages.
`updates`	`[in|out]` Specifies debugging for BGP updates.
`in`	Inbound updates.
`out`	Outbound updates.

Mode Privileged Exec and Global Configuration

Usage If the command is entered with no parameters, then all debug options are enabled.

Examples

```
awplus# debug bgp

awplus# debug bgp events

awplus# debug bgp nht

awplus# debug bgp updates in
```

Related Commands **show debugging bgp (BGP)**
undebug bgp (BGP)

distance (BGP and BGP4+)

This command sets the administrative distance for BGP and BGP4+ routes. The switch uses this value to select between two or more routes to the same destination from two different routing protocols. Set the administrative distance for BGP routes in the Router Configuration mode, and for BGP4+ routes in IPv6 Address Family Configuration mode.

The route with the smallest administrative distance value is added to the Forwarding Information Base (FIB). For more information, see the **Administrative Distance** section in the **Route Selection** chapter of the **AlliedWare Plus Software Reference**.

The **no** variant of this command sets the administrative distance for the route to the default for the route type.

Syntax [BGP/BGP4+]

```
distance <1-255> <ip-address/m> [<listname>]
distance bgp <ebgp> <ibgp> <local>
no distance <1-255> <ip-address/m> [<listname>]
no distance bgp <ebgp> <ibgp> <local>
```

Parameter	Description
`<1-255>`	The administrative distance value you are setting for the route.
`<ip-address/m>`	The IP source prefix that you are changing the administrative distance for, entered in the form `A.B.C.D/M`. This is an IPv4 address in dotted decimal notation followed by a forward slash, and then the prefix length.
`<listname>`	The name of the access list to be applied to the administrative distance to selected routes.
`<ebgp>`	Specifies the administrative distance of external BGP (eBGP) routes. These are routes learnt from a neighbor out of the AS. Specify the distance as a number between 1 and 255. Default: **20**
`<ibgp>`	Specifies the administrative distance of internal BGP (iBGP) routes. These are routes learnt from a neighbor within the same AS. Specify the distance as a number between 1 and 255. Default: **200**
`<local>`	Specifies the administrative distance of local BGP routes. These are routes redistributed from another protocol within your device. Specify the distance as a number between 1 and 255. Default: **200**

Mode [BGP] Router Configuration

Mode [BGP4+] IPv6 Address Family Configuration

Usage

You can use this command to set the administrative distance:

- for each BGP route types by specifying:
  distance (BGP and BGP4+) **<ebgp> <igbp> <local>**
- for a specific route by specifying:
  distance (BGP and BGP4+) **<1-255> <ip-address/m> [<listname>]**

If the administrative distance is changed, it could create inconsistency in the routing table and obstruct routing.

Examples [BGP]

For BGP IPv4, to set the administrative distance to 34 for the route 10.10.0.0/24 in BGP 100, and use the access list "mylist" to filter the routes, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# distance 34 10.10.0.0/24 mylist
```

For BGP IPv4, to set BGP 100's administrative distances for eBGP routes to 34, iBGP routes to 23, and local BGP routes to 15, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# distance bgp 34 23 15
```

Example [BGP4+]

For BGP4+ IPv6, to set BGP 100's administrative distances for eBGP routes to 34, iBGP routes to 23, and local BGP routes to 15, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# address-family ipv6
awplus(config-router-af)# distance bgp 34 23 15
```

exit-address-family (BGP and BGP4+)

Use this command to exit either the IPv4 or the IPv6 Address Family Configuration mode.

Syntax [BGP/BGP4+] `exit-address-family`

Mode [BGP] IPv4 Address Family Configuration

Mode [BGP4+] IPv6 Address Family Configuration

Examples [BGP] To enter and then exit IPv4 Address Family Configuration mode, use the commands:.

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# address-family ipv4
awplus(config-router-af)# exit-address-family
awplus(config-router)#
```

Example (VRF Lite) To enter and then exit IPv4 Address Family Configuration mode for VRF instance red, use the commands:.

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# address-family ipv4 vrf red
awplus(config-router-af)# exit-address-family
awplus(config-router)#
```

Example [BGP4+] To enter and then exit IPv6 Address Family Configuration mode, use the commands:.

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# address-family ipv6
awplus(config-router-af)# exit-address-family
awplus(config-router)#
```

Related Commands address-family (BGP and BGP4+)

ip as-path access-list (BGP and BGP4+)

This command defines a BGP and BGP4+ Autonomous System (AS) path access list.

The named AS path list is a filter based on regular expressions. If the regular expression matches the AS path in a BGP update message, then the permit or deny condition applies to that update. Use this command to define the BGP access list globally, then use neighbor configuration commands to apply the list to a particular neighbor.

The **no** variant of this command disables the use of the access list

Syntax [BGP/BGP4+]

```
ip as-path access-list <listname> {deny|permit} <reg-exp>
no ip as-path access-list <listname> {deny|permit} <reg-exp>
```

Parameter	Description
<listname>	Specifies the name of the access list.
deny	Denies access to matching conditions.
permit	Permits access to matching conditions.
<reg-exp>	Specifies a regular expression to match the BGP AS paths.

Regular expressions listed below can be used with the **ip as-path-access-list** command:

Symbol	Character	Meaning
^	Caret	Used to match the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match.
$	Dollar sign	Used to match the end of the input string.
.	Period	Used to match a single character (white spaces included).
*	Asterisk	Used to match none or more sequences of a pattern.
+	Plus sign	Used to match one or more sequences of a pattern.
?	Question mark	Used to match none or one occurrence of a pattern.
_	Underscore	Used to match spaces, commas, braces, parenthesis, or the beginning and end of an input string.
[]	Brackets	Specifies a range of single-characters.
-	Hyphen	Separates the end points of a range.

Mode [BGP/BGP4+] Global Configuration

Example [BGP/BGP4+]

```
awplus# configure terminal
awplus(config)# ip as-path access-list mylist deny ^65535$
```

ip community-list (BGP and BGP4+)

Use this command to add an entry to a standard or extended BGP community-list filter.

Use the **no** variant of this command to delete a standard or extended community list entry.

Syntax [BGP/BGP4+]

```
ip community-list <listname> {deny|permit} .<community>
no ip community-list <listname> {deny|permit} .<community>
```

Parameter	Description
<listname>	Specifies the community listname.
deny	Specifies the community to reject.
permit	Specifies the community to accept.
.*<community>*	{*<AS:VAL>*| **local-AS** | **no-advertise** | **no-export**}
<AS:VAL>	Specifies the valid value for the community number. This format represents the 32 bit communities value, where AS is the high order 16 bits and VAL is the low order 16 bits in digit format.
local-AS	Specifies routes not to be advertised to external BGP peers.
no-advertise	Specifies routes not to be advertised to other BGP peers.
no-export	Specifies routes not to be advertised outside of Autonomous System boundary.

Mode [BGP/BGP4+]

Global Configuration

Usage [BGP/BGP4+]

A community-list can be used as a filter to BGP updates. Use this command to define the community access list globally, then use neighbor configuration commands to apply the list to a particular neighbor.

There are two kinds of community-lists: expanded and standard. A standard community-list defines the community attributes explicitly and not via a regular expression. An expanded community-list defines the communities attributes with regular expressions.

The standard community-list is compiled into binary format and is directly compared with the BGP communities attribute in the BGP updates. The comparison is faster than the expanded community-list. Any community value that does not match the standard community value is automatically treated as expanded.

Example [BGP/BGP4+]

```
awplus# configure terminal
awplus(config)# ip community-list mylist permit 7675:80 7675:90
```

Related Commands

ip community-list standard (BGP and BGP4+)
ip community-list expanded (BGP and BGP4+)
show ip community-list (BGP and BGP4+)

ip community-list expanded (BGP and BGP4+)

Use this command to add an entry to an expanded BGP community-list filter.

Use the **no** variant of this command to delete the community list entry.

Syntax

```
ip community-list <100-199> {deny|permit} .<line>

no ip community-list <100-199> {deny|permit} .<line>

ip community-list expanded <expanded-listname> {deny|permit} .<line>

no ip community-list expanded <expanded-listname> {deny|permit}
    .<line>
```

Parameter	Description
`<100-199>`	Expanded community list number.
`expanded`	Specifies an expanded community list.
`<expanded-listname>`	Expanded community list entry.
`deny`	Specifies community to reject.
`permit`	Specifies community to accept.
`.<line>`	Specifies community attributes with regular expressions.

Regular expressions listed below can be used with the **ip community-list expanded** command:

Symbol	Character	Meaning
^	Caret	Used to match the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match.
$	Dollar sign	Used to match the end of the input string.
.	Period	Used to match a single character (white spaces included).
*	Asterisk	Used to match none or more sequences of a pattern.
+	Plus sign	Used to match one or more sequences of a pattern.
?	Question mark	Used to match none or one occurrence of a pattern.
_	Underscore	Used to match spaces, commas, braces, parenthesis, or the beginning and end of an input string.
[]	Brackets	Specifies a range of single-characters.
-	Hyphen	Separates the end points of a range.

Mode Global Configuration

Usage A `community-list` can be used as a filter to BGP updates. Use this command to define the community access list globally, then use `neighbor` configuration commands to apply the list to a particular neighbor.

There are two kinds of community-lists: expanded and standard. A standard community-list defines the community attributes explicitly and not via a regular expression. An expanded community-list defines the communities attributes with regular expressions.

The standard community-list is compiled into binary format and is directly compared with the BGP communities attribute in the BGP updates. The comparison is faster than the expanded community-list. Any community value that does not match the standard community value is automatically treated as expanded.

Examples

```
awplus# configure terminal
awplus(config)# ip community-list 125 permit 6789906
awplus(config)# ip community-list expanded CLIST permit .*
```

Related Commands

ip community-list (BGP and BGP4+)
ip community-list standard (BGP and BGP4+)
show ip community-list (BGP and BGP4+)

ip community-list standard (BGP and BGP4+)

Use this command to add an entry to a standard BGP community-list filter.

Use the **no** variant of this command to delete the standard community-list entry.

Syntax

```
ip community-list <1-99> {deny|permit} [.<community>]

no ip community-list <1-99> {deny|permit} [.<community>]

ip community-list standard <standard-listname> {deny|permit}
   [.<community>]

no ip community-list standard <standard-listname> {deny|permit}
   [.<community>]
```

Parameter	Description
<1-99>	Standard community list number.
`standard`	Specifies a standard community list.
<standard-listname>	Standard community list entry.
`deny`	Specifies community to reject.
`permit`	Specifies community to accept.
<community>	{*<AS:VAL>* | **local-AS** | **no-advertise** | **no-export**}
<AS:VAL>	Specifies the valid value for the community number. This format represents the 32 bit communities value, where `AS` is the high order 16 bits and `VAL` is the low order 16 bits in digit format.
`local-AS`	Specifies routes not to be advertised to external BGP peers.
`no-advertise`	Specifies routes not to be advertised to other BGP peers.
`no-export`	Specifies routes not to be advertised outside of the Autonomous System boundary.

Mode Global Configuration

Usage A community-list can be used as a filter to BGP updates. Use this command to define the community access list globally, then use neighbor configuration commands to apply the list to a particular neighbor.

There are two kinds of community-lists: expanded and standard. The standard community-list defines the community attributes as explicit values, without regular expressions. The expanded community-list defines the communities attributes with regular expressions.

The standard community-list is compiled into binary format and is directly compared with the BGP communities attribute in the BGP updates. The comparison is faster than the expanded community-list. Any community value that does not match the standard community value is automatically treated as expanded.

Examples

```
awplus# configure terminal

awplus(config)# ip community-list standard CLIST permit 7675:80
7675:90 no-export

awplus(config)# ip community-list 34 permit 5675:50 no-
advertise
```

Related Commands

ip community-list (BGP and BGP4+)
ip community-list expanded (BGP and BGP4+)
show ip community-list (BGP and BGP4+)

ip extcommunity-list expanded (BGP and BGP4+)

Use this command to create or delete an expanded extended community list.

Use the **no** variant of this command to delete the expanded extended community-list entry.

Syntax

```
ip extcommunity-list <100-199> {deny|permit}
    {.<line>|.<AS:NN>|.<ip-address>}

no ip extcommunity-list <100-199> {deny|permit}
    {.<line>|.<AS:NN>|.<ip-address>}

ip extcommunity-list expanded <expanded-listname> {deny|permit}
    {.<line>|.<AS:NN>|.<ip-address>}

no ip extcommunity-list expanded <expanded-listname> {deny|permit}
    {.<line>|.<AS:NN>|.<ip-address>}

no ip extcommunity-list <100-199>

no ip extcommunity-list expanded <expanded-listname>
```

Parameter	Description
<100-199>	Expanded extcommunity list number.
expanded	Specifies an expanded extcommunity list.
<expanded-listname>	Expanded extcommunity list entry.
deny	Specifies the extcommunity to reject.
permit	Specifies the extcommunity to accept.
.<line>	Specifies extcommunity attributes with regular expression.
<AS:NN>	Specifies the valid value for an extcommunity number. This format represents the 32 bit extcommunities value, where AA is the high order 16 bits and NN is the low order 16 bits in digit format.
<ip-address>	Specifies the IP address to deny or permit.

Regular expressions listed below are used with the **ip extcommunity-list expanded** command:

Symbol	Character	Meaning
^	Caret	Used to match the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match.
$	Dollar sign	Used to match the end of the input string.
.	Period	Used to match a single character (white spaces included).
*	Asterisk	Used to match none or more sequences of a pattern.
+	Plus sign	Used to match one or more sequences of a pattern.

Symbol(cont.)	Character(cont.)	Meaning(cont.)
?	Question mark	Used to match none or one occurrence of a pattern.
_	Underscore	Used to match spaces, commas, braces, parenthesis, or the beginning and end of an input string.
[ ]	Brackets	Specifies a range of single-characters.
-	Hyphen	Separates the end points of a range.

Mode Global Configuration

Examples

```
awplus# configure terminal
awplus(config)# ip extcommunity-list 125 permit 4567335
awplus(config)# ip extcommunity-list expanded CLIST permit .*
```

Related Commands **ip extcommunity-list standard (BGP and BGP4+)**
show ip extcommunity-list (BGP and BGP4+)

ip extcommunity-list standard (BGP and BGP4+)

Use this command to create and delete a standard extended community list.

Use the **no** variant of this command to delete a standard extended community-list entry.

Syntax

```
ip extcommunity-list <1-99> {deny|permit} {rt|soo} <community-number>

ip extcommunity-list standard <standard-listname> {deny|permit}
   {rt|soo} <community-number>

no ip extcommunity-list <1-99> [{deny|permit} {rt|soo}
   <community-number>]

no ip extcommunity-list standard <standard-listname> [{deny|permit}
   {rt|soo} <community-number>]
```

Parameter	Description
<1-99>	Standard extcommunity list number.
`standard`	Specifies a standard extended community list.
<standard-listname>	Standard extended community list entry.
`deny`	Specifies the extended community to reject.
`permit`	Specifies the extended community to accept.
`rt`	Specifies the route target of the extended community.
`soo`	Specifies the site of origin of the extended community.
<community-number>	Specifies the valid value for an extended community number. This can be one of two formats: ■ *<ASN:NN>* where *ASN* is an AS (Autonomous System) number and *NN* is a value chosen by the ASN administrator ■ *<A.B.C.D:NN>* where *A.B.C.D* is an IPv4 address, and *NN* is a value chosen by the ASN administrator. Note that *ASN* and *NN* are both integers from 1 to 4294967295. AS numbers are assigned to the regional registries by IANA (**www.iana.org**) and must be obtained in your region.

Mode Global Configuration

Examples

```
awplus# configure terminal
awplus(config)# ip extcommunity-list 36 permit rt 5675:50
awplus(config)# ip extcommunity-list standard CLIST permit soo
7645:70
```

```
awplus# configure terminal
awplus(config)# ip extcommunity-list 36 deny rt 192.168.1.1:70
awplus(config)# ip extcommunity-list standard CLIST deny soo
10.10.1.1:50
```

Related Commands **ip extcommunity-list expanded (BGP and BGP4+)**
show ip extcommunity-list (BGP and BGP4+)

ip prefix-list (IPv4 Prefix List)

Use this command to create an entry for an IPv4 prefix list.

Use the **no** variant of this command to delete the IPv4 prefix-list entry.

Syntax

```
ip prefix-list <list-name> [seq <1-429496725>]
   {deny|permit}
   {any|<ip-prefix>}
   [ge <0-32>] [le <0-32>]

ip prefix-list <list-name> description <text>

ip prefix-list sequence-number

no ip prefix-list <list-name> [seq <1-429496725>]

no ip prefix-list <list-name> [description <text>]

no ip prefix-list sequence-number
```

Parameter	Description
`<list-name>`	Specifies the name of a prefix list.
`seq <1-429496725>`	Sequence number of the prefix list entry.
`deny`	Specifies that the prefixes are excluded from the list.
`permit`	Specifies that the prefixes are included in the list.
`<ip-prefix>`	Specifies the IPv4 address and length of the network mask in dotted decimal in the format A.B.C.D/M.
`any`	Any prefix match. Same as **0.0.0.0/0 le 32**.
`ge <0-32>`	Specifies the minimum prefix length to be matched.
`le <0-32>`	Specifies the maximum prefix length to be matched.
`description <text>`	Text description of the prefix list.
`sequence-number`	Specify sequence numbers included or excluded in prefix list.

Mode Global Configuration

Usage When the device processes a prefix list, it starts to match prefixes from the top of the prefix list, and stops whenever a permit or deny occurs. To promote efficiency, use the **seq** parameter and place common permits or denials towards the top of the list. If you do not use the **seq** parameter, the sequence values are generated in a sequence of 5.

The parameters **ge** and **le** specify the range of the prefix lengths to be matched. When setting these parameters, set the **le** value to be less than 32, and the **ge** value to be less than or equal to the **le** value and greater than the ip-prefix mask length.

Prefix lists implicitly exclude prefixes that are not explicitly permitted in the prefix list. This means if a prefix that is being checked against the prefix list reaches the end of the prefix list without matching a permit or deny, this prefix will be denied.

Example In the below sample configuration, the last `ip prefix-list` command in the below list matches all, and the first `ip prefix-list c`ommand denies the IP network `76.2.2.0`:

```
awplus(config)# router bgp 100
awplus(config-router)# network 172.1.1.0
awplus(config-router)# network 172.1.2.0
awplus(config-router)# neighbor 10.6.5.3 remote-as 300
awplus(config-router)# neighbor 10.6.5.3 prefix-list mylist out
awplus(config-router)# exit
awplus(config)# ip prefix-list mylist seq 5 deny
                  76.2.2.0/24
awplus(config)# ip prefix-list mylist seq 100 permit any
```

To deny the IP addresses between `10.0.0.0/14` (`10.0.0.0 255.252.0.0`) and `10.0.0.0/22` (`10.0.0.0 255.255.252.0`) within the `10.0.0.0/8` (`10.0.0.0 255.0.0.0`) addressing range, enter the following commands:.

```
awplus# configure terminal
awplus(config)# ip prefix-list mylist seq 12345 deny 10.0.0.0/
                8 ge 14 le 22
```

Related Commands **ipv6 prefix-list (IPv6 Prefix List)**
show ip prefix-list (IPv4 Prefix List)

ipv6 prefix-list (IPv6 Prefix List)

Use this command to create an IPv6 prefix list or an entry in an existing prefix list.

Use the no variant of this command to delete a whole prefix list or a prefix list entry.

Syntax

```
ipv6 prefix-list <list-name> [seq <1-429496725>]
   {deny|permit}
   {any|<ipv6-prefix>}
   [ge <0-128>] [le <0-128>]

ipv6 prefix-list <list-name> description <text>

no ipv6 prefix-list <list-name> [seq <1-429496725>]

no ipv6 prefix-list <list-name> [description <text>]
```

Parameter	Description
<list-name>	Specifies the name of a prefix list.
seq <1-429496725>	Sequence number of the prefix list entry.
deny	Specifies that the prefixes are excluded from the list.
permit	Specifies that the prefixes are included in the list.
<ipv6-prefix>	Specifies the IPv6 prefix and prefix length in hexadecimal in the format X:X::X:X/M.
any	Any prefix match. Same as ::0/0 le 128.
ge <0-128>	Specifies the minimum prefix length to be matched.
le <0-128>	Specifies the maximum prefix length to be matched.
description	Prefix list specific description.
<text>	Up to 80 characters of text description of the prefix list.

Mode Global Configuration

Usage When the device processes a prefix list, it starts to match prefixes from the top of the prefix list, and stops whenever a permit or deny occurs. To promote efficiency, use the seq parameter and place common permits or denials towards the top of the list. If you do not use the seq parameter, the sequence values are generated in a sequence of 5.

The parameters ge and le specify the range of the prefix lengths to be matched. The parameters ge and le are only used if an ip-prefix is stated. When setting these parameters, set the le value to be less than 128, and the ge value to be less than or equal to the le value and greater than the ip-prefix mask length.

Prefix lists implicitly exclude prefixes that are not explicitly permitted in the prefix list. This means if a prefix that is being checked against the prefix list reaches the end of the prefix list without matching a permit or deny, this prefix will be denied.

Example To check the first 32 bits of the prefix 2001:db8:: and the subnet mask must be greater than or equal to 34 and less than or equal to 40, enter the following commands:

```
awplus# configure terminal

awplus(config)# ipv6 prefix-list mylist seq 12345 permit
2001:db8::/32 ge 34 le 40
```

Related Commands **ip prefix-list (IPv4 Prefix List)**
show ipv6 prefix-list (IPv6 Prefix List)

match as-path (Route Map)

Use this command to add an autonomous system (AS) path match clause to a route map entry. Specify the AS path attribute value or values to match by specifying the name of an AS path access list. To create the AS path access list, enter Global Configuration mode and use the **ip as-path access-list (BGP and BGP4+)** command.

A BGP update message matches the route map if its attributes include AS path values that match the AS path access list.

Each entry of a route map can only match against one AS path access list in one AS path match clause. If the route map entry already has an AS path match clause, entering this command replaces that match clause with the new clause.

Note that AS path access lists and route map entries both specify an action of deny or permit. The action in the AS path access list determines whether the route map checks update messages for a given AS path value. The route map action and its **set** clauses determine what the route map does with update messages that contain that AS path value.

Use the **no** variant of this command to remove the AS path match clause from a route map entry.

Syntax

```
match as-path <as-path-listname>
no match as-path [<as-path-listname>]
```

Parameter	Description
<as-path-listname>	Specifies an AS path access list name.

Mode Route-map Configuration

Usage This command is valid for BGP update messages only.

Example To add entry `34` to the route map called `myroute`, which will discard update messages if they contain the AS path values that are included in `myaccesslist`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute deny 34
awplus(config-route-map)# match as-path myaccesslist
```

Related Commands **ip as-path access-list (BGP and BGP4+)**
route-map (Route Map)

match community (Route Map)

Use this command to add a community match clause to a route map entry. Specify the community value or values to match by specifying a community list. To create the community list, enter Global Configuration mode and use the **ip community-list (BGP and BGP4+)** command.

A BGP update message matches the route map if its attributes include community values that match the community list.

Each entry of a route map can only match against one community list in one community match clause. If the route map entry already has a community match clause, entering this command replaces that match clause with the new clause.

Note that community lists and route map entries both specify an action of deny or permit. The action in the community list determines whether the route map checks update messages for a given community value. The route map action and its **set** clauses determine what the route map does with update messages that contain that community value.

Use the **no** variant of this command to remove the community match clause from a route map.

Syntax

```
match community {<community-listname>|<1-99>|<100-199>}[exact-match]
no match community [<community-listname>|<1-99>|<100-199>|exact-
    match]
```

Parameter	Description
<community-listname>	The community list name or number.
<1-99>	Community list number (standard range).
<100-199>	Community list number (expanded range).
exact-match	Exact matching of communities.

Mode Route-map Configuration

Usage This command is valid for BGP update messages only.

Communities are used to group and filter routes. They are designed to provide the ability to apply policies to large numbers of routes by using match and set commands. Community lists are used to identify and filter routes by their common attributes.

Example To add entry `3` to the route map called `myroute`, which will process update messages if they contain the community values that are included in `mylist`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# match community mylist
```

Related Commands
route-map (Route Map)
set community (Route Map)

neighbor activate (BGP and BGP4+)

Use this command to enable the exchange of BGP IPv4 and BGP4+ IPv6 routes with a neighboring router, and also within either an IPv4 or an IPv6 specific address-family.

Use the **no** variant of this command to disable the exchange of information with a BGP or BGP4+ neighbor, in the Router Configuration or the Address Family Configuration mode.

Syntax [BGP/BGP4+]

```
neighbor <neighborid> activate
no neighbor <neighborid> activate
```

Parameter	Description	
<neighborid>	{*<ip-address>*|*<ipv6-addr>*|*<peer-group>*}	
	<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
	<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
	<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the **neighbor peer-group (add a neighbor) (BGP and BGP+)** command on page 45.145, and **neighbor route-map (BGP and BGP4+)** command on page 45.160. When this parameter is used with this command, the command applies on all peers in the specified group.

Mode [BGP] Router Configuration or IPv4 Address Family Configuration for a VRF instance

Mode [BGP4+] IPv6 Address Family Configuration

Usage [BGP] Use this command to enable the exchange of information to a neighbor. To exchange IPv4 or IPv6 prefixes with a BGP or a BGP4+ peer, you must configure this command for the peer or the peer group. This command only enables the exchange of information. You can establish peering without this command, but no prefixes and other information is sent until you apply this command to the neighbor.

This command triggers the switch to start a BGP or BGP4+ peering relationship with the specified BGP or BGP4+ neighbor and start exchanging routes with that neighbor.

The command is required for neighbors configured in Address-Family Configuration mode, but it is not required in Router Configuration mode (that is, it does not affect the device's behavior).

Examples [BGP] To enable an exchange of routes with a neighboring router with the IPv4 address `10.10.10.1`, enter the commands as shown below:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 activate
```

To disable an exchange of routes with a neighboring router with the IPv4 address 10.10.10.1, enter the commands as shown below:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 activate
```

To enable an exchange of routes in Address Family Configuration mode with a neighboring router with the IPv4 address 10.10.10.1, enter the commands as shown below:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.10.1 activate
```

To disable an exchange of routes in Address Family Configuration mode with a neighboring router with the IPv4 address 10.10.10.1, enter the commands as shown below:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.10.1 activate
```

To enable an exchange of routes with a neighboring router with the peer-group named group1, enter the commands as shown below:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.0.63 remote-as 10
awplus(config-router)# neighbor 10.10.0.63 peer-group group1
awplus(config-router)# neighbor group1 activate
```

To disable an exchange of routes with a neighboring router with the peer-group named group1, enter the commands as shown below:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 activate
```

Examples [BGP4+]

To enable an exchange of routes in IPv6 Address Family Configuration mode with a neighboring router with the IPv6 address `2001:0db8:010d::1`, enter the commands as shown below:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 activate
```

To disable an exchange of routes in IPv6 Address Family Configuration mode with a neighboring router with the IPv6 address `2001:0db8:010d::1`, enter the commands as shown below:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
activate
```

To enable an exchange of routes with a neighboring router with the peer-group named `group1`, enter the commands as shown below:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as
10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 activate
```

To disable an exchange of routes with a neighboring router with the peer-group named group1, enter the commands as shown below:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 activate
```

Related Commands

neighbor peer-group (add a neighbor) (BGP and BGP+)
neighbor route-map (BGP and BGP4+)

neighbor advertisement-interval (BGP and BGP4+)

Use this command to set the minimum interval between sending iBGP or eBGP routing updates for a given route. This command reduces the flapping of individual routes.

Use the **no** variant of this command to set the interval time to the default values (30 seconds for eBGP peers and 5 seconds for iBGP peers) for a given route.

Syntax [BGP/BGP4+]

```
neighbor <neighborid> advertisement-interval <time>
no neighbor <neighborid> advertisement-interval [<time>]
```

Parameter	Description	
<neighborid>	{*<ip-address>*|*<ipv6-addr>*|*<peer-group>*}	
	<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
	<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
	<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the **neighbor peer-group (add a neighbor) (BGP and BGP4+)** command on page 45.145, and **neighbor route-map (BGP and BGP4+)** command on page 45.160. When this parameter is used with this command, the command applies on all peers in the specified group. Note that if you apply an advertisement-interval value to a peer group it will apply to all members in the peer group.
<time>	*<0-600>*	Advertisement -interval value in seconds.

Default [BGP/BGP4+] The default interval between sending routing updates for a given route to eBGP peers is 30 seconds, and the default interval for a given route to iBGP peers is 5 seconds.

Mode [BGP/BGP4+] Router Configuration

Usage [BGP/BGP4+] Use this command to set the minimum interval between sending iBGP or eBGP routing updates for a given route. To reduce the flapping of routes to the internet, set a minimum advertisement interval, so iBGP or eBGP routing updates are sent per interval seconds.

BGP dampening can also be used to control the effects of flapping routes. See the **bgp dampening (BGP and BGP4+)** command in this chapter, and the **BGP and BGP4+ Route Dampening** section in the **BGP and BGP4+ Introduction** chapter for more information.

The advertisement-interval time value is the minimum time between the advertisement of Update messages sent from a BGP speaker to report changes to eBGP or iBGP peers. This is the minimum time between two Update messages sent to iBGP or eBGP peers.

See the **neighbor as-origination-interval (BGP and BGP4+)** command to set the interval time between messages to iBGP peers, which have prefixes within the local AS. Use this command instead of the **neighbor as-origination-interval (BGP and BGP4+)**

command for eBGP peers with prefixes not in the same AS and updates not in a local AS.

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.3
advertisement-interval 45

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.3
advertisement-interval

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.0.3 remote-as 10
awplus(config-router)# neighbor 10.10.0.3 peer-group group1
awplus(config-router)# neighbor group1 advertisement-interval
45

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1
advertisement-interval
```

Examples [BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1
advertisement-interval 45
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1
advertisement-interval
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as
10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 peer-group
group1
awplus(config-router-af)# neighbor group1
advertisement-interval 45
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1
advertisement-interval
```

Validation Commands
show bgp ipv6 neighbors (BGP4+)
show ip bgp neighbors (BGP)

Related Commands
neighbor as-origination-interval (BGP and BGP4+)
neighbor peer-group (add a neighbor) (BGP and BGP+)
neighbor route-map (BGP and BGP4+)

neighbor allowas-in (BGP and BGP4+)

Use this command to accept an AS_PATH with the specified Autonomous System (AS) number from inbound updates for both BGP and BGP4+ routes.

This command allows BGP and BGP4+ to accept prefixes with the same ASN in the AS_PATH attribute. This command allows BGP and BGP4+ to accept up to 10 instances, configured by the *<occurrences>* placeholder, of its own AN in the AS_PATH for a prefix.

Use the **no** variant of this command to revert to default functionality (disabled by default).

Syntax [BGP/BGP4+]

```
neighbor <neighborid> allowas-in <occurrences>
no neighbor <neighborid> allowas-in
```

Parameter	Description	
<neighborid>	{*<ip-address>*|*<ipv6-addr>*|*<peer-group>*}	
	<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
	<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
	<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the **neighbor peer-group (add a neighbor) (BGP and BGP+)** command on page 45.145, and **neighbor route-map (BGP and BGP4+)** command on page 45.160. When this parameter is used with this command, the command applies on all peers in the specified group.
<occurrences>	*<1-10>* Specifies the number of occurrences of the AS number.	

Default [BGP/BGP4+] Disabled

Mode [BGP] Router Configuration or IPv4 Address Family Configuration

Mode [BGP4+] IPv6 Address Family Configuration

Usage [BGP/BGP4+] Use this command to configure PE (Provider Edge) routers to allow re-advertisement of all prefixes containing duplicate Autonomous System Numbers (ASNs). In a hub and spoke configuration, a PE router re-advertises all prefixes containing duplicate ASNs. Specify the remote-as or peer-group first using the related commands. The command allows a receiving peer to accept prefixes with its own AN in the AS_PATH, up the maximum number of instances, as configured by the *<occurrences>* placeholder.

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.1 allowas-in 3
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.0.1 allowas-in 3

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.1 allowas-in

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.0.1 allowas-in

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.0.1 remote-as 10
awplus(config-router)# neighbor 10.10.0.1 peer-group group1
awplus(config-router)# neighbor group1 allowas-in 3

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor group1 allowas-in 3
```

Examples [BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
                          allowas-in 3
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
allowas-in
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1
remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 allowas-in 3
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor group1 allowas-in 3
```

Related Commands **neighbor peer-group (add a neighbor) (BGP and BGP+)**
neighbor route-map (BGP and BGP4+)

neighbor as-origination-interval (BGP and BGP4+)

Use this command to adjust the sending of AS (Autonomous System) origination routing updates to a specified iBGP peer. This command adjusts the rate at which updates are sent to a specified iBGP peer (15 seconds by default). You must set a rate when you enable it.

The as-origination-interval is the minimum time set between the advertisement of Update messages sent from a BGP speaker to an iBGP peer to report changes within the local AS.

Use the **no** variant of this command to reset the timer to the default value of 15 seconds.

Syntax [BGP]

```
neighbor <neighbor_address> as-origination-interval <time>
no neighbor <neighbor_address> as-origination-interval [<time>]
```

Syntax [BGP4+]

```
neighbor <ipv6-addr> as-origination-interval <time>
no neighbor <ipv6-addr> as-origination-interval [<time>]
```

Parameter	Description
<neighbor_address>	Specify a neighbor IPv4 address, in dotted decimal in the format A.B.C.D.
<ipv6-addr>	Specify an address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<time>	<1-600> Time in seconds.

Default [BGP/BGP4+] The default interval between sending routing updates to iBGP peers, which include a prefix that originates from the local AS, is 15 seconds by default.

Mode [BGP/BGP4+] Router Configuration

Usage [BGP/BGP4+] This command is used to change the minimum interval between sending AS-origination routing updates. The update interval for iBGP peers can be set from 1 to 600 seconds.

For interoperability with other vendors' devices, we recommend using the default value. The AS origination interval timer may not be available to adjust on other vendors' devices. Applying the default of 15 seconds across the AS maintains a common timer policy.

AlliedWare Plus devices use the default 15 second AS Origination Interval timer as per RFC 4271, a 30 second keepalive timer, a 90 second hold timer, a 120 second connect timer, a 5 second iBGP peer route advertisement interval, and a 30 second eBGP peer route advertisement interval.

Cisco devices use a 60 second keepalive timer, a 180 second hold timer, and no iBGP peer route interval timer (0). Juniper devices use a 10 second AS Origination Interval timer.

The as-origination-interval time value is the minimum amount of time between the advertisement of Update messages sent from a BGP speaker to report changes within the local AS. This is the minimum time between two Update messages to iBGP peers, which contain a prefix that originates from the same AS. See the **neighbor advertisement-interval (BGP and BGP4+)** command to set time between messages to eBGP peers.

Use this command instead of the **neighbor advertisement-interval (BGP and BGP4+)** command for iBGP peers with prefixes in the same AS for updates only within a local AS.

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# neighbor 10.10.0.1
as-origination-interval 10

awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# no neighbor 10.10.0.1
as-origination-interval
```

Examples [BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# neighbor 2001:0db8:010d::1
as-origination-interval 10

awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# no neighbor 2001:0db8:010d::1
as-origination-interval
```

Validation Commands

show bgp ipv6 neighbors (BGP4+)
show ip bgp neighbors (BGP)

Related Commands

neighbor advertisement-interval (BGP and BGP4+)
address-family (BGP and BGP4+)

neighbor attribute-unchanged (BGP and BGP4+)

Use this command to advertise unchanged BGP or BGP4+ attributes to the specified BGP or BGP4+ neighbor.

Use the **no** variant of this command to disable this function.

Syntax [BGP/BGP4+]

```
neighbor <neighborid> attribute-unchanged {as-path|next-hop|med}
no neighbor <neighborid> attribute-unchanged {as-path|next-hop|med}
```

Parameter	Description	
<neighborid>	{*<ip-address>*|*ipv6-addr>*|*<peer-group>*}	
	<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
	<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
	<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the **neighbor peer-group (add a neighbor) (BGP and BGP4+)** command on page 45.145, and **neighbor route-map (BGP and BGP4+)** command on page 45.160. When this parameter is used with this command, the command applies on all peers in the specified group.
as-path	AS path attribute.	
next-hop	Next hop attribute.	
med	Multi Exit Discriminator.	

Mode [BGP] Router Configuration or IPv4 Address Family Configuration

Mode [BGP4+] IPv6 Address Family Configuration

Usage [BGP/BGP4+] Note that specifying this command with the optional **as-path** parameter has the same effect as invoking the **neighbor transparent-as (BGP and BGP4+)** command.

Note this specifying this command with the optional **next-hop** parameter has the same effect as invoking the **neighbor transparent-nexthop (BGP and BGP4+)** command.

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.75 attribute-unchanged
as-path med
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.75
                       attribute-unchanged as-path med
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.0.75
                          attribute-unchanged as-path med
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.0.75
                          attribute-unchanged as-path med
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.0.75 remote-as 10
awplus(config-router)# neighbor 10.10.0.75 peer-group group1
awplus(config-router)# neighbor group1 attribute-unchanged
                       as-path med
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 attribute-unchanged
                       as-path med
```

Examples [BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
                          attribute-unchanged as-path med
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
attribute-unchanged as-path med
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as
10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 attribute-unchanged
as-path med
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1
attribute-unchanged as-path med
```

Related Commands

neighbor transparent-as (BGP and BGP4+)
neighbor transparent-nexthop (BGP and BGP4+)

neighbor capability graceful-restart (BGP and BGP4+)

Use this command to configure the device to advertise the Graceful Restart Capability to BGP and BGP4+ neighbors.

Use the **no** variant of this command to configure the device so it does not advertise the Graceful Restart Capability to its neighbor.

Syntax [BGP/BGP4+]

```
neighbor <neighborid> capability graceful-restart
no neighbor <neighborid> capability graceful-restart
```

Parameter	Description	
<neighborid>	{*<ip-address>*|*<ipv6-addr>*|*<peer-group>*}	
	<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
	<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
	<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the **neighbor peer-group (add a neighbor) (BGP and BGP4+)** command on page 45.145, and **neighbor route-map (BGP and BGP4+)** command on page 45.160. When this parameter is used with this command, the command applies on all peers in the specified group.

Default [BGP/BGP4+] Disabled

Mode [BGP] Router Configuration or IPv4 Address Family Configuration

Mode [BGP4+] IPv6 Address Family Configuration

Usage [BGP/BGP4+] Use the **neighbor capability graceful-restart** command to advertise to the BGP or BGP4+ neighbor routers the capability of graceful restart. First specify the BGP or BGP4+ neighbor's **remote-as** identification number as assigned by the neighbor router.

The graceful restart capability is advertised only when the graceful restart capability has been enabled using the **bgp graceful-restart (BGP and BGP4+)** command on page 45.32.

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.50 capability
graceful-restart
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.50 capability
graceful-restart
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.10.50 capability
graceful-restart
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.10.50 capability
graceful-restart
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.50 remote-as 10
awplus(config-router)# neighbor 10.10.10.50 peer-group group1
awplus(config-router)# neighbor group1 capability
graceful-restart
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 capability
graceful-restart
```

Examples [BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 capability
graceful-restart

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
capability graceful-restart

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as
10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 peer-group
group1
awplus(config-router-af)# neighbor group1 capability
graceful-restart

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 capability
graceful-restart
```

Related Commands

bgp graceful-restart (BGP and BGP4+)
neighbor peer-group (add a neighbor) (BGP and BGP+)
neighbor route-map (BGP and BGP4+)
restart bgp graceful (BGP)

neighbor capability orf prefix-list (BGP and BGP4+)

Use this command to advertise ORF (Outbound Route Filters) capability to neighbors. Use this command to dynamically filter updates. The BGP speaker can advertise a prefix list with prefixes it wishes the peer to prune or filter from outgoing updates.

Use the **no** variant of this command to disable this function.

Syntax [BGP/BGP4+]

```
neighbor <neighborid> capability orf prefix-list {both|receive|send}

no neighbor <neighborid> capability orf prefix-list {both|receive|
   send}
```

Parameter	Description	
<neighborid>	{*<ip-address>*|*<ipv6-addr>*|*<peer-group>*}	
	<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
	<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
	<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the **neighbor peer-group (add a neighbor) (BGP and BGP+)** command on page 45.145, and **neighbor route-map (BGP and BGP4+)** command on page 45.160. When this parameter is used with this command, the command applies on all peers in the specified group.
`orf`	Advertises ORF capability to its neighbors.	
`both`	Indicates that the local router can send ORF entries to its peer as well as receive ORF entries from its peer.	
`receive`	Indicates that the local router is willing to receive ORF entries from its peer.	
`send`	Indicates that the local router is willing to send ORF entries to its peer.	

Mode [BGP] Router Configuration or IPv4 Address Family Configuration for a VRF instance

Mode [BGP4+] IPv6 Address Family Configuration

Default [BGP/BGP4+] Disabled

Usage [BGP/BGP4+] Outbound Route Filters (ORFs) send and receive capabilities to lessen the number of updates exchanged between neighbors. By filtering updates, this option minimizes generating and processing of updates. The local router advertises the ORF capability in `send` mode and the remote router receives the ORF capability in **receive** mode applying the filter as outbound policy. The two routers exchange updates to maintain the ORF for each router. Only an individual router or a peer-group can be configured to be in **receive** or **send** mode. A peer-group member cannot be configured in **receive** or **send** mode.

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.5 capability orf
prefix-list both

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.5 capability orf
prefix-list both

awplus# configure terminal
