Table 89-1: Parameter definitions from the show atmf command(cont.)

Parameter	Definition
`Node ID`	A Unique identifier assigned to a Node on an AMF network.
`Node Depth`	The number of nodes in path from this node to level of the AMF root node. It can be thought of as the vertical depth of the AMF network from a particular node to the zero level of the AMF root node.
`Domain State`	The state of Node in a Domain in AMF network as Controller/Backup.
`Recovery State`	The AMF node recovery status. Indicates whether a node recovery is in progress on this device - Auto, Manual, or None.
`Management VLAN`	The VLAN created for traffic between Nodes of different domain (up/down links). ■ VLAN ID - In this example VLAN 4092 is configured as the Management VLAN. ■ Management Subnet - Network prefix for the subnet. ■ Management IP Address - The IP address allocated for this traffic. ■ Management Mask - The subnet mask used to create a subnet for this traffic (255.255.128.0).
`Domain VLAN`	The VLAN assigned for traffic between Nodes of same domain (crosslink). ■ VLAN ID - In this example VLAN 4091 is configured as the domain VLAN. ■ Domain Subnet. The subnet address used for this traffic. ■ Domain IP Address. The IP address allocated for this traffic. ■ Domain Mask. The subnet mask used to create a subnet for this traffic (255.255.128.0).
`Device Type`	The Product Series Name.
`ATMF Master`	The 'Y' if the node belongs to a Core domain.
`SC`	The Switch Configuration, C - Chassis(SBx81series), S - Stackable (VCS) and N - Standalone.
`Parent`	The a Node to which the current node has an active uplink.
`Node Depth`	The the number of nodes in path from this node to the Core domain.

Note

You can manage your show output, or make it a more selective, by using a command modifier. For information on using show-command modifiers, see: **"Controlling "show" Command Output" on page 1.38**.

Related Commands **show atmf detail**

show atmf backup

This command displays information about AMF backup status.

Syntax `show atmf backup {logs]`

Parameter	Description
`backup`	The backup configuration.
`logs`	Displays detailed log information.

Mode Privileged Exec

Example To display the AMF backup information, use the command:

```
node_1# show atmf backup
```

```
Node_1# show atmf backup
ScheduledBackup ......Enabled
  Schedule.............1 per day starting at 03:00
  Next Backup Time....19 May 2012 03:00
Backup Media..........SD (Total 1974.0 MB, Free197.6MB)
Current Action........Starting manual backup
Started...............18 May 2012 10:08
CurrentNode...........atmf_testbox1

Node Name                          Date          Time       In ATMF     Status

Figure 89-6: Parameter definitions from the show atmf backup command

Parameter	Definition
`Scheduled Backup`	Indicates whether AMF backup scheduling is enabled or disabled.
`Schedule`	Displays the configured backup schedule.
`Next Backup Time`	Displays the date and time of the next scheduled.
`Backup Media`	The current backup medium in use. This will be one of USB, SD, or NONE. Note that the USB will take precedence over the SD card. Utilized and available memory (MB) will be indicated if backup media memory is present.

Figure 89-6: Parameter definitions from the show atmf backup command(cont.)

Parameter	Definition
Current Action	The task that the AMF backup mechanism is currently performing. This will be a combination of either (Idle, Starting, Doing, Stopping), or (manual, scheduled).
Started	The date and time that the currently executing task was initiated in the format DD MMM YYYY.
Current Node	The name of the node that is currently being backed up.
Node Name	The name of the node that is storing backup data - on its backup media.
Date	The data of the last backup in the format DD MMM YYYY.
Time	The time of the last backup in the format HH:MM:SS.
In ATMF	Whether the node shown is active in the AMF network, (Yes or No).
Status	The output can contain one of four values: ■ "-" meaning that the status file cannot be found or cannot be read. ■ "Errors" meaning that there are issues - note that the backup may still be deemed successful depending on the errors. ■ "Stopped" meaning that the backup attempt was manually aborted;. ■ "Good" meaning that the backup was completed successfully.
Log File Location	All backup attempts will generate a result log file in the identified directory based on the node name. In the above example this would be: card:/amf/office/logs/rsync_amf_testbox1.log.
Log Details	The contents of the backup log file.

Note You can manage your show output, or make it a more selective, by using a command modifier. For information on using show-command modifiers, see: **"Controlling "show" Command Output" on page 1.38**.

Related Commands **show atmf**
atmf network-name

show atmf detail

This command displays details about an AMF node.

Syntax `show atmf detail`

Parameter	Description
`show`	Displays running system information
`atmf`	The Allied Telesis Management Framework (AMF)
`detail`	Displays output in greater depth

Mode Privileged Exec

Example-1 To display the AMF node1 information in detail, use the command

```
node1# show atmf detail
```

A typical output screen from this command is shown below:

```
node1#show atmf detail
ATMF Detail Information

Network Name                        : ATMF_NET
Node Name                           : Admin2
Node Address                        : Admin2.atmf
Node ID                             : 15
Node Depth                          : 0
Domain State                        : DomainController
Recovery State                      : None
AMF-ALL License                     : Yes

Management VLAN
 VLAN ID                            : 4092
 Management Subnet                  : 172.31.0.0
 Management IP Address              : 172.31.0.1
 Management Mask                    : 255.255.128.0

Domain VLAN
 VLAN ID                            : 4091
 Domain Subnet                      : 172.31.128.0
 Domain IP Address                  : 172.31.128.1
 Domain Mask                        : 255.255.128.0
```

Table 89-2: Parameter definitions from the show atmf detail command

Parameter	Definition
`ATMF Status`	The Node's AMF status, either Enabled or Disabled.
`Network Name`	The AMF network that a particular node belongs to.
`Node Name`	The name assigned to a particular node.
`Role`	The role configured for this AMF device, either Master or Member.
`Current ATMF Nodes`	The count of AMF nodes in an AMF Network.
`Node Address`	An Address used to access a remotely located node. This is simply the Node Name plus the dotted suffix atmf (.atmf).

Table 89-2: Parameter definitions from the show atmf detail command(cont.)

Parameter	Definition
Node ID	A Unique identifier assigned to a Node on an AMF network.
Node Depth	The number of nodes in path from this node to level of the AMF root node. It can be thought of as the vertical depth of the AMF network from a particular node to the zero level of the AMF root node.
Domain State	The state of Node in a Domain in AMF network as Controller/Backup.
Recovery State	The AMF node recovery status. Indicates whether a node recovery is in progress on this device - Auto, Manual, or None.
Management VLAN	The VLAN created for traffic between Nodes of different domain (up/down links). ■ VLAN ID - In this example VLAN 4092 is configured as the Management VLAN. ■ Management Subnet - Network prefix for the subnet. ■ Management IP Address - The IP address allocated for this traffic. ■ Management Mask - The subnet mask used to create a subnet for this traffic (255.255.128.0).
Domain VLAN	The VLAN assigned for traffic between Nodes of same domain (crosslink). ■ VLAN ID - In this example VLAN 4091 is configured as the domain VLAN. ■ Domain Subnet. The subnet address used for this traffic. ■ Domain IP Address. The IP address allocated for this traffic. ■ Domain Mask. The subnet mask used to create a subnet for this traffic (255.255.128.0).
Device Type	The Product Series Name.
ATMF Master	The 'Y' if the node belongs to a Core domain.
SC	The Switch Configuration, C - Chassis(SBx81series), S - Stackable (VCS) and N - Standalone.
Parent	The a Node to which the current node has an active uplink.
Node Depth	The the number of nodes in path from this node to the Core domain.

show atmf diagnostics

This command displays diagnostic information for an entire AMF Network. It relies on the ability to create a working-set, therefore if Restricted Login is enabled, the command can only be run on an AMF master.

Syntax `show atmf diagnostics [network|links|consistency]`

Parameter	Description
`network`	Display network related diagnostic information
`links`	Display link related diagnostic information
`consistency`	Display working set consistency information

Mode Privileged Exec

Example-1 To display network diagnostic information, use the command:

```
node2# show atmf diagnostics network
```

A typical output screen from this command is shown below:

```
node1# show atmf diagnostics network
================================================================
show system | grep Software
================================================================

AlliedWare Plus (TM) 0.0.0 02/26/14 11:13:41

================================================================
node1, node2, node3:
================================================================

Working set join

Software version   : main-5.4.4

================================================================
show atmf detail | grep Client
================================================================

AlliedWare Plus (TM) 0.0.0 02/26/14 11:13:41

================================================================
node1, node2, node3:
================================================================

Working set join
AMF-ALL Client License             : Yes

...
```

Example-2 To display link diagnostic information, use the command

```
node2# show atmf diagnostics links
```

A typical output screen from this command is shown below:

```
================================================================
show atmf links
================================================================

AlliedWare Plus (TM) 0.0.0 02/26/14 11:13:41

================================================================
node1, node2, node3:
================================================================

Working set join

================================================================
node1:
================================================================

ATMF Link Brief Information:

Local     Link      Link    ATMF         Adjacent            Adjacent Link
Port      Type      Status  State        Node                Ifindex  State
-------------------------------------------------------------------------------
sa1       Downlink  Up      Full         node2               4502     Forwarding
sa2       Downlink  Up      Full         node3               4502     Forwarding

======
node2:
======

...
```

Example-3 To display working-set consistency information, use the command

```
node2# show atmf diagnostics consistency
```

A typical output screen from this command is shown below:

```
node1# show atmf diagnostics consistency
ATMF nodes:       9
Working set size: 9
```

If working-set consistency fails, the command will show the nodes which have failed to join the working-set thus:

```
node1# show atmf diagnostics consistency
Nodes missing from working set:
-node7
-node8
```

Related Commands **show atmf**
show atmf tech

show atmf group

This command can be used to display the group membership within to a particular AMF node. It can also be used with the working-set command to display group membership within a working set.

Each node in the AMF is automatically added to the group that is appropriate to its hardware architecture. e.g x510, x610. Nodes that are configured as masters are automatically assigned to the master group.

You can create arbitrary groups of AMF members based on your own selection criteria. You can then assign commands collectively to any of these groups.

Syntax `show atmf group [user-defined|automatic]`

Parameter	Description
`group`	The amf group.
`user-defined`	User-defined-group information display.
`automatic`	Automatic group information display.

Default All groups are displayed

Mode Privileged Exec

Example-1 To display group membership of node2, use the following command:

```
node2# show atmf group
```

A typical output screen from this command is shown below:

```
ATMF group information
master, x510
node2#
```

This screen shows that node2 contains the groups, master and x510. Note that although the node also contains the implicit groups, these do not appear in the show output.

Example-2 The following commands (entered on node2) will display all the automatic groups within the working set containing node-1 and all nodes that have been pre-defined to contain the sysadmin group:

First define the working-set

```
Node-1# #atmf working-set node-1 group sysadmin
```

A typical output screen from this command is shown below:

```
ATMF group information

master, poe, x8100

========================================
node-1, node-2, node33, node-4, node-5, node-6:
========================================

ATMF group information

sysadmin, x8100

ATMF-Test-NETWORK[6]#
```

This confirms that the six nodes (node_1 to node6) are now members of the working-set and that these nodes reside within the AMF-Test-Network.

Note that to run this command, you must have previously entered the **"atmf working-set" on page 89.32**. This can be seen from the network level prompt, which in this case ATM_Network[6}#.

Figure 89-7: Sample output from the show atmf group command for a working set.

```
ATMF_NETWORK[6]#show atmf group
==========================
node3, node4, node5, node6:
==========================

ATMF group information

edge_switches, x510
```

Figure 89-8: Parameter definitions from the show atmf group command

Parameter	Definition
`ATMF group information`	Displays a list of nodes and the groups that they belong to, for example: ■ master - Shows a common group name for Nodes configured as AMF masters. ■ Hardware Arch - Shows a group for all Nodes sharing a common Hardware architecture: e.g: x8100, x900, x610 etc. ■ User-defined - Arbitrary groups created by the user for AMF nodes.

show atmf group members

This command will display all group memberships within an AMF working-set. Each node in the AMF working set is automatically added to automatic groups which are defined by hardware architecture. e.g x510, x610. Nodes that are configured as masters are automatically assigned to the master group. User can define arbitrary groupings of AMF members based on their own criteria, which can be used to select groups of nodes.

Syntax `show atmf group members [user-defined|automatic]`

Parameter	Description
`group`	The AMF group.
`members`	AMF group members.
`user-defined`	User defined group membership display.
`automatic`	Automatic group membership display.

Mode Privileged Exec

Example To display group membership of all nodes in a working-set, use the command:

```
ATMF_NETWORK[9]# show atmf group members
```

Figure 89-9: Sample output from the show atmf group members command.

```
ATMF Group membership

Automatic         Total
Groups            Members    Members
-------------------------------------------------------------------------------
master            1          Building_1
poe               1          HW_Team1
x510              3          SW_Team1 SW_Team2 SW_Team3
x900              1          Bld1_Floor_2
x610              1          HW_Team1
x8100             2          Building_1 Building_2

ATMF Group membership

User-defined      Total
Groups            Members    Members
-------------------------------------------------------------------------------
marketing           1        Bld1_Floor_1
software            3        SW_Team1 SW_Team2 SW_Team3
```

Figure 89-10: Parameter definitions from the show atmf group command

Parameter	Definition
`Automatic Groups`	Lists the Automatic Groups and their nodal composition. The sample output shows AMF nodes based on same Hardware type or belonging to same Master group.
`User-defined Groups`	Shows grouping of AMF nodes in user defined groups.
`Total Members`	Shows the total number of members in each group.
`Members`	Shows the list of AMF Nodes in each group.

Related Commands

show atmf group
show atmf
atmf group (membership)

show atmf links

This commands display brief information about all the AMF links configured on the selected node.

Syntax `show atmf links [brief]`

Parameter	Description
`links`	AMF links.
`brief`	Brief summary of AMF links configuration and status.

Mode User Exec and Privileged Exec

Example To display the AMF links brief details, use the following command:

```
Building_2# show atmf links
```

or

```
Building_2# show atmf links brief
```

Figure 89-11: Sample output from the show atmf links brief command.

```
ATMF  Links Brief:

Local     Link       Port     ATMF          Adjacent              Adjacent Link
Port      Type       Status   State         Node                  Ifindex  State
-------------------------------------------------------------------------------
sa1       Crosslink  Up       TwoWay        Building_1            4501     Forwarding
1.0.1     Downlink   Up       Full          Bld1_Floor_1          5001     Forwarding
1.0.2     Downlink   Up       Full          Bld1_Floor_2          5003     Forwarding
1.0.3     Downlink   Up       Full          Bld2_Floor_1          6101     Forwarding
```

Figure 89-12: Parameter definitions from the show atmf links detail command

Parameter	Definition
`Local Port`	Shows local port on the Node configured for AMF Network.
`Link Type`	Shows link type as Uplink/Downlink (Parent and child) or Cross-link (Nodes in same domain).
`Port Status`	Shows status of the local port on the Node as UP/DOWN.
`ATMF State`	Shows AMF state of the local port: ■ Init - Link is down. ■ Hold - Link transitioned to up state, but waiting for hold period to ensure link is stable. ■ Incompatible - Neighbor rejected the link because of inconsistency in AMF configurations. ■ OneWay - Link is up and has waited the hold down period and now attempting to link to ■ another unit in another domain ■ Full - Link hello packets are sent and received from its neighbor with its own node id. ■ Shutdown - Link has been shut down by user configuration.
`Adjacent Node`	Shows Adjacent AMF Node to this Node.
`Adjacent IfIndex`	Shows interface on the Adjacent AMF Node connected to this Node.
`Link State`	Shows state of AMF link Forwarding/Blocking.

Note

You can manage your show output, or make it a more selective, by using a command modifier. For information on using show-command modifiers, see: **"Controlling "show" Command Output" on page 1.38**.

Related Commands

no debug all
clear atmf links statistics
show atmf

show atmf links detail

By default, the following commands display various levels of detail about all the AMF links configured on the device and also display detailed statistics about the AMF packet exchanges between the devices.

It is also possible to display the AMF link configuration and packet exchange statistics for a specified interface.

Syntax `show atmf links detail`

Parameter	Description
`links`	AMF links.
`brief`	Brief summary of AMF links configuration and status.
`detail`	Detailed AMF links information.

Mode User Exec

Example To display the AMF link details use this command

```
node_1# show atmf links detail
```

The output from this command will display all the internal data held for AMF links.

Figure 89-13: Sample output from the show atmf links detail command.

```
ATMF  Links Detail:

Figure 89-14: Parameter definitions from the show atmf links detail command

Parameter	Definition
`Local Port`	Shows local port on the Node configured for AMF Network.
`Link Type`	Shows link type as Uplink/Downlink (Parent and child) or Cross-link (Nodes in same domain).
`Port Status`	Shows status of the local port on the Node as UP/DOWN.
`ATMF State`	Shows AMF state of the local port: ■ Init - Link is down. ■ Hold - Link transitioned to up state, but waiting for hold period to ensure link is stable. ■ Incompatible - Neighbor rejected the link because of inconsistency in AMF configurations. ■ OneWay - Link is up and has waited the hold down period and now attempting to link to ■ another unit in another domain ■ Full - Link hello packets are sent and received from its neighbor with its own node id. ■ Shutdown - Link has been shut down by user configuration.
`Adjacent Node`	Shows Adjacent AMF Node to this Node.
`Adjacent IfIndex`	Shows interface on the Adjacent AMF Node connected to this Node.
`Link State`	Shows state of AMF link Forwarding/Blocking.
`Crosslink Ports Information`	Show details of all Crosslink ports on this Node: ■ Port - Name of the Port or static aggregation (sa<*>). ■ Ifindex - Interface index for the crosslink port. ■ VR ID - Virtual router id for the crosslink port. ■ Port Status - Shows status of the local port on the Node as UP/DOWN. ■ Port State - Same as AMF state as described above. ■ Port BPDU Receive Count - The number of AMF protocol PDU's received. ■ Adjacent Node Name - Name of the adjacent node in the domain. ■ Adjacent Ifindex - Ifindex of the adjacent node in the domain. ■ Adjacent VR ID - Virtual router id of the adjacent node in the domain. ■ Adjacent MAC - MAC address of the adjacent node in the domain. ■ Port Last Message Response - Response from the remote neighbor to our AMF last hello packet.
`Link State Entries`	Show all the link state database entries: ■ Node.Ifindex - Shows adjacent Node names and Interface index. ■ Transaction ID - Shows transaction id of the current crosslink transaction. ■ MAC Address - Shows adjacent Node MAC addresses. ■ Link State - Shows AMF states of adjacent nodes on the link.
`Domain Nodes Tree`	Shows all the nodes in the domain: ■ Node - Name of the node in the domain. ■ Links on Node - Number of crosslinks on a vertex/node. ■ Link no - Shows adjacent Node names and Interface index. ■ Forwarding State - Shows state of AMF link Forwarding/Blocking.
`Crosslink Transaction Entries`	Shows all the transaction entries: ■ Node - Name of the AMF node. ■ Transaction ID - transaction id of the node. ■ Uplink Transaction ID - transaction id of the remote node.

Figure 89-14: Parameter definitions from the show atmf links detail command(cont.)

Parameter	Definition
`Uplink Information`	Show all uplink entries. ■ Waiting for Sync - Flag if uplinks are currently waiting for synchronization. ■ Transaction ID - Shows transaction id of the local node. ■ Number of Links - Number of up downlinks in the domain. ■ Number of Local Uplinks - Number of uplinks on this node to the parent domain. ■ Originating Node - Node originating the uplink information. ■ Domain - Name of the parent uplink domain. ■ Node - Name of the node in the parent domain, that is connected to the current domain. ■ Ifindex - Interface index of the parent node's link to the current domain. ■ VR ID - Virtual router id of the parent node's link to the current domain. ■ Transaction ID - Transaction identifier for the neighbor in crosslink. ■ Flags - Used in domain messages to exchange the state: ■ATMF_DOMAIN_FLAG_DOWN = 0 ■ATMF_DOMAIN_FLAG_UP = 1 ■ATMF_DOMAIN_FLAG_BLOCK = 2 ■ATMF_DOMAIN_FLAG_NOT_PRESENT = 4 ■ATMF_DOMAIN_FLAG_NO_NODE = 8 ■ATMF_DOMAIN_FLAG_NOT_ACTIVE_PARENT = 16 ■ATMF_DOMAIN_FLAG_NOT_LINKS = 32 ■ATMF_DOMAIN_FLAG_NO_CONFIG = 64 ■ Domain Controller - Domain Controller in the uplink domain ■ Domain Controller MAC - MAC address of Domain Controller in uplink domain
`Downlink Domain Information`	Shows all the downlink entries: ■ Domain - Name of the downlink domain. ■ Domain Controller - Controller of the downlink domain. ■ Domain Controller MAC - MAC address of the domain controller. ■ Number of Links - Total number of links to this domain from the Node. ■ Number of Links Up - Total number of links that are in UP state. ■ Number of Links on This Node - Number of links terminating on this node. ■ Links are Blocked - 0 links are not blocked to the domain. 1 All links are blocked to the domain.
`Node Transaction List`	List of transactions from this downlink domain node. ■ Node - 0 links are not blocked to the domain. 1 All links are blocked to the domain. ■ Transaction ID - Transaction id for this node. ■ Domain List : Shows list of nodes in the current domain and their links to the downlink domain.: ■ Domain - Domain name of the downlink node. ■ Node - Name of the node in the current domain. ■ Ifindex - Interface index for the link from the node to the downlink domain. ■ Transaction ID - Transaction id of the node in the current domain. ■ Flags - As mentioned above.

Figure 89-14: Parameter definitions from the show atmf links detail command(cont.)

Parameter	Definition
`Up/Downlink Ports Information`	Shows all the configured up and down link ports on this node: ■ Port - Name of the local port. ■ Ifindex - Interface index of the local port. ■ VR ID - Virtual router id for the local port. ■ Port Status - Shows status of the local port on the Node as UP/DOWN. ■ Port State - AMF state of the local port. ■ Adjacent Node - Node name of the adjacent node. ■ Adjacent Internal ID - Unique node identifier of the remote node. ■ Adjacent Ifindex - Interface index for the port of adjacent AMF node. ■ Adjacent Board ID - Product identifier for the adjacent node. ■ Adjacent VR ID - Virtual router id for the port on adjacent AMF node. ■ Adjacent MAC - MAC address for the port on adjacent AMF node. ■ Adjacent Domain Controller - Node name of the Domain controller for Adjacent AMF node. ■ Adjacent Domain Controller MAC - MAC address of the Domain controller for Adjacent AMF node. ■ Port Forwarding State - Local port forwarding state Forwarding or Blocking. ■ Port BPDU Receive Count - Count of AMF protocol PDU's received. ■ Port Sequence Number - hello sequence number, incremented every time the data in the hello packet changes. ■ Port Adjacent Sequence Number - remote ends sequence number used to check if we need to process this packet or just note it arrived. ■ Port Last Message Response - response from the remote neighbor to our last hello packet.

Note

You can manage your show output, or make it a more selective, by using a command modifier. For information on using show-command modifiers, see: **"Controlling "show" Command Output" on page 1.38**.

show atmf links statistics

By default, the following commands display various levels of detail about all the AMF links configured on the device and also display detailed statistics about the AMF packet exchanges between the devices.

It is also possible to display the AMF link configuration and packet exchange statistics for a specified interface.

Syntax `show atmf links statistics [interface [<ifrange>]]`

Parameter	Description
`links`	AMF links.
`statistics`	AMF statistics.
`interface`	Interface information.
`<ifrange>`	Interface range.

Mode User Exec

Example -1 To display AMF link statistics, use the command:

```
node_1# show atmf links statistics interface port1.0.5
```

Figure 89-15: Sample output from the show atmf links statistics command.

```
ATMF Statistics:

port1.0.5  Crosslink Hello Uplink               116             115
port1.0.5  Hello Link                           0               0
```

Figure 89-17: Parameter definitions from the show atmf links statistics command

Parameter	Definition
`Receive`	Shows a count of AMF protocol packets received per message type.
`Transmit`	Shows the number of AMF protocol packets transmitted per message type.
`Database Entries`	Shows the number of AMF elements existing in the distributed database.
`Database Full Ages`	Shows the number of times the entries aged in the database.
`ATMF Packet Discards`	Shows the number of discarded packets of each type: ■ Type0: The number of discarded crosslink hello msgs received on a non crosslink port. ■ Type1: The number of discarded tx update packets - bad checksum. ■ Type2: The number of discarded tx update bitmap packets - bad checksum. ■ Type3: The number of discarded tx update packets - neighbor not in the correct state. ■ Type4: The number of discarded update packets - bad checksum. ■ Type5: The number of discarded update packets - neighbor not in the correct state. ■ Type6: The number of discarded update bitmap packets - bad checksum. ■ Type7: The number of discarded crosslink hello msgs received on a non crosslink port. ■ Type8: The number of discarded crosslink hello msg received on a port that is not in the correct state. ■ Type9: The number of discarded crosslink domain hello msgs received on a non crosslink port. ■ Type10: The number of discarded crosslink domain hello msgs received on a port that is not in the correct state. ■ Type11: The number of crosslink uplink hello msgs received on a non crosslink port. ■ Type12: The number of discarded crosslink uplink hello msgs ignored on a port that is not in the correct state. ■ Type13: The number of messages with an incorrect name for this AMF network. ■ Type14: The number of over-long packets received on a port. ■ Type15: The number of messages with a bad protocol version received on a port. ■ Type16: The number of messages with a bad packet checksum calculation received on a port. ■ Type17: The number of messages with a bad authentication type received on a port. ■ Type18: The number of messages with a bad simple password received on a port. ■ Type19: The number of discarded packets with an unsupported authentication type received on a port. ■ Type20: The number of discarded packets with an unknown neighbor received on a port.

Note

You can manage your show output, or make it a more selective, by using a command modifier. For information on using show-command modifiers, see: **"Controlling "show" Command Output" on page 1.38**.

show atmf nodes

This command displays all nodes currently configured within the AMF network. It displays a topographical representation of the network infrastructure.

This command displays a summary of all virtual links currently in the running configuration.

Syntax `show atmf nodes`

Parameter	Description
`show`	Show running system information
`atmf`	The Allied Telesis Management Framework (AMF)
`nodes`	AMF Node information.

Mode Privileged Exec

Example To display AMF information for all nodes in the AMF, use the command:

```
node_1# show atmf nodes
```

Figure 89-19: Sample output from the show atmf nodes command.

```
node1#show atmf nodes

Node Information:

  * = Local device

 SC = Switch Configuration:
  C = Chassis    S = Stackable    N = Standalone

 Current ATMF node count 8
```

show atmf tech

This command collects and displays all the AMF command output. The command can thus be used to display a complete picture of an AMF network.

Syntax `show atmf tech`

Parameter	Description
`show`	Show running system information
`atmf`	The Allied Telesis Management Framework (AMF)
`tech`	Global AMF information

Mode Privileged Exec

Example To display all AMF commands, use the command:

```
node_1# show atmf tech
```

Figure 89-20: Sample output from the show atmf tech command.

```
node1#show atmf tech

Figure 89-21: Parameter definitions from the show atmf tech command

Parameter	Definition
ATMF Status	Shows status of AMF feature on the Node as Enabled/Disabled..
Network Name	The name of the AMF network to which this node belongs.
Node Name	The name assigned to the node within the AMF network.
Role	The role configured on the switch within the AMF - either master or member.
Current ATMF Nodes	A count of the AMF nodes in the AMF network.
Node Address	The identity of a node (in the format name.atmf) that enables its access it from a remote location.
Node ID	A unique identifier assigned to an AMF node.
Node Depth	The number of nodes in path from this node to the core domain.
Domain State	A node's state within an AMF Domain - either controller or backup.
Recovery State	The AMF node recovery status. Indicates whether a node recovery is in progress on this device - either Auto, Manual, or None.
Management VLAN	The VLAN created for traffic between nodes of different domains (up/down links). VLAN ID - In this example VLAN 4092 is configured as the Management VLAN. Management Subnet - the Network prefix for the subnet. Management IP Address - the IP address allocated for this traffic. Management Mask - the Netmask used to create a subnet for this traffic 255.255.128.0 (= prefix /17)
Domain VLAN	The VLAN assigned for traffic between Nodes of same domain (crosslink). VLAN ID - In this example VLAN 4091 is configured as the domain VLAN. Domain Subnet - the Subnet address used for this traffic. Domain IP Address - the IP address allocated for this traffic. Domain Mask - the Netmask used to create a subnet for this traffic 255.255.128.0 (= prefix /17)
Device Type	Shows the Product Series Name.
ATMF Master	Indicates the nodes membership of the core domain (membership is indicated by Y)
SC	Shows switch configuration: ■ C - Chassis (such as SBx8100 series) ■ S - Stackable (VCS) ■ N - Standalone
Parent	A Node to which connects to the present node's uplink. I.e. one layer higher in the hierarchy.
Node Depth	Shows the number of nodes in path from the current node to the Core domain.

Note The show atmf tech command can produce very large output. For this reason only the most significant terms are defined in this table.

show atmf working-set

This command displays the nodes that form the current AMF working-set.

Syntax `show atmf working-set`

Mode Privileged Exec

Example To show current members of the working-set, use the command:

```
ATMF_NETWORK[6]# show atmf working-set
```

Figure 89-22: Sample output from the show atmf working-set command.

```
ATMF Working Set Nodes:
node1, node2, node3, node4, node5, node6
Working set contains 6 nodes
```

Related Commands **atmf working-set**
show atmf
show atmf group

show debugging atmf

This command shows the debugging modes status for AMF.

Syntax `show debugging atmf`

Mode User Exec and Global Configuration

Parameter	Description
`show`	Show running system information
`debugging`	Debugging functions
`atmf`	The Allied Telesis Management Framework (AMF)

Example To display the AMF debugging status, use the command:

```
node_1# show debugging atmf
```

Figure 89-23: Sample output from the show debugging atmf command.

```
node1# show debugging atmf
ATMF debugging status:
ATMF link debugging is on
ATMF crosslink debugging is on
ATMF database debugging is on
ATMF neighbor debugging is on
ATMF packet debugging is on
ATMF error debugging is on
```

Related Commands **debug atmf packet**

show debugging atmf packet

This command shows details of AMF Packet debug command.

Syntax `show debugging atmf packet`

Mode User Exec and Global Configuration

Parameter	Description
`show`	Show running system information
`debugging`	Debugging functions
`atmf`	The Allied Telesis Management Framework (AMF)
`packet`	AMF packet events

Example To display the AMF packet debugging status, use the command:

```
node_1# show debug atmf packet
```

Figure 89-24: Sample output from the show debugging atmf packet command.

```
ATMF packet debugging is on
=== ATMF Packet Debugging Parameters===
Node Name: x900
Port name: port1.0.1
Limit: 500 packets
Direction: TX
Info Level: Level 2

9. DBE update
10. DBE bitmap update
```

Related Commands **debug atmf**
debug atmf packet

show running-config atmf

This command displays the running system information that is specific to AMF.

Syntax `show running-config atmf`

Mode User Exec and Global Configuration

Example To display the current configuration of AMF, use the following commands:

```
node_1# show running-config atmf
```

Note

You can manage your show output, or make it a more selective, by using a command modifier. For information on using show-command modifiers, see: **"Controlling "show" Command Output" on page 1.38**.

Related Commands **show running-config**
no debug all

switchport atmf-crosslink

This command configures the selected port or aggregated link to be an AMF crosslink. Running this command will automatically place the port or aggregator into trunk mode (i.e. switchport mode trunk).

The connection between two AMF masters must utilize a crosslink. Crosslinks are used to carry the AMF control information between master nodes. Multiple crosslinks can be configured between two master nodes, but only one crosslink can be active at any particular time. All other crosslinks between masters will be placed in the blocking state, in order to prevent broadcast storms.

The "no" variant of this command removes any crosslink that may exist for the selected port or aggregated link.

Syntax

```
switchport atmf-crosslink

no switchport atmf-crosslink
```

Parameter	Description
`switchport`	The Layer 2 Interface.
`atmf-crosslink`	Sets the switchport to be an AMF crosslink.

Mode Interface Configuration

Usage Crosslinks can be used anywhere within an AMF network. They have the effect of separating the AMF network into separate domains.

Where this command is used, it is also good practice to use the **switchport trunk native vlan** command with its parameter "**none**" selected. This is to prevent a network storm on a topology of ring connected switches.

Example-1 To make a switchport 1.0.1 an AMF crosslink, use the following commands:

```
Node_1# configure terminal
Node_1(config)# interface port1.0.1
Node_1(config-if)# switchport atmf-crosslink
```

Example-2 This example is shown twice. Example 2A is the most basic command sequence. Example 2B is a good practice equivalent that avoids problems such as broadcast storms that can otherwise occur.

Example-2A To make static aggregator sa1 an AMF crosslink, use the following commands:

```
Node_1# configure terminal
Node_1(config)# interface sa1
Node_1(config-if)# switchport atmf-crosslink
```

Example-2B To make static aggregator sa1 an AMF crosslink, use the following commands for good practice:

```
Node_1# configure terminal
Node_1(config)# interface sa1
Node_1(config-if)# switchport atmf-crosslink
Node_1(config-if)# switchport trunk allowed vlan add 2
Node_1(config-if)# switchport trunk native vlan none
```

In this example VLAN 2 is assigned to the static aggregator, and the native VLAN (VLAN 1) is explicitly excluded from the aggregated ports and the crosslink assigned to it.

Note The AMF management and domain VLANs are automatically added to the aggregator and the crosslink.

Related Commands **show atmf links statistics**

switchport atmf-link

This command enables you to configure a port or aggregator to be an AMF uplink/downlink. Running this command will automatically place the port or aggregator into trunk mode.

The “no” variant of this command removes any AMF-link that may exist for the selected port or aggregated link.

Syntax

```
switchport atmf-link

no switchport atmf-link
```

Parameter	Description
`switchport`	The Layer 2 Interface.
`atmf-link`	Sets the switchport to be an AMF link.

Mode Interface Configuration

Example To make a switchport 1.0.1 an AMF crosslink, use the following commands

```
Node_1# configure terminal
Node_1(config)# interface port1.0.1
Node_1(config-if)# switchport atmf-link
```

type atmf node

This command configures a trigger to be activated at an AMF node join or leave event.

Syntax `type atmf node {join|leave}`

Parameter	Description
`type`	Configure a particular type of trigger.
`atmf`	The Allied Telesis Management Framework (AMF)
`join`	AMF node join event.
`leave`	AMF node leave event.

Mode Trigger Configuration

Example-1 To configure trigger 5 to activate at an AMF node leave event, use the following commands. In this example the command is entered on node-1:

```
node1(config)# trigger 5
node1(config-trigger) type atmf node leave
```

Example-2 The following commands will configure trigger 5 to activate if an AMF node join event occurs on any node within the working set:

```
node1# atmf working-set group all
```

This command returns the following display:

```
====================
node1, node2, node3:
====================

Working set join
```

Note that the running the above command changes the prompt from the name of the local node, to the name of the AMF-Network followed, in square brackets, by the number of member nodes in the working set.

```
AMF-Net[3]# conf t
AMF-Net[3](config)# trigger 5
AMF-Net[3](config-trigger)# type atmf node leave
AMF-Net[3](config-trigger)# description description "E-mail on
                            AMF Exit"
AMF-Net[3](config-trigger)# active
```

Enter the name of the script to run at the trigger event.

```
AMF-Net[3](config-trigger)# script 1 email_me.scp
AMF-Net[3](config-trigger)# end
```

Display the trigger configurations

```
AMF-Net[3]# show trigger
```

This command returns the following display:

```
=======
node1:
=======

TR# Type & Details     Description          Ac Te Tr Repeat     #Scr Days/Date
-------------------------------------------------------------------------------
001 Periodic (2 min)   Periodic Status Chk  Y  N  Y Continuous  1   smtwtfs
005 ATMF node (leave)  E-mail on ATMF Exit  Y  N  Y Continuous  1   smtwtfs
-------------------------------------------------------------------------------
```

```
==============
Node2, Node3,
==============

TR# Type & Details     Description          Ac Te Tr Repeat     #Scr Days/Date
-------------------------------------------------------------------------------
005 ATMF node (leave)  E-mail on ATMF Exit  Y  N  Y Continuous  1   smtwtfs
-------------------------------------------------------------------------------
```

Display the triggers configured on each of the nodes in the AMF Network.

```
AMF-Net[3]# show running-config trigger
```

This command returns the following display:

```
========
Node1:
========

trigger 1
 type periodic 2
 script 1 atmf.scp
trigger 5
 type atmf node leave
description "E-mail on ATMF Exit"
 script 1 email_me.scp
!
```

```
============
Node2, Node3:
============

trigger 5
 type atmf node leave
description "E-mail on ATMF Exit"
 script 1 email_me.scp
!
```

undebug atmf

This command is an alias for the **no variant of the** **debug atmf** command on page 89.35.

The IPv4 addresses shown may include those specified for documentation purposes in RFC 5737: 192.0.2.0/24, 198.51.100.0/24, 203.0.113.0/24. These addresses should not be used for practical networks (other than for testing purposes), nor should they appear in any public network.

Chapter 90: NTP Introduction and Configuration

Introduction 90.2
Overview 90.2
NTP on the Switch 90.3
Troubleshooting 90.4
Configuration Example 90.5

Introduction

This chapter describes the Network Time Protocol (NTP) service provided by the switch, and how to configure and monitor NTP on the switch.

NTP is a protocol for synchronizing the time clocks on a collection of network devices using a distributed client/server mechanism. NTP uses UDP (User Datagram Protocol) as the transport mechanism. NTP evolved from the Time Protocol (RFC 868) and the ICMP Timestamp message (RFC 792).

NTP provides protocol mechanisms to specify the precision and estimated error of the local clock and the characteristics of the reference clock to which it may be synchronized.

For detailed information about the commands used to configure NTP, see **Chapter 91, NTP Commands**.

Overview

NTP uses a subnetwork with primary reference clocks, gateways, secondary reference clocks, and local hosts. These are organized into a hierarchy with the more accurate clocks near the top and less accurate ones near the bottom.

A number of primary reference clocks, synchronized to national standards, are connected to widely accessible resources (such as backbone gateways or switches) operating as primary time servers. The primary time servers use NTP between them to crosscheck clocks, to mitigate errors due to equipment or propagation failures, and to distribute time information to local secondary time servers. The secondary time servers redistribute the time information to the remaining local hosts.

The hierarchical organization and distribution of time information reduces the protocol overhead, and allows selected hosts to be equipped with cheaper but less accurate clocks. NTP provides information which organizes this hierarchy on the basis of precision or estimated error.

- An NTP entity may be in one of the following operating modes; however, the switch's implementation of NTP supports two modes: client and server.
- An NTP entity operating in a client mode sends periodic messages to its peers, requesting synchronization by its peers.
- An NTP entity enters the server mode temporarily when it receives a client request message from one of its peers, and remains in server mode until the reply to the request has been transmitted.
- An NTP entity operating in symmetric active mode sends messages announcing its willingness to synchronize and be synchronized by its peers.
- An NTP entity enters symmetric passive mode in response to a message from a peer operating in Symmetric Active mode. An NTP entity operating in this mode announces its willingness to synchronize and be synchronized by its peers.
- An NTP entity operating in broadcast mode periodically sends messages announcing its willingness to synchronize all of its peers but not to be synchronized by any of them.

The same message format is used for both requests and replies. When a request is received, the server interchanges addresses and ports, fills in or overwrites certain fields in the message, recalculates the checksum, and returns it immediately. The information included in the NTP message allows each client/ server peer to determine the timekeeping characteristics of its peers, including the expected accuracies of their clocks. Each peer uses this information and selects the best time from possibly several other clocks, updates the local clock, and estimates its accuracy.

There is no provision in NTP for peer discovery, acquisition, or authentication. Data integrity is provided by the IP and UDP checksums. No reachability, circuit-management, duplicate-detection, or retransmission facilities are provided or necessary.

By its very nature clock synchronization requires long periods of time (hours or days) and multiple comparisons in order to maintain accurate timekeeping. The more comparisons performed, the greater the accuracy of the timekeeping.

NTP on the Switch

The implementation of NTP on the switch is based on the following RFCs:

- RFC 958, Network Time Protocol (NTP)
- RFC 1305, Network Time Protocol (Version 3) Specification, Implementation and Analysis
- RFC 1510, The Kerberos Network Authentication Service (V5)

Two modes of operation are supported: client and server. The switch is in client mode most of the time where it polls the configured peer at least once every preconfigured minimum time period.

The peer that the switch refers to must be a more accurate clock source than the switch itself or another switch directly connected to a more accurate clock source. The switch operates as a secondary time server. It cannot operate as a primary time server unless the primary clock source is operating in server mode. A primary clock source usually operates in broadcast mode, which is not supported by the switch's implementation of NTP. When the switch receives a valid reply from the peer, it synchronizes its own internal clock according to the information from the reply.

If the switch receives a synchronization request from an NTP client, it temporarily changes to server mode. It replies to the request with the current time from the switch's internal clock along with other information useful for synchronization. The switch's internal clock is accurate to 0.005 seconds.

Troubleshooting

Problem The switch is not assigning the time to devices on the LAN.

Solutions

- Check that the NTP peer's IP address is entered correctly.
- Check that the NTP peer can reach the switch, by pinging the switch from the NTP peer.

Problem The switch's clock does not synchronize with the NTP peer.

Solution

- The switch's clock can synchronize with the NTP peer only when its initial time is similar to the NTP peer's time (after setting the UTC offset). Manually set the switch's time so that it is approximately correct, and enable NTP again.
- Check that the UTC offset is correct.

Problem The switch's time is incorrect, even though it assigns the correct time to devices on the LAN.

Solution The UTC offset is probably incorrect, or needs to be adjusted for the beginning or end of summer time.

Configuration Example

NTP requires the IP module to be enabled and configured correctly.

The switch's implementation of NTP supports two modes: client and server mode. When a synchronization request is received from a client (e.g. a PC on a LAN), the switch enters server mode and responds with time information derived from the switch's own internal clock. Periodically the switch enters client mode, sending synchronization requests to a predefined peer to synchronize its own internal clock. The peer is assumed to be a primary clock source or another switch connected directly to a primary clock source.

This example illustrates how to configure two switches, one at a Head Office and one at a Regional Office, to provide a network time service. The Head Office switch is connected to a primary time server and provides the most accurate time information. The switch at the Regional Office uses the Head Office switch as its peer to avoid the cost of an additional WAN connection but provides slightly less accurate time information.

To configure NTP on the switch, the NTP module must be enabled and an NTP peer must be defined. NTP transfers time information in UTC format.

To set the switch to automatically change the time when summer time starts and ends, enable a summer time offset setting.

Example configuration parameters for a network time service:

Site	Regional Office	Head Office
Switch Name	RG1	HO1
IP Address of Switch	10.5.35.114	10.12.25.4
IP Address of Peer	10.5.35.113	172.16.7.3

Step 1: Enable NTP and define the NTP peer.

The NTP feature must be enabled on all switches that are to provide a network time service. Each switch must have a peer defined where the switch synchronizes its own internal clock. Enable NTP on the Head Office switch and specify a primary time server as the peer by using the commands:

```
awplus# configure terminal
awplus(config)# ntp peer 172.16.7.3
```

Note that you can also specify an IPv6 address for an NTP peer:

```
awplus# configure terminal
awplus(config)# ntp peer 2001:0db8:010d::1
```

Step 2: Configure the NTP parameters.

On each switch, the offset of local time from UTC time must be specified. In this example, both switches are in the same time zone, which is 12 hours ahead of UTC time. Use the following commands on both switches:

```
awplus(config)# clock timezone utc plus 12
```

Note that the range of offset is `<0-12>`.

Step 3: Check the NTP configuration.

Check the NTP configuration on each switch by using the command:

```
awplus# show ntp status
```

This command displays the following information on the Head Office switch.

```
Clock is synchronized, stratum 0, actual frequency is 0.0000
Hz, precision is 20 reference time is 00000000.00000000
(6:28:16.000 UTC Fri Feb  7 2036)clock offset is 0.000 msec,
root delay is 0.000 msec root dispersion is 0.000 msec,
```

Chapter 91: NTP Commands

Command List 91.2
ntp access-group 91.2
ntp authenticate 91.3
ntp authentication-key 91.4
ntp broadcastdelay 91.5
ntp master 91.6
ntp peer 91.7
ntp server 91.9
ntp source 91.11
ntp trusted-key 91.13
show counter ntp 91.14
show ntp associations 91.16
show ntp status 91.17

Command List

This chapter provides an alphabetical reference for commands used to configure the Network Time Protocol (NTP). For more information, see **Chapter 90, NTP Introduction and Configuration**.

For information about modifying or redirecting the output from **show** commands to a file, see **"Controlling "show" Command Output" on page 1.38**.

ntp access-group

This command creates an NTP access group, and applies a basic IP access list to it. This allows you to control access to NTP services.

The **no** variant of this command removes the configured NTP access group.

Syntax

```
ntp access-group [peer|query-only|serve|serve-only]
    [<1-99>|<1300-1999>]

no ntp access-group [peer|query-only|serve|serve-only]
```

Parameter	Description
`peer`	Allows time requests and NTP control queries, and allows the system to synchronize itself to a system whose address passes the access list criteria.
`query-only`	Allows only NTP control queries from a system whose address passes the access list criteria.
`serve`	Allows time requests and NTP control queries, but does not allow the system to synchronize itself to a system whose address passes the access list criteria.
`serve-only`	Allows only time requests from a system whose address passes the access list criteria.
<1-99>	Standard IP access list.
<1300-1999>	Expanded IP access list.

Mode Global Configuration

Example To create an NTP peer access group for an extended IP access list, use the commands:

```
awplus# configure terminal
awplus(config)# ntp access-group peer 1998
```

To disable the NTP peer access group created above, use the commands:

```
awplus# configure terminal
awplus(config)# no ntp access-group peer
```

ntp authenticate

This command enables NTP authentication. This allows NTP to authenticate the associations with other systems for security purposes.

The **no** variant of this command disables NTP authentication.

Syntax

```
ntp authenticate
no ntp authenticate
```

Mode Global Configuration

Example To enable NTP authentication, use the commands:

```
awplus# configure terminal
awplus(config)# ntp authenticate
```

To disable NTP authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no ntp authenticate
```

ntp authentication-key

This command defines each of the authentication keys. Each key has a key number, a type, and a value. Currently, the only key type supported is MD5.

The **no** variant of this disables the authentication key assigned previously using **ntp authentication-key**.

Syntax

```
ntp authentication-key <keynumber> md5 <key>
no ntp authentication-key <keynumber> md5 <key>
```

Parameter	Description
<keynumber>	*<1-4294967295>* The key number.
<key>	The authentication key.

Mode Global Configuration

Example To define an authentication key number `134343` and a key value `mystring`, use the commands:

```
awplus# configure terminal
awplus(config)# ntp authentication-key 134343 md5 mystring
```

To disable the authentication key number `134343` with the key value `mystring`, use the commands:

```
awplus# configure terminal
awplus(config)# no ntp authentication-key 134343 md5 mystring
```

ntp broadcastdelay

Use this command to set the estimated round-trip delay for broadcast packets.

Use the **no** variant of this command to reset the round-trip delay for broadcast packets to the default offset of 0 microseconds.

Syntax

```
ntp broadcastdelay <delay>
no ntp broadcastdelay
```

Parameter	Description
<delay>	*<1-999999>* The broadcast delay in microseconds.

Default 0 microsecond offset, which can only be applied with the **no** variant of this command.

Mode Global Configuration

Example To set the estimated round-trip delay to 23464 microseconds for broadcast packets, use these commands:

```
awplus# configure terminal
awplus(config)# ntp broadcastdelay 23464
```

To reset the estimated round-trip delay for broadcast packets to the default setting (0 microseconds), use these commands:

```
awplus# configure terminal
awplus(config)# no ntp broadcastdelay
```

ntp master

Use this command to make the device to be an authoritative NTP server, even if the system is not synchronized to an outside time source. Note that no stratum number is set by default.

Use the **no** variant of this command to stop the device being the designated NTP server.

Syntax

```
ntp master [<stratum>]
no ntp master
```

Parameter	Description
<stratum>	*<1-15>* The stratum number defines the configured level that is set for this master within the NTP hierarchy.

Mode Global Configuration

Usage The stratum number is null by default and must be set using this command. The stratum levels define the distance from the reference clock and exist to prevent cycles in the hierarchy. Stratum 1 is used to indicate time servers, which are more accurate than Stratum 2 servers. For more information on the Network Time Protocol go to: **www.ntp.org//**

Examples To stop the switch from being the designated NTP server use the commands:

```
awplus# configure terminal
awplus(config)# no ntp master
```

To make the switch the designated NTP server with stratum number 2 use the commands:

```
awplus# configure terminal
awplus(config)# ntp master 2
```

ntp peer

Use this command to configure an NTP peer association. An NTP association is a peer association if this system is willing to either synchronize to the other system, or allow the other system to synchronize to it.

Use the **no** variant of this command to remove the configured NTP peer association.

Syntax

```
ntp peer {<peeraddress>|<peername>}

ntp peer {<peeraddress>|<peername>}
   [prefer] [key <key>] [version <version>]

no ntp peer {<peeraddress>|<peername>}
```

Parameter	Description
<peeraddress>	Specify the IP address of the peer, entered in the form `A.B.C.D` for an IPv4 address, or in the form `X:XX.X` for an IPv6 address.
<peername>	Specify the peer hostname. The peer hostname can resolve to an IPv4 and an IPv6 address.
`prefer`	Prefer this peer when possible.
`key` *<key>*	*<1-4294967295>* Configure the peer authentication key.
`version` *<version>*	*<1-4>* Configure for this NTP version.

Mode Global Configuration

Examples See the following commands for options to configure NTP peer association, key and NTP version for the peer with an IPv4 address of `192.0.2.23`:

```
awplus# configure terminal
awplus(config)# ntp peer 192.0.2.23
awplus(config)# ntp peer 192.0.2.23 prefer
awplus(config)# ntp peer 192.0.2.23 prefer version 4
awplus(config)# ntp peer 192.0.2.23 prefer version 4 key 1234
awplus(config)# ntp peer 192.0.2.23 version 4 key 1234
awplus(config)# ntp peer 192.0.2.23 version 4
awplus(config)# ntp peer 192.0.2.23 key 1234
```

To remove an NTP peer association for this peer with an IPv4 address of `192.0.2.23`, use the following commands:

```
awplus# configure terminal
awplus(config)# no ntp peer 192.0.2.23
```

See the following commands for options to configure NTP peer association, key and NTP version for the peer with an IPv6 address of `2001:0db8:010d::1`:

```
awplus# configure terminal
awplus(config)# ntp peer 2001:0db8:010d::1
awplus(config)# ntp peer 2001:0db8:010d::1 prefer
awplus(config)# ntp peer 2001:0db8:010d::1 prefer version 4
awplus(config)# ntp peer 2001:0db8:010d::1 prefer version 4 key
1234
awplus(config)# ntp peer 2001:0db8:010d::1 version 4 key 1234
awplus(config)# ntp peer 2001:0db8:010d::1 version 4
awplus(config)# ntp peer 2001:0db8:010d::1 key 1234
```

To remove an NTP peer association for this peer with an IPv6 address of `2001:0db8:010d::1`, use the following commands:

```
awplus# configure terminal
awplus(config)# no ntp peer 2001:0db8:010d::1
```

Related Commands **ntp server**
ntp source

ntp server

Use this command to configure an NTP server. This means that this system will synchronize to the other system, and not vice versa.

Use the **no** variant of this command to remove the configured NTP server.

Syntax

```
ntp server {<serveraddress>|<servername>}
ntp server {<serveraddress>|<servername>}
    [prefer] [key <key>] [version <version>]
no ntp server {<serveraddress>|<servername>}
```

Parameter	Description
<serveraddress>	Specify the IP address of the peer, entered in the form `A.B.C.D` for an IPv4 address, or in the form `X:X::X.X` for an IPv6 address.
<servername>	Specify the server hostname. The server hostname can resolve to an IPv4 and an IPv6 address.
`prefer`	Prefer this server when possible.
`key` *<key>*	*<1-4294967295>* Configure the server authentication key.
`version` *<version>*	*<1-4>* Configure for this NTP version.

Mode Global Configuration

Examples See the following commands for options to configure an NTP server association, key and NTP version for the server with an IPv4 address of `192.0.1.23`:

```
awplus# configure terminal
awplus(config)# ntp server 192.0.1.23
awplus(config)# ntp server 192.0.1.23 prefer
awplus(config)# ntp server 192.0.1.23 prefer version 4
awplus(config)# ntp server 192.0.1.23 prefer version 4 key 1234
awplus(config)# ntp server 192.0.1.23 version 4 key 1234
awplus(config)# ntp server 192.0.1.23 version 4
awplus(config)# ntp server 192.0.1.23 key 1234
```

To remove an NTP peer association for this peer with an IPv4 address of `192.0.1.23`, use the following commands:

```
awplus# configure terminal
awplus(config)# no ntp server 192.0.1.23
```

See the following commands for options to configure an NTP server association, key and NTP version for the server with an IPv6 address of `2001:0db8:010e::2`:

```
awplus# configure terminal
awplus(config)# ntp server 2001:0db8:010e::2
awplus(config)# ntp server 2001:0db8:010e::2 prefer
awplus(config)# ntp server 2001:0db8:010e::2 prefer version 4
awplus(config)# ntp server 2001:0db8:010e::2 prefer version 4
key 1234
awplus(config)# ntp server 2001:0db8:010e::2 version 4 key 1234
awplus(config)# ntp server 22001:0db8:010e::2 version 4
awplus(config)# ntp server 2001:0db8:010e::2 key 1234
```

To remove an NTP peer association for this peer with an IPv6 address of `2001:0db8:010e::2`, use the following commands:

```
awplus# configure terminal
awplus(config)# no ntp server 2001:0db8:010e::2
```

Related Commands **ntp peer**
ntp source

ntp source

Use this command to configure an IPv4 or an IPv6 address for the NTP source interface. This command defines the socket used for NTP messages, and only applies to NTP client behavior.

Use the **no** variant of this command to remove the configured IPv4 or IPv6 address from the NTP source interface.

Syntax

```
ntp source <source-address>

no ntp source
```

Parameter	Description
<source-address>	Specify the IP address of the NTP source interface, entered in the form `A.B.C.D` for an IPv4 address, or in the form `X:X::X.X` for an IPv6 address.

Default An IP address is selected based on the most appropriate egress interface used to reach the NTP peer if a configured NTP client source IP address is unavailable or is an invalid IP address.

Mode Global Configuration

Usage Adding an IPv4 or an IPv6 address allows you to select which source interface NTP uses for peering. The IPv4 or IPv6 address configured using this command is matched to the interface.

When selecting a source IP address to use for NTP messages to the peer, if the configured NTP client source IP address is unavailable then default behavior will apply, and an alternative source IP address is automatically selected. This IP address is based on the most appropriate egress interface used to reach the NTP peer. The configured NTP client source IP may be unavailable if the interface is down, or an invalid IP address is configured that does not reside on the device.

Note that this command only applies to NTP client behavior. The egress interface that the NTP messages use to reach the NTP server determined by the **ntp peer** and **ntp server** commands.

Examples To configure the NTP source interface with the IPv4 address `192.0.1.23`, enter the commands:

```
awplus# configure terminal
awplus(config)# ntp source 192.0.1.23
```

To configure the NTP source interface with the IPv6 address `2001:0db8:010e::2`, enter the commands:

```
awplus# configure terminal
awplus(config)# ntp source 2001:0db8:010e::2
```

To remove a configured address for the NTP source interface, use the following commands:

```
awplus# configure terminal
awplus(config)# no ntp source
```

Related Commands **ntp peer**
ntp server

ntp trusted-key

This command defines a list of trusted authentication keys. If a key is trusted, this system will be ready to synchronize to a system that uses this key in its NTP packets.

Use the **no** variant of this command to remove a configured trusted authentication key.

Syntax

```
ntp trusted-key <1-4294967295>
no ntp trusted-key <1-4294967295>
```

Parameter	Description
<1-4294967295>	The specific key number.

Mode Global Configuration

Example To define a trusted authentication key numbered `234675`, use the following commands:

```
awplus# configure terminal
awplus(config)# ntp trusted-key 234676
```

To remove the trusted authentication key numbered `234675`, use the following commands:

```
awplus# configure terminal
awplus(config)# no ntp trusted-key 234676
```

show counter ntp

This command displays packet counters for NTP.

Syntax `show counter ntp`

Mode User Exec and Privileged Exec

Output **Figure 91-1: Example output from the show counter ntp command**

```
NTP counters
Pkts Sent               ......... 0
Pkts Received           ......... 70958
Pkts Processed          ......... 0
Pkts current version    ......... 0
Pkts old version        ......... 0
Pkts unknown version    ......... 0
Pkts access denied      ......... 70958
Pkts bad length         ......... 0
Pkts bad auth           ......... 0
Pkts rate exceed        ......... 0
```

Table 91-1: Parameters in the output from the show counter ntp command

Parameter	Description
`Pkts Sent`	Total number of NTP client and server packets sent by your device.
`Pkts Received`	Total number of NTP client and server packets received by your device.
`Pkts Processed`	The number of packets processed by NTP. NTP processes a packet once it has determined that the packet is valid by checking factors such as the packet's authentication, format, access rights and version.
`Pkts current version`	The number of version 4 NTP packets received.
`Pkts old version`	The number of NTP packets received that are from an older version, down to version 1, of NTP. NTP is compatible with these versions and processes these packets.
`Pkts unknown version`	The number of NTP packets received that are an earlier version than version 1, or a higher version than version 4. NTP cannot process these packets.
`Pkts access denied`	The number of NTP packets received that do not match any access list statements in the NTP access-groups. NTP drops these packets.
`Pkts bad length`	The number of NTP packets received that do not conform to the standard packet length. NTP drops these packets.
`Pkts bad auth`	The number of NTP packets received that failed authentication. NTP drops these packets. Packets can only fail authentication if NTP authentication is enabled with the **ntp authenticate** command.
`Pkts rate exceed`	The number of packets dropped because the packet rate exceeded its limits.

Example To display counters for NTP, use the command:

```
awplus# show counter ntp
```

show ntp associations

Use this command to display the status of NTP associations. Use the detail option for displaying detailed information about the associations.

Syntax `show ntp associations [detail]`

Mode User Exec and Privileged Exec

Example See the sample output of the **show ntp associations** and **show ntp associations detail** commands displaying the status of NTP associations.

Figure 91-2: Example output from the show ntp associations command

```
awplus#show ntp associations

Introduction

This chapter describes the Dynamic Host Configuration Protocol (DHCP) support provided by your device. This includes how to configure your device to:

- act as a DHCP and BOOTP server
- act as a DHCP relay agent
- use the DHCP client to obtain IP addresses for its own interfaces

Note that you can configure your device to operate as both a DHCP relay agent and a DHCP/BOOTP server.

BOOTP

Bootstrap Protocol (BOOTP) is a UDP-based protocol that enables a booting host to dynamically configure itself without external interventions. A BOOTP server responds to requests from BOOTP clients for configuration information, such as the IP address the client should use. BOOTP is defined in RFC 951, Bootstrap Protocol (BOOTP).

RFC 1542, Clarifications and Extensions for the Bootstrap Protocol, defines extensions to the BOOTP protocol, including the behavior of a DHCP relay agent.

DHCP

DHCP is widely used to dynamically assign host IP addresses from a centralized server that reduces the overhead of administrating IP addresses. DHCP helps conserve the limited IP address space because IP addresses no longer need to be permanently assigned to hosts. DHCP centrally manages IP address assignment for a large number of subscribers.

DHCP is based on BOOTP, and is defined in RFC 2131. It extends the BOOTP mechanism by providing:

- a method for passing configuration information to hosts on a TCP/IP network
- automatic allocation of reusable network addresses
- other additional configuration options

When your device is configured as a DHCP server, it allocates IP addresses and other IP configuration parameters to clients (hosts), when the client requests them. This lets you configure your IP network without manually configuring every client. Note that each client must also be configured to receive its IP address automatically.

As well as addresses, a DHCP server assigns a wide range of parameters to clients, including subnet information and mask, domain and hostname, server addresses, keepalive times, MTUs, boot settings, encapsulation settings, time settings, and TCP settings.

DHCP is designed to interoperate with BOOTP clients and DHCP clients, without the BOOTP clients needing any change to their initialization software.

DHCP Relay Agents

DHCP relay agents pass BOOTP and DHCP messages between servers and clients. Networks where the DHCP or BOOTP server does not reside on the same IP subnet as its clients need the intermediate routers to act as relay agents. A maximum number of 400 DHCP relay agents (one per interface) can be configured on the device. Once this limit has been reached, any further attempts to configure DHCP relay agents will not be successful.

Configuring the DHCP Server

The DHCP server uses **address pools** when responding to DHCP client requests. Address pools contains specific IP configuration details that the DHCP server can allocate to a client. You can configure multiple address pools on the device for different networks.

Note that you cannot configure DHCP Server and DHCP Relay on the same device.

To configure a pool, you must:

- **Create the Pool** and enter its configuration mode.
- **Define the Network** the pool applies to.
- **Define the Range** of IP addresses that the server can allocate to clients. You can specify multiple address ranges for each pool.
- **Set the Lease** for the clients. This defines whether the clients receive a dynamic, permanent, or static IP address.
- **Set the Options** (standard and user-defined) that the clients of a pool require when configuring their IP details.

After configuring the address pools, you can then enable the DHCP server by using the command:

```
awplus(config)# service dhcp-server
```

For networks where you do not want the server to respond to BOOTP requests, you can configure the DHCP server so that it ignores them, by using the command:

```
awplus(config)# ip dhcp bootp ignore
```

Create the Pool

A DHCP pool is identified by a name. To create a DHCP pool and enter the DHCP Configuration mode for the pool, use the command:

```
awplus(config)# ip dhcp pool <pool-name>
awplus(dhcp-config)#
```

Define the Network

Define the network that the DHCP clients are in. You can define one network per address pool. Use the following command to define the network after defining the DHCP pool first:

```
awplus(dhcp-config)# network
```

- For remote clients, set the network address to the network of the remote clients. The **network** command does not need to match a specific interface's network, because the DHCP server listens on all IP interfaces for DHCP requests.
- For locally connected clients, ensure that the desired interface has an IP address and subnet mask defined; use the **ip address IPADDR** command to set a static address. Enter the configuration mode for the pool, and set the DHCP address pool's network to match the interface's network. Pools that span multiple interfaces are possible only if the interface networks are contiguous.

Define the Range

Configure an IP address range for the pool. This range must be in the same subnet as the pool's network setting. Use the command:

```
awplus(dhcp-config)# range <ip-address> [<ip-address>]
```

The first IPv4 address specifies the **low end of the range, while the second IP address is the high end.** You can set the range to a single IP address by specifying only one IP address.

Set the Lease

The DHCP server assigns IP settings to hosts for specific times (the lease time). Each DCHP pool has one lease time setting. You can use DHCP to allocate the following types of addresses:

- A **dynamic** IP addresses
  These are available to a host for a limited amount of time. When the lease expires, the server can reallocate the IP address to another device. To set the lease time for the DHCP pool so that it assigns dynamic IP addresses, use the command:

  ```
  awplus(dhcp-config)# lease <days> <hours> <minutes>
                       [<seconds>]
  ```

- A **permanent** IP addresses
  These are available to a host for an unlimited amount of time. To set the lease time to assign permanent IP addresses, use the command:

  ```
  awplus(dhcp-config)# lease infinite
  ```

- A **static** IP addresses
  These are allocated to a particular client. The DHCP server recognizes the client by its MAC address. This lets you use DHCP to manage most of your network automatically, while having unchanging IP addresses on key devices such as servers. To assign a static IP address to a device, use the command:

  ```
  awplus(dhcp-config)# host <ip-address> <mac-address>
  ```

BOOTP requests can be satisfied by pools with leases set to infinity.

Enable DHCP Leasequery

The DHCP Leasequery protocol (RFC 4388) allows a device or process, for example a DHCP relay agent, to obtain IP address information directly from the DHCP server using DHCPLEASEQUERY messages.

DHCPLEASEQUERY messages support three query regimes:

- IP address

  Only an IP address is supplied in the DHCPLEASEQUERY message. The DHCP server will return any information that it has on the most recent client to have been assigned that IP address.

- MAC address

  Only a MAC address is supplied in the DHCPLEASEQUERY message. The DHCP server will return any information that it has on the IP address most recently accessed by a client with that MAC address. Also, the DHCP server may supply additional IP addresses that have been associated with that MAC address in different subnets.

- Client identifier option

  Only a Client identifier option is supplied in the DHCPLEASEQUERY message. The DHCP server will return any information that it has on the IP address most recently accessed by a client with that Client identifier. Also, the DHCP server may supply additional IP addresses that have been associated with Client identifier in different subnets.

An AlliedWare Plus DHCP server implementing DHCP Leasequery supports all three query regimes.

If the DHCP Leasequery feature is enabled, when a DHCP relay agent needs to know the location of an IP endpoint and sends a DHCPLEASEQUERY message, the DHCP server will reply with either a DHCPLEASEACTIVE, DHCPLEASEUNASSIGNED, or DHCPLEASEUNKNOWN message.

When the DHCP server replies to a DHCPLEASEQUERY message:

- a DHCPLEASEACTIVE message allows the DHCP relay agent to determine the IP endpoint location and the remaining duration of the IP address lease
- a DHCPLEASEUNASSIGNED message indicates that there is no current active lease for the IP address, but the DHCP server does manage that IP address
- a DHCPLEASEUNKNOWN message indicates that the DHCP server supports DHCP Leasequery but has no knowledge of the query information specified in the DHCPLEASEQUERY message (e.g., IP address, MAC address, or Client identifier option)

To enable the DHCP Leasequery feature, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp leasequery enable
```

To disable the DHCP Leasequery feature, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp leasequery enable
```

To display information about DHCP Leasequery messages, use either of the commands:

```
awplus# show counter dhcp-server
awplus# show ip dhcp server statistics
```

To display information about the current configuration of the DHCP server, including whether the DHCP server is configured to support DHCP Leasequery, use the command:

```
awplus# show ip dhcp server summary
```

Set the Options

DHCP allows clients to receive options from the DHCP server. Options describe the network configuration, and various services that are available on the network. Options are configured separately on each DHCP pool. You can configure both standard predefined options and user-defined options for a DHCP pool.

To create a user-defined option, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp option <1-254> [name <option-
name>] [<option-type>]
```

To add a user-defined option to a DHCP address pool, use the command sequence:

```
awplus(config)# ip dhcp pool <pool-name>
awplus(dhcp-config)# option [<1-254>|<option-name>]
<option-value>
```

It is possible to add a user-defined option with the same number as an existing pre-defined option. If this situation occurs, the user-defined option takes precedence—that is, it overrides but does not eliminate the standard option.

You can set some pre-defined options using the following commands:

To set a subnet mask (option 1) for the address pool, use the command:

```
awplus(dhcp-config)# subnet-mask <mask>
```

To add a domain name (option 15) for the address pool, use the command:

```
awplus(dhcp-config)# domain-name <domain-name>
```

To add a default router (option 3) for the address pool, use the command:

```
awplus(dhcp-config)# default-router <ip-address>
```

To add a DNS server (option 6) for the address pool, use the command:

```
awplus(dhcp-config)# dns-server <ip-address>
```

DHCP Lease Probing

Probing is used by the DHCP server to check whether an IP address it wants to lease to a client is already being used by another host. Probing is configured on a per-DHCP pool basis. You can specify probing either by ICMP Echo Request (ping) or by ARPing. ARP probing is useful in networks where ICMP may be blocked on some devices, whereas ARP is always supported. ARP and ping probing are mutually exclusive and cannot operate concurrently within a DHCP pool.

Probing is enabled by default when a DHCP pool is created.

To enable probing if probing has previously been disabled for a DHCP pool, enter the configuration mode for the pool with the **ip dhcp pool** command and then use the command:

```
awplus(dhcp-config)# probe enable
```

The default probe type is ping. To specify the probe type as ARP, enter the configuration mode for the pool and then use the command:

```
awplus(dhcp-config)# probe type arp
```

To set the timeout value in milliseconds to wait for a response after each probe packet is sent, use the command:

```
awplus(dhcp-config)# probe timeout <50-5000>
```

To specify the number of packets sent for each lease probe, use the command:

```
awplus(dhcp-config)# probe packets <0-10>
```

To disable probing for a DHCP pool, enter the configuration mode for the pool and then use the command:

```
awplus(dhcp-config)# no probe enable
```

To display the lease probe configuration settings for a specific DHCP pool or for all DHCP pools configured on the device, use the command:

```
awplus# show ip dhcp pool [<address-pool>]
```

DHCP Relay Agent Introduction

DHCP relay agents pass BOOTP messages between servers and clients. Networks where the DHCP or BOOTP server does not reside on the same IP subnet as its clients need the routers attached to the subnet to act as DHCP relay agents.

Note that both BOOTP and DHCP use BOOTP messages, allowing DHCP relay agents to relay all their packets.

Your device's DHCP Relay Agent relays these message types:

- BOOTREQUEST messages originating from any of the device's interfaces to a user-defined destination
- BOOTREPLY messages addressed to BOOTP clients on networks directly connected to the device

The DHCP relay agent ignores BOOTREPLY messages addressed to clients on networks not directly connected to the device. The device treats these as ordinary IP packets for forwarding.

A BOOTREQUEST message is relayed via unicast.

The hops field in a BOOTP message records the number of DHCP relay agents the message has been through. If the value of the hops field exceeds a predefined threshold, the DHCP relay agent discards the message.

Configuring the DHCP Relay Agent

To enable the DHCP relay agent on your device, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
```

Note DHCP relay agent is enabled by default on your switch. You only need to enter a `service dhcp-relay` command if DHCP relay agent is disabled on your switch.

You must define a relay destination on one of the device's interfaces before the relay agent can relay packets. This is the path to the DHCP server. To define a relay destination on the currently specified interface, use the commands:

```
awplus(config)# interface <interface-name>
awplus(config-if)# ip dhcp-relay server-address {<ipv4-
address>| <ipv6-address> <server-
interface>}
```

You can define more than one relay destination on your device. The following table describes how the DHCP relay agent forwards the packets.

If an interface has...	Then the relay agent relays BOOTP packets it receives on that interface to...
one relay destination defined	the relay destination.
multiple relay destinations defined	each defined relay destination.

To delete a DHCP relay destination, use the command:

```
awplus(config-if)# no ip dhcp-relay server-address {<ipv4-
                   address>| <ipv6-address> <server-interface>}
```

See the **ip dhcp-relay server-address** command on page 93.24 and the **service dhcp-relay** command on page 93.38 for command description and command examples. DHCP servers with IPv4 and IPv6 addresses are configured with **ip dhcp-relay server-address**.

When the 'hops' field in a BOOTP message exceeds a predefined threshold the BOOTP message is discarded. The default of the threshold is 10. To set the threshold, use the command:

```
awplus(config-if)# ip dhcp-relay maxhops <1-255>
```

To display the current configuration of the DHCP relay agent, use the command:

```
awplus# show ip dhcp-relay [interface <interface-name>]
```

DHCP Relay Agent Information Option (Option 82)

You can use DHCP Relay Agent Information Option (Option 82) to protect your switch from spoofing attacks, where untrusted hosts send requests for IP addresses to access the network. The switch relays these requests to DHCP servers and the servers send IP address leases in response. Untrusted hosts then use these IP addresses for spoofing attacks. Option 82 provides information about the location of a DHCP client for the DHCP server.

Enabling the DCHP Relay Agent Information Option feature on the switch allows the switch to insert extra information into the DHCP packets that it is relaying. This information enables accurate identification of a subscriber, as it states which interface on which relay switch the subscriber is connected to. The information is stored in an optional field in the DHCP packet header, the relay agent-information option field, with the option ID 82.

The DHCP relay agent inserts the Option 82 information into the DHCP packets that it is relaying to a DHCP server. DHCP servers that are configured to recognize Option 82 may use the information to implement IP addresses, or other parameter assignment policies, based on the network location of the client device. Alternatively, the server can simply log this information to create a detailed audit trail of the locations of the clients to which given addresses were allocated at given times.

If Option 82 insertion is enabled, then the DHCP packet flow is as follows:

- The DHCP client generates a DHCP request and broadcasts it on the network.
- The DHCP relay agent intercepts the broadcast DHCP request packet and inserts the Option 82 field in the packet.
- The DHCP relay agent unicasts the DHCP request that includes the Option 82 field to the DHCP server.
- The DHCP server receives the packet.
- If the DHCP server supports Option 82, then it echoes the Option 82 field in the DHCP reply. If the server does not support Option 82, it ignores the option and does not echo it in the reply.
- The DHCP server unicasts the reply to the relay agent.
- The relay agent removes the Option 82 field and forwards the packet to the switch port connected to the DHCP client that sent the DHCP request.

For information about DHCP Relay Agent Information Option (Option 82), see RFC 3046.

To enable the relay agent to insert its details into the Option 82 field in requests received from clients on a particular interface, use the command:

```
awplus(config)# interface <interface-name>
awplus(config-if)# ip dhcp-relay agent-option
```

The Option 82 field contains sub-options. You can specify a value for the Remote ID sub-option, which contains information that identifies the host. To specify a value for the Remote ID, use the command:

```
awplus(config)# interface <interface-name>
awplus(config-if)# ip dhcp-relay agent-option remote-id
<remote-id>
```

If a Remote ID value is not specified, the Remote ID sub-option is set to the switch's MAC address. You can also configure the Remote ID value as an alphanumeric string.

Note that the Option 82 agent information added by DHCP Relay differs from the information inserted by DHCP snooping (see **"DHCP Relay Agent Option 82" on page 82.4**).

Dealing with client-originated packets that already contain Option 82 information

It is possible that the requests arriving from the clients to the relay agent could already contain Option 82 data. There are two main circumstances in which this can occur:

1. A client is maliciously inserting bogus information into the packet in an attempt to subvert the process of identifying the client's location. In this case, you would want to drop the packets that contain the bogus information (or remove bogus information).

2. A Layer 2 DHCP snooping switch, that sits between the clients and the DCHP relay, is validly inserting the Option 82 information into the packets. The DHCP snooping switch is not acting as a relay agent, but is inserting the Option 82 information. In this case, you would want to forward the valid information to the DHCP server.

The action taken on packets with an Option 82 field is configurable. The command to configure this action is shown below:

```
awplus(config)# interface <interface-name>
awplus(config-if)# ip dhcp-relay information policy
                   [append|drop|keep|replace]
```

This command sets the action that the DHCP relay should take when a received DHCP client request contains Option 82 information.

This command takes parameters that can configure the switch to:

- Leave the existing Option 82 field untouched (`keep` parameter)
- Append its own Option 82 field after the existing field (`append` parameter - use this when there is a trusted DHCP Snooping switch or another relay device between the clients and the DHCP Relay)
- Drop the packet (`drop` parameter)
- Replace the existing Option 82 information with its own (the default - `replace` parameter).

See the **ip dhcp-relay information policy** command on page 93.19 for a command description and command examples.

Checking Option 82 information in DHCP Server Responses

To configure the switch to check for Option 82 information in DHCP packets from servers, configure DHCP-relay agent-option checking with the Interface Configuration command:

```
awplus(config)# interface <interface-name>
awplus(config-if)# ip dhcp-relay agent-option checking
```

This command enables the DHCP Relay Agent to check Option 82 information in response packets returned from DHCP servers. If the information does not match the information it has configured for its own client (downstream) interface then the DHCP relay agent drops the packet.

See the **ip dhcp-relay agent-option checking** command on page 93.17 for a command description and command examples.

Option 82 maximum message length

Where a DHCP Relay (that has Option 82 insertion enabled) receives a request packet from a DHCP client, it will append the Option 82 component data, and forward the packet to the DHCP server. The DHCP client will sometimes issue packets containing pad option fields that can be overwritten with Option 82 data.

Where there are insufficient pad option fields to contain all the Option 82 data, the DHCP relay will increase the packet size to accommodate the Option 82 data. If the new (increased) packet size exceeds that defined by the **maximum-message-length** parameter, of the **ip dhcp-relay max-message-length** command then the DHCP relay will drop the packet.

```
awplus(config)# interface <interface-name>
awplus(config-if)# ip dhcp-relay max-message-length <548-1472>
```

DHCPv6 Relay Agent Notification for DHCPv6 PD

DHCPv6 relay agent notification for DHCPv6 PD (prefix delegation) allows the switch configured as a DHCPv6 relay agent to find prefix delegation options by reviewing DHCPv6 RELAY-REPLY packets that are relayed by the DHCPv6 relay agent to the DHCPv6 client.

When a DHCPv6 prefix delegation is option is found by the DHCPv6 relay agent, the DHCPv6 relay agent extracts information about the prefix being delegated to and inserts an IPv6 route matching the DHCPv6 prefix delegation information.

Future packets destined for that prefix sent through the DHCPv6 relay agent are forwarded based on information contained in the DHCPv6 prefix delegation information.

The IPv6 route is left in the routing table until the DHCPv6 prefix delegation lease time expires, or the DHCPv6 relay agent receives a release packet from the DHCPv6 client to release the DHCPv6 prefix delegation. No user configuration is required for this functionality. The DHCPv6 relay agent automatically manages IPv6 routes.

The IPv6 routes are added when the DHCPv6 relay agent relays a RELAY-REPLY packet. The DHCPv6 relay agent deletes the IPv6 routes when the DHCPv6 prefix delegation lease time expires, or the DHCPv6 relay agent receives a release packet from the DHCPv6 client. An IPv6 route in the routing table of the DHCPv6 relay agent is updated when the DHCPv6 prefix delegation lease time is extended.

This functionality leaves an IPv6 route on the routing table of the DHCPv6 relay agent. This IPv6 address allows unicast reverse packet forwarding (RPF) to work by allowing the switch to confirm that the IPv6 address on the DHCPv6 relay agent is not spoofed.

IPv6 routes are removed when a DHCP-DECLINE message is sent by the DHCPv6 client to the DHCPv6 relay agent.

Configuring the DHCP Client

You can configure an interface on your device with a static IP address, or with a dynamic IP address assigned using your device's DHCP client. When you use the DHCP client, it obtains the IP address for the interface, and other IP configuration parameters, from a DHCP server. To configure an interface and gain its IP configuration using the DHCP client, use the command:

```
awplus(config)# interface <ifname>
awplus(config-if)# ip address dhcp [client-id <interface>]
[hostname <hostname>]
```

The DHCP client supports the following IP configuration options:

- Option 1—the subnet mask for your device.
- Option 3—a list of default routers.
- Option 6—a list of DNS servers. This list appends the DNS servers set on your device with the **ip name-server** command.
- Option 15—a domain name used to resolve host names. This option replaces the domain name set with the **ip domain-name** command. Your device ignores this domain name if it has a domain list set using the **ip domain-list** command.
- Option 51—lease expiration time.

If an IP interface is configured to get its IP address and subnet mask from DHCP, the interface does not take part in IP routing until the IP address and subnet mask have been set by DHCP.

For information on configuring a static IP address on an interface, see the **ip address** command on page 27.19.

Clearing Dynamically Allocated Lease Bindings

A lease binding is the mapping of an IP address to a physical address. To clear dynamically allocated lease bindings, use the command:

```
awplus# clear ip dhcp binding {ip <ip-address>|mac <mac-
address>|all|pool <pool-name>|range <low-ip-address>
<high-ip-address>}
```

You have the option to clear either a specific lease binding, specified by IP or MAC address, or to clear several lease bindings at once. The options for clearing multiple lease bindings are:

- **all**, to clear all DHCP bindings
- **pool**, to clear a specific DHCP server address pool
- **range**, to clear a range of DHCP clients

Command List

This chapter provides an alphabetical reference for commands used to configure DHCP. For more information, see **Chapter 92, Dynamic Host Configuration Protocol (DHCP) Introduction**.

For information about modifying or redirecting the output from **show** commands to a file, see **"Controlling "show" Command Output" on page 1.38**.

bootfile

This command sets the boot filename for a DHCP server pool. This is the name of the boot file that the client should use in its bootstrap process. It may need to include a path.

The **no** variant of this command removes the boot filename from a DHCP server pool.

Syntax

```
bootfile <filename>
no bootfile
```

Parameter	Description
<filename>	The boot file name.

Mode DHCP Configuration

Example To configure the boot filename for a pool P2, use the command:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# bootfile boot/main_boot.bt
```

clear ip dhcp binding

This command clears either a specific lease binding or the lease bindings specified by the command. The command will only take effect on dynamically allocated bindings, not statically configured bindings.

Syntax

```
clear ip dhcp binding {ip <ip-address>|mac <mac-address>|all|pool
   <pool-name>|range <low-ip-address> <high-ip-address>}
```

Parameter	Description
`ip <ip-address>`	IPv4 address of the DHCP client, in dotted decimal notation in the format A.B.C.D.
`mac <mac-address>`	MAC address of the DHCP client, in hexadecimal notation in the format HHHH.HHHH.HHHH.
`all`	All DHCP bindings.
`pool <pool-name>`	Description used to identify DHCP server address pool. Valid characters are any printable character. If the name contains spaces then you must enclose these in "quotation marks".
`range <low-ip-address> <high-ip-address>`	IPv4 address range for DHCP clients, in dotted decimal notation. The first IP address is the low end of the range, the second IP address is the high end of the range.

Mode User Exec and Privileged Exec

Usage A specific binding may be deleted by **ip** address or **mac** address, or several bindings may be deleted at once using **all**, **pool** or **range**.

Note that if you specify to clear the **ip** or **mac** address of what is actually a static DHCP binding, an error message is displayed. If **all**, **pool** or **range** are specified and one or more static DHCP bindings exist within those addresses, any dynamic entries within those addresses are cleared but any static entries are not cleared.

Examples To clear the specific IP address binding `192.168.1.1`, use the command:

```
awplus# clear ip dhcp binding ip 192.168.1.1
```

To clear all dynamic DHCP entries, use the command:

```
awplus# clear ip dhcp binding all
```

Related Commands **show ip dhcp binding**

default-router

This command adds a default router to the DHCP address pool you are configuring. You can use this command multiple times to create a list of default routers on the client's subnet. This sets the router details using the pre-defined option 3. Note that if you add a user-defined option 3 using the **option** command, then you will override any settings created with this command.

The **no** variant of this command removes either the specified default router, or all default routers from the DHCP pool.

Syntax

```
default-router <ip-address>
no default-router [<ip-address>]
```

Parameter	Description
<ip-address>	IPv4 address of the default router, in dotted decimal notation.

Mode DHCP Configuration

Examples To add a router with an IP address 192.168.1.2 to the DHCP pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# default-router 192.168.1.2
```

To remove a router with an IP address 192.168.1.2 to the DHCP pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no default-router 192.168.1.2
```

To remove all routers from the DHCP pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no default-router
```

dns-server

This command adds a Domain Name System (DNS) server to the DHCP address pool you are configuring. You can use this command multiple times to create a list of DNS name servers available to the client. This sets the DNS server details using the pre-defined option 6. Note that if you add a user-defined option 6 using the **option** command on page 93.30, then you will override any settings created with this command.

The **no** variant of this command removes either the specified DNS server, or all DNS servers from the DHCP pool.

Syntax

```
dns-server <ip-address>
no dns-server [<ip-address>]
```

Parameter	Description
<ip-address>	IPv4 address of the DNS server, in dotted decimal notation.

Mode DHCP Configuration

Examples To add the DNS server with the assigned IP address 192.168.1.1 to the DHCP pool named P1, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# dns-server 192.168.1.1
```

To remove the DNS server with the assigned IP address 192.168.1.1 from the DHCP pool named P1, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no dns-server 192.168.1.1
```

To remove all DNS servers from the DHCP pool named P1, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no dns-server
```

Related Commands

default-router
option
service dhcp-server
show ip dhcp pool
subnet-mask

domain-name

This command adds a domain name to the DHCP address pool you are configuring. Use this command to specify the domain name that a client should use when resolving host names using the Domain Name System. This sets the domain name details using the pre-defined option 15. Note that if you add a user-defined option 15 using the **option** command on page 93.30, then you will override any settings created with this command.

The **no** variant of this command removes the domain name from the address pool.

Syntax

```
domain-name <domain-name>
no domain-name
```

Parameter	Description
<domain-name>	The domain name you wish to assign the DHCP pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in “quotation marks”.

Mode DHCP Configuration

Examples To add the domain name `Nerv_Office` to DHCP pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# domain-name Nerv_Office
```

To remove the domain name `Nerv_Office` from DHCP pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no domain-name Nerv_Office
```

Related Commands

dns-server
option
service dhcp-server
show ip dhcp pool
subnet-mask

host

This command adds a static host address to the DHCP address pool you are configuring. The client with the matching MAC address is permanently assigned this IP address. No other clients can request it.

The **no** variant of this command removes the specified host address from the DHCP pool. Use the **no host all** command to remove all static host addresses from the DHCP pool.

Syntax

```
host <ip-address> <mac-address>
no host <ip-address>
no host all
```

Parameter	Description
<ip-address>	IPv4 address of the DHCP client, in dotted decimal notation in the format A.B.C.D
<mac-address>	MAC address of the DHCP client, in hexadecimal notation in the format HHHH.HHHH.HHHH

Mode DHCP Configuration

Usage Note that a network/mask must be configured using a **network** command before issuing a **host** command. Also note that a host address must match a network to add a static host address.

Examples To add the host at `192.168.1.5` with the MAC address `000a.451d.6e34` to DHCP pool `1`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool 1
awplus(dhcp-config)# network 192.168.1.0/24
awplus(dhcp-config)# host 192.168.1.5 000a.451d.6e34
```

To remove the host at `192.168.1.5` with the MAC address `000a.451d.6e34` from DHCP pool `1`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool 1
awplus(dhcp-config)# no host 192.168.1.5 000a.451d.6e34
```

Related Commands

range
show ip dhcp pool

ip address dhcp

This command activates the DHCP client on the interface you are configuring. This allows the interface to use the DHCP client to obtain its IP configuration details from a DHCP server on its connected network.

The **client-id** and **hostname** parameters are identifiers that you may want to set in order to interoperate with your existing DHCP infrastructure. If neither option is needed, then the DHCP server uses the MAC address field of the request to identify the host.

The DHCP client supports the following IP configuration options:

- Option 1 - the subnet mask for your device.
- Option 3 - a list of default routers.
- Option 6 - a list of DNS servers. This list appends the DNS servers set on your device with the ip name-server command.
- Option 15 - a domain name used to resolve host names. This option replaces the domain name set with the ip domain-name command. Your device ignores this domain name if it has a domain list set using the ip domain-list command.
- Option 51 - lease expiration time.

The **no** variant of this command stops the interface from obtaining IP configuration details from a DHCP server.

Syntax

```
ip address dhcp [client-id <interface>] [hostname <hostname>]
no ip address dhcp
```

Parameter	Description
<interface>	The name of the interface you are activating the DHCP client on. If you specify this, then the MAC address associated with the specified interface is sent to the DHCP server in the optional identifier field. Default: no default
<hostname>	The hostname for the DHCP client on this interface. Typically this name is provided by the ISP. Default: no default

Mode Interface Configuration for a VLAN interface.

Examples To set the interface `vlan10` to use DHCP to obtain an IP address, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# ip address dhcp
```

To stop the interface `vlan10` from using DHCP to obtain its IP address, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip address dhcp
```

Related Commands **ip address**

Validation Commands **show running-config**
show running-config access-list

ip dhcp bootp ignore

This command configures the DHCP server to ignore any BOOTP requests it receives. The DHCP server accepts BOOTP requests by default.

The **no** variant of this command configures the DHCP server to accept BOOTP requests. This is the default setting.

Syntax

```
ip dhcp bootp ignore
no ip dhcp bootp ignore
```

Mode Global Configuration

Examples To configure the DHCP server to ignore BOOTP requests, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp bootp ignore
```

To configure the DHCP server to respond to BOOTP requests, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp bootp ignore
```

Related Commands show ip dhcp server summary

ip dhcp leasequery enable

Use this command to enable the DHCP server to respond to DHCPLEASEQUERY packets. Enabling the DHCP leasequery feature allows a DHCP Relay Agent to obtain IP address information directly from the DHCP server using DHCPLEASEQUERY messages.

Use the **no** variant of this command to disable the support of DHCPLEASEQUERY packets.

For more information, see **"Enable DHCP Leasequery" on page 92.6**.

Syntax

```
ip dhcp leasequery enable
no ip dhcp leasequery enable
```

Default DHCP leasequery support is disabled by default.

Mode Global Configuration

Examples To enable DHCP leasequery support, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp leasequery enable
```

To disable DHCP leasequery support, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp leasequery enable
```

Related Commands

show counter dhcp-server
show ip dhcp server statistics
show ip dhcp server summary

ip dhcp option

This command creates a user-defined DHCP option. You can then use this option when configuring a DHCP pool, by using the **option** command. Options with the same number as one of the pre-defined options override the standard option definition. The pre-defined options use the option numbers 1, 3, 6, 15, and 51.

The **no** variant of this command removes either the specified user-defined option, or removes all user-defined options. This also automatically removes the user-defined options from the associated DHCP address pools.

Syntax

```
ip dhcp option <1-254> [name <option-name>] [<option-type>]
no ip dhcp option [<1-254>|<option-name>]
```

Parameter	Description	
<1-254>	The option number of the option. Options with the same number as one of the standard options overrides the standard option definition.	
<option-name>	Option name used to identify the option. You cannot use a number as the option name. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks". Default: no default	
<option-type>	The option value. You must specify a value that is appropriate to the option type:	
	`asci`	An ASCII text string
	`hex`	A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.
	`ip`	An IPv4 address or mask that has the dotted decimal A.B.C.D notation. To create a list of IP addresses, you must add each IP address individually by using the option command multiple times.
	`integer`	A number from 0 to 4294967295.
	`flag`	A value that either sets (to 1) or unsets (to 0) a flag: **true**, **on**, or **enabled** will set the flag **false**, **off** or **disabled** will unset the flag.

Mode Global Configuration

Examples To define a user-defined ASCII string option as option 66, without a name, use the command:

```
awplus# configure terminal
awplus(config)# ip dhcp option 66 ascii
```

To define a user-defined hexadecimal string option as option 46, with the name "tcpip-node-type", use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp option 46 name tcpip-node-type hex
```

To define a user-defined IP address option as option 175, with the name `special-address`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp option 175 name special-address ip
```

To remove the specific user-defined option with the option number `12`, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp option 12
```

To remove the specific user-defined option with the option name `perform-router-discovery`, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp option perform-router-discovery
```

To remove all user-defined option definitions, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp option
```

subnet-mask

ip dhcp pool

This command will enter the configuration mode for the pool name specified. If the name specified is not associated with an existing pool, the switch will create a new pool with this name, then enter the configuration mode for the new pool.

Once you have entered the DHCP configuration mode, all commands executed before the next **exit** command will apply to this pool.

You can create multiple DHCP pools on devices with multiple interfaces. This allows the device to act as a DHCP server on multiple interfaces to distribute different information to clients on the different networks.

The **no** variant of this command deletes the specific DHCP pool.

Syntax

```
ip dhcp pool <pool-name>
no ip dhcp pool <pool-name>
```

Parameter	Description
<pool-name>	Description used to identify this DHCP pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in “quotation marks”.

Mode Global Configuration

Example To create the DHCP pool named `P2` and enter DHCP Configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)#
```

To delete the DHCP pool named `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp pool P2
```

Related Commands service dhcp-server

ip dhcp-relay agent-option

This command enables the DHCP Relay Agent to insert the DHCP Relay Agent Information Option (Option 82) into the client-request packets that it relays to its DHCP server. This allows the DHCP Relay Agent to pass on information to the server about the network location of the client device. The DHCP Relay Agent then strips the DHCP Relay Agent Option 82 field out of the DHCP server's response, so that the DHCP client never sees this field.

When the DHCP Relay Agent appends its DHCP Relay Agent Option 82 data into the packet, it first overwrites any pad options present; then if necessary, it increases the packet length to accommodate the DHCP Relay Agent Option 82 data.

The **no** variant of this command stops the DHCP Relay Agent from appending the Option 82 field onto DHCP requests before forwarding it to the server.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see **"DHCP Relay Agent Introduction" on page 92.9**. and **"DHCP Relay Agent Information Option (Option 82)" on page 92.10**

Note

The DHCP-relay service might alter the content of the DHCP Relay Agent Option 82 field, if the commands **ip dhcp-relay agent-option** and **ip dhcp-relay information policy** have been configured.

Syntax

```
ip dhcp-relay agent-option
no ip dhcp-relay agent-option
```

Default DHCP Relay Agent Information Option (Option 82) insertion is disabled by default.

Mode Interface Configuration for a VLAN interface.

Usage Use this command to alter the DHCP Relay Agent Option 82 setting when your switch is the first hop for the DHCP client. To limit the maximum length of the packet, use the **ip dhcp-relay max-message-length** command.

This command cannot be enabled if DHCP snooping is enabled on your switch (**service dhcp-snooping** command on page 83.24), and vice versa.

Examples To make the DHCP Relay Agent listening on `vlan15` append the DHCP Relay Agent Option 82 field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan15
awplus(config-if)# ip dhcp-relay agent-option
```

To stop the DHCP Relay Agent from appending the DHCP Relay Agent Option 82 field on `vlan15`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan15
awplus(config-if)# no ip dhcp-relay agent-option
```

Related Commands

ip dhcp-relay agent-option remote-id
ip dhcp-relay information policy
ip dhcp-relay max-message-length
service dhcp-relay

ip dhcp-relay agent-option checking

This command enables the DHCP Relay Agent to check DHCP Relay Agent Information Option (Option 82) information in response packets returned from DHCP servers. If the information does not match the information it has for its own client (downstream) interface then the DHCP Relay Agent drops the packet. Note that **ip dhcp-relay agent-option** must be configured.

The DHCP Relay Agent Option 82 field is included in relayed client DHCP packets if:

- DHCP Relay Agent Option 82 is enabled (**ip dhcp-relay agent-option**), and
- DHCP Relay Agent is enabled on the switch (**service dhcp-relay**)

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see **"DHCP Relay Agent Introduction" on page 92.9**. and **"DHCP Relay Agent Information Option (Option 82)" on page 92.10**

Syntax

```
ip dhcp-relay agent-option checking
no ip dhcp-relay agent-option checking
```

Mode Interface Configuration for a VLAN interface.

Examples To make the DHCP Relay Agent listening on `vlan10` check the DHCP Relay Agent Information Option (Option 82) field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# ip dhcp-relay agent-option
awplus(config-if)# ip dhcp-relay agent-option checking
```

To stop the DHCP Relay Agent on `vlan10` from checking the DHCP Relay Agent Information Option (Option 82) field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip dhcp-relay agent-option checking
```

Related Commands

ip dhcp-relay agent-option
ip dhcp-relay agent-option remote-id
ip dhcp-relay information policy
service dhcp-relay

ip dhcp-relay agent-option remote-id

Use this command to specify the Remote ID sub-option of the DHCP Relay Agent Option 82 field the DHCP Relay Agent inserts into clients' request packets. The Remote ID identifies the device that is inserting the DHCP Relay Agent Option 82 information. If a Remote ID is not specified, the Remote ID sub-option is set to the switch's MAC address.

Use the **no** variant of this command to return the Remote ID for an interface.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see **"DHCP Relay Agent Introduction" on page 92.9**. and **"DHCP Relay Agent Information Option (Option 82)" on page 92.10**

Syntax

```
ip dhcp-relay agent-option remote-id <remote-id>
no ip dhcp-relay agent-option remote-id
```

Parameter	Description
<remote-id>	An alphanumeric (ASCII) string, 1 to 63 characters in length. Additional characters allowed are hyphen (-), underscore (_) and hash (#). Spaces are not allowed.

Default The Remote ID is set to the switch's MAC address by default.

Mode Interface Configuration for a VLAN interface.

Usage The Remote ID sub-option is included in the DHCP Relay Agent Option 82 field of relayed client DHCP packets if:

- DHCP Relay Agent Option 82 is enabled (**ip dhcp-relay agent-option**), and
- DHCP Relay Agent is enabled on the switch (**service dhcp-relay**)

Examples To set the Remote ID to `myid` for client DHCP packets received on `vlan1`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip dhcp-relay agent-option remote-id myid
```

To remove the Remote ID specified for `vlan1`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# no ip dhcp-relay agent-option remote-id
```

Related Commands

ip dhcp-relay agent-option
ip dhcp-relay agent-option checking
show ip dhcp-relay

ip dhcp-relay information policy

This command sets the policy for how the DHCP relay deals with packets arriving from the client that contain DHCP Relay Agent Option 82 information.

If the command **ip dhcp-relay agent-option** has not been configured, then this command has no effect at all - no alteration is made to Option 82 information in packets arriving from the client side.

However, if the command **ip dhcp-relay agent-option** has been configured, this command modifies how the DHCP relay service deals with cases where the packet arriving from the client side already contains DHCP Relay Agent Option 82 information.

This command sets the action that the DHCP relay should take when a received DHCP client request contains DHCP Relay Agent Option 82 information.

By default, the DHCP Relay Agent replaces any existing DHCP Relay Agent Option 82 field with its own DHCP Relay Agent field. This is equivalent to the functionality of the **replace** parameter.

The **no** variant of this command returns the policy to the default behavior - i.e. replacing the existing DHCP Relay Agent Option 82 field.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see **"DHCP Relay Agent Introduction" on page 92.9**. and **"DHCP Relay Agent Information Option (Option 82)" on page 92.10**

Note

The DHCP-relay service might alter the content of the DHCP Relay Agent Option 82 field, if the commands **ip dhcp-relay agent-option** and **ip dhcp-relay information policy** have been configured.

Syntax

```
ip dhcp-relay information policy [append|drop|keep|replace]

no ip dhcp-relay information policy
```

Parameter	Description
`append`	The DHCP Relay Agent appends the DHCP Relay Agent Option 82 field of the packet with its own DHCP Relay Agent Option 82 details.
`drop`	The DHCP Relay Agent discards the packet.
`keep`	The DHCP Relay Agent forwards the packet without altering the DHCP Relay Agent Option 82 field.
`replace`	The DHCP Relay Agent replaces the existing DHCP Relay Agent details in the DHCP Relay Agent Option 82 field with its own details before forwarding the packet.

Mode Interface Configuration for a VLAN interface.

Examples To make the DHCP Relay Agent listening on `vlan15` drop any client requests that already contain DHCP Relay Agent Option 82 information, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan15
awplus(config-if)# ip dhcp-relay information policy drop
```

To reset the DHCP relay information policy to the default policy for interface `vlan15`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan15
awplus(config-if)# no ip dhcp-relay information policy
```

Related Commands

ip dhcp-relay agent-option
ip dhcp-relay agent-option checking
service dhcp-server

ip dhcp-relay maxhops

This command sets the hop count threshold for discarding BOOTP messages. When the hops field in a BOOTP message exceeds the threshold, the DHCP Relay Agent discards the BOOTP message. The hop count threshold is set to 10 hops by default.

Use the **no** variant of this command negation command to reset the hop count to the default.

For DHCP Relay Agent introductory information, see **"DHCP Relay Agent Introduction" on page 92.9**. For Option 82 introductory information, see **"DHCP Relay Agent Information Option (Option 82)" on page 92.10**.

Syntax

```
ip dhcp-relay maxhops <1-255>
no ip dhcp-relay maxhops
```

Parameter	Description
<1-255>	The maximum hop count value.

Default The default hop count threshold is 10 hops.

Mode Interface Configuration for a VLAN interface.

Example To set the maximum number of hops to 5 for packets received on interface `vlan15`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan15
awplus(config-if)# ip dhcp-relay maxhops 5
```

Related Commands **service dhcp-relay**

ip dhcp-relay max-message-length

This command applies when the switch is acting as a DHCP Relay Agent and DHCP Relay Agent Option 82 insertion is enabled. It sets the maximum DHCP message length (in bytes) for the DHCP packet with its DHCP Relay Agent Option 82 data inserted. From this value it calculates the maximum packet size that it will accept at its input. Packets that arrive greater than this value will be dropped.

The **no** variant of this command sets the maximum message length to its default of 1400 bytes.

For DHCP Relay Agent introductory information, see **"DHCP Relay Agent Introduction" on page 92.9**. For Option 82 introductory information, see **"DHCP Relay Agent Information Option (Option 82)" on page 92.10**.

Syntax

```
ip dhcp-relay max-message-length <548-1472>

no ip dhcp-relay max-message-length
```

Parameter	Description
<548-1472>	The maximum DHCP message length (this is the message header plus the inserted DHCP option fields in bytes).

Default The default is 1400 bytes.

Mode Interface Configuration for a VLAN interface.

Usage Where a DHCP Relay Agent (that has DHCP Relay Agent Option 82 insertion enabled) receives a *request* packet from a DHCP client, it will append the DHCP Relay Agent Option 82 component data, and forward the packet to the DHCP server. The DHCP client will sometimes issue packets containing pad option fields that can be overwritten with Option 82 data.

Where there are insufficient pad option fields to contain all the DHCP Relay Agent Option 82 data, the DHCP Relay Agent will increase the packet size to accommodate the DHCP Relay Agent Option 82 data. If the new (increased) packet size exceeds that defined by the **maximum-message-length** parameter, then the DHCP Relay Agent will drop the packet.

Note

Before setting this command, you must first run the **ip dhcp-relay agent-option** command on page 93.15. This will allow the DHCP Relay Agent Option 82 fields to be appended.

Example To set the maximum DHCP message length to 1200 bytes for packets arriving in interface `vlan7`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan7
awplus(config-if)# ip dhcp-relay max-message-length 1200
```

To reset the maximum DHCP message length to the default of 1400 bytes for packets arriving in interface `vlan7`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan7
awplus(config-if)# no ip dhcp-relay max-message-length
```

Related Commands **service dhcp-relay**

ip dhcp-relay server-address

This command adds a DHCP server for the DHCP Relay Agent to forward client DHCP packets to on a particular interface. You can add up to five DHCP servers on each device interface that the DHCP Relay Agent is listening on.

The **no** variant of this command deletes the specified DHCP server from the list of servers available to the DHCP relay agent.

For DHCP Relay Agent introductory information, see **"DHCP Relay Agent Introduction" on page 92.9**. For Option 82 introductory information, see **"DHCP Relay Agent Information Option (Option 82)" on page 92.10**.

Syntax

```
ip dhcp-relay server-address {<ipv4-address>|
    <ipv6-address> <server-interface>}

no ip dhcp-relay server-address {<ipv4-address>|
    <ipv6-address> <server-interface>}
```

Parameter	Description
<ipv4-address>	Specify the IPv4 address of the DHCP server for DHCP Relay Agent to forward client DHCP packets to, in dotted decimal notation. The IPv4 address uses the format A.B.C.D.
<ipv6-address>	Specify the IPv6 address of the DHCPv6 server for DHCPv6 Relay Agent to forward client DHCP packets to, in hexadecimal notation.
<server-interface>	Specify the interface name of the DHCPv6 server. The interface name for the DHCPv6 server is only required for a DHCPv6 server with an IPv6 address not an IPv4 address.

Mode Interface Configuration for a VLAN interface.

Usage For a DHCP server with an IPv6 address you must specify the interface for the DHCP server. See examples below for configuration differences between IPv4 and IPv6 DHCP relay servers.

See also the **service dhcp-relay** command to enable the DHCP Relay Agent on your device. The **ip dhcp-relay server-address** command defines a relay destination on an interface on the device, needed before the DHCP Relay Agent relays DHCP client packets to a DHCP server.

Examples To enable the DHCP Relay Agent to relay DHCP packets on interface `vlan2` to the DHCP server with the IPv4 address `192.0.2.200`, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay server-address 192.0.2.200
```

To remove the DHCP server with the IPv4 address `192.0.2.200` from the list of servers available to the DHCP Relay Agent on interface `vlan2`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay server-address 192.0.2.200
```

To enable the DHCP Relay Agent on your device to relay DHCP packets on interface `vlan10` to the DHCP server with the IPv6 address `2001:0db8:010d::1` on interface `vlan20`, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
awplus(config)# interface vlan10
                2001:0db8:010d::1 vlan20
awplus(config-if)# ip dhcp-relay server-address
```

To remove the DHCP server with the IPv6 address `2001:0db8:010d::1` on interface `vlan20` from the list of servers available to the DHCP Relay Agent on interface `vlan10`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip dhcp-relay server-address
                   2001:0db8:010d::1 vlan20
```

lease

This command sets the expiration time for a leased address for the DHCP address pool you are configuring. The time set by the days, hours, minutes and seconds is cumulative. The minimum total lease time that can be configured is 20 seconds. The maximum total lease time that can be configured is 120 days.

Note that if you add a user-defined option 51 using the **option** command, then you will override any settings created with this command. Option 51 specifies a lease time of 1 day.

Use the **infinite** parameter to set the lease expiry time to infinite (leases never expire).

Use the **no** variant of this command to return the lease expiration time back to the default of one day.

Syntax

```
lease <days> <hours> <minutes> [<seconds>]
lease infinite
no lease
```

Parameter	Description
<days>	The number of days, from 0 to 120, that the lease expiry time is configured for. Default: 1
<hours>	The number of hours, from 0 to 24, that the lease expiry time is configured for. Default: 0
<minutes>	The number of minutes, from 0 to 60, the lease expiry time is configured for. Default: 0
<seconds>	The number of seconds, from 0 to 60, the lease expiry time is configured for.
`infinite`	The lease never expires.

Default The default lease time is 1 day.

Mode DHCP Configuration

Examples To set the lease expiration time for address pool `P2` to 35 minutes, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# lease 0 0 35
```

To set the lease expiration time for the address pool `Nerv_Office` to 1 day, 5 hours, and 30 minutes, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool Nerv_Office
awplus(dhcp-config)# lease 1 5 30
```

To set the lease expiration time for the address pool `P3` to 20 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P3
awplus(dhcp-config)# lease 0 0 0 20
```

To set the lease expiration time for the pool to never expire, use the command:

```
awplus(dhcp-config)# lease infinite
```

To return the lease expiration time to the default of one day, use the command:

```
awplus(dhcp-config)# no lease
```

Related Commands

option
service dhcp-server

network (DHCP)

This command sets the network (subnet) that the DHCP address pool applies to.

The **no** variant of this command removes the network (subnet) from the DHCP address pool.

Syntax

```
network {<ip-subnet-address/prefix-length>|<ip-subnet-address/mask>}
no network
```

Parameter	Description
<ip-subnet-address/prefix-length>	The IPv4 subnet address in dotted decimal notation followed by the prefix length in slash notation.
<ip-subnet-address/mask>	The IPv4 subnet address in dotted decimal notation followed by the subnet mask in dotted decimal notation.

Mode DHCP Configuration

Usage This command will fail if it would make existing ranges invalid. For example, if they do not lie within the new network you are configuring.

The **no** variant of this command will fail if ranges still exist in the pool. You must remove all ranges in the pool before issuing a **no network** command to remove a network from the pool.

Examples To configure a network for the address pool `P2`, where the subnet is `192.0.2.5` and the mask is `255.255.255.0`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# network 192.0.2.5/24
```

or you can use dotted decimal notation instead of slash notation for the subnet-mask:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# network 192.0.2.5 255.255.255.0
```

Related Commands **service dhcp-server**
subnet-mask

next-server

This command sets the next server address for a DHCP server pool. It is the address of the next server that the client should use in its bootstrap process.

The **no** variant of this command removes the next server address from the DHCP address pool.

Syntax

```
next-server <ip-address>
no next-server
```

Parameter	Description
<ip-address>	The server IP address, entered in dotted decimal notation.

Mode DHCP Configuration

Example To set the next-server address for the address pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# next-server 192.0.2.2
```

option

This command adds a user-defined option to the DHCP address pool you are configuring. For the **hex**, **integer**, and **flag** option types, if the option already exists, the new option overwrites the existing option's value. Options with an **ip** type can hold a list of IP addresses or masks (i.e. entries that have the A.B.C.D address format), so if the option already exists in the pool, then the new IP address is added to the list of existing IP addresses.

Options with the same number as one of the pre-defined options override the standard option definition. The pre-defined options use the option numbers 1, 3, 6, 15, and 51.

The **no** variant of this command removes the specified user-defined option from the DHCP pool, or all user-defined options from the DHCP pool.

Syntax

```
option [<1-254>|<option-name>] <option-value>
no option [<1-254>|<option-value>]
```

Parameter	Description	
<1-254>	The option number of the option. Options with the same number as one of the standard options overrides the standard option definition.	
<option-name>	Option name associated with the option.	
<option-value>	The option value. You must specify a value that is appropriate to the option type:	
	`hex`	A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.
	`ip`	An IPv4 address or mask that has the dotted decimal A.B.C.D notation. To create a list of IP addresses, you must add each IP address individually using the option command multiple times.
	`integer`	A number from 0 to 4294967295.
	`flag`	A value of either true, on, or enabled to set the flag, or false, off or disabled to unset the flag.

Mode DHCP Configuration

Examples To add the ASCII-type option named `tftp-server-name` to the pool `P2` and give the option the value `server1`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# option tftp-server-name server1
```

To add the hex-type option named `tcpip-node-type` to the pool `P2` and give the option the value `08af`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# option tcpip-node-type 08af
```

To add multiple IP addresses for the ip-type option `175`, use the command:

```
awplus(dhcp-config)# option 175 192.0.2.6
awplus(dhcp-config)# option 175 192.0.2.12
awplus(dhcp-config)# option 175 192.0.2.33
```

To add the option `179` to a pool, and give the option the value `123456`, use the command:

```
awplus(dhcp-config)# option 179 123456
```

To add a user-defined flag option with the name `perform-router-discovery`, use the command:

```
awplus(dhcp-config)# option perform-router-discovery yes
```

To clear all user-defined options from a DHCP address pool, use the command:

```
awplus(dhcp-config)# no option
```

To clear a user-defined option, named `tftp-server-name`, use the command:

```
awplus(dhcp-config)# no option tftp-server-name
```

Related Commands

dns-server
ip dhcp option
lease
service dhcp-server
show ip dhcp pool

probe enable

Use this command to enable lease probing for a DHCP pool. Probing is used by the DHCP server to check if an IP address it wants to lease to a client is already being used by another host.

The **no** variant of this command disables probing for a DHCP pool.

Syntax

```
probe enable
no probe enable
```

Default Probing is enabled by default.

Mode DHCP Pool Configuration

Examples To enable probing for pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# probe enable
```

To disable probing for pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no probe enable
```

Related Commands

ip dhcp pool
probe packets
probe timeout
probe type
show ip dhcp pool

probe packets

Use this command to specify the number of packets sent for each lease probe. Lease probing is configured on a per-DHCP pool basis. When set to 0 probing is effectively disabled.

The **no** variant of this command sets the number of probe packets sent to the default of 5.

Syntax

```
probe packets <0-10>
no probe packets
```

Parameter	Description
<0-10>	The number of probe packets sent.

Default The default is 5.

Mode DHCP Pool Configuration

Examples To set the number of probe packets to 2 for pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# probe packets 2
```

To set the number of probe packets to the default 5 for pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no probe packets
```

Related Commands

probe enable
probe timeout
probe type
show ip dhcp pool

probe timeout

Use this command to set the timeout value in milliseconds that the server waits for a response after each probe packet is sent. Lease probing is configured on a per-DHCP pool basis.

The **no** variant of this command sets the probe timeout value to the default setting, 200 milliseconds.

Syntax

```
probe timeout <50-5000>

no probe timeout
```

Parameter	Description
<50-5000>	Timeout interval in milliseconds.

Default The default timeout interval is 200 milliseconds.

Mode DHCP Pool Configuration

Examples To set the probe timeout value to 500 milliseconds for pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# probe timeout 500
```

To set the probe timeout value for pool `P2` to the default, 200 milliseconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no probe timeout
```

Related Commands

probe enable
probe packets
probe type
show ip dhcp pool

probe type

Use this command to set the probe type for a DHCP pool. The probe type specifies how the DHCP server checks whether an IP address is being used by other hosts, referred to as lease probing. If **arp** is specified, the server sends an ARP request to determine if an address is in use. If **ping** is specified, the server will send an ICMP Echo Request (ping).

The **no** variant of this command sets the probe type to the default setting, ping.

Syntax

```
probe type {arp|ping}
no probe type
```

Parameter	Description
arp	Probe using ARP.
ping	Probe using ping.

Default The default probe type is ping.

Mode DHCP Pool Configuration

Examples To set the probe type to `arp` for the pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# probe type arp
```

To set the probe type for the pool `P2` to the default, `ping`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no probe type
```

Related Commands

ip dhcp pool
probe enable
probe packets
probe timeout
show ip dhcp pool

range

This command adds an address range to the DHCP address pool you are configuring. The DHCP server responds to client requests received from the pool's network. It assigns an IP addresses within the specified range. The IP address range must lie within the network. You can add multiple address ranges and individual IP addresses for a DHCP pool by using this command multiple times.

The **no** variant of this command removes an address range from the DHCP pool. Use the **no range all** command to remove all address ranges from the DHCP pool.

Syntax

```
range <ip-address> [<ip-address>]
no range <ip-address> [<ip-address>]
no range all
```

Parameter	Description
<ip-address>	IPv4 address range for DHCP clients, in dotted decimal notation. The first IP address is the low end of the range, the second IP address is the high end. Specify only one IP address to add an individual IP address to the address pool.

Mode DHCP Configuration

Examples To add an address range of `192.0.2.5` to `192.0.2.16` to the pool `Nerv_Office`, use the command:

```
awplus# configure terminal
awplus(config)# ip dhcp pool Nerv_Office
awplus(dhcp-config)# range 192.0.2.5 192.0.2.16
```

To add the individual IP address `192.0.2.2` to a pool, use the command:

```
awplus(dhcp-config)# range 192.0.2.2
```

To remove all address ranges from a pool, use the command:

```
awplus(dhcp-config)# no range all
```

Related Commands
ip dhcp pool
service dhcp-server
show ip dhcp pool

route

This command allows the DHCP server to provide static routes to clients.

Syntax `route A.B.C.D/M A.B.C.D {both|opt249|rfc3442}`

Parameter	Description
`A.B.C.D/M`	Subnet for the route
`A.B.C.D`	Next hop for the route
`both`	opt249 and rft3442
`opt249`	Classless static route option for DHCP
`rfc3442`	Classless static route option for DHCP

Mode DHCP Configuration

Examples To distribute static routes for route `0.0.0.0/0` whose next hop is `192.16.1.1` to clients using both `opt249` and `rfc3442`, use the command:

```
awplus# configure terminal
awplus(config)# ip dhcp pool pubic
awplus(dhcp-config)# route 0.0.0.0/0 192.16.1.1 both
```

Related Commands **ip dhcp pool**

service dhcp-relay

This command enables the DHCP Relay Agent on the device. However, on a given IP interface, no DHCP forwarding takes place until at least one DHCP server is specified to forward/relay all clients' DHCP packets to.

The **no** variant of this command disables the DHCP Relay Agent on the device for all interfaces.

Syntax

```
service dhcp-relay
no service dhcp-relay
```

Mode Global Configuration

Usage A maximum number of 400 DHCP Relay Agents (one per interface) can be configured on the device. Once this limit has been reached, any further attempts to configure DHCP Relay Agents will not be successful.

Default The DHCP-relay service is enabled by default.

Examples To enable the DHCP relay global function, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
```

To disable the DHCP relay global function, use the commands:

```
awplus# configure terminal
awplus(config)# no service dhcp-relay
```

Related Commands

ip dhcp-relay agent-option
ip dhcp-relay agent-option checking
ip dhcp-relay information policy
ip dhcp-relay maxhops
ip dhcp-relay server-address

service dhcp-server

This command enables the DHCP server on your device. The server then listens for DHCP requests on all IP interfaces. It will not run if there are no IP interfaces configured.

The **no** variant of this command disables the DHCP server.

Syntax

```
service dhcp-server
no service dhcp-server
```

Mode Global Configuration

Example To enable the DHCP server, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-server
```

Related Commands

ip dhcp pool
show ip dhcp server summary
subnet-mask

show counter dhcp-client

This command shows counters for the DHCP client on your device.

For information on output options, see "Controlling "show" Command Output" on page 1.38.

Syntax `show counter dhcp-client`

Mode User Exec and Privileged Exec

Example To display the message counters for the DHCP client on your device, use the command:

```
awplus# show counter dhcp-client
```

Output **Figure 93-1: Example output from the show counter dhcp-client command**

```
show counter dhcp-client

DHCPDISCOVER out      ......... 10
DHCPREQUEST out       ......... 34
DHCPDECLINE out       ......... 4
DHCPRELEASE out       ......... 0
DHCPOFFER in          ......... 22
DHCPACK in            ......... 18
DHCPNAK in            ......... 0
```

Table 93-1: Parameters in the output of the show counter dhcp-client command

Parameter	Description
DHCPDISCOVER out	The number of DHCP Discover messages sent by the client.
DHCPREQUEST out	The number of DHCP Request messages sent by the client.
DHCPDECLINE out	The number of DHCP Decline messages sent by the client.
DHCPRELEASE out	The number of DHCP Release messages sent by the client.
DHCPOFFER in	The number of DHCP Offer messages received by the client.
DHCPACK in	The number of DHCP Acknowledgement messages received by the client.
DHCPNAK in	The number of DHCP Negative Acknowledgement messages received by the client.

Related Commands ip address dhcp

show counter dhcp-relay

This command shows counters for the DHCP Relay Agent on your device.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show counter dhcp-relay
```

Syntax (VRF Lite)

```
show counter dhcp-relay [vrf <vrf-name>|global]
```

Parameter	Description
`vrf`	Display the output for a VRF Lite instance
`<vrf-name>`	The name of the specific VRF Lite instance.
`global`	Display the output for the Global VRF Lite instance

Mode User Exec and Privileged Exec

Examples To display counters for the DHCP Relay Agent on your device, use the following command:

```
awplus# show counter dhcp-relay
```

Output **Figure 93-2: Example output from the show counter dhcp-relay command**

```
awplus#show counter dhcp-relay

DHCP relay counters

Missing Agent Option ............ 0
Bad Circuit ID .................. 0
Missing Circuit ID .............. 0
Option Insert Failed ............ 0
```

Table 93-2: Parameters in the output of the show counter dhcp-relay command

Parameter	Description
`Requests In`	The number of DHCP Request messages received from clients.
`Replies In`	The number of DHCP Reply messages received from servers.
`Relayed To Server`	The number of DHCP Request messages relayed to servers.
`Relayed To Client`	The number of DHCP Reply messages relayed to clients.
`Out To Server Failed`	The number of failures when attempting to send request messages to servers. This is an internal debugging counter.
`Out To Client Failed`	The number of failures when attempting to send reply messages to clients. This is an internal debugging counter.
`Invalid hlen`	The number of incoming messages dropped due to an invalid hlen field.
`Bogus giaddr`	The number of incoming DHCP Reply messages dropped due to the bogus giaddr field.
`Corrupt Agent Option`	The number of incoming DHCP Reply messages dropped due to a corrupt relay agent information option field. Note that Agent Option counters only increment on errors occurring if the **ip dhcp-relay agent-option** command is configured for an interface. Messages generating the errors are only dropped if the **ip dhcp-relay agent-option checking** command is configured on the interface as well as the **ip dhcp-relay agent-option** command.
`Missing Agent Option`	The number of incoming DHCP Reply messages dropped due to a missing relay agent information option field. Note that Agent Option counters only increment on errors occurring if the **ip dhcp-relay agent-option** command is configured for an interface. Messages generating the errors are only dropped if the **ip dhcp-relay agent-option checking** command is configured on the interface as well as the **ip dhcp-relay agent-option** command.

Table 93-2: Parameters in the output of the show counter dhcp-relay

Parameter	Description
`Bad Circuit ID`	The number of incoming DHCP Reply messages dropped due to a bad circuit ID. Note that Agent Option counters only increment on errors occurring if the **ip dhcp-relay agent-option** command is configured for an interface. Messages generating the errors are only dropped if the **ip dhcp-relay agent-option checking** command is configured on the interface as well as the **ip dhcp-relay agent-option** command
`Missing Circuit ID`	The number of incoming DHCP Reply messages dropped due to a missing circuit ID. Note that Agent Option counters only increment on errors occurring if the **ip dhcp-relay agent-option** command is configured for an interface. Messages generating the errors are only dropped if the **ip dhcp-relay agent-option checking** command is configured on the interface as well as the **ip dhcp-relay agent-option** command
`Bad Remote ID`	The number of incoming DHCP Reply messages dropped due to a bad remote ID. Note that Agent Option counters only increment on errors occurring if the **ip dhcp-relay agent-option** command is configured for an interface. Messages generating the errors are only dropped if the **ip dhcp-relay agent-option checking** command is configured on the interface as well as the **ip dhcp-relay agent-option** command
`Missing Remote ID`	The number of incoming DHCP Reply messages dropped due to a missing remote ID. Note that Agent Option counters only increment on errors occurring if the **ip dhcp-relay agent-option** command is configured for an interface. Messages generating the errors are only dropped if the **ip dhcp-relay agent-option checking** command is configured on the interface as well as the **ip dhcp-relay agent-option** command
`Option Insert Failed`	The number of incoming DHCP Request messages dropped due to an error adding the DHCP Relay Agent information (option-82). This counter increments when: ■ the DHCP Relay Agent is set to drop packets with the DHCP Relay Agent Option 82 field already filled by another DHCP Relay Agent. This policy is set with the **ip dhcp-relay information policy** command. ■ there is a packet error that stops the DHCP Relay Agent from being able to append the packet with its DHCP Relay Agent Information Option (Option 82) field.
`Note that the following parameters are only used on the Global VRF Lite instance when DHCPv6 is running`	
`DHCPv6 Requests In`	The number of incoming DHCPv6 Request messages.
`DHCPv6 Replies In`	The number of incoming DHCPv6 Reply messages.
`DHCPv6 Relayed to Server`	The number of DHCPv6 messages relayed to the server.
`DHCPv6 Relayed to Client`	The number of DHCPv6 messages relayed to the client.

show counter dhcp-server

This command shows counters for the DHCP server on your device.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show counter dhcp-server`

Mode User Exec and Privileged Exec

Example To display counters for the DHCP server on your device, use the command:

```
awplus# show counter dhcp-server
```

Output Figure 93-4: Example output from the **show counter dhcp-server** command

```
DHCP server counters
DHCPDISCOVER in       ......... 20
DHCPREQUEST in        ......... 12
DHCPDECLINE in        ......... 1
DHCPRELEASE in        ......... 0
DHCPINFORM in         ......... 0
DHCPOFFER out         ......... 8
DHCPACK out           ......... 4
DHCPNAK out           ......... 0
BOOTREQUEST in        ......... 0
BOOTREPLY out         ......... 0
```

Table 93-3: Parameters in the output of the **show counter dhcp-server** command

Parameter	Description
`DHCPDISCOVER in`	The number of Discover messages received by the DHCP server.
`DHCPREQUEST in`	The number of Request messages received by the DHCP server.
`DHCPDECLINE in`	The number of Decline messages received by the DHCP server.
`DHCPRELEASE in`	The number of Release messages received by the DHCP server.
`DHCPINFORM in`	The number of Inform messages received by the DHCP server.
`DHCPOFFER out`	The number of Offer messages sent by the DHCP server.
`DHCPACK out`	The number of Acknowledgement messages sent by the DHCP server.
`DHCPNAK out`	The number of Negative Acknowledgement messages sent by the DHCP server. The server sends these after receiving a request that it cannot fulfil because either there are no available IP addresses in the related address pool, or the request has come from a client that doesn't fit the network setting for an address pool.
`BOOTREQUEST in`	The number of bootp messages received by the DHCP server from bootp clients.
`BOOTREPLY out`	The number of bootp messages sent by the DHCP server to bootp clients.

show dhcp lease

This command shows details about the leases that the DHCP client has acquired from a DHCP server for interfaces on the device.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show dhcp lease [<interface>]`

Parameter	Description
<interface>	Interface name to display DHCP lease details for.

Mode User Exec and Privileged Exec

Example To show the current lease expiry times for all interfaces, use the command:

```
awplus# show dhcp lease
```

To show the current lease for vlan1, use the command:

```
awplus# show dhcp lease vlan1
```

Output **Figure 93-5: Example output from the show dhcp lease command**

```
Interface vlan1
-----------------------------------------------------------------
IP Address:                   192.168.22.4

Related Commands **ip address dhcp**

show ip dhcp binding

This command shows the lease bindings that the DHCP server has allocated clients.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show ip dhcp binding [<ip-address>|<address-pool>]`

Parameter	Description
<ip-address>	IPv4 address of a leased IP address, in dotted decimal notation. This displays the lease information for the specified IP address.
<address-pool>	Name of an address pool. This displays the lease information for all clients within the address pool.

Mode User Exec and Privileged Exec

Examples To display all leases for every client in all address pools, use the command:

```
awplus# show ip dhcp binding
```

To display the details for the leased IP address `172.16.2.16`, use the command:

```
awplus# show ip dhcp binding 172.16.2.16
```

To display the leases from the address pool `MyPool`, use the command:

```
awplus# show ip dhcp binding MyPool
```

Output **Figure 93-6: Example output from the show ip dhcp binding command**

```
Pool 30_2_network Network 172.16.2.0/24

show ip dhcp pool

This command displays the configuration details and system usage of the DHCP address pools configured on the device.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show ip dhcp pool [<address-pool>]`

Parameter	Description
<address-pool>	Name of a specific address pool. This displays the configuration of the specified address pool only.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip dhcp pool
```

Output **Figure 93-7: Example output from the show ip dhcp pool command**

```
Pool p1 :
  network: 192.168.1.0/24
  address ranges:
    addr: 192.168.1.10 to 192.168.1.18
  static host addresses:
    addr: 192.168.1.12     MAC addr: 1111.2222.3333
  lease <days:hours:minutes:seconds> <1:0:0:0>
  subnet mask: 255.255.255.0 (pool's network mask)
  Probe:                      Default Values
    Status:       Enabled     [Enabled]
    Type:         ARP         [Ping]
    Packets:      2           [5]
    Timeout:      200 msecs   [200]
  Dynamic addresses:
    Total:        8
    Leased:       2
    Utilization:  25.0 %
  Static host addresses:
    Total:        1
    Leased:       1
```

Output

Figure 93-8: Example output from the show ip dhcp pool command with IP address 192.168.1.12 assigned to a VLAN interface on the device:

```
Pool p1 :
  network: 192.168.1.0/24
  address ranges:
    addr: 192.168.1.10 to 192.168.1.18
            (interface addr 192.168.1.12 excluded)
            (static host addr 192.168.1.12 excluded)
  static host addresses:
    addr: 192.168.1.12     MAC addr: 1111.2222.3333
            (= interface addr, so excluded)
  lease <days:hours:minutes:seconds> <1:0:0:0>
  subnet mask: 255.255.255.0 (pool's network mask)
  Probe:                        Default Values
    Status:       Enabled       [Enabled]
    Type:         ARP           [Ping]
    Packets:      2             [5]
    Timeout:      200 msecs     [200]
  Dynamic addresses:
    Total:        8
    Leased:       2
    Utilization:  25.0 %
  Static host addresses:
    Total:        1
    Leased:       1
```

Table 93-4: Parameters in the output of the show ip dhcp pool command

Parameter	Description
`Pool`	Name of the pool.
`network`	Subnet and mask length of the pool.
`address ranges`	Individual IP addresses and address ranges configured for the pool. The DHCP server can offer clients an IP address from within the specified ranges only. Any of these addresses that match an interface address on the device, or a static host address configured in the pool, will be automatically excluded from the range, and a message to this effect will appear beneath the range entry.
`static host addresses`	The static host addresses configured on the pool. Each IP address is permanently assigned to the client with the matching MAC address. Any of these addresses that match an interface address on the device will be automatically excluded, and a message to this effect will appear beneath the static host entry.
`lease <days:hours:minutes>`	The lease duration for address allocated by this pool.
`domain`	The domain name sent by the pool to clients. This is the domain name that the client should use when resolving host names using DNS.
`subnet mask`	The subnet mask sent by the pool to clients.
`Probe - Status`	Whether lease probing is enabled or disabled.
`Probe - Type`	The lease probe type configured. Either ping or ARP.
`Probe - Packets`	The number of packets sent for each lease probe in the range 0 to 10.

Table 93-4: Parameters in the output of the show ip dhcp pool command(cont.)

Parameter	Description
`Probe - Timeout`	The timeout value in milliseconds to wait for a response after each probe packet is sent. In the range 50 to 5000.
`dns servers`	The DNS server addresses sent to by the pool to clients.
`default-router(s)`	The default router addresses sent by the pool to clients.
`user-defined options`	The list of user-defined options sent by the pool to clients.
`Dynamic addresses - Total`	The total number of IP addresses that have been configured in the pool for dynamic allocation to DHCP clients.
`Dynamic addresses - Leased`	The number of IP addresses in the pool that have been dynamically allocated (leased) to DHCP clients.
`Dynamic addresses - Utilization`	The percentage of IP addresses in the pool that are currently dynamically allocated to clients.
`Static host addresses - Total`	The number of static IP addresses configured in the pool for specific DHCP client hosts.
`Static host addresses - Leased`	The number of static IP addresses assigned to specific DHCP client hosts.

show ip dhcp-relay

This command shows the configuration of the DHCP Relay Agent on each interface.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show ip dhcp-relay [interface <interface-name>]
show ip dhcp-relay [vrf <name>|global] [interface<ifname>]
```

Parameter	Description
<interface-name>	Name of a specific interface. This displays the DHCP configuration for the specified interface only.
`vrf`	Apply this command to a VRF Lite instance.
<vrf-name>	The name of the VRF Lite instance.
global	The Global VRF Lite Instance.

Mode User Exec and Privileged Exec

Example To display the DHCP Relay Agent's configuration on the interface `vlan100`, use the command:

```
awplus# show ip dhcp-relay interface vlan100
```

Output **Figure 93-9: Example output from the show ip dhcp-relay command**

```
DHCP Relay Service is enabled

vlan100 is up, line protocol is up
Maximum hop count is 10
Insertion of Relay Agent Option is disabled
Checking of Relay Agent Option is disabled
The Remote Id string for Relay Agent Option is 0000.cd28.074c
Relay information policy is to append new relay agent
information
List of servers :   192.168.1.200
```

Output **Figure 93-10: Example output from the show ip dhcp-relay command applied for VRF Lite instance red**

```
DHCP Relay Service is enabled

[VRF: red]
vlan2 is up, line protocol is up
Maximum hop count is 10
Maximum DHCP message length is 1400
Insertion of Relay Agent Option is enabled
Checking of Relay Agent Option is disabled
The Remote Id string for Relay Agent Option is 0000.cd28.074c
Relay Information policy is to replace existing relay agent
information
List of servers :   192.168.1.3
```

show ip dhcp server statistics

This command shows statistics related to the DHCP server.

You can display the server counters using the **show counter dhcp-server** command as well as with this command.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show ip dhcp server statistics`

Mode User Exec and Privileged Exec

Example To display the server statistics, use the command:

```
awplus# show ip dhcp server statistics
```

Output **Figure 93-11: Example output from the show counter dhcp server statistics command**

```
DHCP server counters
DHCPDISCOVER in        ......... 20
DHCPREQUEST in         ......... 12
DHCPDECLINE in         ......... 1
DHCPRELEASE in         ......... 0
DHCPINFORM in          ......... 0

```

Figure 93-12: Parameters in the output of the show counter dhcp server statistics command

Parameter	Description
`DHCPDISCOVER in`	The number of Discover messages received by the DHCP server.
`DHCPREQUEST in`	The number of Request messages received by the DHCP server.
`DHCPDECLINE in`	The number of Decline messages received by the DHCP server.
`DHCPRELEASE in`	The number of Release messages received by the DHCP server.
`DHCPINFORM in`	The number of Inform messages received by the DHCP server.
`DHCPOFFER out`	The number of Offer messages sent by the DHCP server.
`DHCPACK out`	The number of Acknowledgement messages sent by the DHCP server.

Figure 93-12: Parameters in the output of the show counter dhcp server statistics command(cont.)

`DHCPNAK out`	The number of Negative Acknowledgement messages sent by the DHCP server. The server sends these after receiving a request that it cannot fulfil because either there are no available IP addresses in the related address pool, or the request has come from a client that doesn't fit the network setting for an address pool.
`BOOTREQUEST in`	The number of bootp messages received by the DHCP server from bootp clients.
`BOOTREPLY out`	The number of bootp messages sent by the DHCP server to bootp clients.
`DHCPLEASEQUERY in`	The number of Lease Query messages received by the DHCP server from DHCP Relay Agents.
`DHCPLEASEUNKNOWN out`	The number of Lease Unknown messages sent by the DHCP server to DHCP Relay Agents.
`DHCPLEASEACTIVE out`	The number of Lease Active messages sent by the DHCP server to DHCP Relay Agents.
`DHCPLEASEUNASSIGNED out`	The number of Lease Unassigned messages sent by the DHCP server to DHCP Relay Agents.

Related Commands

show counter dhcp-server
service dhcp-server
show ip dhcp binding
show ip dhcp pool

show ip dhcp server summary

This command shows the current configuration of the DHCP server. This includes:

- whether the DHCP server is enabled
- whether the DHCP server is configured to ignore BOOTP requests
- whether the DHCP server is configured to support DHCP lease queries
- the details of any user-defined options
- a list of the names of all DHCP address pools currently configured

This show command does not include any configuration details of the address pools. You can display these using the **show ip dhcp pool** command.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show ip dhcp server summary
```

Mode

User Exec and Privileged Exec

Example

To display the current configuration of the DHCP server, use the command:

```
awplus# show ip dhcp server summary
```

Output

Figure 93-13: Example output from the show ip dhcp server summary command

```
DHCP Server service is disabled
BOOTP ignore is disabled
DHCP leasequery support is disabled
Pool list: p2
```

Related Commands

ip dhcp leasequery enable
ip dhcp pool
service dhcp-server

subnet-mask

This command sets the subnet mask option for a DHCP address pool you are configuring. Use this command to specify the client's subnet mask as defined in RFC 950. This sets the subnet details using the pre-defined option 1. Note that if you create a user-defined option 1 using the **option** command, then you will override any settings created with this command. If you do not specify a subnet mask using this command, then the pool's network mask (specified using the **next-server** command) is applied.

The **no** variant of this command removes a subnet mask option from a DHCP pool. The pool reverts to using the pool's network mask.

Syntax

```
subnet-mask <mask>
no subnet-mask
```

Parameter	Description
<mask>	Valid IPv4 subnet mask, in dotted decimal notation.

Mode DHCP Configuration

Examples To set the subnet mask option to `255.255.255.0` for DHCP pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# subnet-mask 255.255.255.0
```

To remove the subnet mask option from DHCP pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no subnet-mask
```

DHCPv6 Introduction

This chapter describes the Dynamic Host Configuration Protocol for IPv6 (DHCPv6), including Prefix Delegation (PD) support, provided by your switch. It includes sample configurations to configure your switch as a DHCPv6 Server to pass configuration information to IPv6 clients, and for configuring the switch as a DHCPv6 Client, to request IPv6 addresses from a DHCPv6 Server. This chapter also includes sample configurations to configure your switch for DHCPv6 Prefix Delegation and DHCPv6 Relay Agent features.

DHCPv6 is specified in RFC 3315 "Dynamic Host Configuration Protocol for IPv6 (DHCPv6)". IPv6 Prefix Delegation is specified in RFC 3769 "Requirements for IPv6 Prefix Delegation". DHCPv6 Prefix Delegation is specified in RFC 3633 "IPv6 Prefix Options for Dynamic Host Configuration Protocol (DHCP) version 6".

See the section **DHCPv6 Messages** for the sequence of messages sent and received between DHCPv6 Servers and DHCPv6 Clients and brief descriptions of the messages.

For the syntaxes, parameters, descriptions, defaults, and examples for all of the commands used in sample DHCPv6 configurations, refer to **Chapter 95, DHCP for IPv6 (DHCPv6) Commands** for the DHCPv6 Client Server PD commands and **Chapter 93, Dynamic Host Configuration Protocol (DHCP) Commands** for the DHCPv6 Relay commands.

Note

The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical networks (other than for testing purposes) nor should they appear on any public network.

DHCPv6 for IPv6

DHCPv6 is used to delegate IPv6 prefixes and to allocate IPv6 addresses. It offers stateful address autoconfiguration, and complements Stateless Address Autoconfiguration (SLAAC) described in RFC 2462, IPv6 Stateless Address Autoconfiguration. Stateless Address Autoconfiguration (SLAAC) allows an IPv6-aware device to be plugged into a network, and given an IPv6 address prefix without manual configuration.

- DHCPv6 Clients first use RA messages to auto-configure themselves with any default IPv6 route(s) via gateway router(s).
- A DHCPv6 Client can then initiate DHCPv6 Prefix Delegation by including an IAPD (Identity Association for Prefix Delegation) option along with an ID in its solicit messages.
- Interface addresses can also be automatically configured that are derived from delegated prefix information.
- A DHCPv6 Server can be configured to set optional M and/or O flags in Router Advertisement (RA) messages that its sends.
- A DHCPv6 Server can be configured to notify clients that they can use a stateful address configuration protocol (for example, DHCPv6 IANA) to obtain an address by setting the single bit Managed Address Configuration (M) flag to 1 in RA messages
- A DHCPv6 Server can be configured to notify clients that they can use a stateful address configuration protocol (for example, DHCPv6) to obtain non-address configuration information such as optional DNS information plus SNTP information by setting the single bit Other Stateful Configuration (O) flag to 1 in RA messages.
- IAPD or IANA delegation pools are configured in a DHCPv6 PD (Prefix Delegation) Server. Prefixes or addresses to be allocated are stored in theses delegation pools.

See the section **"DHCPv6 Client and Server Identification" on page 94.13** for IAPD information. See the section **"DHCPv6 Messages" on page 94.5** for solicit message information.

When the switch is configured as a DHCPv6 Server, it can:

- **delegate prefixes to IPv6 subnets**. Prefixes allow subnets to be selected, rather than a single node. Like IPv4 addresses, a proportion of the left most bits of the address can be used to indicate the subnet (using slash notation, for example, 2001:0db8:1234::/64). EUI64 suffix information can then be appended to form an IPv6 address on an interface. See also the **IPv6 EUI-64 Addressing** section in **Chapter 28, IPv6 Introduction** for further EUI-64 implementation information.
- **assign normal and temporary IPv6 addresses to devices.** An IPv6 address is a hexadecimal string, made up from eight pairs of octets separated by colons, for example 3ffe:2::0:1. Note that these pairs of octets are called segments in IPv6, and there are eight segments in an IPv6 address. Normal addresses are renewed by the server for as long as the device requires an address. Temporary addresses are assigned for a limited time (lease time) and are usually allocated for privacy reasons, as outlined in RFC 3041 "Privacy Extensions for Stateless Address Autoconfiguration in IPv6".

DHCPv6 Prefix Delegation

DHCPv6 Prefix Delegation automates IPv6 prefix assignment in an IPv6 network, and enables user devices to automatically append their own device component for the user device portion of the IPv6 address.

This gives you the ability to centrally control IPv6 addressing used in remote sites where the IPv6 prefix information is the equivalent of the network portion of an IPv4 address.

DHCPv6 Relay is often used with between PE (Provider Edge) devices and CPE (Customer Premises Equipment) devices with DHCPv6 Prefix Delegation. Once a provider delegates prefixes to its customers, the customers can then subnet and assign the prefixes to their internal links.

Providers use the DHCPv6 feature to manage site addressing, subnet, and link updates.

- Stateless DHCPv6 does not require a DHCPv6 Server to maintain any dynamic state for clients, such as Domain Name System (DNS) server addresses. Note that only configuration information is exchanged with stateless prefix delegation.
- Stateful DHCPv6 uses a DHCPv6 Server to centrally manage IPv6 address and prefix assignment. DHCPv6 Clients get IPv6 address or prefix information from the DHCPv6 Server. DHCPv6 Clients can obtain configuration information that is not available from other protocols, such as DNS.

DHCPv6 RFCs

See the below list of DHCPv6 related RFCs:

- RFC 3315 Dynamic Host Configuration Protocol for IPv6 (DHCPv6)
  Stateful DHCPv6 - DHCPv6 has been standardized by the IETF through RFC 3315.
- RFC 3633 IPv6 Prefix Options for DHCPv6
  DHCPv6 Prefix Delegation (DHCPv6-PD) is an extension to DHCPv6 specified in RFC 3315.
- RFC 6276 DHCPv6 Prefix Delegation for Network Mobility (NEMO)
  Specifies DHCPv6 Prefix Delegation use with a mobile router for network mobility.
- RFC 3646 DNS Configuration Options for DHCPv6.
- RFC 3736 Stateless Dynamic Host Configuration Protocol (DHCP) Service for IPv6
  Stateless DHCPv6 is a combination of IPv6 Stateless Address Autoconfiguration (RFC 4862) and Dynamic Host Control Protocol for IPv6 (RFC 3315). It is a counterpart to IPv6 Stateless Address Autoconfiguration, and can be used with or without IPv6 Stateless Address Autoconfiguration to obtain configuration parameters.
- RFC 4649 Dynamic Host Configuration Protocol for IPv6 (DHCPv6) Relay Agent Remote-ID Option.
- RFC 4841 Neighbor Discovery for IP version 6 (IPv6).
- RFC 4862 IPv6 Stateless Address Autoconfiguration.
- RFC 5007 DHCPv6 Leasequery.

DHCPv6 Messages

DHCPv6 uses multicast and unicast addresses for communication. A multicast address provides the equivalent functionality to an IPv4 broadcast address. It identifies a group of interfaces, and packets are sent to all interfaces in that group. Addresses reserved for DHCPv6 messages are:

- ff02::1:2. This link-scope multicast address is used by clients to communicate with DHCPv6 servers. When the DHCPv6 module is enabled the switch listens to this address.
- ff05::1:3. This site-scope multicast address is used by clients to communicate with DHCPv6 servers. When the DHCPv6 module is enabled the switch listens to this address.

A normal DHCPv6 message exchange involves the following messages:

1. **Solicit** - sent by a DHCPv6 Client to locate DHCPv6 Servers.
2. **Advertise** - sent by a DHCPv6 server to a DHCPv6 Client in answer to the solicit message as an affirmative message that DHCPv6 Server services are available to a DHCPv6 Client .
3. **Request** - sent by a DHCPv6 Client to a DHCPv6 Server to request configuration parameters.
4. **Reply** - sent by a DHCPv6 Server to a DHCPv6 Client with configuration information.
5. **Renew** - sent by a DHCPv6 Client to a DHCPv6 Server requesting an extension to the address lifetime.

An IPv6 address may be assigned to the DHCPv6 Client for a limited or unlimited time. If the address lifetime is limited, it has a preferred lifetime and a (generally longer) valid lifetime.

Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires.

Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.

An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.

Once half the time between address assignment and the preferred lifetime has passed (the T1 time), the client sends a **Renew** message to the server, requesting an extension to the address lifetime.

If the client has not received a reply after 80% of the valid lifetime has passed (the T2 time), it sends a multicast **Rebind** message to discover another DHCPv6 Server

DHCPv6 Client/Server/Relay Agent messages are exchanged over UDP ports 546 and 547. DHCPv6 Clients listen for DHCPv6 messages on UDP port 546, while DHCPv6 Servers and DHCPv6 Relay Agents listen for DHCPv6 messages on UDP port 547.

In a DHCPv6 Client/DHCPv6 Server environment, DHCPv6 messages are sent from the DHCPv6 Clients to DHCPv6 Server destination UDP port 547. DHCPv6 Servers respond to DHCPv6 Client destination UDP port 546.

In a DHCPv6 Client/DHCPv6 Relay Agent/DHCPv6 Server environment, DHCPv6 messages are sent from DHCPv6 Clients to DHCPv6 Relay Agent and DHCPv6 Server destination UDP port 547. DHCPv6 Servers respond to DHCPv6 Relay Agents via destination UDP port 547. DHCPv6 Relay Agents respond to DHCPv6 Client destination UDP port 546.

DHCPv6 Message Types

See the below list of DHCPv6 Message Types supported in AlliedWare Plus:

- **SOLICIT**:
  A DHCPv6 Client sends a **SOLICIT** message to locate DHCPv6 Servers.
- **ADVERTISE**:
  A DHCPv6 Server sends an **ADVERTISE** message to indicate that it is available for DHCPv6 service in response to a SOLICIT message received from a DHCPv6 Client.
- **REQUEST**:
  A DHCPv6 Client sends a **REQUEST** message to request configuration parameters, including IPv6 addresses.
- **CONFIRM**:
  A DHCPv6 Client sends a **CONFIRM** message to any available DHCPv6 Server to determine whether the IPv6 addresses it was assigned is still appropriate to the link to which the DHCPv6 Client is connected. This can happen when the DHCPv6 Client detects either a link-layer connectivity change, or if it is powered on and one or more leases are still valid. The **CONFIRM** message is used to confirm whether the DHCPv6 Client is still on the same link or whether it has been moved. The actual lease(s) are not validated; just the prefix portion of the delegated IPv6 addresses or IPv6 prefixes.
- **RENEW**:
  A DHCPv6 Client sends a **RENEW** message to the DHCPv6 Server that originally provided the DHCPv6 Client's addresses and configuration parameters, to extend the lifetimes on the IPv6 addresses assigned to the DHCPv6 Client and to update other configuration parameters.
- **REBIND**:
  A DHCPv6 Client sends a **REBIND** message to any available DHCPv6 Server to extend the lifetimes of the IPv6 addresses assigned to the DHCPv6 Client, and to update other configuration parameters. This message is sent after a DHCPv6 Client receives no response to a **RENEW** message.
- **REPLY**:
  A DHCPv6 Server sends a **REPLY** message containing assigned IPv6 addresses and configuration parameters in response to a **SOLICIT**, **REQUEST**, **RENEW**, and **REBIND** message received from a DHCPv6 Client. A DHCPv6 Server sends a **REPLY** message containing configuration parameters in response to an **INFORMATION-REQUEST** message. A DHCPv6 Server sends a **REPLY** message in response to a **CONFIRM** message confirming or denying that the IPv6 addresses assigned to the DHCPv6 Client are appropriate to the link to which the DHCPv6 Client is connected. A DHCPv6 Server sends a **REPLY** message to acknowledge receipt of a **RELEASE** or **DECLINE** message.
- **RELEASE**:
  A DHCPv6 Client sends a **RELEASE** message to the DHCPv6 Server to inform it that the DHCPv6 Client will no longer use one or more of the assigned IPv6 addresses.
- **DECLINE**:
  A DHCPv6 Client sends a **DECLINE** message to a DHCPv6 Server to indicate that the DHCPv6 Client has determined that one or more IPv6 addresses assigned by the DHCPv6 Server are already in use on the link to which the DHCPv6 Client is connected.

- **RECONFIGURE**:
  A DHCPv6 Server sends a **RECONFIGURE** message to a DHCPv6 Client to inform the DHCPv6 Client that the DHCPv6 Server has new or updated configuration parameters. The DHCPv6 Client is to initiate a **RENEW**/**REPLY** or an **INFORMATION-REQUEST**/ **REPLY** transaction with the DHCPv6 Server to receive updated information.
- **INFORMATION-REQUEST**:
  A DHCPv6 Client sends an **INFORMATION-REQUEST** message to a DHCPv6 Server to request configuration parameters without the assignment of any IPv6 addresses to the DHCPv6 Client.
- **RELAY-FORW**:
  A DHCPv6 Relay Agent sends a **RELAY-FORW** message to relay messages to DHCPv6 Servers, either directly or through another DHCPv6 Relay Agent. The received message, either a DHCPv6 Client message or a **RELAY-FORW** message from another DHCPv6 Relay Agent, is encapsulated in an option in the **RELAY-FORW** message.
- **RELAY-REPL**:
  A DHCPv6 Server sends a **RELAY-REPL** message to a DHCPv6 Relay Agent containing a message that the DHCPv6 Relay Agent delivers to a DHCPv6 Client. The **RELAY-REPL** message may be relayed by other DHCPv6 Relay Agents for delivery to the destination DHCPv6 Relay Agent. The DHCPv6 Server encapsulates the DHCPv6 Client message as an option in the **RELAY-REPL** message, which the DHCPv6 Relay Agent extracts and relays to the DHCPv6 Client.

DHCPv6 Client to DHCPv6 Server Messages

See the below list of DHCPv6 Messages sent from a DHCPv6 Client to a DHCPv6 Server:

- **SOLICIT**
- **REQUEST**
- **CONFIRM**
- **RENEW**
- **REBIND**
- **RELEASE**
- **DECLINE**
- **INFORMATION-REQUEST**

DHCPv6 Server to DHCPv6 Client Messages

See the below list of DHCPv6 Messages sent from a DHCPv6 Server to a DHCPv6 Client:

- **ADVERTISE**
- **REPLY**
- **RECONFIGURE**

DHCPv6 Relay to DHCPv6 Relay/Server Messages

See the below DHCPv6 Message sent from a DHCPv6 Relay to a DHCPv6 Relay/Server:

- **RELAY-FORW**

DHCPv6 Relay/Server to DHCPv6 Relay Messages

See the below DHCPv6 Message sent from a DHCPv6 Relay/Server to a DHCPv6 Relay:

- **RELAY-REPL**

DHCPv6 Renewal and Rebinding

See the below list of descriptions for DHCPv6 Renewal and Rebinding terminology:

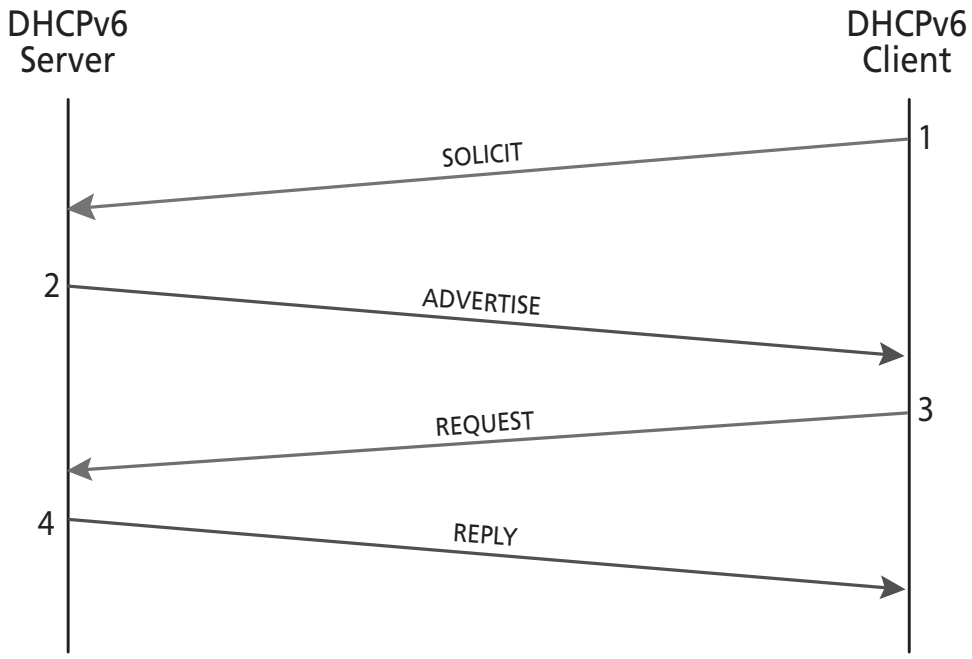
- **T1 Timer:**
  Indicates when a DHCPv6 Client must attempt to renew IPv6 addresses or prefixes.
- **T2 Timer:**
  Indicates when a DHCPv6 Client must attempt to rebind IPv6 addresses or prefixes.
- **Preferred Lifetime:**
  Indicates when preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires. Deprecated addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.
- **Valid Lifetime:**
  Indicates when IPv6 addresses or prefixes must be abandoned. An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.
- **Client States:**
  - **Bound**: Normal operation.
  - **Renewing**: Renewing lease.
  - **Rebinding**: Occurs when no reply has been received from the DHCPv6 Server.
  - **Bound**: Receive, process, and finalize new lease.
- **Renewal Process:**
  - Renewal T1 Timer expires (the default T1 Timer period is 50% of the lease length)
  - DHCPv6 Client transitions from Bound to Renewing state.
  - DHCPv6 Client sends DHCPv6 Request/Renew messages (**REQUEST**/**RENEW** message types)
  - DHCPv6 Client transitions to Rebinding state
    (If no reply from DHCPv6 Server and the T2 Timer expires).
  - DHCPv6 Client transitions to Bound state
    (When DHCPv6 Client receives a reply from DHCPv6 Server).

Stateful DHCPv6 Message Exchange

The sequence for stateful DHCPv6 message exchange between a DHCPv6 Client and a DHCPv6 Server is shown below in **Figure 94-1**.

1. The DHCPv6 Client starts by sending a `SOLICIT` message to the DHCPv6 Server.
2. The DHCPv6 Server sends an `ADVERTISE` message back to the DHCPv6 Client.
3. The DHCPv6 Client sends a `REQUEST` message to the DHCPv6 Server.
4. The DHCPv6 Server sends a `REPLY` message back to the DHCPv6 Client to finish.

Figure 94-1: Stateful DHCPv6 Message Exchange Diagram



See section **"DHCPv6 Messages" on page 94.5** for descriptions of all DHCPv6 messages.

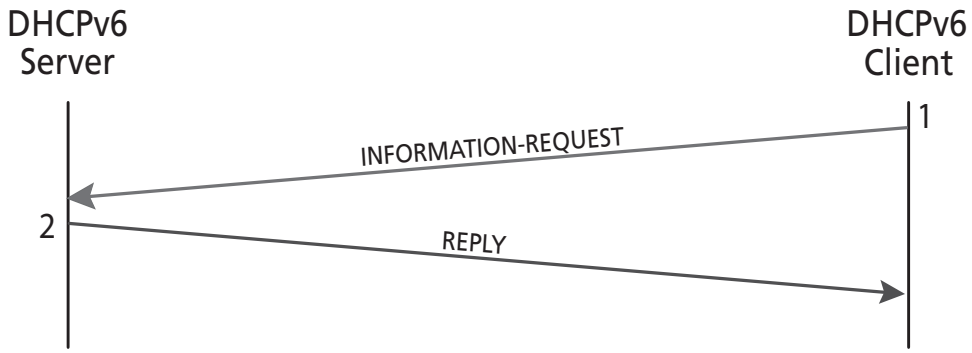
Stateless DHCPv6 Message Exchange

The sequence for stateless DHCPv6 message exchange between a DHCPv6 Client and a DHCPv6 Server is shown below in **Figure 94-2**.

1. The DHCPv6 Client starts by sending an `INFORMATION-REQUEST` message to the DHCPv6 Server. This request specifically excludes the assignment of any IPv6 address.

2. The DHCPv6 Server sends a `REPLY` message back to the DHCPv6 Client to finish.

Figure 94-2: Stateless DHCPv6 Message Exchange Diagram



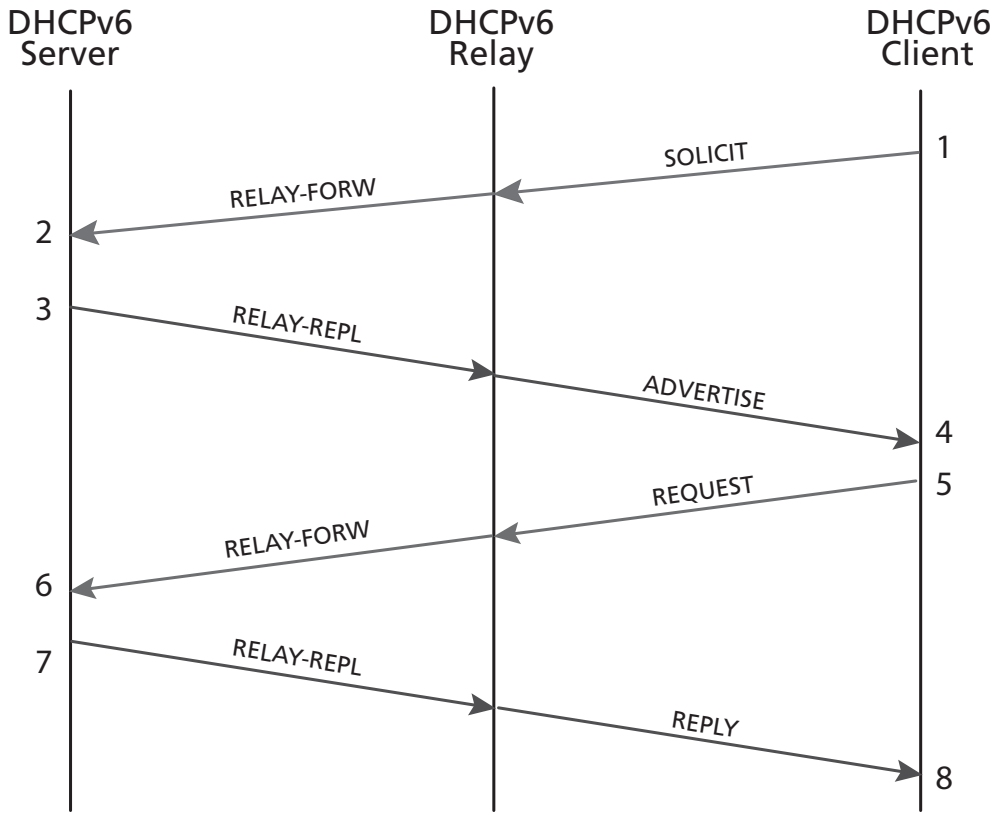
See section **"DHCPv6 Messages" on page 94.5** for descriptions of all DHCPv6 messages.

DHCPv6 Relay Agent Stateful Message Exchange

The sequence for a stateful DHCPv6 message exchange between a DHCPv6 Client, a DHCPv6 Relay, and a DHCPv6 Server is shown below in **Figure 94-3**.

1. The DHCPv6 Client starts by sending a `SOLICIT` message to the DHCPv6 Relay.
2. The DHCPv6 Server receives a `RELAY-FORW` message sent from the DHCPv6 Relay.
3. The DHCPv6 Server sends a `RELAY-REPL` message back to the DHCPv6 Relay.
4. The DHCPv6 Client receives an `ADVERTISE` message sent from the DHCPv6 Relay.
5. The DHCPv6 Client sends a `REQUEST` message to the DHCPv6 Relay.
6. The DHCPv6 Server receives a `RELAY-FORW` message sent from the DHCPv6 Relay.
7. The DHCPv6 Server sends a `RELAY-REPL` message back to the DHCPv6 Relay.
8. TheDHCPv6 Client receives a `RELPY` message sent from the DHCPv6 Relay to finish.

Figure 94-3: DHCPv6 Relay Agent Stateful Message Exchange Diagram



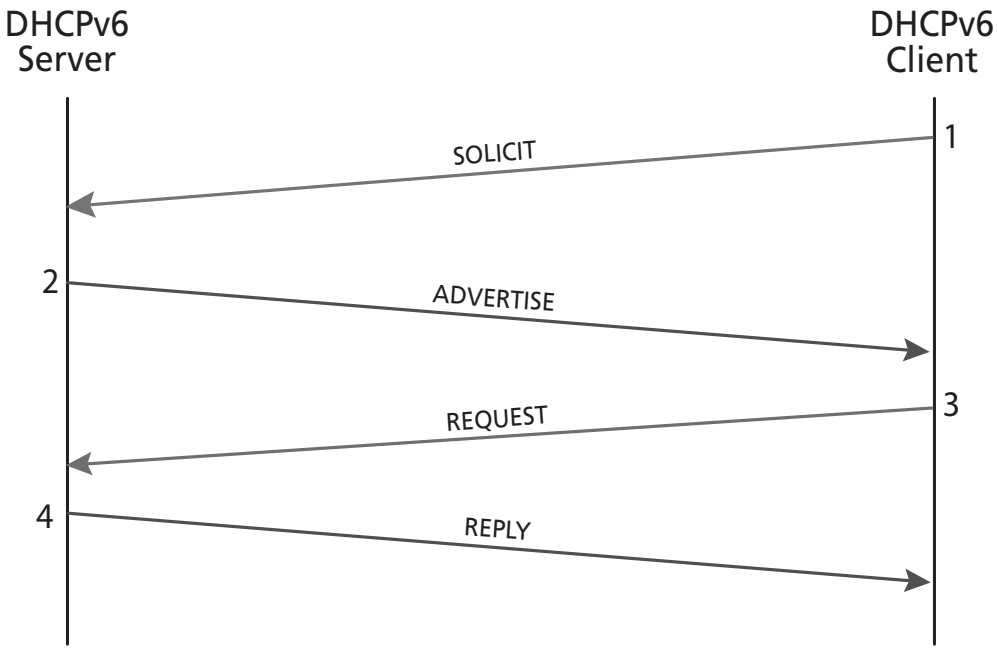
See section **"DHCPv6 Messages" on page 94.5** for message descriptions.

DHCPv6 Prefix Delegation Message Exchange

The sequence for stateful DHCPv6 message exchange between a DHCPv6 Client and a DHCPv6 Server configured for DHCPv6 Prefix Delegation is shown below in **Figure 94-4**.

1. The DHCPv6 Client starts by sending a `SOLICIT` message to the DHCPv6 Server.
2. The DHCPv6 Server sends an `ADVERTISE` message back to the DHCPv6 Client.
3. The DHCPv6 Client sends a `REQUEST` message to the DHCPv6 Server.
4. The DHCPv6 Server sends a `REPLY` message back to the DHCPv6 Client to finish.

Figure 94-4: DHCPv6 Prefix Delegation Message Exchange Diagram



See section **"DHCPv6 Messages" on page 94.5** for descriptions of all DHCPv6 messages.

DHCPv6 Client and Server Identification

DHCPv6 Clients and Servers are identified by a DHCPv6 Unique Identifier (DUID). The DUID consists of a number, followed by a hexadecimal string that identifies the hardware type of the client and the link-layer address of the client.

DHCPv6 Unique Identifier (DUID)

A DUID identifies each DHCPv6 Client and Server, where Client and Server identifier options contain the DUID. The DUID is unique for DHCPv6 Clients and Servers. DHCPv6 uses DUIDs with link-layer addresses for client and server identifiers. The device uses the MAC address from the lowest-numbered interface to determine a DUID.

Prefixes are considered to be for different clients when a DHCPv6 Client requests two prefixes with the same DUID and with different IAIDs on different network interfaces.

Identity Associations (IAPD, IAID, and IANA)

DHCPv6 Clients use identity associations to identify each interface that is configured by DHCPv6. An interface's identity association contains the configuration settings of the interface and an Identity Association Identifier (IAID). When the client requests settings from the server for a particular interface, it includes the IAID, to identify the interface.

An Identity Association for Prefix Delegation (IAPD) is a set of IPv6 prefixes assigned to a requesting device. A requesting device may have more than one IAPD where an IAPD is assigned per interface and the device has multiple interfaces.

IAPDs are identified by IAIDs. IAIDs are chosen by requesting devices and are unique among IAPD IAIDs on requesting devices. IAIDs are consistent after reloading using information from the associated interface that is permanently attached to the device.

IAPD, IAID, and IANA use with Prefix Delegation

For subscriber LAN addressing, you can use DHCPv6 address and/or prefix delegation to provision global IPv6 addresses to subscribers on the LAN.

IAPD or IANA (Identity Association for Non-temporary Addresses) delegation pools are configured in a PD server. Prefixes or addresses to be allocated are stored in delegation pools. RA messages are first used by stateful client(s) to auto-configure themselves with any default IPv6 route(s) via gateway router(s).

When IAPD is specified, a DHCPv6 client can then initiate Prefix Delegation as a requesting device by including an IAPD option with the specified ID in **solicit** messages. Interface addresses can be automatically configured derived from delegated prefix information.

See the section **DHCPv6 Messages** for the sequence of messages sent and received between DHCPv6 Servers and DHCPv6 Clients and brief descriptions of the messages.

DHCPv6 Server and Client Functionality

DHCPv6 Server and Client functionality is mutually exclusive on an interface. When one of these functions is enabled and a user tries to configure a DHCPv6 Client or Server on the same interface, a message is shown to indicate whenever an interface already configured.

DHCPv6 Server Functionality

Configuration parameters for DHCPv6 Clients are configured in DHCPv6 configuration pools. A configuration pool is associated with a particular DHCPv6 Server on an interface. Prefixes that are delegated to DHCPv6 Clients can be specified as a list of assigned IPv6 prefixes for a given DHCPv6 Client or as IPv6 local prefix pools. The list of configured IPv6 prefixes or IPv6 local prefix pools are referenced and used by DHCPv6 configuration pools.

The DHCPv6 Server can provide configuration parameters that do not require the server to maintain any dynamic state for individual clients, such as DNS server addresses and domain search list options. The DHCPv6 Server can be configured for prefix delegation. DHCPv6 Server functionality can be enabled on individual IPv6-enabled VLAN interfaces.

The DHCPv6 Server maintains an automatic binding table in memory to track the assignment of some configuration parameters, such as prefixes between the server and its clients. Automatic bindings can be stored semi-permanently in non-volatile memory.

RA suppression is turned off in the DHCPv6 Server to facilitate neighbor discovery and allow clients via router solicitation to discover gateway routers on the LAN.

DHCPv6 Server Prefix Delegation Pool

A DHCPv6 Server Prefix Delegation pool is named and includes information about the configuration parameters that control assignment of prefixes to clients from the pool.

A prefix delegation pool is configured independently and is associated with the DHCPv6 Server by entering the relevant commands at the console. Each DHCPv6 Prefix Delegation pool can contain the following configuration parameters and information:

- SNTP Server IPv6 addresses.
- DNS Server IPv6 addresses.
- DHCPv6 Prefix Delegation information, including a DHCPv6 prefix pool name and available IPv6 prefixes, both with their configured preferred and valid lifetimes.

See the section **Configuring the DHCPv6 Server Delegation Pool** for the sequence of commands issued together with command modes, command syntaxes, and brief descriptions.

IPv6 Prefix Assignment

A DHCPv6 Server selects prefixes for assignment following a request from a DHCPv6 Client. The DHCPv6 Server selects prefixes for a DHCPv6 Client statically or dynamically. You can statically configure IPv6 prefixes, plus preferred and valid lifetimes for an IAPD, of a DHCPv6 Client as identified by its DUID.

When the delegating DHCPv6 Server receives a request from a DHCPv6 Client, it checks if there is a static binding configured for the IAPD in the message from the DHCPv6 Client. If a static binding is present, prefixes in the binding are returned to the DHCPv6 client. If no binding is found, the DHCPv6 Server can assign prefixes for the DHCPv6 client from DNS.

DHCPv6 Server assigns prefixes dynamically from an IPv6 local prefix pool. When DHCPv6 Server receives a prefix request from a DHCPv6 Client, it attempts to obtain unassigned prefixes from the IPv6 local prefix pool. After the DHCPv6 Client releases the previously assigned IPv6 prefixes, the DHCPv6 server returns them to the pool for reassignment.

Automatic Binding Table

Each DHCPv6 configuration pool has a linked automatic binding table. The automatic binding table records all IPv6 prefixes in the configuration pool that are delegated to DHCPv6 Clients. Each permanent storage to which the binding database is saved is called the database agent. Database agent binding information is stored in NVRAM so configuration information, including prefixes for DHCPv6 Clients from a DHCPv6 Server, is retained after a reload. Each binding table entry contains the following information:

- DHCPv6 Server network interface for the DHCPv6 configuration pool.
- Configuration pool for the binding table.
- Preferred and valid lifetimes per prefix.
- Prefixes delegated to each IAPD.
- IAPDs associated with the client.
- Client IPv6 address.
- Client DUID.

DHCPv6 Server creates a binding table entry when a prefix is delegated to a DHCPv6 Client from the configuration pool, and the entry is updated when the DHCPv6 Client renews, rebinds, or confirms the prefix delegation.

A binding table entry is deleted when the DHCPv6 Client releases all prefixes in the binding, all valid lifetimes expire, or when you run the **clear ipv6 dhcp binding** command. See the **show ipv6 dhcp binding** command for **clear ipv6 dhcp binding**.

The DHCPv6 Server assign prefixes dynamically from an IPv6 local prefix pool. When the DHCPv6 Server receives a prefix request from a DHCPv6 Client, then the DHCPv6 Server gets unassigned prefixes from the DHCPv6 configuration pool. Once the DHCPv6 client releases assigned prefixes, the DHCPv6 Server returns prefixes to the configuration pool.

SNTP Server Functionality

The SNTP Server Functionality gives a list of IPv6 addresses for SNTP Servers that the DHCPv6 Client can use to synchronize system time to a standard time server. The DHCPv6 Server lists the SNTP Servers for the DHCPv6 Clients to select from to synchronize timing.

See the **sntp-address** command for further SNTP information and command examples.

DHCPv6 Server and DNS for IPv6 Address Assignment

Additional options, such as the default domain and DNS name-server address, can be passed back to the DHCPv6 Client. Address pools can be assigned for use on a specific interface, or the DHCPv6 Server can automatically find the appropriate pool.

See the **dns-server (DHCPv6)** and **domain-name (DHCPv6)** commands for examples.

DHCPv6 Client Functionality

DHCPv6 Clients can request the delegation of prefixes from a DHCPv6 Server. The IPv6 prefixes acquired from a delegating DHCPv6 Server are stored in an IPv6 prefix pool. The prefixes in the IPv6 prefix pool can be used to number downstream device interfaces.

A DHCPv6 Client is enabled on an individual IPv6-enabled VLAN interface, and can also request and accept those configuration parameters that do not require a DHCPv6 Server to maintain any dynamic state for individual clients, such as DNS server addresses.

See the section **Configuring the DHCPv6 PD Client** for the sequence of commands issued together with command modes, command syntaxes, and brief descriptions.

DHCPv6 Server Selection by a DHCPv6 Client

A DHCPv6 Client builds a list of DHCPv6 servers by sending a **solicit** message and by receiving **advertisement** replies from DHCPv6 Servers. The replies are ranked by the DHCPv6 Client based on preference value, when DHCPv6 Servers add a preference value to their advertisement messages. For DHCPv6 Clients to obtain IPv6 prefixes from DHCPv6 Servers, only DHCPv6 Servers that advertise prefixes are considered by DHCPv6 Clients.

See the section **DHCPv6 Messages** for the sequence of messages sent and received between DHCPv6 Servers and DHCPv6 Clients and brief descriptions of the messages.

The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical networks (other than for testing purposes) nor should they appear on any public network.

For the syntaxes, parameters, descriptions, defaults, and examples for all of the commands used in the following DHCPv6 configurations, refer to **Chapter 95, DHCP for IPv6 (DHCPv6) Commands** for the DHCPv6 Client Server PD commands and **Chapter 93, Dynamic Host Configuration Protocol (DHCP) Commands** for the DHCPv6 Relay commands.

See the section **Configuring DHCPv6 Prefix Delegation** for the sequence of commands issued together with command modes, command syntaxes, and brief descriptions.

See the **PD Subdelegation System Configuration** section for a an example network topology and configuration output to adapt for your own network configuration

Configuring DHCPv6 Prefix Delegation

See the sections listed below when configuring DHCPv6 Prefix Delegation:

- **Configuring the DHCPv6 Server Delegation Pool**
- **Configuring the DHCPv6 PD Client**

Configuring the DHCPv6 Server Delegation Pool

Perform this sequence of command entries to create and configure the DHCPv6 configuration pool and associate it with a DHCPv6 server on a VLAN interface.

Note the links in the list are for the command name in the relevant command chapter, while the links in the table below the list are for the command syntaxes showing mode.

1. **enable (Privileged Exec mode)**
2. **configure terminal**
3. **ipv6 dhcp pool**
4. **domain-name (DHCPv6)**
5. **dns-server (DHCPv6)**
6. **prefix-delegation pool**
7. **exit**
8. **interface (to configure)**
9. **ipv6 dhcp server**
10. **exit**

Table 94-1: Configuring the DHCPv6 Configuration Pool

1.	`awplus>enable (Privileged Exec mode)`	Enter Privileged Exec mode.
2.	`awplus#configure terminal`	Enter Global Configuration mode.
3.	`awplus(config)#ipv6 dhcp pool <DHCPv6-poolname>`	Configure a DHCPv6 configuration information pool and enters DHCPv6 configuration mode.
4.	`awplus(config-dhcp6)# domain-name <domain-name>`	Configure a domain name for a DHCPv6 client.
5.	`awplus(config-dhcp6)# dns-server <ipv6-address>`	Specify the DNS IPv6 servers available to a DHCPv6 client.
6.	`awplus(config-dhcp6)# prefix-delegation pool <DHCPv6-poolname> [lifetime {<valid-time>|infinite} {<preferred-time>|infinite}]`	Specify a named IPv6 prefix pool from which prefixes are delegated to DHCPv6 clients.

Table 94-1: Configuring the DHCPv6 Configuration Pool

7.	`awplus(config-dhcp6)# exit`	Exit DHCPv6 configuration mode, and returns the device to Global Configuration mode.
8.	`awplus(config)# interface <interface-list>`	Specify a VLAN interface, and enters Interface Configuration mode.
9.	`awplus(config-if)# ipv6 dhcp-server [<DHCPv6-poolname>]`	Enable DHCPv6 on the specified VLAN interface.
10.	`awplus(config-if)# exit`	Return to Global Configuration mode.

Configuring the DHCPv6 PD Client

General prefixes can be defined dynamically from a prefix received by a DHCPv6 prefix delegation client via IAPD. The delegated prefix is stored in a general prefix:

Commands Applied

1. **enable (Privileged Exec mode)**
2. **configure terminal**
3. **interface (to configure)**
4. **ipv6 dhcp client pd**
5. **exit**

Table 94-2: Configuring the DHCPv6 Configuration Pool

1.	`awplus>enable (Privileged Exec mode)`	Enter Privileged Exec mode.
2.	`awplus#configure terminal`	Enter Global Configuration mode.
3.	`awplus(config)# interface <interface-list>`	Specify a VLAN interface, and enters Interface Configuration mode.
4.	`awplus(config-if)# ipv6 dhcp client pd <prefix-name>`	Enables the DHCPv6 client process and enables a request for prefix delegation through a specified VLAN interface.
5.	`awplus(config-if)# exit`	Return to Global Configuration mode.

Note that devices can be optionally configured to advertise connected routing information associated with delegated prefixes to other devices within the domain via dynamic routing protocols.

Note the following configuration examples build from a simple two device system up to a complex sub-delegation system involving multiple devices and multiple delegation pools.

Configure DHCPv6 Server/Stateful Client (Prefix)

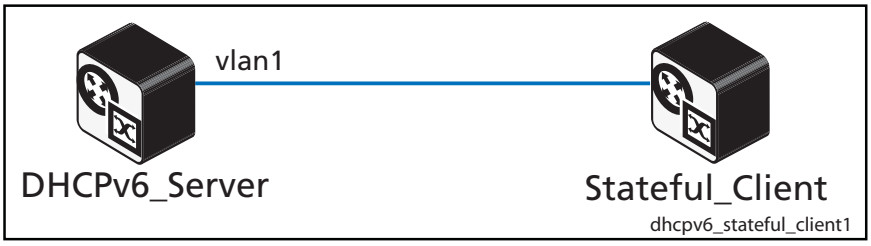
In this example, a stateful client can obtain its interface address (via DHCPv6 IANA) and other information (such as DNS, SNTP) configured in the DHCP Server delegation pool.

- The client is allocated an address from the address prefix configured in the DHCP Server pool. A stateful client can automatically learn about any gateway router(s) on the LAN and dynamically add associated default route(s) into its routing table via next-hop link-local address of the gateway router via router advertisements.
- RA suppression is turned off in the DHCPv6 Server to facilitate neighbor discovery.

For command information, see the **address prefix** and **ipv6 dhcp server** commands on the DHCPv6 Server and the **ipv6 address dhcp** command on the Stateful Client.

Note **bold** configuration command entries show hostnames and interfaces.
Also note the default VLAN interface **vlan1** is applied to all ports on a device.

Figure 94-5: DHCPv6 Server / Stateful Client configuration topology:



DHCPv6_Server Configuration (Prefix)

See the below configuration for a device with the hostname **DHCPv6_Server**:

```
hostname DHCPv6_Server
!
ipv6 dhcp pool pool1
 address prefix 2001:db8:10::/64
 dns-server 2001:db8:10::10
 domain-name example.com
 sntp address 2001:db8:10::20
!
interface vlan1
 description to_Stateful_Client
 ipv6 address 2001:db8:10::1/64
 ipv6 enable
 no ipv6 nd suppress-ra
 ipv6 nd managed-config-flag
 ipv6 nd other-config-flag
 ipv6 dhcp server pool1
!
ipv6 forwarding
```

Stateful_Client Configuration (IANA)

See the below configuration for a device with the hostname **Stateful_Client**:

```
hostname Stateful_Client
!
interface vlan1
 ipv6 address dhcp
```

Configure DHCPv6 Server/Stateful Client (Range)

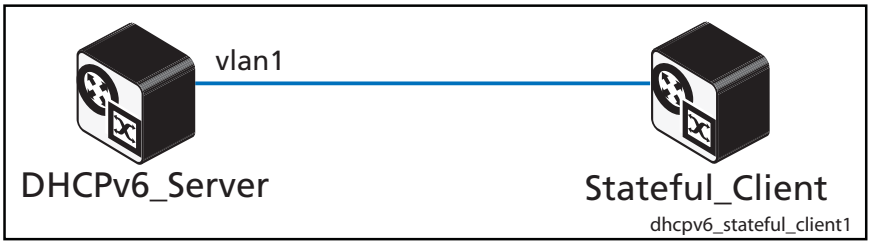
In this example, a stateful client can obtain its interface address (via DHCPv6 IANA) and other information (such as DNS, SNTP) configured in the DHCP Server delegation pool.

- The client is allocated an address from the address range configured in the DHCP Server pool. A stateful client can automatically learn about any gateway router(s) on the LAN and dynamically add associated default route(s) into its routing table via next-hop link-local address of the gateway router via router advertisements.
- RA suppression is turned off in the DHCPv6 Server to facilitate neighbor discovery.

For command information, see the **address range** and **ipv6 dhcp server** commands on the DHCPv6 Server and the **ipv6 address dhcp** command on the Stateful Client.

Note **bold** configuration command entries show hostnames and interfaces.
Also note the default VLAN interface **vlan1** is applied to all ports on a device.

Figure 94-6: DHCPv6 Server / Stateful Client configuration topology:



DHCPv6_Server Configuration (Range)

See the below configuration for a device with the hostname **DHCPv6_Server**:

```
hostname DHCPv6_Server
!
ipv6 dhcp pool pool1
 address range 2001:db8:10::2 2001:db8:10::100
 dns-server 2001:db8:10::10
 domain-name example.com
 sntp address 2001:db8:10::20
!
interface vlan1
 description to_Stateful_Client
 ipv6 address 2001:db8:10::1/64
 ipv6 enable
 no ipv6 nd suppress-ra
 ipv6 nd managed-config-flag
 ipv6 nd other-config-flag
 ipv6 dhcp server pool1
!
ipv6 forwarding
```

Stateful_Client Configuration (IANA)

See the below configuration for a device with the hostname **Stateful_Client**:

```
hostname Stateful_Client
!
interface vlan1
 ipv6 address dhcp
```

Configure DHCPv6 Server/Stateless Client

The Stateless Client can automatically learn about any gateway router(s) on the LAN via router solicitation. It can then dynamically add associated default route(s) into its routing table via the next-hop link-local address of the gateway router.

From RFC 4864, section 5.5.3: If the sum of the prefix length and interface identifier length does not equal 128 bits, the Prefix Information option must be ignored.

The effect is that prefix information received in an RA will not be applied to form an IPv6 address via SLAAC if the prefix is greater or less than 64. Since EUI is 64 bits in length the IPv6 Prefix of the advertising device must be 64 bits as well.

For command information, see the **address prefix** and **ipv6 dhcp server** commands on the DHCPv6 Server and the **ipv6 address autoconfig** command on the Stateless Client.

Note **bold** configuration command entries show hostnames and interfaces.
Also note the default VLAN interface **vlan1** is applied to all ports on a device.

Figure 94-7: DHCPv6 Server / Stateless Client configuration topology:

DHCPv6_Server Configuration (Prefix)

See the below alternative configuration for a device with the hostname **DHCPv6_Server**:

```
hostname DHCPv6_Server
!
ipv6 dhcp pool pool1
 address prefix 2001:db8:10::/64
 dns-server 2001:db8:10::10
 domain-name example.com
 sntp address 2001:db8:10::20
!
interface vlan1
 description to_Stateless_Client
 ipv6 address 2001:db8:10::1/64
 ipv6 enable
 no ipv6 nd suppress-ra
 ipv6 nd managed-config-flag
 ipv6 nd other-config-flag
 ipv6 dhcp server pool1
!
ipv6 forwarding
```

Stateless_Client Configuration (SLAAC)

See the below configuration for a device with the hostname **Stateless_Client**:

```
hostname Stateless_Client
!
interface vlan1
 ipv6 address autoconfig
```

Configure DHCPv6 Relay / Server / Client

In this example, a stateful client device (via IANA) obtains its interface address from a DHCPv6 Server pool. In this example, the DHCPv6 Client resides in a network that is remote from the DHCPv6 Server and communicates via an intermediate DHCPv6 Relay. Diagnostics command output is shown following the configuration output.

The DHCPv6 Server needs a route to the remote LAN, where the client request originates from via the appropriate next-hop. In this example, the next-hop address is the link-local address of the DHCPv6 Relay. The route could be statically configured as in this example, or dynamically learned via an IPv6 routing protocol.

Link addresses are configured in DHCPv6 Server address pools when there are remote clients that communicate via intermediate relay(s).

When a DHCPv6 Relay receives a request from the DHCPv6 Client, it sends a **relay-forward** message toward the DHCPv6 Server. The DHCPv6 Relay message includes an address from the client-facing interface in the link-address field of the **relay-forward** message. The address of the server-facing interface is used as the IPv6 source of the relay message, and the server will send any reply to that address.

The DHCPv6 Relay automatically adds a route for the delegated prefix into its routing table for the duration of the valid lease, via the interface where the PD client device resides.

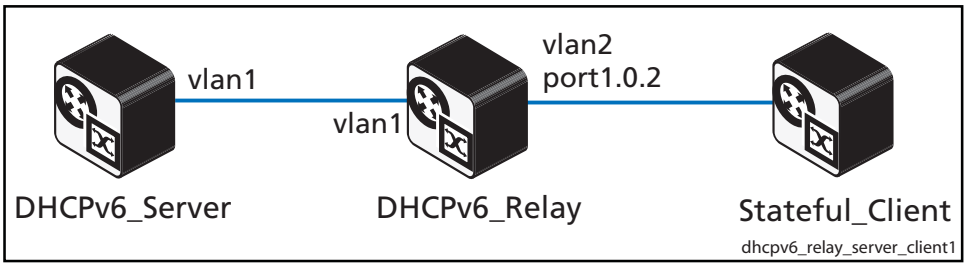
When an address on the incoming interface of the DHCPv6 Server or a link address set in the incoming delegation request packet matches the link-address prefix configured in the delegation pool, the server is able to match and use the appropriate delegation pool for relayed delegation request messages.

Active bindings are stored in non-volatile memory, and are retained over a device reboot.

For more command information, see the **link-address** and **ipv6 dhcp pool** commands on the DHCPv6 Server, the **ip dhcp-relay server-address** command on the DHCPv6 Relay, and the **ipv6 address dhcp** command on the Stateful Client.

Note **bold** configuration command entries show hostnames and interfaces.
Also note the default VLAN interface **vlan1** is applied to all ports on a device.

Figure 94-8: DHCPv6 Server / Relay / Stateful Client configuration topology:



DHCPv6_Server Configuration

See the below configuration for a device with the hostname **DHCPv6_Server**:

```
hostname DHCPv6_Server
!
ipv6 dhcp pool pool1
 address prefix 2001:db8:20::/64
 link-address 2001:db8:20::/64

Use the **show log** command to view additional useful information on the system log.

Real time protocol messages for diagnostic purposes can be viewed via verbose **tcpdump** for traffic traversing a VLAN, for example:

```
awplus#tcpdump -vvvni vlan1
```

Configure PD Server / PD Client / Stateless Client

In this example, the PD Client is assigned a prefix from the PD Server via IAPD.

- PD_Client auto-configures an upstream VLAN interface **vlan1** address via SLAAC.
- PD_Client is assigned a prefix from PD_Server via IAPD.
- PD _Client auto-configures its downstream VLAN interface **vlan2** address derived from a combination the delegated prefix and eui64 suffix.
- Stateless_Client auto configures its VLAN interface address using SLAAC.

For more command information, see the **prefix-delegation pool** and **ipv6 dhcp server** commands on the DHCPv6 PD Server, the **ipv6 dhcp client pd** command on the DHCPv6 PD Client, and the **ipv6 address autoconfig** command on the Stateless Client.

Note **bold** configuration command entries show hostnames and interfaces.
Also note the default VLAN interface **vlan1** is applied to all ports on a device.

Figure 94-9: PD_Server /PD_Client / Stateless_Client configuration topology:

Configure PD via DHCPv6 Relay

This example includes Prefix Delegation (IAPD) via an intermediate DHCPv6 relay. The DHCPv6 server requires a route to the remote IPv6 subnet of the DHCPv6 relay, where the source of the IA PD request originates from via the link-local address of the DHCPv6 Relay.

For detailed command information, see the **prefix-delegation pool** and **ipv6 dhcp server** commands on the DHCPv6 PD Server, the **ip dhcp-relay server-address** command on the DHCPv6 Relay, the **ipv6 dhcp client pd** command on the DHCPv6 PD Client, and the **ipv6 address autoconfig** command on the Stateless Client.

Note **bold** configuration command entries show hostnames and interfaces.
Also note the default VLAN interface **vlan1** is applied to all ports on a device.

Figure 94-10: PD_Server / DHCPv6_Relay / PD_Client / Stateless_Client configuration topology:

Stateless_Client Configuration

See the below configuration for a device with the hostname **Stateless_Client**:

```
hostname Stateless_Client
!
interface vlan1
 ipv6 address autoconfig
!
```

Configure PD subdelegation with SLAAC

In this example, the PD subdelegation device acts as both a PD client on its upstream interface facing the PD server, and also recursively acts as a PD server, to sub-delegate prefixes to a downstream PD client. The PD subdelegation device also supports router solicitation on downstream interfaces to allow stateless client devices to auto configure themselves via SLAAC (Stateless Address Auto Configuration).

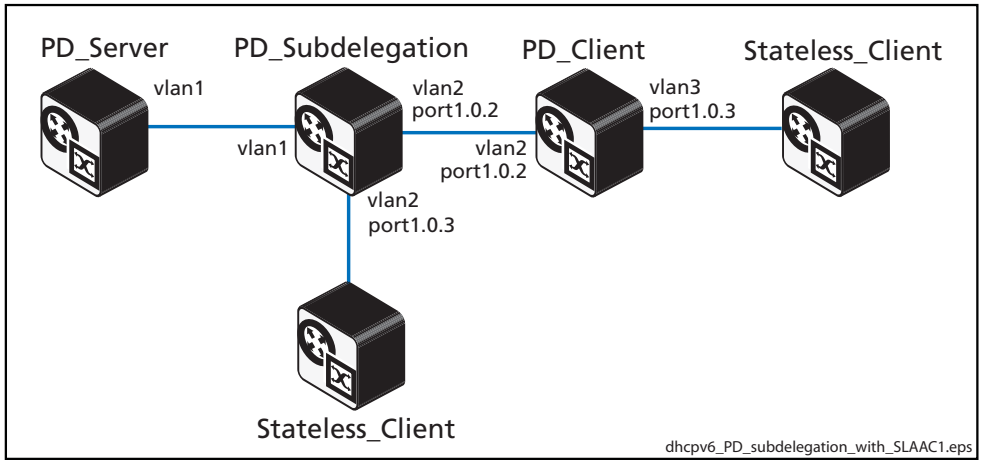
For this example, a longer prefix mask is used for each subdelegated prefix.

- The PD subdelegation device auto configures its upstream interface facing the PD server via SLAAC.
- The PD server device advertises its prefix to the PD subdelegation device. This is stored in the local address pool in the PD subdelegation device.
- The PD subdelegation device then auto configures its downstream interface based on a combination of the advertised prefix and EUI64 suffix, and advertises Router Advertisements (RAs).
- The PD subdelegation device then recursively advertises prefixes stored in its local address pool out its downstream interface to the PD client device.
- The PD client device uses SLAAC to configure its upstream **vlan2** interface. The PD client device configures its downstream **vlan3** interface based on recursively delegated prefix, and advertises RAs via **vlan3** to the attached Stateless_Client device.
- Stateless_Client devices auto configure their address and gateway router information, using SLAAC, via router solicitation and router advertisements.

For detailed command information, see the **prefix-delegation pool** and **ipv6 dhcp server** commands on the DHCPv6 PD Server and the DHCPv6 PD Subdelegation Server, the **ipv6 dhcp client pd** command on the DHCPv6 PD Client, and the **ipv6 address autoconfig** command on the Stateless Client.

Note **bold** configuration command entries show hostnames and interfaces.
Also note the default VLAN interface **vlan1** is applied to all ports on a device.

Figure 94-11: PD Server / Subdelegation / Client / Stateless Client configuration topology:



PD_Server Configuration

See the below configuration for a device with the hostname **PD_Server**:

```
hostname PD_Server

```

Configure PD subdelegation for multiple VLANs

This example is similar to the previous example, **Configure PD subdelegation with SLAAC**, with the difference being that the PD subdelegation device has two downstream VLANs (**vlan2** and **vlan3**) instead of one downstream VLAN (**vlan2**) as shown previously.

For detailed command information, see the **prefix-delegation pool** and **ipv6 dhcp server** commands on the DHCPv6 PD Server and the DHCPv6 PD Subdelegation Server, the **ipv6 dhcp client pd** command on the DHCPv6 PD Client, and the **ipv6 address autoconfig** command on the Stateless Client.

Note **bold** configuration command entries show hostnames and interfaces.
Also note the default VLAN interface **vlan1** is applied to all ports on a device.

Figure 94-12: PD Server / Subdelegation / Client / Stateless Client (multiple VLANs) configuration topology:

PD Subdelegation System Configuration

This section provides an example of a DHCPv6 PD sub-delegating system, involving multiple delegation pools, with device configuration output listed for each of the devices configured for PD sub-delegation:

- **Stateful_Client Configuration**
- **Stateless_Client Configuration**
- **PD_Subdelegation Configuration**
- **PD_Client Configuration**
- **PD_Server1 Configuration**
- **PD_Server2 Configuration**
- **DHCPv6_Relay Configuration**

Note the functionality for configured devices in this multiple delegation pool system:

- **PD_Server1** is configured with a single IAPD delegation pool, **IAPD_pool1**.
- **PD_Server2** is configured with two pools; **IAPD_pool2** is used to delegate prefix information via intermediate **DHCPv6_Relay** to the subdelegation device via **vlan2**, and **IANA_pool3** is used to delegate address information to **Stateful_Client** via **vlan3**.
- **PD_Subdelegation** uses SLAAC to configure its upstream interfaces and acts as PD client on its upstream interfaces (**vlan1** and **vlan4**) that face each PD server.
- **PD_Subdelegation** downstream interface **vlan5** is configured based on the prefix delegated via the upstream interface **vlan1**.
- **PD_Subdelegation** downstream interface **vlan6** is configured based on the prefix delegated via upstream interface **vlan4**.
- Prefix information delegated via **PD_Client** interface **vlan4** is recursively sub-delegated via the downstream interface **vlan6** to **PD_Client**.
- Stateless clients auto configure themselves based on RAs.

Note **bold** configuration command entries show hostnames and interfaces.
Also note the default VLAN interface **vlan1** is applied to all ports on a device.

For the syntaxes, parameters, descriptions, defaults, and examples for all of the commands used in the following DHCPv6 configurations, refer to **Chapter 95, DHCP for IPv6 (DHCPv6) Commands** for the DHCPv6 Client Server PD commands and **Chapter 93, Dynamic Host Configuration Protocol (DHCP) Commands** for the DHCPv6 Relay commands.

Figure 94-14: PD sub-delegation system configuration example topology:

Command List

This chapter provides an alphabetical reference for commands used to configure DHCPv6. For introductory information, see **Chapter 94, DHCP for IPv6 (DHCPv6) Introduction and Configuration**.

DHCPv6 is a network protocol used to configure IPv6 hosts with IPv6 addresses and IPv6 prefixes for an IPv6 network. DHCPv6 is used instead of SLAAC (Stateless Address Autoconfiguration) at sites where centralized management of IPv6 hosts is needed. IPv6 routers require automatic configuration of IPv6 addresses and IPv6 prefixes. DHCPv6 Prefix Delegation provides automatic configuration of IPv6 addresses and IPv6 prefixes.

For information about modifying or redirecting the output from **show** commands to a file, see **"Controlling "show" Command Output" on page 1.38**.

The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical networks (other than for testing purposes) nor should they appear on any public network.

address prefix

Use this command in DHCPv6 Configuration mode to specify an address prefix for address assignment with DHCPv6 server pool configuration.

Use the **no** variant of this command to remove the address prefix from the DHCPv6 server pool.

Syntax

```
address prefix <ipv6-prefix/prefix-length>
   [lifetime {<valid-time>|infinite} {<preferred-time>|infinite}]

no address prefix <ipv6-prefix/prefix-length>
```

Parameter	Description
<ipv6-prefix/prefix-length>	Specify an IPv6 prefix and prefix length, The prefix length indicates the length of the IPv6 prefix assigned to the pool. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.
`lifetime`	Optional. Specify a time period for the hosts to remember router advertisements (RAs). If you specify the optional `lifetime` parameter with this command then you must also specify a *valid-time* and a *preferred-time* value. See the **Usage** notes below this parameter table for a description of preferred and valid lifetimes and how these determine deprecated or invalid IPv6 addresses upon expiry.
<valid-time>	Specify a valid lifetime in seconds in the range <5-315360000>. The default valid lifetime is 2592000 seconds.
`infinite`	Specify an infinite valid lifetime or an infinite preferred lifetime, or both, when using this keyword.
<preferred-time>	Specify a preferred lifetime in seconds in the range <5-315360000>. The default preferred lifetime is 604800 seconds.

Mode DHCPv6 Configuration

Default The default valid lifetime is 2592000 seconds and the default preferred lifetime is 604800 seconds.

Usage This command creates a pool of prefixes from which addresses are assigned to clients on request, and allocates a network prefix from which the DHCPv6 Server leases addresses. This command is an alternative to using a range set using the **address range** command.

The DHCPv6 Server selects an IPv6 address from the range available allocated by the IPv6 prefix, randomly generating the suffix of the IPv6 address, with the specified preferred and valid lifetime leases. Leased IPv6 address are found in the DHCPv6 Server **REPLY** packet, which is located within the IANA (Identity Association for Non-temporary Addresses) IA address field in the **REPLY** message.

For more message information see the **DHCPv6 Messages** section and the **DHCPv6 Client and Server Identification** section in **Chapter 94, DHCP for IPv6 (DHCPv6) Introduction and Configuration**.

Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires.

Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.

An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.

Examples To add IPv6 address prefix `2001:0db8:1::/48` for DHCPv6 server pool configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcp6)# address prefix 2001:0db8:1::/48
```

To remove a configured IPv6 address prefix for DHCPv6 server pool configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcp6)# no address prefix 2001:0db8:1::/48
```

Related Commands
address range
ipv6 dhcp pool

Validation Commands
show ipv6 dhcp binding
show ipv6 dhcp pool

address range

Use this command in DHCPv6 Configuration mode to specify an address range for address assignment with DHCPv6 server pool configuration.

Use the **no** variant of this command to remove an address range from the DHCPv6 server pool.

Syntax

```
address range <first-ipv6-address> <last-ipv6-address>
   [lifetime {<valid-time>|infinite} {<preferred-time>|infinite}]

no address range <first-ipv6-address> <last-ipv6-address>
```

Parameter	Description
<first-ipv6-address>	Specify the first IPv6 address of the IPv6 address range, in hexadecimal notation in the format X:X::X:X.
<last-ipv6-address>	Specify the last IPv6 address of the IPv6 address range, in hexadecimal notation in the format X:X::X:X.
lifetime	Optional. Specify a time period for the hosts to remember router advertisements (RAs). If you specify this parameter then you must also specify a *valid-time* and a *preferred-time* value. See the **Usage** notes below this parameter table for a description of preferred and valid lifetimes and how these determine deprecated or invalid IPv6 addresses upon expiry.
<valid-time>	Specify a valid lifetime in seconds in the range <5-31536000>. The default valid lifetime is 2592000 seconds.
infinite	Specify an infinite valid lifetime or an infinite preferred lifetime, or both, when using this keyword.
<preferred-time>	Specify a preferred lifetime in seconds in the range <5-31536000>. The default preferred lifetime is 604800 seconds.

Default The default valid lifetime is 2592000 seconds and the default preferred lifetime is 604800 seconds.

Mode DHCPv6 Configuration

Usage Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires.

Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.

An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.

Examples

To add the IPv6 address range `2001:0db8:1::1` to `2001:0db8:1fff::1` for DHCPv6 server pool configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcp6)# address range 2001:0db8:1::1
2001:0db8:1fff::1
```

To remove a configured IPv6 address range for DHCPv6 server pool configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcp6)# no address range
```

Related Commands

address prefix
ipv6 dhcp pool

Validation Commands

show ipv6 dhcp binding
show ipv6 dhcp pool

clear counter ipv6 dhcp-client

Use this command in Privileged Exec mode to clear DHCPv6 client counters.

Syntax `clear counter ipv6 dhcp-client`

Mode Privileged Exec

Example To clear DHCPv6 client counters, use the following command:

```
awplus# clear counter ipv6 dhcp-client
```

Related Commands **show counter ipv6 dhcp-client**

clear counter ipv6 dhcp-server

Use this command in Privileged Exec mode to clear DHCPv6 server counters.

Syntax `clear counter ipv6 dhcp-server`

Mode Privileged Exec

Example To clear DHCPv6 server counters, use the following command:

```
awplus# clear counter ipv6 dhcp-server
```

Related Commands **show counter ipv6 dhcp-server**

clear ipv6 dhcp binding

Use this command in Privileged Exec mode to clear either a specific lease binding or the lease bindings as specified by the command parameters. The command will only take effect on dynamically allocated bindings, not statically configured bindings. This command clears binding entries on the DHCPv6 server binding table.

Syntax `clear ipv6 dhcp binding {ipv6 <prefix>|duid <DUID>|all|pool <name>}`

Parameter	Description
`ipv6 <prefix>`	Optional. Specify the IPv6 prefix of the DHCPv6 client, in hexadecimal notation in the format `X:X::X:X`.
`duid <DUID>`	Specify the DUID (DHCPv6 unique ID) of the DHCPv6 client.
`all`	All DHCPv6 bindings.
`pool <name>`	Description used to identify DHCPv6 server address pool. Valid characters are any printable character. If the name contains spaces then you must enclose these in “quotation marks”.

Mode Privileged Exec

Usage A specific binding may be deleted by **ipv6** address or **duid** address, or several bindings may be deleted at once using **all** or **pool**.

Note that if you specify to clear the **ipv6** or **duid** address of what is actually a static DHCPv6 binding, an error message is displayed. If **all** or **pool** are specified and one or more static DHCPv6 bindings exist within those addresses, any dynamic entries within those addresses are cleared but any static entries are not cleared.

The clear ipv6 dhcp binding command is used as a server function. A binding table entry on the DHCPv6 server is automatically:

- Created whenever a prefix is delegated to a client from the configuration pool.
- Updated when the client renews, rebinds, or confirms the prefix delegation.
- Deleted when the client releases all the prefixes in the binding, all prefix lifetimes have expired, or when a user runs the clear ipv6 dhcp binding command.

If the clear ipv6 dhcp binding command is used with the optional IPv6 address parameter, only the binding for the specified client is deleted. If the clear ipv6 dhcp binding command is used without the optional IPv6 address parameter, then all automatic client bindings are deleted from the DHCPv6 bindings table.

Example To clear all dynamic DHCPv6 server binding entries, use the command:

```
awplus# clear ipv6 dhcp binding all
```

Output **Figure 95-1: Example output from the clear ipv6 dhcp binding all command**

```
awplus#clear ipv6 dhcp binding all
% Deleted 1 entries
```

Related Commands **show ipv6 dhcp binding**

clear ipv6 dhcp client

Use this command in Privileged Exec mode to restart a DHCPv6 client on an interface.

Syntax `clear ipv6 dhcp client <interface>`

Parameter	Description
<interface>	Specify the interface name to restart a DHCPv6 client on.

Mode Privileged Exec

Example To restart a DHCPv6 client on interface vlan1, use the following command:

```
awplus# clear ipv6 dhcp client vlan1
```

Related Commands **show ipv6 dhcp binding**

dns-server (DHCPv6)

Use this command to add a Domain Name System (DNS) server to the DHCPv6 address pool you are configuring. You can use this command multiple times to create a list of DNS name servers available to the client. This sets the DNS server details using the pre-defined option 6. Note that if you add a user-defined option 6 using the **option (DHCPv6)** command on page 95.27, then you will override any settings created with this command.

Use the **no** variant of this command to remove either the specified DNS server or all DNS servers from the DHCPv6 pool.

Syntax

```
dns-server <ipv6-address>
no dns-server [<ipv6-address>]
```

Parameter	Description
<ipv6-address>	Specify an IPv6 address of the DNS server, in hexadecimal notation in the format `X:X::X:X`. This parameter is required when adding a DNS server to the DHCPv6 address pool. All DNS servers are removed from the DHCPv6 pool if you enter the `no dns-server` command without this parameter.

Mode DHCPv6 Configuration

Examples To add the DNS server with the assigned IPv6 address `2001:0db8:3000:3000::32` to the DHCPv6 server pool named `P2`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# dns-server 2001:0db8:3000:3000::32
```

To remove the DNS server with the assigned IPv6 address `2001:0db8:3000:3000::32` from the DHCPv6 server pool named `P2`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# no dns-server 2001:0db8:3000:3000::32
```

To remove all DNS servers from the DHCPv6 server pool named `P2`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# no dns-server
```

Related Commands

ipv6 dhcp pool
option (DHCPv6)
show ipv6 dhcp pool

domain-name (DHCPv6)

Use this command in DHCPv6 Configuration mode to add a domain name to the DHCPv6 server address pool you are configuring.

Use the **no** variant of this command to remove a domain name from the address pool.

Syntax

```
domain-name <domain-name>
no domain-name
```

Parameter	Description
<domain-name>	Specify the domain name you wish to assign the DHCPv6 server address pool. Valid characters are printable characters. If the name contains spaces then you must enclose it in "quotation marks".

Mode DHCPv6 Configuration

Mode This command specifies the domain name that a client should use when resolving host names using the Domain Name System, and sets the domain name details using the pre-defined option 15. Note that if you add a user-defined option 15 using the **option (DHCPv6)** command on page 95.27, then you will override any settings created with this command.

Examples To add the domain name `Engineering` to DHCPv6 server pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# domain-name Engineering
```

To remove the domain name `Engineering` from DHCPv6 server pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# no domain-name Engineering
```

Related Commands

dns-server (DHCPv6)
option (DHCPv6)
show ipv6 dhcp pool

ipv6 address (DHCPv6 PD)

Use this command in Interface Configuration mode for a VLAN interface to append an IPv6 address suffix to the IPv6 prefix provided by a DHCPv6 Prefix Delegation (PD) server.

Use the **no** variant of this command to remove the IPv6 address assigned and disable IPv6. Note that if no global addresses are left after removing the IPv6 address then IPv6 is disabled.

Syntax

```
ipv6 address [<ipv6-prefix-name>] <ipv6-addr/prefix-length> [eui64]

no ipv6 address [<ipv6-prefix-name>] <ipv6-addr/prefix-length>
    [eui64]
```

Parameter	Description
<ipv6-prefix-name>	The IPv6 prefix name advertised on the router advertisement message sent from the switch. The IPv6 prefix name is delegated from the DHCPv6 Server configured for DHCPv6 Prefix-Delegation.
<ipv6-addr/prefix-length>	Specifies the IPv6 address to be set, for example, ::1/64. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.
`[eui64]`	EUI-64 is a method of automatically deriving the lower 64 bits of an IPv6 address, based on the switch's MAC address.

Mode Interface Configuration for a VLAN interface.

Usage When specifying the eui64 parameter, the interface identifier of the IPv6 address is derived from the MAC address of the switch.

See the **IPv6 EUI-64 Addressing** section in **Chapter 28, IPv6 Introduction** for further EUI-64 implementation information.

Examples To configure a PD prefix named `prefix1` on interface `vlan1` and then add an IPv6 address, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 dhcp client pd prefix1
awplus(config-if)# ipv6 address prefix1::1/64
```

In this example, the prefix will be assigned from the pool on the PD client. The host portion or suffix will be ::1 for the last 64 bits.

To configure a PD prefix named `prefix1` on interface `vlan1` and then add an IPv6 address using EUI-64 identifiers, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 dhcp client pd prefix1
awplus(config-if)# ipv6 address prefix1/64 eui64
```

In this example, the prefix will be assigned from the pool on the PD client. The host portion or suffix is created from the EUI-64 identifier of the interface for the last 64 bits.

To assign the IPv6 address `2001:0db8::a2/48` to the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 address 2001:0db8::a2/48
```

To remove the IPv6 address `2001:0db8::a2/48` from the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 address 2001:0db8::a2/48
```

To assign the **eui64** derived address in the prefix `2001:db8::/64` to VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 address 2001:0db8::/64 eui64
```

To remove the **eui64** derived address in the prefix `2001:db8::/32` from VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 address 2001:0db8::/64 eui64
```

ipv6 address dhcp

Use this command in Interface Configuration mode to activate the DHCPv6 client on the interface that you are configuring. This allows the interface to use the DHCPv6 client to obtain its IPv6 configuration details from a DHCPv6 server on its connected network.

Use the **no** variant of this command to stop the interface from obtaining IPv6 configuration details from a DHCPv6 server.

The DHCPv6 client supports the following IP configuration options:

- Option 1 - the subnet mask for your switch.
- Option 3 - a list of default routers.
- Option 6 - a list of DNS servers. This list appends the DNS servers set on your switch with the **dns-server (DHCPv6)** command.
- Option 15 - a domain name used to resolve host names. This option replaces the domain name set with the **domain-name (DHCPv6)** command.
- Option 51 - lease expiration time.

Syntax

```
ipv6 address dhcp
no ipv6 address dhcp
```

Mode Interface Configuration for a VLAN interface or a local loopback interface.

Examples To set the interface `vlan10` to use DHCPv6 to obtain an IPv6 address, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config)# ipv6 enable
awplus(config-if)# ipv6 address dhcp
```

To stop the interface `vlan10` from using DHCPv6 to obtain its IPv6 address, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ipv6 address dhcp
```

Related Commands **ipv6 address**

Validation Commands **show running-config**

ipv6 dhcp client pd

Use this command in Interface Configuration mode to enable the DHCPv6 client process and enable requests for prefix delegation through the interface that you are configuring.

Use the **no** variant of this command to disable requests for prefix delegation. This is the default setting.

For further information about DHCPv6 Prefix Delegation, which is used to automate the process of assigning prefixes, see **Chapter 94, DHCP for IPv6 (DHCPv6) Introduction and Configuration**.

Syntax

```
ipv6 dhcp client pd <prefix-name>

no ipv6 dhcp client pd
```

Parameter	Description
<prefix-name>	Specify an IPv6 general prefix name. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks".

Mode Interface Configuration

Default Prefix delegation is disabled by default on an interface.

Usage Entering the **ipv6 dhcp client pd** command starts the DHCPv6 client process if not already running, and enables requests for prefix delegation through the interface on which the command is configured.

When prefix delegation is enabled and a prefix is acquired, the prefix is stored in the IPv6 prefix pool with an internal name defined by the required *<prefix-name>* placeholder parameter. The **ipv6 address** command can then refer to the prefixes stored in the IPv6 prefix pool.

Examples To enable prefix delegation with the prefix name `prefix-name` on the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 dhcp client pd my-prefix-name
```

To disable prefix delegation on the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 dhcp client pd
```

Related Commands
clear ipv6 dhcp client

ipv6 dhcp option

Use this command in Global Configuration mode to create a user-defined DHCPv6 option. You can then use this option when configuring a DHCPv6 server address pool, by using the **option (DHCPv6)** command.

Options with the same number as one of the pre-defined options override the standard option definition. The pre-defined options use the option numbers 1, 3, 6, 15, and 51.

Use the **no** variant of this command to remove either the specified user-defined option. This also removes user-defined options from the associated DHCPv6 server address pools.

Syntax

```
ipv6 dhcp option <1-254> [name <option-name>] [<option-type>]
no ipv6 dhcp option <1-254>|<option-name>
```

Parameter	Description	
<1-254>	The option number of the option. Options with the same number as one of the standard options overrides the standard option definition.	
<option-name>	Option name used to identify the option. You cannot use a number as the option name. Valid characters are any printable character. If the name contains spaces then you must enclose it in “quotation marks”. Default: no default	
<option-type>	The option value. You must specify a value that is appropriate to the option type:	
	`asci`	An ASCII text string
	`hex`	A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.
	`ipv6`	An IPv6 address or prefix that has hexadecimal notation in the format `HHHH:HHHH::HHHH:HHHH`. To create a list of IPv6 addresses, you must add each IPv6 address individually by using the option command multiple times.
	`integer`	A number from 0 to 4294967295.
	`flag`	A value that either sets (to 1) or unsets (to 0) a flag: **true**, **on**, or **enabled** will set the flag **false**, **off** or **disabled** will unset the flag.

Mode Global Configuration

Examples

To define a user-defined ASCII string option as option 66, without a name, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp option 66 ascii
```

To define a user-defined hexadecimal string option as option 46, with the name "tcpip-node-type", use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp option 46 name tcpip-node-type hex
```

To define a user-defined IP address option as option 175, with the name `special-address`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp option 175 name special-address ip
```

To remove the specific user-defined option with the option number `12`, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 dhcp option 12
```

To remove the specific user-defined option with the option name `perform-router-discovery`, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 dhcp option perform-router-discovery
```

Related Commands

domain-name (DHCPv6)
option (DHCPv6)
show ipv6 dhcp

ipv6 dhcp pool

Use this command in Global Configuration mode to enter the DHCPv6 Configuration mode for the DHCPv6 server pool name as specified in the required command parameter. If the name specified is not associated with an existing pool, the switch will create a new pool with this name, then enter the configuration mode for the new pool.

Once you have entered the DHCPv6 configuration mode, all commands executed before the next **exit** command will apply to this pool.

You can create multiple DHCPv6 server pools on switches with multiple interfaces. This allows the switch to act as a DHCPv6 server on multiple interfaces to distribute different information to clients on the different networks.

Use the **no** variant of this command to delete the specific DHCPv6 pool.

Syntax

```
ipv6 dhcp pool <DHCPv6-poolname>
no ipv6 dhcp pool <DHCPv6-poolname>
```

Parameter	Description
<DHCPv6-poolname>	Description used to identify this DHCPv6 server pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in “quotation marks”.

Mode Global Configuration

Usage All DHCPv6 prefix pool names must be unique. IPv6 prefix pools have a similar function to IPv4 address pools. Contrary to IPv4, a block of IPv6 addresses (an IPv6 address prefix) are assigned and not single IPv6 addresses. IPv6 prefix pools are not allowed to overlap.

Once a pool is configured, it cannot be changed. To change the configuration, you must remove then recreate a IPv6 prefix pool. All IPv6 prefixes already allocated are also freed.

Examples To create the DHCPv6 pool named `P2` and enter DHCPv6 configuration mode, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)#
```

To delete the DHCPv6 pool named `P2`, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 dhcp pool P2
```

Related Commands
ipv6 local pool
option (DHCPv6)
prefix-delegation pool
show ipv6 dhcp binding
show ipv6 dhcp pool

ipv6 dhcp server

Use this command in Interface Configuration mode to enable DHCPv6 server for the current IPv6 configured interface to use the specified DHCPv6 server pool name.

The DHCPv6 server service listens for DHCPv6 requests on the IPv6 configured interface. The DHCPv6 server service does not run on interfaces without IPv6 configured on them.

Use the **no** variant of this command to disable the DHCPv6 server.

Syntax

```
ipv6 dhcp-server [<DHCPv6-poolname>]

no ipv6 dhcp-server
```

Parameter	Description
<DHCPv6-poolname>	Specify a named DHCPv6 server pool as defined with the **ipv6 dhcp pool** command. Valid characters are any printable character. If the name contains spaces then you must enclose it in “quotation marks”.

Mode Interface Configuration

Usage The **ipv6 dhcp server** command enables the DHCPv6 service on a specified interface using the pool for prefix delegation and configuration through the specified interface.

Note that DHCPv6 client, DHCPv6 server and DHCPv6 relay are mutually exclusive on an interface. When one of the DHCPv6 functions is enabled on an interface then another DHCPv6 function cannot be enabled on the same interface.

Examples To enable the DHCPv6 server service and use the DHCPv6 pool named `P2` on VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 dhcp server P2
```

To disable the DHCPv6 server on VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 dhcp server
```

Related Commands

ipv6 dhcp pool
show ipv6 dhcp binding
show ipv6 dhcp pool

ipv6 local pool

Use this command in Global Configuration mode to configure a local DHCPv6 server prefix delegation pool specifying a poolname and a prefix/prefix length. You can optionally exclude the locally assigned prefix from the pool with the **exclude-local-prefix** keyword.

Use the **no** variant of this command to remove a local DHCPv6 server prefix delegation pool specifying the poolname.

Syntax

```
ipv6 local pool <DHCPv6-poolname> <delegated-prefix-name>
   <ipv6-prefix/prefix-length> <assigned-length>
   [exclude-local-prefix]

no ipv6 local pool
```

Parameter	Description
<DHCPv6-poolname>	Description used to identify this DHCPv6 server pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in “quotation marks”.
<delegated-prefix-name>	Description used to identify the delegated prefix name from the parent PD (Prefix Delegation) server. If the name contains spaces then you must enclose it in “quotation marks”.
<ipv6-prefix/prefix-length>	Specify an IPv6 prefix and prefix length. The prefix length indicates the length of the IPv6 prefix assigned to the pool. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.
<assigned-length>	Specify an IPv6 prefix length assigned to the user from the pool in the range <1-128>. Note that the value of the *assigned-length* parameter entered cannot be less than or equal to the *prefix-length* parameter value entered. An assigned length must be longer than a prefix length.
exclude-local-prefix	Optional. Specify this keyword to exclude the locally assigned prefix from the pool.

Default No DHCPv6 server prefix delegation pool is configured by default.

Mode Global Configuration

Usage All IPv6 prefix pool names must be unique. IPv6 prefix pools have a similar function to IPv4 address pools. Contrary to IPv4, a block of IPv6 addresses (an IPv6 address prefix) are assigned and not single IPv6 addresses. IPv6 prefix pools are not allowed to overlap.

Once a pool is configured, it cannot be changed. To change the configuration, you must remove then recreate a IPv6 prefix pool. All IPv6 prefixes already allocated are also freed.

Examples To create a local DHCPv6 local pool named `P2` with the IPv6 prefix and prefix length `2001:0db8::/32` with an assigned length of `64`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 local pool P2 2001:0db8::/32 64
```

To remove a configured DHCPv6 local pool, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 local pool
```

Related Commands **ipv6 dhcp pool**
show ipv6 dhcp pool

ipv6 nd prefix (DHCPv6)

Use this command in Interface Configuration mode for a VLAN interface to specify IPv6 RA (Router Advertisement) prefix information generated from the DHCPv6 Server for DHCPv6 Prefix-Delegation for the VLAN interface.

Use the **no** variant of this command to remove IPv6 RA prefix information from the DHCPv6 Server for DHCPv6 Prefix-Delegation for the interface. Use the **all** parameter with the **no** variant of this command to remove all prefix names and all prefixes for an interface.

Syntax

```
ipv6 nd prefix <ipv6-prefix-name> <ipv6-prefix/length>
   {<valid-lifetime>|infinite} {<preferred-lifetime>|infinite}
   {off-link|no-autoconfig}

no ipv6 nd prefix {<ipv6-prefix-name>|<ipv6-prefix/length>|all}
```

Parameter	Description
<ipv6-prefix-name>	The IPv6 prefix name advertised on the router advertisement message sent from the switch. The IPv6 prefix name is delegated from the DHCPv6 Server configured for DHCPv6 Prefix-Delegation.
<ipv6-prefix/length>	The IPv6 prefix and prefix length advertised on the router advertisement message sent from the switch. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64..
<valid-lifetime>	The the period during which the specified IPv6 address prefix is valid. This can be set to a value between 5 and 315360000 seconds. Note that this period should be set to a value greater than that set for the prefix preferred-lifetime. See the **Usage** notes after this parameter table for a description of valid lifetime and how it determines invalid IPv6 addresses upon expiry.
`infinite`	Specifying this keyword instead of entering a value for the *<valid-lifetime>* parameter applies an infinite valid lifetime.
<preferred-lifetime>	Specifies theIPv6 prefix preferred lifetime. This is the period during which the IPv6 address prefix is considered current. Set this to a value between 0 and 315360000 seconds. Note that this period should be set to a value less than that set for the prefix valid-lifetime. See the **Usage** notes after this parameter table for a description of preferred lifetime and how it determines deprecated IPv6 addresses upon expiry.
`infinite`	Specifying this keyword instead of entering a value for the *<preferred-lifetime>* parameter applies an infinite valid lifetime.
`off-link`	Specify the IPv6 prefix off-link flag.
`no-autoconfig`	Specify the IPv6 prefix no autoconfiguration flag. Setting this flag indicates that the prefix is not to be used for autoconfiguration.
`all`	Specify all prefix names and all prefixes are removed when used with the **no** variant of this command.

Mode Interface Configuration for a VLAN interface.

Usage This command specifies the IPv6 prefix flags that are advertised by the router advertisement message.

Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires.

Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.

An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.

Examples The following example configures the switch to issue RAs (Router Advertisements) on the VLAN interface `vlan4`, and advertises the DHCPv6 prefix name `prefix1` and the IPv6 address prefix of `2001:0db8::/32`.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 dhcp client pd prefix1
awplus(config-if)# ipv6 nd prefix prefix1 2001:0db8::/32
```

The following example resets router advertisements on the VLAN interface `vlan4`, so the address prefix of `2001:0db8::/32` is not advertised from the switch.

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# no ipv6 nd prefix 2001:0db8::/32
```

The following example removes all prefix names and prefixes from VLAN interface `vlan4`:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# no ipv6 nd prefix all
```

link-address

Use this command in DHCPv6 Configuration mode to specify a link-address prefix within a DHCPv6 Server pool.

Note that you can only configure one link address per DHCPv6 pool. Configuring another link address in the same DHCPv6 pool overwrites the previously configured link address.

Use the **no** variant of this command to remove the link-address prefix from the DHCPv6 Server pool.

Syntax

```
link-address <ipv6-prefix/prefix-length>

no link-address
```

Parameter	Description
<ipv6-prefix/prefix-length>	Specify an IPv6 prefix and prefix length. The prefix length indicates the length of the IPv6 prefix assigned to the pool. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.

Default No DHCPv6 Server pool configuration link address prefix is configured by default.

Mode DHCPv6 Configuration

Usage Link addresses are configured in DHCPv6 Server address pools when there are remote clients that communicate via intermediate relay(s).

RELAY-FORW and **RELAY-REPL** relay packets contain the requesting link address source.

This command is used to match incoming requests from PD (Prefix Delegation) clients (received via an intermediate relay) to a configured delegation pool.

When an address on the incoming interface of the DHCPv6 server or a link address set in the incoming delegation request packet from the prefix delegation client matches the link-address prefix configured in the delegation pool, the DHCPv6 server is able to match and use the appropriate delegation pool for relayed delegation request messages.

If there is no match between incoming delegation request packets from the prefix delegation client and the link-address prefix configured in the delegation pool, the DHCPv6 Server does not delegate an IPv6 prefix to the requesting device.

The link address should be set to the network prefix where the prefix delegation client resides. The prefix delegation server will also need a forwarding path (IPv6 route) back to the network prefix where the prefix delegation client resides.

See the application of this command in the **Configuring DHCPv6 Prefix Delegation** section of **Chapter 94, DHCP for IPv6 (DHCPv6) Introduction and Configuration** and refer to the topology shown.

Examples To configure the IPv6 prefix and prefix length `2001:0db8:1::/48` as the link address for pool `P2`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# address prefix 2001:0db8:2::/48
awplus(config-dhcp6)# link-address 2001:0db8:1::/48
```

To remove the link address, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# no link-address
```

Related Commands **ipv6 dhcp pool**
show ipv6 dhcp pool

option (DHCPv6)

Use this command in DHCPv6 Configuration mode to add a user-defined option to the DHCPv6 prefix pool you are configuring. For the **hex**, **integer**, and **flag** option types, if the option already exists, the new option overwrites the existing option's value.

Use the **no** variant of this command to remove the specified user-defined option from the DHCPv6 server pool, or to remove all user-defined options from the DHCPv6 server pool.

Syntax

```
option [<1-254>|<option-name>] <option-value>
no option [<1-254>|<option-value>]
```

Parameter	Description	
<1-254>	The option number of the option. Options with the same number as one of the standard options overrides the standard option definition.	
<option-name>	Option name associated with the option.	
<option-value>	The option value. You must specify a value that is appropriate to the option type:	
	`hex`	A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.
	`ipv6`	An IPv6 prefix that has the hexadecimal `X:X::X:X` notation. To create a list of IPv6 prefixes, you must add each IPv6 prefix individually using this command multiple times.
	`integer`	A number from 0 to 4294967295.
	`flag`	A value of either true, on, or enabled to set the flag, or false, off or disabled to unset the flag.

Mode DHCPv6 Configuration

Usage You must define a DHCPv6 option using the **ipv6 dhcp option** command before using the **option (DHCPv6)** command.

Note that options with an **ipv6** type can hold a list of IPv6 prefix (i.e. entries that have the `X:X::X:X` address format), so if the option already exists in the pool, then the new IP address is added to the list of existing IPv6 prefixes. Also note options with the same number as one of the pre-defined options override the standard option definition. The pre-defined options use the option numbers 1, 3, 6, 15, and 51.

Examples To add the IPv6 type option named `sntp-server-addr` to the pool `P2` and give the option the value `ipv6`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp option 22 name
sntp_server_addr ipv6
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# option sntp_server_addr ipv6
```

To add the ASCII-type option named `tftp-server-name` to the pool `P2` and give the option the value `server1`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# option tftp-server-name server1
```

To add the hex-type option named `tcpip-node-type` to the pool `P2` and give the option the value `08af`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# option tcpip-node-type 08af
```

To add multiple IP addresses for the ip-type option `175`, use the following commands:

```
awplus(config-dhcp6)# option 175 2001:0db8:3001::/64
awplus(config-dhcp6)# option 175 2001:0db8:3002::/64
awplus(config-dhcp6)# option 175 2001:0db8:3003::/64
```

To add the option `179` to a pool, and give the option the value `123456`, use the following command:

```
awplus(config-dhcp6)# option 179 123456
```

To add a user-defined flag option with the name `perform-router-discovery`, use the following command:

```
awplus(config-dhcp6)# option perform-router-discovery yes
```

To clear all user-defined options from a DHCP address pool, use the following command:

```
awplus(config-dhcp6)# no option
```

To clear a user-defined option, named `tftp-server-name`, use the following command:

```
awplus(config-dhcp6)# no option tftp-server-name
```

Related Commands

dns-server (DHCPv6)
ipv6 dhcp option

show ipv6 dhcp pool

prefix-delegation pool

Use this command in DHCPv6 Configuration mode to add a DHCPv6 server prefix-delegation pool entry to the current DHCPv6 pool configuration. You must define a DHCPv6 server prefix-delegation pool using the **ipv6 dhcp pool** command before using this command.

Use the **no** variant of this command to remove a DHCPv6 server prefix-delegation pool from the current DHCPv6 pool configuration.

Syntax

```
prefix-delegation pool <DHCPv6-poolname>
    [lifetime {<valid-time>|infinite} {<preferred-time>|infinite}]

no prefix-delegation pool <DHCPv6-poolname>
```

Parameter	Description
<DHCPv6-poolname>	Description used to identify this DHCPv6 server pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in “quotation marks”.
`lifetime`	Optional. Specify a time period for the hosts to remember router advertisements (RAs). If you specify this parameter then you must also specify a *valid-time* and a *preferred-time* value. See the **Usage** notes below this parameter table for a description of preferred and valid lifetimes and how these determine deprecated or invalid IPv6 addresses upon expiry.
<valid-time>	Specify a valid lifetime in seconds in the range <5-315360000>.
`infinite`	Specify an infinite valid lifetime or an infinite preferred lifetime, or both, when using this keyword.
<preferred-time>	Specify a valid lifetime in seconds in the range <5-315360000>.

Default No IPv6 local prefix pool is specified by default.

Mode DHCPv6 Configuration

Usage The DHCPv6 server assigns prefixes dynamically from an IPv6 local prefix pool, which is configured using the **ipv6 local pool** command and is associated with a DHCPv6 configuration pool using this command. When the server receives a prefix request from a client, it attempts to obtain unassigned prefixes from the pool. After the client releases the previously assigned prefixes, the server returns the prefixes to the pool for reassignment.

Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires.

Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.

An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.

Example This example adds DHCPv6 Prefix Delegation pool `pd_pool1` to DHCPv6 pool `pool1`:

```
awplus# configure terminal
awplus(config)# ipv6 local pool pd_pool1 2001:0db8::/48
56
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcp6)# prefix-delegation pool pd_pool1
```

Related Commands
ipv6 dhcp pool
ipv6 local pool
show ipv6 dhcp pool

show counter ipv6 dhcp-client

Use this command in User Exec or Privilege Exec mode to show DHCPv6 client counter information. See **show counter ipv6 dhcp-server** for DHCPv6 server information.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show counter ipv6 dhcp-client`

Mode User Exec and Privileged Exec

Example To display the DHCPv6 client counter information, use the command:

```
awplus# show counter ipv6 dhcp-client
```

Output **Figure 95-2: Example output from the show counter ipv6 dhcp-client command**

```
awplus#show counter ipv6 dhcp-client
SOLICIT out              ......... 20
ADVERTISE in             ......... 12
REQUEST out              ......... 1
CONFIRM out              ......... 0
RENEW out                ......... 0
REBIND out               ......... 0
REPLY in                 ......... 0
RELEASE out              ......... 0
DECLINE out              ......... 0
INFORMATION-REQUEST out  ......... 0
```

Table 95-1: Parameters in the output of the show counter ipv6 dhcp-client command

Parameter	Description
`SOLICIT out`	Displays the count of SOLICIT messages sent by the DHCPv6 client.
`ADVERTISE in`	Displays the count of ADVERTISE messages received by the DHCPv6 client.
`REQUEST out`	Displays the count of REQUEST messages sent by the DHCPv6 client.
`CONFIRM out`	Displays the count of CONFIRM messages sent by the DHCPv6 client.
`RENEW out`	Displays the count of RENEW messages sent by the DHCPv6 client.
`REBIND out`	Displays the count of REBIND messages sent by the DHCPv6 client.
`REPLY in`	Displays the count of REPLY messages received by the DHCPv6 client.
`RELEASE out`	Displays the count of RELEASE messages sent by the DHCPv6 client.
`DECLINE out`	Displays the count of DECLINE messages sent by the DHCPv6 client.
`INFORMATION-REQUEST out`	Displays the count of INFORMATION-REQUEST messages sent by the DHCPv6 client.

Related Commands **show counter ipv6 dhcp-server**

show counter ipv6 dhcp-server

Use this command in User Exec or Privileged Exec mode to show DHCPv6 server counter information. See **show counter ipv6 dhcp-client** for DHCPv6 client information.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show counter ipv6 dhcp-server`

Mode User Exec and Privileged Exec

Example To display the DHCPv6 server counter information, use the command:

```
awplus# show counter ipv6 dhcp-server
```

Output **Figure 95-3: Example output from the show counter ipv6 dhcp-server command**

```
awplus#show counter ipv6 dhcp-server
SOLICIT in               ......... 20
ADVERTISE out            ......... 12
REQUEST in               ......... 1
CONFIRM in               ......... 0
RENEW in                 ......... 0
REBIND in                ......... 0
REPLY out                ......... 0
RELEASE in               ......... 0
DECLINE in               ......... 0
INFORMATION-REQUEST in   ......... 0
```

Table 95-2: Parameters in the output of the show counter ipv6 dhcp-server command

Parameter	Description
`SOLICIT in`	Displays the count of SOLICIT messages received by the DHCPv6 server.
`ADVERTISE out`	Displays the count of ADVERTISE messages sent by the DHCPv6 server.
`REQUEST in`	Displays the count of REQUEST messages received by the DHCPv6 server.
`CONFIRM in`	Displays the count of CONFIRM messages received by the DHCPv6 server.
`RENEW in`	Displays the count of RENEW messages received by the DHCPv6 server.
`REBIND in`	Displays the count of REBIND messages received by the DHCPv6 server.
`REPLY out`	Displays the count of REPLY messages sent by the DHCPv6 server.
`RELEASE in`	Displays the count of RELEASE messages received by the DHCPv6 server.
`DECLINE in`	Displays the count of DECLINE messages received by the DHCPv6 server.
`INFORMATION-REQUEST in`	Displays the count of INFORMATION-REQUEST messages received by the DHCPv6 server

Related Commands **show counter ipv6 dhcp-client**

show ipv6 dhcp

Use this command in User Exec or Privileged Exec mode to show the DHCPv6 unique identifier (DUID) configured on your switch.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax

```
show ipv6 dhcp
```

Mode User Exec and Privileged Exec

Usage The DUID is based on the link-layer address for both DHCPv6 client and DHCPv6 server identifiers. The switch uses the MAC address from the lowest interface number for the DUID.

The DUID is used by a DHCPv6 client to obtain an IPv6 address from a DHCPv6 server. A DHCPv6 server compares the DUID with its database of DUIDs and sends configuration data for an IPv6 address plus the preferred and valid lease time values to a DHCPv6 client.

Example To display the DUID configured on your switch, use the command:

```
awplus# show ipv6 dhcp
```

Output **Figure 95-4: Example output from the show ipv6 dhcp command**

```
awplus#show ipv6 dhcp
DHCPv6 Server DUID: 0001000117ab6876001577f7ba23
```

Related Commands **ipv6 address dhcp**

show ipv6 dhcp binding

Use this command in User Exec or Privileged Exec mode to show the IPv6 address entries that the DHCPv6 server leases to DHCPv6 clients. Note that applying this command with the optional `summary` keyword parameter displays the number of addresses per pool, but not the address or prefix entries per pool.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show ipv6 dhcp binding [summary]`

Parameter	Description
`summary`	Optional. Specify the `summary` keyword to display summarized information for DHCPv6 server leases to client nodes, displaying the number of address entries per pool, not the addresses or prefixes.

Mode User Exec and Privileged Exec

Example 1 To display the total DHCPv6 leasing address entries for all pools, use the command:

```
awplus# show ipv6 dhcp binding summary
```

Output **Figure 95-5: Example output from the show ipv6 dhcp binding summary command**

```
awplus# show ipv6 dhcp binding summary
Pool Name                  Number of Leased Addresses
-----------------------------------------------------
ia-na1                     3
ia-pd1                     5

Total in all Pools:        8
```

Table 95-3: Parameters in the output of the show ipv6 dhcp binding summary command

Parameter	Description
`Pool Name`	Displays a list of all the pool names.
`Number of Leased Addresses`	Displays the number of leased address entries for the pool.
`Total in all Pools`	Displays the total number of leased address entries for all pools.

Example 2 To display addresses, prefixes, and lifetimes for all DHCPv6 leasing entries by pool, enter:

```
awplus# show ipv6 dhcp binding
```

Output **Figure 95-6: Example output from the show ipv6 dhcp binding command**

```
awplus#show ipv6 dhcp binding
Pool ia-na1
 Address 2002:0:3c0::1
         client IAID 77f7ba23, DUID 0001000117c4bbb4001577f7ba23
         preferred lifetime 604800, valid lifetime 2592000
         starts  at 20 Aug 2012 18:38:29
         expires at 19 Sep 2012 18:38:29
Pool ia-pd1
 Prefix  2002:0:3c0::/42
         client IAID 77f7ba23, DUID 0001000117c4bbb4001577f7ba23
         preferred lifetime 604800, valid lifetime 2592000
         starts  at 20 Aug 2012 18:38:29
         expires at 19 Sep 2012 18:38:29
```

Table 95-4: Parameters in the output of the show ipv6 dhcp binding command

Parameter	Description
`Address`	Address delegated to the indicated IAID and DUID. See the IAID and DUID descriptions below for further information.
`Prefix`	Prefix delegated to the indicated IAID and DUID. See the IAID and DUID descriptions below for further information.
`DUID`	DHCPv6 unique identifier (DUID) (see RFC 3315). Each DHCPv6 client has as DUID. DHCPv6 servers use DUIDs to identify clients for the association of IAs (Identity Associations) with DHCPv6 clients. DHCPv6 clients use DUIDs to identify a DHCPv6 server.
`IAID`	Identify Association Identifier (IAID) (see RFC 3315). IAIDs are identifiers for IAs (Identity Associations), where an IA is a collection of IPv6 addresses assigned to a DHCPv6 client. Each IA has an associated IAD. Each DHCPv6 client may have more than one IA assigned to it. Each IA holds one type of address.
`preferred lifetime`	The preferred lifetime setting in seconds for the specified IAID and DUID. Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires. Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.
`valid lifetime`	The valid lifetime setting in seconds for the specified IAID and DUID. An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.
`starts at`	The date and time at which the valid lifetime expires.
`expires at`	The date and time at which the valid lifetime expires.

Related Commands
clear ipv6 dhcp binding
ipv6 dhcp pool
show ipv6 dhcp pool

show ipv6 dhcp interface

Use this command in User Exec or Privileged Exec mode to display DHCPv6 information for a specified interface, or all interfaces when entered without the interface parameter.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show ipv6 dhcp interface [<interface-name>]`

Parameter	Description
<interface-name>	Optional. Specify the name of the interface to show DHCPv6 information about. Omit this optional parameter to display DHCPv6 information for all interfaces DHCPv6 is configured on.

Mode User Exec and Privileged Exec

Example 1 To display DHCPv6 information for all interfaces DHCPv6 is configured on, use the command:

```
awplus# show ipv6 dhcp interface
```

Output **Figure 95-7: Example output from the show ipv6 dhcp interface command**

```
awplus# show ipv6 dhcp interface
vlan1 is in client mode
 Address 1001::3c0:1
         preferred lifetime 9000, valid lifetime 5000
         starts  at 20 Jan 2012 09:21:35
         expires at 20 Jan 2012 10:25:32
vlan2 is in client (Prefix-Delegation) mode
 Prefix name pd1
         prefix 2002:0:3c0::/42
         preferred lifetime 604800, valid lifetime 2592000
         starts  at 20 Aug 2012 09:21:33
         expires at 19 Sep 2012 09:21:33
vlan3 is in server mode
 Using pool   : pool-1;
 Preference   : 0
```

Example 2 To display DHCPv6 information for interface `vlan2`, use the command:

```
awplus# show ipv6 dhcp interface vlan2
```

Output **Figure 95-8: Example output from the show ipv6 dhcp interface vlan2 command**

```
awplus# show ipv6 dhcp interface vlan2
vlan2 is in client (Prefix-Delegation) mode
 Prefix name pd1
         prefix 2002:0:3c0::/42
         preferred lifetime 604800, valid lifetime 2592000
         starts  at 20 Aug 2012 09:21:33
         expires at 19 Sep 2012 09:21:33
```

Table 95-5: Parameters in the output of the show counter dhcp-client command

Parameter	Description
`is in server/ client/(Prefix-Delegation) mode`	Displays whether the specified interface is in server or client mode and whether prefix-delegation is applied to an interface.
`Address`	Displays the address of the DHCPv6 server on the interface.
`Prefix name`	Displays the IPv6 general prefix pool name, where prefixes are stored for the interface.
`Using pool`	Displays the name of the pool used by the interface.
`Preference`	Displays the preference value for the DHCPv6 server.

Related Commands **ipv6 dhcp client pd**

show ipv6 dhcp pool

Use this command in User Exec or Privileged Exec mode to display the configuration details and system usage of the DHCPv6 address pools configured on the switch.

For information on output options, see **"Controlling "show" Command Output" on page 1.38**.

Syntax `show ipv6 dhcp pool [<DHCPv6-address-pool-name>]`

Parameter	Description
<DHCPv6-address-pool-name>	Name of a specific DHCPv6 address pool. This displays the configuration of the specified DHCPv6 address pool only.

Mode User Exec and Privileged Exec

Example

```
awplus# show ipv6 dhcp pool
```

Output **Figure 95-9: Example output from the show ipv6 dhcp pool command**

```
awplus# show ipv6 dhcp pool
DHCPv6 Pool: ia-na
 Address Prefix  : 1001::/64
         Lifetime: 2592000(valid), 604800(preferred)

 DNS Server: 2001::2
 Domain Name: example.com
 Domain Name: example.co.jp
 SNTP Server: 2001::5
 SNTP Server: 2001::6
 Option Code : 150
        Value: [ASCII] test-test
DHCPv6 Pool: ia-pd
 PD Pool Name: pd1
    Prefix   : 2002::/38-42
    Lifetime : 2592000(valid), 604800(preferred)
```

Table 95-6: Parameters in the output of the show ipv6 dhcp pool command

Parameter	Description
`DHCPv6 Pool`	Name of the DHCPv6 pool.
`Address Prefix`	Address prefix to the DHCPv6 pool.

Table 95-6: Parameters in the output of the show ipv6 dhcp pool command(cont.)

Parameter	Description
`Address Lifetime`	Valid and preferred lifetimes to the DHCPv6 pool. Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires. Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected. An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.
`DNS Server`	IPv6 address of the DNS Server
`Domain name`	URL for the domain name.
`SNTP Server`	IPv6 address of the SNTP (Simple Network Time Protocol) Server.
`Option Code`	DHCP Option code (see RFC 2132).
`Option Value`	DHCP Option value type (see RFC 2132).

Related Commands **ipv6 dhcp pool**

sntp-address

Use this command in DHCPv6 Configuration mode to add an SNTP Server IPv6 address to a DHCPv6 Server pool.

Use the **no** variant of this command to remove an SNTP Server IPv6 address from a DHCPv6 Server pool.

Syntax

```
sntp-address <ipv6-address>
no sntp-address <ipv6-address>
```

Parameter	Description
<ipv6-address>	Specify an SNTP Server IPv6 address, in hexadecimal notation in the format `X:X::X:X`.

Mode DHCPv6 Configuration

Examples The following example adds an SNTP Server IPv6 address of `2001:0db8::/32` to the DHCPv6 pool named `P2`:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# sntp-address 2001:0db8::/32
```

The following example removes an SNTP Server IPv6 address of `2001:0db8::/32` to the DHCPv6 pool named `P2`:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# no sntp-address 2001:0db8::/32
```

Introduction

The Simple Network Management Protocol (SNMP) is the network management protocol of choice for the Internet and IP-based internetworks.

This chapter describes the main features of SNMP Version 1 (SNMPv1), SNMP Version 2c (SNMPv2c) and Version 3 (SNMPv3). It also describes support for SNMP on the switch, and how to configure the switch's SNMP agent.

Unless a particular version of SNMP is named, "SNMP" in this chapter refers to versions SNMPv1, SNMPv2c and SNMPv3.

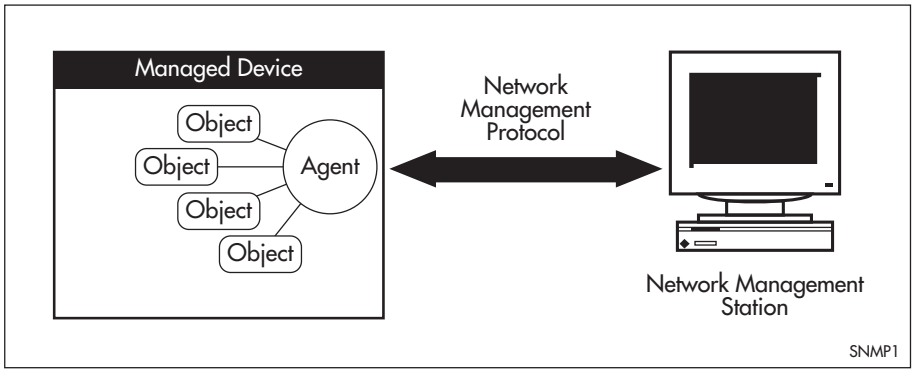
See also **Chapter 97, SNMP Commands** and **Chapter 98, SNMP MIBs**.

Network Management Framework

A network management system has the following components:

- One or more **managed devices**, each containing an agent that provides the management functions. A managed device may be any computing device with a network capability, for example, a host system, workstation, terminal server, printer, router, switch, bridge, hub or repeater.
- One or more **Network Management Stations (NMS)**. An NMS is a host system running a network management protocol and network management applications, enabling the user to manage the network.
- A **network management protocol** used by the NMS and agents to exchange information.

Figure 96-1: Components of a network management system



The Internet-standard Network Management Framework is the framework used for network management in the Internet. The framework was originally defined by the following documents:

- RFC 1155, *Structure and identification of management information for TCP/IP based internets* (referred to as the SMI), details the mechanisms used to describe and name the objects to be managed.
- RFC 1213, *Management Information Base for network management of TCP/ IP-based internets: MIB-II* (referred to as MIB-II), defines the core set of managed objects for the Internet suite of protocols. The set of managed objects can be extended by adding other MIBs specific to particular protocols, interfaces or network devices.
- RFC 1157, *A Simple Network Management Protocol (SNMP)*, is the protocol used for communication between management stations and managed devices.

Subsequent documents that have defined SNMPv2c are:

- RFC 1901, *Introduction to Community-based SNMPv2*
- RFC 1902, *Structure of Management Information for Version 2 of the Simple Network Management Protocol (SNMPv2)*
- RFC 1903, *Textual Conventions for Version 2 of the Simple Network Management Protocol (SNMPv2)*

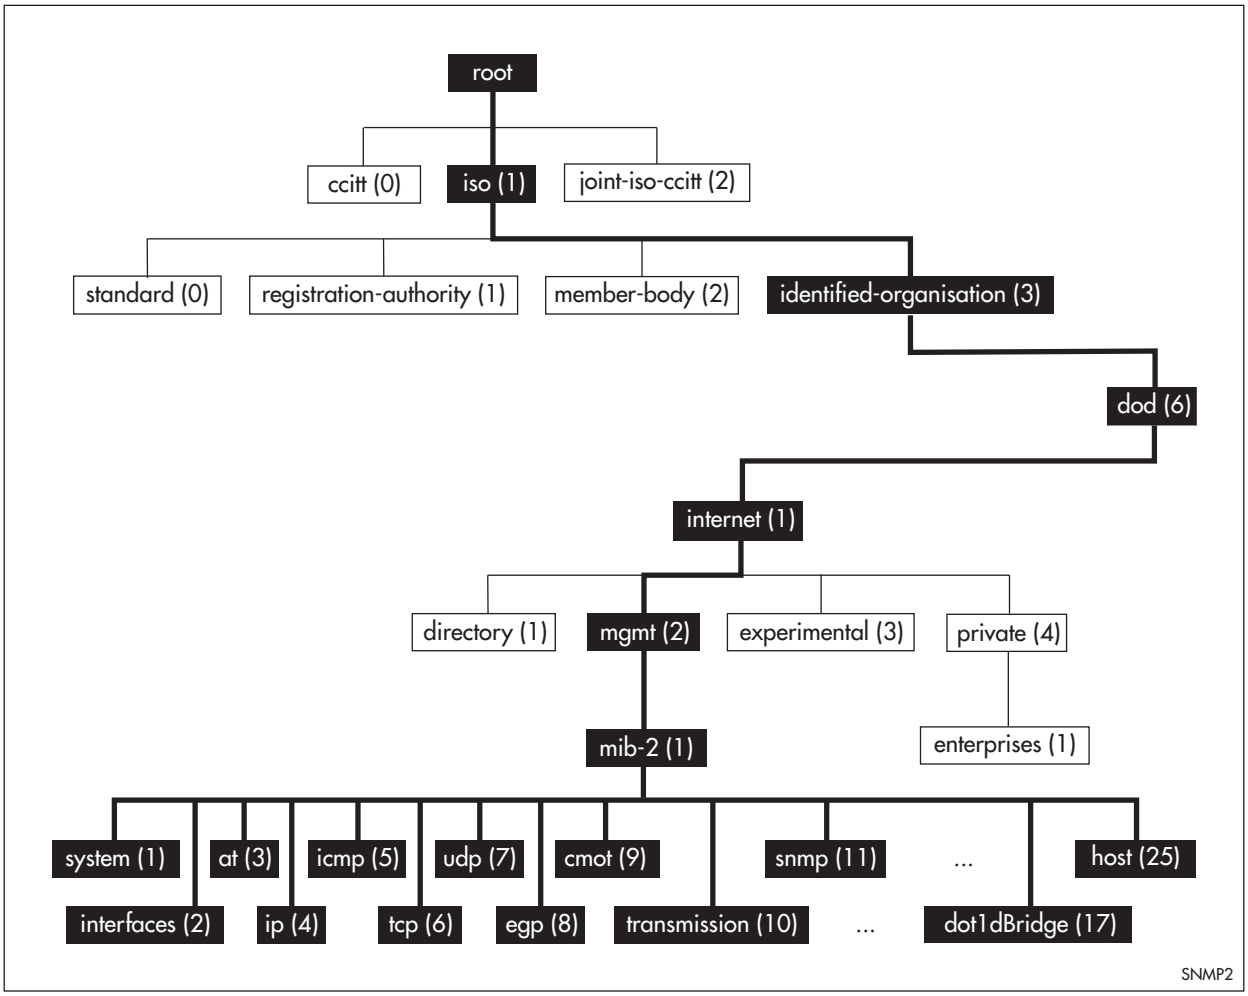
Structure of Management Information

The structure of management information (SMI) defines the schema for a collection of managed objects residing in a virtual store called the management information base (MIB). The information in a MIB includes administrative and operational configuration information, as well as counters of system events and activities.

The MIB is organized into a tree-like hierarchy in which nodes are each assigned an identifier consisting of a non-negative integer and an optional brief textual description.

Each managed object is represented by a leaf node and is defined by its name, syntax, access mode, status and description. It can also be specifically identified by its unique position within the tree. This position is expressed as a series of dot-delimited sub-identifiers that start at the root node and end in the sub-identifier at the particular object's leaf node. For example, in **Figure 96-2** the object named interfaces would be uniquely identified by the string of individual sub-identifiers, 1.3.6.1.2.1.2.

Figure 96-2: Top levels of the Internet-standard Management Information Base (MIB)



Objects defined in the Internet-standard MIB (MIB-II) reside in the mib(1) sub-tree.

Names

Names are used to identify managed objects, and are hierarchical in nature. An object identifier is a globally unique, authoritatively assigned sequence of non-negative integers which traverse the MIB tree from the root to the node containing the object.

Object identifiers may be represented in one of the following forms:

- Dotted notation lists the integer values found by traversing the tree from the root to the node in question, separated by dots. For example, the following identifies the MIB-II sub-tree:

  ```
  1.3.6.1.2.1
  ```

  The following identifies the sysDescr object in the system group of MIB-II:

  ```
  1.3.6.1.2.1.1.1
  ```

- Textual notation lists the textual descriptions found by traversing the tree from the root to the node in question, separated by spaces and enclosed in braces. For following example identifies the internet sub-tree:

  ```
  { iso org dod 1}
  ```

  The name may be abbreviated to a relative form. The following example identifies the first (directory) node of the internet sub-tree:

  ```
  { internet 1}
  ```

- Combined notation lists both the integer values and textual descriptions found by traversing the tree from the root to the node in question. The integer value is placed in parentheses after the textual description. The labels are separated by spaces and enclosed in braces. For example, the following identifies the first (directory) node in the internet sub-tree:

  ```
  {iso(1) org(3) dod(6) internet(1) 1}
  ```

  The name may be abbreviated to the following:

  ```
  directory(1)
  ```

Since there is no effective limit to the magnitude of non-negative integers, and no effective limit to the depth of the tree, the MIB provides an unlimited name space.

An object is also usually assigned an object descriptor. The object descriptor is a unique, mnemonic, printable string intended for humans to use when discussing the MIB.

Instances

Objects are just templates for data types. An actual value that can be manipulated by an NMS is an instance of an object. An instance is named by appending an instance identifier to the end of the object's object identifier. The instance identifier depends on the object's data type:

- If the object is not a column in a table, the instance identifier is 0 (zero). For example, the instance of the sysDescr object is:

  ```
  sysDescr.0
  or 1.3.6.1.2.1.1.1.0
  ```

- If the object is a column in a table, the method used to assign an instance identifier varies. Typically, the value of the index column or columns is used.

The object ifTable in MIB-II contains information about interfaces and is indexed by the interface number, ifIndex. The instance of the ifDescr object for the first interface is:

```
ifDescr.1
or 1.3.6.1.2.1.2.2.1.2.1
```

If the index column is an IP address, the entire IP address is used as the instance identifier. The object ipRouteTable in MIB-II contains information about IP routes and is indexed by the destination address, ipRouteDest. The instance of the ipRouteNextHop object for the route 131.203.9.0 is:

```
ipRouteNextHop.131.203.9.0
or 1.3.6.1.2.1.4.21.1.7.131.203.9.0
```

If the table has more than one index, the values of all the index columns are combined to form the instance identifier. The object tcpConnTable in MIB-II contains information about existing TCP connections and is indexed by the local IP address (tcpConnLocalAddress), the local port number (tcpConnLocalPort), the remote IP address (tcpConnRemAddress) and the remote port number (tcpConnRemPort) of the TCP connection. The instance of the tcpConnState object for the connection between 131.203.8.36,23 and 131.203.9.197,1066 is:

tcpConnState.131.203.8.36.23.131.203.9.197.1066
or 1.3.6.1.2.1.6.13.1.1.131.203.8.36.23.131.203.9.197.1066

Syntax

The syntax of an object describes the abstract data structure corresponding to that object type. For example, INTEGER or OCTET STRING.

Access

The access mode of an object describes the level of access for the object.

Access modes for MIB objects:

Access	Description
Read-only	The object's value can be read but not set.
Read-write	The object's value can be read and set.
Write-only	The object's value can be set but not read.
Not-accessible	The object's value cannot be read or set.

Status

The status of an object describes the implementation requirements for the object.

Status values for MIB objects:

Status	Description
Mandatory	Managed devices must implement the object.
Optional	Managed devices may implement the object.
Obsolete	Managed devices need no longer implement the object.
Deprecated	Managed devices should implement the object. However, the object may be deleted from the next version of the MIB. A new object with equal or superior functionality is defined.

Description

The definition of an object may include an optional textual description of the meaning and use of the object. This description is often essential for successful understanding of the object.

The SNMP Protocol

The SNMP protocol provides a mechanism for management entities, or stations, to extract information from the Management Information Base (MIB) of a managed device.

The normal method of accessing information in a MIB is to use a Network Management Station (NMS), typically a PC or workstation, to send commands to the managed device (in this case the switch) using the SNMP protocol.

SNMP can use a number of different protocols as its underlying transport mechanism, but the most common transport protocol, and the only one supported by the switch, is UDP. Therefore the IP module must be enabled and properly configured in order to use SNMP. SNMP trap messages are sent to UDP port 162; all other SNMP messages are sent to UDP port 161. The switch's SNMP agent accepts SNMP messages up to the maximum UDP length the switch can receive.

Other transport mappings have been defined (e.g. OSI [RFC 1418], AppleTalk [RFC 1419] and IPX [RFC 1420]), but the standard transport mapping for the Internet (and the one the switch uses) is UDP. The IP module must be enabled and configured correctly. See **Chapter 27, IP Addressing and Protocol Commands** for detailed descriptions of the commands required to enable and configure IP.

SNMP Versions

The switch supports SNMP version 1 (SNMPv1), SNMP version 2c (SNMPv2c) and SNMP Version 3 (SNMPv3). The three versions operate similarly.

SNMPv2c updated the original protocol, and offered the following main enhancements:

- a new format for trap messages.
- the get-bulk-request PDU allows for the retrieval of large amounts of data, including tables, with one message.
- more error codes mean that error responses to set messages have more detail than is possible with SNMPv1.
- three new exceptions to errors can be returned for get, get-next and get-bulk-request messages. These are: noSuchObject, noSuchInstance, and endOfMibView.

SNMPv3 provides significant enhancements to address the security weaknesses existing in the earlier versions. This is achieved by implementing two new major features:

- Authentication - by using password hashing and time stamping.
- Privacy - by using message encryption.

Support for multiple versions of SNMP is achieved by responding to each SNMP request with a response of the same version. For example, if an SNMPv1 request is sent to the switch, an SNMPv1 response is returned. If an SNMPv2c request is sent, an SNMPv2c response is returned. Therefore, authentication and encryption functions are not invoked when messages are detected as having either an SNMPv1 or SNMPv2c protocol format.

SNMP Messages

The SNMP protocol is termed simple because it has only six operations, or messages—get, get-next, get-response, set, and trap, and SNMPv2c also has the get-bulk-request message. The replies from the managed device are processed by the NMS and generally used to provide a graphical representation of the state of the network. The two major SNMP operations available to a management station for interacting with a client are the get and set operations. The SNMP set operator can lead to security breaches, since SNMP is not inherently very secure. When forced to operate in either SNMPv1 or v2 mode, when operating with older management stations for example, care must be taken in the choice and safe-guarding of community names, which are effectively passwords for SNMP.

Polling versus Event Notification

SNMP employs a polling paradigm. A Network Management Station (NMS) polls the managed device for information as and when it is required, by sending get-request, get-next-request, and/or get-bulk-request PDUs to the managed device. The managed device responds by returning the requested information in a get-response PDU. The NMS may manipulate objects in the managed device by sending a set-request PDU to the managed device.

The only time that a managed device initiates an exchange of information is in the special case of a trap PDU. A managed device may generate a limited set of traps to notify the NMS of critical events that may affect the ability of the NMS to communicate with the managed device or other managed devices on the network, and therefore to “manage” the network. Such events include the restarting or re-initialization of a device, a change in the status of a network link (up or down), or an authentication failure.

Message Format for SNMPv1 and SNMPv2c

Table 96-1: Fields in an SNMP message

Field	Function
Version	The version of the SNMP protocol. The value is version-1 (0) for the SNMP protocol as defined in RFC 1157, or version-2c (1) for the SNMP protocol as defined in RFC 1902.
Community	The name of an SNMP community, for authentication purposes
SNMP PDU	An SNMP Protocol Data Unit (PDU).

Table 96-2: SNMP PDUs

PDU	Function
get-request	Sent by an NMS to an agent, to retrieve the value of an object.
get-next-request	Sent by an NMS to an agent, to retrieve the value of the next object in the sub-tree. A sub-tree is traversed by issuing a get-request PDU followed by successive get-next-request PDUs.
get-bulk-request	Sent by an NMS to an agent to request a large amount of data with a single message. This is for SNMPv2c messages.
set-request	Sent by an NMS to an agent, to manipulate the value of an object. SNMP PDU Version Community
get-response	Sent by an agent to an NMS in response to a get-request, get-next-request, get-bulk-response, or set-request PDU.
trap	Sent by an agent to an NMS to notify the NMS of a extraordinary event.
report	Although not explicitly defined in the RFCs, reports are used for specific purposes such as EngineID discovery and time synchronization.

Table 96-3: Generic SNMP traps

Value	Meaning
coldStart	The agent is re-initializing itself. Objects may be altered.
warmStart	The agent is re-initializing itself. Objects are not altered.
linkDown	An interface has changed state from up to down.
linkUp	An interface has changed state from down to up.
authenticationFailure	An SNMP message has been received with an invalid community name.
egpNeighborLoss	An EGP peer has transitioned to down state.

SNMP Communities (Version v1 and v2c)

A community is a relationship between an NMS and an agent. The community name is used like a password for a trivial authentication scheme. Both SNMPv1 and SNMPv2c provide security based on the community name only. The concept of communities does not exist for SNMPv3, which instead provides for a far more secure communications method using entities, users, and groups.

Caution

We strongly recommend removing community membership from all SNMPv3 configured devices to prevent access to them via SNMPv1 and SNMv2c, which could bypass the additional SNMPv3 security features.

SNMPv3 Entities

Entities comprise one of the basic components of the SNMPv3 enhanced architecture. They define the functionality and internal structure of the SNMP managers and agents. An in-depth description of entities can be found in RFC 3411, on which the following text is based. SNMPv3 defines two entity types, a manager and an agent. Both entity types contain two basic components: an SNMP engine and a set of applications.

SNMP Engine

The engine provides the basic services to support the agents component applications, in this respect it performs much of the functionality expected of the ISO Session and Presentation layers. These functions include message transmission and reception, authentication and encryption, and access control to its managed objects database (MIB). The SNMP engine comprises the following components:

- Dispatcher
- Message processing Subsystem
- Security Subsystem
- Access Control Subsystem

The only security subsystem presently supported is the user based security model (USM).

Each SNMP engine is identified by an snmpEngineID that must be unique within the management system. A one to one association exists between an engine and the entity that contains it.

Entity Applications

The following applications are defined within the agent applications:

- Command Generator
- Notification Receiver
- Proxy Forwarder
- Command Responder
- Notification Originator
- Other

SNMPv3 Message Protocol Format

Table 96-4: SNMPv3 PDUs

Value	Meaning
msgVersion	Identifies the message format to be SNMPv3.
msgID	An identifier used between SNMP entities to coordinate message requests and responses. Note that a message response takes the msgID value of the initiating message.
msgMaxSize	Conveys the maximum message size (in octets) an integer between 484 and 2^{31}-1, supported by the sender of the message. Specified as msgFlags. A single octet whose last three bits indicate the operational mode for privacy, authentication, and report.
msgSecurityModel	An identifier used to indicate the security mode (i.e. SNMPv1, SNMPv2c or SNMPv3 to be used when processing the message. Note that although only the SNMPv3 identifier is accepted by the switch, these earlier version message formats are detected by the msgVersion field and processed appropriately.
msgAuthoritativeEngineID	The ID of the authoritative engine that relates to a particular message, i.e. the source engine ID for Traps, Responses and Reports, and the destination engine for Gets, GetNexts, Sets, and Informs.
msgAuthoritativeEngineBoots	A value that represents the number of times the authoritative engine has rebooted since its installation. Its value has the range 1 to 2^{31}-1.
msgAuthoritativeEngineTime	The number of seconds since the authoritative engine snmpEngineBoots counter was last incremented.
msgUserName	The name of the user (principal) on whose behalf the message is being exchanged.
msgAuthenticationParameters	If the message has been authenticated, this field contains a serialized OCTET STRING representing the first 12 octets of the HMAC-MD5-96 output done over the whole message.
msgPrivacyParameters	For encrypted data, this field contains the “salt” used to create the DES encryption Initialization Vector (IV).
ContextEngineID	Within a particular administrative domain, this field uniquely identifies an SNMP entity that may realize an instance of a context with a particular contextName
ContextName	A unique name given to a context within a particular SNMP entity.

SNMPv1 and SNMPv2c

Although software levels 2.6.3 and higher support the specific facilities of SNMP v1 and v2, their documentation is available to provide backward compatibility with older network management systems. The far superior security features offered by implementing SNMPv3 should be used wherever possible.

The switch's implementation of SNMPv1 is based on RFC 1157, *A Simple Network Management Protocol (SNMP)*, and RFC 1812, *Requirements for IP Version 4 Routers*.

When the SNMP agent is disabled, the agent does not respond to SNMP request messages. The agent is disabled by default. The current state and configuration of the SNMP agent can be displayed.

SNMP MIB Views for SNMPv1 and SNMPv2c

An SNMP MIB view is a arbitrary subset of objects in the MIB. Objects in the view may be from any part of the object name space, and not necessarily the same sub-tree. An SNMP community profile is the pairing of an SNMP access mode (read-only or read-write) with the access mode defined by the MIB for each object in the view. For each object in the view, the community profile defines the operations that can be performed on the object.

Pairing an SNMP community with an SNMP community profile determines the level of access that the agent affords to an NMS that is a member of the specified community. When an agent receives an SNMP message, it checks the community name encoded in the message. If the agent knows the community name, the message is deemed to be authentic and the sending SNMP entity is accepted as a member of the community. The community profile associated with the community name then determines the sender's view of the MIB and the operations that can be performed on objects in the view.

SNMP Communities

SNMP communities were introduced into SNMPv1 and retained in version 2c. Although the switch's software still supports communities, this is to provide backward compatibility with legacy management systems. Communities should not be used where a secure network is required. Instead, use the secure network features offered by SNMPv3.

An SNMP community is a pairing of an SNMP agent with a set of SNMP application entities. Communities are the main configuration item in the switch's implementation of SNMPv1 and v2, and are defined in terms of a list of IP addresses which define the SNMP application entities (trap hosts and management stations) in the community.

Important community names act as passwords and provide minimal authentication. Any SNMP application entity that knows a community name can read the value of any instance of any object in the MIB implemented in the switch. Any SNMP application entity that knows the name of a community with write access can change the value of any instance of any object in the MIB implemented in the switch, possibly affecting the operation of the switch. For this reason, take care with the security of community names.

When a trap is generated by the SNMP agent it is forwarded to all trap hosts in all communities. The community name and manager addresses are used to provide trivial authentication. An incoming SNMP message is deemed authentic if it contains a valid community name and originated from an IP address defined as a management station for that community.

When a community is disabled, the SNMP agent behaves as if the community does not exist and generates authentication failure traps for messages directed to the disabled community.

The SNMP agent does not support a default community called “public” with read-only access, traps disabled and open access as mandated in RFC 1812, as this is a security hole open for users who wish to use the switch with minimal modification to the default configuration. The default configuration of the switch has no defined communities. Communities must be explicitly created.

SNMP authentication (for SNMPv1 and v2) is a mechanism whereby an SNMP message is declared to be authentic, that is from an SNMP application entity actually in the community to which the message purports to belong. The mechanism may be trivial or secure. The only form of SNMP authentication implemented by the switch’s SNMP agent is trivial authentication. The authentication failure trap may be generated as a result of the failure to authentication an SNMP message.

Switch interfaces can be enabled or disabled via SNMP by setting the ifAdminStatus object in the ifTable of MIB-II MIB to ‘Up(1)’ or ‘Down(2)’ for the corresponding ifIndex. If it is not possible to change the status of a particular interface the switch returns an SNMP error message.

The switch’s implementation of the ifOperStatus object in the ifTable of MIB-II MIB supports two additional values—”Unknown(4)” and “Dormant(5)” (e.g. an inactive dial-on-demand interface).

Caution

An unauthorized person with knowledge of the appropriate SNMP community name could bring an interface up or down. Community names act as passwords for the SNMP protocol. When creating an SNMP community with write access, take care to select a secure community name and to ensure that only authorized personnel know it.

An SNMP MIB view is a subset of objects in the MIB that pertain to a particular network element. For example, the MIB view of a hub would be the objects relevant to management of the hub, and would not include IP routing table objects, for example. The switch’s SNMP agent does not allow the construction of MIB views. The switch supports all relevant objects from all MIBs that it implements.

Note that the switch’s standard set and show commands can also be used to access objects in the MIBs supported by the switch.

Defining Management Stations within Communities

You can add management stations to a community either individually, by entering just its IP address, or you can enter a range of management stations by entering an IP address that ends with a ‘/’ character followed by a number between 1 and 32. The number that follows the ‘/’ character operates as an address mask to define a range of addresses for the management stations. The following example shows how to allocate a band of three binary addresses to a portion of the subnet 146.15.1.X

Example

In this example we make provision for up to 8 possible management stations within a community called “admin”.

Step 1:

Decide on the number of management stations that you want to assign to a particular subnet, then decide how many binary digits are required to define this number of addresses. In this case we need up to 8 management stations, so we will assign 3 binary digits (3 binary digits can provide 8 different values). To assign the last 3 binary digits for management stations, we assign a prefix that is a count of all binary digits in the address minus those to be assigned as management stations. In this case the prefix is 29; this being the number of binary digits in an IP address (32) minus the number of digits assigned to the management stations (3).

Step 2:

The method used in this step depends on whether or not the community already exists.

- If the community called “admin” does not exist, create a new community called “admin” and allocate a three binary digit block of addresses to the address subnet 146.15.1.X.
- If the community called “admin” already exists, allocate a three binary digit block of addresses to an existing community called “admin” with the address subnet 146.15.1.X.

For security reasons, the common management prefix should be larger than the IP subnet. This prevents stations on one subnet from being considered valid management stations on a different subnet.

Configuration Example (SNMPv1 and v2)

This example shows how to configure the switch’s SNMP agent. Two network management stations have been set up on a large network. The central NMS (IP address 192.168.11.5) monitors devices on the network and uses SNMP set messages to manage devices on the network. Trap messages are sent to this management station. The regional network management station (IP addresses 192.168.16.1) is used just to monitor devices on the network by using SNMP get messages. Link traps are enabled for all interfaces on this particular switch.

IP and VLANs must be correctly configured in order to access the SNMP agent in the switch. This is because the IP module handles both the TCP transport functions, and the UDP functions that enable datagrams to transport SNMP messages. See **Chapter 27, IP Addressing and Protocol Commands** for commands that enable and configure IP.

To configure SNMP

Step 1: Enable the SNMP agent.

Enable the SNMP agent and enable the generation of authenticate failure traps to monitor unauthorized SNMP access. SNMP is enabled by default in AlliedWare Plus.

```
awplus(config)# snmp-server enable trap auth
```

Step 2: Create a community with write access for the central NMS.

Create a write access community called “example1rw” for use by the central network management station at 192.168.11.5 Use an ACL to give the central NMS SNMP access to the switch using that community name.

```
awplus(config)# access-list 66 permit 192.168.11.5
awplus(config)# snmp-server community example1rw rw 66
```

Care must be taken with the security of community names. Do not use the names “private” or “public” in your network because they are too obvious. Community names act as passwords and provide only trivial authentication. Any SNMP application entity that knows a community name can read the value of any instance of any object in the MIB implemented in the switch. Any SNMP application entity that knows the name of a community with write access can change the value of any instance of any object in the MIB implemented in the switch, possibly affecting the operation of the switch.

SNMP V1 or V2c provide very minimal security. If security is a concern, you should use SNMPv3.

Step 3: Create a community with read-only access for the regional NMS.

Create a read-only access community called “example2ro” for use by the regional network management station at 192.168.16.1. Use an ACL to give the regional NMS SNMP access to the switch using that community name.

```
awplus(config)# access-list 67 permit 192.168.16.1
awplus(config)# snmp-server community example2ro ro 67
```

Step 4: Enable link traps.

Enable link traps for the desired interfaces. In this example, the NSMs are in VLAN 2 and VLAN 3 and other ports are in VLAN 1 for simplicity.

```
awplus(config)# interface vlan1-3
awplus(config-if)# snmp trap link-status
```

Note that link traps on VLANs are sent when the last port in the VLAN goes down. You will only see a trap for a VLAN if the trap host is in a different VLAN.

You can also enable link traps on channel groups and switch ports. For example, to enable traps on a range of switch ports:

```
awplus(config)# int port1.0.5-1.0.7
awplus(config-if)# snmp trap link-status
```

You can also enable link traps on channel groups and switch ports. For example, to enable traps on a range of switch ports:

Step 5: Configure trap hosts.

Specify the IP address or addresses that the traps will get sent to. In this example, traps will be sent to both NMSes.

```
awplus(config)# snmp-server host 192.168.11.5 version 2c
                example1rw
awplus(config)# snmp-server host 192.168.16.1 version 2c
                example2ro
```

Step 6: Check the configuration.

Check that the current configuration of the SNMP communities matches the desired configuration:

```
awplus# show snmp-server
awplus# show snmp-server community
awplus# show run snmp
```

This is the output of the **show snmp-server community** command for this example:

```
SNMP community information:
  Community Name ........... example1rw
    Access ................. Read-write
    View ................... none
  Community Name ........... example2ro
    Access ................. Read-only
    View ................... none
```

This is the output of the **show run snmp** command for this example:

```
no snmp-server ip
snmp-server enable trap auth
snmp-server community example1rw rw 66
snmp-server community example2ro 67
snmp-server host 192.168.1.2 version 2c example1rw
snmp-server host 192.168.2.2 version 2c example2ro
!
```

Check that the interface link up/down traps have been correctly configured:

```
awplus# show interface vlan1-3
```

This is the output of the **show interface** command for this example:

```
Interface vlan1
  Scope: both
  Link is UP, administrative state is UP

    input packets 0, bytes 0, dropped 0, multicast packets 0
    output packets 0, bytes 0, multicast packets 0 broadcast packets 0
```

SNMPv3

SNMPv3 is the third version of the Simple Network Management Protocol. The architecture comprises the following:

- entities that may be either managers, agents, or both
- a management information base (MIB)
- a transport protocol

At least one manager node runs the SNMP management software in every configuration. Managed devices such as routers, servers, and workstations are equipped with an agent software module. The agent provides access to local objects in the MIB that reflect activity and resources at the node. The agent also responds to manager commands to retrieve values from, and set values in the MIB.

SNMP MIB Views for SNMPv3

An SNMP MIB view is a arbitrary subset of objects in the MIB. Objects in the view may be from any part of the object name space, and not necessarily the same sub-tree.

SNMP Groups

Groups were introduced as part of SNMPv3. They are the means by which users are assigned their views and access control policy. Once a group has been created, users can be added to them. In practice a number of groups would be created, each with varying views and access security requirements. Users would then be added to their most appropriate groups. Each Group name and Security Level pair must be unique within a switch.

SNMP Users

Users were introduced as part of SNMPv3. From a system perspective a user is represented as an entity stored in a table that defines the access and authentication criteria to be applied to access or modify the SNMP MIB data.

Note SNMP **Target Addresses** and **Target Params** in SNMPv3 are not currently supported in Alliedware Plus software.

Configuration Example (SNMPv3)

This example shows how to configure the switch's SNMP agent. Two network management stations have been set up on a large network. The central NMS (IP address 192.168.11.5) monitors devices on the network and uses SNMP set messages to manage devices on the network. Trap messages are sent to this management station.

The IP module must be enabled and correctly configured in order to access the SNMP agent in the switch, since the IP module handles the UDP datagrams used to transport SNMP messages.

To configure SNMP

Step 1: Enable the SNMP agent.

Enable the SNMP agent and enable the generation of authenticate failure traps to monitor unauthorized SNMP access. SNMP is enabled by default in AlliedWare Plus.

Step 2: Add SNMP views.

You can specify views using their OID or the predefined MIB name.

```
awplus(config)# snmp-server view atmib 1.3.6.1.2.14
included

awplus(config)# snmp-server view atmib alliedtelesis
included
```

Step 3: Add SNMP group.

```
awplus(config)# snmp-server group ord-user noauth read
atmib

awplus(config)# snmp-server group admin-user auth read
atmib write atmib notify atmi
```

Step 4: Add SNMP users.

Add users to the groups by using commands such as:

```
awplus(config)# snmp-server user ken admin-user auth md5
mercury
```

Using SNMP to Manage Files and Software

The Allied Telesis Enterprise MIB (**Chapter 98, SNMP MIBs**) includes objects for managing files and software on the switch. This section includes procedures for using MIB objects on the switch to perform some common tasks, via an SNMP management application:

- **"Copy a File to or from a TFTP Server" on page 96.21**
- **"Upgrade Software and Configuration Files" on page 96.23**

For more details about the Allied Telesis Enterprise MIB and public MIBs on the switch, see **Chapter 98, SNMP MIBs**.

Copy a File to or from a TFTP Server

Use this procedure to copy a file (for example, a software version file) to the switch from a TFTP server, or to copy a file (for example, a configuration file) from the switch to a TFTP server. The MIB objects in this procedure reside in the module atFilev2 { modules 600 }, with object ID 1.3.6.1.4.1.207.8.4.4.4.600. For detailed descriptions of the MIB objects used in this procedure, and other file management MIB objects, see **"AT-FILEv2-MIB" on page 98.32**. Other MIB objects can be used in a similar way for moving and deleting files on the switch.

Table 96-5: Procedure for copying a file to or from a device using a TFTP server

	Do this ...	By setting or reading this MIB object ...	Whose object ID is ...	To this value ...
1.	If the source device is part of a stack, set the stack ID. For a standalone switch, keep the default value, 1.	atFilev2SourceStackId	{ atFilev2Operation 1 }	*<stack-id>*
2.	If the destination device is part of a stack, set the stack ID.	atFilev2DestinationStackId	{ atFilev2Operation 4 }	*<stack-id>*
3.	Set the source device.	atFilev2SourceDevice	{ atFilev2Operation 2 }	4 (TFTP) or 1 (Flash)
4.	Set the destination device.	atFilev2DestinationDevice	{ atFilev2Operation 5 }	4 (TFTP) or 1 (Flash)
5.	Set the source filename. Include the path (if any) but not the device.	atFilev2SourceFileName	{ atFilev2Operation 3 }	*<source-filename>* e.g. /awp/config/admin.cfg
6.	Set the destination filename. Include the path (if any) but not the device.	atFilev2DestinationFileName	{ atFilev2Operation 6 }	*<dest-filename>* e.g. /config/admin.cfg

Table 96-5: Procedure for copying a file to or from a device using a TFTP server

	Do this ...	By setting or reading this MIB object ...	Whose object ID is ...	To this value ...
7.	Set the IP address of the TFTP server.	atFilev2TftpIPAddr	{ atFilev2Tftp_4 1 }	*<ip-addr>*
8.	Check that no other transfer is in progress, and that the required parameters have been set.	atFilev2CopyBegin	{ atFilev2Operation 7 }	Read: idle
9.	Start the file transfer.	atFilev2CopyBegin	{ atFilev2Operation 7 }	Set: 1
10	Monitor file transfer progress.	atFilev2CopyBegin	{ atFilev2Operation 7 }	Read: In progress: copying <*src*> --> <*dst*> *or* Success: copy <*src*> --> <*dst*> success *or* Failure: copy <*src*> --> <*dst*> failure: <*err-msg*>

Upgrade Software and Configuration Files

Use this procedure to upgrade to a new software version and boot configuration file. For detailed descriptions of the MIB objects used in this procedure, and other MIB objects for managing software installation and configuration files, see **"AT-SETUP-MIB" on page 98.56**.

Table 96-6: Procedure for upgrading to a new software version and boot configuration

	Do this ...	By reading or setting this MIB object ...	Whose object ID is ...	To this value ...
1.	Check that you have enough flash memory for the currently running software file, the new software version file, and any configuration scripts required.			
2.	Check the version and name of the software currently running.	currSoftVersion currSoftName	1.3.6.1.4.1.207.8.4.4.4.500.2.1.1 1.3.6.1.4.1.207.8.4.4.4.500.2.1.2	Read: <*software-name*> <*software-version*>
3.	If you do not already have the currently running software as a software version file in flash, save the currently running software with a file name to the flash root.	currSoftSaveToFile	1.3.6.1.4.1.207.8.4.4.4.500.2.1.4	Set: <*backup-filename.rel*>
4.	Check that the file saved successfully. (The most common failures result from lack of flash memory space.)	currSoftSaveStatus	1.3.6.1.4.1.207.8.4.4.4.500.2.1.5	Read: ■ 1 (idle) - there is no release file save operation in progress ■ 2 (success) - the last release file save operation completed successfully ■ 3 (failure) - the last release file save operation failed ■ 4 (saving) - a release file save operation is currently in progress
5.	Copy the new software version file to flash memory on the device	See **Table 96-5**.		
6.	Set the new release file to be the current release that the device will install and run the next time it restarts. Include the path.	nextBootPath	1.3.6.1.4.1.207.8.4.4.4.500.2.2.2	Set: <*next-filename*> e.g.: `flash:/release.rel`
7.	Check the version of release file set to install next.	nextBootVersion	1.3.6.1.4.1.207.8.4.4.4.500.2.2.1	Read: <*software-version*>

Table 96-6: Procedure for upgrading to a new software version and boot configuration(cont.)

	Do this ...	By reading or setting this MIB object ...	Whose object ID is ...	To this value ...
8.	Set the previous release file to be the backup release that the device will install and run if the device fails to boot successfully with the new release file. Include the path.	bckpPath	1.3.6.1.4.1.207.8.4.4.4.500.2.3.2	Set: <*backup-filename*> e.g.: `flash:/release.rel`
9.	Check the version of backup release file.	bckpVersion	1.3.6.1.4.1.207.8.4.4.4.500.2.3.1	Read: <*software-version*>
10.	If necessary, copy a configuration file to the device (**Table 96-5**), or save the current running configuration to a file in the root directory of flash. To save the running configuration, specify the filename, but not a device or path.	See **Table 96-5**. or runCnfgSaveAs	1.3.6.1.4.1.207.8.4.4.4.500.3.1.1	Set: <*filename.cfg*> e.g.: myconfig.cfg
11.	Check and if necessary set the file the device will use for configuration when it restarts. Include the full path.	bootCnfgPath	1.3.6.1.4.1.207.8.4.4.4.500.3.2.1	Read/set: <*filename.cfg*> e.g.: flash:/myconfig.cfg
12.	Check that a boot configuration file matching the boot configuration path exists.	bootCnfgExists	1.3.6.1.4.1.207.8.4.4.4.500.3.2.2	Read: TRUE (1) or FALSE (2)
13.	Check that the default configuration file flash:/default.cfg exists.	dfltCnfgExists	1.3.6.1.4.1.207.8.4.4.4.500.3.3.2	Read: TRUE (1) or FALSE (2)
14.	Restart the device.	restartDevice	1.3.6.1.4.1.207.8.4.4.4.500.1	1

Command List

This chapter provides an alphabetical reference for commands used to configure SNMP. For more information, see **Chapter 96, SNMP Introduction**, and **Chapter 98, SNMP MIBs**.

For information about modifying or redirecting the output from **show** commands to a file, see **"Controlling "show" Command Output" on page 1.38**.

debug snmp

This command enables SNMP debugging.

The **no** variant of this command disables SNMP debugging.

Syntax

```
debug snmp [all|detail|error-string|process|receive|send|xdump]
no debug snmp [all|detail|error-string|process|receive|send|xdump]
```

Parameter	Description
`all`	Enable or disable the display of all SNMP debugging information.
`detail`	Enable or disable the display of detailed SNMP debugging information.
`error-string`	Enable or disable the display of debugging information for SNMP error strings.
`process`	Enable or disable the display of debugging information for processed SNMP packets.
`receive`	Enable or disable the display of debugging information for received SNMP packets.
`send`	Enable or disable the display of debugging information for sent SNMP packets.
`xdump`	Enable or disable the display of hexadecimal dump debugging information for SNMP packets.

Mode Privileged Exec and Global Configuration

Example To start SNMP debugging, use the command:

```
awplus# debug snmp
```

To start SNMP debugging, showing detailed SNMP debugging information, use the command:

```
awplus# debug snmp detail
```

To start SNMP debugging, showing all SNMP debugging information, use the command:

```
awplus# debug snmp all
```

Related Commands

show debugging snmp
terminal monitor
undebug snmp

show counter snmp-server

This command displays counters for SNMP messages received by the SNMP agent.

Syntax `show counter snmp-server`

Mode User Exec and Privileged Exec

Example To display the counters for the SNMP agent, use the command:

```
awplus# show counter snmp-server
```

Output **Figure 97-1: Example output from the show counter snmp-server command**

```
SNMP-SERVER counters

```

Table 97-1: Parameters in the output of the show counter snmp-server command

Parameter	Meaning
`inPkts`	The total number of SNMP messages received by the SNMP agent.
`inBadVersions`	The number of messages received by the SNMP agent for an unsupported SNMP version. It drops these messages.The SNMP agent on your device supports versions 1, 2C, and 3.

Table 97-1: Parameters in the output of the show counter snmp-server command

Parameter	Meaning
inBadCommunityNames	The number of messages received by the SNMP agent with an unrecognized SNMP community name. It drops these messages.
inBadCommunityUses	The number of messages received by the SNMP agent where the requested SNMP operation is not permitted from SNMP managers using the SNMP community named in the message.
inASNParseErrs	The number of ASN.1 or BER errors that the SNMP agent has encountered when decoding received SNMP Messages.
inTooBigs	The number of SNMP PDUs received by the SNMP agent where the value of the error-status field is 'tooBig'. This is sent by an SNMP manager to indicate that an exception occurred when processing a request from the agent.
inNoSuchNames	The number of SNMP PDUs received by the SNMP agent where the value of the error-status field is 'noSuchName'. This is sent by an SNMP manager to indicate that an exception occurred when processing a request from the agent.
inBadValues	The number of SNMP PDUs received by the SNMP agent where the value of the error-status field is 'badValue'. This is sent by an SNMP manager to indicate that an exception occurred when processing a request from the agent.
inReadOnlys	The number of valid SNMP PDUs received by the SNMP agent where the value of the error-status field is 'readOnly'. The SNMP manager should not generate a PDU which contains the value 'readOnly' in the error-status field. This indicates that there is an incorrect implementations of the SNMP.
inGenErrs	The number of SNMP PDUs received by the SNMP agent where the value of the error-status field is 'genErr'.
inTotalReqVars	The number of MIB objects that the SNMP agent has successfully retrieved after receiving valid SNMP Get-Request and Get-Next PDUs.
inTotalSetVars	The number of MIB objects that the SNMP agent has successfully altered after receiving valid SNMP Set-Request PDUs.
inGetRequests	The number of SNMP Get-Request PDUs that the SNMP agent has accepted and processed.
inGetNexts	The number of SNMP Get-Next PDUs that the SNMP agent has accepted and processed.
inSetRequests	The number of SNMP Set-Request PDUs that the SNMP agent has accepted and processed.
inGetResponses	The number of SNMP Get-Response PDUs that the SNMP agent has accepted and processed.
inTraps	The number of SNMP Trap PDUs that the SNMP agent has accepted and processed.
outPkts	The number of SNMP Messages that the SNMP agent has sent.

Table 97-1: Parameters in the output of the show counter snmp-server command

Parameter	Meaning
outTooBigs	The number of SNMP PDUs that the SNMP agent has generated with the value 'tooBig' in the error-status field. This is sent to the SNMP manager to indicate that an exception occurred when processing a request from the manager.
outNoSuchNames	The number of SNMP PDUs that the SNMP agent has generated with the value `noSuchName' in the error-status field. This is sent to the SNMP manager to indicate that an exception occurred when processing a request from the manager.
outBadValues	The number of SNMP PDUs that the SNMP agent has generated with the value 'badValue' in the error-status field. This is sent to the SNMP manager to indicate that an exception occurred when processing a request from the manager.
outGenErrs	The number of SNMP PDUs that the SNMP agent has generated with the value 'genErr' in the error-status field. This is sent to the SNMP manager to indicate that an exception occurred when processing a request from the manager.
outGetRequests	The number of SNMP Get-Request PDUs that the SNMP agent has generated.
outGetNexts	The number of SNMP Get-Next PDUs that the SNMP agent has generated.
outSetRequests	The number of SNMP Set-Request PDUs that the SNMP agent has generated.
outGetResponses	The number of SNMP Get-Response PDUs that the SNMP agent has generated.
outTraps	The number of SNMP Trap PDUs that the SNMP agent has generated.
UnSupportedSecLevels	The number of received packets that the SNMP agent has dropped because they requested a securityLevel unknown or not available to the SNMP agent.
NotInTimeWindows	The number of received packets that the SNMP agent has dropped because they appeared outside of the authoritative SNMP agent's window.
UnknownUserNames	The number of received packets that the SNMP agent has dropped because they referenced an unknown user.
UnknownEngineIDs	The number of received packets that the SNMP agent has dropped because they referenced an unknown snmpEngineID.
WrongDigest	The number of received packets that the SNMP agent has dropped because they didn't contain the expected digest value.
DecryptionErrors	The number of received packets that the SNMP agent has dropped because they could not be decrypted.
UnknownSecModels	The number of messages received that contain a security model that is not supported by the server. Valid for SNMPv3 messages only.
InvalidMsgs	The number of messages received where the security model is supported but the authentication fails. Valid for SNMPv3 messages only.
UnknownPDUHandlers	The number of times the SNMP handler has failed to process a PDU. This is a system debugging counter.

Related Commands **show snmp-server**

show debugging snmp

This command displays whether SNMP debugging is enabled or disabled.

Syntax `show debugging snmp`

Mode User Exec and Privileged Exec

Example To display the status of SNMP debugging, use the command:

```
awplus# show debugging snmp
```

Output **Figure 97-2: Example output from the show debugging snmp command**

```
Snmp (SMUX) debugging status:
  Snmp debugging is on
```

Related Commands debug snmp

show running-config snmp

This command displays the current configuration of SNMP on your device.

Syntax `show running-config snmp`

Mode Privileged Exec

Example To display the current configuration of SNMP on your device, use the command:

```
awplus# show running-config snmp
```

Output **Figure 97-3: Example output from the show running-config snmp command**

```
snmp-server contact AlliedTelesis
snmp-server location Philippines
snmp-server group grou1 auth read view1 write view1 notify view1
snmp-server view view1 1 included
snmp-server community public
snmp-server user user1 group1 auth md5 password priv des
password
```

Related Commands show snmp-server

show snmp-server

This command displays the status and current configuration of the SNMP server.

Syntax `show snmp-server`

Mode Privileged Exec

Example To display the status of the SNMP server, use the command:

```
awplus# show snmp-server
```

Output **Figure 97-4: Example output from the show snmp-server command**

```
SNMP Server ......................... Enabled
IP Protocol ......................... IPv4
SNMPv3 Engine ID (configured name) ... Not set
SNMPv3 Engine ID (actual) ............ 0x80001f888021338e4747b8e607
```

Related Commands
debug snmp
show counter snmp-server
snmp-server
snmp-server engineID local
snmp-server engineID local reset

show snmp-server community

This command displays the SNMP server communities configured on the device. SNMP communities are specific to v1 and v2c.

Syntax `show snmp-server community`

Mode Privileged Exec

Example To display the SNMP server communities, use the command:

```
awplus# show snmp-server community
```

Output **Figure 97-5: Example output from the show snmp-server community command**

```
SNMP community information:
  Community Name ........... public
    Access ................. Read-only
    View ................... none
```

Related Commands
show snmp-server
snmp-server community

show snmp-server group

This command displays information about SNMP server groups. This command is used with SNMP version 3 only.

Syntax `show snmp-server group`

Mode Privileged Exec

Example To display the SNMP groups configured on the device, use the command:

```
awplus# show snmp-server group
```

Output **Figure 97-6: Example output from the show snmp-server group command**

```
SNMP group information:
  Group name ..... guireadgroup
    Security Level ..... priv
    Read View ..... guiview
    Write View ..... none
    Notify View ..... none

  Group name ..... guiwritegroup
    Security Level ..... priv
    Read View ..... none
    Write View ..... guiview
    Notify View ..... none
```

Related Commands **show snmp-server**
snmp-server group

show snmp-server user

This command displays the SNMP server users and is used with SNMP version 3 only.

Syntax `show snmp-server user`

Mode Privileged Exec

Example To display the SNMP server users configured on the device, use the command:

```
awplus# show snmp-server user
```

Output **Figure 97-7: Example output from the show snmp-server user command**

```
Name            Group name        Auth       Privacy
-------         -------------     -------    ----------
freddy          guireadgroup      none       none
```

Related Commands **show snmp-server**
snmp-server user

show snmp-server view

This command displays the SNMP server views and is used with SNMP version 3 only.

Syntax `show snmp-server view`

Mode Privileged Exec

Example To display the SNMP server views configured on the device, use the command:

```
awplus# show snmp-server view
```

Output **Figure 97-8: Example output from the show snmp-server view command**

```
SNMP view information:
  View Name ............... view1
    OID ................... 1
    Type .................. included
```

Related Commands **show snmp-server**
snmp-server view

snmp trap link-status

Use this command to enable SNMP to send link status notifications (traps) for the interfaces when an interface goes up (linkUp) or down (linkDown).

Use the **no** variant of this command to disable the sending of link status notifications.

Syntax

```
snmp trap link-status
no snmp trap link-status
```

Default By default, link status notifications are disabled.

Mode Interface Configuration

Usage The link status notifications can be enabled for the following interface types:

- switch port (e.g. port 1.0.1)
- VLAN (e.g. vlan2)
- Ethernet (e.g. eth0)
- static and dynamic link aggregation (e.g. sa2, po3)

To specify where notifications are sent, use the **snmp-server host** command on page 97.25. To configure the switch globally to send other notifications, use the **snmp-server enable trap** command on page 97.19.

Examples To enable SNMP to send link status notifications for ports 1.0.2 to 1.0.12, use following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2-1.0.12
awplus(config-if)# snmp trap link-status
```

To disable the sending of link status notifications for port 1.0.2, use following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no snmp trap link-status
```

Related Commands

show interface
snmp trap link-status suppress
snmp-server enable trap
snmp-server host

snmp trap link-status suppress

Use this command to enable the suppression of link status notifications (traps) for the interfaces beyond the specified threshold, in the specified interval.

Use the **no** variant of this command to disable the suppression of link status notifications for the ports.

Syntax

```
snmp trap link-status suppress
   {time {<1-60>|default}|threshold {<1-20>|default}}

no snmp trap link-status suppress
```

Parameter	Description
`time`	Set the suppression timer for link status notifications.
<1-60>	The suppress time in seconds.
`default`	The default suppress time in seconds (60).
`threshold`	Set the suppression threshold for link status notifications. This is the number of link status notifications after which to suppress further notifications within the suppression timer interval.
<1-20>	The number of link status notifications.
`default`	The default number of link status notifications (20).

Default By default, if link status notifications are enabled (they are enabled by default), the suppression of link status notifications is enabled: notifications that exceed the notification threshold (default 20) within the notification timer interval (default 60 seconds) are not sent.

Mode Interface Configuration

Usage An unstable network can generate many link status notifications. When notification suppression is enabled, a suppression timer is started when the first link status notification of a particular type (linkUp or linkDown) is sent for an interface. If the threshold number of notifications of this type is sent before the timer reaches the suppress time, any further notifications of this type generated for the interface during the interval are not sent. At the end of the interval, the sending of link status notifications resumes, until the threshold is reached in the next interval.

Examples To enable the suppression of link status notifications for ports 1.0.2 to 1.0.12 after 10 notifications have been sent in 40 seconds, use following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2-1.0.12
awplus(config-if)# snmp trap link-status suppress time 40
threshold 10
```

To disable the suppression link status notifications for port 1.0.2, use following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no snmp trap link-status suppress
```

Related Commands **show interface**
snmp trap link-status

snmp-server

Use this command to enable the SNMP agent (server) on the switch. The SNMP agent receives and processes SNMP packets sent to the switch, and generates notifications (traps) that have been enabled by the **snmp-server enable trap** command on page 97.19.

Use the **no** variant of this command to disable the SNMP agent on the switch. When SNMP is disabled, SNMP packets received by the switch are discarded, and no notifications are generated. This does not remove any existing SNMP configuration.

Syntax

```
snmp-server [ip|ipv6]
no snmp-server [ip|ipv6]
```

Parameter	Description
ip	Enable or disable the SNMP agent for IPv4.
ipv6	Enable or disable the SNMP agent for IPv6.

Default By default, the SNMP agent is enabled for both IPv4 and IPv6. If neither the **ip** parameter nor the **ipv6** parameter is specified for this command, then SNMP is enabled or disabled for both IPv4 and IPv6.

Mode Global Configuration

Examples To enable SNMP on the switch for both IPv4 and IPv6, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server
```

To enable the SNMP agent for IPv4 on the device, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server ip
```

To disable the SNMP agent for both IPv4 and IPv6 on the switch, use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-server
```

To disable the SNMP agent for IPv4, use the commands:

```
awplus(config)# no snmp-server ipv4
```

snmp-server location
snmp-server view

snmp-server community

This command creates an SNMP community, optionally setting the access mode for the community. The default access mode is read only. If view is not specified, the community allows access to all the MIB objects. The SNMP communities are only valid for SNMPv1 and v2c and provide very limited security. Communities should not be used when operating SNMPv3.

The **no** variant of this command removes an SNMP community. The specified community must already exist on the device.

Syntax

```
snmp-server community <community-name>
    {view <view-name>|ro|rw|<access-list>}

no snmp-server community <community-name> [{view <view-name>|<access-
    list>}]
```

Parameter	Description
`<community-name>`	Community name. The community name is a string up to 20 characters long and is case sensitive.
`view`	Configure SNMP view. If view is not specified, the community allows access to all the MIB objects.
`<view-name>`	View name. The view name is a string up to 20 characters long and is case sensitive.
`ro`	Read-only community.
`rw`	Read-write community.
`<access-list>`	*<1-99>* Access list number.

Mode Global Configuration

Example The following command creates an SNMP community called "public" with read only access to all MIB variables from any management station.

```
awplus# configure terminal
awplus(config)# snmp-server community public ro
```

The following command removes an SNMP community called "public"

```
awplus# configure terminal
awplus(config)# no snmp-server community public
```

Related Commands
show snmp-server
show snmp-server community
snmp-server view

snmp-server contact

This command sets the contact information for the system. The contact name is:

- displayed in the output of the **show system** command
- stored in the MIB object sysContact

The **no** variant of this command removes the contact information from the system.

Syntax

```
snmp-server contact <contact-info>
no snmp-server contact
```

Parameter	Description
<contact-info>	The contact information for the system, from 0 to 255 characters long. Valid characters are any printable character and spaces.

Mode Global Configuration

Example To set the system contact information to "support@alliedtelesis.co.nz", use the command:

```
awplus# configure terminal
awplus(config)# snmp-server contact support@alliedtelesis.co.nz
```

Related Commands

show system
snmp-server location
snmp-server group

snmp-server enable trap

Use this command to enable the switch to send the specified notifications (traps).

Note that the Environmental Monitoring traps are enabled by default. So you do not need to issue this command for the Environmental Monitoring traps since these are enabled by default. SNMP environmental monitoring traps defined in AT-ENVMONv2-MIB are enabled by default.

Use the **no** variant of this command to disable the sending of the specified notifications.

Syntax

```
snmp-server enable trap {[auth] [bgp] [dhcpsnooping] [epsr] [lldp]
    [loopprot] [mstp] [nsm] [ospf] [pim] [rmon]  [thrash-limit] [vcs]
    [vrrp]}

no snmp-server enable trap {[auth] [bgp] [dhcpsnooping] [epsr] [lldp]
    [loopprot] [mstp] [nsm] [ospf] [pim] [rmon] [thrash-limit] [vcs]
    [vrrp]}
```

Parameter	Description
`auth`	Authentication failure.
`bgp`	BGP traps.
`dhcpsnooping`	DHCP snooping and ARP security traps. These notifications must also be set using the **ip dhcp snooping violation** command on page 83.22, and/or the **arp security violation** command on page 83.3.
`epsr`	EPSR traps.
`lldp`	Link Layer Discovery Protocol (LLDP) traps. These notifications must also be enabled using the **lldp notifications** command on page 100.13, and/or the **lldp med-notifications** command on page 100.8.
`loopprot`	Loop Protection traps.
`mstp`	MSTP traps.
`nsm`	NSM traps.
`ospf`	OSPF traps.
`pim`	PIM traps.
`rmon`	RMON traps.
`thrash-limit`	MAC address Thrash Limiting traps.
`vcs`	VCS traps.
`vrrp`	Virtual Router Redundancy (VRRP) traps.

Default By default, no notifications are generated.

Mode Global Configuration

Usage This command cannot be used to enable link status notifications globally. To enable link

status notifications for particular interfaces, use the **snmp trap link-status** command.

To specify where notifications are sent, use the **snmp-server host** command.

Note that more than one trap can be configured with one command entry, and also note this command applied to notifications send by SNMP version 3.

Examples To enable the device to send MAC address Thrash Limiting traps, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap thrash-limit
```

To disable the device from sending MAC address Thrash Limiting traps, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server enable trap thrash-limit
```

To enable the device to send OSPF and VRRP-related traps, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap ospf vrrp
```

To disable OSPF traps being sent out by the switch, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server enable trap ospf
```

Related Commands
show snmp-server
show ip dhcp snooping
snmp trap link-status
snmp-server host

snmp-server engineID local

Use this command to configure the SNMPv3 engine ID. The SNMPv3 engine ID is used to uniquely identify the SNMPv3 agent on a switch when communicating with SNMP management clients. Once an SNMPv3 engine ID is assigned, this engine ID is permanently associated with the switch until you change it.

Use the **no** variant of this command to set the user defined SNMPv3 engine ID to a system generated pseudo-random value by resetting the SNMPv3 engine. The **no snmp-server engineID local** command has the same effect as the **snmp-server engineID local default** command. Note that the **snmp-server engineID local reset** command is used to force the system to generate a new engine ID when the current engine ID is also system generated.

Syntax

```
snmp-server engineID local {<engine-id>|default}
no snmp-server engineID local
```

Parameter	Description
<engine-id>	Specify SNMPv3 Engine ID value, a string of up to 27 characters.
`default`	Set SNMPv3 engine ID to a system generated value by resetting the SNMPv3 engine, provided the current engine ID is user defined. If the current engine ID is system generated, use the **snmp-server engineID local reset** command to force the system to generate a new engine ID.

Mode Global Configuration

Usage All switches must have a unique engine ID which is permanently set unless it is configured by the user.

In a stacked environment, if the same engine ID was automatically generated for all members of the stack, conflicts would occur if the stack was dismantled. Therefore, each member of the stack will generate its own engine ID and the stack master's ID is used when transmitting SNMPv3 packets. Should a master failover occur, a different engine ID is transmitted. You can modify this behavior by manually assigning all stack members the same engine ID using the **snmp-server engineID local** command. However, should you decide to separate the stack and use the switches individually, you must remember to change or remove this configuration to prevent conflicts.

Example To set the SNMPv3 engine ID to 800000cf030000cd123456, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server engineID local
800000cf030000cd123456
```

To set a user defined SNMPv3 engine ID back to a system generated value, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server engineID local
```

Output The following example shows the engine ID values after configuration:

```
awplus(config)#snmp-server engineid local asdgdfh231234d
awplus(config)#exit
awplus#show snmp-server

SNMP Server ......................... Enabled
IP Protocol ......................... IPv4
SNMPv3 Engine ID (configured name) ... asdgdfh231234d
SNMPv3 Engine ID (actual) ............ 0x80001f888029af52e149198483

awplus(config)#no snmp-server engineid local
awplus(config)#exit
awplus#show snmp-server

SNMP Server ......................... Enabled
IP Protocol ......................... IPv4
SNMPv3 Engine ID (configured name) ... Not set
SNMPv3 Engine ID (actual) ............ 0x80001f888029af52e149198483
```

Validation Commands **show snmp-server**

Related Commands **snmp-server engineID local reset**
snmp-server group

snmp-server engineID local reset

Use this command to force the switch to generate a new pseudo-random SNMPv3 engine ID by resetting the SNMPv3 engine. If the current engine ID is user defined, use the **snmp-server engineID local** command to set SNMPv3 engine ID to a system generated value.

Syntax `snmp-server engineID local reset`

Mode Global Configuration

Example To force the SNMPv3 engine ID to be reset to a system generated value, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server engineID local reset
```

Validation Commands **show snmp-server**

Related Commands **snmp-server engineID local**

snmp-server group

This command is used with SNMP version 3 only, and adds an SNMP group, optionally setting the security level and view access modes for the group. The security and access views defined for the group represent the minimum required of its users in order to gain access.

The **no** variant of this command deletes an SNMP group, and is used with SNMPv3 only. The group with the specified authentication/encryption parameters must already exist.

Syntax

```
snmp-server group <groupname> {auth|noauth|priv}
   [read <readname>|write <writename>|notify <notifyname>]

no snmp-server group <groupname> {auth|noauth|priv}
```

Parameter	Description
`<groupname>`	Group name. The group name is a string up to 20 characters long and is case sensitive.
`auth`	Authentication.
`noauth`	No authentication and no encryption.
`priv`	Authentication and encryption.
`read`	Configure read view.
`<readname>`	Read view name.
`write`	Configure write view.
`<writename>`	Write view name. The view name is a string up to 20 characters long and is case sensitive.
`notify`	Configure notify view.
`<notifyname>`	Notify view name. The view name is a string up to 20 characters long and is case sensitive.

Mode Global Configuration

Examples To add SNMP group, for ordinary users, user the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server group usergroup noauth read
useraccess write useraccess
```

To delete SNMP group `usergroup`, use the following commands

```
awplus# configure terminal
awplus(config)# no snmp-server group usergroup noauth
```

Related Commands

snmp-server
show snmp-server
show snmp-server group
show snmp-server user

snmp-server host

This command specifies an SNMP trap host destination to which Trap or Inform messages generated by the device are sent.

For SNMP version 1 and 2c you must specify the community name parameter. For SNMP version 3, specify the authentication/encryption parameters and the user name. If the version is not specified, the default is SNMP version 1. Inform messages can be sent instead of traps for SNMP version 2c and 3.

Use the **no** variant of this command to remove an SNMP trap host. The trap host must already exist.

The trap host is uniquely identified by:

- host IP address (IPv4 or IPv6),
- inform or trap messages,
- community name (SNMPv1 or SNMP v2c) or the authentication/encryption parameters and user name (SNMP v3).

Syntax

```
snmp-server host {<ipv4-address>|<ipv6-address>} [traps] [version 1]
   <community-name>]

snmp-server host {<ipv4-address>|<ipv6-address>} [informs|traps]
   version 2c <community-name>

snmp-server host {<ipv4-address>|<ipv6-address>} [informs|traps]
   version 3 {auth|noauth|priv} <user-name>

no snmp-server host {<ipv4-address>|<ipv6-address>} [traps]
   [version 1] <community-name>

no snmp-server host {<ipv4-address>|<ipv6-address>} [informs|traps]
   version 2c <community-name>

no snmp-server host {<ipv4-address>|<ipv6-address>} [informs|traps]
   version 3 {auth|noauth|priv} <user-name>
```

Parameter	Description
<ipv4-address>	IPv4 trap host address in the format A.B.C.D, for example, 192.0.2.2.
<ipv6-address>	IPv6 trap host address in the format x:x::x:x for example, 2001:db8::8a2e:7334.
informs	Send Inform messages to this host.
traps	Send Trap messages to this host (default).
version	SNMP version to use for notification messages. Default: version 1.
1	Use SNMPv1(default).
2c	Use SNMPv2c.
3	Use SNMPv3.
auth	Authentication.
noauth	No authentication.

Parameter(cont.)	Description(cont.)
priv	Encryption.
<*community-name*>	The SNMPv1 or SNMPv2c community name.
<*user-name*>	SNMPv3 user name.

Mode Global Configuration

Examples To configure the device to send generated traps to the IPv4 host destination 192.0.2.5 with the SNMPv2c community name *public*, use the following command:

```
awplus# configure terminal
awplus(config)# snmp-server host 192.0.2.5 version 2c public
```

To configure the device to send generated traps to the IPv6 host destination 2001:db8::8a2e:7334 with the SNMPv2c community name *private*, use the following command:

```
awplus# configure terminal
awplus(config)# snmp-server host 2001:db8::8a2e:7334 version 2c
private
```

To remove a configured trap host of 192.0.2.5 with the SNMPv2c community name *public*, use the following command:

```
awplus# configure terminal
awplus(config)# no snmp-server host 192.0.2.5 version 2c public
```

Related Commands **snmp trap link-status**
snmp-server enable trap
snmp-server view

snmp-server location

This command sets the location of the system. The location is:

- displayed in the output of the **show system** command
- stored in the MIB object sysLocation

The **no** variant of this command removes the configured location from the system.

Syntax

```
snmp-server location <location-name>
no snmp-server location
```

Parameter	Description
<location-name>	The location of the system, from 0 to 255 characters long. Valid characters are any printable character and spaces.

Mode Global Configuration

Example To set the location to "server room 523", use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server location server room 523
```

Related Commands

show snmp-server
show system
snmp-server contact

snmp-server source-interface

Use this command to specify the interface that SNMP traps or informs originate from. You cannot specify an interface that does not already have an IP address assigned to the interface.

Use the **no** variant of this command to reset to the default source interface that SNMP traps or informs originate from (the Egress interface as sent from by default).

Syntax

```
snmp-server source-interface {traps|informs} <interface-name>
no snmp-server source-interface {traps|informs}
```

Parameter	Description
`traps`	SNMP traps.
`informs`	SNMP informs.
`<interface-name>`	Interface name (with an IP address already assigned).

Default By default the source interface is the Egress interface where traps or informs were sent from.

Mode Global Configuration

Usage An SNMP trap or inform sent from an SNMP server has the notification IP address of the interface where it was sent from. Use this command to monitor notifications from an interface.

Example To set the interface that SNMP informs originate from to port 1.0.2 for inform packets, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server source-interface informs port1.0.2
```

To reset the interface to the default source interface (the Egress interface) that SNMP traps originate from for trap packets, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server source-interface traps
```

Validation Commands **show running-config**

snmp-server startup-trap-delay

Use this command to set the time in seconds after following completion of the switch startup sequence before the switch sends any SNMP traps (or SNMP notifications).

Use the **no** variant of this command to restore the default startup delay of 30 seconds.

Syntax

```
snmp-server startup-trap-delay <delay-time>

no snmp-server startup-trap-delay
```

Parameter	Description
<delay-time>	Specify an SNMP trap delay time in seconds in the range of 30 to 600 seconds.

Default The SNMP server trap delay time is 30 seconds. The **no** variant restores the default.

Mode Global Configuration

Example To delay the switch sending SNMP traps until 60 seconds after switch startup, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server startup-trap-delay 60
```

To restore the sending of SNMP traps to the default of 30 seconds after switch startup, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server startup-trap-delay
```

Validation Commands **show snmp-server**

snmp-server user

Use this command to create or move users as members of specified groups. This command is used with SNMPv3 only.

The **no** variant of this command removes an SNMPv3 user. The specified user must already exist.

Syntax

```
snmp-server user <username> <groupname> [encrypted]
   [auth {md5|sha} <auth-password>]
   [priv {des|aes} <privacy-password>]

no snmp-server user <username>
```

Parameter	Description
<username>	User name. The user name is a string up to 20 characters long and is case sensitive.
<groupname>	Group name. The group name is a string up to 20 characters long and is case sensitive.
`encrypted`	Use the encrypted parameter when you want to enter encrypted passwords.
`auth`	Authentication protocol.
`md5`	MD5 Message Digest Algorithms.
`sha`	SHA Secure Hash Algorithm.
<auth-password>	Authentication password. The password is a string of 8 to 20 characters long and is case sensitive.
`priv`	Privacy protocol.
`des`	DES Data Encryption Standard.
`aes`	AES Advanced Encryption Standards.
<privacy-password>	Privacy password. The password is a string of 8 to 20 characters long and is case sensitive.

Mode Global Configuration

Usage Additionally this command provides the option of selecting an authentication protocol and (where appropriate) an associated password. Similarly, options are offered for selecting a privacy protocol and password.

- Note that each SNMP user must be configured on both the manager and agent entities. Where passwords are used, these passwords must be the same for both entities.
- Use the **encrypted** parameter when you want to enter already encrypted passwords in encrypted form as displayed in the running and startup configs stored on the switch. For example, you may need to move a user from one group to another group and keep the same passwords for the user instead of removing the user to apply new passwords.
- User passwords are entered using plaintext without the **encrypted** parameter and are

encrypted according to the authentication and privacy protocols selected.

- User passwords are viewed as encrypted passwords in running and startup configs shown from **show running-config** and **show startup-config** commands respectively. Copy and paste encrypted passwords from running-configs or startup-configs to avoid entry errors.

Examples To add SNMP user `authuser` as a member of group `usergroup`, with authentication protocol `md5`, authentication password `Authpass`, privacy protocol `des` and privacy password `Privpass`, use the following commands

```
awplus# configure terminal
awplus(config)# snmp-server user authuser usergroup auth md5
Authpass priv des Privpass
```

Validate the user is assigned to the group using the following command:

```
awplus#show snmp-server user
Name                Group name          Auth        Privacy
-------             -------------       -------     ----------
authuser            usergroup           md5         des
```

To enter existing SNMP user `authuser` with existing passwords as a member of group `newusergroup` with authentication protocol `md5` plus the encrypted authentication password `0x1c74b9c22118291b0ce0cd883f8dab6b74`, privacy protocol `des` plus the encrypted privacy password `0x0e0133db5453ebd03822b004eeacb6608f`, use the following commands

```
awplus# configure terminal
awplus(config)# snmp-server user authuser newusergroup
encrypted auth md5
0x1c74b9c22118291b0ce0cd883f8dab6b74 priv des
0x0e0133db5453ebd03822b004eeacb6608f
```

Note Copy and paste the encrypted passwords from the **running-config** or the **startup-config** displayed, using the **show running-config** and **show startup-config** commands respectively, into the command line to avoid key stroke errors issuing this command.

Validate the user has been moved from the first group using the following command:

```
awplus#show snmp-server user
Name                Group name          Auth        Privacy
-------             -------------       -------     ----------
authuser            newusergroup        md5         des
```

To delete SNMP user `authuser`, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server user authuser
```

Related Commands **show snmp-server user**
snmp-server view

snmp-server view

Use this command to create an SNMP view that specifies a sub-tree of the MIB. Further sub-trees can then be added by specifying a new OID to an existing view. Views can be used in SNMP communities or groups to control the remote manager's access.

Note The object identifier must be specified in a sequence of integers separated by decimal points.

The **no** variant of this command removes the specified view on the device. The view must already exist.

Syntax

```
snmp-server view <view-name> <mib-name> {included|excluded}
no snmp-server view <view-name>
```

Parameter	Description
<view-name>	SNMP server view name. The view name is a string up to 20 characters long and is case sensitive.
<mib-name>	Object identifier of the MIB.
`included`	Include this OID in the view.
`excluded`	Exclude this OID in the view.

Mode Global Configuration

Examples The following command creates a view called "loc" that includes system location mib sub-tree.

```
awplus(config)# snmp-server view loc 1.3.6.1.2.1.1.6.0 included
```

To remove the view "loc" use the following command

```
awplus(config)# no snmp-server view loc
```

Related Commands **show snmp-server view**
snmp-server community

undebug snmp

This command applies the functionality of the no **debug snmp** command.

Introduction

This chapter describes the Management Information Bases (MIBs) and managed objects supported by the AlliedWare Plus™ Operating System. The following topics are covered:

- **"Allied Telesis Enterprise MIB" on page 98.5** describes the objects implemented in the Allied Telesis Enterprise MIB
- **"Public MIBs" on page 98.88** describes the public MIBs supported by the AlliedWare Plus™ Operating System, and any variations from the standard implementation.

About MIBs

A MIB is a collection of managed objects organized into a tree-like hierarchy of nodes in which the managed objects form the leaves. Within the tree, each node is identified by a non-negative integer identifier that is unique among the node's siblings. The address, or object identifier, of any node within the tree is expressed as a series of dot-delimited node identifiers that trace the path from the root of the tree to the node. For example, the object identifier for the sysDescr object is 1.3.6.1.2.1.1.1.

For more information about MIBs and the structure of management information, see **Chapter 96, SNMP Introduction**.

Note This chapter does not indicate which MIB objects are not-accessible (and therefore cannot be queried directly). Please consult the MIB files for that information.

About SNMP

A network management station (NMS) uses a protocol known as Simple Network Management Protocol (SNMP) to query or change the values of objects in the MIB of managed devices.

A managed device uses SNMP to respond to queries from an NMS, and to send unsolicited alerts (traps) to an NMS in response to events.

For more information about the Simple Network Management Protocol (SNMP), see **Chapter 96, SNMP Introduction**.

For information about configuring SNMP, see **Chapter 97, SNMP Commands**.

Obtaining MIBs

You can download MIBs from the following locations:

Download this MIB...	From this location...
Allied Telesis Enterprise MIB	The MIB files are available with the software files from the Support area at **www.alliedtelesis.com/support/software/restricted**
Public MIBs defined in RFCs	**www.rfc-editor.org/rfc.html**
IANAifType-MIB	**www.iana.org/assignments/ianaiftype-mib**

Loading MIBs

Individual MIBs define a portion of the total MIB for a device. For example, the MAU-MIB defines objects for managing IEEE 802.3 medium attachment units (MAUs), and forms a sub-tree under mib-2 with the object identifier snmpDot3MauMgt (1.3.6.1.2.1.26).

All the objects within a MIB are assigned object identifiers relative to a parent object. Most MIBs import the object identifier of the parent object, along with other object identifiers, textual conventions, macros and syntax types from the MIBs where they are defined. This creates dependencies between MIBs.

Some network management stations and MIB compilers will generate errors if you load a MIB that depends on another MIB that has not already been loaded. To avoid these errors, we recommend that you load MIBs in the following order:

1. RFC 1212
   RFC 1239
   RFC 2257
   RFC 3410

2. RFC1155-SMI (RFC 1155)
   SNMPv2-SMI (RFC 2578)
   SNMPv2-PDU (RFC 3416)

3. RFC1213-MIB (RFC 1213)
   RFC 1215
   SNMPv2-TC (RFC 2579)
   SNMPv2-CONF (RFC 2580)

4. IP-MIB (RFC 2011)
   TCP-MIB (RFC 2012)
   UDP-MIB (RFC 2013)
   IP-FORWARD-MIB (RFC 2096)
   SNMP-MPD-MIB (RFC 2572)
   RMON-MIB (RFC 2819)
   HCNUM-TC (RFC 2856)
   SNMP-FRAMEWORK-MIB (RFC 3411)
   SNMP-MPD-MIB (RFC 3412)
   SNMPv2-TM (RFC 3417)
   SNMPv2-MIB (RFC 3418)
   INET-ADDRESS-MIB (RFC 4001)
   IANAifType-MIB

5. IF-MIB (RFC 2863)
   SNMP-TARGET-MIB (RFC 3413)

6. SNMP-COMMUNITY-MIB (RFC 2576)
   EtherLike-MIB (RFC 3635)
   MAU-MIB (RFC 3636)
   BRIDGE-MIB (RFC 4188)
   DISMAN-PING-MIB (RFC 4560)
   SNMP-NOTIFICATION-MIB (RFC 3413)
   SNMP-PROXY-MIB (RFC 3413)

7. P-BRIDGE-MIB (RFC 2674)
   Q-BRIDGE-MIB (RFC 2674)
   RSTP-MIB (RFC 4318)
   LLDP-MIB
   LLDP-EXT-DOT1-MIB
   LLDP-EXT-DOT3-MIB
   LLDP-EXT-MED-MIB
   VRRP-MIB

8. AT-SMI-MIB

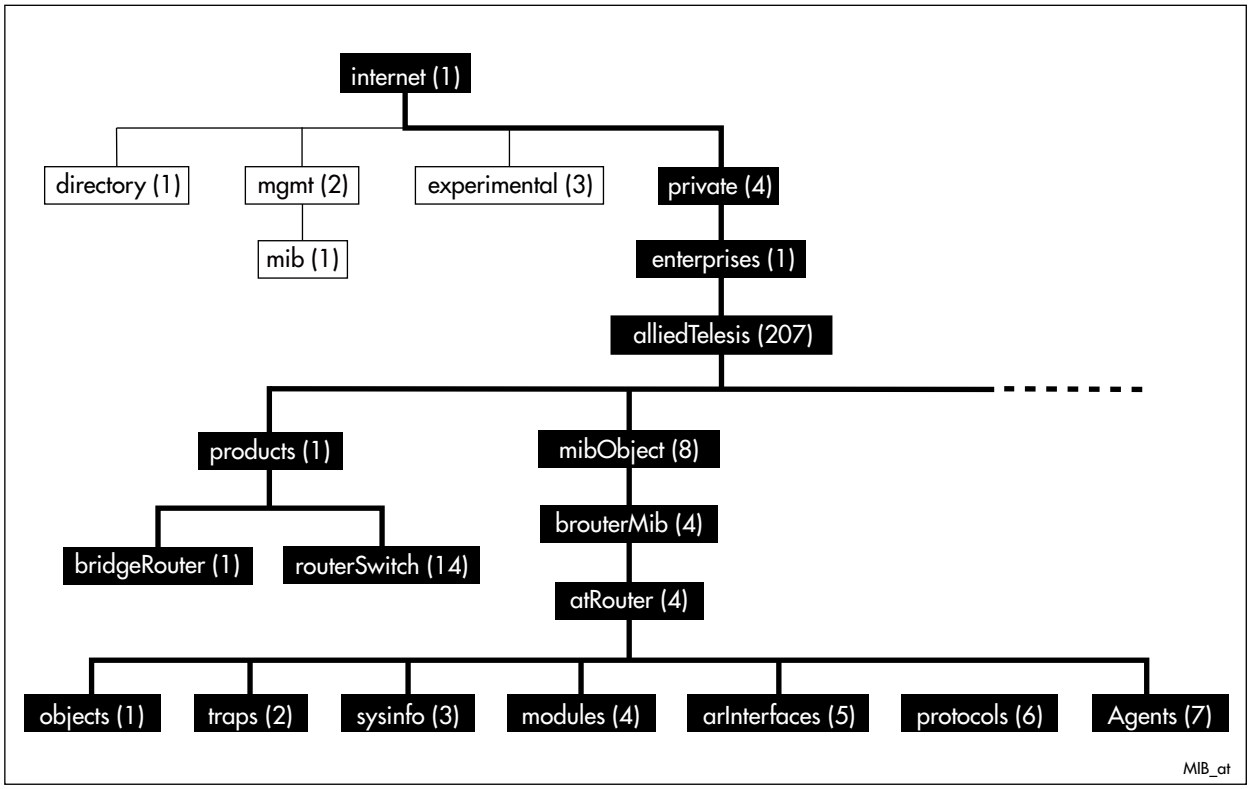
Allied Telesis Enterprise MIB

The *Allied Telesis Enterprise MIB* defines a portion of the Management Information Base (MIB) for managing Allied Telesis products and features that are not supported by public MIBs. Objects defined in this MIB reside in the private(4) subtree and have the object identifier alliedTelesis ({ enterprises 207 }).

This document describes only those portions of the Allied Telesis Enterprise MIB supported by the AlliedWare Plus™ Operating System. **Figure 98-1** shows the structure of the Allied Telesis Enterprise MIB. Each component MIB is detailed in the following sections of this chapter.

Figure 98-1: The Allied Telesis Enterprise MIB sub-tree of the Internet-standard Management Information Base (MIB)



AT-ALMMON-MIB

AT-ALMMON-MIB defines objects for managing alarms **Table 98-1**. Objects in this group have the object identifier sysinfo ({ atRouter 3 }). All objects in this group have read only access.

Table 98-1: .Objects defined by the atAlmMon MIB

Object / Object Identifier	Description
atAlmMon { atAlmMon 24 } (OID 1.3.6.1.4.1.207.8.4.4.3.26)	The AT Alarm Monitoring v2 MIB for managing and reporting device alarms.
atAlmMonActionEntryTable { atAlmMon 1} (207.8.4.4.3.24.1)	Table of information defining alarm monitoring inputs and consequent actions (i.e., fault LED and relay outputs), indexed by: 1. atAlmMonActionStackMemberId 2. atAlmMonActionIndex
atAlmMonActionEntry { atAlmMonActionTable 1 } (207.8.4.4.3.24.1.1)	A description and configuration of what to do for a specific monitored alarm.
atAlmMonActionStackMemberId { atAlmMonActionEntry 1 } (207.8.4.4.3.24.1.1.1)	The index of the stack member of this alarm action.
atAlmMonActionIndex { atAlmMonActionEntry 2 } (207.8.4.4.3.24.1.1.2)	The numeric identifier of this alarm action.
atAlmMonAlarmType { alAlmMonActionEntry 3 } (207.8.4.4.3.24.1.1.3)	The type of alarm that this action monitors. Values can be: 1. alarmTypeInvalid (0) 2. externalPSU (1) 3. epsr (2) 4. contactInput (3) 5. portLinkDown (4) 6. loopDetect (5) 7. mainPse (6) 8. portPoeFailure (7) 9. temperature (8)
atAlmMonAlarmTypeSelection { atAlmMonActionEntry 4}	The 1-based index of the alarm of the particular type (as categorized by AlmMonAlarmType).
atAlmMonActionDescription { atAlmMonActionEntry 5}	The description of this alarm monitoring entry.
atAlmMonActionUseRelay1 { atAlmMonActionEntry 6 }	Indicates/controls whether or not this alarm monitor drives the first relay output. Values can be: ■ Unused (1) ■ Used (2)
atAlmMonActionUseRelay2 { alAlmMonActionEntry 7 }	Indicates/controls whether or not this alarm monitor drives the second relay output. Values can be: ■ Unused (1) ■ Used (2)
atAlmMonActionUseRelay3 { atAlmMonActionEntry 8 }	Indicates/controls whether or not this alarm monitor drives the third relay output. Values can be: ■ Unused (1) ■ Used (2)

Object / Object Identifier	Description
atAlmMonActionUseFaultLed { alAlmMonActionEntry 9 }	Indicates/controls whether or not this alarm monitor drives the fault LED. Values can be: ■ Unused (1) ■ Used (2)
alAlmMonAbnormalState { atAlmMonActionEntry 10 }	Indicates/sets the abnormal (i.e., alarm active) state for a contact input. Only used for contactInput alarm monitors, ignored for all other types. Values can be: ■ open (1) ■ closed (2)
atAlmMonActionState { atAlmMonActionEntry 11 }	Indicates the current state of this alarm monitor. Values can be: ■ Inactive (1) ■ Active (2)

AT-ATMF-MIB

The ATMF-MIB defines objects for managing ATMF objects and triggers are shown diagramatically in **Figure 98-2 on page 98.8** and **Figure 98-3 on page 98.9** Objects in this group have the object identifier ATMF ({ modules 603 }). These are shown listed in **Table 98-2 on page -10**.

Figure 98-2: The Upper levels of the AT-ATMF MIB sub-tree

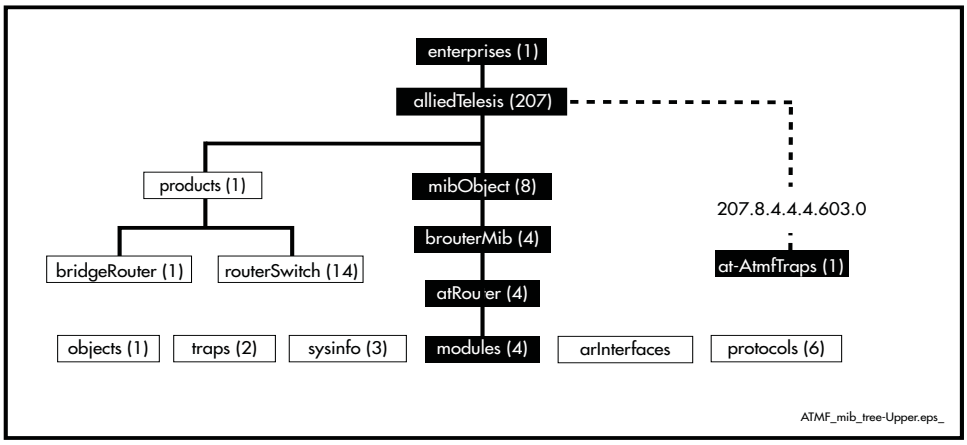


Figure 98-3: The Lower levels of the AT-ATMF MIB sub-tree

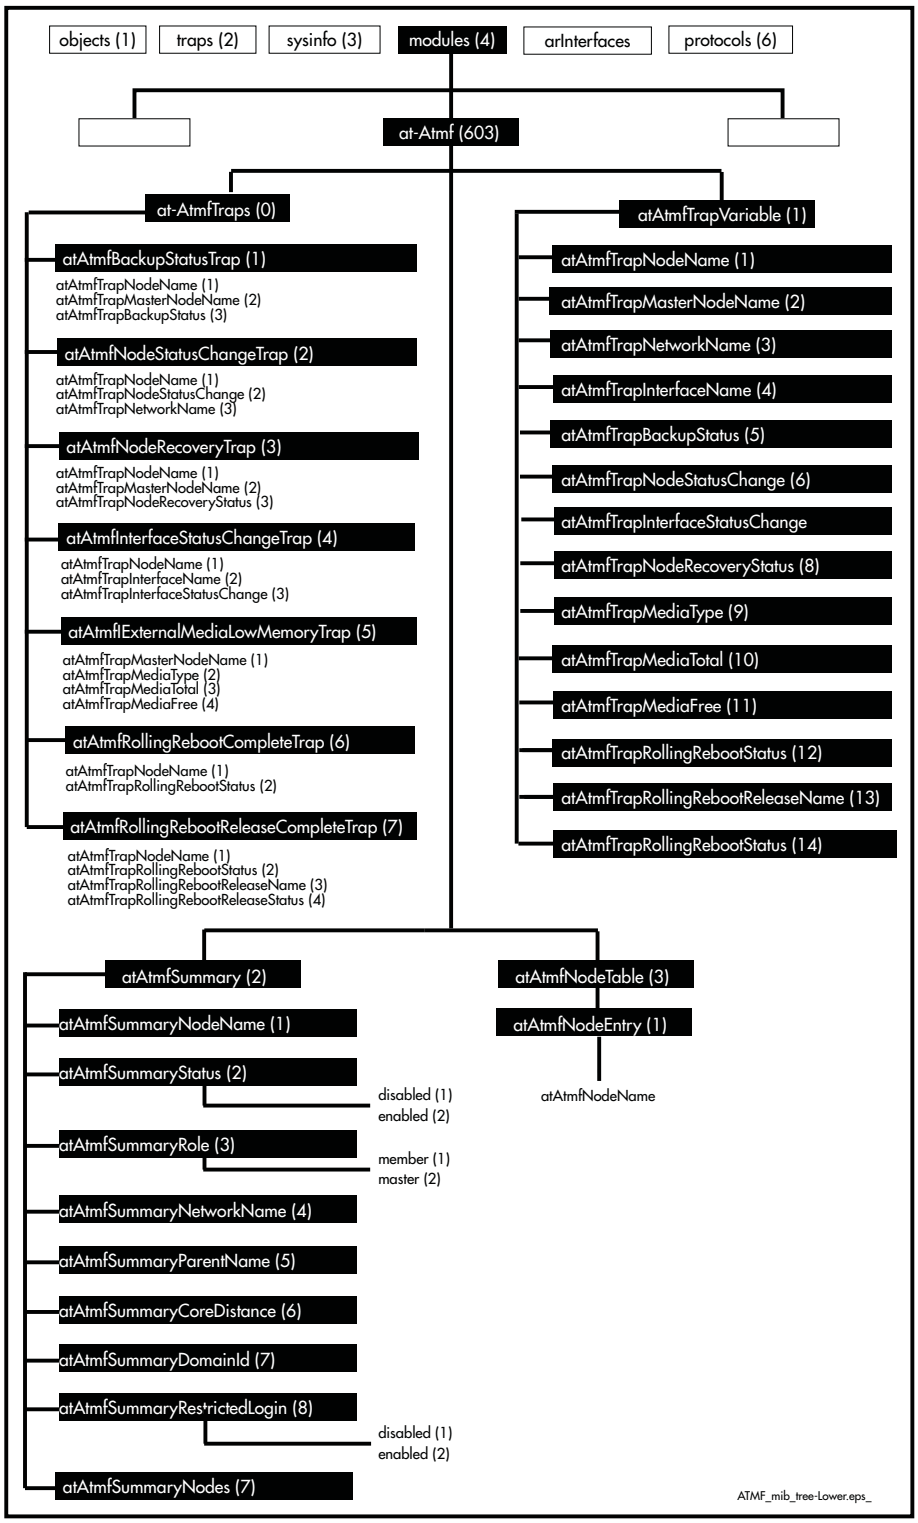

Table 98-2: AT-ATMF MIB Objects

Object	Object Identifier	Description
atmf	{ modules 603 } 1.3.6.1.4.1.207.8.4.4.4.603	Root of the Allied Telesis ATMF MIB under the private(4) node defined in RFC1155-SMI.
atAtmfTraps	{ atmf 0 } 207.8.4.4.4.603.0	Sub-tree of objects describing ATMF traps.
atAtmfBackup StatusTrap	atAtmfTraps 1	This trap is generated when an ATMF master attempts to backup a node's FLASH contents. It states wether the backup of an individual node, or all nodes, to a master node has passed or failed. Its objects are: 1. atAtmfTrapNodeName 2. atAtmfTrapMasterNodeName 3. atAtmfTrapBackupStatus
atAtmfNode StatusChange Trap	atAtmfTraps 2	This trap is generated when an ATMF node joins or leaves the ATMF network. It states whether a node has <left| joined> an ATMF network. Its objects are: 1. atAtmfTrapNodeName 2. atAtmfTrapNodeStatusChange 3. atAtmfTrapNetworkName
atAtmfNode RecoveryTrap	atAtmfTraps 3	This trap is generated when an attempt has been made to recover an ATMF node. It states whether an attempt to recover a node from the specified master has passed or failed. Its objects are: 1. atAtmfTrapNodeName 2. atAtmfTrapMasterNodeName 3. atAtmfTrapNodeRecoveryStatus
atAtmfInterface StatusChangeTrap	atAtmfTraps 4	This trap is generated when an ATMF interface status change occures. It states that an interface on a node has changed status to either blocking or forwarding. Its objects are: 1. atAtmfTrapNodeName 2. atAtmfTrapInterfaceName 3. atAtmfTrapInterfaceStatusChange
atAtmfExternal MediaLowMemory Trap	atAtmfTraps 5	This trap is generated when the available external storage on the ATMF master node falls below a nominated threshold. It states that the external USB or SD card storage on a master node has fallen below the designated threshold and specifies the total available memory <xxx MB> and the total free memory <xxx MB>. Its objects are: 1. atAtmfTrapMasterNodeName 2. atAtmfTrapMediaType 3. atAtmfTrapMediaTotal 4. atAtmfTrapMediaFree
atAtmfRolling RebootComplete Trap	atAtmfTraps 6	This trap is generated when the ATMF rolling reboot process has finished on a particular ATMF node. Nominally, it states that the ATMF rolling reboot, executed against the specified node, has returned a reboot status of either failed or passed. Its objects are: 1. atAtmfTrapNodeName 2. atAtmfTrapRollingRebootStatus

Table 98-2: AT-ATMF MIB Objects(cont.)

Object	Object Identifier	Description
atAtmfRolling RebootRelease CompleteTrap	atAtmfTraps 7	This trap is generated when the ATMF rolling reboot process attempts to push a new software release to a specified ATMF node. Nominally, it states that the ATMF rolling reboot release process, executed from the specified node has returned a reboot status of either failed or passed, the name of the attempted release file and the release status of either "failed" or "passed". Its objects are: 1. atAtmfTrapNodeName 2. atAtmfTrapRollingRebootStatus 3. atAtmfTrapRollingRebootReleaseName 4. atAtmfTrapRollingRebootReleaseStatus
atAtmfTrapVariable	atmf 1	Sub-tree of objects describing ATMF traps.
atAtmfTrapNode Name	atAtmfTrapVariable 1	The ATMF trap node name.
atAtmfTrapMaster NodeName	atAtmfTrapVariable 2	The ATMF trap master node name.
atAtmfTrapNetwork Name	atAtmfTrapVariable 3	The ATMF trap network name.
atAtmfTrapInterface Name	atAtmfTrapVariable 4	The ATMF interface name, "Trap".
atAtmfTrapBackup Status	atAtmfTrapVariable 5	The status of the last trap backup attempt on either a specified ATMF node or all nodes in the ATMF network. Its objects are: 1. failed(1) 2. passed(2)
atAtmfTrapNode StatusChange	atAtmfTrapVariable 6	An ATMF trap node has changed its status in the ATMF network. Its objects are: 1. left(1) 2. joined(2)
AtmfTrapInterface StatusChange	atAtmfTrapVariable 7	An ATMFtrap interface has changed its status. Its objects are: 1. blocking(1) 2. forwarding(2)
atAtmfTrapNode RecoveryStatus	atAtmfTrapVariable 8	The status of the last recovery attempt. Its objects are: 1. failed(1) 2. passed(2)
atAtmfTrapMedia Type	atAtmfTrapVariable 9	The media type resident on the ATMF node - USB or SD.
atAtmfTrapMedia Total	atAtmfTrapVariable 10	The total memory available on the resident media, in MB.
atAtmfTrapMedia Free	atAtmfTrapVariable 11	The free memory available on the resident media, in MB. Each node has a maximum flash of 64MB.
atAtmfTrapRolling RebootStatus	atAtmfTrapVariable 12	The status of the last rolling reboot for a node. Its objects are: 1. failed(1) 2. passed(2)
atAtmfTrapRolling RebootRelease Name	atAtmfTrapVariable 13	The name of the last rolling reboot release.

Table 98-2: AT-ATMF MIB Objects(cont.)

Object	Object Identifier	Description
atAtmfTrapRollingRebootReleaseStatus	atAtmfTrapVariable 14	The release update status of the last rolling reboot for a node. Its objects are: 1. failed(1) 2. passed(2)
atAtmfSummary	atmf 2	
atAtmfSummary NodeName	atAtmfSummary 1	The name assigned to a particular node.
atAtmfSummary Status	atAtmfSummary 2	The Node's ATMF status.
atAtmfSummary Role	atAtmfSummary 3	The role configured for this ATMF device, either Master or Member.
atAtmfSummary NetworkName	atAtmfSummary 4	The ATMF network that a particular node belongs to.
atAtmfSummary ParentName	atAtmfSummary 5	The parent name of the node or 'none'.
atAtmfSummary CoreDistance	atAtmfSummary 6	The ATMF core distance for this node.
atAtmfSummary DomainId	atAtmfSummary 7	The ATMF domain Id for this node.
atAtmfSummary RestrictedLogin	atAtmfSummary 8	The login for this ATMF device is restricted to only those devices that are designated ATMF Masters. Its objects are: 1. disabled(1) 2. enabled(2)
atAtmfSummary Nodes	atAtmfSummary 9	The number of ATMF nodes known to this device.
atAtmfNodeTable	atmf 3	ATMF Node Entry.
atAtmfNodeName	atAtmfNodeTable 1	The name assigned to a particular node.

AT-BOARDS-MIB

AT-BOARDS-MIB defines object identifiers for components of Allied Telesis products—base CPU and expansion boards, interface types, and chip sets. Objects in this MIB have the object identifier objects ({ atRouter 1 }), and are organized into the following groups:

- Base CPU and expansion boards (**Table 98-3**). These object identifiers are for use with the hrDeviceID object in the Host Resources MIB (see **"Public MIBs" on page 98.88**).
- Interface types (**Table 98-4**).
- Chip sets (**Table 98-5**).

Table 98-3: Object identifiers for base CPU and expansion boards

Object	Object Identifier	Description
boards	{ objects 1 }	
pprx90024XT	{ boards 271 }	x900-24XT Enhanced Gigabit Layer 3+ Expandable Switch, 24 x 10/100/1000BASE-T copper ports (RJ-45 connectors), 2 x 20 Gigabit expansion bays
pprx90024XS	{ boards 272 }	x900-24XS Enhanced Gigabit Layer 3+ Expandable Switch, 24 x 10/100/1000BASE-T copper ports (RJ-45 connectors), 2 x 20 Gigabit expansion bays
pprAtXum10Gi	{ boards 273 }	XEM-1XP Expansion Module, 1 x 10Gbe XFP port
pprAtXum12SFPi	{ boards 274 }	XEM-12S Expansion Module, 12 x SFP Gigabit ports
pprAtXum12Ti	{ boards 275 }	XEM-12T Expansion Module, 12 x 10/100/100BASE-T copper ports (RJ-45 connectors)
pprAtXum12TiN	{ boards 280 }	XEM-12T-N Expansion Module, 12 x 10/100/100BASE-T copper ports (RJ-45 connectors), NEBS compliant
pprx90024XTN	{ boards 281 }	x900-24XT Enhanced Gigabit Layer 3+ Expandable Switch, 24 x 10/100/1000BASE-T copper ports (RJ-45 connectors), 2 x 20 Gigabit expansion bays, NEBS compliant
pprSwitchBladex908	{ boards 282 }	Switchblade x908 8 Slot Layer 3 Switch Chassis
pprx90012XTS	{ boards 288 }	AT-x900-12XT/S Advanced Gigabit Layer 3+ Expandable Switch, 12 x combo ports (10/100/1000BASE-T copper or SFP), 1 x 30Gbps expansion bay
pprAt9524TS	{ boards 290 }	x600-24Ts/XP, 24 x 1000BASE-T ports (RJ45 connectors), 4 x SFP (combo) ports
pprAt9524TSXP	{ boards 291 }	x600-24Ts/XP, 24 x 1000BASE-T ports (RJ45 connectors), 4 x SFP (combo) ports, 2 x XFP ports
pprAt9548TS	{ boards 294 }	x600-44Ts, 44 x 1000BASE-T ports, 4 x SFP ports
pprAt9548TSXP	{ boards 295 }	x600-44Ts/XP, 44 x 1000BASE-T ports, 4 x SFP ports, 2 x XFP ports
pprXem2XP	{ boards 306 }	XEM-2XP Expansion Module, 2 x 10Gbe XFP port
pprATStackXG	{ boards 307 }	x600 Expansion Module, Stacking
pprATEMXP	{ boards 308 }	x600 Expansion Module, 2 x 10G XFP ports
pprATLBM	{ boards 309 }	x600 Expansion Module, loopback
pprAtSBx8112	{ boards 316 }	AT-SBx8112, SwitchBlade x8112 chassis
pprAtSBx81CFC400	{ boards 317 }	AT-SBx81CFC, Control Fabric Card for SwitchBlade x8112
pprAtSBx81GP24	{ boards 318 }	AT-SBx81GP24, 24 x 1G PoE line card
pprAtSBxPWRSYSAC	{ boards 320 }	AT-SBxPWR SYS/AC, system power supply unit for the SwitchBlade x8112 (AC input)

Table 98-3: Object identifiers for base CPU and expansion boards(cont.)

Object	Object Identifier	Description
pprAtSBxPWRPOEAC	{ boards 321 }	AT-SBxPWR POE/AC, PoE power supply unit for the SwitchBlade x8112 (AC input)
pprAtSBxFAN12	{ boards 322 }	AT-SBxFAN12, fan tray for the SwitchBlade x8112
pprAtPWR05DC	{ boards 323 }	AT-PWR05, DC power supply unit for SwitchBlade x908
pprXem2XT	{ boards 325 }	XEM-2XT Expansion Module, 2 x 10Gbe copper XEM port
pprx60024TSPOE	{ boards 326 }	x600-24Ts-POE, 24 x 1000BASE-T PoE ports (RJ45 connectors), 4 x SFP (combo) ports
pprx60024TSPOEPLUS	{ boards 327 }	x600-24Ts-POE+, 24 x 1000BASE-T PoE+ ports (RJ45 connectors), 4 x SFP (combo) ports
pprx61048TsXPOEPlus	{ boards 331 }	x610-48Ts/X-POE+, 48 x 1000BASE-T PoE+ ports (RJ45 connectors), 2 x SFP (combo) ports, 2 x SFP+ ports
pprx61048TsPOEPlus	{ boards 332 }	x610-48Ts-POE+, 48 x 1000BASE-T PoE+ ports (RJ45 connectors), 4 x SFP (combo) ports
pprx61024TsXPOEPlus	{ boards 333 }	x610-24Ts/X-POE+, 24 x 1000BASE-T PoE+ ports (RJ45 connectors), 4 x SFP (combo) ports, 2 x SFP+ ports
pprx61024TsPOEPlus	{ boards 334 }	x610-24Ts-POE+, 24 x 1000BASE-T PoE+ ports (RJ45 connectors), 4 x SFP (combo) ports
pprPWR800	{ boards 336 }	AT-PWR800, 800W power supply unit
pprPWR1200	{ boards 337 }	AT-PWR1200, 1200W power supply unit
pprPWR250	{ boards 338 }	AT-PWR250, 250W power supply unit
pprx61048TsX	{ boards 339 }	x610-48Ts/X, 48 x 1000BASE-T ports (RJ45 connectors), 2 x SFP (combo) ports, 2 x SFP+ ports
pprx61048Ts	{ boards 340 }	x610-48Ts, 48 x 1000BASE-T ports (RJ45 connectors), 4 x SFP (combo) ports
pprx61024TsX	{ boards 341 }	x610-24Ts/X, 24 x 1000BASE-T ports (RJ45 connectors), 4 x SFP (combo) ports, 2 x SFP+ ports
pprx61024Ts	{ boards 342 }	x610-24Ts, 24 x 1000BASE-T ports (RJ45 connectors), 4 x SFP (combo) ports
pprPWR250DC	{ boards 351 }	AT-PWR250DC, 250W DC power supply unit
pprAtSBx81GT24	{ boards 352 }	AT-SBx81GT24, 24 x 1G copper line card
pprAtSBx81GS24a	{ boards 353 }	AT-SBx81GS24a, 24 x 1G SFP line card
pprAtSBx81XS6	{ boards 354 }	AT-SBx81XS6, 6 x 10G SFP+ line card
pprx2109GT	{ boards 367 }	AT-x210-9GT, 8xGigbit, 1xSFP/T
pprx21016GT	{ boards 368 }	AT-x210-16GT, 14xGigbit, 2xcombo SFP/T
pprx21024GT	{ boards 369 }	AT-x210-24GT, 20xGigbit, 4xcombo SFP/T
pprx51028GTX	{ boards 370 }	AT-x510-28GTX board with 24 10/100/1000 Base-T ports and four 10Gb/s SFP+ ports.
pprx51028GPX	{ boards 371 }	AT-x510-28GPX board with 24 10/100/1000 Base-T ports, four 10 Gb/s SFP+ ports and PSE function available on pins 1/2 and 3/6 (Mode A) of every copper port.
pprx51028GSX	{ boards 372 }	AT-x510-28GSX with 24 100/1000 SFP ports and four 10 Gb/s SFP+ ports.
pprx51052GTX	{ boards 373 }	AT-x510-52GTX board with 48 10/100/1000 Base-T ports and four 10 Gb/s SFP+ ports.
pprx51052GPX	{ boards 374 }	AT-x510-52GPX board with 48 10/100/1000 Base-T ports, four 10 Gb/s SFP+ ports and PSE function available on pins 1/2 and 3/6 (Mode A) of every copper port.

Table 98-3: Object identifiers for base CPU and expansion boards(cont.)

Object	Object Identifier	Description
pprAtSBx81CFC960	{ boards 377 }	AT-SBx81CFC960 Control Fabric Card for SwitchBlade x8100 Series chassis, four 10GbE SFP+ ports.
pprAtSBx81GT40	{ boards 381 }	AT-SBx81GT40 RJ point five line card.
pprPWR100R	{ boards 384 }	AT-PWR100R, 100W power supply unit
pprPWR250DCR	{ boards 385 }	AT-PWR250R-DC, 250W DC power supply unit
pprx510DP52GTX	{ boards 386 }	AT-x510DP-52GTX board with 48 10/100/1000 Base-T ports and four 10 Gb/s SFP+ ports.
pprxIX528GPX	{ boards 387 }	AT-IX5-28GPX board with 24 10/100/1000 Base-T ports, four 10 Gb/s SFP+ ports and PSE function available on pins 1/2 and 3/6 (Mode A) of every copper port.
pprAtSBx8106	{ boards 375 }	AT-SBx8106, SwitchBlade x8106 chassis
pprAtSBxFAN06	{ boards 376 }	AT-SBxFAN06, fan tray for the SwitchBlade x8106
pprIE5006GT	{ boards 410 }	IE500-6GT L2+ managed industrial Switch with 4 x 10/100/1000T LAN ports and 2 x SFP uplinks (100/1000X). Note that this is a single board device.
pprIE5006GP	{ boards 411 }	IE500-6GP L2+ managed industrial Switch with 4 x 10/100/1000T LAN ports (with 802.3at PoE+) and 2 x SFP uplinks (100/1000X). Note that this is a single board device.
pprIE5006GPW	{ boards 412 }	IE500-6GPW L2+ managed industrial Switch with 4 x 10/100/1000T LAN ports (with 802.3at PoE+) and 2 x SFP uplinks (100/1000X) and 802.11bgn wireless. Note that this is a single board device.

Table 98-4: Object identifiers for interface types

Object	Object Identifier	Description
iftypes	{ objects 3 }	
ifaceEth	{ iftypes 1 }	Ethernet
ifaceSyn	{ iftypes 2 }	Synchronous
ifaceAsyn	{ iftypes 3 }	Asynchronous
ifaceBri	{ iftypes 4 }	BRI ISDN
ifacePri	{ iftypes 5 }	PRI ISDN
ifacePots	{ iftypes 6 }	POTS (voice)
ifaceGBIC	{ iftypes 7 }	GBIC (Gigabit Interface Converter)
chipMips_4kcCpu	{ chips 6 }	Dual MIPS CPU

Table 98-5: Object identifiers for chip sets

Object	Object Identifier	Description
chips	{ objects 4 }	
chip68020Cpu	{ chips 1 }	MC68020 CPU
chip68340Cpu	{ chips 2 }	MC68340 CPU
chip68302Cpu	{ chips 3 }	MC68302 CPU
chip68360Cpu	{ chips 4 }	MC68360 CPU
chip860TCpu	{ chips 5 }	MPC860T CPU

Table 98-5: Object identifiers for chip sets(cont.)

Object	Object Identifier	Description
chipMips4kcCpu	{ chips 6 }	Dual MIPS CPU
chipRtc1	{ chips 21 }	Real Time Clock v1
chipRtc2	{ chips 22 }	Real Time Clock v2
chipRtc3	{ chips 23 }	Real Time Clock v3
chipRtc4	{ chips 24 }	Real Time Clock v4

chipFlash6mb	{ chips 76 }	6 MB FLASH memory
chipFlash8mb	{ chips 78 }	8 MB FLASH memory
chipPem	{ chips 120 }	Processor Enhancement Module

AT-DHCPSN-MIB

This MIB contains objects for displaying and managing DHCP snooping and ARP security information on the switch. (Table 98-6). The objects reside in the module atDhcpsn { modules 537 }, organized in the following groups:

- The DHCP Snooping Events group (atDhcpsnEvents) contains notifications (traps)
- The DHCP Snooping table (atDhcpsnVariablesTable) contains DHCP snooping information
- The ARP Security table (atArpsecVariablesTable) contains ARP security information

Table 98-6: Objects defined in AT-DHCPSN-MIB

Object	Object Identifier	Description
atDhcpsn	{ modules 537 }	This MIB file contains definitions of managed objects for DHCP Snooping in AlliedWare Plus™.
atDhcpsnEvents	{ atDhcpsn 1 }	DHCP Snooping notifications (traps)
atDhcpsnTrap	{ atDhcpsnEvents 1 }	DHCP Snooping violation notification.
atArpsecTrap	{ atDhcpsnEvents 2 }	DHCP Snooping ARP Security violation notification.
atDhcpsnVariablesTable	{ atDhcpsn 1 }	The DHCP Snooping table. This table contains rows of DHCP Snooping information.
atDhcpsnVariablesEntry	{ atDhcpsnVariablesTable 1 }	A set of parameters that describe the DHCP Snooping features.
atDhcpsnIfIndex	{ atDhcpsnVariablesEntry 1 }	Ifindex of the port that the packet was received on.
atDhcpsnVid	{ atDhcpsnVariablesEntry 2 }	VLAN ID of the port that the packet was received on.
atDhcpsnSmac	{ atDhcpsnVariablesEntry 3 }	Source MAC address of the packet that caused the trap.
atDhcpsnOpcode	{ atDhcpsnVariablesEntry 4 }	Opcode value of the BOOTP packet that caused the trap. Only bootpRequest(1) or bootpReply(2) is valid.
atDhcpsnCiaddr	{ atDhcpsnVariablesEntry 5 }	Ciaddr value of the BOOTP packet that caused the trap.
atDhcpsnYiaddr	{ atDhcpsnVariablesEntry 6 }	Yiaddr value of the BOOTP packet that caused the trap.
atDhcpsnGiaddr	{ atDhcpsnVariablesEntry 7 }	Giaddr value of the BOOTP packet that caused the trap.
atDhcpsnSiaddr	{ atDhcpsnVariablesEntry 8 }	Siaddr value of the BOOTP packet that caused the trap.
atDhcpsnChaddr	{ atDhcpsnVariablesEntry 9 }	Chaddr value of the BOOTP packet that caused the trap.

Table 98-6: Objects defined in AT-DHCPSN-MIB(cont.)

Object	Object Identifier	Description
atDhcpsnVioType	{ atDhcpsnVariablesEntry 10 }	The reason that the trap was generated. ■ invalidBootp(1) indicates that the received BOOTP packet was invalid. For example, it is neither BootpRequest nor BootpReply. ■ invalidDhcpAck(2) indicates that the received DHCP ACK was invalid. ■ invalidDhcpRelDec(3) indicates the DHCP Release or Decline was invalid. ■ invalidIp(4) indicates that the received IP packet was invalid. ■ maxBindExceeded(5) indicates that if the entry was added, the maximum bindings configured for the port would be exceeded. ■ opt82InsertErr(6) indicates that the insertion of Option 82 failed. ■ opt82RxInvalid(7) indicates that the received Option 82 information was invalid. ■ opt82RxUntrusted(8) indicates that Option 82 information was received on an untrusted port. ■ opt82TxUntrusted(9) indicates that Option 82 would have been transmitted out an untrusted port. ■ replyRxUntrusted(10) indicates that a BOOTP Reply was received on an untrusted port. ■ srcMacChaddrMismatch(11) indicates that the source MAC address of the packet did not match the BOOTP CHADDR of the packet. ■ staticEntryExisted(12) indicates that the static entry to be added already exists. ■ dbAddErr(13) indicates that adding an entry to the database failed.
atArpsecVariablesTable	{ atDhcpsn 2 }	The ARP Security table. This table contains rows of DHCP Snooping ARP Security information.
atArpsecVariablesEntry	{ atArpsecVariablesTable 1 }	A set of parameters that describe the DHCP Snooping ARP Security features.
atArpsecIfIndex	{ atArpsecVariablesEntry 1 }	Ifindex of the port that the ARP packet was received on.
atArpsecClientIP	{ atArpsecVariablesEntry 2 }	Source IP address of the ARP packet.
atArpsecSrcMac	{ atArpsecVariablesEntry 3 }	Source MAC address of the ARP packet.
atArpsecVid	{ atArpsecVariablesEntry 4 }	VLAN ID of the port that the ARP packet was received on.

Table 98-6: Objects defined in AT-DHCPSN-MIB(cont.)

Object	Object Identifier	Description
atArpsecVioType	{ atArpsecVariablesEntry 5 }	The reason that the trap was generated. ■ srcIpNotFound(1) indicates that the Sender IP address of the ARP packet was not found in the DHCP Snooping database. ■ badVLAN(2) indicates that the VLAN of the DHCP Snooping binding entry associated with the Sender IP address of the ARP packet does not match the VLAN that the ARP packet was received on. ■ badPort(3) indicates that the port of the DHCP Snooping binding entry associated with the Sender IP address of the ARP packet does not match the port that the ARP packet was received on. ■ srcIpNotAllocated(4) indicates that the CHADDR of the DHCP Snooping binding entry associated with the Sender IP address of the ARP packet does not match the Source MAC and/or the ARP source MAC of the ARP packet.

AT-DNS-CLIENT-MIB

AT-DNS-CLIENT-MIB contains definitions of managed objects for the Allied Telesis DNS Client Configuration.

Objects in this group have the object identifier atDns ({ Modules 501 }). **Table 98-7** lists the objects supported by the AlliedWare Plus™ Operating System.

Table 98-7: Objects defined in AT-DNS-CLIENT-MIB

Object	Object Identifier	Description
atDnsClient	{ atDns 1 }	MIB File for DNS Client Configuration.
atDNSServerIndexNext	{ atDnsClient 1 }	The next available value for the object 'atDNSServerIndex'. The value is used by a management application to create an entry in the 'atDNSServerTable'.
atDNSServerTable	{ atDnsClient 2 }	Table of information about the Domain Name System (DNS) Server configurations in the system, indexed by 'atDNSServerIndex'.
atDNSServerEntry	{ atDNSServerTable 1 }	Information about a single DNS Server Configuration.
atDNSServerIndex	{ atDNSServerEntry 1 }	The index corresponding to the particular DNS Server Configuration. When creating a new entry in the table, the value of this object must be equal to the value in the 'atDNSServerIndexNext'.
atDNSServerAddrType	{ atDNSServerEntry 2 }	The Internet Address Type of the 'atDNSServerAddr' object. Can be one of the following: unknown (0) 1. ipv4 (1) - default 2. ipv6 (2) - not supported 3. ipv4z (3) - not supported 4. ipv6z (4) - not supported 5. dns (16) - not supported
atDNSServerAddr	{ atDNSServerEntry 3 }	The IP Address of the DNS Server. When a new entry is created, this object is set to the default of '0.0.0.0' { '00000000'h }. The management application will change this to the desired value using a SET operation.
atDNSServerStatus	{ atDNSServerEntry 4 }	The status of the current entry (row). Can be one of the following: 1. active (1) 2. createAndGo (4) 3. destroy (6) To create a new entry the management application must set this object with value 'createAndGo (4)'. To delete an entry, the management application must set this object with value 'destroy (6)'. Once an entry is deleted, all subsequent entries in the table will be renumbered. The default is 1 (active)

AT-ENVMONv2-MIB

The AT Environment Monitoring v2 MIB (atEnvMonv2-MIB) has the object path 207.8.4.4.3.12. It contains objects for managing and reporting data relating to fans, voltage rails, temperature sensors and power supply units installed in the device (**Table 98-8**). Objects in this group have the object identifier EnvMonv2 ({ sysinfo 12 }).

Table 98-8: Objects defined in AT-ENVMONV2-MIB

Object / Object Identifier	Description
atEnvMonv2Notifications { atEnvMonv2 0 } OID (207.8.4.4.3.12.0)	A collection of traps (notification) objects for monitoring fans, voltage rails, temperature sensors, and power supply bays.
atEnvMonv2FanAlarmSetNotify { atEnvMonv2Notifications 1 } OID (207.8.4.4.3.12.0.1)	A notification that is generated when the monitored speed of a fan drops below its lower threshold. It returns the value of: 1. atEnvMonv2FanStackMemberId 2. atEnvMonv2FanBoardIndex 3. atEnvMonv2FanIndex 4. atEnvMonv2FanDescription 5. atEnvMonv2FanLowerThreshold 6. atEnvMonv2FanCurrentSpeed
atEnvMonv2FanAlarmClearedNotify { atEnvMonv2Notifications 2 }	Notification generated when the monitored speed of a fan returns to an acceptable value, the fan having previously been in an alarm condition. It returns the value of: 1. atEnvMonv2FanStackMemberId 2. atEnvMonv2FanBoardIndex 3. atEnvMonv2FanIndex 4. atEnvMonv2FanDescription 5. atEnvMonv2FanLowerThreshold 6. atEnvMonv2FanCurrentSpeed
atEnvMonv2VoltAlarmSetNotify { atEnvMonv2Notifications 3 }	Notification generated when the voltage of a monitored voltage rail, goes out of tolerance by either dropping below its lower threshold, or exceeding its upper threshold. It returns the value of: 1. atEnvMonv2VoltageStackMemberId 2. atEnvMonv2VoltageBoardIndex 3. atEnvMonv2VoltageIndex 4. atEnvMonv2VoltageDescription 5. atEnvMonv2VoltageUpperThreshold 6. atEnvMonv2VoltageLowerThreshold 7. atEnvMonv2VoltageCurrent (i.e. the voltage currently being measured).

Table 98-8: Objects defined in AT-ENVMONV2-MIB(cont.)

Object / Object Identifier	Description
atEnvMonv2VoltAlarmClearedNotify { atEnvMonv2Notifications 4 }	Notification generated when the voltage of a monitored voltage rail returns to an acceptable value, having previously been in an alarm condition. It returns the value of: 1. atEnvMonv2VoltageStackMemberId 2. atEnvMonv2VoltageBoardIndex 3. atEnvMonv2VoltageIndex 4. atEnvMonv2VoltageDescription 5. atEnvMonv2VoltageUpperThreshold 6. atEnvMonv2VoltageLowerThreshold 7. atEnvMonv2VoltageCurrent (i.e. the voltage currently being measured).
atEnvMonv2TempAlarmSetNotify { atEnvMonv2Notifications 5 }	Notification generated when a monitored temperature exceeds its upper threshold. It returns the value of: 1. atEnvMonv2TemperatureStackMemberId 2. atEnvMonv2TemperatureBoardIndex 3. atEnvMonv2TemperatureIndex 4. atEnvMonv2TemperatureDescription 5. atEnvMonv2TemperatureUpperThreshold 6. atEnvMonv2TemperatureCurrent
atEnvMonv2TempAlarmClearedNotify { atEnvMonv2Notifications 6 }	Notification generated when a monitored temperature returns to an acceptable value, having previously been in an alarm condition. It returns the value of: 1. atEnvMonv2TemperatureStackMemberId 2. atEnvMonv2TemperatureBoardIndex 3. atEnvMonv2TemperatureIndex 4. atEnvMonv2TemperatureDescription 5. atEnvMonv2TemperatureUpperThreshold
atEnvMonv2PsbAlarmSetNotify { atEnvMonv2Notifications 7 }	Notification generated when a monitored parameter of a power supply bay device goes out of tolerance. It returns the value of: 1. atEnvMonv2PsbSensorStackMemberId 2. atEnvMonv2PsbSensorBoardIndex 3. atEnvMonv2PsbSensorIndex 4. atEnvMonv2PsbSensorType 5. atEnvMonv2PsbSensorDescription
atEnvMonv2PsbAlarmClearedNotify { atEnvMonv2Notifications 8 }	Notification generated when a monitored parameter of a power supply bay device returns to an acceptable value, having previously been in an alarm condition. It returns the value of: 1. atEnvMonv2PsbSensorStackMemberId 2. atEnvMonv2PsbSensorBoardIndex 3. atEnvMonv2PsbSensorIndex 4. atEnvMonv2PsbSensorType 5. atEnvMonv2PsbSensorDescription

Table 98-8: Objects defined in AT-ENVMONV2-MIB(cont.)

Object / Object Identifier	Description
atEnvMonv2ContactInputOpenNotify { atEnvMonv2Notifications 9 }	Notification generated when a monitored contact input opens. It returns the value of: 1. atEnvMonv2ContactInputStackMemberId 2. atEnvMonv2ContactInputBoardIndex 3. atEnvMonv2ContactInputIndex 4. atEnvMonv2ContactInputDescription
atEnvMonv2ContactInputCloseNotify { atEnvMonv2Notifications 10 }	Notification generated when a monitored contact input closes. It returns the value of: 1. atEnvMonv2ContactInputStackMemberId 2. atEnvMonv2ContactInputBoardIndex 3. atEnvMonv2ContactInputIndex 4. atEnvMonv2ContactInputDescription
atEnvMonv2ExternalPSUAlarmSetNotify { atEnvMonv2Notifications 11 }	Notification generated when supply potential of a monitored external power supply is not present. It returns the value of: 1. atEnvMonv2ExternalPSUStackMemberId 2. atEnvMonv2ExternalPSUBoardIndex 3. atEnvMonv2ExternalPSUIndex 4. atEnvMonv2ExternalPSUDescription
atEnvMonv2ExternalPSUAlarmClearedNotify { atEnvMonv2Notifications 12 }	Notification generated when supply potential of a monitored external power supply returns to an acceptable level, having previously been in alarm condition. It returns the value of: 1. atEnvMonv2ExternalPSUStatusStackMemberId 2. atEnvMonv2ExternalPSUStatusBoardIndex 3. atEnvMonv2ExternalPSUStatusIndex 4. atEnvMonv2ExternalPSUStatusDescription
atEnvMonv2FanTable { EnvMonv2 1 } OID (207.8.4.4.3.12.1)	Table of information about fans installed in the device that have their fan speeds monitored by environment monitoring hardware, indexed by: 1. atEnvMonv2FanStackMemberId 2. atEnvMonv2FanBoardIndex 3. atEnvMonv2FanIndex
atEnvMonv2FanEntry { atEnvMonv2FanTable 1 }	Description, current speed, lower threshold speed and current status of a single fan.
atEnvMonv2FanStackMemberId { atEnvMonv2FanEntry 1 }	Index of the stack member hosting this fan.
atEnvMonv2FanBoardIndex { atEnvMonv2FanEntry 2 }	Index of the board hosting this fan in the board table.
atEnvMonv2FanIndex { atEnvMonv2FanEntry 3 }	Numeric identifier of this fan on its host board.
atEnvMonv2FanDescription { atEnvMonv2FanEntry 4 }	Description of this fan.
atEnvMonv2FanCurrentSpeed { atEnvMonv2FanEntry 5 }	Current speed of this fan in revolutions per minute.
atEnvMonv2FanLowerThreshold { atEnvMonv2FanEntry 6 }	Minimum acceptable speed of the fan in revolutions per minute.

Table 98-8: Objects defined in AT-ENVMONV2-MIB(cont.)

Object / Object Identifier	Description
atEnvMonv2FanStatus { atEnvMonv2FanEntry 7 }	Whether this fan is currently in an alarm condition. The values can be: 1. Failed. Means that the current speed is too low. 2. Good. Means that the current speed is acceptable.
atEnvMonv2VoltageTable { atEnvMonv2 2 }	Table of information about voltage rails in the device that are monitored by environment monitoring hardware, indexed by: 1. atEnvMonv2VoltageStackMemberId ■ atEnvMonv2VoltageBoardIndex ■ atEnvMonv2VoltageIndex
atEnvMonv2VoltageEntry { atEnvMonv2VoltageTable 1 }	Description, current value, upper & lower threshold settings and current status of a single voltage rail.
atEnvMonv2VoltageStackMemberId { atEnvMonv2VoltageEntry 1 }	Index of the stack member hosting this voltage sensor.
atEnvMonv2VoltageBoardIndex { atEnvMonv2VoltageEntry 2 }	Index of the board hosting this voltage sensor in the board table.
atEnvMonv2VoltageIndex { atEnvMonv2VoltageEntry 3 }	Numeric identifier of this voltage rail on its host board.
atEnvMonv2VoltageDescription { atEnvMonv2VoltageEntry 4 }	Description of this voltage rail.
atEnvMonv2VoltageCurrent { atEnvMonv2VoltageEntry 5 }	Current reading of this voltage rail in millivolts.
atEnvMonv2VoltageUpperThreshold { atEnvMonv2VoltageEntry 6 }	Maximum acceptable reading of this voltage rail in millivolts.
atEnvMonv2VoltageLowerThreshold { atEnvMonv2VoltageEntry 7 }	Minimum acceptable reading of this voltage rail in millivolts.
atEnvMonv2VoltageStatus { atEnvMonv2VoltageEntry 8 }	Whether this voltage rail is currently in an alarm condition. Possible values are: 1. outOfRange (1) - means that the current reading is outside the threshold range. 2. inRange (2) - means that the current reading is acceptable.
atEnvMonv2TemperatureTable { atEnvMonv2 3 }	Table of information about temperature sensors in the device that are monitored by environment monitoring hardware, indexed by: 1. atEnvMonv2TemperatureStackMemberId 2. atEnvMonv2TemperatureBoardIndex 3. atEnvMonv2TemperatureIndex 4. atEnvMonv2TemperatureDescription 5. atEnvMonv2TemperatureCurrent 6. atEnvMonv2TemperatureUpperThreshold 7. atEnvMonv2TemperatureStatus
atEnvMonv2TemperatureEntry { atEnvMonv2TemperatureTable 1 }	Description, current value, upper threshold setting and current status of a single temperature sensor.
atEnvMonv2TemperatureStackMemberId { atEnvMonv2TemperatureEntry 1 }	Index of the stack member hosting this temperature sensor.
atEnvMonv2TemperatureBoardIndex { atEnvMonv2TemperatureEntry 2 }	Index of the board hosting this temperature sensor in the board table.

Table 98-8: Objects defined in AT-ENVMONV2-MIB(cont.)

Object / Object Identifier	Description
atEnvMonv2TemperatureIndex { atEnvMonv2TemperatureEntry 3 }	Numeric identifier of this temperature sensor on its host board.
atEnvMonv2TemperatureDescription { atEnvMonv2TemperatureEntry 4 }	Description of this temperature sensor.
atEnvMonv2TemperatureCurrent { atEnvMonv2TemperatureEntry 5 }	Current reading of this temperature sensor in degrees Celsius.
atEnvMonv2TemperatureUpperThreshold { atEnvMonv2TemperatureEntry 6 }	Maximum acceptable reading for this temperature sensor in degrees Celsius.
atEnvMonv2TemperatureStatus { atEnvMonv2TemperatureEntry 7 }	Whether this temperature sensor is currently in an alarm condition. Can be: 1. outOfRange (1) - means that the current reading is outside the threshold range. 2. inRange (2) - means that the current reading is acceptable.
atEnvMonv2PsbObjects { atEnvMonv2 4 }	Collection of objects for monitoring power supply bays in the system and any devices that are installed. It contains the following objects: 1. atEnvMonv2PsbTable ■ atEnvMonv2PsbSensorTable
atEnvMonv2PsbTable { atEnvMonv2PsbObjects 1 }	Table of information about power supply bays in the system, indexed by: 1. atEnvMonv2PsbHostStackMemberId 2. atEnvMonv2PsbHostBoardIndex 3. atEnvMonv2PsbHostSlotIndex 4. atEnvMonv2PsbHeldBoardIndex 5. atEnvMonv2PsbHeldBoardId 6. atEnvMonv2PsbDescription
atEnvMonv2PsbEntry { atEnvMonv2PsbTable 1 }	Description and current status of a single power supply bay device.
atEnvMonv2PsbHostStackMemberId { atEnvMonv2PsbEntry 1 }	Index of the stack member hosting this power supply bay.
atEnvMonv2PsbHostBoardIndex { atEnvMonv2PsbEntry 2 }	Index of the board hosting this power supply bay in the board table.
atEnvMonv2PsbHostSlotIndex { atEnvMonv2PsbEntry 3 }	Index of this power supply bay slot on its host board. This index is fixed for each slot, on each type of board.
atEnvMonv2PsbHeldBoardIndex { atEnvMonv2PsbEntry 4 }	Index of a board installed in this power supply bay. This value corresponds to atEnvMonv2PsbSensorBoardIndex for each sensor on this board. A value of 0 indicates that a board is either not present or not supported.
atEnvMonv2PsbHeldBoardId { atEnvMonv2PsbEntry 5 }	Type of board installed in this power supply bay. The values of this object are taken from the pprXxx object IDs under the boards sub-tree in the parent MIB. A value of 0 indicates that a board is either not present or not supported.

Table 98-8: Objects defined in AT-ENVMONV2-MIB(cont.)

Object / Object Identifier	Description
atEnvMonv2PsbDescription { atEnvMonv2PsbEntry 6 }	Description of this power supply bay.
atEnvMonv2PsbSensorTable { atEnvMonv2PsbObjects 2 }	Table of information about environment monitoring sensors on devices installed in power supply bays, indexed by: 1. atEnvMonv2PsbSensorStackMemberId ■ atEnvMonv2PsbSensorBoardIndex ■ atEnvMonv2PsbSensorIndex
atEnvMonv2PsbSensorEntry { atEnvMonv2PsbSensorTable 1 }	Description and current status of the sensor on a device installed in a power supply bay.
atEnvMonv2PsbSensorStackMemberId { atEnvMonv2PsbSensorEntry 1 }	Index of the stack member hosting this sensor.
atEnvMonv2PsbSensorBoardIndex { atEnvMonv2PsbSensorEntry 2 }	Index of the board hosting this sensor in the board table.
atEnvMonv2PsbSensorIndex { atEnvMonv2PsbSensorEntry 3 }	Index of this power supply bay environmental sensor on its host board.
atEnvMonv2PsbSensorType { atEnvMonv2PsbSensorEntry 4 }	Type of environmental variable this sensor detects. One of: 1. psbSensorTypeInvalid(0) ■ fanSpeedDiscrete(1) ■ temperatureDiscrete(2) ■ voltageDiscrete(3)
atEnvMonv2PsbSensorDescription { atEnvMonv2PsbSensorEntry 5 }	Description of this power supply bay environmental sensor.
atEnvMonv2PsbSensorStatus { atEnvMonv2PsbSensorEntry 6 }	Whether this environmental sensor is currently in an alarm condition. One of: 1. failed (1) - the device is in a failure condition 2. good (2) - the device is functioning normally. 3. notPowered (3) - a PSU is installed, but not powered up
atEnvMonv2PsbSensorReading { atEnvMonv2PsbSensorEntry 7 }	An indication of whether this environmental sensor is currently reading a value for the monitored device. A value of 'no' indicates that there is no current reading, 'yes' indicates that the monitored device is supplying a reading. 1. no 2. yes
atEnvMonv2Traps { atEnvMonv2 5 } (207.8.4.4.3.12.5)	Note that objects under this portion of the tree have been deprecated, and replaced by objects under the tree portion 207.8.4.4.3.12.0.
atEnvMonv2FaultLedTable { atEnvMonv2 6 }	Table detailing any LED fault indications on the device, indexed by: 1. atEnvMonv2FaultLedStackMemberId
atEnvMonv2FaultLedEntry { atEnvMonv2FaultLedTable 1 }	Information pertaining to a given fault LED.
atEnvMonv2FaultLedStackMemberId { atEnvMonv2FaultLedEntry 1 }	Index of the stack member hosting this fault LED.

Table 98-8: Objects defined in AT-ENVMONV2-MIB(cont.)

Object / Object Identifier	Description
atEnvMonv2FaultLed1Flash { atEnvMonv2FaultLedEntry 2 }	Indicates whether a fault LED is currently showing a system failure by flashing once. Values can be: 1. heatsinkFanFailure (1) - indicates that one or more heatsink fans have failed, or are operating below the recommended speed 2. noFault (2)
atEnvMonv2FaultLed2Flashes { atEnvMonv2FaultLedEntry 3 }	Indicates whether a fault LED is currently showing a system failure by flashing twice. Values can be: 1. chassisFanFailure (1) - indicates that one or both of the chassis fans are not installed, or the fans are operating below the recommended speed 2. noFault (2)
atEnvMonv2FaultLed3Flashes { atEnvMonv2FaultLedEntry 4 }	Indicates whether a fault LED is currently showing a system failure by flashing three times. Values can be: 1. sensorFailure (1) - indicates that the ability to monitor temperature or fans has failed 2. noFault (2)
atEnvMonv2FaultLed4Flashes { atEnvMonv2FaultLedEntry 5 }	Indicates whether a fault LED is currently showing a system failure by flashing four times. Values can be: 1. xemInitialisationFailure (1) - indicates that a XEM failed to initialise or is incompatible 2. noFault (2)
atEnvMonv2FaultLed5Flashes { atEnvMonv2FaultLedEntry 6 }	Indicates whether a fault LED is currently showing a system failure by flashing five times. Values can be: 1. alarmMonitorAlarm (1) - indicates that the Alarm Monitor has detected one or more fault conditions. 2. noFault (2)
atEnvMonv2FaultLed6Flashes { atEnvMonv2FaultLedEntry 7 }	Indicates whether a fault LED is currently showing a system failure by flashing six times. Values can be: 1. temperatureFailure (1) - indicates that the device's temperature has exceeded the recommended threshold 2. noFault (2)
atEnvMonv2ContactInputTable { atEnvMonv2 7 } (1.3.6.1.4.1.207.8.4.4.3.12.7)	Table of information about contact inputs available in the device that are monitored by environment monitoring hardware, indexed by: ■ atEnvMonv2ContactInputStackMemberId ■ atEnvMonv2ContactInputBoardIndex ■ atEnvMonv2ContactInputIndex
atEnvMonv2ContactInputEntry { atEnvMonv2ContactInputTable 1 }	The description and current state of a contact input.
atEnvMonv2ContactInputStackMemberId { atEnvMonv2ContactInputEntry 1 }	Index of the stack member hosting this input contact.
atEnvMonv2ContactInputBoardIndex { atEnvMonv2ContactInputEntry 2 }	Index of the board hosting this input contact in the board table.
atEnvMonv2ContactInputIndex { atEnvMonv2ContactInputEntry 3 }	The numeric identifier of this contact input on its host board.
atEnvMonv2ContactInputDescription { atEnvMonv2ContactInputEntry 4 }	The description of this contact input.

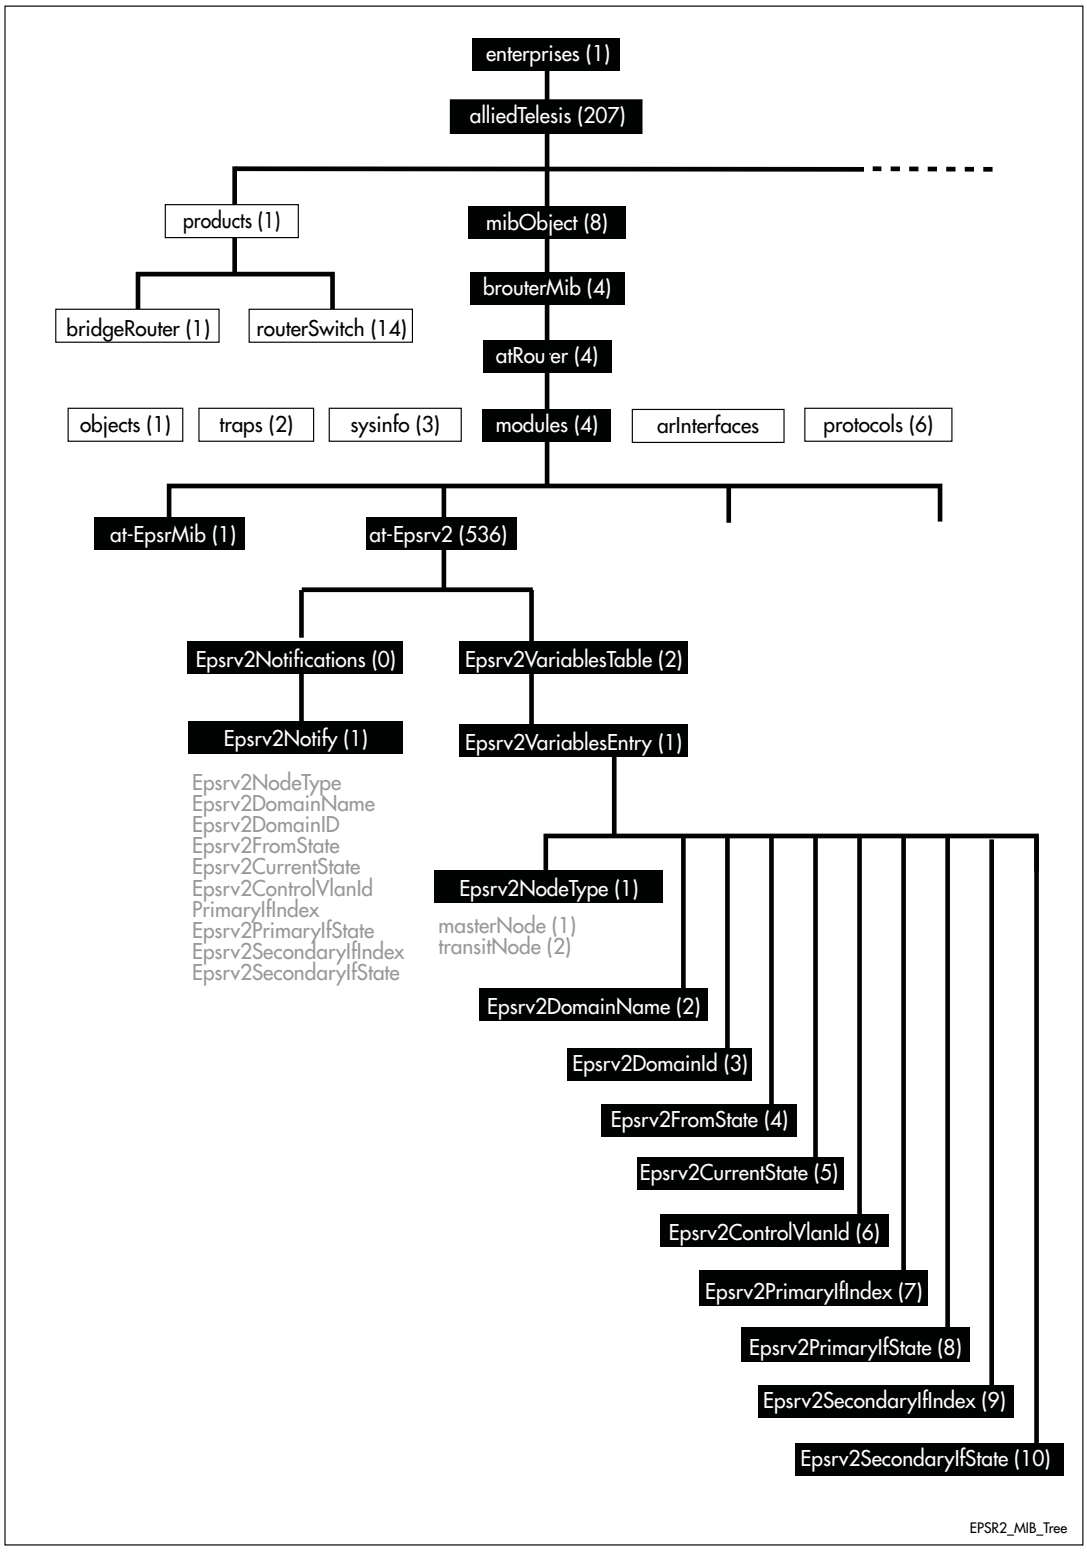
Table 98-8: Objects defined in AT-ENVMONV2-MIB(cont.)

Object / Object Identifier	Description
atEnvMonv2ContactInputState { atEnvMonv2ContactInputEntry 5 }	Current state of the input contact - closed (1) or open (2).
atEnvMonv2ContactIOutputTable { atEnvMonv2 8}	Table of information about contact outputs available in the device that are managed by environment monitoring hardware, indexed by: 1. atEnvMonv2ContactOutputStackMemberId 2. atEnvMonv2ContactOutputBoardIndex 3. atEnvMonv2ContactOutputIndex
atEnvMonv2ContactOutputEntry { atEnvMonv2ContactOutputTable 1 }	
atEnvMonv2ContactOutputStackMemberId { atEnvMonv2ContactInputEntry 1 }	Index of the stack member hosting this output contact.
atEnvMonv2ContactOutputBoardIndex { atEnvMonv2ContactInputEntry 2 }	Index of the board hosting this contact output in the board table.
atEnvMonv2ContactOutputIndex { atEnvMonv2ContactInputEntry 3 }	The numeric identifier of this contact output on its host board.
atEnvMonv2ContactOutputDescription { atEnvMonv2ContactInputEntry 4 }	The description of this contact output.
atEnvMonv2ContactOutputState { atEnvMonv2ContactInputEntry 5 }	Current state of the output contact - closed (1) or open (2).
atEnvMonv2ExternalPSUTable { atEnvMonv2 9}	Table of information about external power supply status monitored by environment monitoring hardware, indexed by: 1. atEnvMonv2ExternalPSUStatusStackMemberId 2. atEnvMonv2ExternalPSUStatusBoardIndex 3. atEnvMonv2ExternalPSUStatusIndex
atEnvMonv2ExernalPSUEntry { atEnvMonv2ExternalPSUStatusTable 1 }	
atEnvMonv2ExternalPSUStackMemberId { atEnvMonv2ExternalPSUEntry 1 }	Index of the stack member hosting this external power supply.
atEnvMonv2ExternalPSUBoardIndex { atEnvMonv2ExternalPSUEntry 2 }	Index of the board hosting this external power supply in the board table.
atEnvMonv2ExternalPSUIndex { atEnvMonv2ExternalPSUEntry 3 }	The numeric identifier of this external power supply on its host board.
atEnvMonv2ExternalPSUDescription { atEnvMonv2ExternalPSUEntry 4 }	The description of this external power supply.
atEnvMonv2ExternalPSUState { atEnvMonv2ExternalPSUEntry 5 }	Current state of the output contact - good (1) or failed (2).

AT-EPSRv2-MIB

The EPSRv2 Group-MIB defines objects for managing Epsrv2 objects and triggers (**Figure 98-4**, **Table**). Objects in this group have the object identifier Epsrv2 ({ modules 536 }).

Figure 98-4: The AT-EPSRv2 MIB sub-tree



.

atEpsrv2Objects Defined in the AT-EPSRV2 MIB

Object	Object Identifier	Description
{ at-Epsrv2 }	{ modules 536 }	The root of the Epsrv2 object sub tree.
{ atEpsrv2Notifications }	{ at-Epsrv2 0 }	
{ atEpsrv2Notify }	{ atEpsrv2Notifications 1 }	EPSR Master/Transit node state transition trap. Note that there is a one to one relationship between nodes and domains.
{ Epsrv2NodeType }	{ atEpsrv2VariablesEntry 1 }	The EPSR node type: either master or transit.
{ atEpsrv2DomainName }	{ atEpsrv2VariablesEntry 2 }	The name of the EPSR domain.
{ atEpsrv2DomainID }	{ atEpsrv2VariablesEntry 3 }	The ID of the EPSR domain.
{ Epsrv2FromState }	{ atEpsrv2VariablesEntry 4 }	The previous state of the EPSR domain
{ Epsrv2Current State }	{ atEpsrv2VariablesEntry 5 }	The current state of the EPSR domain.
{ Epsrv2ControlVlanId }	{ atEpsrv2VariablesEntry 6 }	The VLAN identifier for the control VLAN.
{ Epsrv2PrimaryIfIndex }	{ atEpsrv2VariablesEntry 7 }	The IfIndex of the primary interface.
{ atEpsrv2PrimaryIfState }	{ atEpsrv2VariablesEntry 8 }	The current state of the primary interface.
{ atEpsrv2SecondaryIfIndex }	{ atEpsrv2VariablesEntry 9 }	The IfIndex of the secondary interface.
{ atEpsrv2SecondaryIfState }	{ atEpsrv2VariablesEntry 10 }	The state of the secondary interface.
{ atEpsrv2VariablesTable }	{ at-Epsrv2 2 }	The enterprise Epsrv2VariablesTable.
{ atEpsrv2VariablesEntry }	{ atEpsrv2VariablesTable 1}	Contains entries within the enterprise atEpsrv2VariablesTable.
{ atEpsrv2NodeType }	{ atEpsrv2VariablesEntry 1 }	The EPSR domain node type: either 1. master (1) 2. transit (2)
{ atEpsrv2DomainName }	{ Epsrv2NodeType 2 }	The name of the EPSR domain.
{ atEpsrv2DomainID }	{ Epsrv2NodeType 3 }	The ID of the EPSR domain.
{ atEpsrv2FromState }	{ Epsrv2NodeType 4 }	The previous state of the EPSR domain
{ atEpsrv2Current State }	{ Epsrv2NodeType 5 }	The current state of the EPSR domain.
{ atEpsrv2ControlVlanId }	{ Epsrv2NodeType 6 }	The VLAN identifier for the control VLAN.
{ Epsrv2PrimaryIfIndex }	{ Epsrv2NodeType 7 }	The IfIndex of the primary interface.
{ atEpsrv2PrimaryIfState }	{ Epsrv2NodeType 8 }	The current state of the primary interface.
{ atEpsrv2SecondaryIfIndex }	{ Epsrv2NodeType 9 }	The IfIndex of the secondary interface.
{ atEpsrv2SecondaryIfState }	{ Epsrv2NodeType 10 }	The state of the secondary interface.
TEXTUAL CONVENTIONS		
{ atEpsrv2NodeState }		The trap states that can be advertised for an EPSR domain node. The following states are defined: 1. idle (1) 2. complete (2) 3. failed (3) 4. linksUp (4) 5. linksDown (5) 6. preForward (6) 7. unknown (7)

atEpsrv2Objects Defined in the AT-EPSRV2 MIB(cont.)

Object	Object Identifier	Description
{ atEpsrv2InterfaceState }		The trap states that can be advertised for an EPSR interface. The following states are defined: 1. unknown (1) 2. down (2) 3. blocked (3) 4. forward (4)

AT-FILEv2-MIB

This MIB contains objects for displaying and managing file content of Flash, SD cards and NVS on local and stacked devices, and copying, moving and deleting files from local, stacked and remote sources (**Table 98-9**).

The objects reside in the module atFilev2 { modules 600 }, organized in the following groups:

- The file operation devices - object for various devices supported for file operations
- The SD card table - information about the SD Cards configured on the device
- The File Info Table - information about all files, including pathnames, that are present on the device

The procedure in **"Copy a File to or from a TFTP Server" on page 96.21** shows how to use these MIB objects to upgrade to a new software version and boot configuration file.

Table 98-9: Objects defined in AT-FILEv2-MIB

Object	Object Identifier	Description
atFilev2	{ modules 600 }	MIB containing objects for listing and managing files.
atFilev2FileOperation	{ atFilev2 3 }	Collection of file operation objects available for configuration, to enable copying, moving and deleting files.
atFilev2SourceStackID	{ atFilev2Operation 1 }	Specifies the Stack ID of the source file. Set an integer corresponding to the stack ID of the stack member to use as the source. For devices that are not capable of being stacked, set with the value 1. This value is ignored if the source device is set to TFTP.
atFilev2SourceDevice	{ atFilev2Operation 2 }	Specifies the source device for the file to be copied. Valid values are 1 to 5. Set a value that corresponds with the various devices, as below: ■ 1 - Flash - default ■ 2 - Card ■ 3 - NVS ■ 4 - TFTP ■ 5 - USB - not supported For copying files, you may use any combination of devices for the source and destination, except for copying from TFTP to TFTP. For moving files you cannot use TFTP as source or destination. For deleting files, the source cannot be TFTP. You must fully configure all required parameters before an operation can commence. Where a TFTP operation is configured, an IP address must also be set via atFilev2TftpIPAddr. To copy a file from TFTP to Flash, use 4 for source and 1 for destination.
atFilev2SourceFilename	{ atFilev2Operation 3 }	Specifies the filename of the source file to copy, move or delete. Include any path as required, but the storage type is not necessary. For example, to copy the file `latest.cfg` from the backupconfigs/routers directory on the TFTP server, you would set: `backupconfigs/routers/latest.cfg`

Table 98-9: Objects defined in AT-FILEv2-MIB(cont.)

Object(cont.)	Object Identifier	Description
atFilev2DestinationStackID	{ atFilev2Operation 4 }	Specifies the Stack ID for the destination file. For devices that are not capable of being stacked, set with the value 1. This value is ignored if the destination device is set to TFTP, or if a deletion operation is carried out.
atFilev2DestinationDevice	{ atFilev2Operation 5 }	Specifies the destination device for the files to be copied into. Valid values are 1 to 5. Set a value that corresponds with the various devices, as below: ■ 1 - Flash - default ■ 2 - Card ■ 3 - NVS ■ 4 - TFTP ■ 5 - USB - not supported For copying files, you may use any combination of devices for the source and destination, except for copying from TFTP to TFTP. For moving files you cannot use TFTP as source or destination. For deleting files, this object is ignored. You must fully configure all required parameters before an operation can commence. Where a TFTP operation is configured, an IP address must also be set via atFilev2TftpIPAddr. To copy a file from TFTP to Flash, use 4 for source and 1 for destination.
atFilev2DestinationFilename	{ atFilev2Operation 6 }	Specifies the destination filename of the file to be copied or moved. Include any path as required, but the storage type is not necessary. The destination filename does not need to be the same as the source filename, and this object is ignored for file deletion operations. For example, to copy a release file from the TFTP server to the backup release directory on Flash, you would set: `backuprelease/latest.rel` Note: If the destination is set to Flash, card or NVS, any file at the destination that shares the destination filename will be overwritten by a move or copy operation.

Table 98-9: Objects defined in AT-FILEv2-MIB(cont.)

Object(cont.)	Object Identifier	Description
atFilev2CopyBegin	{ atFilev2Operation 7 }	Represents the status of the copy file operation, in the form of octet string. A read on this object can return several possible values, depending on the current status of the system and the various file operation objects: ■ idle - There is no file operation in progress and all required objects have been set correctly. Setting a '1' to this object will begin the file copy. ■ Error codes: [1-7] - A copy operation cannot be started until these errors are resolved. See below for key. ■ [action]ing x [--> y] - A file operation is currently in progress. You cannot start another operation while the object is returning this value. ■ [action] x [--> y] success - The last copy, move or delete operation was successfully completed. ■ [action] x [--> y] failure: [err] - The last copy, move or delete operation failed, with the error message attached. Common failures include lack of space on the destination file system, incorrect source file names or communication errors with remote services. Upon reading a success or failure message, the message will be cleared and the next read will result in either an 'idle' message or an 'Error codes' message if not all required objects have been correctly set. If the read returned 'idle', a new file operation can now be started. Following are possible values returned as Error codes for file copy: ■ 1 - atFilev2SourceDevice has not been set ■ 2 - atFilev2SourceFilename has not been set ■ 3 - atFilev2DestinationDevice has not been set ■ 4 - atFilev2DestinationFilename has not been set ■ 5 - atFilev2SourceDevice and atFilev2DestinationDevice are both set to TFTP ■ 6 - the combination of source device, stackID and filename is the same as the destination device, stackID and filename (i.e. it is not valid to copy a file onto itself. ■ 7 - TFTP IP address has not been set and TFTP has been set for one of the devices Provided all above requirements are met, immediately upon executing the SNMP set, the device will indicate that it was a success. The actual file copy itself will be started and continue on the device until it has completed. For large files, operations can take several minutes to complete. Subsequent reads of the object will return one of messages shown in the first table, to allow for tracking of the progress of the copy operation.

Table 98-9: Objects defined in AT-FILEv2-MIB(cont.)

Object(cont.)	Object Identifier	Description
atFilev2MoveBegin	{ atFilev2Operation 8 }	Represents the status of the move file operation, in the form of octet string. A read on this object can return several possible values, depending on the current status of the system and the various file operation objects: ■ idle - There is no file operation in progress and all required objects have been set correctly. Setting a '1' to this object will begin the file move. ■ Error codes: [1-6] - A move operation cannot be started until these errors are resolved. See below for key. ■ [action]ing x [--> y] - A file operation is currently in progress. You cannot start another operation while the object is returning this value. ■ [action] x [--> y] success - The last copy, move or delete operation was successfully completed. ■ [action] x [--> y] failure: [err] - The last copy, move or delete operation failed, with the error message attached. Common failures include lack of space on the destination file system, incorrect source file names or communication errors with remote services. Upon reading a success or failure message, the message will be cleared and the next read will result in either an 'idle' message or an 'Error codes' message if not all required objects have been correctly set. If the read returned 'idle', a new file operation can now be started. Following are possible values returned as Error codes for file move: ■ 1 - atFilev2SourceDevice has not been set ■ 2 - atFilev2SourceFilename has not been set ■ 3 - atFilev2DestinationDevice has not been set ■ 4 - atFilev2DestinationFilename has not been set ■ 5 - either atFilev2SourceDevice or atFilev2DestinationDevice are set to TFTP ■ 6 - the combination of source device, stackID and filename is the same as the destination device, stackID and filename (i.e. it is not valid to move a file onto itself. Provided all above requirements are met, immediately upon executing the SNMP set, the device will indicate that it was a success. The actual file move itself will be started and continue on the device until it has completed. For large files, operations can take several minutes to complete. Subsequent reads of the object will return one of messages shown in the first table, to allow for tracking of the progress of the move operation.

Table 98-9: Objects defined in AT-FILEv2-MIB(cont.)

Object(cont.)	Object Identifier	Description
atFilev2DeleteBegin	{ atFilev2Operation 9 }	Represents the status of the delete file operation, in the form of octet string. A read on this object can return several possible values, depending on the current status of the system and the various file operation objects: ■ idle - There is no file operation in progress and all required objects have been set correctly. Setting a '1' to this object will begin the file deletion. ■ Error codes: [1-3] - A delete operation cannot be started until these errors are resolved. See below for key. ■ [action]ing x [--> y] - A file operation is currently in progress. You cannot start another operation while the object is returning this value. ■ [action] x [--> y] success - The last copy, move or delete operation was successfully completed. ■ [action] x [--> y] failure: [err] - The last copy, move or delete operation failed, with the error message attached. Common failures include lack of space on the destination file system, incorrect source file names or communication errors with remote services. Upon reading a success or failure message, the message will be cleared and the next read will result in either an 'idle' message or an 'Error codes' message if not all required objects have been correctly set. If the read returned 'idle', a new file operation can be started. File deletion operations ignore the values set in the atFilev2DestinationStackID, atFilev2DestinationDevice and atFilev2DestinationFilename objects. The file deletion operation is equivalent to the CLI 'delete force [file]' command, so it is possible to delete any normally-protected system files, such as the currently configured boot release. Following are possible values returned as Error codes for file move: ■ 1 - atFilev2SourceDevice has not been set ■ 2 - atFilev2SourceFilename has not been set ■ 3 - atFilev2SourceDevicehas not been set to TFTP Provided all above requirements are met, immediately upon executing the SNMP set, the device will indicate that it was a success. The actual file move itself will be started and continue on the device until it has completed. For large files, operations can take several minutes to complete. Subsequent reads of the object will return one of messages shown in the first table, to allow for tracking of the progress of the move operation.
atFilev2Flash_1	{ atFilev2Operation 10 }	Represents the Flash operation device object
atFilev2Card_2	{ atFilev2Operation 11 }	Represents the Card operation device object
atFilev2Nvs_3	{ atFilev2Operation 12 }	Represents the NVS operation device object
atFilev2Tftp_4	{ atFilev2Operation 13 }	Represents the TFTP operation device object
atFilev2TftpIPAddr	{ atFilev2Tftp_4 1 }	The IP address of the TFTP server that is to be used for the file copy process. This IP Address needs to be reachable from the device, or the file copy will fail.

Table 98-9: Objects defined in AT-FILEv2-MIB(cont.)

Object(cont.)	Object Identifier	Description
atFilev2SDcardTable	{ atFilev2 4 }	The SD Card table, containing information related to SD Cards. Indexed by: ■ atFilev2SDcardStackMemberId
atFilev2SDcardEntry	{ atFilev2SDcardTable 1 }	Data pertaining to an SD Card instance.
atFilev2SDcardStackMemberId	{ atFilev2SDcardEntry 1 }	The index of the stack member hosting this SD Card.
atFilev2SDcardPresence	{ atFilev2SDcardEntry 2 }	This object indicates whether or not an SD Card is inserted into a slot. Possible values are: ■ notPresent (1) ■ present (2)
atFilev2InfoEntry	{ atFilev2InfoTable 1 }	An entry in the list of files, containing information about a single file.
atFilev2InfoFilepath	{ atFilev2InfoEntry 1 }	The full path and name of the file. Files are sorted in alphabetical order and any filepath that is longer than 112 characters will not be displayed due to SNMP Object Identifier length limitations.
atFilev2InfoFileSize	{ atFilev2InfoEntry 2 }	The size of the file in bytes.
atFilev2InfoFileCreationTime	{ atFilev2InfoEntry 3 }	File creation time in the form <MMM DD YYYY HH:MM:SS>. For example, Sep 7 2008 06:07:54.
atFilev2InfoFileIsDirectory	{ atFilev2InfoEntry 4 }	This object will return the value TRUE if the entry is a directory, or FALSE if it is not.
atFilev2InfoFileIsReadable	{ atFilev2InfoEntry 5 }	This object will return the value TRUE if the file is readable, or FALSE if it is not.
atFilev2InfoFileIsWriteable	{ atFilev2InfoEntry 6 }	This object will return the value TRUE if the file is writeable, or FALSE if it is not.
atFilev2InfoFileIsExecutable	{ atFilev2InfoEntry 7 }	This object will return the value TRUE if the file is executable, or FALSE if it is not.
atFilev2FileViewerStackId	atFilev2FileViewer 1	The stack ID of the stack member for which files will be displayed in the FileViewer table. For devices that are not capable of being stacked, this variable will always read as 1, and will cause an error on being written to with any value other than 1. Write this variable with the stack ID of the stack member for which a view of files is required. If the stack member doesn't exist, an error will be returned. For a chassis switch, it corresponds to the card ID. Note that the other variables specifying the files to view will not be altered by changing the stack ID, which means that the file view table could be empty if a non-existant device or path has been referenced previously.

Table 98-9: Objects defined in AT-FILEv2-MIB(cont.)

Object(cont.)	Object Identifier	Description
atFilev2FileViewerDevice	atFilev2FileViewer 2	The file system device for which files will be displayed in the FileViewer table. The values supported for this variable are identical to the values for other variables in the MIB, although not all values will actually result in the display of files. The different devices and whether they will result in the display of files are: ■ 1 - Flash - Onboard Flash - supported ■ 2 - Card - Removable SD card - supported ■ 3 - NVS - Onboard battery backed RAM - supported ■ 4 - FTP - not supported ■ 5 - USB - Removable USB media - supported Setting this variable to a unsupported value will result in an error, but setting to a value that is supported but on a device that doesn't contain that type of device will not. However, no files will be displayed in the File Viewer table in this case.
atFilev2FileViewerCurrentPath	atFilev2FileViewer 3	The file system path for which files will be displayed in the FileViewer table. This path will always read as a full pathname starting with the '/' character. Setting this variable will specify a new directory for which files will be displayed. The path specified must be the full path, relative setting of path does not work. Only paths with invalid characters in them will cause an error, paths specifying non-existant directories will be accepted, but no files will be displayed in the File Viewer table in this case.
atFilev2FileViewerTable	atFilev2FileViewer 4	A list of all files, not including pathnames, that are present on the device specified by atFilev2FileViewerStackId and atFilev2FileViewerDevice, in the path specified by atFilev2FileViewerCurrentPath. Hidden and system files are not displayed. If the Stack ID, device and path are invalid (the path is for a non-existant directory), the table will be empty. This will allow an MIB walk through the table even though the setup parameters are incorrect.
atFilev2FileViewerEntry	atFilev2FileViewerTable 1	An entry in the list of files, containing information about a single file.
atFilev2FileViewerName	atFilev2FileViewerEntry 1	The name of the file. Files are sorted in alphabetical order, and any name that is longer than 112 characters will not be displayed due to SNMP OID length limitations.
atFilev2FileViewerSize	atFilev2FileViewerEntry 2	The size of the file in bytes.
atFilev2FileViewerCreationTime	atFilev2FileViewerEntry 3	File creation time in the form <MMM DD YYYY HH:MM:SS>. For example, Sep 7 2008 06:07:54.
atFilev2FileViewerIsDirectory	atFilev2FileViewerEntry 4	Returns TRUE if the entry is a directory, FALSE otherwise.
atFilev2FileViewerIsReadable	atFilev2FileViewerEntry 5	Returns TRUE if the file is readable, FALSE otherwise.
atFilev2FileViewerIsWriteable	atFilev2FileViewerEntry 6	Returns TRUE if the file is writeable, FALSE otherwise.
atFilev2FileViewerIsExecutable	atFilev2FileViewerEntry 7	Returns TRUE if the file is executable, FALSE otherwise.

AT-IP-MIB

This MIB contains objects for Allied Telesis specific IP address management (**Table 98-10**). The objects reside in the module atIpMib { modules 602 }.

Table 98-10: Objects defined in AT-IP-MIB

Object	Object Identifier	Description
atIpMib	{ modules 602 }	MIB containing objects for IP addressing management.
AtIpAddressAssignmentType	Textual Convention	Object containing conditional coded values for the IP address assignment type being applied to the interface, referred to by objects in this MIB. The possible values and explanation are: ■ notSet (0) - indicates that the IP address assignment type has not yet been configured. This value can only ever be read. ■ primary (1) - indicates that the address is a primary IP address; only one primary address is allowed per interface. ■ secondary (2) - indicates that the address is a secondary IP address; any number of secondary IP addresses may be applied
AtIpAddressTable	{ atIpMib 1 }	A table containing mappings between primary or secondary IP addresses, and the interfaces they are assigned to. Indexed by: ■ atIpAddressAddrType ■ atIpAddressAddr
AtIpAddressEntry	{ AtIpAddressTable 1 }	Information about the address mapping for a particular interface.
atIpAddressAddrType	{ AtIpAddressEntry 1 }	An indication of the IP version of 'atIpAddressAddr'
atIpAddressAddr	{ AtIpAddressEntry 2 }	The IP address to which this entry's addressing information pertains. The address type of this object is specified in object 'atIpAddressAddrType'.
atIpAddressPrefixLen	{ AtIpAddressEntry 3 }	An integer, specifying the prefix length of the IP address represented by this entry.
atIpAddressLabel	{ AtIpAddressEntry 4 }	The name assigned to the IP address represented by this entry.
atIpAddressIfIndex	{ AtIpAddressEntry 5 }	The index value that uniquely identifies the interface to which this entry is applicable. The interface identified by a particular value of this index corresponds to the interface identified by the same value of the IF-MIB's ifIndex.
atIpAddressAssignmentType	{ AtIpAddressEntry 6 }	The IP address assignment type for this entry (primary or secondary), as described in the Textual Convention 'AtIpAddressAssignmentType'.

Table 98-10: Objects defined in AT-IP-MIB(cont.)

Object	Object Identifier	Description
atIpAddressRowStatus	{ AtIpAddressEntry 7 }	The current status of the IP address entry. The following values may be returned when reading this object: ■ active (1) The IP address is currently mapped to an interface and is valid. ■ notReady (3) The IP address is currently partially configured and is not mapped to an interface. The following values may be written to this object: ■ active (1) An attempt will be made to map the IP address to the configured interface. ■ createAndWait (5) An attempt will be made to create a new IP address entry. ■ destroy (6) The IP address setting will be removed from the device. An entry cannot be made active until its atIpAddressPrefixLen, atIpAddressIfIndex and atIpAddressAssignmentType objects have been set to valid values.

AT-LICENSE-MIB

The AT-LICENSE-MIB contains objects for managing the AlliedWare Plus™ Operating System software licenses: listing applied software licenses, adding new licenses and deleting existing licenses (**Table 98-11**). The objects reside in the module license { sysinfo 22 }, organized in the following groups:

- Base Software License Table - a table containing the installed base software licenses on the device
- Installed Software License Table - a list of installed software licenses; used also to remove software license from the device
- Available Software Features Table
- LicenseNew - Objects used to install a new license
- LicenseStackRemove - Objects used to remove a license across a stack of devices

Table 98-11: Objects defined in AT-LICENSE-MIB

Object	Object Identifier	Description
license	{ sysinfo 22 }	MIB containing objects for listing applied software licenses, adding new licenses, and deleting existing licenses.
baseLicenseTable	{ license 1 }	Table containing information about base software licenses installed on a device. Indexed by: ■ baseLicenseStkId
baseLicenseEntry	{ baseLicenseTable 1 }	Information about a single license installed on the device.
baseLicenseStkId	{ baseLicenseEntry 1 }	The stack member ID of the device hosting the license.
baseLicenseName	{ baseLicenseEntry 2 }	The name of the base license.
baseLicenseQuantity	{ baseLicenseEntry 3 }	The number of licenses issued for this entry.
baseLicenseType	{ baseLicenseEntry 4 }	The type of base license issued.
baseLicenseIssueDate	{ baseLicenseEntry 5 }	The date of issue of the base license.
baseLicenseExpiryDate	{ baseLicenseEntry 6 }	The expiry date of the base license.
baseLicenseFeatures	{ baseLicenseEntry 7 }	The feature set that this license enables, in the format of an octet string. Each bit in the returned octet string represents a particular feature that can be license-enabled. The bit position within the string maps to the feature entry with the same index, in licenseFeatureTable. A binary '1' indicates that the feature is included in the license; a binary '0' indicates that the feature is not included in the license.
licenseTable	{ license 2 }	Table containing information about software licenses installed on the device. Indexed by: ■ licenseStackId ■ licenseIndex
licenseEntry	{ licenseTable 1 }	Information about a single installed software license on the device.
licenseStackId	{ licenseEntry 1 }	The stack member ID of the device hosting the license.
licenseIndex	{ licenseEntry 2 }	The index number of the license entry.
licenseName	{ licenseEntry 3 }	The name of the license.
licenseCustomer	{ licenseEntry 4 }	The name of the customer of the license.

Table 98-11: Objects defined in AT-LICENSE-MIB(cont.)

Object	Object Identifier	Description
licenseQuantity	{ licenseEntry 5 }	The number of licenses issued for this entry.
licenseType	{ licenseEntry 6 }	The type of license issued.
licenseIssueDate	{ licenseEntry 7 }	The date of issue of the license.
licenseExpiryDate	{ licenseEntry 8 }	The expiry date of the license.
licenseFeatures	{ licenseEntry 9 }	The feature set that this license enables, in the format of octet string. Each bit in the returned octet string represents a particular feature that can be license-enabled. The bit position within the string maps to the feature entry with the same index, in licenseFeatureTable. A binary '1' indicates that the feature is included in the license; a binary '0' indicates that the feature is not included in the license.
licenseRowStatus	{ licenseEntry 10 }	The current status of the license. The following values may be returned when reading this object: 1. active (1) - the license is currently installed and valid 2. notInService (2) - the license has expired or is invalid The following value may be written to this object: 3. destroy (6) - the license will be removed from the device; this may result in some features being disabled. Note that a stacked device that has a license deleted may not be able to rejoin the stack after reboot, unless the license is also deleted on all other devices in the stack.
licenseFeatureTable	{ license 3 }	Table containing all available Software Features. A feature must be license-enabled to be utilized on the device.
licenseFeatureEntry	{ licenseFeatureTable 1 }	Information about a single feature that must be license-enabled in order to be utilized on the device.
licenseFeatureIndex	{ licenseFeatureEntry 1 }	The index number of the feature which must be license-enabled.
licenseFeatureName	{ licenseFeatureEntry 2 }	The name of the feature under licensing control.
licenseFeatureStkMembers	{ licenseFeatureEntry 3 }	The set of stack members on which the feature is enabled, in the format of an octet string. Each bit in the string maps to an individual stacking member, e.g. bit one represents stacking member one, bit two represents stacking member two, etc. A bit value of '1' indicates that the applicable feature is enabled on the matching device; a bit value of '0' indicates that the feature is disabled.
licenseNew	{ license 4 }	Group of objects available for updates, used when installing a new software license on the device.
licenseNewStackId	{ licenseNew 1 }	The ID of the stacking member upon which the new license is to be installed. The value zero (0) indicates that the license should be applied to all stack members.
licenseNewName	{ licenseNew 2 }	The name of the new license to be installed.
licenseNewKey	{ licenseNew 3 }	The key for the new license to be installed.

Table 98-11: Objects defined in AT-LICENSE-MIB(cont.)

Object	Object Identifier	Description
licenseNewInstall	{ licenseNew 4 }	Used to install new licenses. Values can be: 1. true (1) 2. false (2) To commence installation, a valid license name and key must first have been set via the licenseNewName and licenseNewKey respectively. This object should then be set to the value true (1). If either the license name or key is invalid, the write operation will fail. Once installed, the software modules affected by any newly enabled features will automatically be restarted. Note that a stacked device that has a new license installed on it may not be able to rejoin the stack after reboot, unless the license is also added to all other devices in the stack. When read, the object will always return the value false (2).
licenseNewInstallStatus	{ licenseNew 5 }	The current status of the last license installation request. One of the following values is returned when reading this object: ■ idle (1) ■ processing (2) ■ success (3) ■ failed (4) When a stack license installation operation is complete the first read of this object will return either a success (3) or a failure (4) indication. Subsequent reads of this object will then return an idle (1) indication.
licenseStackRemove	{ license 5 }	Group of objects used when removing a software license across a stack of devices.
licenseStackRemoveName	{ licenseStackRemove 1 }	The name of the license to be removed from all devices across the stack, on which the license currently exists.
licenseStackRemoveExecute	{ licenseStackRemove 2 }	When set to the value true (1), the system will attempt to remove the named license from all devices across the stack on which the license currently exists. All devices in a stack must be from the same product family and the named license must activate the same feature set on all devices.
licenseStackRemoveStatus	{ licenseStackRemove 3 }	The current status of the last requested stack license removal request. One of the following values is returned when reading this object: ■ idle (1) ■ processing (2) ■ success (3) ■ failed (4) When a stack license removal operation is complete the first read of this object will return either a success (3) or failure (4) indication. Subsequent reads of this object will then return an idle (1) indication.

AT-LOG-MIB

The AT Log MIB contains objects for listing log entries from the buffered and permanent logs (Table 98-12). The objects reside in the module log { modules 601 }, organized in the following groups:

- Log Table - objects containing the information from log messages issued by the system, ordered from oldest to newest entry
- Log Options - contains objects used to set up the log options configuration

Table 98-12: Objects defined in AT-LOG-MIB

Object	Object Identifier	Description
log	{ modules 601 }	MIB containing objects for listing log entries from the buffered and permanent logs.
logTable	{ log 1 }	A list of log entries from the source specified in the 'logSource' object. The list is ordered from oldest entry to newest entry. Indexed by: ■ logIndex
logEntry	{ logTable 1 }	Information about a single log entry, from the source specified in the 'logSource' object.
logIndex	{ logEntry 1 }	An index integer. This index is not directly tied to any specific log entry. Over time, the log will grow larger and eventually older entries will be removed from the log.
logDate	{ logEntry 2 }	The date of the log entry. Data resides in the format octet string, in the form YYYY MMM DD, e.g. 2008 Oct 9.
logTime	{ logEntry 3 }	The time of the log entry. Data resides in the format octet string, in the form HH:MM:SS, e.g. 07:15:04.
logFacility	{ logEntry 4 }	The syslog facility that generated the log entry, in the format octet string. See the reference manual for more information.
logSeverity	{ logEntry 5 }	The severity level of the log entry, in the format octet string. Severities are given below: ■ emerg Emergency, system is unusable ■ alert Action must be taken immediately ■ crit Critical conditions ■ errr Error conditions ■ warning Warning conditions ■ notice Normal, but significant, conditions ■ info Informational messages ■ debug Debug-level messages
logProgram	{ logEntry 6 }	The program that generated the log entry, in the format octet string. See the reference manual for more information.
logMessage	{ logEntry 7 }	The message of thew log entry, in the format octet string.
logOptions	{ log 2 }	Contains objects used to set up the required log options configuration.

Table 98-12: Objects defined in AT-LOG-MIB(cont.)

Object	Object Identifier	Description
logSource	{ logOptions 1 }	An integer indicating the source from which the log entries are retrieved. The valid values are: ■ 1 - Buffered log (default) ■ 2 - Permanent log. This information is used when retrieving the logTable objects, and also specifies the log to be cleared when the 'clearLog' object is set.
logAll	{ logOptions 2 }	An integer indicating whether to display all log entries in the logTable objects, or not. The valid values are: ■ 0 - to display only the most recent log messages. This is the default ■ 1 - to show all available log entries. Note: Choosing to display all log entries may result in delays of several seconds when accessing the logTable objects.
clearLog	{ logOptions 3 }	An integer indicating whether to clear the log that is specified by the 'logSource' object. Valid values are: ■ 0 - do not clear log ■ 1 - clear log

AT-LOOPPROTECT-MIB

The atLoopProtect-MIB (**Figure 98-5**, **Table 98-13**) defines objects for managing Loop Protection objects and triggers. Objects in this group have the object identifier atLoopProtect ({ modules 4 }).

Figure 98-5: The ATLoopProtect MIB Sub-tree

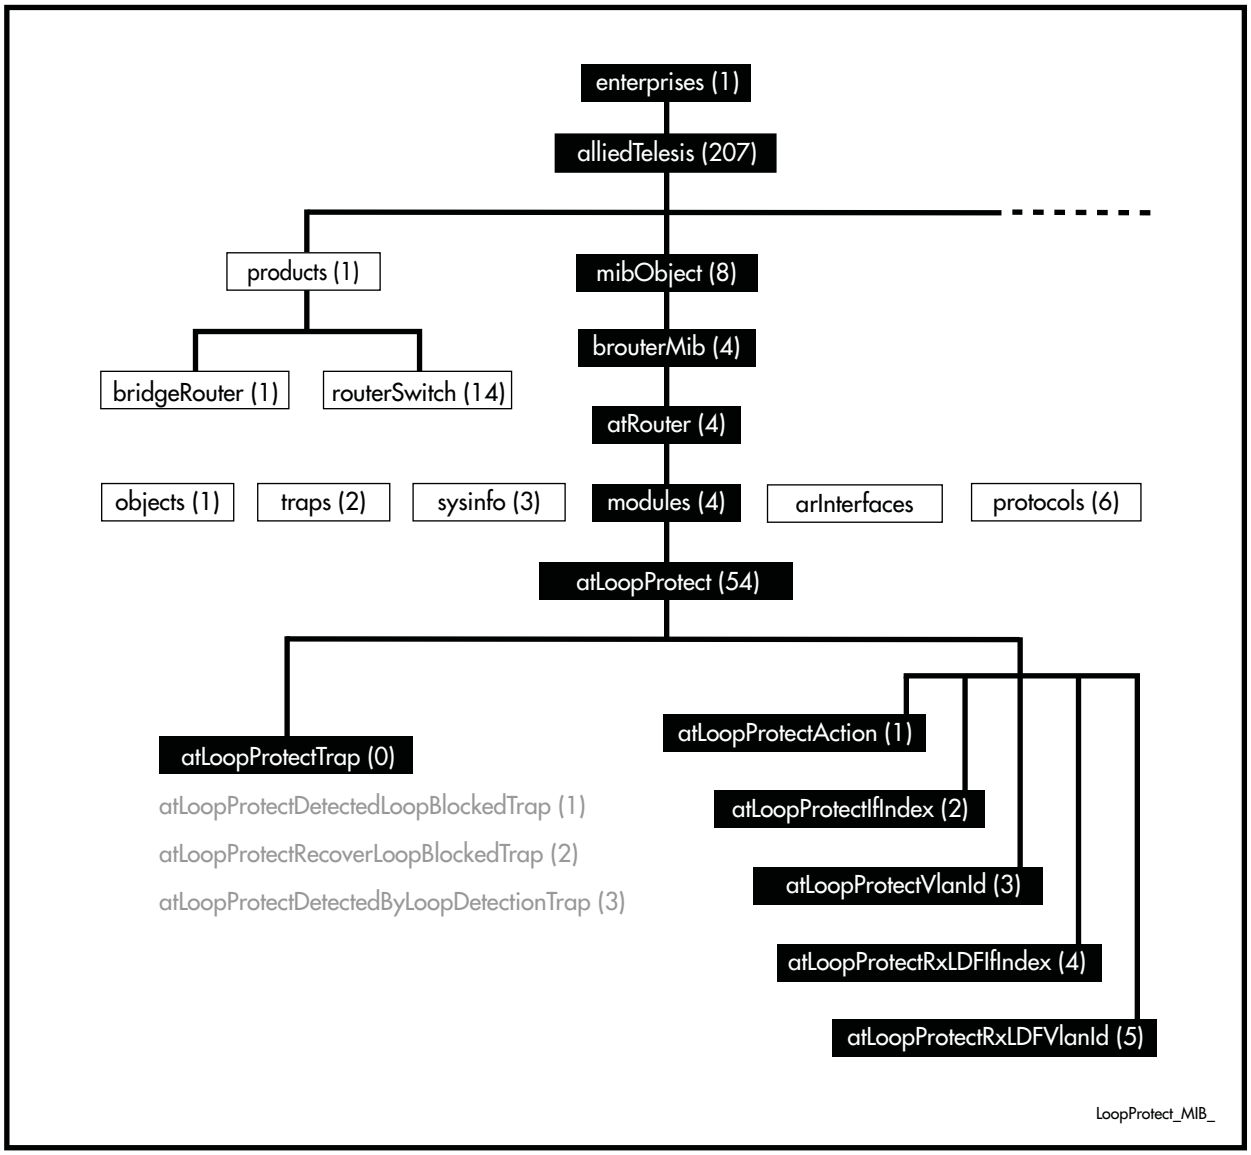


Table 98-13: Objects Defined in the AT-Loop Protect MIB

Object	Object Identifier	Description
{ atLoopProtect }	{ modules 54 }	The root of the Loop Protect object sub tree.
{ atLoopProtectTrap }	{ atLoopProtect0 }	The Loop Protection node state transition trap. List of traps (notifications) generated for Loop Protection.
{ atLoopProtectDetected LoopBlockedTrap }	{ atLoopProtectTrap1 }	Notification generated when the Loop Protection feature blocks an interface with a loop. The following bindings are associated with this trap: 1. atLoopProtectIfIndex 2. atLoopProtectVlanId 3. atLoopProtectAction
{ atLoopProtectRecover LoopBlockedTrap }	{ atLoopProtectTrap2 }	Notification generated when the Loop Protection feature restores a blocked interface back to normal operation. The following bindings are associated with this trap: 1. atLoopProtectIfIndex 2. atLoopProtectVlanId 3. atLoopProtectAction
{ atLoopProtectDetected ByLoopDetectionTrap }	{ atLoopProtectTrap3 }	Notification generated when the Loop Protection feature detects a loop by Loop Detection method. The following bindings are associated with this trap: 1. atLoopProtectIfIndex 2. atLoopProtectVlanId 3. atLoopProtectRxLDFIfIndex 4. atLoopProtectRxLDFVlanId
{ atLoopProtectAction }	{ atLoopProtect1 }	The Action for the Loop Protection feature. The following values are defined: 1. atLoopProtectAction-LearnDisable (0) 2. atLoopProtectAction-LearnEnable (1) 3. atLoopProtectAction-PortDisable (2) 4. atLoopProtectAction-PortEnable (3) 5. atLoopProtectAction-LinkDown (4) 6. atLoopProtectAction-LinkUp (5) 7. atLoopProtectAction-VlanDisable (6) 8. atLoopProtectAction-VlanEnable (7)
{ atLoopProtectIfIndex }	{ atLoopProtect2 }	The interface on which the loop was detected.
{ atLoopProtectVlanId }	{ atLoopProtect3 }	The VLAN ID on which the loop was detected.
{ atLoopProtectRxLDFIfIndex }	{ atLoopProtect4 }	The interface on which the loop detection frame was received.
{ atLoopProtectRxLDFVlanId }	{ atLoopProtect5 }	The VLAN ID on which the loop detection frame was received.

AT-MIBVERSION-MIB

The AT-MIBVERSION-MIB contains an object to display the last software release that contained changes to the supported AT Enterprise MIB definition files (**Table 98-14**). Objects in this group have the object identifier atMibsetVersion ({ sysinfo 15 }).

Table 98-14: Object defined in AT-MIBVERSION-MIB

Object	Object Identifier	Description
atMibVersion	{ sysinfo 15 }	This object returns a five digit integer which indicates the last software release that contained changes to the supported AT Enterprise MIB definition files. For example, If the currently loaded software release on the device is 5.3.1-0.3 but the Enterprise MIBs have not changed since 5.3.1-0.1, then the value returned will be 53101.

AT-NTP-MIB

This MIB contains objects for managing the Allied Telesis Network Time Protocol (NTP) configuration (**Table 98-15**). The objects reside in the module atNtp { modules 502 }, organized in the following groups:

- NTP Peer/Server Table - a table containing information on the Network Time Protocol (NTP) peers or server configurations in the system.
- Associations Table - a list of installed software; used also to remove software from the device.
- Status Table - Objects in this group are not supported.

Table 98-15: Objects defined in AT-NTP-MIB

Object	Object Identifier	Description
atNtp	{ modules 502 }	MIB containing objects for configuring NTP.
atNtpPeerIndexNext	{ atNtp 6 }	The next available index number to be used for object 'atNtpPeerIndex'.
atNtpPeerTable	{ atNtp 7 }	Table containing information on the Network Time Protocol (NTP) peers or server configurations in the system. Indexed by: ■ atNtpPeerIndex
atNtpPeerEntry	{ atNtpPeerTable 1 }	Information about a single NTP server or peer configuration.
atNtpPeerIndex	{ atNtpPeerEntry 1 }	The index number corresponding to a particular NTP server or peer configuration in the system. To create a new entry, the value of this object should be the same as that of the value of atNtpPeerIndexNext object, otherwise the entry creation will fail.
atNtpPeerNameAddr	{ atNtpPeerEntry 2 }	The host name, or the IP address of the NTP peer. When a new row (entry) is created, this object is set with a default of '0.0.0.0', and the management application should change it to a desired value by using a SET operation.
atNtpPeerMode	{ atNtpPeerEntry 3 }	The mode of the peer. Can be one of the following: ■ server (1) ■ peer (2) - default
atNtpPeerPreference	{ atNtpPeerEntry 4 }	The values in this object specifies whether this peer is the preferred one. Valid values are 0 to 2: ■ 0 - unknown - default ■ 1 - not preferred ■ 2 - preferred When the value is 'not preferred' (1) NTP chooses the peer with which to synchronize the time on the local system. If the object is set to 'preferred' (2) NTP will choose the corresponding peer to synchronize the time with.
atNtpPeerVersion	{ atNtpPeerEntry 5 }	The NTP version the peer supports. Can be one of the following: ■ 0 - unknown - default ■ 1 - version 1 ■ 2 - version 2 ■ 3 - version 3 ■ 4 - version 4

Table 98-15: Objects defined in AT-NTP-MIB(cont.)

Object	Object Identifier	Description
atNtpPeerKeyNumber	{ atNtpPeerEntry 6 }	The authentication key number. Default number is 0.
atNtpPeerRow Status	{ atNtpPeerEntry 7 }	The current status of this peer entry. The following values may be returned when reading this object: ■ active (1) - this value is returned on reading of this entry. ■ createAndGo (4) - this value is set by the management application when creating a new entry ■ destroy (6) - value set by the management application when deleting the entry. When an entry is deleted, all subsequent entries in the table will be re-indexed.
atNtpAssociationTable	{ atNtp 10 }	Table containing information on the Network Time Protocol (NTP) associations. Indexed by: ■ atNtpAssociationIndex
atNtpAssociationEntry	{ atNtpAssociationTable 1 }	Information about a single NTP server or peer configuration.
atNtpAssociationIndex	{ atNtpAssociationEntry 1 }	The index number corresponding to a particular NTP server or peer configuration in the system. To create a new entry, the value of this object should be the same as that of the value of atNtpPeerIndexNext object, otherwise the entry creation will fail.
atNtpAssociationPeerAddr	{ atNtpAssociationEntry 2 }	The host name, or the IP address of the NTP peer. When a new row (entry) is created, this object is set with a default of '0.0.0.0', and the management application should change it to a desired value by using a SET operation.
atNtpAssociationStatus	{ atNtpAssociationEntry 3 }	The status of this association. Can be one of the following: ■ master (synced) ■ master (unsynced) ■ selected ■ candidate ■ configured ■ unknown
atNtpAssociationConfigured	{ atNtpAssociationEntry 4 }	The value in this object specifies whether the association is from configuration or not. Value can be: ■ configured ■ dynamic
atNtpAssociationRefClkAddr	{ atNtpAssociationEntry 5 }	The IP Address for the reference clock.
atNtpAssociationStratum	{ atNtpAssociationEntry 6 }	The stratum of the peer clock.
atNtpAssociationPoll	{ atNtpAssociationEntry 7 }	The time between NTP requests from the device to the server, in seconds.
atNtpAssociationReach	{ atNtpAssociationEntry 8 }	An integer that indicates the reachability status of the peer.
atNtpAssociationDelay	{ atNtpAssociationEntry 9 }	The round trip delay between the device and the server.

Table 98-15: Objects defined in AT-NTP-MIB(cont.)

Object	Object Identifier	Description
atNtpAssociationOffset	{ atNtpAssociationEntry 10 }	The difference between the device clock and the server clock.
atNtpAssociationDisp	{ atNtpAssociationEntry 11 }	The lowest measure of error associated with peer offset, based on delay, in seconds.
atNtpStatus	{ atNtp 11 }	Group of objects containing system status information. The objects in this group are not supported.
atNtpSysClockSync	{ atNtpStatus 1 }	Not supported.
atNtpSysStratum	{ atNtpStatus 2 }	Not supported.
atNtpSysReference	{ atNtpStatus 3 }	Not supported.
atNtpSysFrequency	{ atNtpStatus 4 }	Not supported.
atNtpSysPrecision	{ atNtpStatus 5 }	Not supported.
atNtpSysRefTime	{ atNtpStatus 6 }	Not supported.
atNtpSysClkOffset	{ atNtpStatus 7 }	Not supported.
atNtpSysRootDelay	{ atNtpStatus 8 }	Not supported.
atNtpSysRootDisp	{ atNtpStatus 9 }	Not supported.

AT-PRODUCTS-MIB

AT-PRODUCT-MIB defines object identifiers for Allied Telesis products. Objects in this MIB have the object identifier products ({ alliedTelesis 1 }) OID 1.3.6.1.4.1.207.1.

Table 98-16 lists object identifiers for products supported by the AlliedWare Plus™ Operating System.

Table 98-16: Object identifiers for Allied Telesis products supported by the AlliedWare Plus™ Operating System

Object	Object Identifier	Description
products	{ alliedTelesis 1 }	
swhub	{ products 4 }	Subtree beneath which switching hubs are defined.
at_x200_GE52T	{ swhub 181 }	x200-GE52T layer two switch
at_x200_GE28T	{ swhub 182}	x200-GE28T layer two switch
at_x210_9GT	{ swhub 196}	x210-9GT, 8xGigbit, 1xSFP/T
at_x210_16GT	{ swhub 197}	x210-16GT, 14xGigbit, 2xcombo SFP/T
at_x210_24GT	{ swhub 198}	x210-24GT, 20xGigbit, 4xcombo SFP/T
routerSwitch	{ products 14 }	Subtree beneath which router and (non industrial) switch product MIB object IDs are assigned.
at_SwitchBladex908	{ routerSwitch 69 }	Switchblade x908 8 Slot Layer 3 Switch Chassis
at_x900_12XTS	{ routerSwitch 70 }	AT-x900-12XT/S Advanced Gigabit Layer 3+ Expandable Switch, 12 x combo ports (10/100/1000BASE-T copper or SFP), 1 x 30Gbps expansion bay
at_x900_24XT	{ routerSwitch 75 }	x900-24XT Enhanced Gigabit Layer 3+ Expandable Switch, 24 x 10/100/1000BASE-T copper ports (RJ-45 connectors), 2 x 20 Gigabit expansion bays
at_x900_24XS	{ routerSwitch 76 }	x900-24XS Enhanced Gigabit Layer 3+ Expandable Switch, 24 x 10/100/1000BASE-T copper ports (RJ-45 connectors), 2 x 20 Gigabit expansion bays
at_x900_24XT_N	{ routerSwitch 77 }	x900-24XT-N Enhanced Gigabit Layer 3+ Expandable Switch, 24 x 10/100/1000BASE-T copper ports (RJ-45 connectors), 2 x 20 Gigabit expansion bays, NEBS compliant
at_x600_24Ts	{ routerSwitch 80 }	x600-24Ts Stackable Managed L2+/L3 Ethernet Switch, 24 x 1000BASE-T copper ports, 4 x SFP (combo) ports
at_x600_24TsXP	{ routerSwitch 81 }	x600-24Ts/XP Stackable Managed L2+/L3 Ethernet Switch, 24 x 1000BASE-T copper ports, 4 x SFP (combo) ports, 2 x XFP ports
at_x600_48Ts	{ routerSwitch 82 }	x600-48Ts Stackable Managed L2+/L3 Ethernet Switch, 48 x 1000BASE-T copper ports, 4 x SFP ports
at_x600_48TsXP	{ routerSwitch 83 }	x600-48Ts/XP Stackable Managed L2+/L3 Ethernet Switch, 48 x 1000BASE-T copper ports, 4 x SFP ports, 2 x XFP ports
at_x600-24TsPoE	{ routerSwitch 91}	x600-24Ts-POE Stackable Managed L2+/L3 Ethernet PoE Switch, 24 x 1000BASE-T PoE ports, 4 x SFP (combo) ports
at_x600_24TPoEPlus	{routerSwitch 92}	x600-24Ts-POE+ Stackable Managed L2+/L3 Ethernet PoE+ Switch, 24 x 1000BASE-T PoE+ ports, 4 x SFP (combo) ports
x610_48Ts_X_POEPlus	{routerSwitch 93}	x610-48Ts/X-POE+ Stackable Managed L2+/L3 Ethernet PoE+ Switch, 48 x 1000BASE-T PoE+ ports, 2 x SFP (combo) ports, 2 x SFP+ ports

Table 98-16: Object identifiers for Allied Telesis products supported by the AlliedWare Plus™ Operating

Object	Object Identifier	Description
x610_48Ts_POEPlus	{routerSwitch 94}	x610-48Ts-POE+ Stackable Managed L2+/L3 Ethernet PoE+ Switch, 48 x 1000BASE-T PoE+ ports, 4 x SFP (combo) ports
x610_24Ts_X_POEPlus	{routerSwitch 95}	x610-24Ts/X-POE+ Stackable Managed L2+/L3 Ethernet PoE+ Switch, 24 x 1000BASE-T PoE+ ports, 4 x SFP (combo) ports, 2 x SFP+ ports
x610_24Ts_POEPlus	{routerSwitch 96}	x610-24Ts-POE+ Stackable Managed L2+/L3 Ethernet PoE+ Switch, 24 x 1000BASE-T PoE+ ports, 4 x SFP (combo) ports
x610_48Ts_X	{routerSwitch 97}	x610-48Ts/X Stackable Managed L2+/L3 Ethernet Switch, 48 x 1000BASE-T copper ports, 2 x SFP (combo) ports, 2 x SFP+ ports
x610_48Ts	{routerSwitch 98}	x610-48Ts Stackable Managed L2+/L3 Ethernet Switch, 24 x 1000BASE-T copper ports, 4 x SFP (combo) ports
x610_24Ts_X	{routerSwitch 99}	x610-24Ts/X Stackable Managed L2+/L3 Ethernet Switch, 24 x 1000BASE-T copper ports, 4 x SFP (combo) ports, 2 x SFP+ ports
x610_24Ts	{routerSwitch 100}	x610-24Ts Stackable Managed L2+/L3 Ethernet Switch, 24 x 1000BASE-T copper ports, 4 x SFP (combo) ports
x610_24SP_X	{routerSwitch 101}	x610-24SP/X Stackable Managed L2+/L3 Ethernet Switch, 24 x SFP (combo) ports, 2 x SFP+ ports
x510_28GTX	{routerSwitch 109}	x510-28GTX Stackable Managed L2+/L3 Ethernet Switch with 24 x 10/100/1000 Base-T ports and 4 x 10 Gb/s SFP+ ports.
x510_28GPX	{routerSwitch 110}	x510-28GPX Stackable Managed L2+/L3 Ethernet Switch with 24 x 10/100/1000 Base-T ports with PoE, 4 x 10 Gb/s SFP+ ports.
x510_28GSX	{routerSwitch 111}	x510-28GSX Stackable Managed L2+/L3 Ethernet Switch with 24 x 100/1000 SFP ports and 4 x 10 Gb/s SFP+ ports.
x510_52GTX	{routerSwitch 112}	x510-52GTX Stackable Managed L2+/L3 Ethernet Switch with 48 x 10/100/1000 Base-T ports and 4 x 10 Gb/s SFP+ ports.
x510_52GPX	{routerSwitch 113}	x510-52GPX Stackable Managed L2+/L3 Ethernet Switch with 48 x 10/100/1000 Base-T ports with PoE, and 4 x 10 Gb/s SFP+ ports.
at-SBx8106	{routerSwitch 114}	AT-SBx8106, SwitchBlade x8106 chassis.
x510DP_52GTX	{routerSwitch 116}	x510DP-52GTX Stackable Managed L2+/L3 Ethernet Switch with 48 x 10/100/1000 Base-T ports and 4 x 10 Gb/s SFP+ ports.
IX5_28GPX	{routerSwitch 117}	IX5-28GPX Stackable Managed L2+ Ethernet Switch with 24 x 10/100/1000 Base-T ports with PoE, 4 x 10 Gb/s SFP+ ports.
industrialSwitch	{ products 24 }	Subtree beneath which industrial switch product MIB object IDs are assigned.
at_IE500_6GT	{industrialSwitch 1}	IE500-6GT L2+ managed industrial Switch with 4 x 10/100/1000T LAN ports and 2 x SFP uplinks (100/1000X).
at_IE500_6GP	{industrialSwitch 2}	IE500-6GP L2+ managed industrial Switch with 4 x 10/100/1000T LAN ports (with 802.3at PoE+) and 2 x SFP uplinks (100/1000X).
at_IE500_6GPW	{industrialSwitch 3}	IE500-6GPW L2+ managed industrial Switch with 4 x 10/100/1000T LAN ports (with 802.3at PoE+) and 2 x SFP uplinks (100/1000X) and 802.11bgn wireless.

AT-RESOURCE-MIB

The AT-RESOURCE-MIB contains objects for displaying system hardware resource and host information (**Table 98-17**). Objects in this group have the object identifier rsc ({ sysinfo 21 }).

Table 98-17: Objects defined in AT-RESOURCE-MIB

Object and OID	Description
resource { sysinfo 21 }	Contains objects for displaying system hardware resource and host information.
rscBoardTable { resource 1}	Table containing information about boards installed in a device. Indexed by: 1. rscStkId 2. rscResourceId
rscBoardEntry { rscBoardTable 1 }	Information about a single board installed in the device.
rscStkId { rscBoardEntry 1 }	The ID of the stack member. It is a number from 1 to 8, assigned to a stackable unit by the operating system when it is stacked. A default of 1 is given to a stand-alone unit.
rscResourceId { rscBoardEntry 2 }	The resource ID number of the board. It is a number assigned to a hardware resource when the operating system detects its existence. Can be a value in range 1 to 4294967294.
rscBoardType { rscBoardEntry 3 }	The type of board. Can be one of the following: 1. Base 2. Expansion 3. Fan module 4. PSU, etc.
rscBoardName { rscBoardEntry 4 }	The name of the board. Can be one of the following: 1. SwitchBlade x908 2. XEM-12S 3. AT-PWR05-AC, etc
rscBoardId { rscBoardEntry 5 }	The ID number of the board. Its value is an Allied Telesis assigned number, such as 274 for the XEM-12S, or 255 for the AT-9924Ts.
rscBoardBay { rscBoardEntry 6 }	The board installation location. Its value can be Bay1, Bay2, PSU1, etc. For a base board, it has a value of a single character space.
rscBoardRevision { rscBoardEntry 7 }	The revision number of the board.
rscBoardSerialNumber { rscBoardEntry 8 }	The serial number of the board.
hostInfoTable { resource 2 }	Table containing general system information. Indexed by rscStkId.
hostInfoEntry { hostInfoTable 1 }	Information about a single system parameter

Table 98-17: Objects defined in AT-RESOURCE-MIB(cont.)

Object and OID	Description
hostInfoDRAM { hostInfoTable 2 }	The host DRAM information.
hostInfoFlash { hostInfoTable 3 }	The host Flash information.
hostInfoUptime { hostInfoTable 4 }	The host up-time.
hostInfoBootloaderVersion { hostInfoTable 5 }	The host boot loader version.

AT-SETUP-MIB

AT-SETUP-MIB defines objects for managing software installation and configuration files (**Figure 98-6**, **Table 98-18**). Objects in this group have the object identifier setup ({ modules 500 }). The procedure in **Table 96-6 on page 96.23** shows how to use these MIB objects to upgrade to a new software version and boot configuration file. For objects used for file copying, see **"AT-FILEv2-MIB" on page 98.32**.

Figure 98-6: The AT-SETUP-MIB sub-tree

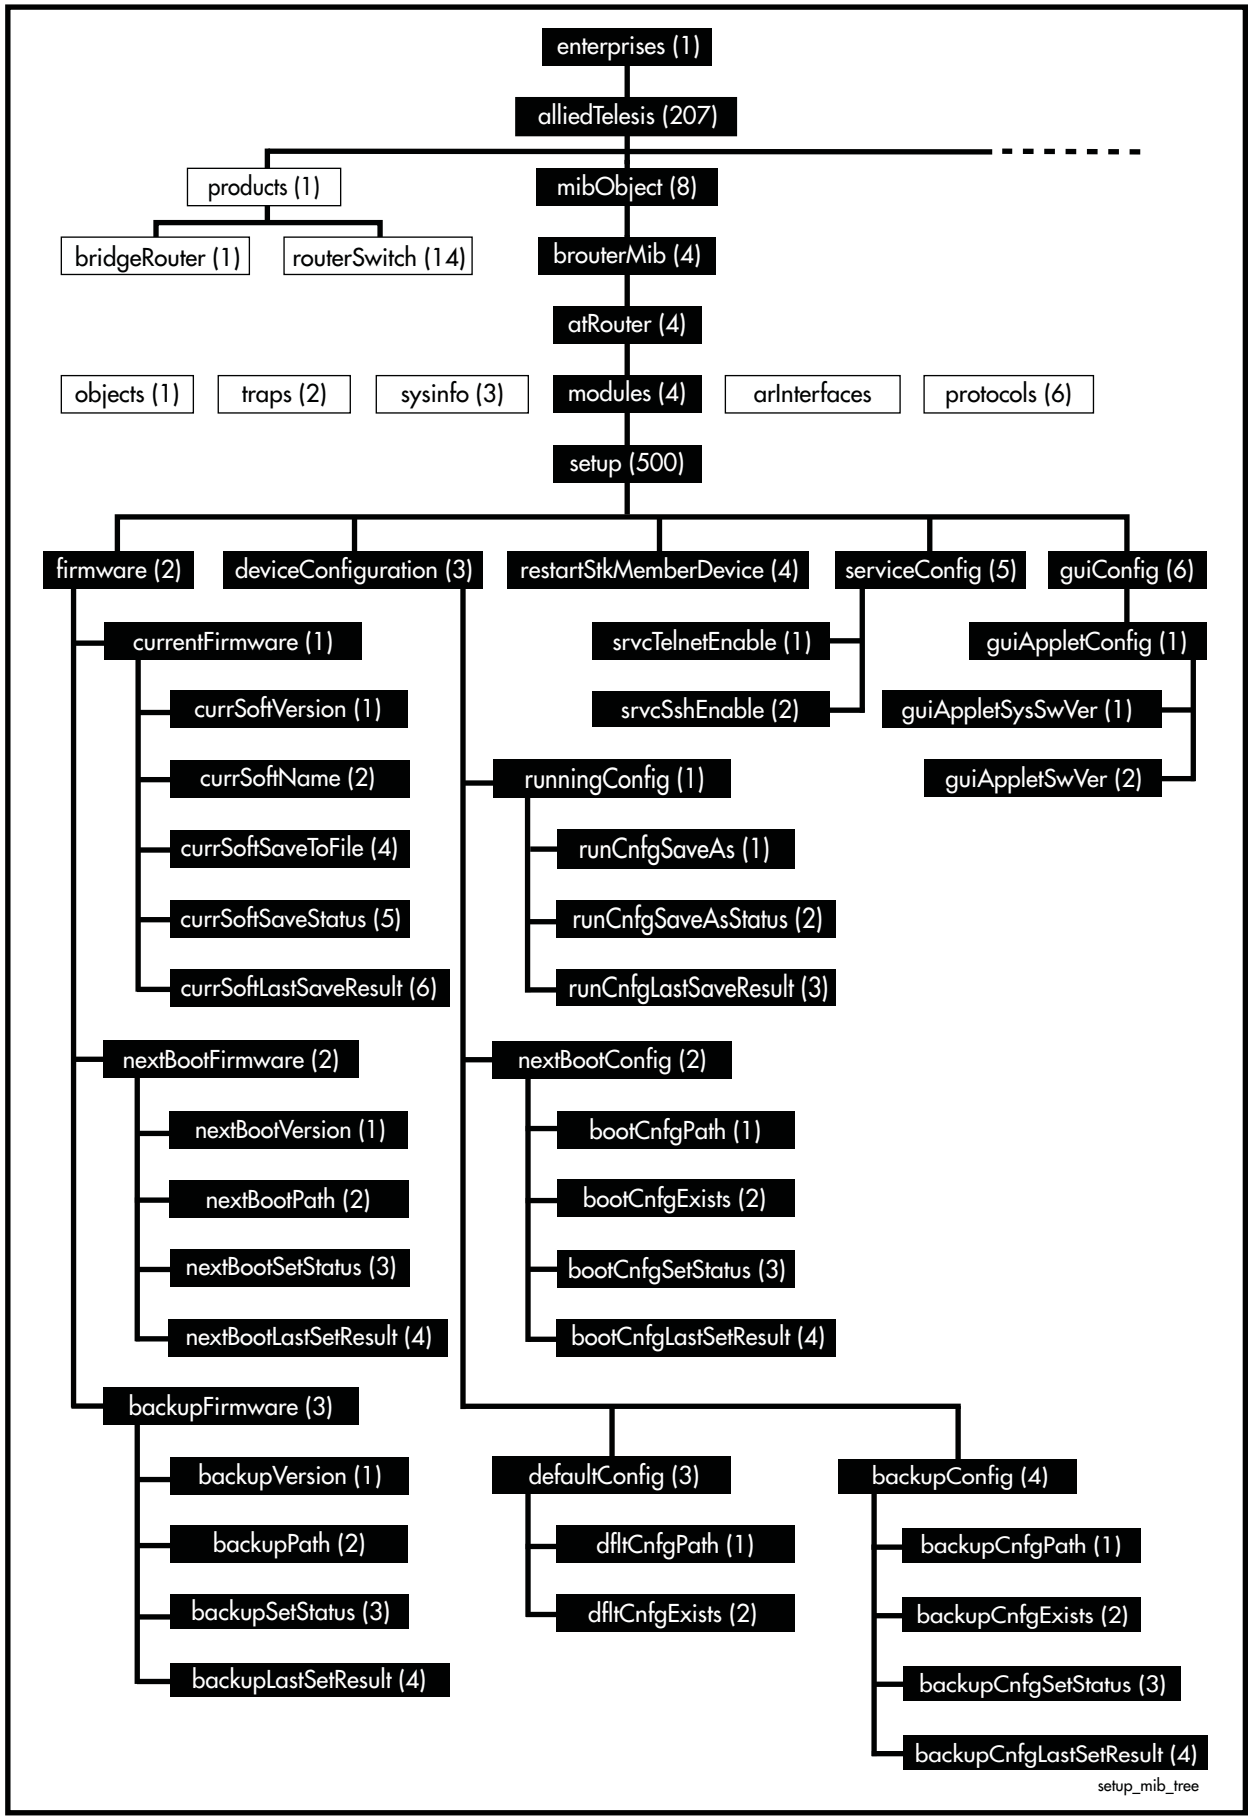

Table 98-18: Objects defined in AT-SETUP-MIB

Object Identifier	Description	Object Identifier
restartDevice	{ setup 1 }	Object for restarting the device. When set to '1', the device will restart immediately. **Note:** This object has been deprecated. Use instead the restartStkMemberDevice object.
firmware	{ setup 2 }	Objects for managing the software version files that the device will install and run.
currentFirmware	{ firmware 1 }	Information about the current software version installed on the device.
currSoftVersion	{ currentFirmware 1 }	Current software version.
currSoftName	{ currentFirmware 2 }	Current software name.
currSoftSaveAs	{ currentFirmware 3 }	The file name to save the currently running software to the root of the Flash. Only one save operation can be executed at a time across all SNMP users. **Note:** This object has been deprecated. Use instead the currSoftSaveToFile, currSoftSaveStatus and currSoftLastSaveResult objects.
currSoftSaveToFile	{ currentFirmware 4 }	Set with a URL to save the currently running software to the root of Flash or USB flash drive (e.g. 'flash:/filename.rel' or 'USB:/filename.rel'). The URL must not contain whitespace characters. Only one save operation can be executed at a time across all SNMP users and an operation may not be started unless the current value of currSoftSaveStatus is 'idle'. Immediately upon executing the set action, the actual firmware save operation is started and will continue on the device until it has completed or a failure occurs. When read, this object will return the URL of the last firmware save operation that was attempted.
currSoftSaveStatus	{ currentFirmware 5 }	This object will return the status of any current operation to store the running software to a release file. The following values may be returned: 1. (idle) - there is no release file save operation in progress 2. (success) - the last release file save operation completed successfully 3. (failure) - the last release file save operation failed 4. (saving) - a release file save operation is currently in progress When a read of this object returns a value of 'success' or 'failure', it will immediately be reset to 'idle' and a new operation may be initiated if desired. A detailed description of the last completed operation may be determined by reading currSoftLastSaveResult.
currSoftLastSaveResult	{ currentFirmware 6 }	Gives an indication of the result of the last completed SNMP operation to save the running firmware to a release file.

Table 98-18: Objects defined in AT-SETUP-MIB

Object Identifier	Description	Object Identifier
nextBootFirmware	{ firmware 2 }	Information about the software version to be installed on the device when booting.
nextBootVersion	{ nextBootFirmware 1 }	Provides information on the software version (major.minor.interim, for example version 5.4.1) that the device will boot from. A zero will be returned if the version cannot be determined.
nextBootPath	{ nextBootFirmware 2 }	The full path to the release file that will be used the next time the device is rebooted. The URL must not contain whitespace characters. Only one set operation can be executed at a time across all SNMP users and an operation may not be started unless the current value of nextBootSetStatus is 'idle'. Immediately upon executing the set action, the system will attempt to set the new configuration path, and the process will continue on the device until it has completed or a failure occurs. This object can be set with an empty string in order to clear the current boot firmware. Otherwise, the path should be of the form 'flash:/filename.cfg' or 'card:/filename.cfg'. In order to set this object, the file must meet the following conditions: ■ it must exist ■ it must be located in the root of Flash (on the active master in a stacked environment) or USB flash drive ■ it must not be the same as the backup release file ■ it must have a .rel suffix ■ it must pass several internal checks to ensure that it is a genuine release file ■ in a stacked environment, there must be enough disk space available to store the release file on each stack member
nextBootSetStatus	{ nextBootFirmware 3 }	Returns the status of any current operation to set the next boot release file. The following values may be returned: ■ 1 (idle) - there is no boot release setting operation in progress ■ 2 (success) - the last boot release setting operation completed successfully ■ 3 (failure) - the last boot release setting operation failed ■ 5 (syncing) - a boot release setting operation is currently in progress and the file is being synchronized across the stack When a read of this object returns a value of 'success' or 'failure', it will immediately be reset to 'idle' and a new operation may be initiated if desired. A detailed description of the last completed operation may be determined by reading nextBootLastSetResult.
nextBootLastSetResult	{ nextBootFirmware 4 }	Gives an indication of the result of the last completed SNMP operation to set the boot release filename.

Table 98-18: Objects defined in AT-SETUP-MIB

Object Identifier	Description	Object Identifier
backupFirmware	{ firmware 3 }	Information about the backup software version and path.
backupVersion	{ backupFirmware 1 }	Provides information on the backup software version (major.minor.interim, for example version 5.4.1) that the device will boot from. A zero will be returned if the version cannot be determined.
backupPath	{ backupFirmware 2 }	The full path to the backup release file that will be used the next time the device is rebooted. The URL must not contain whitespace characters. Only one set operation can be executed at a time across all SNMP users and an operation may not be started unless the current value of backupSetStatus is 'idle'. Immediately upon executing the set action, the system will attempt to set the new configuration path, and the process will continue on the device until it has completed or a failure occurs. This object can be set with an empty string in order to clear the current backup firmware. Otherwise, the path should be of the form 'flash:/filename.cfg' or 'card:/filename.cfg'. In order to set this object, the file must meet the following conditions: ■ it must exist ■ it must be located in the root of Flash (on the active master in a stacked environment) or USB flash drive ■ it must not be the same as the configured main release file ■ it must have a .rel suffix ■ it must pass several internal checks to ensure that it is a genuine release file ■ in a stacked environment, there must be enough disk space available to store the release file on each stack member
backupSetStatus	{ backupFirmware 3 }	Returns the status of any current operation to set the backup boot release file. The following values may be returned: ■ 1 (idle) - there is no backup boot release setting operation in progress ■ 2 (success) - the last backup boot release setting operation completed successfully ■ 3 (failure) - the last backup boot release setting operation failed ■ 5 (syncing) - a backup boot release setting operation is currently in progress and the file is being synchronized across the stack When a read of this object returns a value of 'success' or 'failure', it will immediately be reset to 'idle' and a new operation may be initiated if desired. A detailed description of the last completed operation may be determined by reading backupLastSetResult.
backupLastSetResult	{ backupFirmware 4 }	Gives an indication of the result of the last completed SNMP operation to set the backup boot release filename.
deviceConfiguration	{ setup 3	Objects for managing device configuration.
runningConfig	{ deviceConfiguration 1 }	

Table 98-18: Objects defined in AT-SETUP-MIB

Object Identifier	Description	Object Identifier
runCnfgSaveAs	{ runningConfig 1 }	Set with a URL to save the currently running software to the root of Flash or USB flash drive (e.g. 'flash:/filename.rel' or 'usb:/filename.rel'). The URL must not contain whitespace characters. Only one set operation can be executed at a time across all SNMP users and an operation may not be started unless the current value of runCnfgSaveAsStatus is 'idle'. Immediately upon executing the set action, the system will attempt to save the running configuration and the process will continue on the device until it has completed or a failure occurs. When read, this object will return the URL of the last firmware save operation that was attempted.
runCnfgSaveAsStatus	{ runningConfig 2 }	Returns the status of any current operation to save the running configuration. The following values may be returned: 1. (idle) - there is no config file save operation in progress 2. (success) - the last config file save operation completed successfully 3. (failure) - the last config file save operation failed 4. (saving) - a config file save operation is currently in progress When a read of this object returns a value of 'success' or 'failure', it will immediately be reset to 'idle' and a new operation may be initiated if desired. A detailed description of the last completed operation may be determined by reading runCnfgLastSaveResult.
runCnfgLastSaveResult	{ runningConfig 3 }	Gives an indication of the result of the last completed SNMP operation to save the running configuration.
nextBootConfig	{ deviceConfiguration 2 }	
bootCnfgPath	{ nextBootConfig 1 }	The full path to the configuration file that will be used the next time the device is rebooted. The URL must not contain whitespace characters. Only one set operation can be executed at a time across all SNMP users and an operation may not be started unless the current value of bootCnfgSetStatus is 'idle'. Immediately upon executing the set action, the system will attempt to set the new configuration path, and the process will continue on the device until it has completed or a failure occurs. This object can be set with an empty string in order to clear the current boot configuration. Otherwise, the path should be of the form 'flash:/myconfig.cfg' or 'card:/filename.cfg'. In order to set this object, the file must meet the following conditions: ■ it must exist ■ it must be located in the root of Flash (on the active master in a stacked environment) or USB flash drive ■ it must have a .cfg suffix ■ in a stacked environment, there must be enough disk space available to store the configuration file on each stack member

Table 98-18: Objects defined in AT-SETUP-MIB

Object Identifier	Description	Object Identifier
bootCnfgExists	{ nextBootConfig 2 }	This object will return the value TRUE if the currently defined boot configuration file exists, or FALSE if it does not.
bootCnfgSetStatus	{ nextBootConfig 3 }	Returns the status of any current operation to set the next boot configuration file. The following values may be returned: ■ 1 (idle) - there is no boot configuration setting operation in progress ■ 2 (success) - the last boot configuration setting operation completed successfully ■ 3 (failure) - the last boot configuration setting operation failed ■ 5 (syncing) - a boot configuration setting operation is currently in progress and the file is being synchronized across the stack When a read of this object returns a value of 'success' or 'failure', it will immediately be reset to 'idle' and a new operation may be initiated if desired. A detailed description of the last completed operation may be determined by reading bootCnfgLastSetResult.
bootCnfgLastSetResult	{ nextBootConfig 4 }	Gives an indication of the result of the last completed SNMP operation to set the boot configuration filename.
defaultConfig	{ deviceConfiguration 3 }	
dfltCnfgPath	{ defaultConfig 1 }	The full path of the configuration file to use as backup when the device is rebooted. This object is not settable. The default configuration file is always 'flash:/default.cfg'.
dfltCnfgExists	{ defaultConfig 2 }	This object will return the value TRUE if the currently defined default configuration file exists, or FALSE if it does not.
backupConfig	{ deviceConfiguration 4 }	

Table 98-18: Objects defined in AT-SETUP-MIB

Object Identifier		Description	Object Identifier
	backupCnfgPath	{ backupConfig 1 }	The full path to the backup configuration file that will be used the next time the device is rebooted. The URL must not contain whitespace characters. Only one set operation can be executed at a time across all SNMP users and an operation may not be started unless the current value of backupCnfgSetStatus is 'idle'. Immediately upon executing the set action, the system will attempt to set the new backup configuration path, and the process will continue on the device until it has completed or a failure occurs. This object can be set with an empty string in order to clear the current boot configuration. Otherwise, the path should be of the form 'flash:/myconfig.cfg' or 'card:/filename.cfg'. In order to set this object, the file must meet the following conditions: ■ it must exist ■ it must be located in the root of Flash (on the active master in a stacked environment) or USB flash drive ■ it must have a .cfg suffix ■ in a stacked environment, there must be enough disk space available to store the configuration file on each stack member
	backupCnfgExists	{ backupConfig 2 }	This object will return the value TRUE if the currently defined backup configuration file exists, or FALSE if it does not.
	backupCnfgSetStatus	{ backupConfig 3 }	Returns the status of any current operation to set the next backup boot configuration file. The following values may be returned: ■ 1 (idle) - there is no backup boot configuration setting operation in progress ■ 2 (success) - the last backup boot configuration setting operation completed successfully ■ 3 (failure) - the last backup boot configuration setting operation failed ■ 5 (syncing) - a backup boot configuration setting operation is currently in progress and the file is being synchronized across the stack When a read of this object returns a value of 'success' or 'failure', it will immediately be reset to 'idle' and a new operation may be initiated if desired. A detailed description of the last completed operation may be determined by reading backupCnfgLastSetResult.
	backupCnfgLastSetResult	{ backupConfig 4 }	Gives an indication of the result of the last completed SNMP operation to set the backup boot configuration filename.

Table 98-18: Objects defined in AT-SETUP-MIB

Object Identifier	Description	Object Identifier
restartStkMemberDevice	{ setup 4 }	This object causes a specified device to restart immediately. The restart is initiated by setting its value to the device's stack member ID. Setting its value to zero will cause all devices in the stack, or a standalone device, to restart. Reading the object will always return zero.
serviceConfig	{ setup 5 }	
srvcTelnetEnable	{ serviceConfig 1 }	This object is used to either read or set the state of the telnet server on a device. Telnet can be enabled by setting the value of this object to 'enable(1)' or can be disabled by setting the value 'disable(2)'.
srvcSshEnable	{ serviceConfig 2 }	This object is used to either read or set the state of the SSH server on a device. SSH can be enabled by setting the value of this object to 'enable(1)' or can be disabled by setting the value 'disable(2)'.
guiConfig	{ setup 6 }	
guiAppletConfig	{ guiConfig 1 }	
guiAppletSysSwVer	{ guiAppletConfig 1 }	This object represents the system software release that the currently selected GUI applet was designed to run on. The system automatically searches for GUI applet files that reside in the root directory of the Flash memory, and selects the latest available file that is applicable to the currently running system software. This is the applet that will be uploaded to a user's web browser when they initiate the GUI.
	{ guiAppletConfig 2 }	This object represents the software version of the currently selected GUI applet. The system automatically searches for GUI applet files residing in the root directory of the Flash memory, and selects the latest available one that is applicable to the currently running system software. This is the applet that will be uploaded to a user's web browser when they initiate the GUI.

AT-SMI-MIB

AT-SMI-MIB defines the high-level structure and root objects of the Allied Telesis Enterprise MIB (Table 98-19). These objects are imported by other component MIBs of the Allied Telesis Enterprise MIB.

Table 98-19: AT Enterprise MIB - High Level Structure

Object	Object Identifier	Description
alliedTelesis	{ enterprises 207 } 1.3.6.1.4.1.207	Root of the Allied Telesis Enterprise MIB under the private(4) node defined in RFC1155-SMI.
products	{ alliedTelesis 1 } 1.3.6.1.4.1.207.1	Sub-tree of all product OIDs. Described in "AT-PRODUCTS-MIB" on page 98.52.
bridgeRouter	{ products 1 } 1.3.6.1.4.1.207.1.1	Sub-tree of bridge product MIB objects (not applicable for AlliedWare Plus).
routerSwitch	{ products 14 } 1.3.6.1.4.1.207.1.2	Sub-tree for all router and switch product MIB objects.
industrialSwitch	{ products 24 } 1.3.6.1.4.1.207.1.24	Sub-tree for industrial switch product MIB objects.
mibObject	{ alliedTelesis 8 } 1.3.6.1.4.1.207.8	Sub-tree for all managed objects.
brouterMib	{ mibObject 4 } 1.3.6.1.4.1.207.8.4	Sub-tree of objects for managing bridges, routers, and switches.
atRouter	{ brouterMib 4 } 1.3.6.1.4.1.207.8.4.4	Sub-tree of objects for managing multiprotocol routers and switches.
objects	{ atRouter 1 } 1.3.6.1.4.1.207.8.4.4.1	Sub-tree of OIDs for boards, releases, interface types, and chips.
traps	{ atRouter 2 } 1.3.6.1.4.1.207.8.4.4.2	Sub-tree for generic traps (not applicable for AlliedWare Plus).
sysinfo	{ atRouter 3 } 1.3.6.1.4.1.207.8.4.4.3	Sub-tree of objects describing general system information.
modules	{ atRouter 4 } 1.3.6.1.4.1.207.8.4.4.4	Sub-tree of objects for monitoring and managing software features.
arInterfaces	{ atRouter 5 } 1.3.6.1.4.1.207.8.4.4.5	Sub-tree of objects describing boards, slots and physical interfaces.
protocols	{ atRouter 6 } 1.3.6.1.4.1.207.8.4.4.6	Sub-tree of OIDs for protocols.
atAgents	{ atRouter 7 } 1.3.6.1.4.1.207.8.4.4.7	Sub-tree of objects describing variations from standards.

Table 98-20 lists the major modules of the AT-SMI-MIB grouped by their object identifiers. Note that this is also the order in which they are described in this chapter.

Table 98-20: AT-SMI-MIBs Listed by Object Group

MIB Section	OID	Description
AT-SMI-MIB		This section describes the structure of management information for the Allied Telesis Enterprise object, alliedTelesis { 1.3.6.1.4.1.207 }.
AT-PRODUCTS-MIB	1.3.6.1.4.1.207.1	Object identifiers for Allied Telesis products. See "AT-PRODUCTS-MIB" on page 98.52.

Table 98-20: AT-SMI-MIBs Listed by Object Group(cont.)

MIB Section	OID	Description
AT-BOARDS-MIB	1.3.6.1.4.1.207.8.4.4.1.1	Object identifiers for boards, interface types, and chip sets. See "AT-BOARDS-MIB" on page 98.13.
AT-SYSINFO-MIB	1.3.6.1.4.1.207.8.4.4.3	Objects that describe generic system information and environmental monitoring. See "AT-SYSINFO-MIB" on page 98.68.
AT-XEM-MIB	1.3.6.1.4.1.207.8.4.4.3.11	Objects for managing XEMs (Expansion Modules). See "AT-XEM-MIB" on page 98.86.
AT-ENVMONv2-MIB	1.3.6.1.4.1.207.8.4.4.3.12	Objects and traps for monitoring fans, voltage rails, temperature sensors, and power supply bays. See "AT-ENVMONv2-MIB" on page 98.21.
AT-VCSTACK-MIB	1.3.6.1.4.1.207.8.4.4.3.13	Objects for managing Virtual Chassis Stacking (VCS). See "AT-ENVMONv2-MIB" on page 98.21.
AT-MIBVERSION-MIB	1.3.6.1.4.1.207.8.4.4.3.15	Object to display the last software release that contained changes to the support AT Enterprise MIB definition files. See "AT-MIBVERSION-MIB" on page 98.48.
AT-USER-MIB	1.3.6.1.4.1.207.8.4.4.3.20	Objects for displaying information of users currently logged into a device, or configured in the Local User Data base of the device. See "AT-USER-MIB" on page 98.76.
AT-RESOURCE-MIB	1.3.6.1.4.1.207.8.4.4.3.21	Objects for displaying system hardware resource information. See "AT-RESOURCE-MIB" on page 98.54.
AT-LICENSE-MIB	1.3.6.1.4.1.207.8.4.4.3.22	Objects for managing software licenses on devices using AlliedWare Plus™ Operating System. See "AT-LICENSE-MIB" on page 98.41.
AT-TRIGGER-MIB	1.3.6.1.4.1.207.8.4.4.4.53	Objects for managing triggers. See "AT-TRIGGER-MIB" on page 98.74.
AT-LOOPPROTECT-MIB	1.3.6.1.4.1.207.8.4.4.4.54	Objects for managing Allied Telesis Loop Protection. See "AT-LOOPPROTECT-MIB" on page 98.46.
AT-SETUP-MIB	1.3.6.1.4.1.207.8.4.4.4.500	Objects for managing software installation and configuration files. See "AT-SETUP-MIB" on page 98.56.
AT-DNS-CLIENT-MIB	1.3.6.1.4.1.207.8.4.4.4.501	Objects for managing Allied Telesis DNS Client Configuration. See "AT-DNS-CLIENT-MIB" on page 98.20.
AT-NTP-MIB	1.3.6.1.4.1.207.8.4.4.4.502	Objects for managing Allied Telesis Network Time Protocol (NTP) configuration. See "AT-NTP-MIB" on page 98.49.
AT-EPSRv2-MIB	1.3.6.1.4.1.207.8.4.4.4.536	Objects for managing Allied Telesis EPSR. See "AT-EPSRv2-MIB" on page 98.29.
AT-DHCPSN-MIB	1.3.6.1.4.1.207.8.4.4.4.537	Objects for managing Allied Telesis DHCP Snooping. See "AT-DHCPSN-MIB" on page 98.17.
AT-FILEv2-MIB	1.3.6.1.4.1.207.8.4.4.4.600	Objects for displaying and managing file content on local, stacked and remote sources. See "AT-FILEv2-MIB" on page 98.32.
AT-LOG-MIB	1.3.6.1.4.1.207.8.4.4.4.601	Objects for listing log entries from the buffered and permanent logs. See "AT-LOG-MIB" on page 98.44.

Table 98-20: AT-SMI-MIBs Listed by Object Group(cont.)

MIB Section	OID	Description
AT-IP-MIB	1.3.6.1.4.1.207.8.4.4.4.602	Objects for Allied Telesis specific IP address management. See "AT-IP-MIB" on page 98.39.
AT-ALMMON-MIB	1.3.6.1.4.1.207.8.4.4.3.24	Objects for managing Allied Telesis Alarm Monitor.

AT-SYSINFO-MIB

AT-SYSINFO-MIB defines objects that describe generic system information and environmental monitoring. Objects in this group have the object identifier sysinfo ({ atRouter 3 }). **Table 98-21** lists the objects supported by the AlliedWare Plus™ sysinfo MIB.

Table 98-21: Objects defined in AT-SYSINFO-MIB

Object	Description
sysinfo { atRouter 3 } (1.3.6.1.4.1.207.8.4.4.3)	Subtree containing generic system information.
fanAndPs {sysinfo 1 } (1.3.6.1.4.1.207.8.4.4.3.1)	A collection of objects for monitoring fans and power supplies. For devices running the AlliedWare Plus™ Operating System, these objects are superceded by objects in the AT-ENVMON-MIB (see **"AT-ENVMONv2-MIB" on page 98.21**).
restartGroup {sysinfo 2 }	A collection of objects and traps for activating and monitoring restarts. This group is not supported by devices running the AlliedWare Plus™ Operating System.
cpu {sysinfo 3 }	A collection of objects containing information about the CPU utilization over different periods of time. All values are expressed as a percentage - integer in range 0 to 100.
cpuUtilisationMax {cpu 1 }	Maximum CPU utilization since the device was last restarted.
cpuUtilisationAvg {cpu 2 }	Average CPU utilization since the device was last restarted.
cpuUtilisationAvgLastMinute {cpu 3 }	Average CPU utilization over the past minute.
cpuUtilisationAvgLast10Seconds {cpu 4 }	Average CPU utilization over the past ten seconds.
cpuUtilisationAvgLastSecond {cpu 5 }	Average CPU utilization over the past second.
cpuUtilisationAvgMaxLast5Minutes {cpu 6 }	Maximum CPU utilization over the last 5 minutes.
cpuUtilisationAvgLast5Minutes {cpu 7 }	Average CPU utilization over the past 5 minutes.
cpuUtilisationStackTable {cpu 8 }	A list of stack members.
cpuUtilisationStackEntry {cpuUtilisationStackTable 1}	A set of parameters that describe the CPU utilisation of a stack member
cpuUtilisationStackId {cpuUtilisationStackEntry 1}	Stack member ID.
cpuUtilisationStackMax {cpuUtilisationStackEntry 2}	Maximum CPU utilisation since the router was last restarted. Expressed as a percentage.
cpuUtilisationStackAvg {cpuUtilisationStackEntry 3}	Average CPU utilisation since the router was last restarted. Expressed as a percentage.

Table 98-21: Objects defined in AT-SYSINFO-MIB

Object	Description
cpuUtilisationStackAvgLastMinute {cpuUtilisationStackEntry 4}	Average CPU utilisation over the past minute. Expressed as a percentage.
cpuUtilisationStackAvgLast10Seconds {cpuUtilisationStackEntry 5}	Average CPU utilisation over the past ten seconds. Expressed as a percentage.
cpuUtilisationStackAvgLastSecond {cpuUtilisationStackEntry 6}	Average CPU utilisation over the past second. Expressed as a percentage.
cpuUtilisationStackMaxLast5Minutes {cpuUtilisationStackEntry 7}	Maximum CPU utilisation over the last 5 minutes. Expressed as a percentage.
cpuUtilisationStackAvgLast5Minutes {cpuUtilisationStackEntry 8}	Average CPU utilisation over the past 5 minutes. Expressed as a percentage.
sysTemperature {sysinfo 4 }	A collection of objects and traps for monitoring and managing the temperature status. For devices running the AlliedWare Plus™ Operating System.
atContactDetails {sysinfo 5 }	Contact details for Allied Telesis.
memory {sysinfo 7 }	A collection of objects and traps for monitoring memory usage and status.
xem {sysinfo 11 }	A collection of objects for monitoring XEMs installed in the device. Objects under this portion of the OID are shown in the **"AT-XEM-MIB" on page 98.86**.
atEnvMonv2 {sysinfo 12 }	AT Environment Monitoring v2 MIB for managing and reporting data relating to voltage rails, fan speeds, temperature sensors and power supply units. Objects under this portion of the OID are shown in the **"AT-ENVMONv2-MIB" on page 98.21**.
vcstack {sysinfo 13 }	A collection of objects for managing Virtual Chassis Stacking in AlliedWare Plus™. See **"AT-VCSTACK-MIB" on page 98.79**.
atPortInfo {sysinfo 14 }	Objects containing information about the transceiver of an interface. This portion of the object tree is documented separately in: **"AT-PORTINFO" on page 98.71**.
atVlanInfo {sysinfo 16 }	A collection of objects for counting bytes or incoming frames within a selected VLAN. Note that these objects are only appropriate for the IX5, x510 and x610 series products. Objects under this portion of the OID are shown in the **"AT-VLANINFO-MIB" on page 98.84**.
{sysinfo 17 } to {sysinfo 19 }	These objects are not supported on your switch.

Table 98-21: Objects defined in AT-SYSINFO-MIB

Object	Description
user {sysinfo 20 }	Contains objects for displaying information of users currently logged into a device, or configured in its local database. Objects under this portion of the OID are shown in the **"AT-USER-MIB" on page 98.76**.
resource {sysinfo 21 }	Contains objects for displaying hardware resource information. Objects under this portion of the OID are shown in the **"AT-RESOURCE-MIB" on page 98.54**.
license {sysinfo 22 }	This MIB, is used for listing applied software licenses, adding new licenses, and deleting existing licenses. Objects under this portion of the OID are shown in the **"AT-LICENSE-MIB" on page 98.41**.
chassis {sysinfo 23 }	This MIB is used for accessing trap notifications on chassis based products. Note that these objects are only appropriate for the x8100 series products.

AT-PORTINFO

This table defines objects for managing interface port objects such as transceivers. Objects in this group have the object identifier atPortInfo ({ sysinfo 14 }), OID path, 1.3.6.1.4.1.207.8.4.4.3.14.

Table 98-22: Objects defined in AT-ATPORTINFO portion of the MIB

Object / Object Identifier	Description
atPortInfo {sysinfo 14}	This object returns information about interface transceivers.
atPortInfoTransceiverTable {atPortInfo 1}	A table of information about the transceiver of a interface.
atPortInfoTransceiverEntry {atPortInfoTransceiverTable 1}	The description, the transceiver type of a interface.
atPortInfoTransceiverifIndex {atPortInfoTransceiverEntry 1}	The ifIndex for the interface represented by this entry of the interfaces table.
atPortInfoTransceiverType {atPortInfoTransceiverEntry 2}	This object indicates the type of transceiver on a interface. It contains the following value list objects:

Table 98-22: Objects defined in AT-ATPORTINFO portion of the MIB(cont.)

Object / Object Identifier	Description
	The type of transceiver on an interface can be one of the following: ■ rj45(1) ■ sfp-px(2) ■ sfp-bx10(3) ■ sfp-fx(4) ■ sfp-100base-lx(5) ■ sfp-t(6) ■ sfp-cx(7) ■ sfp-zx-cwdm(8) ■ sfp-lx(9) ■ sfp-sx(10) ■ sfp-oc3-lr(11) ■ sfp-oc3-ir(12) ■ sfp-oc3-mm(13) ■ xfp-srsw(14) ■ xfp-lrlw(15) ■ xfp-erew(16) ■ xfp-sr(17) ■ xfp-lr(18) ■ xfp-er(19) ■ xfp-lrm(20) ■ xfp-sw(21) ■ xfp-lw(22) ■ xfp-ew(23) ■ unknown(24) ■ empty(25) ■ sfpp-sr(26) ■ sfpp-lr(27) ■ sfpp-er(28) ■ sfpp-lrm(29) ■ inf-1-x-copper-pasv(30) ■ inf-1-x-copper-actv(31) ■ inf-1-x-lx(32) ■ inf-1-x-sx(33) ■ cx4(34)

Table 98-22: Objects defined in AT-ATPORTINFO portion of the MIB(cont.)

Object / Object Identifier	Description
atPortRenumberEvents {atPortInfo 2}	The number of times that port number values (represented by the dot1dBasePort object in BRIDGE-MIB), have been re-assigned due to stack member leave/join events or XEM hot-swap events, since the system was initialized.

AT-TRIGGER-MIB

AT-TRIGGER-MIB defines objects for managing triggers (**Table 98-23**). Objects in this group have the object identifier trigger ({ modules 53 }). All objects in this group have read only access.

Table 98-23: Objects defined in AT-TRIGGER-MIB

Object Identifier	Description
triggerTraps { trigger 0 }	Sub-tree for all trigger traps.
triggerTrap { triggerTraps 1 }	Notification generated when a trigger is activated. It returns the value of triggerLastTriggerActivated.
triggerLastTriggerActivated { trigger 1 }	Trigger number of the most recent trigger activated on the switch.
triggerConfigInfoTable { trigger 9 }	Table of information about each trigger that has been configured, indexed by triggerNumber.
triggerConfigInfoEntry { triggerConfigInfoTable 1 }	Information about the configuration of a single trigger.
triggerNumber { triggerConfigInfoEntry 1 }	ID number of the trigger. Values are in range 1- 250.
triggerName { triggerConfigInfoEntry 2 }	Name and description of the trigger.
triggerTypeDetail { triggerConfigInfoEntry 3 }	Trigger type and its activation conditions.
triggerActiveDaysOrDate { triggerConfigInfoEntry 4 }	The days of a week or the date on which the trigger can be activated.
triggerActivateAfter { triggerConfigInfoEntry 5 }	Time after which the trigger can be activated.
triggerActivateBefore { triggerConfigInfoEntry 6 }	Time before which the trigger can be activated.
triggerActiveStatus { triggerConfigInfoEntry 7 }	Whether or not the trigger can be activated.
triggerTestMode { triggerConfigInfoEntry 8 }	Whether or not the trigger is operating in diagnostic (test) mode.
triggerSnmpTrap { triggerConfigInfoEntry 9 }	Whether or a not an SNMP trap will be generated when the trigger is activated.
triggerRepeatTimes { triggerConfigInfoEntry 10 }	Whether the trigger can repeat an unlimited number of times (continuous) or a specified number of times. If the trigger can repeat only a specified number of times, then the number of times the trigger has already been activated is displayed in brackets.
triggerLasttimeModified { triggerConfigInfoEntry 11 }	Date and time that the trigger configuration was last modified.
triggerNumberOfActivation { triggerConfigInfoEntry 12 }	Number of times the trigger has been activated since the last restart of the device.
triggerLasttimeActivation { triggerConfigInfoEntry 13 }	Date and time that the trigger was last activated.
triggerNumberOfScripts { triggerConfigInfoEntry 14 }	Number of scripts that this trigger will execute. Values are in range 0-5.
triggerScript1 { triggerConfigInfoEntry 15 }	Name of the first script that this trigger will execute if the trigger is activated.
triggerScript2 { triggerConfigInfoEntry 16 }	Name of the second script that this trigger will execute if the trigger is activated.

Table 98-23: Objects defined in AT-TRIGGER-MIB(cont.)

Object Identifier	Description
triggerScript3 { triggerConfigInfoEntry 17 }	Name of the third script that this trigger will execute if the trigger is activated.
triggerScript4 { triggerConfigInfoEntry 18 }	Name of the fourth script that this trigger will execute if the trigger is activated.
triggerScript5 { triggerConfigInfoEntry 19 }	Name of the fifth script that this trigger will execute if the trigger is activated.
triggerCounters { trigger 10 }	Collection of counters for trigger activations.
triggerNumOfActivation { triggerCounters 1 }	Number of times a trigger has been activated.
triggerNumOfActivationToday { triggerCounters 2 }	Number of times a trigger has been activated today.
triggerNumOfPerodicActivationToday { triggerCounters 3 }	Number of times a periodic trigger has been activated today.
triggerNumOfInterfaceActivationToday { triggerCounters 4 }	Number of times an interface trigger has been activated today.
triggerNumOfResourceActivationToday { triggerCounters 5 }	Number of times a CPU or memory trigger has been activated today.
triggerNumOfRebootActivationToday { triggerCounters 6 }	Number of times a reboot trigger has been activated today.
triggerNumOfPingPollActivationToday { triggerCounters 7 }	Number of times a ping-poll trigger has been activated today.
triggerNumOfStackMasterFailActivationToday { triggerCounters 8 }	Number of times a stack master fail trigger has been activated today.
triggerNumOfStackMemberActivationToday { triggerCounters 9 }	Number of times a stack member trigger has been activated today.
triggerNumOfStackXemStkActivationToday { triggerCounters 10 }	Number of times a stack XEM trigger has been activated today.

AT-USER-MIB

The AT-USER-MIB contains objects for displaying information about users currently logged into a device, or configured in the Local User Database of the device (**Table 98-24**). Objects in this group have the object identifier user ({ sysinfo 20 }).

Table 98-24: Objects defined in AT-USER-MIB

Object	Object Identifier	Description
userInfoTable (207.8.4.4.3.20.1)	{ user 1 }	Table containing information about users. Each entry in the table represents a user currently logged into the device. Indexed by: rscBoardType and rscBoardIndex.
userInfoEntry	{ userInfoTable 1 }	Information about a single user logged into the device.
userInfoType	{ userInfoEntry 1 }	The type of connection through which the user logged into the device. Can be: 1. console (1) 2. aux (2) 3. telnet (3) 4. script (4) 5. stack (5)
userInfoIndex	{ userInfoEntry 2 }	Index of the line upon which the user logged into the device. Can be a value in range 1 to 16.
userInfoName	{ userInfoEntry 3 }	User name of the user logged into the device.
userInfoPrivilegeLevel	{ userInfoEntry 4 }	The user's privilege level. Can be a value in range 1 to 15.
userInfoIdleTime	{ userInfoEntry 5 }	The amount of time since the user was last active, in the form hh:mm:ss.
userInfoLocation	{ userInfoEntry 6 }	The user location or login method. It can be an IP Address used by the user to telnet into the device, or an asyn port, etc.
userInfoPasswordLifetime	{ userInfoEntry 7 }	The number of days remaining until the user's password expires. Depending on the current user setting it will display one of the following: No Expiry - the password will never expire (default setting) x days - where x is the remaining lifetime of the current password (maximum lifetime value is 1000 days) -x days (expired) - indicating that the current password expired x days ago
userInfoPasswordLastChange	{ userInfoEntry 8 }	The number of days since the password was last altered.

Table 98-24: Objects defined in AT-USER-MIB(cont.)

Object	Object Identifier	Description
userConfigTable	{ user 2 } or (207.8.4.4.3.20.2)	Table containing user configuration information. Each entry in the table relates to a user configured in the Local User Database of the device. Indexed by userConfigIndex.
userConfigEntry	{ userConfigTable 1 }	Information about a single user configured in the Local User Database of the device.
userConfigIndex	{ userConfigEntry 1 }	Unique number used to identify entries in the userConfigTable.
userConfigName	{ userConfigEntry 2 }	The user's name.
userConfigPrivilegeLevel	{ userConfigEntry 3 }	The privilege level granted to the user. Can be a value in range 1 to 15.

Table 98-24: Objects defined in AT-USER-MIB(cont.)

Object	Object Identifier	Description
userSecurityPasswordRules	{ user 3 } or (207.8.4.4.3.20.3)	Information about user password security rules.
userSecurityPasswordHistory	{ userSecurityPasswordRules 1 }	The number of previous passwords that are retained for comparison when a user password is created. A new password must be unique when compared against the previous history. A value of 0 represents no restriction. The maximum number of retained passwords is 15.
userSecurityPasswordLifetime	{ userSecurityPasswordRules 2 }	The maximum number of days that the password may persist before a change is required. A value of 0 represents no expiry. The maximum value is 1000.
userSecurityPasswordWarning	{ userSecurityPasswordRules 3 }	The number of days before the password expires that a warning message is displayed when the user logs in. A value of 0 indicates no warning. The maximum value is 1000 but must always be less than the password lifetime.
userSecurityPasswordMinLength	{ userSecurityPasswordRules 4 }	The minimum allowable password length.
userSecurityPasswordMinCategory	{ userSecurityPasswordRules 5 }	The minimum number of different categories that the password must satisfy to be considered valid. Categories are split into four groups: upper-case letters lower-case letters digits special symbols. ASCII characters not included in the previous three categories.
userSecurityPasswordForced	{ userSecurityPasswordRules 6 }	Whether or not a user with an expired password is forced to change their password at the next login. At login a user with an expired password is prompted to change their password. If the new password meets the current security password rules the user is allowed to log in, otherwise they are rejected.
userSecurityPasswordReject	{ userSecurityPasswordRules 7 }	Whether or not a user login attempt with an expired password is rejected. If the user is not rejected then they can log in.

AT-VCSTACK-MIB

AT-VCSTACK-MIB defines objects for managing Virtual Chassis Stacking (**Table 98-25**). Objects in this group have the object identifier vcstack ({ sysinfo 13 }).

Figure 98-7 on page 98.79 shows the tree structure of the AT-VCSTACK objects.

Figure 98-7: The AT-VCSTACK MIB sub-tree

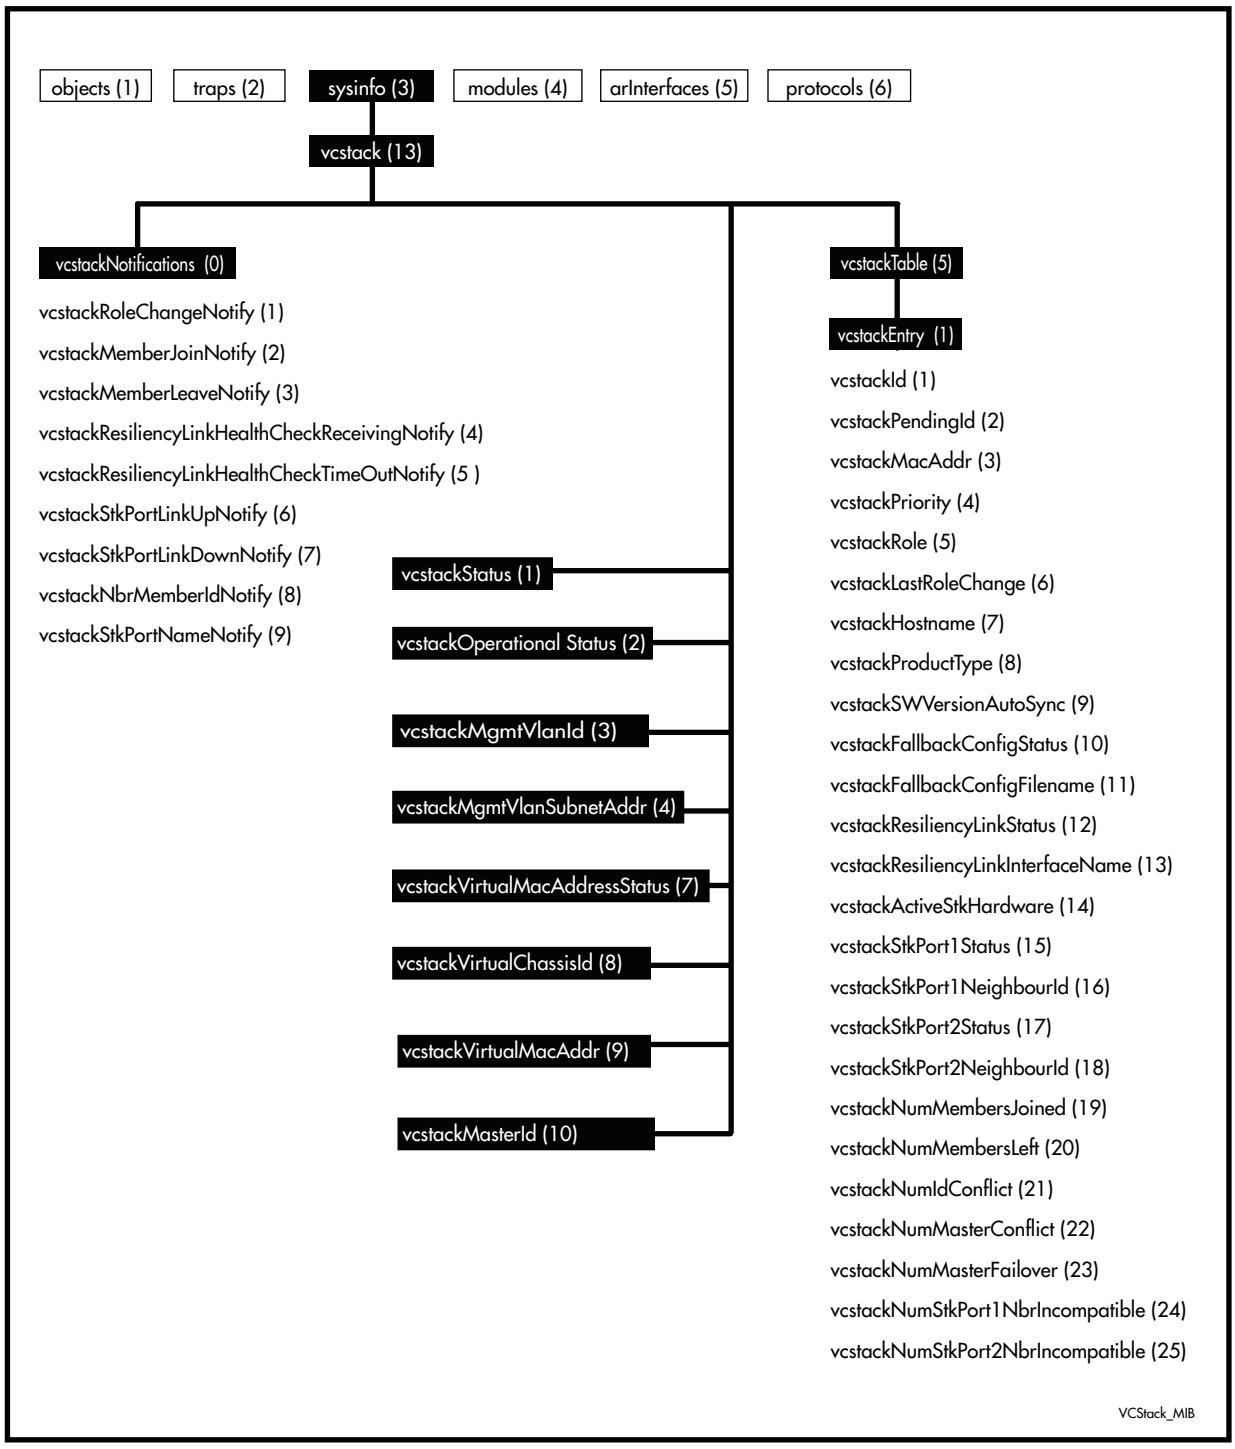

Table 98-25: Objects defined in AT-VCSTACK-MIB

Object	Object Identifier	Description
vcstack	{ sysinfo (13) }	Overall stack status.
vcstackNotifications	{ vcstack 0 }	List of traps (notifications) generated for the stack:
vcstackRoleChangeNotify	{ vcstackNotifications 1 }	The stack status can take one of the following states: 1. normalOperation (1) 2. operatingInFailoverState (2) 3. standaloneUnit (3) 4. ringTopologyBroken (4)
vcstackMemberJoinNotify	{ vcstackNotifications 2 }	Notification generated when a member joins the stack. Displays the objects: 1. vcstackId 2. vcstackNbrMemberId
vcstackMemberLeaveNotify	{ vcstackNotifications 3 }	Notification generated when a member leaves the stack. Displays the objects: 1. vcstackId 2. vcstackNbrMemberId
vcstackResiliencyLinkHealthCheckReceivingNotify	{ vcstackNotifications 4 }	Notification generated when the resiliency link is activated. Displays the objects: 1. vcstackId 2. vcstackResiliencyLinkInterfaceName
vcstackResiliencyLinkHealthCheckTimeOutNotify	{ vcstackNotifications 5 }	Notification generated when the slave's receive timer has timed-out, indicating that the Slave has lost contact with the Master via the resiliency link. Displays the objects: 1. vcstackId 2. vcstackResiliencyLinkInterfaceName
vcstackStkPortLinkUpNotify	{ vcstackNotifications 6 }	Notification generated when the stack port link is up. Displays the objects: 1. vctasckId 2. vcstackStkPortName
vcstackStkPortLinkDownNotify	{ vcstackNotifications 7 }	Notification generated when the stack port link is down. Displays the objects: 1. vcstackId 2. vcstackStkPortName
vvcstackNbrMemberIdNotify	{ vcstackNotifications 8 }	The stack member id related to this trap
vcstackStkPortNameNotify	{ vcstackNotifications 9 }	The stack port name related to this trap

Table 98-25: Objects defined in AT-VCSTACK-MIB(cont.)

Object	Object Identifier	Description
vcstackOperationalStatus	{ vcstack 2 }	The operational status of the stack can be either: 1. enabled (1) 2. disabled (2)
vcstackMgmtVlanId	{ vcstack 3 }	The current stacking management VLAN ID
vcstackMgmtVlanSubnetAddr	{ vcstack 4 }	The current stacking management VLAN subnet address
vcstackTable	{ vcstack 5 }	Table of information about stack members, indexed by vcstackId.
vcstackEntry	{ vcstackTable 1 }	Information about a single stack member, indexed by vcstackId.
vcstackId	{ vcstackEntry 1 }	Stack member ID.
vcstackPendingId	{ vcstackEntry 2 }	Pending stack member ID.
vcstackMacAddr	{ vcstackEntry 3 }	Stack member's hardware MAC address.
vcstackPriority	{ vcstackEntry 4 }	Priority for election of the stack master. The lowest number has the highest priority.
vcstackRole	{ vcstackEntry 5 }	Stack member's role in the stack. Can be one of the following: 1. leaving (1) 2. discovering (2) 3. synchronizing (3) 4. backupMember (4) 5. pendingMaster (5) 6. disabledMaster (6) 7. fallbackMaster (7) 8. activeMaster (8)
vcstackLastRoleChange	{ vcstackEntry 6 }	Time and date when the stack member last changed its role in the stack.
vcstackHostname	{ vcstackEntry 7 }	Stack member's hostname.
vcstackProductType	{ vcstackEntry 8 }	Stack members product type.
vcstackSWVersionAutoSync	{ vcstackEntry 9 }	Whether or not the stack member's software is automatically upgraded.
vcstackFallbackConfigStatus	{ vcstackEntry 10 }	Status of the fallback configuration file. Can be one of: 1. fileExists (1) 2. fileNotFound (2) 3. notConfigured (3)

Table 98-25: Objects defined in AT-VCSTACK-MIB(cont.)

Object	Object Identifier	Description
vcstackFallbackConfigFilename	{ vcstackEntry 11 }	Filename of the fallback configuration file.
vcstackResiliencyLinkStatus	{ vcstackEntry 12 }	Status of the stack members resiliency link. Can be one of: 1. configured (1) 2. successful (2) 3. failed (3) 4. notConfigured (4)
vcstackResiliencyLinkInterfaceName	{ vcstackEntry 13 }	Name of the interface the resiliency link is configured on.
vcstackActiveStkHardware	{ vcstackEntry 14 }	Stack ports hardware type. Can be one of: 1. value (0) is now obsolete 2. xemStk (1) 3. builtinStackingPorts (2) 4. none (3) is now obsolete 5. stackXG (4)
vcstackStkPort1Status	{ vcstackEntry 15 }	Status of stack-port 1. Can be one of the following: 1. down (1) 2. neighbourIncompatible (2) 3. discoveringNeighbour (3) 4. learntNeighbour (4)
vcstackStkPort1NeighbourId	{ vcstackEntry 16 }	ID of the neighbor on stack-port 1. Zero indicates no learned neighbor.
vcstackStkPort2Status	{ vcstackEntry 17 }	Status of stack-port 2. Can be one of: 1. down (1) 2. neighbourIncompatible (2) 3. discoveringNeighbour (3) 4. learntNeighbour (4)
vcstackStkPort2NeighbourId	{ vcstackEntry 18 }	ID of the neighbor on stack-port 2. Zero indicates no learned neighbor.
vcstackNumMembersJoined	{ vcstackEntry 19 }	Number of times the stack has acquired a member.
vcstackNumMembersLeft	{ vcstackEntry 20 }	Number of times the stack has lost a member.
vcstackNumIdConflict	{ vcstackEntry 21 }	Number of times that a stack member ID conflict has occurred.
vcstackNumMasterConflict	{ vcstackEntry 22 }	Number of times that a stack master conflict has occurred.
vcstackNumMasterFailover	{ vcstackEntry 23 }	Number of times that the stack master has failed.

Table 98-25: Objects defined in AT-VCSTACK-MIB(cont.)

Object	Object Identifier	Description
vcstackNumStkPort1NbrIncompatible	{ vcstackEntry 24 }	Number of times that the neighbor on stack port 1 was incompatible.
vcstackNumStkPort2NbrIncompatible	{ vcstackEntry 25 }	Number of times that the neighbor on stack port 2 was incompatible.
vcstackVirtualMacAddressStatus	{vcstack 7}	Indicates whether the virtual MAC address is enabled or disabled. Read-only object.
vcstackVirtualChassisId	{vcstack 8}	Displays the current virtual chassis ID. Read-only object.
vcstackVirtualMacAddr	{vcstack 9}	Displays the virtual MAC address used by the stack. Read-only object.
vcstackMasterId	{vcstack 10}	Displays the stack ID of the master unit, or the stack ID of the standalone unit. Read-only object

AT-VLANINFO-MIB

The atVlanStatistics-MIB (**Figure 98-5**, and **Table 98-13**) defines objects for managing VLANs. The MIB contains a sub tree for managing VLAN statistics. Objects in the VLAN Statistics sub-tree have the object identifier ({atVlanInfo 1}).

Figure 98-8: The atVlanStatistics MIB tree

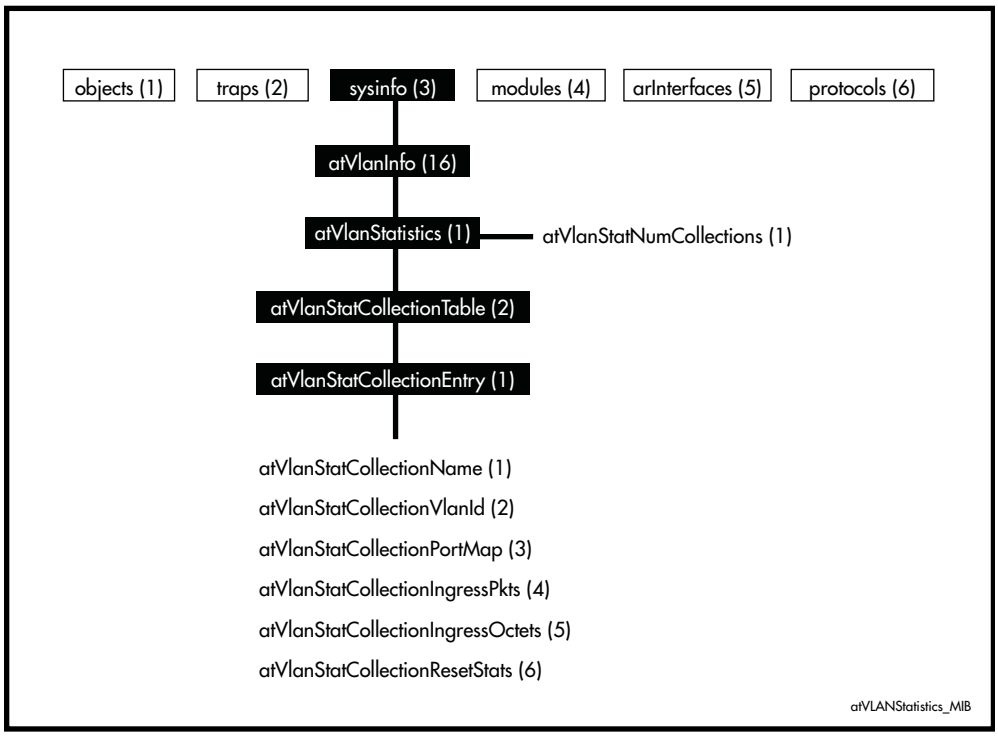

Table 98-26: AT Enterprise MIB - High Level Structure

Object	Description
vlaninfo {sysinfo 16}	Root of the Allied Telesis Enterprise MIB under the private(4) node defined in RFC1155-SMI.
atVlanStatistics {vlaninfo 1}	The number of unique VLAN statistic gathering instances defined on the device.
atVlanStatNumCollections {atVlanStatistics 1}	The number of unique VLAN statistic gathering instances defined on the device.
atVlanStatCollectionTable {atVlanStatistics 2}	A table of VLAN statistic instances.
atVlanStatCollectionEntry {atVlanStatCollectionTable 1}	Each entry represents a unique VLAN statistic gathering instance defined on the device. Sequences are:
atVlanStatCollectionName {atVlanStatCollectionEntry 1}	The name of a VLAN statistics collection instance.
atVlanStatCollectionVlanId {atVlanStatCollectionEntry 2}	The VLAN ID of ingress packets being monitored by this VLAN statistics collection instance.

Table 98-26: AT Enterprise MIB - High Level Structure(cont.)

Object		Description
	atVlanStatCollectionPortMap {atVlanStatCollectionEntry 3}	A bitwise port map indicating the switch ports being monitored by this VLAN statistics collection instance. The bit position within the string, maps to the port with the same index in dot1dBasePortTable in BRIDGE-MIB. A binary '1' indicates that the port is being monitored by this VLAN statistics collection instance, with a '0' indicating that it is not.
	atVlanStatCollectionIngressPkts {atVlanStatCollectionEntry 4}	The number of ingress packets received and counted by this VLAN statistics collection instance.
	atVlanStatCollectionIngressOctets {atVlanStatCollectionEntry 5}	The number of octets of data received from ingress packets counted by this VLAN statistics collection instance.
	atVlanStatCollectionResetStats {atVlanStatCollectionEntry 6}	When read, this object will always return 2 (false). Setting its value to 1 (true) will cause the matching VLAN statistics collection instance's ingress packets and ingress octet values to be reset to zero.

AT-XEM-MIB

AT-XEM-MIB defines objects for managing XEMs (Expansion Modules) installed in the device (**Table 98-27**). Objects in this group have the object identifier xem ({ sysinfo 11 }) and reside in the sysinfo Group of the Allied Telesis Enterprise MIB.

Table 98-27: Objects defined in AT-XEM-MIB

Object	Object Identifier	Description
xemTraps	{ xem 0 }	Collection of traps generated when a XEM is inserted or removed.
xemInserted	{ xemTraps 1 }	Trap generated when a XEM card is inserted to the device. It returns the objects xemInfoStackId and xemInfoBayId.
xemRemoved	{ xemTraps 2 }	Trap generated when a XEM card is removed from the device. It returns the objects xemInfoStackId and xemInfoBayId.
xemInsertedFail	{ xemTraps 3 }	Trap generated when the insertion of a XEM card into the device fails. It returns the objects xemInfoStackId and xemInfoBayId.
xemNumOfXem	{ xem 1 }	Total number of XEMs installed in the device.
xemInfoTable	{ xem 2 }	Table of information about the XEMs installed in the device, indexed by xemInfoMemberId and xemInfoBayId.
xemInfoEntry	{ xemInfoTable 1 }	Information about a single XEM.
xemInfoMemberId	{ xemInfoEntry 1 }	Stack Member ID in which the XEM is installed.
xemInfoBayId	{ xemInfoEntry 2 }	Number of the XEM bay in which the XEM is installed.
xemInfoXemId	{ xemInfoEntry 3 }	Numeric board identity of the XEM. This information is displayed in the ID column of the SHOW SYSTEM command.
xemInfoBoardType	{ xemInfoEntry 4 }	Board type. For XEMs this is always “Expansion”. This information is displayed in the Board column of the SHOW SYSTEM command.
xemInfoBoardName	{ xemInfoEntry 5 }	Name of the XEM. This information is displayed in the Board Name column of the SHOW SYSTEM command.
xemInfoRevision	{ xemInfoEntry 6 }	Board revision of the XEM. This information is displayed in the Rev column of the SHOW SYSTEM command.
xemInfoSerialNumber	{ xemInfoEntry 7 }	Serial number of the XEM. This information is displayed in the Serial Number column of the SHOW SYSTEM command.

Other Enterprise MIBs

In general, all objects are supported except where the relevant protocol or feature is either not supported or not applicable to the device. The following MIBs although under the Enterprise Branch (OID 1.3.6.1.4.1) and utilised by AlliedWare Plus products are not within the AlliedTelesis branch of the MIB object tree.

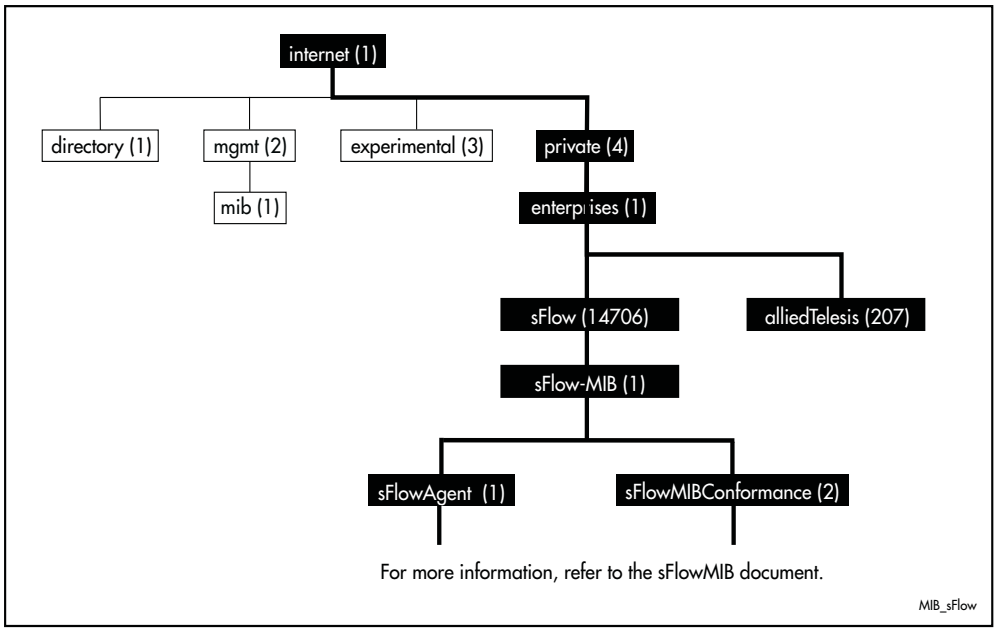
sFlow-MIB

The sFlow-MIB (**Figure 98-9**, and **Table 98-28**) show references to objects for managing the generation and transportation of sFlow data records.

Table 98-28: Objects defined in the sFlow-MIB

MIB Name	Reference / Implementation
sFlow-MIB	All MIB objects are fully supported For more information, see **www.sflow.org/SFLOW-MIB5.txt**

Figure 98-9: The sFlow Statistics MIB tree



Public MIBs

The following table lists the public MIBs supported by the AlliedWare Plus™ Operating System. In general, all objects are supported except where the relevant protocol or feature is either not supported or not applicable to the device. Any variations from the standard are listed.

Public MIBs Supported by AlliedWare Plus™

MIB Name	Reference / Implementation
IANAifType-MIB	**www.iana.org/assignments/ianaiftype-mib**, IANAifType textual convention.
RFC1155-SMI	RFC 1155, *Structure and Identification of Management Information for TCP/IP-based Internets.*
-	RFC 1212, *Concise MIB Definitions*.
RFC1213-MIB	See IP-MIB.
-	RFC 1215, *A Convention for Defining Traps for use with the SNMP*.
-	RFC 1239, *Reassignment of Experimental MIBs to Standard MIBs*.
IP-MIB	The IP MIB tree encompasses IP-MIB, RFC1213-MIB and IP-FORWARD-MIB definitions. The following documents define the components: ■ RFC 1213, *Management Information Base for Network Management of TCP/IP-based internets: MIB-II* ■ RFC 4292, *IP Forwarding Table MIB* ■ RFC 4293, *Management Information Base for the Internet Protocol (IP)* The following objects **are** supported: ■ ipForwarding ■ ipDefaultTTL ■ All ipAddrTable objects except ipAdEntReasmMaxSize ■ All ipNetToPhysicalTable objects except ipNetToPhysicalRowStatus (all read-only) ■ ipCidrRouteNumber ■ All ipCidrRouteTable objects except ipCidrRouteTos All other objects in these MIBs are not supported. Note that an Enterprise version of ipAddressTable objects is provided by atIpAddressTable in AT-IP-MIB. This provides equivalent functionality along with support for primary and secondary IP addresses.
TCP-MIB	RFC 2012, *SNMPv2 Management Information Base for the Transmission Control Protocol using SMIv2*.
UDP-MIB	RFC 2013, *SNMPv2 Management Information Base for the User Datagram Protocol using SMIv2*.
IP-FORWARD-MIB	See IP-MIB.
-	RFC 2257, *Agent Extensibility (AgentX) Protocol Version 1*.
SNMP-MPD-MIB	RFC 2572, *Message Processing and Dispatching for the Simple Network Management Protocol (SNMP)*.
SNMP-COMMUNITY-MIB	RFC 2576, *Coexistence between Version 1, Version 2, and Version 3 of the Internet-standard Network Management Framework*.
SNMPv2-SMI	RFC 2578, *Structure of Management Information Version 2 (SMIv2)*.
SNMPv2-TC	RFC 2579, *Textual Conventions for SMIv2*.

Public MIBs Supported by AlliedWare Plus™(cont.)

MIB Name	Reference / Implementation
SNMPv2-CONF	RFC 2580, *Conformance Statements for SMIv2*.
P-BRIDGE-MIB	RFC 2674, *Definitions of Managed Objects for Bridges with Traffic Classes, Multicast Filtering and Virtual LAN Extensions*. The following objects are not supported: ■ dot1dTpPortOverflowTable ■ dot1dTrafficClassesEnabled ■ dot1dGmrpStatus ■ dot1dPortCapabilitiesTable ■ dot1dUserPriority ■ dot1dTrafficClassPriority ■ dot1dPortOutboundAccessPriorityTable ■ all objects in the dot1dGarp group ■ all objects in the dot1dGmrp group The following read-write object is implemented as read-only: ■ dot1dPortNumTrafficClasses
Q-BRIDGE-MIB	RFC 2674, *Definitions of Managed Objects for Bridges with Traffic Classes, Multicast Filtering and Virtual LAN Extensions*. The following objects are not supported: ■ dot1qGvrpStatus ■ dot1qFdbId ■ dot1qTpFdbAddress ■ dot1qTpGroupTable ■ dot1qForwardAllTable ■ dot1qForwardUnregisteredTable ■ all objects in the dot1qStatic group ■ dot1qVlanTimeMark ■ dot1qVlanIndex ■ dot1qVlanCurrentEgressPorts ■ dot1qVlanCurrentUntaggedPorts ■ dot1qVlanForbiddenEgressPorts ■ dot1qPortGvrpStatus ■ dot1qPortGvrpFailedRegistrations ■ dot1qPortGvrpLastPduOrigin ■ dot1qPortRestrictedVlanRegistration ■ dot1qPortVlanStatisticsTable ■ dot1qPortVlanHCStatisticsTable ■ dot1qLearningConstraintsTable The following read-write objects are implemented as read-only: ■ dot1qPvid ■ dot1qPortAcceptableFrameTypes
VRRPv3-MIB	RFC 6527, *Definitions of Managed Objects for the Virtual Router Redundancy Protocol Version 3 (VRRPv3)*. All objects with read-write and read-create access are implemented as read-only. RFC 6527 (VRRPv3-MIB) obsoletes RFC 2787 (VRRP-MIB).

Public MIBs Supported by AlliedWare Plus™ (cont.)

MIB Name	Reference / Implementation
HOST-RESOURCES-MIB	RFC 2790, *Host Resources MIB*. The following objects are not supported: ■ hrStorageAllocationFailures ■ All objects in hrDevice ■ All objects in hrSWRun ■ All objects in hrSWRunPerf ■ All objects in hrSWInstalled ■ All objects in hrMIBAdminInfo
SNMPv2-PDU	RFC 3416, *Version 2 of the Protocol Operations for the Simple Network Management Protocol (SNMP)*.
SNMPv2-TM	RFC 3417, *Transport Mappings for the Simple Network Management Protocol (SNMP)*.
SNMPv2-MIB	RFC 3418, *Management Information Base (MIB) for the Simple Network Management Protocol (SNMP)*.
EtherLike-MIB	RFC 3635, *Definitions of Managed Objects for the Ethernet-like Interface Types*. The following objects are deprecated: ■ dot3StatsEtherChipSet ■ all objects in the dot3Tests group ■ all objects in the dot3Errors group The following read-write object is implemented as read-only: ■ dot3PauseAdminMode
MAU-MIB	RFC 3636, *Definitions of Managed Objects for IEEE 802.3 Medium Attachment Units (MAUs)*. The following objects are not supported: ■ all objects in the dot3RpMauBasicGroup group ■ ifMauTypeListBits ■ ifMauHCFalseCarriers ■ all object identifiers in the dot3MauType group ■ ifMauAutoNegCapabilityBits ■ ifMauAutoNegCapAdvertisedBits ■ ifMauAutoNegCapReceivedBits ■ ifMauAutoNegRemoteFaultAdvertised ■ ifMauAutoNegRemoteFaultReceived ■ all objects in the mauMod group The following objects are deprecated: ■ ifMauTypeList ■ all objects in the dot3BroadMauBasicGroup group ■ ifMauAutoNegCapability ■ ifMauAutoNegCapAdvertised ■ ifMauAutoNegCapReceived The following read-write object is implemented as read-only: ■ ifMauStatus
INET-ADDRESS-MIB	RFC 4001, *Textual Conventions for Internet Network Addresses*.

Public MIBs Supported by AlliedWare Plus™(cont.)

MIB Name	Reference / Implementation
BRIDGE-MIB	RFC 4188, *Definitions of Managed Objects for Bridges*. The following read-write objects are implemented as read-only: ■ dot1dStpPortEnable ■ dot1dStpPortPathCost The following objects are not supported: ■ dot1dStaticTable ■ dot1dBaseDelayExceededDiscards ■ dot1dBasePortMtuExceededDiscards
RSTP-MIB	RFC 4318, *Definitions of Managed Objects for Bridges with Rapid Spanning Tree Protocol.* The following read-write objects are implemented as read-only: ■ dot1dStpPortProtocolMigration ■ dot1dStpPortAdminEdgePort ■ dot1dStpPortAdminPointToPoint ■ dot1dStpPortAdminPathCost The following object is deprecated: ■ dot1dStpPathCostDefault
DISMAN-PING-MIB	RFC 4560, *Definitions of Managed Objects for Remote Ping, Traceroute, and Lookup Operations*. The following (lldpLocManAddrTable and lldpConfigManAddrTable) read-write object is implemented as read-only: ■ pingMaxConcurrentRequests You can specify multiple ping operations, but the device only performs one ping at a time (pingMaxConcurrentRequests). The device uses ICMP echo for ping operations (pingImplementationTypeDomains).
LLDP-MIB	*IEEE Standard 802.1AB-2005, Section 12, LLDP MIB Definitions*. The following local management address table supports only a single management address per port: ■ lldpConfigManAddrTable
LLDP-EXT-DOT1-MIB	*IEEE Standard 802.1AB-2005, Annex F, IEEE 802.1 Organizationally Specific TLVs., Section F.7.1, IEEE 802.1LLDP extension MIB module*. In each of the following tables, if one entry is set, all other entries in the table are set to the same value. ■ lldpXdot1ConfigVlanNameTxEnable ■ lldpXdot1ConfigProtoVlanTxEnable ■ lldpXdot1ConfigProtocolTxEnable
LLDP-EXT-DOT3-MIB	*IEEE Standard 802.1AB-2005, Annex G, IEEE 802.3 Organizationally Specific TLVs, Section G.7.1, IEEE 802.3 LLDP extension MIB module*
LLDP-EXT-MED-MIB	*ANSI/TIA-1057- 2006, Section 13.3, LLDP-MED MIB Definition*
RIPv2-MIB	*RFC1724 - RIP Version 2 MIB Extension*

In general, all objects are supported except where the relevant protocol or feature is either not supported or not applicable to the device. The following table lists the private MIBs supported by the AlliedWare Plus™ Operating System. Any variations from the standard are listed.

    Configure Authentication for Voice VLAN 99.18

Introduction

This chapter describes the Link Layer Discovery Protocol (LLDP), LLDP for Media Endpoint Devices (LLDP-MED) and Voice VLAN, and general configuration information for these.

LLDP is designed to be managed with the Simple Network Management Protocol (SNMP), and SNMP-based Network Management Systems (NMS). LLDP can be configured, and the information it provides can be accessed, using either the command line interface or SNMP.

- For detailed descriptions of the commands used to configure LLDP and LLDP-MED, see **Chapter 100, LLDP Commands**.
- For Voice VLAN commands, see **Chapter 19, VLAN Commands**.
- For information about the LLDP and LLDP-MED MIBs, see **"Public MIBs" on page 98.88**.

Link Layer Discovery Protocol

Link Layer Discovery Protocol (LLDP) is a Layer 2 protocol defined by the *IEEE Standard 802.1AB-2005*. This switch supports LLDP as specified in this standard, including *Annex F* and *Annex G*.

LLDP enables Ethernet network devices, such as switches and routers, to transmit and/or receive device-related information to or from directly connected devices on the network, and to store such information learned about other devices. The data sent and received by LLDP is useful for many reasons. The switch can discover neighbors—other devices directly connected to it. Devices can use LLDP to advertise some parts of their Layer 2 configuration to their neighbors, enabling some kinds of misconfiguration to be more easily detected and corrected.

LLDP is a link level ("one hop") protocol; LLDP information can only be sent to and received from devices that are directly connected to each other, or connected via a hub or repeater. Advertised information is not forwarded on to other devices on the network.

The information transmitted in LLDP advertisements flows in one direction only, from one device to its neighbors, and the communication ends there. Transmitted advertisements do not solicit responses, and received advertisements do not solicit acknowledgement.

LLDP operates over physical ports (Layer 2) only. For example, it can be configured on switch ports that belong to static or dynamic aggregated links (channel groups), but not on the aggregated links themselves; and on switch ports that belong to VLANs, but not on the VLANs themselves.

LLDP provides a way for the switch to:

- transmit information about itself to neighbors
- receive device information from neighbors
- store and manage information in an LLDP MIB

Each port can be configured to transmit local information, receive neighbor information, or both.

LLDP defines:

- a set of common advertisements (**"LLDP Advertisements" on page 99.4**)
- a protocol for transmitting and receiving advertisements (**"Transmission and Reception" on page 99.8**)
- a method for storing the information that is contained within received advertisements (**"Storing LLDP Information" on page 99.10**)

Interactions

LLDP has the following interactions with other switch features:

- Spanning tree

  Ports blocked by a spanning tree protocol can still transmit and receive LLDP advertisements.

- 802.1x

  Ports blocked by 802.1x port authorization cannot transmit or receive LLDP advertisements. If LLDP has stored information for a neighbor on the port before it was blocked, this information will eventually time out and be discarded.

- VLAN tagging

  LLDP packets are untagged; they do not contain 802.1Q header information with VLAN identifier and priority tagging.

- Virtual Chassis Stacking (VCStack) resiliency link

  When a port is configured as a VCStack resiliency link port, LLDP does not operate on the port; LLDP neither transmits nor receives advertisements, and any LLDP configuration and data stored for the port, including counters, is discarded.

- Mirror ports

  LLDP does not operate on mirror analyzer ports.

LLDP-MED

LLDP for Media Endpoint Devices (LLDP-MED), is an extension of LLDP used between LAN network connectivity devices, such as this switch, and the media endpoint devices connected to them, such as IP phones. LLDP-MED is specified in *ANSI/TIA-1057-2006*. Of the application types specified in *ANSI/TIA-1057-2006*, the switch supports Application Type 1: Voice.

LLDP-MED uses the LLDP advertisement, transmission and storage mechanisms, but transmits, receives, and stores data specifically related to managing the voice endpoint devices. This includes information about network policy, location, hardware configuration, and, for Power over Ethernet-capable devices, power management.

Voice VLAN

Many IP phones (or other IP voice devices) have two interfaces: one to connect to the network and another that allows a computer or similar device to connect to the network via the IP phone. It is often desirable to treat the voice and data traffic separately so that appropriate Quality of Service (QoS) policies can be applied to each. The Voice VLAN feature uses LLDP-MED to convey configuration information (such as VLAN ID and User Priority tagging, and DiffServ Code Point (DSCP)—**"Differentiated Services Architecture" on page 65.4**) for the voice traffic to the IP phone. In response, the IP

phone sends voice traffic according to this configuration. The data traffic coming through the IP phone from the PC is sent with the default configuration, typically untagged with normal priority.

LLDP Advertisements

LLDP transmits advertisements as packets called LLDP Data Units (LLDPDUs). An LLDPDU consists of a set of Type-Length-Value elements (TLV), each of which contains a particular type of information about the device or port transmitting it.

Type-Length-Value (TLV)

A single LLDPDU contains multiple TLVs. TLVs are short information elements that communicate complex data, such as variable length strings, in a standardized format. Each TLV advertises a single type of information, such as its device ID, type, or management addresses. The following table describes fields in a TLV.

Table 99-1: Fields in a Type Length Value element

Field	Description
Type	Identifies the kind of information. It consists of a 7-bit Type code.
Length	Identifies the length of the information. It consists of a 9-bit value that specifies the number of bytes of data in the Value field.
Value	Contains the actual value of the advertised information. This is a variable length data field.

LLDP sends mandatory TLVs in each advertisement; it can also be configured to send one or more optional TLVs, from the following groups:

- Mandatory Base TLVs, included in all LLDP advertisements. See IEEE 802.1AB-2005.
- Optional Base TLVs, which may be included in any LLDP advertisements. See IEEE 802.1AB-2005.
- IEEE 802.1 Organizationally Specific TLVs (802.1 TLVs). See IEEE 802.1AB-2005 Annex F.
- IEEE 802.3 Organizationally Specific TLVs (802.3 TLVs). See IEEE 802.1AB-2005 Annex G.
- LLDP-MED Organizationally Specific TLVs (LLDP-MED TLVs), included in LLDP-MED advertisements. See ANSI/TIA-1057- 2006.

Mandatory and optional TLVs for LLDP and LLDP-MED advertisements are shown in **Table 99-2**.

Table 99-2: TLVs in LLDP advertisements

TLV	Description
Mandatory Base TLVs—IEEE 802.1AB-2005	
Chassis ID	Identifies the device's chassis. On this switch, this is the MAC address of the switch or stack.
Port ID	Identifies the port that transmitted the LLDPDU.

Table 99-2: TLVs in LLDP advertisements(cont.)

TLV	Description
Time To Live (TTL)	Indicates the length of time in seconds for which the information received in the LLDPDU remains valid. If the value is greater than zero, the information is stored in the LLDP remote system MIB. If the value is zero, the information previously received is no longer valid, and is removed from the MIB.
End of LLDPDU	Signals that there are no more TLVs in the LLDPDU.
Optional Base TLVs—IEEE 802.1AB-2005	
Port description	A description of the device's port in alpha-numeric format.
System name	The system's assigned name in alpha-numeric format.
System description	A description of the device in alpha-numeric format. This includes information about the device's hardware and operating system.
System capabilities	The device's router and bridge functions, and whether or not these functions are currently enabled.
Management address	The address of the local LLDP agent. This can be used to obtain information related to the local device.
IEEE 802.1 Organizationally Specific TLVs (802.1 TLVs)—IEEE 802.1AB-2005 Annex F	
Port VLAN	VLAN identifier that the local port associates with untagged or priority tagged frames.
Port & Protocol VLANs	Whether Port & Protocol VLAN is supported and enabled on the port, and the list of Port & Protocol VLAN identifiers.
VLAN Names	List of VLAN names that the port is assigned to.
Protocol IDs	List of protocols that are accessible through the port, for instance: ■ 9000 (Loopback) ■ 00 26 42 42 03 00 00 00 (STP) ■ 00 27 42 42 03 00 00 02 (RSTP) ■ 00 69 42 42 03 00 00 03 (MSTP) ■ 888e01 (802.1x) ■ aa aa 03 00 e0 2b 00 bb (EPSR) ■ 88090101 (LACP) ■ 00540000e302 (Loop protection) ■ 0800 (IPv4) ■ 0806 (ARP) ■ 86dd (IPv6)
IEEE 802.3 Organizationally Specific TLVs (802.3 TLVs)—IEEE 802.1AB-2005 Annex G	
MAC/PHY Configuration/ Status	The current values of the following for the port: ■ Speed and duplex mode auto-negotiation support ■ Auto-negotiation status ■ PMD (physical media dependent) auto-negotiation advertised capability ■ Operational MAU type This TLV is always included in LLDP-MED advertisements.
Power Via MDI	The power-via-MDI capabilities. On devices that are LLDP-MED and PoE-capable, we recommend using the Extended Power-via-MDI TLV instead of this TLV.

Table 99-2: TLVs in LLDP advertisements(cont.)

TLV	Description
Link Aggregation	Whether the link is capable of being aggregated, whether it is currently in an aggregation and if in an aggregation, the port of the aggregation.
Maximum Frame Size	The maximum supported 802.3 frame size that the sending device is capable of receiving—larger frames will be dropped.
LLDP-MED Organizationally Specific TLVs (LLDP-MED TLVs)—ANSI/TIA-1057- 2006	
LLDP-MED Capabilities	Indicates an LLDP-MED capable device, and advertises which LLDP-MED TLVs are supported and enabled, and the device type. For this switch, the device type is Network Connectivity Device. An advertisement containing this TLV is an LLDP-MED advertisement.
Network Policy	Network policy information configured on the port for connected media endpoint devices. The switch supports Application Type 1: Voice, including the following network policy for connected voice devices to use for voice data: ■ Voice VLAN ID ■ Voice VLAN User Priority tagging ■ Voice VLAN Diffserv Code Point (DSCP)
Location Identification	Location information configured for the port, in one or more of the following formats: ■ Civic address ■ Coordinate-based LCI ■ Emergency Location Identification Number (ELIN) For more information, see **"LLDP-MED: Location Identification TLV" on page 99.7**.
Extended Power-via-MDI	For PoE-capable devices, this TLV includes: ■ Power Type field: Power Sourcing Entity (PSE). ■ Power Source field: current power source, either Primary Power Source or Backup Power Source. ■ Power Priority field: power priority configured on the port. ■ Power Value field: In TLVs transmitted by Power Sourcing Equipment (PSE) such as this switch, this advertises the power that the port can supply over a maximum length cable based on its current configuration (that is, it takes into account power losses over the cable). In TLVs received from Powered Device (PD) neighbors, the power value is the power the neighbor requests. Available on devices that are PoE-capable.
Inventory Management TLV Set	Includes the following TLVs, based on the current hardware platform and the software version, identical on every port on the switch: ■ Hardware Revision ■ Firmware Revision ■ Software Revision ■ Serial Number ■ Manufacturer Name ■ Model Name ■ Asset ID On Virtual Chassis Stacking devices, the inventory information is based on the current master.

LLDP-MED: Location Identification TLV

Location information can be configured for each port, and advertised to remote devices, which can then transmit this information in calls; the location associated with voice devices is particularly important for emergency call services. All ports may be configured with the location of the switch, or each port may be configured with the location of the remote voice device connected to it.

The location information for a particular port can be configured using one or more of the following three data formats: coordinate-based, Emergency Location Identification Number (ELIN), and civic address. Up to one location of each type can be assigned to a port.

Location configuration information (LCI) in all configured data formats is transmitted in Location Identification TLVs. When LLDP receives a Location Identification TLV, it updates the remote entry in the LLDP-MED MIB with this information.

Co-ordinate LCI Coordinate-based location data format uses geospatial data, that is, latitude, longitude, and altitude (height or floors), including indications of resolution, with reference to a particular datum: WGS 84, NAD83—North American Vertical Datum of 1988 (NAVD88), or NAD83—Mean Lower Low Water (MLLW). For more information, see *RFC 3825, Dynamic Host Configuration Protocol Option for Coordinate-based Location Configuration Information.*

ELIN LCI Emergency Location Identification Number (ELIN) location data format provides a unique number for each location for Emergency Call Services (ECS). In North America, ELINs are typically 10 digits long; ELINs up to 25 digits are supported.

Civic Address LCI The Civic Address location data format uses common street address format, as described in *RFC4776*.

Transmission and Reception

Table 99-3 describes the LLDP transmission and reception processes. Additional LLDP-MED processes are described in **"LLDP-MED Operation" on page 99.9**.

Table 99-3: LLDP transmission and reception processes

When ...	And ...	Then ...
LLDP is enabled	Ports are configured to transmit LLDP advertisements	Regular LLDP advertisements are sent via these ports at intervals determined by the transmit interval. Each advertisement contains local information (from the Local Systems MIB) for all the mandatory TLVs and the optional TLVs that the port is configured to send.
	Ports are configured to receive LLDP advertisements	Information received in advertisements via these ports is stored in the Neighbor table (Remote Systems MIB). This information is retained until it is replaced by a more recent advertisement from the same neighbor or it times out (the TTL elapses).
Local information changes	The transmission delay time has elapsed since the last advertisement was transmitted	New advertisements are sent containing the new set of local information.
Neighbor information changes	Notifications are enabled, and the notification interval has elapsed since the last notification was sent	The SNMP notification (trap) lldpRemTablesChange is sent.
LLDP transmission and reception is disabled on a port.	An LLDP command was used to do this	It transmits a final 'shutdown' LLDPDU with a Time-To-Live (TTL) TLV that has a value of "0". This tells any remote neighboring devices to remove the information associated with this switch from their remote systems MIB. Then it stops transmitting and receiving advertisements. The neighbor information remains in the Remote Systems MIB until it times out.
	A shutdown command was used on the port	It makes a best effort to send a shutdown LLDPDU. Then it stops transmitting and receiving advertisements. The neighbor information remains in the Remote Systems MIB until it times out.
	Something else disabled LLDP, such as Virtual Chassis Stacking (VCStack) failover	It does not send a shutdown LLDPDU. It stops transmitting and receiving advertisements. The neighbor information remains in the Remote Systems MIB until it times out.
	It is enabled again	LLDP reinitializes and resumes transmitting and receiving advertisements after the reinitialization interval has elapsed.
The Neighbor table has 1600 neighbors		It discards any further neighbors.
LLDP receives a LLDPDU or TLV with a detectable error		It discards the incorrect TLV.
LLDP receives a TLV it does not recognize	It contains no basic format errors	It stores it for possible later retrieval by network management (in the unrecognized TLV information table lldpRemUnknownTLVTable in the LLDP MIB).

LLDP-MED Operation

When LLDP is enabled, LLDP-MED is enabled by default, and uses the same LLDP transmission and reception process described in **Table 99-3**. When LLDP receives an advertisement indicating a newly connected LLDP-MED-capable device on a port, it transmits one LLDP-MED advertisement per second via this port, a configurable number of times (the *fast start count*). Thereafter, it sends regular advertisements at the LLDP transmit interval. When the last advertisement for an LLDP-MED-capable device connected to the port times out, it stops sending LLDP-MED advertisements via the port.

If LLDP-MED notifications are enabled for a port, and SNMP traps for LLDP are enabled, LLDP-MED generates a *Topology Change Notification (LLDP-MED lldpXMedTopology ChangeDetected)* when a new LLDP-MED compliant IP telephony device is connected to a port or removed from a port. This notification includes the following information:

- IP Phone Chassis ID and Chassis ID sub-type (IP address)
- LLDP Endpoint Device Class
- Switch Chassis ID (MAC address) and Port ID where the device is attached.

Storing LLDP Information

When an LLDP device receives a valid LLDP advertisement from a neighboring network device, it stores the information in an IEEE-defined Simple Network Management Protocol (SNMP) Management Information Base (MIB).

LLDP stores information in the LLDP MIB defined in Section 12 of the *IEEE Standard 802.1AB-2005*, its extensions defined in *Annex F*, *Annex G*, and ANSI/TIA-1057- 2006, about:

LLDP-EXT-MED-MIB ANSI/TIA-1057- 2006, Section 13.3, LLDP-MED MIB Definition

- Local system information. This is the information that LLDP can transmit in advertisements to its neighbors.
- Remote systems information. This is the data that the device receives in advertisements from its neighbors.
- LLDP configuration. This can be used with SNMP to configure LLDP on the device.
- LLDP statistics. This includes information about LLDP operation on the device, including packet and event counters.

This information can be accessed either via SNMP, or directly using the command line interface.

Local system

Information about your device is called local system information. The LLDP local system MIB maintains this information, which consists of device details, as well as any user-configured information that you have set up for your switch, for example a port description or a management address.

LLDP on this device can store one management address per port, and transmit this in LLDP advertisements. It can store multiple management addresses received from each neighbor.

Remote systems

Information gained from neighboring devices is called remote system information. The LLDP remote systems MIB maintains this information.

The length of time for which neighbor information remains in the LLDP remote systems MIB is determined by the Time-To-Live (TTL) value of received LLDPDUs. When it receives an advertisement from a neighbor, LLDP starts a timer based on the Time To Live (TTL) information in the advertisement. The Time To Live (TTL) information in an advertisement is:
TTL=transmit interval x holdtime multiplier. If the TTL elapses, for instance if the neighbor has been removed, LLDP deletes the neighbor's information from the MIB. This ensures that only valid LLDP information is stored.

Whenever a new neighbor is discovered, or an existing neighbor sends an advertisement with new information that differs from the previous advertisement, for example a new or changed TLV, a remote tables change event is activated. If SNMP notifications are enabled, the notification lldpRemTablesChange is sent.

To prevent the remote systems MIB from using large amounts of memory and possibly affecting the operation of your switch, it limits the number of neighbors it stores information for to 1600. If it is storing information from 1600 neighbors, and detects any more neighbors, it is considered to have too many neighbors, and discards advertisements from the rest. There is no per-port limit to the number of neighbors.

SNMP utilities

An SNMP utility can read the Neighbors table MIB (Remote Systems Data in the LLDP MIB) on a device to find out about the LLDP neighbors it is directly connected to on each port. Then it can read the Neighbors table MIB on each of these neighbors to find out about their neighboring LLDP devices, and so on.

Configuring LLDP

You can configure LLDP on the device using either:

- the command line interface. For detailed descriptions of the commands, see **Chapter 100, LLDP Commands**, or
- SNMP—see **Chapter 98, SNMP MIBs**.

This section includes the following command line interface configuration procedures:

- **"Configure LLDP" on page 99.12**— This procedure includes configuration for LLDP between network connectivity devices; it does not include LLDP-MED. If you are configuring LLDP-MED only, use the following procedure instead of this one.
- **"Configure LLDP-MED" on page 99.14**—This procedure includes the LLDP configuration required to support LLDP-MED, as well as specific LLDP-MED and Voice VLAN configuration.
- **"Configure Authentication for Voice VLAN" on page 99.18**—This procedure includes 802.1X port authentication configuration including dynamic VLAN assignment to be used with LLDP-MED. Use the previous procedure before using this one.

Because LLDP is often used together with SNMP, consider configuring SNMP before you configure LLDP. LLDP transmits large amounts of data about the network. For security reasons, we recommend configuring SNMP for SNMP version 3 only (for read and write access). Remove all SNMPv1 and SNMPv2 configuration. See **Chapter 96, SNMP Introduction**, and **Chapter 97, SNMP Commands**.

Configure LLDP

Use the procedure in **Table 99-4** below to configure LLDP.

Some optional TLVs send information that can be configured by other commands. If LLDP will be configured to send these TLVs, consider whether to configure the corresponding parameters first.

- Port Description. See the **description (interface)** command on page 14.2.
- System Name. See the **hostname** command on page 10.23.

Table 99-4: Configuration procedure for LLDP

Enable LLDP		
1.	`awplus#`**configure terminal**	Enter Configuration mode.
2.	`awplus(config)#`**lldp run**	Enable LLDP.
Configure ports for LLDP		
Configure each port to determine whether and which LLDP messages are transmitted and received. If all the ports running LLDP require the same configuration, configure them all together. Otherwise repeat these commands for each port or group of ports that requires a particular configuration.		
3.	`awplus(config)# interface <port-list>`	Enter Interface Configuration mode for the switch ports.
4.	`awplus(config-if)#`**lldp tv-select {[<tlv>]...}** `awplus(config-if)#`**lldp tlv-select all**	By default, the mandatory TLVs are included in LLDP messages. Enable the transmission of one or more optional TLVs through these port as required.
5.	`awplus(config-if)#`**exit**	Return to Global Configuration mode.
6.	`awplus(config)#interface <port-list>`	By default, transmission and reception of LLDP advertisements is enabled on all ports. Enter Interface Configuration mode for any switch ports that should have transmission or reception disabled.
7.	`awplus(config-if)#`**no lldp {[transmit] [receive]}**	Disable transmission and/or reception as required.
8.	`awplus(config-if)#`**exit**	Return to Global Configuration mode.
9.	`awplus(config)#`**exit**	Return to Privileged Exec mode.
Check LLDP configuration		
10.	`awplus#`**show lldp** `awplus#`**show lldp interface [<port-list>]** `awplus#`**show lldp local-info [base] [dot1] [dot3] [med] [interface <port-list>]** `awplus#`**show running-config lldp**	Review the LLDP configuration.
Monitor LLDP		
11.	`awplus#`**show lldp neighbors** `awplus#`**show lldp neighbors detail** `awplus#`**show lldp statistics** `awplus#`**show lldp statistics interface [<port-list>]**	Monitor LLDP operations and display neighbor information as required.

Table 99-4: Configuration procedure for LLDP(cont.)

Advanced LLDP configuration		
The configuration procedure above and the defaults for other settings suit most networks. Use the following commands for fine tuning if necessary. Timer intervals should be long enough not to create unnecessarily high numbers of advertisements when there are topology changes. However, be aware that if the intervals are long, a neighbor's information can continue to be stored after its information has changed, or after it is disconnected.		
12.	`awplus#`**configure terminal**	Enter Configuration mode.
13.	`awplus(config)#interface <port-list>`	Enter Interface Configuration mode for the switch ports.
14.	`awplus(config-if)#`**lldp management-address <ipaddr>**	Override the default LLDP management address advertised through this port if required. This must be an IPv4 address that is already configured on the device. To see the management address that will be advertised, use the **show lldp local-info** command on page 100.39.
15.	`awplus(config-if)#`**lldp notifications**	By default, SNMP notifications are not transmitted. Enable them for these ports if required. (SNMP LLDP traps (notifications) must also be enabled.)
16.	`awplus(config-if)#`**exit**	Return to Global Configuration mode.
17.	`awplus(config)#`**lldp timer <5-32768>**	The transmit interval determines how often regular LLDP transmits advertisements from each port. The transmit interval must be at least four times the transmission delay. Default: 30 seconds
18.	`awplus(config)#`**lldp notification-interval <5-3600>**	The notification interval determines the minimum interval between sending SNMP notifications (traps). Default: 5 seconds
19.	`awplus(config)#`**lldp tx-delay <1-8192>**	A series of successive changes over a short period of time can trigger the agent to send a large number of LLDPDUs. To prevent this, there is a transmission delay timer. This establishes a minimum length of time that must elapse between successive LLDP transmissions. The transmission delay cannot be greater than a quarter of the transmit interval. Default: **2** seconds
20.	`awplus(config)#`**lldp reinit <1-10>**	Reinitialization delay timer determines the minimum time after disabling LLDP on a port before it can reinitialize. Default: **2** seconds
21.	`awplus(config)#`**lldp holdtime-multiplier <2-10>**	The transmit interval is multiplied by the holdtime multiplier to give the Time To Live (TTL) value that is advertised to neighbors. Default: **4**
22.	`awplus(config)#`**exit**	Return to Privileged Exec mode.
Clear data		
If necessary, you can clear either neighbor information or LLDP statistics for particular ports or all ports.		
23.	`awplus#`**clear lldp table [interface <port-list>]**	Clear the information from the table of neighbor information.
24.	`awplus#`**clear lldp statistics [interface <port-list>]**	Clear LLDP statistics (packet and event counters).

Configure LLDP-MED

Use the procedure in **Table 99-5** to configure LLDP-MED and Voice VLAN for voice devices connected to the switch.

Consider whether you also need to configure:

- Simple Network Management Protocol (**Chapter 97, SNMP Commands**)
- 802.1X port authentication (**Chapter 68, 802.1X Commands**, **Chapter 70, Authentication Commands**, **Chapter 72, AAA Commands**)
- RADIUS server (**Chapter 78, Local RADIUS Server Commands**, or **Chapter 74, RADIUS Commands**)
- Quality of Service (**Chapter 66, QoS Commands**)
- Access Control Lists (**Chapter 61, IPv4 Hardware Access Control List (ACL) Commands** and **Chapter 62, IPv4 Software Access Control List (ACL) Commands**)

In most cases, configuring LLDP-MED using SNMP or using the CLI command line interface (CLI) described in **Chapter 100, LLDP Commands** has the same effect. However, the effect of configuring location information using SNMP differs from the CLI. When location information is assigned to a port by SNMP and a matching location is not found on the device, then a new location is automatically created and assigned to the specified port. If the location is unset by SNMP later, then the location is removed to prevent accumulating SNMP-set location information. However, if the location is being used for other ports, the automatically created location is not removed until no ports use it. Once it is modified or assigned to other ports by CLI commands, the location remains even after no ports use the location.

Table 99-5: Configuration procedure for Voice VLAN and LLDP-MED

Configure a Voice VLAN Create a VLAN for voice data from voice endpoint devices connected to ports on the switch. Specify the network policy for voice data in this voice VLAN. LLDP-MED sends the network policy to voice devices connected to these ports. The voice devices use this network policy to determine the VLAN, priority and DSCP tagging of voice data it transmits.		
1.	`awplus#` **configure terminal**	Enter Global Configuration mode.
2.	`awplus(config)#` **vlan database**	Enter VLAN Database Configuration mode.
3.	`awplus(config-vlan)#` **vlan <vid> [name <vlan-name>] [state {enable|disable}]**	Create a VLAN to be used for the voice data to and from voice devices connected to the switch. By default, the new VLAN is enabled.
4.	`awplus(config-vlan)#` **exit**	Return to global configuration mode.
5.	`awplus(config)# interface` *<port-list>*	Enter interface configuration mode for the ports to be configured with the same network policy. This may be all the switch ports with voice devices connected to them, or a subset if the network policy will differ between ports.
6.	`awplus(config-if)#` **switchport voice vlan [<vid>|dot1p|dynamic|untagged]**	Specify the VLAN tagging to be used for voice data on these ports. Use the **dynamic** option if the VLAN tagging will be allocated dynamically by a RADIUS server. To configure authentication and dynamic VLAN allocation using the local RADIUS server, see the procedure in **Table 99-6 on page 99.18**. Default: **none**.

Table 99-5: Configuration procedure for Voice VLAN and LLDP-MED(cont.)

7.	`awplus(config-if)#` **switchport voice vlan priority <0-7>**	Specify the priority-tagging that voice endpoint devices should put into their data packets. Default: **5**.
8.	`awplus(config-if)#` **switchport voice dscp <0-63>**	Specify the DSCP value that voice endpoint devices should put into their data packets. Default: **0**.
9.	`awplus(config-if)#` **exit**	Return to global configuration mode.
Enable LLDP		
10.	`awplus(config)#` **lldp run**	Enable LLDP on the switch. Default: LLDP is disabled.
11.	`awplus(config)#` `interface <port-list>`	Enter interface configuration mode for the switch ports LLDP is NOT to run on.
12.	`awplus(config-if)#` **no lldp {[transmit] [receive]}**	Disable transmission or reception on these ports as required. Default: **transmit** and **receive** enabled.
13.	`awplus(config-if)#` **exit**	Return to global configuration mode.
Configure LLDP-MED location information		
Create civic address, coordinate, and/or ELIN locations, and assign them to switch ports.		
14.	`awplus(config)#` **location civic-location identifier <civic-loc-id>**	Specify a civic location ID, and enter configuration mode for this identifier.
15.	`awplus(config-civic)#` **country <country>** `awplus(config-civic)#` **city <city>** `awplus(config-civic)#` **primary-road-name <primary-road-name>** `awplus(config-civic)#` **street-suffix <street-suffix>** `awplus(config-civic)#` **house-number <house-number>** `awplus(config-civic)#` *<other-civic-location-parameters …>*	Specify the civic address location information for the civic address location ID. You must specify a country first, using the upper-case two-letter country code, and then at least one more parameter. For the full set of parameters you can use to specify civic address location, see the **location civic-location configuration** command on page 100.22.
16.	`awplus(config-civic)#` **exit**	Return to global configuration mode.
17.	`awplus(config)#` **location coord-location identifier <coord-loc-id>**	Specify a coordinate location identifier, and enter configuration mode for this identifier.
18.	`awplus(config-coord)#` **latitude <latitude>** `awplus(config-coord)#` **lat-resolution <lat-resolution>** `awplus(config-coord)#` **longitude <longitude>** `awplus(config-coord)#` **long-resolution <long-resolution>** `awplus(config-coord)#` **altitude <altitude> {meters|floor}** `awplus(config-coord)#` **alt-resolution <alt-resolution>** `awplus(config-coord)#` **datum {wgs84|nad83-navd|nad83-mllw}**	Specify the coordinate location for the coordinate location identifier.
19.	`awplus(config-coord)#` **exit**	Return to global configuration mode.
20.	`awplus(config)#` **location elin-location <elin> identifier <elin-loc-id>**	Specify an ELIN location identifier, and the ELIN for this identifier.

Table 99-5: Configuration procedure for Voice VLAN and LLDP-MED(cont.)

21.	`awplus(config)# interface <port-list>`	Enter interface configuration mode for one or more switch ports which require the same location information.
22.	`awplus(config-if)#` **location civic-location-id <civic-loc-id>** `awplus(config-if)#` **location coord-location-id <coord-loc-id>** `awplus(config-if)#` **location elin-location-id <elin-loc-id>**	Assign the civic, coordinate, and/or ELIN location identifier to these ports. LLDP-MED will send the location information associated with a port to the voice endpoint device attached to it.
23.	`awplus(config-if)#` **exit**	Return to global configuration mode.
24.	`awplus(config)#` **exit**	Return to Privileged Exec mode.
Review the LLDP configuration		
25.	`awplus#` **show lldp**	Check general LLDP configuration settings.
26.	`awplus#` **show lldp interface [<port-list>]**	Check LLDP configuration for ports.
27.	`awplus#` **show lldp local-info [base] [dot1] [dot3] [med] [interface <port-list>]**	Check the information that may be transmitted in LLDP advertisements from ports.
28.	`awplus#` **show location {civic-location|coord-location|elin-location}** `awplus#` **show location {civic-location|coord-location|elin-location} identifier {<civic-loc-id>|<coord-loc-id>|<elin-loc-id>}** `awplus#` **show location {civic-location|coord-location|elin-location} interface <port-list>**	Check the location information.
29.	`awplus#` **show running-config lldp**	If you want to display all the LLDP configuration, use this command.
Monitor LLDP-MED		
30.	`awplus#` **show lldp neighbors [interface <port-list>]** `awplus#` **show lldp neighbors detail [base] [dot1] [dot3] [med] [interface <port-list>]** `awplus#` **show lldp statistics** `awplus#` **show lldp statistics interface [<port-list>]**	Monitor LLDP operation.

Advanced configuration

The configuration procedure above and the defaults for other settings suit most networks. Use the following commands for fine tuning if necessary. For information about other advanced configuration for LLDP, including LLDP timers, see **Table 99-4**.

31.	`awplus#`**configure terminal**	Enter Global Configuration mode.
32.	`awplus(config)#` **lldp faststart-count <1-10>**	By default, when LLDP-MED detects an LLDP-MED capable device on a port, it sends 3 advertisements at 1s intervals. Change the fast start count if required. Default: fast start count is 3
33.	`awplus(config)#` **lldp non-strict-med-tlv-order-check**	By default non-strict order checking for LLDP-MED advertisements is disabled. That is, strict order checking is applied to LLDP-MED advertisements, and LLDP-MED TLVs in non-standard order are discarded. If you require LLDP-MED advertisements with non-standard TLV order to be received and stored, enable non-strict order checking.

Table 99-5: Configuration procedure for Voice VLAN and LLDP-MED(cont.)

34.	`awplus(config)# interface <port-list>`	Enter interface configuration mode for switch ports which will have the same advanced configuration.
35.	`awplus(config-if)#` **lldp management-address <ipaddr>**	Override the default LLDP management address advertised through this port if required. This must be an IPv4 address that is already configured on the device. To see the management address that will be advertised, use the **show lldp local-info** command on page 100.39.
36.	`awplus(config-if)#` **lldp med-notifications**	By default, SNMP notifications are not transmitted. Enable LLDP-MED Topology Change Detected notifications for these ports if required. (SNMP LLDP traps (notifications) must also be enabled.) Default: LLDP-MED notifications disabled
37.	`awplus(config-if)#` **lldp tlv-select {[<tlv>]...}**	Enable the transmission of one or more optional LLDP TLVs in LLDP-MED advertisements through this port as required. The **mac-phy-config** TLV is transmitted in LLDP-MED advertisements whether or not it is enabled by this command. Default: all mandatory TLVs are enabled.
38.	`awplus(config-if)#` **lldp med-tlv-select {[capabilities] [network-policy] [location] [inventory-management]}** `awplus(config-if)#` **lldp med-tlv-select all** `awplus(config-if)#` **no lldp med-tlv-select {[capabilities] [network-policy] [location] [inventory-management]}** `awplus(config-if)#` **no lldp med-tlv-select all**	Enable or disable the transmission of optional LLDP-MED TLVs in LLDP-MED advertisements through these ports as required. Default: **capabilities**, **network-policy**, **location**, **power-management** are enabled.
39.	`awplus(config-if)#` **exit**	Return to global configuration mode.
40.	`awplus(config)#` **exit**	Return to privileged exec mode.

Clear data

If necessary, you can clear either neighbor information or LLDP statistics for particular ports or all ports.

41.	`awplus#` **clear lldp table [interface <port-list>]**	Clear the information from the table of neighbor information.
42.	`awplus#` **clear lldp statistics [interface <port-list>]**	Clear LLDP statistics (packet and event counters).

Configure Authentication for Voice VLAN

Use the following procedure with LLDP-MED and Voice VLAN to configure 802.1X port authentication and dynamic VLAN assignment using the local RADIUS server on the switch to which the voice endpoint devices are connected.

This procedure assumes that you have already:

- configured Voice VLAN and LLDP-MED using the procedure in **Table 99-5 on page 99.14**
- set **switchport voice vlan** to **dynamic** in the above procedure

This procedure configures the local RADIUS server. If your configuration uses one or more remote RADIUS servers instead, set the IP addresses of the remote RADIUS servers using the **radius-server host** command (**Step 3 on page 18**), and skip all the steps that configure the local RADIUS server (**Step 3 on page 18** to **Step 14 on page 19**).

Table 99-6: Configuration procedure for Voice VLAN with RADIUS authentication and dynamic VLAN

Configure the IP address of the RADIUS host.		
1.	`awplus#`**configure terminal**	Enter Global Configuration mode.
2.	`awplus(config)#`**radius-server host** 127.0.0.1 key *<key-string>*	Configure the IP address for the RADIUS server to be the local loopback interface address, so that RADIUS requests are sent to the local RADIUS server. Set the key that Network Access Servers (NAS) will need to use to get access to this RADIUS server. RADIUS server hosts configured using this command are included in the default RADIUS server group.
Enable the local RADIUS server.		
3.	`awplus(config)#` **radius-server local**	Enter RADIUS Server Configuration mode.
4.	`awplus(config-radsrv)#` **server enable**	Enable the local RADIUS server.
5.	`awplus(config-radsrv)#` **nas** 127.0.0.1 key *<key-string>*	Set the switch as a client device (Network Access Server), to allow it to send authentication requests to the local RADIUS server. Use the same local loopback interface IP address and key as in the **radius-server host** command used in **Step 2 on page 18**.
Configure a local RADIUS user group for connected PCs.		
6.	`awplus(config-radsrv)#` **group <user-group-name>**	Create a local RADIUS server user group for PCs connected to the switch, and enter RADIUS Server Group Configuration mode.
7.	`awplus(config-radsrv-group)#` **vlan {<vid>|<vlan-name>}**	Set the VLAN ID for the user group. This will assign the untagged VLAN ID to authenticated ports for PCs connected to the switch. To create multiple user groups for PCs with different VLANs, repeat these two steps.
8.	`awplus(config-radsrv-group)#`**exit**	Return to RADIUS Server Configuration mode.
Configure a local RADIUS user group for connected phones.		
9.	`awplus(config-radsrv)#` **group <user-group-name>**	Create a new local RADIUS server user group for phones connected to the switch, and enter RADIUS Server Group Configuration mode.

Table 99-6: Configuration procedure for Voice VLAN with RADIUS authentication and dynamic VLAN(cont.)

10.	`awplus(config-radsrv-group)#` **vlan {<vid>|<vlan-name>}**	Configure the local RADIUS user group for connected phones to use the same VLAN as the PCs in **Step 7**, so that the phones have access to the same untagged VLAN as the PCs.
11.	`awplus(config-radsrv-group)#` **egress-vlan-id** <*vid*> tagged	Set the Egress-VLAN ID attribute for the user group, and set it to send tagged frames. This will assign the tagged VLAN ID to authenticated ports for phones connected to the switch. To create multiple user groups for phones with different VLANs, repeat these two steps.
12.	`awplus(config-radsrv-group)#` **exit**	Return to RADIUS Server Configuration mode.
Add users to the local RADIUS server.		
13.	`awplus(config-radsrv)#` user <radius-user-name> password <user-password> group <user-group>	Add RADIUS user names and passwords to the local RADIUS server for authenticating PCs and phones. Assign the corresponding RADIUS server user groups configured in **Step 6** and **Step 9**. See the **user (RADIUS server)** command on page 78.37.
14.	`awplus(config-radsrv)#` **exit**	Return to Global Configuration mode.
Create VLANs.		
15.	`awplus(config)#` **vlan database**	Enter VLAN Database Configuration mode.
16.	`awplus(config-vlan)#` **vlan** <*vid-range*>	Create the VLANs corresponding to the VLAN IDs that will be allocated to the authenticated ports, as configured in **Step 7**, **Step 10**, and **Step 11**.
17.	`awplus(config-vlan)#` **exit**	Return to Global Configuration mode.
Configure 802.1X port authentication.		
18.	`awplus(config)#` **aaa authentication dot1x** default group radius	Enable 802.1X port authentication and set it to use the default group of RADIUS servers that contains all RADIUS server hosts configured using the **radius-server host** command—in this procedure, the default group consists of the local RADIUS server.
19.	`awplus(config)# interface <port-list>`	Enter interface configuration mode for the ports that have users (PCs and phones) connected to them.
20.	`awplus(config-if)#` **dot1x port-control** auto	Enable 802.1X for port authentication on these ports.
21.	`awplus(config-if)#` **auth host-mode** multi-supplicant	Configure the ports to use multi-supplicant mode for authentication, so that the phone and PC can be dynamically allocated to different VLANs.
22.	`awplus(config-if)#` **auth dynamic-vlan-creation**	Configure the ports to accept dynamic VLAN allocation. In this procedure, the RADIUS server user groups for both the PCs and the phones use the same VLAN (**Step 7** and **Step 10**), so the default rule (**deny**) allows them both the access they need to the port VLAN. For other options, see the **auth dynamic-vlan-creation** command on page 70.6. Default: **deny** differently assigned VLAN IDs.
23.	`awplus(config-if)#` **exit**	Return to Global Configuration mode.
24.	`awplus(config)#` **exit**	Return to Privileged Exec mode.

Table 99-6: Configuration procedure for Voice VLAN with RADIUS authentication and dynamic VLAN(cont.)

Review the authentication configuration.		
25.	`awplus#` **show radius local-server group [<user-group-name>]** `awplus#` **show radius local-server nas [<ip-address>]** `awplus#` **show radius local-server user [<user-name>]**	Check the local RADIUS server configuration.
26.	`awplus#` **show vlan {all|brief|dynamic|static|auto|static-ports<1-4094>}**	Check the VLAN configuration.
27.	`awplus#` **show dot1x [all]**	Check the 802.1X authentication configuration.

Introduction

LLDP and LLDP-MED can be configured using the commands in this chapter, or by using SNMP with the LLDP-MIB and LLDP-EXT-DOT1-MIB (**"Public MIBs" on page 98.88**). The Voice VLAN feature can be configured using commands in **Chapter 19, VLAN Commands**. For more information about LLDP, see **Chapter 99, LLDP Introduction and Configuration**.

LLDP can transmit a lot of data about the network. Typically, the network information gathered using LLDP is transferred to a Network Management System by SNMP. For security reasons, we recommend using SNMPv3 for this purpose (**Chapter 96, SNMP Introduction**, **Chapter 97, SNMP Commands**).

LLDP operates over physical ports only. For example, it can be configured on switch ports that belong to static or dynamic channel groups, but not on the channel groups themselves.

Command List

This chapter contains an alphabetical list of commands used to configure LLDP.

clear lldp statistics

This command clears all LLDP statistics (packet and event counters) associated with specified ports. If no port list is supplied, LLDP statistics for all ports are cleared.

Syntax

```
clear lldp statistics [interface <port-list>]
```

Parameter	Description
<port-list>	The ports for which the statistics are to be cleared.

Mode Privileged Exec

Examples To clear the LLDP statistics on ports 1.0.1 and 1.0.7, use the command:

```
awplus# clear lldp statistics interface port1.0.1,port1.0.7
```

To clear all LLDP statistics for all ports, use the command:

```
awplus# clear lldp statistics
```

Related Commands

show lldp statistics
show lldp statistics interface

clear lldp table

This command clears the table of LLDP information received from neighbors through specified ports. If no port list is supplied, neighbor information is cleared for all ports.

Syntax `clear lldp table [interface <port-list>]`

Parameter	Description
<port-list>	The ports for which the neighbor information table is to be cleared.

Mode Privileged Exec

Examples To clear the table of neighbor information received on ports 1.0.1 and 1.0.7, use the command:

```
awplus# clear lldp table interface port1.0.1,port1.0.7
```

To clear the entire table of neighbor information received through all ports, use the command:

```
awplus# clear lldp table
```

Related Commands **show lldp neighbors**

debug lldp

This command enables specific LLDP debug for specified ports. When LLDP debugging is enabled, diagnostic messages are entered into the system log. If no port list is supplied, the specified debugging is enabled for all ports.

The **no** variant of this command disables specific LLDP debug for specified ports. If no port list is supplied, the specified debugging is disabled for all ports.

Syntax

```
debug lldp {[rx][rxpkt][tx][txpkt]} [interface [<port-list>]]
debug lldp operation
no debug lldp {[rx][rxpkt][tx][txpkt]} [interface [<port-list>]]
no debug lldp operation
no debug lldp all
```

Parameter	Description
`rx`	LLDP receive debug.
`rxpkt`	Raw LLDPDUs received in hex format.
`tx`	LLDP transmit debug.
`txpkt`	Raw Tx LLDPDUs transmitted in hex format.
<port-list>	The ports for which debug is to be configured.
`operation`	Debug for LLDP internal operation on the switch.
`all`	Disables all LLDP debugging for all ports.

Default By default no debug is enabled for any ports.

Mode Privileged Exec

Examples To enable debugging of LLDP receive on ports 1.0.1 and 1.0.7, use the command:

```
awplus# debug lldp rx interface port1.0.1,port1.0.7
```

To enable debugging of LLDP transmit with packet dump on all ports, use the command:

```
awplus# debug lldp tx txpkt
```

To disable debugging of LLDP receive on ports 1.0.1 and 1.0.7, use the command:

```
awplus# no debug lldp rx interface port1.0.1,port1.0.7
```

To turn off all LLDP debugging on all ports, use the command:

```
awplus# no debug lldp all
```

Related Commands
show debugging lldp
show running-config lldp
terminal monitor

lldp faststart-count

Use this command to set the fast start count for LLDP-MED. The fast start count determines how many fast start advertisements LLDP sends from a port when it starts sending LLDP-MED advertisements from the port, for instance, when it detects a new LLDP-MED capable device.

The **no** variant of this command resets the LLDPD-MED fast start count to the default (3).

Syntax

```
lldp faststart-count <1-10>
no lldp faststart-count
```

Parameter	Description
<1-10>	The number of fast start advertisements to send.

Default The default fast start count is 3.

Mode Global Configuration

Examples To set the fast start count to 5, use the command:

```
awplus# configure terminal
awplus(config)# lldp faststart-count 5
```

To reset the fast start count to the default setting (3), use the command:

```
awplus# configure terminal
awplus(config)# no lldp faststart-count
```

Related Commands show lldp

lldp holdtime-multiplier

This command sets the holdtime multiplier value. The transmit interval is multiplied by the holdtime multiplier to give the Time To Live (TTL) value that is advertised to neighbors.

The **no** variant of this command sets the multiplier back to its default.

Syntax

```
lldp holdtime-multiplier <2-10>
no lldp holdtime-multiplier
```

Parameter	Description
<2-10>	The multiplier factor.

Default The default holdtime multiplier value is 4.

Mode Global Configuration

Usage The Time-To-Live defines the period for which the information advertised to the neighbor is valid. If the Time-To-Live expires before the neighbor receives another update of the information, then the neighbor discards the information from its database.

Examples To set the holdtime multiplier to 2, use the commands:

```
awplus# configure terminal
awplus(config)# lldp holdtime-multiplier 2
```

To set the holdtime multiplier back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp holdtime-multiplier 2
```

Related Commands show lldp

lldp management-address

This command sets the IPv4 address to be advertised to neighbors (in the Management Address TLV) via the specified ports. This address will override the default address for these ports.

The **no** variant of this command clears the user-configured management IP address advertised to neighbors via the specified ports. The advertised address reverts to the default.

Syntax

```
lldp management-address <ipaddr>
no lldp management-address
```

Parameter	Description
<ipaddr>	The IPv4 address to be advertised to neighbors, in dotted decimal format. This must be one of the IP addresses already configured on the device.

Default The local loopback interface primary IPv4 address if set, else the primary IPv4 interface address of the lowest numbered VLAN the port belongs to, else the MAC address of the device's baseboard if no VLAN IP addresses are configured for the port.

Mode Interface Configuration

Usage To see the management address that will be advertised, use the **show lldp interface** command or **show lldp local-info** command.

Examples To set the management address advertised by ports 1.0.1 and 1.0.7, to be 192.168.1.6, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.7
awplus(config-if)# lldp management-address 192.168.1.6
```

To clear the user-configured management address advertised by ports 1.0.1 and 1.0.7, and revert to using the default address, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.7
awplus(config-if)# no lldp management-address
```

Related Commands

show lldp interface
show lldp local-info

lldp med-notifications

Use this command to enable LLDP to send LLDP-MED Topology Change Detected SNMP notifications relating to the specified ports. The switch sends an SNMP event notification when a new LLDP-MED compliant IP Telephony device is connected to or disconnected from a port on the switch.

Use the **no** variant of this command to disable the sending of LLDP-MED Topology Change Detected notifications relating to the specified ports.

Syntax

```
lldp med-notifications
no lldp med-notifications
```

Default The sending of LLDP-MED notifications is disabled by default.

Mode Interface Configuration

Examples To enable the sending of LLDP-MED Topology Change Detected notifications relating to ports 1.0.1 and 1.0.7, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.7
awplus(config-if)# lldp med-notifications
```

To disable the sending of LLDP-MED notifications relating to ports 1.0.1 and 1.0.7, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.7
awplus(config-if)# no lldp med-notifications
```

Related Commands

lldp notification-interval
lldp notifications
snmp-server enable trap
show lldp interface

lldp med-tlv-select

Use this command to enable LLDP-MED Organizationally Specific TLVs for transmission in LLDP advertisements via the specified ports. The LLDP-MED Capabilities TLV must be enabled before any of the other LLDP-MED Organizationally Specific TLVs are enabled.

Use the **no** variant of this command to disable the specified LLDP-MED Organizationally Specific TLVs for transmission in LLDP advertisements via these ports. In order to disable the LLDP-MED Capabilities TLV, you must also disable the rest of these TLVs. Disabling all these TLVs disables LLDP-MED advertisements.

Syntax

```
lldp med-tlv-select {[capabilities] [network-policy] [location]
   [inventory-management]}

lldp med-tlv-select all

no lldp med-tlv-select {[capabilities] [network-policy] [location]
   [inventory-management]}

no lldp med-tlv-select all
```

Parameter	Description
`capabilities`	LLDP-MED Capabilities TLV. When this is enabled, the MAC/PHY Configuration/Status TLV from IEEE 802.3 Organizationally Specific TLVs is also automatically included in LLDP-MED advertisements, whether or not it has been explicitly enabled by the **lldp tlv-select** command.
`network-policy`	Network Policy TLV. This TLV is transmitted if Voice VLAN parameters have been configured using the commands: ■ **switchport voice dscp** ■ **switchport voice vlan** ■ **switchport voice vlan priority**
`location`	Location Identification TLV. This TLV is transmitted if location information has been configured using the commands: ■ **location elin-location-id** ■ **location civic-location identifier** ■ **location civic-location configuration** ■ **location coord-location identifier** ■ **location coord-location configuration** ■ **location elin-location**
`inventory-management`	Inventory Management TLV Set, including the following TLVs: ■ Hardware Revision ■ Firmware Revision ■ Software Revision ■ Serial Number ■ Manufacturer Name ■ Model Name ■ Asset ID
`all`	All LLDP-MED Organizationally Specific TLVs.

Default By default LLDP-MED Capabilities, Network Policy, Location Identification and Extended Power-via-MDI TLVs are enabled. Therefore, if LLDP is enabled using the **lldp run** command, by default LLDP-MED advertisements are transmitted on ports that detect LLDP-MED neighbors connected to them.

Mode Interface Configuration

Usage LLDP-MED TLVs are only sent in advertisements via a port if there is an LLDP-MED-capable device connected to it. To see whether there are LLDP-MED capable devices connected to the ports, use the **show lldp neighbors** command.

Examples To enable inclusion of the Inventory TLV Set in advertisements transmitted via ports 1.0.1 and 1.0.7, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.7
awplus(config-if)# lldp med-tlv-select inventory-management
```

To exclude the Inventory TLV Set in advertisements transmitted via ports 1.0.1 and 1.0.7, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.7
awplus(config-if)# no lldp med-tlv-select inventory-management
```

To disable LLDP-MED advertisements transmitted via ports 1.0.1 and 1.0.7, disable all these TLVs using the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.7
awplus(config-if)# no lldp med-tlv-select all
```

Related Commands

location civic-location identifier
location civic-location configuration
location coord-location identifier
location coord-location configuration
location elin-location
show lldp interface
switchport voice dscp
switchport voice vlan
switchport voice vlan priority

lldp non-strict-med-tlv-order-check

Use this command to enable non-strict order checking for LLDP-MED advertisements it receives. That is, use this command to enable LLDP to receive and store TLVs from LLDP-MED advertisements even if they do not use standard TLV order.

Use the **no** variant of this command to disable non-strict order checking for LLDP-MED advertisements, that is, to set strict TLV order checking, so that LLDP discards any LLDP-MED TLVs that occur before the LLDP-MED Capabilities TLV in an advertisement.

Syntax

```
lldp non-strict-med-tlv-order-check
no lldp non-strict-med-tlv-order-check
```

Default By default TLV non-strict order checking for LLDP-MED advertisements is disabled. That is, strict order checking is applied to LLDP-MED advertisements, according to ANSI/TIA-1057, and LLDP-MED TLVs in non-standard order are discarded.

Mode Global Configuration

Usage The ANSI/TIA-1057 specifies standard order for TLVs in LLDP-MED advertisements, and specifies that if LLDP receives LLDP advertisements with non-standard LLDP-MED TLV order, the TLVs in non-standard order should be discarded. This implementation of LLDP-MED follows the standard: it transmits TLVs in the standard order, and by default discards LLDP-MED TLVs that occur before the LLDP-MED Capabilities TLV in an advertisement. However, some implementations of LLDP transmit LLDP-MED advertisements with non-standard TLV order. To receive and store the data from these non-standard advertisements, enable non-strict order checking for LLDP-MED advertisements using this command.

Examples To enable strict TLV order checking, use the commands:

```
awplus# configure terminal
awplus(config)# lldp tlv-order-check
```

To disable strict TLV order checking, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp tlv-order-check
```

Related Commands show running-config lldp

lldp notification-interval

This command sets the notification interval. This is the minimum interval between LLDP SNMP notifications (traps) of each kind (LLDP Remote Tables Change Notification and LLDP-MED Topology Change Notification).

The **no** variant of this command sets the notification interval back to its default.

Syntax

```
lldp notification-interval <5-3600>
no lldp notification-interval
```

Parameter	Description
<5-3600>	The interval in seconds.

Default The default notification interval is 5 seconds.

Mode Global Configuration

Examples To set the notification interval to 20 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# lldp notification-interval 20
```

To set the notification interval back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp notification-interval
```

Related Commands lldp notifications
show lldp

lldp notifications

This command enables the sending of LLDP SNMP notifications (traps) relating to specified ports.

The **no** variant of this command disables the sending of LLDP SNMP notifications for specified ports.

Syntax

```
lldp notifications
no lldp notifications
```

Default The sending of LLDP SNMP notifications is disabled by default.

Mode Interface Configuration

Examples To enable sending of LLDP SNMP notifications for ports 1.0.1 and 1.0.7, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.7
awplus(config-if)# lldp notifications
```

To disable sending of LLDP SNMP notifications for ports 1.0.1 and 1.0.7, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.7
awplus(config-if)# no lldp notifications
```

Related Commands

lldp notification-interval
show lldp interface
snmp-server enable trap

lldp port-number-type

This command sets the type of port identifier used to enumerate, that is to count, the LLDP MIB local port entries. The LLDP MIB (*IEEE Standard 802.1AB-2005, Section 12, LLDP MIB Definitions*.) requires the port number value to count LLDP local port entries.

This command also enables you to optionally set an interface index to enumerate the LLDP MIB local port entries, if required by your management system.

The **no** variant of this command resets the type of port identifier back to the default setting (number).

Syntax

```
lldp port-number-type [number|ifindex]
no lldp port-number-type
```

Parameter	Description
`number`	Set the type of port identifier to a port number to enumerate the LLDP MIB local port entries.
`ifindex`	Set the type of port identifier to an interface index to enumerate the LLDP MIB local port entries.

Default The default port identifier type is number. The no variant of this command sets the port identifier type to the default.

Mode Global Configuration

Examples To set the type of port identifier used to enumerate LLDP MIB local port entries to port numbers, use the commands:

```
awplus# configure terminal
awplus(config)# lldp port-number-type number
```

To set the type of port identifier used to enumerate LLDP MIB local port entries to interface indexes, use the commands:

```
awplus# configure terminal
awplus(config)# lldp port-number-type ifindex
```

To reset the type of port identifier used to enumerate LLDP MIB local port entries the default (port numbers), use the commands:

```
awplus# configure terminal
awplus(config)# no lldp port-number-type
```

Related Commands **show lldp**

lldp reinit

This command sets the value of the reinitialization delay. This is the minimum time after disabling LLDP on a port before it can reinitialize.

The **no** variant of this command sets the reinitialization delay back to its default setting.

Syntax

```
lldp reinit <1-10>
no lldp reinit
```

Parameter	Description
<1-10>	The delay in seconds.

Default The default reinitialization delay is 2 seconds.

Mode Global Configuration

Examples To set the reinitialization delay to 3 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# lldp reinit 3
```

To set the reinitialization delay back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp reinit
```

Related Commands show lldp

lldp run

This command enables the operation of LLDP on the device.

The **no** variant of this command disables the operation of LLDP on the device. The LLDP configuration remains unchanged.

Syntax

```
lldp run
no lldp run
```

Default LLDP is disabled by default.

Mode Global Configuration

Examples To enable LLDP operation, use the commands:

```
awplus# configure terminal
awplus(config)# lldp run
```

To disable LLDP operation, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp run
```

Related Commands show lldp

lldp timer

This command sets the value of the transmit interval. This is the interval between regular transmissions of LLDP advertisements.

The **no** variant of this command sets the transmit interval back to its default.

Syntax

```
lldp timer <5-32768>
no lldp timer
```

Parameter	Description
<5-32768>	The transmit interval in seconds. The transmit interval must be at least four times the transmission delay timer (**lldp tx-delay** command).

Default The default transmit interval is 30 seconds.

Mode Global Configuration

Examples To set the transmit interval to 90 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# lldp timer 90
```

To set the transmit interval back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp timer
```

Related Commands

lldp tx-delay
show lldp

lldp tlv-select

This command enables one or more optional TLVs, or all TLVs, for transmission in LLDP advertisements via the specified ports. The TLVs can be specified in any order; they are placed in LLDP frames in a fixed order (as described in IEEE 802.1AB). The mandatory TLVs (Chassis ID, Port ID, Time To Live, End of LLDPDU) are always included in LLDP advertisements.

In LLDP-MED advertisements the MAC/PHY Configuration/Status TLV will be always be included regardless of whether it is selected by this command.

The **no** variant of this command disables the specified optional TLVs, or all optional TLVs, for transmission in LLDP advertisements via the specified ports.

Syntax

```
lldp tlv-select {[<tlv>]...}

lldp tlv-select all

no lldp tlv-select {[<tlv>]...}

no lldp tlv-select all
```

Parameter	Description
<tlv>	The TLV to transmit in LLDP advertisements. One of these keywords: ■ port-description (specified by the **description (interface)** command on page 14.2) ■ system-name (specified by the **hostname** command on page 10.23) ■ system-description ■ system-capabilities ■ management-address ■ port-vlan ■ port-and-protocol-vlans ■ vlan-names ■ protocol-ids ■ mac-phy-config ■ power-management (Power Via MDI TLV) ■ link-aggregation ■ max-frame-size
`all`	All TLVs.

Default By default no optional TLVs are included in LLDP advertisements. The MAC/PHY Configuration/Status TLV (**mac-phy-config**) is included in LLDP-MED advertisements whether or not it is selected by this command.

Mode Interface Configuration

Examples To include the management-address and system-name TLVs in advertisements transmitted via ports 1.0.1 and 1.0.7, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.7
awplus(config-if)# lldp tlv-select management-address system-
name
```

To include all optional TLVs in advertisements transmitted via ports 1.0.1 and 1.0.7, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.7
awplus(config-if)# lldp tlv-select all
```

To exclude the management-address and system-name TLVs from advertisements transmitted via ports 1.0.1 and 1.0.7, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.7
awplus(config-if)# no lldp tlv-select management-address
system-name
```

To exclude all optional TLVs from advertisements transmitted via ports 1.0.1 and 1.0.7, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.7
awplus(config-if)# no lldp tlv-select all
```

Related Commands

show lldp local-info

lldp transmit receive

This command enables transmission and/or reception of LLDP advertisements to or from neighbors through the specified ports.

The **no** variant of this command disables transmission and/or reception of LLDP advertisements through specified ports.

Syntax

```
lldp {[transmit] [receive]}
no lldp {[transmit] [receive]}
```

Parameter	Description
`transmit`	Enable or disable transmission of LLDP advertisements via this port or ports.
`receive`	Enable or disable reception of LLDP advertisements via this port or ports.

Default LLDP advertisement transmission and reception are enabled on all ports by default.

Mode Interface Configuration

Examples To enable transmission of LLDP advertisements on ports 1.0.1 and 1.0.7, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.7
awplus(config-if)# lldp transmit
```

To enable LLDP advertisement transmission and reception on ports 1.0.1 and 1.0.7, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.7
awplus(config-if)# lldp transmit receive
```

To disable LLDP advertisement transmission and reception on ports 1.0.1 and 1.0.7, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.7
awplus(config-if)# no lldp transmit receive
```

Related Commands **show lldp interface**

lldp tx-delay

This command sets the value of the transmission delay timer. This is the minimum time interval between transmitting LLDP advertisements due to a change in LLDP local information.

The **no** variant of this command sets the transmission delay timer back to its default setting.

Syntax

```
lldp tx-delay <1-8192>
no lldp tx-delay
```

Parameter	Description
<1-8192>	The transmission delay in seconds. The transmission delay cannot be greater than a quarter of the transmit interval (**lldp timer** command).

Default The default transmission delay timer is 2 seconds.

Mode Global Configuration

Examples To set the transmission delay timer to 12 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# lldp tx-delay 12
```

To set the transmission delay timer back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp tx-delay
```

Related Commands

lldp timer
show lldp

location civic-location configuration

Use these commands to configure a civic address location. The country parameter must be specified first, and at least one of the other parameters must be configured before the location can be assigned to a port.

Use the **no** variants of this command to delete civic address parameters from the location.

Syntax

```
country <country>
state <state>
no state
county <county>
no county
city <city>
no city
division <division>
no division
neighborhood <neighborhood>
no neighborhood
street-group <street-group>
no street-group
leading-street-direction <leading-street-direction>
no leading-street-direction
trailing-street-suffix <trailing-street-suffix>
no trailing-street-suffix
street-suffix <street-suffix>
no street-suffix
house-number <house-number>
no house-number
house-number-suffix <house-number-suffix>
no house-number-suffix
landmark <landmark>
no landmark
additional-information <additional-information>
no additional-information
name <name>
no name
postalcode <postalcode>
no postalcode
```

```
building <building>
no building
unit <unit>
no unit
floor <floor>
no floor
room <room>
no room
place-type <place-type>
no place-type
postal-community-name <postal-community-name>
no postal-community-name
post-office-box <post-office-box>
no post-office-box
additional-code <additional-code>
no additional-code
seat <seat>
no seat
primary-road-name <primary-road-name>
no primary-road-name
road-section <road-section>
no road-section
branch-road-name <branch-road-name>
no branch-road-name
sub-branch-road-name <sub-branch-road-name>
no sub-branch-road-name
street-name-pre-modifier <street-name-pre-modifier>
no street-name-pre-modifier
streetname-post-modifier <streetname-post-modifier>
no streetname-post-modifier
```

Parameter	Description
<country>	Upper-case two-letter country code, as specified in *ISO 3166*.
<state>	State (Civic Address (CA) Type 1): national subdivisions (state, canton, region).
<county>	County (CA Type 2): County, parish, gun (JP), district (IN).

Parameter(cont.)	Description(cont.)
<city>	City (CA Type 3): city, township, shi (JP).
<division>	City division (CA Type 4): City division, borough, city district, ward, chou (JP).
<neighborhood>	Neighborhood (CA Type 5): neighborhood, block.
<street-group>	Street group (CA Type 6): group of streets below the neighborhood level.
<leading-street-direction>	Leading street direction (CA Type 16).
<trailing-street-suffix>	Trailing street suffix (CA Type 17).
<street-suffix>	Street suffix (CA Type 18): street suffix or type.
<house-number>	House number (CA Type 19).
<house-number-suffix>	House number suffix (CA Type 20).
<landmark>	Landmark or vanity address (CA Type 21).
<additional-information>	Additional location information (CA Type 22).
<name>	Name (CA Type 23): residence and office occupant.
<postal-code>	Postal/zip code (CA Type 24).
<building>	Building (CA Type 25): structure.
<unit>	Unit (CA Type 26): apartment, suite.
<floor>	Floor (CA Type 27).
<room>	Room (CA Type 28).
<place-type>	Type of place (CA Type 29).
<postal-community-name>	Postal community name (CA Type 30).
<post-office-box>	Post office box (P.O. Box) (CA Type 31).
<additional-code>	Additional code (CA Type 32).
<seat>	Seat (CA Type 33): seat (desk, cubicle, workstation).
<primary-road-name>	Primary road name (CA Type 34).
<road-section>	Road section (CA Type 35).
<branch-road-name>	Branch road name (CA Type 36).
<sub-branch-road-name>	Sub-branch road name (CA Type 37).
<street-name-pre-modifier>	Street name pre-modifier (CA Type 38).
<street-name-post-modifier>	Street name post-modifier (CA Type 39).

Default By default no civic address location information is configured.

Mode Civic Address Location Configuration

Usage The **country** parameter must be configured before any other parameters can be configured; this creates the location. The country parameter cannot be deleted. One or more of the other parameters must be configured before the location can be assigned to a port. The country parameter must be entered as an upper-case two-letter country code, as specified in *ISO 3166*. All other parameters are entered as alpha-numeric strings. Do not configure all the civic address parameters (this would generate TLVs that are too long). Configure a subset of these parameters—enough to consistently and precisely identify the location of the device. If the location is to be used for Emergency Call Service (ECS), the particular ECS application may have guidelines for configuring the civic address location. For more information about civic address format, see **"LLDP-MED: Location Identification TLV" on page 99.7**.

To specify the civic address location, use the **location civic-location identifier** command. To delete the civic address location, use the **no** variant of the **location civic-location identifier** command. To assign the civic address location to particular ports, so that it can be advertised in TLVs from those ports, use the command **location civic-location-id** command.

Examples To configure civic address location 1 with location "27 Nazareth Avenue, Christchurch, New Zealand" in civic-address format, use the commands:

```
awplus# configure terminal
awplus(config)# location civic-location identifier 1
awplus(config-civic)# country NZ
awplus(config-civic)# city Christchurch
awplus(config-civic)# primary-road-name Nazareth
awplus(config-civic)# street-suffix Avenue
awplus(config-civic)# house-number 27
```

Related Commands
location civic-location-id
location civic-location identifier
show lldp local-info
show location

location civic-location identifier

Use this command to enter the Civic Address Location Configuration mode to configure the specified location.

Use the **no** variant of this command to delete a civic address location. This also removes the location from any ports it has been assigned to.

Syntax

```
location civic-location identifier <civic-loc-id>
no location civic-location identifier <civic-loc-id>
```

Parameter	Description
<civic-loc-id>	A unique civic address location ID, in the range 1 to 4095.

Default By default there are no civic address locations.

Mode Global Configuration

Usage To configure the location information for this civic address location identifier, use the **location civic-location configuration** command. To associate this civic location identifier with particular ports, use the **location elin-location-id** command.

Up to 400 locations can be configured on the switch for each type of location information, up to a total of 1200 locations.

Examples To enter Civic Address Location Configuration mode for the civic address location with ID 1, use the commands:

```
awplus# configure terminal
awplus(config)# location civic-location identifier 1
awplus(config-civic)#
```

To delete the civic address location with ID 1, use the commands:

```
awplus# configure terminal
awplus(config)# no location civic-location identifier 1
```

Related Commands

location civic-location-id
location civic-location configuration
show location
show running-config lldp

location civic-location-id

Use this command to assign a civic address location to the ports. The civic address location must already exist. This replaces any previous assignment of civic address location for the ports. Up to one location of each type can be assigned to a port.

Use the **no** variant of this command to remove a location identifier from the ports.

Syntax

```
location civic-location-id <civic-loc-id>
no location civic-location-id [<civic-loc-id>]
```

Parameter	Description
<civic-loc-id>	Civic address location ID, in the range 1 to 4095.

Default By default no civic address location is assigned to ports.

Mode Interface Configuration

Usage The civic address location associated with a port can be transmitted in Location Identification TLVs via the port.

Before using this command, create the location using the following commands:

- **location civic-location identifier** command
- **location civic-location configuration** command

If a civic-address location is deleted using the **no** variant of the **location civic-location identifier** command, it is automatically removed from all ports.

Examples To assign the civic address location 1 to port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# location civic-location-id 1
```

To remove a civic address location from port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no location civic-location-id
```

Related Commands

lldp med-tlv-select
location civic-location identifier
location civic-location configuration
show location

location coord-location configuration

Use this command to configure a coordinate-based location. All parameters must be configured before assigning this location identifier to a port.

Syntax

```
latitude <latitude>
lat-resolution <lat-resolution>
longitude <longitude>
long-resolution <long-resolution>
altitude <altitude> {meters|floor}
alt-resolution <alt-resolution>
datum {wgs84|nad83-navd|nad83-mllw}
```

Parameter	Description
<lat-resolution>	Latitude resolution, as a number of valid bits, in the range 0 to 34.
<latitude>	Latitude value in degrees in the range -90.0 to 90.0
<long-resolution>	Longitude resolution, as a number of valid bits, in the range 0 to 34.
<longitude>	Longitude value in degrees, in the range -180.0 to 180.0.
<alt-resolution>	Altitude resolution, as a number of valid bits, in the range 0 to 30. A resolution of 0 can be used to indicate an unknown value.
<altitude>	Altitude value, in meters or floors.
`meters`	The altitude value is in meters.
`floors`	The altitude value is in floors.
`datum`	The geodetic system (or datum) that the specified coordinate values are based on.
`wgs84`	World Geodetic System 1984.
`nad83-navd`	North American Datum 1983 - North American Vertical Datum.
`nad83-mllw`	North American Datum 1983 - Mean Lower Low Water vertical datum.

Default By default no coordinate location information is configured.

Mode Coordinate Configuration

Usage Latitude and longitude values are always stored internally, and advertised in the Location Identification TLV, as 34-bit fixed-point binary numbers, with a 25-bit fractional part, irrespective of the number of digits entered by the user. Likewise altitude is stored as a 30-bit fixed point binary number, with an 8-bit fractional part. Because the user-entered decimal values are stored as fixed point binary numbers, they cannot always be represented exactly—the stored binary number is converted to a decimal number for display in the output of the **show location** command. For example, a user-entered latitude value of "2.77" degrees is displayed as "2.769999980926513671875000".

The **lat-resolution**, **long-resolution**, and **alt-resolution** parameters allow the user to specify the resolution of each coordinate element as the number of valid bits in the internally-stored binary representation of the value. These resolution values can be used by emergency services to define a search area.

To specify the coordinate identifier, use the **location coord-location identifier** command. To remove coordinate information, delete the coordinate location by using the **no** variant of that command. To associate the coordinate location with particular ports, so that it can be advertised in TLVs from those ports, use the **location elin-location-id** command.

Example To configure the location for the White House in Washington DC, which has the coordinates based on the WGS84 datum of 38.89868 degrees North (with 22 bit resolution), 77.03723 degrees West (with 22 bit resolution), and 15 meters height (with 9 bit resolution), use the commands:

```
awplus# configure terminal
awplus(config)# location coord-location identifier 1
awplus(config-coord)# la-resolution 22
awplus(config-coord)# latitude 38.89868
awplus(config-coord)# lo-resolution 22
awplus(config-coord)# longitude -77.03723
awplus(config-coord)# alt-resolution 9
awplus(config-coord)# altitude 15 meters
awplus(config-coord)# datum wgs84
```

Related Commands
location coord-location-id
location coord-location identifier

show location

location coord-location identifier

Use this command to enter Coordinate Location Configuration mode for this coordinate location.

Use the **no** variant of this command to delete a coordinate location. This also removes the location from any ports it has been assigned to.

Syntax

```
location coord-location identifier <coord-loc-id>
no location coord-location identifier <coord-loc-id>
```

Parameter	Description
<coord-loc-id>	A unique coordinate location identifier, in the range 1 to 4095.

Default By default there are no coordinate locations.

Mode Global Configuration

Usage Up to 400 locations can be configured on the switch for each type of location information, up to a total of 1200 locations.

To configure this coordinate location, use the **location coord-location configuration** command. To associate this coordinate location with particular ports, so that it can be advertised in TLVs from those ports, use the **location coord-location-id** command.

Examples To enter Coordinate Location Configuration mode to configure the coordinate location with ID 1, use the commands:

```
awplus# configure terminal
awplus(config)# location coord-location identifier 1
awplus(config-coord)#
```

To delete coordinate location 1, use the commands:

```
awplus# configure terminal
awplus(config)# no location coord-location identifier 1
```

Related Commands

location coord-location-id
location coord-location configuration
show lldp local-info
show location

location coord-location-id

Use this command to assign a coordinate location to the ports. The coordinate location must already exist. This replaces any previous assignment of coordinate location for the ports. Up to one location of each type can be assigned to a port.

Use the **no** variant of this command to remove a location from the ports.

Syntax

```
location coord-location-id <coord-loc-id>
no location coord-location-id [<coord-loc-id>]
```

Parameter	Description
<coord-loc-id>	Coordinate location ID, in the range 1 to 4095.

Default By default no coordinate location is assigned to ports.

Mode Interface Configuration

Usage The coordinate location associated with a port can be transmitted in Location Identification TLVs via the port.

Before using this command, configure the location using the following commands:

- **location coord-location identifier** command
- **location coord-location configuration** command

If a coordinate location is deleted using the **no** variant of the **location coord-location identifier** command, it is automatically removed from all ports.

Examples To assign coordinate location 1 to port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# location coord-location-id 1
```

To remove a coordinate location from port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no location coord-location-id
```

Related Commands

lldp med-tlv-select

show location

location elin-location

Use this command to create or modify an ELIN location.

Use the **no** variant of this command to delete an ELIN location, and remove it from any ports it has been assigned to.

Syntax

```
location elin-location <elin> identifier <elin-loc-id>
no location elin-location identifier <elin-loc-id>
```

Parameter	Description
<elin>	Emergency Location Identification Number (ELIN) for Emergency Call Service (ECS), in the range 10 to 25 digits long. In North America, ELINs are typically 10 digits long.
<elin-loc-id>	A unique ELIN location identifier, in the range 1 to 4095.

Default By default there are no ELIN location identifiers.

Mode Global Configuration

Usage Up to 400 locations can be configured on the switch for each type of location information, up to a total of 1200 locations.

To assign this ELIN location to particular ports, so that it can be advertised in TLVs from those ports, use the **location elin-location-id** command.

Examples To create a new ELIN location with ID 1, and configure it with ELIN "1234567890", use the commands:

```
awplus# configure terminal
awplus(config)# location elin-location 1234567890 identifier 1
```

To delete existing ELIN location with ID 1, use the commands:

```
awplus# configure terminal
awplus(config)# no location elin-location identifier 1
```

Related Commands

location elin-location-id
show lldp local-info
show location

location elin-location-id

Use this command to assign an ELIN location to the ports. The ELIN location must already exist. This replaces any previous assignment of ELIN location for the ports. Up to one location of each type can be assigned to a port.

Use the **no** variant of this command to remove a location identifier from the ports.

Syntax

```
location elin-location-id <elin-loc-id>
no location elin-location-id [<elin-loc-id>]
```

Parameter	Description
<elin-loc-id>	ELIN location identifier, in the range 1 to 4095.

Default By default no ELIN location is assigned to ports.

Mode Interface Configuration

Usage An ELIN location associated with a port can be transmitted in Location Identification TLVs via the port.

Before using this command, configure the location using the **location elin-location** command.

If an ELIN location is deleted using the **no** variant of one of the **location elin-location** command, it is automatically removed from all ports.

Examples To assign ELIN location 1 to port 1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# location elin-location-id 1
```

To remove an ELIN location from port 1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no location elin-location-id
```

Related Commands

show debugging lldp

This command displays LLDP debug settings for specified ports. If no port list is supplied, LLDP debug settings for all ports are displayed.

Syntax `show debugging lldp [interface <port-list>]`

Parameter	Description
<port-list>	The ports for which the LLDP debug settings are shown.

Mode User Exec and Privileged Exec

Examples To display LLDP debug settings for all ports, use the command:

```
awplus# show debugging lldp
```

To display LLDP debug settings for ports 1.0.1 to 1.0.9, use the command:

```
awplus# show debugging lldp interface port1.0.1-1.0.9
```

Output **Figure 100-1: Example output from the show debugging lldp command**

```
LLDP Debug settings:
Debugging for LLDP internal operation is on
Port        Rx    RxPkt    Tx    TxPkt
-------------------------------------
1.0.1       Yes   Yes      No    No
1.0.2       Yes   No       No    No
1.0.3       No    No       No    No
1.0.4       Yes   Yes      Yes   No
1.0.5       Yes   No       Yes   No
1.0.6       No    No       Yes   No
1.0.7       Yes   Yes      Yes   Yes
1.0.8       Yes   No       Yes   Yes
1.0.9       No    No       Yes   Yes
```

Table 100-1: Parameters in the output of the show debugging lldp command

Parameter	Description
Port	Port name.
Rx	Whether debugging of LLDP receive is enabled on the port.
RxPkt	Whether debugging of LLDP receive packet dump is enabled on the port.
Rx	Whether debugging of LLDP transmit is enabled on the port.
RxPkt	Whether debugging of LLDP transmit packet dump is enabled on the port.

Related Commands debug lldp

show lldp

This command displays LLDP status and global configuration settings.

Syntax `show lldp`

Mode User Exec and Privileged Exec

Example To display LLDP status and global configuration settings, use the command:

```
awplus# show lldp
```

Output

Figure 100-2: Example output from the show lldp command

```
awplus# show lldp

LLDP Global Configuration:              [Default Values]
LLDP Status ............... Enabled     [Disabled]
Notification Interval ..... 5 secs      [5]
Tx Timer Interval ......... 30 secs     [30]
Hold-time Multiplier ...... 4           [4]
(Computed TTL value ....... 120 secs)
Reinitialization Delay .... 2 secs      [2]
Tx Delay .................. 2 secs      [2]
Port Number Type........... Ifindex     [Port-Number]
Fast Start Count .......... 5           [3]

LLDP Global Status:
Total Neighbor Count ...... 47
Neighbors table last updated 0 hrs 0 mins 43 secs ago
```

Table 100-2: Parameters in the output of the show lldp command

Parameter	Description
`LLDP Status`	Whether LLDP is enabled. Default is disabled.
`Notification Interval`	Minimum interval between LLDP notifications.
`Tx Timer Interval`	Transmit interval between regular transmissions of LLDP advertisements.
`Hold-time Multiplier`	The holdtime multiplier. The transmit interval is multiplied by the holdtime multiplier to give the Time To Live (TTL) value that is advertised to neighbors.
`Reinitialization Delay`	The reinitialization delay. This is the minimum time after disabling LLDP transmit on a port before it can reinitialize again.
`Tx Delay`	The transmission delay. This is the minimum time interval between transmitting advertisements due to a change in LLDP local information.
`Port Number Type`	The type of port identifier used to enumerate LLDP MIB local port entries, as set by the lldp port-number-type command.
`Fast Start Count`	The number of times fast start advertisements are sent for LLDP-MED.

Table 100-2: Parameters in the output of the show lldp command(cont.)

Parameter	Description
`Total Neighbor Count`	Number of LLDP neighbors discovered on all ports.
`Neighbors table last updated`	The time since the LLDP neighbor table was last updated.

Related Commands

show lldp interface
show running-config lldp

show lldp interface

This command displays LLDP configuration settings for specified ports. If no port list is specified, LLDP configuration for all ports is displayed.

Syntax `show lldp interface [<port-list>]`

Parameter	Description
<port-list>	The ports for which the LLDP configuration settings are to be shown.

Mode User Exec and Privileged Exec

Examples To display LLDP configuration settings for ports 1.0.1 to 1.0.8, use the command:

```
awplus# show lldp interface port1.0.1-1.0.8
```

To display LLDP configuration settings for all ports, use the command:

```
awplus# show lldp interface
```

Output **Figure 100-3: Example output from the show lldp interface command**

```
awplus# show lldp interface port1.0.1-1.0.8

Table 100-3: Parameters in the output of the show lldp interface command

Parameter	Description
`Port`	Port name.
`Rx`	Whether reception of LLDP advertisements is enabled on the port.
`Tx`	Whether transmission of LLDP advertisements is enabled on the port.
`Notif`	Whether sending SNMP notification for LLDP is enabled on the port: ■ RM = Remote Tables Change Notification ■ TP = LLDP-MED Topology Change Notification
`Management Addr`	Management address advertised to neighbors.
`Base TLVs Enabled for Tx`	List of optional Base TLVs enabled for transmission: ■ Pd = Port Description ■ Sn =System Name ■ Sd = System Description ■ Sc =System Capabilities ■ Ma = Management Address
`802.1 TLVs Enabled for Tx`	List of optional 802.1 TLVs enabled for transmission: ■ Pv = Port VLAN ID ■ Pp = Port And Protocol VLAN ID ■ Vn = VLAN Name ■ Pi =Protocol Identity
`802.3 TLVs Enabled for Tx`	List of optional 802.3 TLVs enabled for transmission: ■ Mp = MAC/PHY Configuration/Status ■ Po = Power Via MDI (PoE) ■ La = Link Aggregation ■ Mf = Maximum Frame Size
`MED TLVs Enabled for Tx`	List of optional LLDP-MED TLVs enabled for transmission: ■ Mc = LLDP-MED Capabilities ■ Np = Network Policy ■ Lo = Location Information, ■ Pe = Extended Power-Via-MDI ■ In = Inventory

Related Commands

show lldp
show running-config lldp

show lldp local-info

This command displays local LLDP information that can be transmitted through specified ports. If no port list is entered, local LLDP information for all ports is displayed.

Syntax

```
show lldp local-info [base] [dot1] [dot3] [med] [interface
   <port-list>]
```

Parameter	Description
`base`	Information for base TLVs.
`dot1`	Information for 802.1 TLVs.
`dot3`	Information for 802.3 TLVs.
`med`	Information for LLDP-MED TLVs.
<port-list>	The ports for which the local information is to be shown.

Mode User Exec and Privileged Exec

Usage Whether and which local information is transmitted in advertisements via a port depends on:

- whether the port is set to transmit LLDP advertisements (**lldp transmit receive** command)
- which TLVs it is configured to send (**lldp tlv-select** command, **lldp med-tlv-select** command)

Examples To display local information transmitted via port 1.0.1, use the command:

```
awplus# show lldp local-info interface port1.0.1
```

To display local information transmitted via all ports, use the command:

```
awplus# show lldp local-info
```

Output **Figure 100-4: Example output from the show lldp local-info command**

```

Table 100-4: Parameters in the output of the show lldp local-info command

Parameter	Description
`Chassis ID Type`	Type of the Chassis ID.
`Chassis ID`	Chassis ID that uniquely identifies the local device.
`Port ID Type`	Type of the Port ID.
`Port ID`	Port ID of the local port through which advertisements are sent.
`TTL`	Number of seconds that the information advertised by the local port remains valid.
`Port Description`	Port description of the local port, as specified by the **description (interface)** command on page 14.2.
`System Name`	System name, as specified by the **hostname** command on page 10.23.
`System Description`	System description.
`System Capabilities (Supported)`	Capabilities that the local port supports.
`System Capabilities (Enabled)`	Enabled capabilities on the local port.
`Management Addresses`	Management address associated with the local port. To change this, use the **lldp management-address** command.
`Port VLAN ID (PVID)`	VLAN identifier associated with untagged or priority tagged frames received via the local port.
`Port & Protocol VLAN (Supported)`	Whether Port & Protocol VLANs (PPV) is supported on the local port.
`Port & Protocol VLAN (Enabled)`	Whether the port is in one or more Port & Protocol VLANs.
`Port & Protocol VLAN (VIDs)`	List of identifiers for Port & Protocol VLANs that the port is in.
`VLAN Names`	List of VLAN names for VLANs that the local port is assigned to.
`Protocol IDs`	List of protocols that are accessible through the local port.
`MAC/PHY Auto-negotiation`	Auto-negotiation support and current status of the 802.3 LAN on the local port.
`Power Via MDI (PoE)`	PoE-capability and current status on the local port.
`Port Class`	Whether the device is a PSE (Power Sourcing Entity) or a PD (Powered Device)
`Pair Control Ability`	Whether power pair selection can be controlled
`Power Pairs`	Which power pairs are selected for power ("Signal Pairs" or "Spare Pairs") if pair selection can be controlled

Table 100-4: Parameters in the output of the show lldp local-info command(cont.)

Parameter	Description
Power Class	The power class of the PD device on the port (class 0, 1, 2, 3 or 4)
Link Aggregation	Whether the link is capable of being aggregated and it is currently in an aggregation.
Aggregated Port-ID	Aggregated port identifier.
Maximum Frame Size	The maximum frame size capability of the implemented MAC and PHY.
LLDP-MED Device Type	LLDP-MED device type
LLDP-MED Capabilities	Capabilities LLDP-MED capabilities supported on the local port.
Network Policy	List of network policies configured on the local port.
VLAN ID	VLAN identifier for the port for the specified application type
Tagged Flag	Whether the VLAN ID is to be used as tagged or untagged
Layer-2 Priority:	Layer 2 User Priority (in the range 0 to 7)
DSCP Value	Diffserv codepoint (in the range 0 to 63)
Location Identification	Location configured on the local port.
Extended Power Via MDI (PoE)	PoE-capability and current status of the PoE parameters for Extended Power-Via-MDI TLV on the local port.
Power Source	The power source the switch currently uses; either primary power or backup power.
Power Priority	The power priority configured on the port; either critical, high or low.
Power Value	The total power the switch can source over a maximum length cable to a PD device on the port. The value shows the power value in Watts from the PD side.
Inventory Management	Inventory information for the device.

Related Commands

description (interface)
hostname
lldp transmit receive

show lldp neighbors

This command displays a summary of information received from neighbors via specified ports. If no port list is supplied, neighbor information for all ports is displayed.

Syntax `show lldp neighbors [interface <port-list>]`

Parameter	Description
<port-list>	The ports for which the neighbor information is to be shown.

Mode User Exec and Privileged Exec

Examples To display neighbor information received via all ports, use the command:

```
awplus# show lldp neighbors
```

To display neighbor information received via ports 1.0.1 and 1.0.7 with LLDP-MED configuration, use the command:

```
awplus# show lldp neighbors interface port1.0.1,port1.0.7
```

Output **Figure 100-5: Example output from the show lldp neighbors command**

```
LLDP Neighbor Information:

Total number of neighbors on these ports .... 4

  System Capability Codes:
    O = Other    P = Repeater    B = Bridge                 W = WLAN Access Point
    R = Router   T = Telephone   C = DOCSIS Cable Device    S = Station Only
  LLDP-MED Device Type and Power Source Codes:
    1 = Class I    3 = Class III     PSE  = PoE     Both = PoE&Local    Prim = Primary
    2 = Class II   N = Network Con.  Locl = Local   Unkn = Unknown      Back = Backup

```

Table 100-5: Parameters in the output of the show lldp neighbors command

Parameter	Description
`Local Port`	Local port on which the neighbor information was received.
`Neighbor Chassis ID`	Chassis ID that uniquely identifies the neighbor.
`Neighbor Port Name`	Port ID of the neighbor.
`Neighbor Sys Name`	System name of the LLDP neighbor.

Table 100-5: Parameters in the output of the show lldp neighbors command(cont.)

Parameter	Description
`Neighbor Capability`	Capabilities that are supported and enabled on the neighbor.
`System Capability`	System Capabilities of the LLDP neighbor.
`MED Device Type`	LLDP-MED Device class (Class I, II, III or Network Connectivity)
`MED Power Source`	LLDP-MED Power Source

Related Commands **show lldp neighbors detail**

show lldp neighbors detail

This command displays in detail the information received from neighbors via specified ports. If no port list is supplied, detailed neighbor information for all ports is displayed.

Syntax

```
show lldp neighbors detail [base] [dot1] [dot3] [med] [interface
   <port-list>]
```

Parameter	Description
`base`	Information for base TLVs.
`dot1`	Information for 802.1 TLVs.
`dot3`	Information for 803.1 TLVs.
`med`	Information for LLDP-MED TLVs.
<port-list>	The ports for which the neighbor information is to be shown.

Mode User Exec and Privileged Exec

Examples To display detailed neighbor information received via all ports, use the command:

```
awplus# show lldp neighbors detail
```

To display detailed neighbor information received via ports 1.0.1, use the command:

```
awplus# show lldp neighbors detail interface port1.0.1
```

Output **Figure 100-6: Example output from the show lldp neighbors detail command**

```
awplus# show lldp neighbors detail interface port1.0.1

Table 100-6: Parameters in the output of the show lldp neighbors detail command

Parameter	Description
`Chassis ID Type`	Type of the Chassis ID.
`Chassis ID`	Chassis ID that uniquely identifies the neighbor.
`Port ID Type`	Type of the Port ID.
`Port ID`	Port ID of the neighbor.
`TTL`	Number of seconds that the information advertised by the neighbor remains valid.
`Port Description`	Port description of the neighbor's port.
`System Name`	Neighbor's system name.

Table 100-6: Parameters in the output of the show lldp neighbors detail

Parameter	Description
`System Description`	Neighbor's system description.
`System Capabilities (Supported)`	Capabilities that the neighbor supports.
`System Capabilities (Enabled)`	Capabilities that are enabled on the neighbor.
`Management Addresses`	List of neighbor's management addresses.
`Port VLAN ID (PVID)`	VLAN identifier associated with untagged or priority tagged frames for the neighbor port.
`Port & Protocol VLAN (Supported)`	Whether Port & Protocol VLAN is supported on the LLDP neighbor.
`Port & Protocol VLAN (Enabled)`	Whether Port & Protocol VLAN is enabled on the LLDP neighbor.
`Port & Protocol VLAN (VIDs)`	List of Port & Protocol VLAN identifiers.
`VLAN Names`	List of names of VLANs that the neighbor's port belongs to.
`Protocol IDs`	List of protocols that are accessible through the neighbor's port.
`MAC/PHY Auto-negotiation`	Auto-negotiation configuration and status
`Power Via MDI (PoE)`	PoE configuration and status of 802.3 Power-Via-MDI TLV
`Link Aggregation`	Link aggregation information
`Maximum Frame Size`	The maximum frame size capability
`LLDP-MED Device Type`	LLDP-MED Device type
`LLDP-MED Capabilities`	LLDP-MED capabilities supported
`Network Policy`	List of network policies
`Location Identification`	Location information
`Extended Power Via MDI (PoE)`	PoE-capability and current status
`Inventory Management`	Inventory information

Related Commands **show lldp neighbors**

show lldp statistics

This command displays the global LLDP statistics (packet and event counters).

Syntax `show lldp statistics`

Mode User Exec and Privileged Exec

Example To display global LLDP statistics information, use the command:

```
awplus# show lldp statistics
```

Output

Figure 100-7: Example output from the show lldp statistics command

```
awplus# show lldp statistics

Global LLDP Packet and Event counters:

  Frames:     Out ................... 345
              In .................... 423
              In Errored ............ 0
              In Dropped ............ 0
  TLVs:       Unrecognized .......... 0
              Discarded ............. 0
  Neighbors:  New Entries ........... 20
              Deleted Entries ....... 20
              Dropped Entries ....... 0
              Entry Age-outs ........ 20
```

Table 100-7: Parameters in the output of the show lldp statistics command

Parameter	Description
`Frames Out`	Number of LLDPDU frames transmitted.
`Frames In`	Number of LLDPDU frames received.
`Frames In Errored`	Number of invalid LLDPDU frames received.
`Frames In Dropped`	Number of LLDPDU frames received and discarded for any reason.
`TLVs Unrecognized`	Number of LLDP TLVs received that are not recognized but the TLV type is in the range of reserved TLV types.
`TLVs Discarded`	Number of LLDP TLVs discarded for any reason.
`Neighbors New Entries`	Number of times the information advertised by neighbors has been inserted into the neighbor table.
`Neighbors Deleted Entries`	Number of times the information advertised by neighbors has been removed from the neighbor table.
`Neighbors Dropped Entries`	Number of times the information advertised by neighbors could not be entered into the neighbor table because of insufficient resources.
`Neighbors Entry Age-outs Entries`	Number of times the information advertised by neighbors has been removed from the neighbor table because the information TTL interval has expired.

Related Commands

clear lldp statistics
show lldp statistics

show location

Use this command to display selected location information configured on the switch.

Syntax

```
show location {civic-location|coord-location|elin-location}

show location {civic-location|coord-location|elin-location}
   identifier {<civic-loc-id>|<coord-loc-id>|<elin-loc-id>}

show location {civic-location|coord-location|elin-location} interface
   <port-list>
```

Parameter	Description
`civic-location`	Display civic location information.
`coord-location`	Display coordinate location information.
`elin-location`	Display ELIN location information.
<civic-loc-id>	Civic address location identifier, in the range 1 to 4095.
<coord-loc-id>	Coordinate location identifier, in the range 1 to 4095.
<elin-loc-id>	ELIN location identifier, in the range 1 to 4095.
<port-list>	Ports to display information about.

Mode User Exec and Privileged Exec

Examples To display a civic address location configured on port1.0.1, use the command:

```
awplus# show location civic-location interface port1.0.1
```

Figure 100-9: Example output from the show location command

```
awplus# show location civic-location interface port1.0.1
Port     ID   Element Type          Element Value
-------------------------------------------------------------
1.0.1    1    Country               NZ
              City                  Christchurch
              Street-suffix         Avenue
              House-number          27
              Primary-road-name     Nazareth
```

To display coordinate location information configured on the identifier 1, use the command:

```
awplus# show location coord-location identifier 1
```

Figure 100-10: Example output from the show location command

```
awplus# show location coord-location identifier 1
  ID  Element Type             Element Value
------------------------------------------------------------------
  1   Latitude Resolution      15 bits
      Latitude                 38.898648113012313842773437 5 degrees
      Longitude Resolution     15 bits
      Longitude                130.232323229312896728515625 0 degrees

Chapter 101: SMTP Commands

Command List 101.2
debug mail 101.2
delete mail 101.3
mail 101.4
mail from 101.5
mail smtpserver 101.6
show counter mail 101.7
show mail 101.8
undebug mail 101.8

Command List

This chapter provides an alphabetical reference for commands used to configure SMTP.

For information about modifying or redirecting the output from **show** commands to a file, see **"Controlling "show" Command Output" on page 1.38**.

debug mail

This command turns on debugging for sending emails.

The **no** variant of this command turns off debugging for sending emails.

Syntax

```
debug mail
no debug mail
```

Mode Privileged Exec

Examples To turn on debugging for sending emails, use the command:

```
awplus# debug mail
```

To turn off debugging for sending emails, use the command:

```
awplus# no debug mail
```

Related Commands

delete mail
mail
mail from
mail smtpserver
show mail
show counter mail
undebug mail

delete mail

This command deletes mail from the queue.

Syntax `delete mail [mail-id <mail-id>|all]`

Parameter	Description	
`mail-id`	Deletes a single mail from the mail queue.	
	`<mail-id>`	An unique mail ID number. Use the **show mail** command to display this for an item of mail.
`all`	Delete all the mail in the queue.	

Mode Privileged Exec

Examples To delete a unique mail item `20060912142356.1234` from the queue, use the command:

```
awplus# delete mail 20060912142356.1234
```

To delete all mail from the queue, use the command:

```
awplus# delete mail all
```

Related Commands
debug mail
mail
mail from
mail smtpserver
show mail

mail

This command sends an email using the SMTP protocol. If you specify a file the text inside the file is sent in the message body.

If you do not specify the **to**, **file**, or **subject** parameters, the CLI prompts you for the missing information.

Before you can send mail using this command, you must specify the sending email address using the **mail from** command and a mail server using the **mail smtpserver** command.

Syntax `mail [{to <to>|subject <subject>|file <filename>}]`

Parameter	Description	
`to`	The email recipient.	
	<to>	Email address.
`subject`	Description of the subject of this email. Use quote marks when the subject text contains spaces.	
	<subject>	String.
`file`	File to insert as text into the message body.	
	<filename>	String.

Mode Privileged Exec

Example To send an email to `rei@nerv.com` with the subject `dummy plug configuration`, and with the message body inserted from the file `plug.conf` use the command:

```
awplus# mail rei@nerv.com subject dummy plug configuration
        filename plug.conf
```

Related Commands
debug mail
delete mail
mail from
mail smtpserver
show mail
show counter mail

mail from

This command sets an email address for the “mail from” SMTP command. You must specify a sending email address with this command before you can send any email.

Syntax `mail from <from>`

Parameter	Description
<from>	The email address that the mail is sent from.

Mode Global Configuration

Example To set the email address you are sending mail from to “kaji@nerv.com, use the command:

```
awplus(config)# mail from kaji@nerv.com
```

Related Commands
delete mail
mail
mail smtpserver
show mail

mail smtpserver

This command sets the IP address of the SMTP server that your device sends email to. You must specify a mail server with this command before you can send any email.

Syntax `mail smtpserver <ip-address>`

Parameter	Description
<ip-address>	Internet Protocol (IP) Address for the mail server specified.

Mode Global Configuration

Example To specify a mail server at 192.168.0.1, use the command:

```
awplus# mail smtpserver 192.168.0.1
```

Related Commands
debug mail
delete mail
mail
mail from
show mail
show counter mail

show counter mail

This command displays the mail counters.

Syntax `show counter mail`

Mode User Exec and Privileged Exec

Output **Figure 101-1: Example output from the show counter mail command**

```
Mail Client (SMTP) counters
Mails Sent            ......... 0
Mails Sent Fails      ......... 1
```

Table 101-1: Parameters in the output of the show counter mail command

Parameter	Description
`Mails Sent`	The number of emails sent successfully since the last device restart.
`Mails Sent Fails`	The number of emails the device failed to send since the last device restart.

Example To show the emails in the queue use the command:

```
awplus# show counter mail
```

Related Commands
debug mail
delete mail
mail
mail from
show mail

show mail

This command displays the emails in the queue.

Syntax `show mail`

Mode Privileged Exec

Example To display the emails in the queue use the command:

```
awplus# show mail
```

Related Commands **delete mail**
mail
show counter mail

undebug mail

This command applies the functionality of the no **debug mail** command on page 101.2.

Chapter 102: RMON Introduction and Configuration

Introduction 102.2
Overview 102.2
RMON Configuration Example 102.4

Introduction

The chapter describes the Remote Network MONitoring (RMON) service on the switch, and describes a configuration example showing how to set up an RMON alarm.

This RMON alarm configuration example described creates SNMP traps and log messages when the rate of receipt of Broadcast packets on a switch port exceeds a threshold, and creates SNMP traps and log messages when the rate of receipt of Broadcast packets on a switch drops below a lower threshold.

For detailed information about the commands used to configure RMON, see **Chapter 103, RMON Commands**

RMON is disabled by default in AlliedWare Plus™. No RMON alarms or events are configured.

Overview

The Remote Network MONitoring (RMON) MIB (RFC2819) was developed by the IETF to support monitoring and protocol analysis of LANs with a focus on Layer 1 and 2 information in networks. RMON is an industry standard that provides the functionality in network analyzers.

An RMON implementation operates in a client/server model. Monitoring devices (or 'probes') contain RMON agents that collect information and analyze packets. The probes are servers and the Network Management applications that communicate with them are clients. While agent configuration and data collection uses SNMP, RMON operates differently than SNMP systems:

- Probes have responsibility for data collection and processing, reducing SNMP traffic and reducing processing load for clients.
- Information is only transmitted to the management application when required, not polled.

RMON is mainly used for 'flow-based' monitoring, while SNMP is mainly used for 'device-based' management. RMON data collected deals mainly with traffic patterns on the network, and SNMP data collected usually deals with the status of individual devices on the network.

One disadvantage of flow based monitoring is that remote devices have much more of the management burden, and require more resources. AlliedWare Plus minimizes the management and resources burden by implementing a subset of the RMON MIB group to provide a minimal RMON agent implementation supporting statistics, history, alarms, and events.

The RMON groups supported in AlliedWare Plus™ are:

- **Statistics** - collects ethernet statistics on a switch port, such as utilization and collisions.
- **History** - collects a history of ethernet statistics on a switch port.
- **Alarms** - monitor a MIB object for a specified interval, trigger an alarm at a specified value (the '**rising threshold**'), and resets the alarm at another value (the '**falling threshold**'). Alarms are used with events to trigger alarms, which generate logs or SNMP traps.

- **Events** - specify the action to take when an event is triggered by an alarm. The action of an event can generate a log or an SNMP trap.

RMON Configuration Example

This configuration example sets up an RMON alarm to create SNMP traps and log messages. This RMON alarm creates SNMP traps and log messages when the rate of receipt of Broadcast packets on a switch port exceeds a threshold, and creates SNMP traps and log messages when the rate of receipt of Broadcast packets on a switch port drops below a lower threshold.

Step 1: Set up an RMON collection on the switch port that is being monitored.

Use the following commands to configure this functionality:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# rmon collection stats 4
```

This will cause the software to build a table in which it stores statistics relating to the switch port.

Step 2: Define an RMON event that will be called by the Alarm when the thresholds are passed.

Create this as a 'trap and log' event, so that both an SNMP trap and a log message will be generated. The trap will be sent to the SNMP community named 'public'.

Use the following command to configure this functionality:

```
awplus# configure terminal
awplus(config)# rmon event 10 log trap public
```

Step 3: Create the RMON alarm.

Every 5 seconds, the alarm checks the broadcast packet counter in RMON collection stats 4. If the change in the value of that counter over the 5 second interval exceeds 5000 (1000 broadcasts per second), the alarm will trigger the event defined in step 2 above.

Additionally, when the rate broadcast falls below 500 broadcasts per 5 seconds, then the alarm will trigger the event defined in step 2 above again.

Use the below command to configure this functionality:

```
awplus# configure terminal
awplus(config)# rmon alarm 5 etherStatsBroadcastPkts.4
                interval 5 delta alarmstartup 3
                rising-threshold 5000 event 10
                falling-threshold 500 event 10
```

For the variable '`etherStatsBroadcastPkts.4`' in this command, note that '`.4`' refers to the index number of the RMON collection stats 4 as defined on `port1.0.4`.

So, '`etherStatsBroadcastPkts.4`' refers to 'Received broadcasts' in RMON collection stats 4. Further counters for RMON are defined in section 5 of RFC 1757.

Step 4: Enable RMON traps.

To ensure that the SNMP trap is sent, you need to enabled RMON traps, and you need to define a trap host in SNMP. Use the below commands to configure this functionality:

```
awplus# configure terminal
awplus(config)# snmp-server
awplus(config)# snmp-server enable trap rmon
awplus(config)# snmp-server community public
awplus(config)# snmp-server host 192.168.2.254 version 2c
public
```

Note that the resulting log message will be of the form listed below:

```
RMON [1024]: Alarm Index 5 alarm Rising Threshold 5000 alarm
Value 5117 alarm Rising event Index 10 event description
RMON_SNMP
```

Chapter 103: RMON Commands

Command List 103.2
rmon alarm 103.2
rmon collection history 103.4
rmon collection stats 103.5
rmon event 103.6
show rmon alarm 103.7
show rmon event 103.8
show rmon history 103.10
show rmon statistics 103.12

Command List

This chapter provides an alphabetical reference for commands used to configure Remote Monitoring (RMON).

For an introduction to RMON and an RMON configuration example, see **Chapter 102, RMON Introduction and Configuration**

RMON is disabled by default in AlliedWare Plus™. No RMON alarms or events are configured.

For information about modifying or redirecting the output from **show** commands to a file, see **"Controlling "show" Command Output" on page 1.38**.

rmon alarm

Use this command to configure an RMON alarm to monitor the value of an SNMP object, and to trigger specified events when the monitored object crosses specified thresholds.

To specify the action taken when the alarm is triggered, use the event index of an event defined by the **rmon event** command.

Use the **no** variant of this command to remove the alarm configuration.

Note Only alarms for switch port interfaces, not for VLAN interfaces, can be configured.

Syntax

```
rmon alarm <alarm-index> <oid> interval <1-2147483647> {delta|
   absolute} rising-threshold <1-2147483647> event <rising-event-
   index> falling-threshold <1-2147483647> event <falling-event-
   index> alarmstartup {1|2|3} [owner <owner>]

no rmon alarm <alarm-index>
```

Parameter	Description
<alarm-index>	*<1-65535>* Alarm entry index value.
<oid>	The variable SNMP MIB Object Identifier (OID) name to be monitored, in the format etherStatsEntry.field.<*stats-index*>. For example, etherStatsEntry.5.22 is the OID for the etherStatsPkts field in the etherStatsEntry table for the interface defined by the <*stats-index*> 22 in the **rmon collection stats** command.
`interval <1-2147483647>`	Polling interval in seconds.
`delta`	The RMON MIB alarmSampleType: the change in the monitored MIB object value between the beginning and end of the polling interval.
`absolute`	The RMON MIB alarmSampleType: the value of the monitored MIB object.

Parameter(cont.)	Description(cont.)
`rising-threshold <1-2147483647>`	Rising threshold value of the alarm entry in seconds.
`<rising-event-index>`	`<1-65535>` The event to be triggered when the monitored object value reaches the rising threshold value. This is an event index of an event specified by the **rmon event** command.
`falling-threshold <1-2147483647>`	Falling threshold value of the alarm entry in seconds.
`<falling-event-index>`	`<1-65535>` The event to be triggered when the monitored object value reaches the falling threshold value. This is an event index of an event specified by the **rmon event** command.
`alarmstartup {1|2|3}`	Whether RMON can trigger a falling alarm (1), a rising alarm (2) or either (3) when you first start monitoring. See the Usage section for more information.
`owner <owner>`	Arbitrary owner name to identify the alarm entry.

Default By default, there are no alarms.

Mode Global Configuration

Usage RMON alarms have a rising and falling threshold. Once the alarm monitoring is operating, you cannot have a falling alarm unless there has been a rising alarm and vice versa.

However, when you start RMON alarm monitoring, an alarm must be generated without the other type of alarm having first been triggered. The **alarmstartup** parameter allows this. It is used to say whether RMON can generate a rising alarm (1), a falling alarm (2) or either alarm (3) as the first alarm.

Note that the SNMP MIB Object Identifier (OID) indicated in the command syntax with <***oid***> must be specified as a dotted decimal value with the form **etherStatsEntry.field.**<***stats-index***>.

Example To configure an alarm to monitor the change per minute in the etherStatsPkt value for interface 22 (defined by stats-index 22 in the **rmon collection stats** command), to trigger event 2 (defined by the **rmon event** command) when it reaches the rising threshold 400, and to trigger event 3 when it reaches the falling threshold 200, and identify this alarm as belonging to Maria, use the commands:

```
awplus# configure terminal
awplus(config)# rmon alarm 229 etherStatsEntry.22.5 interval 60
delta rising-threshold 400 event 2 falling-
threshold 200 event 3 alarmstartup 3 owner
maria
```

Related Commands **rmon collection stats**
rmon event

rmon collection history

Use this command to create a history statistics control group to store a specified number of snapshots (buckets) of the standard RMON statistics for the switch port, and to collect these statistics at specified intervals. If there is sufficient memory available, then the device will allocate memory for storing the set of buckets that comprise this history control.

Use the **no** variant of this command to remove the specified history control configuration.

Note Only a history for switch port interfaces, not for VLAN interfaces, can be collected.

Syntax

```
rmon collection history <history-index> [buckets <1-65535>]
   [interval <1-3600>] [owner <owner>]

no rmon collection history <history-index>
```

Parameter	Description
<history-index>	*<1-65535>* A unique RMON history control entry index value.
buckets *<1-65535>*	Number of requested buckets to store snapshots. Default 50 buckets.
interval *<1-3600>*	Polling interval in seconds. Default 1800 second polling interval.
owner *<owner>*	Owner name to identify the entry.

Default The default interval is 1800 seconds and the default buckets is 50 buckets.

Mode Interface Configuration

Example To create a history statistics control group to store 200 snapshots with an interval of 500 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# rmon collection history 200 buckets 500
                   interval 600 owner herbert
```

To disable the history statistics control group, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no rmon collection history 200
```

rmon collection stats

Use this command to enable the collection of RMON statistics on a switch port, and assign an index number by which to access these collected statistics.

Use the **no** variant of this command to stop collecting RMON statistics on this switch port.

Note Only statistics for switch port interfaces, not for VLAN interfaces, can be collected.

Syntax

```
rmon collection stats <collection-index> [owner <owner>]
no rmon collection stats <collection-index>
```

Parameter	Description
<collection-index>	*<1-65535>* Give this collection of statistics an index number to uniquely identify it. This is the index to use to access the statistics collected for this switch port.
owner *<owner>*	An arbitrary owner name to identify this statistics collection entry.

Default RMON statistics are not enabled by default.

Mode Interface Configuration

Example To enable the collection of RMON statistics with a statistics index of 200, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.3
awplus(config-if)# rmon collection stats 200 owner myrtle
```

To to stop collecting RMON statistics, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.3
awplus(config-if)# no rmon collection stats 200
```

rmon event

Use this command to create an event definition for a log or a trap or both. The event index for this event can then be referred to by the **rmon alarm** command.

Use the **no** variant of this command to remove the event definition.

Note Only the events for switch port interfaces, not for VLAN interfaces, can be collected.

Syntax

```
rmon event <event-index> [description <description>|owner <owner>|
   trap <trap>]

rmon event <event-index> [log [description <description>|
   owner <owner>|trap <trap>] ]

rmon event <event-index> [log trap [description <description>|
   owner <owner>] ]

no rmon event <event-index>
```

Parameter	Description
<event-index>	*<1-65535>* Unique event entry index value.
log	Log event type.
trap	Trap event type.
log trap	Log and trap event type.
description *<description>*	Event entry description.
owner *<owner>*	Owner name to identify the entry.

Default No event is configured by default.

Mode Global Configuration

Example To create an event definition for a log with an index of 299, use this command:

```
awplus# configure terminal
awplus(config)# rmon event 299 log description cond3 owner
alfred
```

To to remove the event definition, use the command:

```
awplus# configure terminal
awplus(config)# no rmon event 299
```

Related Commands **rmon alarm**

show rmon alarm

Use this command to display the alarms and threshold configured for the RMON probe.

Note Only the alarms for switch port interfaces, not for VLAN interfaces, can be shown.

Syntax `show rmon alarm`

Mode User Exec and Privileged Exec

Example To display the alarms and threshold, use this command:

```
awplus# show rmon alarm
```

Related Commands rmon alarm

show rmon event

Use this command to display the events configured for the RMON probe.

Note Only the events for switch port interfaces, not for VLAN interfaces, can be shown.

Syntax `show rmon event`

Mode User Exec and Privileged Exec

Output **Figure 103-1: Example output from the show rmon event command**

```
awplus#sh rmon event
 event Index = 787
       Description TRAP
        Event type log & trap
          Event community name gopher
       Last Time Sent = 0
       Owner  RMON_SNMP

 event Index = 990
       Description TRAP
        Event type trap
          Event community name teabo
       Last Time Sent = 0
       Owner  RMON_SNMP
```

Note The following etherStats counters are not currently available for Layer 3 interfaces:

- etherStatsBroadcastPkts
- etherStatsCRCAlignErrors
- etherStatsUndersizePkts
- etherStatsOversizePkts
- etherStatsFragments
- etherStatsJabbers
- etherStatsCollisions
- etherStatsPkts64Octets
- etherStatsPkts65to127Octets
- etherStatsPkts128to255Octets
- etherStatsPkts256to511Octets
- etherStatsPkts512to1023Octets
- etherStatsPkts1024to1518Octets

Example To display the events configured for the RMON probe, use this command:

```
awplus# show rmon event
```

Related Commands rmon event

show rmon history

Use this command to display the parameters specified on all the currently defined RMON history collections on the device.

Note Only the history for switch port interfaces, not for VLAN interfaces, can be shown.

Syntax `show rmon history`

Mode User Exec and Privileged Exec

Output **Figure 103-2: Example output from the show rmon history command**

```
awplus#sh rmon history
 history index = 56
         data source ifindex = 4501
         buckets requested = 34
        buckets granted = 34
        Interval = 2000
        Owner Andrew

 history index = 458
         data source ifindex = 5004
         buckets requested = 400
        buckets granted = 400
        Interval = 1500
        Owner trev
=========================================================
```

Note The following etherStats counters are not currently available for Layer 3 interfaces:

- etherStatsBroadcastPkts
- etherStatsCRCAlignErrors
- etherStatsUndersizePkts
- etherStatsOversizePkts
- etherStatsFragments
- etherStatsJabbers
- etherStatsCollisions
- etherStatsPkts64Octets
- etherStatsPkts65to127Octets
- etherStatsPkts128to255Octets
- etherStatsPkts256to511Octets
- etherStatsPkts512to1023Octets
- etherStatsPkts1024to1518Octets

Example To display the parameters specified on all the currently defined RMON history collections, us the commands:

```
awplus# show rmon history
```

Related Commands **rmon collection history**

show rmon statistics

Use this command to display the current values of the statistics for all the RMON statistics collections currently defined on the device.

Note Only statistics for switch port interfaces, not for VLAN interfaces, can be shown.

Syntax `show rmon statistics`

Mode User Exec and Privileged Exec

Example To display the current values of the statistics for all the RMON statistics collections, us the commands:

```
awplus# show rmon statistics
```

Output **Figure 103-3: Example output from the show rmon statistics command**

```
awplus#show rmon statistics
    rmon collection index 45
    stats->ifindex = 4501
    input packets 1279340, bytes 85858960, dropped 00, multicast packets 1272100
    output packets 7306090, bytes 268724, multicast packets 7305660 broadcast
packets 290
    rmon collection index 679
    stats->ifindex = 5013
    input packets 00, bytes 00, dropped 00, multicast packets 00
    output packets 8554550, bytes 26777324, multicast packets 8546690 broadcast
packets 7720
```

Note The following etherStats counters are not currently available for Layer 3 interfaces:

- etherStatsBroadcastPkts
- etherStatsCRCAlignErrors
- etherStatsUndersizePkts
- etherStatsOversizePkts
- etherStatsFragments
- etherStatsJabbers
- etherStatsCollisions
- etherStatsPkts64Octets

Chapter 104: Triggers Introduction

Introduction 104.2
Trigger Facility 104.2
Configuring a Trigger 104.2
Troubleshooting Triggers 104.5

Introduction

This chapter provides information about the Trigger facility on this switch. For specific configuration examples, see **Chapter 105, Triggers Configuration**. For detailed descriptions of the commands used to configure triggers, see **Chapter 106, Trigger Commands**.

Trigger Facility

The Trigger facility provides a powerful mechanism for automatic and timed management of your device by automating the execution of commands in response to certain events. For example, you can use triggers to deactivate a service during the weekends, or to collect diagnostic information when the CPU usage is high.

A **trigger** is an ordered sequence of scripts that is executed when a certain event occurs. A **script** is a sequence of commands stored as a plaintext file on a file subsystem accessible to the device, such as Flash memory. Each trigger may reference multiple scripts and any script may be used by any trigger. When an event activates a trigger, the trigger executes the scripts associated with it in sequence. One script is executed completely before the next script begins. Various types of triggers are supported, each activated in a different way.

Configuring a Trigger

The following describes the general steps to configure a trigger. For specific configuration examples, see **Chapter 105, Triggers Configuration**.

Step 1: Create a configuration script

Create a configuration script with the commands you would like executed when the trigger conditions are met. To create the configuration script using the CLI, use the command:

```
awplus# edit [<filename>]
```

Alternatively, you can create a script on a PC then load it onto your device using the copy (URL) command.

Step 2: Enter the trigger configuration mode

You must be in the Global Configuration mode to reach the Trigger Configuration mode. Use the command:

```
awplus# configure terminal
```

To create a trigger, and enter its configuration mode, use the command:

```
awplus(config)# trigger <1-250>
```

Step 3: Set the trigger type

The trigger type determines how the trigger is activated. To set the trigger to activate:

« when a Secure Digital (SD) or Secure Digital High Capacity (SDHC) card is either inserted or removed, use the command:

```
awplus(config-trigger)# type card {in|out}
```

« when CPU usage reaches a certain level, use the command:

```
awplus(config-trigger)# type cpu <1-100> [up|down|any]
```

« when the link status of a particular interface changes, use the command:

```
awplus(config-trigger)# type interface <interface>
                        [up|down|any]
```

« when the RAM usage reaches a certain level, use the command:

```
awplus(config-trigger)# type memory <1-100> [up|down|any]
```

« periodically after a set number of minutes, use the command:

```
awplus(config-trigger)# type periodic <1-1440>
```

« when a ping poll identifies that a target device's status has changed, use the command:

```
awplus(config-trigger)# type ping-poll <1-100> {up|down}
```

« if your device reboots, use the command:

```
awplus(config-trigger)# type reboot
```

« when a stacking link goes up or down, use the command:

```
awplus(config-trigger)# type stack link {up|down}
```

« at a specific time of the day, use the command:

```
awplus(config-trigger)# type time <hh:mm>
```

Note that a combined limit of 10 triggers of the type periodic and type time can be configured. If you attempt to add more than 10 triggers the following error message is displayed:

```
% Cannot configure more than 10 triggers with the type time or
periodic
```

Step 4: Set the time and days that the trigger can activate on

By default triggers can activate at any time of the day, on all days. If you want your trigger to activate only during a specific time of the day, use the command:

```
awplus(config-trigger)# time {[after <hh:mm:ss>]
                        [before <hh:mm:ss>]}
```

If you want your trigger to activate only on a specific date, use the command:

```
awplus(config-trigger)# day <1-31> <month> <2000-2035>
```

If you want the trigger to activate only on specific days of the week, use the command:

```
awplus(config-trigger)# day <weekday>
```

Note that you can set either a specific date, or specific weekdays, but not both.

Step 5: Specify how often the trigger can activate

By default, triggers can activate an unlimited number of times, as long as the trigger conditions are met. To set a limit on the number of times a trigger can activate, use the command:

```
awplus(config-trigger)# repeat {forever|no|once|yes|
                        <1-4294967294>}
```

You device maintains two counters that track the number of times a trigger has activated. One counts the total number of times the trigger is activated and is only reset if the device restarts, or when the trigger is destroyed. The other counter tracks the permitted number of repetitions. To reset this counter, use the **repeat** command on page 106.6.

Step 6: Add the script to the trigger

You can add up to five scripts to the trigger. When a trigger is activated, it executes the scripts in sequence, with the lowest numbered script activated first. The first script runs to completion before the next script begins. To add a script, use the command:

```
awplus(config-trigger)# script <1-5> {<filename>}
```

Note that a script activated from an SD card trigger cannot be located on the SD or SDHC card. It must be located in Flash memory.

Step 7: Specify a description for the trigger

Specify a description for the trigger, so that you can easily identify the trigger in show commands and log output. Use the command:

```
awplus(config-trigger)# description <description>
```

Step 8: Verify the trigger's configuration

To check the configuration of the trigger, use the command:

```
awplus(config-trigger)# show trigger [<1-250>|counter|
                        full]
```

Troubleshooting Triggers

You can use the trigger diagnostic mode and trigger debugging to test your triggers and troubleshoot any issues.

Diagnostic mode is set per trigger. In this mode the trigger activates if its trigger conditions are met, but does not run any of its scripts. Your device generates a log message to indicate that the trigger was activated. To place a trigger in diagnostic mode, enter the trigger's configuration mode and use the command:

```
awplus(config-trigger)# test
```

To start debugging for triggers, use the command:

```
awplus(config-trigger)# debug trigger
```

This generates detailed messages about how your device is processing the trigger commands and activating the triggers.

Enabling and Disabling

Triggers are enabled by default. This allows the trigger to activate as soon as its trigger conditions are met. If you need to disable a trigger but do not want to delete the trigger, use the command:

```
awplus(config-trigger)# no active
```

To enable the trigger again, use the command:

```
awplus(config-trigger)# active
```

To delete the trigger, use the command:

```
awplus(config-trigger)# no trigger <1-250>
```

Chapter 105: Triggers Configuration

Introduction 105.2
Restrict Internet Access 105.2
Capture Unusual CPU and RAM Activity 105.4
See Daily Statistics 105.6
Turn Off Power to Port LEDs 105.7
Reduce Power Supplied to Ports 105.9
Capture Show Output and Save to an SD Card 105.11
Load a Release File From an SD Card 105.12

Introduction

The chapter describes how to configure triggers to:

- Restrict Internet Access
- **Capture Unusual CPU and RAM Activity**
- **See Daily Statistics**
- **Turn Off Power to Port LEDs**
- **Capture Show Output and Save to an SD Card**

For more information about triggers, see **Chapter 104, Triggers Introduction**. For detailed descriptions of the commands used to configure triggers, see **Chapter 106, Trigger Commands**.

Restrict Internet Access

In the following configuration the ACME company wants to restrict its employees from accessing popular video sharing websites as this is causing bandwidth problems during work hours. The ACME company is happy for workers to access the site after work hours.

Employee PCs at ACME are on vlan2. Two triggers with associated scripts are needed:

- Trigger 1 activates at 8.30am and runs a script called **shutdown.scp**. This script adds commands to restrict access to the specified sites
- Trigger 2 activates at 5.30pm and runs the script called **open.scp**. This script removes the configuration specified by shutdown.scp

1. Create the **shutdown.scp** script

Create a configuration script using Access Control List commands to restrict users on vlan2 from accessing the specific sites.

2. Create the **open.scp** script

Create a script to remove the ACL configuration specified in the **shutdown.scp** file.

3. Configure trigger 1

To create trigger 1, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 1
```

Set the trigger to activate at 8:30am, by using the command:

```
awplus(config-trigger)# type time 08:30
```

Set the trigger to activate on Monday, Tuesday, Wednesday, Thursday and Friday:

```
awplus(config-trigger)# day mon tue wed thur fri
```

Add the script **shutdown.scp** to the trigger:

```
awplus(config-trigger)# script 1 shutdown.scp
```

Specify a helpful description, such as **Stops access to video sharing sites**. Use the command:

```
awplus(config-trigger)# description Stops access to video
                        sharing sites
```

Change to Global Configuration mode:

```
awplus(config-trigger)# exit
```

4. Configure trigger 2

To create trigger 2, use the command:

```
awplus(config)# trigger 2
```

Set the trigger to activate at 5.30pm:

```
awplus(config-trigger)# type time 17:30
```

Set the trigger to activate on Monday, Tuesday, Wednesday, Thursday and Friday:

```
awplus(config-trigger)# day mon tue wed thur fri
```

Add the script **open.scp** to the trigger:

```
awplus(config-trigger)# script 1 open.scp
```

Specify a helpful description, such as **Access allowed to video sharing sites**. Use the command:

```
awplus(config-trigger)# description Access allowed to video
                        sharing sites
```

5. Verify the configuration

To check the configuration of the triggers, use the commands:

```
awplus# show trigger 1

awplus# show trigger 2
```

Capture Unusual CPU and RAM Activity

The following configuration allows you to troubleshoot high CPU or RAM usage by the device. It uses two triggers to capture show output, and places this output in a file.

- Trigger 3 activates the script cpu-usage.scp when CPU usage is over 90% and can activate up to 5 times
- Trigger 4 activates the script ram-usage.scp when RAM usage is over 95%, and can activate up to 10 times

1. Create the cpu-usage.scp configuration script

Create a script with the appropriate show command:

```
awplus# show cpu | redirect showcpu.txt
```

The output of the **show cpu** command has been redirected into a file. It is not possible to display trigger script output on the terminal. Redirecting the command output to a file means it is available for later inspection.

If the trigger activates on more than one occasion the contents of **showcpu.txt** will be overwritten with the latest output. To keep a full record for all activations of this trigger an ASH shell script can be added to the trigger to manage the output of the configuration script. For example:

```
#!/bin/ash
date >> showcpu_bkup.txt
cat showcpu.txt >> showcpu_bkup.txt
```

This script concatenates that date and time of activation and the contents of **showcpu.txt** onto the end of the backup file **showcpu_bkup.txt** in flash memory.

Note that the files may grow large accumulating data and consume available flash memory.

2. Create the ram-usage.scp configuration script

Create a script with the appropriate show command:

```
awplus# show memory | redirect showmem.txt
```

The output of the **show memory** command has been redirected into a file. It is not possible to display trigger script output on the terminal. Redirecting the command output to a file means it is available for later inspection.

If the trigger activates on more than one occasion the contents of **showcpu.txt** will be overwritten with the latest output. To keep a full record for all activations of this trigger an ASH shell script can be added to the trigger to manage the output of the configuration script. For example:

```
#!/bin/ash
date >> showmem_bkup.txt
cat showmem.txt >> showmem_bkup.txt
```

This script concatenates that date and time of activation and the contents of **showmem.scp** onto the end of the backup file **showmem_bkup.scp** in flash memory.

Note that the files may grow large accumulating data and consume available flash memory.

3. Configure trigger 3

To create trigger 3, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 3
```

Set the trigger to activate when CPU usage exceeds 80%:

```
awplus(config-trigger)# type cpu 90 up
```

Add the script **cpu-usage.scp** to the trigger:

```
awplus(config-trigger)# script 1 cpu-usage.scp
```

Return to Global Configuration mode:

```
awplus(config-trigger)# exit
```

4. Configure trigger 4

To create trigger 4, use the command:

```
awplus(config)# trigger 4
```

Set the trigger to activate when RAM usage exceeds 95%:

```
awplus(config-trigger)# type cpu 95 up
```

Add the script **cpu-usage.scp** to the trigger:

```
awplus(config-trigger)# script 1 ram-usage.scp
```

5. Verify the configuration

To check the configuration of the triggers, use the command:

```
awplus# show trigger 3
awplus# show trigger 4
```

See Daily Statistics

The ACME company has recently set up QoS on its traffic to give traffic different priorities to the ISP. ACME wants to assess how much traffic is dropped with the QoS bandwidths set over the next week. To do this, they want to generate an hourly report on QoS traffic on the first day that this is implemented.

- Trigger 5 activates the script **qos-stats.scp** every 60 minutes.
  The trigger is set to only activate during work hours.

1. Create the **qos-stats.scp** script

Create a configuration script with the appropriate show commands. You can either create the configuration script using the CLI with the **edit** command or create a script on a PC then load it onto your device using the **copy (URL)** command.

2. Configure trigger 5

To create trigger 5, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 5
```

Set the trigger to activate periodically every 60 minutes:

```
awplus(config-trigger)# type periodic 60
```

Set the trigger to activate only during the hours of 8:00am and 6:00pm:

```
awplus(config-trigger)# time after 8:00 before 18:00
```

Add the script **qos-stats.scp** to the trigger:

```
awplus(config-trigger)# script 1 qos-stats.scp
```

3. Verify the configuration

To check the configuration of the trigger, use the command:

```
awplus# show trigger 5
```

Turn Off Power to Port LEDs

The following configuration allows you to conserve power by using the eco-friendly LED (Light Emitting Diode) feature to turn off power to the port LEDs during non-work hours.

See the **ecofriendly led** command for a detailed command description and command examples. See the section **"Save Power With the Eco-Friendly Feature" on page 1.33**.

- Trigger 6 activates at 5.30pm and runs a script called **LEDoff.scp**. This script adds commands to turn off power to all the port LEDs
- Trigger 7 activates at 8.30am and runs the script called **LEDon.scp**. This script removes the configuration specified by **LEDoff.scp**

1. Create the **LEDoff.scp** script

Create a configuration script with the commands that are executed when the trigger conditions are met. You can either create the configuration script using the CLI with the edit command or create a script on a PC then load it onto your device using the copy (URL) command. The configuration script for this example is:

```
!
enable
configure terminal
ecofriendly led
exit
exit
!
```

2. Create the **LEDon.scp** script

Create a script to remove the configuration specified in the **LEDoff.scp** file. The configuration script for this example is:

```
!
enable
configure terminal
no ecofriendly led
exit
exit
!
```

3. Configure trigger 6

To create trigger 6, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 6
```

Set the trigger to activate at 5:30pm, by using the command:

```
awplus(config-trigger)# type time 17:30
```

Set the trigger to activate on Monday, Tuesday, Wednesday, Thursday and Friday:

```
awplus(config-trigger)# day mon tue wed thur fri
```

Add the script **LEDoff.scp** to the trigger:

```
awplus(config-trigger)# script 1 LEDoff.scp
```

Specify a helpful description, such as **Shutdown power to LEDs**. Use the command:

```
awplus(config-trigger)# description Shutdown power to LEDs
```

Change to Global Configuration mode:

```
awplus(config-trigger)# exit
```

4. Configure trigger 7

To create trigger 7, use the command:

```
awplus(config)# trigger 9
```

Set the trigger to activate at 8.30am:

```
awplus(config-trigger)# type time 08:30
```

Set the trigger to activate on Monday, Tuesday, Wednesday, Thursday and Friday:

```
awplus(config-trigger)# day mon tue wed thur fri
```

Add the script **LEDon.scp** to the trigger:

```
awplus(config-trigger)# script 1 LEDon.scp
```

Specify a helpful description, such as **Turn on power to LEDs**. Use the command:

```
awplus(config-trigger)# description Turn on power to LEDs
```

5. Verify the configuration

To check the configuration of the triggers, use the commands:

```
awplus# show trigger 6
awplus# show trigger 7
```

Reduce Power Supplied to Ports

The following configuration allows you to conserve power by using the eco-friendly LPI (Low Power Idle) feature to reduce power supplied to the ports during non-work hours.

See the **ecofriendly lpi** command for a detailed command description and command examples. See the section **"Save Power With the Eco-Friendly Feature" on page 1.33**.

- Trigger 6 activates at 5.30pm and runs a script called **LPIon.scp**. This script adds commands to reduce power to all the ports.
- Trigger 7 activates at 8.30am and runs the script called **LPIoff.scp**. This script removes the configuration specified by **LPIon.scp**.

1. Create the **LPIon.scp** script

Create a configuration script with the commands that are executed when the trigger conditions are met. You can either create the configuration script using the CLI with the edit command or create a script on a PC then load it onto your device using the copy (URL) command. The configuration script for this example is:

```
!
enable
configure terminal
ecofriendly lpi
exit
exit
!
```

2. Create the **LPIoff.scp** script

Create a script to remove the configuration specified in the **LPIon.scp** file. The configuration script for this example is:

```
!
enable
configure terminal
no ecofriendly lpi
exit
exit
!
```

3. Configure trigger 6

To create trigger 6, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 6
```

Set the trigger to activate at 5:30pm, by using the command:

```
awplus(config-trigger)# type time 17:30
```

Set the trigger to activate on Monday, Tuesday, Wednesday, Thursday and Friday:

```
awplus(config-trigger)# day mon tue wed thur fri
```

Add the script **LPIon.scp** to the trigger:

```
awplus(config-trigger)# script 1 LPIon.scp
```

Specify a helpful description, such as **Turn on LPI**. Use the command:

```
awplus(config-trigger)# description Turn on LPI
```

Change to Global Configuration mode:

```
awplus(config-trigger)# exit
```

4. Configure trigger 7

To create trigger 7, use the command:

```
awplus(config)# trigger 9
```

Set the trigger to activate at 8.30am:

```
awplus(config-trigger)# type time 08:30
```

Set the trigger to activate on Monday, Tuesday, Wednesday, Thursday and Friday:

```
awplus(config-trigger)# day mon tue wed thur fri
```

Add the script **LPIoff.scp** to the trigger:

```
awplus(config-trigger)# script 1 LPIoff.scp
```

Specify a helpful description, such as **Turn off LPI**. Use the command:

```
awplus(config-trigger)# description Turn off LPI
```

5. Verify the configuration

To check the configuration of the triggers, use the commands:

```
awplus# show trigger 6
awplus# show trigger 7
```

Capture Show Output and Save to an SD Card

The following configuration allows you to automatically capture output from the show tech-support command when an SD (or SDHC) card is inserted into the switch. It uses a script called by the SD card trigger to capture the **show tech-support** output and places this output in a file on the SD card.

- Trigger 8 activates the script **shtech-sup.scp** when an SD card is inserted in the switch

1. Create the **shtech-sup.scp** script

Create a configuration script with the commands that are executed when the trigger conditions are met. You can either create the configuration script using the CLI with the edit command or create a script on a PC then load it onto your device using the copy (URL) command. The configuration script for this example is:

```
!
enable
show tech-support outfile card:support.txt.gz
exit
end
!
```

2. Configure trigger 8

To create trigger 8, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 8
```

Set the trigger to activate on the insertion of an SD card:

```
awplus(config-trigger)# type card in
```

Add the script **shtech-sup.scp** to the trigger:

```
awplus(config-trigger)# script 1 shtech-sup.scp
```

3. Verify the configuration

To check the configuration of the triggers, use the command:

```
awplus# show trigger 8
```

Load a Release File From an SD Card

The following configuration allows you to automatically load a release file from an SD (or SDHC) card into Flash memory when a card is inserted into the switch. It uses a script called by the SD card trigger to load the release file from the SD card.

Note that you can only specify that the release file is on an SD card if there is a backup release file already specified in Flash. See the **boot system backup** command for further information.

Caution Anyone with physical access to the switch and who knows the name of the release file loaded by the trigger could insert an SD card and overwrite the boot configuration in flash memory.

- Trigger 10 activates the script **copy.scp** when an SD card is inserted in the switch

1. Create the **copy.scp** script

Create a configuration script with the commands that are executed when the trigger conditions are met. You can either create the configuration script using the CLI with the edit command or create a script on a PC then load it onto your device using the copy (URL) command. The configuration script for this example is:

```
!
enable
copy card flash x900-5.4.4-0.4.rel
wait 5
configure terminal
boot system x900-5.4.4-0.4.rel
exit
end
!
```

2. Configure trigger 10

To create trigger 10, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 10
```

Set the trigger to activate on the insertion of an SD card:

```
awplus(config-trigger)# type card in
```

Add the script **copy.scp** to the trigger:

```
awplus(config-trigger)# script 1 copy.scp
```

Specify a helpful description, such as **Load a release file**. Use the command:

```
awplus(config-trigger)# description Load a release file
```

After an SD card has been inserted in the switch, use the following two steps to check the trigger and current boot configuration details.

1. Verify the trigger configuration

To check the configuration of the trigger, use the command:

```
awplus# show trigger 10
```

Example output from this command is shown below:

```
awplus#show trigger 10
Trigger Configuration Details
-------------------------------------------------------------
Trigger ..................... 10
Description ................. Load a release file
Type and details ............ Card (in)
Days ........................ smtwtfs
After ....................... 00:00:00
Before ...................... 23:59:59
Active ...................... Yes
Test ........................ No
Trap ........................ Yes
Repeat ...................... Continuous
Modified .................... Wed Sep 15 16:25:33 2010
Number of activations ....... 1
Last activation ............. Wed Sep 15 16:26:49 2010
Number of scripts ........... 1
  1. copy.scp
  2. <not configured>
  3. <not configured>
  4. <not configured>
  5. <not configured>
-------------------------------------------------------------
```

2. Display the current boot configuration

To display the current boot configuration, use the command:

```
awplus# show boot
```

Example output from this command is shown below:

```
awplus#show boot
Boot configuration
-------------------------------------------------------------
Current software   : x900-5.4.4-0.4.rel
Current boot image : flash:/x900-5.4.4-0.4.rel
Backup  boot image : flash:/x900-5.4.4-0.4.rel
Default boot config: flash:/default.cfg
Current boot config: flash:/atplab.cfg (file exists)
Backup  boot config: flash:/default.cfg (file exists)
```

Chapter 106: Trigger Commands

Command List 106.2
active (trigger) 106.2
day 106.3

Command List

This chapter provides an alphabetical reference for commands used to configure Triggers. For more information, see **Chapter 104, Triggers Introduction** and **Chapter 105, Triggers Configuration**.

For information about modifying or redirecting the output from **show** commands to a file, see **"Controlling "show" Command Output" on page 1.38**.

active (trigger)

This command enables a trigger. This allows the trigger to activate when its trigger conditions are met.

The **no** variant of this command disables a trigger. While in this state the trigger cannot activate when its trigger conditions are met.

Syntax

```
active
no active
```

Mode Trigger Configuration

Usage Configure a trigger first before you use this command to activate it. See the **Configuring a Trigger** section in **Chapter 104, Triggers Introduction** for trigger configuration steps.

Examples To enable trigger 172, so that it can activate when its trigger conditions are met, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 172
awplus(config-trigger)# active
```

To disable trigger 182, preventing it from activating when its trigger conditions are met, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 182
awplus(config-trigger)# no active
```

Related Commands **show trigger**
trigger

day

This command specifies the days or date that the can trigger activate on. You can specify either:

- A specific date
- A specific day of the week
- A list of days of the week
- every day

By default, the trigger can activate on any day.

Syntax

```
day every-day
day <1-31> <month> <2000-2035>
day <weekday>
```

Parameter	Description
`every-day`	Sets the trigger so that it can activate on any day.
<1-31>	Day of the month the trigger is permitted to activate on.
<month>	Sets the month that the trigger is permitted to activate on. Valid keywords are: **january, february, march, april, may, june, july, august, september, october, november**, and **december**.
<2000-2035>	Sets the year that the trigger is permitted to activate in.
<weekday>	Sets the days of the week that the trigger can activate on. You can specify one or more week days in a space separated list. Valid keywords are: **monday, tuesday, wednesday, thursday, friday, saturday**, and **sunday**.

Mode Trigger Configuration

Usage For example trigger configurations that use the **day** command, see **"Restrict Internet Access" on page 105.2** and **"Turn Off Power to Port LEDs" on page 105.7**.

Examples To permit trigger 55 to activate on the `1 Jun 2010`, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 55
awplus(config-trigger)# day 1 Jun 2010
```

To permit trigger 12 to activate on a Mondays, Wednesdays and Fridays, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 12
awplus(config-trigger)# day monday wednesday friday
```

Related Commands
show trigger
trigger

debug trigger

This command enables trigger debugging. This generates detailed messages about how your device is processing the trigger commands and activating the triggers.

The **no** variant of this command disables trigger debugging.

Syntax

```
debug trigger
no debug trigger
```

Mode Privilege Exec

Examples To start trigger debugging, use the command:

```
awplus# debug trigger
```

To stop trigger debugging, use the command:

```
awplus# no trigger
```

Related Commands
show debugging trigger
show trigger
test
trigger
undebug trigger

description (trigger)

This command adds an optional description to help you identify the trigger. This description is displayed in show command outputs and log messages.

The **no** variant of this command removes a trigger's description. The show command outputs and log messages stop displaying a description for this trigger.

Syntax

```
description <description>
no description
```

Parameter	Description
<description>	A word or phrase that uniquely identifies this trigger or its purpose. Valid characters are any printable character and spaces, up to a maximum of 40 characters.

Mode Trigger Configuration

Examples To give trigger 240 the description `daily status report`, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 240
awplus(config-trigger)# description daily status report
```

To remove the description from trigger `36`, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 36
awplus(config-trigger)# no description
```

Related Commands

show trigger
test
trigger

repeat

This command specifies the number of times that a trigger is permitted to activate. This allows you to specify whether you want the trigger to activate:

- only the first time that the trigger conditions are met
- a limited number of times that the trigger conditions are met
- an unlimited number of times

Once the trigger has reached the limit set with this command, the trigger remains in your configuration but cannot be activated. Use the **repeat** command again to reset the trigger so that it is activated when its trigger conditions are met.

By default, triggers can activate an unlimited number of times. To reset a trigger to this default, specify either **yes** or **forever**.

Syntax

```
repeat {forever|no|once|yes|<1-4294967294>}
```

Parameter	Description
`yes|forever`	The trigger repeats indefinitely, or until disabled.
`no|once`	The trigger activates only once.
<1-4292967294>	The trigger repeats the set number of times.

Mode Trigger Configuration

Examples To allow trigger `21` to activate only once, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 21
awplus(config-trigger)# repeat no
```

To allow trigger `22` to activate an unlimited number of times whenever its trigger conditions are met, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 22
awplus(config-trigger)# repeat forever
```

To allow trigger `23` to activate only the first `10` times the conditions are met, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 23
awplus(config-trigger)# repeat 10
```

Related Commands **show trigger**
trigger

script

This command specifies one or more scripts that are to be run when the trigger activates. You can add up to five scripts to a single trigger.

The sequence in which the trigger runs the scripts is specified by the number you set before the name of the script file. One script is executed completely before the next script begins.

Scripts may be either ASH shell scripts, indicated by a **.sh** filename extension suffix, or AlliedWare Plus™ scripts, indicated by a **.scp** filename extension suffix. AlliedWare Plus™ scripts only need to be readable.

The **no** variant of this command removes one or more scripts from the trigger's script list. The scripts are identified by either their name, or by specifying their position in the script list. The **all** parameter removes all scripts from the trigger.

Syntax

```
script <1-5> {<filename>}
no script {<1-5>|<filename>|all}
```

Parameter	Description
<1-5>	The position of the script in execution sequence. The trigger runs the lowest numbered script first.
<filename>	The path to the script file.

Mode Trigger Configuration

Examples To configure trigger 71 to run the script flash:/cpu_trig.sh in position 3 when the trigger activates, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 71
awplus(config-trigger)# script 3 flash:/cpu_trig.sh
```

To configure trigger 99 to run the scripts **flash:reconfig.scp**, **flash:cpu_trig.sh** and **flash:email.scp** in positions 2, 3 and 5 when the trigger activates, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 99
awplus(config-trigger)# script 2 flash:/reconfig.scp 3 flash:/
cpu_trig.sh 5 flash:/email.scp
```

To remove the scripts 1, 3 and 4 from trigger 71's script list, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 71
awplus(config-trigger)# no script 1 3 4
```

To remove the script flash:/cpu_trig.sh from trigger 71's script list, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 71
awplus(config-trigger)# no script flash:/cpu_trig.sh
```

To remove all the scripts from trigger 71's script list, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 71
awplus(config-trigger)# no script all
```

Related Commands **show trigger**
trigger

show debugging trigger

This command displays the current status for trigger utility debugging. Use this command to show when trigger debugging has been turned on or off from the **debug trigger** command.

Syntax `show debugging trigger`

Mode User Exec and Privileged Exec

Example To display the current configuration of trigger debugging, use the command:

```
awplus# show debugging trigger
```

Output **Figure 106-1: Example output from the show debugging trigger command**

```
awplus#debug trigger
awplus#show debugging trigger
Trigger debugging status:
  Trigger debugging is on

awplus#no debug trigger
awplus#show debugging trigger
Trigger debugging status:
  Trigger debugging is off
```

Related Commands **debug trigger**

show running-config trigger

This command displays the current running configuration of the trigger utility.

Syntax `show running-config trigger`

Mode Privileged Exec

Example To display the current configuration of the trigger utility, use the command:

```
awplus# show running-config trigger
```

Output **Figure 106-2: Example output from the show running-config trigger command**

```
trigger 1
 type card in
trigger 2
 type card out
!
```

Related Commands **show trigger**

show trigger

This command displays configuration and diagnostic information about the triggers configured on the device. Specify the **show trigger** command without any options to display a summary of the configuration of all triggers.

Syntax `show trigger [<1-250>|counter|full]`

Parameter	Description
<1-250>	Displays detailed information about a specific trigger, identified by its trigger ID.
`counter`	Displays statistical information about all triggers.
`full`	Displays detailed information about all triggers.

Mode Privileged Exec

Example To get summary information about all triggers, use the following command:

```
awplus# show trigger
```

Figure 106-3: Example output from the show trigger command

```
awplus#show trigger

Table 106-1: Parameters in the output of the show trigger command

Parameter	Description
`TR#`	Trigger identifier (ID).
`Type & Details`	The trigger type, followed by the trigger details in brackets.
`Name`	Descriptive name of the trigger configured with the **description (trigger)** command.
`Ac`	Whether the trigger is active (Y), or inactive (N).
`Te`	Whether the trigger is in test mode (Y) or not (N).
`Tr`	Whether or not the trigger is enabled to send SNMP traps. See the **trap** command.
`Repeat`	Whether the trigger repeats continuously, and if not, the configured repeat count for the trigger. To see the number of times a trigger has activated, use the **show trigger <1-250>** command.

Table 106-1: Parameters in the output of the show trigger command(cont.)

Parameter	Description
#Scr	Number of scripts associated with the trigger.
Days/Date	Days or date when the trigger may be activated. For the days options, the days are shown as a seven character string representing Sunday to Saturday. A hyphen indicates days when the trigger cannot be activated.

To display detailed information about trigger 3, use the command:

```
awplus# show trigger 3
```

Figure 106-4: Example output from the show trigger command for a specific trigger

```
awplus#show trigger 3

Table 106-2: Parameters in the output of the show trigger full and show trigger commands for a specific trigger

Parameter	Description
Trigger	The ID of the trigger.
Description	Descriptive name of the trigger.
Type and details	The trigger type and its activation conditions.
Days	The days on which the trigger is permitted to activate.
Date	The date on which the trigger is permitted to activate. Only displayed if configured, in which case it replaces "Days".
Active	Whether or not the trigger is permitted to activate.
Test	Whether or not the trigger is operating in diagnostic mode.
Trap	Whether or not the trigger is enabled to send SNMP traps.
Repeat	Whether the trigger repeats an unlimited number of times (Continuous) or for a set number of times. When the trigger can repeat only a set number of times, then the number of times the trigger has been activated is displayed in brackets.
Modified	The date and time of the last time that the trigger was modified.
Number of activations	Number of times the trigger has been activated since the last restart of the device.
Last activation	The date and time of the last time that the trigger was activated.
Number of scripts	How many scripts are associated with the trigger, followed by the names of the script files in the order in which they run.

To display counter information about all triggers use the command:

```
awplus# show trigger counter
```

Figure 106-6: Example output from the show trigger counter command

```
awplus#show trigger counter

-------------------------------------------------------
```

Table 106-3: Parameters in the output of the show trigger counter command

Parameter	Description
`Trigger activations`	Number of times a trigger has been activated.
`Time triggers activated today`	Number of times a time trigger has been activated today.
`Periodic triggers activated today`	Number of times a periodic trigger has been activated today.
`Interface triggers activated today`	Number of times an interface trigger has been activated today.
`Resource triggers activated today`	Number of times a CPU or memory resource trigger has been activated today.
`Ping-poll triggers activated today`	Number of times a ping-poll trigger has been activated today.

Related Commands **trigger**

test

This command puts the trigger into a diagnostic mode. In this mode the trigger may activate but when it does it will not run any of the trigger's scripts. A log message will be generated to indicate when the trigger has been activated.

The **no** variant of this command takes the trigger out of diagnostic mode, restoring normal operation. When the trigger activates the scripts associated with the trigger will be run, as normal.

Syntax

```
test
no test
```

Mode Trigger Configuration

Usage Configure a trigger first before you use this command to diagnose it. See the **Configuring a Trigger** section in **Chapter 104, Triggers Introduction** for trigger configuration steps.

Examples To put trigger 5 into diagnostic mode, where no scripts will be run when the trigger activates, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 5
awplus(config-trigger)# test
```

To take trigger 205 out of diagnostic mode, restoring normal operation, use the commands:

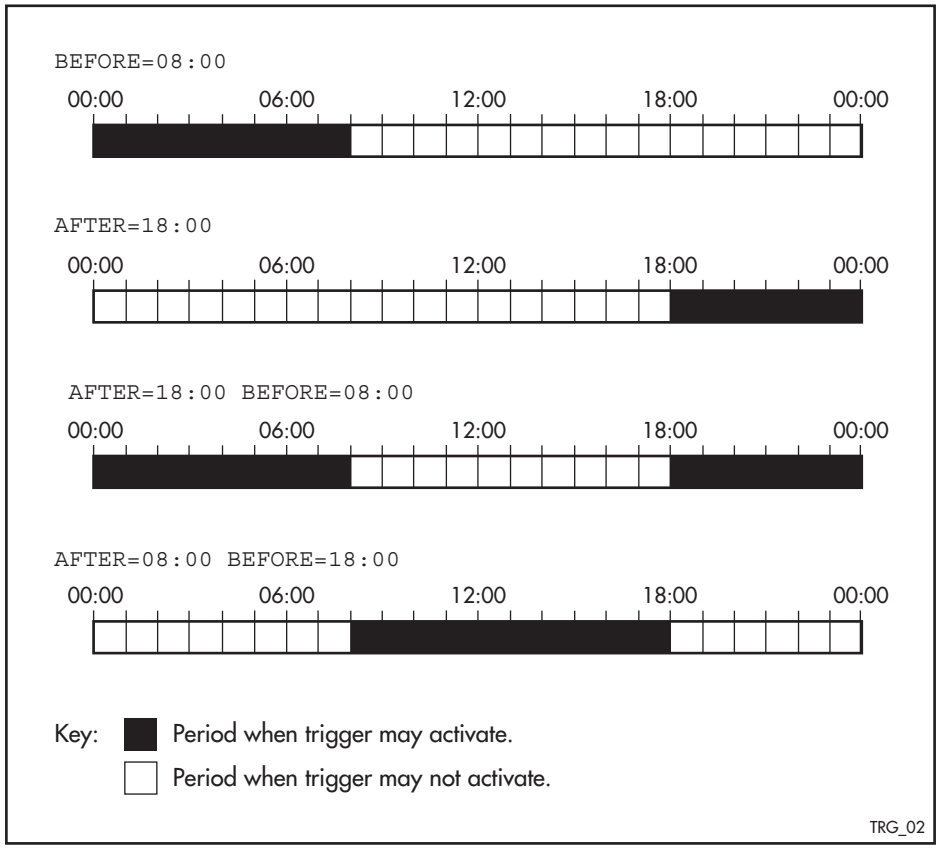
```
awplus# configure terminal
awplus(config)# trigger 205
awplus(config-trigger)# no test
```

Related Commands **show trigger**
trigger

time (trigger)

This command specifies the time of day when the trigger is permitted to activate. The after parameter specifies the start of a time period that extends to midnight during which trigger may activate. By default the value of this parameter is 00:00:00 (am); that is, the trigger may activate at any time. The **before** parameter specifies the end of a time period beginning at midnight during which the trigger may activate. By default the value of this parameter is 23:59:59; that is, the trigger may activate at any time. If the value specified for **before** is later than the value specified for **after**, a time period from "after" to "before" is defined, during which the trigger may activate. This command is not applicable to time triggers (**type time**).

The following figure illustrates how the **before** and **after** parameters operate.



Syntax `time {[after <hh:mm:ss>] [before <hh:mm:ss>]}`

Parameter	Description
`after <hh:mm:ss>`	The earliest time of day when the trigger may be activated.
`before <hh:mm:ss>`	The latest time of day when the trigger may be activated.

Mode Trigger Configuration

Usage For example trigger configurations that use the **time (trigger)** command, see **"Restrict Internet Access" on page 105.2** and **"Turn Off Power to Port LEDs" on page 105.7**.

Examples To allow trigger `63` to activate between midnight and 10:30am, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 63
awplus(config-trigger)# time before 10:30:00
```

To allow trigger `64` to activate between 3:45pm and midnight, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 64
awplus(config-trigger)# time after 15:45:00
```

To allow trigger `65` to activate between 10:30am and 8:15pm, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 65
awplus(config-trigger)# time after 10:30:00 before 20:15:00
```

Related Commands **show trigger**
trigger

trap

This command enables the specified trigger to send SNMP traps.

Use the **no** variant of this command to disable the sending of SNMP traps from the specified trigger.

Syntax

```
trap
no trap
```

Default SNMP traps are enabled by default for all defined triggers.

Mode Trigger Configuration

Usage You must configure SNMP before using traps with triggers. See the following SNMP chapters:
Chapter 96, SNMP Introduction
Chapter 97, SNMP Commands
Chapter 98, SNMP MIBs

Since SNMP traps are enabled by default for all defined triggers, a common usage will be for the **no** variant of this command to disable SNMP traps from a specified trap if the trap is only periodic. Refer in particular to **AT-TRIGGER-MIB** for further information about the relevant SNMP MIB.

Examples To enable SNMP traps to be sent from trigger 5, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 5
awplus(config-trigger)# trap
```

To disable SNMP traps being sent from trigger 205, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 205
awplus(config-trigger)# no trap
```

Related Commands
trigger
show trigger

trigger

This command is used to access the Trigger Configuration mode for the specified trigger. Once Trigger Configuration mode has been entered the trigger type information can be configured and the trigger scripts and other operational parameters can be specified. At a minimum the trigger type information must be specified before the trigger can become active.

The **no** variant of this command removes a specified trigger and all configuration associated with it.

Syntax

```
trigger <1-250>
no trigger <1-250>
```

Parameter	Description
<1-250>	A trigger ID.

Mode Global Configuration

Examples To enter trigger configuration mode for trigger `12` use the command:

```
awplus# trigger 12
```

To completely remove all configuration associated with trigger `12`, use the command:

```
awplus# no trigger 12
```

Related Commands **show trigger**
trigger activate

trigger activate

This command is used to manually activate a specified trigger from the Privileged Exec mode, which has been configured with the **trigger** command from the Global Configuration mode.

Syntax `trigger activate <1-250>`

Parameter	Description
<1-250>	A trigger ID.

Mode Privileged Exec

Usage This command manually activates a trigger without the normal trigger conditions being met.

The trigger is activated even if it is configured as inactive. The scripts associated with the trigger will be executed even if the trigger is in the diagnostic test mode.

Triggers activated manually do not have their repeat counts decremented or their 'last triggered' time updated, and do not result in updates to the '[type] triggers today' counters.

Example To manually activate trigger `12` use the command:

```
awplus# trigger activate 12
```

Related Commands **show trigger**
trigger

type card

Use this command to configure a trigger that activates on either the removal or the insertion of a Secure Digital (SD) or Secure Digital High Capacity (SDHC) card.

Syntax `type card {in|out}`

Parameter	Description
`in`	Trigger activates on insertion of a card.
`out`	Trigger activates on removal of a card.

Mode Trigger Configuration

Usage Card triggers cannot execute script files from a card.

In a VCStack configuration, card triggers are activated on the master for either the insertion or removal of a card on the master only.

For example trigger configurations that use the **type card** command, see **"Capture Show Output and Save to an SD Card" on page 105.11**.

Examples To configure `trigger 1` to activate on the insertion of a card, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 1
awplus(config-trigger)# type card in
```

Related Commands
trigger
show running-config trigger
show trigger

type cpu

This command configures a trigger to activate based on CPU usage level. Selecting the **up** option causes the trigger to activate when the CPU usage exceeds the specified usage level. Selecting the **down** option causes the trigger to activate when CPU usage drops below the specified usage level. Selecting **any** causes the trigger to activate in both situations. The default is **any**.

Syntax `type cpu <1-100> [up|down|any]`

Parameter	Description
<1-100>	The percentage of CPU usage at which to trigger.
`up`	Activate when CPU usage exceeds the specified level.
`down`	Activate when CPU usage drops below the specified level
`any`	Activate when CPU usage passes the specified level in either direction

Mode Trigger Configuration

Usage For an example trigger configuration that uses the **type cpu** command, see **"Capture Unusual CPU and RAM Activity" on page 105.4**.

Examples To configure trigger `28` to be a CPU trigger that activates when CPU usage exceeds 80% use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 28
awplus(config-trigger)# type cpu 80 up
```

To configure trigger `5` to be a CPU trigger that activates when CPU usage either rises above or drops below 65%, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 5
awplus(config-trigger)# type cpu 65
```

or

```
awplus# configure terminal
awplus(config)# trigger 5
awplus(config-trigger)# type cpu 65 any
```

Related Commands **show trigger**
trigger

type interface

This command configures a trigger to activate based on the link status of an interface. The trigger can be activated when the interface becomes operational by using the **up** option, or when the interface closes by using the **down** option. The trigger can also be configured to activate when either one of these events occurs by using the **any** option.

Syntax `type interface <interface> [up|down|any]`

Parameter	Description
`<interface>`	Interface name. This can be the name of a switch port, an eth-management port, or a VLAN.
`up`	Activate when interface becomes operational.
`down`	Activate when the interface closes.
`any`	Activate when any interface link status event occurs.

Mode Trigger Configuration

Example To configure trigger `19` to be an interface trigger that activates when `port1.0.2` becomes operational, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 19
awplus(config-trigger)# type interface port1.0.2 up
```

Related Commands **show trigger**
trigger

type memory

This command configures a trigger to activate based on RAM usage level. Selecting the **up** option causes the trigger to activate when memory usage exceeds the specified level. Selecting the **down** option causes the trigger to activate when memory usage drops below the specified level. Selecting **any** causes the trigger to activate in both situations. The default is **any**.

Syntax `type memory <1-100> [up|down|any]`

Parameter	Description
<1-100>	The percentage of memory usage at which to trigger.
`up`	Activate when memory usage exceeds the specified level.
`down`	Activate when memory usage drops below the specified level.
`any`	Activate when memory usage passes the specified level in either direction.

Mode Trigger Configuration

Examples To configure trigger `12` to be a memory trigger that activates when memory usage exceeds 50% use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 12
awplus(config-trigger)# type memory 50 up
```

To configure trigger `40` to be a memory trigger that activates when memory usage either rises above or drops below 65%, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 40
awplus(config-trigger)# type memory 65
```

or

```
awplus# configure terminal
awplus(config)# trigger 40
awplus(config-trigger)# type memory 65 any
```

Related Commands **show trigger**
trigger

type periodic

This command configures a trigger to be activated at regular intervals. The time period between activations is specified in minutes.

Syntax `type periodic <1-1440>`

Parameter	Description
<1-1440>	The number of minutes between activations.

Mode Trigger Configuration

Usage A combined limit of 10 triggers of the type periodic and time can be configured. If you attempt to add more than 10 triggers the following error message is displayed:

```
% Cannot configure more than 10 triggers with the type time or
periodic
```

For an example trigger configuration that uses the **type periodic** command, see **"See Daily Statistics" on page 105.6**.

Example To configure trigger `44` to activate periodically at `10` minute intervals use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 44
awplus(config-trigger)# type periodic 10
```

Related Commands **show trigger**
trigger

type ping-poll

This command configures a trigger that activates when Ping Polling identifies that a target device's status has changed. This allows you to run a configuration script when a device becomes reachable or unreachable.

Syntax `type ping-poll <1-100> {up|down}`

Parameter	Description
<1-100>	The ping poll ID.
`up`	The trigger activates when ping polling detects that the target is reachable.
`down`	The trigger activates when ping polling detects that the target is unreachable.

Mode Trigger Configuration

Example To configure trigger `106` to activate when ping poll `12` detects that its target device is now unreachable, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 106
awplus(config-trigger)# type ping-poll 12 down
```

Related Commands **show trigger**
trigger

type reboot

This command configures a trigger that activates when your device is rebooted.

Syntax `type reboot`

Mode Trigger Configuration

Example To configure trigger `32` to activate when your device reboots, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 32
awplus(config-trigger)# type reboot
```

Related Commands **show trigger**
trigger

type stack disabled-master

This command (configured to the stack) configures a trigger to activate on a stack member if it becomes the disabled master.

A disabled master has the same configuration as the active master, but has all its links shutdown.

Although this command could activate any trigger script, the intention here is that the script will reactivate the links from their previously shutdown state, to enable the user to manage the switch. An appropriate trigger script must already exist that will apply the **no shutdown** command on page 14.13 on the deactivated links.

It is important that any ports that are configured as trunked ports across master and stack members are disabled at their stack member termination when operating in the fallback configuration. Otherwise, the trunked ports will not function correctly on the switch that is connected downstream.

If the **stack virtual-mac** command on page 112.35 command is enabled, the stack uses a virtual MAC address. The stack will always use this MAC address and the new elected master will still retain the originally configured virtual MAC address. If the **stack virtual-mac** command is disabled, the stack will use the MAC address of the current master. If the stack master fails, the stack MAC address changes to reflect the new master's MAC address. See **"Fixed or Virtual MAC Addressing" on page 111.14** for information on virtual MAC addresses.

Syntax

```
type stack disabled-master
```

Mode Trigger Configuration

Examples To configure trigger `82` to activate on a device if it becomes the disabled master, use the commands:

Command	Description
`awplus#` `configure terminal`	Enter the Global Configuration mode
`awplus(config)#` `trigger 82`	Enter the Trigger Configuration mode for trigger 82
`awplus(config-trigger)#` `type stack disabled master`	Sets the type of trigger
`awplus(config-trigger)#` `script 1 flash:/disabled.scp`	
`awplus(config-trigger)#` `exit`	

Related Commands
stack disabled-master-monitoring
trigger
type stack master-fail
type stack member
type stack link

type stack master-fail

This command (configured to the stack) initiates the action of a pre-configured trigger to occur when the stack enters the fail-over state.

Syntax `type stack master-fail`

Mode Trigger Configuration

Example To configure trigger `86` to activate when stack master fail-over event occurs, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 86
awplus(config-trigger)# type stack master-fail
```

Related Commands stack disabled-master-monitoring
trigger
type stack disabled-master
type stack member
type stack link

type stack member

This command (configured to the stack) initiates the action of a pre-configured trigger to occur when a switch either joins or leaves the stack.

Syntax

```
type stack member {join|leave}
```

Parameter	Description
`join`	Neighbor join event
`leave`	Neighbor leave event

Mode Trigger Configuration

Example To configure a pre-configured trigger number `86` to activate when a new switch joins the stack
Note that the number `86` has no particular significance; you can assign any (previously created) numbered trigger

```
awplus# configure terminal
awplus(config)# trigger 86
awplus(config-trigger)# type stack member join
```

Related Commands
trigger
type stack master-fail
type stack link

type stack link

This command (configured to the stack) initiates the action of a pre-configured trigger to occur when a stacking link is either activated or deactivated.

Syntax `type stack link {up|down}`

Parameter	Description
`up`	Stack link up event
`down`	Stack link down event

Mode Trigger Configuration

Example To configure trigger `86` to activate when the stack link down event occurs, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 86
awplus(config-trigger)# type stack link down
```

Related Commands
show trigger
trigger
type stack master-fail

type time

This command configures a trigger that activates at a specified time of day.

Syntax `type time <hh:mm>`

Parameter	Description
<hh:mm>	The time to activate the trigger.

Mode Trigger Configuration

Usage A combined limit of 10 triggers of the type time and type periodic can be configured. If you attempt to add more than 10 triggers the following error message is displayed:

```
% Cannot configure more than 10 triggers with the type time or
periodic
```

Example To configure trigger `86` to activate at `15:53`, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 86
awplus(config-trigger)# type time 15:53
```

Related Commands **show trigger**
trigger

undebug trigger

This command applies the functionality of the **no debug trigger** command.

Chapter 107: Ping Polling Introduction and Configuration

Introduction 107.2
How Ping Polling Works 107.2

Creating a Polling Instance 107.4
Customizing a Polling Instance 107.5
Troubleshooting Ping Polling 107.6
Interaction with Other Protocols 107.7

Introduction

Ping polling lets your device regularly check whether it can reach other hosts on a network. It works by sending ICMP Echo Requests to a host and waiting for replies sent back. If ping polling indicates that a host's status has changed, then your device can respond to the new status. When a host is unreachable, ping polling continues monitoring the host's reachability.

You can configure triggers to activate when ping polling determines that the host's status has changed. For example, you could configure a trigger to run a script that opens and configures an alternative link if the host at the other end of a preferred link becomes unavailable. You could then configure a second trigger to run a script that automatically returns traffic to the preferred link as soon as it is available again.

How Ping Polling Works

To determine a host's reachability, your device regularly sends ICMP Echo Request packets ("pings") to the host. As long as your device receives ping responses from the host, it considers the host to be reachable. If your device does not receive a reply to a set number of ICMP Echo Requests, it considers that the host is unreachable. It continues to try to ping the device, at an increased rate. After it receives a set number of responses, it considers the device to be reachable again.

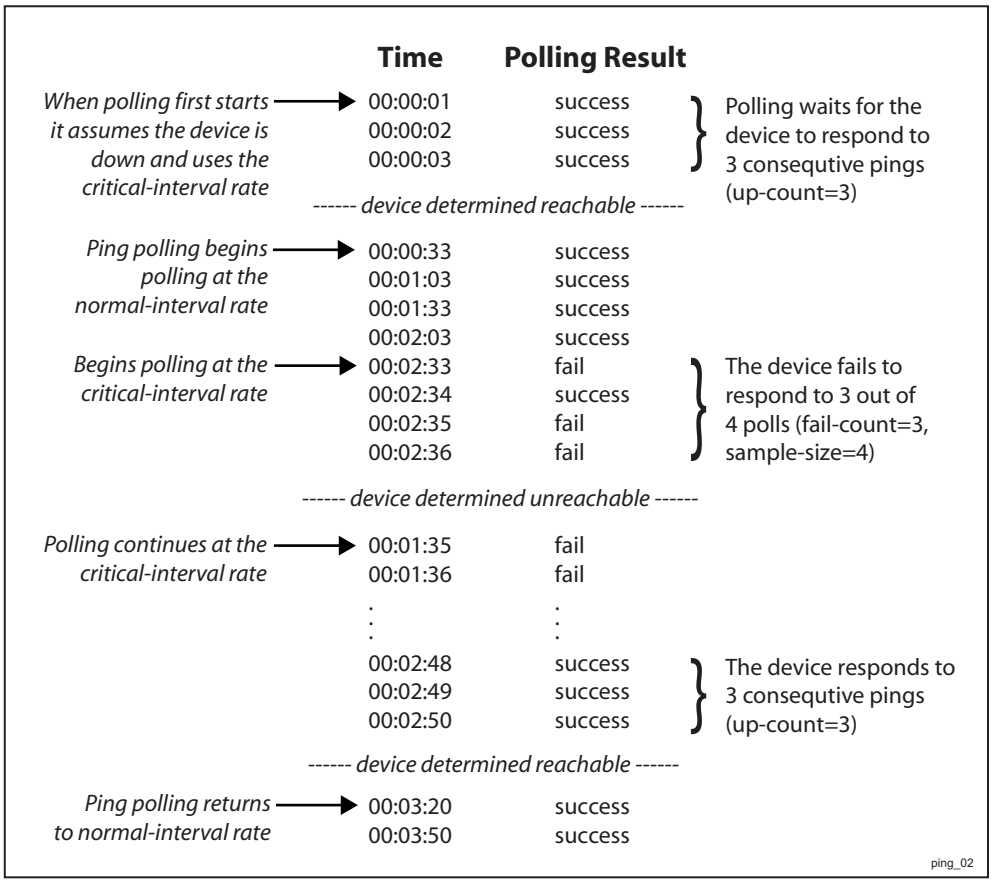
By default, a polling instance sends a ping every 30 seconds as long as it is receiving replies. The frequency of this polling is controlled by the normal-interval command. When a reply is not received, the polling instance increases the frequency at which it polls the device. This frequency is controlled by the critical-interval command, and by default, is set to send a packet every one second. It maintains this higher rate of polling until it has received sufficient consecutive replies.

The polling instance determines whether a device is reachable or unreachable based on the settings of the fail-count, sample-size, and up-count commands. To determine whether a device is reachable, the polling instance counts the number of failed pings within a set sample size. The sample size is set by the sample-size command, and by default is 5 ping responses. Within the sample size, the number of failed pings that means that the device is down is set by the fail-count command. By default this is set to 5. Once a polling instance has determined that a device is unreachable, it must receive a set number of consecutive replies before it changes the device's status back to reachable. This number is configured with the up-count command.

The following figure illustrates a polling instance where the device becomes unreachable, then reachable. It uses this configuration:

```
awplus(config-ping-poll)# fail-count 4
awplus(config-ping-poll)# sample-size 5
awplus(config-ping-poll)# up-count 3
awplus(config-ping-poll)# critical-interval 1
awplus(config-ping-poll)# normal-interval 30
```

Figure 107-1: Interaction between states and parameters for ping polling



On some operating systems, some servers may respond to a ping even if no other functionality is available, and therefore remain in an Up state while malfunctioning.

Responding to status changes

To configuring your device to determine and respond to changes in a device's reachability, you will need to:

- create a polling instance to periodically ping the device
- create scripts to run when the device becomes unreachable and when it becomes reachable again
- configure triggers to run these scripts

To set a trigger to activate when a device's status changes, its trigger type must be **ping-poll**. This is with the following command in the trigger's configuration mode:

```
awplus(config-trigger)# type ping-poll <1-100> {up|down}
```

where **up** activates the trigger when the device is reachable, and **down** activates the trigger when the device is unreachable.

If you use triggers to open a backup link to a remote device in the event of the primary link failing (rather than the remote device failing), the backup link and primary link must point to different IP addresses on the remote device. Otherwise, when the backup link points to the IP address that your device is polling, your device receives ping replies through the backup link, considers the device to be reachable again, and attempts to reopen the primary link instead of using the backup link. See **Chapter 104, Triggers Introduction** for more information about configuring Triggers with Ping Polling.

Configuring Ping Polling

This section contains:

- **Creating a Polling Instance**
  This explains how to quickly create a polling instance using the ping polling defaults.
- **Customizing a Polling Instance**
  This explains how to customize a ping poll and explains the other ping poll commands.
- **Troubleshooting Ping Polling**
  This explains how to use the debugging and monitoring commands for ping polling.

Creating a Polling Instance

The Ping Polling feature in the AlliedWare Plus™ OS allows you to easily configure polling instances with a minimum of commands. To configure a ping poll suitable for most network situations:

1. Create a polling instance by using the command:

```
awplus(config)# ping-poll <1-100>
```

   The range **<1-100>** identifies the polling instance in the trigger commands and in other ping poll commands. Your device can poll up to 100 IP addresses at once.

2. Set the IP address of the device you are polling by using the command:

```
awplus(config-ping-poll)# ip {<ip-address>|<ipv6-address>}
```

3. Enable the polling instance by using the command:

```
awplus(config-ping-poll)# active
```

4. If desired, set an optional description to identify the polling instance, by using the command:

```
awplus(config-ping-poll)# description <description>
```

You do not need to configure any other commands for most networks, because convenient defaults exist for all other ping poll settings. The following table summarizes the default configuration created.

Command	Default
Critical-interval	1 second
Fail-count	5
Length	32 bytes
Normal-interval	30 seconds
Sample-size	5

Command(cont.)	Default(cont.)
Source-ip	The IP address of the interface from which the ping packets are transmitted
Time-out	1 second
Up-count	30

Customizing a Polling Instance

Once you've created a polling instance using the ping-poll and **ip (ping-polling)** command, you may wish to customize the polling instance for your network.

Packet size

If you find that larger packet types in your network are not reaching the polled device while smaller ones such as ping do, you can increase the data bytes included in the ping packets sent by the polling instance. This encourages the polling instance to change the device's status to unreachable when packet of the size you are interested in are being dropped. To change the number of bytes sent in the data portion of the ping packets, use the command:

```
awplus(config-ping-poll)# length <4-1500>
```

Response timeout

The polling instance determines that a device hasn't responded to a ping if one second elapses without a response to the ping. In networks where ping packets have a low priority, you may need to set the allowed response time to a longer time period. To change this, use the command:

```
awplus(config-ping-poll)# timeout <1-30>
```

Polling frequency

By default, a polling instance polls a reachable device every 30 seconds. You can change this by using the command:

```
awplus(config-ping-poll)# normal-interval <1-65536>
```

Once the polling instance has determined that a ping has failed, it starts polling the device at the frequency set as the critical interval—by default, one second. To change the frequency set by the critical interval, use the command:

```
awplus(config-ping-poll)# critical-interval <1-65536>
```

The critical interval enables the polling instance to quickly observe changes in the state of the device, and should be set to a much lower value than the normal interval.

Configuring when the device's status changes

The number of pings that the polling instance examines to consider a change in state is controlled by the interaction of the sample-size, fail-count, and up-count commands. See **"How Ping Polling Works" on page 107.2** for an example showing this interaction.

To determine whether a device is reachable, the polling instance counts the number of failed pings within a sample of a set size. The sample size is 5 pings by default. To change the sample size, use the command:

```
awplus(config-ping-poll)# sample-size <1-100>
```

To change the number of failed pings that the sample must have, use the command:

```
awplus(config-ping-poll)# fail-count <1-100>
```

If the sample size and fail count are the same, the unanswered pings must be consecutive. If the sample size is greater than the fail count, a device that does not always reply to pings may be declared unreachable.

The upcount is the number of consecutive pings that must be answered for the polling instance to consider the device reachable again. To change this from the default of 30, use the command:

```
awplus(config-ping-poll)# up-count <1-100>
```

Checking the configuration

To check the settings and status of the polling instance, use the command:

```
awplus(config-ping-poll)# show ping-poll [<1-100>|state {up|
                          down}] [brief]
```

Troubleshooting Ping Polling

To disable a polling instance, use the command:

```
awplus(config-ping-poll)# no active
```

The polling instance no longer sends ICMP echo requests to the polled device and the counters for this polling instance are reset.

To clear the counters and change the status of a device to unreachable, enter the Privileged Exec mode and use the command:

```
awplus# clear ping-poll {<1-100>|all}
```

The polling instance changes to the polling frequency specified with the critical-interval command. The device status changes to reachable once the device responses have reached the **up-count**.

To start debugging for ping polling, use the command:

```
awplus# debug ping-poll <1-100>
```

Interaction with Other Protocols

Ping polling does not work if the polled host, your device, or any intermediate routers or switches are configured to drop ICMP Echo Requests and Replies.

Ping and Traceroute

Ping and Traceroute are not affected by ping polling. You can enter ping and trace commands at any time and independent of the polling.

Chapter 108: Ping-Polling Commands

Command List 108.2
active (ping-polling) 108.3
clear ping-poll 108.4
critical-interval 108.5
debug ping-poll 108.6
description (ping-polling) 108.7

Command List

This chapter provides an alphabetical reference for commands used to configure Ping Polling. For more information, see **Chapter 107, Ping Polling Introduction and Configuration**.

For information about modifying or redirecting the output from **show** commands to a file, see **"Controlling "show" Command Output" on page 1.38**.

Table 108-1: The following table lists the default values when configuring a ping poll.

Default	Value
Critical-interval	1 second
Description	No description
Fail-count	5
Length	32 bytes
Normal-interval	30 seconds
Sample-size	5
Source-ip	The IP address of the interface from which the ping packets are transmitted
Time-out	1 second
Up-count	30

active (ping-polling)

This command enables a ping-poll instance. The polling instance sends ICMP echo requests to the device with the IP address specified by the **ip (ping-polling)** command.

By default, polling instances are disabled. When a polling instance is enabled, it assumes that the device it is polling is unreachable.

The **no** variant of this command disables a ping-poll instance. The polling instance no longer sends ICMP echo requests to the polled device. This also resets all counters for this polling instance.

Syntax

```
active
no active
```

Mode Ping-Polling Configuration

Examples To activate the ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# active
```

To disable the ping-poll instance 43 and reset its counters, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# no active
```

Related Commands

debug ping-poll
ip (ping-polling)
ping-poll
show ping-poll

clear ping-poll

This command resets the specified ping poll, or all ping poll instances. This clears the ping counters, and changes the status of polled devices to unreachable. The polling instance changes to the polling frequency specified with the **critical-interval** command. The device status changes to reachable once the device responses have reached the **up-count**.

Syntax `clear ping-poll {<1-100>|all}`

Parameter	Description
`<1-100>`	A ping poll ID number. The specified ping poll instance has its counters cleared, and the status of the device it polls is changed to unreachable.
`all`	Clears the counters and changes the device status of all polling instances.

Mode Privileged Exec

Examples To reset the ping poll instance 12, use the command:

```
awplus# clear ping-poll 12
```

To reset all ping poll instances, use the command:

```
awplus# clear ping-poll all
```

Related Commands
active (ping-polling)
ping-poll
show ping-poll

critical-interval

This command specifies the time period in seconds between pings when the polling instance has not received a reply to at least one ping, and when the device is unreachable.

This command enables the device to quickly observe changes in state, and should be set to a much lower value than the **normal-interval** command.

The **no** variant of this command sets the critical interval to the default of one second.

Syntax

```
critical-interval <1-65536>
no critical-interval
```

Parameter	Description
<1-65536>	Time in seconds between pings, when the device has failed to a ping, or the device is unreachable.

Default The default is 1 second.

Mode Ping-Polling Configuration

Examples To set the critical interval to 2 seconds for the ping-polling instance 99, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 99
awplus(config-ping-poll)# critical-interval 2
```

To reset the critical interval to the default of one second for the ping-polling instance 99, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 99
awplus(config-ping-poll)# no critical-interval
```

Related Commands

fail-count
normal-interval
sample-size
show ping-poll
timeout (ping polling)
up-count

debug ping-poll

This command enables ping poll debugging for the specified ping-poll instance. This generates detailed messages about ping execution.

The **no** variant of this command disables ping-poll debugging for the specified ping-poll.

Syntax

```
debug ping-poll <1-100>
no debug ping-poll {<1-100>|all}
```

Parameter	Description
<1-100>	A unique ping poll ID number.
`all`	Turn off all ping-poll debugging.

Mode Privileged Exec

Examples To enable debugging for ping-poll instance 88, use the command:

```
awplus# debug ping-poll 88
```

To disable all ping poll debugging, use the command:

```
awplus# no debug ping-poll all
```

To disable debugging for ping-poll instance 88, use the command:

```
awplus# no debug ping-poll 88
```

Related Commands

active (ping-polling)
clear ping-poll
ping-poll
show ping-poll
undebug ping-poll

description (ping-polling)

This command specifies a string to describe the ping-polling instance. This allows the ping-polling instance to be recognized easily in show commands. Setting this command is optional.

By default ping-poll instances do not have a description.

Use the **no** variant of this command to delete the description set.

Syntax

```
description <description>
no description
```

Parameter	Description
<description>	The description of the target. Valid characters are any printable character and spaces. There is no maximum character length.

Mode Ping-Polling Configuration

Examples To add the text "Primary Gateway" to describe the ping-poll instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# description Primary Gateway
```

To delete the description set for the ping-poll instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# no description
```

Related Commands **ping-poll**
show ping-poll

fail-count

This command specifies the number of pings that must be unanswered, within the total number of pings specified by the **sample-size** command, for the ping-polling instance to consider the device unreachable.

If the number set by the **sample-size** command and the **fail-count** commands are the same, then the unanswered pings must be consecutive. If the number set by the **sample-size** command is greater than the number set by the **fail-count** command, then a device that does not always reply to pings may be declared unreachable.

The **no** variant of this command resets the fail count to the default.

Syntax

```
fail-count <1-100>
no fail-count
```

Parameter	Description
<1-100>	The number of pings within the sample size that a reachable device must fail to respond to before it is classified as unreachable.

Default The default is 5.

Mode Ping-Polling Configuration

Examples To specify the number of pings that must fail within the sample size to determine that a device is unreachable for ping-polling instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# fail-count 5
```

To reset the fail-count to its default of 5 for ping-polling instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# no fail-count
```

Related Commands

critical-interval
normal-interval
ping-poll
sample-size
show ping-poll
timeout (ping polling)
up-count

ip (ping-polling)

This command specifies the IPv4 address of the device you are polling.

Syntax `ip {<ip-address>|<ipv6-address>}`

Parameter	Description
<ip-address>	An IPv4 address in dotted decimal notation `A.B.C.D`
<ipv6-address>	An IPv6 address in hexadecimal notation `X:X::X:X`

Mode Ping-Polling Configuration

Examples To set ping-poll instance 5 to poll the device with the IP address `192.168.0.1`, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 5
awplus(config-ping-poll)# ip 192.168.0.1
```

To set ping-poll instance 10 to poll the device with the IPv6 address `2001:db8::`, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 10
awplus(config-ping-poll)# ip 2001:db8::
```

Related Commands
ping-poll
source-ip
show ping-poll

length (ping-poll data)

This command specifies the number of data bytes to include in the data portion of the ping packet. This allows you to set the ping packets to a larger size if you find that larger packet types in your network are not reaching the polled device, while smaller packets are getting through. This encourages the polling instance to change the device's status to unreachable when the network is dropping packets of the size you are interested in.

The **no** variant of this command resets the data bytes to the default of 32 bytes.

Syntax

```
length <4-1500>
no length
```

Parameter	Description
<4-1500>	The number of data bytes to include in the data portion of the ping packet.

Default The default is 32.

Mode Ping-Polling Configuration

Examples To specify that ping-poll instance 12 sends ping packet with a data portion of 56 bytes, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 12
awplus(config-ping-poll)# length 56
```

To reset the number of data bytes in the ping packet to the default of 32 bytes for ping-poll instance 3, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 12
awplus(config-ping-poll)# length
```

Related Commands **ping-poll**
show ping-poll

normal-interval

This command specifies the time period between pings when the device is reachable.

The **no** variant of this command resets the time period to the default of 30 seconds.

Syntax

```
normal-interval <1-65536>
no normal-interval
```

Parameter	Description
<1-65536>	Time in seconds between pings when the target is reachable.

Default The default is 30 seconds.

Mode Ping-Polling Configuration

Examples To specify a time period of 60 seconds between pings when the device is reachable for ping-poll instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# normal-interval 60
```

To reset the interval to the default of 30 seconds for ping-poll instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# no normal-interval
```

Related Commands

critical-interval
fail-count
ping-poll
sample-size
show ping-poll
timeout (ping polling)
up-count

ping-poll

This command enters the ping-poll configuration mode. If a ping-poll exists with the specified number, then this command enters its configuration mode. If no-ping poll exists with the specified number, then this command creates a new ping poll with this ID number.

To configure a ping-poll, create a ping poll using this command, and use the **ip (ping-polling)** command to specify the device you want the polling instance to poll. It is not necessary to specify any further commands unless you want to change a command's default.

The **no** variant of this command deletes the specified ping poll.

Syntax

```
ping-poll <1-100>
no ping-poll <1-100>
```

Parameter	Description
<1-100>	A unique ping poll ID number.

Mode Global Configuration

Examples To create ping-poll instance 3 and enter ping-poll configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 3
awplus(config-ping-poll)#
```

To delete ping-poll instance 3, use the commands:

```
awplus# configure terminal
awplus(config)# no ping-poll 3
```

Related Commands

active (ping-polling)
clear ping-poll
debug ping-poll
description (ping-polling)
ip (ping-polling)
length (ping-poll data)
show ping-poll
source-ip

sample-size

This command sets the total number of pings that the polling instance inspects when determining whether a device is unreachable. If the number of pings specified by the **fail-count** command go unanswered within the inspected sample, then the device is declared unreachable.

If the numbers set in this command and **fail-count** command are the same, the unanswered pings must be consecutive. If the number set by this command is greater than that set with the **fail-count** command, a device that does not always reply to pings may be declared unreachable.

You cannot set this command's value lower than the **fail-count** value.

The polling instance uses the number of pings specified by the **up-count** command to determine when a device is reachable.

The **no** variant of this command resets this command to the default.

Syntax

```
sample-size <1-100>
no sample size
```

Parameter	Description
<1-100>	Number of pings that determines critical and up counts.

Default The default is 5.

Mode Ping-Polling Configuration

Examples To set the sample-size to 50 for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# sample-size 50
```

To reset sample-size to the default of 5 for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# no sample-size
```

show counter ping-poll

This command displays the counters for ping polling.

Syntax `show counter ping-poll [<1-100>]`

Parameter	Description
<1-100>	A unique ping poll ID number. This displays the counters for the specified ping poll only. If you do not specify a ping poll, then this command displays counters for all ping polls.

Mode User Exec and Privileged Exec

Output **Figure 108-1: Example output from the show counter ping-poll command**

```
Ping-polling counters
Ping-poll: 1
PingsSent               ......... 15
PingsFailedUpState      ......... 0
PingsFailedDownState    ......... 0
ErrorSendingPing        ......... 2
CurrentUpCount          ......... 13
CurrentFailCount        ......... 0
UpStateEntered          ......... 0
DownStateEntered        ......... 0

Ping-poll: 2
PingsSent               ......... 15
PingsFailedUpState      ......... 0
PingsFailedDownState    ......... 0
ErrorSendingPing        ......... 2
CurrentUpCount          ......... 13
CurrentFailCount        ......... 0
UpStateEntered          ......... 0
DownStateEntered        ......... 0

Ping-poll: 5
PingsSent               ......... 13

PingsFailedDownState    ......... 2
ErrorSendingPing        ......... 2
CurrentUpCount          ......... 9
CurrentFailCount        ......... 0
UpStateEntered          ......... 0
DownStateEntered        ......... 0
```

Table 108-2: Parameters in output of the show counter ping-poll command

Parameter	Description
`Ping-poll`	The ID number of the polling instance.
`PingsSent`	The total number of pings generated by the polling instance.
`PingsFailedUpState`	The number of unanswered pings while the target device is in the Up state. This is a cumulative counter for multiple occurrences of the Up state.
`PingsFailedDownSta te`	Number of unanswered pings while the target device is in the Down state. This is a cumulative counter for multiple occurrences of the Down state.

Table 108-2: Parameters in output of the show counter ping-poll command(cont.)

Parameter	Description
`ErrorSendingPing`	The number of pings that were not successfully sent to the target device. This error can occur when your device does not have a route to the destination.
`CurrentUpCount`	The current number of sequential ping replies.
`CurrentFailCount`	The number of ping requests that have not received a ping reply in the current sample-size window.
`UpStateEntered`	Number of times the target device has entered the Up state.
`DownStateEntered`	Number of times the target device has entered the Down state.

Example To display counters for the polling instances, use the command:

```
awplus# show counter ping-poll
```

Related Commands
debug ping-poll
ping-poll
show ping-poll

show ping-poll

This command displays the settings and status of ping polls.

Syntax `show ping-poll [<1-100>|state {up|down}] [brief]`

Parameter	Description	
<1-100>	Displays settings and status for the specified polling instance.	
`state`	Displays polling instances based on whether the device they are polling is currently reachable or unreachable.	
	`up`	Displays polling instance where the device state is reachable.
	`down`	Displays polling instances where the device state is unreachable.
`brief`	Displays a summary of the state of ping polls, and the devices they are polling.	

Mode User Exec and Privileged Exec

Output **Figure 108-2: Example output from the show ping-poll brief command**

```
Ping Poll Configuration
-------------------------------------------------------
Id Enabled State Destination
-------------------------------------------------------
1  Yes     Down  192.168.0.1
2  Yes     Up    192.168.0.100
```

Table 108-3: Parameters in output of the show ping-poll brief command

Parameter	Meaning	
Id	The ID number of the polling instance, set when creating the polling instance with the **ping-poll** command.	
Enabled	Whether the polling instance is enabled or disabled.	
`State`	The current status of the device being polled:	
	`Up`	The device is reachable.
	`Down`	The device is unreachable.
	`Critical Up`	The device is reachable but recently the polling instance has not received some ping replies, so the polled device may be going down.
	`Critical Down`	The device is unreachable but the polling instance received a reply to the last ping packet, so the polled device may be coming back up.

Table 108-3: Parameters in output of the show ping-poll brief command(cont.)

Parameter	Meaning
Destination	The IP address of the polled device, set with the **ip (ping-polling)** command.

Figure 108-3: Example output from the show ping-poll command

```
Ping Poll Configuration
-------------------------------------------------------

Poll 1:
Description                          : Primary Gateway
Destination IP address               : 192.168.0.1
Status                               : Down
Enabled                              : Yes
Source IP address                    : 192.168.0.10
Critical interval                    : 1
Normal interval                      : 30
Fail count                           : 10
Up count                             : 5
Sample size                          : 50
Length                               : 32
Timeout                              : 1
Debugging                            : Enabled

Poll 2:
Description                          : Secondary Gateway
Destination IP address               : 192.168.0.100
Status                               : Up
Enabled                              : Yes
Source IP address                    : Default
Critical interval                    : 5
Normal interval                      : 60
Fail count                           : 20
Up count                             : 30
Sample size                          : 100
Length                               : 56
Timeout                              : 2
Debugging                            : Enabled
```

Table 108-4: Parameters in output of the show ping-poll command

Parameter	Description
Description	Optional description set for the polling instance with the **description (ping-polling)** command.
Destination IP address	The IP address of the polled device, set with the **ip (ping-polling)** command.

Table 108-4: Parameters in output of the show ping-poll command(cont.)

Parameter	Description	
Status	The current status of the device being polled:	
	Up	The device is reachable.
	Down	The device is unreachable.
	Critical Up	The device is reachable but recently the polling instance has not received some ping replies, so the polled device may be going down.
	Critical Down	The device is unreachable but the polling instance received a reply to the last ping packet, so the polled device may be coming back up.
Enabled	Whether the polling instance is enabled or disabled. The **active (ping-polling)** and **no active** commands enable and disable a polling instance.	
Source IP address	The source IP address sent in the ping packets. This is set using the **source-ip** command.	
Critical interval	The time period in seconds between pings when the polling instance has not received a reply to at least one ping, and when the device is unreachable. This is set with the **critical-interval** command.	
Normal interval	The time period between pings when the device is reachable. This is set with the **normal-interval** command.	
Fail count	The number of pings that must be unanswered, within the total number of pings specified by the **sample-size** command, for the polling instance to consider the device unreachable. This is set using the **fail-count** command.	
Up count	The number of consecutive pings that the polling instance must receive a reply to before classifying the device reachable again. This is set using the **up-count** command.	
Sample size	The total number of pings that the polling instance inspects when determining whether a device is unreachable. This is set using the **sample-size** command.	
Length	The number of data bytes to include in the data portion of the ping packet. This is set using the **length (ping-poll data)** command.	
Timeout	The time in seconds that the polling instance waits for a response to a ping packet. This is set using the **timeout (ping polling)** command.	
Debugging	Indicates whether ping polling debugging is **Enabled** or **Disabled**. This is set using the **debug ping-poll** command.	

Examples To display the ping poll settings and the status of all the polls, use the command:

```
awplus# show ping-poll
```

To display a summary of the ping poll settings, use the command:

```
awplus# show ping-poll brief
```

To display the settings for ping poll 6, use the command:

```
awplus# show ping-poll 6
```

To display a summary of the state of ping poll 6, use the command:

```
awplus# show ping-poll 6 brief
```

To display the settings of ping polls that have reachable devices, use the command:

```
awplus# show ping-poll state up
```

To display a summary of ping polls that have unreachable devices, use the command:

```
awplus# show ping-poll 6 state down brief
```

Related Commands **debug ping-poll**
ping-poll

source-ip

This command specifies the source IP address to use in ping packets.

By default, the polling instance uses the address of the interface through which it transmits the ping packets. It uses the device's local interface IP address when it is set. Otherwise, the IP address of the interface through which it transmits the ping packets is used.

The **no** variant of this command resets the source IP in the packets to the device's local interface IP address.

Syntax

```
source-ip {<ip-address>|<ipv6-address>}
no source-ip
```

Parameter	Description
<ip-address>	An IPv4 address in dotted decimal notation `A.B.C.D`
<ipv6-address>	An IPv6 address in hexadecimal notation `X:X::X:X`

Mode Ping-Polling Configuration

Examples To configure the ping-polling instance 43 to use the source IP address `192.168.0.1` in ping packets, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# source-ip 192.168.0.1
```

To configure the ping-polling instance 43 to use the source IPv6 address `2001:db8::` in ping packets, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# source-ip 2001:db8::
```

To reset the source IP address to the device's local interface IP address for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# no source-ip
```

Related Commands

description (ping-polling)
ip (ping-polling)
length (ping-poll data)
ping-poll
show ping-poll

timeout (ping polling)

This command specifies the time in seconds that the polling instance waits for a response to a ping packet. You may find a higher time-out useful in networks where ping packets have a low priority.

The **no** variant of this command resets the set time out to the default of one second.

Syntax

```
timeout <1-30>
no timeout
```

Parameter	Description
<1-30>	Length of time, in seconds, that the polling instance waits for a response from the polled device.

Default The default is 1 second.

Mode Ping-Polling Configuration

Examples To specify the timeout as 5 seconds for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# timeout 5
```

To reset the timeout to its default of 1 second for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# no timeout
```

Related Commands

critical-interval
fail-count
normal-interval
ping-poll
sample-size
show ping-poll
up-count

up-count

This command sets the number of consecutive pings that the polling instance must receive a reply to before classifying the device reachable again.

The **no** variant of this command resets the up count to the default of 30.

Syntax

```
up-count <1-100>
no up-count
```

Parameter	Description
<1-100>	Number of replied pings before an unreachable device is classified as reachable.

Default The default is 30.

Mode Ping-Polling Configuration

Examples To set the upcount to 5 consecutive pings for ping-polling instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# up-count 5
```

To reset the upcount to the default value of 30 consecutive pings for ping-polling instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# no up-count
```

Related Commands

The sFlow MIB 109.14

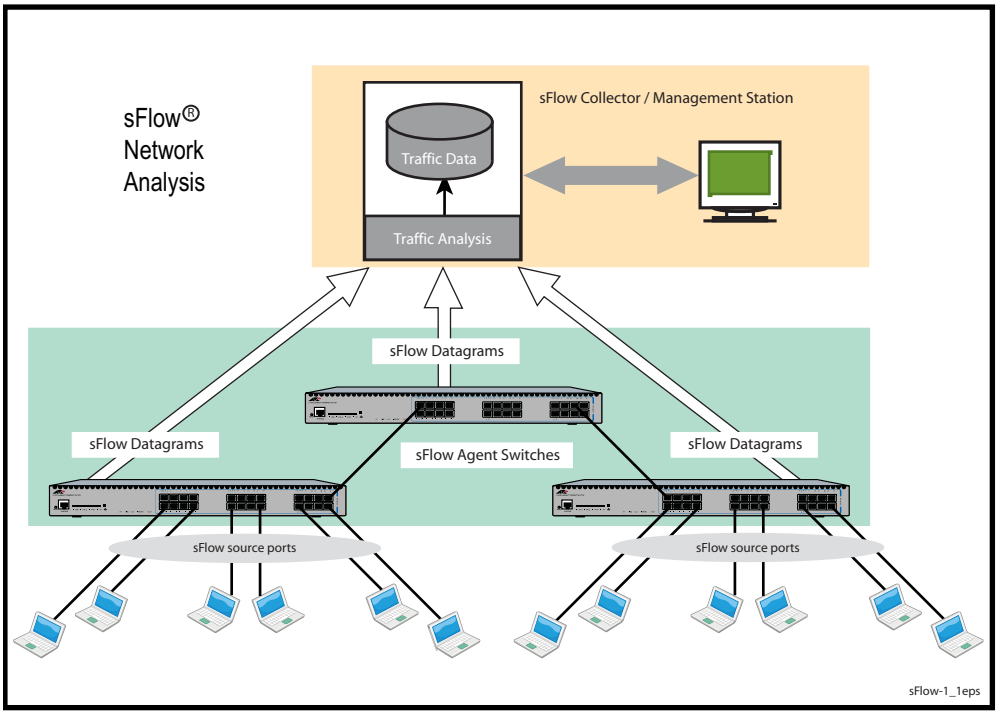
sFlow Introduction

sFlow®[1] provides the ability to monitor traffic in data networks containing switches and routers. A network employing sFlow typically comprises a number of network (sFlow) agents that accumulate sampled data and traffic counter information. The agents then forward this data to a collector. The collector then analyses the information supplied by its agents in order to compile and display statistical profiles of the network and its traffic. The sFlow feature on your switch provides the sFlow Agent capability.

1. **sFlow® is a registered trademark belonging to InMon Corp, San Francisco, CA.**

Figure 109-1 on page 109.2 shows a basic sFlow network structure. The three network switches also function as sFlow agents. Each agent switch captures samples of the traffic passing through its monitored ports, and sends these samples together with counter information back to the sFlow collector. The agents sample data from a number of switch ports, each acting as an sFlow data source.

Figure 109-1: Basic sFlow Network



The sFlow Agent

Your switch can act as an sFlow agent. The key capabilities of the agent are to:

- sample frames as they pass through selected ports on the switch, and provide sampled extracts of the network traffic.
- periodically capture interface counter data.
- package together the sampled frame and counter information that can be sent to the collector for analysis and display.
- be configurable via SNMP MIB objects.
- communicate to heterogeneous collector devices by means of standard protocols.

Agent components and functionality

sFlow functionality on your switch is based on the requirements defined in of RFC 3176 and its updates defined in the sFlow version 5 memo dated July 2004. This memo can be found at the web site, **www.sflow.org/sflow_version_5.txt.**

The terms defined in **Table 109-1** are used to describe the agent and its functionality on your switch:

Table 109-1: sFlow Terminology

sFlow® Component	Definition
Network Device	Typically either a network switch or router that has the ability to forward frames across an Ethernet network; or between Ethernet networks, in the case of a router.
Data Source (sFlow Source Port)	The location of a sampling point within the switch. This is typically a switch port.
Packet Flow	The path taken by the data (frames) as they traverse a network device.
Sampling Rate	The ratio of frames passing through the data source, to those captured and forwarded as sFlow data. See **sflow sampling-rate** command on page 110.13.
Counter Sampling	The periodic polling of counters taken at the data source.
sFlow Datagram	A UDP datagram that contains details of sFlow captured data, and counters sent by the sFlow Agent to its Collector.

The sFlow agent (switch) uses sampling technology to derive traffic statistics from its monitored ports. Samples are taken at the sFlow source ports. After collecting its information, the switch then packetizes its samples and statistical data, and sends both to a remote sFlow collector.

Sampling Methods

Two sampling methods are employed within the sFlow agent, frame sampling, and counter sampling. Both sample types are combined within the datagrams sent to the collector. The frame sample data will result in a relatively constant traffic stream, but the counter information is sent where it can fill available space within each datagram. Datagrams are normally sent to the collector at the rate of one each second. However, several datagrams can be sent in rapid succession, where more information exists than can be sent in a single datagram.

Frame Sampling

As frames enter or leave an sFlow source port, they are sampled at a rate determined by the **sflow sampling-rate** command on page 110.13for that particular port.

Sampling occurs every N frames (on average), where N is the rate value set via **sflow sampling-rate** command. The sampling rate applies to ingress and egress frames independently. For example, a value of 1000, will sample one frame in every 1000 frames received, one in every 1000 frames sent from the specified port.

Caution

Setting the sFlow sampling rate to a very low value (frequent sampling) can place a heavy load on the switch's CPU. The severity of this loading will increase with the number of ports configured for sampling, the port speeds, and their data sampling rates.

Data Confidentiality

Sampling operates by capturing the initial portion of frames (statistically) selected. The portion sampled is set by the **sflow max-header-size** command on page 110.10, or SNMP. If the **maximum header size** is greater than the actual headers in the sampled frames, then portions of the user data (payload) will also be captured and encapsulated in the datagrams sent to the collector. The amount of user data captured can be minimized by careful selection of the maximum header size.

Counter Polling

The function of counter polling is to provide snapshots of various system counters. This produces a series of data counter sets for each port, which can be independently polled at user defined rates, and sent (once a second or less) to the collector. Allied Telesis switches running AlliedWare Plus software support generic interface counters only. For more information on the data types included in the sampling count, see **"sFlow Datagrams" on page 109.13**.

The sFlow Collector

The sFlow collector receives traffic samples and counter information from a number of sFlow agents. These samples are received as a series of UDP datagrams. From the data contained within these datagrams, the collector is able to provide statistical and or graphical information of network traffic.

The sFlow agent application on your switch supports only a single collector configuration.

sFlow collectors are proprietary third party products. Your switch, running as an sFlow agent has been designed for interoperability with any sFlow collector that supports the sFlow Version 5 specification, including the inMon sFlow collector.

The sFlow Collector may also contain an SNMP Manager that is able to configure sFlow on its agent switches.

Configuring sFlow on your Switch

This section provides some guidelines for setting up the sFlow® agent on your switch. sFlow can be configured directly on your switch - using the CLI, or it can be configured via an SNMP manager. The SNMP management function can be carried out either by a the sFlow collector, or a separate SNMP manager. The configuration examples in this section are shown using the CLI.

Caution

On an SBx908 with a XEM-2XP module fitted, sFlow sampling does not operate for this XEM when the XEM-2XP is installed in the lowest numbered SBx908 bay. Ensure that any XEM-2XP modules are not fitted in the lowest bay in an SBx908.

If a XEM module that is installed in a lower numbered SBx908 bay is hot swapped then a XEM-2XP module installed in a higher numbered SBx908 bay may become the XEM in the lowest numbered bay, resulting in sFlow sampling not operating. Ensure that any XEM-2XP modules will not become the XEM in the lowest numbered bay in an SBx908 by fitting the XEM-2XP in the highest numbered bay.

Caution

The sFlow configurations set either by the switch's CLI, or the sFlow collector. Sometimes the collector will overide the sFlow settings that were initially configured by the CLI, in order to apply "its" own default settings.

If you want to apply the sFlow settings set by the CLI, or by an external network management system, then turn off network management at the collector.

We also advise that as part of your sFlow commissioning process, you review your security access procedures relating to sFlow access and its data traffic management.

sFlow configuration can vary greatly with your overall configuration, data profile, and monitoring intensity. Also, many interdependencies existing between parameter settings. For this reason, few firm configuration settings are recommended in this software reference, but instead these parameter relationships are explained and some typical configuration examples are shown.

The default settings on your switch have sFlow turned off for all ports.
The following commands are used to setup and configure sFlow on your switch. These are introduced in the order in which you would logically need to use them.

sFlow Command	Functionality
sflow enable	enables sFlow on your switch (or stack).
sflow max-header-size	sets the maximum sFlow data capture size.
sflow collector max-datagram-size	sets the maximum size for the agent to collector datagrams.
sflow agent (address)	sets the sFlow agent IP address on the switch.
sflow polling-interval	sets the counter polling interval for specified ports.
sflow sampling-rate	sets the mean sampling rate for specified ports.
sflow collector (address)	the sFlow agent's collector IP address and/or UDP port.

Configuration Procedure

The following process sets out a systematic procedure to configure sFlow on your switch:

Information Gathering

sFlow configuration is dependant on your network structure and its data. Start by gathering together the following information.

- Obtain (or determine) the sFlow collector IP address.
- Select an appropriate UDP port for your sFlow datagrams. The recommended value is 6343, and is the default value preconfigured on your switch.
- Select an appropriate IP address for your sFlow agent. We recommend that you use the local IP address of your switch. For more information on local addresses and how to set them up, see the **interface (to configure)** command on page 14.3.
- Assess the sensitivity of the data that your sFlow agent will be sampling.
- Obtain details of the protocols that your sFlow agent will be sampling. If you intend sampling unusual or proprietary protocols, obtain details of their header lengths.
- Calculate the most appropriate max-header-size for your sFlow sampling.
- Select the ports that you want to sample, and their sample rate.
  These two factors vary (not quite) proportionally; so if you double the number of ports and double your sampling rate (i.e. sample half as many frames) then you will "almost" return to your earlier situation. Also note the speeds of the ports you have selected, because - for the same port utilization - the faster the port speed, the greater the load on the CPU.
- Review the speed of the port used to transport the sFlow datagrams to the collector. Unless configured to a specific port, the collector traffic will share the same network port with other traffic.

  The capacity of the collector port should be sufficient to carry the volume of sFlow traffic. This topic is expanded on in the **Configuration Examples** later in this chapter.

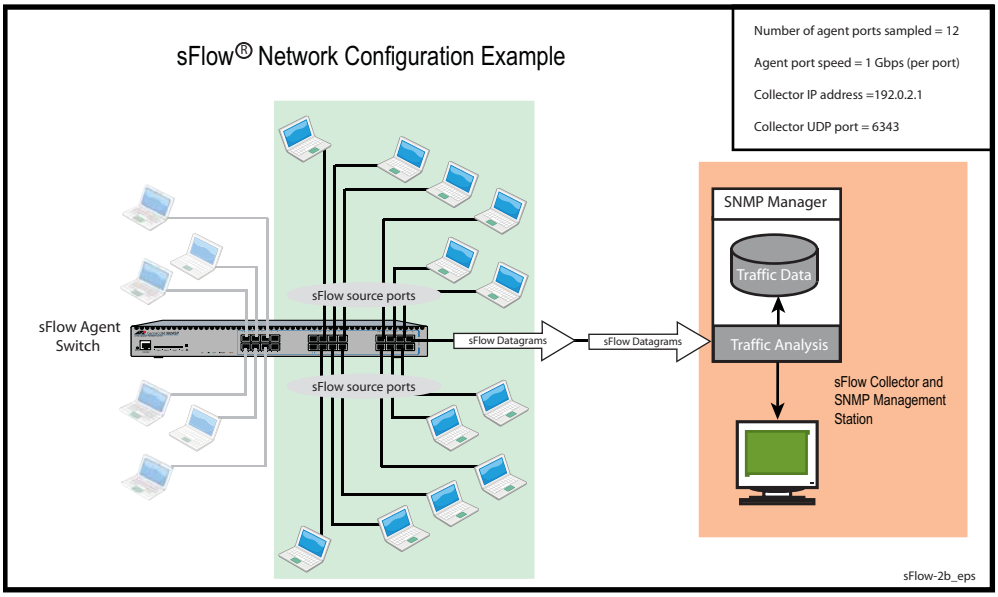
Managing the sFlow processing overhead

The sFlow data sampled on the ports converges into the CPU for processing and UDP packetizing. Therefore one of the major factors when configuring sFlow is to prevent the sFlow data volumes from placing a significant overhead on the CPU processing. The two most significant factors here are, the **number of ports sampled**, and the **sampling rate**. The other (and lessor) factors in this equation are the **frame size distribution** and the **maximum header size.** The shorter the frames are on the network, the heavier the sFlow processing load will be (for the same number of frames per second). Conversely the shorter the maximum header size selected, the lighter the sFlow processing load will be (because less data per frame is sent to the CPU).

Configuration Examples

This section provides a configuration example based on the network shown below:

Figure 109-2: sFlow Configuration Example



Step 1: Determine the IP addresses and UDP ports.

Collector IP address is 192.0.2.65

sFlow UDP port uses the default of 6343

Agent (local) IP address 192.0.2.33. This is the address that the collector may use to configure the agent via SNMP.

Step 2: Determine the maximum sFlow Datagram size.

Datagrams will be sent at one second intervals regardless of the amount of data they contain. If the amount of data to be sent is greater than the maximum datagram size, then several datagrams will be sent in quick succession - within the 1 second interval. The objective is to contain the sFlow information in a the minimum number of datagrams. That is. to fragment datagrams when necessary, but do it as little as possible.

Find the maximum datagram size that will pass through all network components without fragmenting. Then set the sFlow datagram size a little less than this value.

The maximum datagram size should be less than the MTU size.

For this example, the MTU is assumed to be set to its default of 1500 bytes. In this situation we could leave the maximum Datagram size at its default of 1400 bytes; but in order to show this as a configuration step, we will change it to 1200 bytes.

Note

sFlow datagrams are generally transmitted at 1 second intervals. However, where there is more information than can fit into one datagram, several datagrams are sent sequentially, within the 1 second time frame.

Step 3: Determine the max-header-size for the sampled data.

The maximum header size for the sampled data is set by the **sflow max-header-size** command. The optimum setting is to capture only the header portion of the frame and discard the user-data portion. This is especially important where the user data contains sensitive information.

Keeping the max-header-size as small as possible has the additional benefit of lightening the CPU load.

First, inspect the nature of the data to be sampled and the protocols used to carry it.

For this example we will assume that the network contains Ethernet II frames with the 4 byte 802.1Q header component, IP, TCP protocols. In this situation the following rules can be applied:

For an environment using standard TCP\IPv4 over Ethernet frames, consider the following protocol basics.

Ethernet header (including the 4 byte 802.1Q header component) = 18 bytes

IPv4 header = 24 bytes

TCP header = 24 bytes

Total = 66 bytes

A similar calculation can be made for an environment using IPv6 over Ethernet.

Ethernet header (including the 4 byte 802.1Q component) = 18 bytes

IPv6 header = 40 bytes

TCP header = 24 bytes

Total = 82 bytes

Caution

In the above network scenarios:

- **For IPv4 - any data existing between 66 bytes and the value set by this command will be included in the sFlow packet samples. For example, with the default of 128 applied, up to 128-66=62 bytes of user data could be included in the sFlow datagram samples sent between the Agent and the Collector.**
- **For IPv6 - any data existing between 82 bytes and the value set by this command will be included in the sFlow packet samples. For example, with the default of 128 applied, up to 128-82=46 bytes of user data could be included in the sFlow datagram samples sent between the Agent and the Collector.**

For this example the **sflow max-header-size** will be set to 68 bytes (assuming an Ethernet - IPv4 - TCP environment).

Step 4: Select ports to sample

Each sampled sFlow port speed is 1 Gbps

12 ports have been selected for sampling

Check that none of the ports selected have mirroring configured. sFlow will not operate if any port on the switch is configured for mirroring.

Note

When sampling is across ports that form an aggregated link, statistics will be extracted on traffic across all links, but their display is shown as if all traffic is flowing through the first physical link created.

Step 5: Determine the sampling rate

Selecting the sampling rate involves a trade-off between sFlow requirements, and system loading. The greater the sampling rate, the more samples will be taken, and the more accurate their results will be. Unfortunately, taking more samples increases the load on the switch CPU and on the network connection to the collector.

For this particular configuration, the value of the sampling rate was set to 512 so as to present a light load on the CPU.

Step 6: Review and adjust settings

Because sFlow traffic loading will vary with the traffic profile, the following general assumptions are made. The following traffic profile is assumed.

« 50 % of frames are <200 bytes long

« 40 % of frames are >1400 bytes long

The following settings are:

« 12 x 1 Gbps ports are being sampled

« sFlow max-header size = 68 bytes

« sampling rate (N = 512)

« average port utilization is assumed to be approximately 60 %

« average data rate to the collector is assumed to be approximately 1.5 Mbps

When setting the sampling rate, consider the following factors that will affect the CPU load. This load will increase (not necessarily linearly) as you:

« increase the number of ports configured

« increase the port speeds

« decrease the sampling rate

« increase the max-header-size

For this configuration the average sFlow collector traffic is expected to be approximately 1.5 Mbps. In this example the agent-to-collector traffic will be shared with non-sFlow traffic. Although not described in this example, you can specifically configure the collector port to route only sFlow traffic. To do this you would need to assign a separate VLAN (and IP address) to the agent-to collector interface and direct your sFlow traffic to this interface.

We advise that you ensure adequate bandwidth is provided for both the sFlow and general traffic that could share its network connection.

We will now use these settings to configure the network.

Configuration Procedure

The following steps apply the settings obtained in the previous section.

Step 1: Configure sFlow

Enable sFlow on the switch

`awplus#`	
`configure terminal`	Enter Global Configuration Mode.
`awplus(config)#`	
`sflow enable`	Enable the sFlow agent globally on the switch.

Step 2: Configure the sFlow Collector Settings

Set the sFlow collector max-datagram size

`awplus(config)#`	
`sflow collector max-datagram-size 1200`	Set the maximum size of the sFlow datagrams to 1200 bytes.

Set the sFlow collector (address)

`awplus(config)#`	
`sflow collector ip 192.0.2.65`	Set the sFlow collector address to 192.0.2.65.

Step 3: Configure the sFlow Agent Settings

Set the sFlow agent (address)

`awplus(config)#`	
`sflow agent ip 192.0.2.33`	Set the sFlow agent address to 192.0.2.33.

Set the sFlow sampling rate on sFlow Source Ports

`awplus(config)#`	
`interface port1.0.11-port1.0.22`	Select the port range to configure (ports 1.0.11 to 1.0.22).
`awplus(config-if)#`	
`sflow sampling-rate 512`	Set the sampling rate on the selected ports.

Step 4: Check the Configuration

View the sFlow Configuration

`awplus(config-if)#`	
`do sh running-config sflow`	Validate that sFlow is enabled Note that the prefix “do” enables you to run an Exec Mode command from an Interface Mode prompt.

Figure 109-3: Output from the show running-config sFlow command

```
awplus#sh run sflow
!
sflow agent ip 192.0.2.33
sflow collector ip 192.0.2.65
sflow collector max-datagram-size 1200
sflow enable
!
interface port1.0.11-port1.0.22
 sflow sampling-rate 512
```

sFlow Datagrams

After data sampling and counter information has been gathered, each sFlow agent packetizes the data and sends it to an sFlow collector where it can be analyzed and displayed in charts and tables etc.

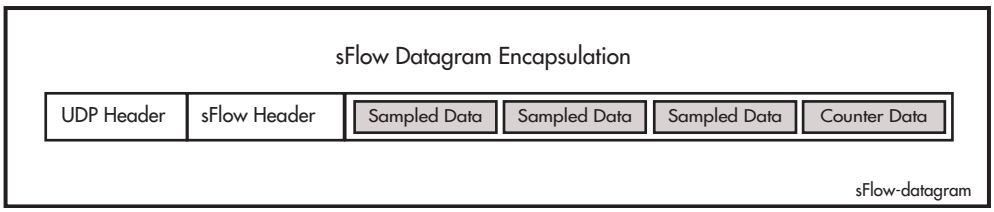
This packetized data is sent to the collector in UDP datagrams. These datagrams bear the IP address of the collector and the port number 6343. Using a standardized port helps to avoid configuration problems between the sFlow agents and collectors.

Although an analysis of the sFlow datagrams is outside the scope of this document, some basic information is provided here for those interested in knowing the basic components of the sFlow datagrams. The full specification of the sFlow protocol can be found at **www.sflow.org/sflow_version_5.txt**.

sFlow datagrams comprise three basic components:

- Datagram header information
- Flow sample information - may contain several samples
- Counter statistical information - fitted in where space permits

Figure 109-4: sFlow Datagram Encapsulation



The content of these datagram components is listed below:

sFlow Header Fields

- Version (The sFlow version being used)
- IP Address Type (Can be either an IPv4 or IPv6 address type)
- Source IP Address (The IP address of the sFlow agent)
- Sequence Number (The datagram sequence number)
- System Up-time
- Sample Count (The number of samples in the datagram)
- Sample Dataset

sFlow Flow Sample Fields

- Flow Sample 1 (The first sample)
- Sample Type (Flow Sample, 0x0001)
- Sample Sequence Number (of flow samples)
- Sampler ID
- Sampling Rate (as set by the **"sflow sampling-rate" on page 110.13** or SNMP)
- Sample Pool (the total number of packets that could have been sampled)
- Packets Dropped (the number of packets dropped, due to a lack of resources)
- Input (the interface that the packet was received on - not supported)
- Output (the index number of the interface that the packet was sent from)
  (Note that your collector should have the ability via SNMP to resolve index numbers to physical port numbers)
- Packet Type
- Header Protocol - Ethernet ISO 88023(1)
- Packet Size (Frame Length including the FCS)
- Header Length - The sampled portion of the frame as set by the **"sflow max-header-size" on page 110.10**. May be shorter for small frames.
- Header Bytes

- Extended Elements Number
- Extended Elements

Note that in practice the Ethernet header is usually followed by components for the IP, TCP, and user data.

sFlow Flow Sample Fields

- Counter Sample
- Sample Type (Counter Sample, 0x0002)
- 'Sample Sequence Number
- Sample ID (source ID index value)
- Sample Interval (as set by the **"sflow polling-interval" on page 110.12**)
- Counter Type (1=generic, 2=Ethernet)

Generic Interface Counters

- ifIndex
- ifType
- ifSpeed
- ifDirection (0=unknown, 1=full-duplex, 2=half-duplex, 3=in, 4=out
- ifStatus
- InOctets
- InUcastpackets
- InMulticast packets
- InBroadcast packets
- InDiscarded packets (= 0)
- InPackets containing errors
- InPackets containing unknown protocols (= 0)
- OutOctets
- OutUcast packets
- OutMulticast packets
- OutBroadcast packets
- OutDiscarded packets
- OutPackets containing errors
- ifPromiscuous Mode

Ethernet Interface Counters

- dot3Stats Alignment Errors (= 0)
- dot3Stats FCS Errors
- dot3Stats Single Collision Frames (= 0)
- dot3Stats Multiple Collision Frames
- dot3Stats SQE Test Errors
- dot3Stats Deferred Transmissions (= 0)
- dot3Stats Late Collisions
- dot3Stats Excessive Collisions
- dot3Stats Internal Mac Transmit Errors
- dot3Stats Carrier Sense Errors (= 0)
- dot3Stats Frame Too Longs
- dot3Stats Internal Mac Receive Errors
- dot3Stats Symbol Errors (= 0)

The sFlow MIB

Your switch fully supports inMon's sFlow MIB. For more information, see **"In general, all objects are supported except where the relevant protocol or feature is either not supported or not applicable to the device. The following table lists the private MIBs supported by the AlliedWare PlusTM Operating System. Any variations from the standard are listed." on page 98.91**, and the website **www.sflow.org/SFLOW-MIB5.txt**.

Chapter 110: sFlow Commands

Command List 110.2
debug sflow 110.2
debug sflow agent 110.3

show running-config sflow 110.16
show sflow 110.17
show sflow interface 110.18
undebug sflow 110.18

Command List

This chapter provides an alphabetical reference for sFlow commands.

debug sflow

This command enables sFlow® debug message logging, for sFlow sampling and polling activity on the specified ports. If no ports are specified, sampling and/or polling debug messages are enabled for all ports.

The **no** variant of this command disables sFlow sampling and or polling debug message logging on the ports selected. If no ports are specified, sampling and/or polling debug messages are disabled on all ports.

Syntax

```
debug sflow [interface <port-list>] [sampling][polling]
no debug sflow [interface <port-list>] [sampling][polling]
```

Parameter	Description
`interface`	Interface information.
`<port-list>`	The ports for which sFlow debug is to be enabled. The ports to display information about. The port list can be: ■ a switch port (e.g. `port1.0.12`) ■ a continuous range of ports separated by a hyphen, e.g. `port1.0.1-1.0.24` ■ a comma-separated list of ports and port ranges, e.g. `port1.0.1,port1.1.1-1.2.24`.
`sampling`	Debug sFlow sampling for the specified port(s).
`polling`	Debug sFlow polling for the specified port(s).

Default The sFlow sampling and or polling debug is disabled.

Mode Privileged Exec

Examples To enable sFlow debug message logging for polling and sampling on `port1.0.1` and `port1.0.7`, use the commands:

```
awplus# debug sflow interface port1.0.1,port1.0.7 sampling
       polling
```

To enable logging and polling of sFlow debug messages for polling and sampling on all ports, use the command:

```
awplus# debug sflow sampling polling
```

Related Commands **show debugging sflow**
no debug all

debug sflow agent

This command enables sFlow® debug message logging that is not specific to particular ports. For example, sending an sFlow datagram to the collector.

The **no** variant of this command applies the command default.

Syntax

```
debug sflow agent
```

```
no debug sflow agent
```

Default The sFlow agent debug message logging (that is not port specific) is disabled.

Mode Privileged Exec

Example To enable logging of sFlow agent debug messages, use the following command:

```
awplus# debug sflow agent
```

Related Commands

show debugging sflow
debug sflow

sflow agent (address)

This command sets the sFlow® agent IP address on the switch. This address is inserted into every sFlow datagram sent from the sFlow agent switch to the sFlow collector device. The sFlow collector can then uses this address to uniquely identify and to access the switch, such as for SNMP. We therefore recommend that you change this address as little as possible.

Although the agent address can be set to any valid IPv4 or IPv6 address; we recommended that you set the sFlow® agent IP address to be the **local address**[1] that is configured on the switch. This ensures that the sFlow collector can maintain connectivity to the switch irrespective of the addition or deletion of VLAN interfaces (each of which will have its own specific IP address). Note that sFlow is rendered inactive whenever the agent address is not set.

The **no** variant of this command applies its default setting to remove a configured address.

Syntax

```
sflow agent {ip <ip-address>|ipv6 <ipv6-address>}
no sflow agent {ip|ipv6}
```

Parameter	Description
<ip-address>	The IPv4 address of the switch that is acting as the sFlow agent.
<ipv6-address>	The IPv6 address of the switch that is acting as the sFlow agent. The IPv6 address uses the format X:X::X:X.

Default The sFlow agent address is unset.

Mode Global Configuration

Examples To set the sFlow agent (IPv4) address to `192.0.2.23`, use the command:

```
awplus# configure terminal
awplus(config)# sflow agent ip 192.0.2.23
```

To remove the sFlow agent (IPv4) address, use the command:

```
awplus# configure terminal
awplus(config)# no sflow agent ip
```

To set the sFlow agent (IPv6) address to `2001:0db8::1`, use the command:

```
awplus# configure terminal
awplus(config)# sflow agent ipv6 2001:0db8::1
```

1. **For information on local addresses and how to set them up, see the interface (to configure) command on page 14.3.**

To remove the sFlow agent (IPv6) address, use the command:

```
awplus# configure terminal
awplus(config)# no sflow agent ipv6
```

Related Commands **show running-config sflow**
show sflow

sflow collector (address)

This command sets the sFlow® agent's collector IP address and/or UDP port. This is the destination IP address and UDP port, for sFlow datagrams sent from the sFlow agent. The IP address can be any valid IPv4 or IPv6 address. Note that sFlow is rendered inactive whenever the collector address is set to 0.0.0.0 (for IPv4) or `::` (for IPv6).

The **no** variant of this command returns the IP address and UDP port values to their defaults, which will result in sFlow being deactivated.

Syntax

```
sflow collector {[ip <ip-address>|ipv6 <ipv6-address>]|
    [port <1-65535>]}

no sflow collector {[ip|ipv6]|[port]}
```

Parameter	Description
<ip-address>	IPv4 address of the remote sFlow collector.
<ipv6-address>	IPv6 address of remote sFlow collector. The IPv6 address uses the format X:X::X:X.
`port`	Destination UDP port for sFlow datagrams sent to the collector.
<1-65535>	UDP port number (default: 6343).

Default The collector address is `0.0.0.0` (which renders sFlow inactive), and the UDP port is `6343`.

Mode Global Configuration

Examples To set the sFlow collector address to `1920.2.25` and UDP port to `9000`, use the command:

```
awplus# configure terminal
awplus(config)# sflow collector ip 192.0.2.25 port 9000
```

To remove the sFlow collector IPv4 address and leave the UDP port unchanged, use the command:

```
awplus# configure terminal
awplus(config)# no sflow collector ip
```

To remove the sFlow collector IPv4 address and to remove the UDP port, use the command:

```
awplus# configure terminal
awplus(config)# no sflow collector ip port
```

To set the sFlow collector address to `2001:0db8::1` and leave the UDP port unchanged, use the command:

```
awplus# configure terminal
awplus(config)# sflow collector ipv6 2001:0db8::1
```

To remove the sFlow collector IPv6 address and leave the UDP port unchanged, use the command:

```
awplus# configure terminal
awplus(config)# no sflow collector ipv6
```

To remove the sFlow collector IPv6 address and to remove the UDP port, use the command:

```
awplus# configure terminal
awplus(config)# no sflow collector ipv6 port
```

Related Commands

show running-config sflow
show sflow

sflow collector max-datagram-size

This command sets the maximum size of the sFlow® datagrams sent to the collector.

The **no** variant of this command resets the maximum-datagram-size to the default.

Syntax

```
sflow collector max-datagram-size <200-1500>
no sflow collector max-datagram-size
```

Parameter	Description
<200-1500>	The maximum number of bytes that can be sent in an sFlow datagram sent from the agent to the collector.

Default 1400 bytes

Mode Global Configuration

Example To set the maximum datagram size to 1200, use the command:

```
awplus# configure terminal
awplus(config)# sflow collector max-datagram-size 1200
```

Related Commands

show running-config sflow
show sflow

sflow enable

This command enables sFlow® globally on the switch. Note that sFlow cannot be enabled if Tx port mirroring is enabled on any port on the device.

The **no** variant of this command disables sFlow globally on the switch.

Note that enabling sFlow does not automatically set its operational status to active. To activate sFlow the following conditions need to be met:

- sFlow is enabled.
- The sFlow agent address is set.
- The sFlow collector address is set to a valid (non zero) IPv4 or IPv6 address.
- Polling or sampling is enabled on the ports to be sampled or polled.

Syntax

```
sflow enable
no sflow enable
```

Default sFlow is disabled globally on the switch.

Mode Global Configuration

Example To enable sFlow operation, use the command:

```
awplus# configure terminal
awplus(config)# sflow enable
```

Related Commands

show running-config sflow
show sflow

sflow max-header-size

This command sets the maximum header size of the ethernet frames sampled on a specified port. The maximum header size is measured in bytes, referenced from the first byte of the ethernet destination address and excludes the ethernet FCS fields.

If a sampled ethernet frame is longer than the maximum header size set by this command, then the frame will be truncated to the first N bytes before being placed in the sFlow datagram, where N is the maximum header size set by this command.

The **no** variant of this command resets the max-header-size to its default.

Syntax

```
sflow max-header-size <14-200>
no sflow max-header-size
```

Parameter	Description
<14-200>	The maximum number of header bytes to be sampled.

Default The max-header-size is 128 bytes.

Mode Interface Configuration

Usage The header size is measured from the first byte of the Ethernet frame MAC Destination Address.

For an environment using standard TCP IPv4 over Ethernet frames, consider the following basic protocol structure:

Ethernet header (including the 4 byte 802.1Q header component) = 18 bytes

IPv4 header = 24 bytes

TCP header = 24 bytes

Total = 66 bytes

See **"Determine the max-header-size for the sampled data." on page 109.9** for more information on configuring this command.

A similar consideration can be made for an environment using TCP IPv6 over Ethernet:

Ethernet header (including the 4 byte 802.1Q header component) = 18 bytes

IPv6 header = 40 bytes

TCP header = 24 bytes

Total = 82 bytes

Caution

In the above network scenarios:

- **For IPv4 - any data existing between 66 bytes and the value set by this command will be included in the sFlow packet samples. For example, with the default of 128 applied, up to 128-66=62 bytes of user data could be included in the sFlow datagram samples sent between the Agent and the Collector.**
- **For IPv6 - any data existing between 82 bytes and the value set by this command will be included in the sFlow packet samples. For example, with the default of 128 applied, up to 128-82=46 bytes of user data could be included in the sFlow datagram samples sent between the Agent and the Collector.**

Note that the agent-to-collector datagrams contain their own UDP headers, which are outside this calculation.

Example To set the maximum header size to 160 bytes for ports 1.0.1 and 1.0.7, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.7
awplus(config-if)# sflow max-header-size 160
```

Related Commands

show running-config sflow
show sflow interface
sflow max-header-size

sflow polling-interval

This command sets the sFlow® counter polling interval (in seconds) for the specified ports. A value of 0 disables polling. A counter sample is taken every N seconds where N is the value set by this command.

The **no** variant of this command applies the default.

Syntax

```
sflow polling-interval {0|<1-16777215>}
no sflow polling-interval
```

Parameter	Description
0	Disable polling (the default).
<1-16777215>	The polling interval in seconds.

Default The polling-interval is 0 (polling disabled).

Mode Interface Configuration

Example To set the polling interval to 60 seconds for ports 1.0.1 and 1.0.7, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.7
awplus(config-if)# sflow polling-interval 60
```

Related Commands

show running-config sflow
show sflow interface

sflow sampling-rate

This command sets the mean sFlow® sampling rate for the specified ports. Sampling occurs every N frames (on average), where N is the rate value set via this command. The sampling rate applies to ingress and egress frames independently. For example, a value of 1000 will sample one frame in every 1000 frames received. One in every 1000 frames sent from the specified port. A value of 0 disables sampling on the specified ports.

The **no** variant of this command applies the default.

Syntax

```
sflow sampling-rate {0|<50-2147483647>}
no sflow sampling-rate
```

Parameter	Description
0	Sets the default.
<50-2147483647>	The sampling rate N, measured in ethernet frames.

Default The sampling-rate is 0 (sampling disabled).

Mode Interface Configuration

Example To set the sampling rate to 500 for ports 1.0.1 and 1.0.7, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.7
awplus(config-if)# sflow sampling-rate 500
```

Related Commands

show running-config sflow
show sflow interface

show debugging sflow

This command displays sFlow® debug settings for agent operation, and for sampling and polling on specific interface ports. If no interface ports are specified, sampling and polling will be applied to all ports.

Syntax `show debugging sflow [interface <port-list>]`

Parameter	Description
`interface`	The interface information.
`<port-list>`	The ports for which the sFlow debug settings are to be shown. The ports to display information about. The port list can be: ■ a switch port (e.g. `port1.1.12`) ■ a continuous range of ports separated by a hyphen, e.g. `port1.0.1-1.0.24` ■ a comma-separated list of ports and port ranges, e.g. `port1.0.1,port1.1.1-1.2.24`.

Mode User Exec and Privileged Exec

Example To display sFlow debug settings on the agent, and for sampling and polling on ports 1.0.1 to 1.0.9, use the command:

```
awplus# show debugging sflow interface port1.0.1-1.0.9
```

Output **Figure 110-1: Sample obtained for an sFlow agent**

```
awplus# show debugging sflow interface port1.0.1-1.0.9

sFlow Agent Debug:    Enabled

           Sampling      Polling
Port        Debug         Debug
-------------------------------
1.0.1      Enabled       Enabled
1.0.2      Enabled          -
1.0.3         -             -
1.0.4         -             -
1.0.5         -             -
1.0.6         -          Enabled
1.0.7         -             -
1.0.8         -          Enabled
1.0.9         -          Enabled
```

To display sFlow debug settings for all ports, use the command:

```
awplus# show debugging sflow
```

Related Commands **show running-config sflow**
show sflow interface

show running-config sflow

This command displays the running system information specific to the sFlow feature.

Syntax `show running-config sflow`

Mode Privileged Exec and Global Configuration

Example To display the sFlow running configuration information, use the command:

```
awplus# show running-config sflow
```

Output **Figure 110-2: Example output from the show running-config sflow command**

```
awplus#sh run sflow
!
sflow agent ip 192.0.2.33
sflow collector ip 192.0.2.65
sflow collector max-datagram-size 1200
sflow enable
!
interface port1.0.11-port1.0.22
 sflow sampling-rate 512
```

Related Commands show running-config

show sflow

This command displays non-port-specific sFlow agent configuration and operational status.

Syntax `show sflow`

Mode Privileged Exec

Example To display sFlow configuration and operational status, use the command:

```
awplus#  show sflow
```

Output

Figure 110-3: Example output from the show sflow command

```
sFlow Agent Configuration:                    Default Values
  sFlow Admin Status ........ Disabled        [Disabled]
  sFlow Agent Address ....... [not set]       [not set]
  Collector Address ......... 0.0.0.0         [0.0.0.0]
  Collector UDP Port ........ 6343            [6343]
  Tx Max Datagram Size ...... 1200            [1400]

sFlow Agent Status:
  Polling/sampling/Tx ....... Inactive because:
                                - sFlow is disabled
                                - Agent Addr is not set
                                - Collector Addr is 0.0.0.0
                                - Polling & sampling disabled
                                  on all ports
```

Table 110-1: Parameters in the output of the show sflow command

Output Parameter	Description
`sFlow Admin Status`	Whether sFlow agent operation is administratively enabled.
`sFlow Agent Address`	The sFlow agent IPv4 or IPv6 address for the device. sFlow is rendered inactive whenever the agent address is not set.
`Collector Address`	The IPv4 or IPv6 collector address to which sFlow datagrams are sent. sFlow is rendered inactive whenever the collector address is set to 0.0.0.0 or 0:0::0.0.
`Collector UDP Port`	The UDP port on the collector to which sFlow datagrams are sent.
`Tx Max Datagram Size`	The maximum size of the sFlow datagrams sent to the collector.
`Polling/sampling/Tx`	Whether sFlow sampling and/or polling (and hence sFlow datagram transmission) are active. If inactive the reasons are listed.

Related Commands show running-config sflow
show sflow interface

show sflow interface

This command displays sFlow agent sampling and polling configuration for specified ports.

Syntax `show sflow interface <ifrange>`

Parameter	Description
`<ifrange>`	The interface range.

Mode Privileged Exec

undebug sflow

This command applies the functionality of the **no debug sflow** command.

VCStack Introduction

This chapter describes Virtual Chassis Stacking (VCStack), its features, and basic connection examples. For detailed descriptions of the commands used to configure VCStack, see **Chapter 112, Stacking Commands**. Also, see **Alliedware Telesis Support Documentation** for detailed instructions on how to install this feature.

VCStack is a group of physically separate switches that are configured to operate as a single logical switch. In order to function as a VCStack, its component switches are connected using high-speed stacking links.

Features of Virtual Chassis Stacking

Creating a VCStack greatly eases network management, because you can configure all the stacked devices via a single IP address. Creating a VCStack will often eliminate your need to configure protocols such as VRRP and Spanning Tree. VCStack also enables you to create highly resilient networks. This resiliency can be applied in several ways.

Within the stack itself, switch interconnection is via two links. The second link is able to provide an alternative data path, thus the stack will continue to function if a single switch fails. Degraded performance might occur however, due to the reduced VCStack bandwidth.

User ports can also be made extremely resilient by utilizing link aggregation. Aggregated links can span ports, modules, and even switches within the stack. Creating aggregated links that span multiple switches within a stack creates an extremely resilient configuration. Communication will still exist even if a switch and its aggregated ports fail. Refer to **Figure 111-4 on page 111.7.**

Caution

Stack operation is only supported if stack virtual-mac is enabled. For more information refer to: "Enabling the stack virtual-mac" on page 111.14 and "stack virtual-mac" on page 112.35

VCStack Capable Switches

VCStack is supported on the following Allied Telesis switch types:

- x900-24XT, x900-24XS, x900-24XT-N
- x900-12XT/s
- SwitchBlade® x908
- x610 Series
- x510 Series

Note

You can only create VCStacks using switches from within the same product group, for example, all x510 Series switches, or all x610 Series switches.

Stacking connectivity and functionality varies slightly between switch types. Your SwitchBlade x908 or x900 Series switch can support a maximum of two devices per stack. Consult the appropriate software reference for stacking functionality on other Allied Telesis switches.

Within the SBx908/x900 Series, switches must be of the same product type to exist within the same stack. Product/stack compatibility is shown in the following table.

Table 111-1: Stacking compatibility by product type

Product Types	x900-24XS, x900-24XT, x900-24XT-N	Via XEM-STK ports.
Product Type	x900-12XT/s	Via XEM-STK ports.
Product Type	SwitchBlade® x908	Via either XEM-STK ports, or high speed rear chassis ports.

The Physical Stack

A stack comprises two individual members interconnected via a high-speed stacking link. A stack always has a primary stack member called the stack master, and a secondary stack member called the backup member.

The basic stack configurations are:

- Two stack members connected in a ring topology via their stack XEM modules. All models.
- On SwitchBlade® x908, two stack members connected via their back-plane chassis connections—a variation of the ring topology.

VCStack stacking modules, cables, and connections

XEM module cables and connections

The XEMStack ports use special cables to construct the physical stack; these are:

- AT-XEM-STK-CBL0.5 (0.5 metres long)
- AT-XEM-STK-CBL2.0 (2 metres long)

Chassis rear cables and connections

The chassis rear stacking ports use special cables to construct the physical stack; these are:

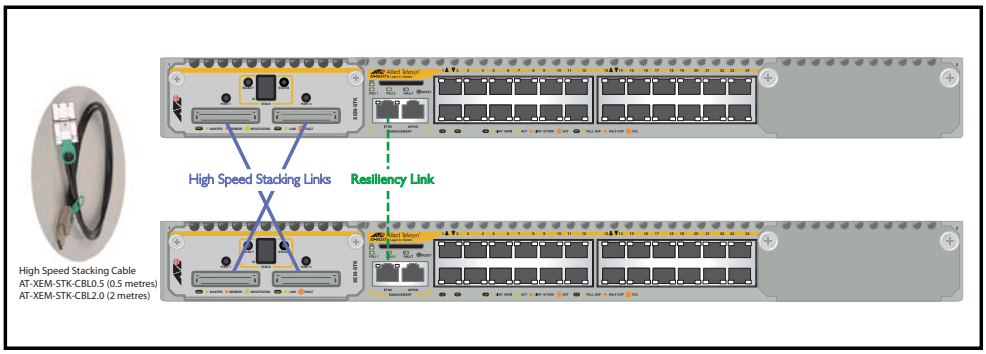
For the back panel chassis connections on the SwitchBlade x908, use the cable type AT-HS-STK-CBL1.0 (1 metre long).

Note Port `1` on one switch must connect to port `2` on the other (or next) switch.

Two Switch Stack Configuration

This configuration, shown in **Figure 111-1 on page 111.4**, uses two switches that are connected via their high-speed stacking links and an optional resiliency link. Note that stacking ports labeled 1 must connect to stacking ports labeled 2. In this configuration the stack can still function using only a single high speed link.

Figure 111-1: Two Switch Stack Configuration



On the SwitchBlade® x908, the two switch configuration can use either the connections on a XEM stacking module, or use stacking ports 1 and 2 located on the chassis rear panel. The chassis rear panel connections have a faster data rate, but do require a special cable.

Resiliency link

The resiliency link carries no network data. Its function is to provide additional stack status information to enable the stack members to more accurately decide whether it is appropriate for one of them to take over the role of stack master if the existing master fails. See **"Stack Resiliency Link" on page 111.15**.

A resiliency link can be created using a single physical connection between two eth0 ports, or it can use a VLAN (resiliency link VLAN) to which the switch ports can be attached.

To create a resiliency link using eth0 ports, connect a standard twisted pair LAN cable (either straight through, or crossover—MDI-MDIX negotiation is supported on these ports) between the two eth0 ports on both devices. Once you have connected the cable you can run the **stack resiliencylink** command on page 112.31 to create the resiliency link.

Resiliency link configurations via switch ports

Two resiliency-link configurations that use switch ports are shown below. The first figure shows the resiliency link connecting in a ring topology, whilst the second figure shows the resiliency link connecting to the switch ports via a network hub. In both configurations, the resiliency link connections are made using a designated VLAN running over switch-port connections between each stack member. For more information on using the resiliency link commands see the **stack resiliencylink** command on page 112.31 and the **switchport resiliencylink** command on page 112.38.

Figure 111-2: Resiliency link connecting to switch ports over the ResiliencyLink VLAN

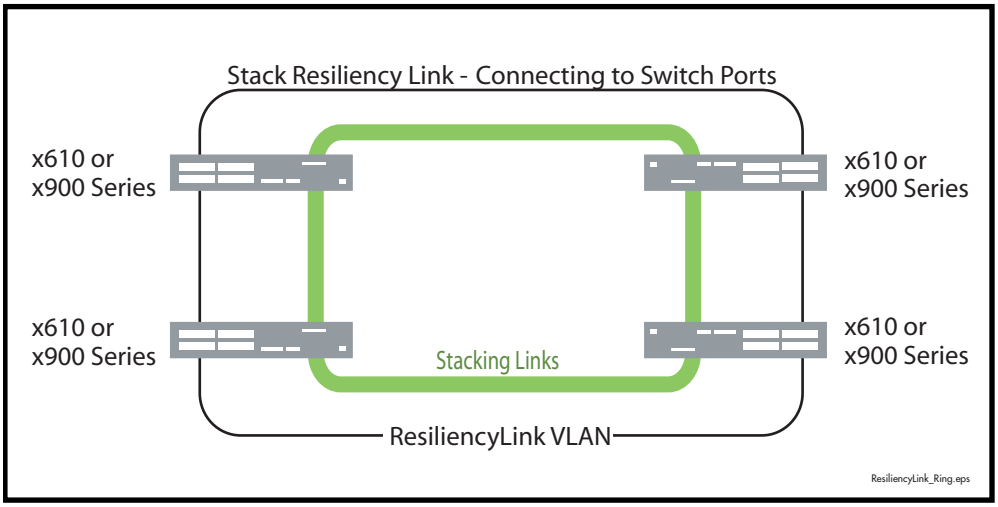


Figure 111-3: Resiliency link connecting to switch ports over the ResiliencyLink VLAN using a network hub .

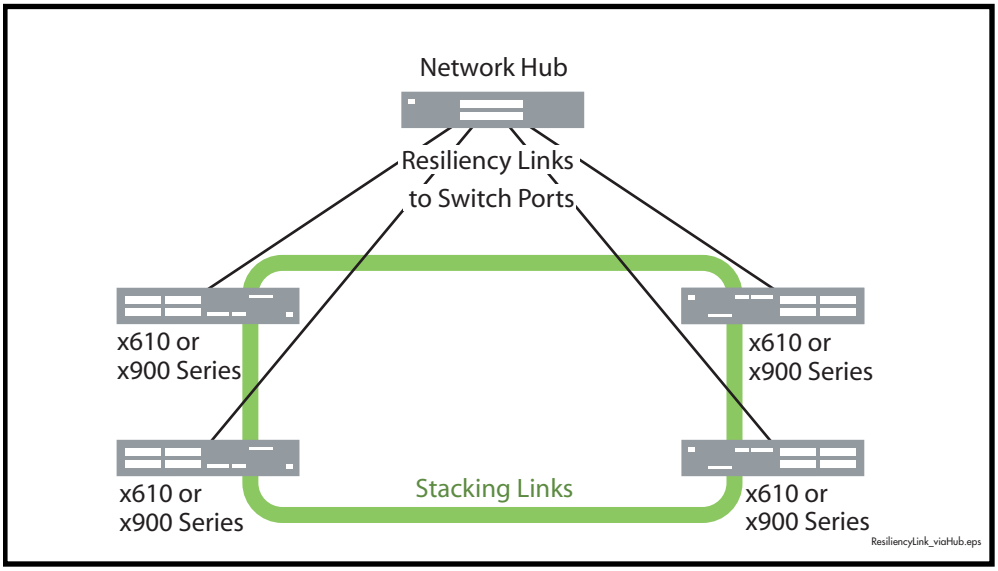
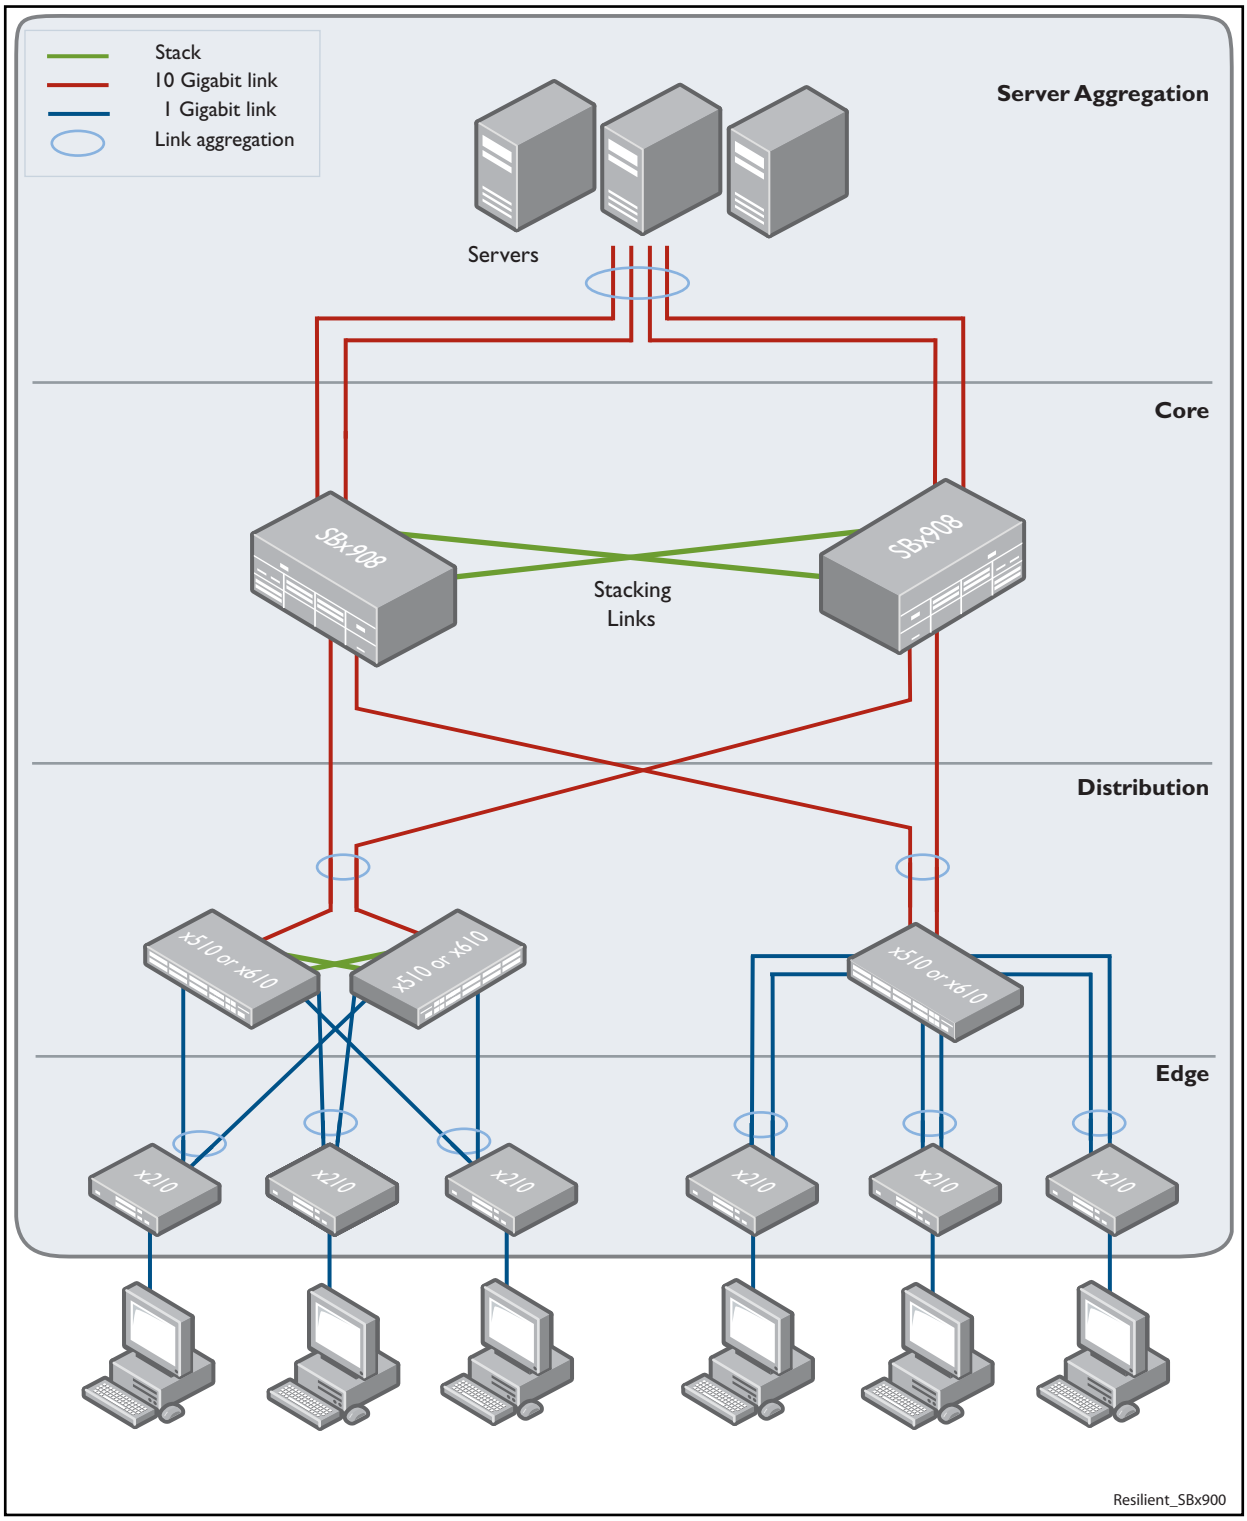


Resilient Stacked Topology

Where network connectivity uptime is a major criteria, you can use virtual chassis stacking to create highly reliable network configurations. The network shown in **Figure 111-4** employs redundant links and switches to create a stacked network that offers extremely reliable user connectivity.

Employing link aggregation rather than spanning tree to manage the parallel paths, enables the bandwidth of both data links to be utilized under normal conditions, whilst enabling a single data link to operate should its partner link fail.

Figure 111-4: VCStack Resilient Stacked Topology Example



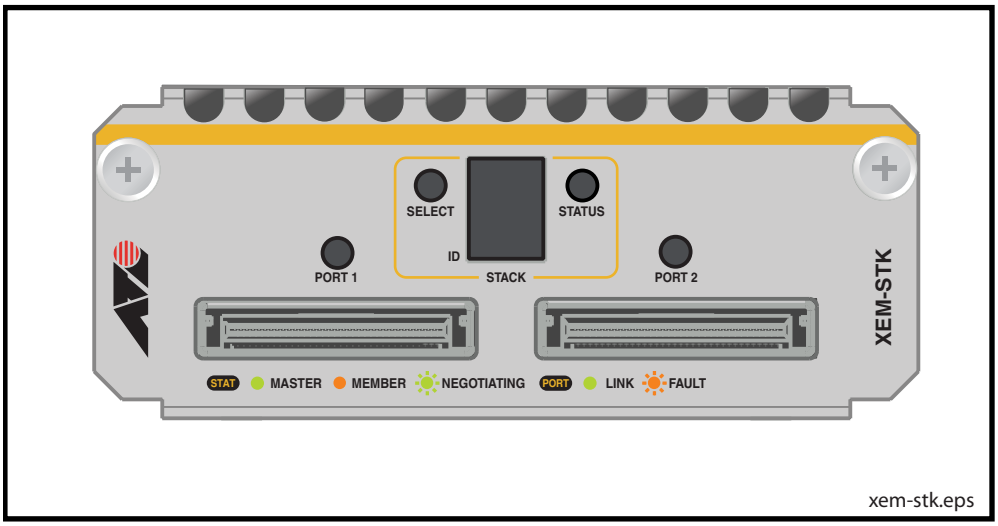
This network employs two SwitchBlade® x908 switches to form an expandable network core. These switches are stacked and so appear as a single logical switch (note that smaller switches such as the x610 can be also be used to form the stacked core or stacked distribution).

This network topology supplies multiple dual connections to a number of downstream distribution switches that can in turn connect to user devices. Similarly, the dual network paths provide very reliable connectivity to the servers portion of the network.

Stack Formation

As previously mentioned, a VCStack always contains a stack master and a stack member. To be part of a stack, a switch must connect to the other potential stack member via dedicated stacking ports. These ports can either be those on the front of a XEM-STK stacking module, or in the case of the SwitchBlade x908, the stacking ports located on the back panel. **Figure 111-5 on page 111.8** shows a stacking XEM-STK module.

Figure 111-5: VCStack Stacking Module (XEM-STK)



On the SwitchBlade® x908, at least one non XEM-STK must be installed in the switch before it is able to participate as a stack member. The SwitchBlade x908 will remain a standalone node until a non-stacking XEM is inserted, at which point it will initiate a topology discovery sequence and join the stack. Note that when the SwitchBlade x908 is operating as a standalone node it will not switch data around the stacking ring.

Once the switches have been physically connected to form a stack, powering all the members on automatically sets off a number of processes that enable the stack members to detect the presence of the other stack members and form themselves into a VCStack.

The Role of the Stack Master

In addition to being a member of its VCStack, the stack master manages functions such as software version control and distribution, routing processing, and network management.

Selecting the stack master

The stack members are able to automatically select which switch will become the stack master. This selection is based on two components:

1. The stack member's priority setting.
2. The stack member's MAC address.

For both components, the lower the number the higher the priority. To set the stack priority, run the **stack priority** command on page 112.28. Note that changes to these settings will not take effect until the next master re-election. To display these components run the **show stack** command on page 112.17.

The master is the switch with the lowest priority setting, or if the priority settings are equal, the switch with the lowest MAC address will become the stack master. When a stack member is initially booted, its priority value defaults to 128. Therefore if all switches retain their defaults, then the stack master will be determined by MAC address comparison.

The stack also assigns a `stack-ID` number to each member. This number provides a unique reference number for switches within the stack; it plays no part in selecting the stack master. The `stack-ID` is used as the first digit of the three component port identifier numbers. For example, port number 2.0.14 has the `stack-ID` of 2.

Note

This last point is an important one to remember when using configuration scripts. You should ensure that you modify your configuration scripts to match any changes you have made to the `stack-ID` assignments.

Note

The ability to independently set both a stack member's priority and its ID means that the stack master does not need to have an ID of `1`; although configuration is simplified by arranging for ID `1` to be the device with the lowest priority value - and thereby forcing it to be the stack master. If you create a stack using new switches, the following (simplified) process should ensure that the master member has an ID of `1`.

New switches are shipped with a Stack Member-ID of `1` and a priority of 128. If two such switches are created as a stack, the switch with the lowest MAC address will be selected to be the stack master (because all priority settings are 128). The remaining stack member device will then reboot. The stack master does not reboot and retains its Stack Member-ID of `1`.

You can change the stack-ID by using either the ID select button on the XEM-STK, or by using the **stack renumber** command on page 112.29.

Common Stack Configuration

Once the switches have configured themselves into a VCStack, they all share the same configuration information and startup scripts.

Once the stack is formed, each stack member's configuration is associated with its Stack Member-ID number. Pressing the select button on a XEM-STK will set its switch member to have Stack Member-ID 1, and it will acquire the configuration settings assigned to that particular ID number. The other switch in the stack will then realign its Stack Member-IDs according to the stack's physical topology.

Stack Management VLAN

Managing the stack is the same as managing an individual switch. You can connect to the asynchronous console port of any stack member, or you can set an IP address on a network VLAN (for example, VLAN 1) and use SSH for remote access.

As the switches form themselves into a stack, each switch creates a common stack management VLAN and a management IP address. Both the VLAN ID and the IP address are internal entities that are used between the stacked switches, via the stacking ports, and therefore do not appear on the user network.

Initially the stack assigns the default VLAN tag ID of 4094 to the management VLAN, and assigns an IP address from the subnet 192.168.255.0/27 to this VLAN as the management IP address. Once the stack has formed, you can change both these settings. To change the VLAN ID use the **stack management vlan command on page 112.27**. To change the management IP address use the **stack management subnet command on page 112.26**. Note however, that you must keep the 27 bit subnet mask, (/27 or 255.255.255.224).

Also note that the management VLAN ID and management IP subnet must be unique across the stack's internal and external network. This means you cannot use the management VLAN ID or management IP subnet elsewhere in the user network. However, note that stacks in the same network can all use the same management VLAN ID and management IP subnet settings internally. To view the current settings for the stack management VLAN ID and IP address, use the **show stack command on page 112.17**.

Stack member identification

When a switch that is connected via a XEM-STK module, becomes a stack member, the numeric display on the XEM-STK indicates the switch's member ID, see the **Figure 111-6 on page 111.11**. If the switch is not a stack member, the XEM-STK seven-segment display will be blank. The following LEDs indicate the switch's status within the stack.

Table 111-2: Stacking LED Functions

LED	State	Meaning
Port 1 and Port 2	Green	A stacking link is established
	Amber (flashing slowly)	The link has transmission fault
	Off	The stacking link is down
Status	Green	The switch is the stack master
	Amber	The switch is a (non master) stack member
	Green (flashing)	The stack is selecting a stack master
	Off	The switch is not a stack member
Numeric ID	1 to 4	The stack member ID
	Off	The switch is not a stack member

The following figure shows the XEM-STK ports and LEDs.

Figure 111-6: XEM-STK LEDs

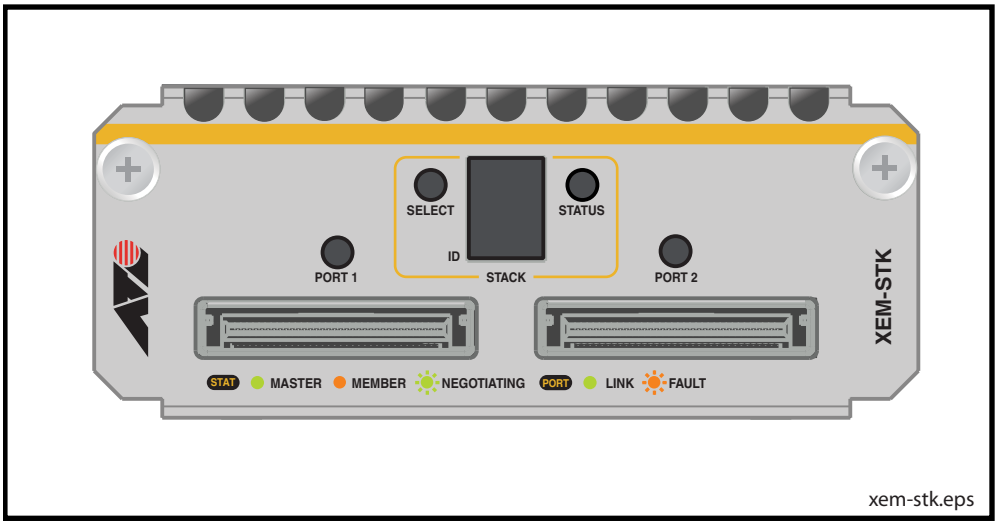


Figure 111-7: SB x908 Stacking LEDs (SwitchBlade x908)

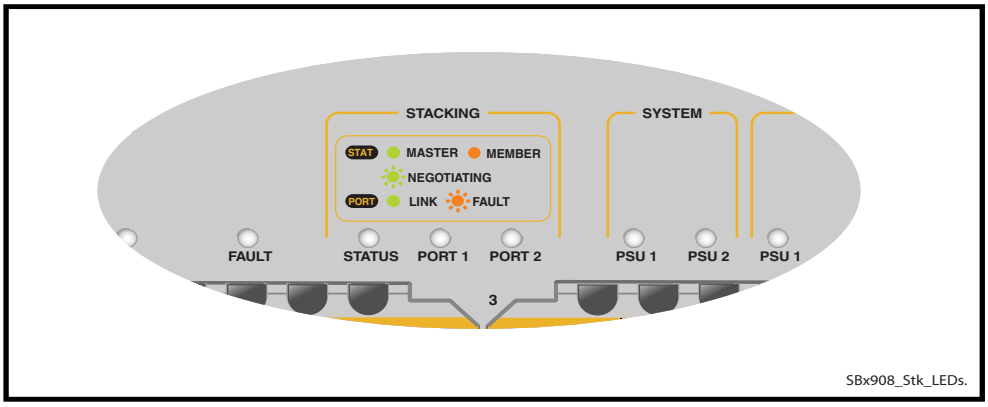

Running commands on specific stack members

In some situations, you may want to obtain information that is specific to a particular stack member. For many **show** commands, you can specify the desired stack member. For example, to show the processes for stack member 2, use the following command:

```
awplus# show process 2
```

In other cases, you can use the **remote-login** command to log into the specific stack member. For example, to see a directory listing for stack member 2, use the following commands:

```
awplus# remote-login 2
awplus-2# enable
awplus-2# dir
```

To return to the command prompt on the master stack member, type **exit**.

For more information on using this command, see the **remote-login command on page 112.10**.

Running QoS within a VCStack

When you configure QoS on a VCStack, you need to make the following changes:

Switches within a VCStack exchange their stack management traffic and user data over their high speed stacking links. The stack management traffic is pre-assigned to the egress queue 7. This is the highest value queue, and (in a stacked configuration) its traffic should not be shared with any user data. However, any CoS tagging of 7 applied to the incoming data will automatically be assigned to queue 7. You will therefore need to reconfigure your CoS to Queue settings to ensure that no user data is sent to queue 7.

To prevent this from happening, we recommend that you make appropriate changes to your queue settings (mappings) to reflect the stacking requirement previously described. For more information on this topic, see **"Mapping CoS tags to traffic types" on page 65.13**.

This process should include (but not be limited to) running the following command to ensure that any remaining user packets still carrying a CoS 7 tag, will be mapped to egress queue 6.

To remap priority CoS traffic to egress queue 6, run the following commands:

```
awplus# config terminal
awplus(config)# mls qos map cos-queue 7 to 6
```

Stack Member Failure and Recovery

Fixed or Virtual MAC Addressing

A VCStack operates using a single virtual MAC address. This address is configurable by using the **stack virtual-mac** command on page 112.35.

Enabling the stack virtual-mac

When the **stack virtual-mac** command is enabled, the stack uses a virtual MAC address selected from an allocated pool of MAC addresses. The stack will then always use this MAC address even if the stack master fails or is removed from the stack. In this situation, the new elected master will still retain the originally configured virtual MAC address.

The virtual MAC address will be used for all external ports, and VLAN interfaces, except the management VLAN. Although each individual switch in the stack retains its own native MAC address; this is only used over the stack management VLAN.

Note If one stack member has the virtual MAC address feature enabled and another has the virtual MAC address feature disabled then they will be able to form together as a stack. From master election onwards, the stack master's virtual MAC address setting will be used by the rest of the stack.

Caution **Stack operation is only supported if stack virtual-mac is enabled.**

Virtual MAC format and value

The virtual MAC address is selected from within the range 0000.cd37.0000 to 0000.cd37.0FFF.
This can be considered as a MAC prefix component of 0000.cd37.0xxx.
Where xxx is called the stack virtual-chassis-ID, and has the range 000 to FFF.

By default, the virtual-chassis-ID is randomly selected from the available range.

To change the virtual MAC address, use the **stack virtual-chassis-id command on page 112.34**.

Note Using the same virtual MAC address settings on stacks in the same network will result in duplicate MAC addresses and network disruption.
Please ensure each stack in your network uses a unique virtual-chassis-ID.

Manually selected virtual address

To manually select a virtual MAC address you enable the stack virtual MAC feature by using the commands:

```
awplus# configure terminal
awplus(config)# stack virtual-mac
```

Then configure the **stack virtual-chassis-id** command on page 112.34 to set a stack virtual-chassis-ID of your chosen value - entered as a decimal number within the range 0 to 4095. The value 120 is used in the following example:

```
awplus# configure terminal
awplus(config)# stack virtual-chassis-id 120
```

Automatically selected virtual address

If you set the **stack virtual-mac** command without entering a value for the stack virtual-chassis-ID, the switch will randomly select a virtual-chassis-ID from the allocated range.

Disabling the stack virtual-mac

When the **stack virtual-mac** command is disabled, the stack will use the MAC address of the current Master. If the stack master fails, the stack MAC address changes to reflect the new master's MAC address. If the stack MAC address does change, ARP tables of devices on the network will update to reflect the change in MAC address via **ip gratuitous-arp-link** command on page 27.36.

Stack Resiliency Link

The purpose of the resiliency link is to provide the stack members with status information that allows them to detect whether the stack master is still operational after a stack failure occurs.

Using the resiliency link, a stack member can differentiate between the master suffering a power-down or a software lock-up, where the master is offline, compared with a stacking-link failure, where the master is still online but connectivity over the stacking cables has been lost.

This enables the other stack members to either operate in the fall-back Disabled Master mode, or to re-elect a new stack master. The **"State Change Table" on page 111.15** shows how the stack members respond to various problems occurring on the master node.

Stack recovery states

The following state-change-table shows stack member failure conditions and recovery actions in situations where the resiliency link is present or absent. .

Table 111-3: State Change Table

Event on Master Node	Reaction on Master	Reaction on Stack Member	Reaction on Stack Member
		With Resiliency Link	Without Resiliency Link
Both stack links removed	No change	**Disabled Master**	Re-elect master [2]
XEM-STK Removed or Faulty	No change	**Disabled Master**	Re-elect master [2]
Hardware reset (or fault)	Reset / offline	Re-elect master	Re-elect master [2]
Run the **no stack enable** command[3]	No change	**Disabled Master**	**Disabled Master**
Software application problem (lock-up or continual crashes)	Reboot as stack member	Re-elect master	Re-elect master
Software crash or lock-up	Frozen[4]	Re-elect master	Re-elect master

Table 111-3: State Change Table

Power-down or PSU failure	Powered down	Re-elect master	Re-elect master
Event on Stack Member Node	**Reaction on Master**	**Reaction on Stack Member**	**Reaction on Stack Member**
Both stack links removed	No change	**Disabled Master**[1]	Re-elect master [2]
XEM-STK removed or faulty	No change	**Disabled Master**[1]	Re-elect master [2]
Hardware reset (or fault)	No change	Reset/offline	Reset/offline
Run the **no stack enable** command[3]	No change	**Disabled Master**	**Disabled Master**
Software application failover (lock-up or continual crashes)	No change	Re-boot as backup member	Reboot as stack member
software crash or lock-up	No change	Frozen[4]	Frozen[4]
Power-down / PSU failure	No change	Powered Down	Powered down

1. If a backup member becomes the **Disabled Master** it will first disable all its switch ports, then activate any triggers specified with the **type stack disabled-master** command that have been configured.
2. The stack member assumes the role of stack master. In specific situations this condition could result in a stack containing two masters. This would present problems with network management and the control of links that were previously aggregated.
3. The following situation will apply to a switch that has been removed from the stack by the using the “no stack enable” command:
   - « The switch will be unaware of further faults within the stack it was previously a member of.
   - « Should this switch then be powered down, all links previously shutdown (as a result of running the no stack enable command) will remain down.
4. If the backup member’s ports are still up, this may cause downstream switches with trunked ports to operate incorrectly.

Stack Failure Recovery

If the stack master either fails, or is removed, the other stack members will re-elect a new stack master. The stack members automatically determine which of them becomes the new stack master. See the **Disabled Master Monitoring (DMM)** and the **Disabled Master** sections for more information. Alternatively, you can manually configure a trigger with the **type stack disabled-master** command on page 106.27 to activate on a stack member if it becomes the disabled master.

Table 111-3 shows how the stack backup members would respond to various problems occurring on the stack master stack .

Note

When VCStack is used with EPSR, the EPSR **failovertime** must be set to at least 5 seconds to avoid any broadcast storms during failover. Broadcast storms may occur if the switch cannot failover quickly enough before the EPSR **failovertime** expires. See the **epsr** command for further information about the EPSR **failovertime**.
See the **reboot rolling** command for further information about stack failover.

Stack Separation and Recovery

Stack stubs occur when a fault results in the stack splitting into two, with one of the stack members taking on the role of stack master. Where the stack master is still active after a fault, and other stack members are not aware that the stack master is still active, the result can be two independently operating stacks, or stubs.

When two stub stacks are reconnected, a dual master situation will be detected, and the console log will display the message that a 'duplicate master' was detected. This situation results in the re-election of the stack master based upon the lowest Priority ID, or, where both members have the same Priority ID, the lowest MAC address. The 'losing' master and other prospective stack members will then reboot and join the new stack as backup stack members.

Note Stubs are unlikely to cause network connectivity problems if a resiliency link is used.

Stack Maintenance

Adding a stack member

An unstacked switch can be added to an existing stack (hot-swapped in) with minimal impact on traffic. To do this, power down the new member switch, then connect its stacking ports and power on the switch. The switch will boot as a member of the stack.

Note The existing Stack Member-ID and the device MAC address will have no effect on the status of the new member switch. The stack will admit the new device as an ordinary stack member and allocate it a new Stack Member-ID if its ID is one that already exists.

However, for good practice we recommend pre-configuring the new member with settings that are appropriate for when the new switch becomes a stack member.

This is to avoid unexpected situations occurring when the stack is rebooted. For example, if the new member had a priority setting that was lower than 128 and all the existing stack members were configured with the default; then, when the stack is rebooted, the new member would be elected as the stack master.

Replacing a stack member

A stack member can be removed from a stack (hot-swapped out) with minimal impact on stack traffic. To do this, power-down the stack member, and disconnect its stacking ports. Insert the new stack member, reconnect the stacking ports and power-up the new stack member.

You can seamlessly swap a stack member switch into the stack to replace another with the same configuration. This provides a simple way to replace an out-of-service switch with minimal impact, and minimal administration requirement. You should configure the replacement switch with the same member ID as its replacement prior to inserting it into the stack.

Disabled Master

A properly functioning VCStack contains an (active) master and one or more (backup) members. Under fault conditions it is possible for some of the stack members to loose connectivity with the stack master. In this situation the stack members without master connectivity will form themselves into a stack stub and elect a “Disabled Master” to manage the stub until the fault is rectified. Once elected to this state the disabled master will disable all of its own ports and those of all other stack members within the stub. Apart from this, the operation and ‘look and feel’ of a disabled master is very similar to an active master.

By disabling all the stub’s switchports, the disabled master avoids potential network connectivity problems that could result from by having two stack masters using the same configuration, or two switches in separated stubs trying to share the same “logical” communications paths such as a non functioning aggregated links. The active master’s ports are unaffected by this, and they will continue to forward traffic normally.

Note that status information for members of the stack stub can be accessed by logging into the disabled master, in the same way as obtaining status information for a normal stack.

Note

In a stack of more than two units, several stack members could become separated from the stack master. In this case, these stack members will form a stack stub together. Only one stack member will become the disabled master. The other switches will remain as backup stack members, but their switchports will still be disabled. Status information for the stack members can be accessed by logging into the disabled master, in the same way as obtaining status information for a normal stack.

Disabled Master Monitoring (DMM)

The stack resiliency link and disabled master state offer a unique prevention of catastrophic network connectivity problems. However, when stack members become separated, the network is still left in a fragile state where the stack master no longer has the redundancy of a backup stack member. If the original stack master were to subsequently fail whilst the stack was separated, then all network connectivity would be lost if the disabled master's switchports remained shutdown.

The Disabled Master Monitoring (DMM) feature avoids this situation by continuing to monitor the status of the original stack master (the active master) via the stack resiliency link. When the DMM feature is enabled, the disabled master can detect a failure of the original stack master within a few seconds. If a failure is detected, the disabled master transitions to the active master state and automatically re-enables all its switchports. This allows traffic forwarding via the stack to continue.

For more information about the disabled master state, see the section **"Disabled Master" on page 111.18**. Note that a disabled master has the same configuration as an active master, but a disabled master has all its links shutdown.

Table 111-4: Stack behavior comparison

Stack behavior with DMM disabled	Stack behavior with DMM enabled
■ The VCStack breaks with the Stack Resiliency Link configured and enabled.	■ The VCStack breaks with the Stack Resiliency Link configured and enabled.
■ The separated stack member becomes a disabled master.	■ The separated stack member becomes a disabled master.
■ The disabled master does not monitor the active master.	■ The disabled master monitors the active master.
■ If the active master fails then the disabled master does not become the active master (no state transition).	■ If the active master fails then the disabled master becomes the active master (disabled to active transition).
■ No switchports are re-enabled on the disabled master. No traffic is forwarded.	■ Switchports on the disabled master are re-enabled. Traffic is still forwarded,

To enable the DMM feature, use the commands:

```
awplus# configure terminal
awplus(config)# stack disabled-master-monitoring
```

To disable the DMM feature, use the commands:

```
awplus# configure terminal
awplus(config)# no stack disabled-master-monitoring
```

To show the status of DMM on the VCStack, use the command:

```
awplus# show stack [detail]
```

To apply a trigger upon transition from active master state to disabled master state, use the command:

```
awplus# type stack disabled-master
```

To apply a trigger upon transition from disabled master state to active master state, use the command:

```
awplus# type stack master-fail
```

Note

A disabled master trigger allows you to specify a script to reconfigure the disabled master on the fly, should a catastrophic failure separate the stack. This is useful to configure an alternate IP address so you can still log in to the disabled master via an SSH or a Telnet connection. The trigger script should use the **no shutdown** command to re-enable any switchports needed for an SSH or a Telnet management connection.

Provisioning (Stack Members)

Stack member provisioning is the pre-configuration of a stack member's position ready for insertion at a later time. Provisioning enables a network administrator to pre-configure vacant stack member capacity within a VCStack, ready to be hot-swapped in at a later time. Later, when the stack member switch is physically added, its configuration is automatically applied with the minimum network disruption. Provisioning is ON by default, and cannot be disabled.

Provisioned capacity can be applied by either of the following actions:

- applying the **switch provision (stack)** command on page 112.37
- installing, then removing a provisionable device from its physical location, that is, a switch from its stack.

Provisioned Board Classes

Provisioning introduces the concept of defined board classes. **Table 111-5 on page 111.21** lists the stack member classes that have been defined for provisioning. Each board class is assigned a class and an appropriate port count. Presently no further definitions have been made for additional features such as media type, or PoE capability. This structure simplifies configuration.

Table 111-5: Provisioned Stack Member Classes

Board Classes		
Class	**Port Count**	**Bays**
x900-12	12	1
x900-24	24	2
SBx908	0	8

Applying Hardware Provisioning

As previously mentioned, provisioning is the pre-configuration of vacant (i.e. unused) device capacity ready for device insertion at a later time.

Without provisioning

On software versions prior to version 5.3.4 - trying to configure an unused port will result in the following error message:

```
awplus(config)# interface port4.0.1
% Can't find interface port4.0.1
```

With provisioning

With provisioning, you can configure stack members and their ports ready for future addition, even though they are not currently physically present:

```
awplus(config)# switch 2 provision <switch-model>
```

For information on using this command, see "switch provision (stack)" on page 112.37.

Now that the switch is provisioned within the stack—although not yet physically present—you can move on to provisionally configure the switch ports themselves. The following example sets the port speed of port 2.0.1 to be 1000 Mbps.

```
awplus(config)# interface port2.0.1
awplus(config-if)# speed 1000
```

You can apply provisional configuration to all interface related commands. However, you cannot apply provisioning where it changes the network's physical topology. For example, you can't provision a switch as stack member 2 and then later change it - while its position is still vacant - to stack member 1. In this situation, you would need to unprovision the switch, then provision it again as stack member 4.

The following example creates a provisioned configuration that shows the association of ports with a VLAN:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 12 state enable
awplus(config-vlan)# exit
awplus(config)# interface port2.0.1
awplus(config-if)# switchport mode access
awplus(config-if)# switchport access vlan 12
awplus(config-if)# exit
awplus(config)# interface port2.0.2-port2.0.26
awplus(config-if)# switchport mode access
```

Provisioning Error Messages

The following error messages may appear when configuring provisioning.

Table 111-6: Provisioning Error Messages (switch x [bay y] provision)

Error Message	Comment
`% Maximum stack size (%d) reached. No more switches can be provisioned`	`%d` = 2 for x908 or x900
`Switch %d must be provisioned before bays can be provisioned.`	`%d` = stack member id
`% Switch %d (%s) has 0 expansion bays.`	`%d` = stack member id `%s` = board class
`% Board class %s is incompatible with this system.`	`%s` = board class from cmd line. Indicates x610/x900 class mismatch
`% Board class %s is incompatible with existing stack members.`	`%s` = board class from cmd line. Indicates a mismatch between x900-class devices.
`% switch %d is already populated with %s.`	Indicates an attempt to provision a switch that is already present.
`% switch %d is already provisioned for %s.`	Indicates an attempt to provision a switch that is already provisioned.
`% switch %d bay %d is already populated with %s.`	Indicates an attempt to provision a XEM bay that is already populated.
`% switch %d bay %d is already provisioned for %s.`	Indicates an attempt to provision a XEM bay that is already provisioned.

Table 111-7: Provisioning Error Messages (no switch x [bay y] provision)

Error Message	Comment
`% switch %d bay %d is currently populated by %s`	You must remove hardware before unprovisioning

Removing Hardware Provisioning

Hardware capacity that has been previously provisioned and is presently unoccupied can be unprovisioned with the no switch provision command. This removes the provisioned configurations for hardware that has either not yet been physically added to a switch or VCStack, or has previously existed, but has been removed.

The no switch provision command will also delete any switch bay commands with the same unit number and all associated interfaces, as well as all configuration for that switch or XEM module.

You cannot unprovision hardware that is currently installed. A no switch command will not succeed if the unit/unit.bay location is currently occupied. For example:

```
awplus(config)# no switch 2 bay 2 provision
                % switch 2 bay 2 is currently populated by xem-1
```

The following example displays the output of a show stack that includes a provisioned VCStack member 2 :

```
Virtual Chassis Stacking summary information
ID  Pending ID  MAC address        Priority  Status    Role
1   -           0000.cd28.5377     128       Ready     ActiveMaster
2   -           0000.0000.0000     -         -         Provisioned
```

Switch ID 2 is then unprovisioned:

```
awplus(config)# no switch 2 provision
```

Run the show stack command to confirm that switch 2 has been unprovisioned.

```
awplus# show stack
```

Note

Ensure that you save your running configuration to your startup configuration after making any provisioning changes using **copy running-config startup-config**

Displaying Provisioned Configurations

In this respect the major difference associated with provisioning, is that interface configurations will still exist in the config files and will appear in show commands, even though a device itself may not be physically installed. This (provisioning) could result from device capability that has been preconfigured for future installation, or could result from the removal of an installed device.

The show running-config command includes switch commands for existing hardware, plus all non-existent, but provisioned, hardware. The following example output of the show running-config command illustrates how provisioned and existing hardware is displayed.

Figure 111-8: Sample display of existing and provisioned show output (x908)

```
sh running-config
.
.
switch 1 provision x908
switch 1 bay 1 provision xem-12
switch 1 bay 2 provision xem-12
switch 1 bay 3 provision xem-12
switch 1 bay 5 provision xem-12
switch 1 bay 7 provision xem-1
switch 1 bay 8 provision xem-1
switch 2 provision x908
switch 2 bay 1 provision xem-12
switch 2 bay 2 provision xem-12
switch 2 bay 3 provision xem-1
switch 2 bay 8 provision xem-1
!

Displaying provisioned hardware status

The status, present or provisioned, appears in monitoring commands such as the show interface brief command. The following sample output from the show interface brief command shows the provisioning status of two configured stack members.

Figure 111-10: Sample show interface brief output showing hardware provisioning status

```
awplus#show interface brief
Interface              Status          Protocol
port2.0.24             admin up        down
port3.0.1              admin up        provisioned
port3.0.2              admin up        provisioned
```

A more detailed inspection of the provisioned port 2.8.12.0.3 is shown below. Note that the MAC address is 0000.0000.0000, which is the value applied as a placeholder for all provisioned ports. Also note that although the port is in the link DOWN state its administrative state of UP PROVISIONED means that it can be further configured. For example, it can be associated with a VLAN, or added to a link aggregation group etc.

Figure 111-11: Sample display showing provisioning status of a specific port

```
Interface port2.8.1
  Scope: both
  Link is DOWN, administrative state is UP PROVISIONED
  Thrash-limiting
    Status Unknown, Action learn-disable, Timeout 1(s)
  Hardware is Ethernet, address is 0000.0000.0000
  index 6801 metric 1 mtu 1500 mru 1522
  <BROADCAST,MULTICAST>
  SNMP link-status traps: Disabled
    input packets 0, bytes 0, dropped 0, multicast packets 0
    output packets 0, bytes 0, multicast packets 0 broadcast
pks0
```

Provisioning and Configuration Management

A benefit of provisioning is configuration settings are no longer dependant on the existence of hardware devices. When a device is removed, all the interfaces for that device are shutdown and its provisioning status is set. This means that you can add or remove physical hardware without affecting your network interfaces. Of course when ports go down (i.e. are physically removed) there will be other changes to network configuration, as protocols may re-converge or, for example, routes may be removed etc.

Switches within a VCStack (or XEMs within a switch) can be hot-swapped without the need for reconfiguration.

The configuration of a newly inserted device that matches the provisioned board-class is achieved on a best-effort basis. For example inserting a non-POE switch into a stack member location configured for PoE will result in the failure of the PoE configuration commands.

Take care that your provisioned configurations, match with the type of hardware that you plan to install.

```
awplus(config)# switch 2 bay 4 provision <product-type>
awplus(config)# interface port2.0.4
awplus(config-if)# shutdown
```

Software Version Auto Synchronization

Introduction

Different software releases have functional and operational differences between them. To maintain consistent behavior across the stack, all new member switches must be running the same software release before they can fully join the stack.

Manually upgrading the software release of each new stack member that joins a stack would be a cumbersome process. The VCStack software version auto synchronization feature automates this process by ensuring the same software release is used on all stack members, and automatically upgrading stack members where required.

Note that to maintain consistent behavior across the stack, all member switches should have the same licenses enabled. See the **Stack License Management** section in this chapter and see **Chapter 8, Licensing Introduction and Configuration** for an overview of feature and release licensing that must be applied to each stack member. Stack members without licensing applied operate in an unlicensed unsupported mode. To purchase feature and release licenses, contact your authorized distributor or reseller.

How auto synchronization works

Software version comparison

When the stack is formed, it elects one of its switches to become the master. The software release running on the stack master will then become the software version used throughout the stack. After a master is elected, all the stack members compare their current software version with the version that is running on the stack master.

If the comparison process detects differences between software versions, the software version synchronization feature will automatically copy the master's software release onto the appropriate stack members. Once the software release has successfully been copied, this version will become the boot software for that particular stack member, which will then reboot in order to load the new software release.

If a software version running on a stack member is incompatible with that running on the master, and software-auto-synchronization is turned off, then that switch will be removed as a stack member. See **stack software-auto-synchronize command on page 112.33**.

When auto-synchronization upgrades a stack member, the member's current running software will be set as the backup software release. If there are any problems loading the new software, then the backup software release will be used to recover.

If the stack member does not have enough free Flash memory space for the new release, then the new release will replace up to two older release files in Flash memory, which is determined by software build dates of the older release files. The oldest release files are replaced first.

Auto synchronization limitations

Because the stack master's software version gets applied to the rest of the stack, care must be taken to ensure the correct switch is elected master. If the master is running an older software release, then software version auto synchronization may actually downgrade the software releases running on other stack members. For configuring which stack member becomes the master, see the **stack priority command on page 112.28**.

Software auto-synchronization will not work if stack members are booting using either one-off boot or from TFTP or YMODEM. In these situations, any stack members running different software will boot as standalone devices.

If software-auto-synchronization is configured as **off** for a stack member that is running a different software release to the master, by applying the command, no stack software-auto-synchronize, then that switch will boot as a standalone device. For more information, see the **stack software-auto-synchronize command on page 112.33**.

Incompatible software releases

The auto-synchronization feature will not always work if there have been significant VCStack or system changes between the two different software releases. The VCStack discovery of other stack members uses an internal 'stack S/W version' to detect compatibility between builds.

If the VCStack software between two stack members is incompatible, the software auto-synchronization feature will not work. Instead, a “incompatible stack S/W version” log message will be displayed and both stack members will boot as standalone devices. This is an undesirable situation because both devices may load the same configuration file, which could cause network conflicts. In order to avoid this situation when upgrading the stack to a new major release, ensure the 'boot system' command succeeds.

In general, the software-auto-synchronize feature will always work between maintenance releases, such as between 5.3.2-0.1 and 5.3.2-0.2, but may not work between major releases that have new VCStack features, such as between 5.2.2-0.9 and 5.3.2-0.2.

Upgrading stack software reliably

When upgrading a stack to a new software release, the **boot system backup** command on page 7.11 will automatically synchronize the new software release across all stack members. If there is insufficient file space on a backup member, the boot system command has an interactive mode that prompts you to delete old releases to free up file space.

However, if you choose not to delete any release files, or if Flash space is taken up with other types of files, then the boot system command can fail to set the preferred release on the backup member. If you do not have enough space in Flash to add a backup release file, then remove unused files in Flash using the delete command.

If you are unsure which files to delete, the following process may assist you.

```
awplus# remote-login 2
awplus-2# enable
awplus-2# dir
```

Use the remote-login command to login to the backup member with insufficient free file space, in this example member 2.

Look for any .rel (release) files, .jar (GUI), or .tgz and .gz (diagnostic) files that are no longer needed and use the delete command to remove them.

Alternatively, you can use the file system commands directly from the master's console prompt using the filepath of the backup member's Flash. Substitute `awplus` for the hostname in the configuration, and use `awplus-2` for stack member 2, and so on.

```
awplus# dir awplus-2/flash:*

awplus# delete awplus-2/flash:/x900-5.4.4-
        0.4.rel
```

Stack License Management

Release and feature licenses across a stack can be managed either via the CLI with the **license** command or via SNMP using the AT-LICENSE-MIB Enterprise MIB.

See **Chapter 8, Licensing Introduction and Configuration** for an introduction and overview of licensing and configuration tasks. See **Chapter 9, Licensing Commands** for command descriptions and examples.

Stack members without licensing applied operate in an unlicensed unsupported mode. To purchase feature and release licenses, contact your authorized distributor or reseller.

The stack does not have to be restarted when a release or feature license is enabled or disabled. When a new release or feature license is enabled across the stack some protocol modules may need to be restarted before the license is activated. A warning is given about the need to restart the protocol modules and a "y/n" prompt is given to proceed with the license installation. If SNMP is used to enable a release or feature license, the affected protocol modules are restarted automatically.

To maintain consistent behavior across the stack, all member switches should have the same release and feature licenses enabled. However, you can enable or disable a release or feature license on a single stack member if required. Note that doing so could result in the stack failing to operate correctly, or in the stack failing to reform after a reboot. If you enable or disable a release or feature license on a single stack member via the CLI a warning message is generated. A warning message is not generated if you manage the stack via SNMP.

The license keys available for purchase include a limit on the number of switches that it can be applied to. If the license is applied to a stack that has more members than the license is valid for via the CLI, a warning message is generated and the event is logged.

For release and feature licenses, contact your authorized distributor or reseller. If a license key expires or a proper key is not installed, some software features will not be available.

Note

See the AlliedWare Plus™ datasheet for a list of current release and feature licenses available by product, and the AlliedWare Plus™ How To notes for information on obtaining them.

To enable a release license or a feature license on all stack members, use the command:

```
awplus# license <label> <key>
```

To disable a release license or a feature license on all stack members, use the command:

```
awplus# no license <label>
```

To display detailed information about release licenses and feature licenses on the stack master, use the command:

```
awplus# show license [feature|release] [<label>|index
       <index-number>]
```

To display detailed information about release licenses and feature licenses on a single stack member or all stack members, use the command:

```
awplus# show license [<label>] member [<1-8>|all]
```

To display brief information about release licenses and feature licenses on a single stack member or all stack members, use the command:

```
awplus# show license [<label>] brief member [<1-8>|all]
```

Chapter 112: Stacking Commands

Introduction 112.2
Command List 112.3
clear counter stack 112.3
debug stack 112.4
reboot rolling 112.5
reload rolling 112.5

stack virtual-mac 112.35
switch bay provision (xem) 112.36
switch provision (stack) 112.37
switchport resiliencylink 112.38
undebug stack 112.38

Introduction

This chapter provides an alphabetical reference for each of the Stacking commands. Also note the following stacking trigger commands that are documented in the Triggers chapter:

type stack disabled-master command on page 106.27
type stack master-fail command on page 106.28
type stack member command on page 106.29
type stack link command on page 106.30

In addition to the stacking commands shown in this chapter, stacking content also exists in the following commands:

hostname command on page 10.23
reload command and **reboot** command on page 10.28
show cpu command on page 10.32
show cpu history command on page 10.35
show exception log command on page 12.39
show file systems command on page 7.36
show memory command on page 10.43
show memory history command on page 10.46
show process command on page 10.50
show system command on page 10.54

Caution

Stack operation is only supported if stack virtual-mac is enabled. For more information refer to: "Enabling the stack virtual-mac" on page 111.14 and "stack virtual-mac" on page 112.35

Command List

clear counter stack

This command clears all stack counters for all stack members.

Syntax `clear counter stack`

Mode Privileged Exec

Example To clear all stack counters:

```
awplus# clear counter stack
```

Related Commands show counter stack

debug stack

This command enables the stacking debugging facilities.

Syntax

```
debug stack [link|topology|trace]
no debug stack [link|topology|trace]
```

Parameter	Description
`link`	Stacking neighbor discovery events on stack links.
`topology`	Stacking topology discovery messages.
`trace`	Notable stacking events.

Default Stack trace debugging is enabled.

Mode Privileged Exec and Global Configuration

Usage The command displays debug information about the stacked devices. If no parameter is specified, all the stack debugging information will be displayed, including link events, topology discovery messages and all notable stacking events. If link parameter is specified, only the link events debugging information will be displayed.

Examples To enable debugging, enter the following command on the stack master:

```
awplus# debug stack
```

To enable link debugging, enter the following command on the stack master:

```
awplus# debug stack link
```

To enable topology discovery debugging, enter the following command on the stack master:

```
awplus# debug stack topology
```

To enable stack trace debugging, enter the following command on the stack master:

```
awplus# debug stack trace
```

Related Commands undebug stack

reboot rolling

This command reboots a stack in a rolling sequence to minimize downtime.

The stack master is rebooted, causing the remaining stack members to failover and elect a new master. The rebooted unit remains separate from the remaining stack and boots up as a stand-alone unit. Once the rebooted unit has finished running its configuration and has brought its ports up, it reboots all the remaining stack members at once.

Syntax `reboot rolling`

Mode Privileged Exec

Usage If you are upgrading to a new software version, the new version must also support rollling reboot.

Note When stacking is used with EPSR, the EPSR **failovertime** must be set to at least 5 seconds to avoid any broadcast storms during failover. Broadcast storms may occur if the switch cannot failover quickly enough before the EPSR **failovertime** expires. For further information about EPSR **failovertime**, see the **epsr** command on page 87.4.

Examples To rolling reboot the stack, use the following commands:

```
awplus# reboot rolling
Continue the rolling reboot of the stack? (y/n):
```

After running this command, the stack master will reboot immediately with the configuration file settings. The remaining stack members will then reboot once the master has finished re-configuring.

```
Continue the rolling reboot of the stack? (y/n):
awplus# y
```

Related Commands **boot system**
epsr

reload rolling

This command performs the same function as the **reboot rolling** command on page 112.5.

remote-command (deprecated)

This command has been deprecated, please use the **remote-login** command on page 112.10, and then the following commands:

show cpu command on page 10.32
show counter stack command on page 112.11
show exception log command on page 12.39
show file command on page 7.35
show log permanent command on page 12.45
show memory command on page 10.43
show process command on page 10.50
show stack command on page 112.17
show system command on page 10.54
clear counter stack command on page 112.3

This command executes a number of host-directed commands that are specific to stack members.

Syntax

```
remote-command <1-8>
   show {cpu|counter|exception|file|memory|process|stack|system}

remote-command <1-8> clear counter stack
```

Parameter	Description
<1-8>	The ID of the stack member where the command should be executed on.
`cpu`	Selects the **show cpu** command on page 10.32.
`counter`	Selects the **show counter stack** command on page 112.11.
`exception`	Selects the **show exception log** command on page 12.39.
`file`	Selects the **show file** command on page 7.35.
`memory`	Selects the **show memory** command on page 10.43.
`process`	Selects the **show process** command on page 10.50.
`stack`	Selects the **show stack** command on page 112.17.
`system`	Selects the **show system** command on page 10.54.
`show CPU history`	Selects the **show cpu history** command on page 10.35.
`show CPU sort pri`	Selects the **show cpu** command on page 10.32 to run with the parameters **sort** and **pri** selected.
`show CPU sort runtime`	Selects the **show cpu** command on page 10.32 to run with the parameters **sort** and **runtime** selected.
`show CPU sort sleep`	Selects the **show cpu** command on page 10.32 to run with the parameters **sort** and **pri** selected.
`show CPU sort thrds`	Selects the **show cpu** command on page 10.32 to run with the parameters **sort** and **thrds** selected.

Parameter(cont.)	Description(cont.)
`show exception log`	Selects the **show exception log** command on page 12.39.
`show file systems`	Selects the **show file systems** command on page 7.36.
`show log permanent`	Selects the **show log permanent** command on page 12.45.
`show log permanent tail`	Selects the tail parameter of the **show log permanent** command on page 12.45.
`show memory`	Selects the **show memory** command on page 10.43.
`show memory history`	Selects the **history** parameter of the **show memory** command on page 10.43.
`show memory sort peak`	Selects the **sort** and **peak** parameters of the **show memory** command on page 10.43.
`show memory sort size`	Selects the **sort** and **size** parameters of the **show memory** command on page 10.43.
`show memory sort stk`	Selects the **sort** and **stk** parameters of the **show memory** command on page 10.43.
`show process`	Selects the **show process** command on page 10.50.
`show process sort cpu`	Selects the **sort** and **cpu** parameters of the **show process** command on page 10.50.
`show process sort mem`	Selects the **sort** and **mem** parameters of the **show process** command on page 10.50.
`show stack`	Selects the **show stack** command on page 112.17.
`show stack detail`	Selects the **details** parameter of the **show stack** command on page 112.17.
`show system`	Selects the **show system** command on page 10.54.
`show system environment`	Selects the **show system environment** command on page 10.55.
`show system pluggable`	Selects the **pluggable** parameter of the **show system** command on page 10.54.
`show system serialnumber`	Selects the **serialnumber** parameter of the **show system** command on page 10.54.
`clear counter stack`	Can be used on a stack master to remotely run the **clear counter stack** command on page 112.3.

Default None

Mode Privileged Exec, and can be also be used in the same mode as the equivalent non-remote command.

Usage This command is used only from the master to execute a command subset that is specific to stack members. If the member ID is not used by any current stack member, the command will be rejected.

Note that although the syntax shows stack members <1-8> in practice you can only enter the numbers that you have defined for your stack members. A two unit stack would normally comprise members 1 and 2. However you could assign to your stack members any two numbers between 1-8, such as 3 and 7. With this configuration, the command would be entered as shown in example-2 below:

Example-1 To execute the **show system** command on stack member 2, use the command:

```
awplus# remote-command 2 show system
```

Example-2 For a stack whose members are numbered 3 and 7, to execute the **show system** command on stack member 7, use the command:

```
awplus# remote-command 7 show system
```

Example-3 To clear the stack counters on stack member 2, use the command:

```
awplus# remote-command 2 clear counter stack
```

remote-login

This command is used only on the master in order to log onto the CLI of another stack member. In most respects the result of this is similar to being logged into the stack master. Configuration commands are still applied to all stack members, but show commands, and commands that access the file system are executed locally.

The specific output obtained will vary greatly depending on the show command chosen.

Syntax `remote-login <stack-ID>`

Parameter	Description
`<stack-ID>`	Stack member number, from 1 to 8.

Mode Privileged Exec

Usage Note that some commands such as **ping** or **telnet** are not available when the remote-login is used.

Example To log onto stack member 2, use the following command:

```
awplus# remote-login 2
```

To return to the command prompt on the master stack member, type **exit**.

show counter stack

Use this command to display stack related counter information.

Syntax `show counter stack`

Default All counters are reset when the stack member is rebooted.

Mode User Exec and Privileged Exec

Usage This displays the stacking counter information for every stack member.

Examples To display the stacking counter information about the whole stack, use the following command.

```
awplus# show counter stack
```

Figure 112-1: Example output from the show counter stack command

Stack member 2:

-- Output repeated for other stack members - details not shown--
```

Table 112-1: Parameters in the output of the show counter stack command

Parameters	Description
Topology Event Counters	
Units joined	Number of times that the stack acquires a member.
Units left	Number of times that the stack loses a member.
Links up	Number of times that a stack link is up in the stack.
Links down	Number of times that a stack link is down in the stack.
ID conflict	Number of times that stack-ID conflicts.
Master conflict	Number of times that stack master conflict occurs.
Master failover	Number of times that stack master fails.
Master elected	Number of times that stack master is elected.
Master discovered	Number of times that stack master is discovered.
SW autoupgrades	Number of times that the software in the stack members are auto upgraded.
Stack port counters	
Link up	Number of times that this unit's physical stack link has come up.

Table 112-1: Parameters in the output of the show counter stack command(cont.)

Parameters	Description
`Link down`	Number of times that this unit's physical stack link has come down.
`Nbr re-init`	Number of times that the neighbor is detected as having reinitialised.
`Nbr incompatible`	Number of times that the neighbor is detected as incompatible.
`Nbr 2way comms`	Number of times that the neighbor is in two way communication. status.
`Nbr full comms`	Number of times that the neighbor is in full communication status.
`Topology message counters`	
`Total`	Number of total topology messages.
`Hellos`	Number of hello messages.
`Topology DB`	Number of topology database messages.
`Topology update`	Number of topology database update messages.
`Link event`	Number of link events messages.
`Reinitialise`	Number of reinitialise messages.
`1-hop transport`	Number of 1-hop transport messages.
`Layer-2 transport`	Number of layer 2 transport messages.
`Link event`	Number of link events messages.
`Reinitialise`	Number of reinitialise messages.
`1-hop transport`	Number of 1-hop transport messages.
`Layer-2 transport`	Number of layer 2 transport messages.
`Topology error counters`	Reasons why a neighboring unit could not join the stack.
`Version unsupported`	Number of stack software version unsupported errors.
`Product unsupported`	Number of Product unsupported errors.
`XEM unsupported`	Number of XEM unsupported errors.
`Too many units`	Number of too may units errors.
`Invalid messages`	Number of invalid messages.
`Health status good`	The number of times that the resiliency link has successfully carried healthchecks following a failure at startup.
`Health status bad`	The number of times that the resiliency link healthcheck has timed out. A timeout occurs when a backup stack member detects a delay greater than two seconds between healthcheck messages received.
`Rx`	The total number of healthcheck messages that a stack member has received from the stack master.
`Rx Error`	The total number of invalid healthcheck messages that have been received from the master. This message is not applicable to the stack master.

Related Commands **show stack**

show debugging stack

This command shows which debugging modes are currently enabled for stacking.

Syntax `show debugging stack`

Mode User Exec and Privileged Exec

Usage To display the stack debugging mode status, use the command:

```
awplus# show debugging stack
```

Figure 112-2: Example output from the show debugging stack command

```
Virtual Chassis Stacking debugging status:
  VCS link debugging is on
  VCS topology debugging is on

Related Commands debug stack

show running-config stack

Use this command to display the running system information specific to the stack.

```
show running-config stack
```

Mode Privileged Exec and Global Configuration

Example To display the stacking running configuration information, use the command:

```
awplus# show running-config stack
```

Output **Figure 112-3: Example output from the show running-config stack command**

```
awplus#show running-config stack

stack virtual-mac
stack virtual-chassis-id 1982
stack management vlan 4000
stack management subnet 192.168.254.0
stack resiliencylink eth0
stack enable
stack 2 priority 20
```

Related Commands show running-config

show provisioning (stack)

Use this command to display the provisioning status of all installed or provisioned hardware. Provisioning is the preconfiguration necessary to accommodate future connection of hardware items such as a switch.

Syntax `show provisioning`

Mode User Exec and Privileged Exec

Example To show provisioning, use the following command:

```
awplus# show provisioning
```

Output **Figure 112-4: Example output from the show provisioning command**

```
Switch provisioning summary information

ID  Board class Status
1.0 x908        Hardware present
1.1 xem-12      Provisioned
1.4 xem-2       Hardware present
1.5 xem-1       Provisioned
```

Table 112-2: Parameters in the output of the show provisioning command

Parameter	Description
`ID`	The unit.bay-location of the hardware provision.
`Board class`	The hardware type.
`Status`	The provisioned state: ■ Hardware Present means that the hardware is currently installed in the stack. ■ Provisioned means that although the hardware is not currently installed; the stack is preconfigured ready to accept the hardware installation.

Related Commands
show stack
switch provision (stack)
switch bay provision (xem)
show provisioning (xem)

show stack

Use this command to display information about current stack members.

Syntax `show stack [detail]`

Parameter	Description
`detail`	Display detailed stacking information.

Default Display summary information only.

Mode User Exec and Privileged Exec

Usage This command displays information about current stack members. If the **detail** parameter is specified, additional information will be displayed for each stack member. By default, only summary information is displayed.

Example To display summary information about the stack, use the command:

```
awplus# show stack
```

Output **Figure 112-5: Example output from the show stack command**

```
Virtual Chassis Stacking summary information

ID  Pending ID  MAC address       Priority  Status  Role
1   -           0000.cd28.07e1    128       Ready   Active Master
2   -           0015.77c2.4d44    128       Ready   Backup Member

Operational Status                Normal operation
Stack MAC address                 0000.cd28.07e1
```

Table 112-3: Parameters in the output from the show stack command

Parameter	Description
`ID`	Stack-ID and line card or control card slot.
`MAC address`	Stack member MAC address.
`Priority`	Stack member master election priority (between 0 and 255) Note that the lowest number has the highest priority.
`Role`	Stack member's role in the stack, this can be one of: ■ **Active Master**. ■ **Disabled Master** (The temporary master when there is a communication break within the stack, but communication still exists across the resiliency link. In this state all switch ports within the stack are disabled by default, but a different configuration can be run by a "type stack disabled-master" trigger). ■ **Backup Member** (A device other than the stack master). ■ **Provisioned** - Indicates that the stack position is provisionally configured, i.e. ready to accept a particular switch type into the stack.

Example To display the detailed stacking information about the stack's overall status:

```
awplus# show stack detail
```

Figure 112-6: Example output from the show stack detail command

```

Stack port 2.1.1 status                 Learnt neighbor 1
Stack port 2.1.2 status                 Learnt neighbor 1
```

Table 112-4: Parameters in the output from the show stack detail command

Parameter	Description
`Auto upgrade`	Whether the software-auto-configuration feature is turned on, or off.
`Host name`	The host name of the stack member.
`ID`	Stack-ID and line card or control card slot.
`Last Role Change`	The date and time with the stack member last changed its role in the stack.
`MAC address`	Stack member MAC address.
`Management VLAN ID`	The VLAN ID currently used for stack management: Default is 4094.
`Management VLAN subnet address`	The current stacking management VLAN subnet address.
`Virtual Chassis ID`	The Virtual Chassis ID determines the last 12 bits of the Virtual MAC address: `0000.cd37.0xxx`
`Virtual MAC Address`	The Virtual MAC address of the stack.
`Disabled Master Monitoring`	The current Disabled Master Monitoring status. This can be: ■ **Enabled** ■ **Disabled** ■ **Inactive**
`Operational Status`	The status of the stack. This can be: ■ **Normal operation**: If any other status is displayed, it may warrant further investigation. ■ **Stacking hardware disabled:** The **stack enable** command needs to be added to the configuration to activate the stacking feature. ■ **Operating in failover mode**: This stack member has become separated from the rest of the stack, or it failed to join the stack correctly. ■ **Standalone unit**: Stacking is enabled, but no other stack members are present ■ **Not all stack ports are up**: One or more stacking ports may be down, or stacking discovery may not have detected the neighbor successfully.
`Stack Status`	The stack's overall status. Note that a warning is issued if the stack is not connected in a standard ring topology.
`Pending ID`	The pending stack member ID. This can be changed by the **stack renumber** command on page 112.29. If there is no pending ID, the "–" symbol will display.
`Stack port status`	The status of the stack port. This can be: ■ **Down** ■ **Neighbor incompatible** ■ **Discovering neighbor** ■ **Learnt neighbor**

Table 112-4: Parameters in the output from the show stack detail command(cont.)

Parameter	Description
`Priority`	Stack member master election priority (between 1 and 255) Note that the lowest number has the highest priority.
`Product Type`	Stack member product type. For example, SwitchBlade x908.
`Switchblade x908 Stacking Ports`	This shows the status of the chassis rear stacking port, only on the SwitchBlade x908.
`Provisioned`	Indicates that the stack position is provisionally configured, i.e. ready to accept a particular switch type into the stack.
`Resiliency link status`	The current status of the resiliency link. The status can be one of: ■ **Not configured**, (Master or Member). ■ **Configured** (Master only). ■ **Successful**: Successfully receiving healthchecks from the Active Master. ■ **Failed** (Member only): Not receiving any healthchecks from the Active Master. ■ **Stopped**: The resiliency link is configured, but is inactive. This may occur in a Disabled Master stack, for example if the Disabled Master Monitoring feature is not used.
`Role`	Stack member's role in the stack, this can be one of: ■ **Active Master**. ■ **Disabled Master** (The temporary master when there is a communication break within the stack, but communication still exists across the resiliency link. In this state all switch ports within the stack are disabled by default, but a different configuration can be run by a "**type stack disabled-master**" trigger command). ■ **Backup Member** (a device other than the stack master). ■ **Discovering** - joining the stack.
`Status`	Indicates how readily a stack member can take over as master if the current stack master were to fail. ■ **Init** - the stack member is completing the startup initialization. ■ **Syncing** - the stack member is synchronizing state information with the stack master following startup. ■ **Ready** - the stack member is fully synchronized with the current master and is ready to take over immediately.

show stack resiliencylink

Use this command to display information about the current status of the resiliency-link across the members of the stack.

```
show stack resiliencylink
```

Mode User Exec and Privileged Exec

Example To display information about the current status of the resiliency-link across the stack members, use the command:

```
awplus# show stack resiliencylink
```

Output **Figure 112-7: Example output from the show stack resiliencylink command**

```
awplus(config)# show stack resiliencylink
Stack member 1:
---------------------------------------------------------------
Status                          Configured
Interface                       vlan4093
Interface state                 UP
Resiliency-link port(s)         port1.2.11

Stack member 2:
---------------------------------------------------------------
Status                          Successful
Interface                       vlan4093
Interface state                 UP
Resiliency-link port(s)         port2.2.11
```

Table 112-5: Parameters in the output of the show stack resiliencylink command

Parameter	Description
`Status`	The current status of the stack member's resiliency link. Can be one of: ■ **Not configured**, (Master or Member). ■ **Configured** (Master only). ■ **Successful**: Successfully receiving healthchecks from the Active Master. ■ **Failed** (Member only): Not receiving any healthchecks from the Active Master. ■ **Stopped**: The resiliency link is configured, but is inactive. This may occur in a Disabled Master stack, for example if the Disabled Master Monitoring feature is not used.
`Interface`	The name of the eth0 or VLAN interface that is connected to the resiliency link.
`Interface state`	The current status of the interface. Can be one of: ■ Up ■ Down
`Resiliency-link port(s)`	The switch port(s) the resiliency link is connected to.

stack resiliencylink
switchport resiliencylink

stack disabled-master-monitoring

This command enables the Disabled Master Monitoring (DMM) feature. If a stack member becomes a disabled master, the DMM feature will use the stack resiliency link to continue monitoring the health of the separated stack master.

Use the **no** variant of this command to disable the DMM feature.

Syntax

```
stack disabled-master-monitoring
no stack disabled-master-monitoring
```

Default By default, Disabled Master Monitoring is enabled. However, it only operates if there is a resiliency link.

Mode Global Configuration

Usage This command enables additional stack resiliency link functionality, which is used if a stack separation occurs. For DDM to operate, a resiliency link must also be configured (**stack resiliencylink** command on page 112.31). A stack separation could result in a stack member becoming a disabled master, which has the configuration as a normal stack master except that all its switchports are shutdown.

For more information about the disabled master state, see **"Disabled Master" on page 111.18**.

When the DMM feature is enabled, the disabled master will continue to monitor the health of the original stack master over the stack resiliency link connection. If the original stack master were to fail, when the DMM feature is enabled, then the disabled master will detect this and will automatically re-enable its switchports. This ensures that the stack will continue to pass network traffic, even if a catastrophic stack failure occurs.

For more information about the DMM feature when the stack member is a disabled master, see **"Disabled Master Monitoring (DMM)" on page 111.19**.

Examples To enable the DMM feature, use the following commands:

```
awplus# configure terminal
awplus(config)# stack disabled-master-monitoring
```

To disable the DMM feature, use the following commands:

```
awplus# configure terminal
awplus(config)# no stack disabled-master-monitoring
```

Related Commands

type stack master-fail

stack enable

This command is used on a stackable stand-alone switch to manually turn on the VCStack feature and XEM-STK links.

This command can also be run on a switch that has previously been removed from a stack (by using the **no** variant of this command) and return it to stacking operation.

The **no** variant of this command removes a selected stack member switch, as specified by the *<stack-ID>* selection in the command syntax, from the virtual chassis stack.

Syntax

```
stack enable

no stack <stack-ID> enable
```

Parameter	Description
<stack-ID>	Stack member number, from 1 to 8.

Default The VCStack feature starts automatically at the device start-up when a stacking link is detected.

Mode Global Configuration

Usage When stack enable is entered, the **stack virtual-mac** is automatically enabled. Using virtual-mac is required in order to minimize disruption on failover.

Running the **no** variant of this command will remove the selected stack member from the stack. At this point the removed member will act as a stand-alone master and will disable all of its ports. The switch can then only be accessed via its console port.

To return the switch to stack membership, first connect to the switch via its console port, then run the **stack enable** command. Then save the configuration and run the **reboot** command on page 10.28. This will reboot the switch and it will re-join the stack as an ordinary member.

If the switch was previously the stack master, you might want to return it to its original stack master status. To do this you must run the **reboot** command on page 10.28 again. This time—because the switch is now a stack member—the command will reboot the whole stack and result in a new master election.

Note the following conditions of applying the **no stack** <*stack-ID*> **enable** command:

- If the specified member is a stack master, and no resiliency link is configured, this command will be rejected.
- If the specified `stack-ID` is not used by any current stack member, the command will be rejected.

Caution Disabling a stack member can significantly degrade the throughput capability of the stack.

Example To turn on stacking on a stackable stand-alone unit, use the command:

```
awplus# configure terminal
awplus(config)# stack enable
```

Related Commands **reboot**

stack management subnet

This command configures the subnet address used by the stack management VLAN.

Use the **no** variant of this command to reset the stack's VLAN subnet management address back to the default address and mask (192.168.255.0/27).

Syntax

```
stack management subnet <ip-address>
no stack management subnet
```

Parameter	Description
<ip-address>	The new subnet address for stack management VLAN.

Default The default stacking management VLAN subnet address is 192.168.255.0 with a subnet mask 255.255.255.224 or /27.

Mode Global Configuration

Usage This command configures the stack management VLAN subnet address.

The management VLAN will be used for high speed communication between stacked units via the stacking ports. Although this command enables you to change the IP address command, the subnet mask must always remain as shown.

The stack management IP subnet is solely used internally to the stacked devices, and cannot be reached external to the stack. You should only change the stack management VLAN subnet address if it causes a conflict within your network.

Note that several separate stacks can use the same default management VLAN subnet address even though their user ports may share the same external network. If the stack subnet address is changed, then the configuration for any new units must also be updated before they are inserted into the stack.

If the management VLAN subnet address is changed by this command, you can use the **no** variant of this command to reset it to it's default.

Example To set the management VLAN subnet address to 192.168.255.144:

```
awplus# configure terminal
awplus(config)# stack management subnet 192.168.255.144
```

Related Commands stack management vlan

stack management vlan

Use this command to configure the stack management VLAN ID.

Use the **no** variant of this command to change the stack management VLAN ID back to the default (VLAN ID 4094).

Syntax

```
stack management vlan <2-4094>
no stack management vlan
```

Parameter	Description
<2-4094>	Stack management VLAN ID.

Default 4094

Mode Global Configuration

Usage The management VLAN is used for high speed communication between stacked units via the stacking links or the two back panel stacking ports (SwitchBlade® x908 only). This command enables you to change the ID of this VLAN.

The default stacking management VLAN ID is 4094, which is the last configurable VLAN ID in the switch.

The stack management VLAN is created and configured automatically so that the stack VLAN cannot be used in the stack's VLAN configuration commands (such as `awplus(config-vlan)# vlan <Stack management VLAN ID>`).

The management VLAN should only be changed if the default stack VLAN ID needs to be used in the stack's VLAN configuration.

Caution

When the command is entered, the updated management VLAN configuration will take effect once the stack is restarted.

If the management VLAN ID is changed by this command, you can use the no variant of this command to change it back to default value.

Examples To set the management VLAN to 4000, enter the following commands:

```
awplus# configure terminal
awplus(config)# stack management vlan 4000
```

To reset the management VLAN back to the default (4094), enter the following commands:

```
awplus# configure terminal
awplus(config)# no stack management vlan
```

Related Commands stack management subnet

stack priority

Use this command to change a specific stack member's master-election priority.

Syntax

```
stack <stack-ID> priority <0-255>
no stack <stack-ID> priority
```

Parameter	Description
<stack-ID>	Stack member number, from 1 to 8.
priority	The stack member's election priority value.
<0-255>	The stack member's new priority value. The lowest value is assigned the highest priority. The default is 128.

Mode Global Configuration

Usage This command is used to change the value of a specific stack member's master-election priority. If the specified stack-ID is not used by any current stack member, the command will be rejected.

The election criteria selects the stack member with the lowest priority value to become the stack master. Where two stack members both have the same lowest priority value, then the stack member with the lowest MAC address will be elected as master.

Note

Assigning a new priority value will not immediately change the current stack master. In order to force a master re-election after the new priority value is assigned, use reboot stack-member <master's ID> to reboot the current stack master, a new stack master will then be elected based on the new priority values.

Example To change the priority of stack member 2 to be 3, use the commands:

```
awplus# configure terminal
awplus(config)# stack 2 priority 3
```

Validation Command **show stack**

stack renumber

Use this command to renumber a specific stack member.

Syntax `stack <existing stack-ID> renumber <new stack-ID>`

Parameter	Description
`<existing stack-ID>`	Enter the existing `stack-ID`, 1 or 2.
`renumber`	Change the existing `stack-ID`.
`<new stack-ID>`	Enter the new `stack-ID`, 1 or 2.

Default Every stack unit will initially try to use a `stack-ID` of 1.

Mode Global Configuration

Usage This command is used to change the ID of a specific stack member - primarily when exchanging stack members. The changes made by this command will not take effect until the switch is rebooted.

Note

This command does not alter any of the stacks's existing configuration, apart from the `stack-ID` specified. For example, if stack member 2 were removed from the stack and a new stack unit is assigned the member 2 `stack-ID`, then the interface configuration that existed for the removed stack member 2 will be applied to the new stack member 2.

The ***existing stack-ID*** must already be assigned to an existing stack member. To avoid duplicating IDs, a warning message will appear if you assign a ***new stack-ID*** that is currently assigned to another stack member. However, you can continue to renumber the stack-IDs and remove ID duplications. If you do not remove the duplications, then one of the devices will be forced to automatically renumber to an unused ID. Once you have removed any duplicate IDs, you can reboot the switch to implement your changes.

Note that the configured `stack-ID` is saved immediately on the renumbered member, and so is not reliant on using the **copy running-config** command for it to take effect.

Example To renumber stack 1 to stack 2, use the commands:

```
awplus# configure terminal
awplus(config)# stack 1 renumber 2
```

Validation Command **show stack**

stack renumber cascade

This command is used to renumber the members of a stack so that their IDs are ordered sequentially, relative to the member's physical position within the stack.

Caution

Changing the stack numbering will upset the existing stack member configurations such as port settings etc. This command is intended for use when the stack is either initially commissioned, or has undergone a major reconfiguration. In this situation you run the stack renumber command (which will automatically reboot the switch), then configure the stack members to meet the new requirements.

Syntax

```
stack <stack-ID> renumber cascade [<stack-ID>]
```

Parameter	Description
<stack-ID>	The ID of the stack member to start renumbering from, (from 1 to 8).
`renumber`	Change the existing stack-ID.
`cascade`	Renumber the existing stack-ID in cascade order.
<stack-ID>	The new ID for the first member renumbered, from 1 to 8.

Default If no stack-ID is specified, the member will take the default ID of 1.

Mode Global Configuration

Usage This command is used to renumber the members of a stack so that their stack-IDs are ordered sequentially, based on physical order of the XEM-STK connections. This would normally be done either when the stack is initially configured or following a major reconfiguration.

This command is equivalent to pressing and holding the select button on the XEM-STK to renumber the stack members. The renumber will start on the specified stack member. If that stack-ID is not used by any of the existing stack member, the command will be rejected.

The starting stack member will be renumbered with the new stack-ID specified, or the default of member ID of 1. The stack-ID of the next physically will be the starting members ID +1, for example member ID 2. This renumbering will continue in cascading order around the stack members.

The changes will take place immediately and reboot all stack members. For this reason a confirmation prompt follows this command entry, asking whether you are sure you want to renumber and reboot the entire stack.

Example

```
awplus(config)# stack 1 renumber cascade

Any existing interface configuration may no longer be valid

Are you sure you want to renumber and reboot the entire stack?
(y/n): y
```

Related Commands

show stack
stack renumber

stack resiliencylink

This command configures the resiliency link used by the stack. The interface used may be either an eth0 port or is a dedicated VLAN (resiliencylink VLAN) to which switch ports may become members. This VLAN is dedicated to the resiliency link function and must not be the stack management VLAN.

Syntax

```
stack resiliencylink <interface>
no stack resiliencylink
```

Parameters	Description
<interface>	The name of the interface that is connected to the resiliency link. This may be either the eth0 port or the resiliencylink VLAN.

Mode Global Configuration

Usage The resiliency-link is only used when a backup member loses connectivity with the master via the stacking cables. Such a communication loss would occur if:

- a stacking link is removed or fails,
- two or more stacking link cables are unplugged or fail,
- the stack master itself fails due to a reboot or power failure.

The resiliency-link allows the backup member to determine if the master is still present in the network by the reception of health-check messages sent by the master over the resiliency-link interface.

Reply health-check messages are received if the master is still online, but the stack will now split into two different 'stubs'. The stub containing the existing master will continue operating as normal. The members in the masterless stub will now use a “type stack disabled-master” trigger to run a configuration to form a second temporary stack. This utilizes the remaining stack members' resources without conflicting directly with the master's configuration. If no “type stack disabled-master” trigger was configured on the switches, then the masterless stub members will disable their switch ports.

If no health-check messages are received, then the master is assumed to be completely offline, and so the other stack members can safely take over the master's configuration.

Caution **The purpose of the resiliency link is to enable the stack members (particularly the backup master) to check the status of the master under fault conditions. If the resiliency link is not configured, and the master loses communication with its other stack members, then the stack will assume the master is NOT present in the network, which could cause network conflicts if the master is still on line. Note that this is a change to the stacking of releases prior to version 5.3.1.**

Example To set the resiliency link to be `eth0`:

```
awplus# configure terminal
awplus(config)# stack resiliencylink eth0
```

To set the resiliency link to be VLAN 4093.

First use the **stack resiliencylink** command to create the resiliency `vlan 4093`

```
awplus# configure terminal
awplus(config)# stack resiliencylink vlan4093
```

Next use the **switchport resiliencylink** command to assign the resiliencylink vlan to the interface port, in this case `port1.0.1`.

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# switchport resiliencylink
```

Related Commands

show stack
show stack resiliencylink
stack disabled-master-monitoring
switchport resiliencylink

stack software-auto-synchronize

This command re-enables the software version auto-synchronization feature either on a specified stack member or all stack members.

Use the **no** variant of this command to turn the software version auto synchronization feature off.

Syntax

```
stack {all|<stack-ID>} software-auto-synchronize
no stack {all|<stack-ID>} software-auto-synchronize
```

Parameter	Description
`all`	All stack members.
<stack-ID>	Stack member number, from 1 to 8.

Default All the stack members have the stack software-auto-synchronize feature enabled by default.

Mode Global Configuration

Usage This command is used to enable the software version auto-synchronization feature for either a specific stack member or all stack members and candidates.

Note that if a device attempts to join a stack, but is running a software release that is different to the other stack members, then the software version auto-synchronization feature will copy the master's software release onto the new member. If the software version auto-synchronization feature is not enabled, then the device will be unable to join the stack.

Note that the software version auto-synchronization feature may also result in the stack member downgrading its software release if the master is running an older software version.

Examples To turn on the software-auto-synchronize feature on stack member 2, which was previously turned off, use the following commands:

```
awplus# configure terminal
awplus(config# stack 2 software-auto-synchronize
```

To turn on the software-auto-synchronize feature for all stack members, which were previously turned off, use the following commands:

```
awplus# configure terminal
awplus(config)# stack all software-auto-synchronize
```

Validation Command **show stack**

stack virtual-chassis-id

This command specifies the stack virtual chassis ID. The ID selected will determine which virtual MAC address the stack will use. The MAC address assigned to a stack must be unique within its network.

Note The command will not take effect until the switch has been rebooted.

Syntax

```
stack virtual-chassis-id <id>
```

Parameter	Description
<id>	The value of the ID - enter a number in the range 0 to 4095.

Mode Global Configuration

Usage The virtual-chassis-id entered will form the last 12 bits of a pre selected MAC prefix component; that is, `0000.cd37.0xxx`. If you enable the stack virtual MAC address feature (by using the **stack virtual-mac** command) without using the **stack virtual-chassis-id** command to select the virtual-chassis-id, then the stack will select a virtual-chassis-id from a number within the assigned range.

Example To set the stack virtual-chassis-id to 63 use the commands

```
awplus# configure terminal
awplus(config)# stack virtual-chassis-id 63
```

This will result in a virtual MAC address of: `0000.cd37.003f`.

stack virtual-mac

stack virtual-mac

This command enables the stack virtual MAC address feature. For more information on this topic refer to **"Fixed or Virtual MAC Addressing" on page 111.14**. With this command set, the value applied for the virtual MAC address is determined by the setting of the command **stack virtual-chassis-id** command on page 112.34.

Caution

Stack operation is only supported if stack virtual-mac is enabled.
Before enabling the virtual MAC address feature, you should check that the stack's virtual-chassis-id is not already used by another stack in the network. Otherwise the duplicate MAC addresses will cause problems for the network traffic.

Syntax

```
stack virtual-mac

no stack virtual mac
```

Mode Global Configuration

Usage Note that this command will not take effect until the switch has been rebooted.

Example

```
awplus# configure terminal
awplus(config)# stack virtual mac
```

stack virtual-chassis-id

switch bay provision (xem)

This command enables you to pre-configure a specific empty bay within a switch ready for inserting a particular XEM type. To run this command, the bay position must be vacant and the selected XEM type must be one that is currently supported.

```
switch <chassis-ID> bay <1-8> {provision|reprovision}{xem-1|
   xem-2|xem-12}
```

```
no switch <chassis-ID> bay <1-8> provision
```

This command is an alias. For a detailed description, see the **switch bay provision (xem)** command on page 17.66.

switch provision (stack)

This command enables you to provide the configuration for a new stack member switch prior to physically connecting it to the stack. To run this command, the stack position must be vacant. The selected hardware type must be compatible existing stack hardware.

Use the **no** variant of this command to remove an existing switch provision.

Syntax

```
switch <stack-ID> {provision|reprovision}{x900-12|x900-24|x908}
no switch <stack-ID> provision
```

Parameter	Description
`<stack-ID>`	Stack member number, from 1 to 8.
`provision`	Provides settings within the stack configuration ready for a specific switch type to become a stack member.
`reprovision`	Reconfigure an existing provision configuration.
`x900-12`	Provision an x900-12switch.
`x900-24`	Provision an x900-24 switch.
`x908`	Provision an x908 switch.

Mode Global Configuration

Usage Note that although the syntax appears to enable provisioning on up to 8 stackable switches, in practice a maximum of 2 are configurable. Normally the stack members would be numbered 1 and 2, and so the command could be run to provision any stack member within this range; and we advise using this procedure. In effect, the syntax then becomes:
`switch <1-2> {provision|reprovision}{x900-12|x900-24|x908}`

However, you could - if you wished - number the stack units with any numbers between 1-8. For example you could number your two stack members 3 and 7. In this case you could provision either of the stack members by using one of these numbers. We advise against numbering your stacks in this way.

Examples To reprovision the switch to be an x900-12 switch as stack member 2, use the following commands:

```
awplus# configure terminal
awplus(config)# switch 2 reprovision x900-12
```

To remove the provision of the x900-12 switch as stack member 2, use the following commands:

```
awplus# configure terminal
awplus(config)# no switch 2 provision
```

show stack

switchport resiliencylink

This command configures the switch port to be a member of the stack resiliency link VLAN. Note that this switchport will only be used for stack resiliency-link traffic and will not perform any other function, or carry any other traffic.

The **no** variant of this command removes the switchport from the resiliency link VLAN.

Syntax

```
switchport resiliencylink
no switchport resiliencylink
```

Mode Global Configuration to create then Interface Configuration to assign the resiliency link.

Examples To set the resiliency link to be VLAN 4093:

First, use the **stack resiliencylink** command to create the resiliency `vlan4093`

```
awplus# configure terminal
awplus(config)# stack resiliencylink vlan4093
```

Next, use the **switchport resiliencylink** command to assign the resiliencylink vlan to the port, in this case `port1.0.1`.

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# switchport resiliencylink
```

Related Commands

Appendix B: Changes in Version 5.4.4-0.4

This appendix lists the changes made in Version 5.4.4-0.4.

- **New or Changed Features**: (**Table B-1 on page B.2**)
- **New or Changed Commands**: (**Table B-2 on page B.3**)
- **New or Changed SNMP MIBs**: (**Table B-3 on page B.13**)

Clicking on a topic in the Feature column will take you to the appropriate section of the manual.

Note

In the following tables the columns x900 and x908 contain the pre-release indicator P[1]. This indicates that the change was introduced in a 5.4.3 maintenance release such as 5.4.3-1.4.

Table B-1: New or Changed Features

Feature	Status	x900	x908	Chapter / Section	Description
AMF	New	P[1]	P[1]	AMF Introduction and Configuration	The Allied Telesis Management Framework (AMF) is a suite of features that combine to simplify network management across all supported network switches from the core to the edge.
BGP4+	New	P[1]	P[1]	BGP and BGP4+ Introduction	Software version 5.4.4 supports the routing protocol BGP4+ for IPv6, as well as BGP for IPv4. BGP4+ is described in RFC 2283 (Multiprotocol Extensions for BGP-4).
DHCP Operation With VRF Lite	Modified	P[1]	P[1]	Internet Protocol (IP) Addressing and Protocols	You can now configure DHCP Relay to forward packets within a VRF Lite instance. DHCP messages between DHCP Clients and a DHCP Server are then able to be relayed between VLAN interfaces within a VRF Lite instance.
DNS Operation With VRF Lite	Modified	P[1]	P[1]	Internet Protocol (IP) Addressing and Protocols	When running VRF Lite, you can now configure DNS Relay functionality to be VRF aware. In this mode DNS Relay messages can be forwarded within specified VRF instances. VRF aware DNS services to remotely connected DNS clients is also supported. These VRF aware services include: ping, traceroute, telnet client, SSH client, and tcpdump.
Release Licensing	Modified	Y	Y	Licensing Introduction and Configuration	From software version 5.4.4 onwards, AlliedWare Plus software releases are licensed. If you want to upgrade your software, please contact your authorized Allied Telesis support center to obtain a release license. You will need to provide the MAC addresses of the switches you want to license.
Two-step Authentication	New	Y	Y	Authentication Introduction and Configuration	Support for Two-step Authentication has been added. Two-step Authentication improves security by requiring two forms of authentication.
Web Authorization Proxy	New	Y	Y	Authentication Introduction and Configuration	Support for Web Authorization Proxy has been added.

Table B-2: New or Changed Commands

Command	Status	x900	x908	Chapter / Section	Description
address-family (BGP and BGP4+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	This command now enters the IPv6 Address Family Configuration command mode with the new **ipv6** parameter, in addition to the IPv4 Address Family Configuration mode with the existing **ipv4** parameter. In this mode you can configure address-family specific parameters.
aggregate-address (BGP and BGP4+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	This command has been modified for BGP4+ to optionally use an IPv6 prefix and length to add an aggregate route that can be advertised to BGP4+ neighbors. This command creates an aggregate entry in the BGP4+ routing table if the switch learns, by any means, any routes that are within the range configured by the aggregate address/mask.
atmf backup bandwidth	New	P[1]	P[1]	AMF Commands	This new command sets the maximum bandwidth when initiating an AMF backup.
atmf distribute firmware	New	P[1]	P[1]	AMF Commands	This new command can be used to upgrade software one AMF node at a time. A URL can be selected from any media location. The latest compatible release for a node will be selected from this location.
atmf log-verbose	New	P[1]	P[1]	AMF Commands	This new command limits the number of log messages displayed on the console or permanently logged.
atmf virtual-link id ip remote-id remote-ip	New	P[1]	P[1]	AMF Commands	This new command creates one or more layer two tunnels that enable AMF nodes to transparently communicate across a wide area network using only layer two protocols.
auth supplicant-mac	Modified	Y	Y	Authentication Commands	This command has a new parameter **skip-second-auth** that enables the second authorisation to be skipped.
auth timeout connect-timeout	New	Y	Y	Authentication Commands	This command sets the connect-timeout period for the interface.
auth two-step enable	New	Y	Y	Authentication Commands	This command enables the two-step authentication feature on the interface.
auth-mac password	New	Y	Y	Authentication Commands	This command changes the password for MAC-based authentication. Changing the password increases the security of MAC-based authentication, because the default password is easy for an attacker to discover.
auth-web forward	Modified	Y	Y	Authentication Commands	This command has a new parameter called <*ip-address*> that enables forwarding to the specified destination IPv4 address.
auth-web-server dhcp-wpad-option	New	Y	Y	Authentication Commands	This command sets the DHCP WPAD option for the web authentication temporary DHCP service.

Table B-2: New or Changed Commands

Command	Status	x900	x908	Chapter / Section	Description
auth-web-server intercept-port	New	Y	Y	Authentication Commands	This command registers any additional TCP port numbers that the web authentication server is to intercept.
bgp router-id (BGP and BGP4+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	This command now configure the router identifier for BGP and BGP4+. Note you must specify an IPv4 address with this when used for BG4+.
clear arp-cache	Modified	P[1]	P[1]	IP Addressing and Protocol Commands	This command now operates with VRF Lite. It can be applied for either the whole switch, the global instance, or a selected VRF instance.
clear bgp (ASN) (BGP and BGP4+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	The **unicast** and **multicast** parameter options have been removed in this release.
clear bgp (IPv4 or IPv6 address) (BGP and BGP4+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	This command now enables you to reset BGP4+ connections for specified peers, as well as BGP connections. The new option has been available since version 5.4.3-2.5.
clear bgp external (BGP and BGP4+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	The unicast and multicast parameter options have been removed in this release.
clear bgp ipv6 (ASN) (BGP4+)	New	P[1]	P[1]	BGP and BGP4+ Commands	This command enables you to reset the BGP4+ connections to all peers in a specified Autonomous System Number (ASN).
clear bgp ipv6 (ipv6 address) (BGP4+)	New	P[1]	P[1]	BGP and BGP4+ Commands	This command resets the BGP4+ connection to the peer specified by the IP address.
clear bgp ipv6 dampening (BGP4+)	New	P[1]	P[1]	BGP and BGP4+ Commands	This command clears route dampening information and unsuppress routes that have been suppressed routes.
clear bgp ipv6 external (BGP4+)	New	P[1]	P[1]	BGP and BGP4+ Commands	This command resets the BGP4+ connections to all external peers.
clear bgp ipv6 flap-statistics (BGP4+)	New	P[1]	P[1]	BGP and BGP4+ Commands	This command clears the flap count and history duration for the specified prefixes.
clear bgp ipv6 peer-group (BGP4+)	New	P[1]	P[1]	BGP and BGP4+ Commands	This command resets the BGP4+ connections to all members of a peer group.
clear ip bgp dampening (BGP)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	The unicast and multicast parameter options have been removed in this release.

Table B-2: New or Changed Commands

Command	Status	x900	x908	Chapter / Section	Description
clear ip bgp flap-statistics (BGP)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	The unicast and multicast parameter options have been removed in this release.
clear ip bgp peer-group (BGP)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	The unicast and multicast parameter options have been removed in this release.
clear ip dns forwarding cache	Modified	P[1]	P[1]	IP Addressing and Protocol Commands	This command has been modified to operate with VRF Lite.
copy proxy-autoconfig-file	New	Y	Y	Authentication Commands	This command downloads the proxy auto configuration (PAC) file to your switch.
erase proxy-autoconfig-file	New	Y	Y	Authentication Commands	This command removes the proxy auto configuration file.
exception coredump size (deprecated)	Deprecated	Y	Y	Logging Commands	This command has been deprecated in 5.4.4 release, and will be removed in a later release. There are no alternative commands.
exit-address-family (BGP and BGP4+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	This command now exits either the IPv6 or the IPv4 Address Family Configuration command mode.
ip name-server	Modified	P[1]	P[1]	IP Addressing and Protocol Commands	This command has been modified to provide VRF Lite capability within VRF Lite instances.
license	Modified	Y	Y	Licensing Commands	This command enables the licensed software feature set.
license certificate	Modified	Y	Y	Licensing Commands	This command enables you to apply software release licenses from a licence certificate file to devices.
license member (deleted)	Deprecated	Y	Y	Licensing Commands	This command has been deleted. Use the **license** command instead to apply feature licenses to stack members.
linkflap action	New	Y	Y	Switching Commands	This command enables port flapping detection. Port flapping detection will disable any ports that flap more than 15 times in less than 15 seconds. This limits the impact of an unreliable link.
neighbor activate (BGP and BGP4+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	This command now enables the exchange of BGP IPv4 and BGP4+ IPv6 routes with a BGP or BGP4+ neighboring router, and also within an IPv4 or an IPv6 specific address-family.
neighbor advertisement-interval (BGP and BGP4+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	This command now sets up the minimum interval between sending the BGP or BGP4+ routing updates.

Table B-2: New or Changed Commands

Command	Status	x900	x908	Chapter / Section	Description
neighbor allowas-in (BGP and BGP4+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	This command now accepts am AS-path with the specified Autonomous System (AS) number from inbound updates for both BGP and BGP4+ routes.
neighbor as-origination-interval (BGP and BGP4+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	This command now enables the sending of AS (Autonomous System) origination routing updates to the specified BGP or BGP4+ neighbor.
neighbor attribute-unchanged (BGP and BGP4+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	This command now advertises unchanged BGP or BGP4+ attributes to the specified BGP or BGP4+ neighbor.
neighbor capability graceful-restart (BGP and BGP4+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	This command now configures the device to advertise the Graceful Restart Capability to BGP and BGP4+ neighbors.
neighbor capability orf prefix-list (BGP and BGP4+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	This command now advertises the OSF (Outbound Route Filters) capability to BGP and BGP4+ neighbors.
neighbor capability route-refresh (BGP and BGP4+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	This command now advertises the route-refresh capability to the specified BGP and BGP4+ neighbors.
neighbor collide-established (BGP and BGP4+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	This command specifies a BGP or BGP4+ neighbor, which is already in an 'established' state, for conflict resolution when a TCP connection collision is detected.
neighbor default-originate (BGP and BGP4+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	This command now allows a BGP or BGP4+ local router to send the default route, 0.0.0.0, to a neighbor.
neighbor description (BGP and BGP4+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	This command now associates a description with a BGP or a BGP4+ neighbor.
neighbor disallow-infinite-holdtime (BGP and BGP4+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	This command now disallows the configuration of infinite holdtime for BGP and BGP4+.

Table B-2: New or Changed Commands

Command	Status	x900	x908	Chapter / Section	Description
neighbor distribute-list (BGP and BGP4+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	This command now filters route updates from a particular BGP or BGP4+ neighbor using an Access Control List (ACL).
neighbor dont-capability-negotiate (BGP and BGP4+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	This command now disables capability negotiation for BGP and BGP4+.
neighbor ebgp-multihop (BGP and BGP4+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	This command now accepts and attempts BGP and BGP4+ connections to external peers on indirectly connected networks.
neighbor enforce-multihop (BGP and BGP4+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	This command now enforces the requirement that BGP and BGP4+ neighbors form multihop connections.
neighbor filter-list (BGP and BGP4+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	This command now creates a BGP or a BGP4+ filter using an AS (Autonomous System) path list.
neighbor interface (BGP and BGP4+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	This command now configures the interface name of a BGP and a BGP4+ speaking neighbor.
neighbor local-as (BGP and BGP4+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	This command now configures a local AS number for the specified BGP or BGP4+ neighbor.
neighbor maximum-prefix (BGP and BGP4+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	This command now controls the number of prefixes that can be received from a BGP or a BGP4+ neighbor.
neighbor next-hop-self (BGP and BGP4+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	This command now configures the BGP or BGP4+ router as the next hop for a BGP or BGP4+ speaking neighbor or peer group.
neighbor override-capability (BGP and BGP4+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	This command now overrides a capability negotiation result for BGP and BGP4+.
neighbor passive (BGP and BGP4+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	This command now configures the local BGP or BGP4+ router to be passive to the specified BGP or BGP4+ neighbor.

Table B-2: New or Changed Commands

Command	Status	x900	x908	Chapter / Section	Description
neighbor password (BGP and BGP4+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	This command now enables MD5 authentication on a TCP connection between BGP and BGP4+ neighbors.
neighbor peer-group (add a neighbor) (BGP and BGP+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	This command now adds a BGP or a BGP4+ neighbor to an existing peer-group.
neighbor peer-group (create a peer-group) (BGP and BGP4+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	This command now creates a peer-group for BGP and BGP4+.
neighbor port (BGP and BGP4+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	This command now specifies the TCP port to which packets are sent to on a BGP or a BGP4+ neighbor.
neighbor prefix-list (BGP and BGP4+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	This command now distributes BGP and BGP4+ neighbor information as specified in a prefix list.
neighbor remote-as (BGP and BGP4+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	This command now configures an internal or external BGP or BGP4+ (iBGP or eBGP) peering relationship with another router.
neighbor restart-time (BGP and BGP4+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	This command now configures a different restart-time from the global restart-time configured using the **bgp graceful-restart** command for BGP and BGP4+.
neighbor route-map (BGP and BGP4+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	This command now applies a route map to incoming or outgoing routes for BGP and BGP4+.
neighbor send-community (BGP and BGP4+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	This command now specifies that a community attribute should be sent to a BGP or BGP4+ neighbor.
neighbor shutdown (BGP and BGP4+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	This command now disables a peering relationship with a BGP or BGP4+ neighbor.
neighbor soft-reconfiguration inbound (BGP and BGP4+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	This command now configures the switch to start storing all updates from the BGP or BGP4+ neighbor, without any consideration of any inward filtering policy that might be applied to the connection with this BGP or BGP4+ neighbor.

Table B-2: New or Changed Commands

Command	Status	x900	x908	Chapter / Section	Description
neighbor timers (BGP and BGP4+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	This command now sets the keepalive, holdtime, and connect timers for a specific BGP or BGP4+ neighbor.
neighbor transparent-as (BGP and BGP4+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	This command now specifies not to append your AS path number even if the BGP or BGP4+ peer is an eBGP peer.
neighbor transparent-nexthop (BGP and BGP4+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	This command now specifies to keep the nexthop value of the route if the BGP or BGP4+ peer is an eBGP peer.
neighbor unsuppress-map (BGP and BGP4+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	This command now selectively leaks more specific routes to a particular BGP or BGP4+ neighbor.
neighbor update-source (BGP and BGP4+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	This command now specifies the source IPv4 or IPv6 address of BGP or BGP4+ packets, which are sent to the neighbor for routing updates, as the IPv4 or IPv6 address configured on the specified interface.
neighbor weight (BGP and BGP4+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	This command now sets default weights for routes from this BGP or BGP4+ neighbor.
network (BGP and BGP4+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	This command now specifies particular routes to be redistributed into the BGP or BGP4+ routing process.
network synchronization (BGP and BGP4+)	Modified	P[1]	P[1]	BGP and BGP4+ Commands	This command now ensures the exact same static network prefix, specified through any of the network commands, is local or has IGP reachability before introduction to BGP or BGP4+.
remote-command (deprecated)	Deprecated	Y	Y	Stacking Commands	This command has been deprecated; please use the **remote-login** command instead.
show atmf detail	New	P[1]	P[1]	AMF Commands	This new command displays details about an AMF node.
show atmf diagnostics	New	P[1]	P[1]	AMF Commands	This new command displays diagnostic information for an entire AMF network.
show atmf links	New	P[1]	P[1]	AMF Commands	This new command displays details about an AMF node.
show atmf links statistics	New	P[1]	P[1]	AMF Commands	In addition to its original function, this command is now also able to display the AMF link configuration and packet exchange statistics for a specified interface.
show atmf memory	New	P[1]	P[1]	AMF Commands	This new command displays a summary of the AMF memory usage.
show atmf nodes	New	P[1]	P[1]	AMF Commands	This new command displays all nodes currently configured within the AMF network by showing a topographical representation of the network infrastructure.

Table B-2: New or Changed Commands

Command	Status	x900	x908	Chapter / Section	Description
show atmf tech	New	P[1]	P[1]	**AMF Commands**	This new command collects and displays all the AMF command output.
show auth two-step supplicant brief	New	Y	Y	**Authentication Commands**	This command displays the supplicant state of the two-step authentication feature on the interface.
show auth-web	Modified	Y	Y	**Authentication Commands**	This command displays the authentication information for Web-based authentication. It now includes output for the new command **auth two-step enable**.
show auth-web-server	Modified	Y	Y	**Authentication Commands**	This command has new output showing the web authentication server configuration and status on the switch.
show bgp ipv6 (BGP4+)	New	P[1]	P[1]	**BGP and BGP4+ Commands**	This command displays BGP4+ network information for a specified IPv6 address.
show bgp ipv6 community (BGP4+)	New	P[1]	P[1]	**BGP and BGP4+ Commands**	This command displays routes that match specified communities within an IPv6 environment.
show bgp ipv6 community-list (BGP4+)	New	P[1]	P[1]	**BGP and BGP4+ Commands**	This command display routes that match the given community-list within an IPv6 environment.
show bgp ipv6 dampening (BGP4+)	New	P[1]	P[1]	**BGP and BGP4+ Commands**	This command shows dampened routes from a BGP4+ instance.
show bgp ipv6 filter-list (BGP4+)	New	P[1]	P[1]	**BGP and BGP4+ Commands**	This command displays routes conforming to the filter-list within an IPv6 environment.
show bgp ipv6 inconsistent-as (BGP4+)	New	P[1]	P[1]	**BGP and BGP4+ Commands**	This command displays routes with inconsistent AS Paths within an IPv6 environment.
show bgp ipv6 longer-prefixes (BGP4+)	New	P[1]	P[1]	**BGP and BGP4+ Commands**	This command displays the route of the local BGP4+ routing table for a specified prefix with a specific mask, or for any prefix having a longer mask than the one specified.
show bgp ipv6 neighbors (BGP4+)	New	P[1]	P[1]	**BGP and BGP4+ Commands**	This command displays detailed information on peering connections to all BGP4+ neighbors within an IPv6 environment.
show bgp ipv6 paths (BGP4+)	New	P[1]	P[1]	**BGP and BGP4+ Commands**	This command displays BGP4+ path information within an IPv6 environment.
show bgp ipv6 prefix-list (BGP4+)	New	P[1]	P[1]	**BGP and BGP4+ Commands**	This command displays routes matching the prefix-list within an IPv6 environment.

Table B-2: New or Changed Commands

Command	Status	x900	x908	Chapter / Section	Description
show bgp ipv6 quote-regexp (BGP4+)	New	P[1]	P[1]	BGP and BGP4+ Commands	This command displays routes matching the AS path regular expression stated in quotes within an IPv6 environment.
show bgp ipv6 regexp (BGP4+)	New	P[1]	P[1]	BGP and BGP4+ Commands	This command displays routes matching the AS path regular expression without using quotes within an IPv6 environment.
show bgp ipv6 route-map (BGP4+)	New	P[1]	P[1]	BGP and BGP4+ Commands	This command displays BGP4+ routes that match the specified route-map within an IPv6 environment.
show bgp ipv6 summary (BGP4+)	New	P[1]	P[1]	BGP and BGP4+ Commands	This command displays a summary of BGP4+ neighbor status within an IPv6 environment.
show counter dhcp-relay	Modified	P[1]	P[1]	Dynamic Host Configuration Protocol (DHCP) Commands	This command shows counters for the DHCP Relay Agent on your device. This command has been modified to provide VRF Lite capability, allowing a specific VRF Lite instance or the global VRF Lite instance.
show debugging atmf	New	P[1]	P[1]	AMF Commands	This command shows the debugging modes status for AMF.
show debugging atmf	New	P[1]	P[1]	AMF Commands	This command shows details of AMF Packet debug command.
show dot1x	Modified	Y	Y	802.1X Commands	This command displays authentication information for 802.1X port authentication. It now includes output for the new commands **auth connect-timeout period** and **auth two-step enable**.
show dot1x interface	Modified	Y	Y	802.1X Commands	This command displays authentication information for 802.1X port authentication. It now includes output for the new commands **auth two-step enable** and **auth connect-timeout period**.
show dot1x supplicant	Modified	Y	Y	802.1X Commands	This command displays the supplicant state of the authentication mode set for the switch. It now displays Two-step Authentication states.
show dot1x supplicant interface	Modified	Y	Y	802.1X Commands	This command displays the supplicant state of the authentication mode set for the switch. It now displays Two-step Authentication states.
show ip dhcp-relay	Modified	P[1]	P[1]	Dynamic Host Configuration Protocol (DHCP) Commands	This command shows the configuration of the DHCP Relay Agent on each interface. This command has been modified to provide VRF Lite capability, allowing a specific VRF Lite instance or the global VRF Lite instance.
show ip dns forwarding cache	Modified	P[1]	P[1]	IP Addressing and Protocol Commands	This command enables you to display the DNS Relay name resolver cache. This command has been modified to provide VRF Lite capability, allowing a specific VRF Lite instance or the global VRF Lite instance.

Table B-2: New or Changed Commands

Command	Status	x900	x908	Chapter / Section	Description
show ip dns forwarding server	Changed	P[1]	P[1]	**IP Addressing and Protocol Commands**	This command has been modified to provide VRF Lite capability.
show ip name-server	Modified	P[1]	P[1]	**IP Addressing and Protocol Commands**	This command displays a list of IPv4 and IPv6 DNS server addresses that your switch will send DNS requests to. This command has been modified to provide VRF Lite capability allowing a specific VRF Lite instance, or the global VRF Lite instance.
show license	Modified	Y	Y	**Licensing Commands**	This command displays information about a specific software license, or all enabled software feature licenses on the device.
show license brief	Modified	Y	Y	**Licensing Commands**	This command displays information about a specific software license, or all enabled software feature licenses on the device.
show license brief member	Modified	Y	Y	**Licensing Commands**	This command displays summarized information about a specific software license, or all software feature licenses enabled on either a specific stack member or all stack members.
show license member	Modified	Y	Y	**Licensing Commands**	This command displays information about a specific software license, or all software feature licenses enabled on either a specific stack member or all stack members.
show proxy-autoconfig-file	New	Y	Y	**Authentication Commands**	This command displays the contents of the proxy autoconfig (PAC) file.
show system mac	New	Y	Y	**System Configuration and Monitoring Commands**	This command displays the physical MAC address available on a stack, or a standalone switch, or a chassis. This command also shows the virtual MAC address for a stack if the stack virtual MAC address feature is enabled with the **stack virtual-mac** command.
show system mac license	New	Y	Y	**Licensing Commands**	This command displays the physical MAC address available on a stack, a chassis, or a standalone device required for release licensing.
synchronization (BGP and BGP4+)	New	P[1]	P[1]	**BGP and BGP4+ Commands**	This command enables IGP (Internal Gateway Protocol) synchronization of Internal BGP4+ (iBGP) learned routes with the IGP system in the Router Configuration mode or in the IPv6 Address Family Configuration mode.

Table B-3: New or Changed SNMP MIBs

Command	Status	x900	x908	Chapter / Section	Description
AT-ATMF-MIB	New	Y	Y	SNMP MIBs	The ATMF-MIB defines objects for managing Allied Telesis Management Framework objects and triggers. Objects in this group have the object identifier ATMF ({ modules 603 })
AT-FILEv2-MIB	Obsoleted	Y	Y	SNMP MIBs	The object atFilev2InfoTable was obsoleted in AT-FILEv2-MIB.

Introduction

This appendix describes how to install, configure and use the Graphical User Interface (GUI) on switches running the AlliedWare Plus™ OS. The GUI provides extensive monitoring and essential configuration functionality for Allied Telesis switches via a web browser. This document explains how to install the GUI using either an SD card or via a TFTP server.

The GUI functionality is provided via a Java applet file. Before you can use the GUI to manage your switches, you must download the Java applet file, and install it to your switch's Flash file system.

Once the Java applet file is present in your switch's Flash, no specific commands are required to enable the GUI, or to inform the switch which Java applet file to use. Instead, when an incoming browser connection is established with the switch, the switch will automatically send the most recent compatible Java applet file that is present in its Flash file system.

Different versions of the Java applet file will be compatible with different versions of the AlliedWare Plus™ OS. The AlliedWare Plus™ OS automatically determines if a Java applet file is compatible, so the Java applet file that is delivered to your browser will always be compatible with the AlliedWare Plus™ OS version running on the switch to which you have connected.

Note which products and software version the GUI works with, along with PC and browser specifications listed. You may need to install and run the latest Java Runtime Environment that you can download from the Sun site so your browser can fully support the GUI Java applet.

Installing the GUI and setting the switch

This section shows you how to install and setup the AlliedWare Plus™ GUI on your switch.

System Requirements

To install and run the AlliedWare Plus™ GUI you will require the following system products and setup:

- PC Platform:
  Windows XP SP2 and up / Windows Vista SP1 and up
- Browser: (must support Java Runtime Environment (JRE) version 6)
  Microsoft Internet Explorer 7.0 and up / Mozilla Firefox 2.0 and up

Installing the GUI to your switch using an SD card

Step 1: Download a GUI Java applet

The GUI Java applet file is available in a compressed (zip) file with the AlliedWare Plus™ Operating System software from the Software Download area of the Allied Telesis Website: **http://www.alliedtelesis.com/support/software/restricted**. Login using your assigned Email Address and Password.

Download the Java applet file. This file will have a `.zip` file name extension. You need to extract the Java `.jar` file from the compressed `.zip` file. The version number of the software applet file (`.jar`) gives the earliest version of the software file (`.rel`) that the GUI can operate with.

Step 2: Copy the GUI Java applet .jar file on an SD card to flash memory

Insert the SD card in the SD slot on the front of your switch. Connect to the management port, then login to the switch.

Copy the GUI Java applet to your switch, using the below commands:

```
awplus# copy card:/<filename.jar> flash:/
```

Where `<filename.jar>` is the GUI Java applet file you downloaded in Step 1.

Installing the GUI to your switch via TFTP server

Step 1: Download a GUI Java applet file from the support site:

The GUI Java applet file is available in a compressed (`.zip`) file with the AlliedWare Plus™ Operating System software from the Support area of the Allied Telesis Website: **http://www.alliedtelesis.com**. Download the Java applet file. This file will have a `.zip` file name extension. You need to extract the Java `.jar` file from the compressed `.zip` file. The version number of the software applet file (.jar) gives the earliest version of the software file (`.rel`) that the GUI can operate with.

Step 2: Copy the GUI applet

Copy the GUI applet **.jar** file onto a TFTP server. Ensure this TFTP server is enabled and ready for the switch. Connect to the management port of the switch, then login to the switch. Do not connect to the management port of the TFTP server

Step 3: Copy the GUI Java applet to your switch

Use the following commands to copy the GUI Java applet to your switch:

```
awplus# copy tftp://<server-address>/
        <filename.jar> flash:/
```

Where *<server-address>* is the IP address for the TFTP server, and where *<filename.jar>* is the GUI Java applet file you downloaded in Step 1.

Setting up your switch and logging into the GUI

Step 1: Assign the IP addresses:

Use the following commands to configure your switch with an appropriate IP address:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip address <address>/<prefix-
length>
```

Where *<address>* is the IP address that you will subsequently browse to when you connect to the GUI Java applet. For example, to give the switch an IP address of `192.168.2.6`, and a subnet mask of `255.255.255.0`, use the following command:

```
awplus(config-if)# ip address 192.168.2.6/24
```

Step 2: Configure the Default Gateway

If necessary, use the following commands to configure the default gateway.

```
awplus(config-if)# exit
awplus(config)# ip route 0.0.0.0/0 <gateway address>
```

Where *<gateway-address>* is the IP address for your gateway device. Note that you do not need to define a default gateway if you browse to the switch from within its own subnet.

Step 3: Create a user account

In order to log into the GUI, you must first create a user account. Use the following commands to setup a user account

```
awplus(config)# username <username> privilege 15
password <password>
```

Note that you can create multiple users to log into the GUI. See the AlliedWare Plus Software Reference for information about the **username** command. The switch must be configured with a local database user, or the switch must be configured to remotely authenticate users with either TACACS+ or RADIUS.

Step 4: Ensure HTTP service is enabled

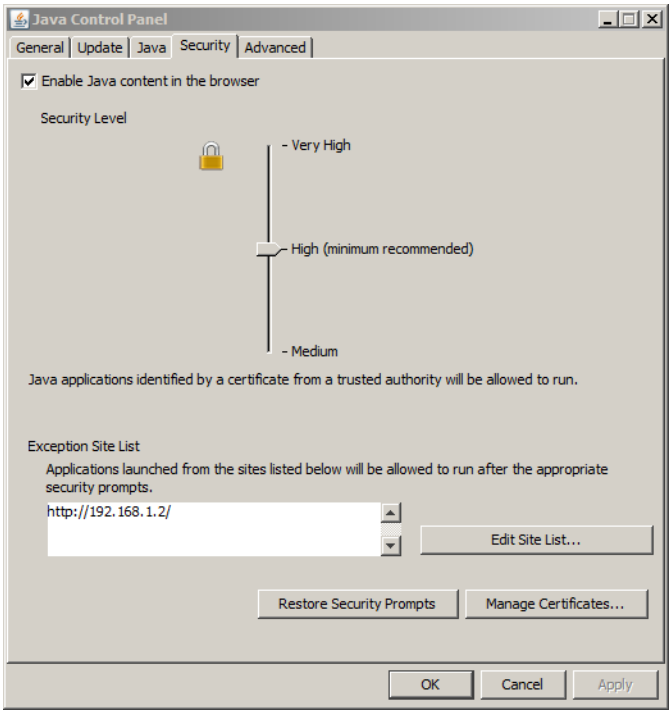
The HTTP service needs to be enabled on the switch before it accepts connections from a web browser. The HTTP service is enabled by default. However, if the HTTP service has been disabled then you must enable the HTTP service again. If the HTTP service is disabled then use the following command to enable the HTTP service:

```
awplus(config)# service http
```

See the AlliedWare Plus™ Software Reference for information about the **service http** command.

Step 5: Start the Java Control Panel to enable Java within a browser

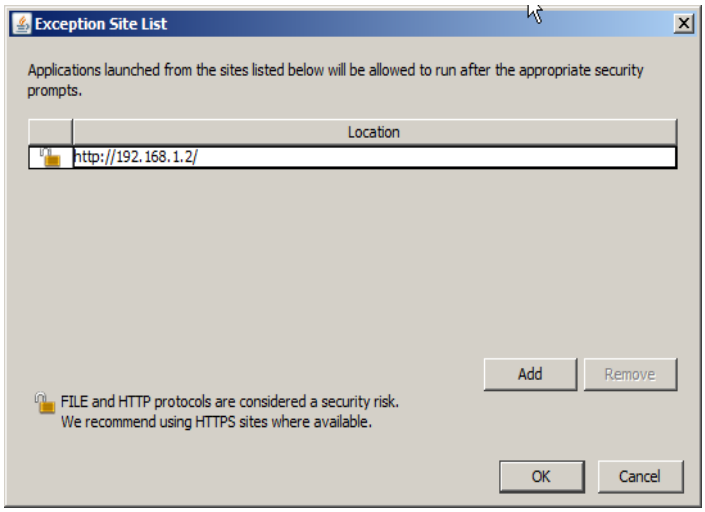
On your PC, start the Java Control Panel by opening the Windows Control Panel from the Windows Start menu. Then enter Java Control Panel in the search field to display and open the Java Control Panel. Next, click on the 'Security' tab as below:



Ensure the 'Enable Java content in the browser' checkbox is selected on this tab.

Step 6: Enter the URL in the Java Control Panel Exception Site List

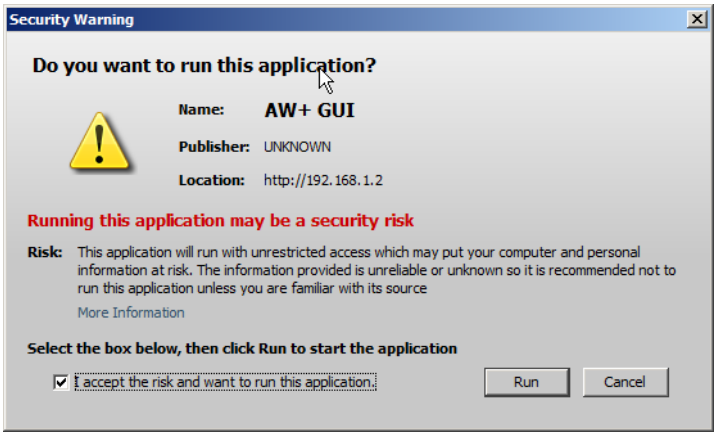
Click on the 'Edit Site List' button in the Java Control Panel dialog Security tab to enter a URL in the below Exception Site List dialog. Enter the IP address you configured in Step 1 with a http:// prefix in the 'Exception Site List' dialog below:



After entering the URL click the Add button then click OK to start the GUI next.

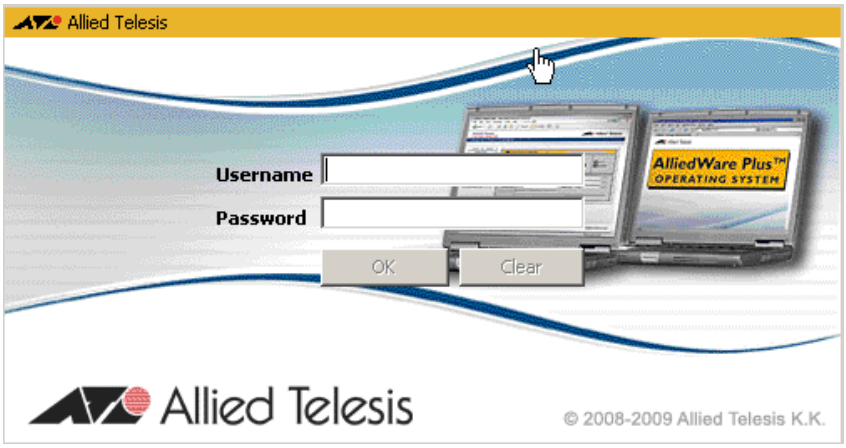
Step 7: Start the GUI in a browser

Start a browser then enter the IP address you configured in Step 1 as the URL. You will then be presented with a Security Warning before you can run the GUI Java applet. Click on the checkbox and click Run to continue to login to the GUI applet:



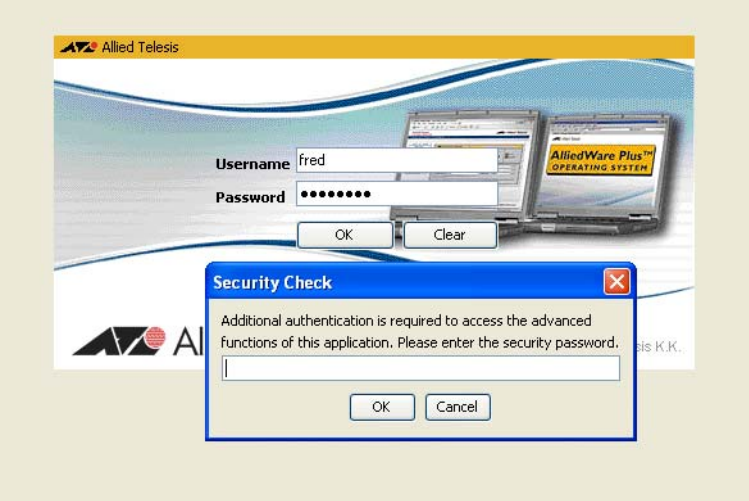
Step 8: Logging into the GUI

Start a browser then enter the IP address you configured in Step 1 as the URL. You will then be presented with a login screen after the GUI Java applet has started. You can then Log in with the username and password that you defined previously in Step 3.

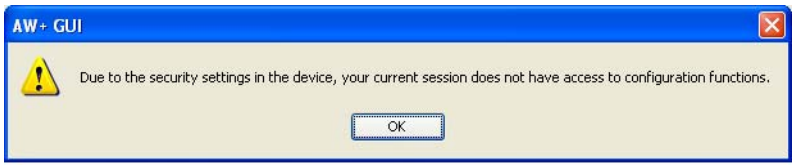


Step 9: Security Check

You may also be presented with a security check password prompt. This will occur when you have logged into the GUI with a user that is configured on the switch and has a privilege level of less than 15, or if the switch has been configured to authenticate enable passwords via TACACS+ using the **aaa authentication enable default group tacacs+** command.



You must enter the privilege level 15 enable password configured on the switch to access GUI configuration dialogs. If you enter an incorrect enable password, or no privilege level 15 enable password has been configured, then a message is shown stating you can use the GUI to monitor the switch, but not to configure the switch.



Using the GUI

This section explains how to use the AlliedWare Plus™ GUI. It assumes that you have installed the GUI on your switches and have the setup the browser on your PC. This procedure is covered in **"Installing the GUI and setting the switch" on page C.4**.

In this section each screen is presented by its tab name and explains the content of the screen components.

System > Status

The **System** > **Status** menu tab enables you to display and configure basic system information.

The **CPU Used %** and **Memory Free %** graphs provide a brief history of CPU and memory usage.

Note For systems equipped and configured using VCStack, there is a separate tab for each stack member with the system name displayed on each tab.

Description

Display Label / Field	Description
`System / Name`	Specifies the network name of the system, as set with the 'hostname' command in the CLI.
`System / Started`	Date and time the switch was last booted.
`System / Uptime`	Elapsed time since the last boot.
`System / Contact`	Contact details for system maintenance.
`System / Location`	Location of the switch
`System / Description`	Description of the switch, including manufacturer, model, and software version.
`Top Ten Utilised Ports`	Displays a sorted list of the ten most used ports listed by port and its utilization. You can rearrange and resort the list by port or utilization.

Description

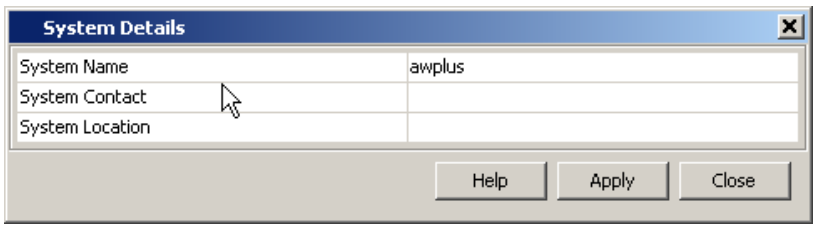
Configuration Button / Field	Description
System Time & Date (icon)	Add or modify System Date, System Time, UTC Time Zone Offset.
Configure System Details	Add or modify System Name, System Contact, System Location.
Configure System Details / System Name	Configures the network name of the system.
Configure System Details / System Contact	Configures the contact information for the system, from 0 to 255 characters long. Valid characters are any printable characters and spaces.
Configure System Details / System Location	Configures the location of the system, from 0 to 255 characters long. Valid characters are any printable characters and spaces.

System > Status > System Details

The **System** > **Status** > **System Details** dialog allows you to configure basic system information.

Configuration Dialog

Example showing **System** > **Status** > **System Details** dialog:



Description

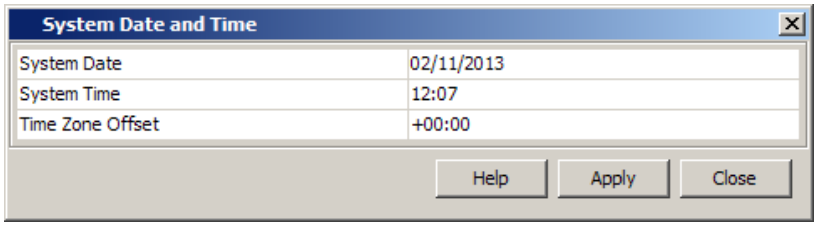
Label / Field / Button	Description
System Name	Enter the network name of the system.
System Contact	Enter the contact information for the system, from 0 to 255 characters long. Valid characters are any printable characters and spaces.
System Location	Enter the location of the system, from 0 to 255 characters long. Valid characters are any printable characters and spaces.

System > Status > System Date and Time

The **System** > **Status** > **System Date and Time** dialog allows you to configure the date and time for the switch.

Configuration Dialog

Example showing **System** > **Status** > **System Date and Time** dialog:



Description

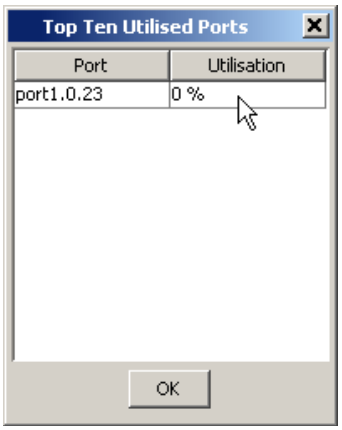
Label / Field / Button	Description
`System Date`	Enter the current system date in month, day, and year format.
`System Time`	Enter the local time for the system clock in hours and minutes.
`Time Zone Offset`	Enter the offset to the UTC (Coordinated Universal Timezone) for a local timezone in hours and minutes.

System > Status > Top Ten Utilised Ports

The **System** > **Status** > **Top Ten Utilised Port** dialog allows you to monitor port utilisation on the switch.

Configuration Dialog

Example showing **System** > **Status** > **Top Ten Utilised Ports** dialog:



Description

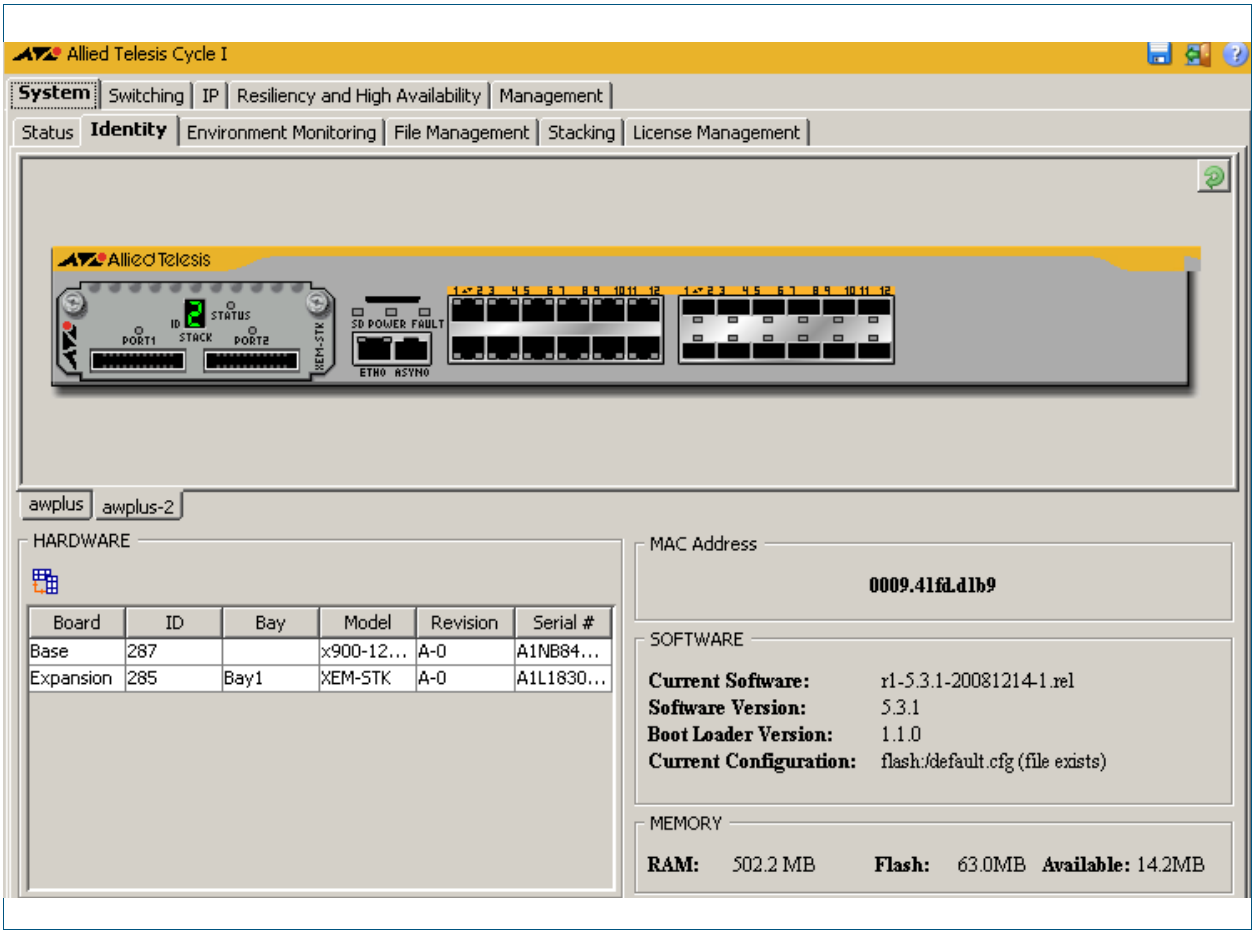
Label / Field / Button	Description
`Port`	Displays up to ten ports that are used the most on the switch. You can sort by ascending or descending port order.
`Utilisation`	Displays the utilisation percentage for the port. You can sort by ascending or descending utilisation percentage.

System > Identity

The **System** > **Identity** menu tab displays physical properties, software version and configuration file name.

Note For systems equipped and configured using VCStack there is a separate tab for each stack member with the system name displayed on each tab.

Menu Tab Example showing the **System** > **Identity** menu tab:



Description

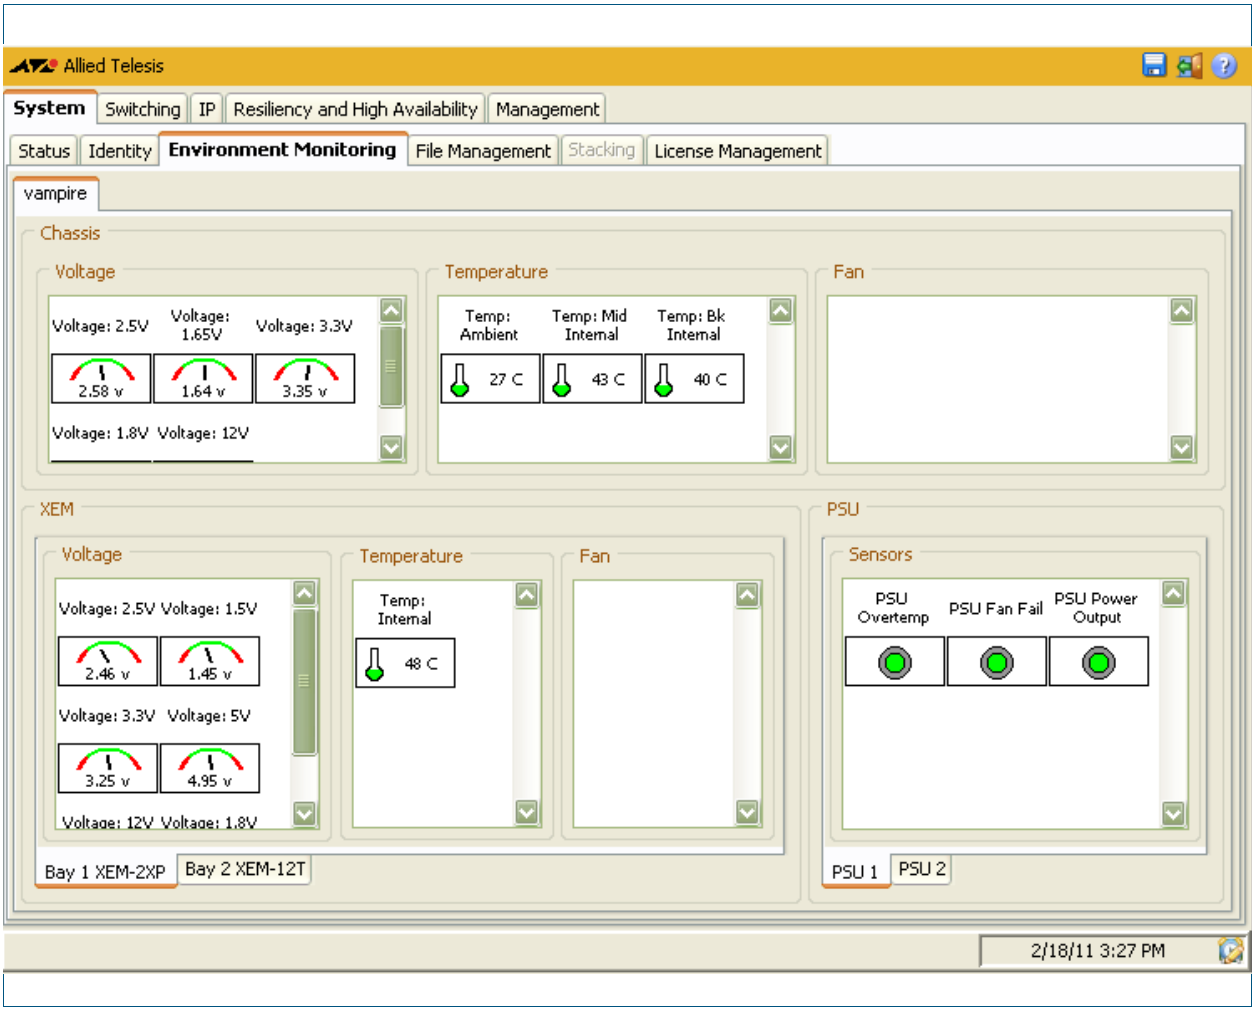
Label / Field / Button	Description
HARDWARE	Displays the board, ID, bay, model, revision and serial number of the switch main board. and any installed XEMs.
MAC Address	Displays the MAC Address of the switch in hexadecimal in the format HHHH.HHHH.HHHH.
SOFTWARE	Displays the software release file name, software version, boot loader version, and configuration file name loaded on the switch.
MEMORY	Displays the amount of installed RAM and Flash, plus the remaining Flash available on the switch.

System > Environment Monitoring

The **System** > **Environment Monitoring** menu tab allows you to display the status of the environmental properties, such as all voltages and temperatures, which the system monitors.

Note For systems equipped and configured using VCStack there is a separate tab for each stack member with the system name displayed on each tab.

Menu Tab Example showing the **System** > **Environment Monitoring** menu tab:



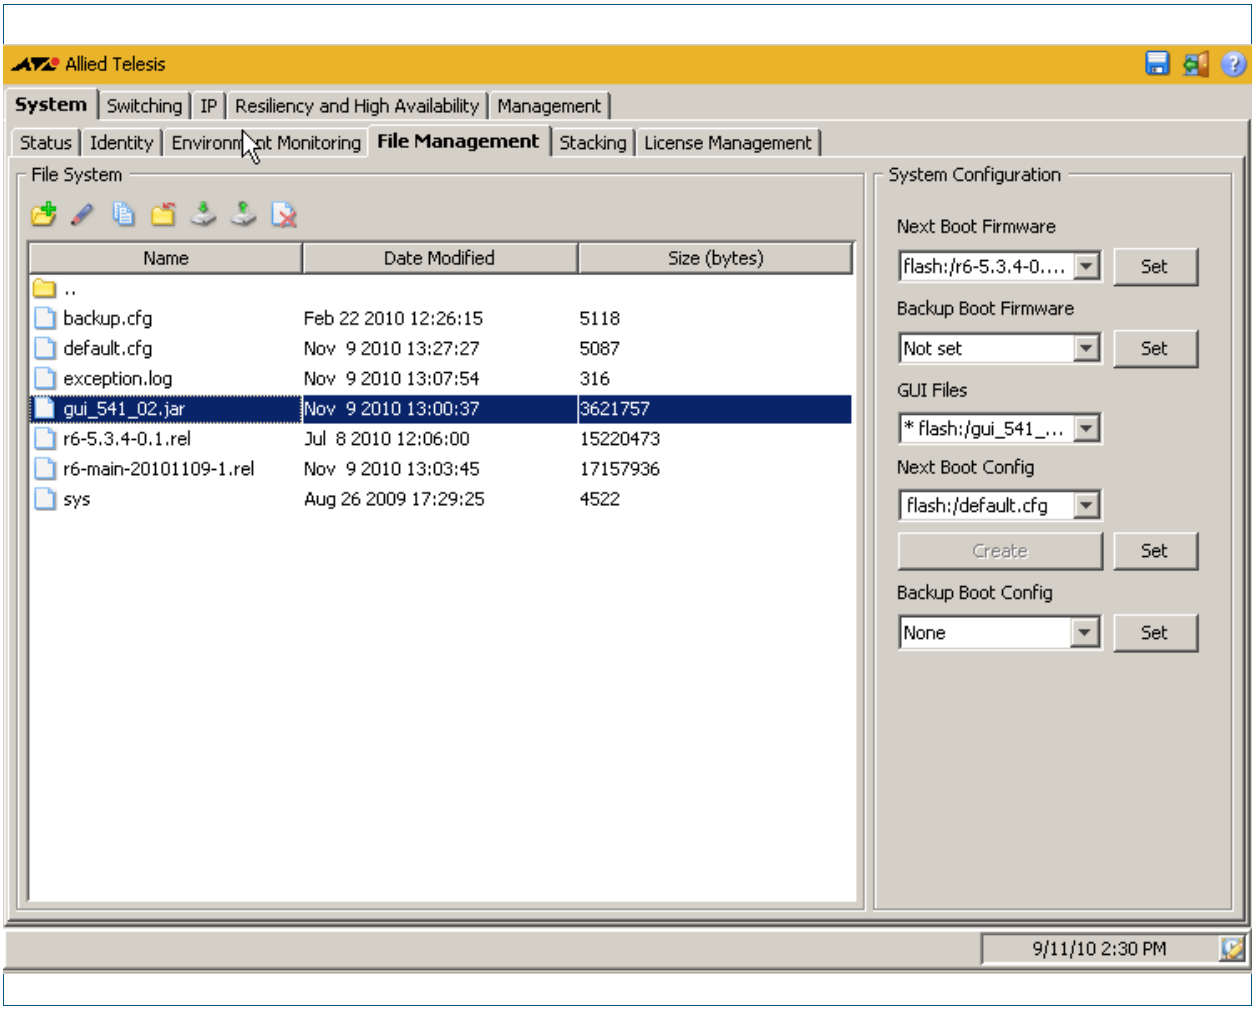
Description

Label / Field / Button	Description
`Chassis`	Displays the operational status of chassis voltages and temperatures for the switch.
`Fan`	Displays the operational status of the switch fans.
`XEM`	Displays the operational status of voltages, temperatures, and fans for any installed XEMs.
`PSU`	Displays the operational status of temperatures and fans for any installed pluggable PSUs.

System > File Management

The **System** > **File Management** menu tab allows you to create, copy, delete, upload or download boot and backup release and configuration files to and from the switch. You can specify fallback or backup release and configuration files in case the boot release or configuration files become corrupted, and you can also specify the boot release and configuration files to boot directly from SD card or to boot from flash.

Menu Tab Example showing the **System** > **File Management** menu tab:



Description: File System

Label / Field / Button	Description
File System	Displays file names, file dates, and file sizes of files in Flash, NVS or SD card. Note that only SD card files that are resident on the stack master are shown. Also, only files that have a total URL length of 112 characters or less are displayed. The URL is the path to the file and is of the form <hostname>-<stack_id>/<filesystem>:/<pathname>, for example, awplus-1/flash:/test.cfg. The GUI will immediately show all file changes to the NVS and Flash filesystems, regardless of how they have been made, either via the GUI or CLI. However, the SD card filesystem is treated differently as it is not permanently mounted. The GUI will only update SD card files when the card is inserted/deleted, or when the changes are made via the GUI. They are not updated if modified via the CLI. The buttons shown below the File System label also allow you upload, download, move, copy, and delete files respectively.
File System / Add Folder	Select the folder you want to create a new sub-folder in then click on the Add Folder button located directly below the File System label.
File System / Rename File	Select the file you want to rename then click on the Rename File or Folder button located directly below the File System label.
File System / Copy File	Select the file you want to copy then click on the Copy File button located directly below the File System label. Choose the Destination Folder from the drop down list in the Copy File dialog then select OK to copy the file to the chosen destination.
File System / Move File	Select the file you want to move then click on the Move File button located directly below the File System label. Choose the Destination Folder from the drop down list in the Move File dialog then select OK to move the file to the chosen destination.
File System / Download File	Select the file you want to download then click on the Download File button located directly below the File System label.
File System / Upload File	Click on the Upload File button located directly below the File System label then select the file you want to upload.
File System / Delete File	Select the file or folder you want to delete then click on the Delete File button located directly below the File System label.

Description: System Configuration

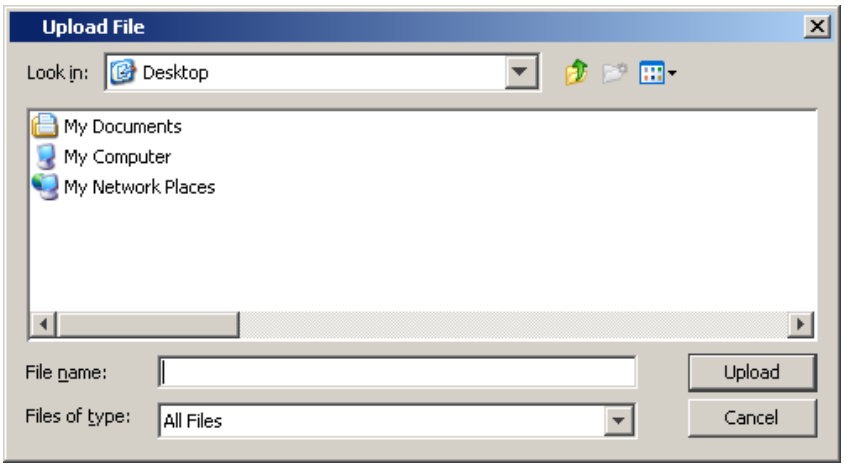
Label / Field / Button	Description
`System Configuration`	Configures running and backup software, GUI software, and configuration files in Flash or card (or storage device) memory available on the switch.
`System Configuration / Next Boot Firmware`	Choose the Next Boot Firmware `.rel` file and path from the drop down list then click Set to make this file the firmware that starts after reboot. From 5.4.1release onwards, you can set a Next Boot Firmware `.rel` file to boot directly from an SD card.
`System Configuration / Backup Boot Firmware`	Choose the Backup Boot Firmware `.rel` file and path from the drop down list then click Set to boot from this file at reboot. A Backup Boot Firmware .rel file is used instead of the Next Boot Firmware `.rel` file if the Next Boot Firmware `.rel` file is corrupted.
`System Configuration / GUI Files`	Displays the GUI file name and file location on the switch and indicates the currently running GUI file with a prefixed asterisk (e.g. `* flash:/gui_534_07.jar`). Note that you cannot set the GUI version from within the GUI itself. See the GUI installation instructions in *Appendix C: GUI Reference* of the current *AlliedWare Plus Software Reference* to install GUI files. The latest version of the GUI .jar file loaded is run by the switch automatically.
`System Configuration / Next Boot Config`	Choose the Next Boot Config `.cfg` file and path from the drop down list then click Set to make this file the Config `.cfg` file that the switch uses at reboot. From 5.4.1release onwards, you can set a Next Boot Config `.cfg` file to load directly from a USB storage device.
`System Configuration / Backup Boot Config`	Choose the Backup Boot Config Files .cfg file and path from the drop down list then click Set to make boot from this file at reboot. A Backup Boot Config `.cfg` file is used instead of the Next Boot config `.cfg` file if the Next Boot Config `.cfg` file is corrupted.

System > File Management > Upload File

The **System** > **File Management** > **Upload File** dialog allows you to upload files (e.g. release and configuration files) from a client device to the switch. Select the Upload File button below the File System label to access this dialog.

Configuration Dialog

Example showing **System** > **File Management** > **Upload File** dialog:



Description

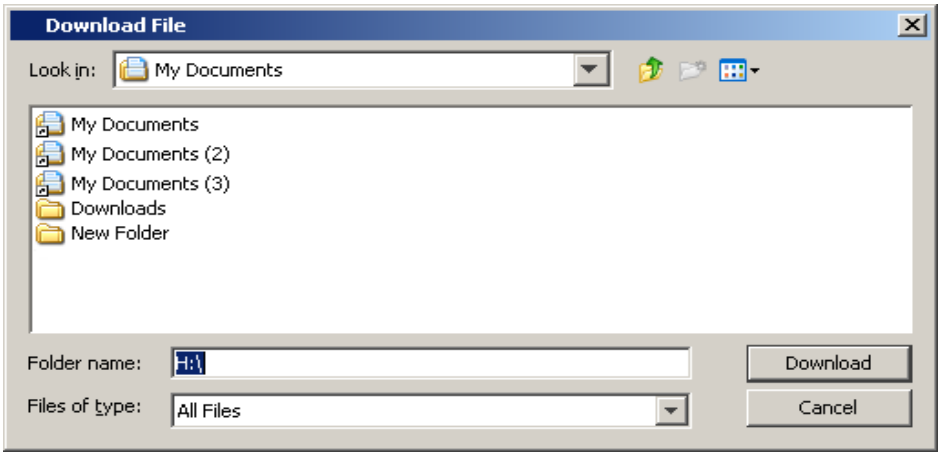
Label / Field / Button	Description
`Destination Folder`	Select the destination folder to upload the selected file from. An uploading progress bar displays after clicking the Upload button.

System > File Management > Download File

The **System > File Management > Download File** dialog allows you to download files (e.g. release and configuration files) from the switch to a client device. Select the Download File button below the File System label to access this dialog.

Configuration Dialog

Example showing **System > File Management > Download File** dialog:



Description

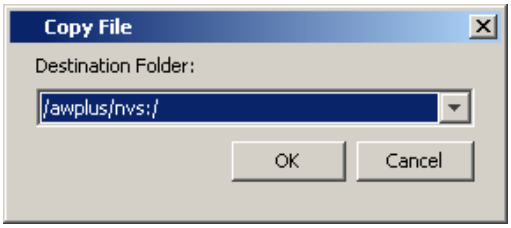
Label / Field / Button	Description
`Destination Folder`	Select the destination folder to download the selected file to. A downloading progress bar displays after clicking the Download button.

System > File Management > Copy File

The **System** > **File Management** > **Copy File** dialog allows you to copy files (e.g. release and configuration files). Select the Copy File button below the File System label to access this dialog.

Configuration Dialog

Example showing **System** > **File Management** > **Copy File** dialog:



Description

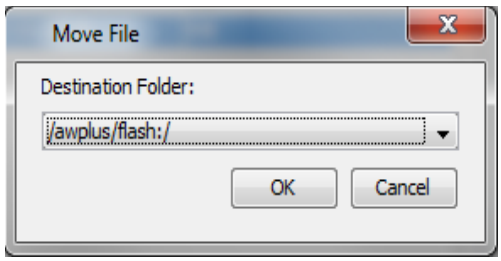
Label / Field / Button	Description
`Destination Folder`	Select the destination folder to copy the selected file to. A copying progress bar displays after clicking the OK button.

System > File Management > Move File

The **System** > **File Management** > **Move File** dialog allows you to move files (e.g. release and configuration files). Select the Move File button below the File System label to access this dialog.

Configuration Dialog

Example showing **System** > **File Management** > **Move File** dialog:



Description

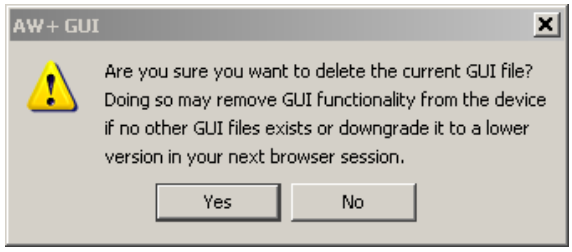
Label / Field / Button	Description
`Destination Folder`	Select the destination folder to move the selected file to. A moving progress bar displays after clicking the OK button.

System > File Management > Delete File

The **System** > **File Management** > **Delete File** dialog allows you to delete files (e.g. release and configuration files). Select the Delete File button below the File System label to access this dialog.

Configuration Dialog

Example showing **System** > **File Management** > **Delete File** dialog:



Description

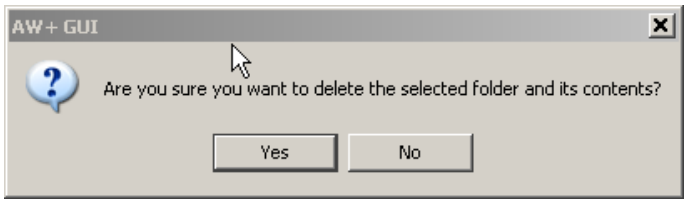
Label / Field / Button	Description
Yes	Confirm selected file deletion operation.
No	Cancel selected file deletion operation.

System > File Management > Delete Folder

The **System** > **File Management** > **Delete Folder** dialog allows you to delete folders in the flash or SD card file system containing files (e.g. release and configuration files). Select the Delete Folder button below the File System label to access this dialog.

Configuration Dialog

Example showing **System** > **File Management** > **Delete Folder** dialog:



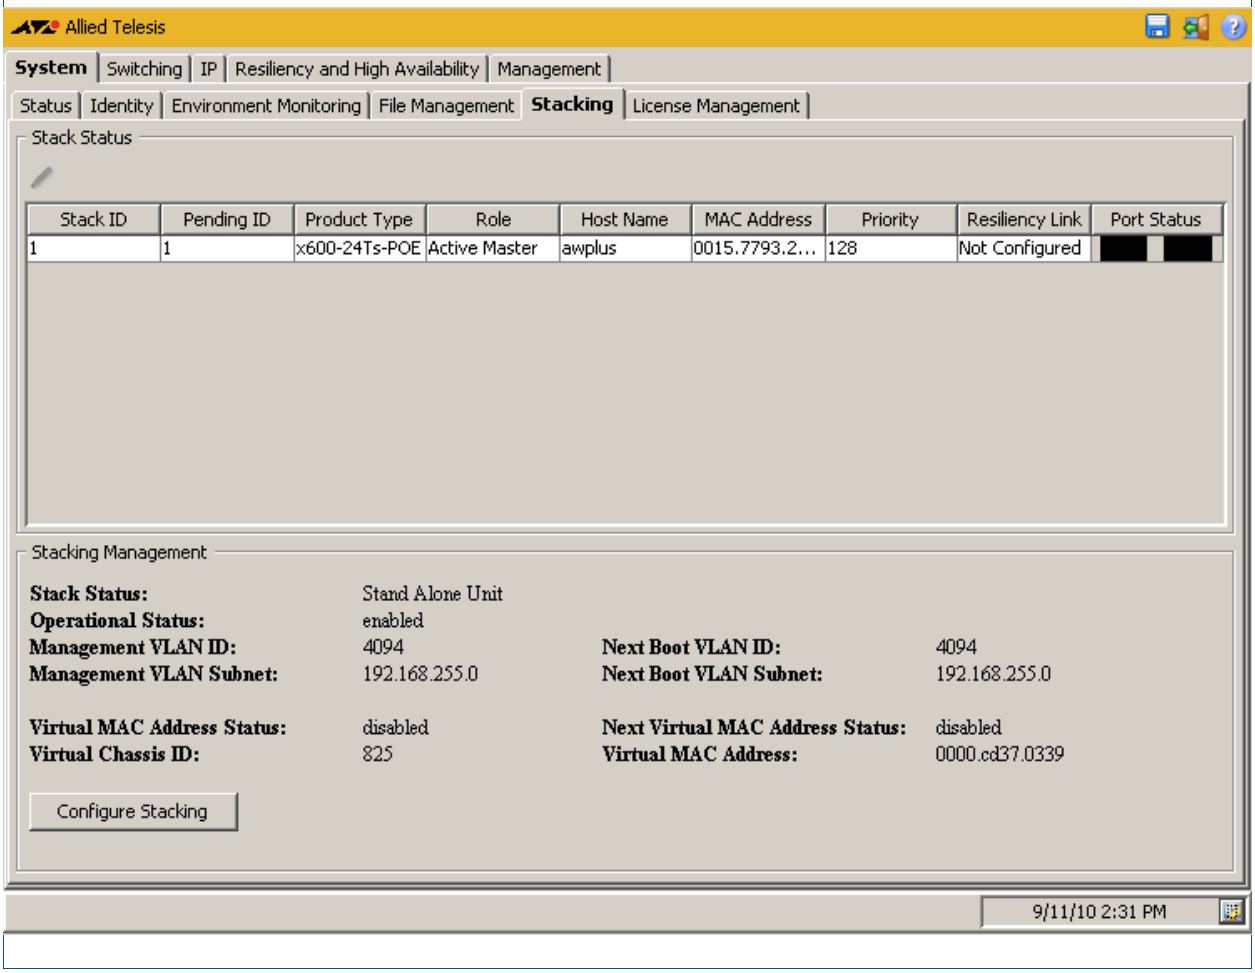
Description

Label / Field / Button	Description
Yes	Confirm selected folder deletion operation.
No	Cancel selected folder deletion operation.

System > Stacking

The **System** > **Stacking** menu tab allows you to display and monitor a summary of the identity and status of stack members, plus you can also configure the VLAN ID and IP subnets used for internal VCStack communication.

Menu Tab Example showing the **System** > **Stacking**:



Description: Stacking Management

Label / Field / Button	Description
`Stacking Management / Stack Status`	The stack's overall status. Note that a warning is issued if the stack is not connected in a standard ring topology.
`Stacking Management / Operational Status`	The operational status of the stack. Can be: enabled (1), disabled (2).
`Stacking Management / Management VLAN ID`	The VLAN ID currently used for stack management. The default stack management VLAN ID is 4094.
`Stacking Management / Next Boot VLAN ID`	The VCS management VLAN ID to be assigned after the next reboot.

Label / Field /	Description(cont.)
Stacking Management / Management VLAN Subnet	The VLAN subnet currently used for stack management.
Stacking Management / Next Boot VLAN Subnet	The stacking management VLAN subnet address after rebooting.
Stacking Management / Virtual MAC Address Status	Indicates whether the virtual MAC address is enabled or disabled.
Stacking Management / Next Virtual MAC Address Status	Indicates whether the next virtual MAC address is enabled or disabled.
Stacking Management / Virtual Chassis ID	Displays the current virtual chassis ID.
Stacking Management / Virtual MAC Address	Displays the virtual MAC address used by the stack.
Configure Stacking	Configures the VCS management VLAN ID, the subnet address of the VCS management VLAN, and the Virtual MAC Address Status.

Description: Stack Status

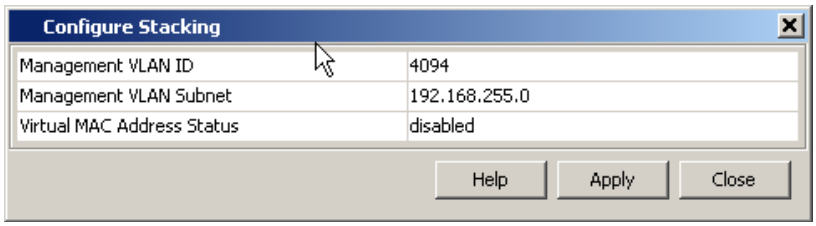
Label / Field / Button	Description
`Stack Status / Stack ID`	The Stack member ID.
`Stack Status / Pending ID`	The Stack member ID to be assigned to the device after the next reboot.
`Stack Status / Product Type`	The Stack member product type; for example, SwitchBlade x908.
`Stack Status / Role`	Stack member's role in the stack (either Active Master or Backup Member).
`Stack Status / Host Name`	The host name of the Stack member.
`Stack Status / MAC Address`	Stack member's hardware MAC address. Note that frames from devices within a stacked virtual chassis will carry the source address of the stack master.
`Stack Status / Priority`	The priority for election of stack master (0 to 255). The lowest number has the highest priority. Note that where stack members have the same priority setting, the switch with the lowest MAC address will become the stack master.
`Stack Status / Resiliency Link`	Status of the stack members resiliency link. Can be one of: `Configured`, `Successful`, `Failed`, `Not Configured`.
`Stack Status / Port Status`	When the rectangle is colored GREEN, it means that the port has a learned neighbor connected. Note that the number in the rectangle indicates the stack ID of the learned neighbor connected to the port. When the rectangle is colored BLACK then the port status is down. When the rectangle is colored RED then Operational Status for the port has been set to disabled.

System > Stacking > Configure Stacking

The **System** > **Stacking** > **Configure Stacking** dialog allows you to configure the VLAN ID and IP subnets used for internal VCStack communication.

Configuration Dialog

Example showing **System** > **Stacking** > **Configure Stacking** dialog:



Description

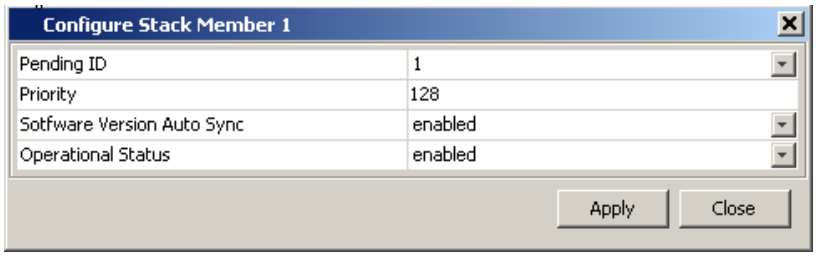
Label / Field / Button	Description
`Management VLAN ID`	Enter the VLAN ID for stack management. The default stack management VLAN ID is 4094.
`Management VLAN subnet`	Enter the subnet address of the VCS management VLAN.
`Virtual MAC Address Status`	Select the status for the Virtual MAC Addressing feature, which can be set to `disabled` or `enabled` from the drop down list. You can only change this field if the `Operational Status` field is enabled, otherwise this field is disabled. Note also that when running VCStack configurations via the GUI, you must enable Virtual MAC Addressing

System > Stacking > Configure Stack Member

The **System** > **Stacking** > **Configure Stack Member** dialog allows you to configure the Pending ID, Priority, Software Version Auto Synchronization and Operational Status used for internal VCStack communication.

Configuration Dialog

Example showing **System** > **Stacking** > **Configure Stack Member** dialog:



Description

Label / Field / Button	Description
`Pending ID`	Enter the Pending ID for the stack member. You can only change this field if the `Operational Status` field is enabled, otherwise this field is disabled.
`Priority`	Enter the Priority for the stack member.
`Software Version Auto Sync`	Select the enabled or disabled options to enable or disable the Software Version Auto Synchronization feature for the stack member. You can only change this field if the `Operational Status` field is enabled, otherwise this field is disabled.
`Operational Status`	Select the enabled or disabled options to enable or disable the stack member.

System > License Management

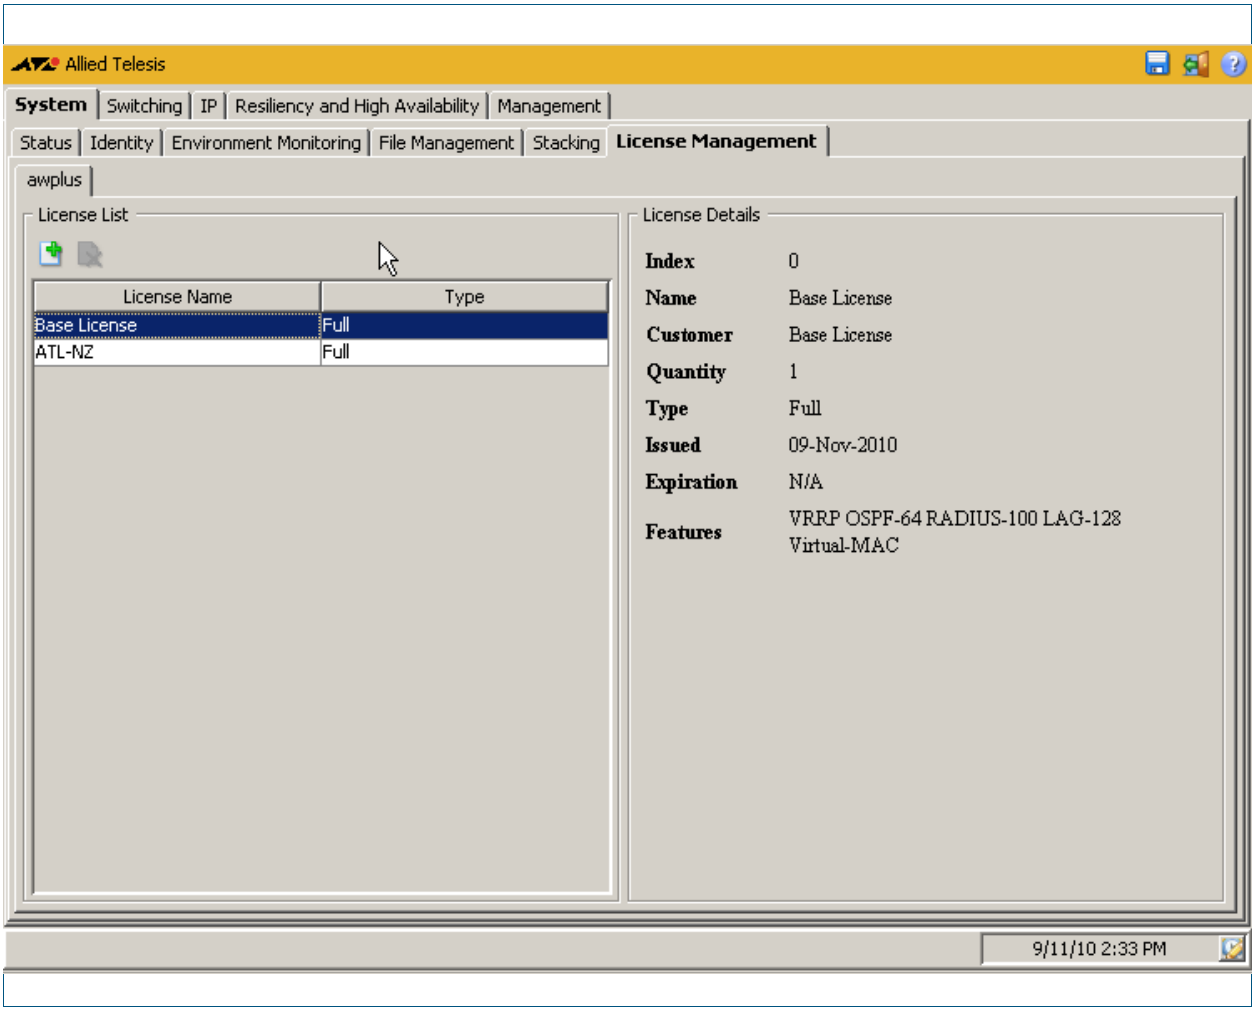
The **System** > **License Management** menu tab allows you to view, add and delete feature licenses.

Note For systems equipped and configured using VCStack there is a separate tab for each stack member with the system name displayed on each tab.

- Selecting the + icon allows you to add a feature license.
- Selecting the x icon allows you to delete a feature license.

Note If a license is added to, or deleted from, a stack member then the same action must be taken on all other stack members. Otherwise incompatible licensing will occur and affected devices will not rejoin the stack following a reboot.

Menu Tab Example showing the **System** > **License Management** menu tab:



Description

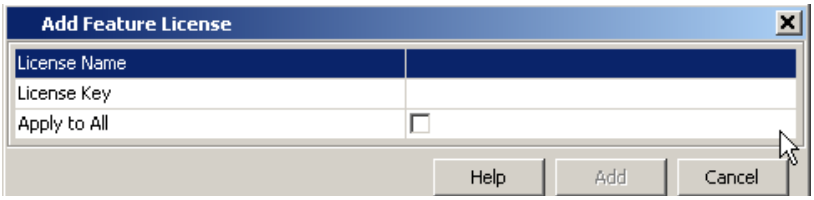
Label / Field / Button	Description
License List / License Name	Name of the license bundle.
License List / Type	The type of license activated on the switch: full or temporary.
License Details / Index	Index identifying entry.
License Details / Name	Name of the license bundle.
License Details / Customer	Customer name.
License Details / Quantity	Quantity of licenses included in the feature key.
License Details / Type	Full or temporary license types.
License Details / Issued	Date the key was generated.
License Details / Expiration	Expiry date for a temporary license.
License Details / Features	List of features enabled by the license.

System > License Management > Add Feature License

The **System > License Management > Add Feature License** dialog allows you add feature licenses by specifying the license name and the license key. You can add a license for all the stack members or for a single stack member.

Configuration Dialog

Example showing **System > License Management > Add Feature License** dialog:



Description

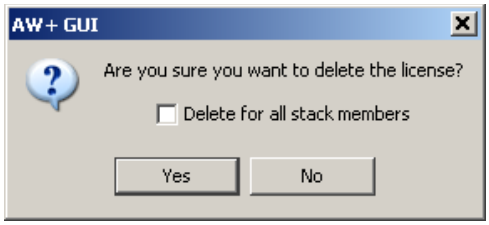
Label / Field / Button	Description
License Name	Enter the license name of the software feature.
License Key	Enter the encrypted license key to enable this software feature.
Apply to All	Select the checkbox to apply the license to all the stack members.

System > License Management > Delete Feature License

The **System > License Management > Delete Feature License** dialog allows you delete feature licenses by specifying the license name and the license key. You can delete a license for all the stack members or for a single stack member.

Configuration Dialog

Example showing **System > License Management > Delete Feature License** dialog:



Description

Label / Field / Button	Description
`Delete for all stack members`	Select the checkbox to delete the license for all the stack members.

Switching > Ports

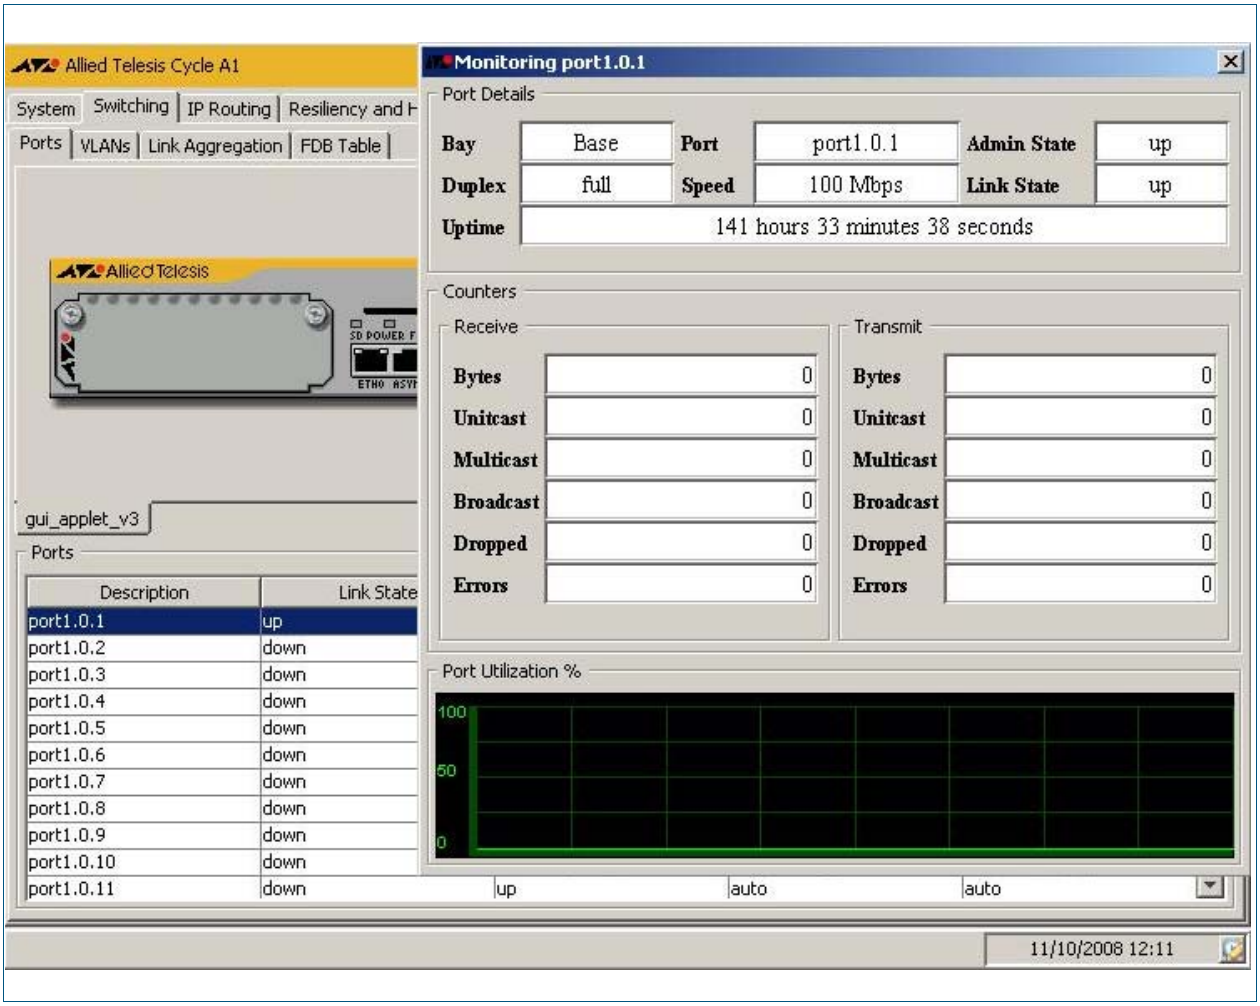
The **Switching** > **Ports** menu tab allows you to view, and configure Layer 1 properties:

- Right-clicking a port allows you to select monitoring or configuration dialogs for the selected port.
- The monitoring dialog displays port status, statistics and a brief utilization history.
- The configuration dialog allows you to configure Administrative State, Auto Negotiation, Speed and Duplex settings for the port.

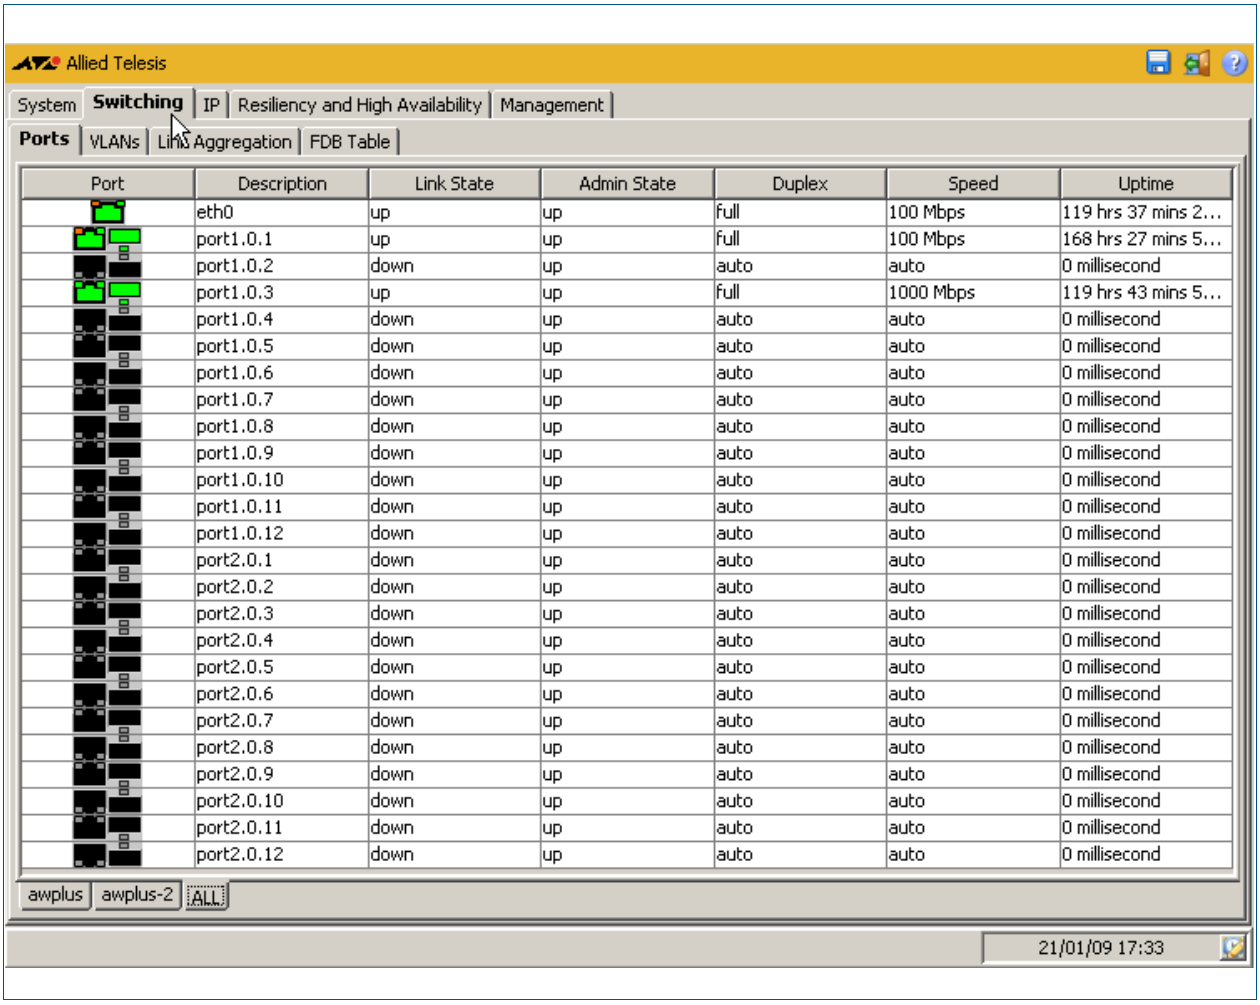
Note Speed and Duplex settings can only be changed if Auto Negotiation is disabled.

Note For systems equipped and configured using VCStack there is a separate tab for each stack member with the system name displayed on each tab.

Menu Tab Example showing the **Switching** > **Ports** menu tab and **monitor**:



Menu Tab Example showing the **Switching > Ports > ALL** menu tab:



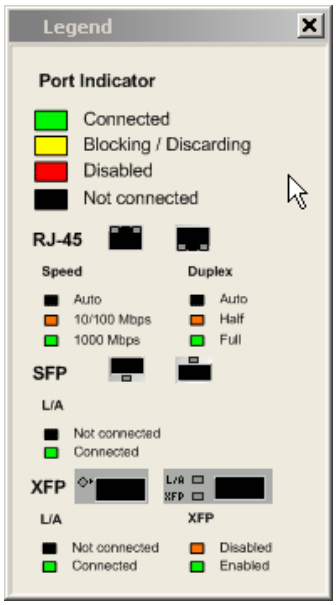
Port	Description	Link State	Admin State	Duplex	Speed	Uptime
	eth0	up	up	full	100 Mbps	119 hrs 37 mins 2...
	port1.0.1	up	up	full	100 Mbps	168 hrs 27 mins 5...
	port1.0.2	down	up	auto	auto	0 millisecond
	port1.0.3	up	up	full	1000 Mbps	119 hrs 43 mins 5...
	port1.0.4	down	up	auto	auto	0 millisecond
	port1.0.5	down	up	auto	auto	0 millisecond
	port1.0.6	down	up	auto	auto	0 millisecond
	port1.0.7	down	up	auto	auto	0 millisecond
	port1.0.8	down	up	auto	auto	0 millisecond
	port1.0.9	down	up	auto	auto	0 millisecond
	port1.0.10	down	up	auto	auto	0 millisecond
	port1.0.11	down	up	auto	auto	0 millisecond
	port1.0.12	down	up	auto	auto	0 millisecond
	port2.0.1	down	up	auto	auto	0 millisecond
	port2.0.2	down	up	auto	auto	0 millisecond
	port2.0.3	down	up	auto	auto	0 millisecond
	port2.0.4	down	up	auto	auto	0 millisecond
	port2.0.5	down	up	auto	auto	0 millisecond
	port2.0.6	down	up	auto	auto	0 millisecond
	port2.0.7	down	up	auto	auto	0 millisecond
	port2.0.8	down	up	auto	auto	0 millisecond
	port2.0.9	down	up	auto	auto	0 millisecond
	port2.0.10	down	up	auto	auto	0 millisecond
	port2.0.11	down	up	auto	auto	0 millisecond
	port2.0.12	down	up	auto	auto	0 millisecond

Description

Label / Field / Button	Description
`Ports`	Displays port number, description of the port, link and administrative status, duplex mode, speed and uptime (in milliseconds) for the selected port.

Legend Example showing S**witching > Ports > Legend**:

To select the Legend panel click the View Legend icon (white L within a blue circle) on the top right of the Switching - Ports screen.

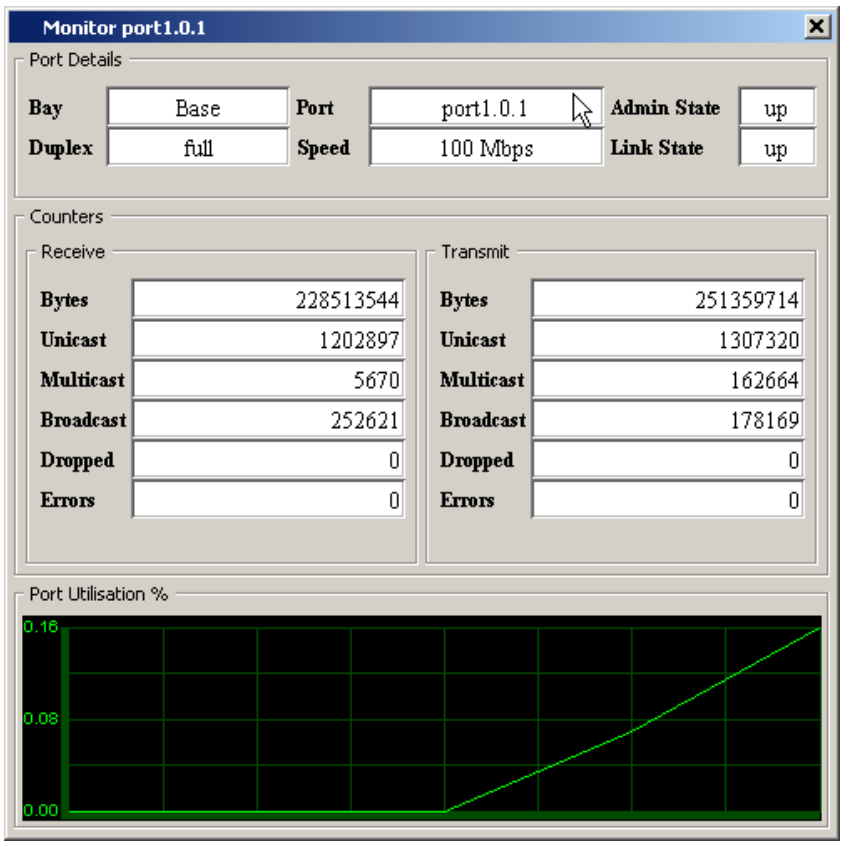


Switching > Ports > Monitor Port

The **Switching > Ports > Monitor Port** dialog allows you monitor port counters.

Configuration Dialog

Example showing the **Switching > Ports > Monitor Port** dialog:



Description

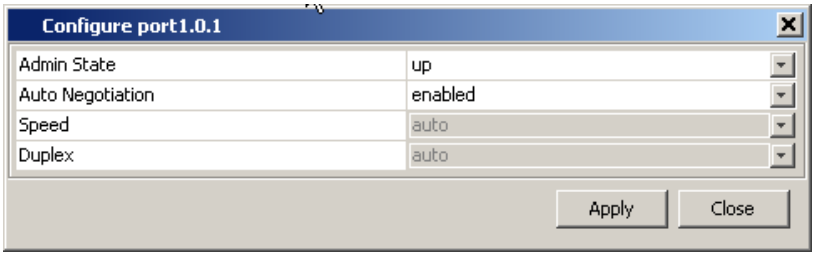
Label / Field / Button	Description
`Port Details`	Monitors the bay, port, duplex, speed, administrative state and link states for the selected port.
`Counters`	Monitors the counters for bytes received/transmitted, unicast packets received/transmitted, multicast packets received/transmitted, broadcast packets received/transmitted, dropped packets received/transmitted, and errors received/transmitted for the selected port.
`Port Utilisation%`	Monitors and graphs the usage percentage for the selected port.

Switching > Ports > Configure Port

The **Switching** > **Ports** > **Configure Port** dialog allows you configure Administrative State, Auto Negotiation, Speed and Duplex settings for the selected port.

Configuration Dialog

Example showing the **Switching** > **Ports** > **Configure Port** dialog:



Description

Label / Field / Button	Description
`Admin State`	Select `up` or `down` from the drop down list in this dialog to specify the administrative state for the selected port.
`Auto Negotiation`	Select `disabled` or `enabled` from the drop down list in this dialog to specify auto negotiation for the selected port. Note that selecting `enabled` to enable `Auto Negotiation` will disable Speed and Duplex options, indicated by greyed out options.
`Speed`	Select `10 Mbps`, `100 Mbps`, `1000 Mbps`, `10 Gbps`, or `auto` from the drop down list in this dialog to specify the speed setting for the selected port. Note that the options for speed settings are only available if `Auto Negotiation` has been `disabled` for the selected port.
`Duplex`	Select `full`, `half`, or `auto` from the drop down list in this dialog to specify the duplex setting for the selected port. Note that the options for duplex settings are only available if `Auto Negotiation` has been `disabled` for the selected port.

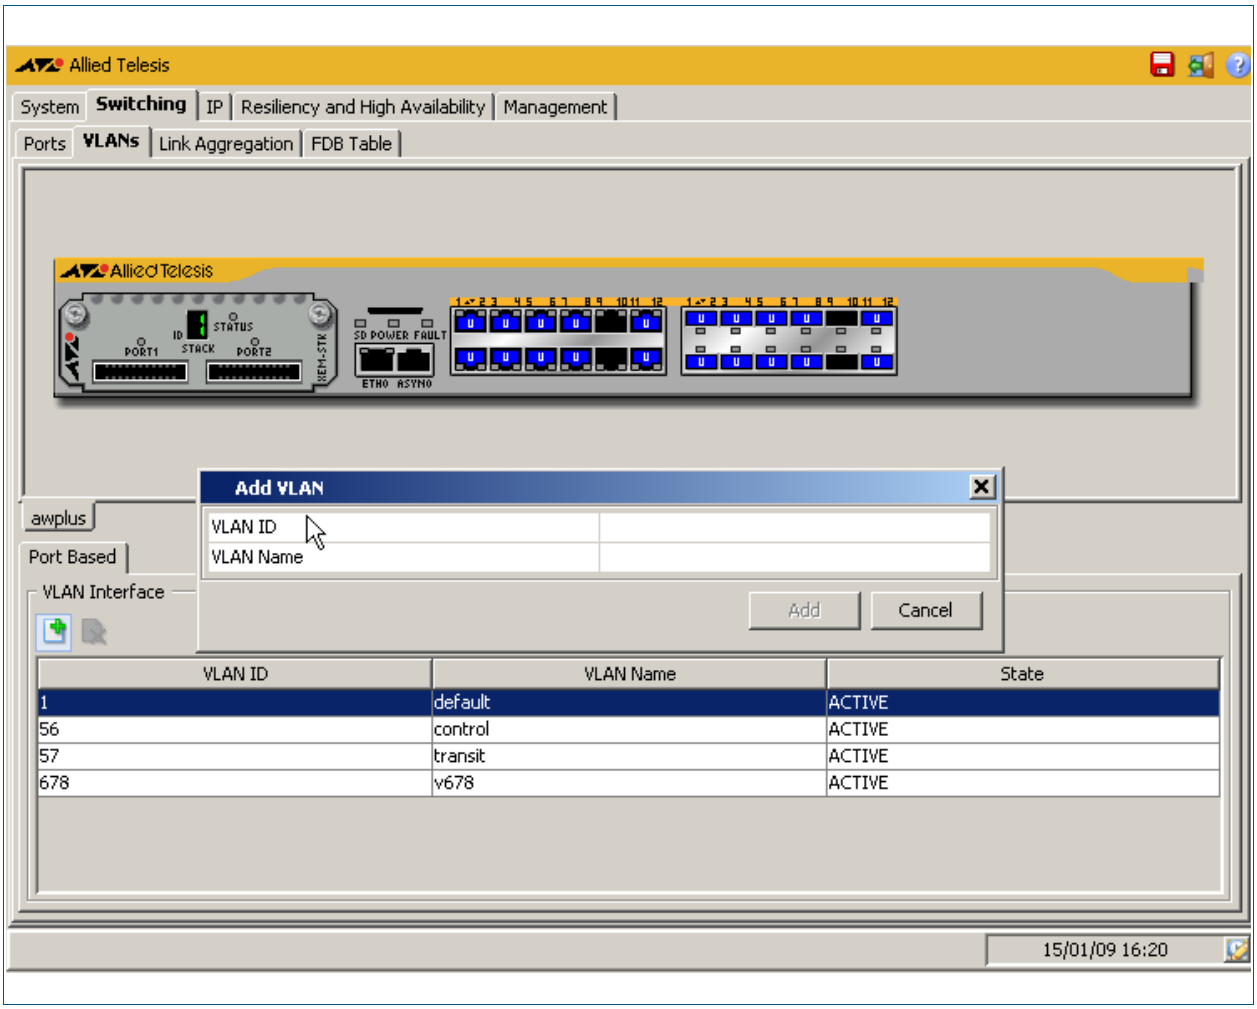
Switching > VLANs

The **Switching** > **VLANs** menu tab allows you to view, a nd configure Layer 2 properties:

- Right-clicking a port allows you to select a VLAN to be tagged or untagged for the port, or to remove a port from the VLAN.
- Define VLANs before assigning VLANs to ports on the front panel of the switch.
- Selecting the **+** icon (under the VLAN Interface label on the VLAN tab below the front panel illustration) allows you to add a VLAN by specifying the VLAN ID and VLAN Name.
- Selecting the **x** icon (under the VLAN Interface label below the front panel illustration) allows you to delete a VLAN (except for the default VLAN 1 that is assigned to all ports).

Note For systems equipped and configured using VCStack there is a separate tab for each stack member with the system name displayed on each tab.

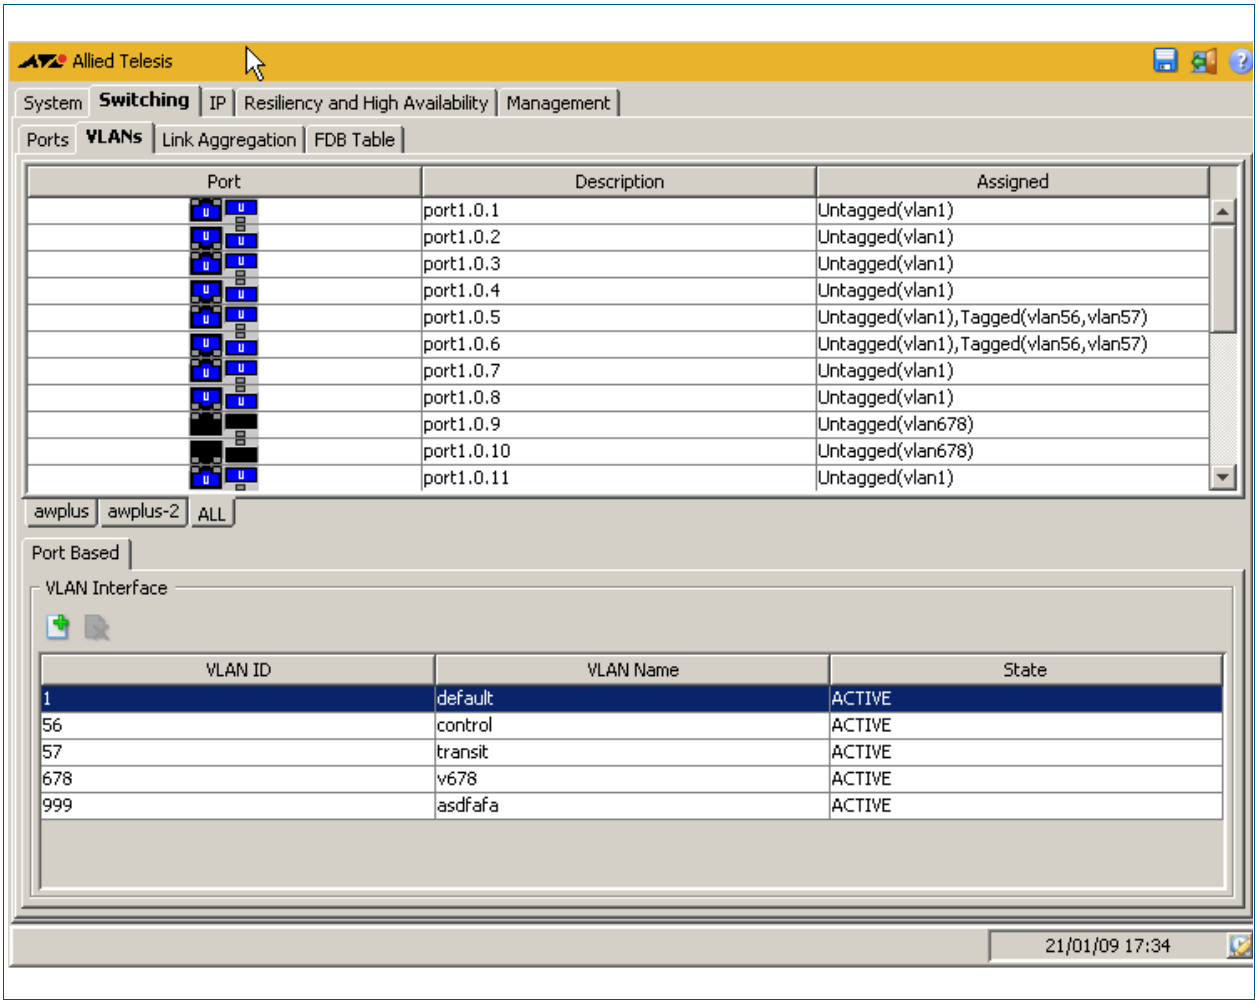
Menu Tab Example showing the **Switching** > **VLANs** menu tab:



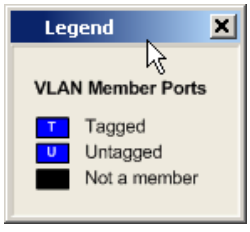
Description

Label / Field / Button	Description
`Port Based / VLAN ID`	The VID of the VLAN that is enabled or disabled in the range 1-4094.
`Port Based / VLAN Name`	The ASCII name of the VLAN with a maximum length of 32 characters.
`Port Based / State`	The state of the VLAN, either enabled ('**ACTIVE**' displayed) or disabled ('**INACTIVE**' displayed).

Menu Tab Example showing the **Switching > VLANs > ALL** menu tab:



Legend Example showing **Switching > VLANs > Legend**:

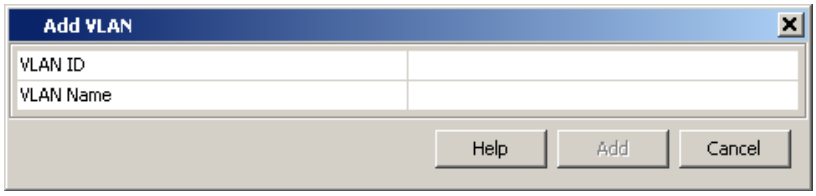


Switching > VLANs > Add VLAN

The **Switching** > **VLANs** > **Add VLAN** dialog allows you add a VLAN by specifying the VLAN ID and VLAN Name.

Configuration Dialog

Example showing the **Switching** > **VLANs** > **Add VLAN** dialog:



Description

Label / Field / Button	Description
`VLAN ID`	Enter the VID of the VLAN that is enabled or disabled in the range <1-4094>.
`VLAN Name`	Enter the ASCII name of the VLAN with a maximum length of 32 characters.

Switching > Link Aggregation

The **Switching** > **Link Aggregation** menu tab allows you to view, and configure Layer 2 properties:

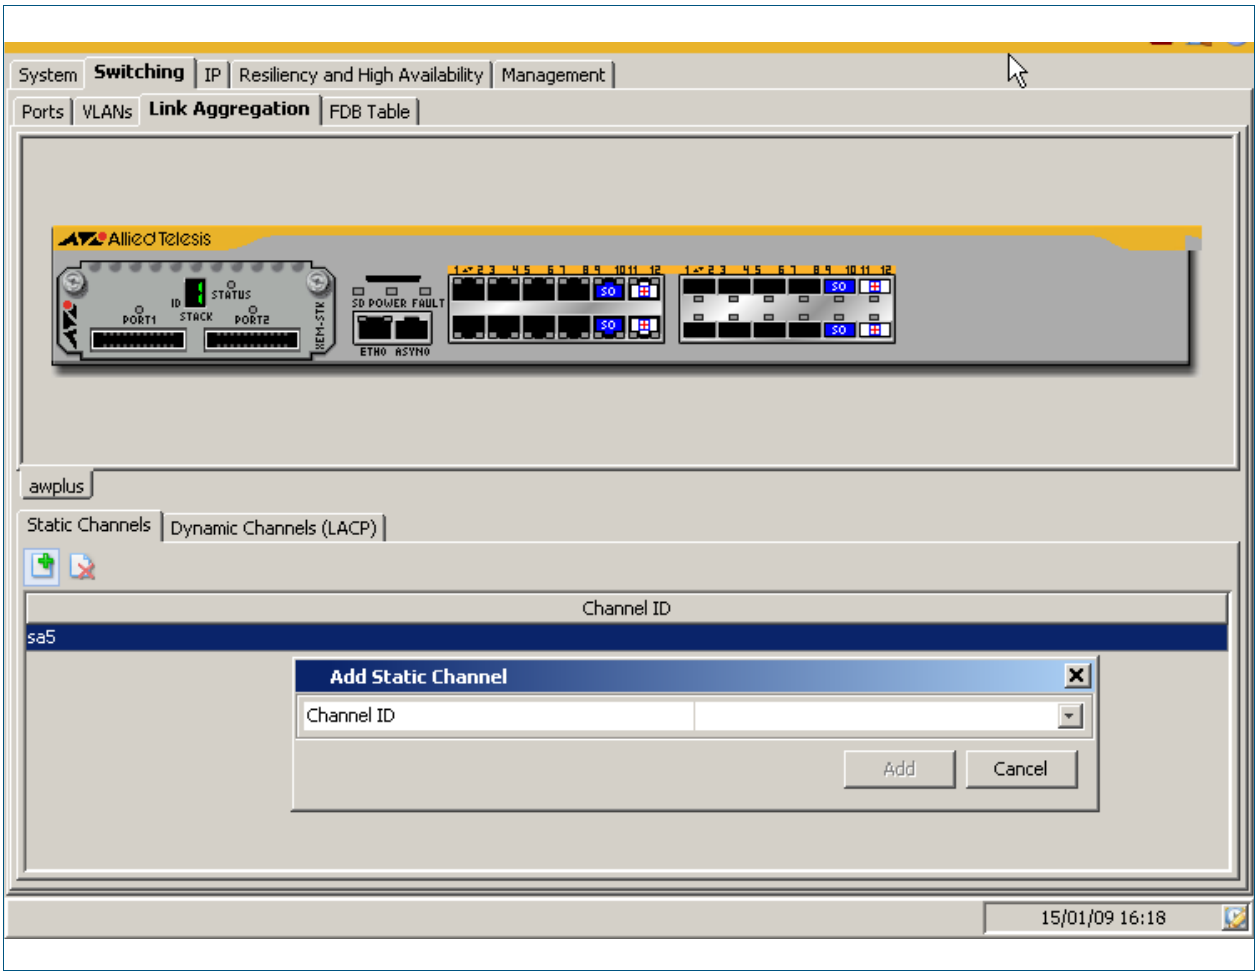
- Right-clicking a port allows you to select assign or remove the port to a Static Channel or a Dynamic Channel (LACP - Link Aggregation Control Protocol) group.
- Define Static Channel or Dynamic Channel (LACP) groups before assigning them to ports on the front panel of the switch.
- Selecting the + icon (located below the front panel illustration of your switch) allows you to add a Static Channel or Dynamic Channel (LACP) group by specifying the Channel ID.

Note Up to 31 Static Channel groups and up to 99 Dynamic Channel (LACP) groups can be defined on a switch.

- Selecting the x icon (located below the front panel illustration of your switch) allows you to delete a Static Channel or Dynamic Channel (LACP) group.

Note For systems equipped and configured using VCStack there is a separate tab for each stack member with the system name displayed on each tab.

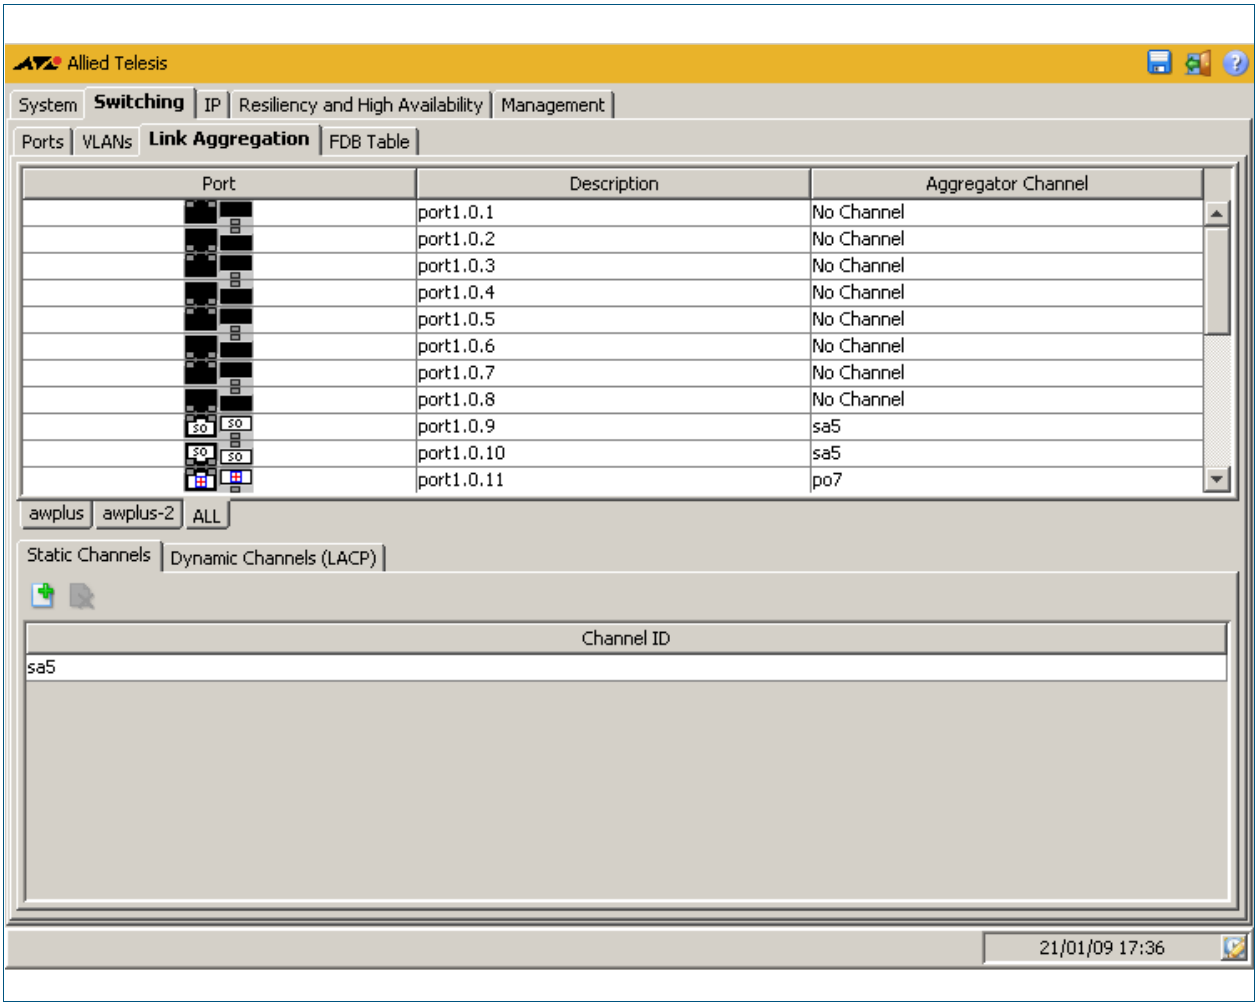
Menu Tab Example showing the **Switching** > **Link Aggregation** menu tab:



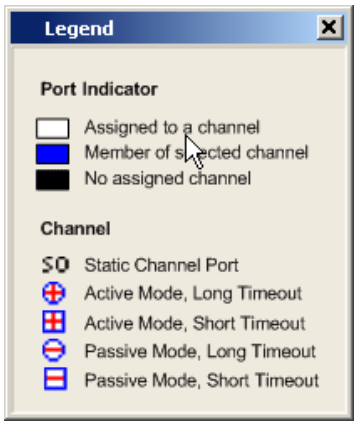
Description

Label / Field / Button	Description
`Static Channels`	Display or specify a static channel group number for an aggregated link. Up to 31 static channel groups can be created on the x900 series switch. Up to 32 static channel groups can be created on the SwitchBlade x908 switch.
`Dynamic Channels (LACP)`	Display or specify a dynamic channel group number for an LACP link. Up to 99 dynamic channel groups can be created on the switch.

Menu Tab Example showing the **Switching > Link Aggregation > ALL** menu tab:



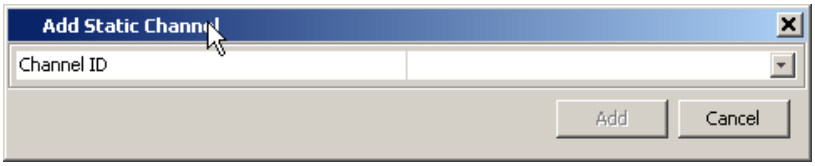
Legend Example showing **Switching > Link Aggregation > Legend**:



Switching > Link Aggregation > Add Static Channel

The **Switching > Link Aggregation > Add Static Channel** dialog allows you to assign the selected port to a Static Channel group.

Configuration Dialog Example showing the **Switching > Link Aggregation > Add Static Channel** dialog:



Description

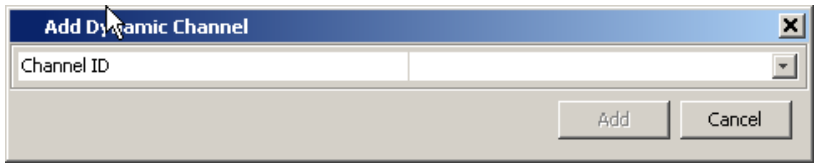
Label / Field / Button	Description
`Channel ID`	Specify a static channel group number for an interface. Up to 31 static channel groups can be created on the switch.

Switching > Link Aggregation > Add Dynamic Channel

The **Switching** > **Link Aggregation** > **Add Dynamic Channel** dialog allows you to assign the selected port to a Dynamic Channel (LACP) group.

Configuration Dialog

Example showing **Switching** > **Link Aggregation** > **Add Dynamic Channel** dialog:



Description

Label / Field / Button	Description
`Channel ID`	Specify a dynamic (LACP) channel group number for an interface. Up to 99 dynamic (LACP) channel groups can be created on the switch.

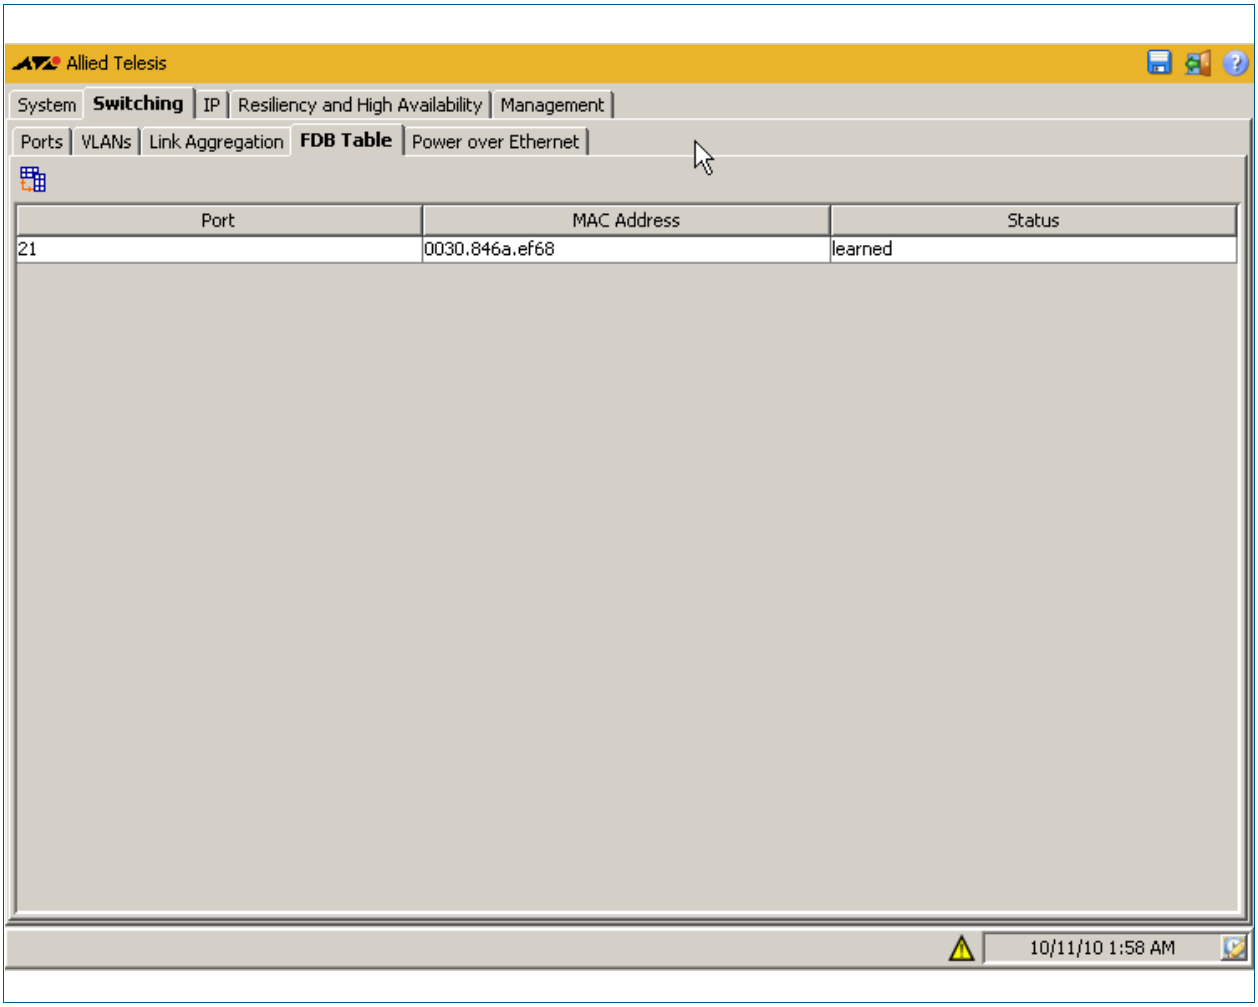
Switching > FDB Table

The **Switching** > **FDB Table** menu tab allows you to view the contents of the Layer 2 Forwarding Database Table.

You can change the FDB Table view to display horizontally or vertically by selecting the table view icon above the FDB Table.

You can also sort or rearrange the display of the FDB Table by Port, MAC Address, or Forwarding Status by selecting the relevant column or by dragging the relevant column respectively.

Menu Tab Example showing the **Switching** > **FDB Table** menu tab:



Description

Label / Field / Button	Description
`FDB Table`	Displays the FDB (Forwarding Database) table for the switch that shows all the available ports, MAC addresses, and port status.

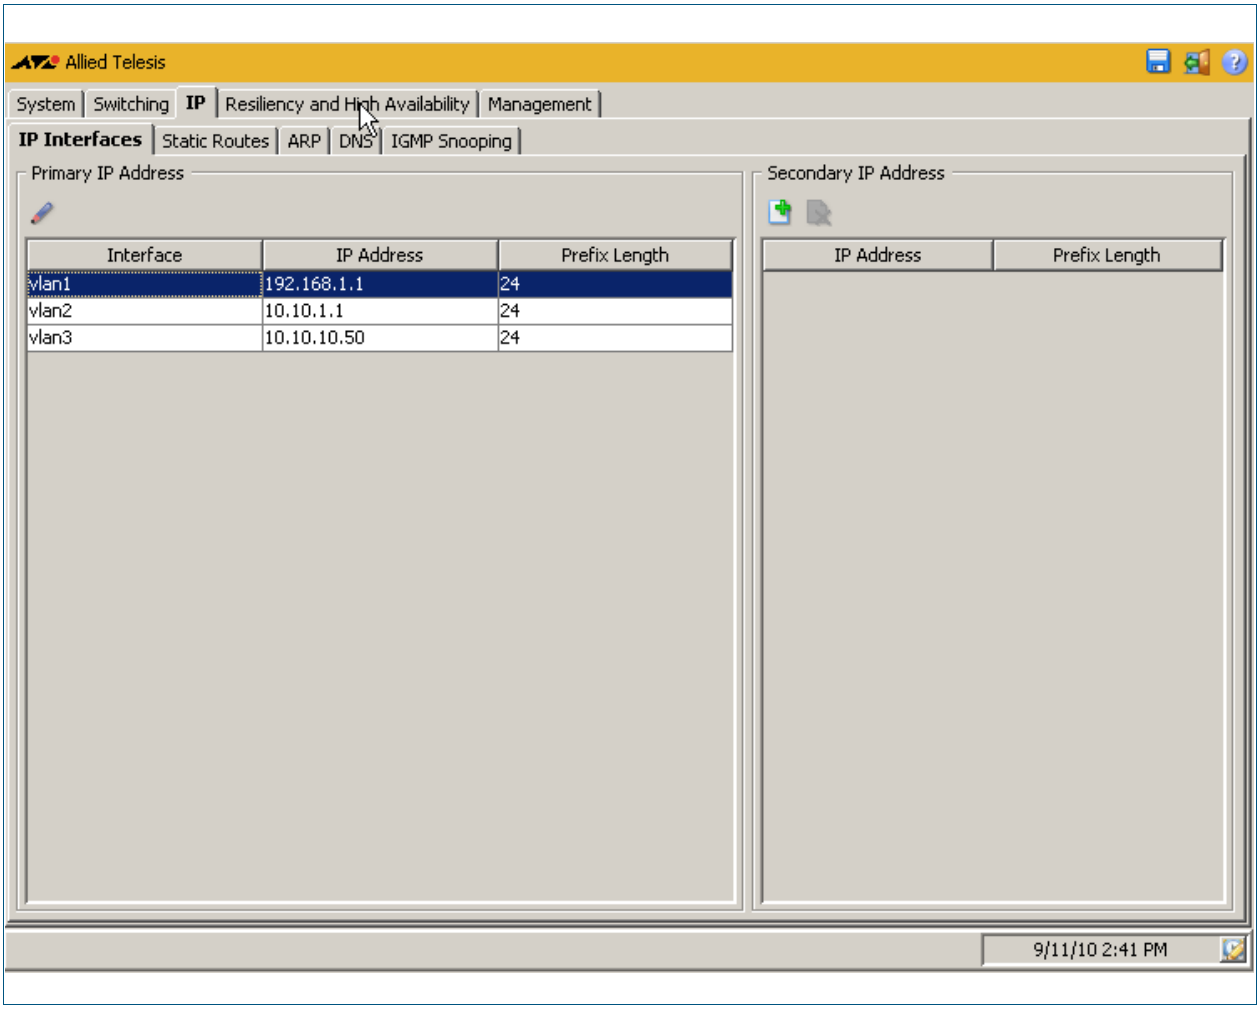
IP > IP Interfaces

The **IP > IP Interfaces** menu tab allows you to view and specify the Primary and Secondary IP Addresses for VLAN and management port interfaces.

Note You may only define a Secondary IP Address for an interface after first defining its Primary IP Address.

- Select an interface then use the pen shaped icon under the Primary IP Address label to configure an IP address. You can delete an assigned Primary IP Address in the Configure Primary IP Address dialog as displayed after selecting the icon under Primary IP Address.
- Select an interface with a Primary IP Address already defined to configure a Secondary IP Address, using the **+** icon under the Secondary IP Address label.
- Remove a selected Secondary IP Address using the **x** icon under the Secondary IP Address label.

Menu Tab Example showing the **IP > IP Interfaces** menu tab:



Description

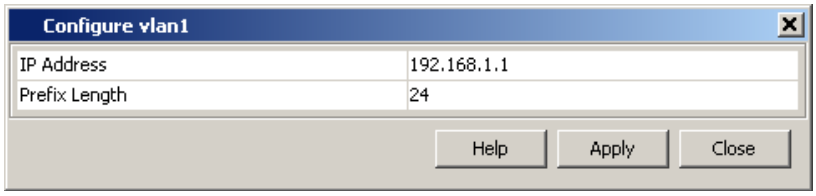
Label / Field / Button	Description
`Primary IP Address`	Displays and configures primary IP addressing for VLANs and management port interfaces that are defined on the switch and assigned to ports.
`Secondary IP Address`	Displays and configures secondary IP addressing for VLANs and management port interfaces that are defined on the switch and assigned to ports.

IP > IP Interfaces > Configure Primary IP Address

The **IP > IP Interfaces > Configure Primary IP Address** dialog allows you to configure a primary address with an IP address and a prefix length for the selected interface.

Configuration Dialog

Example showing the **IP > IP Interfaces > Configure Primary IP Address** dialog:



Description

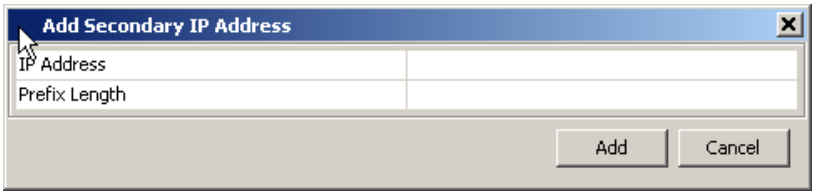
Label / Field / Button	Description
`IP Address`	Enter or remove an IPv4 Address in dotted decimal notation (i.e. A.B.C.D).
`Prefix Length`	Enter the Prefix for the IPv4 Address with the integer as used for slash notation (i.e. 24 instead of /24), not dotted decimal notation (i.e. 255.255.255.0).

IP > IP Interfaces > Add Secondary IP Address

The **IP** > **IP Interfaces** > **Add Secondary IP Address** dialog allows you to add a secondary address with an IP address and a prefix length for the selected interface (only if the selected interface already has a primary address configured).

Configuration Dialog

Example showing the **IP > IP Interfaces > Add Secondary IP Address** dialog:



Description

Label / Field / Button	Description
`IP Address`	Enter an IPv4 Address in dotted decimal notation (i.e. `A.B.C.D`).
`Prefix Length`	Enter the Prefix for the IPv4 Address with the integer as used for slash notation (i.e. `24` instead of `/24`), not dotted decimal notation (i.e. `255.255.255.0`).

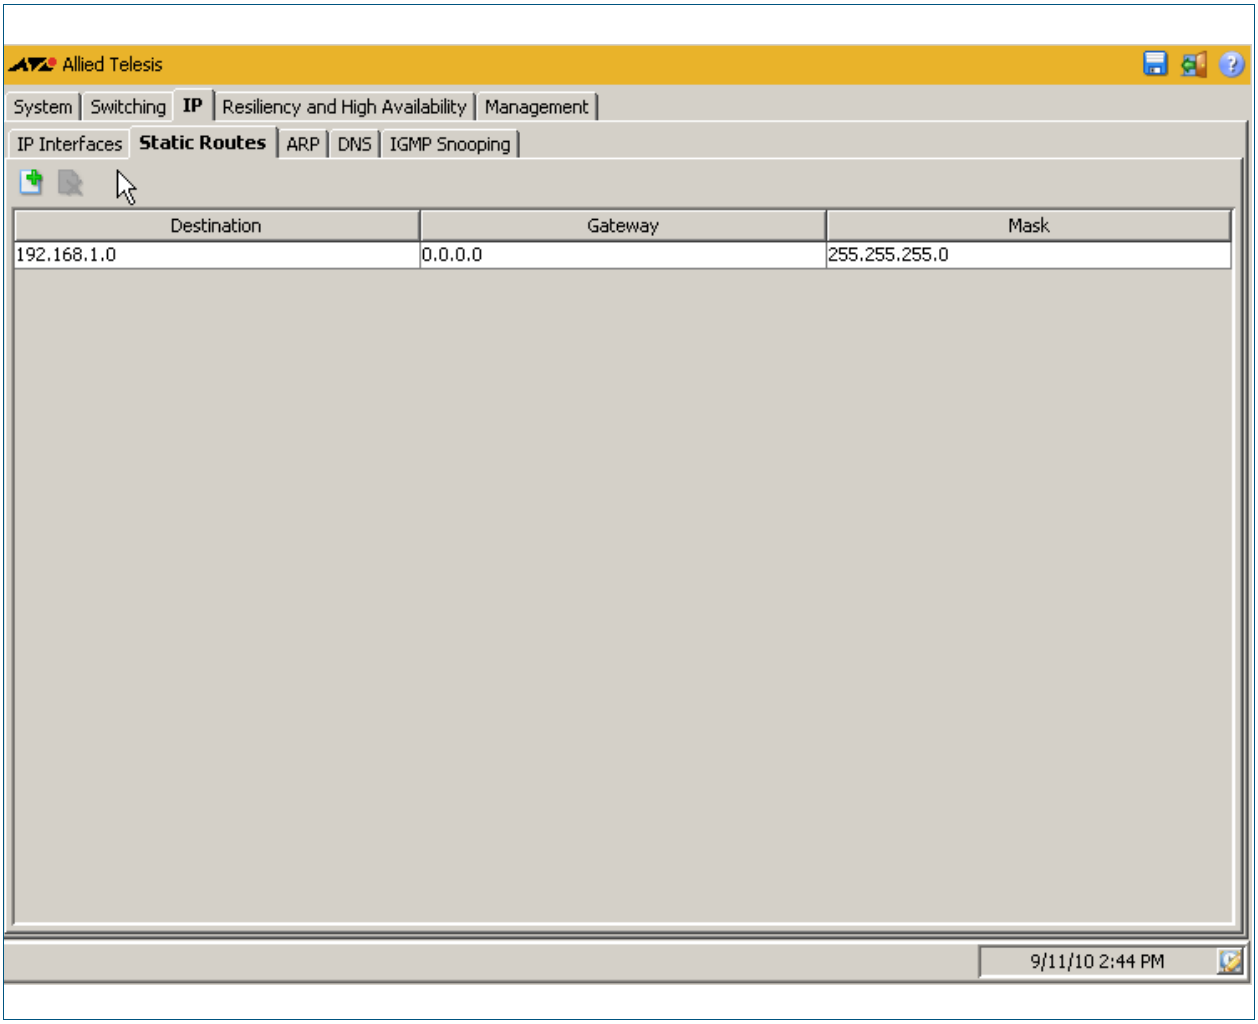
IP > Static Routes

The **IP** > **Static Routes** menu tab allows you to view, add, and delete static IP routes configured on the switch. Static routes are specified using destination IP addresses, masks, and gateways.

You can also sort or rearrange the display of the Static Routes by Destination, Gateway, or Mask by selecting the relevant column or by dragging the relevant column respectively.

- Selecting the + icon allows you to define a Static Route specifying destination and gateway IPv4 addresses with a dotted decimal format subnet mask.
- Selecting the x icon allows you to delete a defined Static Route.

Menu Tab Example showing the **IP** > **Static Routes** menu tab:



Description

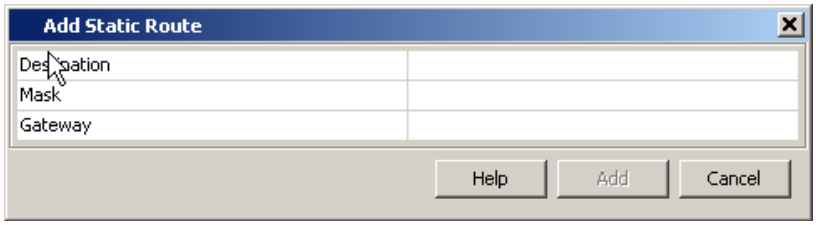
Label / Field / Button	Description
`Static Routes / Destination`	The IPv4 address of the destination subnet address.
`Static Routes / Gateway`	The IPv4 address of the gateway device.
`Static Routes / Mask`	The subnet mask in dotted decimal notation (for example, 255.255.255.0 instead of the slash notation /24).

IP > Static Routes > Add Static Route

The **IP** > **Static Routes** > **Add Static Route** dialog allows you to add a static IP routes on the switch. Static routes are specified using destination IP addresses, masks, and gateways.

Configuration Dialog

Example showing the **IP > Static Routes > Add Static Route** dialog:



Description

Label / Field / Button	Description
`Destination`	Enter the IPv4 address of the destination subnet address.
`Mask`	Enter the subnet mask in dotted decimal notation (for example, 255.255.255.0 instead of the slash notation /24).
`Gateway`	Enter the IPv4 address of the gateway device.

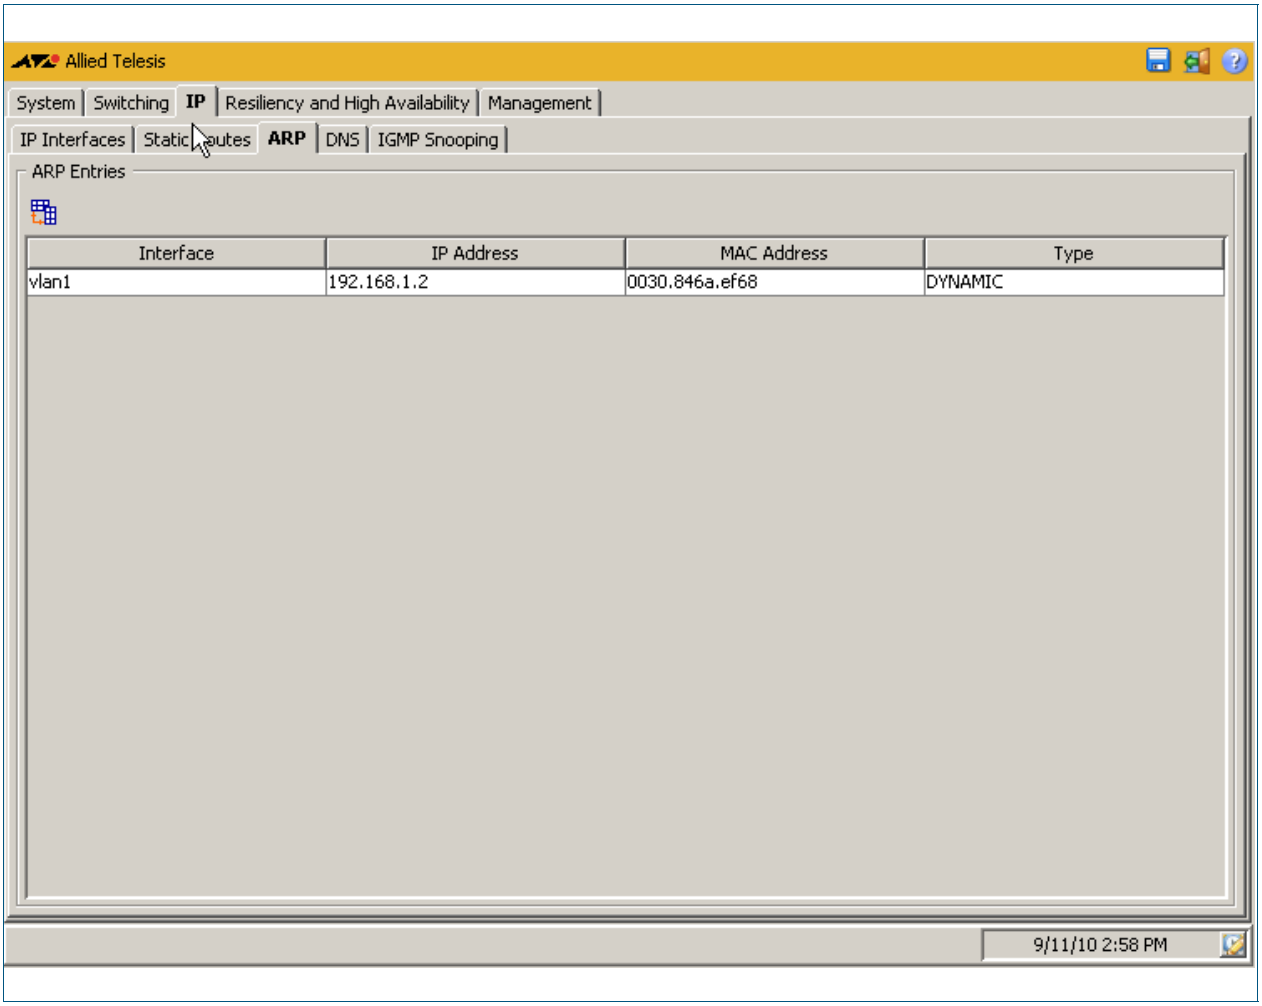
IP > ARP

The **IP** > **ARP** menu tab allows you to view the contents of the ARP (Address Resolution Protocol) Table.

You can change the ARP Entries view to display horizontally or vertically by selecting the table view icon above the ARP Entries.

You can also sort or rearrange the display of the ARP Entries by Interface, IP Address, MAC Address, or Type by selecting the relevant column or by dragging the relevant column respectively.

Menu Tab Example showing the **IP** > **ARP** menu tab:



Description

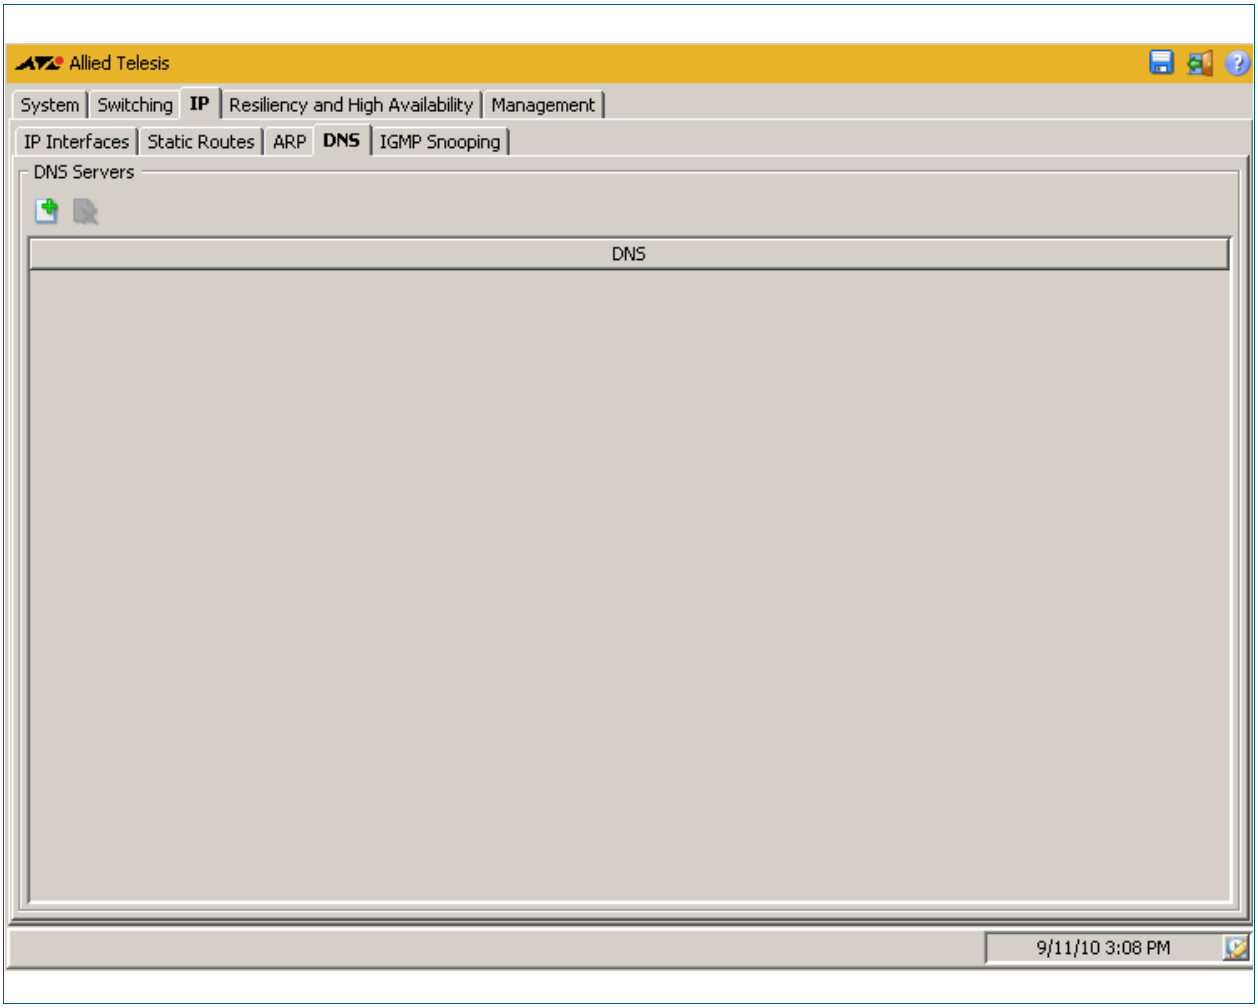
Label / Field / Button	Description
`ARP Entries / Interface`	Interface over which the switch is accessed, usually a VLAN.
`ARP Entries / IP Address`	IP address of the network device this ARP entry maps to.
`ARP Entries / MAC Address`	Hardware address of the switch in hexadecimal format `HHHH.HHHH.HHHH`.
`ARP Entries / Type`	Indicates whether the ARP entry is a Static or Dynamic ARP entry. Static ARP entries are added and dynamic ARP entries are learned.

IP > DNS

The **IP** > **DNS** menu tab allows you to display and configure DNS (Domain Name System) server entries for the switch.

- Selecting the + icon allows you to define a DNS Server specifying the IPv4 address.
- Selecting the x icon allows you to delete a defined DNS Server.

Menu Tab Example showing the **IP** > **DNS** menu tab:



Description

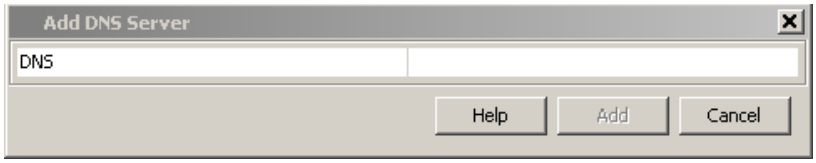
Label / Field / Button	Description
DNS	DNS Server IPv4 address.

IP > DNS > Add DNS Server

The **IP** > **DNS** > **Add DNS Server** dialog allows you to add DNS (Domain Name System) server entries for the switch.

Configuration Dialog

Example showing the **IP** > **DNS** > **Add DNS Server** dialog:



Description

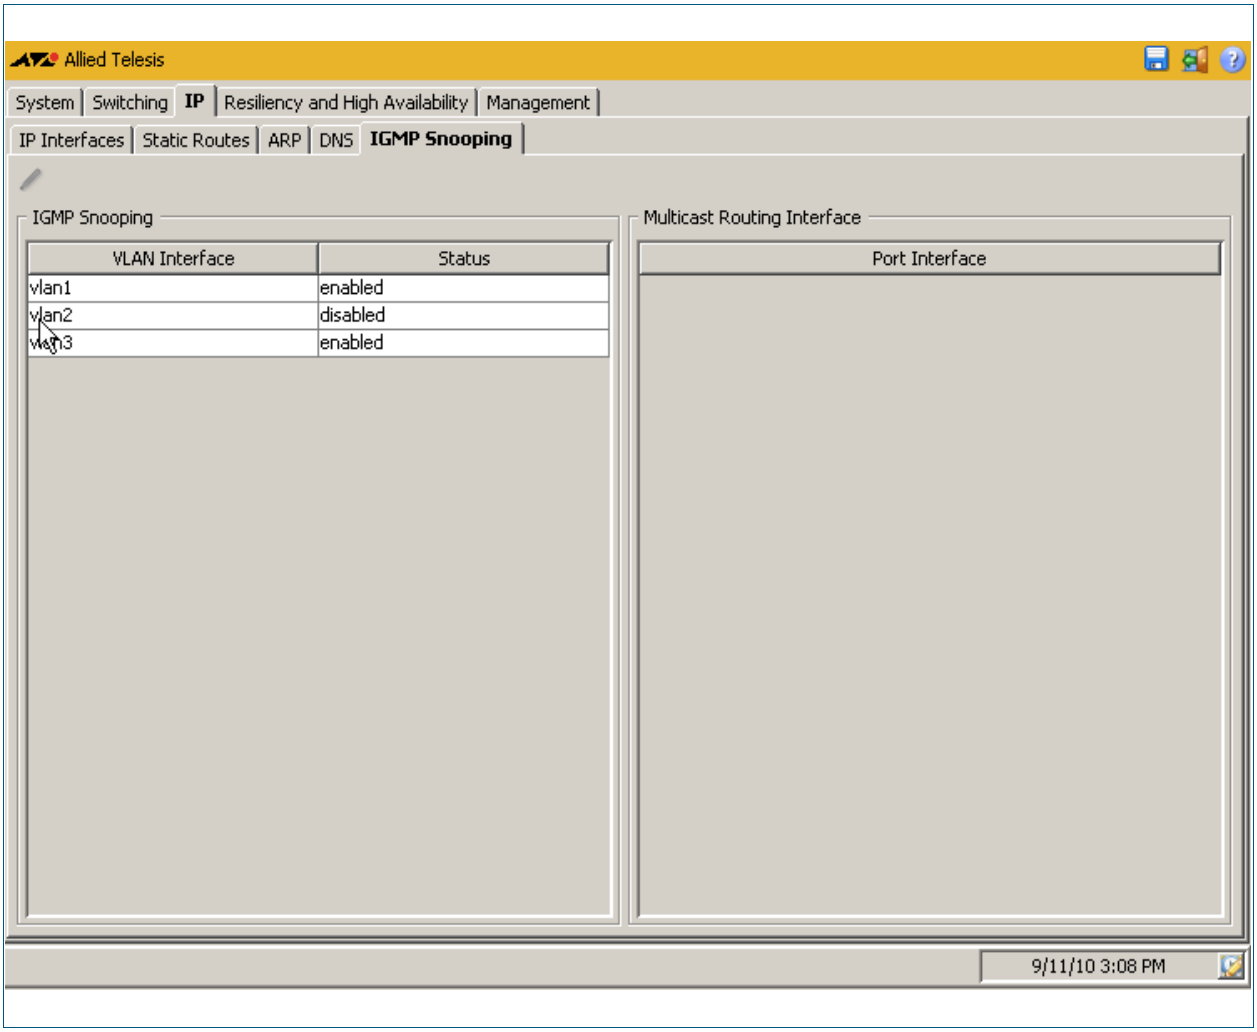
Label / Field / Button	Description
DNS	Enter an IPv4 address in dotted decimal notation (i.e. A.B.C.D) for the DNS (Domain Name System) Server you want to specify.

IP > IGMP Snooping

Menu Tab The **IP > IGMP Snooping** menu tab displays basic IGMP Snooping and Multicast Routing Interface information.

You can also configure IGMP Snooping on individual ports by selecting the VLAN interface that the port is a member of then clicking on the pen shaped icon to display the Configure IGMP Snooping dialog, where you can enable or disable IGMP snooping on desired ports.

Menu Tab Example showing the **IP > IGMP Snooping** menu tab:



Description

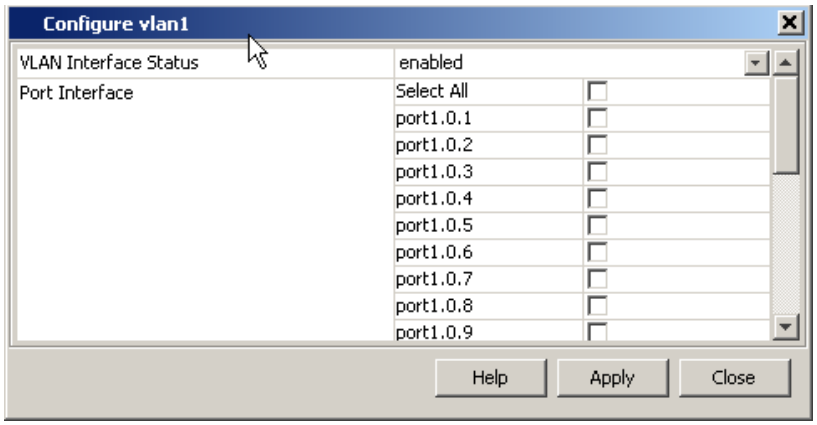
Label / Field / Button	Description
`IGMP Snooping / IGMP Snooping`	Displays and configures IGMP Snooping for a specified VLAN interface.
`IGMP Snooping / Multicast Routing Interface`	Displays and configures the specified port in the VLAN as a multicast router for IGMP Snooping.

IP > IGMP Snooping > Configure Interface

The **IP > IGMP Snooping > Configure Interface** dialog allows you to configure IGMP Snooping on individual ports. First select the VLAN interface that the port is a member of then enable or disable IGMP snooping on desired ports from this dialog.

Configuration Dialog

Example showing the **IP > IGMP Snooping > Configure Interface** dialog:



Description

Label / Field / Button	Description
`VLAN Interface Status`	Displays whether the selected VLAN is enabled or disabled.
`Port Interface`	Select the check box for a given port to allocate it to the VLAN.

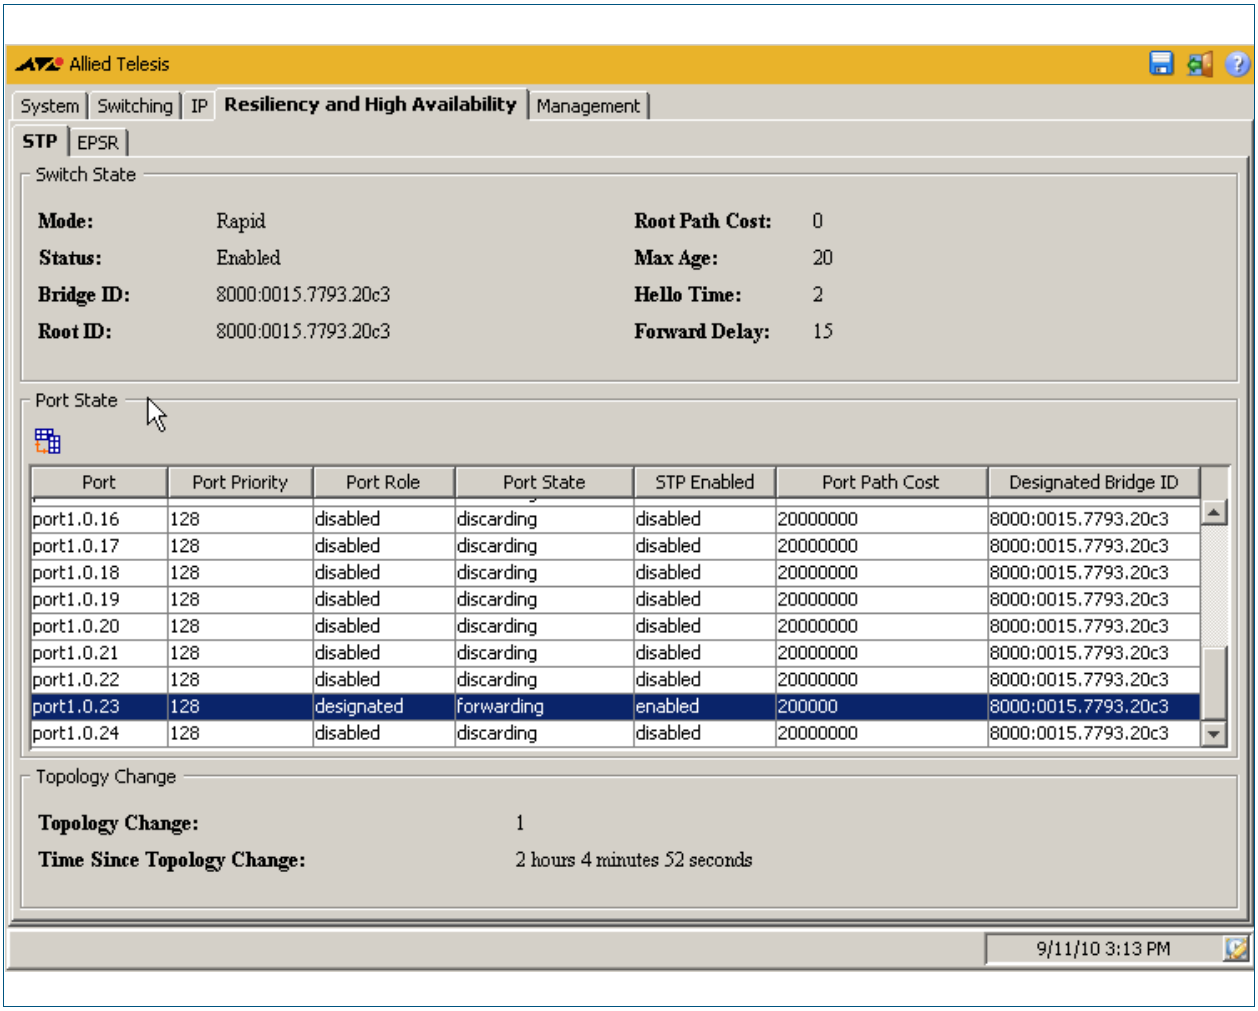
Resiliency and High Availability > STP

The **Resiliency and High Availability > STP** menu tab allows you to view the configuration and status of spanning tree data: for the switch as a whole and for each port.

You can also sort or rearrange the display of the Port State table by Port, Port Priority, Port State, Port Role, STP Enabled, Port Path Cost, or Designated Bridge ID by selecting the relevant column or by dragging the relevant column respectively.

Note STP is not configurable through the GUI. Refer to the relevant STP chapters in the AlliedWare Plus™ Software Reference to configure STP using the CLI instead.

Menu Tab Example showing the **Resiliency and High Availability > STP** menu tab:



Description: Switch State

Label / Field / Button	Description
Switch State / Mode	Spanning Tree Mode displayed: STP (Spanning Tree Protocol), Rapid (Rapid Spanning Tree Protocol - RSTP), or Multiple (Multiple Spanning Tree Protocol - MSTP).
Switch State / Status	Status of the Spanning Tree Mode: enabled or disabled.
Switch State / Bridge ID	Bridge ID, comprising the port priority followed by its MAC address.
Switch State / Root ID	Root Bridge ID, comprising the root priority followed by its MAC address.
Switch State / Root Path Cost	Sum of the costs for each path between the bridge port and the root bridge.
Switch State / Max Age	Time in seconds that the dynamic spanning tree configuration information is stored in the switch before it is discarded.
Switch State / Hello Time	Time in seconds between the transmission of switch spanning tree configuration information, when the switch is the Root Bridge of the spanning tree or is trying to become the Root Bridge.
Switch State / Forward Delay	Time in seconds to control how fast a port changes its spanning tree state when moving towards the forwarding state. This value is used only when the switch is acting as the root bridge. Note that Forward Delay, Max Age, and Hello Time are interrelated.

Description: Port State

Label / Field / Button	Description
Port State / Port	Switch port number in the format 'portX.Y.Z' where X is the switch, Y is the XEM, and Z is the individual switch port number.
Port State / Port Priority	The lower the port priority, the higher the likelihood of the port becoming part of the active network topology.
Port State / Port Role	Displays the port role as configured in the CLI with ‘spanning-tree’ commands, and shows either ‘rootport’, ‘backup’, ‘disabled’ or ‘designated’ port roles.
Port State / Port State	Displays the spanning tree state for the port as configured in the CLI with 'spanning-tree' commands. Indicates spanning tree states of: disabled, blocking, listening, learning, and forwarding.
Port State / STP Enabled	Displays whether spanning-tree is enabled or disabled. Spanning tree is enabled by default.
Port State / Port Path Cost	The cost of a path for the port that determines the total cost path. The lower the total cost, the higher the priority of the path.
Port State / Designated Bridge ID	The unique parent for each bridge that connects it to the next LAN on the path towards the root bridge.

Description: Topology Change

Label / Field / Button	Description
`Topology Change / Topology Change`	The number of STP Topology Changes that have occurred since the switch was rebooted.
`Topology Change / Time Since Topology Change`	The time in hours and seconds since the previous STP Topology Change occurred.

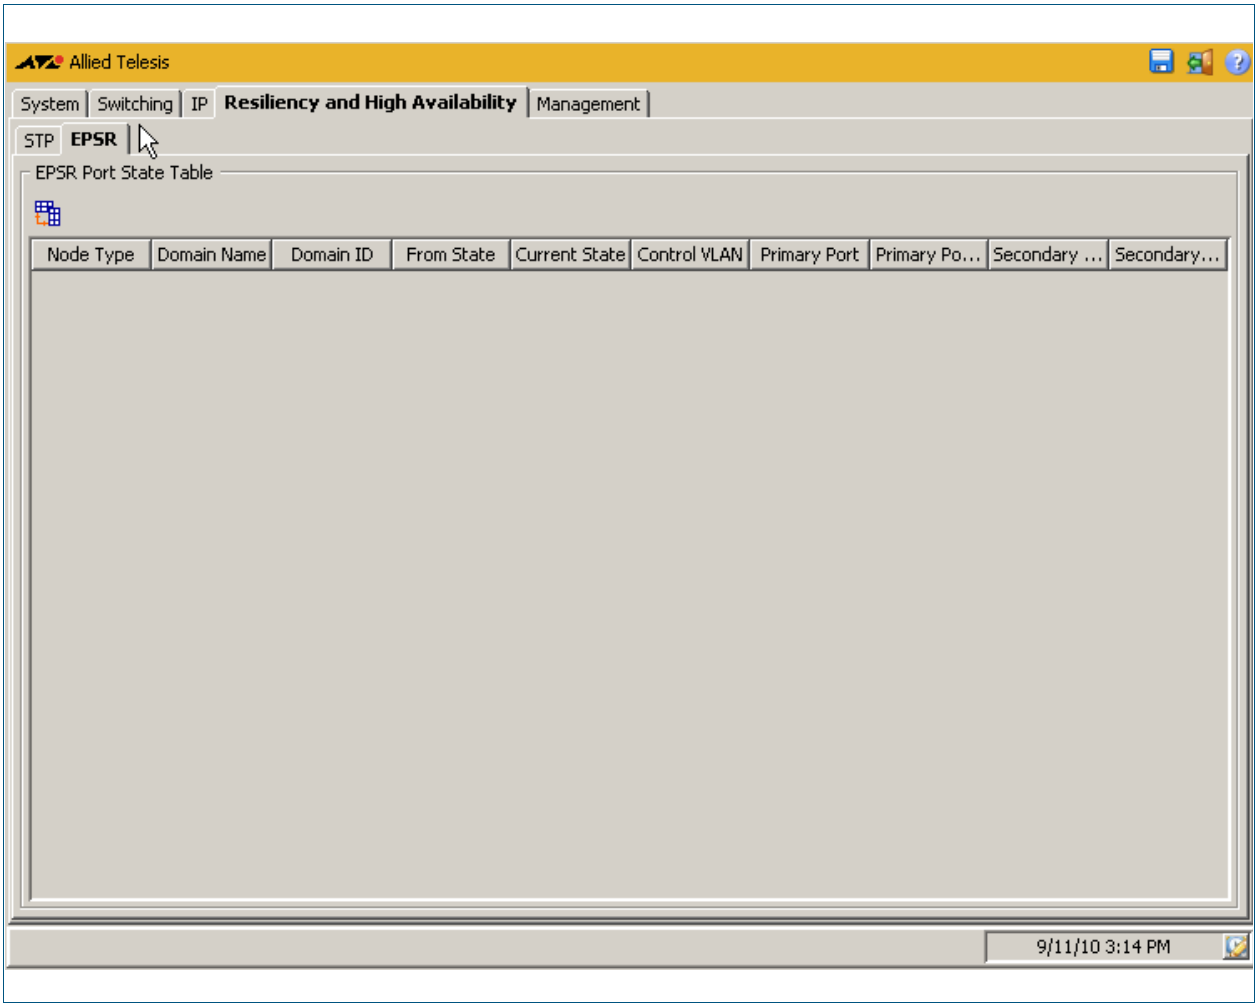
Resiliency and High Availability > EPSR

The **Resiliency and High Availability** > **EPSR** menu tab allows you to display the properties and status of any EPSR domains configured on the switch.

You can also sort or rearrange the display of the EPSR Port State table by Node Type, Domain Name, Domain ID, From State, Current State, Control VLAN, Primary Port, Primary Port Status, Secondary Port, or Secondary Port Status by selecting the relevant column or by dragging the relevant column respectively.

Note EPSR is not configurable through the GUI. Refer to the relevant EPSR chapters in the AlliedWare Plus™ Software Reference to configure EPSR using the CLI instead.

Menu Tab Example showing the **Resiliency and High Availability** > **EPSR** menu tab:



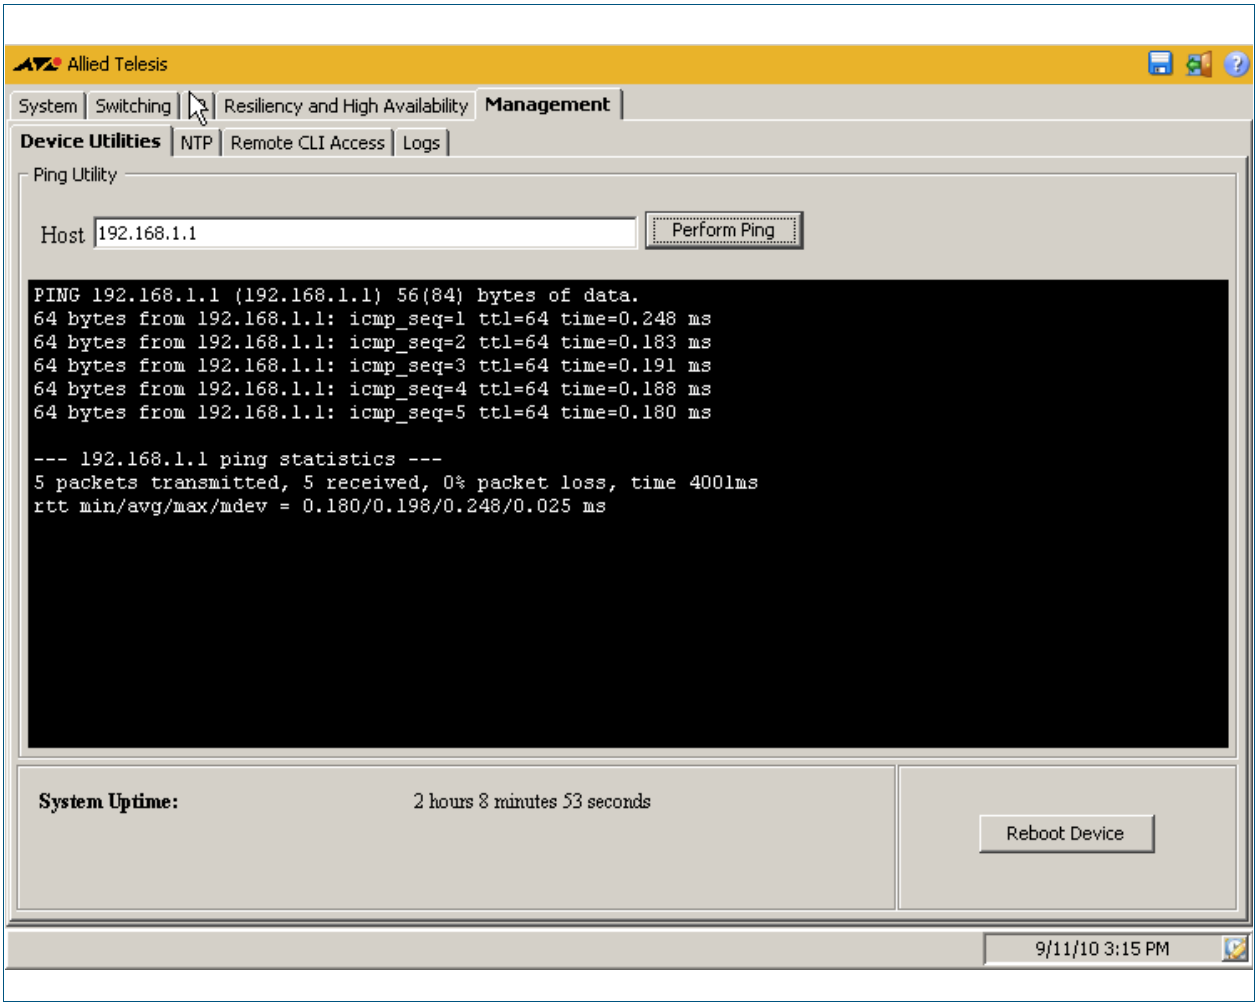
Description

Label / Field / Button	Description
EPSR Port State Table / Node Type	Displays master or transit node as configured in the CLI with the '**epsr mode**' command.
EPSR Port State Table / Domain Name	Displays the domain name. A set of instances across a ring is called a domain.
EPSR Port State Table / Domain ID	Displays the assigned domain number for the domain name.
EPSR Port State Table / From State	Displays the From EPSR state as configured in the CLI with the '**epsr state**' commands.
EPSR Port State Table / Current State	Displays the Current EPSR state as configured in the CLI with the '**epsr state**' commands.
EPSR Port State Table / Control VLAN	Displays the control VLAN as configured in the CLI with the '**epsr mode controlvlan**' command.
EPSR Port State Table / Primary Port	Displays the master node primary port interface name as configured in the CLI with the '**epsr mode primaryport**' command.
EPSR Port State Table / Primary Port Status	Displays the master node primary port interface status: up or down.
EPSR Port State Table / Secondary Port	Displays the assigned secondary port interface name.
EPSR Port State Table / Secondary Port Status	Displays the assigned secondary port interface status: up or down.

Management > Device Utilities

The **Management** > **Device Utilities** menu tab allows you to perform pings and reboot the switch from the GUI.

Menu Tab Example showing the **Management** > **Device Utilities** menu tab:



Description

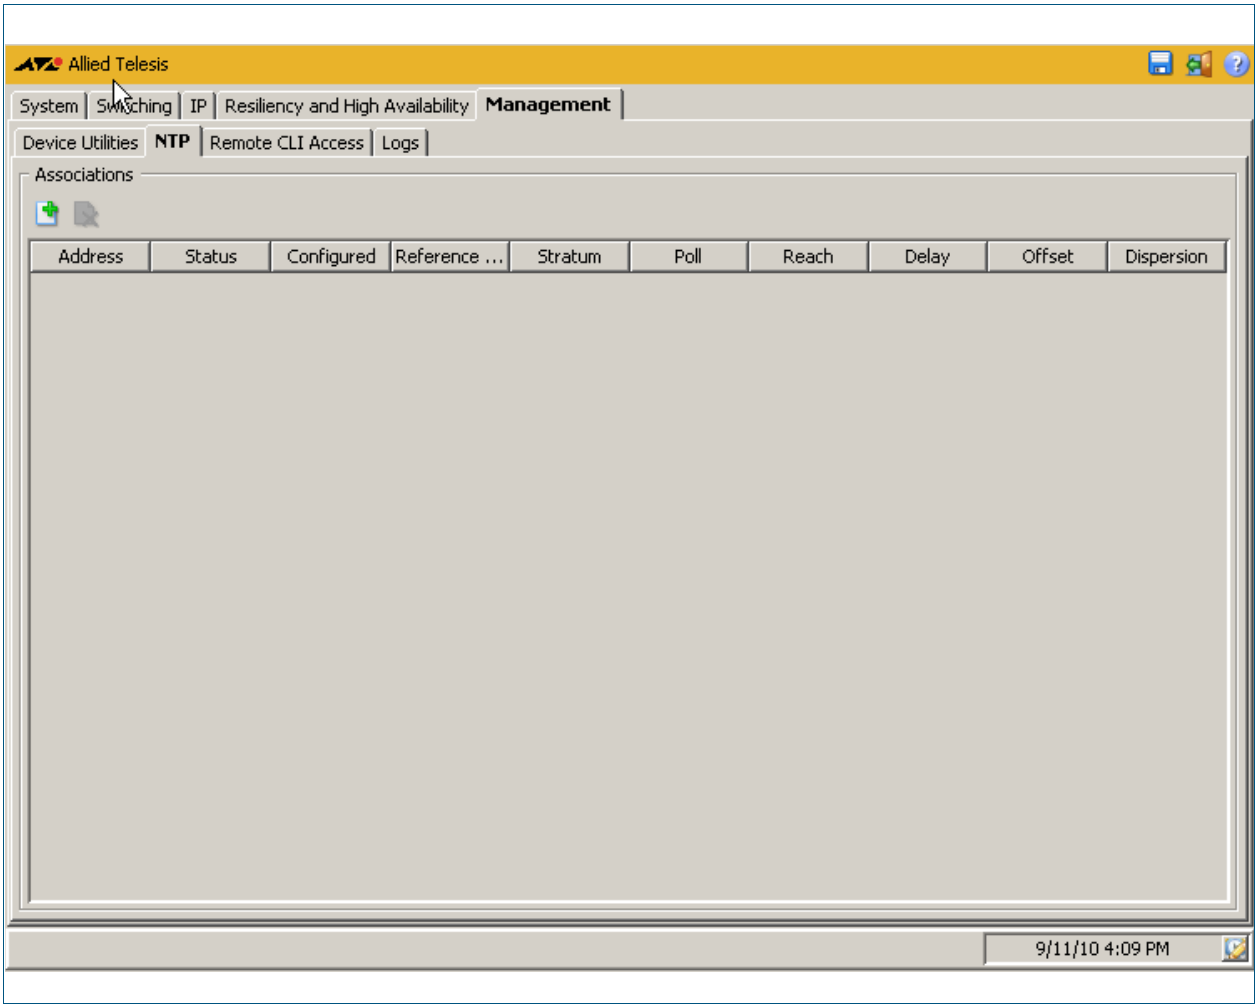
Label / Field / Button	Description
`Ping Utility / Host`	Enter the IPv4 address or the URL that you want to ping in this field.
`Ping Utility / Perform Ping`	Select this button to ping the IPv4 address or URL that you entered in the Host field.
`System Uptime`	Displays the elapsed time since the last reboot in hours, minutes, and seconds.
`Reboot Device`	Select this button to reboot your switch. You will need to login to the GUI again after you reboot your switch. Rebooting closes all Telnet / SSH / SNMP sessions on your switch.

Management > NTP

The **Management** > **NTP** menu tab allows you to display and configure Network Time Protocol (NTP) peer configurations on the switch.

- Selecting the + icon allows you to add an NTP association.
- Selecting the x icon allows you to delete an NTP association.

Menu Tab Example showing the **Management** > **NTP** menu tab:



Description

Label / Field / Button	Description
`Associations / Address`	The NTP peer or NTP server IPv4 address.
`Associations / Status`	Indicates association status, and displays '**master(synced)**'. '**master(unsynced)**', '**selected**', '**candidate**', '**configured**', or '**unknown**'.
`Associations / Configured`	Indicates if the association is configured or not, and displays '**configured**' or '**dynamic**'.

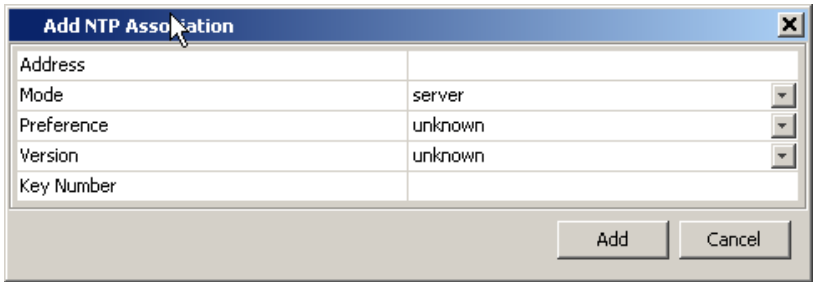
Label / Field / Button(cont.)	Description(cont.)
Associations / Reference Clock	The IPv4 address for the reference clock.
Associations / Stratum	The number of hops between the server and the accurate time source.
Associations / Poll	The time between NTP requests from the device to the server.
Associations / Reach	Shows whether or not the NTP server responded to the last request, which indicates the reachability of the NTP peer.
Associations / Delay	The round trip delay between the device and the server.
Associations / Offset	The difference between the device clock and the server clock, relative to the server clock, in milliseconds.
Associations / Dispersion	The lowest measure of error associated with peer offset based on delay.

Management > NTP > Add NTP Association

The **Management > NTP > Add NTP Association** dialog allows you configure Network Time Protocol (NTP) peer configurations on the switch.

Configuration Dialog

Example showing the **Management > NTP > Add NTP Association** dialog:



Description

Label / Field / Button	Description
Address	Enter the NTP IPv4 address for the NTP peer or NTP server used.
Mode	Select one of the server or peer options from the drop down list to specify the NTP Mode used. When using NTP server mode, the NTP server will not accept updates from clients for updates to the server's time settings. The NTP server is configured to synchronize the NTP clients. When using NTP peer mode, each device shares its time information with the other, and each device can also provide time synchronization to the other.

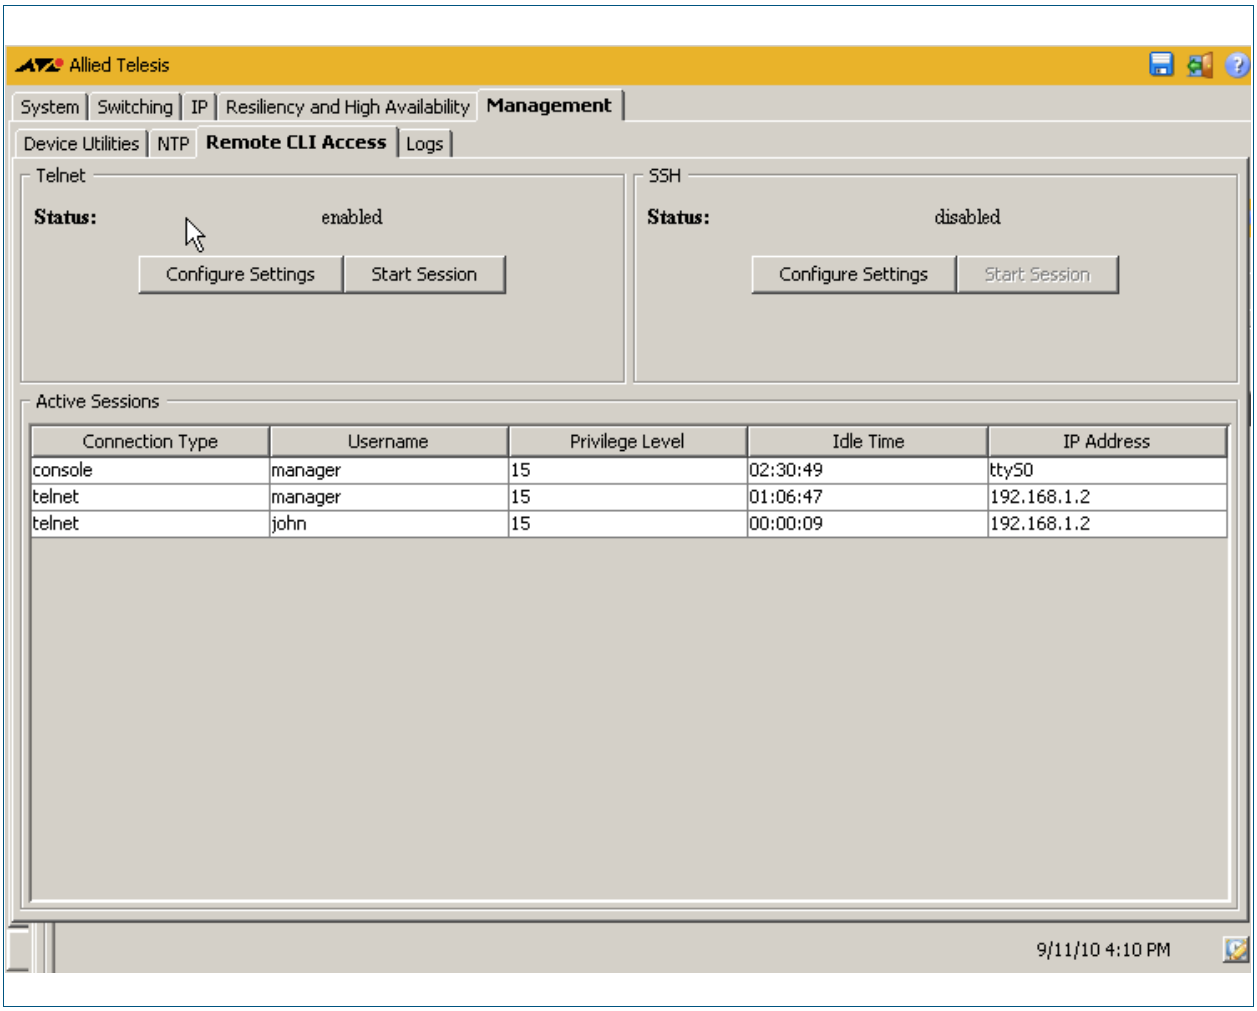
Label / Field / Button(cont.)	**Description**(cont.)
`Preference`	Select one of the `unknown`, `not preferred`, or `preferred` options from the drop down list to specify the NTP Preference used. NTP Preference is used to configure an NTP server, so the NTP server is given preference to synchronize the NTP clients.
`Version`	Select one of the `unknown`, `version 1`, `version 2`, `version 3`, or `version 3, version 4` options from the drop down list to specify the NTP Version used.
`Key Number`	Enter the NTP Key Number for NTP authentication, which allows NTP to authenticate the associations with other systems for security purposes. The NTP Key Number is an integer in the range <1-4294967295>. The MD5 (Message-Digest algorithm 5) key type is supported to encrypt the NTP Key Number used for authentication.

Management > Remote CLI Access

The **Management** > **Remote CLI Access** menu tab allows you to enable, disable and configure Telnet and SSH.

You can create Telnet or SSH connections to the switch, and you can view a list of all current active CLI sessions on the switch from this tab.

Menu Tab Example showing the **Management** > **Remote CLI Access** menu tab:



Description

Label / Field / Button	Description
Telnet / Status	Displays the current Telnet status, either 'enabled' or "disabled'.
Telnet / Configure Settings	Configures the Telnet Status. Select 'enabled' or 'disabled' to configure the status of the Telnet server on the switch.
Telnet / Start Session	Starts a Telnet session to use the CLI. After starting a Telnet session you will need to login to the switch to use the CLI.
SSH / Status	Displays the current SSH status, either 'enabled' or 'disabled'.
SSH / Configure Settings	Configures the SSH Status. Select 'enabled' or 'disabled' to configure the status of the SSH server on the switch. Note that relevant certificates must be installed to initiate an SSH session.
SSH / Start Session	Starts a secure SSH session to use the CLI. After starting an SSH session you will need to login to the switch to use the CLI.

Description

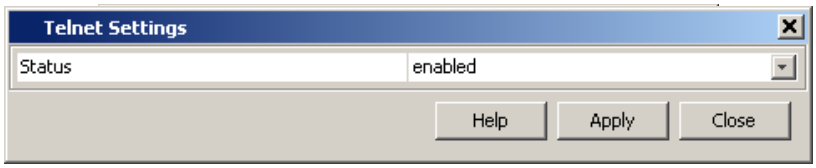
Label / Field / Button	Description
Active Sessions / Connection Type	A Console connection or a VTY connection.
Active Sessions / Username	Login name for a user.
Active Sessions / Privilege Level	The privilege set for a user for VTY or console connection. Privilege levels range from 0-15 with 15 the highest privilege level. Privilege levels are used in the CLI to enable or disable access to different configuration modes and commands. Privilege levels 0-14 only enables users to view system configuration and system behavior. Privilege level 15 enables users to globally configure all the interfaces on a switch.
Active Sessions / Idle Time	Time in seconds that the SSH Server waits to receive data from the SSH Client. The SSH Server disconnects when the Idle Time limit is reached.
Active Sessions / IP Address	The IPv4 address for the VTY connection.

Management > Remote CLI Access > Telnet Settings

The **Management > Remote CLI Access > Telnet Settings** dialog allows you to enable or disable Telnet.

Configuration Dialog

Example showing **Management > Remote CLI Access > Telnet Settings** dialog:



Description

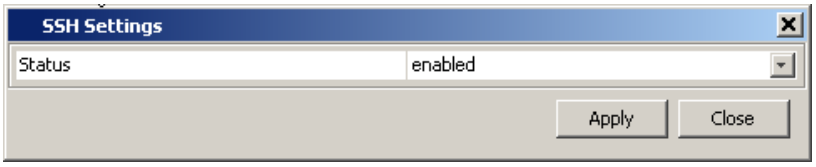
Label / Field / Button	Description
`Status`	Select `enabled` or `disabled` from the drop down list on this dialog to enable or disable Telnet respectively on the switch.

Management > Remote CLI Access > SSH Settings

The **Management > Remote CLI Access > SSH Settings** dialog allows you to enable or disable SSH.

Configuration Dialog

Example showing the **Management > Remote CLI Access > SSH Settings** dialog:



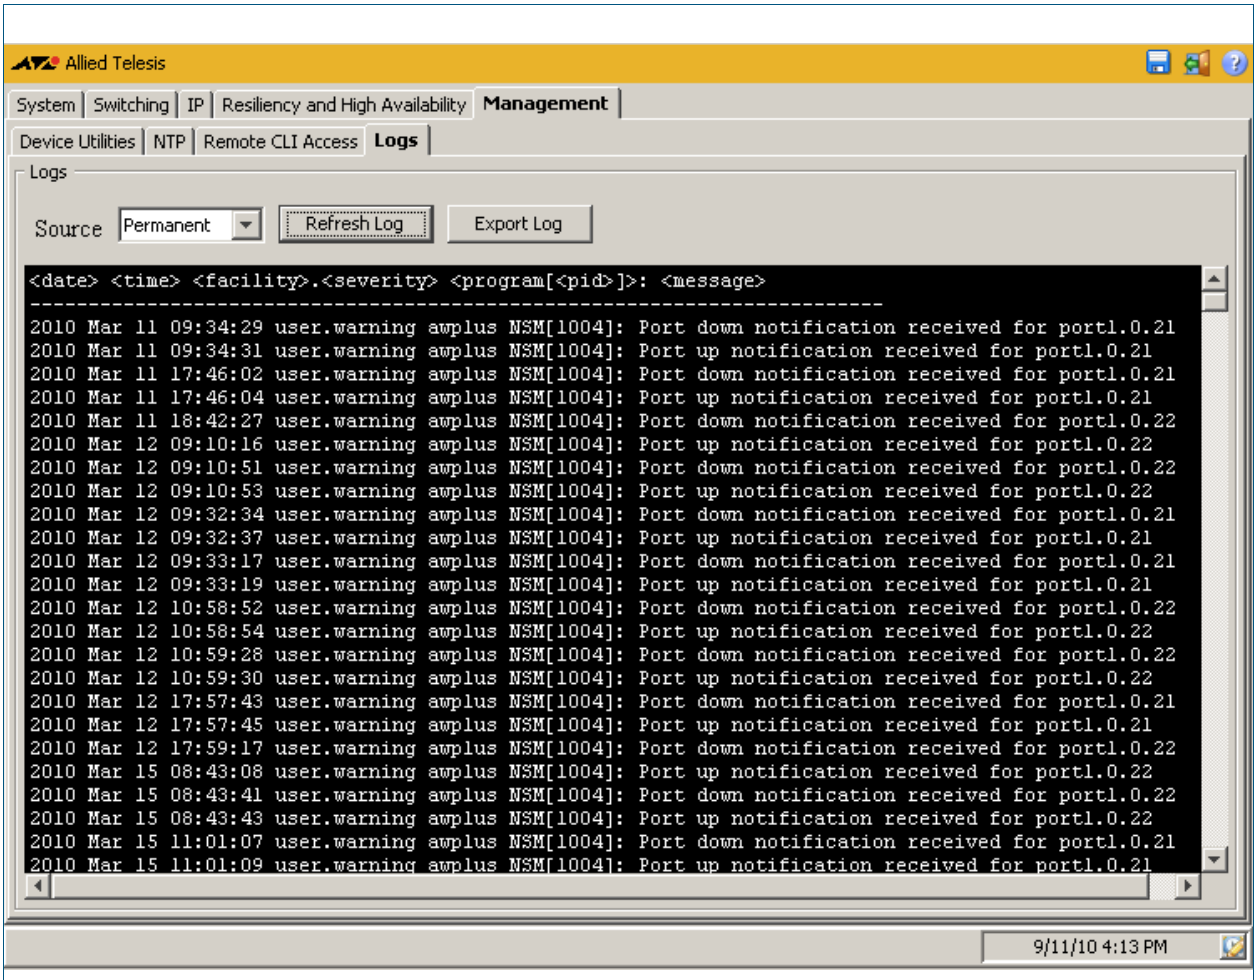
Description

Label / Field / Button	Description
`Status`	Select `enabled` or `disabled` from the drop down list on this dialog to enable or disable SSH respectively on the switch.

Management > Logs

The **Management >Logs** menu tab allows you to view the switch logs, and export the switch logs as .csv format files.

Menu Tab Example showing the **Management > Logs** menu tab:



Description

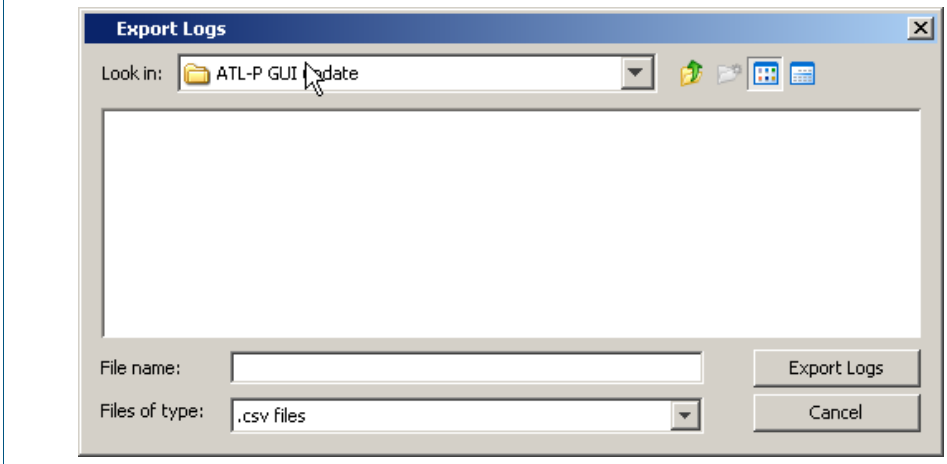
Label / Field / Button	Description
`Logs`	Display, select and export the available switch log files for troubleshooting use.
`Source`	Select the buffered log or the permanent log available on the switch to display or export to a .csv format file for use in a spreadsheet.
`Source / Refresh Log`	Select this button to display an updated buffered or permanent log.
`Source / Export Log`	Select this option to export the log to a .csv format file for use in a spreadsheet.

Management > Logs > Export Logs

The **Management** > **Logs** > **Export Logs** dialog allows you to export the switch logs as .csv format files.

Configuration Dialog

Example showing the **Management** > **Logs** > **Export Logs** dialog:



Description

Label / Field / Button	Description
`File name:`	Enter the file name for the exported log file.
`Files of type:`	Select `.csv files` to export the log file as a comma separated file, so each column of the log file can be formatted in a spreadsheet.

6to4 automatic tunneling

[This entry was written by MG - June 2010]

IPv6 transition is required to migrate from IPv4 to IPv6. One method to connect to the global IPv6 network over the existing IPv4 network is called 6to4 automatic tunneling. Although this method is called '6to4 tunneling', it does not involve discrete point-to-point tunnels. The 'tunneling' in '6to4 tunneling' refers to the fact that the IPv6 packets are encapsulated in IPv4 packets to be 'tunneled' across the IPv4 domain. Hence, '6to4 tunneling' is primarily a scheme for encapsulating IPv6 packets inside IPv4 headers.

For more information and a configuration example see **"6to4 Automatic Tunnel Configuration" on page 30.2**.

10BaseT

10 Mbps/baseband/twisted pair. The IEEE standard for twisted pair Ethernet.

802.1X

IEEE 802.1x is an IEEE Standard for port-based Network Access Control (**NAC**). It is part of the IEEE 802.1 group of networking protocols. It provides an authentication mechanism to devices wishing to attach to a LAN, either establishing a point-to-point connection or preventing it if authentication fails. It is used for securing wireless 802.11 access points and is based on the Extensible Authentication Protocol (**EAP**). Authentication is required on a per-port basis. The main components of an 802.1X implementation are:

- The authenticator - the port on this device that wishes to enforce authentication before allowing access to services that are accessible behind it.
- The supplicant - the port that wishes to access services offered by the authenticator's system. The supplicant may be a port on a PC or other device connected to this device.
- The authentication server - a device that uses the authentication credentials supplied by the supplicant, via the authenticator, to determine if the authenticator should grant access to its services.

See **AAA** and **Tri-authentication**.

For a configuration example see **"Configuring 802.1X" on page 67.7**. For a sample configuration script see **"Sample 802.1X Authentication Configuration" on page 71.7**.

A

AAA

AAA is the collective title for the three related functions of Authentication, Authorization and Accounting. These function can be applied in a variety of methods with a variety of servers.

Authentication is performed in the following contexts:

- Login authentication of user shell sessions on the console port, and via telnet/SSH.
- **802.1X** authentication of devices connecting to switch ports.
- **MAC authentication** of devices connecting to switch ports.
- **Web-authentication** of devices connecting to switch ports.

Accounting is performed in the following contexts:

- Accounting of console login sessions.
- Accounting of 802.1x authenticated connections.
- Accounting of MAC authenticated connections.
- Accounting of Web authenticated connections.

There are two types of servers that can be used:

- Local user database.
- **RADIUS** servers.

When 802.1X authentication, MAC authentication and Web-authentication are configured to run simultaneously on a switch port this is called tri-authentication.

For more information see **Chapter 71, AAA Introduction and Configuration**. For a configuration example see **"Configuring AAA Login Authentication" on page 71.5**. For sample 802.1x, MAC authentication and Web-authentication configuration scripts see **"Sample Authentication Configurations" on page 71.7**.

Access-list

See **ACL**.

ACL

Access Control List. An ACL is one filter, or a sequence of filters, that are applied to an interface to either block, pass, or when using QoS, apply priority to, packets that match the filter definitions. ACLs are used to restrict network access by hosts and devices and to limit network traffic. See **ACL sequence numbers** and **ACL types**.

For more information see **Chapter 60, Access Control Lists Introduction**.

ACL sequence numbers

To help manage **ACLs** you can apply sequence numbers to filters. This allows you to remove filters from named and numbered ACLs without having to reconfigure an ACL. The ability to add sequence numbers to filters simplifies updates through the ability to position a filter within an ACL. When you add a new filter, you can specify a sequence number to position the filter in the ACL and you can also remove a current filter in an ACL by specifying a sequence number.

For more information see **"ACL Filter Sequence Numbers" on page 60.17**.

ACL types

ACLs are separated into two different types, software ACLs and hardware ACLs.

Hardware ACLs are applied directly to an interface, or are used for QoS **Classifications**. They can be either named, or can use the following numeric ranges:

- 3000-3699 for Hardware IP ACLs
- 4000-4699 for Hardware MAC ACLs

For more information see **"Defining Hardware IP ACLs" on page 60.6** and **"Defining Hardware MAC ACLs" on page 60.5**.

Software ACLs can be either named ACLs, using the standard or extended keyword followed by a text string, or they can use the following numeric ranges:

- 1-99
- 100-199
- 1300-1999
- 2000-2699

Software ACLs are used in features such as SNMP, IGMP, BGP and OSPF.

Active master

The switch that manages the stack, or **VCStack**, also referred to as the **Stack master**.

See **Disabled master** for information about how this relates to **Stack master** or **Active master**.

Address resolution

The process of resolving and mapping hardware MAC addresses into their corresponding network layer IP addresses. Depending on the underlying network, address resolution may require broadcasts on a local network.

For more information see **"ARP" on page D.4**.

Adjacency

A state existing between two OSPF routers. These routers build their routing databases by exchanging link state advertisements, often termed hello messages. When a pair has completed the process, the routers are said to be "adjacent."

ARP

Address Resolution Protocol. ARP is used by your device to dynamically learn the Layer 2 address of devices in its networks. Most hosts also have a MAC physical address in addition to the assigned IP address. For Ethernet, this is a 6-byte, globally unique number. ARP enables your device to learn the physical address of the host that has a given IP address.

For more information see **"Address Resolution Protocol (ARP)" on page 26.3**.

AS

Autonomous System. A group of networks with a common routing infrastructure. An AS runs interior gateway protocols (IGPs) such as **RIP** and **OSPF** within its boundaries and uses exterior gateway protocols (EGPs) such as **BGP** to exchange routing information with other ASs.

ASCII

The *American Standard Code for Information Interchange*. A standard character-to-number encoding widely used within the computer industry.

ASIC

Application Specific Integrated Circuit. An integrated circuit (chip) manufactured to perform a specific function.

Asynchronous

Transmission in which each character is sent individually. The time intervals between transmitted characters may be of unequal length. Transmission is controlled by start and stop elements before and after each character. See **"Synchronous" on page D.31**

Autonegotiation

Autonegotiation lets the port adjust its speed and duplex mode to accommodate the device connected to it. When the port connects to another autonegotiating device, they negotiate the highest possible speed and **Duplex mode** for both of them.

Autonomous system

See **AS**.

B

BGP

Border Gateway Protocol. BGP is an exterior gateway protocol that determines the best path in networks, performs optimal routing between multiple autonomous systems or domains, and exchanges routing information with other BGP systems. The RFCs 1771 (BGP4), 1654 (first BGP4 specification), and 1105, 1163, 1267 (older version of BGP) describe BGP and BGP4.

For more information see **"BGP" on page 32.3**. For configuration examples see **"Enabling BGP Peers In The Same Autonomous System" on page 44.3**, **"Enabling BGP Between Different Autonomous Systems" on page 44.5**, **"Configuring a BGP Route Reflector" on page 44.6**, **"Configuring a BGP Confederation" on page 44.8**, **"Configuring BGP Authentication" on page 44.11**, **"Configuring BGP Graceful Reset" on page 44.13** and **"Configuring BGP Graceful Restart" on page 44.18**.

BGP filter types

There are four filter types that can be applied to the BGP updates being exchanged between BGP peers:

- Distribute filters - these use ACLs and look at the individual prefixes within an update message. If a prefix within the update message matches the filter criteria then that individual prefix is filtered out or accepted depending on what action the filter entry has been configured to carry out. Note that you cannot combine distribute filters and prefix filters.
- Path filters - these look at the AS-Path attribute in update messages. If the AS-Path attribute in the update matches the filter criteria then the whole update message is

filtered out or accepted, depending on what action the filter entry has been configured to carry out.

- Prefix filters - these use prefix lists and look at the individual prefixes within an update message. If a prefix within the update message matches the filter criteria then that individual prefix is filtered out or accepted depending on what action the filter entry has been configured to carry out. Note that you cannot combine distribute filters and prefix filters.
- Route maps - these have a complex combination of match criteria and actions. They can be used to filter out routes and also to alter the attributes in update messages.

All these filter types can be used in incoming or outgoing directions. Therefore, all the filters can all be used to filter the update packets that are received from a peer, or the update packets which the router itself is sending to a peer.

BGP peers

Within the BGP protocol, the exchange of routing information is carried out between pairs of routers. Two routers create a TCP connection with each other, and exchange routing information as specific data packets within that TCP session. The routers at the ends of the TCP connection are referred to as BGP peers. Any given router can form peering relationships with multiple routers.

BGP updates

Once a router has established a BGP connection with a peer, it will start to exchange routing information with that peer. A BGP update message is the packet that is used to transfer the routing information.

BIST

Built In Self Test. A mechanism that permits the device to test itself.

Blackhole route

A blackhole route is a routing table entry that does not forward packets. A blackhole route is specified as an interface with an **ip route** command. Note that a blackhole route is also called a **Null route**.

B-MAC

Backbone MAC address.

BPDU

Bridge Protocol Data Unit. A **Spanning tree** protocol initializing packet sent at configurable intervals to exchange information among bridges in the LAN.

For information on the standardized format for MSTP BPDU messages see **"MSTP Bridge Protocol Data Units (BPDUs)" on page 20.17**.

Bridge

A device that connects two or more networks and forwards packets between them. Bridges function at the data link layer or Layer 2 of the OSI reference model. A bridge will filter, send or flood an incoming frame, base on the MAC address of that frame.

Broadcast

One device sends out data that is intended to be received and processed by every device that it reaches.

Broadcast domain

A section of an Ethernet network comprising all the devices that will receive broadcast packets sent by any device in the domain. Separated from the rest of the network by a Layer 3 switch.

BOOTP

Bootstrap Protocol. BOOTP is a UDP-based protocol that enables a booting host to dynamically configure itself without external interventions. A BOOTP server responds to requests from BOOTP clients for configuration information, such as the IP address the client should use.

B-TAG

Backbone TAG Field.

B-VID

Backbone VLAN ID (tunnel).

B-VLAN

Backbone VLAN (tunnel).

C

CHAP

Challenge Handshake Authentication Protocol. CHAP is an authentication method used by PPP servers to validate the identity of clients. CHAP verifies the identity of the client by using a three-way handshake, and the verification is based on a shared secret by the client and the server, such as the client's password.

CIST

Common and Internal Spanning Tree. The CIST is the default spanning tree instance of **MSTP**, i.e. all VLANs that are not members of particular **MSTIs** are members of the CIST. Also, an individual MST region can be regarded as a single virtual bridge by other MST regions. The spanning tree that runs between regions is the CIST. The CIST is also the spanning tree that runs between MST regions and Single Spanning Tree (SST) entities.

For more information see **"Common and Internal Spanning Tree (CIST)" on page 20.15**.

Classification

In **ACLs** and **QoS**, classification is the process of filtering and marking. Filtering involves sorting your data into appropriate traffic types. Marking involves tagging the data so that downstream ports and routers can apply appropriate service policy rules. There are two reasons to classify data:

- To provide network security (security ACLs).
- To apply service quality criteria QoS.

The main application of security ACLs is to block undesired traffic. When using ACLs though QoS, the same classification and action abilities are available, but QoS has some additional fields that it can match on and also provides the ability to perform metering, marking and remarking on packets that match the filter definitions.

For more information on ACL classification see **"Profile Limitations" on page 60.9**. For more information on QoS classification see **"Classifying your Data" on page 65.7**.

Class maps

Class maps are among the pivotal **QoS** components. They provide the means that associate the classified traffic with its appropriate QoS actions. They are the linking elements for the following functions:

- **Classification**.
- policy mapping. See **Policy maps**.
- aggregate policing and metering
- **Premarking**.

The relationship between a class map and a policy map can be one-to-one or many-to-one.

For more information see **"Class Maps" on page 65.8**.

CLI

Command Line Interface. With three distinct modes, the CLI is very secure. In User exec mode you can view settings and troubleshoot problems but you cannot make changes to the system. In Privileged exec mode you can change system settings and restart the device. You can only make configuration changes in Global configuration mode, which reduces the risk of making accidental configuration changes.

For more information see **"How to Work with Command Modes" on page 1.7**.

C-MAC

Customer MAC Address.

Collision domain

A physical region of a local area network (LAN) in which data collisions can occur.

Continuous reboot prevention

The continuous reboot prevention feature allows the user to configure a switch to stop rebooting if the device gets into a cycle of continuous rebooting. The user can configure the time period, the maximum number of times the switch can reboot within the specified time period, referred to as the threshold, and the action to take if the threshold is exceeded.

For more information see **"Continuous Reboot Prevention" on page 1.36**.

Control Plane Prioritization

Control Plane Prioritization (CPP) allows you to allocate priorities to packet types to ensure minimum interruption to the flow of control information through the network. CPP stops the control plane from being flooded by traffic in the event of a network storm or Denial of Service (DoS) attack. This ensures maximal performance and prevents network outages. In addition, with CPP you can also limit the amount of traffic that flows to the CPU to ensure that performance of other services, such as the CLI, are not affected during network storms or DoS attacks.

For more information see the **platform control-plane-prioritization rate** command on page 17.24.

Control VLAN

In **EPSR**, the VLAN over which all control messages are sent and received. EPSR never blocks this VLAN.

For more information see **"Ring Components and Operation" on page 86.2**.

CoS

Class of Service. CoS is a method for classifying traffic on a packet by packet basis using information in the type-of-service (ToS) byte to provide different service levels to different traffic. See **QoS**.

For more information see **"CoS to egress queue premarking" on page 65.12**.

Cost

An indication of the overhead required to send packets across a certain interface.

CPP

Control Plane Prioritization. See **Control Plane Prioritization**.

C-TAG

Customer VLAN TAG.

C-VID

Customer VLAN ID.

C-VLAN

Customer VLAN.

D

Data VLAN

In **EPSR**, a VLAN that needs to be protected from loops. Each EPSR domain has one or more data VLANs.

For more information see **"Ring Components and Operation" on page 86.2**.

Designated bridge

Each bridge or LAN in the **Spanning tree**, except the **Root bridge**, has a unique parent, known as the designated bridge. Each LAN has a single bridge, called the designated bridge, that connects it to the next LAN on the path towards the root bridge.

For an overview of spanning tree operation see **"Spanning tree operation" on page 20.2**.

DHCP

Dynamic Host Configuration Protocol. A method of automatically allocating IP addresses. A DHCP server holds a pool of IP addresses from which it draws individual ones as it allocates them to users when they log on.

For more information see **Chapter 92, Dynamic Host Configuration Protocol (DHCP) Introduction**.

DHCP Leasequery

The DHCP Leasequery protocol (RFC 4388) allows a device or process, for example a DHCP relay agent, to obtain IP address information directly from the DHCP server using DHCPLEASEQUERY messages.

For more information see **"Enable DHCP Leasequery" on page 92.6**.

DHCP lease probing

Probing is used by the DHCP server to check whether an IP address it wants to lease to a client is already being used by another host. Probing is configured on a per-DHCP pool basis.

For more information see **"DHCP Lease Probing" on page 92.8**.

DHCP relay agent option 82

Enabling the DCHP Relay Agent Option 82 feature on the switch allows the switch to insert extra information into the DHCP packets that it is relaying. The information is stored in a specific optional field in the DHCP packet, namely, the agent-information field, which has option ID 82.

Note that the DHCP Relay Agent Option 82 agent information inserted by the DHCP snooping differs from the information added by DHCP Relay. The switch cannot be configured to use both the DHCP relay agent option and DHCP snooping.

For information about the DHCP Relay Agent Option 82 information inserted by DHCP Relay see **"DHCP Relay Agent Information Option (Option 82)" on page 92.10**.

For information about the DHCP Relay Agent Option 82 information inserted by DHCP snooping see **"DHCP Relay Agent Option 82" on page 82.4**.

DHCP relay agents

DHCP relay agents pass BOOTP and DHCP messages between servers and clients. Networks where the DHCP or BOOTP server does not reside on the same IP subnet as its clients need the intermediate routers to act as relay agents.

For information on how to configure the DHCP relay agent see **"DHCP Relay Agent Introduction" on page 92.9**.

DHCP snooping

DHCP snooping provides an extra layer of security on the switch via dynamic IP source filtering. DHCP snooping filters out traffic received from unknown, or 'untrusted' ports, and builds and maintains a DHCP snooping database.

With DHCP snooping, IP sources are dynamically verified, and filtered accordingly. IP packets that are not sourced from recognized IP addresses can be filtered out. This ensures the required traceability.

For more information see **Chapter 82, DHCP Snooping Introduction and Configuration**. For a configuration example see **"Configure DHCP Snooping" on page 82.10**.

Digital Diagnostics Monitoring (DDM)

Modern optical SFP transceivers support Digital Diagnostics Monitoring (DDM) functions. This feature allows you to monitor real-time parameters of the SFP, such as optical output power, optical input power, temperature, laser bias current, and transceiver supply voltage. Additionally, RX LOS (Loss of Signal) is shown when the received optical level is below a preset threshold. Monitoring these parameters allows you to check on the health of all installed SFPs or a specific SFP transceiver. See also **Trouble-shoot fiber and pluggable issues** in **Getting Started**.

SFP transceivers that support DDM display the following output from the **show system pluggable detail** and the **show system pluggable diagnostics** commands for monitoring SFPs:

- **Diagnostic Calibration**: Specifies whether the pluggable supports DDM Internal Calibration. **Internal** is displayed if the pluggable supports DDM Internal Calibration.
- **Power Monitoring**: Displays the received power measurement type, which can be either **OMA** (Optical Module Amplitude) or **Avg** (Average Power) measured in µW.

For further information about the DDM feature on the switch for installed SFP transceivers, see the **show system pluggable detail** command and the **show system pluggable diagnostics** command in **Chapter 10, System Configuration and Monitoring Commands**.

See also **Digital Optical Monitoring (DOM)**. Note DOM is for XFP pluggable transceivers only.

Digital Optical Monitoring (DOM)

Modern optical XFP transceivers support Digital Optical Monitoring (DOM) functions. This feature allows you to monitor real-time parameters of the XFP, such as optical output power, optical input power, temperature, laser bias current, and transceiver supply voltage. Additionally, RX LOS (Loss of Signal) is shown when the received optical level is below a preset threshold. Monitoring these parameters allows you to check on the health of all installed XFPs or a specific XFP transceiver. See also **Trouble-shoot fiber and pluggable issues** in **Getting Started**.

XFP transceivers that support DOM display the following output from the **show system pluggable detail** and the **show system pluggable diagnostics** commands for monitoring XFPs:

- **Diagnostic Calibration**: Specifies whether the pluggable supports DOM Internal Calibration. **Internal** is displayed if the pluggable supports DOM Internal Calibration.
- **FEC BER support**: Specifies whether the FEC (Forward Error Correction) coder can generate a BER (Bit Error Rate) signal to tune the XFP transceiver if DOM is supported.

For further information about the DOM feature on the switch for installed XFP transceivers, see the **show system pluggable detail** command and the **show system pluggable diagnostics** command in **Chapter 10, System Configuration and Monitoring Commands**.

See also **Digital Diagnostics Monitoring (DDM)**. Note DDM is for SFP and SFP+ pluggable transceivers.

Disabled master

The Disabled Master is a variant of the **Stack master** or **Active master** and is used with the **DMM (disabled master monitoring)**feature. The Disabled Master has the same configuration as the **Stack master** or **Active master**, but has all its switchports disabled. The Disabled Master is only used is the stack separates into two stubs. By having all switchports disabled, the Disabled Master avoids potentially detrimental network connectivity problems from having two Stack Masters or Active Masters having the same configuration. The Stack Master's or Active Master's ports are unaffected by the Disabled Master's ports, so the Stack Master or Active Master continues to forward traffic normally.

For information about the Disabled Master and the Disabled Master Monitoring feature, see the **Disabled Master Monitoring (DMM)** section in **Chapter 111, VCStack Introduction** and the **stack disabled-master-monitoring** command in **Chapter 112, Stacking Commands**.

DLF

Destination Lookup Failure. DLF is the event of receiving a unicast Ethernet frame with an unknown destination address.

DMM (disabled master monitoring)

The Disabled Master Monitoring (DMM) features checks the status of the Active Master via the Stack Resiliency Link. If the Active Master fails then the Disabled Master changes state to Active Master. A Disabled Master has the same configuration as the Active Master, but has all links shutdown. This change in state for the Disabled Master to become the Active Master allows traffic forwarding to continue on the VCStack.

For information about the Disabled Master and the Disabled Master Monitoring feature, see the **Disabled Master Monitoring (DMM)** section in **Chapter 111, VCStack Introduction** and the **stack disabled-master-monitoring**

DNS

Domain Name System. DNS allows you to access remote systems by entering human-readable device host names rather than IP addresses. DNS works by creating a mapping between a device name, such as **http://www.alliedtelesis.com**, and its IP address. These mappings are held on DNS servers. The benefits of DNS are that domain names:

- Can map to a new IP address if the host's IP address changes.
- Are easier to remember than an IP address.
- Allow organizations to use a domain name hierarchy that is independent of any IP address assignment.

For more information see **"Domain Name System (DNS)" on page 26.8**.

DNS relay

DNS Relay provides the presence of a local virtual DNS server on your AlliedWare Plus™ device which can service DNS lookup requests sent to it from local hosts. The DNS Relay will usually relay the requests to an external, or upstream, DNS server.

For more information see **"DNS Relay" on page 26.10**.

DoS

Denial of Service. A generic term for attacks that reduce or stop the operation of a network.

DSCP value

The Differentiated Services Code Point within the TOS field of an IP packet header. This is a 6-bit number in the range 0-63.

Duplex mode

See **Full duplex** and **Half duplex**.

Dynamic channel group

A dynamic channel group also known as a LACP channel group, an etherchannel, or a LACP aggregator, enables a number of ports to be dynamically combined to form a single higher bandwidth logical connection. See **LACP**.

For an more information see **"Link Aggregation Control Protocol (LACP)" on page 22.3**. For a configuration example see **"Configuring an LACP Channel Group" on page 22.5**.

Dynamic Link Failover

Dynamic Link Failover (Host Attach) is a versatile feature that enables devices that do not support link aggregation to form multiple active links by using **Triggers** and **Scripts**. You can customize Dynamic Link Failover to suit almost any situation, from a simple redundant backup link to multiple active links capable of basic load-sharing.

E

EAP

Extensible Authentication Protocol. EAP carries out the authentication exchange between the supplicant and the authentication server.

EEE

The IEEE 802.3az Energy Efficient Ethernet (EEE) standard is a specification for lowering the power consumption of Ethernet devices during periods of low link utilization. If no data is being sent then the Ethernet device can enter a sleep state, called Low Power Idle (LPI), to conserve the power consumed by the Ethernet device. See the **LPI** glossary entry.

Etherchannel

See **Dynamic channel group**.

Ethernet Protection Switching Ring

See **EPSR**.

EPSR

EPSR (Ethernet Protection Switching Ring) operates on physical rings of switches (note, not on meshed networks). When all nodes and links in the ring are up, EPSR prevents a loop by blocking data transmission across one port. When a node or link fails, EPSR detects the failure rapidly and responds by unblocking the blocked port so that data can flow around the ring. The EPSR components are:

- **EPSR domain**
- **Master node**
- **Transit node**
- **Ring port**
- **Primary port**
- **Secondary port**
- **Control VLAN**
- **Data VLAN**

For more information and example configurations see **Chapter 86, EPSR Introduction and Configuration**.

EPSR domain

A protection scheme for an Ethernet ring that consists of one or more data VLANs and a control VLAN.

For more information see **"Ring Components and Operation" on page 86.2**.

EGP

Exterior Gateway Protocol. EGP is an obsolete protocol that has been replaced by **BGP**. Not to be confused with the general term exterior gateway protocol.

Egress

Outgoing packet process.

Exterior Gateway Protocol

A protocol that distributes routing information to devices that connect separate autonomous systems (**ASs**).

F

FDB

Forwarding Database.

FIB

Forwarding Information Base. The **RIB** (Routing Information Base) populates the FIB with the best route to each destination. When your device receives an IP packet, and no filters are active that would exclude the packet, it uses the FIB to find the most specific route to the destination. If your device does not find a direct route to the destination, and no default route exists, it discards the packet and sends an ICMP message to that effect back to the source.

For more information see **"RIB and FIB Routing Tables" on page 33.4**.

Full duplex

When a port is in full duplex mode, the port transmits and receives data simultaneously. See **Half duplex**.

G

Guest VLAN

If **802.1X** authentication has been configured on access ports in the network, you might still want to provide limited network access to those users whose devices do not have 802.1x supplicant enabled, or who have unrecognized authentication credentials. The mechanism to achieve this is known as a Guest VLAN. The idea is that if the users device fails 802.1X authentication, or is not even performing any 802.1X authentication, then its connection port can be put into the guest VLAN.

For more information see **"Configuring a Guest VLAN" on page 2** and the **auth guest-vlan** command on page 70.8. For a configuration example see **"Configuring a Guest VLAN" on page 69.2**.

H

Half duplex

When a port is in half duplex mode, the port transmits or receives but not both at the same time. See **Full duplex**.

Hardware ACLs

See **ACL types**.

I

ICMP

Internet Control Message Protocol. ICMP allows networking devices to send information and control messages to other devices or hosts.

For more information see **"Internet Control Message Protocol (ICMP)" on page 26.15**.

ICMPv6

Internet Control Message Protocol Version 6. ICMPv6 is an implementation of **ICMP** for IPv6.

For more information see **"The Internet Control Message Protocol (ICMPv6)" on page 28.7**.

IGMP

Internet Group Management Protocol. IGMP is a communications protocol that hosts use to indicate that they are interested in receiving a particular multicast stream.

IGMP querier or router

A device in a subnetwork that is the coordinator for all multicast streams and IGMP membership information. Each subnet only has one active querier.

IGMP snooper

A device that spies on IGMP messages to create flow efficiencies by ensuring that multicast data streams are only sent to interested ports. A snooper can decide on the best path to send multicast packets at Layer 2 but does not initiate any IGMP communications.

For a configuration example see **"IGMP Snooping and Querier configuration example" on page 51.6**.

IGP

Interior Gateway Protocol. A routing protocol used within an autonomous system (**AS**).

Ingress

Incoming packet process.

Interior Gateway Protocol

See **IGP**.

IP directed broadcast

An IP directed broadcast is an IP packet whose destination address is a broadcast address for some IP subnet, but originates from a node that is not itself part of that destination subnet. When a directed broadcast packet reaches a switch that is directly connected to its destination subnet, the packet is flooded as a broadcast on the destination subnet. IP directed broadcast is enabled and disabled per VLAN interface. When enabled a directed broadcast packet is forwarded to an enabled VLAN interface if received on another subnet.

IP Helper

The IP Helper feature allows the switch to receive UDP broadcasts on one subnet, and forward them as broadcasts or unicasts into another subnet, so a client can use an application which uses UDP broadcast (such as Net-BIOS) when the client and server are located in different subnets. The IP Helper feature forwards UDP broadcast network traffic to specific hosts on another subnet and/or to the broadcast address of another subnet. When the IP Helper feature is enabled on a VLAN interface, the UDP broadcast packets received on the interface are processed for forwarding out through another interface into another subnet.

IRDP

ICMP Router Discovery Protocol. If this feature in configured, the device sends router advertisements periodically and in response to router solicitations. ICMP Router Discovery messages let routers automatically advertise themselves to hosts.

For more information see **"ICMP Router Discovery Protocol (IRDP)" on page 26.16**.

I-SID

Extended Service ID.

ISP

Internet Service Provider. An organization that offers its customers access to the Internet. The ISP connects its customers using a data transmission technology, such as dial-up or DSL etc.

I-TAG

Extended Service TAG.

L

LACP

Link Aggregation Control Protocol. LACP allows bundling of several physical ports to form a single logical channel providing enhanced performance and redundancy. The aggregated channel is viewed as a single link to each switch. The spanning tree views the channel as one interface and not as multiple interfaces. When there is a failure in one physical port, the other ports stay up and there is no disruption. LACP does not interoperate with devices that use Port Aggregation Protocol (PAgP).

For an more information see **"Link Aggregation Control Protocol (LACP)" on page 22.3**.

LACP aggregator

See **Dynamic channel group**.

LACP channel group

See **Dynamic channel group**.

LAG

See **Link aggregation group**.

Layer 3 switch

A Layer 3 switch is an optimized combination of routing software and specialized hardware. The software uses traditional methods (static routing commands, and routing protocols) to build up a table of the best routes to network destinations, and then writes them into a set of registers in the specialized forwarding hardware. The hardware then forwards packets, based on their Layer 3 address content, at very high data rates, using the values that are written into the registers.

LED

Light Emitting Diode (LED). An LED is a semiconductor that emits light by converting electrical energy. Power lights on switches and status lights on switch ports are LEDs. You can save power used by switch LEDs with the **ecofriendly led** command on page 10.18.

For more information and configuration examples see the section **"Save Power With the Eco-Friendly Feature" on page 1.33**. For command information and examples see the **ecofriendly led** command on page 10.18. See also the **LPI** glossary entry.

Link aggregation group

A Link Aggregation Group is a collection of bundled switch ports for an aggregated link. Link aggregation is the bonding together of two or more data channels into a single channel that appears as single logical link of higher bandwidth increasing link performance and reliability.

For an more information see **"Link Aggregation Control Protocol (LACP)" on page 22.3**. For a configuration example see **"Configuring an LACP Channel Group" on page 22.5**

Link-local addresses

A link-local address is an IP (Internet Protocol) address that is only used for communications in the local network, or for a point-to-point connection. Routing does not forward packets with link-local addresses. IPv6 requires a link-local address is assigned to each interface, which has the IPv6 protocol enabled, and when addresses are assigned to interfaces for routing IPv6 packets.

Note that link-local addresses are retained in the system until they are negated by using the no variant of the command that established them. See the **ipv6 enable** command for more information.

Also note that the link-local address is retained in the system if the global address is removed using another command, which was not used to establish the link-local address. For example, if a link local address is established with the **ipv6 enable** command then it will not be removed using a **no ipv6 address** command.

LLDP

Link Layer Discovery Protocol. LLDP is a Layer 2 protocol that enables Ethernet network devices, such as switches and routers, to transmit and/or receive device-related information to or from directly connected devices on the network, and to store such information learned about other devices. LLDP is a link level ("one hop") protocol; LLDP information can only be sent to and received from devices that are directly connected to each other, or connected via a hub or repeater. Advertised information is not forwarded on to other devices on the network.

For more information see **Chapter 99, LLDP Introduction and Configuration**.
For configuration examples see **"Configuring LLDP" on page 99.11**.

LLDPDU

LLDP Data Unit. See **LLDP advertisements**.

LLDP advertisements

LLDP transmits advertisements as packets called LLDP Data Units (LLDPDUs). An LLDPDU consists of a set of Type-Length-Value elements (**TLV**), each of which contains a particular type of information about the device or port transmitting it.

LLDP-MED

Link Layer Discovery Protocol Media Endpoint Discovery. LLDP-MED is an enhancement to IEEE's 802.1AB LLDP, adding media and IP telephony-specific messages that can be exchanged between the network and endpoint devices.

For more information see **"LLDP-MED" on page 99.3**, **"LLDP-MED: Location Identification TLV" on page 99.7** and **"LLDP-MED Operation" on page 99.9**. For the procedure to configure LLDP-MED see **"Configure LLDP-MED" on page 99.14**.

Local RADIUS server

Local RADIUS Server provides a user authentication service feature.

For more information and configuration examples see **Chapter 77, Local RADIUS Server Introduction and Configuration**.

LPI

Low Power Idle (LPI). LPI is a feature of the IEEE 802.3az Energy Efficient Ethernet (EEE) standard. LPI lowers power consumption of switch ports during periods of low link utilization when connected to IEEE 802.3az compliant host devices. If no data is sent then the switch port can enter a sleep state, called Low Power Idle (LPI), to conserve power used by the switch.

For more information and configuration examples see the section **Save Power With the Eco-Friendly Feature** command on page 1.33. For command information and examples see the **ecofriendly lpi** command on page 10.19. See also the **LED** glossary entry.

LSA

Link State Advertisement. OSPF sends link-state advertisements (LSAs) to all other routers within the same hierarchical area. Data on attached interfaces, metrics used, and other variables, are included in OSPF LSAs. As OSPF routers accumulate link-state data, they use the Shortest Path First (SPF) algorithm to calculate the shortest path to each node.

M

MAC address learning

A key optimization in Ethernet switching is that the flooding of unicast traffic is minimized. This is based on switches knowing which port to forward traffic to for given destination MAC addresses. Switches achieve this by the simple process of noting on which ports packets arrive from given MAC addresses, as those will be the ports to which return packets to those MAC addresses will need to be forwarded. This process is referred to as MAC address learning.

MAC authentication

The way that MAC-based authentication works is that when the supplicant device starts sending packets, the authenticating switch will extract the source MAC address from the packets, and send a RADIUS request that uses this MAC address as the username and password in the request. See **AAA** and **Tri-authentication**.

For a sample configuration script see **"Sample MAC Authentication Configuration" on page 71.8**.

Master node

In **EPSR**, the controlling node for a domain, responsible for polling the ring state, collecting error messages, and controlling the flow of traffic in the domain.

Master node states are:

- Complete - the state when there are no link or node failures on the ring.
- Failed - the state when there is a link or node failure on the ring. This state indicates that the master node received a Link-Down message or that the failover timer expired before the master node's secondary port received a Health message.

For more information see **"Ring Components and Operation" on page 86.2**.

MD5

Message Digest 5 authentication algorithm.

Metering

See **Policing**.

Metric

The sum of all the costs along the path to a given destination. See **Cost**.

MLD

Multicast Listener Discovery. MLD is used to exchange membership status information between IPv6 routers that support multicasting and members of multicast groups on a network segment. Host membership in a multicast group is reported by individual member hosts, and membership status is periodically polled by multicast routers.

MLD snooping

MLD snooping is a feature whereby a Layer 2 switch listens to or "snoops" the MLD messages passing through the switch or from member hosts and multicast routers. The purpose of MLD snooping is to provide efficient Layer 2 multicast forwarding, by sending only to hosts that have expressed an interest in receiving the multicast data.

For more information see **Chapter 59, MLD and MLD Snooping Introduction and Commands**.

MSTI

Multiple Spanning Tree Instance. **MSTP** enables the grouping and mapping of VLANs to different spanning tree instances. An MST Instance (MSTI) is a particular set of VLANs that are all using the same spanning tree.

For more information see **"Multiple Spanning Tree Instances (MSTI)" on page 20.12**.

MSTP

Multiple Spanning Tree Protocol. MSTP is similar to Rapid Spanning Tree Protocol (**RSTP**) - it provides loop resolution and rapid convergence. However it also has the extra advantage of making it possible to have different forwarding paths for different multiple spanning tree instances. This enables load balancing of network traffic across redundant links. A device running MSTP is compatible with other devices running RSTP or **STP**.

For more information see **"Multiple Spanning Tree Protocol (MSTP)" on page 20.11**. For a configuration example see **"Configuring MSTP" on page 20.19**.

MSTP regions

An MST region is a set of interconnected switches that all have the same values for the following MST configuration identification elements:

- MST configuration name - the name of the MST region.
- Revision level - the revision number of configuration.
- Configuration Digest - the mapping of which VLANs are mapped to which MST instances.

Each of the MST instances created are identified by an **MSTI** number. This number is locally significant within the MST region. Therefore, an MSTI will not span across MST regions.

For more information see **"MSTP Regions" on page 20.13**.

Multicast

One device sends out data that is intended to be received and processed by a selected group of the devices it reaches.

N

NAC

Network Access Control. NAC provides unprecedented control over user access to the network in order to mitigate threats to network infrastructure. NAC uses **802.1X** port-based authentication with standards-compliant dynamic VLAN assignment, to assess a user's adherence to the network's security policies, and either grant authentication or offer remediation. NAC also supports alternatives to 802.1x port-based authentication, such as **Web-authentication** to enable guest access, and **MAC authentication** for end points that do not have an 802.1x supplicant. Furthermore, if multiple users share a port then multi-authentication can be used and a **Guest VLAN** can be configured to provide a catch-all for users without an 802.1x supplicant.

For more information see **Chapter 67, 802.1X Introduction and Configuration** and **Chapter 69, Authentication Introduction and Configuration**.

NAS

Network Access Server. A NAS is a single point of access to a remote resource. The client connects to the NAS. The NAS then connects to another resource asking whether the client's supplied credentials are valid. Based on that answer the NAS then allows or disallows access to the resource. The NAS contains no information about what resources clients can connect to or what client credentials are valid. The NAS sends the credentials the client supplied to a resource which then validates the client.

Next hop

IP routing involves forwarding packets from one router to the next, until they reach their destination. Routers do not need to know the full path to a packet's destination, they just need to know the next router to forward the packet on to. This 'next router' is referred to as the next hop of an IP route.

Nested VLAN

See **VLAN double tagging**.

NTP

Network Time Protocol. NTP is a protocol for synchronizing the time clocks on a collection of network devices using a distributed client/server mechanism.

For more information see **Chapter 90, NTP Introduction and Configuration**.

Null route

A null route is a routing table entry that does not forward packets. A null route is specified as an interface with an **ip route** command. Note that a null route is also called a **Blackhole route**.

O

OSPF

Open Shortest Path First. A link-state routing protocol, OSPF is an interior gateway protocol (IGP) that uses the Shortest Path First (SPF) Dijsktra algorithm.

For more information see **Chapter 39, OSPF Introduction and Configuration**. For configuration examples see the following sections:

"Enabling OSPF on an Interface" on page 39.10,
"Setting priority" on page 39.12
"Configuring an Area Border Router" on page 39.14
"Redistributing Routes Into OSPF" on page 39.15
"OSPF Cost" on page 39.17
"Configuring Virtual Links" on page 39.20, and
"OSPF Multi-Area Loopback Configuration" on page 39.25.

P

PAP

Password Authentication Protocol. PAP is an authentication protocol that uses a password and is used by PPP to validate users before allowing them to access server resources. PAP transmits plain text ASCII passwords over the network so it is not secure.

PIM-DM

Protocol Independent Multicast - Dense Mode. PIM-DM is a data-driven multicast routing protocol, which builds source-based multicast distribution trees that operate on the Flood-and-Prune principle. It requires unicast-reachability information, but does not depend on a specific unicast routing protocol. PIM-DM is a significantly less complex protocol than PIM-SM. PIM-DM works on the principle that it is probable that any given multicast stream will have at least one downstream listener. PIM-DM is ideal where many hosts subscribe to receive multicast packets, so most of the PIM Routers receive and forward all multicast packets.

For more information see **Chapter 57, PIM-DM Introduction and Configuration**. For a configuration example see **"PIM-DM Configuration" on page 57.4**.

PIM-SM

Protocol Independent Multicast - Sparse Mode. PIM-SM provides efficient communication between members of sparsely distributed groups - the type of groups that are most common in wide-area internetworks. PIM-SM is designed on the principle that several hosts wishing to participate in a multicast conference does not justify flooding the entire internetwork with periodic multicast traffic. PIM-SM is designed to limit multicast traffic so that only those routers interested in receiving traffic for a particular group receive the traffic.

For more information see **Chapter 53, PIM-SM Introduction and Configuration**. For configuration examples see **"Static Rendezvous Point configuration" on page 53.7**, **"Dynamic Rendezvous Point configuration" on page 53.9** and **"Bootstrap Router configuration" on page 53.11**.

Ping

Ping tests the connectivity between two network devices to determine whether each network device can "see" the other device.

Ping-of-death attack

A type of attack on a computer that involves sending a malformed or otherwise malicious ping to a network device.

Ping polling

Ping polling is used to ensure that a device is still present, live, and contactable in the network by periodically sending a packet to an IP address and waiting for a response. Configurable actions can be performed if responses are no longer arriving.

For more information see **Chapter 107, Ping Polling Introduction and Configuration**. For how to configure ping polling see **"Configuring Ping Polling" on page 107.4**.

Policing

In **QoS**, once you have set-up your **Classification** and created your **Class maps**, you can start conditioning your traffic flows. One tool used for traffic conditioning is the policer (or meter). The principle of policing is to measure the data flow that matches the definitions for a particular class-map; then, by selecting appropriate data rates, allocate the flows into one of three categories, Red Yellow or Green. You then decide what action to apply to the Red, Yellow and Green data. See **Premarking**.

For more information see **"Policing (Metering) Your Data" on page 65.17**.

Policy maps

Policy maps are the means by which you apply your **Class maps** to physical switch ports. A policy map can be assigned to several ports, but a port cannot have more than one policy map assigned to it. See **QoS**.

For more information see **"Policy Maps" on page 65.10**.

Port bit map

An efficient method for the storage of a list of ports. Each port is represented by a single bit in a 32-bit or 64-bit value.

Port mirroring

Port mirroring enables traffic being received and transmitted on a switch port to be sent to another switch port, the mirror port, usually for the purposes of capturing the data with a protocol analyzer. The mirror port is the only switch port that does not belong to a VLAN, and therefore does not participate in any other switching. Before the mirror port can be set, it must be removed from all trunk groups and all VLANs except the default VLAN.

PPP

Point-to-Point Protocol. A data link protocol used to establish a direct connection between two networking nodes. PPP can provide connection authentication and transmission encryption. PPPoE (Point-to-Point Protocol over Ethernet) is used over broadband connections as is PPPoA (Point-to-Point Protocol over ATM) with DSL.

Premarking

In **QoS**, premarking relates to adding QoS markers to your incoming data traffic before it is metered. QoS markers can be applied at both the link layer (within the CoS field), and at the network layer (within the DSCP field). See **Policing**.

For more information see **"Premarking Your Traffic" on page 65.12**.

Primary port

In **EPSR**, a ring port on the master node. This port determines the direction of the traffic flow, and is always operational.

For more information see **"Ring Components and Operation" on page 86.2**.

Provisioning

Stack member provisioning is the pre-configuration of **Stack member** position ready for insertion at a later time. Provisioning enables a network administrator to pre-configure vacant stack member capacity within a **VCStack**, ready to be hot-swapped in at a later time. Later, when the stack member switch is physically added, its configuration is automatically applied with the minimum network disruption.

For more information see **"Provisioning (Stack Members)" on page 111.21**.

Proxy ARP

Proxy ARP allows hosts that do not support routing (i.e. they have no knowledge of the network structure) to determine the physical addresses of hosts on other networks.

For more information see **"Proxy ARP" on page 26.4**.

PSU

Power Supply Unit.

Q

Query Solicitation

Query Solicitation minimizes the loss of multicast data after a topology change on networks that use **EPSR** or spanning tree (**STP**, **RSTP**, or **MSTP**) for loop protection. Without Query Solicitation, when the underlying link layer topology changes, multicast data flow can stop for up to several minutes, depending on which port goes down and how much of the IGMP query interval remained at the time of the topology change. Query Solicitation greatly reduces this disruption.

For more information see **"Query Solicitation" on page 51.9**.

QoS

Quality of Service. QoS enables you to both prioritize traffic and limit its available bandwidth. The concept of QoS is a departure from the original networking protocols, in which all traffic on the Internet or within a LAN had the same available bandwidth. Without QoS, all traffic types are equally likely to be dropped if a link becomes oversubscribed. This approach is now inadequate in many networks, because traffic levels have increased and networks often carry time-critical applications such as streams of real-time video data. QoS also enables service providers to easily supply different customers with different amounts of bandwidth. Configuring Quality of Service involves two separate stages:

- Classifying traffic into flows, according to a wide range of criteria. Classification is performed by the switch's **Class maps**.
- Acting on these traffic flows.

For more information see **Chapter 65, Quality of Service (QoS) Introduction**.

Quality of Service

See **QoS**.

R

RADIUS

Remote Authentication Dial-In User Service. RADIUS is a networking protocol that provides centralized **AAA** (Authentication Authorization and Accounting) management for clients to a network. RADIUS is a client/server protocol that runs in the application layer, using UDP (User Datagram Protocol) for data transport. RADIUS authenticates users before granting them access to network resources and can account for the usage of network resources.

For more information see **Chapter 73, RADIUS Introduction and Configuration**. For configuration examples see **"RADIUS Configuration Examples" on page 73.15**.

Redistribute

Advertise routes learnt from one routing protocol into another routing protocol.

Remote network MONitoring

See **RMON**.

Resiliency link

In **VCStack**, an extra, out-of-band, data link between stack members. In the event of loss of communication across the stacking connection, the stack members can determine the status of other members via communication on the resiliency link. This assists the stack members in deciding the correct course of action when communication on the stack is lost.

For more information see **"Stack Resiliency Link" on page 111.15**.

RIB

Routing Information Base. The RIB records all the routes that your device has learnt. Your device uses the RIB to advertise routes to its neighbor devices and to populate the **FIB** (Forwarding Information Base).

For more information see **"RIB and FIB Routing Tables" on page 33.4**.

Ring port

In **EPSR**, a port that connects the node to the ring. On the master node, each ring port is either the primary port or the secondary port. On transit nodes, ring ports do not have roles.

For more information see **"Ring Components and Operation" on page 86.2**.

RIP

Routing Information Protocol. A simple distance vector IPv4 routing protocol, RIP is an Interior Gateway Protocol (IGP) that uses hop counts as its metrics. Given a choice of routes, RIP uses the route that takes the lowest number of hops. If multiple routes have the same hop count, RIP chooses the first route it finds.The AlliedWare Plus™ RIP module supports RFCs 1058 and 1723; the RIPv2 module supports more fields in the RIP packets, and supports security authentication features.

For more information see **"RIP" on page 32.2**. For configuration examples see **"Enabling RIP" on page 35.2**, **"Specifying the RIP Version" on page 35.4**, **"RIPv2 Authentication (Single Key)" on page 35.6**, **"RIPv2 Text Authentication (Multiple Keys)" on page 35.8** and **"RIPv2 md5 authentication (Multiple Keys)" on page 35.12**.

RIPng

Routing Information Protocol next generation. RIPng is a simple distance vector IPv6 routing protocol. It determines the number of hops between the destination and your device, where one hop is one link. Given a choice of routes, RIPng uses the route that takes the lowest number of hops. If multiple routes have the same hop count, RIPng chooses the first route it finds. RIPng is an extension of RIPv2 to support IPv6.

For configuration examples see **"Enabling RIPng" on page 37.2** and **"Troubleshooting RIPng Adjacency" on page 37.5**.

RIPv6

See **RIPng**.

RMON

Remote Network MONitoring. RMON was developed by the IETF to support monitoring and protocol analysis of LANs with a focus on Layer 1 and 2 information in networks. RMON is an industry standard that provides the functionality in network analyzers. An RMON implementation operates in a client/server model. Monitoring devices (or 'probes') contain RMON agents that collect information and analyze packets. The probes are servers and the Network Management applications that communicate with them are clients.

For more information see **Chapter 102, RMON Introduction and Configuration**. For a configuration example see **"RMON Configuration Example" on page 102.4**.

Roaming Authentication

Roaming Authentication improves the usability of network security by enabling users to move within the network without requiring them to re-authenticate each time they move. If a supplicant (client device) moves from one wireless access point to another wireless access point, and the wireless access points are connected to different ports, then the switch (authenticator) recognizes that the supplicant has been authenticated and accepts the supplicant without requiring re-authentication.

For more information see **"Web-Authentication" on page 69.4**.

Root bridge

A single **Bridge** is selected to become the **Spanning tree's** unique root bridge. This is the device that advertises the lowest Bridge ID. Each bridge is uniquely identified by its Bridge ID, which comprises the bridge's root priority (a spanning tree parameter) followed by its MAC address.

For an overview of spanning tree operation see **"Spanning tree operation" on page 20.2**.

Root path cost

A **Spanning tree** property. Each port connecting a **Bridge** to a LAN has an associated cost, called the root path cost. This is the sum of the costs for each path between the particular bridge port and the **Root bridge**. The **Designated bridge** for a LAN is the one that advertises the lowest root path cost. If two bridges on the same LAN have the same lowest root path cost, then the switch with the lowest bridge ID becomes the designated bridge.

For an overview of spanning tree operation see **"Spanning tree operation" on page 20.2**.

Route-map

A mechanism for filtering IP routes and changing their attributes.

RSTP

Rapid Spanning Tree Protocol. RSTP is an evolution of the Spanning Tree Protocol (**STP**) which provides for faster spanning tree convergence after a topology change. A device running RSTP is compatible with other devices running STP.

For more information see **"Rapid Spanning Tree Protocol (RSTP)" on page 20.8**. For a configuration example see **"Configuring RSTP" on page 20.9**.

S

SCP

Secure Copy Protocol. SCP allows for secure file transfer to and from the switch, protecting your network from unwanted downloads and unauthorized file copying.

For more information see **"Copying with Secure Copy (SCP)" on page 6.17**.

Script

A script is a sequence of commands stored as a plaintext file on a file subsystem accessible to the device, such as Flash memory. Each **Trigger** may reference multiple scripts and any script may be used by any trigger. When an event activates a trigger, the trigger executes the scripts associated with it in sequence. One script is executed completely before the next script begins.

See **Dynamic Link Failover**.

SD card

Secure Digital card.

SDHC card

Secure Digital High Capacity card.

Secondary port

In **EPSR**, a second ring port on the master node. This port remains active, but blocks all protected VLANs from operating unless the ring fails. Similar to the blocking port in an STP/RSTP instance.

For more information see **"Ring Components and Operation" on page 86.2**.

sFlow

sFlow®[1] is an industry standard technology for monitoring high speed switched networks. It provides the ability to monitor traffic in data networks containing switches and routers.

For more information see **Chapter 109, sFlow Introduction and Configuration**. For how to configure sFlow see **"Configuring sFlow on your Switch" on page 109.6**.

sFlow agent

A network employing sFlow typically comprises a number of network (sFlow) agents that accumulate sampled data and traffic counter information. The agents then forward this data to a collector. The collector then analyses the information supplied by its agents in order to compile and display statistical profiles of the network and its traffic. The sFlow feature on your switch provides the sFlow agent capability.

For more information see **"The sFlow Agent" on page 109.3**.

1. **sFlow® is a registered trademark belonging to InMon Corp, San Francisco, CA.**

sFlow collector

The sFlow collector receives traffic samples and counter information from a number of sFlow agents. These samples are received as a series of UDP datagrams. From the data contained within these datagrams, the collector is able to provide statistical and or graphical information of network traffic.

For more information see **"The sFlow Collector" on page 109.5**.

SFTP

SSH File Transfer Protocol. SFTP provides a secure way to copy files onto your device from a remote device.

For more information see **"Copying with SSH File Transfer Protocol (SFTP)" on page 6.17**.

Software ACLs

See **ACL types**.

Spanning tree

A loop free portion of a network topology. The network topology is dynamically pruned to provide only one path for any packet. See **STP**, **RSTP** and **MSTP**.

Spanning Tree Protocol Root Guard

See **STP root guard**.

SSH

Secure Shell. SSH is a network protocol that uses strong authentication and encryption for remote access across a nonsecure network. SSH provides sessions between a host running a SSH server and a machine with a SSH client.

For more information see **Chapter 79, Secure Shell (SSH) Introduction**. For how to configure a SSH server see **"Configuring the SSH Server" on page 79.4**. For how to configure a SSH client see **"Configuring the SSH Client" on page 79.9**.

Stack

See **VCStack**.

Stack master

The switch that manages the stack, or **VCStack**, also referred to as the **Active master**.

See **Disabled master** for information about how this relates to **Stack master** or **Active master**.

Stack member

An individual switch that is part of a **VCStack**.

S-TAG

Service VLAN TAG.

Static aggregator

See **Static channel group**.

Static channel group

A static channel group, also known as a static aggregator, enables a number of ports to be manually configured to form a single logical connection of higher bandwidth. By using static channel groups you increase channel reliability by distributing the data path over more than one physical link.

Storm-control

Storm-control enables you to specify the threshold level for broadcasting, multicast, or destination lookup failure (DLF) traffic for a port. Storm-control limits the specified traffic type to the specified threshold.

For more information see **"Storm-control" on page 16.16**.

Storm protection

Storm protection uses **QoS** mechanisms to classify on traffic likely to cause a packet storm (broadcast and multicast). With QoS storm protection, several actions are possible when a storm is detected:

- You can disable the port physically.
- You can disable the port logically.
- You can disable the port for a particular VLAN.

For more information see **"Storm Protection" on page 65.36**.

STP

Spanning Tree Protocol. STP is the original bridge protocol defined by IEEE standard 802.1D-1988. It creates a single spanning tree over a network.

For more information see **"Spanning Tree Protocol (STP)" on page 20.5**. For a configuration example see **"Configuring STP" on page 20.6**.

STP root guard

Spanning Tree Protocol Root Guard. STP Root Guard designates which devices can assume the role of **Root bridge** in an STP network. This stops an undesirable device from taking over this role, where it could either compromise network performance or cause a security weakness.

See the **spanning-tree guard root** command on page 21.44.

Subnet address

A subnet portion of an IP address. In a subnetted network, the host portion of an IP address is split into a subnet portion and a host portion using an address or subnet mask.

Subnet mask

A bit mask used to select bits from an Internet address for subnet addressing. The mask is 32 bits long and selects the network portion of the Internet address and one or more bits of the local portion. Sometimes called address mask.

Superloop

Within an EPSR ring configuration, a superloop is a data loop whose path traverses more than a single EPSR ring. This occurrence is a fault condition that is usually do to a break in a physical segment that is shared by the two rings. For a superloop condition to occur, the two physical rings must share one or more data VLANs. Superloops can be prevented by employing Superloop Protection. For more information, See **"Superloop Protection" on page 86.18**.

Switch instance

A single switch chip with its associated ports, internal data interfaces, hardware tables, and packet buffer memory.

S-VID

Service VLAN ID.

S-VLAN

Service VLAN.

Synchronous

Transmission in which the data characters and bits are transmitted at a fixed rate with the transmitter and receiver synchronized. This eliminates the need for start-stop elements, as in asynchronous transmission, but requires a flag character to be transmitted when there is no data to transmit. See **"Asynchronous" on page D.5**

T

TACACS+

TACACS+ (Terminal Access Controller Access-Control System Plus) provides a method for securely managing multiple network access points from a single management service. TACACS+ is a TCP-based access control protocol that allows a device to forward a user's username and password to an authentication server to determine whether access can be allowed. In addition to this authentication service, TACACS+ can also provide authorization and accounting services. One of the features of TACACS+ is the ability to separate authentication, authorization and accounting so that these functions can be provided independently on separate servers.

For information on the AlliedWare Plus implementation of TACACS+, see **Chapter 75, TACACS+ Introduction and Configuration** and **Chapter 76, TACACS+ Commands**.

TCN

Topology Change Notification.

Thrash limiting

MAC address thrashing occurs when MAC addresses move rapidly between one or more ports or trunks, for example, due to a network loop. Thrash limiting enables you to apply actions to a port when thrashing is detected. It is supported on all port types and also on aggregated ports.

For more information see **"Thrash Limiting" on page 16.18**

TLV

Type-Length-Value. A single **LLDPDU** contains multiple TLVs. TLVs are short information elements that communicate complex data, such as variable length strings, in a standardized format. Each TLV advertises a single type of information, such as its device ID, type, or management addresses. See **LLDP advertisements**.

Traceroute

Traceroute is used to discover the route that packets pass between two systems running the IP protocol. Traceroute sends an initial UDP packets with the Time To Live (TTL) field in the IP header set starting at 1. The TTL field is increased by one for every subsequent packet sent until the destination is reached. Each hop along the path between two systems responds with a TTL exceeded packet (ICMP type 11) and from this the path is determined.

Transit node

In **EPSR**, nodes other than the master node in the domain.

Transit node states are:

- Idle - the state when EPSR is first configured, before the master node determines that all links in the ring are up. In this state, both ports on the node are blocked for the data VLAN. From this state, the node can move to Links Up or Links Down.
- Links Up - the state when both the node's ring ports are up and forwarding. From this state, the node can move to Links Down.
- Links Down - the state when one or both of the node's ring ports are down. From this state, the node can move to Preforwarding.
- Pre-forwarding - the state when both ring ports are up, but one has only just come up and is still blocked to prevent loops. From this state, the transit node can move to Links Up if the master node blocks its secondary port, or to Links Down if another port goes down.

For more information see **"Ring Components and Operation" on page 86.2**.

Tri-authentication

Authentication commands enable you to specify three different types of device authentication: **802.1X** authentication, **MAC authentication**, and **Web-authentication**. All three types can be configured to run simultaneously on a switch port. The simultaneous configuration and authentication of all three types on a port is called tri-authentication.

For a configuration example see **"Tri-Authentication Configuration" on page 69.19**.

Trigger

A trigger is an ordered sequence of scripts that is executed when a certain event occurs. Each trigger may reference multiple scripts and any **Script** may be used by any trigger. When an event activates a trigger, the trigger executes the scripts associated with it in sequence. One script is executed completely before the next script begins.

See **Dynamic Link Failover**.

Type-Length-Value

See **TLV**.

U

Unicast

Two individual devices hold a conversation just between themselves.

V

VCStack

A group of two or more switches operating as a single switch. See **Virtual Chassis Stacking**.

VCStack fast failover

VCStack Fast Failover provides absolutely minimal network downtime in the event of a problem with the stack.

See the **reboot rolling** command on page 112.5.

VID

VLAN Identifier or VLAN ID. When you create a VLAN you give it a numerical VID which is included in VLAN-tagged Ethernet frames to and from this VLAN.

Virtual Chassis Stacking

Virtual Chassis Stacking (VCStack™) is the name given to two or more Allied Telesis switches that are configured to operate as a single switch. From a configuration and management point of view, it is as though the switches are just one device with a seamless transition from the ports of one stack member to the ports of the next.

For more information see **Chapter 111, VCStack Introduction**.

VLAN classification

A packet can be allocated VLAN membership based on its protocol, subnet, or port.

VLAN double tagging

VLAN double tagging is used operate a number of private Layer 2 networks within a single public Layer 2 network. A VLAN double tagging implementation consists of the following port types:

- Provider ports - these connect to a service provider's Layer 2 network
- Customer edge ports - these connect to a customer's private Layer 2 network

For more information see **"VLAN Double Tagging (VLAN Stacking)" on page 18.5**. For a configuration example see **"Configuring double-tagged VLANs" on page 18.6**.

VLAN ID

See **VID**.

VLAN identifier

See **VID**.

VLAN stacking

See **VLAN double tagging**.

VLAN tag

IEEE standard 802.1q defines an additional 4 byte tag field that can be inserted immediately following the MAC address, plus any routing fields present. This field contains a 12 bit VLAN identifier, commonly referred to as the VLAN tag. The VLAN tag is used to determine which VLAN a given frame should be forwarded to.

Other tags included in the 802.1q tag field is a Tag Protocol Identifier tag, and a Type of Service tag used to determine data priority.

Voice VLAN

Voice VLAN automatically separates voice and data traffic into two different VLANS. This automatic separation places delay-sensitive traffic into a voice-dedicated VLAN, which simplifies QoS configurations.

For more information see **"Voice VLAN" on page 99.3**.

VoIP

Voice over Internet Protocol. Enables the delivery of voice communications over IP networks such as the Internet or other packet-switched networks instead of over traditional telephony circuits.

VRF

Virtual Routing and Forwarding. VRF is used with the VRF-Lite feature, where multiple routing and forwarding instances can separately reside within a single x900 series switch.

VRF-lite

Virtual Routing and Forwarding Lite (VRF-Lite) provides a cut back (lightweight) version of the full VRF capability that is used to create large-scale Virtual Private Networks (VPNs). VRF-Lite enables a global routing domain and eight separate VRF routing instances to reside within a single x900 series switch.

VPN

Virtual Private Network (VPN) is a private customer network that exists as part of a larger public or private network infrastructure. Each customer network can operate as a totally isolated entity within the network suppliers infrastructure that operates to its own management policies and rules.

VRID

Virtual Router Identifier.

VRRP

Virtual Router Redundancy Protocol. VRRP combines two or more physical switches into a logical grouping called a virtual router. The physical switches then operate together to provide a single logical gateway for hosts on the LAN. If the master fails, the other devices assume the virtual IP address.

For more information see **Chapter 84, VRRP Introduction and Configuration**. For configuration examples see **"VRRP Configuration Examples" on page 84.14**.

W

Web-authentication

The switch sends a login screen to the client webbrowser which must be authenticated before access is granted to the network. See **AAA** and **Tri-authentication**.

For a sample configuration script see **"Sample Web-Authentication Configuration" on page 71.9**.

Wildcard mask

A subnet mask in which bits set to 0 indicate an exact match and bits set to 1 indicate 'don't care'.

X

XEM

High Speed Expansion Module.
