See detailed usage notes below to configure static multicast router ports when using static IPv6 multicast routes with EPSR, and the destination VLAN is an EPSR data VLAN.

Use the **no** variant of this command to remove the static configuration of the interface as a Multicast Router interface.

**Syntax** `ipv6 mld snooping mrouter interface <port>`  
`no ipv6 mld snooping mrouter interface <port>`

| Parameter | Description                   |
|-----------|-------------------------------|
| <port>    | Specify the name of the port. |

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage notes** This MLD Snooping command statically configures a switch port as a Multicast Router interface.

Note that if static IPv6 multicast routing is being used with EPSR and the destination VLAN is an EPSR data VLAN, then multicast router (mrouter) ports must be statically configured. This minimizes disruption for multicast traffic in the event of ring failure or restoration.

When configuring the EPSR data VLAN, statically configure mrouter ports so that the multicast router can be reached in either direction around the EPSR ring.

For example, if port1.0.1 and port1.0.6 are ports on an EPSR data VLAN vlan101, which is the destination for a static IPv6 multicast route, then configure both ports as multicast router (mrouter) ports as shown in the example commands listed below:

**Example**  
**ipv6 mld**  
**snooping**  
**mrouter**  
**commands**  
**when**  
**static IPv6**  
**multicast**  
**routing is**  
**being used**  
**and the**  
**destination**  
**VLAN is an**  
**EPSR data**  
**VLAN:**

```
awplus>enable
awplus#configure terminal
awplus(config)#interface vlan101
awplus(config-if)#ipv6 mld snooping mrouter interface port1.0.1
awplus(config-if)#ipv6 mld snooping mrouter interface port1.0.6
```

**Examples** This example shows how to specify the next-hop interface to the multicast router for VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping mrouter interface port1.0.5
```

This example shows how to specify the next-hop interface to the multicast router for VLAN interfaces `vlan2-vlan4`:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 mld snooping mrouter interface port1.0.5
```

## ipv6 mld snooping querier

**Overview** Use this command to enable MLD querier operation on a subnet (VLAN) when no multicast routing protocol is configured in the subnet (VLAN). When enabled, the MLD Snooping querier sends out periodic MLD queries for all interfaces on that VLAN.

Use the **no** variant of this command to disable MLD querier configuration.

**Syntax** `ipv6 mld snooping querier`  
`no ipv6 mld snooping querier`

**Mode** Interface Configuration for a specified VLAN interface.

**Usage** This command can only be configured on a single VLAN interface - not on multiple VLANs.

The MLD Snooping querier uses the 0.0.0.0 Source IP address because it only masquerades as an MLD querier for faster network convergence.

The MLD Snooping querier does not start, or automatically cease, the MLD Querier operation if it detects query message(s) from a multicast router. It restarts as an MLD Snooping querier if no queries are seen within the other querier interval.

**Example** `awplus# configure terminal`  
`awplus(config)# interface vlan2`  
`awplus(config-if)# ipv6 mld snooping querier`

## ipv6 mld snooping report-suppression

**Overview** Use this command to enable report suppression from hosts for Multicast Listener Discovery version 1 (MLDv1) on a VLAN in Interface Configuration mode.

Use the **no** variant of this command to disable report suppression on a VLAN in Interface Configuration mode.

**Syntax** `ipv6 mld snooping report-suppression`  
`no ipv6 mld snooping report-suppression`

**Default** Report suppression does not apply to MLDv2, and is turned on by default for MLDv1 reports.

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage** This MLD Snooping command can only be configured on VLAN interfaces. MLDv1 Snooping may be configured to suppress reports from hosts. When a querier sends a query, only the first report for particular set of group(s) from a host will be forwarded to the querier by the MLD Snooping device. Similar reports (to the same set of groups) from other hosts, which would not change group memberships in the querier, will be suppressed by the MLD Snooping device to prevent 'flooding' of query responses.

**Examples** This example shows how to enable report suppression for MLD reports on VLAN interface vlan2:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping report-suppression
```

This example shows how to disable report suppression for MLD reports on VLAN interface vlan2:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 mld snooping report-suppression
```

This example shows how to enable report suppression for MLD reports on VLAN interfaces vlan2-vlan4:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 mld snooping report-suppression
```

This example shows how to disable report suppression for MLD reports on VLAN interfaces vlan2-vlan4:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# no ipv6 mld snooping report-suppression
```

## ipv6 mld static-group

**Overview** Use this command to statically configure IPv6 group membership entries on an interface. To statically add only a group membership, do not specify any parameters.

Use the **no** variant of this command to delete static group membership entries.

**Syntax** `ipv6 mld static-group <ipv6-group-address> [source <ipv6-source-address>] [interface <port>]`  
`no ipv6 mld static-group <ipv6-group-address> [source <ipv6-source-address>] [interface <port>]`

| Parameter                                | Description                                                                                                                                                                                                                                                                |
|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ipv6-group-address&gt;</code>  | Specify a standard IPv6 Multicast group address to be configured as a static group member.<br><br>The IPv6 address uses the format X:X::X:X.                                                                                                                               |
| <code>&lt;ipv6-source-address&gt;</code> | Optional. Specify a standard IPv6 source address to be configured as a static source from where multicast packets originate.<br><br>The IPv6 address uses the format X:X::X:X.                                                                                             |
| <code>&lt;port&gt;</code>                | Optional. Physical interface. This parameter specifies a physical port. If this parameter is used, the static configuration is applied to just that physical interface. If this parameter is not used, the static configuration is applied on all interfaces in the group. |

**Mode** Interface Configuration for a specified VLAN interface.

**Usage notes** This command applies to MLD Snooping on a VLAN interface to statically add groups and/or source records.

**Examples** To add a static group record, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ff1e::10
```

To add a static group and source record, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ff1e::10 source
fe80::2fd:6cff:fe1c:b
```

To add a static group record on a specific port on vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ff1e::10
interface port1.0.8
```

# show debugging mld

**Overview** Use this command to see what debugging is turned on for MLD. MLD debugging modes are enabled with the **debug mld** command.

For information on filtering and saving command output, see the **[“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide.](#)**

**Syntax** show debugging mld

**Mode** Privileged Exec

**Example** awplus# show debugging mld

**Output** The following shows typical output.

## Example output for show debugging mld

```
show debugging mld
MLD Debugging status:
  MLD Decoder debugging is on
  MLD Encoder debugging is on
  MLD Events debugging is on
  MLD FSM debugging is on
  MLD Tree-Info-Base (TIB) debugging is on
```

**Related commands** **debug mld**

## show ipv6 mld groups

**Overview** Use this command to display the multicast groups that have receivers directly connected to the router and learned through MLD.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 mld groups [<ipv6-address>|<interface>] [detail]`

| Parameter      | Description                                                              |
|----------------|--------------------------------------------------------------------------|
| <ipv6-address> | Optional. Specify the address of the multicast group in format X:X::X:X. |
| <interface>    | Optional. The interface to display information about.                    |
| detail         | Display more detailed information.                                       |

**Mode** User Exec and Privileged Exec

**Examples** The following command displays local-membership information for all interfaces:

```
awplus# show ipv6 mld groups
```

The following command displays detailed local-membership information for all interfaces:

```
awplus# show ipv6 mld groups detail
```

**Output** The following shows typical output.

**Example output for show ipv6 mld groups**

```
awplus#show ipv6 mld groups
MLD Connected Group Membership
Group Address      Interface          Uptime    Expires    Last Reporter
ff08::1            vlan10 (port1.0.1) 00:07:27  00:03:10   fe80::200:1ff:fe20:b5ac
```

**Example output for show ipv6 mld groups detail**

```
awplus# show ipv6 mld groups detail
MLD Connected Group Membership Details for port1.0.1
Interface:      port1.0.1
Group:          ff08::1
Uptime:         00:00:13
Group mode:     Include ( )
Last reporter:  fe80::eecd:6dff:fe6b:4783
Group source list: (R - Remote, M - SSM Mapping, S - Static )
Source Address      Uptime    v2 Exp    Fwd  Flags
2001:db8::1         00:00:13  00:04:07  Yes  R
2002:db8::3         00:00:13  00:04:07  Yes  R
```

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# show ipv6 mld interface

**Overview** Use this command to display the state of MLD and MLD Snooping for a specified interface, or all interfaces.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show ipv6 mld interface [<interface>]

| Parameter   | Description                                            |
|-------------|--------------------------------------------------------|
| <interface> | Optionally, an interface to display information about. |

**Mode** User Exec and Privileged Exec

**Example** The following command displays MLD interface status on all interfaces enabled for MLD:

```
awplus# show ipv6 mld interface
```

**Output** The following shows typical output.

## Example output for show ipv6 mld interface

```
awplus#show ipv6 mld interface
Interface vlan1 (Index 301)
  MLD Enabled, Active, Querier, Version 2 (default)
  Internet address is fe80::215:77ff:fec9:7468
  MLD interface has 0 group-record states
  MLD activity: 0 joins, 0 leaves
  MLD robustness variable is 2
  MLD last member query count is 2
  MLD query interval is 125 seconds
  MLD querier timeout is 255 seconds
  MLD max query response time is 10 seconds
  Last member query response interval is 1000 milliseconds
  Group Membership interval is 260 seconds
  MLD Snooping is globally enabled
  MLD Snooping is enabled on this interface
  MLD Snooping fast-leave is not enabled
  MLD Snooping querier is enabled
  MLD Snooping report suppression is enabled
```

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# show ipv6 mld snooping mrouter

**Overview** Use this command to display the multicast router interfaces, both configured and learned, in a VLAN. If you do not specify a VLAN interface then all the VLAN interfaces are displayed.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** show ipv6 mld snooping mrouter [<interface>]

| Parameter   | Description                                            |
|-------------|--------------------------------------------------------|
| <interface> | Optionally, an interface to display information about. |

**Mode** User Exec and Privileged Exec

**Example** To display the multicast router interfaces in vlan2, use the command:

```
awplus# show ipv6 mld snooping mrouter vlan2
```

To display the multicast router interfaces for all VLAN interfaces, use the command:

```
awplus# show ipv6 mld snooping mrouter
```

**Output** The following shows typical output.

## Example output for show ipv6 mld snooping mrouter vlan2

|                                             |           |                     |
|---------------------------------------------|-----------|---------------------|
| awplus#show ipv6 mld snooping mrouter vlan2 |           |                     |
| VLAN                                        | Interface | Static/Dynamic      |
| 2                                           | port1.0.2 | Dynamically Learned |
| 2                                           | port1.0.3 | Dynamically Learned |

## Example output for show ipv6 mld snooping mrouter

|                                       |           |                     |
|---------------------------------------|-----------|---------------------|
| awplus#show ipv6 mld snooping mrouter |           |                     |
| VLAN                                  | Interface | Static/Dynamic      |
| 2                                     | port1.0.2 | Dynamically Learned |
| 2                                     | port1.0.3 | Dynamically Learned |
| 3                                     | port1.0.4 | Statically Assigned |
| 3                                     | port1.0.5 | Statically Assigned |

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# show ipv6 mld snooping statistics

**Overview** Use this command to display MLD Snooping statistics data.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus”\\_Feature Overview and Configuration Guide](#).

**Syntax** show ipv6 mld snooping statistics interface <interface>

| Parameter   | Description                                 |
|-------------|---------------------------------------------|
| <interface> | The interface to display information about. |

**Mode** User Exec and Privileged Exec

**Example** To display MLDv2 statistical information for an interface, use the command:

```
awplus# show ipv6 mld snooping statistics interface vlan1
```

**Output** The following shows typical output.

## Example output for show ipv6 mld snooping statistics interface vlan1

```
awplus#show ipv6 mld snooping statistics interface vlan1
MLD Snooping statistics for vlan1
Interface:      port1.0.1
Group:         ff08::1
Uptime:        00:02:18
Group mode:    Include ( )
Last reporter: fe80::eecd:6dff:fe6b:4783
Group source list: (R - Remote, M - SSM Mapping, S - Static )
Source Address      Uptime    v2 Exp    Fwd  Flags
2001:db8::1         00:02:18  00:02:02  Yes  R
2001:db8::3         00:02:18  00:02:02  Yes  R
```

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# Introduction

**Overview** This chapter provides an alphabetical reference of IPv4 Hardware Access Control List (ACL) commands. It contains detailed command information and command examples about IPv4 hardware ACLs, which you can apply directly to interfaces using the **access-group** command.

To apply ACLs to an LACP channel group, apply it to all the individual switch ports in the channel group. To apply ACLs to a static channel group, apply it to the static channel group itself.

Most ACL command titles include information in parentheses:

- When the command title ends with words in parentheses, these words indicate usage instead of keywords to enter into the CLI. For example, the title **access-list (numbered hardware ACL for ICMP)** indicates that the command is used to create an ACL with the syntax:

```
access-list <3000-3699> <action> icmp <source-ip> <dest-ip>  
[icmp-type <number>] [vlan <1-4094>]
```

- When the command title is completely surrounded by parentheses, the title indicates the type of ACL filter instead of keywords to enter into the CLI. For example, the title **(named hardware ACL: ICMP entry)** represents a command with the syntax:

```
[<sequence-number>] <action> icmp <source-ip> <dest-ip> [icmp-  
type <number>] [vlan <1-4094>]
```

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**Sub-modes** Many of the ACL commands operate from sub-modes that are specific to particular ACL types. The following table shows the CLI prompts at which ACL commands are entered.

### IPv4 Hardware Access List Commands and Prompts

| Command Name                                                 | Command Mode                    | Prompt                    |
|--------------------------------------------------------------|---------------------------------|---------------------------|
| <b>show interface access-group</b>                           | Privileged Exec                 | awplus#                   |
| <b>show access-group</b>                                     | Privileged Exec                 | awplus#                   |
| <b>show access-list (IPv4 Hardware ACLs)</b>                 | Privileged Exec                 | awplus#                   |
| <b>show acl-group ip address</b>                             | Privileged Exec                 | awplus#                   |
| <b>show acl-group ip port</b>                                | Privileged Exec                 | awplus#                   |
| <b>show interface access-group</b>                           | Privileged Exec                 | awplus#                   |
| <b>access-list (numbered hardware ACL for IP packets)</b>    | Global Configuration            | awplus(config)#           |
| <b>access-list (numbered hardware ACL for ICMP)</b>          | Global Configuration            | awplus(config)#           |
| <b>access-list (numbered hardware ACL for IP protocols)</b>  | Global Configuration            | awplus(config)#           |
| <b>access-list (numbered hardware ACL for TCP or UDP)</b>    | Global Configuration            | awplus(config)#           |
| <b>access-list (numbered hardware ACL for MAC addresses)</b> | Global Configuration            | awplus(config)#           |
| <b>access-list hardware (named hardware ACL)</b>             | Global Configuration            | awplus(config)#           |
| <b>access-list hardware-deny-log</b>                         | Global Configuration            | awplus(config)#           |
| <b>acl-group ip address</b>                                  | Global Configuration            | awplus(config)#           |
| <b>acl-group ip port</b>                                     | Global Configuration            | awplus(config)#           |
| <b>(named hardware ACL entry for IP packets)</b>             | IPv4 Hardware ACL Configuration | awplus(config-ip-hw-acl)# |
| <b>(named hardware ACL entry for ICMP)</b>                   | IPv4 Hardware ACL Configuration | awplus(config-ip-hw-acl)# |

## access-group

**Overview** This command adds or removes a hardware-based access-list to or from a switch port interface or interfaces. The number of hardware numbered and named access-lists that can be added to a switch port interface is determined by the available memory in hardware-based packet classification tables.

This command works in both Global Configuration and Interface Configuration modes to apply hardware access-lists to all switch port interfaces or selected switch port interfaces respectively.

The **no** variant of this command removes the selected access-list from an interface.

**Syntax** `access-group [<3000-3699>|<4000-4699>|<hardware-access-list-name>]`  
`no access-group [<3000-3699>|<4000-4699>|<hardware-access-list-name>]`

| Parameter                   | Description                    |
|-----------------------------|--------------------------------|
| <3000-3699>                 | Hardware IP access-list.       |
| <4000-4699>                 | Hardware MAC access-list.      |
| <hardware-access-list-name> | The hardware access-list name. |

**Mode** Interface Configuration or Global Configuration

**Default** Any traffic on an interface controlled by a hardware ACL that does not explicitly match a filter is permitted.

**Usage notes** First create an IP access-list that applies the appropriate permit/deny requirements with the [access-list \(numbered hardware ACL for IP packets\)](#), the [access-list \(numbered hardware ACL for MAC addresses\)](#) or the [access-list hardware \(named hardware ACL\)](#). Then use this command to apply this hardware access- list to a specific port or port range. Note that this command will apply the access-list only to incoming data packets.

To apply ACLs to an LACP aggregated link, apply it to all the individual switch ports in the aggregated group. To apply ACLs to a static channel group, apply it to the static channel group itself. An ACL can even be applied to a static aggregated link that spans more than one switch instance ([Link Aggregation Commands](#)).

Note that you cannot apply software numbered ACLs to switch port interfaces with the access-group command. This command will only apply hardware ACLs.

**NOTE:** Hardware ACLs will access unless by an ACL action.

**Examples** To add the numbered hardware access-list 3005 to all switch ports, enter the following commands:

```
awplus# configure terminal
awplus(config)# access-group 3005
```

To add the numbered hardware access-list 3005 to switch port interface port1.0.1, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# access-group 3005
```

To add the named hardware access-list "hw-acl" to switch port interface port1.0.2, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# access-group hw-acl
```

To apply an ACL to static channel group 2 containing switch port1.0.3 and port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.3-port1.0.4
awplus(config-if)# static-channel-group 2
awplus(config)# interface sa2
awplus(config-if)# access-group 3000
```

## access-list (numbered hardware ACL for ICMP)

**Overview** This command creates an access-list for use with hardware classification. The access-list will match on ICMP packets that have the specified source and destination IP addresses and, optionally, ICMP type. You can use the value **any** instead of source or destination address if an address does not matter.

Once you have configured the ACL, you can use the **access-group** or the **match access-group** command to apply this ACL to a port, VLAN or QoS class-map.

The optional **vlan** parameter can be used to match tagged (802.1q) packets.

The **no** variant of this command removes the previously specified access-list.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:**

*Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.*

**Syntax** `access-list <3000-3699> <action> icmp <source-ip> <dest-ip>`  
`[icmp-type <number>] [vlan <1-4094>] [log]`  
`no access-list <3000-3699>`

The following actions are available for hardware ACLs:

| Values for the <action> parameter                     |                                                                                                                                                                                                                                                                 |
|-------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| deny                                                  | Reject packets that match the source and destination filtering specified with this command.                                                                                                                                                                     |
| permit                                                | Permit packets that match the source and destination filtering specified with this command.                                                                                                                                                                     |
| copy-to-cpu                                           | Send a copy of matching packets to the CPU.                                                                                                                                                                                                                     |
| copy-to-mirror<br>[interface <i>port-number</i> ]     | Send a copy of matching packets to a mirror port.<br>Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |
| send-to-vlan-port<br>vlan <vid> port<br><port-number> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.                                                                                                                              |
| send-to-cpu                                           | Send matching packets to the CPU.                                                                                                                                                                                                                               |

| Parameter   | Description                                                                                                                                                                |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <3000-3699> | An ID number for this hardware IP access-list.                                                                                                                             |
| <action>    | The action that the switch will take on matching packets. See the table above for valid values.                                                                            |
| icmp        | Match against ICMP packets                                                                                                                                                 |
| <source-ip> | The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:    |
|             | any Match any source IP address.                                                                                                                                           |
|             | host <ip-addr> Match a single source host with the IP address given by <ip-addr> in dotted decimal notation.                                                               |
|             | <ip-addr>/<prefix> Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length. |
|             | <ip-addr><br><reverse-mask> Match any source IP address within the specified subnet. Specify the subnet by entering a                                                      |

| Parameter                                             | Description                                                                                                                                                                                                                 |
|-------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                       | reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.                                                                                                |
| <i>&lt;dest-ip&gt;</i>                                | The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:                                      |
| any                                                   | Match any destination IP address.                                                                                                                                                                                           |
| host <i>&lt;ip-addr&gt;</i>                           | Match a single destination host with the IP address given by <i>&lt;ip-addr&gt;</i> in dotted decimal notation.                                                                                                             |
| <i>&lt;ip-addr&gt;/&lt;prefix&gt;</i>                 | Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                                |
| <i>&lt;ip-addr&gt;</i><br><i>&lt;reverse-mask&gt;</i> | Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24. |
| icmp-type<br><i>&lt;number&gt;</i>                    | The type of ICMP message to match against, as defined in RFC792 and RFC950. Values include:                                                                                                                                 |
| 0                                                     | Echo replies.                                                                                                                                                                                                               |
| 3                                                     | Destination unreachable messages.                                                                                                                                                                                           |
| 4                                                     | Source quench messages.                                                                                                                                                                                                     |
| 5                                                     | Redirect (change route) messages.                                                                                                                                                                                           |
| 8                                                     | Echo requests.                                                                                                                                                                                                              |
| 11                                                    | Time exceeded messages.                                                                                                                                                                                                     |
| 12                                                    | Parameter problem messages.                                                                                                                                                                                                 |

| Parameter     | Description                                                                                                                         |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------|
|               | 15 Information requests.                                                                                                            |
|               | 16 Information replies.                                                                                                             |
|               | 17 Address mask requests.                                                                                                           |
|               | 18 Address mask replies.                                                                                                            |
| vlan <1-4094> | The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.                                    |
| log           | Log packets that are denied by this ACL. You must also enable the logging, using the command <b>access-list hardware-deny-log</b> . |

**Mode** Global Configuration

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** This command creates an ACL for use with hardware classification. Once you have configured the ACL, use the **access-group** or the **match access-group** command to apply this ACL to a port, VLAN or QoS class-map.

ACLs numbered in the range 3000-3699 match on packets that have the specified source and destination IP addresses.

ICMP ACLs will match any ICMP packet that has the specified source and destination IP addresses and ICMP type. The ICMP type is an optional parameter.

**Examples** To create an access-list that will permit ICMP packets with a source address of 192.168.1.0/24 with any destination address and an ICMP type of 5 enter the following commands:

```
awplus# configure terminal
awplus(config)# access-list 3000 permit icmp 192.168.1.0/24 any
icmp-type 5
```

To destroy the access-list with an access-list identity of 3000 enter the following commands:

```
awplus# configure terminal
awplus(config)# no access-list 3000
```

**Related commands** **access-group**  
**access-list hardware-deny-log**  
**match access-group**  
**show running-config**  
**show access-list (IPv4 Hardware ACLs)**

**Command changes** Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

# access-list (numbered hardware ACL for IP packets)

**Overview** This command creates an access-list for use with hardware classification. The access-list will match on packets that have the specified source and destination IP addresses. You can use the value **any** instead of source or destination address if an address does not matter.

Once you have configured the ACL, you can use the **access-group** or the **match access-group** command to apply this ACL to a port, VLAN or QoS class-map.

The optional **vlan** parameter can be used to match tagged (802.1q) packets.

The **no** variant of this command removes the previously specified IP hardware access-list.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:**

*Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.*

**Syntax** `access-list <3000-3699> <action> ip <source-ip> <dest-ip> [vlan <1-4094>] [log]`  
`no access-list <3000-3699>`

The following actions are available for hardware ACLs:

| Values for the <action> parameter                     |                                                                                                                                                                                                                                                                 |
|-------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| deny                                                  | Reject packets that match the source and destination filtering specified with this command.                                                                                                                                                                     |
| permit                                                | Permit packets that match the source and destination filtering specified with this command.                                                                                                                                                                     |
| copy-to-cpu                                           | Send a copy of matching packets to the CPU.                                                                                                                                                                                                                     |
| copy-to-mirror<br>[interface <i>port-number</i> ]     | Send a copy of matching packets to a mirror port.<br>Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |
| send-to-vlan-port<br>vlan <vid> port<br><port-number> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.                                                                                                                              |
| send-to-cpu                                           | Send matching packets to the CPU.                                                                                                                                                                                                                               |

#### IP and ICMP parameters in access-list (hardware IP numbered)

| Parameter   | Description                                                                                                                                                                |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <3000-3699> | An ID number for this hardware IP access-list.                                                                                                                             |
| <action>    | The action that the switch will take on matching packets. See the table above for valid values.                                                                            |
| ip          | Match against IP packets                                                                                                                                                   |
| <source-ip> | The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:    |
|             | any Match any source IP address.                                                                                                                                           |
|             | host <ip-addr> Match a single source host with the IP address given by <ip-addr> in dotted decimal notation.                                                               |
|             | <ip-addr>/<prefix> Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length. |

| Parameter                                             | Description                                                                                                                                                                                                                 |
|-------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;ip-addr&gt;</i><br><i>&lt;reverse-mask&gt;</i> | Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.      |
| <i>&lt;dest-ip&gt;</i>                                | The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:                                      |
| any                                                   | Match any destination IP address.                                                                                                                                                                                           |
| host <i>&lt;ip-addr&gt;</i>                           | Match a single destination host with the IP address given by <i>&lt;ip-addr&gt;</i> in dotted decimal notation.                                                                                                             |
| <i>&lt;ip-addr&gt;/&lt;prefix&gt;</i>                 | Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                                |
| <i>&lt;ip-addr&gt;</i><br><i>&lt;reverse-mask&gt;</i> | Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24. |
| vlan <i>&lt;1-4094&gt;</i>                            | The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.                                                                                                                            |
| log                                                   | Log packets that are denied by this ACL. You must also enable the logging, using the command <b>access-list hardware-deny-log</b> .                                                                                         |

**Mode** Global Configuration

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** This command creates an ACL for use with hardware classification. Once you have configured the ACL, use the **access-group** or the **match access-group** command to apply this ACL to a port, VLAN or QoS class-map.

ACLs numbered in the range 3000–3699 match on packets that have the specified source and destination IP addresses.

**Examples** To create an access-list that will permit IP packets with a source address of 192.168.1.1 and any destination address, enter the commands:

```
awplus# configure terminal
```

```
awplus(config)# access-list 3000 permit ip 192.168.1.1/32 any
```

To destroy the access-list with an access-list identity of 3000 enter the following commands:

```
awplus# configure terminal
```

```
awplus(config)# no access-list 3000
```

**Related commands**

**Command changes** Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

# access-list (numbered hardware ACL for IP protocols)

**Overview** This command creates an access-list for use with hardware classification. The access-list will match on packets that have the specified source and destination IP addresses and IP protocol number. You can use the value **any** instead of source or destination address if an address does not matter.

Once you have configured the ACL, you can use the **access-group** or the **match access-group** command to apply this ACL to a port, VLAN or QoS class-map.

The optional **vlan** parameter can be used to match tagged (802.1q) packets.

The **no** variant of this command removes the previously specified IP hardware access-list.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:**

*Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.*

**Syntax** `access-list <3000-3699> <action> proto <1-255> <source-ip>  
<dest-ip> [vlan <1-4094>] [log]`  
`no access-list <3000-3699>`

The following actions are available for hardware ACLs:

| Values for the <action> parameter                     |                                                                                                                                                                                                                                                                 |
|-------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| deny                                                  | Reject packets that match the source and destination filtering specified with this command.                                                                                                                                                                     |
| permit                                                | Permit packets that match the source and destination filtering specified with this command.                                                                                                                                                                     |
| copy-to-cpu                                           | Send a copy of matching packets to the CPU.                                                                                                                                                                                                                     |
| copy-to-mirror<br>[interface <i>port-number</i> ]     | Send a copy of matching packets to a mirror port.<br>Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |
| send-to-vlan-port<br>vlan <vid> port<br><port-number> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.                                                                                                                              |
| send-to-cpu                                           | Send matching packets to the CPU.                                                                                                                                                                                                                               |

#### Parameters in access-list (hardware IP numbered)

| Parameter     | Description                                                                                                                                                                                                                                                                        |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <3000-3699>   | An ID number for this hardware IP access-list.                                                                                                                                                                                                                                     |
| <action>      | The action that the switch will take on matching packets. See the table above for valid values.                                                                                                                                                                                    |
| proto <1-255> | The IP protocol number to match against, as defined by IANA (Internet Assigned Numbers Authority <a href="http://www.iana.org/assignments/protocol-numbers">www.iana.org/assignments/protocol-numbers</a> )<br>See below for a list of IP protocol numbers and their descriptions. |
| <source-ip>   | The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:                                                                                                            |
|               | any Match any source IP address.                                                                                                                                                                                                                                                   |
|               | host <ip-addr> Match a single source host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                                                                       |
|               | <ip-addr>/<prefix> Match any source IP address within the specified subnet.                                                                                                                                                                                                        |

| Parameter                                             | Description                                                                                                                                                                                                                 |
|-------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                       | Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                                                                                              |
| <i>&lt;ip-addr&gt;</i><br><i>&lt;reverse-mask&gt;</i> | Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.      |
| <i>&lt;dest-ip&gt;</i>                                | The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:                                      |
| any                                                   | Match any destination IP address.                                                                                                                                                                                           |
| host <i>&lt;ip-addr&gt;</i>                           | Match a single destination host with the IP address given by <i>&lt;ip-addr&gt;</i> in dotted decimal notation.                                                                                                             |
| <i>&lt;ip-addr&gt;/&lt;prefix&gt;</i>                 | Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                                |
| <i>&lt;ip-addr&gt;</i><br><i>&lt;reverse-mask&gt;</i> | Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24. |
| vlan <i>&lt;1-4094&gt;</i>                            | The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.                                                                                                                            |
| log                                                   | Log packets that are denied by this ACL. You must also enable the logging, using the command <b>access-list hardware-deny-log</b> .                                                                                         |

### IP protocol number and description

| Protocol Number | Protocol Description [RFC]          |

| 255             | Reserved / IANA                               |

**Mode** Global Configuration

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** This command creates an ACL for use with hardware classification. Once you have configured the ACL, use the **access-group** or the **match access-group** command to apply this ACL to a port, VLAN or QoS class-map.

ACLs numbered in the range 3000-3699 match on packets that have the specified source and destination IP addresses.

**Examples** To create an access-list that will deny all IGMP packets (IP protocol 2) from the 192.168.0.0 network, enter the commands:

```
awplus# configure terminal
```

```
awplus(config)# access-list 3000 deny proto 2 192.168.0.0/16 any
```

To destroy the access-list with an access-list identity of 3000 enter the following commands:

```
awplus# configure terminal
```

```
awplus(config)# no access-list 3000
```

**Related commands** **access-group**  
**access-list hardware-deny-log**  
**match access-group**  
**show running-config**  
**show access-list (IPv4 Hardware ACLs)**

**Command changes** Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

## access-list (numbered hardware ACL for MAC addresses)

**Overview** This command creates an access-list for use with hardware classification. The access-list will match on packets that have the specified source and destination MAC addresses. You can use the value **any** instead of source or destination address if an address does not matter.

Once you have configured the ACL, you can use the **access-group** or the **match access-group** command to apply this ACL to a port, VLAN or QoS class-map.

The **no** variant of this command removes the specified MAC hardware filter access-list.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:**

*Specifying a “send” action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.*

**Syntax** `access-list <4000-4699> <action> {<source-mac>|any} {<dest-mac>|any} [vlan <1-4094>] [inner-vlan <1-4094>]`  
`no access-list <4000-4699>`

The following actions are available for hardware ACLs:

| Values for the <action> parameter                     |                                                                                                                                                                                                                                                                 |
|-------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| deny                                                  | Reject packets that match the source and destination filtering specified with this command.                                                                                                                                                                     |
| permit                                                | Permit packets that match the source and destination filtering specified with this command.                                                                                                                                                                     |
| copy-to-cpu                                           | Send a copy of matching packets to the CPU.                                                                                                                                                                                                                     |
| copy-to-mirror<br>[interface <i>port-number</i> ]     | Send a copy of matching packets to a mirror port.<br>Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |
| send-to-vlan-port<br>vlan <vid> port<br><port-number> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.                                                                                                                              |
| send-to-cpu                                           | Send matching packets to the CPU.                                                                                                                                                                                                                               |

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                              |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <4000-4699>  | An ID number for this hardware IP access-list.                                                                                                                                                                                                                                                                                                           |
| <action>     | The action that the switch will take on matching packets. See the table above for valid values.                                                                                                                                                                                                                                                          |
| <source-mac> | The source MAC address to match against, followed by the mask.<br><br>Enter the address in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number.<br><br>Enter the mask in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number. For a mask, each value is either 0 or F, where FF = Ignore, and 00 = Match.      |
| any          | Match against any source MAC address.                                                                                                                                                                                                                                                                                                                    |
| <dest-mac>   | The destination MAC address to match against, followed by the mask.<br><br>Enter the address in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number.<br><br>Enter the mask in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number. For a mask, each value is either 0 or F, where FF = Ignore, and 00 = Match. |

| Parameter              | Description                                                                                                                                                                                                                     |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| any                    | Match against any destination MAC address.                                                                                                                                                                                      |
| vlan <1-4094>          | Match against the specified ID in the packet's VLAN tag.                                                                                                                                                                        |
| inner-vlan<br><1-4094> | Match against the inner VLAN tag (VID). This parameter is used within double-tagged VLANs. It is sometimes referred to as the C-TAG (Customer VLAN TAG), where the vlan VID tag is referred to as the S-TAG (Service VLAN TAG). |

**Mode** Global Configuration

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** This command creates an ACL for use with hardware classification. Once you have configured the ACL, use the **access-group** or the **match access-group** command to apply this ACL to a port, VLAN or QoS class-map.

ACLs numbered in the range 4000-4699 match on packets that have the specified source and destination MAC addresses.

**Examples** To create an access-list that will permit packets with a source MAC address of 0000.00ab.1234 and any destination address, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 4000 permit 0000.00ab.1234
0000.0000.0000 any
```

To create an access-list that will permit packets if their source MAC address starts with 0000.00ab, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 4001 permit 0000.00ab.1234
0000.0000.FFFF any
```

To create an access-list that will send a copy of packets to the mirror port if their source MAC address starts with 0000.00ab, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 4001 copy-to-mirror 0000.00ab.1234
0000.0000.FFFF any
```

You also need to configure the mirror port with the **mirror interface** command.

To destroy the access-list with an access-list identity of 4000 enter the commands:

```
awplus# configure terminal
awplus(config)# no access-list 4000
```

**Related commands** **access-group**  
**match access-group**  
**show running-config**  
**show access-list (IPv4 Hardware ACLs)**

**Command changes** Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

# access-list (numbered hardware ACL for TCP or UDP)

**Overview** This command creates an access-list for use with hardware classification. The access-list will match on TCP or UDP packets that have the specified source and destination IP addresses and optionally, port values. You can use the value **any** instead of source or destination IP address if an address does not matter.

Once you have configured the ACL, you can use the **access-group** or the **match access-group** command to apply this ACL to a port, VLAN or QoS class-map.

You can use the optional **vlan** parameter to match tagged (802.1q) packets.

The **no** variant of this command removes the specified IP hardware access-list.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:**

*Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.*

**Syntax** `access-list <3000-3699> <action> {tcp|udp} <source-ip> [<source-ports>] <dest-ip> [<dest-ports>] [vlan <1-4094>] [log]`  
`no access-list <3000-3699>`

The following actions are available for hardware ACLs:

| Values for the <action> parameter                     |                                                                                                                                                                                                                                                              |
|-------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| deny                                                  | Reject packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| permit                                                | Permit packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| copy-to-cpu                                           | Send a copy of matching packets to the CPU.                                                                                                                                                                                                                  |
| copy-to-mirror<br>[interface <i>port-number</i> ]     | Send a copy of matching packets to a mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |
| send-to-vlan-port<br>vlan <vid> port<br><port-number> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.                                                                                                                           |
| send-to-cpu                                           | Send matching packets to the CPU.                                                                                                                                                                                                                            |

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |     |                              |                |                                                                                               |                    |                                                                                                                                                         |

| <3000-3699>        | An ID number for this hardware IP access-list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |     |                              |                |                                                                                               |                    |                                                                                                                                                         |
| <action>           | The action that the switch will take on matching packets. See the table above for valid values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |     |                              |                |                                                                                               |                    |                                                                                                                                                         |
| tcp                | Match against TCP packets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |     |                              |                |                                                                                               |                    |                                                                                                                                                         |
| udp                | Match against UDP packets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |     |                              |                |                                                                                               |                    |                                                                                                                                                         |
| <source-ip>        | The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source: <table border="1"> <tr> <td>any</td><td>Match any source IP address.</td></tr> <tr> <td>host &lt;ip-addr&gt;</td><td>Match a single source host with the IP address given by &lt;ip-addr&gt; in dotted decimal notation.</td></tr> <tr> <td>&lt;ip-addr&gt;/&lt;prefix&gt;</td><td>Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.</td></tr> </table> | any | Match any source IP address. | host <ip-addr> | Match a single source host with the IP address given by <ip-addr> in dotted decimal notation. | <ip-addr>/<prefix> | Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length. |
| any                | Match any source IP address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |     |                              |                |                                                                                               |                    |                                                                                                                                                         |
| host <ip-addr>     | Match a single source host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |     |                              |                |                                                                                               |                    |                                                                                                                                                         |
| <ip-addr>/<prefix> | Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |     |                              |                |                                                                                               |                    |                                                                                                                                                         |

| Parameter                                   | Description                                                                                                                                                                                                            |
|---------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;ip-addr&gt; &lt;reverse-mask&gt;</i> | Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24. |
| <i>&lt;source-ports&gt;</i>                 | Match source TCP or UDP port numbers. Port numbers are specified as integers between 0 and 65535. You can specify one or more port numbers as follows:                                                                 |
| eq <0-65535>                                | Match a single port number.                                                                                                                                                                                            |
| lt <0-65535>                                | Match all port numbers that are less than the specified port number.                                                                                                                                                   |
| gt <0-65535>                                | Match all port numbers that are greater than the specified port number.                                                                                                                                                |
| ne <0-65535>                                | Match all port numbers except the specified port number.                                                                                                                                                               |
| range <start-port> <end-port>               | Match a range of port numbers.                                                                                                                                                                                         |
| <i>&lt;dest-ip&gt;</i>                      | The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:                                 |
| any                                         | Match any destination IP address.                                                                                                                                                                                      |
| host <ip-addr>                              | Match a single destination host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                     |
| <ip-addr>/<prefix>                          | Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                           |
| <ip-addr> <reverse-mask>                    | Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1                                               |

| Parameter                        | Description                                                                                                                                                 |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                  | 0.0.0.255" is the same as entering 192.168.1.1/24.                                                                                                          |
| <i>&lt;dest-ports&gt;</i>        | Match destination TCP or UDP port numbers. Port numbers are specified as integers between 0 and 65535. You can specify one or more port numbers as follows: |
| eq <0-65535>                     | Match a single port number.                                                                                                                                 |
| lt <0-65535>                     | Match all port numbers that are less than the specified port number.                                                                                        |
| gt <0-65535>                     | Match all port numbers that are greater than the specified port number.                                                                                     |
| ne <0-65535>                     | Match all port numbers except the specified port number.                                                                                                    |
| range <start-port><br><end-port> | Match a range of port numbers.                                                                                                                              |
| vlan <1-4094>                    | The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.                                                            |
| log                              | Log packets that are denied by this ACL. You must also enable the logging, using the command <b>access-list hardware-deny-log</b> .                         |

**Mode** Global Configuration

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** This command creates an ACL for use with hardware classification. Once you have configured the ACL, use the **access-group** or the **match access-group** command to apply this ACL to a port, VLAN or QoS class-map.

ACLs numbered in the range 3000-3699 match on packets that have the specified source and destination IP addresses.

**Examples** To create an access-list that will permit TCP packets with a destination address of 192.168.1.1, a destination port of 80, and any source address and source port, enter the commands:

```
awplus# configure terminal
awplus(config)# access-list 3000 permit tcp any 192.168.1.1/32
eq 80
```

To create an access-list that will copy TCP packets to the mirror port, if they have a destination address of 192.168.1.1, a destination port of 80, and any source address and source port, enter the commands:

```
awplus# configure terminal
awplus(config)# access-list 3000 copy-to-mirror tcp any
192.168.1.1/32 eq 80
```

You also need to configure the mirror port with the [mirror interface](#) command.

**Related commands** [access-group](#)  
[access-list hardware-deny-log](#)  
[match access-group](#)  
[show running-config](#)  
[show access-list \(IPv4 Hardware ACLs\)](#)

**Command changes** Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

# access-list hardware (named hardware ACL)

**Overview** This command creates a named hardware access-list and puts you into IPv4 Hardware ACL Configuration mode, where you can add filter entries to the ACL.

Once you have configured the ACL, you can use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map.

The **no** variant of this command removes the specified named hardware ACL.

**Syntax** access-list hardware <name>  
no access-list hardware <name>

| Parameter | Description                          |
|-----------|--------------------------------------|
| <name>    | Specify a name for the hardware ACL. |

**Mode** Global Configuration

**Default** Any traffic on an interface controlled by a hardware ACL that does not explicitly match a filter is permitted.

**Usage notes** Use this command to name a hardware ACL and enter the IPv4 Hardware ACL Configuration mode. If the named hardware ACL does not exist, it will be created after entry. If the named hardware ACL already exists, then this command puts you into IPv4 Hardware ACL Configuration mode for that existing ACL.

Entering this command moves you to the IPv4 Hardware ACL Configuration mode (config-ip-hw-acl prompt), so you can enter ACL filters with sequence numbers. From this prompt, configure the filters for the ACL. See the [ACL Feature Overview and Configuration Guide](#) for complete examples of configured sequenced numbered ACLs.

**NOTE:** Hardware ACLs will access unless by an ACL action.

**Examples** To create the hardware access-list named "ACL-1" and enter the IPv4 Hardware ACL Configuration mode to specify the ACL filter entry, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware ACL-1
awplus(config-ip-hw-acl)#
```

To remove the hardware access-list named "ACL-1", use the commands:

```
awplus# configure terminal
awplus(config)# no access-list hardware ACL-1
```

**Related commands**

  - (named hardware ACL entry for ICMP)
  - (named hardware ACL entry for IP protocols)
  - (named hardware ACL entry for TCP or UDP)
  - (access-list standard named filter)
- show access-group**
- show interface access-group**
- show access-list (IPv4 Hardware ACLs)**

## access-list hardware-deny-log

**Overview** Use this command to enable logging of packets that are denied by hardware IP ACLs. Hardware IP ACLs are ACLs with an ID number from 3000 to 3699. If you turn on logging, the switch will produce a log message when it drops denied packets.

**CAUTION:** *If you enable this logging, do not use an action of or in any of the switch's ACLs. If you do, packets that match those ACLs will also be dropped.*

Use the **no** variant of this command to disable logging of packets that are denied by hardware IP ACLs.

**Syntax** `access-list hardware-deny-log [info|warn] [rate <1-1000>] [burst <1-1000>] [timeout <1-3600>]`  
`no access-list hardware-deny-log`

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| info             | Give the log messages a severity level of 'info'. This is the default severity level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| warn             | Give the log messages a severity level of 'warn'. If you want the messages to go to the buffered, permanent, and external log as well as the terminal, specify this parameter.                                                                                                                                                                                                                                                                                                                                                                                 |
| rate <1-1000>    | This limits the number of log messages produced per hour. The switch will stop creating log messages if packets are denied at a higher rate than this specified rate. The default is 12 packets per hour. This means, for example, that if there are 60 denied packets in the first hour, then at most the first 12 of these packets will be logged. After that, logging will stop unless the rate drops below 12 an hour. (The actual number of packets logged depends on the number of flows the dropped packets come from; see the <b>burst</b> parameter). |
| burst <1-1000>   | This is the maximum initial number of packets to log for a given flow. A flow is a set of packets with the same source IP address, destination IP address, source port, and destination port. The default is 5. The burst number reduces by 1 each time a packet in the flow is logged. Then it increases by 1 again every time the rate drops below the limit set by the <b>rate</b> parameter, up to the burst number.                                                                                                                                       |
| timeout <1-3600> | This is the length of time it takes for a flow record to expire, in seconds. The switch considers that a flow has expired if it hasn't received any packets that match that flow for the timeout number of seconds. The default is 3600 seconds (1 hour). When a flow expires, its burst value is reset and logging may restart (depending on the current rate of denied packets).                                                                                                                                                                             |

**Default** Disabled

**Mode** Global Configuration

**Usage notes** To enable logging for a particular ACL, enter:

- this command (**access-list hardware-deny-log**)
- the command **terminal monitor**, and
- a **log** parameter at the end of the desired ACL.

The switch will send the log messages to:

- The terminal monitor, by default, as long as you enter the command **terminal monitor**, and
- If you change the severity of the messages to **warn**, to the buffered log, permanent log, and external log as well. The external log defines what logs will be sent to external syslog servers.

The log message format is:

```
DENY> IN=<interface-name> OUT=<blank> MAC=<dest-mac-addr:src-  
mac-addr:eth-type> SRC=<source-ip-address> DST=<dest-ip-address>  
LEN=<packet-length> TOS=<type-of-service> PREC=<precedence>  
TTL=<time-to-live> ID=<packet-ID> PROTO=<L4-protocol>  
SPT=<L4-source-port> DPT=<L4-dest-port> LEN=<L4-packet-length>  
MARK=<internal-packet-marking>
```

An example of a permanent log message is:

```
2023 March 03 07:04:37 local5.warning awplus ulogd[931]: DENY>  
IN=vlan100 OUT= MAC=e0:1a:ea:50:51:fc:00:00:11:11:22:22:08:00  
SRC=192.168.1.100 DST=192.170.1.1 LEN=42 TOS=00 PREC=0x00 TTL=64  
ID=0 PROTO=UDP SPT=63 DPT=63 LEN=22 MARK=0x20000000
```

**Example** To log packets denied by ACL 3000, which denies all Echo requests, use the commands:

```
awplus# terminal monitor  
awplus# configure terminal  
awplus(config)# access-list hardware-deny-log  
awplus(config)# access-list 3000 deny icmp any any icmp-type 8
```

access-list (numbered hardware ACL for IP packets)  
access-list (numbered hardware ACL for IP protocols)  
access-list (numbered hardware ACL for TCP or UDP)  
terminal monitor

**Command changes** Version 5.5.3-0.1: command added

# acl-group ip address

**Overview** Use this command to create a new named IPv4 ACL group that contains one or more IPv4 host or subnets.

This command creates a named IPv4 ACL group and enters the ACL Host Group config mode. IPv4 hosts or subnets can be added to or removed from this group. This host group can be used as a source or destination match for any hardware ACL to simplify large ACL configs with lots of IPv4 hosts.

Use the **no** variant of this command to delete an IPv4 ACL group.

**Syntax** `acl-group ip address <group>`  
`no acl-group ip address <group>`

| Parameter                  | Description                     |
|----------------------------|---------------------------------|
| <code>&lt;group&gt;</code> | The name of the IPv4 ACL group. |

**Default** No ACL groups exist by default.

**Mode** Global Configuration

**Example** To create an IPv4 ACL group named IPV4 \_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ip address IPV4_GROUP1
awplus(config-ip-host-group)#
```

To delete an IPv4 ACL group named IPV4 \_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# no acl-group ip address IPV4_GROUP1
```

**Related commands** [ip \(ip-host-group\)](#)

**Command changes** Version 5.5.0-1.1: command added

# acl-group ip port

**Overview** Use this command to create a new named port ACL group that contains one or more port rules for an ACL.

This command creates a named port ACL group and enters the ACL Port Group config mode. Port matching rules can be added to or removed from this group. This host group can be used to match on source or destination ports when used with an ACL.

Use the **no** variant of this command to delete a port ACL group.

**Syntax** `acl-group ip port <group>`  
`no acl-group ip port <group>`

| Parameter                  | Description                     |
|----------------------------|---------------------------------|
| <code>&lt;group&gt;</code> | The name of the port ACL group. |

**Default** No ACL groups exist by default.

**Mode** Global Configuration

**Example** To create a port ACL group named PORT\_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ip port PORT_GROUP1
awplus(config-ip-port-group)#
```

To delete a port ACL group named PORT\_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# no acl-group ip port PORT_GROUP1
```

**Related commands** [\(acl-group ip port range\)](#)  
[show acl-group ip port](#)

**Command changes** Version 5.5.0-1.1: command added

## (acl-group ip port range)

**Overview** Use this command to add one or more protocol port rules on a port ACL group. These port matching rules are used to simplify large ACL configs where many ACLs block or permit on the same service ports.

Use the **no** variant of this command to remove a rule match on protocol ports.

**Syntax** eq <0-65535>  
lt <0-65535>  
gt <0-65535>  
ne <0-65535>  
range <0-65535> <0-65535>  
no eq <0-65535>  
no lt <0-65535>  
no gt <0-65535>  
no ne <0-65535>  
no range <0-65535> <0-65535>

| Parameter | Description                                            |
|-----------|--------------------------------------------------------|
| eq        | The protocol port matches if equal to this number.     |
| lt        | The protocol port matches if less than this number.    |
| gt        | The protocol port matches if greater than this number. |
| ne        | The protocol port matches if not equal to this number. |
| range     | The protocol port matches if it is in this range.      |
| <0-65535> | The port number.                                       |

**Default** The port ACL group will match on all ports by default.

**Mode** IP ACL Port Group Configuration

**Example** To add the rule match on protocol ports equal to 20 on a port ACL group, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ip port PORT_GROUP1
awplus(config-ip-port-group)# eq 20
```

To add the rule match on protocol ports between 20 and 50 on a port ACL group, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ip port PORT_GROUP1
awplus(config-ip-port-group)# range 20 50
```

To add the rule match on protocol ports greater than 20 except 30 on a port ACL group, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ip port PORT_GROUP1
awplus(config-ip-port-group)# gt 20
awplus(config-ip-port-group)# ne 30
```

To remove the rule match on protocol ports between 20 and 50 on a port ACL group, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ip port PORT_GROUP1
awplus(config-ip-port-group)# no range 20 50
```

**Related commands** [acl-group ip port](#)  
[show acl-group ip port](#)

**Command changes** Version 5.5.0-1.1: command added

# clear access-list counters

**Overview** Use this command to reset the hardware access-list counters to zero. The access-list counters show the number of packets that match your hardware ACLs. Every time a hardware ACL allows or drops a packet, its counter increments.

**Syntax** clear access-list counters [*<acl>*]

| Parameter          | Description                                                                          |
|--------------------|--------------------------------------------------------------------------------------|
| <i>&lt;acl&gt;</i> | Clear the counters for only the specified ACL. You can enter the ACL name or number. |

**Mode** Privileged Exec

**Usage notes** To view the counter values, use the command [show access-list counters](#).

**Example** To clear the counters for the ACL named ACL-1, use the command:  
awplus# clear access-list counters ACL-1

**Related commands** [show access-list counters](#)

**Command changes** Version 5.5.2-2.1: command added

## commit (IPv4)

**Overview** Use this command to commit the IPv4 ACL filter configuration entered at the console to the hardware immediately without exiting the IPv4 Hardware ACL Configuration mode.

This command forces the associated hardware and software IPv4 ACLs to synchronize.

**Syntax** `commit`

**Mode** IPv4 Hardware ACL Configuration

**Usage notes** Normally, when an IPv4 hardware ACL is edited, the new configuration state of the IPv4 ACL is not written to hardware until you exit IPv4 Hardware ACL Configuration mode. By entering this command you can ensure that the current state of a hardware access-list that is being edited is written to hardware immediately.

Scripts typically do not include the **exit** command to exit configuration modes, potentially leading to IPv4 ACL filters in hardware not being correctly updated. Using this **commit** command in a configuration script after specifying an IPv4 hardware ACL filter ensures that it is updated in the hardware immediately.

**Example** To update the hardware with the IPv4 ACL filter configuration, use the command:

```
awplus# configure terminal
awplus(config)# access-list hardware my-hw-list
awplus(config-ip-hw-acl)# commit
```

**Related commands** [access-list hardware \(named hardware ACL\)](#)

## ip (ip-host-group)

**Overview** Use this command to add an IPv4 host or subnet to an IPv4 ACL group. Adding IPv4 hosts and subnets to an ACL group allows you to simplify ACL config when the same IP addresses are required for many ACLs.

Use the **no** variant of this command to remove an IPv4 host or subnet from an IPv4 ACL group.

**Syntax** ip {any|<match-ip>}  
no ip {any|<match-ip>}

| Parameter  | Description                                                                                                                                                                                                                                                                              |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| any        | Match any IP address.                                                                                                                                                                                                                                                                    |
| <match-ip> | The addresses to match against. You can specify a single host or a subnet. The following are the valid formats for specifying the addresses:                                                                                                                                             |
|            | <div><div>&lt;ip-addr&gt;</div><div>Match a single host with the IP address given by &lt;ip-addr&gt; in dotted decimal notation.</div></div>                                                                                                                                             |
|            | <div><div>&lt;ip-addr&gt;/&lt;prefix&gt;</div><div>Match any IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.</div></div>                                                                          |
|            | <div><div>&lt;ip-addr&gt;<br/>&lt;reverse-mask&gt;</div><div>Match any IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.</div></div> |

**Default** No hosts or subnets are in an IPv4 ACL group by default.

**Mode** IP ACL Host Group Configuration

**Example** To add the subnet 192.168.1.0/24 to an IPv4 ACL group IPV4\_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ip address IPV4_GROUP1
awplus(config-ip-host-group)# ip 192.168.1.0/24
```

To remove the subnet 192.168.1.0/24 from an IPv4 ACL group IPV4\_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ip address IPV4_GROUP1
awplus(config-ip-host-group)# no ip 192.168.1.0/24
```

**Related commands** [acl-group ip address](#)  
[show acl-group ip address](#)

**Command changes** Version 5.5.0-1.1: command added

## (named hardware ACL entry for ICMP)

**Overview** Use this command to add a new ICMP filter entry to the current hardware access-list. The filter will match on any ICMP packet that has the specified source and destination IP addresses and (optionally) ICMP type. You can specify the value **any** if source or destination address does not matter.

If you specify a sequence number, the switch inserts the new filter at the specified location. Otherwise, the switch adds the new filter to the end of the access-list.

The **no** variant of this command removes an ICMP filter entry from the current hardware access-list. You can specify the ICMP filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its ICMP filter profile without specifying its sequence number (e.g. **no permit icmp 192.168.1.0/24 any icmp-type 11**).

You can find the sequence number by running the **show access-list (IPv4 Hardware ACLs)** command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:**

*Specifying a “send” action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.*

**Syntax** [*<sequence-number>*] *<action>* icmp *<source-ip>* *<dest-ip>* [icmp-type *<number>*] [vlan *<1-4094>*] [log]  
no *<sequence-number>*  
no *<action>* icmp *<source-ip>* *<dest-ip>* [icmp-type *<number>*]  
[vlan *<1-4094>*] [log]

The following actions are available for hardware ACLs:

| Values for the <i>&lt;action&gt;</i> parameter                                  |                                                                                                                                                                                                                                                                 |
|---------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| deny                                                                            | Reject packets that match the source and destination filtering specified with this command.                                                                                                                                                                     |
| permit                                                                          | Permit packets that match the source and destination filtering specified with this command.                                                                                                                                                                     |
| copy-to-cpu                                                                     | Send a copy of matching packets to the CPU.                                                                                                                                                                                                                     |
| copy-to-mirror<br>[interface <i>port-number</i> ]                               | Send a copy of matching packets to a mirror port.<br>Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |
| send-to-vlan-port<br>vlan <i>&lt;vid&gt;</i> port<br><i>&lt;port-number&gt;</i> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.                                                                                                                              |
| send-to-cpu                                                                     | Send matching packets to the CPU.                                                                                                                                                                                                                               |

| Parameter                      | Description                                                                                                                                                                                                                                                          |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;sequence-number&gt;</i> | The sequence number for the filter entry of the selected access control list, in the range 1-65535. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number. |
| <i>&lt;action&gt;</i>          | The action that the switch will take on matching packets. See the table above for valid values.                                                                                                                                                                      |
| icmp                           | Match against ICMP packets                                                                                                                                                                                                                                           |
| <i>&lt;source-ip&gt;</i>       | The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:                                                                                              |
|                                | any                      Match any source IP address.                                                                                                                                                                                                                |
|                                | host <i>&lt;ip-addr&gt;</i> Match a single source host with the IP address given by <i>&lt;ip-addr&gt;</i> in dotted decimal notation.                                                                                                                               |

| Parameter                                             | Description                                                                                                                                                                                                                                                                          |
|-------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                       | <p><i>&lt;ip-addr&gt;/&lt;prefix&gt;</i> Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.</p>                                                                                 |
|                                                       | <p><i>&lt;ip-addr&gt;</i><br/><i>&lt;reverse-mask&gt;</i> Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.</p> |
| <i>&lt;dest-ip&gt;</i>                                | <p>The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:</p>                                                                                        |
| any                                                   | Match any destination IP address.                                                                                                                                                                                                                                                    |
| host <i>&lt;ip-addr&gt;</i>                           | Match a single destination host with the IP address given by <i>&lt;ip-addr&gt;</i> in dotted decimal notation.                                                                                                                                                                      |
| <i>&lt;ip-addr&gt;/&lt;prefix&gt;</i>                 | Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                                                                                         |
| <i>&lt;ip-addr&gt;</i><br><i>&lt;reverse-mask&gt;</i> | Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.                                                          |
| icmp-type<br><i>&lt;number&gt;</i>                    | <p>The type of ICMP message to match against, as defined in RFC792 and RFC950. Values include:</p>                                                                                                                                                                                   |
| 0                                                     | Echo replies.                                                                                                                                                                                                                                                                        |
| 3                                                     | Destination unreachable messages.                                                                                                                                                                                                                                                    |

|                                  | 16 Information replies.                                                                                                             |
|                                  | 17 Address mask requests.                                                                                                           |
|                                  | 18 Address mask replies.                                                                                                            |
| <code>vlan &lt;1-4094&gt;</code> | The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.                                    |
| <code>log</code>                 | Log packets that are denied by this ACL. You must also enable the logging, using the command <b>access-list hardware-deny-log</b> . |

**Mode** IPv4 Hardware ACL Configuration (accessed by running the command **access-list hardware (named hardware ACL)**)

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** To use this command, first run the command **access-list hardware (named hardware ACL)** and enter the desired access-list name. This changes the prompt to:

```
awplus(config-ip-hw-acl)#
```

Then use this command (and the other “named hardware ACL: entry” commands) to add filter entries. You can add multiple filter entries to an ACL. You can insert a new filter entry into the middle of an existing list by specifying the appropriate sequence number. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Then use the **access-group** or the **match access-group** command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

**Examples** To add an access-list filter entry with a sequence number of 100 to the access-list named “my-list” that will permit ICMP packets with a source address of 192.168.1.0/24, any destination address and an ICMP type of 5, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# 100 permit icmp 192.168.1.0/24 any
icmp-type 5
```

To remove an access-list filter entry with a sequence number of 100 from the access-list named “my-list”, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# no 100
```

**Related commands**

- access-list hardware (named hardware ACL)**
- access-list hardware-deny-log**
- match access-group**
- show running-config**
- show access-list (IPv4 Hardware ACLs)**

**Command changes** Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

## (named hardware ACL entry for IP packets)

**Overview** Use this command to add an IP packet filter entry to the current hardware access-list. The filter will match on IP packets that have the specified IP and/or MAC addresses. You can use the value **any** instead of source or destination IP or MAC address if an address does not matter.

If you specify a sequence number, the switch inserts the new filter at the specified location. Otherwise, the switch adds the new filter to the end of the access-list.

The **no** variant of this command removes a filter entry from the current hardware access-list. You can specify the filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its filter profile without specifying its sequence number (e.g. **no deny ip 192.168.0.0/16 any**).

You can find the sequence number by running the **show access-list (IPv4 Hardware ACLs)** command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:**

*Specifying a “send” action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.*

**Syntax** [*<sequence-number>*] *<action>* ip *<source-ip>* *<dest-ip>* [*<source-mac>* *<dest-mac>*] [vlan *<1-4094>*] [log]  
no *<sequence-number>*  
no *<action>* ip *<source-ip>* *<dest-ip>* [*<source-mac>* *<dest-mac>*]  
[vlan *<1-4094>*] [log]

The following actions are available for hardware ACLs:

| Values for the <i>&lt;action&gt;</i> parameter                                  |                                                                                                                                                                                                                                                                 |
|---------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| deny                                                                            | Reject packets that match the source and destination filtering specified with this command.                                                                                                                                                                     |
| permit                                                                          | Permit packets that match the source and destination filtering specified with this command.                                                                                                                                                                     |
| copy-to-cpu                                                                     | Send a copy of matching packets to the CPU.                                                                                                                                                                                                                     |
| copy-to-mirror<br>[interface <i>port-number</i> ]                               | Send a copy of matching packets to a mirror port.<br>Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |
| send-to-vlan-port<br>vlan <i>&lt;vid&gt;</i> port<br><i>&lt;port-number&gt;</i> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.                                                                                                                              |
| send-to-cpu                                                                     | Send matching packets to the CPU.                                                                                                                                                                                                                               |

| Parameter                      | Description                                                                                                                                                                                                                                                          |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;sequence-number&gt;</i> | The sequence number for the filter entry of the selected access control list, in the range 1-65535. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number. |
| <i>&lt;action&gt;</i>          | The action that the switch will take on matching packets. See the table above for valid values.                                                                                                                                                                      |
| ip                             | Match against IP packets                                                                                                                                                                                                                                             |
| <i>&lt;source-ip&gt;</i>       | The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:                                                                                              |
|                                | any Match any source IP address.                                                                                                                                                                                                                                     |
|                                | dhcpsnooping Match the source address learned from the DHCP Snooping binding database.                                                                                                                                                                               |
|                                | host <i>&lt;ip-addr&gt;</i> Match a single source host with the IP address given by                                                                                                                                                                                  |

| Parameter                                             | Description                                                                                                                                                                                                                 |
|-------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                       | <i>&lt;ip-addr&gt;</i> in dotted decimal notation.                                                                                                                                                                          |
| <i>&lt;ip-addr&gt;/&lt;prefix&gt;</i>                 | Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                                     |
| <i>&lt;ip-addr&gt;</i><br><i>&lt;reverse-mask&gt;</i> | Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.      |
| <i>&lt;dest-ip&gt;</i>                                | The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:                                      |
| any                                                   | Match any destination IP address.                                                                                                                                                                                           |
| host <i>&lt;ip-addr&gt;</i>                           | Match a single destination host with the IP address given by <i>&lt;ip-addr&gt;</i> in dotted decimal notation.                                                                                                             |
| <i>&lt;ip-addr&gt;/&lt;prefix&gt;</i>                 | Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                                |
| <i>&lt;ip-addr&gt;</i><br><i>&lt;reverse-mask&gt;</i> | Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24. |
| <i>&lt;source-mac&gt;</i>                             | The source MAC address to match against. You can specify a single MAC address, a range (through a mask), the address learned from DHCP snooping, or any:                                                                    |
| any                                                   | Match against any source MAC address.                                                                                                                                                                                       |

| Parameter                  | Description                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;source-mac&gt;</i>  | <p>The source MAC address to match against, followed by the mask.</p> <p>Enter the address in the format <i>&lt;HHHH.HHHH.HHHH&gt;</i>, where each <i>H</i> is a hexadecimal number.</p> <p>Enter the mask in the format <i>&lt;HHHH.HHHH.HHHH&gt;</i>, where each <i>H</i> is a hexadecimal number. For a mask, each value is either 0 or F, where FF = Ignore, and 00 = Match.</p>      |
| dhcpsnooping               | Match the source address learned from the DHCP Snooping binding database.                                                                                                                                                                                                                                                                                                                 |
| <i>&lt;dest-mac&gt;</i>    | The destination MAC address to match against. You can specify a single MAC address, a range (through a mask), or any:                                                                                                                                                                                                                                                                     |
| any                        | Match against any destination MAC address.                                                                                                                                                                                                                                                                                                                                                |
| <i>&lt;dest-mac&gt;</i>    | <p>The destination MAC address to match against, followed by the mask.</p> <p>Enter the address in the format <i>&lt;HHHH.HHHH.HHHH&gt;</i>, where each <i>H</i> is a hexadecimal number.</p> <p>Enter the mask in the format <i>&lt;HHHH.HHHH.HHHH&gt;</i>, where each <i>H</i> is a hexadecimal number. For a mask, each value is either 0 or F, where FF = Ignore, and 00 = Match.</p> |
| vlan <i>&lt;1-4094&gt;</i> | The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.                                                                                                                                                                                                                                                                                          |
| log                        | Log packets that are denied by this ACL. You must also enable the logging, using the command <b>access-list hardware-deny-log</b> .                                                                                                                                                                                                                                                       |

**Mode** IPv4 Hardware ACL Configuration (accessed by running the command **access-list hardware (named hardware ACL)**)

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** To use this command, first run the command **access-list hardware (named hardware ACL)** and enter the desired access-list name. This changes the prompt to:

```
awplus(config-ip-hw-acl)#
```

Then use this command (and the other “named hardware ACL: entry” commands) to add filter entries. You can add multiple filter entries to an ACL. You can insert a new filter entry into the middle of an existing list by specifying the appropriate sequence number. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Then use the **access-group** or the **match access-group** command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

**Examples** To add a filter entry to the access-list named “my-list” that will permit any IP packet with a source address of 192.168.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# permit ip 192.168.1.1/32 any
```

To add a filter entry to the access-list named “my-list” that will permit any IP packet with a source address of 192.168.1.1 and a MAC source address of ffee.ddcc.bbba, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# permit ip 192.168.1.1/32 any mac
    ffee.ddcc.bbba 0000.0000.0000 any
```

To add a filter entry to the access-list named “my-list” that will deny all IP packets on vlan 2, use the commands:

```
awplus# enable
awplus(config)# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# deny ip any any vlan 2
```

**Command changes** Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

## (named hardware ACL entry for IP protocols)

**Overview** Use this command to add an IP protocol type filter entry to the current hardware access-list. The filter will match on IP packets that have the specified IP protocol number, and the specified IP and/or MAC addresses. You can use the value **any** instead of source or destination IP or MAC address if an address does not matter.

If you specify a sequence number, the switch inserts the new filter at the specified location. Otherwise, the switch adds the new filter to the end of the access-list.

The **no** variant of this command removes a filter entry from the current hardware access-list. You can specify the filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its filter profile without specifying its sequence number (e.g. **no deny proto 2 192.168.0.0/16 any**).

You can find the sequence number by running the **show access-list (IPv4 Hardware ACLs)** command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:**

*Specifying a “send” action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.*

**Syntax** [*<sequence-number>*] *<action>* proto *<1-255>* *<source-ip>* *<dest-ip>*  
[*<source-mac>* *<dest-mac>*] [vlan *<1-4094>*] [log]  
no *<sequence-number>*  
no *<action>* proto *<1-255>* *<source-ip>* *<dest-ip>* [*<source-mac>*  
*<dest-mac>*] [vlan *<1-4094>*] [log]

The following actions are available for hardware ACLs:

| Values for the <i>&lt;action&gt;</i> parameter                                  |                                                                                                                                                                                                                                                                 |
|---------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| deny                                                                            | Reject packets that match the source and destination filtering specified with this command.                                                                                                                                                                     |
| permit                                                                          | Permit packets that match the source and destination filtering specified with this command.                                                                                                                                                                     |
| copy-to-cpu                                                                     | Send a copy of matching packets to the CPU.                                                                                                                                                                                                                     |
| copy-to-mirror<br>[interface <i>port-number</i> ]                               | Send a copy of matching packets to a mirror port.<br>Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |
| send-to-vlan-port<br>vlan <i>&lt;vid&gt;</i> port<br><i>&lt;port-number&gt;</i> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.                                                                                                                              |
| send-to-cpu                                                                     | Send matching packets to the CPU.                                                                                                                                                                                                                               |

### Parameters in IP protocol ACL entries

| Parameter                      | Description                                                                                                                                                                                                                                                                            |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;sequence-number&gt;</i> | The sequence number for the filter entry of the selected access control list, in the range 1-65535. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.                   |
| <i>&lt;action&gt;</i>          | The action that the switch will take on matching packets. See the table above for valid values.                                                                                                                                                                                        |
| proto <i>&lt;1-255&gt;</i>     | The IP protocol number to match against, as defined by IANA (Internet Assigned Numbers Authority <a href="http://www.iana.org/assignments/protocol-numbers">www.iana.org/assignments/protocol-numbers</a> )<br><br>See below for a list of IP protocol numbers and their descriptions. |
| <i>&lt;source-ip&gt;</i>       | The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:                                                                                                                |
| any                            | Match any source IP address.                                                                                                                                                                                                                                                           |

| Parameter                   | Description                                                                                                                                                                                                                 |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dhcpsnooping                | Match the source address learned from the DHCP Snooping binding database.                                                                                                                                                   |
| host <ip-addr>              | Match a single source host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                               |
| <ip-addr>/<prefix>          | Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                                     |
| <ip-addr><br><reverse-mask> | Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.      |
| <dest-ip>                   | The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:                                      |
| any                         | Match any destination IP address.                                                                                                                                                                                           |
| host <ip-addr>              | Match a single destination host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                          |
| <ip-addr>/<prefix>          | Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                                |
| <ip-addr><br><reverse-mask> | Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24. |

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <source-mac>  | The source MAC address to match against. You can specify a single MAC address, a range (through a mask), the address learned from DHCP snooping, or any:                                                                                                                                                                                                                   |
|               | any Match against any source MAC address.                                                                                                                                                                                                                                                                                                                                  |
|               | <source-mac><br><br>The source MAC address to match against, followed by the mask.<br><br>Enter the address in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number.<br><br>Enter the mask in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number. For a mask, each value is either 0 or F, where FF = Ignore, and 00 = Match.    |
|               | dhcpsnooping Match the source address learned from the DHCP Snooping binding database.                                                                                                                                                                                                                                                                                     |
| <dest-mac>    | The destination MAC address to match against. You can specify a single MAC address, a range (through a mask), or any:                                                                                                                                                                                                                                                      |
|               | any Match against any destination MAC address.                                                                                                                                                                                                                                                                                                                             |
|               | <dest-mac><br><br>The destination MAC address to match against, followed by the mask.<br><br>Enter the address in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number.<br><br>Enter the mask in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number. For a mask, each value is either 0 or F, where FF = Ignore, and 00 = Match. |
| vlan <1-4094> | The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.                                                                                                                                                                                                                                                                           |
| log           | Log packets that are denied by this ACL. You must also enable the logging, using the command <b>access-list hardware-deny-log</b> .                                                                                                                                                                                                                                        |

### IP protocol number and description

**Mode** IPv4 Hardware ACL Configuration (accessed by running the command **access-list hardware (named hardware ACL)**)

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** To use this command, run the command **access-list hardware (named hardware ACL)** and enter the desired access-list name. This changes the prompt to:

```
awplus(config-ip-hw-acl)#
```

Then use this command (and the other “named hardware ACL: entry” commands) to add filter entries. You can add multiple filter entries to an ACL. You can insert a new filter entry into the middle of an existing list by specifying the appropriate sequence number. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Then use the **access-group** or the **match access-group** command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

**Examples** To add a filter entry to the access-list named "my-list" that will deny all IGMP packets (protocol 2) from the 192.168.0.0 subnet, and give it a sequence number of 50, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# 50 deny proto 2 192.168.0.0/16 any
```

**Related commands**

- access-group**
- access-list hardware (named hardware ACL)**
- access-list hardware-deny-log**
- match access-group**
- show running-config**
- show access-list (IPv4 Hardware ACLs)**

**Command changes**

Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

## (named hardware ACL entry for MAC addresses)

**Overview** Use this command to add a MAC address filter entry to the current hardware access-list. The access-list will match on packets that have the specified source and destination MAC addresses. You can use the value **any** instead of source or destination MAC address if an address does not matter.

If you specify a sequence number, the switch inserts the new filter at the specified location. Otherwise, the switch adds the new filter to the end of the access-list.

The **no** variant of this command removes a filter entry from the current hardware access-list. You can specify the filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its filter profile without specifying its sequence number (e.g. **no permit mac aaaa.bbbb.cccc 0000.0000.0000 any**).

You can find the sequence number by running the **show access-list (IPv4 Hardware ACLs)** command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:**

*Specifying a “send” action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.*

**Syntax** [*<sequence-number>*] *<action>* mac {*<source-mac>*|any} {*<dest-mac>*|any} [vlan *<1-4094>*] [inner-vlan *<1-4094>*]  
no *<sequence-number>*  
no *<action>* mac {*<source-mac>*|any} {*<dest-mac>*|any} [vlan *<1-4094>*] [inner-vlan *<1-4094>*]

The following actions are available for hardware ACLs:

| Values for the <i>&lt;action&gt;</i> parameter                                  |                                                                                                                                                                                                                                                                 |
|---------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| deny                                                                            | Reject packets that match the source and destination filtering specified with this command.                                                                                                                                                                     |
| permit                                                                          | Permit packets that match the source and destination filtering specified with this command.                                                                                                                                                                     |
| copy-to-cpu                                                                     | Send a copy of matching packets to the CPU.                                                                                                                                                                                                                     |
| copy-to-mirror<br>[interface <i>port-number</i> ]                               | Send a copy of matching packets to a mirror port.<br>Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |
| send-to-vlan-port<br>vlan <i>&lt;vid&gt;</i> port<br><i>&lt;port-number&gt;</i> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.                                                                                                                              |
| send-to-cpu                                                                     | Send matching packets to the CPU.                                                                                                                                                                                                                               |

| Parameter                      | Description                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;sequence-number&gt;</i> | The sequence number for the filter entry of the selected access control list, in the range 1-65535. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.                                                                                                            |
| <i>&lt;action&gt;</i>          | The action that the switch will take on matching packets. See the table above for valid values.                                                                                                                                                                                                                                                                                 |
| mac                            | Match against MAC address                                                                                                                                                                                                                                                                                                                                                       |
| <i>&lt;source-mac&gt;</i>      | The source MAC address to match against, followed by the mask.<br><br>Enter the address in the format <i>&lt;HHHH.HHHH.HHHH&gt;</i> , where each <i>H</i> is a hexadecimal number.<br><br>Enter the mask in the format <i>&lt;HHHH.HHHH.HHHH&gt;</i> , where each <i>H</i> is a hexadecimal number. For a mask, each value is either 0 or F, where FF = Ignore, and 00 = Match. |
| any                            | Match against any source MAC address.                                                                                                                                                                                                                                                                                                                                           |

| Parameter                        | Description                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;dest-mac&gt;</code>    | <p>The destination MAC address to match against, followed by the mask.</p> <p>Enter the address in the format <code>&lt;HHHH.HHHH.HHHH&gt;</code>, where each <i>H</i> is a hexadecimal number.</p> <p>Enter the mask in the format <code>&lt;HHHH.HHHH.HHHH&gt;</code>, where each <i>H</i> is a hexadecimal number. For a mask, each value is either 0 or F, where FF = Ignore, and 00 = Match.</p> |
| <code>any</code>                 | Match against any destination MAC address.                                                                                                                                                                                                                                                                                                                                                            |
| <code>vlan &lt;1-4094&gt;</code> | Match against the specified ID in the packet's VLAN tag.                                                                                                                                                                                                                                                                                                                                              |

**Mode** IPv4 Hardware ACL Configuration (accessed by running the command **access-list hardware (named hardware ACL)**)

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** To use this command, first run the command **access-list hardware (named hardware ACL)** and enter the desired access-list name. This changes the prompt to:

```
awplus(config-ip-hw-acl)#
```

Then use this command (and the other “named hardware ACL: entry” commands) to add filter entries. You can add multiple filter entries to an ACL. You can insert a new filter entry into the middle of an existing list by specifying the appropriate sequence number. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Then use the **access-group** or the **match access-group** command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

**Examples** To add a filter entry to the access-list named "my-list" that will permit packets with a source MAC address of 0000.00ab.1234 and any destination MAC address, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# permit mac 0000.00ab.1234
0000.0000.0000 any
```

To remove a filter entry that permit packets with a source MAC address of 0000.00ab.1234 and any destination MAC address, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# no permit mac 0000.00ab.1234
0000.0000.0000 any
```

- [access-list hardware \(named hardware ACL\)](#)
- [match access-group](#)
- [show running-config](#)
- [show access-list \(IPv4 Hardware ACLs\)](#)

**Command changes** Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

## (named hardware ACL entry for TCP or UDP)

**Overview** Use this command to add a TCP or UDP filter entry to the current hardware access-list. The access-list will match on TCP or UDP packets that have the specified source and destination IP addresses and optionally, port values. You can use the value **any** instead of source or destination IP address if an address does not matter.

If you specify a sequence number, the switch inserts the new filter at the specified location. Otherwise, the switch adds the new filter to the end of the access-list.

The **no** variant of this command removes a filter entry from the current hardware access-list. You can specify the filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its filter profile without specifying its sequence number (e.g. **no permit udp 192.168.0.0/16 any**).

You can find the sequence number by running the **show access-list (IPv4 Hardware ACLs)** command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:**

*Specifying a “send” action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.*

**Syntax** [*<sequence-number>*] *<action>* {tcp|udp} *<source-ip>* [*<source-ports>*] *<dest-ip>* [*<dest-ports>*] [vlan *<1-4094>*] [log]  
no *<sequence-number>*  
no *<action>* {tcp|udp} *<source-ip>* [*<source-ports>*] *<dest-ip>* [*<dest-ports>*] [vlan *<1-4094>*] [log]

The following actions are available for hardware ACLs:

| Values for the <i>&lt;action&gt;</i> parameter                                  |                                                                                                                                                                                                                                                                 |
|---------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| deny                                                                            | Reject packets that match the source and destination filtering specified with this command.                                                                                                                                                                     |
| permit                                                                          | Permit packets that match the source and destination filtering specified with this command.                                                                                                                                                                     |
| copy-to-cpu                                                                     | Send a copy of matching packets to the CPU.                                                                                                                                                                                                                     |
| copy-to-mirror<br>[interface <i>port-number</i> ]                               | Send a copy of matching packets to a mirror port.<br>Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |
| send-to-vlan-port<br>vlan <i>&lt;vid&gt;</i> port<br><i>&lt;port-number&gt;</i> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.                                                                                                                              |
| send-to-cpu                                                                     | Send matching packets to the CPU.                                                                                                                                                                                                                               |

| Parameter                      | Description                                                                                                                                                                                                                                                          |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;sequence-number&gt;</i> | The sequence number for the filter entry of the selected access control list, in the range 1-65535. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number. |
| <i>&lt;action&gt;</i>          | The action that the switch will take on matching packets. See the table above for valid values.                                                                                                                                                                      |
| tcp                            | Match against TCP packets.                                                                                                                                                                                                                                           |
| udp                            | Match against UDP packets.                                                                                                                                                                                                                                           |
| <i>&lt;source-ip&gt;</i>       | The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:                                                                                              |
|                                | any                      Match any source IP address.                                                                                                                                                                                                                |
|                                | host <i>&lt;ip-addr&gt;</i> Match a single source host with the IP address given by <i>&lt;ip-addr&gt;</i> in dotted decimal notation.                                                                                                                               |

| Parameter                                        | Description                                                                                                                                                                                                            |
|--------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;ip-addr&gt;/&lt;prefix&gt;</i>            | Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                                |
| <i>&lt;ip-addr&gt; &lt;reverse-mask&gt;</i>      | Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24. |
| <i>&lt;source-ports&gt;</i>                      | Match source TCP or UDP port numbers. Port numbers are specified as integers between 0 and 65535. You can specify one or more port numbers as follows:                                                                 |
| eq <i>&lt;0-65535&gt;</i>                        | Match a single port number.                                                                                                                                                                                            |
| lt <i>&lt;0-65535&gt;</i>                        | Match all port numbers that are less than the specified port number.                                                                                                                                                   |
| gt <i>&lt;0-65535&gt;</i>                        | Match all port numbers that are greater than the specified port number.                                                                                                                                                |
| ne <i>&lt;0-65535&gt;</i>                        | Match all port numbers except the specified port number.                                                                                                                                                               |
| range <i>&lt;start-port&gt; &lt;end-port&gt;</i> | Match a range of port numbers.                                                                                                                                                                                         |
| <i>&lt;dest-ip&gt;</i>                           | The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:                                 |
| any                                              | Match any destination IP address.                                                                                                                                                                                      |
| host <i>&lt;ip-addr&gt;</i>                      | Match a single destination host with the IP address given by <i>&lt;ip-addr&gt;</i> in dotted decimal notation.                                                                                                        |
| <i>&lt;ip-addr&gt;/&lt;prefix&gt;</i>            | Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                           |

| Parameter                                   | Description                                                                                                                                                                                                                 |
|---------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;ip-addr&gt; &lt;reverse-mask&gt;</i> | Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24. |
| <i>&lt;dest-ports&gt;</i>                   | Match destination TCP or UDP port numbers. Port numbers are specified as integers between 0 and 65535. You can specify one or more port numbers as follows:                                                                 |
| eq <0-65535>                                | Match a single port number.                                                                                                                                                                                                 |
| lt <0-65535>                                | Match all port numbers that are less than the specified port number.                                                                                                                                                        |
| gt <0-65535>                                | Match all port numbers that are greater than the specified port number.                                                                                                                                                     |
| ne <0-65535>                                | Match all port numbers except the specified port number.                                                                                                                                                                    |
| range <start-port> <end-port>               | Match a range of port numbers.                                                                                                                                                                                              |
| vlan <1-4094>                               | The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.                                                                                                                            |
| log                                         | Log packets that are denied by this ACL. You must also enable the logging, using the command <b>access-list hardware-deny-log</b> .                                                                                         |

**Mode** IPv4 Hardware ACL Configuration (accessed by running the command **access-list hardware (named hardware ACL)**)

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** To use this command, first run the command **access-list hardware (named hardware ACL)** and enter the desired access-list name. This changes the prompt to:

```
awplus(config-ip-hw-acl)#
```

Then use this command (and the other “named hardware ACL: entry” commands) to add filter entries. You can add multiple filter entries to an ACL. You can insert a new filter entry into the middle of an existing list by specifying the appropriate sequence number. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Then use the **access-group** or the **match access-group** command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

**Example** To add a filter entry to access-list named “my-list” that will permit TCP packets with a destination address of 192.168.1.1, a destination port of 80, from any source, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# permit tcp any 192.168.1.1/32 eq 80
```

- show running-config**
- show access-list (IPv4 Hardware ACLs)**

**Command changes**

Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

# show access-group

**Overview** Use this command to show the access-lists attached globally. If an access-list is specified, only that access-list will be displayed.

**Syntax** show access-group [{<3000-3699>|<4000-4699>|<access-list-name>}]

| Parameter          | Description                               |
|--------------------|-------------------------------------------|
| <3000-3699>        | Specify a Hardware IP access-list.        |
| <4000-4699>        | Specify a Hardware MAC access-list.       |
| <access-list-name> | Specify a Hardware IPv4 access-list name. |

**Mode** User Exec and Privileged Exec

**Example** To show all access-lists attached globally:

```
awplus# show access-group
```

**Output** The following shows typical output.

## Example output from show access-group

```
Global access control list
access-group 3000
access-group 4000
```

**Related commands**

- [access-group](#)
- [show access-list counters](#)
- [show interface access-group](#)

## show access-list (IPv4 Hardware ACLs)

**Overview** Use this command to display the specified access-list, or all access-lists if none have been specified. Note that only defined access-lists are displayed. An error message is displayed for an undefined access-list.

**Syntax** `show access-list [<1-99>|<100-199>|<1300-1999>|<2000-2699>|<3000-3699>| <4000-4499>|<access-list-name>]`

| Parameter          | Description                                          |
|--------------------|------------------------------------------------------|
| <1-99>             | IP standard access-list.                             |
| <100-199>          | IP extended access-list.                             |
| <1300-1999>        | IP standard access-list (standard - expanded range). |
| <2000-2699>        | IP extended access-list (extended - expanded range). |
| <3000-3699>        | Hardware IP access-list.                             |
| <4000-4499>        | Hardware MAC access-list.                            |
| <access-list-name> | IP named access-list.                                |

**Mode** User Exec and Privileged Exec

**Examples** To show all access-lists configured on the switch:

```
awplus# show access-list
```

```
Standard IP access list 1
  deny 172.16.2.0, wildcard bits 0.0.0.255
Standard IP access list 20
  deny 192.168.10.0, wildcard bits 0.0.0.255
  deny 192.168.12.0, wildcard bits 0.0.0.255
Hardware IP access list 3001
  permit ip 192.168.20.0 255.255.255.0 any
Hardware IP access list 3020
  permit tcp any 192.0.2.0/24
```

To show the access-list with an ID of 20:

```
awplus# show access-list 20
```

```
Standard IP access-list 20
  deny 192.168.10.0, wildcard bits 0.0.0.255
  deny 192.168.12.0, wildcard bits 0.0.0.255
```

ACLs that are added dynamically during port authentication will be displayed with the label 'dynamic':

```
awplus# show access-list
```

```
Hardware IP access list 3000
  4 permit ip any any
Hardware IP access list 3001
  4 deny ip 192.168.0.0/24 any
Hardware IP access list dacl-port1.0.49-eccd.6dc9.c0d2 (dynamic)
  4 permit ip 192.168.1.0/24 192.168.2.0/24
  8 deny ip 192.168.1.0/24 any
```

The following error message is displayed if you try to show an undefined access-list.

```
awplus# show access-list 2
```

```
% Can't find access-list 2
```

**Related commands** [access-list extended \(named\)](#)  
[access-list \(numbered hardware ACL for MAC addresses\)](#)  
[access-list hardware \(named hardware ACL\)](#)

# show access-list counters

**Overview** Use this command to show the number of packets that match one or all of your hardware ACLs. Every time a hardware ACL allows or drops a packet, its counter increments. This lets you check your ACL configuration.

**Syntax** show access-list counters [<acl>]

| Parameter | Description                                                                                            |
|-----------|--------------------------------------------------------------------------------------------------------|
| <acl>     | Display the number of packets that match only the specified ACL. You can enter the ACL name or number. |

**Mode** User Exec and Privileged Exec

**Usage notes** This command displays the counter values since the last time they were cleared. To clear the counter values, enter the command **clear access-list counters**.

To accurately measure the number of packet hits per ACL, you need to read the counters for all ACLs frequently.

**Example** To show the number of packets that match all hardware ACLs, use the following command:

```
awplus# show access-list counters
```

**Output** The following shows typical output.

## Example output from show access-list counters

```
awplus#show access-list counters
Hardware ACL Packet Counters

ACL-1
Packet Hits: 17
ACL-2
Packet Hits: 0
ACL-3
Packet Hits: 1
```

**Output** The following shows typical output.

**Example output from show access-list counters ACL-1**

```
awplus#show access-list counters ACL-1
Hardware ACL Packet Counters

ACL-1
Packet Hits: 17
```

**Parameters in the output from show access-list counters**

| Parameter   | Description                                                                                    |
|-------------|------------------------------------------------------------------------------------------------|
| Packet Hits | The number of packets that match the ACL. The count includes both dropped and allowed packets. |

**Related commands** [clear access-list counters](#)  
[show access-group](#)  
[show interface access-group](#)

**Command changes** Version 5.5.2-2.1: reading the counters no longer clears them  
Version 5.5.1-2.1: command added

# show acl-group ip address

**Overview** Use this command to show the hosts and subnets in a named IPv4 ACL group.

**Syntax** show acl-group ip address <group>

| Parameter | Description                     |
|-----------|---------------------------------|
| <group>   | The name of the IPv4 ACL group. |

**Mode** Privileged Exec

**Example** To show all hosts and subnets in an IPv4 ACL group IPV4\_GROUP1, use the command:

```
awplus# show acl-group ip address IPV4_GROUP1
```

**Output** The following shows typical output.

**Example output from show acl-group ip address IPV4\_GROUP1**

```
awplus#show acl-group ip address IPV4_GROUP1
Host Group: IPV4_GROUP1

192.168.1.2/32
192.168.2.5/32
10.0.0.0/8
```

**Related commands** [acl-group ip address](#)  
[ip \(ip-host-group\)](#)

**Command changes** Version 5.5.0-1.1: command added

# show acl-group ip port

**Overview** Use this command to show the port rules in a named port ACL group.

**Syntax** show acl-group ip port <group>

| Parameter | Description                     |
|-----------|---------------------------------|
| <group>   | The name of the port ACL group. |

**Mode** Privileged Exec

**Example** To show all port rules in a port ACL group PORT\_GROUP1, use the command:

```
awplus# show acl-group ip port PORT_GROUP1
```

**Output** The following shows typical output.

**Example output from show acl-group ip port PORT\_GROUP1**

```
awplus#show acl-group ip port PORT_GROUP1
Port Group: PORT_GROUP1

eq 11
gt 20
lt 503
ne 500
```

**Related commands** (acl-group ip port range)  
acl-group ip port

**Command changes** Version 5.5.0-1.1: command added

# show interface access-group

**Overview** Use this command to display the access groups attached to a port. If an access group is specified, then the output only includes the ports that the specified access group is attached to. If no access group is specified then this command displays all access groups that are attached to the ports that are specified with <port-list>.

Note that **access group** is the term given for an access-list when it is applied to an interface.

**Syntax** show interface <port-list> access-group [<3000-3699>|<4000-4699>|<access-list-name>]  
show interface <port-list> access-group [<3000-3699>|<4000-4699>]

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <port-list>        | Specify the ports to display information. A port-list can be either: <ul style="list-style-type: none"><li>• a switch port (e.g. port1.0.6) a static channel group (e.g. sa2) or a dynamic (LACP) channel group (e.g. po2)</li><li>• a continuous range of ports separated by a hyphen, e.g. port1.0.1-1.0.6 or port1.0.1-port1.0.6 or po1-po2</li><li>• a comma-separated list of ports and port ranges, e.g. port1.0.1,port1.0.3-1.0.6. Do not mix switch ports, static channel groups, and LACP channel groups in the same list.</li></ul> |
| access group       | Select the access group whose details you want to show.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <3000-3699>        | Specifies the Hardware IP access-list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <4000-4699>        | Specifies the Hardware MAC access-list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <access-list-name> | Specify the Hardware IPv4 access-list name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Mode** User Exec and Privileged Exec

**Example** To show all access-lists attached to port1.0.1, use the command:

```
awplus# show interface port1.0.1 access-group
```

**Output** The following shows typical output.

**Example output from the show interface access-group command**

```
Interface port1.0.1
  access-group 3000
  access-group 3002
  access-group 3001
```

# Introduction

**Overview** This chapter provides an alphabetical reference for the IPv4 Software Access Control List (ACL) commands, and contains detailed command information and command examples about IPv4 software ACLs as applied to Routing and Multicasting, which are not applied to interfaces.

For information about ACLs, see the [ACL Feature Overview and Configuration Guide](#).

To apply ACLs to an LACP channel group, apply it to all the individual switch ports in the channel group. To apply ACLs to a static channel group, apply it to the static channel group itself. For more information on link aggregation see the following references:

- the [Link Aggregation Feature Overview\\_and\\_Configuration\\_Guide](#).
- [Link Aggregation Commands](#)

**NOTE:** Text in parenthesis in command names indicates usage not keyword entry. For example, indicates named IPv4 hardware ACLs entered as <> where <> is a placeholder not a keyword.

Parenthesis surrounding ACL filters indicates the type of ACL filter not the keyword entry in the CLI, such as (**access-list standard numbered filter**) represents command entry in the format shown in the syntax:

```
[<sequence-number>] {deny|permit} {<source-address>|host <host-address>|any}
```

**deny**explicitly permitted

**Sub-modes** Many of the ACL commands operate from sub-modes that are specific to particular ACL types. The following table shows the CLI prompts at which ACL commands are entered.

### IPv4 Software Access List Commands and Prompts

| Command Name                              | Command Mode                    | Prompt                     |
|-------------------------------------------|---------------------------------|----------------------------|
| show ip access-list                       | Privileged Exec                 | awplus#                    |
| access-group                              | Global Configuration            | awplus(config)#            |
| access-list (extended named)              | Global Configuration            | awplus(config)#            |
| access-list (extended numbered)           | Global Configuration            | awplus(config)#            |
| access-list (standard named)              | Global Configuration            | awplus(config)#            |
| access-list (standard numbered)           | Global Configuration            | awplus(config)#            |
| maximum-access-list                       | Global Configuration            | awplus(config)#            |
| (access-list extended ICMP filter)        | IPv4 Extended ACL Configuration | awplus(config-ip-ext-acl)# |
| (access-list extended IP filter)          | IPv4 Extended ACL Configuration | awplus(config-ip-ext-acl)# |
| (access-list extended IP protocol filter) | IPv4 Extended ACL Configuration | awplus(config-ip-ext-acl)# |
| (access-list extended TCP UDP filter)     | IPv4 Extended ACL Configuration | awplus(config-ip-ext-acl)# |
| (access-list standard named filter)       | IPv4 Standard ACL Configuration | awplus(config-ip-std-acl)# |
| (access-list standard numbered filter)    | IPv4 Standard ACL Configuration | awplus(config-ip-std-acl)# |

## access-list extended (named)

**Overview** This command configures an extended named access-list that permits or denies packets from specific source and destination IP addresses. You can:

- use this command to enter a new or existing ACL name and enter the IPv4 Extended ACL Configuration mode. Once in that mode, you can create an ACL filter entry. This approach lets you give the entry a sequence number.
- or, use this command to create an ACL and an ACL filter entry at the same time. With this approach, you cannot give the entry a sequence number, so the entry will go after any existing entries.

The **no** variant of this command removes a specified extended named access-list.

**Syntax [to enter the sub-mode]** access-list extended *<list-name>*  
no access-list extended *<list-name>*

| Parameter                | Description                             |
|--------------------------|-----------------------------------------|
| <i>&lt;list-name&gt;</i> | A user-defined name for the access-list |

**Syntax [icmp]** access-list extended <list-name> {deny|permit} icmp <source>  
<destination> [icmp-type <type-number>] [log]  
no access-list extended <list-name> {deny|permit} icmp <source>  
<destination> [icmp-type <type-number>] [log]

#### Parameters in the access-list extended (named) command - icmp

| Parameter     | Description                                                                                                                                                                       |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <list-name>   | A user-defined name for the access-list.                                                                                                                                          |
| deny          | The access-list rejects packets that match the type, source, and destination filtering specified with this command.                                                               |
| permit        | The access-list permits packets that match the type, source, and destination filtering specified with this command.                                                               |
| icmp          | The access-list matches only ICMP packets.                                                                                                                                        |
| icmp-type     | Matches only a specified type of ICMP messages. This is valid only when the filtering is set to match ICMP packets.                                                               |
| <source>      | The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:                        |
|               | any Matches any source IP address.                                                                                                                                                |
|               | host <ip-addr> Matches a single source host with the IP address given by <ip-addr> in dotted decimal notation.                                                                    |
|               | <ip-addr>/<prefix> An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.                          |
|               | <ip-addr><reverse-mask> Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering 192.168.1.1 0.0.0.255 is the same as entering 192.168.1.1/24. |
| <destination> | The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:         |
|               | any Matches any destination IP address.                                                                                                                                           |

| Parameter                   | Description                                                                                                                                               |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| host <ip-addr>              | Matches a single destination host with the IP address given by <ip-addr> in dotted decimal notation.                                                      |
| <ip-addr>/<br><prefix>      | An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.                |
| <ip-addr><br><reverse-mask> | Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering 192.168.1.1 0.0.0.255 is the same as entering 192.168.1.1/24. |
| <type-number>               | The ICMP type, as defined in RFC792 and RFC950. Specify one of the following integers to create a filter for the ICMP message type:                       |
| 0                           | Echo replies.                                                                                                                                             |
| 3                           | Destination unreachable messages.                                                                                                                         |
| 4                           | Source quench messages.                                                                                                                                   |
| 5                           | Redirect (change route) messages.                                                                                                                         |
| 8                           | Echo requests.                                                                                                                                            |
| 11                          | Time exceeded messages.                                                                                                                                   |
| 12                          | Parameter problem messages.                                                                                                                               |
| 13                          | Timestamp requests.                                                                                                                                       |
| 14                          | Timestamp replies.                                                                                                                                        |
| 15                          | Information requests.                                                                                                                                     |
| 16                          | Information replies.                                                                                                                                      |
| 17                          | Address mask requests.                                                                                                                                    |
| 18                          | Address mask replies.                                                                                                                                     |
| log                         | Logs the results.                                                                                                                                         |

**Syntax [tcp|udp]** access-list extended <list-name> {deny|permit} {tcp|udp}  
<source> [eq <sourceport>|lt <sourceport>|gt <sourceport>|ne  
<sourceport>] <destination> [eq <destport>|lt <destport>|gt  
<destport>|ne <destport>] [log]  
no access-list extended <list-name> {deny|permit} {tcp|udp}  
<source> [eq <sourceport>|lt <sourceport>|gt <sourceport>|ne  
<sourceport>] <destination> [eq <destport> |lt <destport>|gt  
<destport>|ne <destport>][log]

#### Parameters in the access-list extended (named) command - tcp|udp

| Parameter                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |     |                                |                |                                                                                                 |                        |                                                                                                                                       |                             |                                                                                                                                                           |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|--------------------------------|----------------|-------------------------------------------------------------------------------------------------|------------------------|---------------------------------------------------------------------------------------------------------------------------------------|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <list-name>                 | A user-defined name for the access-list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |     |                                |                |                                                                                                 |                        |                                                                                                                                       |                             |                                                                                                                                                           |
| deny                        | The access-list rejects packets that match the type, source, and destination filtering specified with this command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |     |                                |                |                                                                                                 |                        |                                                                                                                                       |                             |                                                                                                                                                           |
| permit                      | The access-list permits packets that match the type, source, and destination filtering specified with this command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |     |                                |                |                                                                                                 |                        |                                                                                                                                       |                             |                                                                                                                                                           |
| tcp                         | The access-list matches only TCP packets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |     |                                |                |                                                                                                 |                        |                                                                                                                                       |                             |                                                                                                                                                           |
| udp                         | The access-list matches only UDP packets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |     |                                |                |                                                                                                 |                        |                                                                                                                                       |                             |                                                                                                                                                           |
| <source>                    | The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source: <table border="1"> <tr> <td>any</td><td>Matches any source IP address.</td></tr> <tr> <td>host &lt;ip-addr&gt;</td><td>Matches a single source host with the IP address given by &lt;ip-addr&gt; in dotted decimal notation.</td></tr> <tr> <td>&lt;ip-addr&gt;/<br/>&lt;prefix&gt;</td><td>An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.</td></tr> <tr> <td>&lt;ip-addr&gt;<br/>&lt;reverse-mask&gt;</td><td>Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering 192.168.1.1 0.0.0.255 is the same as entering 192.168.1.1/24.</td></tr> </table> | any | Matches any source IP address. | host <ip-addr> | Matches a single source host with the IP address given by <ip-addr> in dotted decimal notation. | <ip-addr>/<br><prefix> | An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet. | <ip-addr><br><reverse-mask> | Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering 192.168.1.1 0.0.0.255 is the same as entering 192.168.1.1/24. |
| any                         | Matches any source IP address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |     |                                |                |                                                                                                 |                        |                                                                                                                                       |                             |                                                                                                                                                           |
| host <ip-addr>              | Matches a single source host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |     |                                |                |                                                                                                 |                        |                                                                                                                                       |                             |                                                                                                                                                           |
| <ip-addr>/<br><prefix>      | An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |     |                                |                |                                                                                                 |                        |                                                                                                                                       |                             |                                                                                                                                                           |
| <ip-addr><br><reverse-mask> | Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering 192.168.1.1 0.0.0.255 is the same as entering 192.168.1.1/24.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |     |                                |                |                                                                                                 |                        |                                                                                                                                       |                             |                                                                                                                                                           |
| <destination>               | The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |     |                                |                |                                                                                                 |                        |                                                                                                                                       |                             |                                                                                                                                                           |

| Parameter                 | Description                                                                                                                                                                                             |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                           | any<br>Matches any destination IP address.                                                                                                                                                              |
|                           | host <i>&lt;ip-addr&gt;</i><br>Matches a single destination host with the IP address given by <i>&lt;ip-addr&gt;</i> in dotted decimal notation.                                                        |
|                           | <i>&lt;ip-addr&gt;/&lt;prefix&gt;</i><br>An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.                     |
|                           | <i>&lt;ip-addr&gt;&lt;reverse-mask&gt;</i><br>Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering 192.168.1.1 0.0.0.255 is the same as entering 192.168.1.1/24. |
| <i>&lt;sourceport&gt;</i> | The source port number, specified as an integer between 0 and 65535.                                                                                                                                    |
| <i>&lt;destport&gt;</i>   | The destination port number, specified as an integer between 0 and 65535.                                                                                                                               |
| eq                        | Matches port numbers equal to the port number specified immediately after this parameter.                                                                                                               |
| lt                        | Matches port numbers less than the port number specified immediately after this parameter.                                                                                                              |
| gt                        | Matches port numbers greater than the port number specified immediately after this parameter.                                                                                                           |
| ne                        | Matches port numbers not equal to the port number specified immediately after this parameter.                                                                                                           |

| host <ip-addr>          | Matches a single source host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |     |                                     |                |                                                                                                 |                    |                                                                                                                                       |                         |                                                                                                                                                          |
| <ip-addr>/<prefix>      | An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |     |                                     |                |                                                                                                 |                    |                                                                                                                                       |                         |                                                                                                                                                          |
| <ip-addr><reverse-mask> | Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering 192.168.1.10.0.0.255 is the same as entering 192.168.1.1/24.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |     |                                     |                |                                                                                                 |                    |                                                                                                                                       |                         |                                                                                                                                                          |
| <destination>           | <p>The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:</p> <table> <tr> <td>any</td><td>Matches any destination IP address.</td></tr> </table>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | any | Matches any destination IP address. |                |                                                                                                 |                    |                                                                                                                                       |                         |                                                                                                                                                          |
| any                     | Matches any destination IP address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |     |                                     |                |                                                                                                 |                    |                                                                                                                                       |                         |                                                                                                                                                          |

| Parameter               | Description                                                                                                                                                                                                                                                    |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| host <ip-addr>          | Matches a single destination host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                                                           |
| <ip-addr>/<prefix>      | An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.                                                                                                                     |
| <ip-addr><reverse-mask> | Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering 192.168.1.10.0.0.255 is the same as entering 192.168.1.1/24.                                                                                                       |
| log                     | Logs the results.                                                                                                                                                                                                                                              |
| <ip-protocol>           | The IP protocol number, as defined by IANA (Internet Assigned Numbers Authority <a href="http://www.iana.org/assignments/protocol-numbers">www.iana.org/assignments/protocol-numbers</a> ) See below for a list of IP protocol numbers and their descriptions. |

### IP protocol number and description

| Protocol Number | Protocol Description [RFC]                             |
|-----------------|--------------------------------------------------------|
| 1               | Internet Control Message [RFC792]                      |
| 2               | Internet Group Management [RFC1112]                    |
| 3               | Gateway-to-Gateway [RFC823]                            |
| 4               | IP in IP [RFC2003]                                     |
| 5               | Stream [RFC1190] [RFC1819]                             |
| 6               | TCP (Transmission Control Protocol) [RFC793]           |
| 8               | EGP (Exterior Gateway Protocol) [RFC888]               |
| 9               | IGP (Interior Gateway Protocol) [IANA]                 |
| 11              | Network Voice Protocol [RFC741]                        |
| 17              | UDP (User Datagram Protocol) [RFC768]                  |
| 20              | Host monitoring [RFC869]                               |
| 27              | RDP (Reliable Data Protocol) [RFC908]                  |
| 28              | IRTP (Internet Reliable Transaction Protocol) [RFC938] |

| Protocol Number | Protocol Description [RFC]                            |
|-----------------|-------------------------------------------------------|
| 29              | ISO-TP4 (ISO Transport Protocol Class 4) [RFC905]     |
| 30              | Bulk Data Transfer Protocol [RFC969]                  |
| 33              | DCCP (Datagram Congestion Control Protocol) [RFC4340] |

**Mode** Global Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage** Use this command when configuring access-lists for filtering IP software packets.

You can either create access-lists from within this command, or you can enter **access-list extended** followed by only the name. Entering only the name moves you to the IPv4 Extended ACL Configuration mode for the selected access-list. From there you can configure your access-lists by using the commands **(access-list extended ICMP filter)**, **(access-list extended IP filter)**, and **(access-list extended IP protocol filter)**.

Note that packets must match both the source and the destination details.

**NOTE:**

Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Examples** You can enter the extended named ACL in the Global Configuration mode together with the ACL filter entry on the same line, as shown below:

```
awplus# configure terminal
awplus(config)# access-list extended TK deny tcp 2.2.2.3/24 eq
14 3.3.3.4/24 eq 12 log
```

Alternatively, you can enter the extended named ACL in Global Configuration mode before specifying the ACL filter entry in the IPv4 Extended ACL Configuration mode, as shown below:

```
awplus# configure terminal
awplus(config)# access-list extended TK
awplus(config-ip-ext-acl)# deny tcp 2.2.2.3/24 eq 14 3.3.3.4/24
eq 12 log
```

**Related commands** **(access-list extended ICMP filter)**  
**(access-list extended IP filter)**  
**(access-list extended TCP UDP filter)**  
**show access-group**  
**show interface access-group**  
**show ip access-list**  
**show running-config**

## access-list (extended numbered)

**Overview** This command configures an extended numbered access-list that permits or denies packets from specific source and destination IP addresses. You can:

- use this command to enter a new or existing ACL number and enter the IPv4 Extended ACL Configuration mode. Once in that mode, you can create an ACL filter entry. This approach lets you give the entry a sequence number.
- or, use this command to create an ACL and an ACL filter entry at the same time. With this approach, you cannot give the entry a sequence number, so the entry will go after any existing entries.

The **no** variant of this command removes a specified extended named access-list.

**Syntax [to enter the sub-mode]**

```
access-list {<100-199>|<2000-2699>}  
no access-list {<100-199>|<2000-2699>}
```

**Syntax [to create an ACL entry]** `access-list {<100-199>|<2000-2699>} {deny|permit} ip <source> <destination>`  
`no access-list {<100-199>|<2000-2699>} {deny|permit} ip <source> <destination>`

| Parameter                   | Description                                                                                                                                                                                                                    |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <100-199>                   | IP extended access-list.                                                                                                                                                                                                       |
| <2000-2699>                 | IP extended access-list (expanded range).                                                                                                                                                                                      |
| deny                        | Access-list rejects packets that match the source and destination filtering specified with this command.                                                                                                                       |
| permit                      | Access-list permits packets that match the source and destination filtering specified with this command.                                                                                                                       |
| <source>                    | The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:                                                                     |
| any                         | Matches any source IP address.                                                                                                                                                                                                 |
| host <ip-addr>              | Matches a single source host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                                |
| <ip-addr><br><reverse-mask> | An IPv4 address, followed by a reverse mask in dotted decimal format. For example, entering 192.168.1.1 0.0.0.255 is the same as entering 192.168.1.1/24. This matches any source IP address within the specified subnet.      |
| <destination>               | The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:                                                      |
| any                         | Matches any destination IP address.                                                                                                                                                                                            |
| host <ip-addr>              | Matches a single destination host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                           |
| <ip-addr><br><reverse-mask> | An IPv4 address, followed by a reverse mask in dotted decimal format. For example, entering 192.168.1.1 0.0.0.255 is the same as entering 192.168.1.1/24. This matches any destination IP address within the specified subnet. |

**Mode** Global Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage notes** Use this command when configuring access-list for filtering IP software packets.

You can either create access-lists from within this command, or you can enter **access - list** followed by only the number. Entering only the number moves you to the IPv4 Extended ACL Configuration mode for the selected access-list. From there you can configure your access-lists by using the commands **(access-list extended ICMP filter)**, **(access-list extended IP filter)**, and **(access-list extended IP protocol filter)**.

Note that packets must match both the source and the destination details.

**NOTE:** *Software ACLs will access unless by an ACL action.*

**Examples** You can enter the extended ACL in the Global Configuration mode together with the ACL filter entry on the same line, as shown below:

```
awplus# configure terminal
awplus(config)# access-list 101 deny ip 172.16.10.0 0.0.0.255
any
```

Alternatively, you can enter the extended ACL in Global Configuration mode before specifying the ACL filter entry in the IPv4 Extended ACL Configuration mode, as shown below:

```
awplus# configure terminal
awplus(config)# access-list 101
awplus(config-ip-ext-acl)# deny ip 172.16.10.0 0.0.0.255 any
```

- (access-list extended TCP UDP filter)**
- show access-group**
- show interface access-group**
- show ip access-list**
- show running-config**

## (access-list extended ICMP filter)

**Overview** Use this ACL filter to add a new ICMP filter entry to the current extended access-list. If the sequence number is specified, the new filter is inserted at the specified location. Otherwise, the new filter is added at the end of the access-list.

The **no** variant of this command removes an ICMP filter entry from the current extended access-list. You can specify the ICMP filter entry for removal by entering either its sequence number (e.g. **no 10**), or by entering its ICMP filter profile without specifying its sequence number.

Note that the sequence number can be found by running the **show access-list (IPv4 Software ACLs)** command.

**Syntax [icmp]** [*<sequence-number>*] {deny|permit} icmp *<source>* *<destination>*  
[icmp-type *<icmp-value>*] [log]  
no {deny|permit} icmp *<source>* *<destination>*[icmp-type *<icmp-value>*] [log]  
no *<sequence-number>*

| Parameter                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                       |                                                                                                                                            |     |                                     |

**Mode** IPv4 Extended ACL Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage notes** An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 4 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

**NOTE:** *The access control list being configured is selected by running the command or the command, with the required access control list number, or name - but with no further parameters selected.*

*Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.*

**Examples** To add a new entry in access-list called 'my-list' that will reject ICMP packets from 10.0.0.1 to 192.168.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# access-list extended my-list
awplus(config-ip-ext-acl)# deny icmp 10.0.0.1/32 192.168.1.1/32
```

Use the following commands to add a new filter at sequence number 5 position of the access-list called 'my-list'. The filter will accept the ICMP type 8 packets from 10.1.1.0/24 network, to 192.168.1.0 network:

```
awplus# configure terminal
awplus(config)# access-list extended my-list
awplus(config-ip-ext-acl)# 5 permit icmp 10.1.1.0/24
192.168.1.0/24 icmp-type 8
```

**Related commands**

- show access-group**
- show interface access-group**
- show running-config**
- show ip access-list**

## (access-list extended IP filter)

**Overview** Use this ACL filter to add a new IP filter entry to the current extended access-list. If the sequence number is specified, the new filter is inserted at the specified location. Otherwise, the new filter is added at the end of the access-list.

The **no** variant of this command removes an IP filter entry from the current extended access-list. You can specify the IP filter entry for removal by entering either its sequence number (e.g. **no 10**), or by entering its IP filter profile without specifying its sequence number.

Note that the sequence number can be found by running the **show access-list (IPv4 Software ACLs)** command.

**Syntax [ip]** [*<sequence-number>*] {deny|permit} ip *<source>* *<destination>*  
no {deny|permit} ip *<source>* *<destination>*  
no *<sequence-number>*

**Mode** Extended ACL Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage notes** An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 4 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

**NOTE:** *The access control list being configured is selected by running the command or the command, with the required access control list number, or name - but with no further parameters selected.*

*Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.*

**Example 1** First use the following commands to enter the IPv4 Extended ACL  
**[list-number]** Configuration mode and define a numbered extended access-list 101:

```
awplus# configure terminal
awplus(config)# access-list 101
awplus(config-ip-ext-acl)#
```

Then use the following commands to add a new entry to the numbered extended access-list 101 that will reject packets from 10.0.0.1 to 192.168.1.1:

```
awplus(config-ip-ext-acl)# deny ip host 10.0.0.1 host
192.168.1.1
awplus(config-ip-ext-acl)# 20 permit ip any any
```

**Example 2** First use the following commands to enter the IPv4 Extended ACL  
**[list-name]** Configuration mode and define a named access-list called 'my-acl':

```
awplus# configure terminal
awplus(config)# access-list extended my-acl
awplus(config-ip-ext-acl)#
```

Then use the following commands to add a new entry to the named access-list 'my-acl' that will reject packets from 10.0.0.1 to 192.168.1.1:

```
awplus(config-ip-ext-acl)# deny ip host 10.0.0.1 host
192.168.1.1
awplus(config-ip-ext-acl)# 20 permit ip any any
```

**Example 3** Use the following commands to remove the access-list filter entry with  
**[list-number]** sequence number 20 from extended numbered access-list 101.

```
awplus# configure terminal
awplus(config)# access-list 101
awplus(config-ip-ext-acl)# no 20
```

**Example 4** Use the following commands to remove the access-list filter entry with  
**[list-name]** sequence number 20 from extended named access-list my - ac l:

```
awplus# configure terminal
awplus(config)# access-list extended my-acl
awplus(config-ip-ext-acl)# no 20
```

- access-list (extended numbered)**
- show access-group**
- show interface access-group**
- show ip access-list**
- show running-config**

## (access-list extended IP protocol filter)

**Overview** Use this ACL filter to add a new IP protocol type filter entry to the current extended access-list. If the sequence number is specified, the new filter is inserted at the specified location. Otherwise, the new filter is added at the end of the access-list.

The **no** variant of this command removes an IP protocol filter entry from the current extended access-list. You can specify the IP filter entry for removal by entering either its sequence number (e.g. **no 10**), or by entering its IP filter profile without specifying its sequence number.

Note that the sequence number can be found by running the **show access-list (IPv4 Software ACLs)** command.

**Syntax** [*<sequence-number>*] {deny|permit} proto *<ip-protocol>* *<source>*  
**[proto]** *<destination>* [log]  
 no {deny|permit} proto *<ip-protocol>* *<source>* *<destination>*  
 [log]  
 no *<sequence-number>*

| <source>            | The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source: <table><tr><td>&lt;ip-addr&gt;/&lt;prefix&gt;</td><td>An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.</td></tr><tr><td>any</td><td>Matches any source IP address.</td></tr></table>                          | <ip-addr>/<prefix> | An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.      | any | Matches any source IP address.      |
| <ip-addr>/<prefix>  | An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.                                                                                                                                                                                                                                                                                                                         |                    |                                                                                                                                            |     |                                     |
| any                 | Matches any source IP address.                                                                                                                                                                                                                                                                                                                                                                                                                                |                    |                                                                                                                                            |     |                                     |
| <destination>       | The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination: <table><tr><td>&lt;ip-addr&gt;/&lt;prefix&gt;</td><td>An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.</td></tr><tr><td>any</td><td>Matches any destination IP address.</td></tr></table> | <ip-addr>/<prefix> | An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet. | any | Matches any destination IP address. |
| <ip-addr>/<prefix>  | An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.                                                                                                                                                                                                                                                                                                                    |                    |                                                                                                                                            |     |                                     |
| any                 | Matches any destination IP address.                                                                                                                                                                                                                                                                                                                                                                                                                           |                    |                                                                                                                                            |     |                                     |
| log                 | Log the results.                                                                                                                                                                                                                                                                                                                                                                                                                                              |                    |                                                                                                                                            |     |                                     |

### IP protocol number and description

**Mode** IPv4 Extended ACL Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage notes** An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 4 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

**NOTE:** *The access control list being configured is selected by running the command or the command, with the required access control list number, or name - but with no further parameters selected.*

*Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.*

**Example 1** Use the following commands to add a new access-list filter entry to the access-list named 'my-list' that will reject IP packets from source address 10.10.1.1/32 to destination address 192.68.1.1/32:

```
awplus# configure terminal
awplus(config)# access-list extended my-list
awplus(config-ip-ext-acl)# deny ip 10.10.1.1/32 192.68.1.1/32
```

**Example 2** Use the following commands to add a new access-list filter entry at sequence position 5 in the access-list named 'my-list' that will accept packets from source address 10.10.1.1/24 to destination address 192.68.1.1/24:

```
awplus# configure terminal
awplus(config)# access-list extended my-list
awplus(config-ip-ext-acl)# 5 permit ip 10.10.1.1/24
192.68.1.1/24
```

**Related commands**

- access-list extended (named)**
- access-list (extended numbered)**
- show access-group**
- show interface access-group**
- show ip access-list**
- show running-config**

## (access-list extended TCP UDP filter)

**Overview** Use this ACL filter to add a new TCP or UDP filter entry to the current extended access-list. If the sequence number is specified, the new filter is inserted at the specified location. Otherwise, the new filter is added at the end of the access-list.

The **no** variant of this command removes a TCP or UDP filter entry from the current extended access-list. You can specify the TCP or UDP filter entry for removal by entering either its sequence number (e.g. **no 10**), or by entering its TCP or UDP filter profile without specifying its sequence number.

Note that the sequence number can be found by running the **show access-list (IPv4 Software ACLs)** command.

**Syntax [tcp|udp]** [*<sequence-number>*] {deny|permit} {tcp|udp} *<source>* {eq *<sourceport>* |lt *<sourceport>*|gt *<sourceport>*|ne *<sourceport>*} *<destination>* [eq *<destport>*|lt *<destport>*|gt *<destport>*|ne *<destport>*] [log]

no [*<sequence-number>*] {deny|permit} {tcp|udp} *<source>* {eq *<sourceport>* |lt *<sourceport>*|gt *<sourceport>*|ne *<sourceport>*} *<destination>* [eq *<destport>*|lt *<destport>*|gt *<destport>*|ne *<destport>*] [log]

no *<sequence-number>*

| Parameter                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                            |                                                                                                                                            |     |                                     |

| Parameter  | Description                                                                                   |
|------------|-----------------------------------------------------------------------------------------------|
| <destport> | The destination port number, specified as an integer between 0 and 65535.                     |
| eq         | Matches port numbers equal to the port number specified immediately after this parameter.     |
| lt         | Matches port numbers less than the port number specified immediately after this parameter.    |
| gt         | Matches port numbers greater than the port number specified immediately after this parameter. |
| ne         | Matches port numbers not equal to the port number specified immediately after this parameter. |
| log        | Log the results.                                                                              |

**Mode** IPv4 Extended ACL Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage** An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 4 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

**NOTE:** *access-list (extended numbered)access-list extended (named)*

*Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.*

**Example 1** To add a new entry to the access-list named 'my-list' that will reject TCP packets from 10.0.0.1 on TCP port 10 to 192.168.1.1 on TCP port 20, use the commands:  
**[creating a list]**

```
awplus# configure terminal
awplus(config)# access-list extended my-list
awplus(config-ip-ext-acl)# deny tcp 10.0.0.1/32 eq 10
192.168.1.1/32 eq 20
```

**Example 2** To insert a new entry with sequence number 5 into the access-list named 'my-list' that will accept UDP packets from 10.1.1.0/24 network to 192.168.1.0/24 network on UDP port 80, use the commands:

```
awplus# configure terminal
awplus(config)# access-list extended my-list
awplus(config-ip-ext-acl)# 5 permit udp 10.1.1.0/24
192.168.1.0/24 eq 80
```

**Related commands**

- access-list extended (named)**
- access-list (extended numbered)**
- show access-group**
- show interface access-group**
- show ip access-list**
- show running-config**

## access-list standard (named)

**Overview** This command configures a standard named access-list that permits or denies packets from a specific source IP address. You can:

- use this command to enter a new or existing ACL name and enter the IPv4 Standard ACL Configuration mode. Once in that mode, you can create an ACL filter entry using the command (**access-list standard named filter**). This approach lets you give the entry a sequence number.
- or, use this command to create an ACL and an ACL filter entry at the same time. With this approach, you cannot give the entry a sequence number, so the entry will go after any existing entries.

The **no** variant of this command removes a specified standard named access-list.

**Syntax [to enter the sub-mode]** `access-list standard <standard-acl-name>`  
`no access-list standard <standard-acl-name>`

**Syntax [to create an ACL entry]** `access-list standard <standard-acl-name> {deny|permit} {any|<ip-addr>/<prefix>}`  
`no access-list standard <standard-acl-name> {deny|permit} {any|<ip-addr>/<prefix>}`

| Parameter                                   | Description                                                                                                                                                                                                          |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;standard-acl-name&gt;</code>      | Specify a name for the standard access-list.                                                                                                                                                                         |
| <code>deny</code>                           | The access-list rejects packets that match the source filtering specified with this command.                                                                                                                         |
| <code>permit</code>                         | The access-list permits packets that match the source filtering specified with this command.                                                                                                                         |
| <code>any</code>                            | Match any source IP address.                                                                                                                                                                                         |
| <code>&lt;ip-addr&gt;/&lt;prefix&gt;</code> | Match the source address of the packets. Specify an IPv4 address in dotted decimal format, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet. |

**Mode** Global Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage notes** Use this command when configuring a standard named access-list for filtering IP software packets.

You can either create access-lists from within this command, or you can enter **access-list standard** followed by only the name. Entering only the name moves you to the IPv4 Standard ACL Configuration mode for the selected access-list. From there you can configure your access-lists by using the command **(access-list standard named filter)**.

**NOTE:** *Software ACLs will access unless by an ACL action.*

**Examples** To define a standard access-list named 'my-list' and deny any packets from any source, use the commands:

```
awplus# configure terminal
awplus(config)# access-list standard my-list deny any
```

Alternatively, to define a standard access-list named 'my-list' and enter the IPv4 Standard ACL Configuration mode, and then create ACL entry 5 to deny any packets from any source, use the commands:

```
awplus# configure terminal
awplus(config)# access-list standard my-list
awplus(config-ip-std-acl)# 5 deny any
```

**Related commands** **(access-list standard named filter)**  
**show access-group**  
**show interface access-group**  
**show ip access-list**  
**show running-config**

## access-list (standard numbered)

**Overview** This command configures a standard numbered access-list that permits or denies packets from a specific source IP address. You can:

- use this command to enter a new or existing ACL number and enter the IPv4 Standard ACL Configuration mode. Once in that mode, you can create an ACL filter entry using the command (**access-list standard numbered filter**). This approach lets you give the entry a sequence number.
- or, use this command to create an ACL and an ACL filter entry at the same time. With this approach, you cannot give the entry a sequence number, so the entry will go after any existing entries.

The **no** variant of this command removes a specified standard numbered access-list.

**Syntax [to enter the sub-mode]**

```
access-list {<1-99>|<1300-1999>}  
no access-list {<1-99>|<1300-1999>}
```

**Syntax [to create an ACL entry]**

```
access-list {<1-99>|<1300-1999>} {deny|permit} <source>  
no access-list {<1-99>|<1300-1999>} {deny|permit} <source>
```

| <1-99>                      | IP standard access-list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                             |                                                                                                                                                                    |           |                                                                                             |                |                                                                                             |     |                     |
| <1300-1999>                 | IP standard access-list (expanded range).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                             |                                                                                                                                                                    |           |                                                                                             |                |                                                                                             |     |                     |
| deny                        | Access-list rejects packets from the specified source.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                             |                                                                                                                                                                    |           |                                                                                             |                |                                                                                             |     |                     |
| permit                      | Access-list accepts packets from the specified source.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                             |                                                                                                                                                                    |           |                                                                                             |                |                                                                                             |     |                     |
| <source>                    | The source address of the packets. The following are the valid formats for specifying the source: <table><tr><td>&lt;ip-addr&gt;<br/>&lt;reverse-mask&gt;</td><td>A source subnet, specified by entering the address and a reverse mask in dotted decimal format. For example, 192.168.1.0 0.0.0.255 (equivalent to 192.168.1.0/24).</td></tr><tr><td>&lt;ip-addr&gt;</td><td>A single source address to match. The source address is specified in dotted decimal format.</td></tr><tr><td>host &lt;ip-addr&gt;</td><td>A single source address to match. The source address is specified in dotted decimal format.</td></tr><tr><td>any</td><td>Any source address.</td></tr></table> | <ip-addr><br><reverse-mask> | A source subnet, specified by entering the address and a reverse mask in dotted decimal format. For example, 192.168.1.0 0.0.0.255 (equivalent to 192.168.1.0/24). | <ip-addr> | A single source address to match. The source address is specified in dotted decimal format. | host <ip-addr> | A single source address to match. The source address is specified in dotted decimal format. | any | Any source address. |
| <ip-addr><br><reverse-mask> | A source subnet, specified by entering the address and a reverse mask in dotted decimal format. For example, 192.168.1.0 0.0.0.255 (equivalent to 192.168.1.0/24).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                             |                                                                                                                                                                    |           |                                                                                             |                |                                                                                             |     |                     |
| <ip-addr>                   | A single source address to match. The source address is specified in dotted decimal format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                             |                                                                                                                                                                    |           |                                                                                             |                |                                                                                             |     |                     |
| host <ip-addr>              | A single source address to match. The source address is specified in dotted decimal format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                             |                                                                                                                                                                    |           |                                                                                             |                |                                                                                             |     |                     |
| any                         | Any source address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                             |                                                                                                                                                                    |           |                                                                                             |                |                                                                                             |     |                     |

**Mode** Global Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage notes** Use this command when configuring a standard numbered access-list for filtering IP software packets.

You can either create access-lists from within this command, or you can enter **access-list** followed by only the number. Entering only the number moves you to the IPv4 Standard ACL Configuration mode for the selected access-list. From there you can configure your access-lists by using the command **(access-list standard numbered filter)**.

**NOTE:** *Software ACLs will access unless by an ACL action.*

**Examples** To create ACL number 67 that will deny packets from subnet 172.16.10.0, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 67 deny 172.16.10.0 0.0.0.255
```

Alternatively, to define ACL number 67 and enter the IPv4 Standard ACL Configuration mode, and then create ACL entry 5 to deny any packets from subnet 172.16.10.0, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 67
awplus(config-ip-std-acl)# 5 deny 172.16.10.0 0.0.0.255
```

**Related commands** **(access-list standard numbered filter)**  
**show access-group**  
**show interface access-group**  
**show ip access-list**  
**show running-config**

## (access-list standard named filter)

**Overview** This ACL filter adds a source IP address filter entry to a current named standard access-list. If the sequence number is specified, the new filter entry is inserted at the specified location. Otherwise, the new entry is added at the end of the access-list.

The **no** variant of this command removes a source IP address filter entry from the current named standard access-list. You can specify the source IP address filter entry for removal by entering either its sequence number (e.g. **no 10**), or by entering its source IP address filter profile without specifying its sequence number (e.g. **no deny any**).

Note that you can find the sequence number by running the **show access-list (IPv4 Software ACLs)** command.

**Syntax** [*<sequence-number>*] {deny|permit} {any|*<ip-addr>/<prefix>*  
[exact-match]}  
no *<sequence-number>*  
no {deny|permit} {any|*<ip-addr>/<prefix>* [exact-match]}

| Parameter                             | Description                                                                                                                                                                                                          |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;sequence-number&gt;</i>        | <1-65535><br><br>The sequence number for the filter entry of the selected access control list.                                                                                                                       |
| deny                                  | Access-list rejects packets of the source filtering specified.                                                                                                                                                       |
| permit                                | Access-list allows packets of the source filtering specified                                                                                                                                                         |
| any                                   | Match any source IP address.                                                                                                                                                                                         |
| <i>&lt;ip-addr&gt;/&lt;prefix&gt;</i> | Match the source address of the packets. Specify an IPv4 address in dotted decimal format, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet. |
| exact-match                           | Specify an exact IP prefix to match on.                                                                                                                                                                              |

**Mode** IPv4 Standard ACL Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage notes** An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 4 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

**NOTE:** *The access control list being configured is selected by running the command with the required access control list name, but with no further parameters selected.*

*Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.*

**Examples** Use the following commands to add a new filter entry to access-list 'my-list' that will reject IP address 10.1.1.1:

```
awplus# configure terminal
awplus(config)# access-list standard my-list
awplus(config-ip-std-acl)# deny 10.1.1.1/32
```

Use the following commands to insert a new filter entry into access-list 'my-list' at sequence position number 15 that will accept IP network 10.1.2.0:

```
awplus# configure terminal
awplus(config)# access-list standard my-list
awplus(config-ip-std-acl)# 15 permit 10.1.2.0/24
```

## (access-list standard numbered filter)

**Overview** This ACL filter adds a source IP address filter entry to a current standard numbered access-list. If a sequence number is specified, the new filter entry is inserted at the specified location. Otherwise, the new filter entry is added at the end of the access-list.

The **no** variant of this command removes a source IP address filter entry from the current standard numbered access-list. You can specify the source IP address filter entry for removal by entering either its sequence number (e.g. **no 10**), or by entering its source IP address filter profile without specifying its sequence number.

Note that the sequence number can be found by running the **show access-list (IPv4 Software ACLs)** command.

**Syntax** [*<sequence-number>*] {deny|permit} *<source>*  
no {deny|permit} *<source>*  
no *<sequence-number>*

| Parameter                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                       |                                                                                                                                                                    |                        |                                                                                             |                             |                                                                                             |     |                     |

The source address is specified in dotted decimal format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                       |                                                                                                                                                                    |                        |                                                                                             |                             |                                                                                             |     |                     |
| host <i>&lt;ip-addr&gt;</i>                           | A single source address to match. The source address is specified in dotted decimal format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                       |                                                                                                                                                                    |                        |                                                                                             |                             |                                                                                             |     |                     |
| any                                                   | Any source address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                       |                                                                                                                                                                    |                        |                                                                                             |                             |                                                                                             |     |                     |

**Mode** IPv4 Standard ACL Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage notes** An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 4 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

**NOTE:** *The access control list being configured is selected by running the command with the required access control list number but with no further parameters selected.*

*Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.*

**Example** To add a new entry accepting the IP network 10.1.1.0/24 at the sequence number 15 position, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 99
awplus(config-ip-std-acl)# 15 permit 10.1.2.0 0.0.0.255
```

**Related commands** **access-list (standard numbered)**  
**show access-group**  
**show interface access-group**  
**show ip access-list**  
**show running-config**

## dos

**Overview** Use this command to configure Denial-of-Service (DoS) protection features for a port. Six different DoS attacks can be detected: IP Options, Land, Ping-of-Death, Smurf, Synflood and Teardrop.

When the attack is detected, three different actions are available:

- Shutdown the port for one minute
- Cause an SNMP trap.
- Send traffic to the mirror port

**Syntax** `dos {ipoptions|land|ping-of-death|smurf broadcast <ip-address>|synflood|teardrop} action {shutdown|trap|mirror}`

| Parameter     | Description                  |
|---------------|------------------------------|
| dos           | Denial-Of-Service.           |
| ipoptions     | IP Options attack.           |
| land          | Land attack.                 |
| ping-of-death | Large ping attack.           |
| smurf         | Ping to broadcast address.   |
| broadcast     | Broadcast.                   |
| <ip-address>  | Local IP Broadcast Address.  |
| synflood      | SYN flood attack.            |
| teardrop      | IP fragmentation attack.     |
| action        | Action.                      |
| shutdown      | Shutdown port.               |
| trap          | Trap to SNMP.                |
| mirror        | Send packets to mirror port. |

**Mode** Interface Configuration for a switch port interface.

**Default** DoS attack detection is not configured by default on any switch port interface.

**Usage notes** See the below table for more information about the DoS attacks recognized by this command:

| Type of DoS attack | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ipoptions          | <p>This type of attack occurs when an attacker sends packets containing bad IP options to a victim node. There are many different types of IP options attacks and this software does not try to distinguish between them. Rather, if this defense is activated, the number of ingress IP packets containing IP options is counted. If the number exceeds 20 packets per second, the switch considers this a possible IP options attack.</p> <p>This defense does not require the CPU to monitor packets, so does not put extra load on the switch's CPU.</p> |
| land               | <p>This type of attack occurs when the Source IP and Destination IP address are the same. This can cause a target host to be confused. Since packets with the same source and destination addresses should never occur, these packets are dropped when this attack is enabled.</p> <p>This defense does not require the CPU to monitor packets, so does not put extra load on the switch's CPU.</p>                                                                                                                                                          |
| ping-of-death      | <p>This type of attack results from a fragmented packet which, when reassembled, would exceed the maximum size of a valid IP datagram. To detect this attack, the final fragment of ICMP packets has to be sent to the CPU for inspection. This defense can therefore load the CPU.</p> <p>Note that the extra CPU load will not affect normal traffic switching between ports, but other protocols such as IGMP and STP may be affected. This defense is not recommended where a large number of fragmented packets are expected.</p>                       |
| smurf              | <p>This type of attack is an ICMP ping packet to a broadcast address. Although routers should not forward packets to local broadcast addresses anymore (see RFC2644), the Smurf attack can still be explicitly discarded with this command. In order for the Smurf attack to work, the broadcast IP address is required. Any ICMP Ping packet with this destination address is considered an attack.</p> <p>This defense does not require the CPU to monitor packets, so does not put extra load on the switch's CPU.</p>                                    |
| synflood           | <p>In this type of attack, an attacker, seeking to overwhelm a victim with TCP connection requests, sends a large number of TCP SYN packets with bogus source addresses to the victim. The victim responds with SYN ACK packets, but since the original source addresses are bogus, the victim node does not receive any replies. If the attacker sends enough requests in a short enough</p>                                                                                                                                                                |

| Type of DoS attack | Description                                                                                                                                                                                                                                                                                                          |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                    | <p>period, the victim may freeze operations once the requests exceed the capacity of its connections queue.</p> <p>To defend against this form of attack, a switch port monitors the number of ingress TCP-SYN packets it receives. An attack is recorded if a port receives more 60 TCP-SYN packets per second.</p> |
| teardrop           | <p>In this DoS attack, an attacker sends a packet in several fragments with a bogus offset value, used to reconstruct the packet, in one of the fragments to a victim. This results in the victim being unable to reassemble the packet, possibly causing it to freeze operations.</p>                               |

**Examples** To configure **smurf** DoS detection on port1.0.1, and shutdown the interface if an attack is detected, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# dos smurf broadcast 192.168.1.0 action
shutdown
```

To configure **land** DoS detection on port1.0.1, and shutdown the interface if an attack is detected, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# dos land action shutdown
```

To configure **ipoptions** DoS detection on port1.0.1, and shutdown the interface if an attack is detected, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# dos ipoptions action shutdown
```

To configure **ping-of-death** DoS detection on port1.0.1, and shutdown the interface if an attack is detected, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# dos ping-of-death action shutdown
```

To configure **synflood** DoS detection on port1.0.1, and shutdown the interface if an attack is detected, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# dos synflood action shutdown
```

To configure **teardrop** DoS detection on port1.0.1, and shutdown the interface if an attack is detected, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# dos teardrop action shutdown
```

**Related commands** [show dos interface](#)

## maximum-access-list (deleted)

**Overview** This command has been removed from version 5.5.1-01 onwards. There is no alternative command.

## show access-list (IPv4 Software ACLs)

**Overview** Use this command to display the specified access-list, or all access-lists if none have been specified. Note that only defined access-lists are displayed. An error message is displayed for an undefined access-list

**Syntax** `show access-list [<1-99>|<100-199>|<1300-1999>|<2000-2699>|<3000-3699>|<4000-4499>|<access-list-name>]`

| Parameter          | Description                                          |
|--------------------|------------------------------------------------------|
| <1-99>             | IP standard access-list.                             |
| <100-199>          | IP extended access-list.                             |
| <1300-1999>        | IP standard access-list (standard - expanded range). |
| <2000-2699>        | IP extended access-list (extended - expanded range). |
| <3000-3699>        | Hardware IP access-list.                             |
| <4000-4499>        | Hardware MAC access-list.                            |
| <access-list-name> | IP named access-list.                                |

**Mode** User Exec and Privileged Exec

**Examples** To show all access-lists configured on the switch:

```
awplus# show access-list
```

```
Standard IP access list 1
  deny 172.16.2.0, wildcard bits 0.0.0.255
Standard IP access list 20
  deny 192.168.10.0, wildcard bits 0.0.0.255
  deny 192.168.12.0, wildcard bits 0.0.0.255
Hardware IP access list 3001
  permit ip 192.168.20.0 255.255.255.0 any
Hardware IP access list 3020
  permit tcp any 192.0.2.0/24
awplus#show access-list 20
```

To show the access-list with an ID of 20:

```
awplus# show access-list 20
```

```
Standard IP access-list 20
  deny 192.168.10.0, wildcard bits 0.0.0.255
  deny 192.168.12.0, wildcard bits 0.0.0.255
```

Note the following error message is displayed if you attempt to show an undefined access-list:

```
awplus# show access-list 2
```

```
% Can't find access-list 2
```

**Related commands** [access-list standard \(named\)](#)  
[access-list \(standard numbered\)](#)  
[access-list \(extended numbered\)](#)

# show dos interface

**Overview** Use this command to display the Denial-of-Service (DoS) features configured on a switch port interface from the **dos** command. See the **dos** command for descriptions of DoS attack types.

**Syntax** `show dos interface {<port-list>}`

| Parameter                      | Description                                                                                                |
|--------------------------------|------------------------------------------------------------------------------------------------------------|
| <code>&lt;port-list&gt;</code> | Specify the switch port or port list to display DoS configuration options set with the <b>dos</b> command. |

**Mode** Privileged Exec

**Output** The following shows typical output.

**Example output from the show dos interface command prior to a DoS attack**

```
awplus#configure terminal
Enter configuration commands, one per line. End with CTNLT/Z.
awplus(config)#interface port1.0.1
awplus(config-if)#dos synflood action shutdown
awplus(config-if)#exit
awplus(config)#exit
awplus#show dos interface port1.0.1

DoS settings  for interface port1.0.1
-----
Port status      : Enabled
ipoptions        : Disabled
land             : Disabled
ping-of-death    : Disabled
smurf            : Disabled
synflood         : Enabled
  Action         : Shutdown port
  Attacks detected : 0
teardrop         : Disabled
awplus#
```

**Example output from the show dos interface command after a synflood DoS attack**

```
awplus#show dos interface port1.0.1

DoS settings for interface port1.0.1
-----
Port status      : Enabled
ipoptions        : Disabled
land             : Disabled
ping-of-death    : Disabled
smurf            : Disabled
synflood         : Enabled
  Action         : Shutdown port
  Attacks detected : 1
teardrop         : Disabled
awplus#
```

**Parameters in the show dos interface command output:**

| Type of DoS attack | Description                                                                                                                                                                                                                                                     |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port status        | Displays Enabled when the port is configured as being administratively up after issuing the <b>no shutdown</b> command.<br><br>Displays Disabled when the port is configured as being administratively down with the <b>shutdown</b> command.                   |
| ipoptions          | Displays Enabled when the <b>ipoptions</b> parameter is configured with the <b>dos</b> command, plus the action (Shutdown port, Mirror port, or Trap port) and the number of instances of any <b>ipoptions</b> DoS attacks that have occurred on the interface. |

| Type of DoS attack | Description                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                    | Displays Disabled when the <b>ipoptions</b> parameter is not configured with the <b>dos</b> command.                                                                                                                                                                                                                                                                                           |
| land               | <p>Displays Enabled when the <b>land</b> parameter is configured with the <b>dos</b> command, plus the action (Shutdown port, Mirror port, or Trap port) and the number of instances of any <b>land</b> DoS attacks that have occurred on the interface.</p> <p>Displays Disabled when the <b>land</b> parameter is not configured with the <b>dos</b> command.</p>                            |
| ping-of-death      | <p>Displays Enabled when the <b>ping-of-death</b> parameter is configured with the <b>dos</b> command, plus the action (Shutdown port, Mirror port, or Trap port) and the number of instances of any <b>ping-of-death</b> DoS attacks that have occurred on the interface.</p> <p>Displays Disabled when the <b>ping-of-death</b> parameter is not configured with the <b>dos</b> command.</p> |
| smurf              | <p>Displays Enabled when the <b>smurf</b> parameter is configured with the <b>dos</b> command, plus the action (Shutdown port, Mirror port, or Trap port) and the number of instances of any <b>smurf</b> DoS attacks that have occurred on the interface.</p> <p>Displays Disabled when the <b>smurf</b> parameter is not configured with the <b>dos</b> command.</p>                         |
| synflood           | <p>Displays Enabled when the <b>synflood</b> parameter is configured with the <b>dos</b> command, plus the action (Shutdown port, Mirror port, or Trap port) and the number of instances of any <b>synflood</b> DoS attacks that have occurred on the interface.</p> <p>Displays Disabled when the <b>synflood</b> parameter is not configured with the <b>dos</b> command.</p>                |
| teardrop           | <p>Displays Enabled when the <b>teardrop</b> parameter is configured with the <b>dos</b> command, plus the action (Shutdown port, Mirror port, or Trap port) and the number of instances of any <b>teardrop</b> DoS attacks that have occurred on the interface.</p> <p>Displays Disabled when the <b>teardrop</b> parameter is not configured with the <b>dos</b> command.</p>                |

**Related dos commands**

# show ip access-list

**Overview** Use this command to display IP access-lists.

**Syntax** `show ip access-list [<1-99>|<100-199>|<1300-1999>|<2000-2699>|<access-list-name>]`

| Parameter          | Description                               |
|--------------------|-------------------------------------------|
| <1-99>             | IP standard access-list.                  |
| <100-199>          | IP extended access-list.                  |
| <1300-1999>        | IP standard access-list (expanded range). |
| <2000-2699>        | IP extended access-list (expanded range). |
| <access-list-name> | IP named access-list.                     |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip access-list`

**Output** The following shows typical output.

## Example output from the show ip access-list command

```
Standard IP access-list 1
  permit 172.168.6.0, wildcard bits 0.0.0.255
  permit 192.168.6.0, wildcard bits 0.0.0.255
```

## vtty access-class (numbered)

**Overview** For IPv4, use this command to set a standard numbered software access list to be the management ACL. This is then applied to all available VTY lines for controlling remote access by Telnet and SSH. This command allows or denies packets containing the IP addresses included in the ACL to create a connection to your device.

ACLs that are attached using this command have an implicit deny-all filter as the final entry in the ACL. So a typical configuration would be to permit a specific address, or range of addresses, and rely on the deny-all filter to block all other access.

Use the **no** variant of this command to remove the access list.

**Syntax** vty access-class {<1-99>|<1300-1999>}  
no vty access-class [<1-99>|<1300-1999>]

| Parameter   | Description                                       |
|-------------|---------------------------------------------------|
| <1-99>      | IPv4 standard access-list number                  |
| <1300-1999> | IPv4 standard access-list number (expanded range) |

**Mode** Global Configuration

**Examples** To set access-list 4 to be the management ACL, use the following commands:

```
awplus# configure terminal  
awplus(config)# vty access-class 4
```

To remove access-list 4 from the management ACL, use the following commands:

```
awplus# configure terminal  
awplus(config)# no vty access-class 4
```

**Output** The following shows typical output.

**Example output from the show running-config command**

```
awplus#show running-config|grep access-class  
vty access-class 4
```

**Related commands** [show running-config](#)  
[vty ipv6 access-class \(named\)](#)

# Introduction

**Overview** This chapter provides an alphabetical reference for the IPv6 Hardware Access Control List (ACL) commands, and contains detailed command information and command examples about IPv6 hardware ACLs, which are applied directly to interfaces using the **ipv6 traffic-filter** command.

For information about ACLs, see the **ACL Feature Overview and Configuration Guide**.

To apply ACLs to an LACP channel group, apply it to all the individual switch ports in the channel group. To apply ACLs to a static channel group, apply it to the static channel group itself. For more information on link aggregation see the following references:

- **Link Aggregation Feature Overview\_and\_Configuration\_Guide**.
- **Link Aggregation Commands**

Most ACL command titles include usage information in parentheses. When the command title is completely surrounded by parentheses, the title indicates the type of ACL filter instead of keywords to enter into the CLI. For example, the title **(named IPv6 hardware ACL: IP protocol entry)** represents a command with the syntax:

```
[<sequence-number>] <action> proto <1-255> <source-addr> <dest-addr> [vlan <1-4094>]
```

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**Sub-modes** Many of the ACL commands operate from sub-modes that are specific to particular ACL types. The following table shows the CLI prompts at which ACL commands are entered.

### IPv6 Hardware Access List Commands and Prompts

| Command Name                                        | Command Mode                      | Prompt                          |
|-----------------------------------------------------|-----------------------------------|---------------------------------|
| <b>show acl-group ipv6 address</b>                  | Privileged Exec                   | awplus#                         |
| <b>show ipv6 access-list (IPv6 Hardware ACLs)</b>   | Privileged Exec                   | awplus#                         |

## access-list hardware-deny-log

**Overview** Use this command to enable logging of packets that are denied by hardware IP ACLs. Hardware IP ACLs are ACLs with an ID number from 3000 to 3699. If you turn on logging, the switch will produce a log message when it drops denied packets.

**CAUTION:** *If you enable this logging, do not use an action of or in any of the switch's ACLs. If you do, packets that match those ACLs will also be dropped.*

Use the **no** variant of this command to disable logging of packets that are denied by hardware IP ACLs.

**Syntax** `access-list hardware-deny-log [info|warn] [rate <1-1000>] [burst <1-1000>] [timeout <1-3600>]`  
`no access-list hardware-deny-log`

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| info             | Give the log messages a severity level of 'info'. This is the default severity level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| warn             | Give the log messages a severity level of 'warn'. If you want the messages to go to the buffered, permanent, and external log as well as the terminal, specify this parameter.                                                                                                                                                                                                                                                                                                                                                                                 |
| rate <1-1000>    | This limits the number of log messages produced per hour. The switch will stop creating log messages if packets are denied at a higher rate than this specified rate. The default is 12 packets per hour. This means, for example, that if there are 60 denied packets in the first hour, then at most the first 12 of these packets will be logged. After that, logging will stop unless the rate drops below 12 an hour. (The actual number of packets logged depends on the number of flows the dropped packets come from; see the <b>burst</b> parameter). |
| burst <1-1000>   | This is the maximum initial number of packets to log for a given flow. A flow is a set of packets with the same source IP address, destination IP address, source port, and destination port. The default is 5. The burst number reduces by 1 each time a packet in the flow is logged. Then it increases by 1 again every time the rate drops below the limit set by the <b>rate</b> parameter, up to the burst number.                                                                                                                                       |
| timeout <1-3600> | This is the length of time it takes for a flow record to expire, in seconds. The switch considers that a flow has expired if it hasn't received any packets that match that flow for the timeout number of seconds. The default is 3600 seconds (1 hour). When a flow expires, its burst value is reset and logging may restart (depending on the current rate of denied packets).                                                                                                                                                                             |

**Default** Disabled

**Mode** Global Configuration

**Usage notes** To enable logging for a particular ACL, enter:

- this command (**access-list hardware-deny-log**)
- the command **terminal monitor**, and
- a **log** parameter at the end of the desired ACL.

The switch will send the log messages to:

- The terminal monitor, by default, as long as you enter the command **terminal monitor**, and
- If you change the severity of the messages to **warn**, to the buffered log, permanent log, and external log as well. The external log defines what logs will be sent to external syslog servers.

The log message format is:

```
DENY> IN=<interface-name> OUT=<blank> MAC=<dest-mac-addr:src-  
mac-addr:eth-type> SRC=<source-ip-address> DST=<dest-ip-address>  
LEN=<packet-length> TOS=<type-of-service> PREC=<precedence>  
TTL=<time-to-live> ID=<packet-ID> PROTO=<L4-protocol>  
SPT=<L4-source-port> DPT=<L4-dest-port> LEN=<L4-packet-length>  
MARK=<internal-packet-marking>
```

An example of a permanent log message is:

```
2023 March 03 07:04:37 local5.warning awplus ulogd[931]: DENY>  
IN=vlan100 OUT= MAC=e0:1a:ea:50:51:fc:00:00:11:11:22:22:08:00  
SRC=192.168.1.100 DST=192.170.1.1 LEN=42 TOS=00 PREC=0x00 TTL=64  
ID=0 PROTO=UDP SPT=63 DPT=63 LEN=22 MARK=0x20000000
```

**Example** To log packets denied by ACL 3000, which denies all Echo requests, use the commands:

```
awplus# terminal monitor  
awplus# configure terminal  
awplus(config)# access-list hardware-deny-log  
awplus(config)# access-list 3000 deny icmp any any icmp-type 8
```

**Command changes** Version 5.5.3-0.1: command added

## acl-group ipv6 address

**Overview** Use this command to create a new named IPv6 ACL group that contains one or more IPv6 host or subnets.

This command creates a named IPv6 ACL group and enters the ACL Host Group config mode. IPv6 hosts or subnets can be added to or removed from this group. This host group can be used as a source or destination match for any hardware ACL to simplify large ACL configs with lots of IPv6 hosts.

Use the **no** variant of this command to delete an IPv6 ACL group.

**Syntax** `acl-group ipv6 address <group>`  
`no acl-group ipv6 address <group>`

| Parameter                  | Description                     |
|----------------------------|---------------------------------|
| <code>&lt;group&gt;</code> | The name of the IPv6 ACL group. |

**Default** No ACL groups exist by default.

**Mode** Global Configuration

**Example** To create an IPv6 ACL group named IPV6 \_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ipv6 address IPV6_GROUP1
awplus(config-ip-host-group)#
```

To delete an IPv6 ACL group named IPV6 \_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# no acl-group ipv6 address IPV6_GROUP1
```

**Related commands** [ipv6 \(ipv6-host-group\)](#)  
[show acl-group ipv6 address](#)

**Command changes** Version 5.5.0-1.1: command added

# clear access-list counters

**Overview** Use this command to reset the hardware access-list counters to zero. The access-list counters show the number of packets that match your hardware ACLs. Every time a hardware ACL allows or drops a packet, its counter increments.

**Syntax** clear access-list counters [*<acl>*]

| Parameter          | Description                                                                          |
|--------------------|--------------------------------------------------------------------------------------|
| <i>&lt;acl&gt;</i> | Clear the counters for only the specified ACL. You can enter the ACL name or number. |

**Mode** Privileged Exec

**Usage notes** To view the counter values, use the command [show access-list counters](#).

**Example** To clear the counters for the ACL named ACL-1, use the command:  
awplus# clear access-list counters ACL-1

**Related commands** [show access-list counters](#)

**Command changes** Version 5.5.2-2.1: command added

## commit (IPv6)

**Overview** Use this command to commit the IPv6 ACL filter configuration entered at the console to the hardware immediately without exiting the IPv6 Hardware ACL Configuration mode.

This command forces the associated hardware and software IPv6 ACLs to synchronize.

**Syntax** `commit`

**Mode** IPv6 Hardware ACL Configuration

**Usage notes** Normally, when an IPv6 hardware ACL is edited, the new configuration state of the IPv6 ACL is not written to hardware until you exit IPv6 Hardware ACL Configuration mode. By entering this command you can ensure that the current state of a hardware access-list that is being edited is written to hardware immediately.

Scripts typically do not include the **exit** command to exit configuration modes, potentially leading to IPv6 ACL filters in hardware not being correctly updated. Using this **commit** command in a configuration script after specifying an IPv6 hardware ACL filter ensures that it is updated in the hardware.

**Example** To update the hardware with the IPv6 ACL filter configuration, use the command:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-ipv6-acl
awplus(config-ipv6-hw-acl)# commit
```

**Related commands** [ipv6 access-list \(named IPv6 hardware ACL\)](#)

## ipv6 (ipv6-host-group)

**Overview** Use this command to add an IPv6 host or subnet to an IPv6 ACL group. Adding IPv6 hosts and subnets to an ACL group allows you to simplify ACL config when the same IP addresses are required for many ACLs.

Use the **no** variant of this command to remove an IPv6 host or subnet from an IPv6 ACL group.

**Syntax** `ipv6 {any|<match-ip>}`  
`no ipv6 {any|<match-ip>}`

| Parameter                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                          |                                                                             |                                         |                                                                                                                                                                                |                                                   |                                                     |

The prefix-length is usually set between 0 and 64, or has the value 128. | <i>&lt;ipv6-addr&gt;<br/>&lt;reverse-mask&gt;</i> | An IPv6 host and a reverse mask in format X:X::X:X. |
| <i>&lt;ipv6-addr&gt;</i>                          | Specifies a single host address. The IPv6 address uses the format X:X::X:X.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                          |                                                                             |                                         |                                                                                                                                                                                |                                                   |                                                     |
| <i>&lt;ipv6-addr&gt;/&lt;prefix&gt;</i>           | Specifies an address and prefix length. The IPv6 address prefix uses the format X:X::/ prefix-length. The prefix-length is usually set between 0 and 64, or has the value 128.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                          |                                                                             |                                         |                                                                                                                                                                                |                                                   |                                                     |
| <i>&lt;ipv6-addr&gt;<br/>&lt;reverse-mask&gt;</i> | An IPv6 host and a reverse mask in format X:X::X:X.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                          |                                                                             |                                         |                                                                                                                                                                                |                                                   |                                                     |

**Default** No hosts or subnets are in an IPv6 ACL group by default.

**Mode** IPv6 ACL Host Group Configuration

**Example** To add the subnet 2001:DB8::/32 to an IPv6 ACL group IPV6\_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ipv6 address IPV6_GROUP1
awplus(config-ipv6-host-group)# ipv6 2001:DB8::/32
```

To remove the subnet 2001:DB8::/32 from an IPv6 ACL group IPV6\_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ipv6 address IPV6_GROUP1
awplus(config-ipv6-host-group)# no ipv6 2001:DB8::/32
```

**Related commands** [acl-group ipv6 address](#)  
[show acl-group ipv6 address](#)

**Command changes** Version 5.5.0-1.1: command added

# ipv6 access-list (named IPv6 hardware ACL)

**Overview** Use this command to either create a new IPv6 hardware access-list, or to select an existing IPv6 hardware access-list in order to apply a filter entry to it.

Use the **no** variant of this command to delete an existing IPv6 hardware access-list.

**NOTE:** Before you can delete an access-list, you must first remove it from any interface it is assigned to.

**Syntax** `ipv6 access-list <ipv6-access-list-name>`  
`no ipv6 access-list <ipv6-access-list-name>`

| Parameter                                  | Description                       |
|--------------------------------------------|-----------------------------------|
| <code>&lt;ipv6-access-list-name&gt;</code> | Specify an IPv6 access-list name. |

**Mode** Global Configuration

**Default** Any traffic on an interface controlled by a hardware ACL that does not explicitly match a filter is permitted.

**Usage notes** Use IPv6 hardware named access-lists to control the transmission of IPv6 packets on an interface, and restrict the content of routing updates. The switch stops checking the IPv6 hardware named access-list when a match is encountered.

This command moves you to the (config-ipv6-hw-acl) prompt for the selected IPv6 hardware named access-list number. From there you can configure the filters for this selected IPv6 hardware named access-list.

Once you have configured the ACL, use the **ipv6 traffic-filter** or the **match access-group** command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**Examples** To create an IPv6 access-list named "my-ipv6-acl", use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-ipv6-acl
awplus(config-ipv6-hw-acl)#
```

To delete the IPv6 access-list named "my-ipv6-acl", use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 access-list my-ipv6-acl
```

**Related commands** **(named IPv6 hardware ACL: ICMP entry)**  
**(named IPv6 hardware ACL: IPv6 packet entry)**  
**(named IPv6 hardware ACL: IP protocol entry)**  
**(named IPv6 hardware ACL: TCP or UDP entry)**  
**ipv6 traffic-filter**  
**match access-group**  
**show ipv6 access-list (IPv6 Hardware ACLs)**

## ipv6 traffic-filter

**Overview** This command adds an IPv6 hardware-based access-list to an interface. The number of access-lists that can be added is determined by the amount of available space in the hardware-based packet classification tables.

Use the **no** variant of this command to remove an IPv6 hardware-based access-list from an interface.

You can apply or remove an IPv6 hardware access-list from all ports or selected ports as required.

**Syntax** `ipv6 traffic-filter <ipv6-access-list-name>`  
`no ipv6 traffic-filter <ipv6-access-list-name>`

| Parameter                                  | Description                     |
|--------------------------------------------|---------------------------------|
| <code>&lt;ipv6-access-list-name&gt;</code> | Hardware IPv6 access-list name. |

**Mode** Interface Configuration (to apply an IPv6 hardware ACL to a specific switch port).

Alternatively, Global Configuration (to apply an IPv6 hardware ACL to all of the switch ports).

**Usage notes** This command adds an IPv6 hardware-based access-list to an interface. The number of access-lists that can be added is determined by the amount of available space in the hardware-based packet classification tables.

To apply the access-list to all ports on the switch, execute the command in the Global Configuration mode. To apply the access-list to a Layer 2 interface or Layer 2 interface range, apply the command in the Interface Configuration mode. See the examples for each mode below.

**Examples** To add access-list "acl1" as a traffic-filter to all ports on the switch, enter the commands:

```
awplus# configure terminal
awplus(config)# ipv6 traffic-filter acl1
```

To remove access-list "acl1" as a traffic-filter from all ports on the switch, enter the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 traffic-filter acl1
```

To add access-list "acl1" as a traffic-filter to interface port1.0.1, enter the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# ipv6 traffic-filter acl1
```

To remove access-list "acl1" as a traffic-filter from interface port1.0.1, enter the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no ipv6 traffic-filter acl1
```

## (named IPv6 hardware ACL: ICMP entry)

**Overview** Use this command to add a new ICMP filter entry to the current IPv6 hardware access-list. The filter will match on any ICMP packet that has the specified IPv6 source and destination IP addresses and (optionally) ICMP type. You can specify the value **any** if source or destination address does not matter.

The **no** variant of this command removes a filter entry from the current IPv6 hardware access-list. You can specify the filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its filter profile without specifying its sequence number (e.g. **no deny icmp 2001::0db8::0/64 any**).

You can find the sequence number by running the **show ipv6 access-list (IPv6 Hardware ACLs)** command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:**

*Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.*

**Syntax** [**<sequence-number>**] **<action>** icmp **<source-addr>** **<dest-addr>**  
 [icmp-type **<number>**] [vlan **<1-4094>**] [log]  
 no **<sequence-number>**  
 no **<action>** icmp **<source-addr>** **<dest-addr>** [icmp-type **<number>**]  
 [vlan **<1-4094>**] [log]

The following actions are available for hardware ACLs:

| Values for the <action> parameter                     |                                                                                                                                                                                                                                                                     |
|-------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| deny                                                  | Reject packets that match the source and destination filtering specified with this command.                                                                                                                                                                         |
| permit                                                | Permit packets that match the source and destination filtering specified with this command.                                                                                                                                                                         |
| copy-to-cpu                                           | Send a copy of matching packets to the CPU.                                                                                                                                                                                                                         |
| copy-to-mirror<br>[interface <i>port-number</i> ]     | Send a copy of matching packets to a mirror port.<br><br>Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |
| send-to-vlan-port<br>vlan <vid> port<br><port-number> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.                                                                                                                                  |
| send-to-cpu                                           | Send matching packets to the CPU.                                                                                                                                                                                                                                   |

| Parameter                                     | Description                                                                                                                                                                  |
|-----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;sequence-number&gt;</i>                | The sequence number for the filter entry of the selected access control list, in the range 1-65535.                                                                          |
| <i>&lt;action&gt;</i>                         | The action that the switch will take on matching packets. See the table above for valid values.                                                                              |
| icmp                                          | Match against ICMP packets.                                                                                                                                                  |
| <i>&lt;source-addr&gt;</i>                    | The source addresses to match against. You can specify a single host, a range, or all source addresses. The following are the valid formats for specifying the source:       |
| any                                           | Match any source host.                                                                                                                                                       |
| <i>&lt;ipv6-src-address/prefix-length&gt;</i> | Match the specified source address and prefix length.<br><br>The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64. |

| Parameter                          | Description                                                                                                                                                                                                                                                                                           |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                    | <p><i>&lt;ipv6-src-address&gt;</i><br/><i>&lt;ipv6-src-wildcard&gt;</i></p> <p>Match the specified IPv6 source address, masked using wildcard bits.</p> <p>The IPv6 address uses the format X:X::X:X.</p> <p>In the wildcard bits, 1 represents bits to ignore, and 0 represents bits to match.</p>   |
|                                    | <p>host <i>&lt;ipv6-source-host&gt;</i></p> <p>Match a single source host address.</p> <p>The IPv6 address uses the format X:X::X:X.</p>                                                                                                                                                              |
| <i>&lt;dest-addr&gt;</i>           | <p>The destination addresses to match against. You can specify a single host, a range, or all destination addresses. The following are the valid formats for specifying the destination:</p>                                                                                                          |
|                                    | <p>any</p> <p>Match any destination host.</p>                                                                                                                                                                                                                                                         |
|                                    | <p><i>&lt;ipv6-dest-address/prefix-length&gt;</i></p> <p>Match the specified destination address and prefix length.</p> <p>The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.</p>                                                        |
|                                    | <p><i>&lt;ipv6-dest-address&gt;</i><br/><i>&lt;ipv6-dest-wildcard&gt;</i></p> <p>Match the specified destination address, masked using wildcard bits.</p> <p>The IPv6 address uses the format X:X::X:X.</p> <p>In the wildcard bits, 1 represents bits to ignore, and 0 represents bits to match.</p> |
|                                    | <p>host <i>&lt;ipv6-dest-host&gt;</i></p> <p>Match a single destination host address.</p> <p>The IPv6 address uses the format X:X::X:X.</p>                                                                                                                                                           |
| icmp-type<br><i>&lt;number&gt;</i> | <p>The type of ICMP message to match against, as defined in RFC792 and RFC950. Values include:</p>                                                                                                                                                                                                    |

| Parameter                        | Description                                                                                                                         |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
|                                  | 4 Source quench messages.                                                                                                           |
|                                  | 5 Redirect (change route) messages.                                                                                                 |
|                                  | 8 Echo requests.                                                                                                                    |
|                                  | 11 Time exceeded messages.                                                                                                          |
|                                  | 12 Parameter problem messages.                                                                                                      |
|                                  | 13 Timestamp requests.                                                                                                              |
|                                  | 14 Timestamp replies.                                                                                                               |
|                                  | 15 Information requests.                                                                                                            |
|                                  | 16 Information replies.                                                                                                             |
|                                  | 17 Address mask requests.                                                                                                           |
|                                  | 18 Address mask replies.                                                                                                            |
| <code>vlan &lt;1-4094&gt;</code> | The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.                                    |
| <code>log</code>                 | Log packets that are denied by this ACL. You must also enable the logging, using the command <b>access-list hardware-deny-log</b> . |

**Mode** IPv6 Hardware ACL Configuration (accessed by running the command **ipv6 access-list (named IPv6 hardware ACL)**)

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** To use this command, first run the command **ipv6 access-list (named IPv6 hardware ACL)** and enter the desired access-list name. This changes the prompt to:

```
awplus(config-ipv6-hw-acl)#
```

Then use this command (and the other “named IPv6 hardware ACL: entry” commands) to add filter entries. You can add multiple filter entries to an ACL.

If you specify a sequence number, the new entry is inserted at the specified location. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Once you have configured the ACL, use the **ipv6 traffic-filter** or the **match access-group** command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

**Examples** To add a filter entry to the ACL named “my-acl”, to block ICMP packets sent from network 2001:0db8::0/64 , use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# deny icmp 2001:0db8::0/64 any
```

To remove a filter entry from the ACL named “my-acl” that blocks all ICMP packets sent from network 2001:0db8::0/ 64 , use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# no deny icmp 2001:0db8::0/64 any
```

To specify an ACL named “my-acl1” and add a filter entry that blocks all ICMP6 echo requests, enter the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl1
awplus(config-ipv6-hw-acl)# deny icmp any any icmp-type 128
```

To specify an ACL named “my-acl2” and add a filter entry that blocks all ICMP6 echo requests on the default VLAN (vlan1), enter the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl2
awplus(config-ipv6-hw-acl)# deny icmp any any icmp-type 128 vlan
1
```

To remove a filter entry that blocks all ICMP6 echo requests from the ACL named “my-acl1”, enter the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl1
awplus(config-ipv6-hw-acl)# no deny icmp any any icmp-type 128
```

**ipv6 access-list (named IPv6 hardware ACL)**  
**ipv6 traffic-filter**  
**match access-group**  
**show ipv6 access-list (IPv6 Hardware ACLs)**

**Command changes** Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

## (named IPv6 hardware ACL: IPv6 packet entry)

**Overview** Use this command to add an IPv6 packet filter entry to the current hardware access-list. The filter will match on IPv6 packets that have the specified source and destination IPv6 address and (optionally) prefix. You can use the value **any** instead of source or destination IPv6 address if an address does not matter.

The **no** variant of this command removes a filter entry from the current hardware access-list. You can specify the filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its filter profile without specifying its sequence number (e.g. **no deny ipv6 2001:0db8::0/64 any**).

You can find the sequence number by running the **show ipv6 access-list (IPv6 Hardware ACLs)** command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:**

*Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.*

**Syntax** [*<sequence-number>*] *<action>* ipv6 *<source-addr>* *<dest-addr>*  
[vlan *<1-4094>*] [log]  
no *<sequence-number>*  
no *<action>* ipv6 *<source-addr>* *<dest-addr>* [vlan *<1-4094>*] [log]

The following actions are available for hardware ACLs:

| Values for the <i>&lt;action&gt;</i> parameter                                  |                                                                                                                                                                                                                                                                 |
|---------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| deny                                                                            | Reject packets that match the source and destination filtering specified with this command.                                                                                                                                                                     |
| permit                                                                          | Permit packets that match the source and destination filtering specified with this command.                                                                                                                                                                     |
| copy-to-cpu                                                                     | Send a copy of matching packets to the CPU.                                                                                                                                                                                                                     |
| copy-to-mirror<br>[interface <i>port-number</i> ]                               | Send a copy of matching packets to a mirror port.<br>Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |
| send-to-vlan-port<br>vlan <i>&lt;vid&gt;</i> port<br><i>&lt;port-number&gt;</i> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.                                                                                                                              |
| send-to-cpu                                                                     | Send matching packets to the CPU.                                                                                                                                                                                                                               |

| Parameter                      | Description                                                                                                                                                                                                                |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;sequence-number&gt;</i> | The sequence number for the filter entry of the selected access control list, in the range 1-65535.                                                                                                                        |
| <i>&lt;action&gt;</i>          | The action that the switch will take on matching packets. See the table above for valid values.                                                                                                                            |
| ipv6                           | Match against IPv6 packets                                                                                                                                                                                                 |
| <i>&lt;source-addr&gt;</i>     | The source addresses to match against. You can specify a single host, a range, or all source addresses. The following are the valid formats for specifying the source:                                                     |
|                                | any Match any source host.                                                                                                                                                                                                 |
|                                | <i>&lt;ipv6-src-address/prefix-length&gt;</i> Match the specified source address and prefix length.<br><br>The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64. |
|                                | <i>&lt;ipv6-src-address&gt;</i><br><i>&lt;ipv6-src-wildcard&gt;</i> Match the specified IPv6 source address, masked using wildcard bits.                                                                                   |

| Parameter                                   | Description                                                                                                                                                                                                             |
|---------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                             | <p>The IPv6 address uses the format X:X::X:X.</p> <p>In the wildcard bits, 1 represents bits to ignore, and 0 represents bits to match.</p>                                                                             |
| host <ipv6-source-host>                     | <p>Match a single source host address.</p> <p>The IPv6 address uses the format X:X::X:X.</p>                                                                                                                            |
| <dest-addr>                                 | <p>The destination addresses to match against. You can specify a single host, a range, or all destination addresses. The following are the valid formats for specifying the destination:</p>                            |
| any                                         | Match any destination host.                                                                                                                                                                                             |
| <ipv6-dest-address/prefix-length>           | <p>Match the specified destination address and prefix length.</p> <p>The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.</p>                                |
| <ipv6-dest-address><br><ipv6-dest-wildcard> | <p>Match the specified destination address, masked using wildcard bits.</p> <p>The IPv6 address uses the format X:X::X:X.</p> <p>In the wildcard bits, 1 represents bits to ignore, and 0 represents bits to match.</p> |
| host <ipv6-dest-host>                       | <p>Match a single destination host address.</p> <p>The IPv6 address uses the format X:X::X:X.</p>                                                                                                                       |
| vlan <1-4094>                               | The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.                                                                                                                        |
| log                                         | Log packets that are denied by this ACL. You must also enable the logging, using the command <b>access-list hardware-deny-log</b> .                                                                                     |

**Mode** IPv6 Hardware ACL Configuration (accessed by running the command **ipv6 access-list (named IPv6 hardware ACL)**)

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** To use this command, first run the command **ipv6 access-list (named IPv6 hardware ACL)** and enter the desired access-list name. This changes the prompt to:

```
awplus(config-ipv6-hw-acl)#
```

Then use this command (and the other “named IPv6 hardware ACL: entry” commands) to add filter entries. You can add multiple filter entries to an ACL.

If you specify a sequence number, the new entry is inserted at the specified location. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Once you have configured the ACL, use the **ipv6 traffic-filter** or the **match access-group** command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

**Examples** To add a filter entry to the ACL named “my-acl” to block IPv6 traffic sent from network 2001:0db8::0/64, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# deny ipv6 2001:0db8::0/64 any
```

To remove a filter entry from the ACL named “my-acl” that blocks all IPv6 traffic sent from network 2001:0db8::0/ 64, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# no deny ipv6 2001:0db8::0/64 any
```

**Related commands** **access-list hardware-deny-log**  
**ipv6 access-list (named IPv6 hardware ACL)**  
**ipv6 traffic-filter**  
**match access-group**  
**show ipv6 access-list (IPv6 Hardware ACLs)**

**Command changes** Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

## (named IPv6 hardware ACL: IP protocol entry)

**Overview** Use this command to add an IP protocol type filter entry to the current IPv6 hardware access-list. The filter will match on IPv6 packets that have the specified IP protocol number, and the specified IPv6 addresses. You can use the value **any** instead of source or destination IPv6 address if an address does not matter.

The **no** variant of this command removes a filter entry from the current hardware access-list. You can specify the filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its filter profile without specifying its sequence number (e.g. **no deny proto 2 2001:0db8::0/64 any**).

You can find the sequence number by running the **show ipv6 access-list (IPv6 Hardware ACLs)** command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:**

*Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.*

**Syntax** [*<sequence-number>*] *<action>* proto *<1-255>* *<source-addr>* *<dest-addr>* [vlan *<1-4094>*] [log]  
no *<sequence-number>*  
no *<action>* proto *<1-255>* *<source-addr>* *<dest-addr>* [vlan *<1-4094>*] [log]

The following actions are available for hardware ACLs:

| Values for the <i>&lt;action&gt;</i> parameter                                  |                                                                                                                                                                                                                                                                 |
|---------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| deny                                                                            | Reject packets that match the source and destination filtering specified with this command.                                                                                                                                                                     |
| permit                                                                          | Permit packets that match the source and destination filtering specified with this command.                                                                                                                                                                     |
| copy-to-cpu                                                                     | Send a copy of matching packets to the CPU.                                                                                                                                                                                                                     |
| copy-to-mirror<br>[interface <i>port-number</i> ]                               | Send a copy of matching packets to a mirror port.<br>Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |
| send-to-vlan-port<br>vlan <i>&lt;vid&gt;</i> port<br><i>&lt;port-number&gt;</i> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.                                                                                                                              |
| send-to-cpu                                                                     | Send matching packets to the CPU.                                                                                                                                                                                                                               |

### Parameters in IP protocol ACL entries

| Parameter                      | Description                                                                                                                                                                                                                                                                            |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;sequence-number&gt;</i> | The sequence number for the filter entry of the selected access control list, in the range 1-65535.                                                                                                                                                                                    |
| <i>&lt;action&gt;</i>          | The action that the switch will take on matching packets. See the table above for valid values.                                                                                                                                                                                        |
| proto <i>&lt;1-255&gt;</i>     | The IP protocol number to match against, as defined by IANA (Internet Assigned Numbers Authority <a href="http://www.iana.org/assignments/protocol-numbers">www.iana.org/assignments/protocol-numbers</a> )<br><br>See below for a list of IP protocol numbers and their descriptions. |
| <i>&lt;source-addr&gt;</i>     | The source addresses to match against. You can specify a single host, a range, or all source addresses. The following are the valid formats for specifying the source:                                                                                                                 |
|                                | any Match any source host.                                                                                                                                                                                                                                                             |
|                                | <i>&lt;ipv6-src-address/prefix-length&gt;</i> Match the specified source address and prefix length.                                                                                                                                                                                    |

| Parameter                                                       | Description                                                                                                                                                                                                             |
|-----------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                 | <p>The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.</p>                                                                                                  |
| <p>&lt;ipv6-src-address&gt;<br/>&lt;ipv6-src-wildcard&gt;</p>   | <p>Match the specified IPv6 source address, masked using wildcard bits.</p> <p>The IPv6 address uses the format X:X::X:X.</p> <p>In the wildcard bits, 1 represents bits to ignore, and 0 represents bits to match.</p> |
| <p>host &lt;ipv6-source-host&gt;</p>                            | <p>Match a single source host address.</p> <p>The IPv6 address uses the format X:X::X:X.</p>                                                                                                                            |
| <dest-addr>                                                     | <p>The destination addresses to match against. You can specify a single host, a range, or all destination addresses. The following are the valid formats for specifying the destination:</p>                            |
| any                                                             | Match any destination host.                                                                                                                                                                                             |
| <ipv6-dest-address/<br>prefix-length>                           | <p>Match the specified destination address and prefix length.</p> <p>The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.</p>                                |
| <p>&lt;ipv6-dest-address&gt;<br/>&lt;ipv6-dest-wildcard&gt;</p> | <p>Match the specified destination address, masked using wildcard bits.</p> <p>The IPv6 address uses the format X:X::X:X.</p> <p>In the wildcard bits, 1 represents bits to ignore, and 0 represents bits to match.</p> |
| <p>host &lt;ipv6-dest-host&gt;</p>                              | <p>Match a single destination host address.</p> <p>The IPv6 address uses the format X:X::X:X.</p>                                                                                                                       |
| vlan <1-4094>                                                   | The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.                                                                                                                        |

| Parameter | Description                                                                                                                         |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------|
| log       | Log packets that are denied by this ACL. You must also enable the logging, using the command <b>access-list hardware-deny-log</b> . |

### IP protocol number and description

**Mode** IPv6 Hardware ACL Configuration (accessed by running the command **ipv6 access-list (named IPv6 hardware ACL)**)

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** To use this command, first run the command **ipv6 access-list (named IPv6 hardware ACL)** and enter the desired access-list name. This changes the prompt to:

```
awplus(config-ipv6-hw-acl)#
```

Then use this command (and the other “named IPv6 hardware ACL: entry” commands) to add filter entries. You can add multiple filter entries to an ACL.

If you specify a sequence number, the new entry is inserted at the specified location. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Once you have configured the ACL, use the **ipv6 traffic-filter** or the **match access-group** command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

**Examples** To add a filter entry to the ACL named "my-acl" to deny IGMP packets from 2001:0db8::0/64 , use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# deny proto 2 2001:0db8::0/64 any
```

To remove a filter entry that blocks IGMP packets from network 2001:0db8::0/64 from the ACL named "my-acl", use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# no deny proto 2 2001:0db8::0/64 any
```

**Related commands** [access-list hardware-deny-log](#)  
[ipv6 access-list \(named IPv6 hardware ACL\)](#)  
[ipv6 traffic-filter](#)  
[match access-group](#)  
[show ipv6 access-list \(IPv6 Hardware ACLs\)](#)

**Command changes** Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

## (named IPv6 hardware ACL: TCP or UDP entry)

**Overview** Use this command to add a TCP or UDP filter entry to the current IPv6 hardware access-list. The access-list will match on TCP or UDP packets that have the specified source and destination IP addresses and optionally, port values. You can use the value **any** instead of source or destination IP address if an address does not matter.

The **no** variant of this command removes a filter entry from the current hardware access-list. You can specify the filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its filter profile without specifying its sequence number (e.g. **no deny tcp 2001:0db8::0/64 any**).

You can find the sequence number by running the **show ipv6 access-list (IPv6 Hardware ACLs)** command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:**

*Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.*

**Syntax** [*<sequence-number>*] *<action>* {tcp|udp} *<source-addr>* [*<source-ports>*] *<dest-addr>* [*<dest-ports>*] [vlan *<1-4094>*] [log]  
no *<sequence-number>*  
no *<action>* {tcp|udp} *<source-addr>* [*<source-ports>*] *<dest-addr>* [*<dest-ports>*] [vlan *<1-4094>*] [log]

The following actions are available for hardware ACLs:

| Values for the <i>&lt;action&gt;</i> parameter                                  |                                                                                                                                                                                                                                                                 |
|---------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| deny                                                                            | Reject packets that match the source and destination filtering specified with this command.                                                                                                                                                                     |
| permit                                                                          | Permit packets that match the source and destination filtering specified with this command.                                                                                                                                                                     |
| copy-to-cpu                                                                     | Send a copy of matching packets to the CPU.                                                                                                                                                                                                                     |
| copy-to-mirror<br>[interface <i>port-number</i> ]                               | Send a copy of matching packets to a mirror port.<br>Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |
| send-to-vlan-port<br>vlan <i>&lt;vid&gt;</i> port<br><i>&lt;port-number&gt;</i> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.                                                                                                                              |
| send-to-cpu                                                                     | Send matching packets to the CPU.                                                                                                                                                                                                                               |

| Parameter                      | Description                                                                                                                                                                                                                                                          |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;sequence-number&gt;</i> | The sequence number for the filter entry of the selected access control list, in the range 1-65535. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number. |
| <i>&lt;action&gt;</i>          | The action that the switch will take on matching packets. See the table above for valid values.                                                                                                                                                                      |
| tcp                            | Match against TCP packets.                                                                                                                                                                                                                                           |
| udp                            | Match against UDP packets.                                                                                                                                                                                                                                           |
| <i>&lt;source-addr&gt;</i>     | The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:                                                                                              |
|                                | any                      Match any source IP address.                                                                                                                                                                                                                |
|                                | host <i>&lt;ip-addr&gt;</i> Match a single source host with the IP address given by <i>&lt;ip-addr&gt;</i> in dotted decimal notation.                                                                                                                               |

| Parameter                                        | Description                                                                                                                                                                                                            |
|--------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;ip-addr&gt;/ &lt;prefix&gt;</i>           | Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                                |
| <i>&lt;ip-addr&gt; &lt;reverse-mask&gt;</i>      | Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24. |
| <i>&lt;source-ports&gt;</i>                      | Match source TCP or UDP port numbers. Port numbers are specified as integers between 0 and 65535. You can specify one or more port numbers as follows:                                                                 |
| eq <i>&lt;0-65535&gt;</i>                        | Match a single port number.                                                                                                                                                                                            |
| lt <i>&lt;0-65535&gt;</i>                        | Match all port numbers that are less than the specified port number.                                                                                                                                                   |
| gt <i>&lt;0-65535&gt;</i>                        | Match all port numbers that are greater than the specified port number.                                                                                                                                                |
| ne <i>&lt;0-65535&gt;</i>                        | Match all port numbers except the specified port number.                                                                                                                                                               |
| range <i>&lt;start-port&gt; &lt;end-port&gt;</i> | Match a range of port numbers.                                                                                                                                                                                         |
| <i>&lt;dest-addr&gt;</i>                         | The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:                                 |
| any                                              | Match any destination IP address.                                                                                                                                                                                      |
| host <i>&lt;ip-addr&gt;</i>                      | Match a single destination host with the IP address given by <i>&lt;ip-addr&gt;</i> in dotted decimal notation.                                                                                                        |
| <i>&lt;ip-addr&gt;/ &lt;prefix&gt;</i>           | Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                           |

| Parameter                                   | Description                                                                                                                                                                                                                 |
|---------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;ip-addr&gt; &lt;reverse-mask&gt;</i> | Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24. |
| <i>&lt;dest-ports&gt;</i>                   | Match destination TCP or UDP port numbers. Port numbers are specified as integers between 0 and 65535. You can specify one or more port numbers as follows:                                                                 |
| eq <0-65535>                                | Match a single port number.                                                                                                                                                                                                 |
| lt <0-65535>                                | Match all port numbers that are less than the specified port number.                                                                                                                                                        |
| gt <0-65535>                                | Match all port numbers that are greater than the specified port number.                                                                                                                                                     |
| ne <0-65535>                                | Match all port numbers except the specified port number.                                                                                                                                                                    |
| range <start-port> <end-port>               | Match a range of port numbers.                                                                                                                                                                                              |
| vlan <1-4094>                               | The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.                                                                                                                            |
| log                                         | Log packets that are denied by this ACL. You must also enable the logging, using the command <b>access-list hardware-deny-log</b> .                                                                                         |

**Mode** IPv6 Hardware ACL Configuration (accessed by running the command **ipv6 access-list (named IPv6 hardware ACL)**)

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** To use this command, first run the command **ipv6 access-list (named IPv6 hardware ACL)** and enter the desired access-list name. This changes the prompt to:

```
awplus(config-ipv6-hw-acl)#
```

Then use this command (and the other “named IPv6 hardware ACL: entry” commands) to add filter entries. You can add multiple filter entries to an ACL.

If you specify a sequence number, the new entry is inserted at the specified location. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Once you have configured the ACL, use the **ipv6 traffic-filter** or the **match access-group** command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

**Examples** To add a filter entry that blocks all SSH traffic from network 2001:0db8::0/64 to the hardware IPv6 access-list named “my-acl”, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# deny tcp 2001:0db8::0/64 any eq 22
```

To add a filter entry that blocks all SSH traffic from network 2001:0db8::0/64 on the default VLAN (vlan1) to the hardware IPv6 access-list named “my-acl”, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# deny tcp 2001:0db8::0/64 any eq 22
vlan 1
```

To remove an ACL filter entry that blocks all SSH traffic from network 2001:0db8::0/ 64 from the hardware IPv6 access-list named “my-acl”, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# no deny tcp 2001:0db8::0/64 any eq
22
```

**Related commands** **access-list hardware-deny-log**  
**ipv6 access-list (named IPv6 hardware ACL)**  
**ipv6 traffic-filter**  
**match access-group**  
**show ipv6 access-list (IPv6 Hardware ACLs)**

**Command changes** Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

# show access-list counters

**Overview** Use this command to show the number of packets that match one or all of your hardware ACLs. Every time a hardware ACL allows or drops a packet, its counter increments. This lets you check your ACL configuration.

**Syntax** show access-list counters [<acl>]

| Parameter | Description                                                                                            |
|-----------|--------------------------------------------------------------------------------------------------------|
| <acl>     | Display the number of packets that match only the specified ACL. You can enter the ACL name or number. |

**Mode** User Exec and Privileged Exec

**Usage notes** This command displays the counter values since the last time they were cleared. To clear the counter values, enter the command **clear access-list counters**.

To accurately measure the number of packet hits per ACL, you need to read the counters for all ACLs frequently.

**Example** To show the number of packets that match all hardware ACLs, use the following command:

```
awplus# show access-list counters
```

**Output** The following shows typical output.

## Example output from show access-list counters

```
awplus#show access-list counters
Hardware ACL Packet Counters

ACL-1
Packet Hits: 17
ACL-2
Packet Hits: 0
ACL-3
Packet Hits: 1
```

**Output** The following shows typical output.

**Example output from show access-list counters ACL-1**

```
awplus#show access-list counters ACL-1
Hardware ACL Packet Counters

ACL-1
Packet Hits: 17
```

**Parameters in the output from show access-list counters**

| Parameter   | Description                                                                                    |
|-------------|------------------------------------------------------------------------------------------------|
| Packet Hits | The number of packets that match the ACL. The count includes both dropped and allowed packets. |

**Related commands** [clear access-list counters](#)  
[show access-group](#)  
[show interface access-group](#)

**Command changes** Version 5.5.2-2.1: reading the counters no longer clears them  
Version 5.5.1-2.1: command added

# show acl-group ipv6 address

**Overview** Use this command to show the hosts and subnets in a named IPv6 ACL group.

**Syntax** show acl-group ipv6 address <group>

| Parameter | Description                     |
|-----------|---------------------------------|
| <group>   | The name of the IPv6 ACL group. |

**Mode** Privileged Exec

**Example** To show all hosts and subnets in an IPv6 ACL group IPV6\_GROUP1, use the command:

```
awplus# show acl-group ipv6 address IPV6_GROUP1
```

**Output** The following shows typical output.

**Example output from show acl-group ipv6 address IPV6\_GROUP1**

```
awplus#show acl-group ipv6 address IPV6_GROUP1
Host Group: IPV6_GROUP1

2001:DB8::/32
2001:DB9::1/128
```

**Related commands** [acl-group ipv6 address](#)  
[ipv6 \(ipv6-host-group\)](#)

**Command changes** Version 5.5.0-1.1: command added

# show ipv6 access-list (IPv6 Hardware ACLs)

**Overview** Use this command to display all configured hardware IPv6 access-lists or the IPv6 access-list specified by name. Omitting the optional name parameter will display all IPv6 ACLs.

**Syntax** show ipv6 access-list [<name>]

| Parameter | Description                     |
|-----------|---------------------------------|
| <name>    | Hardware IPv6 access-list name. |

**Mode** User Exec and Privileged Exec

**Example** To show all configured IPv6 access-lists use the command:

```
awplus# show ipv6 access-list
```

**Output** The following shows typical output.

## Example output from the show ipv6 access-list command

```
IPv6 access-list deny_ssh  
deny tcp abcd::0/64 any eq 22
```

ACLs that are added dynamically during port authentication will be displayed with the label 'dynamic':

```
awplus# show ipv6 access-list
```

```
Named Standard IPv6 access list red  
10 deny any  
  
Named Extended IPv6 access list blue  
10 deny ip any any  
  
Hardware IPv6 access list dacl-port1.0.45-2477.03fe.ded4-ipv6 (dynamic)  
4 deny ipv6 any any
```

## IPv6 Software Access Control List (ACL) Commands

- Contents**
- **Introduction** on page 1320
  - **ipv6 access-list standard (named)** on page 1321
  - **(ipv6 access-list standard filter)** on page 1323
  - **show ipv6 access-list (IPv6 Software ACLs)** on page 1325
  - **vty ipv6 access-class (named)** on page 1327

# Introduction

**Overview** This chapter provides an alphabetical reference for the IPv6 Software Access Control List (ACL) commands, and contains detailed command information and command examples about IPv6 software ACLs as applied to Routing and Multicasting, which are not applied to interfaces.

For information about ACLs, see the [ACL Feature Overview and Configuration Guide](#).

To apply ACLs to an LACP channel group, apply it to all the individual switch ports in the channel group. To apply ACLs to a static channel group, apply it to the static channel group itself. For more information on link aggregation see the following references:

- [Link Aggregation Feature Overview\\_and\\_Configuration\\_Guide](#).
- [Link Aggregation Commands](#)

Note that text in parenthesis in command names indicates usage not keyword entry. For example, **ipv6-access-list (named)** indicates named IPv6 ACLs entered as:

```
ipv6-access-list <name>
```

where <name> is a placeholder not a keyword.

Note also that parenthesis surrounding ACL filters indicates the type of ACL filter not the keyword entry in the CLI. For example, **(ipv6 access-list standard IPv6 filter)** represents command entry in the format shown in the syntax:

```
[<sequence-number>] {deny|permit} [<source-ipv6-address/prefix-length>|any]
```

**NOTE:** Software ACLs will access unless by an ACL action.

**Sub-modes** Many of the ACL commands operate from sub-modes that are specific to particular ACL types. The following table shows the CLI prompts at which ACL commands are entered.

## IPv6 Software Access List Commands and Prompts

| Command Name                                      | Command Mode                    | Prompt                       |
|---------------------------------------------------|---------------------------------|------------------------------|
| <b>show ipv6 access-list (IPv6 Software ACLs)</b> | Privileged Exec                 | awplus#                      |
| <b>ipv6 access-list standard (named)</b>          | Global Configuration            | awplus(config)#              |
| <b>(ipv6 access-list standard filter)</b>         | IPv6 Standard ACL Configuration | awplus(config-ipv6-std-acl)# |

## ipv6 access-list standard (named)

**Overview** This command configures an IPv6 standard access-list for filtering frames that permit or deny IPv6 packets from a specific source IPv6 address.

The **no** variant of this command removes a specified IPv6 standard access-list.

**Syntax [list-name]** `ipv6 access-list standard <ipv6-acl-list-name>`  
`no ipv6 access-list standard <ipv6-acl-list-name>`

| Parameter                               | Description                                                     |
|-----------------------------------------|-----------------------------------------------------------------|
| <code>&lt;ipv6-acl-list-name&gt;</code> | A user-defined name for the IPv6 software standard access-list. |

**Syntax [deny|permit]** `ipv6 access-list standard <ipv6-acl-list-name> [{deny|permit} {<ipv6-source-address/prefix-length>|any} [exact-match]]`  
`no ipv6 access-list standard <ipv6-acl-list-name> [{deny|permit} {<ipv6-source-address/prefix-length>|any} [exact-match]]`

| Parameter                                              | Description                                                                                                                                                   |
|--------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ipv6-acl-list-name&gt;</code>                | A user-defined name for the IPv6 software standard access-list.                                                                                               |
| deny                                                   | The IPv6 software standard access-list rejects packets that match the type, source, and destination filtering specified with this command.                    |
| permit                                                 | The IPv6 software standard access-list permits packets that match the type, source, and destination filtering specified with this command.                    |
| <code>&lt;ipv6-source-address/prefix-length&gt;</code> | Specifies a source address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64. |
| any                                                    | Matches any source IPv6 address.                                                                                                                              |
| exact-match                                            | Exact match of the prefixes.                                                                                                                                  |

**Mode** Global Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage notes** Use IPv6 standard access-lists to control the transmission of IPv6 packets on an interface, and restrict the content of routing updates. The switch stops checking the IPv6 standard access-list when a match is encountered.

For backwards compatibility you can either create IPv6 standard access-lists from within this command, or you can enter `ipv6 access-list standard` followed by only the IPv6 standard access-list name. This latter (and preferred) method moves you to the `(config-ipv6-std-acl)` prompt for the selected IPv6 standard access-list, and from here you can configure the filters for this selected IPv6 standard access-list.

**NOTE:** *Software ACLs will access unless by an ACL action.*

**Example** To enter the IPv6 Standard ACL Configuration mode for the access-list named `my-list`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list standard my-list
awplus(config-ipv6-std-acl)#
```

**Related commands** **([ipv6 access-list standard filter](#))**  
**[show ipv6 access-list \(IPv6 Software ACLs\)](#)**  
**[show running-config](#)**

## (ipv6 access-list standard filter)

**Overview** Use this ACL filter to add a filter entry for an IPv6 source address and prefix length to the current standard IPv6 access-list. If a sequence number is specified, the new entry is inserted at the specified location. Otherwise, the new entry is added at the end of the access-list.

The **no** variant of this command removes a filter entry for an IPv6 source address and prefix from the current standard IPv6 access-list. You can specify the filter entry for removal by entering either its sequence number, or its filter entry profile.

**Syntax [icmp]** [`<sequence-number>`] {deny|permit} {`<ipv6-source-address/prefix-length>`|any}  
no {deny|permit} {`<ipv6-source-address/prefix-length>`|any}  
no `<sequence-number>`

| Parameter                                              | Description                                                                                                       |
|--------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------|
| <code>&lt;sequence-number&gt;</code>                   | <code>&lt;1-65535&gt;</code><br><br>The sequence number for the filter entry of the selected access control list. |
| deny                                                   | Specifies the packets to reject.                                                                                  |
| permit                                                 | Specifies the packets to accept.                                                                                  |
| <code>&lt;ipv6-source-address/prefix-length&gt;</code> | IPv6 source address and prefix-length in the form X:X::X:X/P.                                                     |
| any                                                    | Any IPv6 source host address.                                                                                     |

**Mode** IPv6 Standard ACL Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage** The filter entry will match on any IPv6 packet that has the specified IPv6 source address and prefix length. The parameter any may be specified if an address does not matter.

**NOTE:** *Software ACLs will access unless by an ACL action.*

**Examples** To add an ACL filter entry with sequence number 5 that will deny any IPv6 packets to the standard IPv6 access-list named my-list, enter the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list standard my-list
awplus(config-ipv6-std-acl)# 5 deny any
```

To remove the ACL filter entry that will deny any IPv6 packets from the standard IPv6 access-list named my-list, enter the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list standard my-list
awplus(config-ipv6-std-acl)# no deny any
```

Alternately, to remove the ACL filter entry with sequence number 5 to the standard IPv6 access-list named my-list, enter the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list standard my-list
awplus(config-ipv6-std-acl)# no 5
```

**Related commands** **ipv6 access-list standard (named)**  
**show ipv6 access-list (IPv6 Software ACLs)**  
**show running-config**

# show ipv6 access-list (IPv6 Software ACLs)

**Overview** Use this command to display all configured IPv6 access-lists or the IPv6 access-list specified by name.

**Syntax** show ipv6 access-list [<access-list-name>]  
show ipv6 access-list standard [<access-list-name>]

| Parameter          | Description                                                                 |
|--------------------|-----------------------------------------------------------------------------|
| <access-list-name> | Only display information about an IPv6 access-list with the specified name. |
| standard           | Only display information about standard access-lists.                       |

**Mode** User Exec and Privileged Exec

**Example** To show all configured IPv6 access-lists, use the following command:  
awplus# show ipv6 access-list

**Output** The following shows typical output.

## Example output from show ipv6 access-list

```
IPv6 access-list deny_icmp
deny icmp any any vlan 1

IPv6 access-list deny_ssh
deny tcp abcd::0/64 any eq 22
```

**Example** To show the IPv6 access-list named **deny\_icmp**, use the following command:  
awplus# show ipv6 access-list deny\_icmp

**Output** The following shows typical output.

## Example output from show ipv6 access-list for a named ACL

```
IPv6 access-list deny_icmp
deny icmp any any vlan 1
```

**Related commands** [ipv6 access-list standard \(named\)](#)  
[\(ipv6 access-list standard filter\)](#)

## vty ipv6 access-class (named)

**Overview** For IPv6, use this command to set a standard named software access list to be the management ACL. This is then applied to all available VTY lines for controlling remote access by Telnet and SSH. This command allows or denies packets containing the IPv6 addresses included in the ACL to create a connection to your device.

ACLs that are attached using this command have an implicit 'deny-all' filter as the final entry in the ACL. A typical configuration is to permit a specific address, or range of addresses, and rely on the 'deny-all' filter to block all other access.

Use the **no** variant of this command to remove the access list.

**Syntax** vty ipv6 access-class <access-name>  
no vty ipv6 access-class [<access-name>]

| Parameter     | Description                                        |
|---------------|----------------------------------------------------|
| <access-name> | Specify an IPv6 standard software access-list name |

**Mode** Global Configuration

**Examples** To set the named standard access-list named **access-ctrl** to be the IPv6 management ACL, use the following commands:

```
awplus# configure terminal
awplus(config)# vty ipv6 access-class access-ctrl
```

To remove **access-ctrl** from the management ACL, use the following commands:

```
awplus# configure terminal
awplus(config)# no vty ipv6 access-class access-ctrl
```

**Output** The following shows typical output.

**Example output from the show running-config command**

```
awplus#show running-config|grep access-class
 vty ipv6 access-class access-ctrl
```

**Related commands** [show running-config](#)  
[vty access-class \(numbered\)](#)

# Introduction

**Overview** This chapter provides an alphabetical reference for Quality of Service commands.

QoS uses ACLs. For more information about ACLs, see the [ACL Feature Overview and Configuration Guide](#).

# class

**Overview** Use this command to associate an existing class-map to a policy or policy-map (traffic classification), and to enter Policy Map Class Configuration mode to configure the class- map.

Use the **no** variant of this command to delete an existing class-map.

If your class-map does not exist, you can create it by using the **class-map** command.

**Syntax** class {<name>|default}  
no class <name>

| Parameter | Description                               |
|-----------|-------------------------------------------|
| <name>    | Name of the (already existing) class-map. |
| default   | Specify the default class-map.            |

**Mode** Policy Map Configuration

**Example** The following example creates the policy-map pmap1(using the policy-map command), then associates this to an already existing class-map named cmap1, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)#
```

**Related commands** **class-map**  
**policy-map**

## class-map

**Overview** Use this command to create a class-map.  
Use the **no** variant of this command to delete the named class-map.

**Syntax** class-map <name>  
no class-map <name>

| Parameter | Description                          |
|-----------|--------------------------------------|
| <name>    | Name of the class-map to be created. |

**Mode** Global Configuration

**Example** This example creates a class-map called cmap1, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)#
```

# clear mls qos interface policer-counters

**Overview** Resets an interface's policer counters to zero. You can either clear a specific class-map, or you can clear all class-maps by not specifying a class map.

**Syntax** `clear mls qos interface <port> policer-counters [class-map <class-map>]`

| Parameter   | Description                                                                                                                      |
|-------------|----------------------------------------------------------------------------------------------------------------------------------|
| <port>      | The port may be a switch port (e.g. port1.0.4), a static channel group (e.g. sa3), or a dynamic (LACP) channel group (e.g. po4). |
| class-map   | Select a class-map.                                                                                                              |
| <class-map> | Class-map name.                                                                                                                  |

**Mode** Privileged Exec

**Example** To reset the policy counters to zero for all class-maps for port1.0.4, use the command:

```
awplus# clear mls qos interface port1.0.4 policer-counters
```

**Related commands** [show mls qos interface policer-counters](#)

# clear mls qos interface queue-counters

**Overview** Use this command to clear the QoS queue counters for an interface.

**Syntax** clear mls qos interface *<interface>* queue-counters

| Parameter                | Description                                                                                                                   |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;interface&gt;</i> | The interface to clear the counters for. This can be a switchport, a static channel group, or a dynamic (LACP) channel group. |

**Mode** Privileged Exec

**Example** To clear the egress queue counters on interface port1.0.1, use the command:

```
awplus# clear mls qos interface port1.0.1 queue-counters
```

To clear the egress queue counters on the static aggregator sa1, use the command:

```
awplus# clear mls qos interface sa1 queue-counters
```

**Related commands** [show mls qos interface queue-counters](#)

**Command changes** Version 5.5.2-2.1: command added

# default-action

**Overview** Use this command to set the action for the default class-map belonging to a particular policy-map. The action for a non-default class-map depends on the action of any ACL that is applied to the policy-map.

You can think of the default action as the action that the switch will apply to any data that does not meet the criteria specified by the applied matching commands.

Use the **no** variant of this command to reset to the default action of 'permit'.

**Syntax** default-action <action>  
no default-action

| Parameter |                                                   | Description                                                                                                                                                                                                                                                                   |
|-----------|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <action>  | permit                                            | Permit packets                                                                                                                                                                                                                                                                |
|           | deny                                              | Deny packets.                                                                                                                                                                                                                                                                 |
|           | send-to-cpu                                       | Send packets to the CPU.                                                                                                                                                                                                                                                      |
|           | copy-to-cpu                                       | Copy packets to the CPU as well as forwarding them.                                                                                                                                                                                                                           |
|           | copy-to-mirror<br>[interface <i>port-number</i> ] | Copy packets to the mirror port as well as forwarding them.<br><br>Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |

**Default** The default is **permit**.

**Mode** Policy Map Configuration

**Examples** To set the action for the default class-map to 'deny' for the policy map named 'map1', use the commands:

```
awplus# configure terminal
awplus(config)# mls qos enable
awplus(config)# policy-map map1
awplus(config-pmap)# default-action deny
```

To set the action for the default class-map to 'copy-to-mirror' for use with the **mirror interface** command, for the policy map named 'map1', use the commands:

```
awplus# configure terminal
awplus(config)# mls qos enable
awplus(config)# policy-map map1
awplus(config-pmap)# default-action copy-to-mirror
```

**Related commands** **mirror interface**

## description (QoS policy-map)

**Overview** Adds a textual description of the policy-map. This can be up to 80 characters long.

Use the **no** variant of this command to remove the current description from the policy-map.

**Syntax** `description <line>`  
`no description`

| Parameter                 | Description                               |
|---------------------------|-------------------------------------------|
| <code>&lt;line&gt;</code> | Up to 80 character long line description. |

**Mode** Policy Map Configuration

**Example** To add the description, VOIP traffic, use the command:

```
awplus(config-pmap)# description VOIP traffic
```

# egress-rate-limit

**Overview** Use this command to limit the amount of traffic that can be transmitted per second from this port.

Use the **no** variant of this command to disable the limiting of traffic egressing on the interface.

**Syntax** egress-rate-limit <rate-limit>  
no egress-rate-limit

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <rate-limit> | <p>Bandwidth &lt;1-10000000 units per second&gt; (usable units: k, m, g).</p> <p>Not all values of egress rate limit are valid. If you enter an invalid number, the switch will round it up to the nearest valid value.</p> <p>The default unit is Kb (<b>k</b>), but Mb (<b>m</b>) or Gb (<b>g</b>) can also be specified. The command syntax is not case sensitive, so a value such as 20m or 20M will be interpreted as 20 megabits.</p> |

**Mode** Interface Configuration

**Usage notes** You cannot use this command at the same time as the **wrr-queue queue-limit** or **strict-priority-queue queue-limit** commands.

**Examples** To enable egress rate limiting on a port, with a limit of approximately 500Mbps, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# egress-rate-limit 500m
```

To disable egress rate limiting on a port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no egress-rate-limit
```

**Related commands** **egress-rate-limit overhead**

## egress-rate-limit overhead

**Overview** Use this command to allow for the size of packet preamble and inter-packet gap (the “overhead”) in egress queue rate limiting on switch ports.

Doing this keeps the rate limit at the same percentage of line rate for all packet sizes. Otherwise, the percentage of line rate changes with packet size, because of the size of the overhead relative to smaller packets. This means smaller packets take up a larger percentage of the line rate.

Use the **no** variant of this command to turn off the overhead allowance.

**Syntax** egress-rate-limit overhead <bytes>  
no egress-rate-limit overhead

| Parameter | Description                                                                                                                                                 |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <bytes>   | The number of bytes to allow for overhead. For standard ethernet packets, use a value of 20 bytes (8 bytes of preamble and a inter-packet gap of 12 bytes). |

**Default** No overhead allowance

**Mode** Interface Configuration

**Example** To configure an overhead allowance of 20 bytes (8 bytes of preamble and a inter-packet gap of 12 bytes) on port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# egress-rate-limit overhead 20
```

To return port1.0.1 to the default of no overhead allowance, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no egress-rate-limit overhead
```

**Related commands** [egress-rate-limit](#)

**Command changes** Version 5.4.9-2.1: command added

## match access-group

**Overview** Use this command to apply an ACL to a class-map or VLAN.

Use the **no** variant of this command to remove the match.

**Syntax** match access-group {<hw-IP-ACL>|<hw-MAC-ACL>|<hw-named-ACL>}  
no match access-group {<hw-IP-ACL>|<hw-MAC-ACL>|<hw-named-ACL>}

| Parameter      | Description                                                     |
|----------------|-----------------------------------------------------------------|
| <hw-IP-ACL>    | Specify a hardware IP ACL number in the range <3000-3699>.      |
| <hw-MAC-ACL>   | Specify a hardware MAC ACL number in the range <4000-4699>.     |
| <hw-named-ACL> | Specify a hardware named ACL (IP, IPv6 or MAC address entries). |

**Mode** Class Map or VLAN Access-Map

**Usage notes** First create an access-list that applies the appropriate action to matching packets. Then use the **match access-group** command to apply this access-list as desired. Note that this command will apply the access-list matching only to *incoming* data packets.

**Examples** To configure a class-map named "cmap1", which matches traffic against access-list 3001, which allows IP traffic from any source to any destination, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 3001 permit ip any any
awplus(config)# class-map cmap1
awplus(config-cmap)# match access-group 3001
```

To configure a class-map named "cmap2", which matches traffic against access-list 4001, which allows MAC traffic from any source to any destination, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 4001 permit any any
awplus(config)# class-map cmap2
awplus(config-cmap)# match access-group 4001
```

To configure a class-map named "cmap3", which matches traffic against access-list "hw\_acl", which allows IP traffic from any source to any destination, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware hw_acl
awplus(config-ip-hw-acl)# permit ip any any
awplus(config)# class-map cmap3
awplus(config-cmap)# match access-group hw_acl
```

To apply ACL 3001 to VLAN 48, where the ACL drops IP traffic from any source to any destination, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 3001 deny ip any any
awplus(config)# vlan access-map deny_all
awplus(config-vlan-access-map)# match access-group 3001
awplus(config-vlan-access-map)# exit
awplus(config)# vlan filter deny_all vlan-list 48 input
```

**Related commands** [class-map](#)  
[vlan access-map](#)

**Command changes** Version 5.4.6-2.1: support for VLAN access-maps added

## match cos

**Overview** Use this command to define a CoS to match against incoming packets.  
Use the **no** variant of this command to remove CoS.

**Syntax** match cos <0-7>  
no match cos

| Parameter | Description            |
|-----------|------------------------|
| <0-7>     | Specify the CoS value. |

**Mode** Class Map Configuration

**Examples** To set the class-map's CoS to 4, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match cos 4
```

To remove CoS from a class-map, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match cos
```

## match dscp

**Overview** Use this command to define the DSCP to match against incoming packets. Use the **no** variant of this command to remove a previously defined DSCP.

**Syntax** match dscp <0-63>  
no match dscp

| Parameter | Description                                           |
|-----------|-------------------------------------------------------|
| <0-63>    | Specify DSCP value (only one value can be specified). |

**Mode** Class Map Configuration

**Usage** Use the **match dscp** command to define the match criterion after creating a class-map.

**Examples** To configure a class-map named cmap1 with criterion that matches DSCP 56, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match dscp 56
```

To remove a previously defined DSCP from a class-map named cmap1, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match dscp
```

**Related commands** [class-map](#)

## match eth-format protocol

**Overview** This command sets the Ethernet format and the protocol for a class-map to match on.

Select one Layer 2 format and one Layer 3 protocol when you issue this command.

Use the **no** variant of this command to remove the configured Ethernet format and protocol from a class-map.

**Syntax** match eth-format <layer-two-format> protocol <layer-three-protocol>

no match eth-format protocol

The following eth-formats and protocols are available (note that not all options are available on all AlliedWare Plus switch models):

| Parameter               | Description                                                                                                              |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------|
| <layer-two-formats>     |                                                                                                                          |
| 802dot2-tagged          | 802.2 Tagged Packets (enter the parameter name).                                                                         |
| 802dot2-untagged        | 802.2 Untagged Packets (enter the parameter name).                                                                       |
| ethii-tagged            | EthII Tagged Packets (enter the parameter name).                                                                         |
| ethii-untagged          | EthII Untagged Packets (enter the parameter name).                                                                       |
| ethii-any               | EthII Tagged or Untagged Packets (enter the parameter name).                                                             |
| netwareraw-tagged       | Netware Raw Tagged Packets (enter the parameter name).                                                                   |
| netwareraw-untagged     | Netware Raw Untagged Packets (enter the parameter name).                                                                 |
| snap-tagged             | SNAP Tagged Packets (enter the parameter name).                                                                          |
| snap-untagged           | SNAP Untagged Packets (enter the parameter name).                                                                        |
| <layer-three-protocols> |                                                                                                                          |
| <word>                  | A Valid Protocol Number in hexadecimal.                                                                                  |
| any                     | Note that the parameter "any" is only valid when used with the netwarerawtagged and netwarerawuntagged protocol options. |
| sna-path-control        | Protocol Number 04 (enter the parameter name or its number).                                                             |
| proway-lan              | Protocol Number 0E (enter the parameter name or its number).                                                             |
| eia-rs Protocol         | Number 4E (enter the parameter name or its number).                                                                      |

| Parameter         | Description                                                    |
|-------------------|----------------------------------------------------------------|
| proway Protocol   | Number 8E (enter the parameter name or its number).            |
| ipx-802dot2       | Protocol Number E0 (enter the parameter name or its number).   |

| ipx              | Protocol Number 8137 (enter the parameter name or its number). |
| ipv6             | Protocol Number 86DD (enter the parameter name or its number). |

## Mode Class Map Configuration

**Examples** To set the eth-format to ethii-tagged and the protocol to 0800 (IP) for class-map cmap1, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match eth-format ethii-tagged protocol 0800
awplus(config-cmap)# match eth-format ethii-tagged protocol ip
```

To remove the eth-format and the protocol from the class-map cmap1, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match eth-format protocol
```

## match inner-cos

**Overview** Sets the Inner CoS for a class-map to match on.  
Use the **no** variant of this command to remove CoS.

**Syntax** match inner-cos <0-7>  
no match inner-cos

| Parameter | Description                  |
|-----------|------------------------------|
| <0-7>     | Specify the Inner CoS value. |

**Mode** Class Map Configuration

**Examples** To set the class-map's inner-cos to 4, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match inner-cos 4
```

To remove CoS from the class-map, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match inner-cos
```

## match inner-tpid

**Overview** Sets the Inner Tag Protocol Identifier (TPID) for a class-map to match on.  
Use the **no** variant of this command to remove the TPID for a class-map.

**Syntax** match inner-tpid <tpid>  
no match inner-tpid

| Parameter | Description                                        |
|-----------|----------------------------------------------------|
| <tpid>    | Two byte hexadecimal number representing the TPID. |

**Mode** Class Map Configuration

**Examples** To set the class-map's inner-tpid to 0x9100, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match inner-tpid 0x9100
```

To remove the class-map's inner-tpid, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match inner-tpid
```

## match inner-vlan

**Overview** Use this command to define the inner VLAN ID as match criteria.

Use the **no** variant of this command to disable the VLAN ID used as match criteria.

**Syntax** match inner-vlan <1-4094>  
no match inner-vlan

| Parameter | Description      |
|-----------|------------------|
| <1-4094>  | The VLAN number. |

**Mode** Class Map Configuration

**Usage notes** This command is used in double-tagged networks to match on a VLAN ID belonging to the client network. For more information on VLAN double-tagged networks, see the [VLAN\\_Feature Overview and Configuration Guide](#).

**Examples** To configure a class-map named cmap1 to match traffic from inner VLAN 3, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match inner-vlan 3
```

To disable the configured VLAN ID as a match criteria for the class-map named cmap1, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match inner-vlan
```

## match ip-precedence

**Overview** Use this command to identify IP precedence values as match criteria.  
Use the **no** variant of this command to remove IP precedence values from a class-map.

**Syntax** match ip-precedence <0-7>  
no match ip-precedence

| Parameter | Description                         |
|-----------|-------------------------------------|
| <0-7>     | The precedence value to be matched. |

**Mode** Class Map Configuration

**Example** To configure a class-map named cmap1 to match all IPv4 packets with a precedence value of 5, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match ip-precedence 5
```

## match mac-type

**Overview** Use this command to set the MAC type for a class-map to match on.  
Use **no** variant of this command to remove the MAC type match entry.

**Syntax** match mac-type {l2mcast|l2ucast}  
no match mac-type

| Parameter | Description                              |
|-----------|------------------------------------------|
| l2mcast   | Layer 2 Multicast and Broadcast traffic. |
| l2ucast   | Layer 2 Unicast traffic.                 |

**Mode** Class Map Configuration

**Examples** To set the class-map's MAC type to Layer 2 multicast, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match mac-type l2mcast
```

To remove the class-map's MAC type entry, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match mac-type
```

## match tcp-flags

**Overview** Sets one or more TCP flags (control bits) for a class-map to match on.

Use the **no** variant of this command to remove one or more TCP flags for a class-map to match on.

**Syntax** match tcp-flags [ack] [fin] [psh] [rst] [syn] [urg]  
no match tcp-flags [ack] [fin] [psh] [rst] [syn] [urg]

| Parameter | Description  |
|-----------|--------------|
| ack       | Acknowledge. |
| fin       | Finish.      |
| psh       | Push.        |
| rst       | Reset.       |
| syn       | Synchronize. |
| urg       | Urgent.      |

**Mode** Class Map Configuration

**Examples** To set the class-map's TCP flags to **ack** and **syn**, use the commands:

```
awplus# configure terminal
awplus(config)# class-map
awplus(config-cmap)# match tcp-flags ack syn
```

To remove the TCP flags **ack** and **rst**, use the commands:

```
awplus# configure terminal
awplus(config)# class-map
awplus(config-cmap)# no match tcp-flags ack rst
```

## match tpid

**Overview** Sets the Tag Protocol Identifier (TPID) for a class-map to match on.  
Use the **no** variant of this command to remove the TPID for a class-map.

**Syntax** match tpid <tpid>  
no match tpid

| Parameter | Description                          |
|-----------|--------------------------------------|
| <tpid>    | Specify the Tag Protocol Identifier. |

**Mode** Class Map Configuration

**Examples** To set the TPID of class-map named cmap1 to 0x9100, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match tpid 0x9100
```

To remove the TPID set previously for class-map named cmap1, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match tpid
```

## match vlan

**Overview** Use this command to define the VLAN ID as match criteria.

Use the **no** variant of this command to disable the VLAN ID used as match criteria.

**Syntax** match vlan <1-4094>  
no match vlan

| Parameter | Description      |
|-----------|------------------|
| <1-4094>  | The VLAN number. |

**Mode** Class Map Configuration

**Examples** To configure a class-map named cmap1 to include traffic from VLAN 3, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match vlan 3
```

To disable the configured VLAN ID as a match criteria for the class-map named cmap1, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match vlan
```

# mls qos aggregate-police action

**Overview** This command creates or reconfigures an aggregate-policer for a class-map.

The **no** variant of this command removes a previously configured exceed action.

**Syntax** For single rate metering:

```
mls qos aggregate-police <name> single-rate <CIR> <CBS> <EBS>  
action [drop-red|transmit]
```

For twin rate metering:

```
mls qos aggregate-police <name> twin-rate <CIR> <CBS> <EIR>  
<PBS> action [drop-red|transmit]
```

```
no mls qos aggregate-police <name>
```

| Parameter   | Description                                                                                                                                                |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <name>      | Specify aggregate-policer name.                                                                                                                            |
| single-rate | Single rate meter (one rate and two burst sizes).                                                                                                          |
| twin-rate   | Twin rate meter (two rates and two burst sizes).                                                                                                           |
| <CIR>       | The Committed Information Rate. Specify an average traffic rate, 1-16000000 (kbps).                                                                        |
| <CBS>       | The amount by which the data is allowed to burst beyond the value set by the CIR.<br>Specify a value from 0-16777216 (bytes).                              |
| <EIR>       | Excess Information Rate. Specify an average traffic rate, 1-16000000 (kbps).                                                                               |
| <EBS>       | For single-rate metering, this is the amount by which the data is allowed to burst beyond the value set by the CIR.                                        |
| <PBS>       | For twin-rate metering, this is the amount by which the data is allowed to burst beyond the value set by the EIR. Specify a value from 1-16777216 (bytes). |
| action      | Specify the action: either drop-red or policed-dscp-transmit.                                                                                              |
| drop-red    | Drop the red packets.                                                                                                                                      |
| transmit    | Packets are sent without modification.                                                                                                                     |

**Mode** Global Configuration

**Usage notes** A policer can be used to meter the traffic classified by the class-map and as a result will be given one of three bandwidth classes. These are green (conforming), yellow (partially-conforming), and red (non-conforming).

Once you have created an aggregate policer, you can use the **police-aggregate** to assign it to one or more class-maps. This enables traffic classified by different characteristics to have accumulative application to the same policer. Another application of aggregate policers is to attach them to a single class-map but apply the class-maps to multiple ports (via its policy-map). This enables the same traffic to have accumulative policed application over multiple ports.

A single-rate policer is based on three values. These are:

- average rate (or Committed Information Rate CIR)
- minimum burst (or Committed Burst Size CBS)
- maximum burst (or Excess Burst Size EBS)

Traffic is classed as green if the rate is less than the combined CIR plus CBS values. Traffic is classed as yellow if the data rate is between the CBS and the EBS. Traffic is classed as red if the rate exceeds the average rate and the EBS.

A dual-rate policer is based on four values. These are:

- average rate (or Committed Information Rate CIR)
- minimum burst (or Committed Burst Size CBS)
- maximum burst (or Excess Burst Size EBS)
- Excess Information Rate (EIR)

Traffic is classed as green if the rate is less than the CIR and CBS. Traffic is classed as yellow if the rate is between the CBS and the EBS. Traffic is classed as red if the rate exceeds the average rate and the EBS.

Using an action of **drop-red** will result in all packets classed as red being discarded.

**Example** To create a single rate meter measuring traffic of 10 Mbps that drops any traffic bursting over 30000 bytes, use the commands:

```
awplus# configure terminal
awplus(config)# mls qos aggregate-police ap1 single-rate 10000
                20000 30000 action drop-red
```

**police-aggregate**

**show mls qos aggregate-policer**

# mls qos aggregate-police counters

**Overview** Use this command to enable policer counters for an aggregate-policer. This command can be used separately or in conjunction with a traffic meter (single or twin-rate meters).

Use the **no** variant of this command to disable policer counters for an aggregate-policer.

**Syntax** mls qos aggregate-police <name> counters  
no mls qos aggregate-police <name> counters

| Parameter | Description                     |
|-----------|---------------------------------|
| <name>    | Specify aggregate-policer name. |

**Default** Policer counters are disabled by default.

**Mode** Global Configuration

**Example** To enable policer counters for aggregate-policer MYPolicer, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# mls qos aggregate-police MyPolicer counters
```

To disable policer counters for aggregate-policer MYPolicer, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no mls qos aggregate-police MyPolicer counters
```

**Related commands** [police counters](#)  
[police single-rate action](#)  
[police twin-rate action](#)

## mls qos cos

**Overview** This command assigns a CoS (Class of Service) user-priority value to untagged frames entering a specified interface. By default, all untagged frames are assigned a CoS value of 0.

Use the **no** variant of this command to return the interface to the default CoS setting for untagged frames entering the interface.

**Syntax** mls qos cos <0-7>  
no mls qos cos

| Parameter | Description                                |
|-----------|--------------------------------------------|
| <0-7>     | The Class of Service, user-priority value. |

**Default** By default, all untagged frames are assigned a CoS value of 0. Note that for tagged frames, the default behavior is not to alter the CoS value.

**Mode** Interface Configuration

**Example** To assign a CoS user priority value of 2 to all untagged packets entering port1.0.1 to port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.4
awplus(config-if)# mls qos cos 2
```

# mls qos enable

**Overview** Use this command to enable QoS.

Note that traffic transmitted from the port will be dropped for up to 1 second after you enable QoS. A warning will display and you will be prompted for a confirmation before QoS is enabled.

Use the **no** variant of this command to globally disable QoS and remove all QoS configuration. The **no** variant of this command removes all class-maps, policy-maps, and policers that have been created. Running the **no mls qos** command will therefore remove all pre-existing QoS configurations on the switch.

**Mode** Global Configuration

**Syntax** mls qos enable  
no mls qos

**Example** To enable QoS on the switch, use the commands:

```
awplus# configure terminal
awplus(config)# mls qos enable
```

## mls qos map cos-queue

**Overview** Use this command to set the default CoS to egress queue mapping. This is the default queue mapping for packets that do not get assigned an egress queue via any other QoS functionality.

Use the **no** variant of this command to reset the cos-queue map back to its default setting. The default mappings for this command are:

|                |   |   |   |   |   |   |   |   |
|----------------|---|---|---|---|---|---|---|---|
| CoS Priority : | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
| -----          |   |   |   |   |   |   |   |   |
| CoS QUEUE:     | 2 | 0 | 1 | 3 | 4 | 5 | 6 | 7 |

**Syntax** mls qos map cos-queue <cos-priority> to <queue-number>  
no mls qos map cos-queue

| Parameter      | Description                                           |
|----------------|-------------------------------------------------------|
| <cos-priority> | CoS priority value. Can take a value between 0 and 7. |
| <queue-number> | Queue number. Can take a value between 0 and 7.       |

**Mode** Global Configuration

**Examples** To map CoS 2 to queue 0, use the command:

```
awplus# configure terminal
awplus(config)# mls qos map cos-queue 2 to 0
```

To set the cos-queue map back to its defaults, use the command:

```
awplus# configure terminal
awplus(config)# no mls qos map cos-queue
```

**Related commands** [show mls qos interface](#)

## mls qos map premark-dscp

**Overview** This command configures the premark-dscp map. It is used when traffic is classified by a class-map that has **trust dscp** configured. Based on a lookup DSCP, the map determines new QoS settings for the traffic.

The **no** variant of this command resets the premark-dscp map to its defaults. If no DSCP is specified then all DSCP entries will be reset to their defaults.

**Syntax** `mls qos map premark-dscp <0-63> to  
{[new-dscp <0-63>] [new-cos <0-7>] [new-queue <0-7>]  
[new-bandwidth-class {green|yellow|red}]]}  
no mls qos map premark-dscp [<0-63>]`

| Parameter           | Description                                                                                                           |
|---------------------|-----------------------------------------------------------------------------------------------------------------------|
| premark-dscp <0-63> | The DSCP value on ingress.                                                                                            |
| new-dscp <0-63>     | The DSCP value that the packet will have on egress.<br>If unspecified, this value will remain the DSCP ingress value. |
| new-cos <0-7>       | The CoS value that the packet will have on egress.<br>If unspecified, this value will retain its value on ingress.    |
| new-queue <0-7>     | Modify Egress Queue.                                                                                                  |
| new-bandwidth-class | Modify Egress Bandwidth-class.<br>If unspecified, this value will be set to green.                                    |
| green               | Egress Bandwidth-class green (marked down Bandwidth-class).                                                           |
| yellow              | Egress Bandwidth-class yellow (marked down Bandwidth-class).                                                          |
| red                 | Egress Bandwidth-class red (marked down Bandwidth-class).                                                             |

**Mode** Global Configuration

**Usage notes** With the **trust dscp** command set, this command (**mls qos map premark-dscp**) enables you to remap the DSCP, CoS, output queue, or bandwidth class values.

However, note that you cannot simultaneously change the DSCP and CoS, because they use the same byte in the IP header.

Used together, the premark-dscp map and the **trust dscp** command are one way to change packets' DSCP, bandwidth-class, CoS and queue. They act by assigning a QoS profile to traffic that matches the policy-map.

Alternatively, you can set these values explicitly for a class-map inside a policy-map, by using one of the commands:

- **set bandwidth-class**
- **set cos**
- **set dscp**
- **set queue**

Do not use a mixture of the **set** commands and the map.

This is because using any one (or more) of the **set** commands overrides the whole premark-dscp map, because the **set** commands cause the switch to replace the QoS profile. In the replacement profile, values that are not set by a **set** command default to:

- bandwidth-class: green
- CoS: 0
- DSCP: 0
- queue: 0

**Example** To send packets to queue 1 if they have a DSCP of 34, use the commands:

```
awplus# configure terminal
awplus(config)# mls qos map premark-dscp 34 to new-queue 1
```

**Example** To set the entry for DSCP 1 to use a new DSCP of 2, use the command:

```
awplus# configure terminal
awplus(config)# mls qos map premark-dscp 1 to new-dscp 2
```

**Example** To set the entry for DSCP 1 to use a new CoS of 3, and a new bandwidth class of yellow, use the command:

```
awplus# configure terminal
awplus(config)# mls qos map premark-dscp 1 to new-cos 3 new-
bandwidth-class yellow
```

**Example** To reset the entry for DSCP 1 use the command:

```
awplus# configure terminal
awplus(config)# no mls qos map premark-dscp 1
```

**Related commands**

- set bandwidth-class**
- set cos**
- set dscp**
- set queue**
- show mls qos maps premark-dscp**
- trust dscp**

## mls qos queue

**Overview** This command configures the default egress queue for any packet arriving on the specified interface. When no default queue is configured, the cos-queue map is used to choose the queue for the packet.

Use the **no** variant of this command to turn off the use of a default queue on the interface.

**Syntax** mls qos queue <0-7>  
no mls qos queue

| Parameter | Description                  |
|-----------|------------------------------|
| <0-7>     | The particular queue number. |

**Mode** Interface Configuration

**Examples** To set the default egress queue to 7, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# mls qos queue 7
```

To turn off the default queue usage on port1.0.1 use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no mls qos queue
```

**Related commands** [show mls qos interface](#)

## mls qos queue name

**Overview** Use this command to give a name and optional description to a specific egress queue.

Use the **no** variant of this command to remove the name and description from an egress queue.

**Syntax** mls qos queue <0-7> name <name> [description <description>]  
no mls qos queue <0-7> name

| Parameter     | Description                                                                                                                                    |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <0-7>         | The number of the egress queue to name.                                                                                                        |
| <name>        | The name you want to give the egress queue. The name can contain any printable ASCII character (ASCII 33-126), except for spaces.              |
| <description> | The description you want to give the egress queue. The description can contain any printable ASCII character (ASCII 32-126), including spaces. |

**Default** Queues have no name or description

**Mode** Global Configuration

**Example** To give queue 6 the name 'Video' and the description 'Real-time interactive, broadcast video', use the commands:

```
awplus# configure terminal
awplus(config)# mls qos queue 6 name Video description Real-time
interactive, broadcast video
```

To remove the name and description from queue 6, use the commands:

```
awplus# configure terminal
awplus(config)# no mls qos queue 6 name
```

**Command changes** Version 5.5.2-2.1: command added

# mls qos scheduler-set

**Overview** Use this command to set a scheduler-set on an interface.

Use the **no** variant of this command to reset an interface back to the default of strict priority.

**Syntax** mls qos scheduler-set <1-12>  
no mls qos scheduler-set

| Parameter | Description       |
|-----------|-------------------|
| <1-12>    | Scheduler-set ID. |

**Mode** Interface Configuration

**Example** To set port1.0.1 to use scheduler-set 1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# mls qos scheduler-set 1
```

To reset scheduler-set 1 back to strict priority, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no mls qos scheduler-set
```

**Related commands** [mls qos scheduler-set priority-queue](#)  
[mls qos scheduler-set wrr-queue group](#)  
[show mls qos scheduler-set](#)

**Command changes** Version 5.5.5-2.1: more scheduler-sets supported on some products

# mls qos scheduler-set priority-queue

**Overview** Use this command to configure strict priority-based scheduling on the specified egress queues for a specific scheduler-set. You must specify at least one queue.

**Syntax** `mls qos scheduler-set <1-12> priority-queue [0][1][2][3][4][5][6][7]`

| Parameter    | Description                                                |
|--------------|------------------------------------------------------------|
| <1-12>       | Scheduler-set ID.                                          |
| [0][1]...[7] | Specify the egress queues to apply the scheduling rule to. |

**Mode** Global Configuration

**Example** To apply priority based scheduling to egress queues 5, 6, and 7, for scheduler-set 1, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# mls qos scheduler-set 1 priority-queue 5 6 7
```

**Related commands** [mls qos scheduler-set wrr-queue group](#)  
[show mls qos scheduler-set](#)

**Command changes** Version 5.5.5-2.1: more scheduler-sets supported on some products

# mls qos scheduler-set wrr-queue group

**Overview** Use this command to configure weighted round-robin-based (WRR-based) scheduling on the specified egress queues for a specific scheduler-set.

You can group queues into one of two weighted round robin groups, called WRR1 and WRR2. Within each group, the queues will be emptied using a weighted round robin algorithm. There are two ways you can set the weights for the queues:

- Using the **weight** parameter, within each group, you must give each queue a relative weight. Within that group, the switch empties the queues in proportion to their weights. The exact weight values are irrelevant, as long as they result in the ratio you want.
- Using the **percent** parameter, within each group, you must give each queue a percentage. The percentages in that group must total to 100%. Within that group, the switch empties the queues based on the percentage.

WRR1 does not take priority over WRR2, or vice versa; priority is determined by the queue number. The switch first empties queue 7 and any other queues in the same WRR group as queue 7. Then it empties queue 6 and any other queues in the same WRR group as queue 6, and so on.

**Syntax** mls qos scheduler-set <1-12> wrr-queue group <1-2> weight <1-255> queues [0][1][2][3][4][5][6][7]  
mls qos scheduler-set <1-12> wrr-queue group <1-2> percent <1-100> queues [0][1][2][3][4][5][6][7]

| Parameter    | Description                                                |
|--------------|------------------------------------------------------------|
| <1-12>       | Scheduler-set ID.                                          |
| <1-2>        | WRR group 1 or 2.                                          |
| <1-255>      | Specify the weighting applied to the egress queues.        |
| <1-100>      | Specify the percentage applied to the egress queues.       |
| [0][1]...[7] | Specify the egress queues to apply the scheduling rule to. |

**Mode** Global Configuration

**Example** To configure wrr-queue group 2 applying a weighting value of 10 to queues 0 and 1 for scheduler-set 1, use the commands:

```
awplus# configure terminal
awplus(config)# mls qos scheduler-set 1 wrr-queue group 2 weight
10 queues 0 1
```

To configure wrr-queue group 2 applying a weighting value of 20 to queues 2 and 3 for scheduler-set 1, use the commands:

```
awplus# configure terminal
awplus(config)# mls qos scheduler-set 1 wrr-queue group 2 weight
20 queues 2 3
```

The switch will empty twice as many packets from queues 2 and 3 as it will from queues 0 and 1.

To configure wrr-queue group 2 applying a percent value of 25 to queues 0 and 1 for scheduler-set 1, use the commands:

```
awplus# configure terminal
awplus(config)# mls qos scheduler-set 1 wrr-queue group 2
percent 25 queues 0 1
```

To configure wrr-queue group 2 applying a percent value of 50 to queue 2 for scheduler-set 1, use the commands:

```
awplus# configure terminal
awplus(config)# mls qos scheduler-set 1 wrr-queue group 2
percent 50 queues 2
```

The switch will empty twice as many packets from queue 2 as it will from queues 0 and 1.

**Related commands** [mls qos scheduler-set priority-queue](#)  
[show mls qos scheduler-set](#)

**Command changes** Version 5.5.5-2.1: **percent** parameter added; more scheduler-sets supported on some products

# no police

**Overview** Use this command to disable any policer previously configured on the class-map.

**Syntax** no police

**Mode** Policy Map Class Configuration

**Usage notes** This command disables any policer previously configured on the class-map.

**Example** To disable policing on a class-map, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map name
awplus(config-pmap)# class classname
awplus(config-pmap-c)# no police
```

**Related commands** [police single-rate action](#)  
[police twin-rate action](#)

# police-aggregate

**Overview** Use this command to apply a previously created aggregate-policer to the class-map.

Use the **no** variant of this command to remove a previously created aggregate-policer from the class-map.

**Syntax** police-aggregate <name>  
no police-aggregate <name>

| Parameter | Description                       |
|-----------|-----------------------------------|
| <name>    | Specify a aggregate policer name. |

**Mode** Policy Map Class Configuration

**Usage** This command enables you to apply an aggregate policer to a number of different class- maps, and meter them as one group. Note that you cannot apply this command to any class-map that already has a policer assigned by using the **police single (or twin) rate exceed action** command.

**Examples** To apply aggregate policer ap1 to a class-map, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map name
awplus(config-pmap)# class classname
awplus(config-pmap-c)# police-aggregate ap1
```

To remove a previously created aggregate-policer from the class-map, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map name
awplus(config-pmap)# class classname
awplus(config-pmap-c)# no police-aggregate ap1
```

# police counters

**Overview** Use this command to enable policer counters for a class-map. This command can be used separately or in conjunction with a traffic meter (single or twin-rate meters).

Use the **no** variant of this command to disable policer counters for a class-map.

**Syntax** police counters  
no police counters

**Default** Policer counters are disabled by default.

**Mode** Policy Map Class Configuration

**Usage notes** This command only allows counting of traffic forwarded in hardware. Traffic that is dropped or trapped to the CPU does not increment the counter, unless it is also forwarded in hardware.

**Example** To enable policer counters for a class-map, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map name
awplus(config-pmap)# class classname
awplus(config-pmap-c)# police counters
```

To disable policer counters for a class-map, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map name
awplus(config-pmap)# class classname
awplus(config-pmap-c)# no police counters
```

**Related commands** [mls qos aggregate-police counters](#)  
[police single-rate action](#)  
[police twin-rate action](#)  
[show mls qos interface policer-counters](#)  
[storm-protection](#)

## police single-rate action

**Overview** Configures a single-rate policer for a class-map.

**Syntax** `police single-rate <cir> <cbs> <ebs> action {drop-red|transmit}`

| Parameter | Description                                                      |
|-----------|------------------------------------------------------------------|
| <cir>     | Specify the Committed Information Rate (CIR) (1-100000000 kbps). |
| <cbs>     | Specify the Committed Burst Size (CBS) (0-16777216 bytes).       |
| <ebs>     | Specify a Excess Burst Size (EBS) (0-16777216 bytes).            |
| action    | Specify the action if the rate is exceeded.                      |
| drop-red  | Drop the red packets.                                            |
| transmit  | Packets are sent without modification.                           |

**Mode** Policy Map Class Configuration

**Usage notes** You can use a policer to meter the traffic classified by the class-map and assign it to one of three bandwidth classes.

The bandwidth classes are green (conforming), yellow (partially-conforming), and red (non-conforming). A single-rate policer is based on three values. These are the average rate, minimum burst and maximum burst.

| Color  | Definition                                                           |
|--------|----------------------------------------------------------------------|
| green  | The traffic rate is less than the average rate and minimum burst.    |
| yellow | The traffic rate is between the minimum burst and the maximum burst. |
| red    | The traffic rate exceeds the average rate and the maximum burst.     |

Using an action of drop-red means that any packets classed as red are discarded.

**NOTE:**

*This command will not take effect when applied to a class-map that attaches to a channel group whose ports span processor instances.*

**Example** To configure a single rate meter measuring traffic of 100 Mbps that drops a sustained burst of traffic over this rate, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map name
awplus(config-pmap)# class classname
awplus(config-pmap-c)# police single-rate 100000 1875000 1875000
action drop-red
```

**Related commands** **no police**  
**police twin-rate action**

## police twin-rate action

**Overview** Configures a twin-rate policer for a class-map.

**Syntax** `police twin-rate <cir> <pir> <cbs> <pbs> action {drop-red|transmit}`

| Parameter | Description                                                      |
|-----------|------------------------------------------------------------------|
| <cir>     | Specify the Committed Information Rate (CIR) (1-100000000 kbps). |
| <pir>     | Specify the Peak Information Rate (PIR) (1-100000000 kbps).      |
| <cbs>     | Specify the Committed Burst Size (CBS) (0-16777216 bytes).       |
| <pbs>     | Specify the Peak Burst Size (PBS) (0-16777216 bytes).            |
| action    | Specify the action if rate is exceeded.                          |
| drop-red  | Drop the red packets.                                            |
| transmit  | Transmit packets.                                                |

**Mode** Policy Map Class Configuration

**Usage notes** A policer can be used to meter the traffic classified by the class-map and as a result will be given one of three bandwidth classes. These are green (conforming), yellow (partially-conforming), and red (non-conforming).

A twin-rate policer is based on four values. These are the minimum rate (CIR), minimum burst size (CBS), maximum rate (PIR), and maximum burst size (PBS). The following table shows how these values define the bandwidth classes.

| Bandwidth Class | Definition                                                                                                                                                             |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| green           | The sum of the number of existing (buffered) bytes plus those arriving at the port per unit time results in a value that is less than that set for the CBS.            |
| yellow          | The sum of the number of existing (buffered) bytes plus those arriving at the port per unit time results in a value that is between those set for the CBS and the PBS. |
| red             | The sum of the number of existing (buffered) bytes plus those arriving at the port per unit time results in a value that exceeds that set for the PBS.                 |

Using an action of drop-red means that any packets classed as red will be discarded.

**Example** To configure a twin rate meter measuring a minimum rate of 10 Mbps and a maximum rate of 20 Mbps, and drop red packets, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map name
awplus(config-pmap)# class classname
awplus(config-pmap-c)# police twin-rate 10000 20000 1875000
3750000 action drop-red
```

**Related commands** [no police](#)  
[police single-rate action](#)

# policy-map

**Overview** Use this command to create a policy-map and to enter Policy Map Configuration mode to configure the specified policy-map.  
Use the **no** variant of this command to delete an existing policy-map.

**Syntax** policy-map <name>  
no policy-map <name>

| Parameter | Description             |
|-----------|-------------------------|
| <name>    | Name of the policy-map. |

**Mode** Global Configuration

**Example** To create a policy-map called pmap1, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)#
```

**Related commands** [class-map](#)

# service-policy input

**Overview** Use this command to apply a policy-map to the input of an interface.  
Use the **no** variant of this command to remove a policy-map and interface association.

**Syntax** service-policy input <policy-map>  
no service-policy input <policy-map>

| Parameter    | Description                                        |
|--------------|----------------------------------------------------|
| <policy-map> | Policy map name that will be applied to the input. |

**Mode** Interface Configuration

**Usage notes** This command can be applied to switch ports or static channel groups, but not to dynamic (LACP) channel groups.

**Example** To apply a policy-map named pmap1 to interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
wplus(config-if)# service-policy input pmap1
```

## set bandwidth-class

**Overview** Use this command to set a bandwidth-class color to assign to classified traffic. The color represents the traffic's conformance to the policer's allocated bandwidth. Green traffic is assumed to be conforming, yellow is semi-conforming, and red is non-conforming.

Use the **no** variant of this command to turn off a bandwidth-class color assigned to classified traffic.

**Syntax** `set bandwidth-class {green|yellow|red}`  
`no set bandwidth-class {green|yellow|red}`

| Parameter | Description                |
|-----------|----------------------------|
| green     | Mark the packet as green.  |
| yellow    | Mark the packet as yellow. |
| red       | Mark the packet as red.    |

**Mode** Policy Map Class Configuration

**Usage notes** There is a limit to the number of unique combinations of CoS, DSCP, queue, and bandwidth-class color values that can be assigned to classified traffic. Each unique combination of values is referred to as a QoS profile.

This **set bandwidth-class** command is one way to set the packets' bandwidth class. The premark-dscp map is an alternative way to do this. Both methods work by assigning a QoS profile to traffic that matches the policy-map.

As well as bandwidth class, there are also commands to explicitly set CoS, DSCP and queue values for packets that match a class-map inside a policy-map. The other commands are:

- **set cos**
- **set dscp**
- **set queue**

Do not use a mixture of the **set** commands and the premark-dscp map.

This is because using any one (or more) of the **set** commands overrides the premark-dscp map, because the **set** commands cause the switch to replace the QoS profile. In the replacement profile, values that are not set by a **set** command default to:

- bandwidth-class: green
- CoS: 0
- DSCP: 0
- queue: 0

**Examples** To set the bandwidth class for all traffic classified by this class-map, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# set bandwidth-class green
```

Note that the class-map and policy-map should already have been created by using the **class-map** and the **policy-map**.

To stop setting packets green for the policy pmap1 and the class cmap1, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# no set bandwidth-class green
```

**Related** **class-map**  
**commands** **set cos**  
**set dscp**  
**set queue**  
**trust dscp**

## set cos

**Overview** Use this command to set a CoS value to assign to classified traffic.

Use the **no** variant of this command to turn off the CoS value assigned to classified traffic.

**Syntax** set cos <0-7>  
no set cos

| Parameter | Description                       |
|-----------|-----------------------------------|
| <0-7>     | The new CoS value to be assigned. |

**Mode** Policy Map Class Configuration

**Usage notes** There is a limit to the number of unique combinations of CoS, DSCP, queue, and bandwidth-class color values that can be assigned to classified traffic. Each unique combination of values is referred to as a QoS profile.

This **set cos** command is one way to set the packets' CoS. The premark-dscp map is an alternative way to do this. Both methods work by assigning a QoS profile to traffic that matches the policy-map.

As well as CoS, there are also commands to explicitly set bandwidth class, DSCP and queue values for packets that match a class-map inside a policy-map. The other commands are:

- **set bandwidth-class**
- **set dscp**
- **set queue**

Do not use a mixture of the **set** commands and the premark-dscp map.

This is because using any one (or more) of the **set** commands overrides the premark-dscp map, because the **set** commands cause the switch to replace the QoS profile. In the replacement profile, values that are not set by a **set** command default to:

- bandwidth-class: green
- CoS: 0
- DSCP: 0
- queue: 0

**Examples** To set the CoS value to 7 for all traffic classified by the selected class-map and policy-map, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# set cos 7
```

To turn off the above setting, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# no set cos
```

**Related commands**

- set bandwidth-class**
- set dscp**
- set queue**
- set dscp**

## set dscp

**Overview** For a specific class-map and policy-map this command will assign or change the DSCP value within the packet. Note that where more than one class-map has been assigned to a particular DSCP, the switch will apply the action of the class-map that was created first.

The **no** variant of this command will negate the DSCP value specified with the **set dscp** command.

**Syntax** set dscp <0-63>  
no set dscp

| Parameter | Description                                   |
|-----------|-----------------------------------------------|
| <0-63>    | The new DSCP value. A value between 0 and 63. |

**Mode** Policy Map Class Configuration

**Usage notes** There is a limit to the number of unique combinations of CoS, DSCP, queue, and bandwidth-class color values that can be assigned to classified traffic. Each unique combination of values is referred to as a QoS profile.

This **set dscp** command is one way to set the packets' DSCP. The premark-dscp map is an alternative way to do this. Both methods work by assigning a QoS profile to traffic that matches the policy-map.

As well as DSCP, there are also commands to explicitly set bandwidth class, CoS and queue values for packets that match a class-map inside a policy-map. The other commands are:

- **set bandwidth-class**
- **set cos**
- **set queue**

Do not use a mixture of the **set** commands and the premark-dscp map.

This is because using any one (or more) of the **set** commands overrides the premark-dscp map, because the **set** commands cause the switch to replace the QoS profile. In the replacement profile, values that are not set by a **set** command default to:

- bandwidth-class: green
- CoS: 0
- DSCP: 0
- queue: 0

**Example** To set a DSCP value of 35 to all traffic classified by a class-map of cmap1 and a policy-map of pmap1, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# set dscp 35
```

**Related commands**

- set bandwidth-class**
- set cos**
- set queue**
- trust dscp**

# set queue

**Overview** Use this command to set a queue value to assign to classified traffic. This will override the default queue as configured by the **mls qos queue** command, but may be overridden by subsequent QoS mechanisms (such as remarking).

Use the **no** variant of this command to negate the queue value assigned to classified traffic by the **set queue** command.

**Syntax** set queue <0-7>  
no set queue

| Parameter | Description                |
|-----------|----------------------------|
| <0-7>     | Specify a new queue value. |

**Mode** Policy Map Class Configuration

**Usage notes** There is a limit to the number of unique combinations of CoS, DSCP, queue, and bandwidth-class color values that can be assigned to classified traffic. Each unique combination of values is referred to as a QoS profile.

This **set queue** command is one way to set the packets' queue. The premark-dscp map is an alternative way to do this. Both methods work by assigning a QoS profile to traffic that matches the policy-map.

As well as queue, there are also commands to explicitly set CoS, DSCP and bandwidth class values for packets that match a class-map inside a policy-map. The other commands are:

- **set bandwidth-class**
- **set cos**
- **set dscp**

Do not use a mixture of the **set** commands and the premark-dscp map.

This is because using any one (or more) of the **set** commands overrides the premark-dscp map, because the **set** commands cause the switch to replace the QoS profile. In the replacement profile, values that are not set by a **set** command default to:

- bandwidth-class: green
- CoS: 0
- DSCP: 0
- queue: 0

**Example** To set the queue to value 5 for all traffic classified as cmap1 and pmap1, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# set queue 5
```

**Related commands**

- set bandwidth-class**
- set cos**
- set dscp**
- trust dscp**

# show class-map

**Overview** Use this command to display the QoS class-maps' criteria for classifying traffic.

**Syntax** `show class-map [<class-map-name>]`

| Parameter        | Description            |
|------------------|------------------------|
| <class-map-name> | Name of the class-map. |

**Mode** User Exec and Privileged Exec

**Example** To display a QoS class-map's match criteria for classifying traffic, use the command:

```
awplus# show class-map cmap1
```

**Output** The following shows typical output.

## Example output from the show class-map command

```
awplus#show class-map
CLASS-MAP-NAME: myClass
Match Mac Type: 2 l2mcast
CLASS-MAP-NAME: default
```

**Related commands** [class-map](#)

# show mls qos

**Overview** Use this command to display whether QoS is enabled or disabled on the switch.

**Syntax** show mls qos

**Mode** User Exec and Privileged Exec

**Example** To display whether QoS is enabled or disabled, use the command:  
awplus# show mls qos

**Output** The following shows typical output.

## Example output from the show mls qos command

```
awplus#show mls qos
Enable
```

**Related commands** [mls qos enable](#)

# show mls qos aggregate-policer

**Overview** Displays all or a single aggregate-policer. If no name is specified, all aggregate policers will be displayed.

**Syntax** show mls qos aggregate-policer [<name>]

| Parameter | Description             |
|-----------|-------------------------|
| <name>    | Aggregate policer name. |

**Mode** User Exec and Privileged Exec

**Example** To display all aggregate-policers, use the command:

```
awplus# show mls qos aggregate-policer
```

**Output** The following shows typical output.

## Example output from the show mls qos aggregate-policer command

```
AGGREGATE-POLICER-NAME: ap1
Policer single-rate action drop-red:
average rate(1 kbps) minimum burst(2 B) maximum burst(3 B)
AGGREGATE-POLICER-NAME: ap2
Policer twin-rate action drop-red policed-dscp-tx:
minimum rate(1 kbps) maximum rate(2 kbps) minimum burst(3 B)
maximum burst(4 B)
```

**Related commands** [mls qos aggregate-police action](#)  
[police-aggregate](#)

## show mls qos interface

**Overview** Displays the current settings for the interface. This includes its default CoS and queue, scheduling used for each queue, and any policies/maps that are attached.

**Syntax** show mls qos interface [*<port>*]

| Parameter           | Description  |
|---------------------|--------------|
| <i>&lt;port&gt;</i> | Switch port. |

**Mode** User Exec and Privileged Exec

**Example** To display current CoS and queue settings for interface port1.0.1, use the command:

```
awplus# show mls qos interface port1.0.1
```

**Output** The following shows typical output.

**Example output from the show mls qos interface command for port1.0.1**

```
awplus#show mls qos interface port1.0.1
Interface: port1.0.1

The number of COS Values mapped: 8
Cos (Queue): 0(0), 1(0), 2(0), 3(0), 4(0), 5(0), 6(0), 7(0)
```

**Parameters in the output of the show mls qos interface command**

| Parameter     | Description                                                                                                                                           |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| Scheduler-set | The number of the scheduler set that is applied to this interface. The scheduler set determines which queues are emptied using a weighted round robin |

| Parameter                       | Description                                                                                                                                                                                                   |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                 | algorithm instead of being emptied in strict priority order.                                                                                                                                                  |
| Number of egress queues         | The total number of egress queues available on this interface.                                                                                                                                                |
| Egress Queue                    | Number of this egress queue.                                                                                                                                                                                  |
| Status                          | Queue can either be enabled or disabled.                                                                                                                                                                      |
| Queue Limit                     | The percentage of the port's buffers that have been allocated to this queue.                                                                                                                                  |
| Egress Rate Limit               | The amount of traffic that can be transmitted via this queue per second. 0 Kb means there is currently no rate-limiting enabled.                                                                              |
| Egress Traffic Shaping Overhead | The number of bytes specified to allow for the size of packet preamble and inter-packet gap (the "overhead") in egress queue rate limiting. Use the <b>egress-rate-limit overhead</b> command to change this. |

**Related commands** **mls qos queue**  
**mls qos scheduler-set**  
**wrr-queue queue-limit**

**Command changes** Version 5.5.1-0.1: DSCP queue mapping removed from output

# show mls qos interface policer-counters

**Overview** This command displays an interface's policer counters. This can either be for a specific class-map or for all class-maps attached to the interface. If no class-map is specified then all class-map policer counters attached to the interface are displayed.

**Syntax** `show mls qos interface <port> policer-counters [class-map <class-map>]`

| Parameter   | Description         |
|-------------|---------------------|
| <port>      | Switch port.        |
| class-map   | Select a class-map. |
| <class-map> | Class-map name.     |

**Mode** User Exec and Privileged Exec

**Usage** Note that:

- You must also turn on policer counters, by entering the **police counters** command.
- The counters are based on metering performed on the specified class-map. Therefore, the 'Dropped Bytes' counter is the number of bytes dropped due to metering. This is different from packets dropped via a 'deny' action in the ACL. If a policer is configured to perform re-marking, bytes can be marked Red but are not dropped, and is shown with a value of 0 for the Dropped field and a non-0 value for the 'Red Bytes' field.

**Example** To show the counters for all class-maps attached to port1.0.1, use the command:

```
awplus# show mls qos interface port1.0.1 policer-counters
```

**Output** The following shows typical output.

**Example output from show mls qos interface policer-counters on a port**

```
awplus#show mls qos interface port1.0.1 policer-counters
Interface:                port1.0.1
Class-map:                cmap1
  Green Bytes:            217
  Yellow Bytes:           0
  Red Bytes:              0
  Dropped Bytes:          0
  Non-dropped Bytes:      217
```

**Related commands**

- [wrr-queue queue-limit](#)

# show mls qos interface queue-counters

**Overview** This command displays an interface's egress queue counters. This can either be for a specific queue or for all queues on the interface. If no queue is specified all queue counters on the interface will be displayed.

The counters show the number of frames currently in the queue and the maximum number of frames allowed in the queue, for individual egress queues and the port's queue (which will be a sum of all egress queues).

**Syntax** `show mls qos interface <port> queue-counters [queue <0-7>]`

| Parameter   | Description                                      |
|-------------|--------------------------------------------------|
| <port>      | The switch port to display counters for.         |
| queue <0-7> | The number of the queue to display counters for. |

**Mode** User Exec and Privileged Exec

**Example** To show the counters for all queues on port1.0.1, use the command:  
`awplus# show mls qos interface port1.0.1 queue-counters`

**Output** The following shows typical output.

**Example output from show mls qos interface queue-counters**

```
awplus#show mls qos interface port1.0.1 queue-counters
Interface port1.0.1 Queue Counters:
  Port queue length      12(maximum 844)
  Egress Queue length:
    Queue 0              0 (maximum 18)
    Queue 1              0 (maximum 18)
    Queue 2              12(maximum 18)
    Queue 3              0 (maximum 18)
    Queue 4              0 (maximum 18)
    Queue 5              0 (maximum 18)
    Queue 6              0 (maximum 18)
    Queue 7              0 (maximum 18)

  Egress queue drop/transmit counters:
    Queue 0              0          0          0          0
    Queue 1              0          0          0          0
    Queue 2              0          0          0          0
    Queue 3              0          0          0          0
    Queue 4              0          0          576          9
    Queue 5              0          0          0          0
    Queue 6              0          0      10489664      63901
    Queue 7              0          0          0          0
```

**Parameters in the output from show mls qos interface queue-counters**

| Parameter                           | Description                                                                                  |
|-------------------------------------|----------------------------------------------------------------------------------------------|
| Interface                           | Port we are showing the counters for.                                                        |
| Port queue length                   | Number of frames in the port's queue. This will be the sum of all egress queues on the port. |
| Egress Queue length                 | Number of frames in a specific egress queue.                                                 |
| Egress queue drop/transmit counters | The number of bytes and packets dropped and transmitted on each egress queue.                |

**Related commands** [clear mls qos interface queue-counters](#)  
[wrr-queue queue-limit](#)

# show mls qos interface storm-status

**Overview** Show the current configuration and status of the QoS Storm Protection (QSP) on the given port.

Note that before you can enable storm protection, you must first enable policer counters. To do this, enter the **police counters** command in **config-pmap-c** mode.

**Syntax** show mls qos interface <port> storm-status

| Parameter | Description  |
|-----------|--------------|
| <port>    | Switch port. |

**Mode** User Exec and Privileged Exec

**Example** To see the QSP status on port1.0.1, use the command:  
awplus# show mls qos interface port1.0.1 storm-status

**Output** The following shows typical output.

## Example output from show mls qos interface storm-status

|                      |             |
|----------------------|-------------|
| Interface:           | port1.0.1   |
| Storm-Protection:    | Enabled     |
| Port-status:         | Enabled     |
| Storm Action:        | vlandisable |
| Storm Window:        | 5000 ms     |
| Storm Downtime:      | 0 s         |
| Timeout Remaining:   | 0 s         |
| Last read data-rate: | 0 kbps      |
| Storm Rate:          | 1000 kbps   |

## show mls qos maps premark-dscp

**Overview** This command displays the premark-dscp map. This map is used to replace the DSCP, CoS, queue and/or bandwidth class of a packet matching the class-map, based on a lookup DSCP value.

**Syntax** show mls qos maps premark-dscp [<0-63>]

| Parameter | Description       |
|-----------|-------------------|
| <0-63>    | DSCP table entry. |

**Mode** User Exec and Privileged Exec

**Example** To display the premark-dscp map for DSCP 1, use the command:

```
awplus# show mls qos maps premark-dscp 1
```

**Output** The following shows typical output.

**Example output from the show mls qos maps premark-dscp command**

|                     |       |        |     |  |
|---------------------|-------|--------|-----|--|
| PREMARK-DSCP-MAP:   |       |        |     |  |
| DSCP 1              |       |        |     |  |
| Bandwidth Class     | Green | Yellow | Red |  |
| -----               |       |        |     |  |
| New DSCP            | 1     | -      | -   |  |
| New CoS             | 0     | -      | -   |  |
| New Queue           | 5     | -      | -   |  |
| New Bandwidth Class | green | -      | -   |  |
| ...                 |       |        |     |  |

# show mls qos scheduler-set

**Overview** Use this command to display the scheduler-set configuration.

**Syntax** show mls qos scheduler-set

**Mode** Privileged Exec

**Example** To display the scheduler-set configuration, use the command:

```
awplus# show mls qos scheduler-set
```

**Output** The following shows typical output.

**Example output from the show mls qos scheduler-set command when configured with the weight parameter**

```
awplus(config)#show mls qos scheduler-set
Key: SP = Strict Priority
      WRR1 = Weighted Round Robin arbitration group 1
      WRR2 = Weighted Round Robin arbitration group 2

egress queue:          0      1      2      3      4      5      6      7

Scheduler-set 1 algorithm: WRR1  WRR1  WRR1  WRR1  WRR1  WRR1  SP      SP
                        WRR weight: 25   25   25   25   25   25

Scheduler-set 2 algorithm: WRR1  WRR1  WRR1  WRR1  SP      SP      SP      SP
                        WRR weight: 10   20   30   50

Scheduler-set 3...
```

**Example output from the show mls qos scheduler-set command when configured with the percent parameter**

```
awplus(config)#show mls qos scheduler-set
Key: SP = Strict Priority
      WRR1 = Weighted Round Robin arbitration group 1
      WRR2 = Weighted Round Robin arbitration group 2

egress queue:          0      1      2      3      4      5      6      7

Scheduler-set 1 algorithm: SP      SP      SP      SP      SP      SP      SP      SP
                        WRR weight:

Scheduler-set 2 algorithm: WRR2  WRR2  WRR1  WRR1  WRR1  SP      SP      SP
                        WRR weight: 50%  50%  50%  25%  25%

Scheduler-set 3...
```

**Example output from the show mls qos scheduler-set command showing warning messages when incorrectly configured with the percent parameter**

```
awplus(config)#show mls qos scheduler-set
Key: SP = Strict Priority
      WRR1 = Weighted Round Robin arbitration group 1
      WRR2 = Weighted Round Robin arbitration group 2

**Output  
parameters**

Depending on your switch, you will see some of the following parameters in the output from **show platform classifier statistics utilization brief**

| Parameter      | Description                                                                                                                                                                                                                                                                                                                   |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IPv6 Multicast | Reserved hardware space for use by IPv6 multicast.                                                                                                                                                                                                                                                                            |
| System         | Fixed system entries. For example, resiliency links make use of system ACLs.                                                                                                                                                                                                                                                  |
| MLD Snooping   | Entries to send various packets that MLD Snooping is interested in to the CPU.                                                                                                                                                                                                                                                |
| DHCP Snooping  | Entries used to send DHCP and ARP packets to the CPU. User-added DHCP Snooping filters under ACLs are counted under the ACL or QoS categories.                                                                                                                                                                                |
| Loop Detection | Entries uses to send the special loop detection frame to the CPU.                                                                                                                                                                                                                                                             |
| EPSR           | Entries used to send EPSR control traffic to the CPU.                                                                                                                                                                                                                                                                         |
| CFM            | Entries used by Connectivity Fault Management.                                                                                                                                                                                                                                                                                |
| G8032          | Entries used to send G.8032 control traffic to the CPU.                                                                                                                                                                                                                                                                       |
| Global ACLs    | Entries for ACLs appear here if the ACLs are applied globally instead of per switchport.                                                                                                                                                                                                                                      |
| ACL            | Entries for ACL filters that have been applied directly to ports using the <b>access-group</b> command.                                                                                                                                                                                                                       |
| VACL           | Entries for VLAN-based ACLs (ACLs that are applied to VLANs instead of ports).                                                                                                                                                                                                                                                |
| DOS            | Entries used for Denial of Service protection.                                                                                                                                                                                                                                                                                |
| UFO            | Entries used by Upward Forwarding Only (UFO).                                                                                                                                                                                                                                                                                 |
| QoS            | Entries for ACL filters and other class-map configurations, such as policers, applied through policy maps using the <b>service input</b> command.                                                                                                                                                                             |
| RA Guard       | Entries used to block IPv6 router advertisements, configured with the <b>ipv6 nd raguard</b> command.                                                                                                                                                                                                                         |
| AMFAPPS        | Entries used by AMF Application Proxy. These entries enable the SES Controller to block infected ports.                                                                                                                                                                                                                       |
| Pre-Ingress    | Entries used for VLAN ID Translation (and also for subnet-based and MAC-based VLAN entries on SBx81XLEM cards).                                                                                                                                                                                                               |
| Egress         | Entries used for VLAN ID Translation.                                                                                                                                                                                                                                                                                         |
| UDB            | User Defined Bytes (UDB), which are a limited resource of bytes that can be used to implement additional arbitrary matching on packet bytes on some switches. The software manages the use and allocation of these bytes automatically. The output of this table is intended for use by Allied Telesis Customer Support only. |

**Related** **show platform**  
**commands** **ipv6 access-list (named IPv6 hardware ACL)**

# show policy-map

**Overview** Displays the policy-maps configured on the switch. The output also shows whether or not they are connected to a port (attached / detached) and shows their associated class-maps.

**Syntax** show policy-map [<name>]

| Parameter | Description                        |
|-----------|------------------------------------|
| <name>    | The name of a specific policy-map. |

**Mode** User Exec and Privileged Exec

**Example** To display a listing of the policy-maps configured on the switch, use the command:

```
awplus# show policy-map
```

**Output** The following shows typical output.

## Example output from the show policy-map command

```
POLICY-MAP-NAME: example
  Interfaces:
    Default class-map action: permit

  CLASS-MAP-NAME: default
    Policer counters enabled
```

**Related commands** [no police](#)  
[service-policy input](#)

# storm-action

**Overview** Sets the action to be taken when triggered by QoS Storm Protection (QSP). There are three available options:

- **portdisable** will disable the port in software.
- **vlandisable** will disable the port from the VLAN matched by the class-map in class-map. This option requires the match vlan class-map to be present in the class-map
- **linkdown** will physically bring the port down. .

The **no** variant of this command will negate the action set by the **storm-action** command.

**Syntax** storm-action {portdisable|vlandisable|linkdown}  
no storm-action

| Parameter   | Description                   |
|-------------|-------------------------------|
| portdisable | Disable the port in software. |
| vlandisable | Disable the VLAN.             |
| linkdown    | Shutdown the port physically. |

**Mode** Policy Map Class Configuration

**Examples** To apply the storm protection of **vlandisable** to the policy-map named "pmap2" and the class-map named "cmap1", use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap1
awplus(config-pmap-c# storm-action vlandisable
```

To negate the storm protection set on the policy-map named "pmap2" and the class-map named "cmap1", use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap1
awplus(config-pmap-c# no storm-action
```

**Related commands** [storm-downtime](#)  
[storm-protection](#)  
[storm-rate](#)  
[storm-window](#)

# storm-downtime

**Overview** Sets the time to re-enable a port that has been disabled by QoS Storm Protection (QSP). The time is given in seconds, from a minimum of one second to maximum of 86400 seconds (i.e. one day).

The **no** variant of this command resets the time to the default value of 10 seconds.

**Syntax** storm-downtime <1-86400>  
no storm-downtime

| Parameter | Description |
|-----------|-------------|
| <1-86400> | Seconds.    |

**Default** 10 seconds

**Mode** Policy Map Class Configuration

**Examples** To re-enable the port in 1 minute, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# storm-downtime 60
```

To re-set the port to the default (10 seconds), use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# no storm-downtime
```

**Related commands** [storm-action](#)  
[storm-protection](#)  
[storm-rate](#)  
[storm-window](#)

# storm-protection

**Overview** Use this command to enable policy-based Storm Protection (such as QSP - QoS Storm Protection). Storm protection is activated on a port after port state decisions have been made. However, it will only be functional after **storm-rate** and **storm-window** have been set.

The **no** variant of this command disables policy-based Storm Protection.

**Syntax** storm-protection  
no storm-protection

**Default** By default, storm protection is disabled.

**Mode** Policy Map Class Configuration

## Usage notes

**Examples** To enable QSP on cmap2 in pmap2, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# police counters
awplus(config-pmap-c)# storm-protection
```

To disable QSP on cmap2 in pmap2, use the following commands:

```
awplus# policy-map pmap2
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# no storm-protection
```

**Related commands** **police counters**  
**show mls qos interface storm-status**  
**storm-action**  
**storm-downtime**  
**storm-rate**  
**storm-window**

# storm-rate

**Overview** Sets the data rate that triggers the storm-action. The rate is in kbps and the range is from 1kbps to 40Gbps.

Note that this setting is made in conjunction with the **storm-window** command.

Use the **no** variant of this command to negate the **storm-rate** command.

**Syntax** storm-rate <1-40000000>  
no storm-rate

| Parameter    | Description                  |
|--------------|------------------------------|
| <1-40000000> | The range of the storm-rate. |

**Default** No default

**Mode** Policy Map Class Configuration

**Usage** This setting is made in conjunction with the **storm-window**.

**Examples** To limit the data rate to 100Mbps, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# storm-rate 100000
```

To negate the limit set previously, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# no storm-rate
```

**Related commands** **storm-action**  
**storm-downtime**  
**storm-protection**  
**storm-window**

# storm-window

**Overview** Sets the window size of QoS Storm Protection (QSP). This sets the time to poll the data-rate every given milliseconds. Minimum window size is 100 ms and the maximum size is 60 sec.

Use the **no** variant of this command to negate the **storm-window** command.

**Syntax** storm-window <100-60000>  
no storm-window

| Parameter   | Description                                |
|-------------|--------------------------------------------|
| <100-60000> | The window size, measured in milliseconds. |

**Default** No default

**Mode** Policy Map Class Configuration

**Usage** This command should be set in conjunction with the **storm-rate**.

**Examples** To set the QSP window size to 5000 ms, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# storm-window 5000
```

To negate the QSP window size set previously, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# no storm-window
```

**Related commands** **storm-action**  
**storm-downtime**  
**storm-protection**  
**storm-rate**

# strict-priority-queue egress-rate-limit queues

**Overview** Sets a limit on the amount of traffic that can be transmitted per second from these queues. The default unit is in Kb, but Mb or Gb can also be specified. The minimum is 651 Kb.

This limit applies to WRR queues too. Setting the limit with this command is the same as setting it with [wrr-queue egress-rate-limit queues](#).

**Syntax** `strict-priority-queue egress-rate-limit <bandwidth> queues [0] [1][2][3][4][5][6][7]`  
`no strict-priority-queue egress-rate-limit <bandwidth> queues [0][1][2][3][4][5][6][7]`

| Parameter    | Description                                            |
|--------------|--------------------------------------------------------|
| <bandwidth>  | Bandwidth <1-100000000 kbits> (usable units: k, m, g). |
| [0][2]...[7] | Selects one or more queues numbered 0 to 7.            |

**Mode** Interface Configuration

**Example** To limit the egress rate of queues 0, 1 and 2 on port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# strict-priority-queue egress-rate-limit 500M
queues 0 1 2
```

**Related commands** [show mls qos interface](#)  
[wrr-queue egress-rate-limit queues](#)

# strict-priority-queue queue-limit

**Overview** This command is the same as the [wrr-queue queue-limit](#) command.

It sets the percentages of a port's total buffer pool that each queue is allowed to use. This queue limit is applicable no matter what type of scheduling is configured for the specified queues (i.e. WRR or strict priority).

Note that traffic transmitted from the port will be dropped for up to 1 second while the queue limit is being configured. A warning will display and you will be prompted for a confirmation before the new setting is applied.

See [wrr-queue queue-limit](#) for command details.

# trust dscp

**Overview** This command enables the premark-dscp map to replace the DSCP, bandwidth-class, CoS and/or queue of classified traffic based on a lookup DSCP value.

With the **no** variant of this command, no premark-dscp mapping function will be applied for the selected class-map. QoS components of the packet existing either at ingress, or applied by the class-map, will pass unchanged.

**Syntax** trust dscp  
no trust

**Mode** Policy-Map Configuration

**Usage notes** Used together, the **trust dscp** command and the premark-dscp map are one way to change packets' DSCP, bandwidth-class, CoS and queue. They act by assigning a QoS profile to traffic that matches the policy-map.

Alternatively, you can set these values explicitly for a class-map inside a policy-map, by using one of the commands:

- **set bandwidth-class**
- **set cos**
- **set dscp**
- **set queue**

Do not use a mixture of the **set** commands and the map.

This is because using any one (or more) of the **set** commands overrides the whole premark-dscp map, because the **set** commands cause the switch to replace the QoS profile. In the replacement profile, values that are not set by a **set** command default to:

- bandwidth-class: green
- CoS: 0
- DSCP: 0
- queue: 0

**Examples** To enable the premark-dscp map lookup for policy-map pmap1, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# trust dscp
```

To disable the premark-dscp map lookup for policy-map pmap1, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# no trust
```

**Related commands**

- mls qos map premark-dscp**
- set bandwidth-class**
- set cos**
- set dscp**
- set queue**

## wrr-queue disable queues

**Overview** Use this command to disable an egress queue from transmitting traffic. The **no** variant of this command enables an egress queue to transmit traffic.

**Syntax** wrr-queue disable queues [0][1][2][3][4][5][6][7]  
no wrr-queue disable queues [0][1][2][3][4][5][6][7]

| Parameter    | Description                                 |
|--------------|---------------------------------------------|
| [0][2]...[7] | Selects one or more queues numbered 0 to 7. |

**Mode** Interface Configuration

**Examples** To disable queue 1 on port1.0.1 from transmitting traffic, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# wrr-queue disable queues 1
```

To enable queue 1 on port1.0.1 to transmit traffic, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no wrr-queue disable queues 1
```

**Related commands** [show mls qos interface](#)

## wrr-queue egress-rate-limit queues

**Overview** Sets a limit on the amount of traffic that can be transmitted per second from these queues. The default unit is in Kb, but Mb or Gb can also be specified. The minimum is 651 Kb.

This limit applies to strict priority queues too. Setting the limit with this command is the same as setting it with **strict-priority-queue egress-rate-limit queues**.

**Syntax** `wrr-queue egress-rate-limit <bandwidth> queues [0][1][2][3][4][5][6][7]`  
`no wrr-queue egress-rate-limit <bandwidth> queues [0][1][2][3][4][5][6][7]`

| Parameter    | Description                                            |
|--------------|--------------------------------------------------------|
| <bandwidth>  | Bandwidth <1-100000000 kbits> (usable units: k, m, g). |
| [0][2]...[7] | Selects one or more queues numbered 0 to 7.            |

**Mode** Interface Configuration

**Example** To limit the egress rate of queues 0, 1 and 2 on port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# wrr-queue egress-rate-limit 500M queues 0 1 2
```

**Related commands** **show mls qos interface**  
**strict-priority-queue egress-rate-limit queues**

## wrr-queue queue-limit

**Overview** Sets the percentages of a port's total buffer pool that each queue is allowed to use. This queue limit is applicable no matter what type of scheduling is configured for the specified queues (i.e. WRR or strict priority).

This command is the same as the **strict-priority-queue queue-limit** command.

Note that traffic transmitted from the port will be dropped for up to 1 second while the queue limit is being configured. A warning will display and you will be prompted for a confirmation before the new setting is applied.

**Syntax** `wrr-queue queue-limit <1-100> <1-100> <1-100> <1-100> <1-100> <1-100> <1-100> <1-100>`  
`no wrr-queue queue-limit`

| Parameter | Description              |
|-----------|--------------------------|
| <1-100>   | Queue ratio for Queue 0. |
| <1-100>   | Queue ratio for Queue 1. |
| <1-100>   | Queue ratio for Queue 2. |
| <1-100>   | Queue ratio for Queue 3. |
| <1-100>   | Queue ratio for Queue 4. |
| <1-100>   | Queue ratio for Queue 5. |
| <1-100>   | Queue ratio for Queue 6. |
| <1-100>   | Queue ratio for Queue 7. |

**Mode** Interface Configuration

**Usage notes** Note that at any time you cannot apply more than five unique sets of ratios across ports. The portion of the port's buffer pool that is assigned to each queue is divided by three, with one third applied to each of the three drop precedence colors, red, green, and yellow.

Where no color metering is applied, the queue limit is effectively reduced to a third of the configured value, because in this situation all traffic is classed as green. For example, if the overall queue size available is 792 frames, and equal portions (12.5% of 792 = 99 frames) are assigned to each queue, then 33 frames are assigned to each of the three drop precedence colors. Where no color metering is applied, all traffic is (by default) defined as green, and so is allocated 33 frames per queue. Tail dropping is then applied when each queue is only one third full.

Note that you cannot use this command at the same time as the **egress-rate-limit** command.

**Example** To configure a queue-limit of 12% on port1.0.1 to port1.0.4 for each queue, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.4
awplus(config-if)# wrr-queue queue-limit 12 12 12 12 12 12 12 12 12
```

**Related commands** **show mls qos interface queue-counters**

# Introduction

**Overview** 802.1X is an IEEE standard providing a mechanism for authenticating devices attached to a LAN port or wireless device. Devices wishing to access services behind a port must authenticate themselves before any Ethernet packets are allowed to pass through. The protocol is referred to as 802.1X because it was initially defined in the IEEE standard 802.1X, published in 2001 and revised in 2004 and again as the current 802.1X 2010 standard.

This chapter provides an alphabetical reference of commands used to configure 802.1X port access control. For more information, see the [AAA and Port Authentication\\_Feature Overview and Configuration Guide](#).

# dot1x accounting

**Overview** This command overrides the **default** RADIUS accounting method for IEEE 802.1X-based authentication on an interface by allowing you to apply a user-defined named method list.

Use the **no** variant of this command to remove the named list from the interface and apply the **default** method list.

**Syntax** dot1x accounting {default|<list-name>}  
no dot1x accounting

| Parameter   | Description                              |
|-------------|------------------------------------------|
| default     | Apply the default accounting method list |
| <list-name> | Apply the user-defined named list        |

**Default** The **default** method list is applied to an interface by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Example** To apply the named list 'vlan10\_acct' on the vlan10 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# dot1x accounting vlan10_acct
```

To remove the named list from the vlan10 interface and set the authentication method back to **default**, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no dot1x accounting
```

**Related commands** [aaa accounting dot1x](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# dot1x authentication

**Overview** This command overrides the **default** 802.1X-based authentication method on an interface by allowing you to apply a user-defined named list.

Use the **no** variant of this command to remove the named list from the interface and apply the **default** method.

**Syntax** dot1x authentication {default|<list-name>}  
no dot1x authentication

| Parameter      | Description                                  |
|----------------|----------------------------------------------|
| <i>default</i> | Apply the default authentication method list |
| <list-name>    | Apply the user-defined named list            |

**Default** The **default** method list is applied to an interface by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Example** To apply the named list 'vlan10\_auth' on the vlan10 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# dot1x authentication vlan10_auth
```

To remove the named list from the vlan10 interface and set the authentication method back to **default**, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no dot1x authentication
```

**Related commands** [aaa authentication dot1x](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# debug dot1x

**Overview** Use this command to enable 802.1X IEEE Port-Based Network Access Control troubleshooting functions.

Use the **no** variant of this command to disable this function.

**Syntax** debug dot1x [all|auth-web|event|nsm|packet|timer]  
no debug all dot1x  
no debug dot1x [all|auth-web|event|nsm|packet|timer]

| Parameter | Description                                                                                      |
|-----------|--------------------------------------------------------------------------------------------------|
| all       | Used with the <b>no</b> variant of this command exclusively; turns off all debugging for 802.1X. |
| auth-web  | Specifies debugging for 802.1X auth-web information.                                             |
| events    | Specifies debugging for 802.1X events.                                                           |
| nsm       | Specifies debugging for NSM messages.                                                            |
| packet    | Specifies debugging for 802.1X packets.                                                          |
| timer     | Specifies debugging for 802.1X timers.                                                           |

**Mode** Privileged Exec and Global Configuration

**Usage notes** This command turns on a mode where trace-level information is output during authentication conversations. Be aware that this is a very verbose output. It is mostly useful to capture this as part of escalating an issue to ATI support.

**Examples** Use this command without any parameters to turn on normal 802.1X debug information.

```
awplus# debug dot1x
awplus# show debugging dot1x
```

```
802.1X debugging status:
 802.1X events debugging is
 802.1X timer debugging is on
 802.1X packets debugging is on
 802.1X NSM debugging is on
```

**Related commands** [show debugging dot1x](#)  
[undebug dot1x](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

## dot1x control-direction

**Overview** This command sets the direction of the filter for the unauthorized interface.

If the optional **in** parameter is specified with this command then packets entering the specified port are discarded. The **in** parameter discards the ingress packets received from the supplicant.

If the optional **both** parameter is specified with this command then packets entering (ingress) and leaving (egress) the specified port are discarded. The **both** parameter discards the packets received from the supplicant and sent to the supplicant.

The **no** variant of this command sets the direction of the filter to **both**. The port will then discard both ingress and egress traffic.

**Syntax** dot1x control-direction {in|both}  
no dot1x control-direction

| Parameter | Description                                                                                                                |
|-----------|----------------------------------------------------------------------------------------------------------------------------|
| in        | Discard received packets from the supplicant (ingress packets).                                                            |
| both      | Discard received packets from the supplicant (ingress packets) and transmitted packets to the supplicant (egress packets). |

**Default** The authentication port direction is set to **both** by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To set the port direction to the default (**both**) for port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x control-direction
```

To set the port direction to **in** for port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x control-direction in
```

To set the port direction to **in** for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x control-direction in
```

**Related commands**

- auth profile (global)**
- show dot1x**

## dot1x eap

**Overview** This command selects the transmit mode for the EAP packet. If the authentication feature is not enabled then EAP transmit mode is not enabled. The default setting discards EAP packets.

**Syntax** `dot1x eap {discard|forward|forward-untagged-vlan|forward-vlan}`

| Parameter             | Description                                   |
|-----------------------|-----------------------------------------------|
| discard               | Discard.                                      |
| forward               | Forward to all ports on the switch.           |
| forward-untagged-vlan | Forward to ports with the same untagged VLAN. |
| forward-vlan          | Forward to ports with the same VLAN.          |

**Default** The transmit mode is set to discard EAP packets by default.

**Mode** Global Configuration

**Examples** To set the transmit mode of EAP packet to **forward**, to forward EAP packets to all ports on the switch, use the commands:

```
awplus# configure terminal
awplus(config)# dot1x eap forward
```

To set the transmit mode of EAP packet to **discard**, to discard EAP packets, use the commands:

```
awplus# configure terminal
awplus(config)# dot1x eap discard
```

To set the transmit mode of EAP packet to **forward-untagged-vlan**, to forward EAP packets to ports with the same untagged VLAN, use the commands:

```
awplus# configure terminal
awplus(config)# dot1x eap forward-untagged-vlan
```

To set the transmit mode of EAP packet to **forward-vlan**, to forward EAP packets to ports with the same VLAN, use the commands:

```
awplus# configure terminal
awplus(config)# dot1x eap forward-vlan
```

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# dot1x eapol-version

**Overview** This command sets the EAPOL protocol version for EAP packets when 802.1X port authentication is applied.

Use the **no** variant of this command to set the EAPOL protocol version to 1.

The default EAPOL protocol version is version 1.

**Syntax** dot1x eapol-version {1|2}  
no dot1x eapol-version

| Parameter | Description                    |
|-----------|--------------------------------|
| 1 2       | EAPOL protocol version 1 or 2. |

**Default** The EAP version for 802.1X authentication is set to 1 by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To set the EAPOL protocol version to 2 for port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x eapol-version 2
```

To set the EAPOL protocol version to the default version (1) for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x eapol-version
```

To set the EAPOL protocol version to 2 for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x eapol-version 2
```

**Validation Commands** **auth profile (global)**  
**show dot1x**  
**show dot1x interface**

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# dot1x initialize interface

**Overview** This command removes authorization for a specified connected interface. The connection will attempt to re-authorize when the specified port attempts to make use of the network connection.

**NOTE:** *Reauthentication could be a long time after the use of this command because the reauthorization attempt is not triggered by this command. The attempt is triggered by the first packet from the interface trying to access the network resources.*

**Syntax** dot1x initialize interface <interface-list>

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <interface-list> | <p>The interfaces or ports to configure. An interface-list can be:</p> <ul style="list-style-type: none"><li>• a VLAN (e.g. vlan2)</li><li>• a switchport (e.g. port1.0.4)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li><li>• a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3)</li><li>• a comma-separated list (e.g. port1.0.1, port1.0.3-port1.0.4). Do not mix interface types in a list.</li></ul> <p>The specified interfaces must exist.</p> |

**Mode** Privileged Exec

**Examples** To initialize 802.1X port authentication on the interface port1.0.2, use the command:

```
awplus# dot1x initialize interface port1.0.2
```

To unauthorize switch port1.0.2 and attempt reauthentication on switch port1.0.2, use the command:

```
awplus# dot1x initialize interface port1.0.2
```

To unauthorize all switch ports for a 18-port device and attempt reauthentication, use the command:

```
awplus# dot1x initialize interface port1.0.1-port1.0.18
```

**Related commands** [dot1x initialize supplicant](#)

[show dot1x interface](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# dot1x initialize supplicant

**Overview** This command removes authorization for a connected supplicant with the specified MAC address or username. The connection will attempt to re-authorize when the specified supplicant attempts to make use of the network connection.

**NOTE:** *Reauthentication could be a long time after the use of this command because the reauthorization attempt is not triggered by this command. The attempt is triggered by the first packet from the supplicant trying to access the network resources.*

**Syntax** dot1x initialize supplicant {<macadd>|username}

| Parameter  | Description                                      |
|------------|--------------------------------------------------|
| dot1x      | IEEE 802.1X Port-Based Access Control.           |
| initialize | Initialize the port to attempt reauthentication. |
| supplicant | Specify the supplicant to initialize.            |
| <macadd>   | MAC (hardware address of the supplicant.         |
| username   | The name of the supplicant entry.                |

**Mode** Privileged Exec

**Example** To initialize the supplicant authentication, use the commands

```
awplus# configure terminal
awplus(config)# dot1x initialize supplicant 0090.99ab.a020
awplus(config)# dot1x initialize supplicant guest
```

**Related commands** [dot1x initialize interface](#)  
[show dot1x](#)  
[show dot1x supplicant](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# dot1x keytransmit

**Overview** Use this command to enable key transmission on the interface specified previously in Interface mode.

This command enables key transmission over an Extensible Authentication Protocol (EAP) packet between the authenticator and supplicant.

The **no** variant of this command disables key transmission on the interface specified.

**Syntax** dot1x keytransmit  
no dot1x keytransmit

**Default** Key transmission for port authentication is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To enable the key transmit feature on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x keytransmit
```

To disable the key transmit feature on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x keytransmit
```

**Related commands** [show dot1x](#)  
[show dot1x interface](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

## dot1x max-auth-fail

**Overview** Use this command to configure the maximum number of login attempts for a supplicant (client device) using the **auth-fail vlan** feature, when using 802.1X port authentication on an interface.

The **no** variant of this command resets the maximum login attempts for a supplicant (client device) using the auth-fail vlan feature, to the default configuration of 3 login attempts.

**Syntax** dot1x max-auth-fail <0-10>  
no dot1x max-auth-fail

| Parameter | Description                                                                                                    |
|-----------|----------------------------------------------------------------------------------------------------------------|
| <0-10>    | Specify the maximum number of login attempts for supplicants on an interface using 802.1X port authentication. |

**Default** The default maximum number of login attempts for a supplicant on an interface using 802.1X port authentication is 3 login attempts.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** This command sets the maximum number of login attempts for supplicants on an interface. The supplicant is moved to the auth-fail VLAN from the Guest VLAN after the number of failed login attempts using 802.1X authentication is equal to the number set with this command.

See the [AAA and Port Authentication Feature Overview and Configuration Guide](#) for information about:

- the auth-fail VLAN feature, and
- restrictions regarding combinations of authentication enhancements working together

**Examples** To configure the maximum number of login attempts for a supplicant on interface port1.0.2 to a single login attempt, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x max-auth-fail 1
```

To configure the maximum number of login attempts for a supplicant on interface port1.0.2 to the default number of 3 login attempts, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x max-auth-fail
```

To configure the maximum number of login attempts for a supplicant on authentication profile 'student' to a single login attempt, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x max-auth-fail 1
```

**Related commands**

- auth auth-fail vlan**
- auth profile (global)**
- dot1x max-reauth-req**
- show dot1x interface**

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

## dot1x max-reauth-req

**Overview** Use this command to set the number of reauthentication attempts before an interface is unauthorized.

The **no** variant of this command resets the reauthentication delay to the default.

**Syntax** dot1x max-reauth-req <1-10>

no dot1x max-reauth-req

| Parameter | Description                                                                                                               |
|-----------|---------------------------------------------------------------------------------------------------------------------------|
| <1-10>    | Specify the maximum number of reauthentication attempts for supplicants on an interface using 802.1X port authentication. |

**Default** The default maximum reauthentication attempts for interfaces using 802.1X port authentication is two (2) reauthentication attempts, before an interface is unauthorized.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** Use this command to set the maximum reauthentication attempts after failure.

**Examples** To configure the maximum number of reauthentication attempts for interface port1.0.2 to a single (1) reauthentication request, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x max-reauth-req 1
```

To configure the maximum number of reauthentication attempts for interface port1.0.2 to the default maximum number of two (2) reauthentication attempts, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x max-reauth-req
```

To configure the maximum number of reauthentication attempts for authentication profile 'student' to a single (1) reauthentication request, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x max-reauth-req 1
```

**Related commands**

- auth profile (global)**
- auth supplicant-ip**
- auth supplicant-mac**
- dot1x max-auth-fail**
- dot1x max-req**
- show dot1x interface**

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

## dot1x max-req

**Overview** Use this command to change the number of times the device resends an EAP Request packet if that packet is lost between the authenticating device and the supplicant. If the supplicant does not respond to an EAP Request after this number of retries, the supplicant fails the authentication process.

Use the **no** variant of this command to return to the default number of retries.

**Syntax** dot1x max-req <1-10>  
no dot1x max-req

| Parameter | Description                                                                                                                                                 |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <1-10>    | The number of retries. Note that this does not include the initial attempt, so the total number of attempts is one higher than the number you specify here. |

**Default** The default value is 2.

Note: This means the authenticator sends the original attempt and 2 more attempts, which is 3 attempts in total.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** You can set this on a per-supplicant basis by using the **max-req** parameter in the commands:

- **auth supplicant-ip**
- **auth supplicant-mac**

**Example** To change the number of retries to 5 for port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x max-req 5
```

To return the number of retries to the default setting of 2 for port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x max-req
```

To set the number of retries to 1 for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x max-req 1
```

**Related commands**

- auth profile (global)**
- auth supplicant-ip**
- auth supplicant-mac**
- dot1x max-reauth-req**
- show dot1x interface**

**Command changes** Version 5.5.3-1.1: command added

# dot1x port-control

**Overview** This command enables 802.1X port authentication on the interface specified, and sets the control of the authentication port.

The **no** variant of this command disables the port authentication on the interface specified.

**Syntax** dot1x port-control {force-unauthorized|force-authorized|auto}  
no dot1x port-control

| Parameter          | Description                                                                                                  |
|--------------------|--------------------------------------------------------------------------------------------------------------|
| force-unauthorized | Force the port state to unauthorized.<br>Specify this to force a port to always be in an unauthorized state. |
| force-authorized   | Force the port state to authorized.<br>Specify this to force a port to always be in an authorized state.     |
| auto               | Allow the port client to negotiate authentication.<br>Specify this to enable authentication on the port.     |

**Default** 802.1X port control is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** Use this command to force a port state.

When **port-control** is set to **auto**, the 802.1X authentication feature is executed on the interface, but only if the **aaa authentication dot1x** command has been issued.

If you attempt to change the authentication configuration on an interface that has threat protection quarantine configured, you will see the following error message:

```
% portx.x.x: Application Proxy quarantine configuration must be removed before port authentication is changed
```

Before changing the interface's authentication configuration you must either:

- remove the interface's threat protection configuration, or
- shut down the interface.

**Examples** To enable port authentication on the interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x port-control auto
```

To enable port authentication force authorized on the interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x port-control force-authorized
```

To disable port authentication on the interface port1.0.2 use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x port-control
```

To enable port authentication on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x port-control auto
```

**Related commands** **aaa authentication dot1x**  
**auth profile (global)**

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# dot1x timeout tx-period

**Overview** This command sets the transmit timeout for the authentication request on the specified interface.

The **no** variant of this command resets the transmit timeout period to the default (30 seconds).

**Syntax** dot1x timeout tx-period <1-65535>  
no dot1x timeout tx-period

| Parameter | Description |
|-----------|-------------|
| <1-65535> | Seconds.    |

**Default** The default transmit period for port authentication is 30 seconds.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** Use this command to set the interval between successive attempts to request an ID.

**Examples** To set the transmit timeout period to 5 seconds on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x timeout tx-period 5
```

To reset transmit timeout period to the default (30 seconds) on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x timeout tx-period
```

To set the transmit timeout period to 5 seconds on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x timeout tx-period 5
```

**Related commands** **auth profile (global)**

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# show debugging dot1x

**Overview** Use this command to see what debugging is turned on for 802.1X.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show debugging dot1x

**Mode** User Exec and Privileged Exec

**Example** To enable 802.1X debugging and display the debugging option set, use the following commands:

```
awplus# debug dot1x
awplus# show debugging dot1x
```

## Example output from the show debugging dot1x command

```
802.1X debugging status:
 802.1X events debugging is on
 802.1X timer debugging is on
 802.1X packets debugging is on
 802.1X NSM debugging is on
```

**Related commands** [debug dot1x](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# show dot1x

**Overview** Use this command to show authentication information for 802.1X port authentication.

If you specify the optional **all** parameter then this command also displays all authentication information for each port available on the switch.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare\\_Plus” Feature Overview and Configuration Guide](#).

**Syntax** show dot1x [all]

| Parameter | Description                                                                    |
|-----------|--------------------------------------------------------------------------------|
| all       | Displays all authentication information for each port available on the switch. |

**Mode** Privileged Exec

**Example** awplus# show dot1x all

**Example output from the show dot1x all command**

```
awplus# show dot1x all

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# show dot1x diagnostics

**Overview** This command shows 802.1X authentication diagnostics for the specified interface (optional).

If no interface is specified then authentication diagnostics are shown for all interfaces.

For information on filtering and saving command output, see the **[“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#)**.

**Syntax** show dot1x diagnostics [interface <interface-list>]

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| interface        | Specify a port to show.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <interface-list> | <p>The interfaces or ports to configure. An interface-list can be:</p> <ul style="list-style-type: none"><li>• a VLAN (e.g. vlan2)</li><li>• a switchport (e.g. port1.0.4)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li><li>• a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3)</li><li>• a comma-separated list (e.g. port1.0.1, port1.0.3-port1.0.4). Do not mix interface types in a list.</li></ul> <p>The specified interfaces must exist.</p> |

**Mode** Privileged Exec

**Example** See the sample output below showing 802.1X authentication diagnostics for port1.0.2:

```
awplus# show dot1x diagnostics interface port1.0.2
```

**Output** The following shows typical output.

**Example output from the show dot1x diagnostics command**

```
Authentication Diagnostics for interface port1.0.2
  Supplicant address: 00d0.59ab.7037
    authEnterConnecting: 2

EAPOL Last Frame Version Rx: 1 - EAPOL Last Frame
Src:00d0.59ab.7037
```

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# show dot1x supplicant

**Overview** This command shows the supplicant state of the authentication mode set for the switch.

This command shows a summary when the optional **brief** parameter is used.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare\\_Plus” Feature Overview and Configuration Guide](#).

**Syntax** show dot1x supplicant [<macadd>] [brief]

| Parameter | Description                               |
|-----------|-------------------------------------------|
| <macadd>  | MAC (hardware) address of the Supplicant. |
| brief     | Brief summary of the Supplicant state.    |

**Mode** Privileged Exec

**Example** See sample output below showing the 802.1X authenticated supplicant on the switch:

```
awplus# show dot1x supplicant
```

**Example output from the show dot1x supplicant command**

```
authenticationMethod: dot1x
totalSupplicantNum: 1
authorizedSupplicantNum: 1
macBasedAuthenticationSupplicantNum: 0
dot1xAuthenticationSupplicantNum: 1
webBasedAuthenticationSupplicantNum: 0
Supplicant name: manager
Supplicant address: 00d0.59ab.7037
  authenticationMethod: dot1x
    Two-Step Authentication:
      firstAuthentication: Pass - Method: mac
      secondAuthentication: Pass - Method: dot1x
portStatus: Authorized - currentId: 4
abort:F fail:F start:F timeout:F success:T
PAE: state: Authenticated - portMode: Auto
PAE: reAuthCount: 0 - rxRespId: 0
PAE: quietPeriod: 60 - maxReauthReq: 2 - txPeriod: 30
BE: state: Idle - reqCount: 0 - idFromServer: 3
BE: suppTimeout: 30 - serverTimeout: 30
CD: adminControlledDirections: in - operControlledDirections: in
CD: bridgeDetected: false
KR: rxKey: false
KT: keyAvailable: false - keyTxEnabled: false
RADIUS server group (auth): radius
RADIUS server (auth): 192.168.1.40
```

See sample output below showing the supplicant on the switch using the **brief** parameter:

```
awplus# show dot1x supplicant 00d0.59ab.7037 brief
```

```
Interface port1.0.2
  authenticationMethod: dot1x
  totalSupplicantNum: 1
  authorizedSupplicantNum: 1
    macBasedAuthenticationSupplicantNum: 0
    dot1xAuthenticationSupplicantNum: 1
    webBasedAuthenticationSupplicantNum: 0
```

| Interface | VID | Mode | MAC Address    | Status        | IP Address    | Username |
|-----------|-----|------|----------------|---------------|---------------|----------|
| =====     | ==  | ==   | =====          | =====         | =====         | =====    |
| port1.0.2 | 2   | D    | 00d0.59ab.7037 | Authenticated | 192.168.2.201 | manager  |

See sample output below showing the supplicant on the switch using the **brief** parameter:

```
awplus# show dot1x supplicant brief
```

For example, if two-step authentication is configured with 802.1X authentication as the first method and web authentication as the second method then the output is as follows:

```
Interface port1.0.2 authenticationMethod: dot1x/web
  Two-Step Authentication
    firstMethod: dot1x
    secondMethod: web
  totalSupplicantNum: 1
  authorizedSupplicantNum: 1
    macBasedAuthenticationSupplicantNum: 0
    dot1xAuthenticationSupplicantNum: 0
```

|                                        |       |       |                |               |               |          |
|----------------------------------------|-------|-------|----------------|---------------|---------------|----------|
| webBasedAuthenticationSupplicantNum: 1 |       |       |                |               |               |          |
| otherAuthenticationSupplicantNum: 0    |       |       |                |               |               |          |
| Interface                              | VID   | Mode  | MAC Address    | Status        | IP Address    | Username |
| =====                                  | ===== | ===== | =====          | =====         | =====         | =====    |
| port1.0.2                              | 5     | W     | 0008.0d5e.c216 | Authenticated | 192.168.1.200 | web      |

**Related commands** [show dot1x supplicant interface](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# show dot1x supplicant interface

**Overview** Use this command to show the supplicant state of the authentication mode set for the interface.

This command shows a summary when the optional **brief** parameter is used.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare\\_Plus” Feature Overview and Configuration Guide](#).

**Syntax** show dot1x supplicant interface *<interface-list>* [brief]

| Parameter                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;interface-list&gt;</i> | The interfaces to display information about. An interface-list can be: <ul style="list-style-type: none"><li>• a VLAN (e.g. vlan2)</li><li>• a switchport (e.g. port1.0.4)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li><li>• a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3)</li><li>• a comma-separated list (e.g. port1.0.1, port1.0.3-port1.0.4). Do not mix interface types in a list.</li></ul> |
| brief                         | Brief summary of the Supplicant state.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

**Mode** Privileged Exec

**Examples** See sample output below showing the supplicant on the interface port1.0.2:

```
awplus# show dot1x supplicant interface port1.0.2
```

**Example output from the show dot1x supplicant interface command**

```
Interface port1.0.2
authenticationMethod: dot1x
totalSupplicantNum: 1
authorizedSupplicantNum: 1
  macBasedAuthenticationSupplicantNum: 0
  dot1xAuthenticationSupplicantNum: 1
  webBasedAuthenticationSupplicantNum: 0
  otherAuthenticationSupplicantNum: 0

# Introduction

**Overview** Port authentication commands enable you to specify three different types of device authentication: 802.1X authentication, web authentication, and MAC authentication.

- 802.1X is an IEEE standard providing a mechanism for authenticating devices attached to a LAN port or wireless device.
- Web authentication is applicable to devices that have a human user who opens the web browser and types in a user name and password when requested.
- MAC authentication is used to authenticate devices that have neither a human user nor implement 802.1X supplicant when making a network connection request.

This chapter provides an alphabetical reference for MAC and web authentication commands. For a list of 802.1X commands see the **802.1X Commands** chapter.

For more information on configuring and using port authentication, see the **AAA and Port Authentication Feature Overview and Configuration Guide**.

## auth auth-fail vlan

**Overview** Use this command to enable the **auth-fail vlan** feature on the specified vlan interface. This feature assigns supplicants (client devices) to the specified VLAN if they fail port authentication.

Use the **no** variant of this command to disable the auth-fail vlan feature for a specified VLAN interface.

**Syntax** auth auth-fail vlan <1-4094>  
no auth auth-fail vlan

| Parameter | Description                                                                  |
|-----------|------------------------------------------------------------------------------|
| <1-4094>  | Assigns the VLAN ID to any supplicants that have failed port authentication. |

**Default** The auth-fail vlan feature is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** Use the auth-fail vlan feature when using web authentication instead of the Guest VLAN feature, when you need to separate networks where one supplicant (client device) requires authentication and another supplicant does not require authentication from the same interface.

This is because the DHCP lease time using the Web-Authentication feature is shorter, and the auth-fail vlan feature enables assignment to a different VLAN if a supplicant fails authentication.

To enable the auth-fail vlan feature with web authentication, you need to set the web authentication server virtual IP address by using the **auth-web-server ipaddress** or the **auth-web-server dhcp ipaddress**.

When using 802.1X port authentication, use a **dot1x max-auth-fail** command to set the maximum number of login attempts. Three login attempts are allowed by default for 802.1X port authentication before supplicants trying to authenticate are moved from the Guest VLAN to the auth-fail VLAN. See the **dot1x max-auth-fail** for command information.

See the **AAA and Port Authentication Feature Overview and Configuration Guide** for information about:

- the auth-fail VLAN feature, which allows the Network Administrator to separate the supplicants who attempted authentication, but failed, from the supplicants who did not attempt authentication, and
- restrictions regarding combinations of authentication enhancements working together

Use appropriate ACLs (Access Control Lists) on interfaces for extra security if a supplicant allocated to the designated auth-fail vlan can access the same network as a supplicant on the Guest VLAN. For more information about ACL concepts, and configuring ACLs see the **ACL Feature Overview and Configuration Guide**. For more information about ACL commands see:

- **IPv4 Hardware Access Control List (ACL) Commands**
- **IPv4 Software Access Control List (ACL) Commands**
- **IPv6 Software Access Control List (ACL) Commands**

**Examples** To enable the auth-fail vlan feature for port1.0.2 and assign VLAN 100, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth auth-fail vlan 100
```

To disable the auth-fail vlan feature for port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth auth-fail vlan
```

**Related commands** **auth profile (global)**  
**dot1x max-auth-fail**  
**show dot1x**  
**show dot1x interface**  
**show running-config**

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# auth critical

**Overview** Use this command to enable the critical port feature on the interface. When the critical port feature is enabled on an interface, and all the RADIUS servers are unavailable, then the interface becomes authorized. The **no** variant of this command disables the critical port feature on the interface.

**Syntax** `auth critical`  
`no auth critical`

**Default** The critical port of port authentication is disabled.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To enable the critical port feature on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth critical
```

To disable the critical port feature on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth critical
```

To enable the critical port feature on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth critical
```

**Related commands** [auth profile \(global\)](#)  
[show auth-web-server](#)  
[show dot1x](#)  
[show dot1x interface](#)  
[show running-config](#)

## auth dynamic-acl enable

**Overview** Use this command to enable Dynamic Access Control Lists (ACLs). This lets you configure port authentication to dynamically apply ACLs when a supplicant is authorized. These ACLs are automatically removed when the supplicant disconnects.

Use the **no** variant of this command to disable Dynamic ACLs.

**Syntax** `auth dynamic-acl enable`  
`no auth dynamic-acl enable`

**Default** Disabled.

**Mode** Interface configuration for switch port or static aggregator.

**Usage notes** Dynamic ACLs are created and attached to a switchport in the following way:

- A RADIUS server holds the ACL rules for a supplicant, along with that supplicants user name and password.
- These ACL rules can be either:
  - a complete IPv4 hardware rule (stored as a RADIUS NAS-Filter-Rule attribute), or
  - name or number reference to an existing ACL rule (stored as a RADIUS Filter-Id attribute)
- When the first packet from a supplicant arrives on a switchport the authenticator starts the authentication process with the RADIUS server.
- The RADIUS server returns Access-Accept packet to the authenticator with the configured ACL rules.
- The authenticator creates and installs these ACLs dynamically on the switchport and authorizes the supplicant.
- These Dynamic ACLs are named IPv4 hardware access-lists. They are internally maintained and cannot be removed or modified from the CLI.
- All traffic on the switchport is filtered using these ACLs.
- When the supplicant is unauthorized, dynamically installed ACLs are removed and detached from the switchport.

For more information, see the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

**Examples** This example uses the local RADIUS server to define two ACL rules that are applied to MAC authenticated supplicants on port1.0.2.

Define the local RADIUS server as the RADIUS server to use:

```
awplus# configure terminal
awplus(config)# radius-server host 127.0.0.1 key awplus-local-radius-server
```

Define the authentication method list:

```
awplus(config)# aaa authentication auth-mac default group radius
```

Enable MAC authentication and dynamic ACLs on port1.0.2:

```
awplus(config)# interface port1.0.2
awplus(config-if)# auth-mac enable
awplus(config-if)# auth dynamic-acl enable
awplus(config-if)# exit
```

Configure the local RADIUS server with the required ACL rules:

```
awplus(config)# radius-server local
awplus(config-radsrv)# group dacl-rule
awplus(config-radsrv-group)# attribute repeated NAS-Filter-Rule
"ip:permit ip 192.168.1.0/24 192.168.2.0/24"
awplus(config-radsrv-group)# attribute repeated NAS-Filter-Rule
"ip:deny ip 192.168.1.0/24 any"
awplus(config-radsrv-group)# exit
```

Add a user with the Dynamic ACL rules and enable the local RADIUS server:

```
awplus(config-radsrv)# user xx-xx-xx-xx-xx-xx password xx-xx-xx-xx-xx-x group dacl-rule
awplus(config-radsrv)# server enable
awplus(config-radsrv)# exit
```

These ACL rules will reject IP traffic from 192.168.1.x to any destination except 192.168.2.x for supplicants on port1.0.2.

**Related commands**

- radius-server local**
- show access-list (IPv4 Hardware ACLs)**
- show auth supplicant**
- user (radsrv)**

**Command changes** Version 5.5.0-1.1: command added

## auth dynamic-vlan-creation

**Overview** Use this command to enable and disable the Dynamic VLAN assignment feature.

The Dynamic VLAN assignment feature allows a supplicant (client device) to be placed into a specific VLAN based on information returned from the RADIUS server during authentication, on a given interface.

Use the **no** variant of this command to disable the Dynamic VLAN assignment feature.

**Syntax** `auth dynamic-vlan-creation [rule {deny|permit}] [type {multi|single}]`  
`no auth dynamic-vlan-creation`

| Parameter | Description                                                                                                                                                                                |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rule      | VLAN assignment rule.                                                                                                                                                                      |
| deny      | Deny a differently assigned VLAN ID. This is the default rule.                                                                                                                             |
| permit    | Permit a differently assigned VLAN ID.                                                                                                                                                     |
| type      | Specifies whether multiple different VLANs can be assigned to supplicants (client devices) attached to the port, or whether only a single VLAN can be assigned to supplicants on the port. |
| multi     | Multiple Dynamic VLAN.                                                                                                                                                                     |
| single    | Single Dynamic VLAN.                                                                                                                                                                       |

**Default** By default, the Dynamic VLAN assignment feature is disabled.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** If the Dynamic VLAN assignment feature is enabled, VLAN assignment is dynamic. If the Dynamic VLAN assignment feature is disabled then RADIUS attributes are ignored and configured VLANs are assigned to ports. Dynamic VLANs may be associated with authenticated MAC addresses if the **type** parameter is applied with the **rule** parameter.

The **rule** parameter deals with the case where there are multiple supplicants attached to a port, and the type parameter has been set to **single-vlan**. The parameter specifies how the switch should act if different VLAN IDs end up being assigned to different supplicants. The keyword value **deny** means that once a given VID has been assigned to the first supplicant, then if any subsequent supplicant is assigned a different VID, that supplicant is rejected. The keyword value **permit** means that once a given VID has been assigned to the first supplicant, then if any subsequent supplicant is assigned a different VID, that supplicant is accepted, but it is actually assigned the same VID as the first supplicant.

If you issue an **auth dynamic-vlan-creation** command without a **rule** parameter then a second supplicant with a different VLAN ID is rejected. It is not assigned to the first supplicant's VLAN. Issuing an **auth dynamic-vlan-creation** command without a **rule** parameter has the same effect as issuing an **auth dynamic-vlan-creation rule deny** command rejecting supplicants with differing VLANs.

The **type** parameter specifies whether multiple different VLANs can be assigned to supplicants attached to the port, or whether only a single VLAN can be assigned to supplicants on the port. The **type** parameter can select the port base VLAN or the MAC base VLAN from the RADIUS VLAN ID. This can be used when the host-mode is set to multi-supplicant. For **single**-host ports, the VLAN ID will be assigned to the port. It is not supported with the Guest VLAN feature. Display the ID assigned using a **show vlan** command. For **multi**-host ports, the VLAN ID will be assigned to the MAC address of the authenticated supplicant. The VLAN ID assigned for the MAC Base VLAN is displayed using the **show platform table vlan** command.

To configure Dynamic VLAN with Web Authentication, you need to set the Web Authentication Server virtual IP address by using the **auth-web-server ipaddress** command or the **auth-web-server dhcp ipaddress** command. You also need to create a hardware access-list that can be applied to the switch port interface.

You need to configure an IPv4 address for the VLAN interface on which Web Authentication is running.

**Examples** To enable the Dynamic VLAN assignment feature on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport access vlan 10
awplus(config-if)# auth-web enable
awplus(config-if)# auth dynamic-vlan-creation
awplus(config-if)# interface vlan10
awplus(config-if)# ip address 10.1.1.1/24
```

To enable the Dynamic VLAN assignment feature with Web Authentication on interface port1.0.2 when Web Authentication is needed, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ipaddress 1.2.3.4
awplus(config)# access-list hardware acl-web send-to-cpu ip any
1.2.3.4
awplus(config)# interface port1.0.2
awplus(config-if)# auth-web enable
awplus(config-if)# auth dynamic-vlan-creation
awplus(config-if)# access-group acl-web
awplus(config-if)# interface vlan1
awplus(config-if)# ip address 10.1.1.1/24
```

To disable the Dynamic VLAN assignment feature on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth dynamic-vlan-creation
```

To enable the Dynamic VLAN assignment feature on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth dynamic-vlan-creation
```

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

## auth guest-vlan

**Overview** Use this command to enable and configure the Guest VLAN feature on the interface specified by associating a Guest VLAN with an interface. This command does not start authentication. The supplicant's (client device's) traffic is associated with the native VLAN of the interface unless it is already associated with another VLAN. The **routing** option enables routing from the Guest VLAN to another VLAN, so the switch can lease DHCP addresses and accept access to a limited network.

The **no** variant of this command disables the guest VLAN feature on the interface specified.

**Syntax** `auth guest-vlan <1-4094> [routing]`  
`no auth guest-vlan [routing]`

| Parameter | Description                                         |
|-----------|-----------------------------------------------------|
| <1-4094>  | VLAN ID (VID).                                      |
| routing   | Enables routing from the Guest VLAN to other VLANs. |

**Default** The Guest VLAN authentication feature is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** The Guest VLAN feature may be used by supplicants (client devices) that have not attempted authentication, or have failed the authentication process. Note that if a port is in multi-supplicant mode with per-port dynamic VLAN configuration, after the first successful authentication, subsequent hosts cannot use the guest VLAN due to the change in VLAN ID. This may be avoided by using per-user dynamic VLAN assignment.

When using the Guest VLAN feature with the multi-host mode, a number of supplicants can communicate via a guest VLAN before authentication. A supplicant's traffic is associated with the native VLAN of the specified switch port. The supplicant must belong to a VLAN before traffic from the supplicant can be associated.

Note that you must enable 802.1X on the port and define a VLAN using the **vlan** command before you can configure it as a guest VLAN.

Roaming Authentication cannot be enabled if DHCP snooping is enabled (**service dhcp-snooping** command), and vice versa.

Note that Guest VLAN can use only untagged ports.

See the **AAA and Port Authentication Feature Overview and Configuration Guide** for information about:

- Guest VLAN, and
- restrictions regarding combinations of authentication enhancements working together

**Examples** To define vlan100 and assign the guest VLAN feature to vlan100 on interface port1.0.2, and enable routing from the guest VLAN to other VLANs, use the following commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 100
awplus(config-vlan)# exit
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth guest-vlan 100 routing
```

To disable the guest VLAN feature on port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth guest-vlan
```

To define vlan100 and assign the guest VLAN feature to vlan100 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 100
awplus(config-vlan)# exit
awplus(config)# auth profile student
awplus(config-auth-profile)# auth guest-vlan 100
```

**Related commands**

- show dot1x interface**

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

## auth guest-vlan forward

**Overview** Use this command to enable packet forwarding from the guest VLAN to a destination IP address or subnet. If this command is configured, the device can lease DHCP addresses and accept access to a limited part of your network. Also, when using NAP authentication, the supplicant can log on to a domain controller to gain certification.

Use the **no** variant of this command to disable packet forwarding from the Guest VLAN to a destination IP address or subnet.

**Syntax** `auth guest-vlan forward {<ip-address>|<ip-address/mask>} [dns | tcp <1-65535>|udp <1-65535>]`  
`no auth guest-vlan forward {<ip-address>|<ip-address/mask>} [dns|tcp <1-65535>|udp <1-65535>]`

| Parameter                                              | Description                                                                                      |
|--------------------------------------------------------|--------------------------------------------------------------------------------------------------|
| <code>&lt;ip-address&gt;&lt;ip-address/mask&gt;</code> | The IP address or subnet to which the guest VLAN can forward packets, in dotted decimal notation |
| <code>dns</code>                                       | Enable forwarding of DNS packets                                                                 |
| <code>tcp &lt;1-65535&gt;</code>                       | Enable forwarding of packets for the specified TCP port number                                   |
| <code>udp &lt;1-65535&gt;</code>                       | Enable forwarding of packets for the specified UDP port number                                   |

**Default** Forwarding is disabled by default.

**Mode** Interface Configuration mode for a specified switch port, or Authentication Profile mode

**Usage** Before using this command, you must configure the guest VLAN with the **auth guest-vlan** command.

**Example** To enable packet forwarding from the guest VLAN to the destination IP address on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth guest-vlan forward 10.0.0.1
```

To enable forwarding of DNS packets from the guest VLAN to the destination IP address on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface
awplus(config-if)# auth guest-vlan forward 10.0.0.1 dns
```

To disable forwarding of DNS packets from the guest VLAN to the destination IP address on port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth guest-vlan forward 10.0.0.1 dns
```

To enable the TCP forwarding port 137 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth guest-vlan forward 10.0.0.1
tcp 137
```

**Related commands** [auth guest-vlan](#)  
[auth profile \(global\)](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# auth guest-vlan hw-forwarding

**Overview** Use this command to enable hardware forwarding on the guest VLAN. By default, hardware forwarding is disabled and all traffic on the VLAN is forwarded by the CPU.

Use the **no** variant of this command to disable hardware forwarding on the guest VLAN.

**Syntax** `auth guest-vlan hw-forwarding`  
`no auth guest-vlan hw-forwarding`

**Default** Disabled.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Example** To enable guest VLAN hardware forwarding on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth guest-vlan hw-forwarding
```

To disable guest VLAN hardware forwarding on port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth guest-vlan hw-forwarding
```

To enable guest VLAN hardware forwarding authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth guest-vlan hw-forwarding
```

**Related commands** [auth profile \(global\)](#)  
[auth guest-vlan](#)  
[auth guest-vlan forward](#)

**Command changes** Version 5.5.0-1.1: command added to x230, GS970M, IE210 series switches.  
Version 5.5.1-0.1: command added to all other AlliedWare Plus switches.

## auth host-mode

**Overview** Use this command to select the host mode on the specified interface.

Use the **no** variant of this command to set host mode to the default setting (single host).

**Syntax** `auth host-mode {host-plus-voice|single-host|multi-host|multi-supPLICANT}`  
`no auth host-mode`

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| host-plus-voice  | In this mode, only one voice device (IP phone) and one host device can join the network. You use the RADIUS attribute 'Cisco-AVPair device-traffic-class=voice' to identify the IP phone. For more information and a step-by-step configuration example, see the "Limit the number of supplicants when connecting via an IP phone" section of the <a href="#">AAA and Port Authentication Feature Overview and Configuration Guide</a> . |
| single-host      | In this mode, only one supplicant is allowed per port. This is the default mode.                                                                                                                                                                                                                                                                                                                                                         |
| multi-host       | In this mode, once the first host on a port is authenticated, all other downstream hosts are allowed without being authenticated (piggy-back mode).                                                                                                                                                                                                                                                                                      |
| multi-supPLICANT | In this mode, multiple separate supplicants are individually authenticated on one port.                                                                                                                                                                                                                                                                                                                                                  |

**Default** The default host mode for port authentication is for a single host.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

### Usage notes **Single-host mode**

With this mode, only one supplicant may be authenticated on the port. Once that host has been authenticated, no other supplicants may be authenticated until the first supplicant's session has closed. This means, of course, that none of the other hosts downstream of the port will be able to send or receive traffic on that port.

This option is recommended when you know that there should only be one host connected to a port. By limiting the port to a single authenticated host, you guard against the consequences of someone accidentally or maliciously connecting a downstream switch to the port.

### **Multi-host mode**

With this mode, once the first host has been authenticated on the port, all other downstream hosts are allowed without being authenticated. This is sometimes known as piggy-back mode. It is useful when the downstream switch attached to the authenticating port is an intelligent switch that can act as an authentication supplicant.

If you trust that malicious users cannot be connected to that switch but you do not know the identity of those users, then you can simply authenticate the switch and then allow its attached users to have network access. If the valid switch is disconnected and an invalid one is connected which is not configured with the correct authentication credentials, then the devices connected to the invalid switch will be blocked from accessing the network.

**Examples** To set the host mode to multi-suppliant on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth host-mode multi-suppliant
```

To set the host mode to the default (single host) on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth host-mode
```

To set the host mode to multi-suppliant on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth host-mode multi-suppliant
```

To set the host mode to the default (single host) on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth host-mode
```

**Related commands** **auth profile (global)**  
**show dot1x**  
**show dot1x interface**  
**show running-config**

**Command changes** Version 5.5.2-1.1: **host-plus-voice** parameter added

## auth log

**Overview** Use this command to configure the types of authentication feature log messages that are output to the log file.

Use the **no** variant of this command to remove either specified types or all types of authentication feature log messages that are output to the log file.

**Syntax** `auth log {dot1x|auth-mac|auth-web} {success|failure|logoff|all}`  
`no auth log {dot1x|auth-mac|auth-web} {success|failure|logoff|all}`

| Parameter | Description                                                                                                                                                 |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dot1x     | Specify only 802.1X-Authentication log messages are output to the log file.                                                                                 |
| auth-mac  | Specify only MAC-Authentication log messages are output to the log file.                                                                                    |
| auth-web  | Specify only Web-Authentication log messages are output to the log file.                                                                                    |
| success   | Specify only successful authentication log messages are output to the log file.                                                                             |
| failure   | Specify only authentication failure log messages are output to the log file.                                                                                |
| logoff    | Specify only authentication log-off messages are output to the log file. Note that link down, age out and expired ping polling messages will be included.   |
| all       | Specify all types of authentication log messages are output to the log file. Note that this is the default behavior for the authentication logging feature. |

**Default** All types of authentication log messages are output to the log file by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To configure the logging of MAC authentication failures to the log file for supplicants (client devices) connected to interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth log auth-mac failure
```

To disable the logging of all types of authentication log messages to the log file for auth-mac supplicants (client devices) connected to interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth log auth-mac all
```

To configure the logging of web authentication failures to the log file for supplicants (client devices) connected to authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth log auth-web failure
```

To disable the logging of all types of authentication log messages to the log file for auth-mac supplicants (client devices) connected to authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth log auth-mac all
```

**Related commands** [auth profile \(global\)](#)  
[show running-config](#)

# auth max-supPLICANT

**Overview** Use this command to set the maximum number of supplicants (client devices) that can be authenticated on the selected port. Once this value is exceeded, further supplicants will not be authenticated.

The **no** variant of this command resets the maximum supplicant number to the default.

**Syntax** `auth max-supPLICANT <2-1024>`  
`no auth max-supPLICANT`

| Parameter | Description   |
|-----------|---------------|
| <2-1024>  | Limit number. |

**Default** 1024

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To set the maximum number of supplicants to 10 on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth max-supPLICANT 10
```

To reset the maximum number of supplicants to the default value on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth max-supPLICANT
```

To set the maximum number of supplicants to 10 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth max-supPLICANT 10
```

To reset the maximum number of supplicants to the default value on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth max-supPLICANT
```

## auth max-supPLICANT tagged-vlan

**Overview** Use this command to set the maximum number of supplicants (client devices) that can be authenticated on the selected port on tagged VLANs. Once this value is exceeded, further supplicants will not be authenticated on tagged VLANs on that port.

This command is useful for preventing unwanted supplicants from connecting to the network when a host (e.g. a PC) connects to an AlliedWare Plus NAS via an IP phone. For more information and a step-by-step configuration example, see the "Limit the number of supplicants when connecting via an IP phone" section of the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

Use the **no** variant of this command to reset the maximum number of supplicants on tagged VLANs to the default.

**Syntax** `auth max-supPLICANT tagged-vlan <0-1024>`  
`no auth max-supPLICANT tagged-vlan <0-1024>`

**Default** 1024

**Mode** Interface Configuration for a switch port; or Authentication Profile mode.

**Examples** To set the maximum number of supplicants on tagged VLANs on interface port1.0.2 to 1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth max-supPLICANT tagged-vlan 1
```

To reset the maximum number of supplicants on tagged VLANs on interface port1.0.2 to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth max-supPLICANT tagged-vlan
```

To set the maximum number of supplicants on tagged VLANs on authentication profile 'accounts' to 1, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile accounts
awplus(config-auth-profile)# auth max-supPLICANT tagged-vlan 1
```

To reset the maximum number of supplicants on tagged VLANs on authentication profile 'accounts' to the default value, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile accounts
awplus(config-auth-profile)# no auth max-supPLICANT tagged-vlan
```

**Related commands** **auth max-suppliant**  
**auth max-suppliant untagged-vlan**

**Command changes** Version 5.5.2-1.1: command added

# auth max-suppliant untagged-vlan

**Overview** Use this command to set the maximum number of supplicants (client devices) that can be authenticated on the selected port on untagged VLANs. Once this value is exceeded, further supplicants will not be authenticated on untagged VLANs on that port.

This command is useful for preventing unwanted supplicants from connecting to the network when a host (e.g. a PC) connects to an AlliedWare Plus NAS via an IP phone. For more information and a step-by-step configuration example, see the "Limit the number of supplicants when connecting via an IP phone" section of the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

Use the **no** variant of this command to reset the maximum number of supplicants on untagged VLANs to the default.

**Syntax** `auth max-suppliant untagged-vlan <0-1024>`  
`no auth max-suppliant untagged-vlan <0-1024>`

**Default** 1024

**Mode** Interface Configuration for a switch port; or Authentication Profile mode.

**Examples** To set the maximum number of supplicants on untagged VLANs on interface port1.0.2 to 1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth max-supPLICant untagged-vlan 1
```

To reset the maximum number of supplicants on untagged VLANs on interface port1.0.2 to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth max-supPLICant untagged-vlan
```

To set the maximum number of supplicants on untagged VLANs on authentication profile 'accounts' to 1, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile accounts
awplus(config-auth-profile)# auth max-supPLICant untagged-vlan 1
```

To reset the maximum number of supplicants on untagged VLANs on authentication profile 'accounts' to the default value, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile accounts
awplus(config-auth-profile)# no auth max-supPLICant untagged-vlan
```

**Related commands** [auth max-supPLICant](#)  
[auth max-supPLICant tagged-vlan](#)

**Command changes** Version 5.5.2-1.1: command added

## auth multi-vlan-session

**Overview** Use this command to enable packet forwarding on multiple VLANs for an authenticated supplicant attached to a trunked (tagged VLAN) port.

By default, AlliedWare Plus only allows packet forwarding on the VLAN that a device was authenticated on. This command enables packet forwarding to the attached device on any VLAN configured on the switchport. After the device authenticates it will have access to all VLANs configured on the switchport.

Use the **no** variant of this command to disable packet forwarding on multiple VLANs for an authenticated supplicant.

**Syntax** `auth multi-vlan-session`  
`no auth multi-vlan-session`

**Default** By default, **multi-vlan-session** is disabled.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Example** To allow a client attached to port1.0.2 to access all VLANs configured on the AlliedWare Plus device, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode trunk
awplus(config-if)# switchport trunk allowed vlan all
awplus(config-if)# auth host-mode multi-supplicant
awplus(config-if)# auth multi-vlan-session
```

To disable **multi-vlan-session** on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth multi-vlan-session
```

**Related commands**

- auth-mac enable**
- auth-web enable**
- dot1x port-control**
- show auth interface**
- show dot1x interface**

**Command changes** Version 5.4.8-1.1: command added  
Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

## auth priority

**Overview** Use this command to enable authentication priority on an interface. This sets the tri-authentication order of priority for MAC, 802.1X, and web-based authentication. If tri-authentication is not configured on the interface then this command has no effect.

You specify the authentication methods in order of priority. The first method in the list has the highest priority, the second method has the second highest priority, and the third method has the lowest priority. Any methods not specified will have the lowest priority.

Use the **no** variant of this command to disable authentication priority.

**Syntax** `auth priority {[auth-mac] [dot1x] [auth-web]}`  
`no auth priority`

| Parameter | Description                            |
|-----------|----------------------------------------|
| auth-mac  | Set MAC authentication priority.       |
| dot1x     | Set 802.1X authentication priority.    |
| auth-web  | Set web-based authentication priority. |

**Default** Authentication priority is not set.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** Before using this command you must correctly configure tri-authentication on the interface. Tri-authentication is when multiple authentication methods (MAC, 802.1X, and/or web-based) are configured on the same interface. With tri-authentication, a supplicant is authorized to use the network as soon as they are successfully authenticated by any of the configured authentication methods.

When authentication priority is not set, once a supplicant is authenticated any future attempts to authenticate are ignored. When, however, authentication priority is set, and a higher priority authentication attempt is made by the supplicant, a new authentication process starts. The supplicant will then be authorized, or unauthorized, based on the result of this new authentication attempt.

**Example** To configure 802.1X authentication to have a higher priority than MAC authentication on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode access
awplus(config-if)# auth-mac enable
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth priority dot1x auth-mac
```

To disable authentication priority on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth priority
```

To configure 802.1X authentication to have a higher priority than MAC authentication on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-if)# switchport mode access
awplus(config-if)# auth-mac enable
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth priority dot1x auth-mac
```

**Related commands**

- auth profile (interface)**
- auth-mac enable**
- auth-web enable**
- dot1x port-control**

**Command changes** Version 5.5.0-2.1: command added

## auth profile (global)

**Overview** Use this command to enter port authentication profile mode and configure a port authentication profile.

If the specified profile does not exist a new authentication profile is created with the name provided.

Use the **no** variant of this command to delete the specified port authentication profile.

**Syntax** `auth profile <profile-name>`  
`no auth profile <profile-name>`

| Parameter                         | Description                                 |
|-----------------------------------|---------------------------------------------|
| <code>&lt;profile-name&gt;</code> | Name of the profile to create or configure. |

**Default** No port authentication profiles are created by default.

**Mode** Global Configuration

**Usage** A port authentication profile is a configuration object that aggregates multiple port authentication commands. These profiles are attached or detached from an interface using the **auth profile (interface)** command.

**Example** To create a new authentication profile 'student', use the following commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)#
```

To delete an authentication profile 'student', use the following commands:

```
awplus# configure terminal
awplus(config)# no auth profile student
```

**Related commands** **auth profile (interface)**  
**description (auth-profile)**

## auth profile (interface)

**Overview** Use this command to attach a port authentication profile to the current interface.

Use the **no** variant of this command to detach a port authentication profile from the current interface.

**Syntax** `auth profile <profile-name>`  
`no auth profile <profile-name>`

| Parameter                         | Description                                                 |
|-----------------------------------|-------------------------------------------------------------|
| <code>&lt;profile-name&gt;</code> | The name of the profile to attach to the current interface. |

**Default** No profile is attached by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage** This command attaches an authentication profile, that was created using the **auth profile (global)** command, to a static channel, a dynamic (LACP) channel group, or a switch port.

You can only attach one profile to an interface at a time. Use the **no** variant of the command to detach a profile before attempting to attach another one.

**Example** To attach the authentication profile 'student' to port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth profile student
```

To detach the authentication profile 'student' from port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth profile student
```

**Related commands** **auth profile (global)**

# auth reauthentication

**Overview** Use this command to enable re-authentication on the interface specified in the Interface mode, which may be a static channel group (or static aggregator) or a dynamic (or LACP) channel group or a switch port.

Use the **no** variant of this command to disable reauthentication on the interface.

**Syntax** `auth reauthentication`  
`no auth reauthentication`

**Default** Reauthentication of port authentication is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To enable reauthentication on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth reauthentication
```

To disable reauthentication on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth reauthentication
```

To enable reauthentication on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth reauthentication
```

**Related commands** [auth profile \(global\)](#)  
[show dot1x](#)  
[show dot1x interface](#)  
[show running-config](#)

# auth roaming disconnected

**Overview** This command allows a supplicant to move to another authenticating interface without reauthentication, even if the link is down for the interface that the supplicant is currently connected to.

You must enter the **auth roaming enable** command on both interfaces before using this command.

The **no** variant of this command disables roaming authentication on interfaces that are link-down, and forces a supplicant to be reauthenticated when moving between interfaces.

See the **AAA and Port Authentication Feature Overview and Configuration Guide** for further information about this feature.

**Syntax** auth roaming disconnected  
no auth roaming disconnected

**Default** By default, the authentication status for a roaming supplicant is deleted when an interface goes down, so supplicants must reauthenticate.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** Note that 802.1X port authentication, MAC-authentication, or Web-authentication must be configured before using this feature. The port that the supplicant is moving to must have the same authentication configuration as the port the supplicant is moving from.

Roaming Authentication cannot be enabled if DHCP snooping is enabled (**service dhcp-snooping** command), and vice versa.

**Examples** To allow supplicants to move from port1.0.2 without reauthentication even when the link is down, when using 802.1X authentication, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth roaming enable
awplus(config-if)# auth roaming disconnected
```

To require supplicants to reauthenticate when moving from port1.0.2 if the link is down, when using 802.1X authentication, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth roaming disconnected
```

To allow supplicants using authentication profile 'student' to move between ports without reauthentication even when the link is down, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth roaming disconnected
```

To require supplicants using authentication profile 'student' to reauthenticate when moving between ports if the link is down, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth roaming disconnected
```

**Related commands**

- auth roaming enable**
- auth-web enable**
- dot1x port-control**
- show auth interface**
- show dot1x interface**
- show running-config**

## auth roaming enable

**Overview** Use this command to allow a supplicant to move to another authenticating interface without reauthentication, providing the link is up for the interface that the supplicant is currently connected to.

The **no** variant of this command disables roaming authentication on an interface, and forces a supplicant to be reauthenticated when moving between interfaces.

See the [AAA and Port Authentication Feature Overview and Configuration Guide](#) for further information about this feature.

**Syntax** auth roaming enable  
no auth roaming enable

**Default** Roaming authentication is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** Note that 802.1X port authentication, MAC authentication, or web-based authentication must be configured before using this feature. The port that the supplicant is moving to must have the same authentication configuration as the port the supplicant is moving from.

This command only enables roaming authentication for links that are up. If you want roaming authentication on links that are down, you must also use the command [auth roaming disconnected](#).

Roaming Authentication cannot be enabled if DHCP snooping is enabled ([service dhcp-snooping](#) command), and vice versa.

**Examples** To enable roaming authentication for port1.0.4, when using auth-mac authentication, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# auth-mac enable
awplus(config-if)# auth roaming enable
```

To disable roaming authentication for port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# no auth roaming enable
```

To enable roaming authentication for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth roaming enable
```

# auth supplicant-ip

**Overview** Use this command to add a supplicant (client device) IP address on a given interface.

Use the **no** variant of this command to delete the supplicant IP address and reset other parameters to their default values. The IP address can be determined before authentication for auth-web clients only.

**Syntax** `auth supplicant-ip <ip-addr> [max-reauth-req <1-10>] [max-req <1-10>] [port-control {auto|force-authorized|force-unauthorized|skip-second-auth}] [quiet-period <1-65535>] [reauthentication] [reauth-period <1-4294967295>] [supp-timeout <1-65535>] [server-timeout <1-65535>]`  
`no auth supplicant-ip <ip-addr> [reauthentication]`

| Parameter                                       | Description                                                                                                                                                                                                                                                                                                                                |
|-------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ip-addr&gt;</code>                    | IP address of the supplicant entry in A.B.C.D/P format.                                                                                                                                                                                                                                                                                    |
| <code>max-reauth-req &lt;1-10&gt;</code>        | Number of reauthentication attempts before becoming unauthorized (default 2).                                                                                                                                                                                                                                                              |
| <code>max-req &lt;1-10&gt;</code>               | Number of times the device resends an EAP Request packet if that packet is lost between the authenticating device and the specified supplicant (default 2, which is 3 transmission attempts in total). If the supplicant does not respond to an EAP Request after this number of retries, the supplicant fails the authentication process. |
| <code>port-control</code>                       | Port control options:<br><b>auto:</b> Allow port client to negotiate authentication<br><b>force-authorized:</b> Force port state to authorized<br><b>force-unauthorized:</b> Force port state to unauthorized<br><b>skip-second-auth:</b> Skip second authentication step.                                                                 |
| <code>quiet-period &lt;1-65535&gt;</code>       | Quiet period in the HELD state in seconds (default 60 seconds).                                                                                                                                                                                                                                                                            |
| <code>reauthentication</code>                   | Enable reauthentication on a port.                                                                                                                                                                                                                                                                                                         |
| <code>reauth-period &lt;1-4294967295&gt;</code> | Seconds between reauthorization attempts (default 3600 seconds).                                                                                                                                                                                                                                                                           |
| <code>supp-timeout &lt;1-65535&gt;</code>       | Supplicant response timeout in seconds (default 30 seconds).                                                                                                                                                                                                                                                                               |
| <code>server-timeout &lt;1-65535&gt;</code>     | Authentication server response timeout in seconds (default 30 seconds).                                                                                                                                                                                                                                                                    |

**Default** No supplicant IP address for port authentication exists by default until first created with the **auth supplicant-ip** command. The parameter defaults are shown in the table above.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To add the supplicant IP address 192.168.10.0/24 to force authorized port control for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth supplicant-ip 192.168.10.0/24 port-
control force-authorized
```

To delete the supplicant IP address 192.168.10.0/24 for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth supplicant-ip 192.168.10.0/24
```

To disable reauthentication for the supplicant(s) IP address 192.168.10.0/24 for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth supplicant-ip 192.168.10.0/24
reauthentication
```

To add the supplicant IP address 192.168.10.0/24 to force authorized port control for auth profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth supplicant-ip 192.168.10.0/24
port-control force-authorized
```

**Command changes** Version 5.5.3-1.1: **max-req** parameter added

## auth supplicant-mac

**Overview** This command adds a supplicant (client device) MAC address or MAC mask on a given interface with the parameters as specified in the table below.

Use the **no** variant of this command to delete the supplicant MAC address and reset other parameters to their default values.

**Syntax** `auth supplicant-mac <mac-addr> [mask <mac-addr-mask>] [max-reauth-req <1-10>] [max-req <1-10>] [port-control {auto|force-authorized|force-unauthorized|skip-second-auth}] [quiet-period <1-65535>] [reauthentication] [reauth-period <1-4294967295>] [supp-timeout <1-65535>] [server-timeout <1-65535>]`  
`no auth supplicant-mac <mac-addr> [reauthentication]`

| Parameter                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;mac-addr&gt;</code>             | MAC (hardware) address of the supplicant entry in HHHH.HHHH.HHHH MAC address hexadecimal format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <code>mask &lt;mac-addr-mask&gt;</code>   | <p>A mask applied to MAC addresses in order to select only those addresses containing a specific string.</p> <p>The mask comprises a string of three (period separated) bytes, where each byte comprises four hexadecimal characters that will generally be either 1 or 0. When the mask is applied to a specific MAC address, a match is only required for characters that correspond to a 1 in the mask. Characters that correspond to a 0 in the mask are effectively ignored.</p> <p>In the examples section below, the mask ffff.ff00.0000 is applied for the MAC address 0000.5E00.0000. The applied mask will then match only those MAC addresses that begin with 0000.5E (in this case the OUI component). The remaining portion of the addresses (in this case the NIC component) will be ignored.</p> |
| <code>max-reauth-req &lt;1-10&gt;</code>  | Number of reauthentication attempts before becoming unauthorized (default 2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <code>max-req &lt;1-10&gt;</code>         | Number of times the device resends an EAP Request packet if that packet is lost between the authenticating device and the specified supplicant (default 2, which is 3 transmission attempts in total). If the supplicant does not respond to an EAP Request after this number of retries, the supplicant fails the authentication process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <code>port-control</code>                 | <p>Port control options:</p> <p><b>auto:</b> Allow port client to negotiate authentication</p> <p><b>force-authorized:</b> Force port state to authorized</p> <p><b>force-unauthorized:</b> Force port state to unauthorized</p> <p><b>skip-second-auth:</b> Skip second authentication step.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <code>quiet-period &lt;1-65535&gt;</code> | Quiet period in the HELD state in seconds (default 60 seconds).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Parameter                       | Description                                                             |
|---------------------------------|-------------------------------------------------------------------------|
| reauthentication                | Enable reauthentication on a port.                                      |
| reauth-period<br><1-4294967295> | Seconds between reauthorization attempts (default 3600 seconds).        |
| supp-timeout<br><1-65535>       | Supplicant response timeout in seconds (default 30 seconds).            |
| server-timeout<br><1-65535>     | Authentication server response timeout in seconds (default 30 seconds). |

**Default** No supplicant MAC address for port authentication exists by default until first created with the **auth supplicant-mac** command. The defaults for parameters are shown in the table above.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To add the supplicant MAC address 0000.5E00.5343 to force authorized port control for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth supplicant-mac 0000.5E00.5343 port-
control force-authorized
```

To apply the mask ffff.ff00.0000 in order to add any supplicant MAC addresses whose MAC address begins with 0000.5E, and then to force authorized port control for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth supplicant-mac 0000.5E00.0000 mask
ffff.ff00.0000 port-control force-authorized
```

To delete the supplicant MAC address 0000.5E00.5343 for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth supplicant-mac 0000.5E00.5343
```

To disable reauthentication for the supplicant MAC address 0000.5E00.5343 for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth supplicant-mac 0000.5E00.5343
reauthentication
```

To add the supplicant MAC address 0000.5E00.5343 to force authorized port control for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth supplicant-mac 0000.5E00.5343
port-control force-authorized
```

To delete the supplicant MAC address 0000.5E00.5343 for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth supplicant-mac
0000.5E00.5343
```

**Command changes** Version 5.5.3-1.1: **max-req** parameter added

# auth timeout connect-timeout

**Overview** Use this command to set the connect-timeout period for the interface.

Use the **no** variant of this command to reset the connect-timeout period to the default.

**Syntax** `auth timeout connect-timeout <1-65535>`  
`no auth timeout connect-timeout`

| Parameter | Description                                        |
|-----------|----------------------------------------------------|
| <1-65535> | Specifies the connect-timeout period (in seconds). |

**Default** The connect-timeout default is 30 seconds.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** This command is used for MAC and web authentication. If the connect-timeout has lapsed and the supplicant has the state **connecting**, then the supplicant is deleted. When **auth-web-server session-keep** or **auth two-step enable** is enabled, we recommend you configure a longer connect-timeout period.

**Examples** To set the connect-timeout period to 3600 seconds for port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth timeout connect-timeout 3600
```

To reset the connect-timeout period to the default (30 seconds) for port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth timeout connect-timeout
```

To set the connect-timeout period to 3600 seconds for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth timeout connect-timeout 3600
```

# auth timeout quiet-period

**Overview** Use this command to set a time period for which another authentication request is not accepted on a given interface, after an authentication request has failed.

Use the **no** variant of this command to reset the quiet period to the default.

**Syntax** `auth timeout quiet-period <1-65535>`  
`no auth timeout quiet-period`

| Parameter                    | Description                              |
|------------------------------|------------------------------------------|
| <code>&lt;1-65535&gt;</code> | Specifies the quiet period (in seconds). |

**Default** The quiet period for port authentication is 60 seconds.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To set the quiet period to 10 seconds for interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth timeout quiet-period 10
```

To reset the quiet period to the default (60 seconds) for interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth timeout quiet-period
```

To set the quiet period to 10 seconds for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth timeout quiet-period 10
```

**Related commands** [auth profile \(global\)](#)

## auth timeout reauth-period

**Overview** Use this command to set the timer for reauthentication on a given interface. The re-authentication for the supplicant (client device) is executed at this timeout. The timeout is only applied if the **auth reauthentication** command is applied.

Use the **no** variant of this command to reset the **reauth-period** parameter to the default (3600 seconds).

**Syntax** auth timeout reauth-period <1-4294967295>  
no auth timeout reauth-period

| Parameter      | Description                                       |
|----------------|---------------------------------------------------|
| <1-4294967295> | The reauthentication timeout period (in seconds). |

**Default** The default reauthentication period for port authentication is 3600 seconds, when reauthentication is enabled on the port.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To set the reauthentication period to 1 day for interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth timeout reauth-period 86400
```

To reset the reauthentication period to the default (3600 seconds) for interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth timeout reauth-period
```

To set the reauthentication period to 1 day for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth timeout reauth-period 86400
```

To reset the reauthentication period to the default (3600 seconds) for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth timeout reauth-period
```

# auth timeout server-timeout

**Overview** Use this command to set the timeout for the waiting response from the RADIUS server on a given interface.

Use the **no** variant of this command to reset the server-timeout to the default (30 seconds).

**Syntax** `auth timeout server-timeout <1-65535>`  
`no auth timeout server-timeout`

| Parameter                    | Description                         |
|------------------------------|-------------------------------------|
| <code>&lt;1-65535&gt;</code> | Server timeout period (in seconds). |

**Default** The server timeout for port authentication is 30 seconds.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To set the server timeout to 120 seconds for interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth timeout server-timeout 120
```

To set the server timeout to the default (30 seconds) for interface port1.0.2 use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth timeout server-timeout
```

To set the server timeout to 120 seconds for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth timeout server-timeout 120
```

To set the server timeout to the default (30 seconds) for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth timeout server-timeout
```

# auth timeout supp-timeout

**Overview** This command sets the timeout of the waiting response from the supplicant (client device) on a given interface.

The **no** variant of this command resets the supplicant timeout to the default (30 seconds).

**Syntax** `auth timeout supp-timeout <1-65535>`  
`no auth timeout supp-timeout`

| Parameter                    | Description                                 |
|------------------------------|---------------------------------------------|
| <code>&lt;1-65535&gt;</code> | The supplicant timeout period (in seconds). |

**Default** The supplicant timeout for port authentication is 30 seconds.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To set the supplicant timeout to 2 seconds for interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth timeout supp-timeout 2
```

To reset the supplicant timeout to the default (30 seconds) for interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth timeout supp-timeout
```

To set the supplicant timeout to 2 seconds for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth timeout supp-timeout 2
```

**Related commands** [auth profile \(global\)](#)  
[show dot1x](#)  
[show dot1x interface](#)  
[show running-config](#)

## auth vlan-restriction

**Overview** Use this command to restrict port authenticated supplicants on an interface to one per VLAN. This is useful, for example, if you have configured multiple supplicants on an interface but you want to restrict network access to a single IP phone and a single authorized workstation.

Use the **no** variant of this command to remove the single supplicant per VLAN restriction.

**Syntax** `auth vlan-restriction`  
`no auth vlan-restriction`

**Default** Not configured

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** This is a port authentication command, so you should first configure 802.1X, MAC, or web authentication. In addition, configure multi-supplicants on the interface using the **auth host-mode multi-supplicant** command.

This command works with both dynamic VLANs and static voice VLAN configurations.

**Examples** To restrict supplicants to a one per VLAN on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth vlan-restriction
```

To remove the one per VLAN supplicant restriction on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth vlan-restriction
```

**Related commands**

- show dot1x interface**
- switchport voice vlan**

**Command changes** Version 5.5.1-2.1: command added

## auth two-step enable

**Overview** Use this command to enable a two-step authentication feature on an interface. When this feature is enabled, the supplicant is authorized in a two-step process. If authentication succeeds, the supplicant becomes authenticated.

Use this command to apply the two-step authentication method based on 802.1X, MAC or web authentication.

Use the **no** variant of this command to disable the two-step authentication feature.

**Syntax** auth two-step enable  
no auth two-step enable

**Default** Two step authentication is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage** The single step authentication methods (either user or device authentication) have a potential security risk:

- an unauthorized user can access the network with an authorized device, or
- an authorized user can access the network with an unauthorized device.

Two-step authentication solves this problem by authenticating both the user and the device. The supplicant will only become authenticated if both these steps are successful. If the first authentication step fails, then the second step is not started.

**Examples** To enable the two step authentication feature, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth two-step enable
```

To disable the two step authentication feature, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth two-step enable
```

To enable MAC authentication followed by 802.1X authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode access
awplus(config-if)# auth-mac enable
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth dynamic-vlan-creation
awplus(config-if)# auth two-step enable
```

To enable MAC authentication followed by web authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode access
awplus(config-if)# auth-mac enable
awplus(config-if)# auth-web enable
awplus(config-if)# auth dynamic-vlan-creation
awplus(config-if)# auth two-step enable
```

To enable 802.1X authentication followed by web authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode access
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth-web enable
awplus(config-if)# auth dynamic-vlan-creation
awplus(config-if)# auth two-step enable
```

To enable the two step authentication feature for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth two-step enable
```

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

## auth two-step order

**Overview** Use this command to configure the order for two-step authentication. Two-step authentication and the relevant authentication methods must be enabled on the interface.

Use the **no** variant of this command to reset the authentication order to the default.

**Syntax** `auth two-step order auth-mac {dot1x|auth-web}`  
`auth two-step order dot1x {auth-mac|auth-web}`  
`no auth two-step order`

| Parameter | Description           |
|-----------|-----------------------|
| auth-mac  | MAC authentication    |
| dot1x     | 802.1X authentication |
| auth-web  | Web authentication    |

**Default** Order is determined by the authentication methods configured on the interface (see **Usage notes**).

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** The default authentication order depends on the combination of the authentication methods configured on the interface:

- If auth-mac is configured then auth-mac will be the first method.
- If auth-mac is **not** configured then dot1x will become the first method.
- If only two methods are configured then the remaining method becomes the second method.
- If all three methods are configured then the second method is chosen based on the packet type received (dot1x for an EAPOL packet and auth-web for an HTTP packet).

**Examples** To set the two-step authentication order on port1.0.1 for 802.1X authentication and then MAC authentication, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# switchport mode access
awplus(config-if)# auth-mac enable
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth two-step enable
awplus(config-if)# auth two-step order dot1x auth-mac
```

To reset the two-step authentication order back to the default, which would be MAC authentication then 802.1X authentication if configured as above, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no auth two-step order
```

**Related commands**

- auth two-step enable**
- auth-mac enable**
- auth-web enable**
- dot1x port-control**
- show auth interface**
- show auth supplicant**

**Command changes** Version 5.5.0-0.3: command added

# auth-mac accounting

**Overview** Use this command to override the **default** RADIUS accounting method for MAC-based authentication on an interface by allowing you to apply a user-defined named list.

Use the **no** variant of this command to remove the named list from the interface and apply the **default** method.

**Syntax** `auth-mac accounting {default|<list-name>}`  
`no auth-mac accounting`

| Parameter   | Description                              |
|-------------|------------------------------------------|
| default     | Apply the default accounting method list |
| <list-name> | Apply the user-defined named list        |

**Default** The **default** method list is applied to an interface by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Example** To apply the named list 'vlan10\_acct' on the vlan10 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# auth-mac accounting vlan10_acct
```

To remove the named list from the vlan10 interface and set the accounting method back to **default**, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no auth-mac accounting
```

**Related commands** [aaa accounting auth-mac](#)

**Command changes** Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# auth-mac authentication

**Overview** This command overrides the **default** MAC authentication method on an interface by allowing you to apply a user-defined named list.

Use the **no** variant of this command to remove the named list from the interface and apply the **default** method.

**Syntax** `auth-mac authentication {default|<list-name>}`  
`no auth-mac authentication`

| Parameter   | Description                                  |
|-------------|----------------------------------------------|
| default     | Apply the default authentication method list |
| <list-name> | Apply a user-defined named list              |

**Default** The **default** method list is applied to an interface by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Example** To apply the named list 'vlan10\_auth' on the vlan10 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# auth-mac authentication vlan10_auth
```

To remove the named list from the vlan10 interface and set the authentication method back to **default**, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no auth-mac authentication
```

**Related commands** [aaa authentication auth-mac](#)

**Command changes** Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# auth-mac enable

**Overview** This command enables MAC authentication on the interface specified in the Interface command mode.

Use the **no** variant of this command to disable MAC authentication on an interface.

**Syntax** auth-mac enable  
no auth-mac enable

**Default** MAC-Authentication is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** Enabling **spanning-tree edgeport** on ports after enabling MAC authentication avoids unnecessary re-authentication when the port state changes, which does not happen when spanning tree edgeport is enabled. Note that re-authentication is correct behavior without **spanning-tree edgeport** enabled.

Applying **switchport mode access** on ports is also good practice to set the ports to access mode with ingress filtering turned on, whenever ports for MAC authentication are in a VLAN.

If you attempt to change the authentication configuration on an interface that has threat protection quarantine configured, you will see the following error message:

% portx.x.x: Application Proxy quarantine configuration must be removed before port authentication is changed

Before changing the interface's authentication configuration you must either:

- remove the interface's threat protection configuration, or
- shut down the interface.

**Examples** To enable MAC authentication on interface port1.0.2 and enable spanning tree edgeport to avoid unnecessary re-authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth-mac enable
awplus(config-if)# spanning-tree edgeport
awplus(config-if)# switchport mode access
```

To disable MAC authentication on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth-mac enable
```

To enable MAC authentication on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-mac enable
```

**Related commands**

- auth profile (global)**
- show auth**
- show auth interface**
- show running-config**

**Command changes** Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

## auth-mac method

**Overview** This command sets the type of authentication method for MAC authentication that is used with RADIUS on the interface specified in the interface command mode.

The **no** variant of this command resets the authentication method used to the default method (PAP) as the RADIUS authentication method used by the MAC authentication.

**Syntax** `auth-mac method [eap-md5|pap]`  
`no auth-mac method`

| Parameter | Description                                  |
|-----------|----------------------------------------------|
| eap-md5   | Enable EAP-MD5 as the authentication method. |
| pap       | Enable PAP as the authentication method.     |

**Default** The MAC authentication method is PAP.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To set the MAC authentication method to PAP on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth-mac method pap
```

To set the MAC authentication method to the default on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth-mac method
```

To set the MAC authentication method to EAP-MD5 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-mac method eap-md5
```

**Related commands** **auth profile (global)**  
**show auth**  
**show auth interface**  
**show running-config**

**Command changes** Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# auth-mac password

**Overview** This command changes the password for MAC-based authentication.  
Use the **no** variant of this command to return the password to its default.

**Syntax** `auth-mac [encrypted] password <password>`  
`no auth-mac password`

| Parameter                     | Description                                                                                                                                                                                                       |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>auth-mac</code>         | MAC-based authentication                                                                                                                                                                                          |
| <code>encrypted</code>        | Specify an encrypted password                                                                                                                                                                                     |
| <code>password</code>         | Configure the password                                                                                                                                                                                            |
| <code>&lt;password&gt;</code> | The new password. Passwords can be up to 64 characters in length and can contain any printable characters except: <ul style="list-style-type: none"><li>• ?</li><li>• " (double quotes)</li><li>• space</li></ul> |

**Default** By default, the password is the MAC address of the supplicant.

**Mode** Global Configuration

**Usage notes** Changing the password increases the security of MAC-based authentication, because the default password is easy for an attacker to discover. This is particularly important if:

- some MAC-based supplicants on the network are intelligent devices, such as computers, and/or
- you are using two-step authentication (see the “Ensuring Authentication Methods Require Different Usernames and Passwords” section of the [AAA and Port Authentication Feature\\_Overview\\_and\\_Configuration\\_Guide](#)).

**Examples** To change the password to verySecurePassword, use the commands:

```
awplus# configure terminal
awplus(config)# auth-mac password verySecurePassword
```

**Related commands** [auth two-step enable](#)  
[show auth](#)

**Command changes** Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# auth-mac reauth-relearning

**Overview** This command sets the MAC address learning of the supplicant (client device) to re-learning for re-authentication on the interface specified in the interface command mode.

Use the **no** variant of this command to disable the auth-mac re-learning option.

**Syntax** auth-mac reauth-relearning  
no auth-mac reauth-relearning

**Default** Re-learning for port authentication is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To enable the re-authentication re-learning feature on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth-mac reauth-relearning
```

To disable the re-authentication re-learning feature on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth-mac reauth-relearning
```

To enable the re-authentication re-learning feature on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-mac reauth-relearning
```

**Related commands** [auth profile \(global\)](#)  
[show auth](#)  
[show auth interface](#)  
[show running-config](#)

**Command changes** Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# auth-mac static

**Overview** This command configures MAC authentication to use static entries in the FDB. Static entries persist in the FDB, even if there is no traffic flow from the supplicant.

When static FDB entries are configured, the **auth roaming disconnected** command is supported for MAC authentication. This command allows a supplicant to move to another authenticating interface without re-authentication.

Use the **no** variant of this command to revert to dynamic FDB entries.

**Syntax** `auth-mac static`  
`no auth-mac static`

**Default** By default MAC authentication supplicants are added to the FDB dynamically.

**Mode** Global Configuration

**Example** To configure MAC authentication to use static FDB entries, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-mac static
```

To configure MAC authentication to use dynamic FDB entries, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-mac static
```

**Related commands** **auth roaming disconnected**  
**show auth**  
**show dot1x**

**Command changes** Version 5.4.7-2.4: Command added  
Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

## auth-mac username

**Overview** Use this command to specify the format of the MAC address in the username and password field when a request for MAC-based authorization is sent to a RADIUS server.

**Syntax** `auth-mac username {ietf|unformatted} {lower-case|upper-case}`

| Parameter   | Description                                                                          |
|-------------|--------------------------------------------------------------------------------------|
| ietf        | The MAC address includes a hyphen between each 2 bytes. (Example: xx-xx-xx-xx-xx-xx) |
| unformatted | The MAC address does not include hyphens. (Example: xxxxxxxxxxxx)                    |
| lower-case  | The MAC address uses lower-case characters (a-f)                                     |
| upper-case  | The MAC address uses upper-case characters (A-F)                                     |

**Default** `auth-mac username ietf lower-case`

**Mode** Global Configuration

**Usage** This command is provided to allow other vendors', AlliedWare, and AlliedWare Plus switches to share the same format on the RADIUS server.

**Example** To configure the format of the MAC address in the username and password field to be changed to IETF and upper-case, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-mac username ietf upper-case
```

**Related commands** [auth-mac username](#)  
[show running-config](#)

**Command changes** Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# auth-web accounting

**Overview** This command overrides the default RADIUS accounting method for web-based authentication on an interface by allowing you to apply a user-defined named list.

Use the **no** variant of this command to remove the named list from the interface and apply the default method.

**Syntax** `auth-web accounting {default|<list-name>}`  
`no auth-web accounting`

| Parameter   | Description                              |
|-------------|------------------------------------------|
| default     | Apply the default accounting method list |
| <list-name> | Apply a named accounting method list     |

**Default** The **default** method list is applied to an interface by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Example** To apply the named list 'vlan10\_acct' on the vlan10 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# auth-web accounting vlan10_acct
```

To remove the named list from the vlan10 interface and set the accounting method back to default, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no auth-web accounting
```

**Related commands** [aaa accounting auth-web](#)

# auth-web authentication

**Overview** Use this command to override the default web-based authentication method on an interface by allowing you to apply a user-defined named list.

Use the **no** variant of this command to remove the named list from the interface and apply the default method.

**Syntax** `auth-web authentication {default|<list-name>}`  
`no auth-web authentication`

| Parameter   | Description                                  |
|-------------|----------------------------------------------|
| default     | Apply the default authentication method list |
| <list-name> | Apply the user-defined named list            |

**Default** The **default** method list is applied to an interface by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Example** To apply the named list 'vlan10\_auth' on the vlan10 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# auth-web authentication vlan10_auth
```

To remove the named list from the vlan10 interface and set the authentication method back to default, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no auth-web authentication
```

**Related commands** [aaa authentication auth-web](#)

# auth-web enable

**Overview** Use this command to enable web-based authentication in Interface mode on the interface specified.

Use the **no** variant of this command to apply its default.

**Syntax** auth-web enable  
no auth-web enable

**Default** Web authentication is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** Web-based authentication cannot be enabled if DHCP snooping is enabled by using the **service dhcp-snooping** command, and vice versa. You need to configure an IPv4 address for the VLAN interface on which web authentication is running.

If you attempt to change the authentication configuration on an interface that has threat protection quarantine configured, you will see the following error message:

```
% portx.x.x: Application Proxy quarantine configuration must be removed before port authentication is changed
```

Before changing the interface's authentication configuration you must either:

- remove the interface's threat protection configuration, or
- shut down the interface.

**Examples** To enable web authentication on static-channel-group 2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# static-channel-group 2
awplus(config-if)# exit
awplus(config)# interface sa2
awplus(config-if)# auth-web enable
```

To disable web authentication on static-channel-group 2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface sa2
awplus(config-if)# no auth-web enable
```

To enable web authentication on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-web enable
```

To disable web authentication on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth-web enable
```

**Related commands**

- auth profile (global)**
- show auth**
- show auth interface**
- show running-config**

## auth forward

**Overview** Use this command to enable the authentication packet forwarding feature on the interface specified. This command also enables ARP forwarding, and adds forwarded packets to the **tcp** or **udp** port number specified.

Use the **no** variant of this command to disable the specified packet forwarding feature on the interface.

**Syntax** `auth forward [<ip-address>|<ip-address/prefix-length>] {dns|tcp <1-65535>|udp <1-65535>}`

or

`auth forward {arp|dhcp|dns|tcp <1-65535>|udp <1-65535>}`

The **no** variants of this command are:

`no auth forward [<ip-address>|<ip-address/prefix-length>] {dns|tcp <1-65535>|udp <1-65535>}`

or

`no auth forward {arp|dhcp|dns|tcp <1-65535>|udp <1-65535>}`

| Parameter                                                       | Description                                                            |
|-----------------------------------------------------------------|------------------------------------------------------------------------|
| <code>&lt;ip-address&gt;&lt;ip-address/prefix-length&gt;</code> | The IP address or subnet on which the authentication is to be enabled. |
| <code>arp</code>                                                | Enable forwarding of ARP.                                              |
| <code>dhcp</code>                                               | Enable forwarding of DHCP (67/udp).                                    |
| <code>dns</code>                                                | Enable forwarding of DNS (53/udp).                                     |
| <code>tcp</code>                                                | Enable forwarding of TCP specified port number.                        |
| <code>&lt;1-65535&gt;</code>                                    | TCP Port number.                                                       |
| <code>udp</code>                                                | Enable forwarding of UDP specified port number.                        |
| <code>&lt;1-65535&gt;</code>                                    | UDP Port number.                                                       |

**Default** Packet forwarding for port authentication is enabled by default for “arp”, “dhcp” and “dns”.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** For more information about the *<ip-address>* parameter, and an example, see the “auth forward” section in the **Alliedware Plus Technical Tips and Tricks**.

**Examples** To enable the ARP forwarding feature on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth forward arp
```

To add TCP forwarding port 137 on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth forward tcp 137
```

To add the DNS Server IP address 192.168.1.10 on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode access
awplus(config-if)# auth-web enable
awplus(config-if)# auth dynamic-vlan-creation
awplus(config-if)# auth forward 192.168.1.10 dns
```

To disable the ARP forwarding feature on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth forward arp
```

To delete TCP forwarding port 137 on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth forward tcp 137
```

To delete all TCP forwarding on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth forward tcp
```

To enable the ARP forwarding feature on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth forward arp
```

To add TCP forwarding port 137 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth forward tcp 137
```

To disable the ARP forwarding feature on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth forward arp
```

To delete TCP forwarding port 137 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth forward tcp 137
```

To delete all TCP forwarding on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth forward tcp
```

**Command changes** Version 5.5.4-0.1: syntax changed from **auth-web forward** to **auth forward**

# auth-web idle-timeout enable

**Overview** Use this command to enable the idle-timeout for client of web authentication on the interface.

The **no** variant of this command to disable the idle-timeout for client of web authentication on the interface.

**Syntax** auth-web idle-timeout enable  
no auth-web idle-timeout enable

**Default** The idle-timeout is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Example** To enable the idle-timeout on an interface, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config)# auth-web enable
awplus(config-if)# auth-web idle-timeout enable
```

To disable the idle-timeout on an interface, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth-web idle-timeout enable
```

**Related commands** [auth-web enable](#)  
[auth-web idle-timeout timeout](#)

# auth-web idle-timeout timeout

**Overview** Use this command to set the timeout value for web authentication client in seconds. The client will be unauthorized when it does not have any activity for a period that exceeds the timeout value.

The **no** variant of this command sets the timeout value to the default setting, 3600 seconds.

**Syntax** `auth-web idle-timeout timeout <420-86400>`  
`no auth-web idle-timeout timeout`

| Parameter                      | Description      |
|--------------------------------|------------------|
| <code>&lt;420-86400&gt;</code> | Time in seconds. |

**Default** The timeout is 3600 seconds by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Example** To set 30 minutes as the idle-timeout, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth-web idle-timeout timeout 1800
```

To return the idle-timeout to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth-web idle-timeout timeout
```

**Related commands** [auth-web enable](#)  
[auth-web idle-timeout enable](#)

## auth-web max-auth-fail

**Overview** Use this command to set the number of authentication failures allowed before rejecting further authentication requests. When the supplicant (client device) fails more than the specified number of times, then login requests are refused during the quiet period.

Use the **no** variant of this command to reset the maximum number of authentication failures to the default.

**Syntax** auth-web max-auth-fail <0-10>  
no auth-web max-auth-fail

| Parameter | Description                                                                              |
|-----------|------------------------------------------------------------------------------------------|
| <0-10>    | The maximum number of authentication failures allowed before login requests are refused. |

**Default** The maximum number of authentication failures is set to 3.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To set the lock count to 5 on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth-web max-auth-fail 5
```

To set the lock count to the default on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth-web max-auth-fail
```

To set the lock count to 5 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-web max-auth-fail 5
```

To set the lock count to the default on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth-web max-auth-fail
```

**Related commands**

- auth profile (global)**
- auth timeout quiet-period**
- show auth**
- show auth interface**
- show running-config**

## auth-web method

**Overview** Use this command to set the web authentication access method that is used with RADIUS on the interface specified.

Use the **no** variant of this command to set the authentication method to PAP for the interface specified when web authentication is also used with the RADIUS authentication method.

**Syntax** `auth-web method {eap-md5|pap}`  
`no auth-web method`

| Parameter | Description                                  |
|-----------|----------------------------------------------|
| eap-md5   | Enable EAP-MD5 as the authentication method. |
| pap       | Enable PAP as the authentication method.     |

**Default** The web authentication method is set to PAP by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Example** To set the web authentication method to EAP-MD5 on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth-web method eap-md5
```

To set the web authentication method to EAP-MD5 for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-web method eap-md5
```

**Related commands** [auth profile \(global\)](#)  
[show auth](#)  
[show auth interface](#)  
[show running-config](#)

# auth-web-server blocking-mode

**Overview** Use this command to enable blocking mode for the Web-Authentication server. The blocking mode displays an authentication success or failure screen immediately from the response result from a RADIUS server.

Use the **no** variant of this command to disable blocking mode for the Web-Authentication server.

**Syntax** `auth-web-server blocking-mode`  
`no auth-web-server blocking-mode`

**Default** By default, blocking mode is disabled for the Web-Authentication server.

**Mode** Global Configuration

**Example** To enable blocking mode for the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server blocking-mode
```

To disable blocking mode for the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server blocking-mode
```

**Related commands** [auth-web-server redirect-delay-time](#)  
[show auth-web-server](#)  
[show running-config](#)

# auth-web-server dhcp ipaddress

**Overview** Use this command to assign an IP address and enable the DHCP service on the Web-Authentication server for supplicants (client devices).

Use the **no** variant of this command to remove an IP address and disable the DHCP service on the Web-Authentication server for supplicants.

**Syntax** `auth-web-server dhcp ipaddress <ip-address/prefix-length>`  
`no auth-web-server dhcp ipaddress`

| Parameter                                     | Description                                                                                                        |
|-----------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ip-address/prefix-length&gt;</code> | The IPv4 address and prefix length assigned for the DHCP service on the Web-Authentication server for supplicants. |

**Default** No IP address for the Web-Authentication server is set by default.

**Mode** Global Configuration

**Usage notes** See the [AAA and Port Authentication Feature Overview and Configuration Guide](#) for information about:

- using DHCP with web authentication, and
- restrictions regarding combinations of authentication enhancements working together

You cannot use the IPv4 address assigned to the device's interface as the Web-Authentication server address.

Note that this Web Authentication virtual DHCP server is a limited implementation of the DHCP protocol. Separation of IP addresses depends on allocating addresses incrementally and a short lease time. In a situation where a supplicant remains permanently connected but does not authenticate, there is a risk of re-allocation of the same IP address once the server has rolled through the entire address range.

**Examples** To assign the IP address 10.0.0.1 to the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server dhcp ipaddress 10.0.0.1/8
```

To remove an IP address on the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server dhcp ipaddress
```

**Related** **auth-web-server dhcp lease**  
**commands** **show auth-web-server**  
**show running-config**

# auth-web-server dhcp lease

**Overview** Use this command to set the DHCP lease time for supplicants (client devices) using the DHCP service on the Web-Authentication server.

Use the **no** variant of this command to reset to the default DHCP lease time for supplicants using the DHCP service on the Web-Authentication server.

**Syntax** `auth-web-server dhcp lease <20-60>`  
`no auth-web-server dhcp lease`

| Parameter | Description                                                                                          |
|-----------|------------------------------------------------------------------------------------------------------|
| <20-60>   | DHCP lease time for supplicants using the DHCP service on the Web- Authentication server in seconds. |

**Default** The default DHCP lease time for supplicants using the DHCP service on the Web- Authentication server is set to 30 seconds.

**Mode** Global Configuration

**Usage notes** See the [AAA and Port Authentication Feature Overview and Configuration Guide](#) for information about:

- using DHCP with web authentication, and
- restrictions regarding combinations of authentication enhancements working together

**Examples** To set the DHCP lease time to 1 minute for supplicants using the DHCP service on the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server dhcp lease 60
```

To reset the DHCP lease time to the default setting (30 seconds) for supplicants using the DHCP service on the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server dhcp lease
```

**Validation Commands** [show running-config](#)

**Related commands** [show auth-web-server](#)  
[auth-web-server dhcp ipaddress](#)

# auth-web-server dhcp-wpad-option

**Overview** This command sets the DHCP WPAD (Web Proxy Auto-Discovery) option for the Web-Authentication temporary DHCP service.

For more information and examples, see the “Web Auth Proxy” section in the [AlliedWare Plus Technical Tips and Tricks](#).

Use the **no** variant of this command to disable the DHCP WPAD function.

**Syntax** `auth-web-server dhcp wpad-option <url>`  
`no auth-web-server dhcp wpad-option`

| Parameter | Description                               |
|-----------|-------------------------------------------|
| <url>     | URL to the server which gets a .pac file. |

**Default** The Web-Authentication server DHCP WPAD option is not set.

**Mode** Global Configuration

**Usage notes** If the supplicant is configured to use WPAD, the supplicant’s web browser will use TCP port 80 as usual. Therefore, the packet can be intercepted by Web-Authentication as normal, and the Web-Authentication Login page can be sent. However, after authentication, the browser does not know where to get the WPAD file and so cannot access external web pages. The WPAD file is usually named proxy.pac file and tells the browser what web proxy to use.

Use this command to tell the supplicant where it can get this file from. The switch itself can be specified as the source for this file, and it can deliver it to the supplicant on request.

**Example** To specify that the proxy.pac file is found on the server at 192.168.1.100, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server dhcp wpad-option
http://192.168.1.100/proxy/proxy.pac
```

**Related commands** [show auth-web-server](#)

# auth-web-server host-name

**Overview** This command assigns a hostname to the web authentication server.

Use the **no** variant of this command to remove the hostname from the web authentication server.

**Syntax** `auth-web-server host-name <hostname>`  
`no auth-web-server host-name`

| Parameter                     | Description                |
|-------------------------------|----------------------------|
| <code>&lt;hostname&gt;</code> | URL string of the hostname |

**Default** The web authentication server has no hostname.

**Mode** Global Configuration

**Usage notes** When the web authentication server uses HTTPS protocol, the web browser will validate the certificate. If the certificate is invalid, the web page gives a warning message before displaying server content. However, the web page will not give warning message if the server has a hostname same as the one stored in the installed certificate.

**Examples** To set the auth.example.com as the hostname of the web authentication server, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server host-name auth.example.com
```

To remove hostname auth.example.com from the web authentication server, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server host-name
```

**Related commands** [aaa authentication auth-web](#)  
[auth-web enable](#)

# auth-web-server intercept-port

**Overview** This command specifies any additional TCP port numbers that the Web-Authentication server is to intercept.

Use the **no** variant of this command to stop intercepting the TCP port numbers.

**Syntax** `auth-web-server intercept-port {<1-65535>|any}`  
`no auth-web-server intercept-port {<1-65535>|any}`

| Parameter | Description               |
|-----------|---------------------------|
| <1-65535> | TCP port number.          |
| any       | Intercept all TCP packets |

**Default** No additional TCP port numbers are intercepted by default.

**Mode** Global Configuration

**Usage notes** If this command is not specified, AlliedWare Plus Web-Authentication intercepts the supplicant's initial TCP port 80 connection to a web page and sends it the Web-Authentication Login page. However, if the supplicant is configured to use a web proxy, then it will usually be using TCP port 8080 (or another user configured port number). In this case Web-Authentication cannot intercept the connection.

To overcome this limitation you can use this command to tell the switch which additional port it should intercept, and then send the Web-Authentication Login page to the supplicant.

When the web authentication switch is in a guest network, the switch does not know the proxy server's port number in the supplicant's proxy setting. To overcome this limitation, you can use the **any** option in this command to intercept all TCP packets.

When you use this command in conjunction with a proxy server configured in the web browser, you must add the proxy server's network as a 'No Proxy' network. You can specify 'No Proxy' networks in the proxy settings in your web browser. For more information, see the "Web Auth Proxy" section in the [Alliedware Plus Technical Tips and Tricks](#).

**Example** To additionally intercept port number 3128, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server intercept-port 3128
```

**Related** [show auth-web-server commands](#)

# auth-web-server ip-conflict-prefer-newer-supPLICANT

**Overview** Use this command to alter the behavior of a Network Access Server (NAS) when it detects a supplicant with a duplicate IP address.

The default behavior is for the NAS to not authorize the newer supplicant. This command allows it to authorize the newer supplicant and unauthorize the original supplicant.

This command applies to Web-based authentication supplicants only.

Use the **no** variant of this command to set the behavior back to default.

**Syntax** `auth-web-server ip-conflict-prefer-newer-supPLICANT`  
`no auth-web-server ip-conflict-prefer-newer-supPLICANT`

**Default** The default behavior is to not authorize the newer supplicant if the NAS detects a duplicate IP address.

**Mode** Global Configuration

**Usage notes** Allied Telesis recommends you investigate and resolve the root cause of the conflicting IP addresses.

**Example** To configure a NAS to authorize the newer supplicant, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ip-conflict-prefer-newer-supPLICANT
```

**Related commands** [auth-web enable](#)  
[show auth](#)

**Command changes** Version 5.5.2-0.1: command added

## auth-web-server ipaddress

**Overview** This command sets the IP address for the Web-Authentication server.

Use the **no** variant of this command to delete the IP address for the Web-Authentication server.

You cannot use the IPv4 address assigned to the device's interface as the Web-Authentication server address.

**Syntax** `auth-web-server ipaddress <ip-address>`  
`no auth-web-server ipaddress`

| Parameter                       | Description                                                            |
|---------------------------------|------------------------------------------------------------------------|
| <code>&lt;ip-address&gt;</code> | Web-Authentication server dotted decimal IP address in A.B.C.D format. |

**Default** The Web-Authentication server address on the system is not set by default.

**Mode** Global Configuration

**Examples** To set the IP address 10.0.0.1 to the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ipaddress 10.0.0.1
```

To delete the IP address from the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ipaddress
```

**Validation** `show auth`  
**Commands** `show auth-web-server`  
`show running-config`

# auth-web-server page language

**Overview** Use this command to set the presentation language of Web authentication pages. Titles and subtitles of Web authentication pages will be set accordingly. Note that presently only English or Japanese are offered.

Use the **no** variant of this command to set the presentation language of Web authentication pages to its default (English).

**Syntax** `auth-web-server page language {english|japanese}`  
`no auth-web-server page language`

| Parameter | Description                                         |
|-----------|-----------------------------------------------------|
| english   | Web authentication pages are presented in English.  |
| japanese  | Web authentication pages are presented in Japanese. |

**Default** Web authentication pages are presented in English by default.

**Mode** Global Configuration

**Examples** To set Japanese as the presentation language of Web authentication pages, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page language japanese
```

To set English as the presentation language of Web authentication pages, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page language english
```

To unset the presentation language of Web authentication pages and use English as the default presentation language, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page language
```

**Related commands** [auth-web-server page title](#)  
[auth-web-server page sub-title](#)  
[show auth-web-server page](#)

# auth-web-server login-url

**Overview** This command sets the web-authentication login page URL. This lets you replace the login page with your own page. See “Customising the Login Page” in the [AAA and Port Authentication Feature Overview and Configuration Guide](#) for details.

Use the **no** variant of this command to delete the URL.

**Syntax** `auth-web-server login-url <URL>`  
`no auth-web-server login-url`

| Parameter | Description        |
|-----------|--------------------|
| <URL>     | Set login page URL |

**Default** The built-in login page is set by default.

**Mode** Global Configuration

**Examples** To set `http://example.com/login.html` as the login page, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server login-url http://example.com/login.html
```

To unset the login page URL, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server login-url
```

**Related commands** [show running-config](#)

## auth-web-server page logo

**Overview** This command sets the type of logo that will be displayed on the web authentication page.

Use the **no** variant of this command to set the logo type to **auto**.

Note that if you need to customize the login page extensively, you can instead replace it with your own page. See “Customising the Login Page” in the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

**Syntax** auth-web-server page logo {auto|default|hidden}  
no auth-web-server page logo

| Parameter | Description                                                              |
|-----------|--------------------------------------------------------------------------|
| auto      | Display the custom logo if installed; otherwise display the default logo |
| default   | Display the default logo                                                 |
| hidden    | Hide the logo                                                            |

**Default** Logo type is **auto** by default.

**Mode** Global Configuration

**Examples** To display the default logo with ignoring installed custom logo, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page logo default
```

To set back to the default logo type **auto**, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page logo
```

**Validation Commands** [show auth-web-server page](#)

# auth-web-server page sub-title

**Overview** This command sets the custom sub-title on the web authentication page.

Use the **no** variant of this command to reset the sub-title to its default.

Note that if you need to customize the login page extensively, you can instead replace it with your own page. See “Customising the Login Page” in the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

**Syntax** `auth-web-server page sub-title {hidden|text <sub-title>}`  
`no auth-web-server page sub-title`

| Parameter   | Description                  |
|-------------|------------------------------|
| hidden      | Hide the sub-title           |
| <sub-title> | Text string of the sub-title |

**Default** “Allied-Telesis” is displayed by default.

**Mode** Global Configuration

**Examples** To set the custom sub-title, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page sub-title text Web
Authentication
```

To hide the sub-title, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page sub-title hidden
```

To change back to the default title, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page sub-title
```

**Validation Commands** [show auth-web-server page](#)

# auth-web-server page success-message

**Overview** This command sets the success message on the web-authentication page.

Use the **no** variant of this command to remove the success message.

Note that if you need to customize the login page extensively, you can instead replace it with your own page. See “Customising the Login Page” in the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

**Syntax** auth-web-server page success-message text *<success-message>*  
no auth-web-server page success-message

| Parameter                      | Description                        |
|--------------------------------|------------------------------------|
| <i>&lt;success-message&gt;</i> | Text string of the success message |

**Default** No success message is set by default.

**Mode** Global Configuration

**Examples** To set the success message on the web-authentication page, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# auth-web-server page success-message text Your  
success message
```

To unset the success message on the web-authentication page, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no auth-web-server page success-message
```

**Validation Commands** [show auth-web-server page](#)

# auth-web-server page title

**Overview** This command sets the custom title on the web authentication page.

Use the **no** variant of this command to remove the custom title.

Note that if you need to customize the login page extensively, you can instead replace it with your own page. See “Customising the Login Page” in the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

**Syntax** auth-web-server page title {hidden|text <title>}  
no auth-web-server page title

| Parameter | Description              |
|-----------|--------------------------|
| hidden    | Hide the title           |
| <title>   | Text string of the title |

**Default** “Web Access Authentication Gateway” is displayed by default.

**Mode** Global Configuration

**Examples** To set the custom title on the web authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page title text Login
```

To hide the title on the web authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page title hidden
```

To unset the custom title on the web authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page title
```

**Validation Commands** [show auth-web-server page](#)

# auth-web-server page welcome-message

**Overview** This command sets the welcome message on the web-authentication login page.

Use the **no** variant of this command to remove the welcome message.

Note that if you need to customize the login page extensively, you can instead replace it with your own page. See “Customising the Login Page” in the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

**Syntax** auth-web-server page welcome-message text <welcome-message>  
no auth-web-server page welcome-message

| Parameter         | Description                        |
|-------------------|------------------------------------|
| <welcome-message> | Text string of the welcome message |

**Default** No welcome message is set by default.

**Mode** Global Configuration

**Examples** To set the welcome message on the web-authentication page, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# auth-web-server page welcome-message text Your  
welcome message
```

To remove the welcome message on the web-authentication page, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no auth-web-server page welcome-message
```

**Validation Commands** [show auth-web-server page](#)

# auth-web-server ping-poll enable

**Overview** This command enables the ping polling to the supplicant (client device) that is authenticated by Web-Authentication.

The **no** variant of this command disables the ping polling to the supplicant that is authenticated by Web-Authentication.

**Syntax** auth-web-server ping-poll enable  
no auth-web-server ping-poll enable

**Default** The ping polling feature for Web-Authentication is disabled by default.

**Mode** Global Configuration

**Examples** To enable the ping polling feature for Web-Authentication, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# auth-web-server ping-poll enable
```

To disable the ping polling feature for Web-Authentication, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# no auth-web-server ping-poll enable
```

**Validation Commands** **show auth**  
**show auth-web-server**  
**show running-config**

# auth-web-server ping-poll failcount

**Overview** This command sets a fail count for the ping polling feature when used with Web-Authentication. The **failcount** parameter specifies the number of unanswered pings. A supplicant (client device) is logged off when the number of unanswered pings are greater than the failcount set with this command.

Use the **no** variant of this command to resets the fail count for the ping polling feature to the default (5 pings).

**Syntax** `auth-web-server ping-poll failcount <1-100>`  
`no auth-web-server ping-poll failcount`

| Parameter                  | Description |
|----------------------------|-------------|
| <code>&lt;1-100&gt;</code> | Count.      |

**Default** The default failcount for ping polling is 5 pings.

**Mode** Global Configuration

**Examples** To set the failcount of ping polling to 10 pings, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# auth-web-server ping-poll failcount 10
```

To set the failcount of ping polling to default, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# no auth-web-server ping-poll failcount
```

**Validation Commands** `show auth`  
`show auth-web-server`  
`show running-config`

# auth-web-server ping-poll interval

**Overview** This command is used to change the ping poll interval. The interval specifies the time period between pings when the supplicant (client device) is reachable.

Use the **no** variant of this command to reset to the default period for ping polling (30 seconds).

**Syntax** auth-web-server ping-poll interval <1-65535>  
no auth-web-server ping-poll interval

| Parameter | Description |
|-----------|-------------|
| <1-65535> | Seconds.    |

**Default** The interval for ping polling is 30 seconds by default.

**Mode** Global Configuration

**Examples** To set the interval of ping polling to 60 seconds, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# auth-web-server ping-poll interval 60
```

To set the interval of ping polling to the default (30 seconds), use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# no auth-web-server ping-poll interval
```

**Validation Commands** **show auth**  
**show auth-web-server**  
**show running-config**

# auth-web-server ping-poll reauth-timer-refresh

**Overview** This command modifies the **reauth-timer-refresh** parameter for the Web-Authentication feature. The **reauth-timer-refresh** parameter specifies whether a re-authentication timer is reset and when the response from a supplicant (a client device) is received.

Use the **no** variant of this command to reset the **reauth-timer-refresh** parameter to the default setting (disabled).

**Syntax** auth-web-server ping-poll reauth-timer-refresh  
no auth-web-server ping-poll reauth-timer-refresh

**Default** The reauth-timer-refresh parameter is disabled by default.

**Mode** Global Configuration

**Examples** To enable the reauth-timer-refresh timer, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll reauth-timer-refresh
```

To disable the reauth-timer-refresh timer, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll reauth-timer-refresh
```

**Validation Commands** **show auth**  
**show auth-web-server**  
**show running-config**

# auth-web-server ping-poll timeout

**Overview** This command modifies the ping poll **timeout** parameter for the Web-Authentication feature. The **timeout** parameter specifies the time in seconds to wait for a response to a ping packet.

Use the **no** variant of this command to reset the timeout of ping polling to the default (1 second).

**Syntax** `auth-web-server ping-poll timeout <1-30>`  
`no auth-web-server ping-poll timeout`

| Parameter | Description |
|-----------|-------------|
| <1-30>    | Seconds.    |

**Default** The default timeout for ping polling is 1 second.

**Mode** Global Configuration

**Examples** To set the timeout of ping polling to 2 seconds, use the command:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll timeout 2
```

To set the timeout of ping polling to the default (1 second), use the command:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll timeout
```

**Validation** `show auth`  
**Commands** `show auth-web-server`  
`show running-config`

## auth-web-server ping-poll type

**Overview** Use this command to set the type of polling used to check that a web authenticated supplicant is still connected. The polling can be done using either ICMP (ping), or ARP messages.

If there is a firewall between an authenticating server and a supplicant, it may block ICMP traffic. If this occurs try changing to ARP polling.

Polling only starts when ping-polling is enabled and the supplicant has been authorized.

Use the **no** variant of this command to set the default polling type of ICMP (ping).

**Syntax** auth-web-server ping-poll type {arp|ping}  
no auth-web-server ping-poll type

| Parameter       | Description                                      |
|-----------------|--------------------------------------------------|
| auth-web-server | Web authentication server configuration commands |
| arp             | Enable polling via ARP                           |
| ping            | Enable polling via ICMP (ping)                   |

**Default** ICMP

**Mode** Global Configuration

**Examples** To set the polling type to ARP, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll enable
awplus(config)# auth-web-server ping-poll type arp
```

To set the polling type to ICMP, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll enable
awplus(config)# auth-web-server ping-poll type ping
```

To set the polling type to the default, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll type
```

**Related commands** **auth-web-server ping-poll enable**  
**auth-web-server ping-poll failcount**  
**auth-web-server ping-poll interval**  
**auth-web-server ping-poll reauth-timer-refresh**  
**auth-web-server ping-poll timeout**  
**show auth-web-server**

**Command changes** Version 5.5.1-1.1: command added

# auth-web-server port

**Overview** This command sets the HTTP port number for the Web-Authentication server.

Use the **no** variant of this command to reset the HTTP port number to the default (80).

**Syntax** `auth-web-server port <port-number>`  
`no auth-web-server port`

| Parameter                        | Description                                                                               |
|----------------------------------|-------------------------------------------------------------------------------------------|
| <code>&lt;port-number&gt;</code> | Set the local Web-Authentication server port within the TCP port number range 1 to 65535. |

**Default** The Web-Authentication server HTTP port number is set to 80 by default.

**Mode** Global Configuration

**Examples** To set the HTTP port number 8080 for the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server port 8080
```

To reset to the default HTTP port number 80 for the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server port
```

**Validation Commands** `show auth`  
`show auth-web-server`  
`show running-config`

# auth-web-server redirect-delay-time

**Overview** Use this command to set the delay time in seconds before redirecting the supplicant to a specified URL when the supplicant is authorized.

Use the variant **no** to reset the delay time set previously.

**Syntax** `auth-web-server redirect-delay-time <5-60>`  
`no auth-web-server redirect-delay-time`

| Parameter                        | Description                                                                              |
|----------------------------------|------------------------------------------------------------------------------------------|
| <code>redirect-delay-time</code> | Set the delay time before jumping to a specified URL after the supplicant is authorized. |
| <code>&lt;5-60&gt;</code>        | The time in seconds.                                                                     |

**Default** The default redirect delay time is 5 seconds.

**Mode** Global Configuration

**Examples** To set the delay time to 60 seconds for the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server redirect-delay-time 60
```

To reset the delay time, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server redirect-delay-time
```

**Related commands** [auth-web-server blocking-mode](#)  
[auth-web-server redirect-url](#)  
[show auth-web-server](#)  
[show running-config](#)

# auth-web-server redirect-url

**Overview** This command sets a URL for supplicant (client device) authentication. When a supplicant is authorized it will be automatically redirected to the specified URL. Note that if the http redirect feature is used then this command is ignored.

Use the **no** variant of this command to delete the URL string set previously.

**Syntax** auth-web-server redirect-url <url>  
no auth-web-server redirect-url

| Parameter | Description                           |
|-----------|---------------------------------------|
| <url>     | URL (hostname or dotted IP notation). |

**Default** The redirect URL for the Web-Authentication server feature is not set by default (null).

**Mode** Global Configuration

**Examples** To enable and set redirect a URL string www.alliedtelesis.com for the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server redirect-url http://
www.alliedtelesis.com
```

To delete a redirect URL string, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server redirect-url
```

**Related commands** [auth-web-server redirect-delay-time](#)  
[show auth](#)  
[show auth-web-server](#)  
[show running-config](#)

# auth-web-server session-keep

**Overview** This command enables the session-keep feature to jump to the original URL after being authorized by Web-Authentication.

Use the **no** variant of this command to disable the session keep feature.

**Syntax** `auth-web-server session-keep`  
`no auth-web-server session-keep`

**Default** The session-keep feature is disabled by default.

**Mode** Global Configuration

**Usage notes** This function doesn't ensure to keep session information in all cases. Authenticated supplicant may be redirected to unexpected page when session-keep is enabled. This issue occurred by supplicant sending HTTP packets automatically after authentication page is displayed and the URL is written.

**Examples** To enable the session-keep feature, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server session-keep
```

To disable the session-keep feature, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server session-keep
```

**Validation** `show auth`  
**Commands** `show auth-web-server`  
`show running-config`

## auth-web-server ssl

**Overview** This command enables HTTPS functionality for the Web-Authentication server feature.

Use the **no** variant of this command to disable HTTPS functionality for the Web-Authentication server.

**Syntax** `auth-web-server ssl`  
`no auth-web-server ssl`

**Default** HTTPS functionality for the Web-Authentication server feature is disabled by default.

**Mode** Global Configuration

**Examples** To enable HTTPS functionality for the Web-Authentication server feature, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ssl
```

To disable HTTPS functionality for the Web-Authentication server feature, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ssl
```

**Validation Commands** `show auth`  
`show auth-web-server`  
`show running-config`

# auth-web-server ssl intercept-port

**Overview** Use this command to register HTTPS intercept port numbers when the HTTPS server uses custom port number (not TCP port number 443).

Note that you need to use the **auth-web-server intercept-port** command to register HTTP intercept port numbers.

Use the **no** variant of this command to delete registered port number.

**Syntax** `auth-web-server ssl intercept-port <1-65535>`  
`no auth-web-server ssl intercept-port <1-65535>`

| Parameter                    | Description                                       |
|------------------------------|---------------------------------------------------|
| <code>&lt;1-65535&gt;</code> | TCP port number in the range from 1 through 65535 |

**Default** 443/TCP is registered by default.

**Mode** Global Configuration

**Examples** To register HTTPS port number 3128, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ssl intercept-port 3128
```

To delete HTTPS port number 3128, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ssl intercept-port 3128
```

**Validation Commands** **show auth-web-server**

**Related commands** **auth-web-server intercept-port**

# auth-web-server trustpoint

**Overview** Use this command to set the PKI trustpoint to use for secure web authentication communication to an AlliedWare Plus device.

Use the **no** variant of this command to revert to using the default trustpoint 'default-selfsigned'.

**Syntax** `auth-web-server trustpoint <trustpoint-name>`  
`no auth-web-server trustpoint`

| Parameter                            | Description        |
|--------------------------------------|--------------------|
| <code>&lt;trustpoint-name&gt;</code> | Name of trustpoint |

**Default** By default, web authentication uses the 'default-selfsigned' trustpoint.

**Mode** Global Configuration

**Usage notes** Before using the **auth-web-server trustpoint** command you will need to establish a trustpoint. For example, you can create a local self-signed trustpoint using the procedure outlined below.

Create a self-signed trustpoint called 'web-trust' with keypair 'web\_key':

```
awplus# configure terminal
awplus(config)# crypto pki trustpoint web-trust
awplus(ca-trustpoint)# enrollment selfsigned
awplus(ca-trustpoint)# rsakeypair web_key
awplus(ca-trustpoint)# exit
awplus(config)# exit
```

Create the root and server certificates for this trustpoint:

```
awplus# crypto pki authenticate web-trust
awplus# crypto pki enroll web-trust
```

For more information about the AlliedWare Plus implementation of Public Key Infrastructure (PKI), see the [Public Key Infrastructure \(PKI\) Feature Overview and Configuration Guide](#)

**Example** To configure web authentication to use the trustpoint 'web-trust', use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server trustpoint web-trust
```

To configure web authentication to use the default trustpoint 'default-selfsigned', use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server trustpoint
```

**Related commands**

- crypto pki trustpoint**
- show crypto pki certificates**
- show crypto pki trustpoint**

**Command changes** Version 5.5.1-2.1: command added

## copy proxy-autoconfig-file

**Overview** Use this command to download the proxy auto configuration (PAC) file to your switch. The Web-Authentication supplicant can get the downloaded file from the system web server.

**Syntax** `copy <filename> proxy-autoconfig-file`

| Parameter  | Description              |
|------------|--------------------------|
| <filename> | The URL of the PAC file. |

**Mode** Privileged Exec

**Example** To download the PAC file to this device, use the command:

```
awplus# copy tftp://server/proxy.pac proxy-autoconfig-file
```

**Related commands** [show proxy-autoconfig-file](#)  
[erase proxy-autoconfig-file](#)

# copy web-auth-https-file

**Overview** Use this command to download the SSL server certificate for web-based authentication. The file must be in PEM (Privacy Enhanced Mail) format, and contain the private key and the server certificate.

**Syntax** `copy <filename> web-auth-https-file`

| Parameter  | Description                             |
|------------|-----------------------------------------|
| <filename> | The URL of the server certificate file. |

**Mode** Privileged Exec

**Example** To download the server certificate file `verisign_cert.pem` from the TFTP server directory `server`, use the command:

```
awplus# copy tftp://server/verisign_cert.pem web-auth-https-file
```

**Related commands**

- [auth-web-server ssl](#)
- [erase web-auth-https-file](#)
- [show auth-web-server](#)

## description (auth-profile)

**Overview** Use this command to add a description to an authentication profile in Authentication Profile mode.

Use the **no** variant of this command to remove the current description.

**Syntax** `description <description>`

| Parameter                        | Description                                          |
|----------------------------------|------------------------------------------------------|
| <code>&lt;description&gt;</code> | Text describing the selected authentication profile. |

**Default** No description configured by default.

**Mode** Authentication Profile

**Example** To add a description to the authentication profile 'student', use the following commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# description student room setting
```

To remove a description from the authentication profile 'student', use the following commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no description
```

**Related commands** [auth profile \(global\)](#)

# erase proxy-autoconfig-file

**Overview** Use this command to remove the proxy auto configuration file.

**Syntax** erase proxy-autoconfig-file

**Mode** Privileged Exec

**Example** To remove the proxy auto configuration file, use the command:

```
awplus# erase proxy-autoconfig-file
```

**Related commands** [show proxy-autoconfig-file](#)  
[copy proxy-autoconfig-file](#)

# erase web-auth-https-file

**Overview** Use this command to remove the SSL server certificate for web-based authentication.

**Syntax** erase web-auth-https-file

**Mode** Privileged Exec

**Example** To remove the SSL server certificate file for web-based authentication use the command:

```
awplus# erase web-auth-https-file
```

**Related commands**

- [auth-web-server ssl](#)
- [copy web-auth-https-file](#)
- [show auth-web-server](#)

## show auth

**Overview** This command shows the configuration state of authentication.

**Syntax** show auth [all]

| Parameter | Description                                                                                                                                                                           |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| all       | Display all authentication information for each authenticated interface. This can be a static channel (or static aggregator), or a dynamic (or LACP) channel group, or a switch port. |

**Mode** Privileged Exec

**Example** To display all authentication information, enter the command:

```
awplus# show auth all
```

**Output** The following shows typical output.

**Example output from the show auth command**

## show auth diagnostics

**Overview** This command shows authentication diagnostics, optionally for the specified interface, which may be a static channel (or static aggregator) or a dynamic (or LACP) channel group or a switch port.

If no interface is specified then authentication diagnostics are shown for all interfaces.

**Syntax** show auth diagnostics [interface <interface-list>]

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| interface        | Specify ports to show.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <interface-list> | <p>The interfaces or ports to configure. An interface-list can be:</p> <ul style="list-style-type: none"><li>• an interface (e.g. vlan2), a switch port (e.g. port1.0.6), a static channel group (e.g. sa2) or a dynamic (LACP) channel group (e.g. po2)</li><li>• a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. vlan2-8, or port1.0.1-1.0.4, or sa1-2, or po1-2</li><li>• a comma-separated list of the above; e.g. port1.0.1, port1.0.4-1.0.6. **Related commands** [show dot1x interface](#)

# show auth supplicant

**Overview** Use this command to show the supplicant (client device) state when authentication is configured for the switch. Use the optional **brief** parameter to show a summary of the supplicant state.

**Syntax** show auth supplicant [<macadd>] [brief]

| Parameter | Description                                                                                |
|-----------|--------------------------------------------------------------------------------------------|
| <macadd>  | Mac (hardware) address of the supplicant.<br>Entry format is HHHH.HHHH.HHHH (hexadecimal). |
| brief     | Brief summary of the supplicant state.                                                     |

**Mode** Privileged Exec

**Examples** To display a summary of authenticated supplicant information on the device, enter the command:

```
awplus# show auth supplicant brief
```

To display authenticated supplicant information on the device, enter the command:

```
awplus# show auth supplicant
```

To display authenticated supplicant information for the device with MAC address 0000.5E00.5301, enter the command:

```
awplus# show auth supplicant 0000.5E00.5301
```

**Output** The following shows typical output.

**Example output from show auth supplicant brief**

```
awplus#show auth supplicant brief
Interface port1.0.3

# show auth supplicant interface

**Overview** This command shows the supplicant (client device) state for the authentication mode set for the interface. Use the optional **brief** parameter to show a summary of the supplicant state.

**Syntax** show auth-web supplicant interface *<interface-list>* [brief]

| Parameter                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;interface-list&gt;</i> | <p>The interfaces or ports to configure. An interface-list can be:</p> <ul style="list-style-type: none"><li>• an interface (e.g. v lan2), a switch port (e.g. port1.0.6), a static channel group (e.g. sa2) or a dynamic (LACP) channel group (e.g. po2)</li><li>• a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. v lan2-8, or port1.0.1-1.0.4, or sa1-2, or po1-2</li><li>• a comma-separated list of the above; e.g. port1.0.1, port1.0.4-1.0.6. Do not mix interface types in a list</li></ul> <p>The specified interfaces must exist.</p> |
| brief                         | Brief summary of the supplicant state.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Mode** Privileged Exec

**Examples** To display the authenticated supplicant on the interface port1.0.2, enter the command:

```
awplus# show auth supplicant interface port1.0.2
```

To display brief summary output for the authenticated supplicant on the interface port1.0.2, enter the command:

```
awplus# show auth supplicant interface port1.0.2 brief
```

# show auth two-step supplicant brief

**Overview** This command displays the supplicant state of the two-step authentication feature on the interface.

**Syntax** show auth two-step supplicant [interface <interface-list>]  
brief

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| interface        | The interface selected for display.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <interface-list> | The interfaces to display information about. An interface-list can be: <ul style="list-style-type: none"><li>• a VLAN (e.g. vlan2)</li><li>• a switchport (e.g. port1.0.4)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li><li>• a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3)</li><li>• a comma-separated list (e.g. port1.0.1, port1.0.3-port1.0.4). Do not mix interface types in a list.</li></ul> |

**Mode** Privileged Exec

**Usage notes** Do not mix interface types in a list. The specified interfaces must exist.

**Example** To display the supplicant state of the two-step authentication feature, enter the command:

```
awplus# show two-step supplicant interface port1.0.2 brief
```

**Output** The following shows typical output.

**Example output from show auth two-step supplicant brief**

```
interface port1.0.2
  authenticationMethod: dot1x/mac

  Two-Step Authentication:
    firstMethod:mac
    secondMethod:dot1x
    totalSupplicantNum: 1
    authorizedSupplicantNum: 1
    macBasedAuthenticationSupplicantNum: 0
    dot1xAuthenticationSupplicantNum: 1
    webBasedAuthenticationSupplicantNum: 0
    otherAuthenticationSupplicantNum: 0
```

| Interface | VID | Mode | MAC Address     | Status        | FirstStep | SecondStep |
|-----------|-----|------|-----------------|---------------|-----------|------------|
| =====     | === | ==== | =====           | =====         | =====     | =====      |
| port1.0.8 | 1   | D    | 000b..db67.00f7 | Authenticated | Pass      | Pass       |

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# show auth-web-server

**Overview** This command shows the Web-Authentication server configuration and status on the switch.

**Syntax** show auth-web-server

**Mode** Privileged Exec

**Example** To display Web-Authentication server configuration and status, enter the command:

```
awplus# show auth-web-server
```

**Output** The following shows typical output.

## Example output from the show auth-web-server command

```
Web authentication server
  Server status: enabled
  Server mode: none
  Server address: 192...
    DHCP server enabled
    DHCP lease time: 20
    DHCP WPAD Option URL: http://...
  HTTP Port No: 80
  Security: disabled
  Certification: default
  SSL Port No: 443
  Redirect URL: --
  Redirect Delay Time: 5
  HTTP Redirect: enabled
  Session keep: disabled
  PingPolling: disabled
  PingPollingType: Ping
  PingInterval: 30
  Timeout: 1
  FailCount: 5
  ReauthTimerReFresh: disabled
```

# show auth-web-server page

**Overview** This command displays the web-authentication page configuration and status.

**Syntax** show auth-web-server page

**Mode** Privileged Exec

**Examples** To show the web-authentication page information, use the command:  
awplus# show auth-web-server page

## Example output from the show auth-web-server page command

```
awplus#show auth-web-server page
Web authentication page
  Logo: auto
  Title: default
  Sub-Title: Web Authentication
  Welcome message: Your welcome message
  Success message: Your success message
```

# show proxy-autoconfig-file

**Overview** This command displays the contents of the proxy auto configuration (PAC) file.

**Syntax** show proxy-autoconfig-file

**Mode** Privileged Exec

**Example** To display the contents of the proxy auto configuration (PAC) file, enter the command:

```
awplus# show auth proxy-autoconfig-file
```

**Output** The following shows typical output.

## Example output from show proxy-autoconfig-file

```
function FindProxyForURL(url,host)
{
  if (isPlainHostName(host) ||
      isInNet(host, "192.168.1.0", "255.255.255.0")) {
    return "DIRECT";
  }
  else {
    return "PROXY 192.168.110.1:8080";
  }
}
```

# Introduction

**Overview** AAA is the collective title for the three related functions of Authentication, Authorization and Accounting. These functions can be applied in a variety of methods with a variety of servers.

The purpose of the AAA commands is to map instances of the AAA functions to sets of servers. The Authentication function can be performed in multiple contexts, such as authentication of users logging in at a console, or 802.1X-Authentication of devices connecting to Ethernet ports.

For each of these contexts, you may want to use different sets of servers for examining the proffered authentication credentials and deciding if they are valid. AAA Authentication commands enable you to specify which servers will be used for different types of authentication.

This chapter provides an alphabetical reference for AAA commands for Authentication, Authorization and Accounting. For more information, see the [\*\*AAA and Port\\_Authentication Feature Overview and Configuration Guide\*\*](#).

## aaa accounting auth-mac

**Overview** This command configures an accounting method list for MAC-based authentication. An accounting method list specifies what type of accounting messages are sent and which RADIUS servers the accounting messages are sent to. Use this command to configure either the default method list, which is automatically applied to interfaces with MAC-based authentication enabled, or a named method list, which can be applied to an interface with the **auth-mac accounting** command.

Use the **no** variant of this command to disable either the default or a named accounting method list for MAC-based authentication. Once all method lists are disabled, AAA accounting for MAC-based authentication is disabled globally.

**Syntax** `aaa accounting auth-mac {default|<list-name>} {start-stop|stop-only|none} group {<group-name>|radius}`  
`no aaa accounting auth-mac {default|<list-name>}`

| Parameter    | Description                                                                                                               |
|--------------|---------------------------------------------------------------------------------------------------------------------------|
| default      | Configure the default accounting method list                                                                              |
| <list-name>  | Configure a named accounting method list                                                                                  |
| start-stop   | Sends a start accounting message at the beginning of the session and a stop accounting message at the end of the session. |
| stop-only    | Only sends a stop accounting message at the end of the session.                                                           |
| none         | No accounting record sent.                                                                                                |
| group        | Use a server group                                                                                                        |
| <group-name> | Server group name.                                                                                                        |
| radius       | Use all RADIUS servers.                                                                                                   |

**Default** RADIUS accounting for MAC-based Authentication is disabled by default

**Mode** Global Configuration

**Usage notes** This command can be used to configure either the default accounting method list or a named accounting method list:

- **default**: the default accounting method list which is automatically applied to all interfaces with MAC-based authentication enabled.
- **<list-name>**: a user named list which can be applied to an interface using the **auth-mac accounting** command.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius**: use all RADIUS servers configured by **radius-server host** command
- **group <group-name>**: use the specified RADIUS server group configured with the **aaa group server** command

The accounting event to send to the RADIUS server is configured with the following options:

- **start-stop**: sends a **start** accounting message at the beginning of a session and a **stop** accounting message at the end of the session.
- **stop-only**: sends a **stop** accounting message at the end of a session.
- **none**: disables accounting.

**Examples** To enable the default RADIUS accounting for MAC-based authentication, and use all available RADIUS servers, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# aaa accounting auth-mac default start-stop group  
radius
```

To disable RADIUS accounting for MAC-based Authentication, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no aaa accounting auth-mac default
```

To enable a named RADIUS accounting method list 'vlan10\_acct' for MAC-based authentication, with the RADIUS server group 'rad\_group\_vlan10', use the commands:

```
awplus# configure terminal
```

```
awplus(config)# aaa accounting auth-mac vlan10_acct start-stop  
group rad_group_vlan10
```

To disable a named RADIUS accounting method list 'vlan10\_acct' for MAC-based authentication, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no aaa accounting auth-mac vlan10_acct
```

**Related commands**

- aaa authentication auth-mac**
- aaa group server**
- auth-mac accounting**
- auth-mac enable**
- radius-server host**
- show aaa server group**

## aaa accounting auth-web

**Overview** This command configures an accounting method list for Web-based authentication. An accounting method list specifies what type of accounting messages are sent and which RADIUS servers the accounting messages are sent to. Use this command to configure either the default method list, which is automatically applied to interfaces with Web-based authentication enabled, or a named method list, which can be applied to an interface with the **auth-web accounting** command.

Use the **no** variant of this command to disable either the default or a named accounting method list for Web-based authentication. Once all method lists are disabled, AAA accounting for Web-based authentication is disabled globally.

**Syntax** `aaa accounting auth-web {default|<list-name>} {start-stop|stop-only|none} group {<group-name>|radius}`  
`no aaa accounting auth-web {default|<list-name>}`

| Parameter    | Description                                                                                                               |
|--------------|---------------------------------------------------------------------------------------------------------------------------|
| default      | Configure the default accounting method list                                                                              |
| <list-name>  | Configure a named accounting method list                                                                                  |
| start-stop   | Sends a start accounting message at the beginning of the session and a stop accounting message at the end of the session. |
| stop-only    | Only sends a stop accounting message at the end of the session.                                                           |
| none         | No accounting record sent.                                                                                                |
| group        | Use a server group                                                                                                        |
| <group-name> | Server group name.                                                                                                        |
| radius       | Use all RADIUS servers.                                                                                                   |

**Default** RADIUS accounting for Web-based authentication is disabled by default.

**Mode** Global Configuration

**Usage notes** This command can be used to configure either the default accounting method list or a named accounting method list:

- **default:** the default accounting method list which is automatically applied to all interfaces with Web-based authentication enabled.
- **<list-name>:** a user named list which can be applied to an interface using the **auth-web accounting** command.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius:** use all RADIUS servers configured by **radius-server host** command
- **group <group-name>:** use the specified RADIUS server group configured with the **aaa group server** command

Configure the accounting event to be sent to the RADIUS server with the following options:

- **start-stop:** sends a start accounting message at the beginning of a session and a stop accounting message at the end of the session.
- **stop-only:** sends a stop accounting message at the end of a session.
- **none:** disables accounting.

**Examples** To enable the default RADIUS accounting method for Web-based authentication, and use all available RADIUS servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting auth-web default start-stop group
radius
```

To disable the default RADIUS accounting method for Web-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting auth-web default
```

To enable a named RADIUS accounting method list 'vlan10\_acct' for Web-based authentication, with the RADIUS server group 'rad\_group\_vlan10', use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting auth-web vlan10_acct start-stop
group rad_group_vlan10
```

To disable a named RADIUS accounting method list 'vlan10\_acct' for Web-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting auth-web vlan10_acct
```

**Related commands**

- aaa authentication auth-web**
- aaa group server**
- auth-web accounting**
- auth-web enable**
- radius-server host**
- show aaa server group**

## aaa accounting commands

**Overview** This command configures and enables TACACS+ accounting on commands entered at a specified privilege level. Once enabled for a privilege level, accounting messages for commands entered at that privilege level will be sent to a TACACS+ server.

In order to account for all commands entered on a device, configure command accounting for each privilege level separately.

The command accounting message includes, the command as entered, the date and time the command finished executing, and the user-name of the user who executed the command.

Use the **no** variant of this command to disable command accounting for a specified privilege level.

TACACS+ is not available in Secure Mode (see the [crypto secure-mode](#) command).

**Syntax** `aaa accounting commands <1-15> default stop-only group tacacs+`  
`no aaa accounting commands <1-15> default`

| Parameter | Description                                                                                                        |
|-----------|--------------------------------------------------------------------------------------------------------------------|
| <1-15>    | The privilege level being configured, in the range 1 to 15.                                                        |
| default   | Use the default method list, this means the command is applied globally to all user exec sessions.                 |
| stop-only | Send accounting message when the commands have stopped executing.                                                  |
| group     | Specify the server group where accounting messages are sent. Only the tacacs+ group is available for this command. |
| tacacs+   | Use all TACACS+ servers configured by the <a href="#">tacacs-server host</a> command.                              |

**Default** TACACS+ command accounting is disabled by default.

**Mode** Global Configuration

**Usage notes** This command only supports a **default** method list, this means that it is applied to every console and VTY line.

The **stop-only** parameter indicates that the command accounting messages are sent to the TACACS+ server when the commands have stopped executing.

The **group tacacs+** parameters signifies that the command accounting messages are sent to the TACACS+ servers configured by the **tacacs-server host** command.

Note that up to four TACACS+ servers can be configured for accounting. The servers are checked for reachability in the order they are configured with only the first reachable server being used. If no server is found, the accounting message is dropped.

Command accounting cannot coexist with triggers. An error message is displayed if you attempt to enable command accounting while a trigger is configured. Likewise, an error message is displayed if you attempt to configure a trigger while command accounting is configured.

**Examples** To configure command accounting for privilege levels 1, 7, and 15, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting commands 1 default stop-only
group tacacs+
awplus(config)# aaa accounting commands 7 default stop-only
group tacacs+
awplus(config)# aaa accounting commands 15 default stop-only
group tacacs+
```

To disable command accounting for privilege levels 1, 7, and 15, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting commands 1 default
awplus(config)# no aaa accounting commands 7 default
awplus(config)# no aaa accounting commands 15 default
```

**Related commands** [aaa authentication login](#)

## aaa accounting dot1x

**Overview** Use this command to configure an accounting method list for IEEE 802.1X-based authentication. An accounting method list specifies what type of accounting messages are sent and which RADIUS servers the accounting messages are sent to. Use this command to configure either the default method list, which is automatically applied to interfaces with IEEE 802.1X-based authentication enabled, or a named method list, which can be applied to an interface with the **dot1x accounting** command.

Use the **no** variant of this command to disable either the default or a named accounting method list for 802.1X-based authentication. Once all method lists are disabled, AAA accounting for 802.1x-based authentication is disabled globally.

**Syntax** `aaa accounting dot1x {default|<list-name>} {start-stop|stop-only|none} group {<group-name>|radius}`  
`no aaa accounting dot1x {default|<list-name>}`

| Parameter    | Description                                                                                                               |
|--------------|---------------------------------------------------------------------------------------------------------------------------|
| default      | Configure the default accounting method list                                                                              |
| <list-name>  | Configure a named accounting method list                                                                                  |
| start-stop   | Sends a start accounting message at the beginning of the session and a stop accounting message at the end of the session. |
| stop-only    | Only sends a stop accounting message at the end of the session.                                                           |
| none         | No accounting record sent.                                                                                                |
| group        | Use a server group                                                                                                        |
| <group-name> | Server group name.                                                                                                        |
| radius       | Use all RADIUS servers.                                                                                                   |

**Default** RADIUS accounting for 802.1X-based authentication is disabled by default (there is no default server set by default).

**Mode** Global Configuration

**Usage notes** This command can be used to configure either the default accounting method list or a named accounting method list:

- **default**: the default accounting method list which is automatically applied to all interfaces with 802.1X-based authentication enabled.
- **<list-name>**: a user named list which can be applied to an interface using the **dot1x accounting** command.

There are two ways to define servers where RADIUS accounting messages will be sent:

- **group radius**: use all RADIUS servers configured by **radius-server host** command.
- **group <group-name>**: use the specified RADIUS server group configured with the **aaa group server** command.

The accounting event to send to the RADIUS server is configured by the following options:

- **start-stop**: sends a **start** accounting message at the beginning of a session and a **stop** accounting message at the end of the session.
- **stop-only**: sends a **stop** accounting message at the end of a session.
- **none**: disables accounting.

**Examples** To enable RADIUS accounting for 802.1X-based authentication, and use all available RADIUS Servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting dot1x default start-stop group
radius
```

To disable RADIUS accounting for 802.1X-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting dot1x default
```

To enable a named RADIUS accounting method list 'vlan10\_acct' for 802.1X-based authentication, with the RADIUS server group 'rad\_group\_vlan10', use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting dot1x vlan10_acct start-stop
group rad_group_vlan10
```

To disable a named RADIUS accounting method list 'vlan10\_acct' for 802.1X-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting dot1x vlan10_acct
```

**Related commands**

- aaa accounting update**
- aaa authentication dot1x**
- aaa group server**
- dot1x accounting**
- dot1x port-control**
- radius-server host**
- show aaa server group**

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

## aaa accounting login

**Overview** This command configures RADIUS and TACACS+ accounting for login shell sessions. The specified method list name can be used by the **accounting login** command in the Line Configuration mode. If the **default** parameter is specified, then this creates a default method list that is applied to every console and VTY line, unless another accounting method list is applied on that line.

Note that unlimited RADIUS servers and up to four TACACS+ servers can be configured and consulted for accounting. The first server configured is regarded as the primary server and if the primary server fails then the backup servers are consulted in turn. A backup server is consulted if the primary server fails, i.e. is unreachable.

TACACS+ is not available in Secure Mode (see the **crypto secure-mode** command).

Use the **no** variant of this command to remove an accounting method list for login shell sessions configured by an **aaa accounting login** command. If the method list being deleted is already applied to a console or VTY line, accounting on that line will be disabled. If the default method list name is removed by this command, it will disable accounting on every line that has the default accounting configuration.

**Syntax** `aaa accounting login {default|<list-name>}{start-stop|stop-only|none} {group {radius|tacacs+|<group-name>}}`  
`no aaa accounting login {default|<list-name>}`

| Parameter    | Description                                                                                  |
|--------------|----------------------------------------------------------------------------------------------|
| default      | Default accounting method list.                                                              |
| <list-name>  | Named accounting method list.                                                                |
| start-stop   | Start and stop records to be sent.                                                           |
| stop-only    | Stop records to be sent.                                                                     |
| none         | No accounting record to be sent.                                                             |
| group        | Specify the servers or server group where accounting packets are sent.                       |
| radius       | Use all RADIUS servers configured by the <b>radius-server host</b> .                         |
| tacacs+      | Use all TACACS+ servers configured by the <b>tacacs-server host</b> command.                 |
| <group-name> | Use the specified RADIUS server group, as configured by the <b>aaa group server</b> command. |

**Default** Accounting for login shell sessions is disabled by default.

**Mode** Global Configuration

**Usage notes** This command enables you to define a named accounting method list. The items that you define in the accounting options are:

- the types of accounting packets that will be sent
- the set of servers to which the accounting packets will be sent

You can define a default method list with the name **default** and any number of other named method lists. The name of any method list that you define can then be used as the *<list-name>* parameter in the **accounting login** command.

If the method list name already exists, the command will replace the existing configuration with the new one.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius** : use all RADIUS servers configured by **radius-server host** command
- **group <group-name>** : use the specified RADIUS server group configured with the **aaa group server** command

There is one way to define servers where TACACS+ accounting messages are sent:

- **group tacacs+** : use all TACACS+ servers configured by **tacacs-server host** command

The accounting event to send to the RADIUS or TACACS+ server is configured with the following options:

- **start-stop** : sends a **start** accounting message at the beginning of a session and a **stop** accounting message at the end of the session.
- **stop-only** : sends a **stop** accounting message at the end of a session.
- **none** : disables accounting.

**Examples** To configure RADIUS accounting for login shell sessions, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting login default start-stop group
radius
```

To configure TACACS+ accounting for login shell sessions, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting login default start-stop group
tacacs+
```

To reset the configuration of the default accounting list, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting login default
```

**Related commands**

- [aaa accounting login](#)
- [aaa accounting update](#)
- [accounting login](#)
- [radius-server host](#)
- [tacacs-server host](#)

## aaa accounting update

**Overview** This command enables periodic accounting reporting to either the RADIUS or TACACS+ accounting server(s) wherever login accounting has been configured.

Note that unlimited RADIUS servers and up to four TACACS+ servers can be configured and consulted for accounting. The first server configured is regarded as the primary server and if the primary server fails then the backup servers are consulted in turn. A backup server is consulted if the primary server fails, i.e. is unreachable.

Use the **no** variant of this command to disable periodic accounting reporting to the accounting server(s).

**Syntax** `aaa accounting update [periodic <1-65535>]`  
`no aaa accounting update`

| Parameter                    | Description                                                                      |
|------------------------------|----------------------------------------------------------------------------------|
| <code>periodic</code>        | Send accounting records periodically.                                            |
| <code>&lt;1-65535&gt;</code> | The interval to send accounting updates (in minutes). The default is 30 minutes. |

**Default** Disabled

**Mode** Global Configuration

**Usage notes** Use this command to enable the device to send periodic AAA login accounting reports to the accounting server. When periodic accounting reporting is enabled, interim accounting records are sent at the interval specified by the **periodic** parameter. The accounting updates are start messages.

If the **no** variant of this command is used to disable periodic accounting reporting, any interval specified by the **periodic** parameter is reset to the default of 30 minutes when accounting reporting is re-enabled, unless this interval is specified.

**Examples** To configure the switch to send period accounting updates every 30 minutes, the default period, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting update
```

To configure the switch to send period accounting updates every 10 minutes, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting update periodic 10
```

To disable periodic accounting updates wherever accounting has been configured, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting update
```

**Related commands**

- [radius-server host](#)

## aaa authentication auth-mac

**Overview** This command enables MAC-based authentication globally and allows you to enable either the default authentication method list (in this case, a list of RADIUS servers), which is automatically applied to every interface running MAC-based authentication, or a user named authentication method list, which is applied to an interface with the **auth-mac authentication** command.

Use the **no** variant of this command to disable either the default or a named method list for MAC-based authentication. Once all method lists are disabled MAC-based authentication is disabled globally.

**Syntax** `aaa authentication auth-mac {default|<list-name>} group {<group-name>|radius}`  
`no aaa authentication auth-mac {default|<list-name>}`

| Parameter    | Description                                      |
|--------------|--------------------------------------------------|
| default      | Configure the default authentication method list |
| <list-name>  | Configure a named authentication method list     |
| group        | Use a server group                               |
| <group-name> | Server group name.                               |
| radius       | Use all RADIUS servers.                          |

**Default** MAC-based Port Authentication is disabled by default.

**Mode** Global Configuration

**Usage notes** This command can be used to configure either the default authentication method list or a named authentication method list:

- **default**: the default authentication method list which is automatically applied to all interfaces with Web-based authentication enabled.
- **<list-name>**: a user named list which can be applied to an interface using the **auth-web authentication** command.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius**: use all RADIUS servers configured by **radius-server host** command
- **group <group-name>**: use the specified RADIUS server group configured with the **aaa group server** command

All configured RADIUS Servers are automatically members of the server group **radius**. If a server is added to a named group **<group-name>**, it also remains a member of the group **radius**.

**Examples** To enable MAC-based authentication globally for all RADIUS servers, and use all available RADIUS servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authentication auth-mac default group
radius
```

To disable MAC-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication auth-mac default
```

To enable MAC-based authentication for named list 'vlan10\_auth', with RADIUS server group 'rad\_group\_vlan10', use the commands:

```
awplus# configure terminal
awplus(config)# aaa authentication auth-mac vlan10_auth group
rad_group_vlan10
```

To disable MAC-based authentication for named list 'vlan10\_auth', use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication auth-mac vlan10_acct
```

**Related commands**

## aaa authentication auth-web

**Overview** This command enables Web-based authentication globally and allows you to enable either the default authentication method list (in this case, a list of RADIUS servers), which is automatically applied to every interface running Web-based authentication, or a user named authentication method list, which is applied to an interface with the **auth-web authentication** command.

Use the **no** variant of this command to disable either the default or a named method list for Web-based authentication. Once all method lists are disabled Web-based authentication is disabled globally.

**Syntax** `aaa authentication auth-web {default|<list-name>} group {<group-name>|radius}`  
`no aaa authentication auth-web {default|<list-name>}`

| Parameter    | Description                                      |
|--------------|--------------------------------------------------|
| default      | Configure the default authentication method list |
| <list-name>  | Configure a named authentication method list     |
| group        | Use a server group                               |
| <group-name> | Server group name.                               |
| radius       | Use all RADIUS servers.                          |

**Default** Web-based authentication is disabled by default.

**Mode** Global Configuration

**Usage notes** This command can be used to configure either the default authentication method list or a named authentication method list:

- **default:** the default authentication method list which is automatically applied to all interfaces with Web-based authentication enabled.
- **<list-name>:** a user named list which can be applied to an interface using the **auth-web authentication** command.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius:** use all RADIUS servers configured by **radius-server host** command
- **group <group-name>:** use the specified RADIUS server group configured with the **aaa group server** command

Note that you need to configure an IPv4 address for the VLAN interface on which Web authentication is running.

**Examples** To enable Web-based authentication globally for all RADIUS servers, and use all available RADIUS servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authentication auth-web default group
radius
```

To disable Web-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication auth-web default
```

To enable Web-based authentication for named list 'vlan10\_auth', with RADIUS server group 'rad\_group\_vlan10', use the commands:

```
awplus# configure terminal
awplus(config)# aaa authentication auth-web vlan10_auth group
rad_group_vlan10
```

To disable Web-based authentication for named list 'vlan10\_auth', use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication vlan10_auth
```

**Related commands**

- radius-server host**

# aaa authentication dot1x

**Overview** Use this command to enable IEEE 802.1X-based authentication globally and to allow you to enable either the default authentication method list (in this case, a list of RADIUS servers), which is automatically applied to every interface running IEEE 802.1X-based authentication, or a user named authentication method list, which is applied to an interface with the **dot1x authentication** command.

Use the **no** variant of this command to disable either the default or a named method list for 802.1X-based authentication. Once all method lists are disabled 802.1x-based authentication is disabled globally.

**Syntax** `aaa authentication dot1x {default|<list-name>} group {<group-name>|radius}`  
`no aaa authentication dot1x {default|<list-name>}`

| Parameter    | Description                                      |
|--------------|--------------------------------------------------|
| default      | Configure the default authentication method list |
| <list-name>  | Configure a named authentication method list     |
| group        | Use a server group                               |
| <group-name> | Server group name.                               |
| radius       | Use all RADIUS servers.                          |

**Default** 802.1X-based Port Authentication is disabled by default.

**Mode** Global Configuration

**Usage notes** This command can be used to configure either the default authentication method list or a named authentication method list:

- **default:** the default authentication method list which is automatically applied to all interfaces with 802.1X-based authentication enabled.
- **<list-name>:** a user named list which can be applied to an interface using the **aaa authentication dot1x** command.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius:** use all RADIUS servers configured by **radius-server host** command
- **group <group-name>:** use the specified RADIUS server group configured with the **aaa group server** command

**Examples** To enable 802.1X-based authentication globally with all RADIUS servers, and use all available RADIUS servers, use the command:

```
awplus# configure terminal
awplus(config)# aaa authentication dot1x default group radius
```

To disable 802.1X-based authentication, use the command:

```
awplus# configure terminal
awplus(config)# no aaa authentication dot1x default
```

To enable 802.1X-based authentication for named list 'vlan10\_auth', with RADIUS server group 'rad\_group\_vlan10', use the commands:

```
awplus# configure terminal
awplus(config)# aaa authentication dot1x vlan10_auth group
rad_group_vlan10
```

To disable 802.1X-based authentication for named list 'vlan10\_auth' use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication dot1x vlan10_acct
```

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# aaa authentication enable default group tacacs+

**Overview** This command enables privilege level authentication against a TACACS+ server.

Use the **no** variant of this command to disable privilege level authentication.

TACACS+ is not available in Secure Mode (see the **crypto secure-mode** command).

**Syntax** `aaa authentication enable default group tacacs+ [local] [none]`  
`no aaa authentication enable default`

| Parameter | Description                                                                                      |
|-----------|--------------------------------------------------------------------------------------------------|
| local     | Use the locally configured enable password ( <b>enable password</b> command) for authentication. |
| none      | No authentication.                                                                               |

**Default** Local privilege level authentication is enabled by default (**aaa authentication enable default local** command).

**Mode** Global Configuration

**Usage notes** A user is configured on a TACACS+ server with a maximum privilege level. When they enter the **enable (Privileged Exec mode)** command they are prompted for an enable password which is authenticated against the TACACS+ server. If the password is correct and the specified privilege level is equal to or less than the users maximum privilege level, then they are granted access to that level. If the user attempts to access a privilege level that is higher than their maximum configured privilege level, then the authentication session will fail and they will remain at their current privilege level.

**NOTE:** *If both are specified, you must always specify first.*

If the TACACS+ server goes offline, or is not reachable during enable password authentication, and command level authentication is configured as:

- **aaa authentication enable default group tacacs+**  
then the user is never granted access to Privileged Exec mode.
- **aaa authentication enable default group tacacs+ local**  
then the user is authenticated using the locally configured enable password, which if entered correctly grants the user access to Privileged Exec mode. If no enable password is locally configured (**enable password** command), then the enable authentication will fail until the TACACS+ server becomes available again.
- **aaa authentication enable default group tacacs+ none**  
then the user is granted access to Privileged Exec mode with no authentication. This is true even if a locally configured enable password is configured.
- **aaa authentication enable default group tacacs+ local none**  
then the user is authenticated using the locally configured enable password. If no enable password is locally configured, then the enable authentication will grant access to Privileged Exec mode with no authentication.

If the password for the user is not successfully authenticated by the server, then the user is again prompted for an enable password when they enter **enable** via the CLI.

**Examples** To enable a privilege level authentication method that will not allow the user to access Privileged Exec mode if the TACACS+ server goes offline, or is not reachable during enable password authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication enable default group tacacs+
```

To enable a privilege level authentication method that will allow the user to access Privileged Exec mode if the TACACS+ server goes offline, or is not reachable during enable password authentication, and a locally configured enable password is configured, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication enable default group tacacs+
local
```

To disable privilege level authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication enable default
```

# aaa authentication enable default local

**Overview** This command enables local privilege level authentication.  
Use the **no** variant of this command to disable local privilege level authentication.

**Syntax** `aaa authentication enable default local`  
`no aaa authentication enable default`

**Default** Local privilege level authentication is enabled by default.

**Mode** Global Configuration

**Usage notes** The privilege level configured for a particular user in the local user database is the privilege threshold above which the user is prompted for an **enable (Privileged Exec mode)** command.

**Examples** To enable local privilege level authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication enable default local
```

To disable local privilege level authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication enable default
```

**Related commands** [aaa authentication login](#)  
[enable \(Privileged Exec mode\)](#)  
[enable password](#)  
[enable secret \(deprecated\)](#)

## aaa authentication login

**Overview** Use this command to create an ordered list of methods for authenticating user logins. It can also be used to replace an existing method list with a list of the same name. Specify one or more of the options **local** or **group**, in the order you want them to be applied. If the **default** method list name is specified, it is applied to every console and VTY line immediately unless another method list is applied to that line by the **login authentication** command. To apply a non-default method list, you must also use the **login authentication** command.

TACACS+ is not available in Secure Mode (see the **crypto secure-mode** command).

Use the **no** variant of this command to remove a method list from user login authentication. The specified method list name is deleted from the configuration. If the method list name has been applied to any console or VTY line, user login authentication on that line will fail.

Note that the **no aaa authentication login default** command does not remove the default method list. This will return the default method list to its default state (**local** is the default).

**Syntax** `aaa authentication login {default|<list-name>} {[local] [group {radius|ldap|tacacs+|<group-name>}]}`  
`no aaa authentication login {default|<list-name>}`

| Parameter    | Description                                                                  |
|--------------|------------------------------------------------------------------------------|
| default      | Set the default authentication server for user login.                        |
| <list-name>  | Name of authentication server.                                               |
| local        | Use the local username database.                                             |
| group        | Use server group.                                                            |
| radius       | Use all RADIUS servers configured by the <b>radius-server host</b> command.  |
| ldap         | Use all LDAP servers configured by the <b>ldap-server</b> command.           |
| tacacs+      | Use all TACACS+ servers configured by the <b>tacacs-server host</b> command. |
| <group-name> | Use the specified RADIUS or LDAP server group.                               |

**Default** If the default server is not configured using this command, user login authentication uses the local user database only.

If the **default** method list name is specified, it is applied to every console and VTY line immediately unless a named method list server is applied to that line by the **login authentication** command.

**local** is the default state for the default method list unless a named method list is applied to that line by the **login authentication** command. You can reset it to the default method list using the **no aaa authentication login default** command.

**Mode** Global Configuration

**Usage notes** When a user attempts to log in, the switch sends an authentication request to the first authentication server in the method list. If the first server in the list is reachable and it contains a username and password matching the authentication request, the user is authenticated and the login succeeds. If the authentication server denies the authentication request because of an incorrect username or password, the user login fails. If the first server in the method list is unreachable, the switch sends the request to the next server in the list, and so on.

For example, if the method list specifies **group tacacs+ local**, and a user attempts to log in with a password that does not match a user entry in the first TACACS+ server, if this TACACS+ server denies the authentication request, then the switch does not try any other TACACS+ servers nor the local user database; the user login fails.

**Examples** To configure the default authentication method list for user login to first use all available RADIUS servers for user login authentication, and then use the local user database, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication login default group radius
local
```

To configure the default authentication method list for user login to first use all available LDAP servers for user login authentication, and then use the local user database, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication login default group ldap
local
```

To configure a user login authentication method list called 'USERS' to first use the RADIUS server group 'RAD\_GROUP1' for user login authentication, and then use the local user database, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication login USERS group RAD_GROUP1
local
```

To configure a user login authentication method list called 'USERS' to first use the TACACS+ servers for user login authentication, and then use the local user database, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication login USERS group tacacs+
local
```

To return to the default method list (**local** is the default server), use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication login default
```

To delete an existing authentication method list 'USERS' created for user login authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication login USERS
```

**Command changes** Version 5.5.2-1.1: **ldap** parameter added

## aaa authorization commands

**Overview** This command configures a method list for commands authorization that can be applied to console or VTY lines. When command authorization is enabled for a privilege level, only authorized users can executed commands in that privilege level.

Use the **no** variant of this command to remove a named method list or disable the default method list for a privilege level.

**Syntax** `aaa authorization commands <privilege-level> {default|<list-name>} group tacacs+ [none]`  
`no aaa authorization commands <privilege-level> {default|<list-name>}`

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <privilege-level> | The privilege level of the set of commands the method list will be applied to.<br><br>AlliedWare Plus defines three sets of commands, that are indexed by a level value:<br><b>Level = 1:</b> All commands that can be accessed by a user with privilege level between 1 and 6 inclusive<br><b>Level = 7:</b> All commands that can be accessed by a user with privilege level between 7 and 14 inclusive<br><b>Level = 15:</b> All commands that can be accessed by a user with privilege level 15 |
| group             | Specify the server group where authorization messages are sent. Only the tacacs+ group is available for this command.                                                                                                                                                                                                                                                                                                                                                                               |
| tacacs+           | Use all TACACS+ servers configured by the <b>tacacs-server host</b> command.                                                                                                                                                                                                                                                                                                                                                                                                                        |
| default           | Configure the default authorization commands method list.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <list-name>       | Configure a named authorization commands method list                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| none              | If specified, this provides a local fallback to command authorization so that if authorization servers become unavailable then the device will accept all commands normally allowed for the privilege level of the user.                                                                                                                                                                                                                                                                            |

**Mode** Global Configuration

**Usage notes** TACACS+ command authorization provides centralized control of the commands available to a user of an AlliedWare Plus device. Once enabled:

- The command string and username are encrypted and sent to the first available configured TACACS+ server (the first server configured) for authorization.
- The TACACS+ server decides if the user is authorized to execute the command and returns the decision to the AlliedWare Plus device.
- Depending on this decision the device will then either execute the command or notify the user that authorization has failed.

If multiple TACACS+ servers are configured, and the first server is unreachable or does not respond, the other servers will be queried, in turn, for an authorization decision. If all servers are unreachable and a local fallback has been configured, with the **none** parameter, then commands are authorized based on the user's privilege level; the same behavior as if command authorization had not been configured. If, however, the local fallback is not configured and all servers become unreachable then all commands except **logout**, **exit**, and **quit** will be denied.

The **default** method list is defined with a local fallback unless configured differently using this command.

**Example** To configure a commands authorization method list, named TAC15, using all TACACS+ servers to authorize commands for privilege level 15, with a local fallback, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# aaa authorization commands 15 TAC15 group tacacs  
+ none
```

To configure the default method list to authorize commands for privilege level 7, with no local fallback, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# aaa authorization commands 7 default group  
tacacs+
```

To remove the authorization method list TAC15, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# no aaa authorization commands 15 TAC15
```

**Related commands** [aaa authorization config-commands](#)  
[authorization commands](#)  
[tacacs-server host](#)

**Command changes** Version 5.4.6-2.1: command added

# aaa authorization config-commands

**Overview** Use this command to enable command authorization on configuration mode commands. By default, command authorization applies to commands in exec mode only.

Use the **no** variant of this command to disable command authorization on configuration mode commands.

**Syntax** `aaa authorization config-commands`  
`no aaa authorization config-commands`

**Default** By default, command authorization is disabled on configuration mode commands.

**Mode** Global Configuration

**Usage notes** If authorization of configuration mode commands is not enabled then all configuration commands are accepted by default, including command authorization commands.

**NOTE:** *Authorization of configuration commands is required for a secure TACACS+ command authorization configuration as it prevents the feature from being disabled to gain access to unauthorized exec mode commands.*

**Example** To enable command authorization for configuration mode commands, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authorization config-commands
```

To disable command authorization for configuration mode commands, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authorization config-commands
```

**Related commands** [aaa authorization commands](#)  
[authorization commands](#)  
[tacacs-server host](#)

**Command changes** Version 5.4.6-2.1: command added

## aaa group server

**Overview** Use this command to create an AAA group of RADIUS or LDAP servers, and to enter Server Group Configuration mode.

A server group is used to specify a subset of RADIUS or LDAP servers in AAA commands. Once in Server Group Configuration mode you can add servers to the group.

Use the **no** variant of this command to remove an existing server group.

**Syntax** `aaa group server {radius|ldap} <group-name>`  
`no aaa group server {radius|ldap} <group-name>`

| Parameter    | Description                                |
|--------------|--------------------------------------------|
| radius       | Create or configure a RADIUS server group. |
| ldap         | Create or configure an LDAP server group.  |
| <group-name> | Server group name.                         |

**Mode** Global Configuration

**Usage notes** To add servers to a RADIUS or LDAP server group, use the **server** command. Each RADIUS server in a server group must be configured using the **radius-server host** command. Similarly, each LDAP server in a server group must be configured using the **ldap-server** command.

Server groups named 'radius' and 'ldap' are predefined and include all RADIUS and LDAP servers configured using the **radius-server host** or **ldap-server** commands.

**Examples** To create a RADIUS server group named 'GROUP1' with hosts 192.168.1.1, 192.168.2.1 and 192.168.3.1, use the commands:

```
awplus(config)# aaa group server radius GROUP1
awplus(config-sg)# server 192.168.1.1 auth-port 1812 acct-port 1813
awplus(config-sg)# server 192.168.2.1 auth-port 1812 acct-port 1813
awplus(config-sg)# server 192.168.3.1 auth-port 1812 acct-port 1813
```

To remove a RADIUS server group named 'GROUP1' from the configuration, use the command:

```
awplus(config)# no aaa group server radius GROUP1
```

To create an LDAP server group named 'GROUP2' with servers named 'SERVER1', 'SERVER2' and 'SERVER3', use the commands:

```
awplus(config)# aaa group server ldap GROUP2
awplus(config-ldap-group)# server SERVER1
awplus(config-ldap-group)# server SERVER2
awplus(config-ldap-group)# server SERVER3
```

To remove an LDAP server group named 'GROUP2' from the configuration, use the command:

```
awplus(config)# no aaa group server ldap GROUP2
```

# aaa local authentication attempts lockout-time

**Overview** This command configures the duration of the user lockout period.

Use the **no** variant of this command to restore the duration of the user lockout period to its default of 300 seconds (5 minutes).

**Syntax** `aaa local authentication attempts lockout-time <lockout-time>`  
`no aaa local authentication attempts lockout-time`

| Parameter                         | Description                                                         |
|-----------------------------------|---------------------------------------------------------------------|
| <code>&lt;lockout-time&gt;</code> | <code>&lt;0-10000&gt;</code> . Time in seconds to lockout the user. |

**Mode** Global Configuration

**Default** The default for the lockout-time is 300 seconds (5 minutes).

**Usage notes** While locked out all attempts to login with the locked account will fail. The lockout can be manually cleared by another privileged account using the **clear aaa local user lockout** command.

**Examples** To configure the lockout period to 10 minutes (600 seconds), use the commands:

```
awplus# configure terminal
```

```
awplus(config)# aaa local authentication attempts lockout-time 600
```

To restore the default lockout period of 5 minutes (300 seconds), use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no aaa local authentication attempts lockout-time
```

**Related commands** **aaa local authentication attempts max-fail**  
**aaa local authentication attempts max-fail remote-login-only**  
**clear aaa local user lockout**

# aaa local authentication attempts max-fail

**Overview** This command configures the maximum number of failed login attempts before a user account is locked out. Every time a login attempt fails the failed login counter is incremented.

Use the **no** variant of this command to restore the maximum number of failed login attempts to the default setting (five failed login attempts).

**Syntax** `aaa local authentication attempts max-fail <failed-logins>`  
`no aaa local authentication attempts max-fail`

| Parameter       | Description                                                         |
|-----------------|---------------------------------------------------------------------|
| <failed-logins> | <1-32>. Number of login failures allowed before locking out a user. |

**Mode** Global Configuration

**Default** The default for the maximum number of failed login attempts is five failed login attempts.

**Usage** When the failed login counter reaches the limit configured by this command that user account is locked out for a specified duration configured by the [aaa local authentication attempts lockout-time](#) command.

When a successful login occurs the failed login counter is reset to 0. When a user account is locked out all attempts to login using that user account will fail.

**Examples** To configure the number of login failures that will lock out a user account to two login attempts, use the commands:

```
awplus# configure terminal
awplus(config)# aaa local authentication attempts max-fail 2
```

To restore the number of login failures that will lock out a user account to the default number of login attempts (five login attempts), use the commands:

```
awplus# configure terminal
awplus(config)# no aaa local authentication attempts max-fail
```

**Related commands**   **aaa local authentication attempts logout-time**  
**aaa local authentication attempts max-fail remote-login-only**  
**clear aaa local user logout**

# aaa local authentication attempts max-fail remote-login-only

**Overview** Use this command to configure account lockout to remote logins only. This means that console logins are not subject to lock out when this feature is configured.

This command allow users to login via the physical console port even when the account is locked due to reaching the maximum number of failed login attempts.

Use the **no** variant of this command to prevent users from logging in via the console port when the maximum number of failed login attempts is reached.

**Syntax** `aaa local authentication attempts max-fail remote-login-only`  
`no aaa local authentication attempts max-fail remote-login-only`

**Default** Not set. Max-fail lockout applies to all logins.

**Mode** Global Configuration

**Example** To configure account lock-out to remote login only, use the commands:

```
awplus# configure terminal
awplus(config)# aaa local authentication attempts max-fail
remote-login-only
```

To configure account lock-out to apply to all logins, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa local authentication attempts max-fail
remote-login-only
```

**Related commands** [aaa local authentication attempts max-fail](#)  
[aaa local authentication attempts lockout-time](#)  
[clear aaa local user lockout](#)

**Command changes** Version 5.5.4-1.2: command added

## aaa login fail-delay

**Overview** Use this command to configure the minimum time period between failed login attempts. This setting applies to login attempts via the console, SSH and Telnet.

Use the **no** variant of this command to reset the minimum time period to its default value.

**Syntax** `aaa login fail-delay <1-10>`  
`no aaa login fail-delay`

| Parameter | Description                                                   |
|-----------|---------------------------------------------------------------|
| <1-10>    | The minimum number of seconds required between login attempts |

**Default** 1 second

**Mode** Global configuration

**Example** To apply a delay of at least 5 seconds between login attempts, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa login fail-delay 5
```

**Related commands** [aaa authentication login](#)  
[aaa local authentication attempts lockout-time](#)  
[clear aaa local user lockout](#)

# accounting login

**Overview** This command applies a login accounting method list to console or VTY lines for user login. When login accounting is enabled using this command, logging events generate an accounting record to the accounting server.

The accounting method list must be configured first using this command. If an accounting method list is specified that has not been created by this command then accounting will be disabled on the specified lines.

The **no** variant of this command resets AAA Accounting applied to console or VTY lines for local or remote login. **default** login accounting is applied after issuing the **no accounting login** command. Accounting is disabled with **default**.

**Syntax** accounting login {default|<list-name>}  
no accounting login

| Parameter   | Description                     |
|-------------|---------------------------------|
| default     | Default accounting method list. |
| <list-name> | Named accounting method list.   |

**Default** By default login accounting is disabled in the **default** accounting server. No accounting will be performed until accounting is enabled using this command.

**Mode** Line Configuration

**Examples** To apply the accounting server USERS to all VTY lines, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 32
awplus(config-line)# accounting login USERS
```

To reset accounting for login sessions on the console, use the following commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# no accounting login
```

**Related commands** [aaa accounting commands](#)  
[aaa accounting login](#)

## authorization commands

**Overview** This command applies a command authorization method list, defined using the **aaa authorization commands** command, to console and VTY lines.

Use the **no** variant of this command to reset the command authorization configuration on the console and VTY lines.

**Syntax** authorization commands *<privilege-level>* {default|*<list-name>*}  
no authorization commands *<privilege-level>*

| Parameter                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;privilege-level&gt;</i> | The privilege level of the set of commands the method list will be applied to.<br><br>AlliedWare Plus defines three sets of commands, that are indexed by a level value:<br><b>Level = 1:</b> All commands that can be accessed by a user with privilege level between 1 and 6 inclusive<br><b>Level = 7:</b> All commands that can be accessed by a user with privilege level between 7 and 14 inclusive<br><b>Level = 15:</b> All commands that can be accessed by a user with privilege level 15 |
| default                        | Configure the default authorization commands method list.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <i>&lt;list-name&gt;</i>       | Configure a named authorization commands method list                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**Default** The **default** method list is applied to each console and VTY line by default.

**Mode** Line Configuration

**Usage notes** If the specified method list does not exist users will not be able to execute any commands in the specified method list on the specified VTY lines.

**Example** To apply the TAC15 command authorization method list with privilege level 15 to VTY lines 0 to 5, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 5
awplus(config-line)# authorization commands 15 TAC15
```

To reset the command authorization configuration with privilege level 15 on VTY lines 0 to 5, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 5
awplus(config-line)# no authorization commands 15
```

**Related commands** [aaa authorization commands](#)  
[aaa authorization config-commands](#)  
[tacacs-server host](#)

**Command changes** Version 5.4.6-2.1: command added

# clear aaa local user logout

**Overview** Use this command to clear the logout on a specific user account or all user accounts.

**Syntax** clear aaa local user logout {username <username>|all}

| Parameter  | Description                          |
|------------|--------------------------------------|
| username   | Clear logout for the specified user. |
| <username> | Specifies the user account.          |
| all        | Clear logout for all user accounts.  |

**Mode** Privileged Exec

**Examples** To unlock the user account 'bob' use the following command:

```
awplus# clear aaa local user logout username bob
```

To unlock all user accounts use the following command:

```
awplus# clear aaa local user logout all
```

**Related commands** [aaa local authentication attempts logout-time](#)

# debug aaa

**Overview** This command enables AAA debugging.

Use the **no** variant of this command to disable AAA debugging.

**Syntax** debug aaa [accounting|all|authentication|authorization]  
no debug aaa [accounting|all|authentication|authorization]

| Parameter      | Description                        |
|----------------|------------------------------------|
| accounting     | Accounting debugging.              |
| all            | All debugging options are enabled. |
| authentication | Authentication debugging.          |
| authorization  | Authorization debugging.           |

**Default** AAA debugging is disabled by default.

**Mode** Privileged Exec

**Examples** To enable authentication debugging for AAA, use the command:

```
awplus# debug aaa authentication
```

To disable authentication debugging for AAA, use the command:

```
awplus# no debug aaa authentication
```

**Related commands** [show debugging aaa](#)  
[undebug aaa](#)

# login authentication

**Overview** Use this command to apply an AAA server for authenticating user login attempts from a console or remote logins on these console or VTY lines. The authentication method list must be specified by the **aaa authentication login** command. If the method list has not been configured by the **aaa authentication login** command, login authentication will fail on these lines.

Use the **no** variant of this command to reset AAA Authentication configuration to use the default method list for login authentication on these console or VTY lines.

**Command** login authentication {default|<list-name>}

**Syntax** no login authentication

| Parameter   | Description                                                                                                                                                                                               |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| default     | The default authentication method list. If the default method list has not been configured by the <b>aaa authentication login</b> command, the local user database is used for user login authentication. |
| <list-name> | Named authentication server.                                                                                                                                                                              |

**Default** The default login authentication method list, as specified by the **aaa authentication login** command, is used to authenticate user login. If this has not been specified, the default is to use the local user database.

**Mode** Line Configuration

**Examples** To apply the authentication method list called CONSOLE to the console port terminal line (asyn 0), use the following commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# login authentication CONSOLE
```

To reset user authentication configuration on all VTY lines, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 32
awplus(config-line)# no login authentication
```

**Related commands** **aaa authentication login**  
**line**

# proxy-port

**Overview** Use this command to change the local UDP port used for communication between local RADIUS client applications and the RadSecProxy AAA application. Any unused UDP port may be selected. The default port is 1645.

Use the **no** variant of this command to change the UDP port back to the default of 1645.

**Syntax** proxy-port <port>  
no proxy-port

| Parameter | Description               |
|-----------|---------------------------|
| <port>    | UDP Port Number, 1-65536. |

**Default** The default port is 1645.

**Mode** RadSecProxy AAA Configuration Mode

**Usage notes** It is not necessary to change the value from the default unless UDP port 1645 is required for another purpose. RADIUS requests received on this port from external devices will be ignored. The port is only used for local (intra-device) communication.

**Example** To configure change the UDP port to 7001, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy aaa
awplus(config-radsecproxy-aaa)# proxy-port 7001
```

**Related commands** [radius-secure-proxy aaa](#)  
[server \(radsecproxy-aaa\)](#)  
[server name-check](#)  
[server trustpoint](#)

## radius-secure-proxy aaa

**Overview** Use this command to enter the RadSecProxy AAA (authentication, authorization, and accounting) application configuration mode. This application allows local RADIUS-based clients on system to communicate with remote RadSec servers via a secure (TLS) proxy.

**Syntax** radius-secure-proxy aaa

**Mode** Global Configuration Mode

**Example** To change mode from User Exec mode to the RadSecProxy AAA configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy aaa
awplus(config-radsecproxy-aaa)#
```

**Related commands**

- proxy-port**
- server (radsecproxy-aaa)**
- server name-check**
- server trustpoint**

## server (radsecproxy-aaa)

**Overview** Use this command to add a server to the RadSecProxy AAA application. Local RADIUS client applications will attempt, via the proxy, to communicate with any RadSec servers that are operational (in addition to any non-TLS RADIUS servers that are configured).

Use the **no** variant of this command to delete a previously-configured server from the RadSecProxy AAA application.

**Syntax** `server {<hostname>|<ip-addr>} [timeout <1-1000>] [name-check {on|off}]`  
`no server {<hostname>|<ip-addr>}`

| Parameter  | Description                                                                                                                                                                         |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <hostname> | Hostname of RadSec server                                                                                                                                                           |
|            | < Specify the client IPv4 address, in dotted decimal notation a (A.B.C.D).                                                                                                          |
|            | t Specify the amount of time that the RadSecProxy AAA application should wait for replies from this server. RADIUS server timeout (which defaults to 5 seconds).                    |
|            | < Time in seconds to wait for a server reply.                                                                                                                                       |
|            | n Specify whether or not to enforce certificate name c checking for this client. If the parameter is not specified then the global behavior, which defaults to <b>on</b> , is used. |
|            | Enable name checking for this client.                                                                                                                                               |
|            | Disable name checking for this client.                                                                                                                                              |

**Mode** RadSecProxy AAA Configuration Mode

**Usage notes** The server may be specified by its domain name or by its IPv4 address. If a domain name is used, it must be resolvable using a configured DNS name server.

Each server may be configured with a timeout; if not specified, the global timeout value for RADIUS servers will be used. The global timeout may be changed using the **radius-server timeout** command. The default global timeout is 5 seconds.

Each server may be configured to use certificate name-checking; if not specified, the global behavior defined by **server name-check** or **no server name-check** will be used. If name checking is enabled, the Common Name portion of the subject field of the server's X.509 certificate must match the domain name or IP address specified in this command.

**Example** To add a server 'mynas.local' with a timeout of 3 seconds, and name checking off, use the commands:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy aaa
awplus(config-radsecproxy-aaa)# server mynas.local name-check
off
```

**Related commands**

- proxy-port**
- radius-secure-proxy aaa**
- server name-check**
- server trustpoint**

## server mutual-authentication

**Overview** This command enables or disables mutual certificate authentication for all RadSecProxy servers. When enabled, the RadSecProxy AAA application will send a local X.509 certificate to the server when establishing a TLS connection.

Use the **no** variant of this command to disable mutual certificate validation causing the RadSecProxy AAA application to not transmit a certificate to the server.

**NOTE:** *If mutual authentication is disabled on the client (AAA) application but enabled on the server, a connection will not be established.*

**Syntax** server mutual-authentication  
no server mutual-authentication

**Default** Mutual authentication is enabled by default.

**Mode** RadSecProxy AAA Configuration Mode

**Example** Disable mutual certificate validation with the following command:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy aaa
awplus(config-radsecproxy-aaa)# no server mutual-authentication
```

**Related commands** [radius-secure-proxy aaa](#)  
[server name-check](#)  
[server \(radsecproxy-aaa\)](#)

**Command changes** Version 5.4.6-2.1: command added

## server name-check

**Overview** This command sets the global behavior for certificate name-checking for the RadSecProxy AAA application to **on**. This behavior will be used for all servers associated with the application that do not specify a behavior on a per-server basis. If name-checking is enabled, the Common Name portion of the subject field of the client's X.509 certificate must match the domain name or IP address specified in the **server (radsecproxy-aaa)** command.

Use the **no** variant of this command to set the global behavior for certificate name checking to **off**

**Syntax** server name-check  
no server name-check

**Default** Certificate name checking is on by default.

**Mode** RadSecProxy AAA Configuration Mode

**Example** Disable certificate name checking globally with the following command:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy aaa
awplus(config-radsecproxy-aaa)# no server name-check
```

**Related commands** [proxy-port](#)  
[radius-secure-proxy aaa](#)  
[server \(radsecproxy-aaa\)](#)  
[server trustpoint](#)

# server trustpoint

**Overview** This command adds one or more trustpoints to be used with the RadSecProxy AAA application. Multiple trustpoints may be specified, or the command may be executed more than once, to add multiple trustpoints to the application.

The **no** version of this command removes one or more trustpoints from the list of trustpoints associated with the application.

**Syntax** `server trustpoint [<trustpoint-list>]`  
`no server trustpoint [<trustpoint-list>]`

| Parameter         | Description                                             |
|-------------------|---------------------------------------------------------|
| <trustpoint-list> | Specify one or more trustpoints to be added or deleted. |

**Default** By default, no trustpoints are associated with the application.

**Mode** RadSecProxy AAA Configuration Mode

**Usage notes** The device certificate associated with first trustpoint added to the application will be transmitted to remote servers. The certificate received from the remote server must have an issuer chain that terminates with the root CA certificate for any of the trustpoints that are associated with the application.

If no trustpoints are specified in the command, the trustpoint list will be unchanged.

If **no server trustpoint** is issued without specifying any trustpoints, then all trustpoints will be disassociated from the application.

**Example** You can add multiple trustpoints to the RadSecProxy AAA application by executing the command multiple times:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy aaa
awplus(config-radsecproxy-aaa)# server trustpoint example_1
awplus(config-radsecproxy-aaa)# server trustpoint example_2
```

Alternatively, add multiple trustpoints with a single command:

```
awplus(config-radsecproxy-aaa)# server trustpoint example_3
example_4
```

Disassociate all trustpoints from the RadSecProxy AAA application using the command:

```
awplus(config-radsecproxy-aaa)# no server trustpoint
```

**Related commands**

- proxy-port**
- radius-secure-proxy aaa**
- server (radsecproxy-aaa)**
- server name-check**

## show aaa local user locked

**Overview** This command displays the failed attempts against each user account attempting to login into the device, along with the failure times and locations.

Use this command's output to see if a user is currently locked out or not. You can check:

- the number of login attempts that have a 'V' in the 'Valid' column, and
- if the last attempt happened within the lockout time. If the number of 'V' attempts exceeds the maximum allowed number of attempts, and the last attempt is within the lockout time, then the user is locked out.

The maximum number of attempts is 5 by default. You can change it using the command **aaa local authentication attempts max-fail**.

The lockout time is 5 minutes by default. You can change it using the command **aaa local authentication attempts lockout-time**.

Once a user's lockout status is cleared, this command will no longer display any failed attempts for that user. The status gets cleared by:

- being manually cleared by another privileged user, using the **clear aaa local user lockout** command, or
- the locked out user successfully logs into the system after waiting for the lockout time to pass.

In the Valid column:

- 'V' means this login attempt counts towards the maximum allowed number of attempts
- 'I' means this login attempt does not count towards the maximum allowed number of attempts, because it was more than 15 minutes ago.

**Syntax** show aaa local user locked

**Mode** User Exec and Privileged Exec

**Example** To display the current failed attempts for local users, use the command:

```
awplus# show aaa local user locked
```

**Output** The following shows typical output.

**Example output from the show aaa local user locked command**

```
awplus#show aaa local user locked
manager:
When                Type  Source                Valid
2023-02-09 11:48:15 RHOST 192.168.5.1          V
2023-02-09 11:48:21 RHOST 192.168.5.1          V
user1:
When                Type  Source                Valid
2023-02-09 11:47:28 RHOST 192.168.5.1          V

2023-02-09 11:47:19 RHOST 192.168.5.1          V
2023-02-09 11:47:23 TTY   /dev/ttyS0           V
user2:
When                Type  Source                Valid
2023-02-09 11:47:52 TTY   /dev/ttyS0           V
2023-02-09 11:47:55 RHOST 192.168.5.1          V
2023-02-09 11:47:58 TTY   /dev/ttyS0           V
2023-02-09 11:48:05 RHOST 192.168.5.1          V
2023-02-09 11:22:51 RHOST 192.168.5.1          I
2023-02-09 11:22:54 TTY   /dev/ttyS0           I
user3:
When                Type  Source                Valid
2023-02-09 11:38:58 TTY   /dev/ttyS0           V
2023-02-09 11:39:04 RHOST 192.168.5.1          V
2023-02-09 11:39:06 TTY   /dev/ttyS0           V
2023-02-09 11:39:22 RHOST 192.168.5.1          V
2023-02-09 11:39:26 TTY   /dev/ttyS0           V
```

This output example was run at 11:49. The lockout-time and max-fail settings are set to their defaults:

- manager: is not locked out because they only have 2 valid attempts.
- user1: is locked out because they have 7 valid attempts and the most recent was within the lockout time.
- user2: is not locked out because only 4 attempts are valid.
- user3: is not locked out. Even though they have 5 valid attempts, the most recent attempt is older than the lockout time of 5 minutes.

## show aaa server group

**Overview** Use this command to list AAA users and any method lists applied to them.

**Syntax** show aaa server group

**Mode** Privileged Exec

**Example** To show the AAA configuration on a device, use the command:

```
awplus# show aaa server group
```

**Output** The following shows typical output.

### Example output from show aaa server group

| awplus#show aaa server group |      |             |                  |       |            |
|------------------------------|------|-------------|------------------|-------|------------|
| User                         |      | List Name   | Method           |       | Acct-Event |
| login                        | auth | default     | -                | local | -          |
| cmd-1                        | auth | -           | -                | -     | -          |
| cmd-7                        | auth | -           | -                | -     | -          |
| cmd-15                       | auth | -           | -                | -     | -          |
| login                        | acct | -           | -                | -     | -          |
| dot1x                        | auth | default     | radius           | group | -          |
| dot1x                        | acct | vlan30_acct | rad_group_4      | group | start-stop |
| auth-mac                     | auth | default     | radius           | group | -          |
| auth-mac                     | acct | vlan10_acct | rad_group_vlan10 | group | start-stop |
| auth-web                     | auth | default     | radius           | group | -          |
| auth-web                     | acct | default     | rad_group_3      | group | start-stop |
| isakmp                       | auth | default     | radius           | group | -          |

# show debugging aaa

**Overview** Use this command to see what debugging is turned on for AAA (Authentication, Authorization, Accounting).

**Syntax** show debugging aaa

**Mode** User Exec and Privileged Exec

**Example** To display the current debugging status of AAA, use the command:  
awplus# show debug aaa

**Output** The following shows typical output.

## Example output from the show debug aaa command

```
AAA debugging status:  
Authentication debugging is on  
Accounting debugging is off
```

# show radius server group

**Overview** Use this command to show the RADIUS server group configuration.

**Syntax** show radius server group [*<group-name>*]

| Parameter                 | Description               |
|---------------------------|---------------------------|
| <i>&lt;group-name&gt;</i> | RADIUS server group name. |

**Default** Command name is set to something by default.

**Mode** Privileged Exec

**Usage** Use this command with the *<group-name>* parameter to display information for a specific RADIUS server group, or without the parameter to display information for all RADIUS server groups.

**Example** To display information for all RADIUS server groups, use the command:

```
awplus# show radius server group
```

To display a information for a RADIUS server group named 'rad\_group\_list1', use the command:

```
awplus# show radius server group rad_group_list1
```

**Output** The following shows typical output.

**Example output from show radius server group**

```
awplus#show radius server group
RADIUS Group Configuration
  Group Name : radius#
    Server Host/   Auth  Acct  Auth  Acct
    IP Address     Port  Port  Status Status
    -----
    192.168.1.101  1812 1813  Active Active
    192.168.1.102  1812 1813  Active Active

  Group Name : rad_group_list1
    Server Host/   Auth  Acct  Auth  Acct
    IP Address     Port  Port  Status Status
    -----
    192.168.1.101  1812 1813  Active Active

  Group Name : rad_group_list2
    Server Host/   Auth  Acct  Auth  Acct
    IP Address     Port  Port  Status Status
    -----
    192.168.1.102  1812 1813  Active Active
```

**Example output from show radius server group rad\_group\_list1**

```
awplus#show radius server group rad_group_list1
RADIUS Group Configuration
  Group Name : rad_group_list1
    Server Host/   Auth  Acct  Auth  Acct
    IP Address     Port  Port  Status Status
    -----
    192.168.1.101  1812 1813  Active Active
```

# Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure Lightweight Directory Access Protocol (LDAP).

LDAP is an authentication protocol that facilitates user access to various IT resources e.g. applications, servers, networking equipment, and file servers.

It can be used to connect to internal networks over OpenVPN. Although both LDAP and RADIUS are interchangeable on AlliedWare Plus devices as an authentication protocol, LDAP is added because of its ability to interact with directory services such as Microsoft's Active Directory (AD).

For more information, see the **LDAP Feature Overview and Configuration Guide**.

## authentication (ldap-server)

**Overview** Use this command to set the authentication method used to authenticate users against the Lightweight Directory Access Protocol (LDAP) server.

Use the **no** variant of this command to reset the authentication method to **search**.

**Syntax** authentication {search|bind-only}  
no authentication

| Parameter | Description                                                                                                                                                                                                                                                                                                          |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| search    | The <b>search</b> method initially binds to the LDAP server, then searches for the user, then binds to the user using the DN found with the search. The initial bind is either anonymous, or using the user specified with the <b>bind authenticate root-dn</b> command.                                             |
| bind-only | The <b>bind-only</b> method attempts to bind to the LDAP server using a predicted DN based on the username, the user attribute (set with the login-attribute command) and the base DN (set with the <b>base-dn</b> command). The format of this user DN is as follows: '<username>=<login-attribute>,<base-dn>'.<br> |

**Default** Search

**Mode** LDAP Server Configuration

**Example** To set the authentication method to bind-only for the LDAP server called 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# authentication bind-only
```

To reset the authentication method to the default (search) for 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no authentication
```

**Related commands**   **base-dn**  
                          **bind authenticate root-dn**  
                          **ldap-server**  
                          **login-attribute**  
                          **search-filter**

**Command changes**   Version 5.5.2-1.1: command added

# base-dn

**Overview** Use this command to set the base DN (Distinguished Name) of the LDAP server.

When using 'search' authentication, the base DN is the LDAP server's starting point to search for the user within the directory.

If 'bind-only' authentication is enabled, then the base DN is the suffix of the DN that is used to bind to the user.

Use the **no** variant of this command to remove the configured base DN.

**Syntax** base-dn <base-dn>  
no base-dn

| Parameter | Description                     |
|-----------|---------------------------------|
| <base-dn> | The base DN of the LDAP server. |

**Default** Not set

**Mode** LDAP Server Configuration

**Example** To set the base DN for the LDAP server called 'Server1' to 'dc=example, dc=com', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# base-dn dc=example,dc=com
```

To clear the base DN for Server1, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no base-dn
```

**Related commands**

**Command changes** Version 5.5.2-1.1: command added

# bind authenticate root-dn

**Overview** Use this command to set the authenticated user to bind to when searching for a user on an LDAP server. Do not set this option if you wish to use anonymous binding with the 'search' method.

This option is ignored with the 'bind-only' authentication method.

Use the **no** variant of this command to unset the authenticated user.

**Syntax** bind authenticate root-dn <user-dn> password <password>  
no bind authenticate root-dn

| Parameter  | Description                                  |
|------------|----------------------------------------------|
| <user-dn>  | The DN of the authenticated user to bind to. |
| <password> | The password of the authenticated user.      |

**Default** Not set

**Mode** LDAP Server Configuration

**Example** To set the authenticated user to 'cn=admin,dc=example,dc=com' with the password '12345678' for the LDAP server called 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# bind authenticate root-dn
cn=admin,dc=example,dc=com password 12345678
```

**Related commands** [authentication \(ldap-server\)](#)  
[base-dn](#)

**Command changes** Version 5.5.2-1.1: command added

# deadtime (ldap-server)

**Overview** Use this command to configure the deadtime for an LDAP server. The configured deadtime is how long in seconds before an unresponsive LDAP server is considered dead.

Use the **no** variant of this command to remove the deadtime configured on an LDAP server. When you remove the deadtime, the server will never be considered dead.

**Syntax** deadtime <0-1440>  
no deadtime

| Parameter | Description                                                                                 |
|-----------|---------------------------------------------------------------------------------------------|
| <0-1440>  | The number of seconds that the server can be unresponsive for before it is considered dead. |

**Default** 0 seconds (the LDAP server is never considered dead)

**Mode** LDAP Server Configuration

**Example** To set the deadtime to 20 seconds for the LDAP server called 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# deadtime 20
```

To reset the deadtime to the default for 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no deadtime
```

**Command changes** Version 5.5.2-1.1: command added

# debug ldap client

**Overview** Use this command to enable LDAP debugging.  
Use the **no** variant of this command to disable all LDAP debugging.

**Syntax** debug ldap client all  
debug ldap client {[acl] [args] [ber] [config] [conns] [filter]  
[packets] [parse] [shell] [stats] [stats2] [sync] [trace]}  
no debug ldap client

| Parameter | Enable or disable debugging for ...                       |
|-----------|-----------------------------------------------------------|
| all       | All LDAP debugging options                                |
| acl       | Access Control List processing                            |
| args      | Heavy trace debugging (args, arguments)                   |
| ber       | Print out packets sent and received (ber, Bit Error Rate) |
| config    | Configuration processing                                  |
| conns     | Connection management                                     |
| filter    | Search filter processing                                  |
| packets   | Debug packet handling                                     |
| parse     | Parsing processing                                        |
| shell     | Print communication with shell backends                   |
| stats     | Stats from connections, operations and results            |
| stats2    | Stats from log entries sent                               |
| sync      | Syncrepl consumer processing (LDAP Sync replication)      |
| trace     | Trace function calls                                      |

**Default** By default, all LDAP debugging is disabled.

**Mode** Global Configuration

**Example** To turn on all LDAP debugging, use the command:

```
awplus# debug ldap client all
```

To turn on filter and packet LDAP debugging, use the command:

```
awplus# debug ldap client filter packets
```

To disable all LDAP debugging, use the command:

```
awplus# no debug ldap client
```

**Related commands** [aaa authentication login](#)  
[aaa group server](#)  
[ldap-server](#)

**Command changes** Version 5.5.2-1.1: command added

# group-attribute

**Overview** Use this command to configure the name of the attribute that group members are stored in.

It is only necessary to set this option if **group-dn** is used and you don't want to use the default attribute, which is 'uniquemember'.

Use the **no** variant of this command to revert to the default group attribute.

**Syntax** group-attribute <attribute>  
no group-attribute

| Parameter   | Description                                     |
|-------------|-------------------------------------------------|
| <attribute> | The attribute that group members are stored in. |

**Default** The default group attribute is 'uniquemember'.

**Mode** LDAP Server Configuration

**Example** To set the group attribute for the LDAP server called 'Server1' to 'member', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# group-attribute member
```

To reset the group attribute to default for 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no group-attribute
```

**Related commands**

- base-dn**
- bind authenticate root-dn**
- group-dn**
- ldap-server**
- login-attribute**
- search-filter**

**Command changes** Version 5.5.2-1.1: command added

## group-dn

**Overview** Use this command to configure the group DN (Distinguished Name) of the group that users should be a member of.

By default the device will determine this by checking the 'uniquemember' attribute of the group to see if it contains the user's DN string. This can be changed with the **group-attribute** command.

Use the **no** variant of this command to remove the configured group DN.

**Syntax** group-dn <group-dn>  
no group-dn

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| <group-dn> | The DN of the group that users should be a member of. |

**Default** Not set

**Mode** LDAP Server Configuration

**Example** To set the group DN for the LDAP server called 'Server1' to 'cn=Users,dc=example,dc=com', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# group-dn cn=Users,dc=example, dc=com
```

To clear the group DN for 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no group-dn
```

**Related commands** **base-dn**  
**bind authenticate root-dn**  
**group-attribute**  
**ldap-server**  
**login-attribute**  
**search-filter**

**Command changes** Version 5.5.2-1.1: command added

# host (ldap-server)

**Overview** Use this command to configure the address of the remote LDAP server you want to connect to.

Use the **no** variant of this command to remove the remote LDAP server.

**Syntax** host {<host-name>|<ip-address>|<ipv6-address>}  
no host

| Parameter      | Description                                                    |
|----------------|----------------------------------------------------------------|
| <hostname>     | The hostname of the LDAP server.                               |
| <ip-address>   | The IPv4 address of the LDAP server. Uses the format A.B.C.D.  |
| <ipv6-address> | The IPv6 address of the LDAP server. Uses the format x:x::x:x. |

**Default** Not set

**Mode** LDAP Server Configuration

**Example** To set the host for the LDAP server called 'Server1' to the IP address 10.0.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# host 10.0.0.1
```

To set the host for Server1 to the IPv6 address 2001:0db8::a2, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# host 2001:db8::a2
```

To set the host for Server1 to the hostname www.ldapserver.com, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# host www.ldapserver.com
```

To unset the host for Server1, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no host
```

# ldap-server

**Overview** Use this command to configure an LDAP server and enter LDAP server configuration mode.

Use the **no** variant of this command to remove the specified server.

**Syntax** ldap-server <server-name>  
no ldap-server <server-name>

| Parameter     | Description                  |
|---------------|------------------------------|
| <server-name> | The name of the LDAP server. |

**Default** Not set

**Mode** Global Configuration

**Example** To create and configure an LDAP server called 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)#
```

To configure the LDAP server called 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)#
```

To remove an LDAP server called 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# no ldap-server Server1
```

**Command changes** Version 5.5.2-1.1: command added

# login-attribute

**Overview** Use this command to set the name of the attribute user names are stored in. The device will search this attribute for the user's DN (Distinguished Name).

It is only necessary to set this option if you don't want to use the default attribute, which is 'uid'.

If the authentication method is 'bind-only', then this attribute is used as the first component of the user DN, with the base DN added to complete the user DN.

Use the **no** variant of this command to reset the login attribute to the default of 'uid'.

**Syntax** login-attribute <attribute>  
no login-attribute

| Parameter   | Description                                                     |
|-------------|-----------------------------------------------------------------|
| <attribute> | The LDAP attribute to use for the username of connecting users. |

**Default** uid

**Mode** LDAP Server Configuration

**Example** To set the login attribute for the LDAP server called 'Server1' to 'sAMAccountName', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# login-attribute sAMAccountName
```

To reset the login attribute for 'Server1' to the default, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no login-attribute
```

## port (ldap-server)

**Overview** Use this command to configure the port you are using to connect to the remote LDAP server.

Note that if secure ciphers are enabled, then the secure port is used instead. Secure ciphers are configured with the **secure mode (ldap-server)** command.

Use the **no** variant of this command to reset the port number to the default (389).

**Syntax** port <1-65535>  
no port

| Parameter | Description                       |
|-----------|-----------------------------------|
| <1-65535> | Port number from 1 through 65535. |

**Default** 389

**Mode** LDAP Server Configuration

**Example** To set the port for the LDAP server called 'Server1' to 1579, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# port 1579
```

To reset the port for 'Server1' to the default of 389, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no port
```

# retransmit (ldap-server)

**Overview** Use this command to configure the number of times a device will attempt to reconnect to the LDAP server before aborting.

Use the **no** variant of this command to reset the reconnect attempts to the default value of 3.

**Syntax** retransmit <0-100>  
no retransmit

| Parameter | Description                                                                  |
|-----------|------------------------------------------------------------------------------|
| <0-100>   | The number of times the device will attempt to reconnect to the LDAP server. |

**Default** 3 times

**Mode** LDAP Server Configuration

**Example** To set the number of reconnect attempts for the LDAP server called 'Server1' to 5 attempts, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# retransmit 5
```

To reset the number of reconnect attempts for 'Server1' to 3 attempts, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no retransmit
```

**Related commands** [deadtime \(ldap-server\)](#)  
[host \(ldap-server\)](#)  
[ldap-server](#)  
[port \(ldap-server\)](#)  
[timeout \(ldap-server\)](#)

**Command changes** Version 5.5.2-1.1: command added

## search-filter

**Overview** Use this command to add a filter to use when searching for a user on the LDAP server.

The filter should be a form similar to 'attribute=value' or '&(attribute1=value1)(attribute2=value2)

Use the **no** variant of this command to remove the search filter.

**Syntax** search-filter <filter>  
no search-filter

| Parameter | Description                                  |
|-----------|----------------------------------------------|
| <filter>  | The filter to use when searching for a user. |

**Default** Not set

**Mode** LDAP Server Configuration

**Usage notes** If the 'bind-only' authentication method is used, then this value is unused.  
For the search authentication method, a search operation is used to search the LDAP server. The client specifies the starting point (base DN) of the search, the search scope (either the object, its children, or the subtree rooted at the object), and a search filter.

**Example** To set a search filter on the LDAP server called 'Server1' to 'building=block1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# search-filter building=block1
```

To unset the search filter of 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no search-filter
```

**Related commands**   **authentication (ldap-server)**  
**base-dn**  
**bind authenticate root-dn**  
**group-attribute**  
**group-dn**  
**ldap-server**

**Command changes**   Version 5.5.2-1.1: command added

## secure cipher (ldap-server)

**Overview** Use this command to configure the OpenSSL ciphers used in LDAP secure mode. You can choose groups of ciphers from a number of Mozilla TLS configs, or specify multiple individual ciphers in OpenSSL format.

Use the **no** variant of this command to remove the configured ciphers on a server.

**Syntax** secure cipher {old|intermediate|modern}  
secure cipher <cipher-list>  
no secure cipher

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| old           | Ciphers in Mozilla's old TLS config. Alongside the modern and intermediate ciphers, this includes the following ciphers:<br><br>DHE-RSA-CHACHA20-POLY1305,ECDHE-ECDSA-AES128SHA256, ECDHE-RSA-AES128-SHA256,ECDHE-ECDSA-AES128-SHA, ECDHE-RSA-AES128-SHA,ECDHE-ECDSA-AES256-SHA384,<br><br>ECDHE-RSA-AES256-SHA384, ECDHE-ECDSA-AES256-SHA, ECDHE-RSA-AES256-SHA,DHE-RSA-AES128-SHA256, DHE-RSA-AES256-SHA256, AES128-GCM-SHA256, AES256-GCM-SHA384,AES128-SHA256, AES256-SHA256, AES128-SHA, AES256-SHA, DES-CBC3-SHA |
| intermediate  | Ciphers in Mozilla's intermediate TLS config. | modern        | Ciphers in Mozilla's modern TLS config. Includes the following ciphers:<br><br>TLS_AES_128_GCM_SHA256, TLS_AES_256_GCM_SHA384, TLS_CHACHA20_POLY1305_SHA256                                                                                                                                                                                                                                                                                                                                                            |
| <cipher-list> | The name (or names) of a cipher in OpenSSL format. This is a <b>space</b> separated list of cipher names, for example:<br><br>DHE-DSS-AES256-GCM-SHA384 TLS_AES_256_GCM_SHA384                                                                                                                                                                                                                                                                                                                                         |

**Default** Not set

**Mode** LDAP Server Configuration

**Example** To use the Intermediate Mozilla cipher suite on the LDAP server called Server1, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# secure cipher intermediate
```

To remove the configured ciphers on 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no secure cipher
```

To use the ciphers DHE-DSS-AES256-GCM-SHA384 and TLS\_AES\_256\_GCM\_SHA384 on 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# secure cipher DHE-DSS-AES256-GCM-SHA384 TLS_AES_256_GCM_SHA384
```

**Command changes** Version 5.5.2-1.1: command added

## secure mode (ldap-server)

**Overview** Use this command to configure the LDAP server to use secure mode. Secure mode encrypts communications with the LDAP server using TLS (Transport Layer Security). If you don't specify a port number, the default port (636) is used.

For secure mode, you should also set the CA certificate using the **secure trustpoint (ldap-server)** command.

Use **no secure mode** to disable secure mode for communicating with this LDAP server.

Use **no secure mode secure-port** to reset the secure mode port to the default.

**Syntax** secure mode [secure-port <port>]  
no secure mode  
no secure mode secure-port

| Parameter | Description                                            |
|-----------|--------------------------------------------------------|
| <port>    | The secure port for communicating with the LDAP server |

**Default** Secure mode is disabled, and the default port is 636

**Mode** LDAP Server Configuration

**Example** To enable secure mode for communicating with the LDAP server called 'Server1', with the default port, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# secure mode
```

To disable secure mode for communicating with 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no secure mode
```

To enable secure mode with the port 1234 for communicating with 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# secure mode secure-port 1234
```

To reset the secure mode port to the default on 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no secure mode secure-port
```

**Related commands**

- host (ldap-server)**
- ldap-server**
- port (ldap-server)**
- secure cipher (ldap-server)**
- secure trustpoint (ldap-server)**

**Command changes** Version 5.5.2-1.1: command added

# secure trustpoint (ldap-server)

**Overview** Use this command to link a preconfigured trustpoint to the LDAP server configuration. The trustpoint must be the LDAP server certificate and is required to successfully connect to the LDAP server when secure mode is enabled.

Use the **no** variant of this command to remove a trustpoint from an LDAP server.

**Syntax** secure trustpoint <trustpoint>  
no secure trustpoint

| Parameter    | Description                                          |
|--------------|------------------------------------------------------|
| <trustpoint> | The name of the trustpoint used for LDAP secure mode |

**Default** Not set

**Mode** LDAP Server Configuration

**Example** To set the trustpoint to Trustpoint1 for the LDAP server called 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap server Server1
awplus(config-ldap-server)# secure trustpoint Trustpoint1
```

To remove the trustpoint from 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap server Server1
awplus(config-ldap-server)# no secure trustpoint
```

**Related commands** [host \(ldap-server\)](#)  
[ldap-server](#)  
[port \(ldap-server\)](#)  
[secure cipher \(ldap-server\)](#)  
[secure mode \(ldap-server\)](#)

**Command changes** Version 5.5.2-1.1: command added

# server (ldap-group)

**Overview** Use this command to add an LDAP server to an LDAP server group.

The server is identified by the name of the server, which is created using the **ldap-server** command.

Use the **no** variant of this command to remove an LDAP server from an LDAP server group.

**Syntax** server <server-name>  
no server <server-name>

| Parameter     | Description                                                                 |
|---------------|-----------------------------------------------------------------------------|
| <server-name> | The name of the LDAP server group, specified when creating the LDAP server. |

**Default** By default, LDAP servers are only added to the default 'ldap' server group.

**Mode** LDAP Server Group Configuration

**Usage notes** The server is appended to the server list of the group, and the order of configuration determines the precedence of servers.

**Example** To add the LDAP server called 'Server1' to the LDAP server group called 'Group1', use the commands:

```
awplus# configure terminal
awplus(config)# aaa group server ldap Group1
awplus(config-ldap-group)# server Server1
```

To remove 'Server1' from 'Group1', use the commands:

```
awplus# configure terminal
awplus(config)# aaa group server ldap Group1
awplus(config-ldap-group)# no server Server1
```

**Related commands** [aaa authentication login](#)  
[aaa group server](#)  
[ldap-server](#)  
[show ldap server group](#)

**Command changes** Version 5.5.2-1.1: command added

# show ldap server group

**Overview** Use this command to display information about LDAP server groups, their servers and the status of those servers.

**Syntax** show ldap server group [<group-name>]

| Parameter    | Description                        |
|--------------|------------------------------------|
| <group-name> | The name of the LDAP server group. |

**Mode** Global Configuration

**Usage notes** If you specify a single group name, you will only see information relating to that specific server group. Otherwise, all LDAP server groups are shown, including the 'ldap' group that contains every LDAP server.

**Example** To show all server groups, use the command:

```
awplus# show ldap server group
```

To show the default LDAP group that includes all the LDAP servers, use the command:

```
awplus# show ldap server group ldap
```

To show a server group named 'CustomGroup1', use the command:

```
awplus# show ldap server group CustomGroup1
```

**Output** The following shows typical output.

## Example output from show ldap server group

```
LDAP Group Configuration
Group Name : ldap
  LDAP server name  Server Host/IP Address  Port  Status
-----
server_one         10.1.1.1                N/A   Alive
server_two         10.2.1.1                N/A   Dead (1 hour)

Group Name : CustomGroup1
  LDAP server name  Server Host/IP Address  Port  Status
-----
server_one         10.1.1.1                N/A   Alive

Group Name : CustomGroup2
  LDAP server name  Server Host/IP Address  Port  Status
-----
No LDAP servers currently defined
```

                          [server \(ldap-group\)](#)

**Command changes**   Version 5.5.2-1.1: command added

# timeout (ldap-server)

**Overview** Use this command to set the time to wait for a connection before reattempting to connect to the LDAP server.

Use the **no** variant of this command to reset the timeout back to the default value.

**Syntax** timeout <1-1000>  
no timeout

| Parameter | Description                                                                                       |
|-----------|---------------------------------------------------------------------------------------------------|
| <1-1000>  | The number of seconds to wait for a connection before reattempting to connect to the LDAP server. |

**Default** 5 seconds

**Mode** LDAP Server Configuration

**Example** To set the server timeout for the LDAP server called 'Server1' to 10 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# timeout 10
```

To set the server timeout for 'Server1' to the default, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no timeout
```

**Related commands** [deadtime \(ldap-server\)](#)

# Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure the device as a RADIUS client.

For more information, see the **[RADIUS Feature Overview and Configuration Guide](#)**.

# auth-mac-promiscuous

**Overview** Use this command to enable promiscuous mode for MAC address authentication on a local RADIUS server.

Use the **no** variant of this command to disable MAC authentication promiscuous mode on a local RADIUS server.

**Syntax** auth-mac-promiscuous  
no auth-mac-promiscuous

**Default** Disabled.

**Mode** RADIUS Server Configuration

**Usage notes** In promiscuous mode, the RADIUS server will respond with an Access-Accept for any Access-Request with a Radius Service-Type attribute of 'Call-Check', when the supplicants credentials are NOT in the user database.

If the credentials do appear in the database, the behavior of the server is unchanged.

**Example** To disable MAC authentication promiscuous mode on a local RADIUS server, use the commands:

```
awplus# radius-server local  
awplus(config-radsrv)# no auth-mac-promiscuous
```

**Related commands** [show radius local-server auth-mac-promiscuous](#)

**Command changes** Version 5.5.3-2.1: command added

# auth radius send nas-identifier

**Overview** Use this command to enable the device to include the NAS-Identifier(32) attribute in RADIUS authentication requests.

Use the **no** variant of this command to stop including the NAS-Identifier attribute.

**Syntax** `auth radius send nas-identifier {<name>|vlan-id}`  
`no auth radius send nas-identifier`

| Parameter | Description                                                                                                                                  |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <name>    | Send this user-defined text as the NAS-Identifier. You can specify up to 253 characters.                                                     |
| vlan-id   | Send the VLAN ID of the authentication port as the NAS-Identifier. This is the configured VLAN ID, not the dynamic VLAN ID or guest VLAN ID. |

**Mode** Global Configuration

**Example** To use a user-defined identifier of NASID100 as the NAS-Identifier attribute, use the commands:

```
awplus# configure terminal
awplus(config)# auth radius send nas-identifier NASID100
```

To use the VLAN ID as the NAS-Identifier attribute, use the commands:

```
awplus# configure terminal
awplus(config)# auth radius send nas-identifier vlan-id
```

To stop sending the NAS-Identifier attribute, use the commands:

```
awplus# configure terminal
awplus(config)# no auth radius send nas-identifier
```

**Related commands** [auth radius send service-type](#)

## auth radius send service-type

**Overview** Use this command to enable the device to include the Service-Type(6) attribute in RADIUS authentication requests. The Service-Type attribute has a value of:

- Framed(2) for 802.1x
- Call-Check(10) for MAC authentication
- Unbound(5) for Web authentication.

Use the **no** variant of this command to stop including the Service-Type attribute.

**Syntax** auth radius send service-type  
no auth radius send service-type

**Mode** Global Configuration

**Example** To send the Service-Type attribute, use the commands:

```
awplus# configure terminal
awplus(config)# auth radius send service-type
```

**Related commands** [auth radius send nas-identifier](#)

# clear radius dynamic-authorization counters

**Overview** Use this command to set the Dynamic Authorization message counters to zero.

**Syntax** clear radius dynamic-authorization counters

**Mode** Privileged Exec

**Example** To set the Dynamic Authorization message counters to zero, use the command:

```
awplus# clear radius dynamic-authorization counters
```

**Related commands** [radius dynamic-authorization-client](#)  
[show radius dynamic-authorization counters](#)

**Command changes** Version 5.5.1-1.1: command added

## deadtime (RADIUS server group)

**Overview** Use this command to configure the **deadtime** parameter for the RADIUS server group. This command overrides the global dead-time configured by the **radius-server deadtime**. The configured deadtime is the time period in minutes to skip a RADIUS server for authentication or accounting requests if the server is 'dead'. Note that a RADIUS server is considered 'dead' if there is no response from the server within a defined time period.

Use the **no** variant of this command to reset the deadtime configured for the RADIUS server group. If the global deadtime for RADIUS server is configured the value will be used for the servers in the group. The global deadtime for the RADIUS server is set to 0 minutes by default.

**Syntax** `deadtime <0-1440>`  
`no deadtime`

| Parameter                   | Description                |
|-----------------------------|----------------------------|
| <code>&lt;0-1440&gt;</code> | Amount of time in minutes. |

**Default** The deadtime is set to 0 minutes by default.

**Mode** RADIUS Server Group Configuration

**Usage** If the RADIUS server does not respond to a request packet, the packet is retransmitted the number of times configured for the **retransmit** parameter (after waiting for a **timeout** period to expire). The server is then marked 'dead', and the time is recorded. The **deadtime** parameter configures the amount of time to skip a dead server; if a server is dead, no request message is sent to the server for the **deadtime** period.

**Examples** To configure the deadtime for 5 minutes for the RADIUS server group 'GROUP1', use the commands:

```
awplus(config)# aaa group server radius GROUP1
awplus(config-sg)# server 192.168.1.1
awplus(config-sg)# deadtime 5
```

To remove the deadtime configured for the RADIUS server group 'GROUP1', use the commands:

```
awplus(config)# aaa group server radius GROUP1
awplus(config-sg)# no deadtime
```

**Related commands** **aaa group server**  
**radius-server deadtime**

# debug radius

**Overview** This command enables RADIUS debugging. If no option is specified, all debugging options are enabled.

Use the **no** variant of this command to disable RADIUS debugging. If no option is specified, all debugging options are disabled.

**Syntax** debug radius [packet|event|all]  
no debug radius [packet|event|all]

| Parameter | Description                                          |
|-----------|------------------------------------------------------|
| packet    | Debugging for RADIUS packets is enabled or disabled. |
| event     | Debugging for RADIUS events is enabled or disabled.  |
| all       | Enable or disable all debugging options.             |

**Default** RADIUS debugging is disabled by default.

**Mode** Privileged Exec

**Examples** To enable debugging for RADIUS packets, use the command:

```
awplus# debug radius packet
```

To enable debugging for RADIUS events, use the command:

```
awplus# debug radius event
```

To disable debugging for RADIUS packets, use the command:

```
awplus# no debug radius packet
```

To disable debugging for RADIUS events, use the command:

```
awplus# no debug radius event
```

**Related commands** [show debugging radius](#)  
[undebug radius](#)

# ip radius require-message-authenticator

**Overview** Use this command to configure the RADIUS client to reject unverified RADIUS packets. This means it will discard any received RADIUS Access-Accept, Access-Challenge, and Access-Reject packets that do not have a valid Message-Authenticator attribute.

Use the **no** variant of this command to allow the client to accept unverified RADIUS packets.

**Syntax** `ip radius require-message-authenticator`  
`no ip radius require-message-authenticator`

**Default** Disabled

**Mode** Global Configuration

**Example** To require Message-Authenticator attributes in responses from RADIUS servers, use the commands:

```
awplus# configure terminal
awplus(config)# ip radius require-message-authenticator
```

**Related commands** [nas message-authenticator \(radsvr\)](#)  
[radius-server host](#)  
[show radius local-server nas](#)

**Command changes** Version 5.5.4-2.3: command added

## ip radius source-interface

**Overview** This command configures the source IP address of every outgoing RADIUS packet to use a specific IP address or the IP address of a specific interface. If the specified interface is down or there is no IP address on the interface, then the source IP address of outgoing RADIUS packets depends on the interface the packets leave.

Use the **no** variant of this command to remove the source interface configuration. The source IP address in outgoing RADIUS packets will be the IP address of the interface from which the packets are sent.

**Syntax** `ip radius source-interface {<interface>|<ip-address>}`  
`no ip radius source-interface`

| Parameter                       | Description                                      |
|---------------------------------|--------------------------------------------------|
| <code>&lt;interface&gt;</code>  | Interface name.                                  |
| <code>&lt;ip-address&gt;</code> | IP address in the dotted decimal format A.B.C.D. |

**Default** Source IP address of outgoing RADIUS packets depends on the interface the packets leave.

**Mode** Global Configuration

**Examples** To configure all outgoing RADIUS packets to use the IP address of the interface "vlan1" for the source IP address, use the following commands:

```
awplus# configure terminal
awplus(config)# ip radius source-interface vlan1
```

To configure the source IP address of all outgoing RADIUS packets to use 192.168.1.10, use the following commands:

```
awplus# configure terminal
awplus(config)# ip radius source-interface 192.168.1.10
```

To reset the source interface configuration for all outgoing RADIUS packets, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip radius source-interface
```

**Related commands** [radius-server host](#)  
[show radius statistics](#)

# radius dynamic-authorization-client

**Overview** Use this command to add a Dynamic Authorization Client (DAC). A Network Access Server (NAS) will only accept Dynamic Authorization (DA) messages from DACs that have been authorized using this command.

Use the **no** variant of this command to remove a DAC from the list of authorized clients.

**Syntax** radius dynamic-authorization-client <ip-address> key <key-string>

no radius dynamic-authorization-client <ip-address>

When in secure mode (see the **crypto secure-mode** command), the syntax in config files will be:

radius dynamic-authorization-client <ip-address> key-encrypted <encrypted-key-string>

When not in secure mode, the syntax in config files will be:

radius dynamic-authorization-client <ip-address> key <encoded-key-string> encrypted

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                  |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ip-address>  | IP address of the DAC, entered in the form A.B.C.D                                                                                                                                                                                                                                                                                                           |
| key           | Sets the shared-key of the client.                                                                                                                                                                                                                                                                                                                           |
| key-encrypted | <p>This parameter displays in configuration files when secure mode is enabled.</p> <p>Set an encrypted shared secret key. When secure mode is enabled, the running configuration contains this parameter instead of the key parameter. It indicates that the device stores keys in the running configuration in encrypted form instead of in plain text.</p> |
| encrypted     | <p>This parameter displays in configuration files when secure mode is disabled.</p> <p>Means that the password that follows is encoded, not plain text. This parameter is only used in generated configuration files. In configuration files, the device prints encrypted in front of passwords to indicate that it is displaying the encoded password.</p>  |

**Mode** Global Configuration

**Usage notes** The RADIUS protocol does not support unsolicited messages sent from the RADIUS server to the NAS. This means that the network access configuration a supplicant receives from a RADIUS server cannot be updated until the supplicant re-authenticates with the RADIUS server.

In some situations it is desirable to either update a supplicant's configuration, or even disconnect their session.

This command allows a Dynamic Authentication Client to send a message that will either update or terminate a supplicant's session.

**Example** To add a DAC with IP address 10.0.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# radius dynamic-authorization-client 10.0.0.1 key
secret-key
```

To remove the configuration for a DAC with IP address 10.0.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# no radius dynamic-authorization-client 10.0.0.1
```

**Related commands** [clear radius dynamic-authorization counters](#)  
[show radius dynamic-authorization counters](#)

**Command changes** Version 5.5.4-0.1: **encrypted** parameter added  
Version 5.5.1-1.1: command added

## radius-server deadtime

**Overview** Use this command to specify the global **deadtime** for all RADIUS servers. If a RADIUS server is considered dead, it is skipped for the specified deadtime. This command specifies for how many minutes a RADIUS server that is not responding to authentication requests is passed over by requests for RADIUS authentication.

Use the **no** variant of this command to reset the global deadtime to the default of 0 seconds, so that RADIUS servers are not skipped even if they are dead.

**Syntax** radius-server deadtime <minutes>  
no radius-server deadtime

| Parameter | Description                                                          |
|-----------|----------------------------------------------------------------------|
| <minutes> | RADIUS server deadtime in minutes in the range 0 to 1440 (24 hours). |

**Default** The default RADIUS deadtime configured on the system is 0 seconds.

**Mode** Global Configuration

**Usage** The RADIUS client considers a RADIUS server to be dead if it fails to respond to a request after it has been retransmitted as often as specified globally by the **radius-server retransmit** command or for the server by the **radius-server host** command. To improve RADIUS response times when some servers may be unavailable, set a **deadtime** to skip dead servers.

**Examples** To set the dead time of the RADIUS server to 60 minutes, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server deadtime 60
```

To disable the dead time of the RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server deadtime
```

**Related commands**   **deadtime (RADIUS server group)**  
**radius-server host**  
**radius-server retransmit**  
**show radius statistics**

## radius-server host

**Overview** Use this command to specify a remote RADIUS server host for authentication or accounting, and to set server-specific parameters. The parameters specified with this command override the corresponding global parameters for RADIUS servers. This command specifies the IP address or host name of the remote RADIUS server host and assigns authentication and accounting destination UDP port numbers.

This command adds the RADIUS server address and sets parameters to the RADIUS server. The RADIUS server is added to the running configuration after you issue this command. If parameters are not set using this command then common system settings are applied.

Use the **no** variant of this command to remove the specified server host as a RADIUS authentication and/or accounting server and set the destination port to the default RADIUS server port number (1812).

**Syntax** `radius-server host {<host-name>|<ip-address>} [acct-port <0-65535>] [auth-port <0-65535>] [key <key-string>] [encrypted] [retransmit <0-100>] [timeout <1-1000>]`  
`no radius-server host {<host-name>|<ip-address>} [acct-port <0-65535>] [auth-port <0-65535>]`

**Syntax (Secure Mode)** `radius-server host {<host-name>|<ip-address>} [acct-port <0-65535>] [auth-port <0-65535>] [key-encrypted <encrypted-key-string>] [retransmit <0-100>] [timeout <1-1000>]`  
`no radius-server host {<host-name>|<ip-address>} [acct-port <0-65535>] [auth-port <0-65535>]`

When in secure mode, the syntax in config files will be:

`radius-server key-encrypted <encrypted-key-string>`

When not in secure mode, the syntax in config files will be:

`radius-server key <encoded-key-string> encrypted`

| Parameter                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;host-name&gt;</i>  | Server host name. The DNS name of the RADIUS server host.                                                                                                                                                                                                                                                                                                                                                                           |
| <i>&lt;ip-address&gt;</i> | The IP address of the RADIUS server host.                                                                                                                                                                                                                                                                                                                                                                                           |
| acct-port                 | Accounting port. Specifies the UDP destination port for RADIUS accounting requests. If 0 is specified, the server is not used for accounting. The default UDP port for accounting is 1813.                                                                                                                                                                                                                                          |
| <i>&lt;0-65535&gt;</i>    | UDP port number. (Accounting port number is set to 1813 by default) Specifies the UDP destination port for RADIUS accounting requests. If 0 is specified, the host is not used for accounting.                                                                                                                                                                                                                                      |
| auth-port                 | Authentication port. Specifies the UDP destination port for RADIUS authentication requests. If 0 is specified, the server is not used for authentication. The default UDP port for authentication is 1812.                                                                                                                                                                                                                          |
| <i>&lt;0-65535&gt;</i>    | UDP port number (authentication port number is set to 1812 by default). Specifies the UDP destination port for RADIUS authentication requests. If 0 is specified, the host is not used for authentication.                                                                                                                                                                                                                          |
| timeout                   | Specifies the amount of time to wait for a response from the server. If this parameter is not specified the global value configured by the <b>radius-server timeout</b> command is used.                                                                                                                                                                                                                                            |
| <i>&lt;1-1000&gt;</i>     | Time in seconds to wait for a server reply (timeout is set to 5 seconds by default). The time interval (in seconds to wait for the RADIUS server to reply before retransmitting a request or considering the server dead. This setting overrides the global value set by the <b>radius-server timeout</b> command. If no timeout value is specified for this server, the global value is used.                                      |
| retransmit                | Specifies the number of retries before skip to the next server. If this parameter is not specified the global value configured by the <b>radius-server retransmit</b> command is used.                                                                                                                                                                                                                                              |
| <i>&lt;0-100&gt;</i>      | Maximum number of retries (maximum number of retries is set to 3 by default). The maximum number of times to resend a RADIUS request to the server, if it does not respond within the timeout interval, before considering it dead and skipping to the next RADIUS server. This setting overrides the global setting of the <b>radius-server retransmit</b> command. If no retransmit value is specified, the global value is used. |

| Parameter                           | Description                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| key                                 | Set shared secret key with RADIUS servers.                                                                                                                                                                                                                                                                                                                                                                              |
| <i>&lt;key-string&gt;</i>           | <p>Shared key string applied. Specifies the shared secret authentication or encryption key for all RADIUS communications between this device and the RADIUS server. This key must match the encryption used on the RADIUS daemon. All leading spaces are ignored.</p> <p>This setting overrides the global setting of the <b>radius-server key</b> command. If no key value is specified, the global value is used.</p> |
| encrypted                           | Means that the password that follows is encoded, not plain text. This parameter is only used in generated configuration files. In configuration files, the device prints encrypted in front of passwords to indicate that it is displaying the encoded password.                                                                                                                                                        |
| key-encrypted                       | Set an encrypted shared secret key. When secure mode is enabled, the running configuration contains this parameter instead of the key parameter. It indicates that the device stores keys in the running configuration in encrypted form instead of in plain text.                                                                                                                                                      |
| <i>&lt;encrypted-key-string&gt;</i> | Encrypted shared key string.                                                                                                                                                                                                                                                                                                                                                                                            |

**Default** The RADIUS client address is not configured (null) by default. No RADIUS server is configured.

**Mode** Global Configuration

**Usage** Multiple **radius-server host** commands can be used to specify multiple hosts. The software searches for hosts in the order they are specified. If no host-specific timeout, retransmit, or key values are specified, the global values apply to that host. If there are multiple RADIUS servers for this client, use this command multiple times—once to specify each server.

If you specify a host without specifying the auth port or the acct port, it will by default be configured for both authentication and accounting, using the default UDP ports. To set a host to be a RADIUS server for authentication requests only, set the **acct-port** parameter to 0; to set the host to be a RADIUS server for accounting requests only, set the auth-port parameter to 0.

A RADIUS server is identified by IP address, authentication port and accounting port. A single host can be configured multiple times with different authentication or accounting ports. All the RADIUS servers configured with this command are included in the predefined RADIUS server group radius, which may be used by AAA authentication, authorization and accounting commands. The client transmits (and retransmits, according to the **retransmit** and **timeout** parameters) RADIUS authentication or accounting requests to the servers in the order you specify them, until it gets a response.

**Examples** To add the RADIUS server 10.0.0.20, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host 10.0.0.20
```

To set the secret key to 'mySecret' on the RADIUS server 10.0.0.20, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host 10.0.0.20 key mySecret
```

To delete the RADIUS server 10.0.0.20, use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server host 10.0.0.20
```

To configure rad1.company.com for authentication only, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host rad1.company.com acct-port 0
```

To remove the RADIUS server rad1.company.com configured for authentication only, use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server host rad1.company.com acct-port
0
```

To configure rad2.company.com for accounting only, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host rad2.company.com auth-port 0
```

To configure 192.168.1.1 with authentication port 1000, accounting port 1001 and retransmit count 5, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host 192.168.1.1 auth-port 1000
acct-port 1001 retransmit 5
```

- Version 5.4.9-2.1: **key-encrypted** parameter added

## radius-server key

**Overview** This command sets a global secret key for RADIUS authentication on the device. The shared secret text string is used for RADIUS authentication between the device and a RADIUS server.

Note that if no secret key is explicitly specified for a RADIUS server, the global secret key will be used for the shared secret for the server.

Use the **no** variant of this command to reset the secret key to the default (null).

**Syntax** radius-server key *<key-string>*  
no radius-server key

When in secure mode, the syntax in config files will be:

radius-server key-encrypted *<encrypted-key-string>*

When not in secure mode, the syntax in config files will be:

radius-server key *<encoded-key-string>* [encrypted]

| Parameter                                            | Description                                                                                                                                                                                                                                                                                                                                                           |
|------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| key <i>&lt;key-string&gt;</i>                        | Shared secret among RADIUS server and 802.1X client.                                                                                                                                                                                                                                                                                                                  |
| encrypted                                            | Means that the password that follows is encoded, not plain text. This parameter is only used in generated configuration files. In configuration files, the device prints encrypted in front of passwords to indicate that it is displaying the encoded password.                                                                                                      |
| key-encrypted<br><i>&lt;encrypted-key-string&gt;</i> | This parameter indicates that the key is in its encrypted form. You would not normally enter this command. Instead, if you enter key and secure mode is enabled, the running config contains this parameter instead of the key parameter. This indicates that in secure mode the device stores keys in the running config in encrypted form instead of in plain text. |

**Default** The RADIUS server secret key on the system is not set by default (null).

**Mode** Global Configuration

**Usage** Use this command to set the global secret key shared between this client and its RADIUS servers. If no secret key is specified for a particular RADIUS server using the **radius-server host** command, this global key is used.

After enabling AAA authentication with the **aaa authentication login** command, set the authentication and encryption key using the **radius-server key** command so the key entered matches the key used on the RADIUS server.

**Examples** To set the global secret key to **allied** for RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server key allied
```

To set the global secret key to **secret** for RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server key secret
```

To delete the global secret key for RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server key
```

**Related commands** **radius-server host**  
**show radius statistics**

**Command changes** Version 5.5.3-2.1: **encrypted** parameter added

## radius-server retransmit

**Overview** This command sets the retransmit counter to use RADIUS authentication on the device. This command specifies how many times the device transmits each RADIUS request to the RADIUS server before giving up.

This command configures the **retransmit** parameter for RADIUS servers globally. If the **retransmit** parameter is not specified for a RADIUS server by the **radius-server host** command then the global configuration set by this command is used for the server instead.

Use the **no** variant of this command to reset the re-transmit counter to the default (3).

**Syntax** radius-server retransmit <retries>  
no radius-server retransmit

| Parameter | Description                                                                                                                                                                                                                                                                                                                                        |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <retries> | RADIUS server retries in the range <0-100>.<br><br>The number of times a request is resent to a RADIUS server that does not respond, before the server is considered dead and the next server is tried. If no retransmit value is specified for a particular RADIUS server using the <b>radius-server host</b> command, this global value is used. |

**Default** The default RADIUS retransmit count on the device is 3.

**Mode** Global Configuration

**Examples** To set the RADIUS **retransmit** count to 1, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server retransmit 1
```

To set the RADIUS **retransmit** count to the default (3), use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server retransmit
```

To configure the RADIUS **retransmit** count globally with 5, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server retransmit 5
```

To disable retransmission of requests to a RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server retransmit 0
```

**Related commands** [radius-server deadtime](#)  
[radius-server host](#)

## radius-server timeout

**Overview** Use this command to specify the RADIUS global timeout value. This is how long the device waits for a reply to a RADIUS request before retransmitting the request, or considering the server to be dead. If no timeout is specified for the particular RADIUS server by the **radius-server host** command, it uses this global timeout value.

Note that this command configures the **timeout** parameter for RADIUS servers globally.

The **no** variant of this command resets the transmit timeout to the default (5 seconds).

**Syntax** radius-server timeout <seconds>  
no radius-server timeout

| Parameter | Description                                                                                                                                                                                                                                                                      |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <seconds> | RADIUS server timeout in seconds in the range 1 to 1000.<br><br>The global time in seconds to wait for a RADIUS server to reply to a request before retransmitting the request, or considering the server to be dead (depending on the <b>radius-server retransmit</b> command). |

**Default** The default RADIUS transmit timeout on the system is 5 seconds.

**Mode** Global Configuration

**Examples** To globally set the device to wait 20 seconds before retransmitting a RADIUS request to unresponsive RADIUS servers, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server timeout 20
```

To set the RADIUS **timeout** parameter to 1 second, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server timeout 1
```

To set the RADIUS **timeout** parameter to the default (5 seconds), use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server timeout
```

To configure the RADIUS server **timeout** period globally with 3 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server timeout 3
```

To reset the global **timeout** period for RADIUS servers to the default, use the following command:

```
awplus# configure terminal
awplus(config)# no radius-server timeout
```

## server (RADIUS server group)

**Overview** This command adds a RADIUS server to a server group in RADIUS Server Group Configuration mode. The RADIUS server should be configured by the **radius-server host** command.

The device adds each server to the end of the group's list of servers, so add the servers in order of priority. If you add a server and it is already in the list, it will be removed and then re-added to the end of the list.

The server is identified by IP address and authentication and accounting UDP port numbers. So a RADIUS server can have multiple entries in a group with different authentication and/or accounting UDP ports. The **auth-port** specifies the UDP destination port for authentication requests to the server. To disable authentication for the server, set **auth-port** to 0. If the authentication port is missing, the default port number is 1812. The **acct-port** specifies the UDP destination port for accounting requests to the server. To disable accounting for the server, set **acct-port** to 0. If the accounting port is missing, the default port number is 1813.

Use the **no** variant of this command to remove a RADIUS server from the server group.

**Syntax** `server {<hostname>|<ip-address>} [auth-port <0-65535>] [acct-port <0-65535>]`  
`no server {<hostname>|<ip-address>} [auth-port <0-65535>] [acct-port <0-65535>]`

| Parameter    | Description                                                                                                                                                                                                                                                            |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <hostname>   | Server host name                                                                                                                                                                                                                                                       |
| <ip-address> | Server IP address<br>The server is identified by IP address, authentication and accounting UDP port numbers. So a RADIUS server can have multiple entries in a group with different authentication and/or accounting UDP ports.                                        |
| auth-port    | Authentication port<br>The <b>auth-port</b> specifies the UDP destination port for authentication requests to the server. To disable authentication for the server, set <b>auth-port</b> to 0. If the authentication port is missing, the default port number is 1812. |
| <0-65535>    | UDP port number (default: 1812)                                                                                                                                                                                                                                        |
| acct-port    | Accounting port<br>The <b>acct-port</b> specifies the UDP destination port for accounting requests to the server. To disable accounting for the server, set <b>acct-port</b> to 0. If the accounting port is missing, the default port number is 1813.                 |
| <0-65535>    | UDP port number (default: 1813)                                                                                                                                                                                                                                        |

**Default** The default Authentication port number is 1812 and the default Accounting port number is 1813.

**Mode** RADIUS Server Group Configuration

**Usage notes** The RADIUS server to be added must be configured by the **radius-server host** command. In order to add or remove a server, the **auth-port** and **acct-port** parameters in this command must be the same as the corresponding parameters in the **radius-server host** command.

**Examples** To create a RADIUS server group 'RAD\_AUTH1' for authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa group server radius RAD_AUTH1
awplus(config-sg)# server 192.168.1.1 acct-port 0
awplus(config-sg)# server 192.168.2.1 auth-port 1000 acct-port
0
```

To create a RADIUS server group 'RAD\_ACCT1' for accounting, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa group server radius RAD_ACCT1
awplus(config-sg)# server 192.168.2.1 auth-port 0 acct-port 1001
awplus(config-sg)# server 192.168.3.1 auth-port 0
```

To remove server 192.168.3.1 from the existing server group 'GROUP1', use the following commands:

```
awplus# configure terminal
awplus(config)# aaa group server radius GROUP1
awplus(config-sg)# no server 192.168.3.1
```

# show debugging radius

**Overview** This command displays the current debugging status for the RADIUS servers.

**Syntax** show debugging radius

**Mode** User Exec and Privileged Exec

**Example** To display the current debugging status of RADIUS servers, use the command:

```
awplus# show debugging radius
```

**Output** The following shows typical output.

## Example output from the show debugging radius command

```
RADIUS debugging status:  
RADIUS event debugging is off  
RADIUS packet debugging is off
```

# show radius

**Overview** This command displays the current RADIUS server configuration and status.

**Syntax** show radius

**Mode** User Exec and Privileged Exec

**Example** To display the current status of RADIUS servers, use the command:  
awplus# show radius

**Output** The following shows typical output.

## Example output from the show radius command showing RADIUS servers

```
RADIUS Global Configuration
Source Interface : not configured
Secret Key : secret
Timeout : 5 sec
Retransmit Count : 3
Deadtime : 20 min
Server Host : 192.168.1.10
Authentication Port : 1812
Accounting Port : 1813
Secret Key : secret
Timeout : 3 sec
Retransmit Count : 2
Server Host : 192.168.1.11
Authentication Port : 1812
Accounting Port : not configured

Server Name/   Auth   Acct   Auth   Acct
IP Address    Port   Port   Status Status
-----
192.168.1.10  1812   1813   Alive  Alive
192.168.1.11  1812   N/A    Alive  N/A
```

**Example** See the sample output below showing RADIUS client status and RADIUS configuration:  
awplus# show radius

**Output** The following shows typical output.

**Example output from the show radius command showing RADIUS client status**

```
RADIUS global interface name: awplus
Secret key:
Timeout: 5
Retransmit count: 3
Deadtime: 0

Server Address: 150.87.18.89
Auth destination port: 1812
Accounting port: 1813
Secret key: swg
Timeout: 5
Retransmit count: 3
Deadtime: 0
```

| Output Parameter    | Meaning                                                                                                                                                                 |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Source Interface    | The interface name or IP address to be used for the source address of all outgoing RADIUS packets.                                                                      |
| Secret Key          | A shared secret key to a radius server.                                                                                                                                 |
| Timeout             | A time interval in seconds.                                                                                                                                             |
| Retransmit Count    | The number of retry count if a RADIUS server does not response.                                                                                                         |
| Deadtime            | A time interval in minutes to mark a RADIUS server as "dead".                                                                                                           |
| Interim-Update      | A time interval in minutes to send Interim-Update Accounting report.                                                                                                    |
| Group Deadtime      | The deadtime configured for RADIUS servers within a server group.                                                                                                       |
| Server Host         | The RADIUS server hostname or IP address.                                                                                                                               |
| Authentication Port | The destination UDP port for RADIUS authentication requests.                                                                                                            |
| Accounting Port     | The destination UDP port for RADIUS accounting requests.                                                                                                                |
| Auth Status         | The status of the authentication port.<br><br>The status ("dead", "error", or "alive") of the RADIUS authentication server and, if dead, how long it has been dead for. |
|                     | Alive      The server is alive.                                                                                                                                         |
|                     | Error      The server is not responding.                                                                                                                                |

| Output Parameter | Meaning                                                                                                                                                                          |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                  | Dead<br>The server is detected as dead and it will not be used for deadtime period. The time displayed in the output shows the server is in dead status for that amount of time. |
|                  | Unknown<br>The server is never used or the status is unknown.                                                                                                                    |
| Acct Status      | The status of the accounting port.<br>The status ("dead", "error", or "alive") of the RADIUS accounting server and, if dead, how long it has been dead for.                      |

# show radius dynamic-authorization counters

**Overview** Use this command to display the Dynamic Authorization message counters. It shows the count of sent and received messages, as well as a count of any error messages.

**Syntax** show radius dynamic-authorization counters

**Mode** Privileged Exec

**Example** To display the Dynamic Authorization message counters, use the following command:

```
awplus# show radius dynamic-authorization counters
```

**Output** The following shows typical output.

## Example output from show radius dynamic-authorization counters

```
awplus#show radius dynamic-authorization counters

RADIUS Dynamic Authorization packet counters
-----
Received:
  Disconnect request      : 9
  CoA request             : 6

Sent:
  Disconnect ACK         : 4
  CoA ACK                : 0
  Disconnect NAK         : 2
  CoA NAK                : 6

Dropped:
  Duplicate packet       : 2
  Expired packet         : 1

Error-cause:
  Unsupported attribute   : 0
  Missing attribute       : 0
  Invalid request        : 0
  NAS ID mismatch        : 0
  No session context found : 3

Errors:
  Unknown message type    : 0
  Unknown client          : 0
  Bad attribute           : 0
  Bad authenticator       : 0
  Malformed packet        : 0
```

[clear radius dynamic-authorization counters](#)

**Command changes** Version 5.5.1-1.1: command added

# show radius local-server auth-mac-promiscuous

**Overview** Use this command to show the status of the **auth-mac-promiscuous** command.

**Syntax** show radius local-server auth-mac-promiscuous

**Mode** User Exec

**Usage notes** In promiscuous mode, the RADIUS server will respond with an Access-Accept for any Access-Request with a Radius Service-Type attribute of 'Call-Check', when the supplicants credentials are NOT in the user database.

If the credentials do appear in the database, the behavior of the server is unchanged.

**Example** To display the status of the **auth-mac-promiscuous** command, use the command:

```
awplus# show radius local-server auth-mac-promiscuous
```

**Output** The following shows typical output.

## Example output from show radius local-server auth-mac-promiscuous

```
awplus#show radius local-server auth-mac-promiscuous
Auth-mac promiscuous mode: Disabled
...
```

**Related commands** [auth-mac-promiscuous](#)

**Command changes** Version 5.5.3-2.1: command added

# show radius statistics

**Overview** This command shows the RADIUS client statistics for the device.

**Syntax** show radius statistics

**Mode** User Exec and Privileged Exec

**Example** See the sample output below showing RADIUS client statistics and RADIUS configuration:

```
awplus# show radius statistics
```

**Output** The following shows typical output.

**Example output from the show radius statistics command:**

```
RADIUS statistics for Server: 150.87.18.89
Access-Request Tx : 5 - Retransmit : 0
Access-Accept Rx : 1 - Access-Reject Rx : 2
Access-Challenge Rx : 2
Unknown Type : 0 - Bad Authenticator : 0
Malformed Access-Resp : 0 - Wrong Identifier : 0
Bad Attribute : 0 - Packet Dropped : 0
TimeOut : 0 - Dead count : 0
Pending Request : 0
```

# undebbug radius

**Overview** This command applies the functionality of the **no debug radius** .

# 36

# Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure the local RADIUS server on the device. For more information, see the [Local RADIUS Server Feature Overview and Configuration Guide](#).

The local RADIUS server is not available in Secure Mode (see the [crypto secure-mode](#) command).

# attribute (radsrv-grp)

**Overview** Use this command to define a RADIUS attribute for the local RADIUS server user group.

For a complete list of defined RADIUS attributes and values, see the [Local RADIUS Server Feature Overview and Configuration Guide](#).

When used with the **value** parameter the **attribute** command configures RADIUS attributes to the user group. If the specified attribute is already defined then it is replaced with the new value.

Use the **no** variant of this command to delete an attribute from the local RADIUS server user group.

**Syntax** attribute [repeated] {<attribute-name>|<attribute-id>} <value>  
no attribute {<attribute-name>|<attribute-id>}

| Parameter        | Description                                                                                                                                                                                   |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| repeated         | This optional parameter allows you to set multiple instances of the same attribute name or attribute ID.                                                                                      |
| <attribute-name> | RADIUS attribute name for standard attributes or Vendor- Specific attributes (see the <a href="#">Local RADIUS Server Feature Overview and Configuration Guide</a> for tables of attributes). |
| <attribute-id>   | RADIUS attribute numeric identifier for standard attributes.                                                                                                                                  |
| <value>          | RADIUS attribute value.                                                                                                                                                                       |

**Default** By default, no attributes are configured.

**Mode** Local RADIUS Server User Group Configuration

**Usage notes** For the Standard attributes, the attribute may be specified using either the attribute name, or its numeric identifier. For example, the command:

```
awplus(config-radsrv-group)# attribute acct-terminate-cause 1
```

will produce the same results as the command:

```
awplus(config-radsrv-group)# attribute 49 1
```

In the same way, where the specific attribute has a pre-defined value, the parameter *<value>* may be substituted with the Value Name or with its numeric value, for example the command:

```
awplus(config-radsrv-group)# attribute acct-terminate-cause  
user-request
```

will produce the same results as the command:

```
awplus(config-radsrv-group)# attribute 49 1
```

or the command:

```
awplus(config-radsrv-group)# attribute acct-terminate-cause 1
```

You can define more than one instance of an attribute name (or id) by using the **repeated** parameter. For example:

```
awplus(config-radsrv-group)# attribute repeated Nas-filter-Rule  
"deny in tcp from any to 0.0.0.0/0 23"
```

```
awplus(config-radsrv-group)# attribute repeated Nas-filter-Rule  
"deny in tcp from any to fe80::b1 23"
```

**Examples** To define the attribute name 'Service-Type' with Administrative User (6) to the RADIUS User Group 'Admin', use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group Admin
awplus(config-radsrv-group)# attribute Service-Type 6
```

To delete the attribute 'Service-Type' from the RADIUS User Group 'Admin', use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group Admin
awplus(config-radsrv-group)# no attribute Service-Type
```

To define multiple values for attribute 'NAS-Filter-Rule', use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group dynamicAcl
awplus(config-radsrv-group)# attribute repeated NAS-Filter-Rule
"deny in tcp from any to 0.0.0.0/0 23"
awplus(config-radsrv-group)# attribute repeated NAS-Filter-Rule
"deny in tcp from any to fe80::b1 23"
```

To delete a specific value from the attribute 'NAS-Filter-Rule', use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group dynamicAcl
awplus(config-radsrv-group)# no attribute NAS-Filter-Rule "deny
in tcp from any to 0.0.0.0/0 23"
```

**Command changes** Version 5.5.0-1.1: **repeated** parameter added

# authentication

**Overview** Use this command to enable the specified authentication methods on the local RADIUS server.

Use the **no** variant of this command to disable specified authentication methods on the local RADIUS server.

**Syntax** authentication {mac|eapmd5|eaptls|peap}  
no authentication {mac|eapmd5|eaptls|peap}

| Parameter | Description                            |
|-----------|----------------------------------------|
| mac       | Enable MAC authentication method.      |
| eapmd5    | Enable EAP-MD5 authentication method.  |
| eaptls    | Enable EAP-TLS authentication method.  |
| peap      | Enable EAP-PEAP authentication method. |

**Default** All authentication methods are enabled by default.

**Mode** RADIUS Server Configuration

**Examples** The following commands enable EAP-MD5 authentication methods on the local RADIUS server.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# authentication eapmd5
```

The following commands disable EAP-MD5 authentication methods on Local RADIUS server.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no authentication eapmd5
```

**Related commands** [server enable](#)  
[show radius local-server statistics](#)

## client (radsecproxy-srv)

**Overview** Use this command to add a RadSec client (for example, a NAS device) to the RadSecProxy local-server application. The application will accept RADIUS requests from all configured clients.

Use the **no** variant of this command to delete a previously-configured client from the RadSecProxy local-server application.

**Syntax** `client {<hostname>|<ip-addr>} [name-check {on|off}]`  
`no client {<hostname>|<ip-addr>}`

| Parameter | Description                                                                                                                  |
|-----------|------------------------------------------------------------------------------------------------------------------------------|
| <         | Hostname of client.                                                                                                          |
| <ip-addr> | Specify the client IPv4 address, in dotted decimal notation (A.B.C.D).                                                       |
| n         | Specify whether or not to enforce certificate name                                                                           |
| c         | checking for this client. If the parameter is not specified then the global behavior, which defaults to <b>on</b> , is used. |
|           | Enable name checking for this client.                                                                                        |
|           | Disable name checking for this client.                                                                                       |

**Mode** RadSecProxy Local Server Configuration

**Usage notes** The client may be specified by its domain name or by its IPv4 address. If a domain name is used, it must be resolvable using a configured DNS name server.

Each client may be configured to use certificate name-checking; if not specified, the global behavior defined by **client name-check** or **no client name-check** will be used. If name checking is enabled, the Common Name portion of the subject field of the client's X.509 certificate must match the domain name or IP address specified in this command.

**NOTE:** *If mutual authentication is disabled then this parameter has no effect, see the command.*

**Example** To add a client called 'mynas.local' with certificate name checking **off**, use the commands:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy local-server
awplus(config-radsecproxy-srv)# client mynas.local name-check
off
```

**Related commands**

- client mutual-authentication**
- client name-check**
- client trustpoint**
- radius-secure-proxy local-server**

# client mutual-authentication

**Overview** This command enables or disables mutual certificate authentication for all RadSecProxy clients. When enabled, the RadSecProxy local-server application will request and validate an X.509 certificate from the client when establishing a connection.

The **no** variant of this command disables mutual certificate validation. The local-server application will still transmit the local server certificate to the client, but will not expect or validate a certificate from the client.

**Syntax** client mutual-authentication  
no client mutual-authentication

**Default** Mutual authentication is enabled by default.

**Mode** RadSecProxy Local Server Configuration

**Example** Disable mutual certificate validation with the following command:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy local-server
awplus(config-radsecproxy-srv)# no client mutual-authentication
```

**Related commands** [client \(radsecproxy-srv\)](#)  
[client name-check](#)  
[radius-secure-proxy local-server](#)

**Command changes** Version 5.4.6-2.1: command added

# client name-check

**Overview** This command sets the global behavior for certificate name-checking for the RadSecProxy localserver application to **on**. This behavior will be used for all clients associated with the application that do not specify a behavior on a per-client basis. If name-checking is enabled, the Common Name portion of the subject field of the client's X.509 certificate must match the domain name or IP address specified in the **client (radsecproxy-aaa)** command.

Use the **no** variant of this command to set the global behavior for certificate name checking to **off**

**Syntax** client name-check  
no client name-check

**Default** Certificate name checking is on by default.

**Mode** RadSecProxy Local Server Configuration

**Example** Disable certificate name checking globally with the following command:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy local-server
awplus(config-radsecproxy-srv)# no client name-check
```

**Related commands** **client (radsecproxy-srv)**  
**client trustpoint**  
**radius-secure-proxy local-server**

# client trustpoint

**Overview** This command adds one or more trustpoints to be used with the RadSecProxy local-server application. Multiple trustpoints may be specified, or the command may be executed more than once, to add multiple trustpoints to the application.

The **no** version of this command removes one or more trustpoints from the list of trustpoints associated with the application.

**Syntax** `client trustpoint [<trustpoint-list>]`  
`no client trustpoint [<trustpoint-list>]`

| Parameter         | Description                                             |
|-------------------|---------------------------------------------------------|
| <trustpoint-list> | Specify one or more trustpoints to be added or deleted. |

**Mode** RadSecProxy Local Server Configuration

**Usage notes** The device certificate associated with the first trustpoint added to the application will be transmitted to remote servers. The certificate received from the remote server must have an issuer chain that terminates with the root CA certificate for any of the trustpoints that are associated with the application.

If you enter **client trustpoint** without specifying a trustpoint, the trustpoint list will be unchanged.

If you enter **no client trustpoint** without specifying a trustpoint, all trustpoints will be disassociated from the application.

**Example** You can add multiple trustpoints to the RadSecProxy local-server by executing the command multiple times:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy local-server
awplus(config-radsecproxy-srv)# client trustpoint example_1
awplus(config-radsecproxy-srv)# client trustpoint example_2
```

Alternatively, add multiple trustpoints with a single command:

```
awplus(config-radsecproxy-srv)# client trustpoint example_3
example_4
```

Disassociate all trustpoints from the RadSecProxy local-server application using the command:

```
awplus(config-radsecproxy-srv)# no client trustpoint
```

**Related commands** [client \(radsecproxy-srv\)](#)  
[client name-check](#)  
[radius-secure-proxy local-server](#)

# clear radius local-server statistics

**Overview** Use this command to clear the statistics stored on the device for the local RADIUS server.

Use this command without any parameters to clear all types of local RADIUS server statistics.

**Syntax** clear radius local-server statistics [nas|server|user]

| Parameter | Description                                                                                                                                  |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------|
| nas       | Clear the NAS (Network Access Server) statistics on the device. For example, clearing statistics stored for NAS server invalid passwords.    |
| server    | Clear the Local RADIUS Server statistics on the device. For example, clearing Local RADIUS Servers statistics for all failed login attempts. |
| user      | Clear the Local RADIUS Server user statistics. For example, clearing statistics stored for the number of successful user logins.             |

**Mode** Privileged Exec

**Usage** Refer to the sample output for the [show radius local-server statistics](#) for further information about the type of statistics each parameter option for this command clears. Both the **nas** and **server** parameters clear unknown username and invalid passwords statistics, while the user parameter clears the number of successful and failed logins for each local RADIUS server user.

**Examples** To clear the NAS (Network Access Server) statistics stored on the device, use the command:

```
awplus# clear radius local-server statistics nas
```

To clear the local RADIUS server statistics stored on the device, use the command:

```
awplus# clear radius local-server statistics server
```

To clear the local RADIUS server user statistics stored on the device, use the command:

```
awplus# clear radius local-server statistics user
```

**Related commands** [show radius local-server statistics](#)

## copy fdb-radius-users (to file)

**Overview** Use this command to create a set of local RADIUS server users from MAC addresses in the local FDB. A local RADIUS server user created using this command can be used for MAC authentication.

**Syntax** `copy fdb-radius-users {local-radius-user-db|flash|usb|debug|tftp|scp|fserver|<url>} [interface <port>] [vlan <vid>] [group <name>] [export-vlan [<radius-group-name>]]`

| Parameter            | Description                                                                                                          |
|----------------------|----------------------------------------------------------------------------------------------------------------------|
| local-radius-user-db | Copy the local RADIUS server users created to the local RADIUS server.                                               |
| flash                | Copy the local RADIUS server users created to Flash memory.                                                          |
| usb                  | Copy the local RADIUS server users created to USB storage device.                                                    |
| debug                | Copy the local RADIUS server users created to debug.                                                                 |
| tftp                 | Copy the local RADIUS server users created to the TFTP destination.                                                  |
| scp                  | Copy the local RADIUS server users created to the SCP destination.                                                   |
| fserver              | Copy the local RADIUS server users created to the remote file server.                                                |
| <url>                | Copy the local RADIUS server users created to the specified URL.                                                     |
| interface <port>     | Copy only MAC addresses learned on a specified device port. Wildcards may be used when specifying an interface name. |
| vlan <vid>           | Copy only MAC addresses learned on a specified VLAN.                                                                 |
| group <name>         | Assign a group name to the local RADIUS server users created.                                                        |
| export-vlan          | Export VLAN ID assigned to exported FDB entry.                                                                       |
| <radius-group-name>  | Prefix for Radius group name storing VLAN ID                                                                         |

**Mode** Privileged Exec

**Usage notes** The local RADIUS server users created are written to a specified destination file in local RADIUS user CSV (Comma Separated Values) format. The local RADIUS server users can then be imported to a local RADIUS server using the **copy local-radius-user-db (from file)** command.

The name and password of the local RADIUS server users created use a MAC address, which can be used for MAC authentication.

This command does not copy a MAC address learned by the CPU or the management port.

This command can filter FDB entries by the interface name and the VLAN ID. When the interface name and the VLAN ID are specified, this command generates local RADIUS server users from only the MAC address learned on the specified interface and on the specified VLAN.

**Examples** To register the local RADIUS server users from the local FDB directly to the local RADIUS server, use the command:

```
awplus# copy fdb-radius-users local-radius-user-db
```

To register the local RADIUS server users from the interface port1.0.1 to the local RADIUS server, use the command:

```
awplus# copy fdb-radius-users local-radius-user-db interface  
port1.0.1
```

To copy output generated as local RADIUS server user data from MAC addresses learned on vlan10 on interface port1.0.1 to the file radius-user.csv, use the command:

```
awplus# copy fdb-radius-users radius-user.csv interface  
port1.0.1 vlan10
```

To copy output generated as local RADIUS server user data from MAC addresses learned on vlan10 on interface port1.0.1 to a file on the remote file server, use the command:

```
awplus# copy fdb-radius-users fserver interface port1.0.1 vlan10
```

**Related commands** **copy local-radius-user-db (to file)**  
**copy local-radius-user-db (from file)**

## copy local-radius-user-db (from file)

**Overview** Use this command to copy the Local RADIUS server user data from a file. The file, including the RADIUS user data in the file, must be in the CSV (Comma Separated Values) format.

You can select **add** or **replace** as the copy method. The **add** parameter option copies the contents of specified file to the local RADIUS server user database. If the same user exists then the old user is removed before adding a new user. The **replace** parameter option deletes all contents of the local RADIUS server user database before copying the contents of specified file.

**Syntax** `copy <source-url> local-radius-user-db [add|replace]`

| Parameter    | Description                                                           |
|--------------|-----------------------------------------------------------------------|
| <source-url> | URL of the source file.                                               |
| add          | Add file contents to local RADIUS server user database.               |
| replace      | Replace current local RADIUS server user database with file contents. |

**Default** When no copy method is specified with this command the **replace** option is applied.

**Mode** Privileged Exec

**Examples** To replace the current local RADIUS server user data to the contents of `http://datahost/ user.csv`, use the following command:

```
awplus# copy http://datahost/user.csv local-radius-user-db
```

To add the contents of `http://datahost/user.csv` to the current local RADIUS server user database, use the following command:

```
awplus# copy http://datahost/user.csv local-radius-user-db add
```

**Related commands** [copy fdb-radius-users \(to file\)](#)  
[copy local-radius-user-db \(to file\)](#)

## copy local-radius-user-db (to file)

**Overview** Use this command to copy the local RADIUS server user data to a file. The output file produced is CSV (Comma Separated Values) format.

**Syntax** `copy local-radius-user-db {flash|usb|tftp|scp|<destination-url>}`

| Parameter         | Description                  |
|-------------------|------------------------------|
| flash             | Copy to Flash memory.        |
| usb               | Copy to USB storage device.  |
| tftp              | Copy to TFTP destination.    |
| scp               | Copy to SCP destination.     |
| <destination-url> | URL of the Destination file. |

**Mode** Privileged Exec

**Example** Copy the current local RADIUS server user data to `http://datahost/user.csv`.

```
awplus# copy local-radius-user-db http://datahost/user.csv
```

**Related commands** [copy fdb-radius-users \(to file\)](#)

**crypto pki trustpoint** *<trustpoint>*

Note that “local” is a valid name for a trustpoint, so you do not need to modify existing configurations or scripts.

# debug crypto pki (deleted)

**Overview** This command is no longer available.

## domain-style

**Overview** Use this command to enable a specified domain style on the local RADIUS server. The local RADIUS server decodes the domain portion of a username login string when this command is enabled.

Use the **no** variant of this command to disable the specified domain style on the local RADIUS server.

**Syntax** domain-style {suffix-atsign|ntdomain}  
no domain-style {suffix-atsign|ntdomain}

| Parameter     | Description                                                    |
|---------------|----------------------------------------------------------------|
| suffix-atsign | Enable at sign "@" delimited suffix style, i.e. "user@domain". |
| ntdomain      | Enable NT domain style, i.e. "domain\user".                    |

**Default** This feature is disabled by default.

**Mode** RADIUS Server Configuration

**Usage notes** When both domain styles are enabled, the first domain style configured has the highest priority. A username login string is matched against the first domain style enabled. Then, if the username login string is not decoded, it is matched against the second domain style enabled.

**Examples** To enable NT domain style on the local RADIUS server, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# domain-style ntdomain
```

To disable NT domain style on the local RADIUS server, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no domain-style ntdomain
```

**Related commands** [server enable](#)

## egress-vlan-id (radsrv-grp)

**Overview** Use this command to configure the standard RADIUS attribute 'Egress-VLANID (56)' for the local RADIUS Server user group.

Use the **no** variant of this command to remove the Egress-VLANID attribute from the local RADIUS server user group.

**Syntax** egress-vlan-id <vid> [tagged|untagged]  
no egress-vlan-id

| Parameter | Description                                                                                                                       |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------|
| <vid>     | The VLAN identifier to be used for the Egress VLANID attribute, in the range 1 to 4094.                                           |
| tagged    | Set frames on the VLAN as tagged. This sets the tag indication field to indicate that all frames on this VLAN are tagged.         |
| untagged  | Set all frames on the VLAN as untagged. This sets the tag indication field to indicate that all frames on this VLAN are untagged. |

**Default** By default, no Egress-VLANID attributes are configured.

**Mode** Local RADIUS Server User Group Configuration

**Usage** When a Voice VLAN is configured for dynamic VLAN allocation (**switchport voice vlan**), the RADIUS server must be configured to send the VLAN information when an IP phone is successfully authenticated. Use either the **egress-vlan-id (radsrv-grp)** command or the **egress-vlan-name (radsrv-grp)**, and specify the **tagged** parameter.

**Examples** To set the 'Egress-VLANID' attribute for the 'NormalUsers' local RADIUS server user group to VLAN identifier 200, with tagged frames, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# egress-vlan-id 200 tagged
```

To remove the 'Egress-VLANID' attribute for the 'NormalUsers' local RADIUS server user group, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# no egress-vlan-id
```

**Related commands** [attribute \(radsrv-grp\)](#)  
[egress-vlan-name \(radsrv-grp\)](#)  
[switchport voice vlan](#)

## egress-vlan-name (radsrv-grp)

**Overview** Use this command to configure the standard RADIUS attribute 'Egress-VLAN-Name (58)' for the local RADIUS server user group.

Use the **no** variant of this command to remove the Egress-VLAN-Name attribute from the local RADIUS server user group.

**Syntax** egress-vlan-name <vlan-name> [tagged|untagged]  
no egress-vlan-name

| Parameter   | Description                                                                                                                       |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <vlan-name> | The VLAN name to be configured as the Egress-VLAN-Name attribute.                                                                 |
| tagged      | Set frames on the VLAN as tagged. This sets the tag indication field to indicate that all frames on this VLAN are tagged.         |
| untagged    | Set all frames on the VLAN as untagged. This sets the tag indication field to indicate that all frames on this VLAN are untagged. |

**Default** By default, no Egress-VLAN-Name attributes are configured.

**Mode** Local RADIUS Server User Group Configuration

**Usage** When a Voice VLAN is configured for dynamic VLAN allocation (**switchport voice vlan**), the RADIUS server must be configured to send the VLAN information when an IP phone is successfully authenticated. Use either the **egress-vlan-id (radsrv-grp)** or the **egress-vlan-name (radsrv-grp)** command, and specify the **tagged** parameter.

**Examples** To configure the 'Egress-VLAN-Name' attribute for the RADIUS server user group 'NormalUsers' with the VLAN name vlan2 and all frames on this VLAN tagged, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# egress-vlan-name vlan2 tagged
```

To delete the 'Egress-VLAN-Name' attribute for the 'NormalUsers' group, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# no egress-vlan-name
```

**Related commands** [attribute \(radsrv-grp\)](#)

[switchport voice vlan](#)

## group (radsrv)

**Overview** Use this command to create a local RADIUS server user group, and enter local RADIUS Server User Group Configuration mode.

Use the **no** variant of this command to delete the local RADIUS server user group.

**Syntax** group <user-group-name>  
no group <user-group-name>

| Parameter         | Description             |
|-------------------|-------------------------|
| <user-group-name> | User group name string. |

**Mode** RADIUS Server Configuration

**Examples** The following command creates the user group NormalUsers.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
```

The following command deletes the user group NormalUsers.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no group NormalUsers
```

**Related commands** [user \(radsrv\)](#)  
[show radius local-server user](#)  
[vlan \(radsrv-grp\)](#)

# help radius-attribute

**Overview** Use this command to display a list of standard and vendor specific valid RADIUS attributes that are supported by the local RADIUS server.

**Syntax** help radius-attribute [<attribute-name>|<attribute-ID>]

| Parameter        | Description                                                        |
|------------------|--------------------------------------------------------------------|
| <attribute-name> | List the details and predefined values for the named attribute.    |
| <attribute-ID>   | List the details and predefined values for the given attribute ID. |

**Mode** Privileged Exec

**Usage notes** When used without a parameter, this command lists all of the available RADIUS attributes.

When used with an attribute name or ID, this command displays the attribute name, value type, and any predefined values.

**Example** To list all available RADIUS attributes, use the following command:

```
awplus# help radius-attribute
```

```
awplus#help radius-attribute
Standard Attributes:
 1      User-Name
 2      User-Password
 3      CHAP-Password
 4      NAS-IP-Address
 5      NAS-Port
 6      Service-Type
...
```

To display the details for the RADIUS attribute Frag-Status, use the following command:

```
awplus# help radius-attribute frag-status
```

```
awplus#help radius-attribute frag-status
Frag-Status : integer (Integer number)

Pre-defined values :
  Fragmentation-Supported (1)
  More-Data-Pending (2)
  More-Data-Request (3)
  Reserved (0)
```

**Related commands** [attribute \(radsrv-grp\)](#)

**Command** Version 5.4.8-0.2: command added  
**changes** Version 5.4.9-0.1: added to x530 Series products

## nas

**Overview** This command adds a client device (the Network Access Server or the NAS) to the list of devices that are able to send authentication requests to the local RADIUS server. The NAS is identified by its IP address and a shared secret (also referred to as a shared key) must be defined that the NAS will use to establish its identity.

Use the **no** variant of this command to remove a NAS client from the list of devices that are allowed to send authentication requests to the local RADIUS server.

**Syntax** `nas <ip-address> key <nas-keystring> [encrypted]`  
`no nas <ip-address>`

| Parameter       | Description                                                                                                                                                                                                                                                      |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ip-address>    | RADIUS NAS IP address.                                                                                                                                                                                                                                           |
| <nas-keystring> | NAS shared keystring.                                                                                                                                                                                                                                            |
| encrypted       | Means that the password that follows is encoded, not plain text. This parameter is only used in generated configuration files. In configuration files, the device prints encrypted in front of passwords to indicate that it is displaying the encoded password. |

**Mode** RADIUS Server Configuration

**Examples** The following commands add the NAS with an IP address of 192.168.1.2 to the list of clients that may send authentication requests to the local RADIUS server. Note the shared key that this NAS will use to establish its identity is NAS\_PASSWORD.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# nas 192.168.1.2 key NAS_PASSWORD
```

The following commands remove the NAS with an IP address of 192.168.1.2 from the list of clients that are allowed to send authentication requests to the local RADIUS server:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no nas 192.168.1.2
```

**Related commands** [nas message-authenticator \(radsrv\)](#)  
[show radius local-server nas](#)

**Command changes** Version 5.5.3-2.1: **encrypted** parameter added

## nas message-authenticator (radsvr)

**Overview** Use this command to decide whether or not to require verification of RADIUS packets for a specific NAS. Verification prevents RADIUS protocol forgery attacks. It is achieved by putting a Message-Authenticator attribute in Access-Requests from the NAS.

Use the **no** variant of this command to return the setting to the default.

**Syntax** nas <ip-address> message-authenticator {required|optional|auto}  
no nas <ip-address> message-authenticator

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                       |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ip-address> | The IP address of the NAS.                                                                                                                                                                                                                                                                                                                        |
| required     | Discard Access-Requests that have no Message-Authenticator attribute, or that have an invalid Message-Authenticator attribute.                                                                                                                                                                                                                    |
| optional     | Allow Access-Requests that have no Message-Authenticator attribute, and discard Access-Requests that have an invalid Message-Authenticator attribute.                                                                                                                                                                                             |
| auto         | Determine the mode based on the content of the first Access-Request received. On the basis of this, the device will produce a log message to tell you which mode you should configure. Only use <b>auto</b> temporarily while you are transitioning an existing network or adding new NAS devices with unknown support for Message-Authenticator. |

**Default** auto

**Mode** RADIUS Server Configuration

**Usage notes** If you use both MAC authentication and web authentication to authenticate the same TQ Series access point, make sure you set this to **optional**. Otherwise, web authentication may fail.

This is because if the first packet that the server receives from the client contains a valid Message-Authenticator attribute, then by default all subsequent packets from that client must also contain the same Message-Authenticator attribute. If packets don't contain the attribute, the server drops them. This can cause an issue on TQ series APs, because on these APs, MAC authentication's initial packet contains the attribute, and web authentication's initial packet doesn't. This means that web authentication will fail if MAC authentication has already happened.

Setting this to **optional** allows the server to accept packets from a client when the packets don't have a Message-Authenticator attribute, even if the server has already received a packet from that client that contained a Message-Authenticator attribute. This means both web authentication and MAC authentication will succeed, no matter which happens first.

**Examples** To require Message-Authenticator attributes in messages from a registered NAS whose IP address is 192.168.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsvr)# nas 192.168.1.2 message-authenticator
required
```

To make Message-Authenticator attributes optional in messages from a registered NAS whose IP address is 192.168.1.9, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsvr)# nas 192.168.1.9 message-authenticator
optional
```

To return to the default behavior of **auto** for the NAS whose IP address is 192.168.1.9, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsvr)# no nas 192.168.1.9 message-authenticator
```

**Command changes** Version 5.5.4-2.3: command added

# radius-secure-proxy local-server

**Overview** Use this command to enter the RadSecProxy local-server application configuration mode. This application allows remote RadSec clients to communicate with the local RADIUS server process via a secure (TLS) proxy.

**Syntax** radius-secure-proxy local-server

**Mode** Global Configuration Mode

**Example** To change mode from User Exec mode to the RadSecProxy local-server configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy local-server
awplus(config-radsecproxy-srv)#
```

**Related commands**

- client (radsecproxy-srv)**
- client name-check**
- client trustpoint**

# radius-server local

**Overview** Use this command to navigate to the Local RADIUS server configuration mode (config-radsrv) from the Global Configuration mode (config).

**Syntax** radius-server local

**Mode** Global Configuration

**Example** Local RADIUS Server commands are available from config-radsrv configuration mode. To change mode from User Exec mode to the Local RADIUS Server mode (config-radsrv), use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)#
```

**Output**

```
awplus(config)#radius-server local
Creating Local CA repository.....OK
Enrolling Local System to local trustpoint..OK
awplus(config-radsrv)#
```

**Related commands**

- [show radius local-server group](#)
- [show radius local-server nas](#)
- [show radius local-server statistics](#)
- [show radius local-server user](#)

# server auth-port

**Overview** Use this command to change the UDP port number for local RADIUS server authentication.

Use the **no** variant of this command to reset the RADIUS server authentication port back to the default.

**Syntax** server auth-port <1-65535>  
no server auth-port

| Parameter | Description      |
|-----------|------------------|
| <1-65535> | UDP port number. |

**Default** The default local RADIUS server UDP authentication port number is 1812.

**Mode** RADIUS Server Configuration

**Examples** The following commands set the RADIUS server authentication port to 10000.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# server auth-port 10000
```

The following commands reset the RADIUS server authentication port back to the default UDP port of 1812.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no server auth-port
```

**Related commands** [server enable](#)  
[show radius local-server statistics](#)

# server enable

**Overview** This command enables the local RADIUS server. The local RADIUS server feature is started immediately when this command is issued.

The **no** variant of this command disables local RADIUS server. When this command is issued, the local RADIUS server stops operating.

**Syntax** server enable  
no server enable

**Default** The local RADIUS server is disabled by default and must be enabled for use with this command.

**Mode** RADIUS Server Configuration

**Examples** To enable the local RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# server enable
```

To disable the local RADIUS server, use the command:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no server enable
```

**Related commands** [server auth-port](#)  
[show radius local-server statistics](#)

## server trustpoint (radsrv)

**Overview** Use this command to add one or more trustpoints to the local RADIUS server. You can specify multiple trustpoints on one line, or execute the command more than once to add multiple trustpoints to the local RADIUS server.

Use the **no** variant to remove one or more trustpoints from the local RADIUS server.

**Syntax** `server trustpoint [<trustpoint-list>]`  
`no server trustpoint [<trustpoint-list>]`

| Parameter         | Description                                            |
|-------------------|--------------------------------------------------------|
| <trustpoint-list> | Specify one or more trustpoints to be added or deleted |

**Default** By default, the local trustpoint is associated with the local RADIUS server.

**Mode** RADIUS Server Configuration

**Usage Notes** If you do not specify any trustpoints, the command displays a list of trustpoints but leaves the list unchanged.

If you use the **no server trustpoint** command without specifying any trustpoints, then all trustpoints will be removed from the local RADIUS server.

**Example** To configure a trustpoint called 'my\_trustpoint' on the local RADIUS server, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# server trustpoint my_trustpoint
```

You can add multiple trustpoints to the local RADIUS server by executing the **server trustpoint** command multiple times:

```
awplus(config-radsrv)# server trustpoint my_trustpoint1
my_trustpoint2
```

To remove the trustpoint called 'my\_trustpoint' from the local RADIUS server, use the command:

```
awplus(config-radsrv)# no server trustpoint my_trustpoint
```

To remove all trustpoints from the local RADIUS server, use the command:

```
awplus(config-radsrv)# no server trustpoint
```

**Related commands** **show radius local-server trustpoint**  
**server enable**  
**client trustpoint**  
**server trustpoint**

**Command changes** Version 5.4.1-1.1: command added.

# show radius local-server group

**Overview** Use this command to display information about the local RADIUS server user group.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show radius local-server group [*<user-group-name>*]

| Parameter                      | Description             |
|--------------------------------|-------------------------|
| <i>&lt;user-group-name&gt;</i> | User group name string. |

**Mode** User Exec and Privileged Exec

**Example** The following command displays Local RADIUS server user group information.

```
awplus# show radius local-server group
```

**Output** The following shows typical output.

**Example output from the show radius local-server group command**

|                  |               |
|------------------|---------------|
| Group-Name       | Vlan          |
| -----            | -----         |
| NetworkOperators | ManagementNet |
| NormalUsers      | CommonNet     |

**Parameters in the output of the show radius local-server group command**

| Parameter  | Description                      |
|------------|----------------------------------|
| Group-Name | Group name.                      |
| Vlan       | VLAN name assigned to the group. |

**Related commands** [group \(radsrv\)](#)

## show radius local-server nas

**Overview** Use this command to display information about NAS (Network Access Servers) registered to the local RADIUS server.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show radius local-server nas [<ip-address>]

| Parameter    | Description                             |
|--------------|-----------------------------------------|
| <ip-address> | Specify NAS IP address for show output. |

**Mode** User Exec and Privileged Exec

**Example** The following command displays NAS information.

```
awplus# show radius local-server nas
```

**Output** The following shows typical output.

**Example output from the show radius local-server nas command**

| NAS-Address | Shared-Key (encrypted) | Message Authenticator |
|-------------|------------------------|-----------------------|
| 127.0.0.1   | dbSQ8ED....            | optional              |

**Parameters in the output of the show radius local-server nas command**

| Parameter             | Description                            |
|-----------------------|----------------------------------------|
| NAS-Address           | IP address of NAS.                     |
| Shared-Key            | Shared key used for RADIUS connection. |
| Message Authenticator | The message-authenticator mode.        |

**Related commands** [nas](#)  
[nas message-authenticator \(radsvr\)](#)

# show radius local-server statistics

**Overview** Use this command to display statistics about the local RADIUS server.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show radius local-server statistics

**Mode** User Exec and Privileged Exec

**Usage notes** Both unknown usernames and invalid passwords will display as failed logins in the show output.

**Example** The following command displays local RADIUS server statistics.

```
awplus# show radius local-server statistics
```

**Output** The following shows typical output.

## Example output from the show radius local-server statistics command

```
awplus# show radius local-server statistics

**server auth-port**

# show radius local-server trustpoint

**Overview** Displays the PKI trustpoints associated with the local RADIUS server.

**Syntax** show radius local-server trustpoint

**Mode** User Exec

**Example** To show the local RADIUS server trustpoint(s), use the commands:

```
awplus# show radius local-server trustpoint
```

**Output** The following shows typical output.

**Example output from show radius local-server trustpoint**

```
show radius local-server trustpoint
Current PKI trustpoints for RADIUS EAP-TLS:
my_trustpoint
```

**Related commands**

- [server trustpoint \(radsrv\)](#)
- [radius-server local](#)
- [server enable](#)
- [show radius local-server statistics](#)

**Command changes** Version 5.4.6-1.1: command added

## show radius local-server user

**Overview** Use this command to display information about the local RADIUS server user.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show radius local-server user [*<user-name>*]  
show radius local-server user [*<user-name>*] format csv  
show radius local-server user [*<user-name>*] detail

| Parameter                | Description                                                                             |
|--------------------------|-----------------------------------------------------------------------------------------|
| <i>&lt;user-name&gt;</i> | RADIUS user name. If no user name is specified, information for all users is displayed. |
| format csv               | Format output as CSV. This parameter is only available in Privileged Exec mode.         |
| detail                   | Display detailed information about the user.                                            |

**Mode** User Exec and Privileged Exec

**Examples** The following command displays Local RADIUS server user information for user Tom.

```
awplus# show radius local-server user Tom
```

**Example output from the show radius local-server user command**

| User-Name | Group            | Vlan          |
|-----------|------------------|---------------|
| -----     | -----            | -----         |
| Tom       | NetworkOperators | ManagementNet |

The following command displays all Local RADIUS server information for all users.

```
awplus# show radius local-server user
```

The following command displays Local RADIUS server user information for Tom in CSV format (only available in Privileged Exec mode).

```
awplus# show radius local-server user Tom format csv
```

**Example output from the show radius local-server user Tom format csv command**

```
true,"NetworkOperators","Tom","abcd",0,2099/01/01,1,"","","ManagementNet"false,3600,false,0,"",false
```

The following command displays detailed Local RADIUS server user information for all users.

```
awplus# show radius local-server user detail
```

**Example output from the show radius local-server user detail command**

```
awplus# show radius local-server user detail
Total users: 1
Maximum users allowed by license: 3
-----
Username   : Tom
Group      : NetworkOperators
Vlan       : VlanName
```

**Parameters in the output from the show radius local-server user command**

| Parameter   | Description                      |
|-------------|----------------------------------|
| User - Name | User name.                       |
| Group       | Group name assigned to the user. |
| Vlan        | VLAN name assigned to the user.  |

**Related commands** [group \(radsrv\)](#)  
[user \(radsrv\)](#)

**Command changes** Version 5.4.9-0.1: **detail** parameter added

## user (radsrv)

**Overview** Use this command to register a user to the local RADIUS server.

Use the **no** variant of this command to delete a user from the local RADIUS server.

**Syntax** user <radius-user-name> [encrypted] password <user-password>  
[group <user-group>]  
no user <radius-user-name>

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <radius-user-name> | RADIUS user name. See the Usage Notes for details. This can also be a MAC address in the IEEE standard format of HH-HH-HH-HH-HH-HH if you are configuring MAC authentication to use local RADIUS server.                                                                                                                                                                                                                                                                                                                                                               |
| encrypted          | <p>Specifies that the password is being entered in its encrypted form, so that it is not further encrypted.</p> <p>When creating a new user, enter the password in plaintext, and do not use the <b>encrypted</b> parameter.</p> <p>Use the <b>encrypted</b> parameter only when referring to a user that has previously been created. For instance, when adding an existing user from another RADIUS server, use the <b>encrypted</b> parameter, and enter the encrypted version of the password that appears in the output of <b>show</b> commands for the user.</p> |
| <user-password>    | User password. This can also be a MAC address in the IEEE standard format of HH-HH-HH-HH-HH-HH if you are configuring MAC authentication to use local RADIUS server.                                                                                                                                                                                                                                                                                                                                                                                                   |
| group              | Specify the group for the user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <user-group>       | User group name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**Mode** RADIUS Server Configuration

**Usage notes** The user name can contain alphanumeric ASCII characters, plus signs (ASCII 43), dashes (ASCII 45), dots (ASCII 46), @ signs (ASCII 64), slashes (ASCII 47), backslashes (ASCII 92), and underscores (ASCII 95). It cannot contain spaces. It must not start with a digit, a plus sign, a dash or an @ sign. It must not end with an @ sign. On the AlliedWare Plus CLI, it is case sensitive.

It cannot contain question marks (?), spaces ( ), or double quote characters.

RADIUS user names containing the following characters cannot use certificate authentication:

/ \ \$ & ( ) \* ; < > |

Certificates cannot be created and exported for RADIUS user names that contain the above characters. We advise you to avoid using these characters in RADIUS user names if you need to use certificate authentication, because you will not be able to create and export certificates.

You also can use the IEEE standard format hexadecimal notation (HH-HH-HH-HH-HH-HH) to specify a supplicant MAC address to configure the user name and user password parameters to use local RADIUS server for MAC Authentication. See the [AAA and Port\\_Authentication Feature Overview and Configuration\\_Guide](#) for a sample MAC configuration. See also the command **user 00-db-59-ab-70-37 password 00-db-59-ab-70-37** as shown in the command examples.

**Examples** The following commands add user 'Tom' to the local RADIUS server and sets his password to 'QwerSD'.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# user Tom password QwerSD
```

The following commands add user 'Tom' to the local RADIUS server user group 'NormalUsers' and sets his password 'QwerSD'.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# user Tom password QwerSD group
NormalUsers
```

The following commands remove user 'Tom' from the local RADIUS server:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no user Tom
```

The following commands add the supplicant MAC address 00-d0-59-ab-70-37 to the local RADIUS server:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# user 00-db-59-ab-70-37 password 00-db-59-
ab-70-37
```

The following commands remove the supplicant MAC address 00-d0-59-ab-70-37 from the local RADIUS server:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no user 00-db-59-ab-70-37
```

**Related commands** [group \(radsrv\)](#)  
[show radius local-server user](#)

## vlan (radsrv-grp)

**Overview** Use this command to set the VLAN ID or name for the local RADIUS server user group. The VLAN information is used for authentication with the dynamic VLAN feature.

Use the **no** variant of this command to clear the VLAN ID or VLAN name for the local RADIUS server user group.

**Syntax** `vlan {<vid>|<vlan-name>}`  
`no vlan`

| Parameter   | Description |
|-------------|-------------|
| <vid>       | VLAN ID.    |
| <vlan-name> | VLAN name.  |

**Default** VLAN information is not set by default.

**Mode** Local RADIUS Server User Group Configuration

**Examples** The following commands set VLAN ID 200 to the group named 'NormalUsers':

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# vlan 200
```

The following commands remove VLAN ID 200 from the group named 'NormalUsers':

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# no vlan
```

# Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure the Public Key Infrastructure (PKI) capabilities on an AlliedWare Plus device. For more information about PKI, see the [Public Key Infrastructure \(PKI\) Feature Overview and Configuration Guide](#).

# crypto key generate rsa

**Overview** Use this command to generate a cryptographic public/private key pair for the Rivest-Shamir-Adleman (RSA) encryption algorithm.

**Syntax** `crypto key generate rsa [label <keylabel>] [<1024-16384>]`

| Parameter    | Description                                                                                                                                                                                                                                                                                 |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| label        | Specify and optional label for the key.                                                                                                                                                                                                                                                     |
| <keylabel>   | The name of the key to be created. The name must start with an alphanumeric character, and may only contain alphanumeric characters, underscores, dashes, or periods. The maximum length of the name is 63 characters. If no label is specified the default value "server-default" is used. |
| <1024-16384> | The bit length for the key. If no bit length is specified the default of 2048 is used.                                                                                                                                                                                                      |

**Mode** Privileged Exec

**Usage notes** The generated key may be used for multiple server certificates in the system. A key is referenced by its label. A bit length between 1024 and 16384 bits may be specified. Larger bit lengths are more secure, but require more computation time.

The specified key must not already exist.

**Example** To create a key with the label 'example-server-key' and a bit length of 4096, use the commands:

```
awplus> enable
awplus# crypto key generate rsa label example-server-key 4096
```

**Related commands** [crypto key zeroize](#)  
[rsakeypair \(ca-trustpoint\)](#)

[show crypto key mypubkey rsa](#)

**Command changes** Version 5.5.2-2.1: Key length increased to 16384

# crypto key zeroize

**Overview** Use this command to delete one or all cryptographic public/private key pairs.

**Syntax** `crypto key zeroize rsa <keylabel>`  
`crypto key zeroize all`

| Parameter        | Description                                                                        |
|------------------|------------------------------------------------------------------------------------|
| <code>rsa</code> | Delete a single key pair for the Rivest-Shamir-Adleman (RSA) encryption algorithm. |
| <code>all</code> | Delete all keys.                                                                   |

**Mode** Privileged Exec

## Usage notes

When the system is in secure mode, this command will securely delete the file (the file's sectors in NVS will be overwritten with random data three times before deletion). When the device is not in secure mode, this command has the same effect as using the **delete** command (it deletes the file from Flash memory but does not overwrite it with zeros).

The specified key must exist but must not be in use for any existing server certificates.

A key may not be deleted if it is associated with the server certificate or server certificate signing request for an existing trustpoint. To remove a server certificate so that the key may be deleted, use the **no crypto pki enroll** command to de-enroll the server.

**Example** To delete an RSA key named "example-server-key", use the following command:

```
awplus# crypto key zeroize rsa example-server-key
```

**Related commands** [crypto key generate rsa](#)  
[show crypto key mypubkey rsa](#)  
[crypto secure-mode](#)

**Command changes** Version 5.4.6-1.1: zeroize functionality added to x930 Series  
Version 5.4.8-1.2: zeroize functionality added to x220, XS900MX, x550 Series  
Version 5.4.8-2.1: zeroize functionality added to SBx908 GEN2, x950 Series

# crypto pki authenticate

**Overview** Use this command to authenticate a trustpoint by generating or importing the root CA certificate. This must be done before the server can be enrolled to the trustpoint.

**Syntax** `crypto pki authenticate <trustpoint>`

| Parameter    | Description                                     |
|--------------|-------------------------------------------------|
| <trustpoint> | The name of the trustpoint to be authenticated. |

**Mode** Privileged Exec

**Usage notes** If the trustpoint's **enrollment** setting is "selfsigned", then this command causes a private key to be generated for the root CA, and a self-signed certificate to be generated based on that key.

If the trustpoint's **enrollment** setting is "terminal", then this command prompts the user to paste a certificate Privacy Enhanced Mail (PEM) file at the CLI terminal. If the certificate is a valid selfsigned CA certificate, then it will be stored as the trustpoint's root CA certificate.

The specified trustpoint must already exist, and its enrollment mode must have been defined.

**Example** To show the **enrollment** setting of a trustpoint named "example" and then generate a certificate from it, use the commands:

```
awplus> enable
awplus# configure terminal
awplus(config)# crypto pki trustpoint example
awplus(ca-trustpoint)# enrollment selfsigned
awplus(config)# exit
awplus# exit
awplus# crypto pki authenticate example
```

**Related commands** [crypto pki import pem](#)  
[crypto pki trustpoint](#)  
[enrollment \(ca-trustpoint\)](#)

# crypto pki enroll

**Overview** Use this command to enroll the local server to the specified trustpoint.  
Use the **no** variant of this command to de-enroll the server by removing its certificate

**Syntax** `crypto pki enroll <trustpoint>`  
`no crypto pki enroll <trustpoint>`

| Parameter                       | Description                               |
|---------------------------------|-------------------------------------------|
| <code>&lt;trustpoint&gt;</code> | The name of the trustpoint to be enrolled |

**Mode** Privileged Exec

**Usage notes** For the local server, “enrollment” is the process of creating of a certificate for the server that has been signed by a CA associated with the trustpoint. The public portion of the RSA key pair specified using the `rsakeypair` parameter for the trustpoint will be included in the server certificate.

If the trustpoint represents a locally self-signed certificate authority, then this command results in the direct generation of the server certificate, signed by the root CA for the trustpoint.

If the trustpoint represents an external certificate authority, then this command results in the generation of a Certificate Signing Request (CSR) file, which is displayed at the terminal in Privacy-Enhanced Mail (PEM) format, suitable for copying and pasting into a file or message. The CSR must be sent to the external CA for processing. When the CA replies with the signed certificate, that certificate should be imported using the `crypto pki import pem` command, to complete the enrollment process.

The specified trustpoint must already exist, and it must already be authenticated.

**Example** To enroll the local server with the trustpoint “example”, use the following commands:

```
awplus> enable
awplus# crypto pki enroll example
```

**Related commands** [crypto pki enroll user](#)  
[crypto pki import pem](#)  
[crypto pki trustpoint](#)  
[enrollment \(ca-trustpoint\)](#)

# crypto pki enroll user

**Overview** Use this command to enroll a single RADIUS user or all RADIUS users to the specified trustpoint.

Use the **no** variant of this command to remove the PKCS#12 file from the system. Note that the PKCS#12 files are generated in a temporary (volatile) file system, so a system restart also results in removal of all of the files.

**Syntax** `crypto pki enroll <trustpoint>  
{user <username>|local-radius-all-users}  
no crypto pki enroll <trustpoint>  
{user <username>|local-radius-all-users}`

| Parameter    | Description                                                   |
|--------------|---------------------------------------------------------------|
| <trustpoint> | The name of the trustpoint to which users are to be enrolled. |
| <username>   | The name of the user to enroll to the trustpoint.             |

**Mode** Privileged Exec

**Usage notes** For RADIUS users, “enrollment” is the process of generating a private key and a corresponding client certificate for each user, with the certificate signed by the root CA for the trustpoint. The resulting certificates may be exported to client devices, for use with PEAP or EAP-TLS authentication with the local RADIUS server.

The specified trustpoint must represent a locally self-signed certificate authority.

The private key and certificate are packaged into a PKCS#12-formatted file, suitable for export using the **crypto pki export pkcs12** command. The private key is encrypted for security, with a passphrase that is entered at the command line. The passphrase is required when the PKCS#12 file is imported on the client system. The passphrase is not stored anywhere on the device, so users are responsible for remembering it until the export-import process is complete.

If **local-radius-all-users** is specified instead of an individual user, then keys and certificates for all RADIUS users will be generated at once. All the keys will be encrypted using the same passphrase.

The specified trustpoint must already exist, it must represent a locally self-signed CA, and it must already have been authenticated.

**Example** To enroll the user “example-user” with the trustpoint “example”, use the following commands:

```
awplus> enable
```

```
awplus# crypto pki enroll example user example-user
```

To enroll all local RADIUS users with the trustpoint “example”, use the following commands:

```
awplus> enable
```

```
awplus# crypto pki enroll example local-radius-all-users
```

**Related commands** [crypto pki export pkcs12](#)  
[crypto pki trustpoint](#)

# crypto pki export pem

**Overview** Use this command to export the root CA certificate for the given trustpoint to a file in Privacy-Enhanced Mail (PEM) format. The file may be transferred to the specified destination URL, or displayed at the terminal.

**Syntax** `crypto pki export <trustpoint> pem [terminal|<url>]`

| Parameter    | Description                                                                     |
|--------------|---------------------------------------------------------------------------------|
| <trustpoint> | The name of the trustpoint for which the root CA certificate is to be exported. |
| terminal     | Display the PEM file to the terminal.                                           |
| <url>        | Transfer the PEM file to the specified URL.                                     |

**Default** The PEM will be displayed to the terminal by default.

**Mode** Privileged Exec

**Usage notes** The specified trustpoint must already exist, and it must already be authenticated.

**Example** To display the PEM file for the trustpoint “example” to the terminal, use the following commands:

```
awplus> enable
```

```
awplus# crypto pki export example pem terminal
```

To export the PEM file “example.pem” for the trustpoint “example” to the URL “tftp://server\_a/”, use the following commands:

```
awplus> enable
```

```
awplus# crypto pki export example pem tftp://server_a/  
example.pem
```

**Related commands**

- [crypto pki authenticate](#)
- [crypto pki import pem](#)
- [crypto pki trustpoint](#)

## crypto pki export pkcs12

**Overview** Use this command to export a certificate and private key for an entity in a trustpoint to a file in PKCS#12 format at the specified URL. The private key is encrypted with a passphrase for security.

**Syntax** `crypto pki export <trustpoint> pkcs12 {ca|server|<username>} <url>`

| Parameter    | Description                                                                                                                                                                                                                                        |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <trustpoint> | The name of the trustpoint for which the certificate and key are to be exported.                                                                                                                                                                   |
| ca           | If this option is specified, the command exports the root CA certificate and corresponding key.                                                                                                                                                    |
| server       | If this option is specified, the command exports the server certificate and corresponding key.                                                                                                                                                     |
| <username>   | If a RADIUS username is specified, the command exports the PKCS#12 file that was previously generated using the <code>crypto pki enroll user</code> command. To avoid ambiguity with keywords, the username may be prefixed by the string "user:". |
| <url>        | The destination URL for the PKCS#12 file. The format of the URL is the same as any valid destination for a file copy command.                                                                                                                      |

**Mode** Privileged Exec

**Usage notes** If the **ca** option is specified, this command exports the root CA certificate and the corresponding private key, if the trustpoint has been authenticated as a locally selfsigned CA. (If the trustpoint represents an external CA, then there is no private key on the system corresponding to the root CA certificate. Use the **crypto pki export pem** file to export the certificate by itself.) The command prompts for a passphrase to encrypt the private key.

If the **server** option is specified, this command exports the server certificate and the corresponding private key, if the server has been enrolled to the trustpoint. The command prompts for a passphrase to encrypt the private key.

If a RADIUS username is specified, this command exports the PKCS#12 file that was generated using the **crypto pki enroll user** command. (The key within the file was already encrypted as part of the user enrollment process.)

In the event that there is a RADIUS user named "ca" or "server", enter "user:ca" or "user:server" as the username.

The key and certificate must already exist.

**Example** To export the PKCS#12 file "example.pk12" for the trustpoint "example" to the URL "tftp://backup/", use the following commands:

```
awplus> enable
```

```
awplus# crypto pki export example pkcs12 ca tftp://backup/  
example.pk12
```

**Related commands** **crypto pki enroll user**  
**crypto pki export pem**  
**crypto pki import pkcs12**

# crypto pki import pem

**Overview** This command imports a certificate for the given trustpoint from a file in Privacy-Enhanced Mail (PEM) format. The file may be transferred from the specified destination URL, or entered at the terminal.

**Syntax** `crypto pki import <trustpoint> pem [terminal|<url>]`

| Parameter    | Description                                                                                                                                                                |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <trustpoint> | The name of the trustpoint for which the root CA certificate is to be imported.                                                                                            |
| terminal     | Optional parameter, If specified, the command prompts the user to enter (or paste) the PEM file at the terminal. If parameter is specified terminal is assumed by default. |
| <url>        | Optional parameter, If specified, the PEM file is transferred from the specified URL                                                                                       |

**Default** The PEM will be imported from the terminal by default.

**Mode** Privileged Exec

**Usage notes** The command is generally used for trustpoints representing external certificate authorities. It accepts root CA certificates, intermediate CA certificates, and server certificates. The system automatically detects the certificate type upon import.

Using this command to import root CA certificates at the terminal is identical to the functionality provided by the `crypto pki authenticate` command, for external certificate authorities. The imported certificate is validated to ensure it is a proper CA certificate.

Intermediate CA certificates are validated to ensure they are proper CA certificates, and that the issuer chain ends in a root CA certificate already installed for the trustpoint. If there is no root CA certificate for the trustpoint (i.e., if the trustpoint is unauthenticated) then intermediate CA certificates may not be imported.

Server certificates are validated to ensure that the issuer chain ends in a root CA certificate already installed for the trustpoint. If there is no root CA certificate for the trustpoint (i.e., if the trustpoint is unauthenticated) then server certificates may not be imported.

The specified trustpoint must already exist. If the imported certificate is self-signed, then no certificates may exist for the trustpoint. Otherwise, the issuer's certificate must already be present for the trustpoint.

**Example** To import the PEM file for the trustpoint “example” from the terminal, use the following commands:

```
awplus> enable
```

```
awplus# crypto pki import example pem
```

To import the PEM file for the trustpoint “example” from the URL “tftp://server\_a/”, use the following commands:

```
awplus> enable
```

```
awplus# crypto pki import example pem tftp://server_a/  
example.pem
```

**Related commands**

- crypto pki authenticate**
- crypto pki export pem**
- crypto pki trustpoint**

# crypto pki import pkcs12

**Overview** This command imports a certificate and private key for an entity in a trustpoint from a file in PKCS#12 format at the specified URL. The command prompts for a passphrase to decrypt the private key within the file.

**Syntax** `crypto pki import <trustpoint> pkcs12 {ca|server} <url>`

| Parameter    | Description                                                                                                              |
|--------------|--------------------------------------------------------------------------------------------------------------------------|
| <trustpoint> | The name of the trustpoint for which the certificate and key are to be imported.                                         |
| ca           | If this option is specified, the command imports the root CA certificate and corresponding key.                          |
| server       | If this option is specified, the command imports the server certificate and corresponding key.                           |
| <url>        | The source URL for the PKCS#12 file. The format of the URL is the same as any valid destination for a file copy command. |

**Mode** Privileged Exec

**Usage notes** If the **ca** option is specified, this command imports the root CA certificate and the corresponding private key. This is only valid if the root CA certificate does not already exist for the trustpoint (i.e., if the trustpoint is unauthenticated).

If the **server** option is specified, this command imports the server certificate and the corresponding private key. The imported private key is given a new unique label of the form "localN", where N is a non-negative integer. This operation is only valid if the server certificate does not already exist for the trustpoint (i.e., if the server is not enrolled to the trustpoint).

PKCS#12 files for RADIUS users may not be imported with this command. (There is no value in doing so, as the files are not needed on the local system.)

The specified trustpoint must already exist. The key and certificate must not already exist.

**Example** To import the PKCS#12 file "example.pk12" for the trustpoint "example" to the URL "tftp://backup/", use the following commands:

```
awplus> enable
awplus# crypto pki import example pkcs12 ca tftp://backup/
example.pk12
```

**Related** [crypto pki export pkcs12](#)  
**commands** [crypto pki import pem](#)

# crypto pki trustpoint

**Overview** Use this command to declare the named trustpoint and enter trustpoint configuration mode.

Use the **no** variant of this command to destroy the trustpoint.

**Syntax** `crypto pki trustpoint <trustpoint>`  
`no crypto pki trustpoint <trustpoint>`

| Parameter    | Description                                                                                                                                                                                                     |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <trustpoint> | The name of the trustpoint. The name must start with an alphanumeric character, and may only contain alphanumeric characters, underscores, dashes, or periods. The maximum length of the name is 63 characters. |

**Mode** Global Configuration

**Usage notes** If the trustpoint did not previously exist, it is created as a new trustpoint. The trustpoint will be empty (unauthenticated) unless the name "local" is selected, in which case the system will automatically authenticate the trustpoint as a local self-signed certificate authority.

The **no** variant of this command destroys the trustpoint by removing all CA and server certificates associated with the trustpoint, as well as the private key associated with the root certificate (if the root certificate was locally self-signed). This is a destructive and irreversible operation, so this command should be used with caution.

**Example** To configure a trustpoint named "example", use the following commands:

```
awplus> enable
awplus# configure terminal
awplus(config)# crypto pki trustpoint example
```

Version 5.4.8-2.1: command added to SBx908 GEN2, x950 Series

## crypto secure-mode

**Overview** Use this command to put the device into Secure Mode. When in Secure Mode, the following are disabled:

- Telnet
- SSHv1
- SNMPv1/v2
- All privilege levels except 1 and 15
- Algorithms that are not supported under FIPS, including MD5, RSA-1 and DSA
- The ability to store passwords in cleartext and to specify an **enable** password.

In Secure Mode, the web server on the device (used by the Device GUI) only accepts AES128-SHA ciphers.

**NOTE:** *Note: Stacking is not supported in Secure Mode.*

Use the **no** variant of this command to leave Secure Mode. You should delete all sensitive information first; see the ["Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide](#).

**Syntax** crypto secure-mode  
no crypto secure-mode

**Default** By default, the device is not in Secure Mode.

**Mode** Global Configuration

**Example** For step-by-step instructions about how to enter and leave Secure Mode, see "How to Enable Secure Mode" in the ["Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide](#).

# crypto secure-mode delete hostkey

**Overview** Use this command to delete the encryption key used for securing configuration secrets in secure mode. Note that doing this will make these secrets impossible to decrypt, potentially impacting the device configuration.

**Syntax** `crypto secure-mode delete hostkey`

**Default** Not set.

**Mode** Privileged Exec

**Example** To delete the encrypted key, use the command:  
`awplus# crypto secure-mode delete hostkey`

**Related commands** [radius-server host](#)  
[radius-server key](#)  
[ntp authentication-key](#)  
[crypto secure-mode](#)

**Command changes** Version 5.4.9-2.1: command added

## crypto verify

**Overview** Use this command to compare the SHA256 checksum of a file with its correct checksum. This confirms that the file has not been corrupted or interfered with during download. You can verify any kind of file, but you cannot specify a file path, so the file must be stored in the top level of the device's flash memory.

**CAUTION:** *If a file fails to verify and you believe the file may have been interfered with, we recommend immediately performing a security audit of your network.*

Once the device has verified the file, you can use the **copy running-config startup-config** command to save the file/hash pair in the running configuration. If you do this, the device will verify the file every time it boots up and will take action if the verification fails.

The action taken when verification fails on boot-up depends on the type of file and whether the device is in Secure Mode:

- If the device is in Secure Mode and the boot-up firmware file fails verification, the device will not boot. Contact Allied Telesis support if this happens.
- If the device is not in Secure Mode and the boot-up firmware file fails verification, the device will display the following warning message after booting: "% Verification Failed". If this occurs because the saved hash is incorrect, use this command to replace the hash. If this occurs because the firmware file is corrupted or may have been interfered with, ensure that your device is secure, then replace the failed file with a known good file and reboot.
- If you use the **gui** parameter and the GUI fails verification, the device will boot up but the GUI will be disabled (the **service http** command will be disabled).
- If any other file fails verification, the device will display the following warning message after booting: "% Verification Failed"

You can use the **show hash** command to see the current hash of a file.

Use the **no** variant of this command to remove a verified filename/hash combination from the running configuration.

**Syntax** `crypto verify <filename> <hash-value>`  
`crypto verify gui <hash-value>`  
`no crypto verify <filename>`

| Parameter                       | Description                                                                                                                                                                         |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;filename&gt;</code>   | The AlliedWare Plus file that you want to verify                                                                                                                                    |
| <code>gui</code>                | Verify the current Device GUI file                                                                                                                                                  |
| <code>&lt;hash-value&gt;</code> | The known correct checksum of the file. For firmware and GUI files, the correct checksum is listed in the sha256sum file that is available from the Allied Telesis Download Center. |

**Default** No default

**Mode** Global Configuration

**Usage notes** All models of a particular series run the same firmware file and therefore have the same checksum for that firmware file. For example, all x930 Series switches have the same checksum.

If your network has extremely strict security requirements, such as FIPS compliance, you may need to verify the bootloader on boot-up and use signature verification for the firmware file. To configure these, use the commands **crypto verify bootrom** and **crypto verify signed**. These commands make it difficult to upgrade the bootloader or firmware, so only use them if necessary.

**Examples** To verify the firmware file for 5.5.3-0.1 on an x930 Series switch, use the commands:

```
awplus# configure terminal
awplus(config)# crypto verify x930-5.5.3-0.1.rel
7f22d8a30c991a4ddc0a2aed47246282b23b4e4a865e07f79795c0959c47de78
```

**Related commands** **crypto secure-mode**  
**crypto verify bootrom**  
**crypto verify signed**  
**show hash**  
**show secure-mode**

**Command changes** Version 5.5.5-1.1: command available on all AlliedWare Plus devices  
Version 5.5.3-0.1: **gui** parameter added; **<filename>** parameter expanded to cover all file types

# crypto verify bootrom

**Overview** Use this command to compare the SHA256 checksum hash value of a bootloader with its correct checksum. This confirms that the bootloader has not been corrupted or interfered with.

If the verification fails, contact Allied Telesis customer support.

If the device is in Secure Mode, running **crypto verify bootrom** also stores the hash value permanently. When in Secure Mode, we recommend only using this command in networks with extremely strict security requirements, such as in FIPS-compliant networks. This is because you can only remove the hash value by erasing flash memory (for example, by using the **erase factory-default** command).

If the device is not in Secure Mode, you can use the **write** command to save the hash value to the boot configuration file. The device will verify the checksum every time it boots up and will warn you if it fails the verification.

When not in Secure Mode, you can use the **no** variant of this command to remove the bootrom/hash combination from the running configuration.

**Syntax** `crypto verify bootrom <hash-value>`  
`no crypto verify <filename>`

| Parameter                       | Description                                                                                                                                                                                                      |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;hash-value&gt;</code> | The known correct checksum of the bootloader. To see the correct hash value, run the command <b>show hash bootrom</b> straight after you first boot the device up, or check the Deployment Guide for the device. |

**Default** No default

**Mode** Global Configuration

**Usage notes** Please use this command in accordance with the User Guidance documentation for your required security certification.

All models of a particular series run the same bootloader file and therefore have the same checksum. For example, all x930 Series switches have the same bootloader checksum.

**Examples** To verify the bootrom file, use the commands:

```
awplus# configure terminal
awplus(config)# crypto verify bootrom
5e80e70b6a2200965abf5f62f72af1bdc1654f3726bdf554afcbd76270c91
```

Note that the hash in this example is an example only; it is not the hash of the device's bootloader.

**Related commands**

- crypto secure-mode**
- crypto verify**
- crypto verify signed**
- show hash**
- show secure-mode**

**Command changes** Version 5.5.5-1.1: command available on all AlliedWare Plus devices

# crypto verify signed

**Overview** Use this command to compare the HMAC-SHA checksum hash value of a firmware file with its correct checksum. This confirms that the firmware has not been corrupted or interfered with. When the device is in Secure Mode, this command also forces the device to check the hash whenever it boots up, and prevents the device from booting if the verification fails.

**Caution:**

If the device is in Secure Mode, this command makes it difficult to upgrade the device's firmware file. Therefore, only use this command if the device is in Secure Mode and you have extremely strict security requirements, such as in FIPS-compliant networks. Otherwise, use the **crypto verify** command. See the Usage Notes below for more detail.

If the verification fails, contact Allied Telesis customer support.

**Syntax** `crypto verify signed <filename> <hash-value>`

| Parameter                       | Description                                                                                                                                                                  |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;filename&gt;</code>   | The AlliedWare Plus file that you want to verify                                                                                                                             |
| <code>&lt;hash-value&gt;</code> | The known correct checksum of the file. This is a keyed HMAC-SHA hash. This is available in a .sig file, which you can get from your Allied Telesis customer representative. |

**Default** No default

**Mode** Global Configuration

**Usage notes** **Caution:**

If the device is in Secure Mode, and if the firmware file verified is the boot release and signed verification succeeds, then the device stores the signed hash and uses it to verify the firmware file on all subsequent reboots. This means that if you change the firmware version, the switch will not boot up. You can only change the firmware version if you reset the switch to the factory defaults **before** changing the firmware version, by using the command **erase factory-default**.

If the device is not in Secure Mode, you can use the **write** command to save the hash value to the boot configuration file. The device will verify the checksum every time it boots up and will warn you if it fails the verification.

All models of a particular series run the same release file and therefore have the same checksum. For example, all x930 Series switches have the same checksum.

**Examples** To use signature verification to verify the firmware file for 5.5.3-0.1 on an x930 Series switch, use the commands:

```
awplus# configure terminal
awplus(config)# crypto verify signed x930-5.5.3-0.1.rel
3f50420644aebd277dd48b3aee30639801348896ffffce231fc5615995ecde5d9
```

**Related commands**

- crypto secure-mode**
- crypto verify**
- crypto verify bootrom**
- show hash**
- show secure-mode**

**Command changes** Version 5.5.5-1.1: command available on all AlliedWare Plus devices

## enrollment (ca-trustpoint)

**Overview** Use this command to declare how certificates will be added to the system for the current trustpoint.

**Syntax** `enrollment {selfsigned|terminal|est|scep}`

| Parameter  | Description                                                                                           |
|------------|-------------------------------------------------------------------------------------------------------|
| selfsigned | Sets the enrollment mode for the current trustpoint to selfsigned.                                    |
| terminal   | Sets the enrollment mode for the current trustpoint to terminal.                                      |
| est        | Sets the enrollment mode for the current trustpoint to Secure Transport (EST).                        |
| scep       | Sets the enrollment mode for the current trustpoint to Simple Certificate Enrollment Protocol (SCEP). |

**Mode** Trustpoint Configuration

**Usage notes** If the enrollment is set to **selfsigned**, then the system will generate a root CA certificate and its associated key when the **crypto pki authenticate** command is issued. It will generate a server certificate (signed by the root CA certificate) when the **crypto pki enroll** command is issued.

If the enrollment is set to **terminal**, then the system will prompt the user to paste the root CA certificate Privacy Enhanced Mail (PEM) file at the terminal, when the **crypto pki authenticate** command is issued. It will create a Certificate Signing Request (CSR) file for the local server when the **crypto pki enroll** command is issued. The server certificate received from the external CA should be imported using the **crypto pki import pem** command.

The trustpoint named "local" may only use the **selfsigned** enrollment setting.

If enrollment is set to **EST**, the system will contact the EST server specified by **est-url** when the **crypto pki authenticate** command is issued to retrieve the root CA certificate. When the **crypto pki enroll** command is issued, the system will generate a Certificate Signing Request (CSR) for the local server, send it to the EST server for signing, and, if successful, receive the signed server certificate.

If enrollment is set to **SCEP**, the system will contact the SCEP server specified by **scep-url** when the **crypto pki authenticate** command is issued to retrieve the root CA certificate. When the **crypto pki enroll** command is issued, the system will generate a Certificate Signing Request (CSR) for the local server, send it to the SCEP server for signing, and, if successful, receive the signed server certificate.

If no enrollment mode is specified, the **crypto pki authenticate** command will fail for the trustpoint.

**Example** To configure the trustpoint named "example" and set its enrollment to **selfsigned**, use the following commands:

```
awplus> enable
awplus# configure terminal
awplus(config)# crypto pki trustpoint example
awplus(ca-trustpoint)# enrollment selfsigned
```

**Related commands** **crypto pki enroll**  
**crypto pki trustpoint**  
**show crypto pki trustpoint**

# fingerprint (ca-trustpoint)

**Overview** Use this command to declare that certificates with the specified fingerprint should be automatically accepted, when importing certificates from an external certificate authority. This can affect the behavior of the **crypto pki authenticate** and **crypto pki import pem** commands.

Use the **no** variant of this command to remove the specified fingerprint from the pre-accepted list.

**Syntax** fingerprint <word>  
no fingerprint <word>

| Parameter | Description                                                                                                     |
|-----------|-----------------------------------------------------------------------------------------------------------------|
| <word>    | The fingerprint as a series of 40 hexadecimal characters, optionally separated into multiple character strings. |

**Default** By default, no fingerprints are pre-accepted for the trustpoint.

**Mode** Trustpoint Configuration

**Usage notes** Specifying a fingerprint adds it to a list of pre-accepted fingerprints for the trustpoint. When a certificate is imported, if it matches any of the pre-accepted values, then it will be saved in the system automatically. If the imported certificate's fingerprint does not match any pre-accepted value, then the user will be prompted to verify the certificate contents and fingerprint visually.

This command is useful when certificates from an external certificate authority are being transmitted over an insecure channel. If the certificate fingerprint is delivered via a separate messaging channel, then pre-entering the fingerprint value via cut-and-paste may be less errorprone than attempting to verify the fingerprint value visually.

The fingerprint is a series of 40 hexadecimal characters. It may be entered as a continuous string, or as a series of up to multiple strings separated by spaces. The input format is flexible because different certificate authorities may provide the fingerprint string in different formats.

**Example** To configure a fingerprint "5A81D34C 759CC4DA CFCA9F65 0303AD83 410B03AF" for the trustpoint named "example", use the following commands:

```
awplus> enable
awplus# configure terminal
awplus(config)# crypto pki trustpoint example
awplus(ca-trustpoint)# fingerprint 5A81D34C 759CC4DA CFCA9F65
0303AD83 410B03AF
```

**Related commands**

- crypto pki authenticate**
- crypto pki import pem**
- crypto pki trustpoint**
- show crypto pki trustpoint**

# lifetime

**Overview** Use this command to specify the lifetime of self-signed X.509 certificates as part of configuring the trustpoint. You can specify the certificate lifetime in days (1-3650), months (1-120) or years (1-10).

Use the **no** variant of this command to return to the default lifetime.

**Syntax** lifetime {days <1-3650>|months <1-120>|years <1-10>}  
no lifetime

| Parameter      | Description                                |
|----------------|--------------------------------------------|
| days <1-3650>  | Specify the certificate lifetime in days   |
| months <1-120> | Specify the certificate lifetime in months |
| years <1-10>   | Specify the certificate lifetime in years  |

**Default** 5 years

**Mode** Trustpoint Configuration

**Example** To make the lifetime 10 years for the trustpoint named 'example', use the commands:

```
awplus# configure terminal
awplus(config)# crypto pki trustpoint example
awplus(ca-trustpoint)# lifetime years 10
```

**Related commands** [crypto pki trustpoint](#)  
[show crypto pki trustpoint](#)

**Command changes** Version 5.5.4-0.1: maximum increased to 10 years  
Version 5.5.3-2.1: command added with maximum of 5 years

# no crypto pki certificate

**Overview** Use this command to delete a certificate with the specified fingerprint from the specified trustpoint.

**Syntax** no crypto pki certificate <trustpoint> <word>

| Parameter    | Description                                                                                                     |
|--------------|-----------------------------------------------------------------------------------------------------------------|
| <trustpoint> | The name of the trustpoint.                                                                                     |
| <word>       | The fingerprint as a series of 40 hexadecimal characters, optionally separated into multiple character strings. |

**Default** By default, no fingerprints are pre-accepted for the trustpoint.

**Mode** Privileged Exec

**Usage notes** The fingerprint can be found in the output of the **show crypto pki certificates** command. If there are dependent certificates in the trustpoint (i.e., if other certificates were signed by the specified certificate), the command will be rejected.

If the specified certificate is the root CA certificate and the trustpoint represents a locally selfsigned CA, then the corresponding private key is also deleted from the system. Deleting the root CA certificate effectively resets the trustpoint to an unauthenticated state.

**Example** To delete a certificate with the fingerprint "594EDEF9 C7C4308C 36D408E0 77E784F0 A59E8792" from the trustpoint "example", use the following commands:

```
awplus> enable
awplus# no crypto pki certificate example
594EDEF9 C7C4308C 36D408E0 77E784F0 A59E8792
```

**Related commands** no **crypto pki trustpoint**  
**show crypto pki certificates**

# rsakeypair (ca-trustpoint)

**Overview** Use this command to declare which RSA key pair should be used to enroll the local server with the trustpoint. Note that this defines the key pair used with the server certificate, not the key pair used with the root CA certificate.

Use the **no** variant of this command to restore the default value, "server-default".

**Syntax** `rsakeypair <keylabel> [<1024-4096>]`  
`no rsakeypair`

| Parameter   | Description                                                                                                                                                                                                                                             |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <keylabel>  | The key to be used with the server certificate for this trustpoint. The name must start with an alphanumeric character, and may only contain alphanumeric characters, underscores, dashes, or periods. The maximum length of the name is 63 characters. |
| <1024-4096> | The bit length for the key, to be used if the key is implicitly generated during server enrollment.                                                                                                                                                     |

**Default** The default value for **keylabel** is "server-default".

The default value for the key bit length is 2048.

**Mode** Trustpoint Configuration

**Usage notes** If the label specified does not refer to an existing key created by the **crypto key generate rsa** command, the key will be implicitly generated when the **crypto pki enroll** command is issued to generate the server certificate or the server certificate signing request. The optional numeric parameter defines the bit length for the key, and is only applicable for keys that are implicitly created during enrollment.

This command does not affect server certificates or server certificate signing requests that have already been generated. The trustpoint's server certificate is set to use whatever key pair was specified for the trustpoint at the time the **crypto pki enroll** command is issued.

The default key pair is "server-default". The default bit length is 2048 bits.

**Example** To configure trustpoint "example" to use the key pair "example-server-key" with a bit length of 2048, use the following commands:

```
awplus> enable
awplus# configure terminal
awplus(config)# crypto pki trustpoint example
awplus(ca-trustpoint)# rsakeypair example-server-key 2048
```

**Related commands** [crypto key generate rsa](#)  
[crypto pki trustpoint](#)  
[show crypto pki trustpoint](#)

# show crypto key mypubkey rsa

**Overview** Use this command to display information about the specified Rivest-Shamir-Adleman encryption key.

**Syntax** show crypto key mypubkey rsa [<keylabel>]

| Parameter  | Description                                    |
|------------|------------------------------------------------|
| <keylabel> | The name of the key to be shown, if specified. |

**Default** By default, all keys will be shown.

**Mode** Privileged Exec

**Usage notes** If no key label is specified, information about all keys is shown. The command displays the bit length of the key, a key fingerprint (a hash of the key contents to help uniquely identify a key), and a list of trustpoints in which the server certificate is using the key.

The specified keys must exist.

**Example** To show all keys, use the following commands:

```
awplus> enable
awplus# show crypto key mypubkey rsa
```

**Output** The following shows typical output.

## Example output from show crypto key mypubkey rsa

```
awplus#show crypto key mypubkey rsa
-----
RSA Key Pair "example-server-key":
  Key size      : 2048 bits
  Fingerprint   : 1A605D73 C2274CB7 853886B3 1C802FC6 7CDE45FB
  Trustpoints   : example
-----
RSA Key Pair "server-default":
  Key size      : 2048 bits
  Fingerprint   : 34AC4D2D 5249A168 29D426A3 434FFC59 C4A19901
  Trustpoints   : local
```

**Related commands** [crypto key generate rsa](#)

# show crypto pki certificates

**Overview** Use this command to display information about existing certificates for the specified trustpoint.

**Syntax** show crypto pki certificates [<trustpoint>]

| Parameter    | Description                                                |
|--------------|------------------------------------------------------------|
| <trustpoint> | The trustpoint for which the certificates are to be shown. |

**Default** By default, the certificates for all trustpoints are shown.

**Mode** Privileged Exec

**Usage notes** If no trustpoint is specified, certificates for all trustpoints are shown. The command displays the certificates organized into certificate chains. It starts with the server certificate and then displays its issuer, and continues up the issuer chain until the root CA certificate is reached.

For each certificate, the command displays the certificate type, the subject's distinguished name (the entity identified by the certificate), the issuer's distinguished name (the entity that signed the certificate), the validity dates for the certificate, and the fingerprint of the certificate. The fingerprint is a cryptographic hash of the certificate contents that uniquely identifies the certificate.

The specified trustpoints must already exist.

**Example** To show the certificates for the trustpoint "example", use the following command:

```
awplus> enable
awplus# show crypto pki certificates example
```

**Output** The following shows typical output.

**Example output from show crypto pki certificates**

```
awplus>enable
awplus#show crypto pki certificates example
-----
Trustpoint "example" Certificate Chain

```

**Related commands** [crypto pki trustpoint](#)

# show crypto pki enrollment user

**Overview** Use this command to display a list of trustpoints for which RADIUS user enrollments have been performed, using the **crypto pki enroll user** command. This indicates that PKCS#12 files for the user are available for export for the given trustpoints, using the **crypto pki export pkcs12** command.

**Syntax** `crypto pki enrollment user <username>`

| Parameter                     | Description                                     |
|-------------------------------|-------------------------------------------------|
| <code>&lt;username&gt;</code> | The user for which enrollments are to be shown. |

**Mode** Privileged Exec

**Example** To show the list of trustpoints to which user "exampleuser1" is enrolled, use the following commands:

```
awplus> enable
awplus(config)# show crypto pki enrollment user exampleuser1
```

**Output** The following shows typical output.

## Example output from show crypto pki enrollment user

```
awplus> enable
awplus# show crypto pki enrollment user exampleuser1
User "exampleuser1" is enrolled to the following trustpoints:
local, example
```

**Related commands** [crypto pki enroll user](#)  
[crypto pki export pkcs12](#)

# show crypto pki trustpoint

**Overview** Use this command to display information about the specified trustpoint.

**Syntax** show crypto pki trustpoint [*<trustpoint>*]

| Parameter                 | Description                            |
|---------------------------|----------------------------------------|
| <i>&lt;trustpoint&gt;</i> | The name of the trustpoint to be shown |

**Default** By default, all trustpoints are shown.

**Mode** Privileged Exec

**Usage notes** If no trustpoint is specified, information about all trustpoints is shown. The command displays the authentication status of the trustpoint, the fingerprint of the root CA certificate (if it exists), the enrollment status of the local server with the trustpoint, a list of any applications that are configured to use the trustpoint, and the trustpoint parameters that were configured from trustpoint-configuration mode.

The specified trustpoints must already exist.

**Example** To show the details of the trustpoint "example", use the following commands:

```
awplus> enable
awplus# show crypto pki trustpoint example
```

**Output** The following shows typical output.

## Example output from show crypto pki trustpoint

```
awplus> enable
awplus# show crypto pki trustpoint example
-----
Trustpoint "example"
  Type           : Self-signed certificate authority
  Root Certificate: 50C1856B EEC7555A 0F3A61F6 690D9463 67DF74D1
  Local Server   : The server is enrolled to this trustpoint.
  Server Key     : example-server-key
  Applications    : RADIUS

Authentication and Enrollment Parameters:
  Enrollment     : selfsigned
  RSA Key Pair   : example-server-key (2048 bits)
  Lifetime       : 120 months
-----
```

**Related** **crypto pki trustpoint**  
**commands** **show crypto pki certificates**

# show hash

**Overview** Use this command to display the hash for a specified file on the device, or for the device's current bootloader.

**Syntax** show hash <filename>  
show hash bootrom

| Parameter  | Description                                   |
|------------|-----------------------------------------------|
| <filename> | The name of the file to display the hash for. |
| bootrom    | Display the hash for the current bootloader.  |

**Mode** Privileged Exec

**Examples** To show the hash for the GUI file named awplus-gui\_552\_27.gui, use the command:

```
awplus# show hash awplus-gui_552_27.gui
```

To show the hash for a file named 'example.txt', which is in the folder named 'example' in flash memory, use the command:

```
awplus# show hash flash://example/example.txt
```

To show the hash for the bootloader, use the command:

```
awplus# show hash bootrom
```

**Output** The following shows typical output.

## Example output from show hash

```
awplus#show hash awplus-gui_552_27.gui  
b793e2c7fc5580513472017f964316f3bb0e79fbf1ddfd6f3844a2a8311c5c64
```

**Related commands** [crypto secure-mode](#)  
[crypto verify](#)

**Command changes** Version 5.5.3-0.1: command added

# show secure-mode

**Overview** Use this command to see whether secure mode is enabled or not. Secure mode disables a number of insecure features, such as Telnet.

**Syntax** show secure-mode

**Mode** User Exec/Privileged Exec

**Example** To see if secure mode is enabled, use the command:  
awplus# show secure-mode

**Output** The following shows typical output.

## Example output from show secure-mode

```
awplus#show secure-mode  
Secure mode is enabled
```

**Related commands** [crypto secure-mode](#)

## subject-name (ca-trustpoint)

**Overview** Use this command to specify the distinguished name string that should be used for the subject field in the server certificate, when enrolling the server (generating the server certificate or server certificate signing request).

**Syntax** subject-name <word>

| Parameter | Description                                                                                                                                                   |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <word>    | Specify the subject name as a distinguished name string. Complex strings (e.g., strings containing spaces) should be surrounded with double-quote characters. |

**Default** If no subject name is specified for the trustpoint, then the system automatically builds a name of the form "/O=AlliedWare Plus/CN=xxxx.yyyy.zzz", where "xxxx" is the hostname of the system and "yyy.zzz" is the default search domain for the system.

**Mode** Trustpoint Configuration

**Usage notes** The subject name is specified as a variable number of fields, where each field begins with a forward-slash character ("/"). Each field is of the form "XX=value", where "XX" is the abbreviation of the node type in the tree.

Common values include:

- "C" (country),
- "ST" (state),
- "L" (locality),
- "O" (organization),
- "OU" (organizational unit), and
- "CN" (common name).

Of these fields, "CN" is usually the most important.

**NOTE:** For a server certificate, many applications require that the network name of the server matches the common name in the server's certificate.

**Example** To configure the trustpoint named "example" and set its subject name, use the following commands:

```
awplus> enable
awplus# configure terminal
awplus(config)# crypto pki trustpoint example
awplus(ca-trustpoint)# subject-name "/O=My Company/
CN=192.168.1.1
```

# Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure the device to use TACACS+ servers. For more information about TACACS+, see the [TACACS+ Feature Overview and Configuration Guide](#).

TACACS+ is not available in Secure Mode (see the [crypto secure-mode](#) command).

## aaa authorization commands

**Overview** This command configures a method list for commands authorization that can be applied to console or VTY lines. When command authorization is enabled for a privilege level, only authorized users can executed commands in that privilege level.

Use the **no** variant of this command to remove a named method list or disable the default method list for a privilege level.

**Syntax** `aaa authorization commands <privilege-level> {default|<list-name>} group tacacs+ [none]`  
`no aaa authorization commands <privilege-level> {default|<list-name>}`

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <privilege-level> | The privilege level of the set of commands the method list will be applied to.<br><br>AlliedWare Plus defines three sets of commands, that are indexed by a level value:<br><b>Level = 1:</b> All commands that can be accessed by a user with privilege level between 1 and 6 inclusive<br><b>Level = 7:</b> All commands that can be accessed by a user with privilege level between 7 and 14 inclusive<br><b>Level = 15:</b> All commands that can be accessed by a user with privilege level 15 |
| group             | Specify the server group where authorization messages are sent. Only the tacacs+ group is available for this command.                                                                                                                                                                                                                                                                                                                                                                               |
| tacacs+           | Use all TACACS+ servers configured by the <b>tacacs-server host</b> command.                                                                                                                                                                                                                                                                                                                                                                                                                        |
| default           | Configure the default authorization commands method list.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <list-name>       | Configure a named authorization commands method list                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| none              | If specified, this provides a local fallback to command authorization so that if authorization servers become unavailable then the device will accept all commands normally allowed for the privilege level of the user.                                                                                                                                                                                                                                                                            |

**Mode** Global Configuration

**Usage notes** TACACS+ command authorization provides centralized control of the commands available to a user of an AlliedWare Plus device. Once enabled:

- The command string and username are encrypted and sent to the first available configured TACACS+ server (the first server configured) for authorization.
- The TACACS+ server decides if the user is authorized to execute the command and returns the decision to the AlliedWare Plus device.
- Depending on this decision the device will then either execute the command or notify the user that authorization has failed.

If multiple TACACS+ servers are configured, and the first server is unreachable or does not respond, the other servers will be queried, in turn, for an authorization decision. If all servers are unreachable and a local fallback has been configured, with the **none** parameter, then commands are authorized based on the user's privilege level; the same behavior as if command authorization had not been configured. If, however, the local fallback is not configured and all servers become unreachable then all commands except **logout**, **exit**, and **quit** will be denied.

The **default** method list is defined with a local fallback unless configured differently using this command.

**Example** To configure a commands authorization method list, named TAC15, using all TACACS+ servers to authorize commands for privilege level 15, with a local fallback, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# aaa authorization commands 15 TAC15 group tacacs  
+ none
```

To configure the default method list to authorize commands for privilege level 7, with no local fallback, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# aaa authorization commands 7 default group  
tacacs+
```

To remove the authorization method list TAC15, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# no aaa authorization commands 15 TAC15
```

**Related commands** [aaa authorization config-commands](#)  
[authorization commands](#)

**Command changes** Version 5.4.6-2.1: command added

# aaa authorization config-commands

**Overview** Use this command to enable command authorization on configuration mode commands. By default, command authorization applies to commands in exec mode only.

Use the **no** variant of this command to disable command authorization on configuration mode commands.

**Syntax** `aaa authorization config-commands`  
`no aaa authorization config-commands`

**Default** By default, command authorization is disabled on configuration mode commands.

**Mode** Global Configuration

**Usage notes** If authorization of configuration mode commands is not enabled then all configuration commands are accepted by default, including command authorization commands.

**NOTE:** *Authorization of configuration commands is required for a secure TACACS+ command authorization configuration as it prevents the feature from being disabled to gain access to unauthorized exec mode commands.*

**Example** To enable command authorization for configuration mode commands, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authorization config-commands
```

To disable command authorization for configuration mode commands, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authorization config-commands
```

# authorization commands

**Overview** This command applies a command authorization method list, defined using the **aaa authorization commands** command, to console and VTY lines.

Use the **no** variant of this command to reset the command authorization configuration on the console and VTY lines.

**Syntax** authorization commands <privilege-level> {default|<list-name>}  
no authorization commands <privilege-level>

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <privilege-level> | The privilege level of the set of commands the method list will be applied to.<br><br>AlliedWare Plus defines three sets of commands, that are indexed by a level value:<br><b>Level = 1:</b> All commands that can be accessed by a user with privilege level between 1 and 6 inclusive<br><b>Level = 7:</b> All commands that can be accessed by a user with privilege level between 7 and 14 inclusive<br><b>Level = 15:</b> All commands that can be accessed by a user with privilege level 15 |
| default           | Configure the default authorization commands method list.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <list-name>       | Configure a named authorization commands method list                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**Default** The **default** method list is applied to each console and VTY line by default.

**Mode** Line Configuration

**Usage notes** If the specified method list does not exist users will not be able to execute any commands in the specified method list on the specified VTY lines.

**Example** To apply the TAC15 command authorization method list with privilege level 15 to VTY lines 0 to 5, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 5
awplus(config-line)# authorization commands 15 TAC15
```

To reset the command authorization configuration with privilege level 15 on VTY lines 0 to 5, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 5
awplus(config-line)# no authorization commands 15
```

**Related commands** [aaa authorization commands](#)  
[aaa authorization config-commands](#)  
[tacacs-server host](#)

**Command changes** Version 5.4.6-2.1: command added

# ip tacacs source-interface

**Overview** This command sets the source interface, or IP address, to use for all TACACS+ packets sent from the device. By default, TACACS+ packets use the source IP address of the egress interface.

Use the **no** variant of this command to remove the source interface configuration and use the source IP address of the egress interface.

**Syntax** `ip tacacs source-interface {<interface>|<ip-address>}`  
`no ip tacacs source-interface`

| Parameter    | Description                                      |
|--------------|--------------------------------------------------|
| <interface>  | Interface name.                                  |
| <ip-address> | IP address in the dotted decimal format A.B.C.D. |

**Default** The source IP address of outgoing TACACS+ packets default to the IP address of the egress interface.

**Mode** Global Configuration

**Usage notes** Setting the source interface ensures that all TACACS+ packets sent from the device will have the same source IP address. Once configured this affects all TACACS+ packets, namely accounting, authentication, and authorization.

If the specified interface is down or there is no IP address on the interface, then the source IP address of outgoing TACACS+ packets will default to the IP address of the egress interface.

**Example** To configure all outgoing TACACS+ packets to use the IP address of the loop-back "lo" interface as the source IP address, use the following commands:

```
awplus# configure terminal
awplus(config)# ip tacacs source-interface lo
```

To reset the source interface configuration for all TACACS+ packets, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip tacacs source-interface
```

**Related commands** [tacacs-server host](#)  
[show tacacs+](#)

**Command changes** Version 5.4.6-2.1: command added

## show tacacs+

**Overview** This command displays the current TACACS+ server configuration and status.

**Syntax** show tacacs+

**Mode** User Exec and Privileged Exec

**Example** To display the current status of TACACS+ servers, use the command:  
awplus# show tacacs+

**Output** The following shows typical output.

**Example output from the show tacacs+ command**

|                              |                  |
|------------------------------|------------------|
| TACACS+ Global Configuration |                  |
| Source Interface             | : not configured |
| Timeout                      | : 5 sec          |
| Server Host/<br>IP Address   | Server<br>Status |
| -----                        |                  |
| 192.168.1.10                 | Alive            |
| 192.168.1.11                 | Unknown          |

**Parameters in the output of the show tacacs+ command**

| Output Parameter       | Meaning                                                                                       |
|------------------------|-----------------------------------------------------------------------------------------------|
| Source Interface       | IP address of source interface if set with <b>ip tacacs source-interface</b> .                |
| Timeout                | A time interval in seconds.                                                                   |
| Server Host/IP Address | TACACS+ server hostname or IP address.                                                        |
| Server Status          | The status of the authentication port.                                                        |
|                        | Alive            The server is alive.                                                         |
|                        | Dead            The server has timed out.                                                     |
|                        | Error            The server is not responding or there is an error in the key string entered. |
|                        | Unknown        The server is never used or the status is unknown.                             |
|                        | Unreachable    The server is unreachable.                                                     |
|                        | Unresolved     The server name can not be resolved.                                           |

**Command changes** Version 5.4.6-2.1: **Source Interface** parameter added

## tacacs-server host

**Overview** Use this command to specify a remote TACACS+ server host for authentication, authorization and accounting, and to set the shared secret key to use with the TACACS+ server. The parameters specified with this command override the corresponding global parameters for TACACS+ servers.

Use the **no** variant of this command to remove the specified server host as a TACACS+ authentication and authorization server.

**Syntax** tacacs-server host {<host-name>|<ip-address>} [key [8|9] <key-string>]  
no tacacs-server host {<host-name>|<ip-address>}

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <host-name>  | Server host name. The DNS name of the TACACS+ server host.                                                                                                                                                                                                                                                                                                                                                                   |
| <ip-address> | The IP address of the TACACS+ server host, in dotted decimal notation A.B.C.D.                                                                                                                                                                                                                                                                                                                                               |
| key          | Set shared secret key with TACACS+ servers.                                                                                                                                                                                                                                                                                                                                                                                  |
| 8            | Specifies a string in a DES encrypted format instead of plain text. DES has been deprecated and should not be used. The default encryption format is now AES.                                                                                                                                                                                                                                                                |
| 9            | Specifies a string in an AES encrypted format instead of plain text. This is the default.                                                                                                                                                                                                                                                                                                                                    |
| <key-string> | Shared key string applied, a value in the range 1 to 64 characters.<br><br>Specifies the shared secret authentication or encryption key for all TACACS+ communications between this device and the TACACS+ server. This key must match the encryption used on the TACACS+ server. This setting overrides the global setting of the <b>tacacs-server key</b> command. If no key value is specified, the global value is used. |

**Default** No TACACS+ server is configured by default.

**Mode** Global Configuration

**Usage** A TACACS+ server host cannot be configured multiple times like a RADIUS server.

As many as four TACACS+ servers can be configured and consulted for login authentication, enable password authentication and accounting. The first server configured is regarded as the primary server and if the primary server fails then the backup servers are consulted in turn. A backup server is consulted if the primary server fails, not if a login authentication attempt is rejected. The reasons a server would fail are:

- it is not network reachable
- it is not currently TACACS+ capable
- it cannot communicate with the switch properly due to the switch and the server having different secret keys

**Examples** To add the server tac1.company.com as the TACACS+ server host, use the following commands:

```
awplus# configure terminal
awplus(config)# tacacs-server host tac1.company.com
```

To set the secret key to 'secret' on the TACACS+ server 192.168.1.1, use the following commands:

```
awplus# configure terminal
awplus(config)# tacacs-server host 192.168.1.1 key secret
```

To remove the TACACS+ server tac1.company.com, use the following commands:

```
awplus# configure terminal
awplus(config)# no tacacs-server host tac1.company.com
```

- Version 5.5.2-1.1: **vrf** parameter added for products that support VRF

## tacacs-server key

**Overview** This command sets a global secret key for TACACS+ authentication, authorization and accounting. The shared secret text string is used for TACACS+ communications between the switch and all TACACS+ servers.

Note that if no secret key is explicitly specified for a TACACS+ server with the **tacacs-server host** command, this global secret key will be used for the shared secret for the server.

Use the **no** variant of this command to remove the global secret key.

**Syntax** tacacs-server key [8|9] <key-string>  
no tacacs-server key

| Parameter    | Description                                                                                                                                                                                                                                                                        |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 8            | Specifies a string in a DES encrypted format instead of plain text. DES has been deprecated and should not be used. The default encryption format is now AES.                                                                                                                      |
| 9            | Specifies a string in an AES encrypted format instead of plain text.                                                                                                                                                                                                               |
| <key-string> | Shared key string applied, a value in the range 1 to 64 characters.<br><br>Specifies the shared secret authentication or encryption key for all TACACS+ communications between this device and all TACACS+ servers. This key must match the encryption used on the TACACS+ server. |

**Default** AES encrypted format

**Mode** Global Configuration

**Usage notes** Use this command to set the global secret key shared between this client and its TACACS+ servers. If no secret key is specified for a particular TACACS+ server using the **tacacs-server host** command, this global key is used.

**Examples** To set the global secret key to secret for TACACS+ server, use the following commands:

```
awplus# configure terminal
awplus(config)# tacacs-server key secret
```

To delete the global secret key for TACACS+ server, use the following commands:

```
awplus# configure terminal
awplus(config)# no tacacs-server key
```

**Related commands** **tacacs-server host**  
**show tacacs+**

**Command changes** Version 5.5.4-0.1: DES encrypted format deprecated

# tacacs-server timeout

**Overview** Use this command to specify the TACACS+ global timeout value. The timeout value is how long the device waits for a reply to a TACACS+ request before considering the server to be dead.

Note that this command configures the **timeout** parameter for TACACS+ servers globally.

The **no** variant of this command resets the transmit timeout to the default (5 seconds).

**Syntax** tacacs-server timeout <seconds>  
no tacacs-server timeout

| Parameter | Description                                                |
|-----------|------------------------------------------------------------|
| <seconds> | TACACS+ server timeout in seconds, in the range 1 to 1000. |

**Default** The default timeout value is 5 seconds.

**Mode** Global Configuration

**Examples** To set the timeout value to 3 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# tacacs-server timeout 3
```

To reset the timeout period for TACACS+ servers to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# no tacacs-server timeout
```

# Introduction

**Overview** This chapter gives detailed information about the commands used to configure DHCP snooping. For detailed descriptions of related ACL commands, see [IPv4 Hardware Access Control List \(ACL\) Commands](#). For more information about DHCP snooping, see the [DHCP Snooping Feature Overview and Configuration Guide](#).

DHCP snooping can operate on static link aggregators (e.g. sa2) and dynamic link aggregators (e.g. po2), as well as on switch ports (e.g. port1.0.2).

# arp security

**Overview** Use this command to enable ARP security on untrusted ports in the VLANs, so that the switch only responds to/forwards ARP packets if they have recognized IP and MAC source addresses.

Use the **no** variant of this command to disable ARP security on the VLANs.

**Syntax** arp security  
no arp security

**Default** Disabled

**Mode** Interface Configuration (VLANs)

**Usage** Enable ARP security to provide protection against ARP spoofing. DHCP snooping must also be enabled on the switch (**service dhcp-snooping**), and on the VLANs (**ip dhcp snooping**).

**Example** To enable ARP security on VLANs 2 to 4, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# arp security
```

**Related commands** **arp security violation**  
**show arp security**  
**show arp security interface**  
**show arp security statistics**

# arp security drop link-local-arps

**Overview** Use this command to enable ARP security on a per-port basis. This means that IPv4 link-local ARPs will be dropped without causing an ARP security violation when received.

Use the **no** variant of this command to return to the default setting of disabled.

**Syntax** `arp security drop link-local-arps`  
`no arp security drop link-local-arps`

**Default** Disabled by default.

**Mode** Interface Configuration

**Usage notes** Hosts that implement RFC 3927 may automatically assign themselves link-local IPv4 addresses in the subnet 169.254.0.0/16, if they are configured to learn their IP addresses via DHCP but are unable to contact a DHCP server. This is common behavior for all versions of Microsoft Windows since Windows XP. In an attempt to avoid IP address collision with other devices on the local network, the host will broadcast ARP probes for its randomly selected link-local IP address.

By default, ARP security will treat these ARP probes as violations and carry out the configured violation action on the port they are received on. If the violation action is configured as link-down, this will result in the host being disconnected from the network, which will interrupt any DHCP IP address discovery that was in progress.

Use this command to configure ARP Security to drop these ARP probes, and any other ARPs that contain link-local IP addresses, without raising a violation on the affected port. The count of ARPs dropped in this manner can be seen in the output of **show arp security statistics detail**.

**Example** To configure ARP security to drop IPv4 link local ARPs on port1.0.1 to port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.4
awplus(config-if)# arp security drop link-local-arps
```

**Related commands** [arp security](#)  
[arp security violation](#)  
[show arp security statistics](#)

**Command changes** Version 5.4.9-1.1: command added.

## arp security violation

**Overview** Use this command to specify an additional action to perform if an ARP security violation is detected on the ports. ARP security must also be enabled (**arp security**).

Use the **no** variant of this command to remove the specified action, or all actions. Traffic violating ARP security will be dropped, but no other action will be taken.

**Syntax** `arp security violation {log|trap|link-down} ...`  
`no arp security violation [log|trap|link-down] ...`

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| log       | Generate a log message. To display these messages, use the <b>show log</b> .                                                                                                                                                                                                                                                                                                                                                               |
| trap      | <p>Generate an SNMP notification (trap). To send SNMP notifications, SNMP must also be configured, and DHCP snooping notifications must be enabled using the <b>snmp-server enable trap</b>.</p> <p>Notifications are limited to one per second and to one per source MAC and violation reason. Additional violations within a second of a notification being sent will not result in further notifications.</p> <p>Default: disabled.</p> |
| link-down | <p>Shut down the port that received the packet.</p> <p>Default: disabled.</p>                                                                                                                                                                                                                                                                                                                                                              |

**Default** When the switch detects an ARP security violation, it drops the packet. By default, it does not perform any other violation actions.

**Mode** Interface Configuration (switch ports, static or dynamic aggregated links)

**Usage notes** When the switch detects an ARP security violation on an untrusted port in a VLAN that has ARP security enabled, it drops the packet. This command sets the switch to perform additional actions in response to ARP violations.

If a port has been shut down in response to a violation, to bring it back up again after any issues have been resolved, use the **shutdown**.

**Example** To send SNMP notifications for ARP security violations on ports 1.0.1 to 1.0.6, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap dhcpsnooping
awplus(config)# interface port1.0.1-port1.0.6
awplus(config-if)# arp security violation trap
```

**Related commands**

- arp security**
- show arp security interface**
- show arp security statistics**
- show log**
- snmp-server enable trap**

# clear arp security statistics

**Overview** Use this command to clear ARP security statistics for the specified ports, or for all ports.

**Syntax** clear arp security statistics [interface *<port-list>*]

| Parameter                | Description                                                                                                                                                               |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;port-list&gt;</i> | The ports to clear statistics for. If no ports are specified, statistics are cleared for all ports. The ports may be switch ports, or static or dynamic link aggregators. |

**Mode** Privileged Exec

**Example** To clear statistics for ARP security on interface port1.0.1, use the command:

```
awplus# clear arp security statistics interface port1.0.1
```

**Related commands**

- [arp security violation](#)
- [show arp security](#)
- [show arp security statistics](#)

# clear ip dhcp snooping binding

**Overview** Use this command to remove one or more DHCP Snooping dynamic entries from the DHCP Snooping binding database. If no options are specified, all entries are removed from the database.

**CAUTION:**

**Syntax** `clear ip dhcp snooping binding [<ipaddr>] [interface <port-list>] [vlan <vid-list>]`

| Parameter   | Description                                                                                                                          |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <ipaddr>    | Remove the entry for this client IP address.                                                                                         |
| <port-list> | Remove all entries for these ports. The port list may contain switch ports, and static or dynamic link aggregators (channel groups). |
| <vid-list>  | Remove all entries associated with these VLANs.                                                                                      |

**Mode** Privileged Exec

**Usage** This command removes dynamic entries from the database. Note that dynamic entries can also be deleted by using the **no** variant of the **ip dhcp snooping binding**.

Dynamic entries can individually be restored by using the **ip dhcp snooping binding** command.

To remove static entries, use the **no** variant of the **ip source binding**.

**Example** To remove a dynamic lease entry from the DHCP snooping database for a client with the IP address 192.168.1.2, use the command:

```
awplus# clear ip dhcp snooping binding 192.168.1.2
```

**Related commands**

- ip dhcp snooping binding**
- ip source binding**
- show ip dhcp snooping binding**

# clear ip dhcp snooping statistics

**Overview** Use this command to clear DHCP snooping statistics for the specified ports, or for all ports.

**Syntax** clear ip dhcp snooping statistics [interface *<port-list>*]

| Parameter                | Description                                                                                                                                                                        |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;port-list&gt;</i> | The ports to clear statistics for. If no ports are specified, statistics are cleared for all ports. The port list can contain switch ports, or static or dynamic link aggregators. |

**Mode** Privileged Exec

**Example** To clear statistics for the DHCP snooping on interface port1.0.1, use the command:

```
awplus# clear ip dhcp snooping statistics interface port1.0.1
```

**Related commands**

- [clear arp security statistics](#)
- [show ip dhcp snooping](#)
- [show ip dhcp snooping statistics](#)

# debug arp security

**Overview** Use this command to enable ARP security debugging.

Use the **no** variant of this command to disable debugging for ARP security.

**Syntax** debug arp security  
no debug arp security

**Default** Disabled

**Mode** Privileged Exec

**Example** To enable ARP security debugging, use the commands:

```
awplus# debug arp security
```

**Related commands** [show debugging arp security](#)  
[show log](#)  
[terminal monitor](#)

# debug ip dhcp snooping

**Overview** Use this command to enable the specified types of debugging for DHCP snooping.

Use the **no** variant of this command to disable the specified types of debugging.

**Syntax** debug ip dhcp snooping {all|acl|db|packet [detail]}  
no debug ip dhcp snooping {all|acl|db|packet [detail]}

| Parameter | Description                                                                                                                                |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------|
| all       | All DHCP snooping debug.                                                                                                                   |
| acl       | DHCP snooping access list debug.                                                                                                           |
| db        | DHCP snooping binding database debug.                                                                                                      |
| packet    | DHCP snooping packet debug. For the <b>no</b> variant of this command, this option also disables detailed packet debug, if it was enabled. |
| detail    | Detailed packet debug.                                                                                                                     |

**Default** Disabled

**Mode** Privileged Exec

**Example** To enable access list debugging for DHCP snooping, use the commands:

```
awplus# debug ip dhcp snooping acl
```

**Related commands** [debug arp security](#)  
[show debugging ip dhcp snooping](#)  
[show log](#)  
[terminal monitor](#)

# ip dhcp snooping

**Overview** Use this command to enable DHCP snooping on one or more VLANs.  
Use the **no** variant of this command to disable DHCP snooping on the VLANs.

**Syntax** ip dhcp snooping  
no ip dhcp snooping

**Default** DHCP snooping is disabled on VLANs by default.

**Mode** Interface Configuration (VLANs)

## Usage notes Enabling DHCP snooping

For DHCP snooping to operate on a VLAN, you must:

- enable the service on the switch by using the **service dhcp-snooping** command, and
- enable DHCP snooping on the particular VLAN by using the **ip dhcp snooping** command, and
- if there is an external DHCP server, configure the port connected to the server as a trusted port, by using the **ip dhcp snooping trust** command

## Disabling DHCP snooping

Use **no service dhcp-snooping** to disable DHCP snooping.

Disabling DHCP snooping removes all DHCP snooping configuration from the running configuration, except for:

- any DHCP snooping maximum bindings settings (**ip dhcp snooping max-bindings**), and
- any additional DHCP snooping-based ACLs you have created for filtering on untrusted ports.

You must remove any such additional DHCP snooping-based ACLs, using the **no access-group** command. This is because these ACLs block all traffic except for traffic that matches DHCP snooping entries. Once you have disabled DHCP snooping, these ACLs will block all traffic. Note that if you disable DHCP snooping on particular VLANs (using the **no ip dhcp snooping** command), you need to make sure you remove any such additional ACLs that apply to those VLANs.

If you re-enable the service, the switch repopulates the DHCP snooping database from the dynamic lease entries in the database backup file (see the **ip dhcp snooping database** command). It also updates the lease expiry times.

**Examples** To enable DHCP snooping on VLANs 2 to 4, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ip dhcp snooping
```

To disable DHCP snooping on the switch, use the command:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# no ip dhcp snooping
```

**Related commands**

- ip dhcp snooping trust**
- service dhcp-snooping**
- show ip dhcp snooping**

## ip dhcp snooping agent-option

**Overview** Use this command to enable DHCP Relay Agent Option 82 information insertion on the switch. When this is enabled, the switch:

- inserts DHCP Relay Agent Option 82 information into DHCP packets that it receives on untrusted ports
- removes DHCP Relay Agent Option 82 information from DHCP packets that it sends to untrusted ports.

Use the **no** variant of this command to disable DHCP Relay Agent Option 82 insertion.

**Syntax** `ip dhcp snooping agent-option`  
`no ip dhcp snooping agent-option`

**Default** DHCP Relay Agent Option 82 insertion is enabled by default when DHCP snooping is enabled.

**Mode** Global Configuration

**Usage notes** DHCP snooping must also be enabled on the switch ([service dhcp-snooping](#)), and on the VLANs ([ip dhcp snooping](#)).

**Example** To disable DHCP Relay Agent Option 82 on the switch, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp snooping agent-option
```

**Related commands** [ip dhcp snooping](#)  
[ip dhcp snooping agent-option allow-untrusted](#)  
[service dhcp-snooping](#)  
[show ip dhcp snooping](#)

# ip dhcp snooping agent-option allow-untrusted

**Overview** Use this command to enable DHCP Relay Agent Option 82 information reception on untrusted ports. When this is enabled, the switch accepts incoming DHCP packets that contain DHCP Relay Agent Option 82 information on untrusted ports.

Use the **no** variant of this command to disable DHCP Relay Agent Option 82 information reception on untrusted ports.

**Syntax** ip dhcp snooping agent-option allow-untrusted  
no ip dhcp snooping agent-option allow-untrusted

**Default** Disabled

**Mode** Global Configuration

**Usage notes** If the switch is connected via untrusted ports to edge switches that insert DHCP Relay Agent Option 82 information into DHCP packets, you may need to allow these DHCP packets through the untrusted ports, by using this command.

When this is disabled (default), the switch treats incoming DHCP packets on untrusted ports that contain DHCP Relay Agent Option 82 information as DHCP snooping violations: it drops them and applies any violation action specified by the **ip dhcp snooping violation**. The switch stores statistics for packets dropped; to display these statistics, use the **show ip dhcp snooping statistics**.

**Example** To enable DHCP snooping Option 82 information reception on untrusted ports, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp snooping agent-option allow-untrusted
```

**Related commands** **ip dhcp snooping agent-option**  
**ip dhcp snooping violation**  
**show ip dhcp snooping**  
**show ip dhcp snooping statistics**

# ip dhcp snooping agent-option circuit-id vlantriplet

**Overview** Use this command to specify the Circuit ID sub-option of the DHCP Relay Agent Option 82 field as the VLAN ID and port number. The Circuit ID specifies the switch port and VLAN ID that the client-originated DHCP packet was received on.

Use the **no** variant of this command to set the Circuit ID to the default, the VLAN ID and Ifindex (interface number).

**Syntax** `ip dhcp snooping agent-option circuit-id vlantriplet`  
`no ip dhcp snooping agent-option circuit-id`

**Default** By default, the Circuit ID is the VLAN ID and Ifindex (interface number).

**Mode** Interface Configuration for a VLAN interface.

**Usage** The Circuit ID sub-option is included in the DHCP Relay Agent Option 82 field of forwarded client DHCP packets:

- DHCP snooping Option 82 information insertion is enabled (**ip dhcp snooping agent-option**; enabled by default), and
- DHCP snooping is enabled on the switch (**service dhcp-snooping**) and on the VLAN to which the port belongs (**ip dhcp snooping**)

**Examples** To set the Circuit ID to `vlantriplet` for client DHCP packets received on `vlan1`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip dhcp snooping agent-option circuit-id
vlantriplet
```

To return the Circuit ID format to the default for `vlan1`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# no ip dhcp snooping agent-option circuit-id
```

**Related commands** **ip dhcp snooping agent-option**  
**ip dhcp snooping agent-option remote-id**  
**show ip dhcp snooping**  
**show ip dhcp snooping agent-option**

# ip dhcp snooping agent-option remote-id

**Overview** Use this command to specify the Remote ID sub-option of the DHCP Relay Agent Option 82 field. The Remote ID identifies the device that inserted the Option 82 information. If a Remote ID is not specified, the Remote ID sub-option is set to the switch's MAC address.

Use the **no** variant of this command to set the Remote ID to the default, the switch's MAC address.

**Syntax** `ip dhcp snooping agent-option remote-id <remote-id>`  
`no ip dhcp snooping agent-option remote-id`

| Parameter                      | Description                                                                                                                                                      |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;remote-id&gt;</code> | An alphanumeric (ASCII) string, 1 to 63 characters in length. If the Remote ID contains spaces, it must be enclosed in double quotes. Wildcards are not allowed. |

**Default** The Remote ID is set to the switch's MAC address by default.

**Mode** Interface Configuration for a VLAN interface.

**Usage** The Remote ID sub-option is included in the DHCP Relay Agent Option 82 field of forwarded client DHCP packets:

- DHCP snooping Option 82 information insertion is enabled (**ip dhcp snooping agent-option**; enabled by default), and
- DHCP snooping is enabled on the switch (**service dhcp-snooping**) and on the VLAN to which the port belongs (**ip dhcp snooping**)

**Examples** To set the Remote ID to `myid` for client DHCP packets received on `vlan1`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip dhcp snooping agent-option remote-id myid
```

To return the Remote ID format to the default for `vlan1`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# no ip dhcp snooping agent-option remote-id
```

**Related commands** **ip dhcp snooping agent-option**  
**ip dhcp snooping agent-option circuit-id vlantriplet**  
**show ip dhcp snooping**  
**show ip dhcp snooping agent-option**

## ip dhcp snooping binding

**Overview** Use this command to manually add a dynamic-like entry (with an expiry time) to the DHCP snooping database. Once added to the database, this entry is treated as a dynamic entry, and is stored in the DHCP snooping database backup file. This command is not stored in the switch's running configuration.

Use the **no** variant of this command to delete a dynamic entry for an IP address from the DHCP snooping database, or to delete all dynamic entries from the database.

### CAUTION:

**Syntax** `ip dhcp snooping binding <ipaddr> [<macaddr>] vlan <vid>  
interface <port> expiry <expiry-time>  
no ip dhcp snooping binding [<ipaddr>]`

| Parameter     | Description                                                                                                                  |
|---------------|------------------------------------------------------------------------------------------------------------------------------|
| <ipaddr>      | Client's IP address.                                                                                                         |
| <macaddr>     | Client's MAC address in HHHH.HHHH.HHHH format.                                                                               |
| <vid>         | The VLAN ID for the entry, in the range 1 to 4094.                                                                           |
| <port>        | The port the client is connected to. The port can be a switch port, or a static or dynamic link aggregation (channel group). |
| <expiry-time> | The expiry time for the entry, in the range 5 to 2147483647 seconds.                                                         |

**Mode** Privileged Exec

**Usage notes** Note that dynamic entries can also be deleted from the DHCP snooping database by using the [clear ip dhcp snooping binding](#).

To add or remove static entries from the database, use the [ip source binding](#).

**Example** To restore an entry in the DHCP snooping database for a DHCP client with the IP address 192.168.1.2, MAC address 0001.0002.0003, on port1.0.6 of vlan6, and with an expiry time of 1 hour, use the commands:

```
awplus# ip dhcp snooping binding 192.168.1.2 0001.0002.0003 vlan  
6 interface port1.0.6 expiry 3600
```

**Related commands** **clear ip dhcp snooping binding**  
**ip source binding**  
**show ip dhcp snooping binding**

## ip dhcp snooping database

**Overview** Use this command to set the location of the file to which the dynamic entries in the DHCP snooping database are written. This file provides a backup for the DHCP snooping database.

Use the **no** variant of this command to set the database location back to the default, a folder named nvs within Flash memory.

**Syntax** `ip dhcp snooping database {nvs|flash|usb}`  
`no ip dhcp snooping database`

| Parameter | Description                                                                                                                                         |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| nvs       | The switch checks the database and writes the file to a folder named nvs within Flash memory on the switch at 2 second intervals if it has changed. |
| flash     | The switch checks the database and writes the file to Flash memory on the switch at 60 second intervals if it has changed.                          |
| usb       | The switch checks the database and writes the file to a USB storage device installed in the switch at 2 second intervals if it has changed.         |

**Default** nvs

**Mode** Global Configuration

**Usage notes** In a stack, the backup file is automatically synchronized across all stack members to the location configured. If the backup file is stored on a USB storage device on the stack master, it is only synchronized across stack members that also have USB storage devices installed.

If the location of the backup file is changed by using this command, a new file is created in the new location, and the old version of the file remains in the old location. This can be removed if necessary (hidden file: `.dhcp.dsn.gz`).

**Example** To set the location of the DHCP snooping database to Flash memory, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp snooping database flash
```

**Related commands** [show ip dhcp snooping](#)

# ip dhcp snooping delete-by-client

**Overview** Use this command to set the switch to remove a dynamic entry from the DHCP snooping database when it receives a valid DHCP release message with matching IP address, VLAN ID, and client hardware address on an untrusted port, and to discard release messages that do not match an entry in the database.

Use the **no** variant of this command to set the switch to forward DHCP release messages received on untrusted ports without removing any entries from the database.

**Syntax** `ip dhcp snooping delete-by-client`  
`no ip dhcp snooping delete-by-client`

**Default** Enabled: by default, DHCP lease entries are deleted from the DHCP snooping database when matching DHCP release messages are received.

**Mode** Global Configuration

**Usage** DHCP clients send a release message when they no longer wish to use the IP address they have been allocated by a DHCP server. Use this command to enable DHCP snooping to use the information in these messages to remove entries from its database immediately. Use the **no** variant of this command to ignore these release messages. Lease entries corresponding to ignored DHCP release messages eventually time out when the lease expires.

**Examples** To set the switch to delete DHCP snooping lease entries from the DHCP snooping database when a matching release message is received, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp snooping delete-by-client
```

To set the switch to forward and ignore the content of any DHCP release messages it receives, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp snooping delete-by-client
```

**Related commands** [show ip dhcp snooping](#)

# ip dhcp snooping delete-by-linkdown

**Overview** Use this command to set the switch to remove a dynamic entry from the DHCP snooping database when its port goes down. If the port is part of an aggregated link, the entries in the database are only deleted if all the ports in the aggregated link are down.

Use the **no** variant of this command to set the switch not to delete entries when ports go down.

**Syntax** `ip dhcp snooping delete-by-linkdown`  
`no ip dhcp snooping delete-by-linkdown`

**Default** Disabled: by default DHCP Snooping bindings are not deleted when an interface goes down.

**Mode** Global Configuration

**Examples** To set the switch to delete DHCP snooping lease entries from the DHCP snooping database when links go down, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp snooping delete-by-linkdown
```

To set the switch not to delete DHCP snooping lease entries from the DHCP snooping database when links go down, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp snooping delete-by-linkdown
```

**Related commands** [show ip dhcp snooping](#)

## ip dhcp snooping max-bindings

**Overview** Use this command to set the maximum number of DHCP lease entries that can be stored in the DHCP snooping database for each of the ports. Once this limit has been reached, no further DHCP lease allocations made to devices on the port are stored in the database.

Use the **no** variant of this command to reset the maximum to the default, 1.

**Syntax** `ip dhcp snooping max-bindings <0-520>`  
`no ip dhcp snooping max-bindings`

| Parameter | Description                                                                                                                                                                       |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <0-520>   | The maximum number of bindings that will be stored for the port in the DHCP snooping binding database. If 0 is specified, no entries will be stored in the database for the port. |

**Default** The default for maximum bindings is 1.

**Mode** Interface Configuration (port)

**Usage notes** The maximum number of leases cannot be changed for a port while there are DHCP snooping Access Control Lists (ACL) associated with the port. Before using this command, remove any DHCP snooping ACLs associated with the ports. To display ACLs used for DHCP snooping, use the [show ip dhcp snooping acl](#).

In general, the default (1) will work well on an edge port with a single directly connected DHCP client. If the port is on an aggregation switch that is connected to an edge switch with multiple DHCP clients connected through it, then use this command to increase the number of lease entries for the port.

If there are multiple VLANs configured on the port, the limit is shared between all the VLANs on this port. For example, the default only allows one lease to be stored for one VLAN. To allow connectivity for the other VLANs, use this command to increase the number of lease entries for the port.

**Example** To set the maximum number of bindings to be stored in the DHCP snooping database to 10 per port for ports 1.0.1 to 1.0.6, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.6
awplus(config-if)# ip dhcp snooping max-bindings 10
```

**Related** **access-group**  
**commands** **show ip dhcp snooping acl**  
**show ip dhcp snooping interface**

# ip dhcp snooping trust

**Overview** Use this command to set the ports to be DHCP snooping trusted ports.  
Use the **no** variant of this command to return the ports to their default as untrusted ports.

**Syntax** ip dhcp snooping trust  
no ip dhcp snooping trust

**Default** All ports are untrusted by default.

**Mode** Interface Configuration (port)

**Usage notes** Typically, ports connecting the switch to trusted elements in the network (towards the core) are set as trusted ports, while ports connecting untrusted network elements are set as untrusted. Configure ports connected to DHCP servers as trusted ports.

**Example** To set switch ports 1.0.1 and 1.0.2 to be trusted ports, use the commands:  
awplus# configure terminal  
awplus(config)# interface port1.0.1-port1.0.2  
awplus(config-if)# ip dhcp snooping trust

**Related commands** [show ip dhcp snooping interface](#)

# ip dhcp snooping verify mac-address

**Overview** Use this command to verify that the source MAC address and client hardware address match in DHCP packets received on untrusted ports.  
Use the **no** variant of this command to disable MAC address verification.

**Syntax** ip dhcp snooping verify mac-address  
no ip dhcp snooping verify mac-address

**Default** Enabled—source MAC addresses are verified by default.

**Mode** Global Configuration

**Usage** When MAC address verification is enabled, the switch treats DHCP packets with source MAC address and client hardware address that do not match as DHCP snooping violations: it drops them and applies any other violation action specified by the **ip dhcp snooping violation**. To bring the port back up again after any issues have been resolved, use the **shutdown**.

**Example** To disable MAC address verification on the switch, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp snooping verify mac-address
```

**Related commands** **ip dhcp snooping violation**  
**show ip dhcp snooping**  
**show ip dhcp snooping statistics**

## ip dhcp snooping violation

**Overview** Use this command to specify the action the switch will take when it detects a DHCP snooping violation by a DHCP packet on the ports.

Use the **no** variant of this command to disable the specified violation actions, or all violation actions.

**Syntax** `ip dhcp snooping violation {log|trap|link-down} ...`  
`no ip dhcp snooping violation [{log|trap|link-down} ...]`

| Parameter | Description                                                                                                                                                                                                                                                                                                              |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| log       | Generate a log message. To display these messages, use the <a href="#">show log</a> .<br>Default: disabled.                                                                                                                                                                                                              |
| trap      | Generate an SNMP notification (trap). To send SNMP notifications, SNMP must also be configured, and DHCP snooping notifications must be enabled using the <a href="#">snmp-server enable trap</a> .<br>Notifications are limited to one per second and to one per source MAC and violation reason.<br>Default: disabled. |
| link-down | Set the port status to link-down.<br>Default: disabled.                                                                                                                                                                                                                                                                  |

**Default** By default, DHCP packets that violate DHCP snooping are dropped, but no other violation action is taken.

**Mode** Interface Configuration (port)

**Usage notes** If a port has been shut down in response to a violation, to bring it back up again after any issues have been resolved, use the [shutdown](#).

IP packets dropped by DHCP snooping filters do not result in other DHCP snooping violation actions.

**Example** To set the switch to send an SNMP notification and set the link status to link-down if it detects a DHCP snooping violation on switch ports 1.0.1 to 1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap dhcpsnooping
awplus(config)# interface port1.0.1-port1.0.4
awplus(config-if)# ip dhcp snooping violation trap link-down
```

**Related commands** [show ip dhcp snooping interface](#)  
[show log](#)  
[snmp-server enable trap](#)

## ip source binding

**Overview** Use this command to add or replace a static entry in the DHCP snooping database.

Use the **no** variant of this command to delete the specified static entry or all static entries from the database.

**Syntax** `ip source binding <ipaddr> [<macaddr>] vlan <vid> interface <port>`  
`no ip source binding [<ipaddr>]`

| Parameter | Description                                                                                                                                            |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ipaddr>  | Client's IP address. If there is already an entry in the DHCP snooping database for this IP address, then this command replaces it with the new entry. |
| <macaddr> | Client's MAC address in HHHH.HHHH.HHHH format.                                                                                                         |
| <vid>     | The VLAN ID associated with the entry.                                                                                                                 |
| <port>    | The port the client is connected to.                                                                                                                   |

**Mode** Global Configuration

**Usage notes** This command removes static entries from the database.

To remove dynamic entries, use the **clear ip dhcp snooping binding** or the **no** variant of the **ip dhcp snooping binding**.

**Examples** To add a static entry to the DHCP snooping database for a client with the IP address 192.168.1.2, MAC address 0001.0002.0003, on port1.0.6 of vlan6, use the command:

```
awplus# configure terminal
awplus(config)# ip source binding 192.168.1.2 0001.0002.0003
vlan 6 interface port1.0.6
```

To remove the static entry for IP address 192.168.1.2 from the database, use the commands:

```
awplus# configure terminal
awplus(config)# no ip source binding 192.168.1.2
```

To remove all static entries from the database, use the commands:

```
awplus# configure terminal
awplus(config)# no ip source binding
```

**Related commands**

- clear ip dhcp snooping binding**
- ip dhcp snooping binding**
- show ip dhcp snooping binding**
- show ip source binding**

## service dhcp-snooping

**Overview** Use the **service dhcp-snooping** command to enable the DHCP snooping service globally on the switch. As well, you need to enable it on the desired VLANs, using the **ip dhcp snooping** command. The switch creates a global DHCP snooping Access Control list (ACL) the first time you use the **ip dhcp snooping** command, to send DHCP packets to the CPU for processing. Note that the switch will forward all DHCP traffic to the CPU, no matter what VLAN it belongs to.

Use the **no** variant of this command to disable the DHCP snooping service on the switch.

**Syntax** service dhcp-snooping  
no service dhcp-snooping

**Default** Disabled

**Mode** Global Configuration

### Usage notes **Enabling DHCP snooping**

For DHCP snooping to operate on a VLAN, you must:

- enable the service on the switch by using this command, and
- enable DHCP snooping on the particular VLAN by using the **ip dhcp snooping** command, and
- if there is an external DHCP server, configure the port connected to the server as a trusted port, by using the **ip dhcp snooping trust** command

### **Disabling DHCP snooping**

Use **no service dhcp-snooping** to disable DHCP snooping.

Disabling DHCP snooping removes all DHCP snooping configuration from the running configuration, except for:

- any DHCP snooping maximum bindings settings (**ip dhcp snooping max-bindings**), and
- any additional DHCP snooping-based ACLs you have created for filtering on untrusted ports.

You must remove any such additional DHCP snooping-based ACLs, using the **no access-group** command. This is because these ACLs block all traffic except for traffic that matches DHCP snooping entries. Once you have disabled DHCP snooping, these ACLs will block all traffic. Note that if you disable DHCP snooping on particular VLANs (using the **no ip dhcp snooping** command), you need to make sure you remove any such additional ACLs that apply to those VLANs.

If you re-enable the service, the switch repopulates the DHCP snooping database from the dynamic lease entries in the database backup file (see the **ip dhcp snooping database** command). It also updates the lease expiry times.

**Examples** To enable the DHCP snooping service on only the VLANs that have DHCP snooping enabled, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-snooping
```

To disable the DHCP snooping service on the switch, use the commands:

```
awplus# configure terminal
awplus(config)# no service dhcp-snooping
```

**Related commands**

**Command changes** Version 5.4.9-2.1: **per -vlan** parameter added for SBx8100, x530, and x320 series.

Version 5.4.9-2.1: **per -vlan** parameter added for IE510, IE340, IE300, SBx908 GEN2, x950, x930, and x510 series.

# show arp security

**Overview** Use this command to display ARP security configuration.

**Syntax** show arp security

**Mode** User Exec and Privileged Exec

**Example** To display ARP security configuration on the switch use the command:

```
awplus# show arp security
```

## Example output from the show arp security command

```
awplus# show arp security

ARP Security Information:
  Total VLANs enabled ..... 2
  Total VLANs disabled ..... 11
  vlan1 ..... Disabled
  vlan2 ..... Disabled
  vlan3 ..... Disabled
  vlan4 ..... Disabled
  vlan5 ..... Disabled
  vlan100 ..... Disabled
  vlan101 ..... Disabled
  vlan102 ..... Disabled
  vlan103 ..... Disabled
  vlan104 ..... Disabled
  vlan105 ..... Enabled
  vlan1000 ..... Disabled
  vlan1001 ..... Enabled
```

## Parameters in the output from the show arp security command

| Parameter            | Description                                          |
|----------------------|------------------------------------------------------|
| Total VLANs enabled  | The number of VLANs that have ARP security enabled.  |
| Total VLANs disabled | The number of VLANs that have ARP security disabled. |

**Related commands**

- [arp security](#)
- [show arp security interface](#)

## show arp security interface

**Overview** Use this command to display ARP security configuration for the specified ports or all ports.

**Syntax** show arp security interface [*<port-list>*]

| Parameter                | Description                                                                                                                          |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;port-list&gt;</i> | The ports to display ARP security information about. The port list can include switch ports, and static or dynamic aggregated links. |

**Mode** User Exec and Privileged Exec

**Example** To display ARP security configuration for ports, use the command:

```
awplus# show arp security interface
```

**Example output from the show arp security interface command**

```
awplus#show arp security interface

Arp Security Port Status and Configuration:

  Port: Provisioned ports marked with brackets, e.g. (portx.y.z)
  KEY:  LG = Log
        TR = Trap
        LD = Link down

Port          Action
-----
port1.0.1     -- -- --
port1.0.2     -- -- --
port1.0.3     LG TR LD
port1.0.4     LG -- --
port1.0.5     LG -- --
port1.0.6     LG TR --
port1.0.7     LG -- LD
...
```

**Parameters in the output from the show arp security interface command**

| Parameter     | Description                                                                        |
|---------------|------------------------------------------------------------------------------------|
| Action        | The action the switch takes when it detects an ARP security violation on the port. |
| Port          | The port. Parentheses indicate that ports are configured for provisioning.         |
| LG, Log       | Generate a log message                                                             |
| TR, Trap      | Generate an SNMP notification (trap).                                              |
| LD, Link down | Shut down the link.                                                                |

**Related commands**

- [arp security violation](#)
- [show arp security](#)

- [snmp-server enable trap](#)

# show arp security statistics

**Overview** Use this command to display ARP security statistics for the specified ports or all ports.

**Syntax** show arp security statistics [detail] [interface *<port-list>*]

| Parameter                          | Description                                                                                                                |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| detail                             | Display detailed statistics.                                                                                               |
| interface <i>&lt;port-list&gt;</i> | Display statistics for the specified ports. The port list can include switch ports, and static or dynamic aggregated links |

**Mode** User Exec and Privileged Exec

**Example** To display the brief statistics for the ARP security, use the command:

```
awplus# show arp security statistics
```

**Example output from the show arp security statistics command**

```
awplus# show arp security statistics

DHCP Snooping ARP Security Statistics:
  Interface      In      In
                Packets Discards
  -----
  port1.0.3      20      20
  port1.0.4      30      30
  port1.0.12     120      0
```

**Parameters in the output from the show arp security statistics command**

| Parameter   | Description                                                                               |
|-------------|-------------------------------------------------------------------------------------------|
| Interface   | A port name. Parentheses indicate that ports are configured for provisioning.             |
| In Packets  | The total number of incoming ARP packets that are processed by DHCP Snooping ARP Security |
| In Discards | The total number of ARP packets that are dropped by DHCP Snooping ARP Security.           |

**Example output from the show arp security statistics detail command**

```
awplus#show arp security statistics detail

DHCP Snooping ARP Security Statistics:
Interface ..... port1.0.3
  In Packets ..... 20
  In Discards ..... 20
  No Lease ..... 20
  Bad Vlan ..... 0
  Bad Port ..... 0
  Source Ip Not Allocated .... 0
Interface ..... port1.0.4
  In Packets ..... 30
  In Discards ..... 30
  No Lease ..... 30
  Bad Vlan ..... 0
  Bad Port ..... 0
  Source Ip Not Allocated .... 0
Interface ..... port1.0.12
  In Packets ..... 120

## show ip dhcp snooping acl

**Overview** Use this command to display information about the Access Control Lists (ACL) that are using the DHCP snooping database.

**Syntax** `show ip dhcp snooping acl`  
`show ip dhcp snooping acl [detail|hardware] [interface`  
`<interface-list>]`

| Parameter        | Description                                  |
|------------------|----------------------------------------------|
| detail           | Detailed DHCP Snooping ACL information.      |
| hardware         | DHCP Snooping hardware ACL information.      |
| interface        | ACL Interface information.                   |
| <interface-list> | The interfaces to display information about. |

**Mode** User Exec and Privileged Exec

**Example** To display DHCP snooping ACL information, use the command:

```
awplus# show ip dhcp snooping acl
```

**Example output from the show ip dhcp snooping acl command**

```
awplus#show ip dhcp snooping acl
```

DHCP Snooping Based Filters Summary:

| Interface    | Bindings | Maximum Bindings | Template Filters | Attached Hardware Filters |
|--------------|----------|------------------|------------------|---------------------------|
| port1.0.1    | 1        | 520              | 0                | 0                         |
| port1.0.2    | 1        | 3                | 2                | 6                         |
| port1.0.3    | 1        | 2                | 4                | 8                         |
| port1.0.4    | 1        | 2                | 7                | 14                        |
| port1.0.5    | 0        | 2                | 6                | 12                        |
| port1.0.6    | 0        | 1                | 0                | 0                         |
| port1.0.7    | 0        | 1                | 0                | 0                         |
| port1.0.8    | 0        | 1                | 0                | 0                         |
| port1.0.9    | 0        | 1                | 0                | 0                         |

To display DHCP snooping hardware ACL information, use the command:

```
awplus# show ip dhcp snooping acl hardware
```

**Example output from the show ip dhcp snooping acl hardware command**

```
awplus#show ip dhcp snooping acl hardware
```

DHCP Snooping Based Filters in Hardware:

| Interface | Access-list(/ClassMap) | Source IP   | Source MAC     |
|-----------|------------------------|-------------|----------------|
| port1.0.2 | dhcpsn1                | 10.10.10.10 | aaaa.bbbb.cccc |
| port1.0.2 | dhcpsn1                | 20.20.20.20 | 0000.aaaa.bbbb |
| port1.0.2 | dhcpsn1                | 0.0.0.0     | 0000.0000.0000 |

# show ip dhcp snooping agent-option

**Overview** Use this command to display DHCP snooping Option 82 information for all interfaces, a specific interface or a range of interfaces.

**Syntax** show ip dhcp snooping agent-option [interface <interface-list>]

| Parameter        | Description                              |
|------------------|------------------------------------------|
| interface        | Specify the interface.                   |
| <interface-list> | The name of the interface or interfaces. |

**Mode** User Exec and Privileged Exec

**Examples** To display DHCP snooping Option 82 information for all interfaces, use the command:

```
awplus# show ip dhcp snooping agent-option
```

To display DHCP snooping Option 82 information for vlan1, use the command:

```
awplus# show ip dhcp snooping agent-option interface vlan1
```

To display DHCP snooping Option 82 information for port1.0.1, use the command:

```
awplus# show ip dhcp snooping agent-option interface port1.0.1
```

**Output** The following shows typical output.

**Example output from the show ip dhcp snooping agent-option command**

```
awplus#show ip dhcp snooping agent-option

DHCP Snooping Option 82 Configuration:

Key:      C Id = Circuit Id Format
          R Id = Remote Id
          S Id = Subscriber Id

Option 82 insertion ..... Enabled
Option 82 on untrusted ports ..... Not allowed

-----
vlan1      C Id = vlanifindex
           R Id = Access-Island-01-M1
vlan2      C Id = vlantriplet
           R Id = Access-Island-01-M1
vlan3      C Id = vlantriplet
           R Id = Access-Island-01-M3
vlan4      C Id = vlantriplet
           R Id = 0000.cd28.074c
vlan5      C Id = vlantriplet
           R Id = 0000.cd28.074c
vlan6      C Id = vlantriplet
           R Id = 0000.cd28.074c
port1.0.1  S Id =
port1.0.2  S Id =
port1.0.3  S Id = phone_1
port1.0.4  S Id =
port1.0.5  S Id = PC_1
port1.0.6  S Id = phone_2
```

# show ip dhcp snooping binding

**Overview** Use this command to display all dynamic and static entries in the DHCP snooping binding database.

**Syntax** show ip dhcp snooping binding

**Mode** User Exec and Privileged Exec

**Example** To display entries in the DHCP snooping database, use the command:

```
awplus# show ip dhcp snooping binding
```

### Example output from the show ip dhcp snooping binding command

# show ip dhcp snooping interface

**Overview** Use this command to display information about DHCP snooping configuration and leases for the specified ports, or all ports.

**Syntax** show ip dhcp snooping interface [*<port-list>*]

| Parameter                | Description                                                                                                                          |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;port-list&gt;</i> | The ports to display DHCP snooping configuration information for. If no ports are specified, information for all ports is displayed. |

**Mode** User Exec and Privileged Exec

**Example** To display DHCP snooping information for all ports, use the command:

```
awplus# show ip dhcp snooping interface
```

### Example output from the show ip dhcp snooping interface command

```
awplus#show ip dhcp snooping interface

DHCP Snooping Port Status and Configuration:

Port: Provisioned ports marked with brackets, e.g. (portx.y.z)
Action: LG = Log
        TR = Trap
        LD = Link down
```

| Port       | Status    | Full Leases | Max Leases | Action   | Subscriber-ID      |
|------------|-----------|-------------|------------|----------|--------------------|
| port1.0.1  | Untrusted | 1           | 1          | LG -- -- |                    |

### Parameters in the output from the show ip dhcp snooping interface command

| Parameter     | Description                                                                                                                                                                                                          |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port          | The port interface name.                                                                                                                                                                                             |
| Status        | The port status: untrusted (default) or trusted.                                                                                                                                                                     |
| Full Leases   | The number of entries in the DHCP snooping database for the port.                                                                                                                                                    |
| Max Leases    | The maximum number of entries that can be stored in the database for the port.                                                                                                                                       |
| Action        | The DHCP snooping violation actions for the port.                                                                                                                                                                    |
| Subscriber ID | The subscriber ID for the port. If the subscriber ID is longer than 34 characters, only the first 34 characters are displayed. To display the whole subscriber ID, use the command <b>show running-config dhcp</b> . |

# show ip dhcp snooping statistics

**Overview** Use this command to display DHCP snooping statistics.

**Syntax** `show ip dhcp snooping statistics [detail] [interface <interface-list>]`

| Parameter                                     | Description                                                                                                                                                  |
|-----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>detail</code>                           | Display detailed statistics.                                                                                                                                 |
| <code>interface &lt;interface-list&gt;</code> | Display statistics for the specified interfaces. The interface list can contain switch ports, static or dynamic link aggregators (channel groups), or VLANs. |

**Mode** User Exec and Privileged Exec

**Example** To show the current DHCP snooping statistics for all interfaces, use the command:

```
awplus# show ip dhcp snooping statistics
```

**Example output from the show ip dhcp snooping statistics command**

```
awplus# show ip dhcp snooping statistics
```

**Parameters in the output from the show ip dhcp snooping statistics command**

| Parameter         | Description                                                               |
|-------------------|---------------------------------------------------------------------------|
| Interface         | The interface name.                                                       |
| In Packets        | The total number of incoming packets that are processed by DHCP Snooping. |
| In BOOTP Requests | The total number of incoming BOOTP Requests.                              |
| In BOOTP Replies  | The total number of incoming BOOTP Replies.                               |
| In Discards       | The total number of incoming packets that have been discarded.            |

| Parameter                        | Description                                                                                                                               |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| Invalid BOOTP Information        | Packet contained invalid BOOTP information, such as an invalid BOOTP.OPCode.                                                              |
| Invalid DHCP ACK                 | A DHCP ACK message was discarded, for reasons such as missing Server Option or Lease Option.                                              |
| Invalid DHCP Release or Decline  | A DHCP Release or Decline message was discarded, for reasons such as mismatch between received interface and current binding information. |
| Invalid IP/UDP Header            | A problem was detected in the IP or UDP header of the packet.                                                                             |
| Max Bindings Exceeded            | Accepting the packet would cause the maximum number of bindings on a port to be exceeded.                                                 |
| Reply Received On Untrusted Port | A BOOTP reply was received on an untrusted port.                                                                                          |
| Source MAC/CHADDR Mismatch       | The L2 Source MAC address of the packet did not match the client hardware address field (BOOTP.CHADDR).                                   |
| Static Entry Already Exists      | An entry could not be added as a static entry already exists.                                                                             |

# show ip source binding

**Overview** Use this command to display static entries in the DHCP snooping database. These are the entries that have been added by using the **ip source binding**.

**Syntax** show ip source binding

**Mode** User Exec and Privileged Exec

**Example** To display static entries in the DHCP snooping database information, use the command:

```
awplus# show ip source binding
```

## Example output from the show ip source binding command

|                                |                |       |           |                  |        |  |
|--------------------------------|----------------|-------|-----------|------------------|--------|--|
| awplus# show ip source binding |                |       |           |                  |        |  |
| IP Source Bindings:            |                |       |           |                  |        |  |
| Client<br>IP Address           | MAC<br>Address | VLAN  | Port      | Expires<br>(sec) | Type   |  |

| 1.1.1.1                        | 0000.1111.2222 | 1     | port1.0.1 | Infinite         | Static |  |

## Parameters in the output from the show ip source binding command

| Parameter         | Description                                                                                                |
|-------------------|------------------------------------------------------------------------------------------------------------|
| Client IP Address | The IP address of the DHCP client.                                                                         |
| MAC Address       | The MAC address of the DHCP client.                                                                        |
| VLAN              | The VLAN ID the packet is received on.                                                                     |
| Port              | The Layer 2 port name the packet is received on.                                                           |
| Expires (sec)     | Always infinite for static bindings, or when the leave time in the DHCP message was 0xffffffff (infinite). |
| Type              | DHCP Snooping binding type: Static                                                                         |

# Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure the OpenFlow protocol.

# openflow

**Overview** Use this command to specify a port or static aggregator as a data plane port. The ingress and egress traffic on the data plane port become controlled by the OpenFlow Controller. A data plane port number is assigned to the port automatically.

Use the **no** variant of this command to cancel the setting of a port as a data plane port.

**Syntax** openflow  
no openflow

**Default** All the ports are non-data plane ports by default.

**Mode** Interface mode for a switch port (e.g. port1.0.1) or static aggregator (e.g. sa1)

**Example** To specify port1.0.1 as a data plane port:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# openflow
```

**Related commands** [show openflow config](#)

**Command changes** Version 5.4.6-1.1: command added

Version 5.4.7-1.1: command added to GS900MX, XS900MX, x550 series products

Version 5.4.7-2.1: command added to IE300, IE500 series products

Version 5.4.8-0.2: added to SBx908 GEN2

Version 5.4.8-1.1: added to IE210L series products

# openflow controller

**Overview** Use this command to specify the name, address, and port number of the OpenFlow Controller. If you do not specify a controller name, a name will automatically be created using the following format: 'ocxx', where 'xx' is a sequential number starting from 1.

You can specify one or more OpenFlow Controllers to the switch.

Use the **no** variant of this command to delete one or more OpenFlow Controllers specified to the switch.

You can delete a controller by specifying only the controller name. If you do not know the controller name, you can identify it from the **show openflow config** command output.

**Syntax** openflow controller <protocol> <address> <port>  
openflow controller <controller-name> <protocol> <address>  
<port> [in-band]  
no openflow controller <controller-name>

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <controller-name> | The user specified or auto-generated (in the case of legacy syntax) controller name that can contain alphanumeric and/or special characters other than the following set of characters: ':', '=', ';;', '[', ']', '{', '}', '!', '<', '>'                                                                                                                                                                                                                |
| <protocol>        | The protocol type to communicate with the OpenFlow Controller.<br><br>There are two options, TCP and SSL:<br><br>Use <b>TCP</b> for an insecure connection. Use <b>SSL</b> for a connection protected by TLS.<br><br>OpenFlow switches support TLSv1.2 and v1.3. The TLS version used between an OpenFlow switch and OpenFlow Controller is determined by peer negotiation. The peer negotiation will select the highest version supported by both ends. |
| <address>         | The IPv4 address of the Controller.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <port>            | Port number used to communicate with the Controller. The IANA has assigned the number 6653 for this purpose, but a different number can be used for local reasons.                                                                                                                                                                                                                                                                                       |
| in-band           | Optional: Specifies that the controller be set up as an in-band controller. Out-of-band is the alternative choice (denoted by leaving out the in-band parameter) and is the default.                                                                                                                                                                                                                                                                     |

**Default** No OpenFlow Controller is configured by default.

**Mode** Global Configuration

**Usage notes** The older version of this command is supported. If you enter the legacy CLI syntax (without the controller name), it will automatically adapt and display in the running configuration as the newer syntax.

For example, entering the legacy command:

```
awplus(config)# openflow controller tcp 192.168.1.2 6653
```

Displays as following in the running-config:

```
awplus(config)# openflow controller oc1 tcp 192.168.1.2 6653
```

**Examples** To add an OpenFlow Controller with the address 10.1.1.1 using the TCP protocol and the IANA assigned port number of 6653, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# openflow controller tcp 10.1.1.1 6653
```

To add an OpenFlow Controller for the switch whose name is 'controller1', with the address 10.1.2.1 using the TCP protocol on port number 6653, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# openflow controller controller1 tcp 10.1.2.1  
6653
```

To add on OpenFlow Controller for the switch whose name is 'controller1', with the address 10.1.2.1, using the TCP protocol on port number 6653. This is also an in-band Controller.

```
awplus# configure terminal
```

```
awplus(config)# openflow controller controller1 tcp 10.1.2.1  
6653 in-band
```

To delete an OpenFlow Controller whose name is 'controller1', use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no openflow controller controller1
```

- Version 5.4.8-1.1: command added to IE210L series products
- Version 5.4.8-2.1: *<controller-name>* parameter added
- Version 5.5.3-0.1: TLSv1.0 and 1.2 support removed
- Version 5.5.3-1.1: TLSv1.3 support added
- Version 5.5.3-1.2: **in-band** parameter added

# openflow datapath-id

**Overview** Use this command to change the Datapath Identifier (DPID) of the OpenFlow switch.

Use the **no** variant of this command to revert back to the default DPID.

**Syntax** openflow datapath-id <dpid>  
no openflow datapath-id

| Parameter | Description                                                                                                                             |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <dpid>    | The DPID field consists of 16 Hex digits. If you specify a DPID less than 16 Hex digits, then the upper bits are padded out with zeros. |

**Default** Each OpenFlow instance on a switch is identified by a Datapath Identifier. This is a 64 bit number. By default, the lower 48 bits are configured based on the switch MAC address. The top 16 bits are padded with zeros.

**Mode** Global Configuration

**Usage notes** This command changes the DPID, which is used as the OpenFlow switch ID in OpenFlow Controller(s).

**Example** To change the DPID to "0000000000000001", use the commands:

```
awplus# configure terminal  
awplus(config)# openflow datapath-id 1
```

To revert back to the default DPID, use the commands:

```
awplus# configure terminal  
awplus(config)# no openflow datapath-id
```

# openflow failmode

**Overview** Use this command to set the operation mode for the switch when the Controller connection fails or no Controllers are defined.

Use the **no** variant of this command to return to the default mode.

**Syntax** openflow failmode secure non-rule-expired  
openflow failmode standalone  
no openflow failmode

| Parameter               | Description                                                                 |
|-------------------------|-----------------------------------------------------------------------------|
| secure non-rule-expired | Set the mode to secure non-rule-expired. See the Usage section for details. |
| standalone              | Set the mode to standalone. See the Usage section for details.              |

**Default** Secure mode, without the **non-rule-expired** option

**Mode** Global Configuration

**Usage notes** If an OpenFlow switch loses contact with all Controllers as a result of echo request timeouts, then the OpenFlow switch goes into **fail mode**. There are three fail modes available:

- In **standalone** mode, if no message is received from the OpenFlow Controller for three times the inactivity probe interval, then OpenFlow will take over responsibility for setting up flows. OpenFlow will cause the switch to act like an ordinary MAC-learning switch, but continue to retry connecting to the Controller in the background. When the connection succeeds, it will discontinue its standalone behavior.

**NOTE:** *If the OpenFlow switch is in fail mode, and you change the configured fail mode to or from standalone mode, OpenFlow will flush all existing rules.*

- In **secure** mode, OpenFlow will not set up new flows on its own when the Controller connection fails or when no Controllers are defined, but all existing flows are left in place. The switch will continue to retry connecting to any defined Controllers forever, unless a rule timeout causes it to expire.

This mode is the default, and you can also set it by using the command **no openflow failmode**.

- In **secure non-rule-expired** mode, OpenFlow will not set up new flows on its own when the Controller connection fails or when no Controllers are defined, but all existing flows are left in place. The switch will continue to retry connecting to any defined Controllers forever. The **non-rule-expired** parameter means that existing rules won't be expired regardless of their timeouts while under fail mode. In other words, the OpenFlow switch will ignore timeout values of both idle timeout and hard timeout in existing rules.

**Example** To set the fail mode to **standalone** mode, use the commands:

```
awplus# configure terminal
awplus(config)# openflow failmode standalone
```

To set the fail mode to **secure non-rule-expired** mode, use the commands:

```
awplus# configure terminal
awplus(config)# openflow failmode secure non-rule-expired mode
```

To revert the fail mode to the default mode, use the commands:

```
awplus# configure terminal
awplus(config)# no openflow failmode
```

# openflow inactivity

**Overview** Use this command to set the value of the Controller inactivity timeout.

Use the **no** variant of this command to reset the inactivity timeout value to its default.

**Syntax** openflow inactivity <5-2073600>  
no openflow inactivity

| Parameter   | Description                            |
|-------------|----------------------------------------|
| <5-2073600> | Specifies the timeout value in seconds |
| inactivity  | OpenFlow inactivity probe              |

**Default** 10 seconds.

**Mode** Global Configuration

**Usage notes** OpenFlow uses the inactivity probe timer to monitor its connection to Controller(s). If no message is received from any Controller for three times the inactivity probe interval, then OpenFlow will take over responsibility for setting up flows, if in standalone mode.

**Example** To configure the inactivity probe timeout to 20 seconds, enter the commands:

```
awplus# configure terminal  
awplus(config)# openflow inactivity 20
```

To reset the inactivity probe timeout to its default value of 10 seconds, enter the commands:

```
awplus# configure terminal  
awplus(config)# no openflow inactivity
```

## openflow native vlan

**Overview** Use this command to specify a VLAN as a native VLAN for the data plane ports. You must create a VLAN (using the **vlan database** command) before specifying the VLAN as a native VLAN.

The OpenFlow native VLAN **must** be different from the native VLAN of the control plane. This prevents the OpenFlow ports from receiving any broadcast or multicast traffic flooded on the control plane native VLAN.

The VLAN used as the OpenFlow native VLAN should not be used on non-OpenFlow ports.

Use the **no** variant of this command to change the native VLAN for the data plane ports back to the default VLAN 1.

**Syntax** openflow native vlan <vlan-id>  
no openflow native vlan

| Parameter | Description                   |
|-----------|-------------------------------|
| <vlan-id> | VLAN ID in the range <1-4090> |

**Default** The native VLAN for the data plane ports is VLAN 1 by default.

**Mode** Global Configuration

**Example** To specify VLAN 100 as a native VLAN for the data plane ports:

```
awplus# configure terminal
awplus(config)# openflow native vlan 100
```

To change the native VLAN for the data plane ports back to the VLAN 1:

```
awplus# configure terminal
awplus(config)# no openflow native vlan
```

Version 5.4.8-1.1: added to IE210L series products

# openflow ssl peer certificate

**Overview** Use this command to enable a peer certificate to be sent from the machine that the OpenFlow Controller is running.

Use the **no** variant of this command to disable a peer certificate from being sent from the machine that the OpenFlow Controller is running.

**Syntax** openflow ssl peer certificate {<file>|bootstrap}  
no openflow ssl peer certificate

| Parameter | Description                                                                                                                                                                                                                                                                   |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <file>    | The CA certificate of an OpenFlow Controller must be in PEM format and specified with an absolute path using the format flash:cacert.pem. You must copy the file from the machine on which the OpenFlow Controller is running beforehand to the OpenFlow switch.              |
| bootstrap | In bootstrap mode, when the switch first connects to the OpenFlow Controller, it accepts and saves to RAM a self-signed CA certificate sent from the Controller. Thereafter, the OpenFlow switch will only connect to OpenFlow Controllers signed by the same CA certificate. |

**Default** Peer certificate validation is disabled by default.

**Mode** Global Configuration

**Usage notes** This command enables or disables peer certification on an OpenFlow Controller.

**Example** To validate a peer certificate using the bootstrap mode, use the commands:

```
awplus# configure terminal
awplus(config)# openflow ssl peer certificate bootstrap
```

To disable peer certificate validation, use the commands:

```
awplus# configure terminal
awplus(config)# no openflow ssl peer certificate
```

# openflow ssl trustpoint

**Overview** Use this command to configure the local trustpoint to be used for authentication.

Use the **no** variant of this command to disable the local trustpoint.

**Syntax** openflow ssl trustpoint local  
no openflow ssl trustpoint local

**Default** There is no trustpoint configured by default.

**Mode** Global Configuration mode.

**Usage notes** Use this command to specify a local self-signed certificate authority trustpoint for authentication. You must first create the trustpoint using the **crypto pki trustpoint** command.

**Example** To configure a local trustpoint, use the commands:  
awplus# configure terminal  
awplus(config)# openflow ssl trustpoint local  
To delete the local trustpoint, use the command:  
awplus(config)# no openflow ssl trustpoint

# openflow version

**Overview** Use this command to change the supported OpenFlow version numbers on the switch. You can specify a list of version numbers.

Use the **no** variant of this command to change the version number of the OpenFlow protocol back to the default version 1.3.

**Syntax** openflow version <version-list>  
no openflow version

| Parameter      | Description                                                                                    |
|----------------|------------------------------------------------------------------------------------------------|
| <version-list> | Specifies a list of version numbers separated by a space. The version numbers are 1.0 and 1.3. |

**Default** The OpenFlow version is set to 1.3 by default.

**Mode** Global Configuration

**Usage notes** This command overwrites any previously configured OpenFlow versions with the default OpenFlow version 1.3.

**Example** To change the OpenFlow protocol version to 1.0 and 1.3:

```
awplus(config)# openflow version 1.0 1.3
```

To change the OpenFlow protocol version to the default 1.3:

```
awplus(config)# no openflow version
```

**Related commands** [show openflow config](#)

# show openflow config

**Overview** Use this command to display the OpenFlow configuration database on the switch.

**Syntax** show openflow config

**Mode** User Exec/Privileged Exec

**Example** To show the contents of the OpenFlow configuration database on the switch:

```
awplus# show openflow config
```

**Output** The following shows typical output.

### Example output from show openflow config

```
awplus# show openflow config
258a3d74-d349-4d18-9d75-09ab66e19d81
  Bridge of0
    Controller "tcp:192.168.1.2:6653"
      is_connected: true
    fail_mode: standalone
  Port of0
    Interface of0
      type: internal
  Port port1.0.4
    Interface port1.0.4
      type: system
      options: {ifindex="5004", mtu="1500", native_vlan="4090"}
  Port port1.0.8
    Interface port1.0.8
      type: system
      options: {ifindex="5008", mtu="1500", native_vlan="4090"}
...
```

### Parameters in the output from show openflow config

| Parameter          | Description                                                                                                                                                                                                                                                                     |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| First line         | The switch ID                                                                                                                                                                                                                                                                   |
| Bridge of0         | The configuration of the OpenFlow bridge.                                                                                                                                                                                                                                       |
| Controller         | The address of the OpenFlow Controller and SSL port number                                                                                                                                                                                                                      |
| is_connected: true | Indicates that the switch is connected to the OpenFlow Controller. If the switch is not connected to the Controller, "is_connected" is not displayed.                                                                                                                           |
| fail_mode          | The fail mode. When the fail mode is "secure," OpenFlow on the switch does not set up flows when the OpenFlow Controller fails.<br><br>When the fail mode is "standalone", OpenFlow on the switch sets up flows to work as a Layer 2 switch when the OpenFlow Controller fails. |
| Port               | The port information                                                                                                                                                                                                                                                            |

# show openflow coverage

**Overview** Use this command to display the OpenFlow counters from the Open vSwitch.

**Syntax** show openflow coverage

**Mode** User Exec/Privileged Exec

**Usage** The information displayed by this command is for troubleshooting. Contact Allied Telesis Technical Support for assistance.

**Example** To show OpenFlow counters:  
awplus# show openflow coverage

**Output** The following shows typical output.

### Example output from show openflow coverage

```
awplus# show openflow coverage
Event coverage, avg rate over last: 5 seconds, last minute, last hour,
hash=86bbd699:
netlink_sent          0.0/sec      0.000/sec      0.0000/sec      total: 14

### Parameters in the output from show openflow coverage

| Parameter                     | Description                                                  |
|-------------------------------|--------------------------------------------------------------|
| Event coverage                | The name of a coverage event                                 |
| avg rate over last: 5 seconds | The rate at which the event occurred for the last 5 seconds  |
| last minute                   | The rate at which the event occurred for the last one minute |

| Parameter        | Description                                                                                                     |
|------------------|-----------------------------------------------------------------------------------------------------------------|
| last hour        | The rate at which the event occurred for the last one hour                                                      |
| hash             | The name of the internal hash on the counter                                                                    |
| total:           | The total number of occurrences of the event                                                                    |
| events never hit | The number of coverage events that have never occurred. When the value is 0, this information is not displayed. |

# show openflow flows

**Overview** Use this command to display all the entries in the switch's flow tables that resulted from receiving packets on OpenFlow ports.

**Syntax** show openflow flows

**Mode** Privileged Exec

**Usage notes** The switch uses OpenFlow rules from the Controller to create a rule table that tells the switch what to do with packets. From the rules, the switch creates a software flow table to process packets. From the software flow table, the switch creates entries in its silicon hardware flow tables, when possible. When silicon table entries exist, the switch uses them to switch packets. When silicon table entries do not exist, the switch uses the software flow table to process packets.

See the "Communication and Packet Processing" section of the OpenFlow Feature Overview and Configuration Guide for a detailed explanation of how the switch puts entries into the software and silicon flow tables.

This command displays flows in both the software and silicon flow tables. A symbol at the start of each flow output indicates whether it is a silicon or software table entry:

- # indicates silicon flow table entries, and
- ~ indicates software flow table entries

**Example** To show the entries of the flow tables on the switch:

```
awplus# show openflow flows
```

**Output** Where possible, the switch uses OpenFlow rules from the Controller to create entries in its silicon hardware flow tables, and switches packets according to the silicon flow tables.

In the following example output, the OpenFlow ports are port1.0.14, port1.0.15, port1.0.16, port1.0.33 and sa3 (port1.0.27 and port1.0.38). As LOCAL and LAG ports are now supported, the first OpenFlow port number is used as the local port.

OpenFlow port numbering becomes:

- port1.0.14 is OpenFlow port number 2
- port1.0.15 is OpenFlow port number 3
- port1.0.33 is OpenFlow port number 5
- sa3 is OpenFlow port number 6

The clients are connected to port1.0.15 and port1.0.33 in this scenario and sa3 is used as OpenFlow ports for the uplink. The **show openflow flows** command shows the following:

#### Example output from show openflow flows

```
awplus# show openflow flows

~recirc_id(0),in_port(3),eth(src=08:00:27:9a:b6:7f,dst=08:00:27:4b:ef:3b),eth_type(0x0800),ipv4(fr

~recirc_id(0),in_port(5),eth(src=08:00:27:96:2d:48,dst=08:00:27:4b:ef:3b),eth_type(0x0806),
packets:0, bytes:0, used:never, actions:push_vlan(vid=79,pcp=0),6
```

**NOTE:** This output includes added line spacing for readability purposes

#### Parameters in the output from show openflow flows

| Parameter | Description                                                                                                                                                                       |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| recirc_id | Used to select the next packet processing steps among multiple instances of recirculation. Packets initially enter the process with an ID of 0, which indicates no recirculation. |
| in_port   | The OpenFlow port number                                                                                                                                                          |
| eth       | The source and destination MAC address of the packet                                                                                                                              |
| eth_type  | The Ethernet type                                                                                                                                                                 |
| ipv4      | The information in the IPv4 header                                                                                                                                                |
| packets   | The number of matched packets                                                                                                                                                     |

| Parameter | Description                                         |
|-----------|-----------------------------------------------------|
| bytes     | The number of matched bytes                         |
| actions   | A set of actions for the packets that match the key |

## show openflow rules

**Overview** Use this command to display the software flow table and rules set by the OpenFlow controller.

**Syntax** show openflow rules

**Mode** User Exec/Privileged Exec

**Example** To show the contents of the flow table on the switch:  
awplus# show openflow rules

**Output** The following shows typical output.

### Example output from show openflow rules

```
awplus# show openflow rules
duration=14s, n_packets=0, n_bytes=0,
priority=399,in_port=1,dl_src=ec:cd:6d:c4:21:bd,actions=drop

duration=14s, n_packets=0, n_bytes=0,
priority=399,in_port=2,dl_src=ec:cd:6d:c4:21:bd,actions=drop

### Parameters in the output from show openflow rules

| Parameter | Description                                                |
|-----------|------------------------------------------------------------|
| duration  | The duration of the flow entry in seconds                  |
| n_packets | The number of packets that match the flow entry            |
| n_bytes   | The number of bytes that match the flow entry              |
| priority  | The priority of the flow entry                             |
| in_port   | The OpenFlow port number on which the packets are received |
| dl_src    | The source address                                         |
| dl_dst    | The destination address                                    |

| Parameter | Description                                                                                             |
|-----------|---------------------------------------------------------------------------------------------------------|
| actions   | A set of actions applied to a packet. The actions are: "drop", "goto_table", "pop_vlan", or "push_vlan" |
| table_id  | The table ID of the flow entry                                                                          |

# show openflow ssl

**Overview** Use this command to display the current SSL configuration for OpenFlow.

**Syntax** show openflow ssl

**Mode** Privileged Exec

**Usage notes** This command displays the current SSL configuration for OpenFlow.

**Example** To display the current SSL configuration for OpenFlow, use the command:  
awplus# show openflow ssl

**Output** The following shows typical output.

## Example output from show openflow ssl

```
awplus#show openflow ssl
Private key: /flash/.certs/pki/local/cakey.pem
Certificate: /flash/.certs/pki/local/cacert.pem
CA Certificate: /etc/openvswitch/cacert.pem
Bootstrap: true
```

# show openflow status

**Overview** Use this command to display the status of each data plane port and the OpenFlow protocol messages queried by the OpenFlow Controller.

**Syntax** show openflow status

**Mode** Privileged Exec

**Example** To show the status of a switch with four OpenFlow ports, enter the command:

```
awplus# show openflow status
```

**Output** The following shows typical output.

**Example output from show openflow status**

```
awplus#show openflow status

# Introduction

**Overview** This chapter provides an alphabetical reference for Virtual Chassis Stacking (VCStack™) commands.

For information on stacking, see **VCStack Feature Overview and Configuration Guide**.

VCStack is not available in Secure Mode (see the **crypto secure-mode** command).

Also note the following stacking trigger commands that are documented in the Triggers chapter:

- **type stack disabled-master**
- **type stack master-fail**
- **type stack member**
- **type stack link**

In addition to the stacking commands shown in this chapter, stacking content also exists in the following commands:

- **hostname**
- **reboot**
- **reload**
- **show cpu**
- **show cpu history**
- **show exception log**
- **show file systems**
- **show memory**
- **show memory history**
- **show process**
- **show system**

**CAUTION:** Stack operation is only supported if is enabled. For more information refer to .

# clear counter stack

**Overview** This command clears all stack counters for all stack members.

**Syntax** clear counter stack

**Mode** Privileged Exec

**Example** To clear all stack counters:  
awplus# clear counter stack

**Related commands** [show counter stack](#)

# debug stack

**Overview** This command enables the stacking debugging facilities.

**Syntax** debug stack [link|topology|trace]  
no debug stack [link|topology|trace]

| Parameter | Description                                        |
|-----------|----------------------------------------------------|
| link      | Stacking neighbor discovery events on stack links. |
| topology  | Stacking topology discovery messages.              |
| trace     | Notable stacking events.                           |

**Default** Stack trace debugging is enabled.

**Mode** Privileged Exec and Global Configuration

**Usage notes** The command displays debug information about the stacked devices. If no parameter is specified, all the stack debugging information will be displayed, including link events, topology discovery messages and all notable stacking events. If link parameter is specified, only the link events debugging information will be displayed.

**Examples** To enable debugging, enter the following command on the stack master:

```
awplus# debug stack
```

To enable link debugging, enter the following command on the stack master:

```
awplus# debug stack link
```

To enable topology discovery debugging, enter the following command on the stack master:

```
awplus# debug stack topology
```

To enable stack trace debugging, enter the following command on the stack master:

```
awplus# debug stack trace
```

**Related commands** [undebug stack](#)

# delete stack-wide force

**Overview** Use this command to delete files from all members of a stack.

**Syntax** delete stack-wide force [recursive] <name>

| Parameter | Description                                                                                                                                                                                              |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| recursive | Delete directories that match the name, including their contents.                                                                                                                                        |
| <name>    | The name of the files or directories to delete.<br><br>The filename can include the wildcard *. Use the wildcard with caution, because this command does not ask for confirmation before deleting files. |

**Mode** Privileged Exec.

**Usage notes** This is a non-interactive command, so if the specified file or files exist, they are deleted without question or warning. This is indicated by the mandatory **force** parameter.

You can use this command within an AMF working set.

**Examples** To delete a file "test.scp" that is located in flash memory on all stack members, use the following command:

```
awplus# delete stack-wide force test.scp
```

To remove directories "output1" and "output2" from an external USB memory device on all stack members, use the following command:

```
awplus# delete stack-wide force recursive usb:output*
```

**Related commands** **cd**  
**dir stack-wide**

**Command changes** Version 5.4.7-0.1: command added.

## dir stack-wide

**Overview** This command lists the files on all stack members at once. If you don't specify a directory or file, then this command lists the files in the current directory.

**Syntax** `dir stack-wide [recursive] [sort [reverse] [name|size|time]] [<filename>|debug|flash|nvs|usb]`

| Parameter               | Description                                                                                                                              |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| recursive               | List the contents of directories recursively.                                                                                            |
| sort                    | Sort directory listing.                                                                                                                  |
| reverse                 | Sort using reverse order.                                                                                                                |
| name                    | Sort by name.                                                                                                                            |
| size                    | Sort by size.                                                                                                                            |
| time                    | Sort by modification time (default).                                                                                                     |
| <i>&lt;filename&gt;</i> | The name of the directory or file. If you don't specify a directory or file, then this command lists the files in the current directory. |
| debug                   | Debug root directory                                                                                                                     |
| flash                   | Flash memory root directory                                                                                                              |
| nvs                     | NVS memory root directory                                                                                                                |
| usb                     | USB storage device root directory                                                                                                        |

**Mode** Privileged Exec

**Examples** To list the files in the current directory across all stack members, use the command:

```
awplus# dir stack-wide
```

To list files in the root flash directory across all stack members, use the command:

```
awplus# dir stack-wide flash
```

To list files recursively in the root flash directory across all stack members, use the command:

```
awplus# dir stack-wide recursive flash
```

To list the files in alphabetical order, use the command:

```
awplus# dir stack-wide sort name
```

To list the files by size, smallest to largest, use the command:

```
awplus# dir stack-wide sort reverse size
```

To sort the files by modification time, oldest to newest, use the command:

```
awplus# dir stack-wide sort reverse time
```

**Output** The following shows typical output.

**Example output from using the `dir stack-wide` command to list files that start with `atmf`**

```
awplus#dir stack-wide atmf*

Stack member 1:
263 rw Nov 15 2017 15:22:52 flash:/atmfStableNodes.sh
3117 rw Nov 14 2017 13:26:31 flash:/atmf-find.sh
2346 rw Nov 14 2017 13:26:19 flash:/atmf-rec.sh

Stack member 2:
263 rw Nov 15 2017 15:22:52 flash:/atmfStableNodes.sh
3117 rw Nov 14 2017 13:26:31 flash:/atmf-find.sh
2346 rw Nov 14 2017 13:26:19 flash:/atmf-rec.sh
```

**Related commands**

**cd**

**dir**

**mkdir**

**delete stack-wide force**

**Command changes** Version 5.4.8-0.2: command added.

# remote-login

## Overview

This command is used only on the master in order to log onto the CLI of another stack member. In most respects the result of this is similar to being logged into the stack master. Configuration commands are still applied to all stack members, but show commands and commands that access the file system are executed locally.

The specific output obtained will vary greatly depending on the show command chosen.

**Syntax** remote-login <stack-ID>

| Parameter  | Description                       |
|------------|-----------------------------------|
| <stack-ID> | Stack member number, from 1 to 8. |

**Mode** Privileged Exec

**Usage notes** Note that some commands such as **ping** or **telnet** are not available when the remote-login is used.

**Example** To log onto stack member 2, use the following command:

```
awplus# remote-login 2
```

To return to the command prompt on the master stack member, type **exit**.

# show counter stack

**Overview** Use this command to display stack related counter information.

**Syntax** show counter stack

**Default** All counters are reset when the stack member is rebooted.

**Mode** User Exec and Privileged Exec

**Usage notes** This displays the stacking counter information for every stack member.

**Examples** To display the stacking counter information about the whole stack, use the following command:

```
awplus# show counter stack
```

### Example output from the show counter stack command

```
Virtual Chassis Stacking counters

Stack member 1:

Topology Event counters
Units joined          .....1
Units left            .....0
Links up              .....1
Links down            .....0
ID conflict            .....0
Master conflict       .....0
Master failover       .....0
Master elected         .....1
Master discovered     .....0

### Parameters in the output of the show counter stack command

| Parameters                | Description                                                               |
|---------------------------|---------------------------------------------------------------------------|
| Topology Event Counters   |                                                                           |
| Units joined              | Number of times that the stack acquires a member.                         |
| Units left                | Number of times that the stack loses a member.                            |
| Links up                  | Number of times that a stack link is up in the stack.                     |
| Links down                | Number of times that a stack link is down in the stack.                   |
| ID conflict               | Number of times that stack-ID conflicts.                                  |
| Master conflict           | Number of times that stack master conflict occurs.                        |
| Master failover           | Number of times that stack master fails.                                  |
| Master elected            | Number of times that stack master is elected.                             |
| Master discovered         | Number of times that stack master is discovered.                          |
| SW autoupgrades           | Number of times that the software in the stack members are auto upgraded. |
| Stack port                |                                                                           |
| Link up                   | Number of times that this unit's physical stack link has come up.         |
| Link down                 | Number of times that this unit's physical stack link has come down.       |
| Nbr re-init               | Number of times that the neighbor is detected as having reinitialized.    |
| Nbr incompatible          | Number of times that the neighbor is detected as incompatible.            |
| Nbr 2way comms            | Number of times that the neighbor is in two way communication status.     |
| Nbr full comms            | Number of times that the neighbor is in full communication status.        |
| Topology message counters |                                                                           |
| Total                     | Total number of topology messages.                                        |
| Hellos                    | Number of hello messages.                                                 |

| Parameters              | Description                                                                                                                                                                                         |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Topology DB             | Number of topology database messages.                                                                                                                                                               |
| Topology update         | Number of topology database update messages.                                                                                                                                                        |
| Link event              | Number of link event messages.                                                                                                                                                                      |
| Reinitialise            | Number of reinitialize messages.                                                                                                                                                                    |
| 1-hop transport         | Number of 1-hop transport messages.                                                                                                                                                                 |
| Layer-2 transport       | Number of layer 2 transport messages.                                                                                                                                                               |
| Link event              | Number of link event messages.                                                                                                                                                                      |
| Reinitialise            | Number of reinitialize messages.                                                                                                                                                                    |
| 1-hop transport         | Number of 1-hop transport messages.                                                                                                                                                                 |
| Layer-2 transport       | Number of Layer 2 transport messages.                                                                                                                                                               |
| Topology error counters | Reasons why a neighboring unit could not join the stack.                                                                                                                                            |
| Version unsupported     | Number of stack software version unsupported errors.                                                                                                                                                |
| Product unsupported     | Number of product unsupported errors.                                                                                                                                                               |
| XEM unsupported         | Number of XEM unsupported errors.                                                                                                                                                                   |
| Too many units          | Number of too many units errors.                                                                                                                                                                    |
| Invalid messages        | Number of invalid messages.                                                                                                                                                                         |
| Health status good      | The number of times that the resiliency link has successfully carried healthchecks following a failure at startup.                                                                                  |
| Health status bad       | The number of times that the resiliency link healthcheck has timed out. A timeout occurs when a backup stack member detects a delay greater than two seconds between healthcheck messages received. |
| Rx                      | The total number of healthcheck messages that a stack member has received from the stack master.                                                                                                    |
| Rx Error                | The total number of invalid healthcheck messages that have been received from the master. This message is not applicable to the stack master.                                                       |

**Related** [show stack](#)  
**commands**

# show debugging stack

## Overview

This command shows which debugging modes are currently enabled for stacking.

**Syntax** show debugging stack

**Mode** User Exec and Privileged Exec

**Example** To display the stack debugging mode status, use the command:

```
awplus# show debugging stack
```

## Example output from the show debugging stack command

```
Virtual Chassis Stacking debugging status:  
VCS link debugging is on  
VCS topology debugging is on  
VCS trace debugging is on
```

**Related commands** [debug stack](#)

# show running-config stack

**Overview** Use this command to display the running system information specific to the stack.

**Syntax** show running-config stack

**Mode** Privileged Exec and Global Configuration

**Example** To display the stacking running configuration information, use the command:

```
awplus# show running-config stack
```

**Output** The following shows typical output.

## Example output from the show running-config stack command

```
awplus#show running-config stack

stack virtual-mac
stack virtual-chassis-id 1982
stack management vlan 4000
stack management subnet 192.168.254.0
stack resiliencylink port1.0.1
stack enable
stack 2 priority 20
```

**Related commands** [show running-config](#)

# show provisioning (stack)

**Overview** Use this command to display the provisioning status of all installed or provisioned hardware. Provisioning is the preconfiguration necessary to accommodate future connection of hardware items such as a switch.

**Syntax** show provisioning

**Mode** User Exec and Privileged Exec

**Example** To show provisioning, use the following command:

```
awplus# show provisioning
```

**Output** The following shows typical output.

## Example output from show provisioning

```
Switch provisioning summary information
```

```
ID  Board class Status
1.0 x240-26      Hardware present
```

## Parameters in the output of the show provisioning command

| Parameter   | Description                                                                                                                                                                                                                                                                                                     |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ID          | The unit bay-location of the hardware provision.                                                                                                                                                                                                                                                                |
| Board class | The hardware type.                                                                                                                                                                                                                                                                                              |
| Status      | The provisioned state: <ul style="list-style-type: none"><li>• Hardware Present means that the hardware is currently installed in the stack.</li><li>• Provisioned means that although the hardware is not currently installed, the stack is preconfigured ready to accept the hardware installation.</li></ul> |

[switch provision \(stack\)](#)

# show stack

**Overview** Use this command to display summary information about current stack members.

**Syntax** show stack

**Mode** User Exec and Privileged Exec

**Usage notes** This command displays summary information about current stack members. See [show stack detail](#) to display detailed stack information.

**Example** To display summary information about the stack, use the command:  
awplus# show stack

**Output** The following shows typical output.

**Example output from the show stack command**

| Virtual Chassis Stacking summary information |            |                |                  |        |               |
|----------------------------------------------|------------|----------------|------------------|--------|---------------|
| ID                                           | Pending ID | MAC address    | Priority         | Status | Role          |
| 1                                            | -          | 0000.cd28.07e1 | 128              | Ready  | Active Master |

**Parameters in the output from the show stack command**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ID          | Stack-ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Pending ID  | The pending stack member ID. This displays if you have used the command <b>stack renumber</b> to change the stack ID and have not yet applied the change by rebooting the switch. If there is no pending ID, the "-" symbol will display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| MAC address | Stack member MAC address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Priority    | Stack member master election priority (between 0 and 255). Note that the lowest number has the highest priority.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Role        | Stack member's role in the stack, this can be one of: <ul style="list-style-type: none"><li>• <b>Active Master</b></li><li>• <b>Disabled Master</b>— this is the temporary master when there is a communication break within the stack, but communication still exists across the resiliency link. In this state all switch ports within the stack are disabled by default, but a different configuration can be run by a 'type stack disabled-master' trigger.</li><li>• <b>Backup Member</b>— a device other than the stack master.</li><li>• <b>Provisioned</b>— indicates that the stack position is provisionally configured, i.e. ready to accept a particular switch type into the stack.</li></ul> |

#### Parameters in the output from the show stack detail command

| Parameter  | Description                                                                                                                                                                                                                               |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Host name  | The host name of the stack member.                                                                                                                                                                                                        |
| ID         | Stack-ID .                                                                                                                                                                                                                                |
| Pending ID | The pending stack member ID. This displays if you have used the command <b>stack renumber</b> to change the stack ID and have not yet applied the change by rebooting the switch. If there is no pending ID, the "-" symbol will display. |

| Parameter                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Last Role Change               | The date and time the stack member last changed its role in the stack.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| MAC address                    | Stack member MAC address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Management VLAN ID             | The VLAN ID currently used for stack management: the default is 4094.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Management VLAN subnet address | The current stacking management VLAN subnet address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Virtual Chassis ID             | The Virtual Chassis ID determines the last 12 bits of the Virtual MAC address: 0000.cd37.0xxx                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Virtual MAC Address            | The Virtual MAC address of the stack.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Operational Status             | <p>The status of the stack. This can be:</p> <ul style="list-style-type: none"> <li>• <b>Normal operation:</b><br/>If any other status is displayed, it may warrant further investigation.</li> <li>• <b>Stacking hardware disabled:</b><br/>Use the <b>stack enable</b> command to activate the stacking feature.</li> <li>• <b>Operating in failover mode:</b><br/>This stack member has become separated from the rest of the stack, or it failed to join the stack correctly.</li> <li>• <b>Standalone unit:</b><br/>Stacking is enabled, but no other stack members are present.</li> <li>• <b>Not all stack ports are up:</b><br/>One or more stacking ports may be down, or stacking discovery may not have detected the neighbor successfully.</li> </ul> |
| Stack Status                   | The stack's overall status. Note that a warning is issued if the stack is not connected in a standard ring topology.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Stack port status              | <p>The status of the stack port. This can be:</p> <ul style="list-style-type: none"> <li>• Down</li> <li>• Neighbor incompatible</li> <li>• Discovering neighbor</li> <li>• Learned neighbor</li> </ul> <p>If the stack has learned a neighbor, the status also shows the neighbor's stacking number and the port the stack members are connected through.</p>                                                                                                                                                                                                                                                                                                                                                                                                    |

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Priority     | Stack member master election priority (between 1 and 255) Note that the lowest number has the highest priority.                                                                                                                                                                                                                                                                                                                                                                        |
| Product Type | The switch series that the stack member belongs to.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Provisioned  | Indicates that the stack position is provisionally configured, i.e. ready to accept a particular switch type into the stack.                                                                                                                                                                                                                                                                                                                                                           |
| Role         | Stack member's role in the stack, this can be one of: <ul style="list-style-type: none"><li>• <b>Active Master.</b></li><li>• <b>Backup Member</b>— a device other than the stack master.</li><li>• <b>Discovering</b>— joining the stack.</li></ul>                                                                                                                                                                                                                                   |
| Status       | Indicates how readily a stack member can take over as master if the current stack master were to fail. <ul style="list-style-type: none"><li>• <b>Init</b> — the stack member is completing the startup initialization.</li><li>• <b>Syncing</b>— the stack member is synchronizing state information with the stack master following startup.</li><li>• <b>Ready</b>— the stack member is fully synchronized with the current master and is ready to take over immediately.</li></ul> |

**Related commands** [show stack](#)  
[show counter stack](#)

# show stack resiliencylink

**Overview** Use this command to display information about the current status of the resiliency-link across the members of the stack.

**Syntax** show stack resiliencylink

**Mode** User Exec and Privileged Exec

**Example** To display information about the current status of the resiliency-link across the stack members, use the command:

```
awplus# show stack resiliencylink
```

**Output** The following shows typical output.

**Example output from the show stack resiliencylink command**

```
awplus(config)# show stack resiliencylink
Stack member 1:
-----
Status                Configured
Interface              vlan4093
Interface state        UP
Resiliency-link port(s) port1.0.11

Stack member 2:
-----
Status                Successful
Interface              vlan4093
Interface state        UP
Resiliency-link port(s) port2.0.11
```

**Parameters in the output of the show stack resiliencylink command**

| Parameter               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Status                  | <p>The current status of the stack member's resiliency link. Can be one of:</p> <ul style="list-style-type: none"><li>• <b>Not configured</b> (Master or Member).</li><li>• <b>Configured</b> (Master only).</li><li>• <b>Successful:</b><br/>Successfully receiving healthchecks from the Active Master.</li><li>• <b>Failed</b> (Member only):<br/>Not receiving any healthchecks from the Active Master.</li><li>• <b>Stopped:</b><br/>The resiliency link is configured, but is inactive. This may occur in a Disabled Master stack, for example if the Disabled Master Monitoring feature is not used.</li></ul> |
| Interface state         | <p>The current status of the interface. Can be either up or down.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Resiliency-link port(s) | <p>The switch port(s) the resiliency link is connected to.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

# stack disabled-master-monitoring

**Overview** This command enables the Disabled Master Monitoring (DMM) feature. If a stack member becomes a disabled master, the DMM feature will use the stack resiliency link to continue monitoring the health of the separated stack master.

Use the **no** variant of this command to disable the DMM feature.

**Syntax** stack disabled-master-monitoring  
no stack disabled-master-monitoring

**Default** By default, Disabled Master Monitoring is enabled. However, it only operates if there is a resiliency link.

**Mode** Global Configuration

**Usage** This command enables additional stack resiliency link functionality, which is used if a stack separation occurs. For DMM to operate, a resiliency link must also be configured (see the [stack resiliencylink](#) command). A stack separation could result in a stack member becoming a disabled master, which has the configuration as a normal stack master except that all its switchports are shutdown.

For more information about the disabled master state, see the [VCStack Feature Overview and Configuration Guide](#).

When the DMM feature is enabled, the disabled master will continue to monitor the health of the original stack master over the stack resiliency link connection. If the original stack master were to fail, when the DMM feature is enabled, then the disabled master will detect this and will automatically re-enable its switchports. This ensures that the stack will continue to pass network traffic, even if a catastrophic stack failure occurs.

For more information about the DMM feature when the stack member is a disabled master, see the [VCStack Feature Overview and Configuration Guide](#).

**Examples** To enable the DMM feature, use the following commands:

```
awplus# configure terminal
awplus(config)# stack disabled-master-monitoring
```

To disable the DMM feature, use the following commands:

```
awplus# configure terminal
awplus(config)# no stack disabled-master-monitoring
```

# stack enable

## Overview

This command is used on a stackable stand-alone switch to manually turn on the VCStack feature.

This command can also be used to return a switch to stacking operation, if the switch has previously been removed from a stack (by using the **no** variant of this command).

The **no** variant of this command removes a specified stack member switch from the virtual chassis stack. We recommend you unstack the stack member from the stack before issuing the **no** command.

## Syntax

stack enable  
no stack <stack-ID> enable

| Parameter  | Description                       |
|------------|-----------------------------------|
| <stack-ID> | Stack member number, from 1 to 8. |

## Default

The VCStack feature is disabled by default. The feature must be manually enabled in order to use VCStack.

## Mode

Global Configuration

**Usage** For step-by-step instructions on how to set up a stack, see the [Virtual Chassis Stacking \(VCStack\) Feature Overview and Configuration Guide](#).

When **stack enable** is entered, the **stack virtual-mac** command is automatically enabled. The **stack virtual-mac** command is required in order to minimize disruption on failover.

#### **Disabling stacking on a switch**

Running the **no** variant of this command will remove the selected stack member from the stack. At this point the removed member will act as a stand-alone master and will disable all of its ports. The switch can then only be accessed via its console port. If the command is run on the master then all current members of the stack will be disabled. We recommend you uncable the stack member from the stack before disabling stacking on it.

Note the following when using the **no** variant of this command:

- If the specified stack-ID is not used by any current stack member, the command will be rejected.

#### **Returning a switch to a stack**

To return the switch to stack membership, first connect to the switch via its console port, then run the **stack enable** command. Then save the configuration and run the **reboot** command. This will reboot the switch and it will re-join the stack as an ordinary member.

If the switch was previously the stack master, you might want to return it to its original stack master status. To do this you must run the **reboot** command again. This time—because the switch is now a stack member—the command will reboot the whole stack, which will result in a new master election.

For more information, see the [Virtual Chassis Stacking \(VCStack\) Feature Overview and Configuration Guide](#).

**Example** To turn on stacking on a stackable stand-alone unit, use the commands:

```
awplus# configure terminal
awplus(config)# stack enable
```

[stackport](#)

**Command changes** Version 5.5.4-1.2: command added on x240

# stack management subnet

**Overview** This command configures the subnet address used by the stack management VLAN.

Use the **no** variant of this command to reset the stack's VLAN subnet management address back to the default address and mask (192.168.255.0/27).

**Syntax** stack management subnet <ip-address>  
no stack management subnet

| Parameter    | Description                                           |
|--------------|-------------------------------------------------------|
| <ip-address> | The new subnet address for the stack management VLAN. |

**Default** The default stacking management VLAN subnet address is 192.168.255.0 with a subnet mask 255.255.255.224 or /27.

**Mode** Global Configuration

**Usage notes** This command configures the stack management VLAN subnet address. The management VLAN will be used for high speed communication between stacked units via the stacking ports. Although this command enables you to change the IP address command, the subnet mask must always remain as shown.

The stack management IP subnet is solely used internally to the stacked devices, and cannot be reached external to the stack. You should only change the stack management VLAN subnet address if it causes a conflict within your network.

Note that several separate stacks can use the same default management VLAN subnet address even though their user ports may share the same external network. If the stack subnet address is changed, then the configuration for any new units must also be updated before they are inserted into the stack.

If the management VLAN subnet address is changed by this command, you can use the **no** variant of this command to reset it to its default.

**Example** To set the management VLAN subnet address to 192.168.255.144:

```
awplus# configure terminal
awplus(config)# stack management subnet 192.168.255.144
```

**Related commands** [stack management vlan](#)

# stack management vlan

## Overview

Use this command to configure the stack management VLAN ID.

Use the **no** variant of this command to change the stack management VLAN ID back to the default (VLAN ID 4094).

## Syntax

```
stack management vlan <2-4094>
no stack management vlan
```

| Parameter | Description               |
|-----------|---------------------------|
| <2-4094>  | Stack management VLAN ID. |

**Default** VLAN ID 4094

**Mode** Global Configuration

## Usage notes

The management VLAN is used for high speed communication between stacked units. This command enables you to change the ID of this VLAN.

The default stacking management VLAN ID is 4094, which is the last configurable VLAN ID in the switch.

The stack management VLAN is created and configured automatically so that the stack VLAN cannot be used in the stack's VLAN configuration commands. This means you cannot enter commands such as:

```
awplus(config-vlan)# vlan <stack-management-VLAN-ID>
```

You should only change the management VLAN if the VLAN ID 4094 needs to be used in the stack's VLAN configuration.

If necessary, you can use the **no** variant of this command to change the management VLAN back to its default value.

Changes to the stacking management VLAN configuration will take effect once the stack is restarted.

**Examples** To set the management VLAN to 4000, enter the following commands:

```
awplus# configure terminal
awplus(config)# stack management vlan 4000
```

To reset the management VLAN back to the default (4094), enter the following commands:

```
awplus# configure terminal
awplus(config)# no stack management vlan
```

**Related** [stack management subnet commands](#)

# stack priority

## Overview

When creating a stack, use this command to set the priority of the switch you want to be master for the stack.

**Syntax** `stack <stack-ID> priority <0-255>`  
`no stack <stack-ID> priority`

| Parameter  | Description                                                                                                   |
|------------|---------------------------------------------------------------------------------------------------------------|
| <stack-ID> | Stack member number, from 1 to 8.                                                                             |
| priority   | The stack member's election priority value.                                                                   |
| <0-255>    | The stack member's new priority value. The lowest value is assigned the highest priority. The default is 128. |

## Mode

Global Configuration

**Usage notes** This command is used to change the value of a specific stack member's master-election priority. If the specified stack-ID is not used by any current stack member, the command will be rejected.

The election criteria selects the stack member with the lowest priority value to become the stack master. Where two stack members both have the same lowest priority value, then the stack member with the lowest MAC address will be elected as master.

**NOTE:** *Assigning a new priority value will not immediately change the current stack master. In order to force a master re-election after the new priority value is assigned, use `reboot stack-member <master's ID>` to reboot the current stack master, a new stack master will then be elected based on the new priority values.*

**Example** To change the priority of stack member 2 to be 3, use the command:

```
awplus# configure terminal
awplus(config)# stack 2 priority 3
```

**Validation Command** `show stack`

# stack renumber

**Overview** Use this command to renumber a specific stack member.

**Syntax** `stack <existing stack-ID> renumber <new stack-ID>`

| Parameter           | Description                          |
|---------------------|--------------------------------------|
| <existing stack-ID> | Enter the existing stack-ID, 1 or 2. |
| renumber            | Change the existing stack-ID.        |
| <new stack-ID>      | Enter the new stack-ID, 1 or 2.      |

**Default** Every stack unit will initially try to use a stack-ID of 1.

**Mode** Global Configuration

**Usage notes** This command is used to change the ID of a specific stack member, primarily when exchanging stack members. The changes made by this command will not take effect until the switch is rebooted.

You can see renumbering changes that have not yet taken effect by checking the Pending ID field in the output of the [show stack](#) command.

**NOTE:** *This command does not alter any of the stack's existing configuration, apart from the stack-ID specified. For example, if stack member 2 were removed from the stack and a new stack unit is assigned the member 2 stack-ID, then the interface configuration that existed for the removed stack member 2 will be applied to the new stack member 2.*

The existing stack-ID must already be assigned to an existing stack member. To avoid duplicating IDs, a warning message will appear if you assign a new stack-ID that is currently assigned to another stack member. However, you can continue to renumber the stack-IDs and remove ID duplications. If you do not remove the duplications, then one of the devices will be forced to automatically renumber to an unused ID. Once you have removed any duplicate IDs, you can reboot the switch to implement your changes.

Note that the configured stack-ID is saved immediately on the renumbered member, and so is not reliant on using the **copy running-config** command for it to take effect.

**Example** To renumber stack 1 to stack 2, use the commands:

```
awplus# configure terminal
awplus(config)# stack 1 renumber 2
```

**Validation** **show stack**  
**Command**

## stack renumber cascade

**Overview** This command is used to renumber the members of a stack so that their IDs are ordered sequentially, relative to the member's physical position within the stack.

**CAUTION:** *Changing the stack numbering will upset the existing stack member configurations such as port settings. This command is intended for use when the stack is either initially commissioned, or has undergone a major reconfiguration. In this situation you run the stack renumber command (which will automatically reboot the switch), then configure the stack members to meet the new requirements.*

**Syntax** stack <stack-ID> renumber cascade [<new-stack-ID>]

| Parameter      | Description                                                        |
|----------------|--------------------------------------------------------------------|
| <stack-ID>     | The ID of the stack member to start renumbering from, from 1 to 8. |
| renumber       | Change the existing stack-ID.                                      |
| cascade        | Renumber the existing stack-ID in cascade order.                   |
| <new-stack-ID> | The new ID for the first member renumbered, from 1 to 8.           |

**Default** If no new-stack-ID is specified, the member will take the default ID of 1.

**Mode** Global Configuration

**Usage notes** This command is used to renumber the members of a stack so that their stack-IDs are ordered sequentially. This would normally be done either when the stack is initially configured or following a major reconfiguration.

The renumber will start on the specified stack member. If that stack-ID is not used by any of the existing stack members, the command will be rejected.

The starting stack member will be renumbered with the new stack-ID specified, or the default of member ID of 1. The stack-ID of the next physically will be the starting member's ID +1, for example member ID 2. This renumbering will continue in cascading order around the stack members.

The changes will take place immediately and reboot all stack members. For this reason a confirmation prompt follows this command entry, asking whether you are sure you want to renumber and reboot the entire stack.

**Example** `awplus(config)# stack 1 renumber cascade`

Any existing interface configuration  
may no longer be valid.

Are you sure you want to renumber and reboot the entire stack?  
(y/n): y

**Related commands** `show stack`  
`switch provision (stack)`  
`stack renumber`

# stack resiliencylink

**Overview** This command configures the resiliency link used by the stack.

The interface used is a dedicated VLAN (resiliencylink VLAN) to which switch ports may become members. This VLAN is dedicated to the resiliency link function and must not be the stack management VLAN.

**Syntax** stack resiliencylink <interface>

no stack resiliencylink

| Parameters  | Description                                                                                                 |
|-------------|-------------------------------------------------------------------------------------------------------------|
| <interface> | The name of the interface that is connected to the resiliency link.<br><br>This is the resiliencylink VLAN. |

**Mode** Global Configuration

**Usage notes** The resiliency-link is only used when a backup member loses connectivity with the master via the stacking cables. Such a communication loss would occur if:

- a stacking link is removed or fails
- two or more stacking link cables are unplugged or fail
- the stack master itself fails due to a reboot or power failure

The resiliency-link allows the backup member to determine if the master is still present in the network by the reception of healthcheck messages sent by the master over the resiliency-link interface.

**Example** To set the resiliency link to be VLAN 4093, first create VLAN 4093 as the resiliencylink VLAN. You do not have to use **vlan database** to create the VLAN, because the **stack resiliencylink** command creates it:

```
awplus# configure terminal
```

```
awplus(config)# stack resiliencylink vlan4093
```

Next assign VLAN 4093 to the interface port, in this case port1.0.1:

```
awplus(config)# interface port1.0.1
```

```
awplus(config-if)# switchport resiliencylink
```

**Related commands**

- show stack resiliencylink**
- stack disabled-master-monitoring**
- switchport resiliencylink**

# stack software-auto-synchronize

**Overview** This command re-enables the software version auto-synchronization feature either on a specified stack member or all stack members.

Use the **no** variant of this command to turn the software version auto-synchronization feature off.

**Syntax** `stack {all|<stack-ID>} software-auto-synchronize`  
`no stack {all|<stack-ID>} software-auto-synchronize`

| Parameter                     | Description                       |
|-------------------------------|-----------------------------------|
| <code>all</code>              | All stack members.                |
| <code>&lt;stack-ID&gt;</code> | Stack member number, from 1 to 8. |

**Default** Enabled on all stack members

**Mode** Global Configuration

**Usage notes** This command is used to enable the software version auto-synchronization feature for either a specific stack member or all stack members and candidates.

Note that if a device attempts to join a stack but is running a software release that is different to the other stack members, the software version auto-synchronization feature will copy the master's software release onto the new member. If the software version auto-synchronization feature is not enabled, then the device will be unable to join the stack.

Note that the software version auto-synchronization feature may also result in the stack member downgrading its software release if the master is running an older software version.

**Examples** To turn on the software-auto-synchronize feature on stack member 2, which was previously turned off, use the following commands:

```
awplus# configure terminal
awplus(config)# stack 2 software-auto-synchronize
```

To turn on the software-auto-synchronize feature for all stack members, which were previously turned off, use the following commands:

```
awplus# configure terminal
awplus(config)# stack all software-auto-synchronize
```

**Related commands** [show stack](#)

# stack virtual-chassis-id

## Overview

This command specifies the stack virtual chassis ID. The ID selected will determine which virtual MAC address the stack will use. The MAC address assigned to a stack must be unique within its network.

**NOTE:** *The command will not take effect until the switch has been rebooted.*

**Syntax** stack virtual-chassis-id <id>

| Parameter | Description                                                          |
|-----------|----------------------------------------------------------------------|
| <id>      | The value of the ID - enter a decimal number in the range 0 to 4095. |

**Mode** Global Configuration

**Usage notes** The virtual-chassis-id entered will form the last 12 bits of a pre-selected MAC prefix component; that is, 0000.cd37.0xxx. If you enable the stack virtual MAC address feature (by using the **stack virtual-mac** command) without using the stack virtual- chassis-id command to select the virtual-chassis-id, then the stack will select a virtual- chassis-id from a number within the assigned range.

**Example** To set the stack virtual-chassis-id to 63 use the commands

```
awplus# configure terminal
awplus(config)# stack virtual-chassis-id 63
```

This will result in a virtual MAC address of 0000.cd37.003f.

**Related commands** **show running-config**  
**show stack**  
**stack virtual-mac**

# stack virtual-mac

## Overview

This command enables the stack virtual MAC address feature. For more information on this topic, see the [VCStack Feature Overview and Configuration Guide](#). With this command set, the value used as the virtual MAC address is determined by the setting of the command [stack virtual-chassis-id](#).

You must enable **stack virtual-mac**, in order to minimize data loss if a new stack member is required to become the VCStack master.

Before enabling the virtual MAC address feature, you should check that the stack's virtual-chassis-id is not already used by another stack in the network. Otherwise the duplicate MAC addresses will cause problems for the network traffic.

**Syntax** `stack virtual-mac`  
`no stack virtual-mac`

**Default** The stack virtual MAC address feature is disabled by default. However, if you manually turn on stacking (by entering the **stack enable** command), then that enables the stack virtual MAC address feature as well.

**Mode** Global Configuration

**Usage notes** Note that this command will not take effect until the switch has been rebooted.

**Example** `awplus# configure terminal`  
`awplus(config)# stack virtual-mac`

**Related commands** [show running-config](#)  
[show stack](#)  
[stack virtual-chassis-id](#)

# stackport

**Overview** Use this command to enable a port to become a stacking port. This means you can stack the switch through any of its ports.

Use the **no** variant of this command to return the port to being a network port.

**Syntax** stackport  
no stackport

**Default** No ports are configured as stacking ports.

**Mode** Interface mode

**Usage notes** After changing ports to or from stacking ports, reboot the switch. You need to do this before cabling the switches together into a stack. For step-by-step instructions in how to set up a stack, see [Virtual Chassis Stacking \(VCStack\) Feature Overview and Configuration Guide](#).

**Example 1** To configure ports 1 and 2 as stacking ports, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.2
awplus(config-if)# stackport
awplus(config-if)# exit
awplus(config)# exit
awplus# write
awplus# reboot
```

Once you have set the stack ports on both switches, then you can cable the stack.

**Related commands** [show stack detail](#)

**Command changes** Version 5.5.4-1.2: command added on x240  
Version 5.4.7-2.1: command added to x908 GEN2, x950.  
Version 5.4.7-0.1: command added to XS900MX.

# switch provision (stack)

**Overview** This command enables you to provide the configuration for a new stack member switch prior to physically connecting it to the stack. To run this command, the stack position must be vacant. The selected hardware type must be compatible with existing stack hardware.

Use the **no** variant of this command to remove an existing switch provision.

**Syntax** switch <stack-ID> provision {x240-10|x240-26}  
no switch <stack-ID> provision

| Parameter  | Description                                                                                                 |
|------------|-------------------------------------------------------------------------------------------------------------|
| <stack-ID> | Stack member number, from 1 to 8.                                                                           |
| provision  | Provides settings within the stack configuration ready for a specific switch type to become a stack member. |
| x240-10    | Provision a 10-port x240 Series switch.                                                                     |
| x240-26    | Provision a 26-port x240 Series switch.                                                                     |

**Mode** Global Configuration

**Usage notes** Note that although the syntax appears to enable provisioning on up to 8 stackable switches, in practice a maximum of 2 are configurable.

Normally you would number the stack units 1 and 2. However, you can number the stack units with any numbers between 1 and 8. For example you could number your two stack members 3 and 4, if you wish. In this case you could provision either of the stack members by using one of these numbers. We advise against numbering your stacks in this way.

**Examples** To provision an x240-26GHXm switch as stack member 2, use the following commands:

```
awplus# configure terminal
awplus(config)# switch 2 provision x240-26
```

To remove the provision of the x240-26GHXm switch as stack member 2, use the following commands:

```
awplus# configure terminal
awplus(config)# no switch 2 provision
```

**Related commands** [show provisioning \(stack\)](#)  
[show stack](#)

**Command changes** Version 5.4.8-1.1: SBx908 GEN2 syntax changed

# switchport resiliencylink

**Overview** This command configures the switch port to be a member of the stack resiliency link VLAN. Note that this switchport will only be used for stack resiliency-link traffic and will not perform any other function, or carry any other traffic.

The **no** variant of this command removes the switchport from the resiliency link VLAN.

**Syntax** switchport resiliencylink  
no switchport resiliencylink

**Mode** Interface Configuration

**Usage notes** Note that a resiliency link cannot be part of a static or dynamic aggregator group.

**Examples** To set the resiliency link to be VLAN 4093:

First, use the **stack resiliencylink** command to create the resiliency-link vlan `vlan4093`

```
awplus# configure terminal
```

```
awplus(config)# stack resiliencylink vlan4093
```

Next, use the **switchport resiliencylink** command to assign the resiliency-link vlan to the port, in this case `port1.0.1`.

```
awplus# configure terminal
```

```
awplus(config)# interface port1.0.1
```

```
awplus(config-if)# switchport resiliencylink
```

**Related commands** **stack resiliencylink**

# Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure Ethernet Protection Switched Ring (EPSRing™). For more information, see the [EPSR Feature Overview and Configuration Guide](#).  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

# debug epsr

**Overview** This command enables EPSR debugging.

The **no** variant of this command disables EPSR debugging.

**Syntax** `debug epsr {info|msg|pkt|state|timer|all}`  
`no debug epsr {info|msg|pkt|state|timer|all}`

| Parameter | Description                                                                                                                                                                                                                  |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| info      | Send general EPSR information to the console.<br><br>Using this parameter with the <b>no debug epsr</b> command will explicitly exclude the above information from being sent to the console.                                |
| msg       | Send the decoded received and transmitted EPSR packets to the console.<br><br>Using this parameter with the <b>no debug epsr</b> command will explicitly exclude the above packets from being sent to the console.           |
| pkt       | Send the received and transmitted EPSR packets as raw ASCII text to the console.<br><br>Using this parameter with the <b>no debug epsr</b> command will explicitly exclude the above packets from being sent to the console. |
| state     | Send EPSR state transitions to the console.<br><br>Using this parameter with the <b>no debug epsr</b> command will explicitly exclude state transitions from being sent to the console.                                      |
| timer     | Send EPSR timer information to the console.<br><br>Using this parameter with the <b>no debug epsr</b> command will explicitly exclude timer information from being sent to the console.                                      |
| all       | Send all EPSR debugging information to the console.<br><br>Using this parameter with the <b>no debug epsr</b> command will explicitly exclude any debugging information from being sent to the console.                      |

**Mode** Privileged Exec and Global Configuration

**Examples** To enable state transition debugging, use the command:

```
awplus# debug epsr state
```

To disable EPSR packet debugging, use the command:

```
awplus# no debug epsr pkt
```

**Related commands** [undebug epsr](#)

## epsr

**Overview** This command sets the timer values for an EPSR instance. These are only valid for master nodes.

**NOTE:** *This command will only run on switches that are capable of running as an EPSR master node. However, even if your switch cannot function as an EPSR master node, you still may need to configure this command on whatever switch is the master within your EPSR network.*

**Syntax** `epsr <epsr-instance> {hellotime <1-32767>|failovertime <2-65535>  
ringflaptime <0-65535>}`  
`no epsr <epsr-instance>`

**CAUTION:** *Using the no variant of this command will remove the specified EPSR instance.*

| Parameter                                 | Description                                                                                                                                                                                                                                                                                                                          |
|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;epsr-instance&gt;</code>        | Name of the EPSR instance.                                                                                                                                                                                                                                                                                                           |
| <code>hellotime &lt;1-32767&gt;</code>    | The number of seconds between the transmission of health check messages.                                                                                                                                                                                                                                                             |
| <code>failovertime &lt;2-65535&gt;</code> | The number of seconds that a master waits for a returning health check message before entering the failed state. <b>The failover time should be greater than twice the hellotime.</b> This is to force the master node to wait until it detects the absence of two sequential healthcheck messages before entering the failed state. |
| <code>ringflaptime &lt;0-65535&gt;</code> | The minimum number of seconds that a master must remain in the failed state.                                                                                                                                                                                                                                                         |

**Mode** EPSR Configuration

**Examples** To set the hellotimer to 5 seconds for the EPSR instance called blue, use the command:

```
awplus(config-epsr)# epsr blue hellotime 5
```

**NOTE:**

*When stacking is used with EPSR, the EPSR **failovertime** should be at least 5 seconds.*

To delete the EPSR instance called blue, use the command:

```
awplus(config-epsr)# no epsr blue
```

**Related commands**

- show epsr**

# epsr configuration

**Overview** Use this command to enter EPSR Configuration mode so that EPSR can be configured.

**Syntax** `epsr configuration`

**Mode** Global Configuration

**Example** To change to EPSR mode, use the command:  
`awplus(config)# epsr configuration`

**Related commands** `epsr mode master controlvlan primary port`  
`epsr`  
`show epsr`

## epsr datavlan

**Overview** This command adds a data VLAN or a range of VLAN identifiers to a specified EPSR instance.

The **no** variant of this command removes a data VLAN or data VLAN range from an EPSR instance.

**Syntax** `epsr <epsr-instance> datavlan {<vlanid>|<vlanid-range>}`  
`no epsr <epsr-instance> datavlan {<vlanid>|<vlanid-range>}`

| Parameter       | Description                                                                                      |
|-----------------|--------------------------------------------------------------------------------------------------|
| <epsr-instance> | Name of the EPSR instance.                                                                       |
| datavlan        | Adds a data VLAN to be protected by the EPSR instance.                                           |
| <vlanid>        | The VLAN's VID - a number between 1 and 4094 excluding the number selected for the control VLAN. |
| <vlanid-range>  | Specify a range of VLAN identifiers using a hyphen to separate identifiers.                      |

**Mode** EPSR Configuration

**Usage notes** We recommend you

- set the EPSR control VLAN to vlan2, using the **epsr mode master controlvlan primary port** and **epsr mode transit controlvlan** commands, then
- set the EPSR data VLAN between to be a value between 3 and 4094, using the **epsr datavlan** command.

**Examples** To add vlan3 to the EPSR instance called blue, use the command:

```
awplus(config-epsr)# epsr blue datavlan vlan3
```

To add vlan2 and vlan3 to the EPSR instance called blue, use the command:

```
awplus(config-epsr)# epsr blue datavlan vlan2-vlan3
```

To remove vlan3 from the EPSR instance called blue, use the command:

```
awplus(config-epsr)# no epsr blue datavlan vlan3
```

To remove vlan2 and vlan3 from the EPSR instance called blue, use the command:

```
awplus(config-epsr)# no epsr blue datavlan vlan2-vlan3
```

**Related commands** **epsr mode master controlvlan primary port**  
**epsr mode transit controlvlan**  
**show epsr**

# epsr enhancedrecovery enable

**Overview** This command enables EPSR’s enhanced recovery mode. Enhanced recovery mode enables a ring to apply additional recovery procedures when a ring with more than one break partially mends. For more information, see the [EPSR Feature Overview and Configuration Guide](#).

The **no** variant of this command disables the enhanced recovery mode.

**Syntax** `epsr <epsr-instance> enhancedrecovery enable`  
`no epsr <epsr-instance> enhancedrecovery enable`

| Parameter                          | Description                |
|------------------------------------|----------------------------|
| <code>&lt;epsr-instance&gt;</code> | Name of the EPSR instance. |

**Default** Default is that enhanced recovery mode disabled.

**Mode** EPSR Configuration

**Example** To apply enhanced recovery on the EPSR instance called blue, use the command:

```
awplus(config-epsr)# epsr blue enhancedrecovery enable
```

**Related commands** [show epsr](#)

## epsr flush-type

**Overview** Use this command to set how EPSR flushes Layer 2 entries when a topology change occurs. It can be configured to flush all Layer 2 entries on its EPSR interfaces or only flush the Layer 2 entries on its EPSR data VLANs.

Use the **no** variant of this command to revert to the default setting.

**Syntax** `epsr <epsr-name> flush-type {interface|vlan}`  
`no epsr <epsr-name> flush-type`

| Parameter   | Description                                                                          |
|-------------|--------------------------------------------------------------------------------------|
| <epsr-name> | The name of the EPSR instance to set the flush-type for.                             |
| interface   | Flush all Layer 2 entries from the EPSR interface on a topology change.              |
| vlan        | Flush the Layer 2 entries on the EPSR interface and data VLANs on a topology change. |

**Default** The default flush-type is vlan

**Mode** EPSR Configuration

**Usage notes** To flush all entries on the EPSR interface (including non-EPSR data VLANs) the flush-type command must be explicitly configured on the EPSR ring with the **interface** parameter.

Select **interface** as the flush-type to help reduce latency caused during EPSR topology changes. This type of flushing is quicker and less granular than flushing per data vlan, as flushing on a data **vlan** may incur a higher overhead, reducing EPSR responsiveness to ring topology changes.

Interface flushing can be used to optimize EPSR rings with a large number of VLANs. It will however also require relearning on any VLANs that are on an EPSR interface but not part of the EPSR configuration.

**Example** To configure the behavior of EPSR ring 'red' transit node on topology changes to flush all Layer 2 entries on its EPSR ring interfaces, use the following commands:

```
awplus# configure terminal
awplus(config)# epsr configuration
awplus(config-epsr)# epsr red mode transit controlvlan 10
awplus(config-epsr)# epsr red datavlan 20-29
awplus(config-epsr)# epsr red flush-type interface
awplus(config-epsr)# epsr red state enable
```

**Related commands** [show epsr](#)

**Command changes** Version 5.4.9-1.1: command added

# epsr mode master controlvlan primary port

**Overview** This command creates a master EPSR instance.

**NOTE:** This command will only run on switches that are capable of running as an EPSR master node. However, even if your switch cannot function as an EPSR master node, you still need to configure this command on whatever switch is the master within your EPSR network.

**Syntax** `epsr <epsr-instance> mode master controlvlan <2-4094> primaryport <port>`

| Parameter       | Description                                                                                                                                         |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <epsr-instance> | Name of the EPSR instance.                                                                                                                          |
| mode            | Determines the node is acting as a master.                                                                                                          |
| master          | Sets switch to be the master node for the named EPSR ring.                                                                                          |
| controlvlan     | The VLAN that will transmit EPSR control frames.                                                                                                    |
| <2-4094>        | VLAN id.                                                                                                                                            |
| primaryport     | Primary port for the EPSR instance.                                                                                                                 |
| <port>          | The primary port. The port may be a switch port (e.g. port1.0.4) or a static channel group (e.g. sa3). It cannot be a dynamic (LACP) channel group. |

**NOTE:** The software allows you to configure more than two ports or static channel groups to the control VLAN within a single switch or stacked node. However, we advise against this because in certain situations it can produce unpredictable results.

**Mode** EPSR Configuration

**Example** To create a master EPSR instance called blue with vlan2 as the control VLAN and port1.0.1 as the primary port, use the command:

```
awplus(config-epsr)# epsr blue mode master controlvlan vlan2  
primaryport port1.0.1
```

**Related commands** [epsr mode transit controlvlan](#)  
[show epsr](#)

# epsr mode transit controlvlan

**Overview** This command creates a transit EPSR instance.

**Syntax** `epsr <epsr-instance> mode transit controlvlan <2-4094>`

| Parameter       | Description                                                 |
|-----------------|-------------------------------------------------------------|
| <epsr-instance> | Name of the EPSR instance.                                  |
| mode            | Determines the node is acting as a transit node.            |
| transit         | Sets switch to be the transit node for the named EPSR ring. |
| controlvlan     | The VLAN that will transmit EPSR control frames.            |
| <2-4094>        | VLAN id.                                                    |

**NOTE:** The software allows you to configure more than two ports or static channel groups to the control VLAN within a single switch. However, we advise against this because in certain situations it can produce unpredictable results.

If the control VLAN contains more than two ports (or static channels) an algorithm selects the two ports or channels with the lowest number to be the ring ports. However if the switch has only one channel group is defined to the control vlan, EPSR will not operate on the secondary port.

EPSR does not support Dynamic link aggregation (LACP).

**Mode** EPSR Configuration

**Example** To create a transit EPSR instance called `blue` with `vlan2` as the control VLAN, use the command:

```
awplus(config-epsr)# epsr blue mode transit controlvlan vlan2
```

**Related commands** [epsr mode master controlvlan primary port](#)  
[epsr mode transit controlvlan](#)  
[show epsr](#)

## epsr priority

**Overview** This command sets the priority of an EPSR instance on an EPSR node. Priority is used to prevent “superloops” forming under fault conditions with particular ring configurations. Setting a node to have a priority greater than one turns on **superloop protection**.

The **no** variant of this command returns the priority of the EPSR instance back to its default value of 0, which also disables EPSR Superloop prevention.

**Syntax** `epsr <epsr-instance> priority <0-127>`  
`no <epsr-instance> priority`

| Parameter                          | Description                                                                                   |
|------------------------------------|-----------------------------------------------------------------------------------------------|
| <code>&lt;epsr-instance&gt;</code> | Name of the EPSR instance.                                                                    |
| <code>priority</code>              | The priority of the ring instance selected by the <code>epsr-name</code> parameter.           |
| <code>&lt;0-127&gt;</code>         | The priority to be applied (0 is the lowest priority and represents no superloop protection). |

**Default** The default priority of an EPSR instance on an EPSR node is 0. The negated form of this command resets the priority of an EPSR instance on an EPSR node to the default value.

**Mode** EPSR Configuration

**Example** To set the priority of the EPSR instance called ‘blue’ to the highest priority (127), use the command:

```
awplus(config-epsr)# epsr blue priority 127
```

To reset the priority of the EPSR instance called ‘blue’ to the default (0), use the command:

```
awplus(config-epsr)# no epsr blue priority
```

**Related commands** [epsr configuration](#)

# epsr state

**Overview** This command enables or disables an EPSR instance.

**Syntax** `epsr <epsr-instance> state {enabled|disabled}`

| Parameter                          | Description                        |
|------------------------------------|------------------------------------|
| <code>&lt;epsr-instance&gt;</code> | The name of the EPSR instance.     |
| <code>state</code>                 | The operational state of the ring. |
| <code>enabled</code>               | EPSR instance is enabled.          |
| <code>disabled</code>              | EPSR instance is disabled.         |

**Mode** EPSR Configuration

**Usage notes** In a super-loop protection scenario, if you have:

- a device on the common segment acting as the master node for multiple EPSR rings,
- and you disable the rings and later re-enable them (e.g., when doing EPSR configuration changes),
- then you must re-enable the ring with the highest EPSR SLP priority **last**.

If you do not re-enable the rings in that order, the primary port may end up permanently in a blocking state. If the primary port does end up in a permanent blocking state, recover by disabling and re-enabling the EPSR ring that has the highest priority.

**Example** To enable the EPSR instance called 'blue', use the command:

```
awplus(config-epsr)# epsr blue state enabled
```

**Related commands** [epsr mode master controlvlan primary port](#)  
[epsr mode transit controlvlan](#)

## epsr topology-change

**Overview** Use this command to allow the given EPSR instance to accept notifications from other topology protocols, namely G.8032, for Topology Change Notifications (TCN).

Use the **no** variant of this command to return the EPSR instance to where it does not accept TCNs from the other specified protocol, and as a result does not send out a “flush FDB” message.

**Syntax** `epsr <epsr-name> topology-change g8032`  
`no epsr <epsr-name> topology-change g8032`

| Parameter       | Description                                                                                                                                                                             |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <epsr-name>     | The name of the EPSR instance for which the topology-change applies to.                                                                                                                 |
| topology-change | The topology-change value to be set for the instance.                                                                                                                                   |
| g8032           | Specify that G.8032 is the other protocol that the topology-change notifications are allowed to be accepted from in order to send “flush FDB” messages to other EPSR nodes in the ring. |

**Default** The default value is no notifications are accepted and in turn no “flush FDB” messages are sent.

**Mode** EPSR Configuration

**Usage notes** The purpose of this command is to allow EPSR to accept notifications from other topology protocols, namely G.8032, about Topology Change Notifications (TCN). Once EPSR accepts the TCN, it will in turn notify the other nodes on the EPSR ring to perform an FDB flush.

**Example** To configure an EPSR instance named “red” to accept G.8032 TCNs, use the following command:

```
awplus(config-epsr)# epsr red topology-change g8032
```

To configure an EPSR instance named “red” to no longer accept G.8032 TCNs, use the following command:

```
awplus(config-epsr)# no epsr red topology-change g8032
```

**Related commands** [show epsr](#)  
[show g8032 erp-instance](#)

**Command changes** Version 5.4.7-1.1: command added

## epsr trap

**Overview** This command enables SNMP traps for an EPSR instance. The traps will be sent when the EPSR instance changes state.

The **no** variant of this command disables SNMP traps for an EPSR instance. The traps will no longer be sent when the EPSR instance changes state.

**Syntax** `epsr <epsr-instance> trap`  
`no epsr <epsr-instance> trap`

| Parameter                          | Description                      |
|------------------------------------|----------------------------------|
| <code>&lt;epsr-instance&gt;</code> | Name of the EPSR instance.       |
| <code>trap</code>                  | SNMP trap for the EPSR instance. |

**Mode** EPSR Configuration

**Example** To enable traps for the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# epsr blue trap
```

To disable traps for the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# no epsr blue trap
```

**Related commands** [epsr mode master controlvlan primary port](#)  
[epsr mode transit controlvlan](#)  
[show epsr](#)

# show debugging epsr

**Overview** This command shows the debugging modes enabled for EPSR.

**Syntax** show debugging epsr

**Mode** User Exec and Privileged Exec

**Example** To show the enabled debugging modes, use the command:

```
awplus# show debugging epsr
```

**Related commands** [debug epsr](#)

## service epsr

**Overview** Use this command to enable the EPSR service.

Use the **no** version of the command to disable the unused EPSR service.

**Syntax** service epsr  
no service epsr

**Default** Disabled

**Mode** Global Configuration

**Usage notes** This service is disabled by default, to reduce memory use on switches that are not using EPSR. Enable it before configuring EPSR.

If you disable the service, that change won't take effect until you save the configuration and restart the device.

**Examples** To enable the EPSR service, use the commands:

```
awplus# configure terminal
awplus(config)# service epsr
```

To disable the EPSR service, use the commands:

```
awplus# configure terminal
awplus(config)# no service epsr
```

% Save the config and restart the device for this change to take effect

```
awplus(config)# exit
awplus# write
awplus# reboot
```

**Command changes** Version 5.5.5-0.1: command added

# show epsr

**Overview** This command displays information about all EPSR instances.

**Syntax** show epsr

**Mode** User Exec and Privileged Exec

**Example** To show the current settings of all EPSR instances, use the command:

```
awplus# show epsr
```

**Output: non-superloop topology** The following examples show the output display for a non-superloop topology network.

**Example output from the show epsr command run on a transit node**

```
-----
EPSR Information
-----
Name ..... test2
Mode ..... Transit
Status ..... Enabled
State ..... Links-Up
Control Vlan ..... 2
Data VLAN(s) ..... 10
Interface Mode ..... Ports Only
First Port ..... port1.0.1
First Port Status ..... Down
First Port Direction ..... Unknown
Second Port ..... port1.0.2
Second Port Status ..... Down
Second Port Direction ..... Unknown
Trap ..... Enabled
Master Node ..... Unknown
Enhanced Recovery ..... Disabled

-----
```

**Parameters displayed in the output of the show epsr command**

| Parameter on Master Node | Parameter on Transit Node | Description                    |
|--------------------------|---------------------------|--------------------------------|
| Name                     | Name                      | The name of the EPSR instance. |

| Parameter on Master Node | Parameter on Transit Node | Description                                                                                                                                                                                                                                                               |
|--------------------------|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mode                     | Mode                      | The mode in which the EPSR instance is configured - either Master or Transit                                                                                                                                                                                              |
| Status                   | Status                    | Indicates whether the EPSR instance is enabled or disabled                                                                                                                                                                                                                |
| State                    | State                     | Indicates state of the EPSR instance's state machine. Master states are: Idle, Complete, and Failed. Transit states are Links-Up, Links-Down, and Pre-Forwarding.                                                                                                         |
| Control Vlan             | Control Vlan              | Displays the VID of the EPSR instance's control VLAN.                                                                                                                                                                                                                     |
| Data VLAN(s)             | Data VLAN(s)              | The VID(s) of the instance's data VLANs.                                                                                                                                                                                                                                  |
| Interface Mode           | Interface Mode            | Whether the EPSR instance's ring ports are both physical ports (Ports Only) or are both static aggregators (Channel Groups Only).                                                                                                                                         |
| Primary Port             | First Port                | The EPSR instance's primary ring port.                                                                                                                                                                                                                                    |
| - Status                 | - Status                  | Whether the ring port is forwarding (Forwarding) or blocking (Blocked), or has link down (Down), and if forwarding or blocking, "(logical)" indicates the instance has only logically set the blocking state of the port because it does not have physical control of it. |
|                          | - Direction               | The ring port on which the last EPSR control packet was received is indicated by "Upstream". The other ring port is then "Downstream"                                                                                                                                     |
| - Is On Common Segment   | - Is On Common Segment    | Whether the ring port is on a shared common segment link to another node, and if so, "(highest rank)" indicates it is the highest priority instance on that common segment.                                                                                               |
| - Blocking Control       | - Blocking Control        | Whether the instance has "physical" or "logical" control of                                                                                                                                                                                                               |

| Parameter on Master Node | Parameter on Transit Node | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Secondary Port           | Second Port               | The EPSR instance's secondary port.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| - Status                 | - Status                  | Whether the ring port is forwarding (Forwarding) or blocking (Blocked), or has link down (Down), and if forwarding or blocking, "(logical)" indicates the instance has only logically set the blocking state of the port, because it does not have physical control of it. Note that on a master configured for SuperLoop Prevention (non-zero priority) its secondary ring port can be physically forwarding, but logically blocking. This situation arises when it is not the highest priority node in the topology (and so does not receive LINKS-DOWN messages upon common segment breaks) and a break on a common segment in its ring is preventing reception of its own health messages. |
|                          | - Direction               | The ring port on which the last EPSR control packet was received is indicated by "Upstream". The other ring port is then "Downstream"                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| - Is On Common Segment   | - Is On Common Segment    | Whether the ring port is on a shared common segment link to another node, and if so, "(highest rank)" indicates it is the highest priority instance on that common segment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| - Blocking Control       | - Blocking Control        | Whether the instance has "physical" or "logical" control of the ring port's blocking in the instance's data VLANs                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Hello Time               |                           | The EPSR instance's setting for the interval between transmissions of health check messages (in seconds)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Parameter on Master Node | Parameter on Transit Node | Description                                                                                                        |
|--------------------------|---------------------------|--------------------------------------------------------------------------------------------------------------------|
| Failover Time            |                           | The time (in seconds) the EPSR instance waits to receive a health check message before it decides the ring is down |
| Ring Flap Time           |                           | The minimum time the EPSR instance must remain in the failed state                                                 |
| Trap                     | Trap                      | Whether the EPSR instance has EPSR SNMP traps enabled                                                              |

[show epsr counters](#)

# show epsr common segments

**Overview** This command displays information about all the superloop common segment ports on the switch.

**Syntax** show epsr common segments

**Mode** User Exec and Privileged Exec

**Example** To display information about all the superloop common segment ports on the switch, use the command:

```
awplus# show epsr common segments
```

## Example output from the show epsr common segments command

| EPSR Common Segments    |                  |         |      |              |                       |                     |

[show epsr counters](#)

# show epsr config-check

**Overview** This command checks the configuration of a specified EPSR instance, or all EPSR instances.

If an instance is enabled, this command will check for the following errors or warnings:

- The control VLAN has the wrong number of ports.
- There are no data VLANs.
- Some of the data VLANs are not assigned to the ring ports.
- The instance is a master with its secondary port on a common segment.

**Syntax** show epsr [*<instance>*] config-check

| Parameter               | Description                            |
|-------------------------|----------------------------------------|
| <i>&lt;instance&gt;</i> | Name of the EPSR instance to check on. |

**Mode** User Exec and Privileged Exec

**Example** To check the configuration of all EPSR instances and display the results, use the command:

```
awplus# show epsr config-check
```

## Example output from show epsr config-check

| EPSR Instance                                                                                        | Status  | Description                              |
|------------------------------------------------------------------------------------------------------|---------|------------------------------------------|
| red                                                                                                  | OK.     |                                          |
| white                                                                                                | OK.     |                                          |
| blue                                                                                                 | Warning | Primary port is not in data VLANs 29-99. |
| orange                                                                                               | OK.     |                                          |
| Don't forget to check that this node's configuration is consistent with all other nodes in the ring. |         |                                          |

**Related commands** [show epsr](#)

# show epsr <epsr-instance>

**Overview** This command displays information about the specified EPSR instance.

**Syntax** show epsr <epsr-instance>

| Parameter       | Description                |
|-----------------|----------------------------|
| <epsr-instance> | Name of the EPSR instance. |

**Mode** User Exec and Privileged Exec

**Example** To show the current settings of the EPSR instance called blue, use the command:

```
awplus# show epsr blue
```

**Related commands** [epsr mode master controlvlan primary port](#)  
[epsr mode transit controlvlan](#)  
[show epsr counters](#)

# show epsr <epsr-instance> counters

**Overview** This command displays counter information about the specified EPSR instance.

**Syntax** show epsr <epsr-instance> counters

| Parameter       | Description                |
|-----------------|----------------------------|
| <epsr-instance> | Name of the EPSR instance. |

**Mode** User Exec and Privileged Exec

**Example** To show the counters of the EPSR instance called blue, use the command:  
awplus# show epsr blue counters

**Related commands** [epsr mode master controlvlan primary port](#)  
[epsr mode transit controlvlan](#)  
[show epsr](#)

# show epsr counters

**Overview** This command displays counter information about all EPSR instances.

**Syntax** show epsr counters

**Mode** User Exec and Privileged Exec

**Example** To show the counters of all EPSR instances, use the command:

```
awplus# show epsr counters
```

**Related commands** [epsr mode master controlvlan primary port](#)  
[epsr mode transit controlvlan](#)  
[show epsr](#)

## show epsr summary

**Overview** This command displays summary information about all EPSR instances on the switch

**Syntax** show epsr summary

**Mode** User Exec and Privileged Exec

**Example** To display EPSR summary information, use the command:  
awplus# show epsr summary

### Example output from the show epsr summary command

#### EPSR Summary Information

##### Abbreviations:

M = Master node

T = Transit node

C = is on a common segment with other instances

P = instance on a common segment has physical control of the shared port's data VLAN blocking

LB = ring port is Logically Blocking - applicable to master only

| EPSR Instance | Mode | Status   | State      | Ctrl VLAN | Prio | Primary/1st Port Status | Secondary/2nd Port Status |
|---------------|------|----------|------------|-----------|------|-------------------------|---------------------------|
| test-12345    | T    | Enabled  | Links-Down | 6         | 127  | Blocking (C,P)          | Blocking (C,P)            |
| test1         | M    | Enabled  | Complete   | 5         | 12   | Fwding                  | Fwding (LB)               |
| test2         | T    | Enabled  | Pre-Fwding | 4         | 126  | Fwding (C)              | Blocking (C)              |
| localB        | T    | Disabled | Idle       | 40        | 0    | Unknown                 | Unknown                   |
| localC        | T    | Disabled | Idle       | 41        | 0    | Unknown                 | Unknown                   |

# undebug epsr

**Overview** This command applies the functionality of the **no** variant of the **debug epsr**.

# 43

# Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure G.8032 Ethernet Ring Protection Switching.

For more information, see the [\*\*G.8032 Ethernet Ring Protection Switching Feature Overview and Configuration Guide\*\*](#).

## cfm-sf-notify

**Overview** Use this command to configure this ERP instance to receive signal fail notifications from a Local MEP(s). This command can be used multiple times to allow multiple Local MEPs to be specified.

Use the **no** variant of this command to remove a Local MEP from sending notifications to this G.8032 ERP instance.

**Syntax** `cfm-sf-notify mep mpid <mep-id> domain <domain-name> service <ma-name>`  
`no cfm-sf-notify mep mpid <mep-id> domain <domain-name> service <ma-name>`

| Parameter     | Description                                                                                                              |
|---------------|--------------------------------------------------------------------------------------------------------------------------|
| mep           | Specify that a Local Maintenance End Point (MEP) is to provide the Signal Fail notification to this G.8032 ERP instance. |
| mpid          | Specify that the Local MEP is to be identified by MEP-id.                                                                |
| <mep-id>      | 1-8191. Specify the Local MEP's ID.                                                                                      |
| domain        | Specify the Maintenance Domain that the Local MEP is associated with.                                                    |
| <domain-name> | Specify the Maintenance Domain's CLI instance name.                                                                      |
| service       | Specify the Maintenance Association that the Local MEP is associated with.                                               |
| <ma-name>     | Specify the Maintenance Association's CLI instance name.                                                                 |

**Mode** G8032 Configure Switch

**Usage notes** CFM and Continuity Check Messaging (CCM) can be configured to detect link faults on the East or West interface ports as a whole, or faults on the R-APS VLAN on the East or West interface. In this situation CFM Local MEPs can notify G.8032 of defects it detects. G.8032 will treat these notifications as a Signal Fail (SF) for that East or West ring port. Similarly, CFM Local MEPs can notify G.8032 that the fault has cleared. When this command is used, this G.8032 ERP instance will ensure that the specified Local MEP is a Down MEP for the East or West interface used by this instance or for the R-APS VLAN on the East or West interface used by this instance.

**Example** To configure an ERP instance to receive signal fail notifications from a local MEP with an MEP ID of "12", an MD named "MD-INST1", and an MA named "MA-INST1-1", use the following commands:

```
awplus(config)# g8032 erp-instance ring2
awplus(g8032-config-switch)# cfm-sf-notify mep mpid 12 domain
MD-INST1 service MA-INST1-1
```

**Related commands**

- ethernet cfm domain-name**
- ethernet cfm mep**
- g8032 erp-instance**
- service ma-name**
- show g8032 erp-instance**

**Command changes**

- Version 5.4.7-0.1: command added
- Version 5.4.7-1.1: added to x310 series products
- Version 5.4.7-2.1: added to x550 series products
- Version 5.4.8-0.2: added to SBx8100 series products
- Version 5.4.8-1.1: added to SBx908 GEN2 series products

# clear g8032 erp-instance

**Overview** Use this command to:

- trigger a reversion immediately, without waiting for timers to expire, or
- clear a forced-switch or manual-switch command that was previously successfully entered on a G.8032 Ethernet Ring Protection (ERP) instance.

**Syntax** clear g8032 erp-instance <erp-instance-name>

| Parameter           | Description                         |
|---------------------|-------------------------------------|
| <erp-instance-name> | The name of the G.8032 ERP instance |

**Mode** Privileged Exec

**Usage notes** This command can be used after a protection switch has occurred and the failure has cleared. If reversion is enabled, this command will trigger a reversion immediately, without having to wait for certain timers to expire (such as WTB or WTR). If reversion has been disabled, this command will trigger a reversion.

Alternatively, this command can be used on an ERP instance where a forced-switch or manual-switch command has been successfully entered to clear that action. The command will be ignored if a force-switch or manual-switch command had not been previously entered successfully, even if such node is in the FORCED\_SWITCH or MANUAL\_SWITCH state.

**Examples** To trigger a reversion immediately without waiting for a timer to expire on an ERP instance named "blue", use the following command:

```
awplus# clear g8032 erp-instance blue
```

Alternatively, to clear a previously applied forced-switch from an ERP instance named "blue", use the following command:

```
awplus# clear g8032 erp-instance blue
```

The forced-switch would be created using a command like this one, which forces a protection switch on the East interface of an ERP instance named "blue":

```
awplus# g8032 forced-switch erp-instance blue east-interface
```

**Related commands**

- [g8032 erp-instance](#)
- [g8032 forced-switch erp-instance](#)
- [g8032 manual-switch erp-instance](#)

**Command changes** Version 5.4.7-0.1: command added  
Version 5.4.7-1.1: added to x310 series products  
Version 5.4.7-2.1: added to x550 series products  
Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

# clear g8032 erp-instance statistics

**Overview** Use this command to clear the statistics data being collected by a G.8032 Ethernet Ring Protection (ERP) instance.

**Syntax** `clear g8032 erp-instance <erp-instance-name> statistics`

| Parameter                              | Description                                |
|----------------------------------------|--------------------------------------------|
| <code>&lt;erp-instance-name&gt;</code> | The name of a specific G.8032 ERP instance |

**Mode** Privileged Exec

**Usage notes** A G.8032 ERP instance keeps statistical data as counts on a variety of data such as the number of certain types of Ring-Automatic Protection Switching (R-APS) messages sent and received over its ring port(s) and error conditions detected. Use this command to clear the statistics data.

**Example** To clear the statistics for an ERP instance named “blue”, use the following command:

```
awplus# clear g8032 erp-instance blue statistics
```

**Related commands** [g8032 erp-instance](#)  
[show g8032 erp-instance statistics](#)

**Command changes** Version 5.4.7-0.1: command added  
Version 5.4.7-1.1: added to x310 series products  
Version 5.4.7-2.1: added to x550 series products  
Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

## data-traffic

**Overview** Use this command to add a data traffic VLAN or a range of VLANs to be protected by this G.8032 Ethernet Ring Protection (ERP) instance.

Use the **no** variant of this command to remove a data traffic VLAN or a range of VLANs.

**Syntax** data-traffic <vid-list>  
no data-traffic <vid-list>

| Parameter  | Description                                                                                                                                                                                                     |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <vid-list> | The data traffic VLAN ID(s). This can be a single VLAN ID, or can be a range of VLAN IDs separated by hyphen, or a comma separated list of VLAN IDs and ranges. Each VLAN ID can take on the range of 1 to 4094 |

**Mode** G8032 Configure Switch

- Usage notes**
- A G.8032 ERP instance can protect 0, 1 or more VLANs carrying data traffic.
  - This ERP instance must be associated with a physical ring instance.
  - Other ERP instances using the same physical ring instance are not allowed to have the same data traffic VLAN(s) as this ERP instance.
  - The data VLAN(s) must already exist.
  - The data VLAN(s)' port members should be members of the ring interface(s), but it is not enforced.
  - When a data traffic VLAN(s) is removed, any blocks that were in place on the ring ports for this VLAN(s) are removed. The user should make sure when removing the VLAN(s) from the ERP instance that a loop is not formed.
  - Data traffic VLAN(s) can be added or removed while the ERP instance is enabled or disabled.

**Example** To add a data traffic VLAN with a VLAN ID of "103" to an ERP instance named "blue", use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)# data-traffic 103
```

**Related commands** **g8032 erp-instance**  
**show g8032 erp-instance**

**Command changes** Version 5.4.7-0.1: command added  
Version 5.4.7-1.1: added to x310 series products  
Version 5.4.7-2.1: added to x550 series products  
Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

# debug g8032

**Overview** Use this command to enable G.8032 debugging.  
Use the **no** variant of this command to disable G.8032 debugging.

**Syntax** debug g8032 {all|event|rx|tx}  
no debug g8032 {all|event|rx|tx}

| Parameter | Description                       |
|-----------|-----------------------------------|
| all       | Turn on all G.8032 debugging      |
| event     | Turn on G.8032 Event debugging    |
| rx        | Turn on G.8032 Receive debugging  |
| tx        | Turn on G.8032 Transmit debugging |

**Mode** Privileged Exec

**Example** To enable all G.8032 debugging, use the following command:  
awplus# debug g8032 all

**Related commands** [show debugging](#)  
[show debugging g8032](#)  
[undebug g8032](#)

**Command changes** Version 5.4.7-0.1: command added  
Version 5.4.7-1.1: added to x310 series products  
Version 5.4.7-2.1: added to x550 series products  
Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

# enable (g8032-profile)

**Overview** Use this command to change the revertive or non-revertive operation of the associated G.8032 Ethernet Ring Protection (ERP) instance.

**Syntax** enable {revertive|non-revertive}

| Parameter     | Description                                                                                 |
|---------------|---------------------------------------------------------------------------------------------|
| revertive     | This allows the ERP instance associated with this profile to operate in revertive mode.     |
| non-revertive | This allows the ERP instance associated with this profile to operate in non-revertive mode. |

**Default** By default, the mode of operation is revertive.

**Mode** G8032 Profile Configuration

**Usage notes** An ERP instance uses a profile which contains timer configurations and configurations for revertive modes of operation. Once a ring failure has abated, a G.8032 ring instance will check its mode of operation, and if the mode is revertive, it will attempt to revert back to where the RPL-Owner controls the blocking of the ring. Otherwise, it operates in non-revertive mode.

**Example** To enable revertive mode for a profile named "prof\_1", use the following commands:

```
awplus(config)# g8032 profile prof_1
awplus(g8032-profile-config)# enable revertive
```

**Related commands** [g8032 profile](#)  
[show g8032 profile](#)

**Command changes** Version 5.4.7-0.1: command added  
Version 5.4.7-1.1: added to x310 series products  
Version 5.4.7-2.1: added to x550 series products  
Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

## epsr topology-change

**Overview** Use this command to allow the given EPSR instance to accept notifications from other topology protocols, namely G.8032, for Topology Change Notifications (TCN).

Use the **no** variant of this command to return the EPSR instance to where it does not accept TCNs from the other specified protocol, and as a result does not send out a “flush FDB” message.

**Syntax** `epsr <epsr-name> topology-change g8032`  
`no epsr <epsr-name> topology-change g8032`

| Parameter       | Description                                                                                                                                                                             |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <epsr-name>     | The name of the EPSR instance for which the topology-change applies to.                                                                                                                 |
| topology-change | The topology-change value to be set for the instance.                                                                                                                                   |
| g8032           | Specify that G.8032 is the other protocol that the topology-change notifications are allowed to be accepted from in order to send “flush FDB” messages to other EPSR nodes in the ring. |

**Default** The default value is no notifications are accepted and in turn no “flush FDB” messages are sent.

**Mode** EPSR Configuration

**Usage notes** The purpose of this command is to allow EPSR to accept notifications from other topology protocols, namely G.8032, about Topology Change Notifications (TCN). Once EPSR accepts the TCN, it will in turn notify the other nodes on the EPSR ring to perform an FDB flush.

**Example** To configure an EPSR instance named “red” to accept G.8032 TCNs, use the following command:

```
awplus(config-epsr)# epsr red topology-change g8032
```

To configure an EPSR instance named “red” to no longer accept G.8032 TCNs, use the following command:

```
awplus(config-epsr)# no epsr red topology-change g8032
```

**Related commands** [show epsr](#)  
[show g8032 erp-instance](#)

**Command changes** Version 5.4.7-1.1: command added

# erp-instance

**Overview** Use this command to enable or disable a G.8032 Ethernet Ring Protection (ERP) instance.

**Syntax** `erp-instance {enabled|disabled}`

| Parameter | Description                         |
|-----------|-------------------------------------|
| enabled   | The G.8032 ERP instance is enabled  |
| disabled  | The G.8032 ERP instance is disabled |

**Default** The ERP instance is disabled.

**Mode** G8032 Configure Switch

**Usage notes** Once a G.8032 ERP instance has been configured with the correct parameter settings or defaults, it can be enabled to run the G.8032 protocol. To change certain ERP instance parameters, the instance may need to be disabled.

When enabled, the instance is restarted back to the G8032\_ST\_INIT state. In this state, if the node has an RPL-Owner or RPL-Neighbor port, it will be blocked. Otherwise the node will block one of its ring ports. All the nodes will send Ring-Automatic Protection Switching (R-APS) messages initially. The G.8032 protocol and state machines will transition the ring into another more appropriate state.

When disabled, the ERP instance will no longer process incoming R-APS messages for that instance, nor send any R-APS messages. The raps-channel VLAN and any data-traffic VLANs used by this instance will be put in the forwarding state for its physical ring ports. Caution should be taken to avoid loops when disabling an ERP instance.

**Example** To enable an ERP instance named "blue", use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)# erp-instance enabled
```

**Related commands** [g8032 erp-instance](#)  
[show g8032 erp-instance](#)  
[trap \(g8032-switch\)](#)

**Command changes** Version 5.4.7-0.1: command added  
Version 5.4.7-1.1: added to x310 series products  
Version 5.4.7-2.1: added to x550 series products  
Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

## g8032 erp-instance

**Overview** Use this command to create a G.8032 Ethernet Ring Protection (ERP) instance, or to enter an existing instance's context.

Use the **no** variant of this command to destroy the specified instance.

**Syntax** g8032 erp-instance <erp-instance-name>  
no g8032 erp-instance <erp-instance-name>

| Parameter           | Description                                                           |
|---------------------|-----------------------------------------------------------------------|
| <erp-instance-name> | The name of the G.8032 ERP instance. This can be up to 32 characters. |

**Mode** Global Configuration

**Usage notes** The ERP protocol in AlliedWare Plus™ can run one or more instances. A G.8032 ERP instance is made up of:

- two ERP ring ports,
- a Control VLAN that carries Ring-Automatic Protection Switching (R-APS) messages, and
- zero, one, or more Protected traffic data VLANs that the instance protects when the ring fails.

An ERP instance must be associated with a G.8032 physical ring and a G.8032 profile.

**Example** To enter the context of an instance named "blue", use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)#
```

**Related commands**

- clear g8032 erp-instance**
- clear g8032 erp-instance statistics**
- data-traffic**
- erp-instance**

**Command changes**

- Version 5.4.7-0.1: command added
- Version 5.4.7-1.1: added to x310 series products
- Version 5.4.7-2.1: added to x550 series products
- Version 5.4.8-0.2: added to SBx8100 series products
- Version 5.4.8-1.1: added to SBx908 GEN2 series products

## g8032 forced-switch erp-instance

**Overview** Use this command to force a protection switch on a G.8032 Ethernet Ring Protection (ERP) instance ring port.

**Syntax** `g8032 forced-switch erp-instance <erp-instance-name> {east-interface|west-interface|terminating-interface}`

| Parameter                              | Description                                     |
|----------------------------------------|-------------------------------------------------|
| <code>&lt;erp-instance-name&gt;</code> | The name of the G.8032 ERP instance             |
| <code>east-interface</code>            | The G.8032 ERP instance's East ring port        |
| <code>west-interface</code>            | The G.8032 ERP instance's West ring port        |
| <code>terminating-interface</code>     | The G.8032 ERP instance's Terminating ring port |

**Mode** Privileged Exec

**Usage notes** G.8032 supports a Forced Protection Switch action initiated by the operator. A Forced Protection Switch command is to be issued at a given G.8032 node and given port in the ring. This results in a block being applied at that ring port (and an unblock on the opposite ring port), and a R-APS designated Forced Switch message to flow around the ring causing the RPL to become unblocked.

Multiple Forced Switch actions can take place along a G.8032 ring. Care must be taken when using the Force Switch command as it can only be undone by issuing a Clear command and not by a failure nor the clearing of a failure. If a node that was issued a Force Switch command later fails, then it becomes difficult to remove the Force Switch condition from the ring. In this situation, the operator has to go to the nodes that are adjacent to the failed node, and for each one, issue a Forced Switch command on the ring link facing the failed node followed by a Clear command.

If the G.8032 Physical Ring instance associated with the specified ERP instance is set to terminating-interface, then only one ring port is available and terminating-interface must be used in this command, otherwise specify the east-interface or the west-interface.

To clear this action command, use the [clear g8032 erp-instance](#) command.

**Example** To issue a Forced Protection Switch on the East interface of an ERP instance named "blue", use the following command:

```
awplus# g8032 forced-switch erp-instance blue east-interface
```

**Related commands** [clear g8032 erp-instance](#)  
[g8032 erp-instance](#)

**Command changes** Version 5.4.7-0.1: command added  
Version 5.4.7-1.1: added to x310 series products  
Version 5.4.7-2.1: added to x550 series products  
Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

## g8032 manual-switch erp-instance

**Overview** Use this command to manually cause a protection switch on a G.8032 Ethernet Ring Protection (ERP) instance ring port.

**Syntax** g8032 manual-switch erp-instance <erp-instance-name> {east-interface|west-interface|terminating-interface}

| Parameter             | Description                                     |
|-----------------------|-------------------------------------------------|
| <erp-instance-name>   | The name of the G.8032 ERP instance             |
| east-interface        | The G.8032 ERP instance's East ring port        |
| west-interface        | The G.8032 ERP instance's West ring port        |
| terminating-interface | The G.8032 ERP instance's Terminating ring port |

**Mode** Privileged Exec

**Usage notes** G.8032 supports a Manual Protection Switch action initiated by the operator. A Manual Protection Switch command is to be issued at a given G.8032 node and given port in the ring. This results in a block being applied at that ring port (and an unblock on the opposite ring port), and a R-APS designated Manual Switch message to flow around the ring causing the RPL to become unblocked.

The difference between a Manual switch and a Forced switch is that the Manual Switch will be ignored under various conditions. In particular, only one Manual Switch is allowed on a G.8032 ring at a time.

If the G.8032 Physical Ring instance associated with the specified ERP instance is set to terminating-interface, then only one ring port is available and terminating-interface must be used in this command, otherwise specify the east-interface or the west-interface.

To clear this action command, use the **clear g8032 erp-instance** command.

**Example** To issue a Manual Protection Switch on the East interface of an ERP instance named "blue", use the following command:

```
awplus# g8032 manual-switch erp-instance blue east-interface
```

**Related commands** **clear g8032 erp-instance**  
**g8032 erp-instance**

**Command changes** Version 5.4.7-0.1: command added  
Version 5.4.7-1.1: added to x310 series products  
Version 5.4.7-2.1: added to x550 series products  
Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

## g8032 physical-ring

**Overview** Use this command to create a G.8032 Ethernet Ring Protection (ERP) physical ring profile which specifies the Ethernet ports that will be used as G.8032 ring ports.

**Syntax** `g8032 physical-ring <physical-ring-name> {east-interface <interface-name1> west-interface <interface-name2>| terminating-interface <interface-name>}  
no g8032 physical-ring <physical-ring-name>`

| Parameter             | Description                                                                                                                     |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <physical-ring-name>  | The name of the profile (up to 37 characters)                                                                                   |
| east-interface        | The East G.8032 ring port                                                                                                       |
| <interface-name1>     | The name of the switch interface, either port or channel group, for the East ring port. It must differ from the West ring port. |
| west-interface        | The West G.8032 ring port                                                                                                       |
| <interface-name2>     | The name of the switch interface, either port or channel group, for the West ring port. It must differ from the East ring port. |
| terminating-interface | The Terminating ring port. This should only be used for G.8032 ERP instance that is at the end of a sub-ring.                   |
| <interface-name>      | The name of the switch interface, either port or channel group, for the Terminating ring port.                                  |

**Mode** Global Configuration

**Usage notes** Each ERP instance will be associated with a physical ring profile. A physical ring profile is made up of two physical Ethernet ports or aggregated interfaces, unless it is the terminating point of a sub-ring in which case only one port is needed. When two ports are used, they are referred to as East and West ports. When only a single port is used, it is referred to as a Terminating port.

**Example** To create a physical ring profile named “red” where the East interface port is port1.0.4 and the West interface port is port1.0.8, use the following commands:

```
awplus# configure terminal
awplus(config)# g8032 physical-ring red east-interface port1.0.4
west-interface port1.0.8
```

**Related commands** [physical-ring](#)  
[rpl role](#)  
[show g8032 physical-ring](#)  
[sub-ring](#)

**Command changes** Version 5.4.7-0.1: command added  
Version 5.4.7-1.1: added to x310 series products  
Version 5.4.7-2.1: added to x550 series products  
Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

# g8032 profile

**Overview** Use this command to create a G.8032 Ethernet Ring Protection (ERP) instance profile, or to enter that instance's profile context.  
Use the **no** variant of this command to destroy the specified instance.

**Syntax** g8032 profile {<erp-profile-name>|default-profile}  
no g8032 profile <erp-profile-name>

| Parameter          | Description                                                                                                                        |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <erp-profile-name> | The name of the G.8032 profile. This can be up to 32 characters.                                                                   |
| default-profile    | The name of the system's default profile for G.8032. This profile is created by the system automatically and can not be destroyed. |

**Default** A profile with the name "default-profile" will exist in the system and is used by default by an ERP instance. All the parameters in the default profile take on the default values.

**Mode** Global Configuration

**Example** To enter the context of a profile named "prof\_1", use the following commands:

```
awplus(config)# g8032 profile prof_1  
awplus(g8032-profile-config)#
```

**Related commands** **enable (g8032-profile)**  
**profile name**  
**show g8032 profile**  
**timer (g8032-profile)**

**Command changes** Version 5.4.7-0.1: command added  
Version 5.4.7-1.1: added to x310 series products  
Version 5.4.7-2.1: added to x550 series products  
Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

# level (g8032-switch)

**Overview** Use this command to configure the level for Ring-Automatic Protection Switching (R-APS) messages.

**Syntax** level <0-7>

| Parameter | Description                                |
|-----------|--------------------------------------------|
| <0-7>     | The level used by the G.8032 ERP instance. |

**Default** The default level is 0.

**Mode** G8032 Configure Switch

**Usage notes** Inside the R-APS messages is the Level field. The G.8032 Ethernet Ring Protection (ERP) instance will use the configured level for sending R-APS messages, and is the level that the instance expects to receive. If the node receives an R-APS message with the improper level then the message will not be processed.

The ERP instance must be disabled to change the level, otherwise the setting is denied.

**Example** To set the R-APS message level field for an ERP instance named "blue" to 3, use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)# level 3
```

**Related commands** [g8032 erp-instance](#)  
[show g8032 erp-instance](#)

**Command changes** Version 5.4.7-0.1: command added  
Version 5.4.7-1.1: added to x310 series products  
Version 5.4.7-2.1: added to x550 series products  
Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

# physical-ring

**Overview** Use this command to specify which G.8032 physical ring instance is to be used by this G.8032 Ethernet Ring Protection (ERP) instance.

**Syntax** `physical-ring <physical-ring-name>`

| Parameter                               | Description                             |
|-----------------------------------------|-----------------------------------------|
| <code>&lt;physical-ring-name&gt;</code> | The name of the physical ring instance. |

**Mode** G8032 Configure Switch

**Usage notes** A G.8032 ERP instance in general has two ring ports, unless it is at the end of a sub-ring in which case it has only one ring port. Ring port(s) are specified using a G.8032 physical ring instance.

This command can only be accepted when the ERP instance is disabled.

**Example** To configure an ERP instance named "blue" to use a physical ring instance named "red", use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)# physical-ring red
```

**Related commands** [g8032 erp-instance](#)  
[g8032 physical-ring](#)  
[show g8032 erp-instance](#)

**Command changes** Version 5.4.7-0.1: command added  
Version 5.4.7-1.1: added to x310 series products  
Version 5.4.7-2.1: added to x550 series products  
Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

# profile name

**Overview** Use this command to associate a G.8032 profile instance with this G.8032 Ethernet Ring Protection (ERP) instance.

**Syntax** profile name <erp-profile-name>

| Parameter          | Description                    |
|--------------------|--------------------------------|
| <erp-profile-name> | The name of the G.8032 profile |

**Default** If this command is not used, a profile with the name “default-profile” will be used for this G.8032 ERP instance.

**Mode** G8032 Configure Switch Mode

**Usage notes** A G.8032 ERP instance uses a profile which contains timer configurations and configurations for revertive modes of operation. This configuration can be accepted regardless of the ERP instance being disabled or enabled. Any parameters from a changed profile will take effect the next time the G.8032 state machine uses the parameters in the updated profile.

**Example** To associate a G.8032 profile named “prof\_1” with a G.8032 ERP instance named “blue”, use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)# profile name prof_1
```

**Related commands** [g8032 erp-instance](#)  
[g8032 profile](#)  
[show g8032 erp-instance](#)

**Command changes** Version 5.4.7-0.1: command added  
Version 5.4.7-1.1: added to x310 series products  
Version 5.4.7-2.1: added to x550 series products  
Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

# raps-channel

**Overview** Use this command to specify which VLAN to use as a channel for G.8032 Ring-Automatic Protection Switching (R-APS) messages sent and received by this G.8032 Ethernet Ring Protection (ERP) instance.

Use the **no** variant of this command to remove the VLAN from being used as the R-APS channel VLAN.

**Syntax** `raps-channel <vid>`  
`no raps-channel`

| Parameter | Description                              |
|-----------|------------------------------------------|
| <vid>     | A single VLAN-id in the range 2 to 4094. |

**Mode** G8032 Configure Switch

**Usage notes** For a G.8032 ERP instance, a VLAN is used as a channel for carrying an R-APS message. This VLAN is also used to identify the proper ring instance to all the other nodes in the ring.

The VLAN must be tagged members of the G.8032 physical ring instance associated with this ERP instance. A G.8032 physical ring instance must be associated with this ERP instance. The ERP instance can not be enabled until this raps-channel VLAN has been configured properly.

The ERP instance must be disabled when using the **no** variant.

**Example** To configure a VLAN with a VLAN-id of "103" as a R-APS channel for an ERP instance named "blue", use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)# raps-channel 103
```

**Related commands** [g8032 erp-instance](#)

**Command changes** Version 5.4.7-0.1: command added  
Version 5.4.7-1.1: added to x310 series products  
Version 5.4.7-2.1: added to x550 series products  
Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

## service onm

**Overview** Use this command to enable the ONM service, which underlies CFM and G.8032.

Use the **no** version of the command to disable the ONM service if you are not using it.

**Syntax** service onm  
no service onm

**Default** Disabled

**Mode** Global Configuration

**Usage notes** The ONM service is disabled by default, to minimize memory usage on switches that are not running CFM and G.8032, particularly when many VLANs are configured on ports. Enable it before configuring CFM and G.8032.

If you disable the service, that change won't take effect until you save the configuration and restart the device.

**Example** To enable the ONM service, use the commands:

```
awplus# configure terminal
awplus(config)# service onm
```

To disable the ONM service, use the commands:

```
awplus# configure terminal
awplus(config)# no service onm
```

% Save the config and restart the device for this change to take effect

```
awplus(config)# exit
awplus# write
awplus# reboot
```

**Command changes** Version 5.5.5-0.1: default changed to disabled  
Version 5.5.0-2.1: command added

## rpl role

**Overview** Use this command to specify the role of each G.8032 Ethernet Ring Protection (ERP) ring port (also known as a link). The role can be specified as to whether it is a Ring Protection Link (RPL) or not, and if it is an RPL, whether it is the Owner or Neighbor end of an RPL.

Use the **none** variant of this command to set all the ERP instance's ring ports' RPL role to **none**.

**Syntax** `rpl role {owner|neighbor}{east-interface|west-interface|terminating-interface}`  
`rpl role none`

| Parameter             | Description                                                    |
|-----------------------|----------------------------------------------------------------|
| owner                 | This sets the specified ring port to be an RPL Owner           |
| neighbor              | This sets the specified ring port to be an RPL Neighbor        |
| east-interface        | The ring port's east-interface.                                |
| west-interface        | The ring port's west-interface.                                |
| terminating-interface | The ring port's terminating-interface                          |
| none                  | This sets all the ERP instance's ring ports' RPL role to none. |

**Default** A RPL role of "none" is the default.

**Mode** G8032 Configure Switch

**Usage notes** If a node has one of its ring ports set to Owner or Neighbor, then **none** is automatically set on any other ring port as **none** is the only possible setting for the other ring port.

When using this command to set the RPL role to **none**, an interface need not be specified, as this command will set all the ring ports RPL role to **none**.

The command can only be accepted when the G.8032 ERP Instance is disabled, and the ERP instance must also have an association to a ERP Physical Ring instance.

As in the case of a sub-ring with only one physical ring port, use **terminating-interface** when specifying the RPL role as Owner or Neighbor.

**Example** To configure the east-interface of a ring port named “blue” to be an RPL Owner, use the following commands:

```
awplus(config)# g8032 erp-instance blue  
awplus(g8032-config-switch)# rpl role owner east-interface
```

# show debugging g8032

**Overview** Use this command to show the debugging modes enabled for G.8032.

**Syntax** show debugging g8032

**Mode** User Exec and Privileged Exec

**Example** To show the debugging modes enabled for G.8032, use the following command:

```
awplus# show debugging g8032
```

**Output** The following shows typical output.

**Example output from the show debugging g8032 command.**

```
awplus#show debugging g8032
G.8032 event debugging is off
G.8032 receive debugging is off
G.8032 transmit debugging is off
```

## show g8032 erp-instance

**Overview** Use this command to show one or all G.8032 Ethernet Ring Protection (ERP) instance(s) configuration and dynamic state data.

**Syntax** `show g8032 erp-instance {<erp-instance-name>|all}`

| Parameter                              | Description                                 |
|----------------------------------------|---------------------------------------------|
| <code>&lt;erp-instance-name&gt;</code> | The name of a specific G.8032 ERP instance. |
| <code>all</code>                       | Use this to show all instances.             |

**Mode** User Exec and Privileged Exec

**Example** To show the configuration and dynamic state data for an ERP instance named "blue", use the following command:

```
awplus# show g8032 erp-instance blue
```

**Output** The following shows typical output.

**Example output from the show g8032 erp-instance command.**

```
awplus#show g8032 erp-instance blue
```

**Parameters in the output from the show g8032 erp-instance command.**

| Parameter     | Description                                                                                             |
|---------------|---------------------------------------------------------------------------------------------------------|
| Instance name | The configured <erp-instance-name> for this instance.                                                   |
| Admin State   | The configured administrative state of this instance, either enabled or disabled. When the ERP instance |

| Parameter                       | Description                                                                                                                                                                                                                                                                                |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                 | is disabled, all dynamic data for other parameters in this table will be shown as "-", except for the East Link or West Link which will show the last known block or unblocked state.                                                                                                      |
| G.8032 State                    | A dynamic parameter showing the current state of the instance per the G.8032 state machine. If the ERP Instance is disabled, it will be in the INIT state.                                                                                                                                 |
| Phy Ring                        | Shows the Physical Ring Instance name that this ERP Instance is associated with along with the East/ West or Terminating Interface used by the Physical Ring Instance.                                                                                                                     |
| East Link or West Link          | A dynamic variable showing whether the instance's ring port and its VLANs are blocked or not. In the special case of an interconnection node where a sub-ring terminates, both the East Link and the West Link are the same.                                                               |
| RPL Role East Link or West Link | Shows the configuration of the link's role.                                                                                                                                                                                                                                                |
| CFM MEP East or West            | Identifies the configured MEP, if any, that is being used to provide a CFM based Signal Fail indication to this instance. The MEP is identified by its direction (Up or Down), its MEP-id, and the Maintenance Domain (MD) and Maintenance Association (MA) it is associated with by name. |
| ERP Profile                     | Identifies the ERP Profile instance that was configured for use by this ERP Ring instance.                                                                                                                                                                                                 |
| Level                           | The Level that was configured for R-APS messages that are used by this ERP Ring instance.                                                                                                                                                                                                  |
| Ring-ID                         | The Ring-ID that is to be used by this ERP instance.                                                                                                                                                                                                                                       |
| RAPS-Channel VLAN               | The VLAN-id that is configured used for sending and receiving R-APS messages for this ERP instance.                                                                                                                                                                                        |
| Sub-ring                        | Specifies whether the ring is operating as a Sub-ring or otherwise as a Major ring.                                                                                                                                                                                                        |
| Virtual Channel                 | Specifies whether the sub-ring is operating with a virtual channel or not.                                                                                                                                                                                                                 |
| Data Traffic VLANs              | A comma-separated list of configured VLAN-ids (individually, or range) that are used for data-traffic and protected by this ERP instance.                                                                                                                                                  |
| TCN To Inst                     | A comma-separated list of protocols and their instances that are to be notified when a Topology Change Notification occurs for this ERP instance.                                                                                                                                          |

| Parameter           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                     | This only applies to a sub-ring with a Terminating interface and in which case "-" will be displayed if no target instances have been identified. Otherwise a "-" is displayed anyway. Identifies the protocol to notify. Only "G8032" will be supported initially. <instance-name> - Identifies the instance to notify for the given protocol.                                                                                                                                                                                                                                                                                                                                                               |
| TCN Flush Event     | Specifies if this instance as a target instance is to send out Flush FDB messages upon TCN notifications by a detecting instance. Identifies the notifying protocol allowed. Only "G8032" will be supported initially. If no protocols have been configured then display "-".                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| SNMP Traps          | Indicates whether SNMP traps have been enabled or disabled for this ERP instance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Signal Fail         | Indicates whether a Signal Fail condition is being received over the East or West ring interface. <signal-fail> consists of: "-" no Signal Fail is being indicated "Link" - indicates the interface port or LAG has gone operationally down. "CFM MEP <mep-id>" - indicates that a local CFM MEP has indicated a Signal Fail, and which MEP by mep-id.                                                                                                                                                                                                                                                                                                                                                        |
| Failure of Protocol | Indicates that there are defects in the receipt of an R-APS message. There are the following types: FOP-PM (Provisioning Mismatch) - "true" indicates per G.8032, that the RPL-Owner is receiving R-APS(NR,RB) messages with a node-id not of itself. In addition, since the initial implementation does not support version 1, any R-APS messages with version 1 will also indicate a FOP-PM error. The FOP-PM error can occur on an East or a West Port. FOP-TO (Time Out) - "true" indicates that a node has not received an R-APS message on any of its ring ports for 3.5 times the R-APS message interval even though one or both ring ports are capable of receiving R-APS messages (no SF, Admin Up). |
| Version             | The version of the R-APS message that is being received or sent over the East or West ring interface. An R-APS message version of "1" corresponds to G.8032 version 2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Request             | Indicates the protection switch request being sent or received in the R-APS message. Consists of one of: NR - No Request for protection switching SF - Signal Fail MS - Manual Switch request FS - Force Switch request Event - Request a Flush to be performed. Note this is a transient condition.                                                                                                                                                                                                                                                                                                                                                                                                          |

| Parameter                    | Description                                                                                                                                                                                                                                          |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RPL Block                    | Indicates whether the RPL is being blocked or not. consists of one of the following: "RB" - RPL Block is being applied by the RPL-Owner. "-" - No RPL Block is being applied by the RPL-Owner, or the R-APS message originated from a non-RPL-Owner. |
| DNF                          | Indicates the value of the Do Not Flush bit in the R-APS message. The value is either "0" or "1".                                                                                                                                                    |
| Block Port Ref               | Block Port Reference refers to the node's East or West port that is being blocked and shows as "0" or "1" in accordance to G.8032.                                                                                                                   |
| Node-ID                      | The MAC address of this Node or the MAC address used in sending/receiving R-APS messages.                                                                                                                                                            |
| East Sending or West Sending | If this local node is not sending R-APS, then all the fields are shown as "-"                                                                                                                                                                        |
| Timers                       | Wait-to-Restore - "Running" indicates this timer is active, otherwise is "-".Wait-to-Block - "Running" indicates this timer is active, otherwise is "-".Hold Off Timer - "Running" indicates this timer is active, otherwise is "-".                 |

- Version 5.4.8-1.1: added to SBx908 GEN2 series products

## show g8032 erp-instance statistics

**Overview** Use this command to show the G.8032 Ethernet Ring Protection (ERP) instance statistics.

**Syntax** `show g8032 erp-instance <erp-instance-name> statistics`

| Parameter                              | Description                                |
|----------------------------------------|--------------------------------------------|
| <code>&lt;erp-instance-name&gt;</code> | The name of a specific G.8032 ERP instance |

**Mode** User Exec and Privileged Exec

**Example** To show the statistics for an ERP instance named “blue”, use the following command:

```
awplus# show g8032 erp-instance blue statistics
```

**Output** The following shows typical output.

**Example output from the show g8032 erp-instance statistics command.**

```
awplus#show g8032 erp-instance blue statistics
-----
Instance Name      : blue
Local Clear        : 0
FOP-T0             : 0
-----
  East Receiving   | West Receiving
-----
RAPS NR           15 | RAPS NR           11
RAPS NR-RB         2 | RAPS NR-RB         0
RAPS SF            0 | RAPS SF            0
RAPS FS            0 | RAPS FS            0
RAPS MS            0 | RAPS MS            0
RAPS Event         0 | RAPS Event         0
Drop Guard         0 | Drop Guard         0
Drop Error         0 | Drop Error         0
Local SF           1 | Local SF           1
FOP-PM             0 | FOP-PM             0
-----
  East Sending     | West Sending
-----
RAPS NR           17 | RAPS NR           17
RAPS NR-RB 20067   | RAPS NR-RB 20067

RAPS FS            0 | RAPS FS            0
RAPS MS            0 | RAPS MS            0
RAPS Event         0 | RAPS Event         0
-----
```

**Parameters in the output from the show g8032 erp-instance statistics command**

| Parameter     | Description                                                                                 |
|---------------|---------------------------------------------------------------------------------------------|
| Instance Name | The configured <erp-instance-name> for this instance.                                       |
| Local clear   | The number of Clear commands invoked locally.                                               |
| FOP-T0        | The number of Failure of Protocol Time Out events seen locally.                             |
| RAPS NR       | The number of R-APS messages with a No Request (NR) being received or sent.                 |
| RAPS NR-RB    | The number of R-APS messages with a No Request, RPL Blocked (NR,RB) being received or sent. |
| RAPS SF       | The number of R-APS messages with Signal Fail (SF) being received or sent.                  |
| RAPS FS       | The number of R-APS messages with Forced Switch (FS) being received or sent.                |

| Parameter  | Description                                                                                                                                                                                   |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RAPS MS    | The number of R-APS messages with Manual Switch (MS) being received or sent.                                                                                                                  |
| RAPS Event | The number of R-APS messages with Event (Flush) being received or sent.                                                                                                                       |
| Drop Guard | The number of R-APS messages discarded due to Guard Timer.                                                                                                                                    |
| Drop Error | The number of R-APS messages discarded due to incorrect MAC Address (unmatched Ring-ID), incorrect version, unusable Request/State, or other invalid code point in one of the message fields. |
| Local SF   | The number of Signal Fail events seen locally.                                                                                                                                                |
| FOP-PM     | The number of Failure of Protocol events seen locally.                                                                                                                                        |

# show g8032 physical-ring

**Overview** Use this command to show the G.8032 physical ring instance information.

**Syntax** show g8032 physical-ring {<physical-ring-name>|all}

| Parameter            | Description                                                      |
|----------------------|------------------------------------------------------------------|
| <physical-ring-name> | The name of the physical ring                                    |
| all                  | This shows all physical ring instances that have been configured |

**Mode** User Exec and Privileged Exec

**Example** To show the details of a physical ring instance named "red", use the following command:

```
awplus# show g8032 physical-ring red
```

**Output** The following shows typical output.

**Example output from the show g8032 physical-ring command.**

```
awplus#show g8032 physical-ring red
Ring : red
=====
East   : port1.0.4
West   : port1.0.8
ERP Inst : blue
```

**Parameters in the output from the show g8032 physical-ring command.**

| Parameter               | Description                                                                                                                                              |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ring                    | The name of the physical ring that was configured for this physical ring instance.                                                                       |
| East, West, Terminating | The physical interface port or LAG of the East or West Ring interface, or the Terminating interface that was configured for this physical ring instance. |
| ERP Inst                | A comma-separated list of ERP instances by name that have been configured to use this physical ring instance, or "-" if none.                            |

## show g8032 profile

**Overview** Use this command to show one specific G.8032 profile or all G.8032 profiles, and the configured information within each profile.

**Syntax** `show g8032 profile {<erp-profile-name>|default-profile|all}`

| Parameter                             | Description                                                                          |
|---------------------------------------|--------------------------------------------------------------------------------------|
| <code>&lt;erp-profile-name&gt;</code> | The name of the G.8032 profile that was created by the user.                         |
| <code>default-profile</code>          | The default name of the G.8032 profile that was created automatically by the system. |
| <code>all</code>                      | Using this will show all G.8032 profiles.                                            |

**Mode** User Exec and Privileged Exec

**Example** To show the profile details for a profile named “prof1”, use the following command:

```
awplus# show g8032 profile prof1
```

**Output** The following shows typical output.

**Example output from the show g8032 profile command.**

```
awplus#show g8032 profile prof1
Profile : prof1
=====
Wait-To-Restore : 5 mins
Hold Off Timer  : 0 ms
Guard Timer     : 500 ms
Wait-To-Block   : 5500 ms
Protection Type  : Revertive
ERP Inst        : blue
```

**Parameters in the output from show g8032 profile command.**

| Parameter       | Description                                                                                                      |
|-----------------|------------------------------------------------------------------------------------------------------------------|
| Wait-To-Restore | The configured value in <1-12> minutes.                                                                          |
| Hold Off Timer  | The configured value but shown instead in milliseconds which ranges from 0 to 10,000 (10s) in 100 ms increments. |
| Guard Timer     | The configured value which ranges from 10 to 2000 in 10 ms increments.                                           |
| Wait-To-Block   | 5 seconds more than the configured Guard Time. The range is 5010 to 5200.                                        |
| ERP Inst        | Comma separated list of ERP instances using this profile, or "-" if there are none.                              |

# sub-ring

**Overview** Use this command to configure the mode of operation for the G.8032 Ethernet Ring Protection (ERP) instance as a sub-ring.

Use the **no** variant of this command to change the mode of operation to that of a normal fully enclosed ring.

**Syntax** sub-ring  
no sub-ring

**Default** By default the mode is **no sub-ring**.

**Mode** G8032 Configure Switch

**Usage notes** An ERP instance can operate normally as a fully enclosed ring, commonly called a major ring, or as a partially enclosed ring, called a sub-ring. Sub-rings must be attached to either a major ring (one that is fully closed) or to other sub-rings where one of the other sub-rings itself is attached to a major ring.

Setting the mode to sub-ring should also be set for all nodes in the sub-ring, as the G.8032 state machine is different from that of a major ring.

This configuration can only be accepted when the ERP instance is disabled.

When the physical ring instance used by this ERP instance is configured for terminating interface, then this ERP instance will automatically be configured to be in the sub-ring mode and can not be changed.

**Example** To configure an ERP instance named "blue" as a sub-ring, use the following commands:

```
awplus(config)# g8032 erp-instance blue  
awplus(g8032-config-switch)# sub-ring
```

**Related commands** [g8032 erp-instance](#)

Version 5.4.8-1.1: added to SBx908 GEN2 series products

## timer (g8032-profile)

**Overview** Use this command to configure a timer for a specified G.8032 Ethernet Ring Protection (ERP) instance profile.

**Syntax** timer wait-to-restore {<1-12>|default}  
timer hold-off {<0-100>|default}  
timer guard-timer {<1-200>|default}

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| wait-to-restore | This timer is used to soak signal failure abatement to ensure the signal failure abatement is not intermittent. This timer is only used by the RPL Owner when in the revertive operation, and thus is attempting to restore the ring. It is configurable in steps of 1 to 12 minutes (default is 5 minutes).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| hold-off        | This timer allows any other underlying protection schemes to recover before G.8032 reacts to its defect as this gives time for the G.8032 defect to clear. A classic example is when the ERP Physical ring port is carried over a SONET/SDH transmission system that itself has 50ms recovery times. If G.8032 detects a failure, then increasing this timer to some value greater than 50ms would allow the SONET/SDH system to recover and have the defect that G.8032 detected disappear thus preventing the need for G.8032 to try and recover. The Hold Off timer is configurable in 0 to 10 seconds in steps of 100ms (default is 0 ms).                                                                                                                                                                                        |
| guard-timer     | This is the amount of time that an ERP instance discards most R-APS messages before being allowed to process them. It is used when a clearing condition occurs yet at the same time older messages are still propagating around the ring with failure indications. For example two nodes that just noticed a link failure abatement condition could start clearing and almost immediately one of them could receive an old Signal Fail indication message from the other node (that was still in flight) which in turn causes the receiving node to react to the Signal Fail inadvertently. This timer is particularly useful where R-APS propagation time through the ring is large. Refer to ITU-T G.8032 for more information. The Guard timer is configurable in 10ms steps between 10ms and 2 seconds (default is 50 for 500ms). |

**Mode** G8032 Profile Configuration

**Example** To set the wait-to-restore timer of a profile named “prof\_1” to a value of 1 minute, use the following commands:

```
awplus(config)# g8032 profile prof_1  
awplus(g8032-profile-config)# timer wait-to-restore 1
```

**Related commands** **g8032 profile**

Version 5.4.8-1.1: added to SBx908 GEN2 series products

# topology-change

**Overview** Use this command to enable this G.8032 Ethernet Ring Protection (ERP) instance to send a Flush Event message after notification of a Topology Change Notification (TCN) by a detecting instance.

Use the **no** variant of this command to disable the sending of the Flush Event.

**Syntax** topology-change {g8032}  
no topology-change {g8032}

| Parameter | Description                                                           |
|-----------|-----------------------------------------------------------------------|
| g8032     | Specify that G.8032 is the protocol that is affected by this command. |

**Default** Topology change is enabled by default for G.8032.

**Mode** G8032 Configure Switch

**Usage notes** If this ERP instance is on an interconnecting node, then the ERP instance may need to be notified of a topology change that occurred in another G.8032 sub-ring attached to this node. The former will be termed the "target" ERP instance, and the latter the "detecting" ERP instance.

The criteria for notification is:

- the detecting ERP instance is configured as a sub-ring with a Terminating interface,
- it is protecting the same data VLANs as the target instance, and
- the target ERP instance must have two ring ports.

When the detecting ERP instance detects a topology change on its sub-ring, AlliedWare Plus™ will automatically determine which target ERP instance(s) needs to be notified. It does this by comparing the same data VLANs in the detecting ERP instance with all the other instances.

If target ERP instances are identified and these instances also have both an East and a West interface configured, then those target instances are notified. Upon notification, the target ERP instance has a couple of actions that it has to perform:

- To flush the FDB on both its East and West interfaces for the protected VLANs.
- To send out an R-APS flush event message over its East and West interfaces. The flush event message is sent around the target ring and each node on the target ring will perform an FDB flush of its protected VLANs. The sending of a R-APS flush event may not be needed in some cases and as such it is configurable.

**Example** To enable sending of R-APS flush event messages on an ERP instance named "blue", use the following commands:

```
awplus(config)# g8032 erp-instance blue  
awplus(g8032-config-switch)# topology-change g8032
```

**Related commands** **g8032 erp-instance**

# trap (g8032-switch)

**Overview** Use this command to enable or disable SNMP traps for a G.8032 Ethernet Ring Protection (ERP) instance.

**Syntax** trap {enabled|disabled}

| Parameter | Description                                      |
|-----------|--------------------------------------------------|
| enabled   | Enable this ERP instance to generate traps.      |
| disabled  | Disable this ERP instance from generating traps. |

**Default** The SNMP traps for the ERP instance are enabled.

**Mode** G8032 Configure Switch

**Usage notes** Globally, ERP traps are disabled by default but can be enabled globally using the [snmp-server enable trap](#) command.

**Example** To disable the SNMP traps for an ERP instance named "blue", use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)# trap disabled
```

**Related commands** [erp-instance](#)

Version 5.4.8-1.1: added to SBx908 GEN2 series products

# undebg g8032

**Overview** Use this command to turn off debugging for various G.8032 debug attributes.

**Syntax** undebg g8032 {all|event|rx|tx}

| Parameter | Description                          |
|-----------|--------------------------------------|
| all       | All G.8032 debugging                 |
| event     | G.8032 debugging events              |
| rx        | G.8032 debugging Receive activities  |
| tx        | G.8032 debugging Transmit activities |

**Mode** Privileged Exec

**Example** To turn off all G.8032 debugging, use the following command:

```
awplus# undebg g8032 all
```

**Related commands** [debug g8032](#)  
[show debugging g8032](#)

# 44 RRP Snooping Commands

- Contents**
- **Introduction** on page 2076
  - **ip rrp snooping** on page 2077
  - **show ip rrp snooping** on page 2078

# Introduction

**Overview** This section provides an alphabetical reference for commands used to configure the Router Redundancy Protocol (RRP).

# ip rrp snooping

**Overview** Use this command to enable RRP snooping.  
Use the **no** variant of this command to disable RRP Snooping.

**Syntax** ip rrp snooping  
no ip rrp snooping

**Default** The default is **disabled**.

**Mode** Global Configuration

**Usage** Use this command to enable the RRP Snooping feature. You cannot use RRP Snooping at the same time as the following features:

- STP, RSTP, or MSTP, except for edge ports. RSTP is enabled by default. To disable it, use the command **spanning-tree enable**.
- Port security (the command **switchport port-security**)
- Port authentication
- EPSR
- Port mirroring

**Examples** The example below shows you how to enable RRP Snooping.

```
awplus# configure terminal
awplus(config)# ip rrp snooping
```

**Related commands** **show ip rrp snooping**

## show ip rrp snooping

**Overview** Use this command to display Router Redundancy Protocol snooping global settings and status.

**Syntax** show ip rrp snooping

**Mode** Privileged Exec

**Output** The following example show the output display for the **show ip rrp snooping** command

|                             |           |                     |          |
|-----------------------------|-----------|---------------------|----------|
| awplus#show ip rrp snooping |           |                     |          |
| Status                      | : Enabled |                     |          |
| Vlan                        | Master    | Virtual MAC Address | UpTime   |
| -----                       | -----     | -----               | -----    |
| vlan1                       | Port1.0.1 | 00e0.2b00.0085      | 00:00:39 |
| -----                       | -----     | -----               | -----    |

The following table shows the output display for the **show ip rrp snooping** command

| Parameter           | Description                                                                             |
|---------------------|-----------------------------------------------------------------------------------------|
| Status              | Displays if RRP Snooping is enabled or disabled                                         |
| Vlan                | Displays the VLAN ID                                                                    |
| Master              | Displays the port ID connected to the master router or the network of the master router |
| Virtual MAC Address | Displays the virtual MAC address of the router                                          |
| UpTime              | Displays the time that the current master router has been the master router             |

**Related commands** [ip rrp snooping](#)

# Introduction

**Overview** This chapter provides an alphabetical reference for AMF and AMF Plus commands. AMF is the Allied Telesis Autonomous Management Framework™, and AMF Plus is an expanded version of AMF. Both AMF and AMF Plus are a suite of features that combine to simplify network management across all supported network equipment from the core to the edge. They also integrate with Vista Manager, our graphical monitoring and management platform.

On the AlliedWare Plus command line, AMF and AMF Plus are identical. The difference between them is in Vista Manager, where AMF Plus includes additional AMF Plus intent-based networking features.

**In the rest of this chapter, we use 'AMF' to refer to both AMF and AMF Plus.**

**AMF master nodes** Every AMF network must have at least one master node, which acts as the core of the AMF network. Not all AlliedWare Plus devices are capable of acting as a AMF master. See the [AMF Feature Overview and Configuration Guide](#) for information about master support.

**AMF edge** AlliedWare Plus CentreCOM® Series switches can only be used as edge switches in an AMF network. The full management power and convenience of AMF is available on these switches, but they can only link to one other AMF node. They cannot form cross-links or virtual links.

**AMF naming convention** When AMF is enabled on a device, it will automatically be assigned a host name. If a host name has already been assigned, by using the command [hostname](#), this will remain. If however, no host name has been assigned, then the name applied will be the prefix, **host\_** followed (without a space) by the MAC address of the device. For example, a device whose MAC address is **0016.76b1.7a5e** will have the name **host\_0016\_76b1\_7a5e** assigned to it.

To efficiently manage your network using AMF, we strongly advise that you devise a naming convention for your network devices, and apply an appropriate hostname to each device in your AMF network.

**AMF and STP** On AR-Series UTM firewalls and Secure VPN routers, you cannot use STP at the same time as AMF.

# application-proxy ip-filter

**Overview** Use this command to enable global IP filtering on a device. Once enabled the device will add a global ACL in response to a threat message from an AMF Security (AMF-Sec) Controller.

Use the **no** variant of this command to disable global IP filtering.

**Syntax** application-proxy ip-filter  
no application-proxy ip-filter

**Default** Global IP filtering is disabled by default.

**Mode** Global Configuration

**Usage notes** For this feature to work, the AMF Application Proxy service needs to be enabled on your network, using the command **service atmf-application-proxy**.

**Example** To enable global IP filtering, use the commands:

```
awplus# configure terminal
awplus(config)# application-proxy ip-filter
```

To disable global IP filtering, use the commands:

```
awplus# configure terminal
awplus(config)# no application-proxy ip-filter
```

**Related commands** **application-proxy redirect-url**  
**application-proxy threat-protection**  
**clear application-proxy threat-protection**  
**service atmf-application-proxy**  
**show application-proxy threat-protection**

**Command changes** Version 5.4.7-2.5: command added

# application-proxy quarantine-vlan

**Overview** Use this command to set the quarantine VLAN to use when an AMF Security (AMF-Sec) Controller detects a threat. The port/s on which the threat is detected are moved to this VLAN if the **application-proxy threat-protection** action is set to **quarantine**.

Use the **no** variant of this command to delete the quarantine VLAN. If no quarantine VLAN is specified then no quarantine action will be performed.

**Syntax** application-proxy quarantine-vlan <vlan-id>  
no application-proxy quarantine-vlan

| Parameter | Description                                       |
|-----------|---------------------------------------------------|
| <i>i</i>  | < The ID of the VLAN to use. In the range 1-4094. |

**Default** By default, no quarantine VLAN is configured.

**Mode** Global Configuration

**Example** To configure VLAN 100 as the quarantine VLAN, use the commands:

```
awplus# configure terminal
awplus(config)# application-proxy quarantine-vlan 100
```

To delete the quarantine VLAN, use the commands:

```
awplus# configure terminal
awplus(config)# no application-proxy quarantine-vlan
```

**Related commands** **application-proxy threat-protection**  
**clear application-proxy threat-protection**  
**application-proxy threat-protection send-summary**  
**service atmf-application-proxy**  
**show application-proxy threat-protection**

**Command changes** Version 5.4.7-2.2: command added

# application-proxy redirect-url

**Overview** Use this command to redirect a user to a helpful URL when they are blocked because of an **application-proxy ip-filter**.

Use the **no** variant of this command to remove the URL redirect.

**Syntax** application-proxy redirect-url <url>  
no application-proxy redirect-url

| Parameter | Description                  |
|-----------|------------------------------|
| <url>     | URL to redirect the user to. |

**Default** No URL is configured by default.

**Mode** Global Configuration

**Example** To configure a redirect URL, use the command:

```
awplus# application-proxy redirect-url http://my.dom/help.html
```

To remove a redirect URL, use the command:

```
awplus# no application-proxy redirect-url
```

**Related commands** **application-proxy ip-filter**  
**application-proxy threat-protection**  
**clear application-proxy threat-protection**  
**service atmf-application-proxy**  
**show application-proxy threat-protection**

**Command changes** Version 5.4.9-0.1: command added

# application-proxy threat-protection

**Overview** Use this command to set the blocking action to take when a threat detected message is received from an AMF Security (AMF-Sec) Controller.

Use the **no** variant of this command to disable threat protection blocking actions on the port.

**Syntax** application-proxy threat-protection {drop|link-down|quarantine|log-only}

no application-proxy threat-protection

| Parameter  | Description                                                                                                                                                                      |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| drop       | Drop the traffic that generates the threat reports. This is a Layer 2 drop. Note that the device will only drop packets that arrive at the port, not packets sent from the port. |
| link-down  | Take the link down in response to threats, by setting it to error disabled.                                                                                                      |
| quarantine | Move the offending port to a quarantine VLAN.                                                                                                                                    |
| log-only   | Log when a threat is detected.                                                                                                                                                   |

**Default** Threat protection is disabled by default.

**Mode** Interface Configuration

**Example** To set the threat protection blocking action on port1.0.4 to drop, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# application-proxy threat-protection drop
```

To disable threat protection blocking actions on port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# no application-proxy threat-protection
```

**Related commands** **application-proxy quarantine-vlan**  
**application-proxy threat-protection send-summary**  
**clear application-proxy threat-protection**  
**service atmf-application-proxy**  
**show application-proxy threat-protection**

**Command changes** Version 5.5.2-0.1: added to switch ports on AR series devices  
Version 5.4.9-0.1: **log-only** parameter added  
Version 5.4.7-2.2: command added

# application-proxy threat-protection send-summary

**Overview** Use this command to send a summary of all current threat-protection blocking requests to all AMF Application Proxy service nodes. This command can only be performed on an AMF master.

**Syntax** application-proxy threat-protection send-summary

**Mode** Privileged Exec

**Example** To send a summary of all current threat-protection blocking requests to all AMF Application Proxy service nodes, use the command:

```
awplus# application-proxy threat-protection send-summary
```

**Related commands**

- [application-proxy quarantine-vlan](#)
- [application-proxy threat-protection](#)
- [clear application-proxy threat-protection](#)
- [service atmf-application-proxy](#)
- [show application-proxy threat-protection](#)

**Command changes** Version 5.4.7-2.2: command added

# application-proxy whitelist advertised-address

**Overview** Use this command to register a Layer 3 interface, and the IPv4 address that is attached to this interface, as the advertised application-proxy whitelist address for a device.

Use the **no** variant of this command to stop advertising the Layer 3 interface and its associated IPv4 address.

**Syntax** application-proxy whitelist advertised-address <interface>  
no application-proxy whitelist advertised-address

| Parameter   | Description                                               |
|-------------|-----------------------------------------------------------|
| <interface> | Layer 3 interface to configure as the advertised address. |

**Default** No address advertised by default.

**Mode** Global Configuration

**Example** To configure the IPv4 address attached to VLAN 1as the advertised address, use the commands:

```
awplus# configure terminal
awplus(config)# application-proxy whitelist advertised-address
vlan1
```

To remove the advertised address, use the commands:

```
awplus# configure terminal
awplus(config)# no application-proxy whitelist advertised-
address
```

**Related commands** [application-proxy whitelist server](#)  
[show application-proxy whitelist advertised-address](#)

**Command changes** Version 5.4.9-1.1: command added

# application-proxy whitelist enable

**Overview** Use this command to enable application-proxy whitelist based authentication on an interface.

Use the **no** variant of this command to disable the whitelist authentication.

**Syntax** application-proxy whitelist enable  
no application-proxy whitelist enable

**Default** Application-proxy whitelist is disabled by default.

**Mode** Interface Configuration

**Usage notes** When **port-control** is set to **auto**, the 802.1X authentication feature is executed on the interface, but only if the **aaa authentication dot1x** command has been issued.

If you attempt to change the authentication configuration on an interface that has threat protection quarantine configured, you will see the following error message:

```
% portx.x.x: Application Proxy quarantine configuration must be removed before port authentication is changed
```

Before changing the interface's authentication configuration you must either:

- remove the interface's threat protection configuration, or
- shut down the interface.

**Example** To enable application-proxy whitelist authentication on the interface port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# application-proxy whitelist enable
```

To disable application-proxy whitelist authentication on the interface port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# no application-proxy whitelist enable
```

**Related commands**   **application-proxy whitelist server**  
**show application-proxy whitelist interface**  
**show application-proxy whitelist server**  
**show application-proxy whitelist supplicant**

**Command changes**   Version 5.4.9-0.1: command added

# application-proxy whitelist protection tls

**Overview** Use this command to configure the application-proxy whitelist control channel to use TLS protection. If no trustpoint is specified then TLS will operate without authentication.

Use the **no** variant of this command to stop using TLS.

**Syntax** application-proxy whitelist protection tls [trustpoint <name>]  
no application-proxy whitelist protection tls

| Parameter  | Description                                                                                                 |
|------------|-------------------------------------------------------------------------------------------------------------|
| trustpoint | Specify an optional trustpoint. If no trustpoint is specified then TLS will operate without authentication. |
| <name>     | Name of the trustpoint.                                                                                     |

**Default** TLS is disabled by default.

**Mode** Global Configuration

**Example** To configure an AMF application-proxy whitelist to use TLS with the trustpoint 'corpca', use the commands:

```
awplus# configure terminal
awplus(config)# application-proxy whitelist protection tls
trustpoint corpca
```

To configure an AMF application-proxy whitelist to stop using TLS, use the commands:

```
awplus# configure terminal
awplus(config)# no application-proxy whitelist protection tls
```

**Related commands** [application-proxy whitelist enable](#)  
[application-proxy whitelist server](#)  
[show application-proxy whitelist server](#)

**Command changes** Version 5.5.0-2.1: command added

# application-proxy whitelist server

**Overview** Use this command to set an AMF master to act as a whitelist authentication proxy between AMF members, acting as Network Access Servers, and an external whitelist RADIUS server.

Use the **no** variant of this command to disable the whitelist proxy functionality.

**Syntax** application-proxy whitelist server *<ip-address>* key *<key>*  
[encrypted] [auth-port *<1-65535>*]  
no application-proxy whitelist server

| Parameter                        | Description                                                                                                                                                                                                                                                      |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;ip-address&gt;</i>        | IPv4 address of the upstream RADIUS server in dotted decimal format A.B.C.D.                                                                                                                                                                                     |
| key <i>&lt;key&gt;</i>           | Set the shared secret encryption key for communication with the upstream RADIUS server.                                                                                                                                                                          |
| encrypted                        | Means that the password that follows is encoded, not plain text. This parameter is only used in generated configuration files. In configuration files, the device prints encrypted in front of passwords to indicate that it is displaying the encoded password. |
| auth-port <i>&lt;1-65535&gt;</i> | Set the RADIUS server UDP port. This is only necessary if you don't want to use the default port 1812.                                                                                                                                                           |

**Default** Disabled by default.

**Mode** Global Configuration

**Example** To configure an AMF master to work as a proxy to the external RADIUS server 192.168.1.10, with shared secret 'mysecurekey', on port 1822, use the commands:

```
awplus# configure terminal
awplus(config)# application-proxy whitelist server 192.168.1.10
key mysecurekey auth-port 1822
```

To configure an AMF master to work as a proxy to the external RADIUS server 192.168.1.10, with shared secret 'mysecurekey', on the default port (1812), use the commands:

```
awplus# configure terminal
awplus(config)# application-proxy whitelist server 192.168.1.10
key mysecurekey
```

To disable the whitelist proxy, use the commands:

```
awplus# configure terminal
awplus(config)# no application-proxy whitelist server
```

**Related commands**

- application-proxy whitelist enable**
- service atmf-application-proxy**
- show application-proxy whitelist interface**
- show application-proxy whitelist server**
- show application-proxy whitelist supplicant**

**Command changes**

- Version 5.5.3-2.1: **encrypted** parameter added
- Version 5.4.9-0.1: command added

# application-proxy whitelist trustpoint (deprecated)

**Overview** This command has been deprecated. It has been replaced by the **application-proxy whitelist protection tls** command.

This command sets the trustpoint to use when communicating with the external whitelist RADIUS server. This enables RADIUS over TLS (RadSec) protection.

**Syntax** application-proxy whitelist trustpoint <name>  
no application-proxy whitelist trustpoint

**Command changes** Version 5.4.9-1.1: command added  
Version 5.5.0-2.1: command deprecated

## area-link

**Overview** Use this command to create an area-link between a Virtual AMF Appliance (VAA) host controller and an AMF container.

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

Use the **no** variant of this command to remove an area-link from a container.

**Syntax** area-link <area-name>  
no area-link

| Parameter   | Description                            |
|-------------|----------------------------------------|
| <area-name> | AMF area name of the container's area. |

**Mode** AMF Container Configuration

**Usage notes** The AMF area-link connects the AMF controller on a VAA host to the AMF container. Once a container has been created with the [atmf container](#) command and an area-link configured with the **area-link** command, it can be enabled using the [state](#) command.

You can only configure a single area-link on a container. You will see the following message if you try and configure a second one:

% AreaLink already configured for this container

Each container has two virtual interfaces:

- Interface eth0, used to connect to the AMF controller on the VAA host via an AMF area-link, configured using this area-link command.
- Interface eth1, used to connect to the outside world using a bridged L2 network link, configured using the [bridge-group \(amf-container\)](#) command.

See the [AMF Feature Overview and Configuration\\_Guide](#) for more information on these virtual interfaces and links.

**Example** To create the area-link to “wlg” on container “vac-wlg-1”, use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# area-link wlg
```

To remove an area-link from container “vac-wlg-1”, use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# no area-link
```

**Related commands** [atmf container](#)  
[show atmf container](#)

**Command changes** Version 5.4.7-0.1: command added

## atmf-arealink

**Overview** Use this command to enable an eth interface, on a TQR, ARX or AR-series device, as an AMF area link. AMF area links are designed to operate between two nodes in different areas in an AMF network.

On ARX and AR-Series devices, this command is only available if your network is running in AMF secure mode (see [atmf secure-mode](#) for more information on AMF secure mode).

Use the **no** variant of this command to remove any AMF area links that may exist for the selected eth interface.

**Syntax** atmf-arealink remote-area <area-name> vlan <2-4094>  
no atmf-arealink

| Parameter   | Description                                                                                                                          |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <area-name> | The name of the remote area that the interface is connecting to.                                                                     |
| <2-4094>    | The VLAN ID for the link. This VLAN cannot be used for any other purpose, and the same VLAN ID must be used at each end of the link. |

**Default** No area links are configured

**Mode** Interface configuration for an eth interface

**Usage notes** Run this command on the interface at both ends of the link.

Each area must have the area-name configured, and the same area password must exist on both ends of the link.

Running this command will synchronize the area information stored on the two nodes.

You can configure multiple area links between two area nodes, but only one area link at any time will be in use. All other area links will block information, to prevent network storms.

**NOTE:** See the command to configure an AMF area link on an a switch port or link aggregator

**Example** To configure eth1 as an AMF area link to the 'Auckland' area on VLAN 6, use the following commands:

```
master_1# configure terminal
master_1(config)# interface eth1
master_1(config-if)# atmf-area link remote-area Auckland vlan 6
```

To remove eth1 as an AMF area link, use the following commands:

```
master_1# configure terminal
master_1(config)# interface eth1
master_1(config-if)# no atmf-area link
```

**Related commands**

- [atmf area password](#)
- [atmf virtual-link](#)
- [show atmf links](#)

**Command changes** Version 5.5.0-1.1: command added

# atmf-link

**Overview** Use this command to enable an eth interface on a TQR, ARX or AR-series device as an up/down AMF link.

On ARX and AR-Series devices, this command is only available if your network is running in AMF secure mode (see [atmf secure-mode](#) for more information on AMF secure mode).

Use the **no** variant of this command to remove any AMF link that may exist for the selected eth interface.

**Syntax** atmf-link  
no atmf-link

**Default** No AMF links are configured

**Mode** Interface configuration for an eth interface

**Usage notes** Up/down links and virtual links interconnect domains in a vertical hierarchy, with the highest domain being the core domain. In effect, they form a tree of interconnected AMF domains. This tree must be loop-free. Therefore you must configure your up/down and virtual links so that no loops are formed.

On ARX and AR-series devices, if you run the command and AMF secure mode is not enabled, you will see the following error message:

```
Node_1(config)#int eth1
Node_1(config-if)#atmf-link
% Cannot configure eth1 because atmf secure-mode is not enabled.
```

**NOTE:** See the command to configure an AMF up/down link on an a switch port or link aggregator

**Example** To configure eth1 as an AMF up/down link, use the following commands:

```
Node_1# configure terminal
Node_1(config)# interface eth1
Node_1(config-if)# atmf-link
```

To remove eth1 as an AMF up/down link, use the following commands:

```
Node_1# configure terminal
Node_1(config)# interface eth1
Node_1(config-if)# no atmf-link
```

**Related commands** **atmf recover over-eth**  
**atmf secure-mode**  
**show atmf detail**  
**show atmf links**  
**switchport atmf-link**

**Command changes** Version 5.5.4-0.1: command added on TQ-R series  
Version 5.5.0-1.1: command added

## atmf amfplus-license-only

**Overview** Use this command if you want to use the AMF Plus features in Vista Manager EX, and you have a mixture of AMF and AMF Plus licenses on your master node. This command sets the AMF network to only count **AMF Plus** licensed nodes.

Use the **no** variant of this command to include both AMF and AMF Plus licenses when calculating the number of licensed nodes in an area count.

**Syntax** atmf amfplus-license-only  
no atmf amfplus-license-only

**Default** The **no** version is the default. That is, consider both AMF and AMF Plus licenses when calculating the number of licensed nodes.

**Mode** Global Configuration

**Usage notes** From software version 5.5.2-2.3 onwards, AMF licenses are no longer available to purchase. Instead, AMF Plus licenses become available. Existing AMF licenses remain valid. You only need to change to AMF Plus licenses if you want to manage more nodes, or use the new AMF Plus menu in Vista Manager.

**CAUTION:** *If the network has more AMF nodes than are licensed with AMF Plus:*

- *AMF Plus will still be enabled in Vista Manager EX (provided there is no AMF license)*
- *any AMF nodes above the license count won't join the AMF network.*

The AMF Plus menu replaces the AOI menu in Vista Manager EX when all the AMF Masters and Controllers have:

- An AMF Plus Controller/Master license on all Masters and Controllers, and
- No AMF Controller/Master licenses applied, or AMF Controller/Master licenses disabled with this command.

**Example** To set the AMF network to only count AMF Plus licensed nodes, use the commands:

```
awplus#configure terminal
awplus(config)#atmf amfplus-license-only
```

**Output** The following shows typical output.

**Example using atmf amfplus-license-only**

```
ATMF Summary Information:
ATMF Status           : Enabled
Network Name          : gtnet
Node Name              : node2
Role                   : Master
Restricted login        : Enabled
Secure Mode            : Disabled
Current ATMF Guests    : 0
Current ATMF Nodes     : 10
Total number of licensed nodes available is 22

node2#configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
node2(config)#atmf amfplus-license-only
node2(config)#15:41:36 node2 ATMF[1041]: The number of nodes
allowed on this ATMF network is 12

node2(config)#do show atmf
ATMF Summary Information:

**Command changes** Version 5.5.3-0.1: command added

## atmf area

**Overview** This command creates an AMF area and gives it a name and ID number.

Use the **no** variant of this command to remove the AMF area.

This command is only valid on AMF controllers, master nodes and gateway nodes.

**Syntax** `atmf area <area-name> id <1-4094> [local]`  
`no atmf area <area-name>`

| Parameter                      | Description                                                                                                                                                                                                                                                                           |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;area-name&gt;</code> | The AMF area name. The area name can be up to 15 characters long. Valid characters are: a..zA..Z0..9-_<br><br>Names are case sensitive and must be unique within an AMF network. The name cannot be the word "local" or an abbreviation of the word "local" (such as "l", "lo" etc.). |
| <code>&lt;1-4094&gt;</code>    | An ID number that uniquely identifies this area.                                                                                                                                                                                                                                      |
| <code>local</code>             | Set the area to be the local area. The local area contains the device you are configuring.                                                                                                                                                                                            |

**Mode** Global Configuration

**Usage notes** This command enables you to divide your AMF network into areas. Each area is managed by at least one AMF master node. Each area can have up to 120 nodes, depending on the license installed on that area's master node.

The whole AMF network is managed by up to 8 AMF controllers. Each AMF controller can communicate with multiple areas. The number of areas supported on a controller depends on the license installed on that controller.

You must give each area in an AMF network a unique name and ID number.

Only one local area can be configured on a device. You must specify a local area on each controller, remote AMF master, and gateway node.

**Example** To create the AMF area named New-Zealand, with an ID of 1, and specify that it is the local area, use the command:

```
controller-1(config)# atmf area New-Zealand id 1 local
```

To configure a remote area named Auckland, with an ID of 100, use the command:

```
controller-1(config)# atmf area Auckland id 100
```

**Related commands**

- atmf area password**
- show atmf area**
- show atmf area summary**
- show atmf area nodes**
- switchport atmf-area link**

**Command changes** Version 5.5.1-2.1: area **id** maximum increased to 4094

## atmf area password

**Overview** This command sets a password on an AMF area.

Use the **no** variant of this command to remove the password.

This command is only valid on AMF controllers, master nodes and gateway nodes. The area name must have been configured first.

**Syntax** `atmf area <area-name> password [8] <password>`  
`no atmf area <area-name> password`

| Parameter   | Description                                                                                                                                                                           |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <area-name> | The AMF area name.                                                                                                                                                                    |
| 8           | This parameter is displayed in <b>show running-config</b> output to indicate that it is displaying the password in encrypted form. You should not enter <b>8</b> on the CLI yourself. |
| <password>  | The password is between 8 and 32 characters long. It can include spaces.                                                                                                              |

**Mode** Global Configuration

**Usage notes** You must configure a password on each area that an AMF controller communicates with, except for the controller's local area. The areas must already have been created using the **atmf area** command.

Enter the password identically on both of:

- the area that locally contains the controller, and
- the remote AMF area masters

The command **show running-config atmf** will display the encrypted version of this password. The encryption keys will match between the controller and the remote AMF master.

If multiple controller and masters exist in an area, they must all have the same area configuration.

**Example** To give the AMF area named *Auckland* a password of "secure#1" use the following command on the controller:

```
controller-1(config)# atmf area Auckland password secure#1
```

and also use the following command on the master node for the Auckland area:

```
auck-master(config)# atmf area Auckland password secure#1
```

**Related commands**

- atmf area**
- show atmf area**
- show atmf area summary**
- show atmf area nodes**
- switchport atmf-area link**

# atmf authorize

**Overview** On an AMF network, with secure mode enabled, use this command on an AMF master to authorize an AMF node to join the network. AMF nodes waiting to be authorized appear in the pending authorization queue, which can be examined using the [show atmf authorization](#) command with the **pending** parameter.

Use the **no** variant of this command to revoke authorization for an AMF node on an AMF master.

**Syntax** `atmf authorize {<node-name> [area <area-name>]|all-pending}`  
`no atmf authorize <node-name> [area <area-name>]`

| Parameter   | Description                                                              |
|-------------|--------------------------------------------------------------------------|
| <node-name> | The name of the node to be authorized or have its authorization revoked. |
| area        | Specify an AMF area.                                                     |
| <area-name> | This is the name of the area the node belongs to.                        |
| all-pending | Authorize all nodes in the pending queue.                                |

**Mode** Privileged Exec

**Usage notes** On an AMF controller, AMF remote-area masters must be authorized by the controller, and the AMF remote-area masters will also need to authorized access from the AMF controller.

**Example** To authorize all AMF nodes in the pending authorization queue on an AMF master, use the command:

```
awplus# atmf authorize all-pending
```

To authorize a node called "node2" in remote AMF area "area3", use the command:

```
awplus# atmf authorize node2 area "area3"
```

To authorize a node called "node4" on an AMF master, use the command:

```
awplus# atmf authorize node4
```

To revoke authorization for a node called "node4" on an AMF master, use the command:

```
awplus# no atmf authorize node4
```

**Related commands**

- atmf secure-mode**
- clear atmf secure-mode certificates**
- show atmf authorization**
- show atmf secure-mode**
- show atmf secure-mode certificates**
- show atmf secure-mode statistics**

**Command changes** Version 5.4.7-0.3: command added

## atmf authorize provision

**Overview** Use this command from an AMF controller or AMF master to pre-authorize a node on an AMF network running in secure mode. This allows a node to join the AMF network the moment the **atmf secure-mode** command is run on that node.

Use the **no** variant of this command to remove a provisional authorization from an AMF controller or AMF master.

**Syntax**

```
atmf authorize provision [timeout <minutes>] node <node-name>
interface <interface-name> [area <area-name>]
atmf authorize provision [timeout <minutes>] mac <mac-address>
atmf authorize provision [timeout <minutes>] all
no atmf authorize provision node <node-name> interface
<interface-name> [area <area-name>]
no atmf authorize provision mac <mac-address>
no atmf authorize provision all
```

| Parameter        | Description                                                                                                            |
|------------------|------------------------------------------------------------------------------------------------------------------------|
| timeout          | Timeout for provisional authorization. Authorization for provisioned nodes expires after the timeout period specified. |
| <minutes>        | Timeout in minutes. A value between 1 and 6000 is permissible with the default being 60 minutes.                       |
| node             | Specify a node to provision by node name.                                                                              |
| <node-name>      | The name of the node to provisionally authorize.                                                                       |
| interface        | Specify the interface the node will connect on.                                                                        |
| <interface-name> | The name of the interface, this can be a switchport, link aggregator, LACP link, or virtual link.                      |
| area             | Specify the AMF area.                                                                                                  |
| <area-name>      | This is the name of the area the node belongs to.                                                                      |
| mac              | Specify a node to provision by MAC address.                                                                            |
| <mac-address>    | Enter a MAC address to provisionally authorize in the format HHHH.HHHH.HHHH.                                           |
| all              | Provision authorization for all secure mode capable nodes.                                                             |

**Default** The default timeout is 60 minutes.

**Mode** Privileged Exec

**Example** To provisionally authorize all non-secure AMF nodes, use the command:

```
awplus# atmf authorize provision all
```

To authorize a node with a MAC address of 0000.cd28.0880 for 2 hours, use the command:

```
awplus# authorize provision timeout 120 mac 0000.cd28.0880
```

To remove all provisional authorization, on an AMF master, use the command:

```
awplus# no atmf authorize provision all
```

**Related commands** [show atmf authorization](#)  
[show atmf secure-mode](#)

**Command changes** Version 5.4.7-0.3: command added

# atmf backup

**Overview** This command can only be applied to a master node. It manually schedules an AMF backup to start at a specified time and to execute a specified number of times per day.

Use the **no** variant of this command to disable the schedule.

**Syntax** `atmf backup {default|<hh:mm> frequency <1-24>}`

| Parameter        | Description                                                                                                            |
|------------------|------------------------------------------------------------------------------------------------------------------------|
| default          | Restore the default backup schedule.                                                                                   |
| <hh:mm>          | Sets the time of day to apply the first backup, in hours and minutes. Note that this parameter uses the 24 hour clock. |
| backup           | Enables AMF backup to external media.                                                                                  |
| frequency <1-24> | Sets the number of times within a 24 hour period that backups will be taken.                                           |

**Default** Backups run daily at 03:00 AM, by default

**Mode** Global Configuration

**Usage notes** Running this command only configures the schedule. To enable the schedule, you should then apply the command **atmf backup enable**.

We recommend using the ext3 or ext4 filesystem on external media that are used for AMF backups.

**Example** To schedule backup requests to begin at 11 am and execute twice per day (11 am and 11 pm), use the following command:

```
node_1# configure terminal
```

```
node_1(config)# atmf backup 11:00 frequency 2
```

**CAUTION:** File names that comprise identical text, but with differing case, such as *Test.txt* and *test.txt*, will not be recognized as being different on FAT32 based backup media such as a USB storage device. However, these filenames will be recognized as being different on your Linux based device. Therefore, for good practice, ensure that you apply a consistent case structure for your back-up file names.

**Related** **atmf backup enable**  
**commands** **atmf backup stop**  
**show atmf backup**

# atmf backup area-masters delete

**Overview** Use this command to delete from external media, a backup of a specified node in a specified area.

Note that this command can only be run on an AMF controller.

**Syntax** `atmf backup area-masters delete area <area-name> node <node-name>`

| Parameter                      | Description                                                   |
|--------------------------------|---------------------------------------------------------------|
| <code>&lt;area-name&gt;</code> | The area that contains the node whose backup will be deleted. |
| <code>&lt;node-name&gt;</code> | The node whose backup will be deleted.                        |

**Mode** Privileged Exec

**Example** To delete the backup of the remote area-master named “well-gate” in the AMF area named Wellington, use the command:

```
controller-1# atmf backup area-masters delete area wellington  
node well-gate
```

**Related commands** [show atmf backup area](#)

# atmf backup area-masters enable

**Overview** Use this command to enable backup of remote area-masters from the AMF controller. This command is only valid on AMF controllers.

Use the **no** form of the command to stop backups of remote area-masters.

**Syntax** atmf backup area-masters enable  
no atmf backup area-masters enable

**Mode** Global configuration

**Default** Remote area backups are disabled by default

**Usage notes** Use the following commands to configure the remote area-master backups:

- **atmf backup** to configure when the backups begin and how often they run
- **atmf backup server** to configure the backup server.

We recommend using the ext3 or ext4 filesystem on external media that are used for AMF backups.

**Example** To enable scheduled backups of AMF remote area-masters, use the commands:

```
controller-1# configure terminal
controller-1(config)# atmf backup area-masters enable
```

To disable scheduled backups of AMF remote area-masters, use the commands:

```
controller-1# configure terminal
controller-1(config)# no atmf backup area-masters enable
```

**Related commands** **atmf backup server**  
**atmf backup**  
**show atmf backup area**

# atmf backup area-masters now

**Overview** Use this command to run an AMF backup of one or more remote area-masters from the AMF controller immediately.

This command is only valid on AMF controllers.

**Syntax** `atmf backup area-masters now [area <area-name>|area <area-name> node <node-name>]`

| Parameter   | Description                                    |
|-------------|------------------------------------------------|
| <area-name> | The area whose area-masters will be backed up. |
| <node-name> | The node that will be backed up.               |

**Mode** Privileged Exec

**Example** To back up all local master nodes in all areas controlled by controller-1, use the command

```
controller-1# atmf backup area-masters now
```

To back up all local masters in the AMF area named Wellington, use the command

```
controller-1# atmf backup area-masters now area Wellington
```

To back up the local master "well-master" in the Wellington area, use the command

```
controller-1# atmf backup area-masters now area Wellington node well-master
```

**Related commands** [atmf backup area-masters enable](#)  
[atmf backup area-masters synchronize](#)  
[show atmf backup area](#)

# atmf backup area-masters synchronize

**Overview** Use this command to synchronize backed-up area-master files between the active remote file server and the backup remote file server. Files are copied from the active server to the remote server.

Note that this command is only valid on AMF controllers.

**Syntax** atmf backup area-masters synchronize

**Mode** Privileged Exec

**Example** To synchronize backed-up files between the remote file servers for all area-masters, use the command:

```
controller-1# atmf backup area-masters synchronize
```

**Related commands** [atmf backup area-masters enable](#)  
[atmf backup area-masters now](#)  
[show atmf backup area](#)

# atmf backup bandwidth

**Overview** This command sets the maximum bandwidth in kilobytes per second (kBps) available to the AMF backup process. This command enables you to restrict the bandwidth that is utilized for downloading file contents during a backup.

**NOTE:** *This command will only run on an AMF master. An error message will be generated if the command is attempted on node that is not a master.*

*Also note that setting the bandwidth value to zero will allow the transmission of as much bandwidth as is available, which can exceed the maximum configurable speed of 1000 kBps. In effect, zero means unlimited.*

Use the **no** variant of this command to reset (to its default value of zero) the maximum bandwidth in kilobytes per second (kBps) available when initiating an AMF backup. A value of zero tells the backup process to transfer files using unlimited bandwidth.

**Syntax** atmf backup bandwidth <0-1000>  
no atmf backup bandwidth

| Parameter | Description                                       |
|-----------|---------------------------------------------------|
| <0-1000>  | Sets the bandwidth in kilobytes per second (kBps) |

**Default** The default value is zero, allowing unlimited bandwidth when executing an AMF backup.

**Mode** Global Configuration

**Examples** To set an atmf backup bandwidth of 750 kBps, use the commands:

```
node2# configure terminal
node2(config)# atmf backup bandwidth 750
```

To set the AMF backup bandwidth to the default value for unlimited bandwidth, use the commands:

```
node2# configure terminal
node2(config)# no atmf backup bandwidth
```

**Related commands** [show atmf backup](#)

# atmf backup delete

**Overview** This command removes the backup file from the external media of a specified AMF node.

Note that this command can only be run from an AMF master node.

**Syntax** `atmf backup delete <node-name>`

| Parameter                      | Description                                         |
|--------------------------------|-----------------------------------------------------|
| <code>&lt;node-name&gt;</code> | The AMF node name of the backup file to be deleted. |

**Mode** Privileged Exec

**Example** To delete the backup file from node2, use the following command:

```
Node_1# atmf backup delete node2
```

**Related commands**

- [show atmf backup](#)
- [atmf backup now](#)
- [atmf backup stop](#)

# atmf backup enable

**Overview** This command enables automatic AMF backups on the AMF master node that you are connected to. By default, automatic backup starts at 3:00 AM. However, this schedule can be changed by the [atmf backup](#). Note that backups are initiated and stored only on the master nodes.

Use the **no** variant of this command to disable any AMF backups that have been scheduled and previously enabled.

**Syntax** atmf backup enable  
no atmf backup enable

**Default** Automatic AMF backup functionality is enabled on the AMF master when it is configured and external media, i.e. an SD card or a USB storage device or remote server, is detected.

**Mode** Global Configuration

**Usage notes** A warning message will appear if you run the [atmf backup enable](#) command with either insufficient or marginal memory availability on your external storage device.

You can use the command [show atmf backup](#) to check the amount of space available on your external storage device.

We recommend using the ext3 or ext4 filesystem on external media that are used for AMF backups.

**Example** To turn on automatic AMF backup, use the following command:

```
AMF_Master_1# configure terminal
AMF_Master_1(config)# atmf backup enable
```

**Related commands** [show atmf](#)  
[show atmf backup](#)  
[atmf backup](#)  
[atmf backup now](#)  
[atmf enable](#)

# atmf backup guests delete

**Overview** This command removes a guest node's backup files from external media such as a USB drive, SD card, or an external file server.

**Syntax** `atmf backup guests delete <node-name> <guest-port>`

| Parameter                       | Description                          |
|---------------------------------|--------------------------------------|
| <code>&lt;node-name&gt;</code>  | The name of the guest's parent node. |
| <code>&lt;guest-port&gt;</code> | The port number on the parent node.  |

**Mode** User Exec/Privileged Exec

**Example** On a parent node named "node1" (which, in this case, the user has a direct console connection to) use the following command to remove the backup files of the guest node that is directly connected to port1.0.3.

```
node1# atmf backup guests delete node1 port1.0.3
```

**Related Command** [atmf backup delete](#)  
[atmf backup area-masters delete](#)  
[show atmf backup guest](#)

# atmf backup guests enable

**Overview** Use this command to enable backups of remote guest nodes from an AMF master.

Use the **no** variant of this command to disable the ability of the guest nodes to be backed up.

**Syntax** atmf backup guests enable  
no atmf backup guests enable

**Default** Guest node backups are enabled by default.

**Mode** Global Config

**Usage notes** We recommend using the ext3 or ext4 filesystem on external media that are used for AMF backups.

**Example** On the AMF master node, enable all scheduled guest node backups:

```
atmf-master# configure terminal
atmf-master(config)# atmf backup guests enable
```

**Related commands** **atmf backup area-masters enable**  
**show atmf backup guest**  
**atmf backup guests synchronize**

# atmf backup guests now

**Overview** This command manually triggers an AMF backup of guest nodes on a AMF Master.

**Syntax** atmf backup guests now [*<node-name>*] [*<guest-port>*]

| Parameter                 | Description                                      |
|---------------------------|--------------------------------------------------|
| <i>&lt;node-name&gt;</i>  | The name of the guest's parent node.             |
| <i>&lt;guest-port&gt;</i> | The port number that connects to the guest node. |

**Default** n/a

**Mode** Privileged Exec

**Example** Use the following command to manually trigger the backup of all guests in the AMF network

```
awplus# atmf backup guests now
```

**Example** To manually trigger the backup of a guest node connected to port 1.0.23 of node1, use the following command:

```
awplus# atmf backup guests now node1 port1.0.23
```

**Related commands** [show atmf backup guest](#)

# atmf backup guests synchronize

**Overview** This command initiates a manual synchronization of all guest backup file-sets across remote file servers and various redundancy backup media, such as USB storage devices. This facility ensures that each device contains the same backup image files. Note that this backup synchronization process will occur as part of the regular backups scheduled by the **atmf backup** command.

**Syntax** atmf backup guests synchronize

**Default** n/a

**Mode** User Exec/Privileged Exec

**Example** To synchronize backups across remote file servers and storage devices, use the command:

```
Node1#atmf backup guests synchronize
```

**Related commands** **atmf backup redundancy enable**

**show atmf guests**

**atmf backup guests enable**

## atmf backup now

**Overview** This command initiates an immediate AMF backup of either all AMF members, or a selected AMF member. Note that this backup information is stored in the external media on the master node of the device on which this command is run, even though the selected AMF member may not be a master node.

Note that this command can only be run on an AMF master node.

**Syntax** atmf backup now [<nodename>]

| Parameter                | Description                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <nodename> or <hostname> | The name of the AMF member to be backed up, as set by the command <b>hostname</b> . Where no name has been assigned to this device, then you must use the default name, which is the word "host", then an underscore, then (without a space) the MAC address of the device to be backed up. For example host_0016_76b1_7a5e.<br><br>Note that the node-name appears as the command Prompt when in Privileged Exec mode. |

**Default** A backup is initiated for all nodes on the AMF (but stored on the master nodes).

**Mode** Privileged Exec

**Usage notes** Although this command will select the AMF node to be backed-up, it can only be run from any AMF master node.

**NOTE:** The backup produced will be for the selected node but the backed-up config will reside on the external media of the AMF master node on which the command was run. However, this process will result in the information on one master being more up-to-date. To maintain concurrent backups on both masters, you can apply the backup now command to the master working-set. This is shown in Example 4 below.

**Example 1** In this example, an AMF member has not been assigned a host name. The following command is run on the AMF\_Master\_2 node to immediately backup the device that is identified by its MAC address of 0016.76b1.7a5e:

```
AMF_Master_2# atmf backup now host_0016_76b1_7a5e
```

**NOTE:** When a host name is derived from its MAC address, the syntax format entered changes from XXXX.XXXX.XXXX to XXXX\_XXXX\_XXXX.

**Example 2** In this example, an AMF member has the host name, **office\_annex**. The following command will immediately backup this device:

```
AMF_Master_2# atmf backup now office_annex
```

This command is initiated on the device's master node named **AMF\_Master\_2** and initiates an immediate backup on the device named **office\_annex**.

**Example 3** To initiate from AMF\_master\_1 an immediate backup of all AMF member nodes, use the following command:

```
AMF_Master_1# amf backup now
```

**Example 4** To initiate an immediate backup of the node with the host-name "office\_annex" and store the configuration on both masters, use the following process:

From the AMF\_master\_1, set the working-set to comprise only of the automatic group, master nodes.

```
AMF_Master_1# atmf working-set group master
```

This command returns the following display:

```
=====
AMF_Master_1, AMF_Master_2
=====

Working set join
```

Backup the AMF member with the host name, **office\_annex** on both the master nodes as defined by the working set.

```
AMF_Master[2]# atmf backup now office_annex
```

Note that the [2] shown in the command prompt indicates a 2 node working-set.

**Related commands**

- atmf backup**
- atmf backup stop**
- hostname**
- show atmf backup**

# atmf backup redundancy enable

**Overview** This command is used to enable or disable AMF backup redundancy.

**Syntax** atmf backup redundancy enable  
no atmf backup redundancy enable

**Default** Disabled

**Mode** Global Configuration

**Usage notes** If the AMF Master or Controller supports any removable media (SD card/USB), it uses the removable media as the redundant backup for the AMF data backup.

This feature is valid only if remote file servers are configured on the AMF Master or Controller.

We recommend using the ext3 or ext4 filesystem on external media that are used for AMF backups.

**Example** To enable AMF backup redundancy, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# atmf backup redundancy enable
```

To disable AMF backup redundancy, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no atmf backup redundancy enable
```

**Related commands** [atmf backup synchronize](#)  
[show atmf backup](#)  
[show atmf backup area](#)

## atmf backup server

**Overview** This command configures remote file servers as the destination for AMF backups.

Use the **no** variant of this command to remove the destination server(s). When all servers are removed the system will revert to backup from external media.

**Syntax** `atmf backup server id {1|2} <hostlocation> username <username> [path <path>|port <1-65535>]`  
`no atmf backup server id {1|2}`

| Parameter      | Description                                                                                                                                                                                      |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id             | Remote server backup server identifier.                                                                                                                                                          |
| {1 2}          | The backup server identifier number (1 or 2). Note that there can be up to two backup servers, numbered 1 and 2 respectively, and you would need to run this command separately for each server. |
| <hostlocation> | Either the name or the IP address (IPv4 or IPv6) of the selected backup server (1 or 2).                                                                                                         |
| username       | Configure the username to log in with on the selected remote file server.                                                                                                                        |
| <username>     | The selected remote file server's username.                                                                                                                                                      |
| path           | The location of the backup files on the selected remote file server. By default this will be the home directory of the username used to log in with.                                             |
| <path>         | The directory path utilized to store the backup files on the selected remote file server. No spaces are allowed in the path.                                                                     |
| port           | The connection to the selected remote backup file server using SSH. By default SSH connects to a device on TCP port 22 but this can be changed with this command.                                |
| <1-65535>      | A TCP port within the specified range.                                                                                                                                                           |

**Defaults** Remote backup servers are not configured. The default SSH TCP port is 22. The path utilized on the remote file server is the home directory of the username.

**Mode** Global Exec

**Usage notes** The hostname and username parameters must both be configured.

**Examples** To configure server 1 with an IPv4 address and a username of *backup1*, use the commands:

```
AMF_Master_1# configure terminal
AMF_Master_1(config)# atmf backup server id 1 192.168.1.1
username backup1
```

To configure server 1 with an IPv6 address and a username of *backup1*, use the command:

```
AMF_backup1_1# configure terminal
AMF_Master_1(config)# atmf backup server id 1 FFEE::01 username
backup1
```

To configure server 2 with a hostname and username, use the command:

```
AMF_Master_1# configure terminal
AMF_Master_1(config)# atmf backup server id 2 www.example.com
username backup2
```

To configure server 2 with a hostname and username in addition to the optional path and port parameters, use the command:

```
AMF_Master_1# configure terminal
AMF_Master_1(config)# atmf backup server id 2 www.example.com
username backup2 path tokyo port 1024
```

To unconfigure the AMF remote backup file server 1, use the command:

```
AMF_Master_1# configure terminal
AMF_Master_1(config)# no atmf backup server id 1
```

**Related commands** [show atmf backup](#)

# atmf backup stop

**Overview** Running this command stops a backup that is currently running on the master node you are logged onto. Note that if you have two masters and want to stop both, then you can either run this command separately on each master node, or add both masters to a working set, and issue this command to the working set.

Note that this command can only be run on a master node.

**Syntax** `atmf backup stop`

**Mode** Privileged Exec

**Usage notes** This command is used to halt an AMF backup that is in progress. In this situation the backup process will finish on its current node and then stop.

**Example** To stop a backup that is currently executing on master node node-1, use the following command:

```
AMF_Master_1# amf backup stop
```

**Related commands**

- [atmf backup](#)
- [atmf backup enable](#)
- [atmf backup now](#)
- [show atmf backup](#)

# atmf backup synchronize

**Overview** For the master node you are connected to, this command initiates a system backup of files from the node's active remote file server to its backup remote file server. Note that this process happens automatically each time the network is backed up.

Note that this command can only be run from a master node.

**Syntax** atmf backup synchronize

**Mode** Privileged Exec

**Example** When connected to the master node AMF\_Master\_1, the following command will initiate a backup of all system related files from its active remote file server to its backup remote file server.

```
AMF_Master_1# atmf backup synchronize
```

**Related commands**

- atmf backup enable**
- atmf backup redundancy enable**
- show atmf**
- show atmf backup**

# atmf cleanup

**Overview** This command is an alias to the **erase factory-default** command.

# atmf container

**Overview** Use this command to create or update an AMF container on a Virtual AMF Appliance (VAA) virtual machine.

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

Use the **no** variant of this command to remove an AMF container.

**Syntax** `atmf container <container-name>`  
`no atmf container <container-name>`

| Parameter                           | Description                                                 |
|-------------------------------------|-------------------------------------------------------------|
| <code>&lt;container-name&gt;</code> | The name of the AMF container to create, update, or remove. |

**Mode** AMF Container Configuration

**Usage notes** You cannot delete a container while it is still running. First use the **state disable** command to stop the container.

**Examples** To create or update the AMF container “vac-wlg-1”, use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)#
```

To remove the AMF container “vac-wlg-1”, use the commands:

```
awplus# configure terminal
awplus(config)# no atmf container vac-wlg-1
```

**Related commands**

- [area-link](#)
- [atmf container login](#)
- [bridge-group \(amf-container\)](#)
- [description \(amf-container\)](#)
- [show atmf container](#)
- [state](#)

**Command changes** Version 5.4.7-0.1: command added

# atmf container login

**Overview** Use this command to login to an AMF container on a Virtual AMF Appliance (VAA).

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

**Syntax** atmf container login <container-name>

| Parameter        | Description                                           |
|------------------|-------------------------------------------------------|
| <container-name> | The name of the AMF container you wish to login into. |

**Mode** Privileged Exec

**Usage notes** If you try to login to a AMF container that has not been created, or is not running, you will see the following message:

% Container does not exist or is not running.

To exit from a container and return to the host VAA press <Ctrl+a q>.

**Example** To login to container "vac-wlg-1", use the command:

```
awplus# atmf container login vac-wlg-1
```

You will then be presented with a login screen for that container:

```
Connected to tty 1
Type <Ctrl+a q> to exit the console, <Ctrl+a Ctrl+a> to enter Ctrl+a itself

vac-wlg-1 login: manager
Password: friend

AlliedWare Plus (TM) 5.4.7 02/03/17 08:46:12

vac-wlg-1>
```

**Related commands** [atmf container](#)  
[show atmf container](#)

**Command changes** Version 5.4.7-0.1: command added

# atmf controller

**Overview** Use this command to configure the device as an AMF controller. This enables you to split a large AMF network into multiple areas.

AMF controller is a licensed feature. The number of areas supported on a controller depends on the license installed on that controller.

Use the **no** variant of this command to remove the AMF controller functionality.

**Syntax** atmf controller  
no atmf controller

**Mode** Global configuration

**Usage notes** If a valid AMF controller license is not available on the device, the device will accept this command but will not act as a controller until you install a valid license. The following message will warn you of this:

"An AMF Controller license must be installed before this feature will become active"

**NOTE:** *If the AMF controller functionality is removed from a device using the command then the device must be rebooted if it is to function properly as an AMF master.*

**Example** To configure the node named *controller-1* as an AMF controller, use the commands:

```
controller-1# configure terminal
controller-1(config)# atmf controller
```

To stop the node named *controller-1* from being an AMF controller, use the commands:

```
controller-1# configure terminal
controller-1(config)# no atmf controller
```

**Related commands** [atmf area](#)  
[show atmf](#)

## atmf distribute firmware

**Overview** This command can be used to upgrade software one AMF node at a time. A URL can be selected from any media location. The latest compatible release for a node will be selected from this location.

Several procedures are performed to ensure the upgrade will succeed. This includes checking the current node release boots from flash. If there is enough space on flash, the software release is copied to flash on the new location.

The new release name is updated using the **boot system** command. The old release will become the backup release file. If a release file exists in a remote device (such as TFTP or HTTP, for example) then the URL should specify the exact release filename without using a wild card character.

The command will continue to upgrade software until all nodes are upgraded. At the end of the upgrade cycle the command should be used on the working-set.

**Syntax** atmf distribute firmware <filename>

| Parameter  | Description                                                                                                                           |
|------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <filename> | The filename and path of the file. See the <a href="#">File Management Feature Overview and Configuration Guide</a> for valid syntax. |

**Mode** Privileged Exec

**Examples** To upgrade nodes in a AMF network with a predefined AMF group called 'teams', use the following command:

Team1# atmf working-set group teams

```
=====
Team1, Team2, Team3:
=====
Working set join
```

ATMF\_NETWORK[3]# atmf distribute firmware card:\*.rel

```
Retrieving data from Team1
Retrieving data from Team2
Retrieving data from Team3

ATMF Firmware Upgrade:

Node Name           New Release File           Status
-----
Team1                x510-5.4.7-1.1.rel         Release ready
Team2                x930-5.4.7-1.1.rel         Release ready
Team3                x930-5.4.7-1.1.rel         Release ready
Continue the rolling reboot ? (y/n):y

ATMF_NETWORK[3]#
```

**Related** [atmf working-set commands](#)

## atmf domain vlan

**Overview** The AMF domain VLAN is created when the AMF network is first initiated and is assigned a default VID of 4091. This command enables you to change the VID from this default value on this device.

The AMF domain VLAN is one of AMF's internal VLANs (the management VLAN is the other internal VLAN). AMF uses these internal VLANs to communicate network status information between nodes. These VLANs must be reserved for AMF and not used for other purposes.

An important point conceptually is that although the domain VLAN exists globally across the AMF network, it is assigned separately to each domain. The AMF network therefore can be thought of as comprising a series of domain VLANs each having the same VID and each being applied to a horizontal slice (domain) of the AMF. It follows therefore that the domain VLANs are only applied to ports that form cross-links and not to ports that form uplinks/downlinks.

**CAUTION:** Every member of your AMF network must have the same domain VLAN, management VLAN, and management subnet.

**CAUTION:** If you change the domain VLAN, management VLAN, or management subnet of a node, that change takes effect immediately and the node will immediately leave the AMF network and try to rejoin it. The AMF network will not be complete until you have given all devices the same setting, so they can all rejoin the AMF network.

Use the **no** variant of this command to reset the VLAN ID to its default value of 4091.

**Syntax** atmf domain vlan <2-4090>  
no atmf domain vlan

| Parameter | Description                             |
|-----------|-----------------------------------------|
| <2-4090>  | The VLAN number in the range 2 to 4090. |

**Default** VLAN 4091

**Mode** Global Configuration

**Usage notes** We recommend you only change the domain VLAN when first creating the AMF network, and only if VLAN 4091 is already being used in your network.

However, if you do need to change the VLAN on an existing AMF network, use the following steps:

1. Create a working set of the whole of your AMF network, using the commands:

```
master# atmf working-set group all
```

You must use **working-set group all** if changing the domain VLAN. If you use a different working-set, nodes that are not in that working-set will lose contact with the AMF network.

2. The prompt will display the number of nodes in the AMF network. Record this number. In this example, the network is named "test" and has 10 nodes:

```
test[10]#
```

3. Enter the new VLAN ID, using the commands:

```
test[10]# configure terminal
```

```
test(config)[10]# atmf domain vlan <2-4090>
```

The nodes will execute the command in parallel, leave the AMF network, and attempt to rejoin through the new VLAN.

4. Create the working set again, using the commands:

```
master(config)# exit
```

```
master# atmf working-set group all
```

5. Save the configuration, using the command:

```
test[10]# write
```

6. The prompt will display the number of nodes in the AMF network. Check that this is the same as the number in step 1. If it is not, you will need to change the VLAN on missing devices by logging into their consoles directly.

**NOTE:** *The domain VLAN will automatically be assigned an IP subnet address based on the value configured by the command .*

The default VLAN ID lies outside the user-configurable range. If you need to reset the VLAN to the default VLAN ID, use the **no** variant of this command to do so.

**Examples** To change the AMF domain VLAN to 4090 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
test[10]# configure terminal
test(config)[10]# atmf domain vlan 4090
master(config)# exit
master# atmf working-set group all
test[10]# write
```

To reset the AMF domain VLAN to its default of 4091 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
test[10]# configure terminal
test(config)[10]# no atmf domain vlan
master(config)# exit
master# atmf working-set group all
test[10]# write
```

**Related commands** [atmf management subnet](#)  
[atmf management vlan](#)

# atmf enable

**Overview** This command manually enables (turns on) the AMF feature for the device being configured.

Use the **no** variant of this command to disable (turn off) the AMF feature on the member node.

**Syntax** atmf enable  
no atmf enable

**Default** Once AMF is configured, the AMF feature starts automatically when the device starts up.

**Mode** Global Configuration

**Usage notes** The device does not auto negotiate AMF domain specific settings such as the Network Name. You should therefore, configure your device with any domain specific (non default) settings before enabling AMF.

**Examples** To turn off AMF, use the command:

```
MyNode# config terminal
MyNode(config)# no atmf enable
```

To turn on AMF, use the command:

```
MyNode(config)# atmf enable
```

This command returns the following display:

```
% Warning: The ATMF network config has been set to enable
% Save the config and restart the system for this change to take
effect.
```

# atmf group (membership)

**Overview** This command configures a device to be a member of one or more AMF groups. Groups exist in three forms: Implicit Groups, Automatic Groups, and User-defined Groups.

- Implicit Groups
  - all: All nodes in the AMF
  - current: The current working-set
  - local: The originating node.

Note that the Implicit Groups do not appear in show group output.

- Automatic Groups - These are defined by hardware architecture, e.g. x510, x230, x8100, AR3050S, AR4050S.
- User-defined Groups - These enable you to define arbitrary groups of AMF members based on your own criteria.

Each node in the AMF is automatically assigned membership to the implicit groups, and the automatic groups that are appropriate to its node type, e.g. x230, PoE. Similarly, nodes that are configured as masters are automatically assigned to the master group.

Use the **no** variant of this command to remove the membership.

**Syntax** atmf group *<group-list>*  
no atmf group *<group-list>*

| Parameter                 | Description                                                                                                                                                         |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;group-list&gt;</i> | A list of group names. These should be entered as a comma delimited list without spaces.<br><br>Names can contain alphanumeric characters, hyphens and underscores. |

**Mode** Global Configuration

**Usage notes** You can use this command to define your own arbitrary groups of AMF members based on your own network's configuration requirements. Applying a node to a non existing group will result in the group automatically being created.

Note that the master nodes are automatically assigned to be members of the pre-existing master group.

The following example configures the device to be members of three groups; two are company departments, and one comprises all devices located in building\_2. To avoid having to run this command separately on each device that is to be added to these groups, you can remotely assign all of these devices to a working-set, then use the capabilities of the working-set to apply the **atmf group (membership)** command to all members of the working set.

**Example 1** To specify the device to become a member of AMF groups named *marketing*, *sales*, and *building\_2*, use the following commands:

```
node-1# configure terminal
node-1(config)# atmf group marketing,sales,building_2
```

**Example 2** To add the nodes *member\_node\_1* and *member\_node\_2* to groups *building1* and *sales*, first add the nodes to the working-set:

```
master_node# atmf working-set member_node_1,member_node_2
```

This command returns the following output confirming that the nodes *member\_node\_1* and *member\_node\_2* are now part of the working-set:

```
=====
member_node_1, member_node_2
=====

Working set join
```

Then add the members of the working set to the groups:

```
atmf-net[2]# configure terminal
atmf-net[2](config)# atmf group building1,sales
atmf-net[2](config)# exit
atmf-net[2]# show atmf group
```

This command returns the following output displaying the groups that are members of the working-set.

```
=====
member_node_1
=====

AMF group information
building1, sales
```

**Related commands** [show atmf group](#)  
[show atmf group members](#)

# atmf guest-class

**Overview** This modal command creates a guest-class. Guest-classes are modal templates that can be applied to selected guest types. Once you have created a guest-class, you can select it by entering its mode. From here, you can then configure a further set of operational settings specifically for the new guest-class.

These settings can then all be applied to a guest link by running the **switchport atmf-guestlink** command. The following settings can be configured from each guest class mode:

- discovery method
- model type
- http-enable setting
- guest port, user name, and password

The **no** variant of this command removes the guest-class. Note that you cannot remove a guest-class that is assigned to a port.

**Syntax** `atmf guest-class <guest-class-name>`  
`no atmf guest-class <guest-class-name>`

| Parameter                             | Description                                                                                                    |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------|
| <code>&lt;guest-class-name&gt;</code> | The name assigned to the guest-class type. This can be chosen from an arbitrary string of up to 15 characters. |

**Mode** Global Configuration

**Example** To create a guest-class named 'camera' use the commands:

```
node1# configure terminal
node1(config)# atmf guest-class camera
node1(config-atmf-guest)#
```

To remove the guest-class named 'camera' use the commands:

```
node1# configure terminal
node1(config)# no atmf guest-class camera
```

**login-fallback enable**

# atmf log-verbose

**Overview** This command limits the number of log messages displayed on the console or permanently logged.

Use the **no** variant of this command to reset to the default.

**Syntax** atmf log-verbose <1-3>  
no atmf log-verbose

| Parameter | Description                                         |
|-----------|-----------------------------------------------------|
| <1-3>     | The verbose limitation (3 = noisiest, 1 = quietest) |

**Default** The default log display is 3.

**Usage** This command is intended for use in large networks where verbose output can make the console unusable for periods of time while nodes are joining and leaving.

**Mode** Global Configuration

**Example** To set the log-verbose to noise level 2, use the command:

```
node-1# configure terminal
node-1(config)# atmf log-verbose 2
```

**Validation Command** **show atmf**

## atmf management subnet

**Overview** This command is used to assign a subnet that will be allocated to the AMF management and domain management VLANs. From the address space defined by this command, two subnets are created, a management subnet component and a domain component, as explained in the Usage section below.

AMF uses these internal IPv4 subnets to communicate network status information between nodes. These subnet addresses must be reserved for AMF and not used for other purposes.

**CAUTION:** Every member of your AMF network must have the same domain VLAN, management VLAN, and management subnet.

**CAUTION:** If you change the domain VLAN, management VLAN, or management subnet of a node, that change takes effect immediately and the node will immediately leave the AMF network and try to rejoin it. The AMF network will not be complete until you have given all devices the same setting, so they can all rejoin the AMF network.

Use the **no** variant of this command to remove the assigned subnet.

**Syntax** atmf management subnet <a.b.0.0>  
no atmf management subnet

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                    |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a.b.0.0> | <p>The IP address selected for the management subnet. Because a mask of 255.255.0.0 (i.e. /16) will be applied automatically, an IP address in the format a.b.0.0 must be selected.</p> <p>Usually this subnet address is selected from an appropriate range from within the private address space of 172.16.0.0 to 172.31.255.255, or 192.168.0.0, as defined in RFC1918.</p> |

**Default** 172.31.0.0. A subnet mask of 255.255.0.0 will automatically be applied.

**Mode** Global Configuration

**Usage notes** Running this command will result in the creation of a further two subnets (within the class B address space assigned) and the mask will extend from /16 to /17.

For example, if the management subnet is assigned the address 172.31.0.0/16, this will result in the automatic creation of the following two subnets:

- 172.31.0.0/17 assigned to the **atmf management vlan**
- 172.31.128.0/17 assigned to the **atmf domain vlan**.

We recommend you only change the management subnet when first creating the AMF network, and only if 172.31.0.0 is already being used in your network.

However, if you do need to change the subnet on an existing AMF network, use the following steps:

1. Create a working set of the whole of your AMF network, using the commands:

```
master# atmf working-set group all
```

You must use **working-set group all** if changing the domain VLAN, management VLAN, or management subnet. If you use a different working-set, nodes that are not in that working-set will lose contact with the AMF network.

2. The prompt will display the number of nodes in the AMF network. Record this number. In this example, the network is named "test" and has 10 nodes:

```
test[10]#
```

3. Enter the new subnet address, using the commands:

```
test[10]# configure terminal
```

```
test(config)[10]# atmf management subnet <a.b.0.0>
```

The nodes will execute the command in parallel, leave the AMF network, and attempt to rejoin through the new subnet.

4. Create the working set again, using the commands:

```
master(config)# exit
```

```
master# atmf working-set group all
```

5. Save the configuration, using the command:

```
test[10]# write
```

6. The prompt will display the number of nodes in the AMF network. Check that this is the same as the number in step 1. If it is not, you will need to change the subnet on missing devices by logging into their consoles directly.

**Examples** To change the AMF management subnet address to 172.25.0.0 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
test[10]# configure terminal
test(config)[10]# atmf management subnet 172.25.0.0
master(config)# exit
master# atmf working-set group all
test[10]# write
```

To reset the AMF management subnet address to its default of 172.31.0.0 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
test[10]# configure terminal
test(config)[10]# no atmf management subnet
master(config)# exit
master# atmf working-set group all
test[10]# write
```

**Related commands** [atmf domain vlan](#)  
[atmf management vlan](#)

## atmf management vlan

**Overview** The AMF management VLAN is created when the AMF network is first initiated and is assigned a default VID of 4092. This command enables you to change the VID from this default value on this device.

The AMF management VLAN is one of AMF's internal VLANs (the domain VLAN is the other internal VLAN). AMF uses these internal VLANs to communicate network status information between nodes. These VLANs must be reserved for AMF and not used for other purposes.

**CAUTION:** Every member of your AMF network must have the same domain VLAN, management VLAN, and management subnet.

**CAUTION:** If you change the domain VLAN, management VLAN, or management subnet of a node, that change takes effect immediately and the node will immediately leave the AMF network and try to rejoin it. The AMF network will not be complete until you have given all devices the same setting, so they can all rejoin the AMF network.

Use the **no** variant of this command to restore the VID to the default of 4092.

**Syntax** atmf management vlan <2-4090>  
no atmf management vlan

| Parameter | Description                                  |
|-----------|----------------------------------------------|
| <2-4090>  | The VID assigned to the AMF management VLAN. |

**Default** VLAN 4092

**Mode** Global Configuration

**Usage notes** We recommend you only change the management VLAN when first creating the AMF network, and only if VLAN 4092 is already being used in your network.

However, if you do need to change the VLAN on an existing AMF network, use the following steps to ensure you change it on all nodes simultaneously:

1. Create a working set of the whole of your AMF network, using the commands:

```
master# atmf working-set group all
```

You must use **working-set group all** if changing the management VLAN. If you use a different working-set, nodes that are not in that working-set will lose contact with the AMF network.

2. The prompt will display the number of nodes in the AMF network. Record this number. In this example, the network is named "test" and has 10 nodes:

```
test[10]#
```

3. Enter the new VLAN ID, using the commands:

```
test[10]# configure terminal
```

```
test(config)[10]# atmf management vlan <2-4090>
```

The nodes will execute the command in parallel, leave the AMF network, and attempt to rejoin through the new VLAN.

4. Create the working set again, using the commands:

```
master(config)# exit
```

```
master# atmf working-set group all
```

5. Save the configuration, using the command:

```
test[10]# write
```

6. The prompt will display the number of nodes in the AMF network. Check that this is the same as the number in step 1. If it is not, you will need to change the VLAN on missing devices by logging into their consoles directly.

**NOTE:** *The management VLAN will automatically be assigned an IP subnet address based on the value configured by the command .*

The default VLAN ID lies outside the user-configurable range. If you need to reset the VLAN to the default VLAN ID, use the **no** variant of this command to do so.

**Examples** To change the AMF management VLAN to 4090 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
test[10]# configure terminal
test(config)[10]# atmf management vlan 4090
master(config)# exit
master# atmf working-set group all
test[10]# write
```

To reset the AMF management VLAN to its default of 4092 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
test[10]# configure terminal
test(config)[10]# no atmf management vlan
master(config)# exit
master# atmf working-set group all
test[10]# write
```

**Related commands** [atmf domain vlan](#)  
[atmf management subnet](#)

# atmf master

**Overview** This command configures the device to be an AMF master node and automatically creates an AMF master group. The master node is considered to be the core of the AMF network, and must be present for the AMF to form. The AMF master has its node depth set to 0. Note that the node depth vertical distance is determined by the number of uplinks/downlinks that exist between the node and its master.

An AMF master node must be present for an AMF network to form. Up to two AMF master nodes may exist in a network, and they **must** be connected by an AMF crosslink.

**NOTE:** Master nodes are an essential component of an AMF network. In order to run AMF, an AMF License is required for each master node.

If the crosslink between two AMF masters fails, then one of the masters will become isolated from the rest of the AMF network.

Use the **no** variant of this command to remove the device as an AMF master node. The node will retain its node depth of 0 until the network is rebooted.

**NOTE:** Node depth is the vertical distance (or level) from the master node (whose depth value is 0).

**Syntax** atmf master  
no atmf master

**Default** The device is not configured to be an AMF master node.

**Mode** Global Configuration

**Example** To specify that this node is an AMF master, use the following command:

```
node-1# configure terminal
node-1(config)# atmf master
```

**Related commands** [show atmf](#)  
[show atmf group](#)

## atmf mtu

**Overview** This command configures the AMF network Maximum Transmission Unit (MTU). The MTU value will be applied to the AMF Management VLAN, the AMF Domain VLAN and AMF Area links.

Use the **no** variant of this command to restore the default MTU.

**Syntax** `atmf mtu <1300-1442>`  
`no atmf mtu`

| Parameter   | Description                                                                                                                               |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <1300-1442> | The value of the maximum transmission unit for the AMF network, which sets the maximum size of all AMF packets generated from the device. |

**Default** 1300

**Mode** Global Configuration

**Usage notes** The default value of 1300 will work for all AMF networks (including those that involve virtual links over IPsec tunnels). If there are virtual links over IPsec tunnels anywhere in the AMF network, we recommend not changing this default. If there are no virtual links over IPsec tunnels, then this AMF MTU value may be increased for network efficiency.

**Example** To change the ATMF network MTU to 1442, use the command:

```
awplus(config)# atmf mtu 1442
```

**Related commands** [show atmf detail](#)

## atmf network-name

**Overview** This command applies an AMF network name to a (prospective) AMF node. In order for an AMF network to be valid, its network-name must be configured on at least two nodes, one of which must be configured as a master and have an AMF License applied. These nodes may be connected using either AMF downlinks or crosslinks.

For more information on configuring an AMF master node, see the command **atmf master**.

Use the **no** variant of this command to remove the AMF network name.

**Syntax** `atmf network-name <name>`  
`no atmf network-name`

| Parameter                 | Description                                                                              |
|---------------------------|------------------------------------------------------------------------------------------|
| <code>&lt;name&gt;</code> | The AMF network name. Up to 15 printable characters can be entered for the network-name. |

**Mode** Global Configuration

**Usage notes** This is one of the essential commands when configuring AMF and must be entered on each node that is to be part of the AMF.

A switching node (master or member) may be a member of only one AMF network.

**CAUTION:** *Ensure that you enter the correct network name. Entering an incorrect name will cause the AMF network to fragment (at the next reboot).*

**Example** To set the AMF network name to `amf_net` use the command:

```
Node_1(config)# atmf network-name amf_net
```

# atmf provision (interface)

**Overview** This command configures a specified port on an AMF node to accept a provisioned node, via an AMF link, some time in the future.

Use the **no** variant of this command to remove the provisioning on the node.

**Syntax** `atmf provision <nodename>`

`no atmf provision`

| Parameter                     | Description                                                                         |
|-------------------------------|-------------------------------------------------------------------------------------|
| <code>&lt;nodename&gt;</code> | The name of the provisioned node that will appear on the AMF network in the future. |

**Mode** Interface Configuration for a switchport, a static aggregator, dynamic channel group or an Eth port on an AR-Series device.

**Usage notes** The port should be configured as an AMF link or cross link and should be 'down' to add or remove a provisioned node.

**Example** To provision an AMF node named node1 for port1.0.1, use the commands:

```
host1(config)# interface port1.0.1
host1(config-if)# atmf provision node1
```

**Related commands**

- `atmf provision node`
- `clone (amf-provision)`
- `configure boot config (amf-provision)`
- `configure boot system (amf-provision)`
- `copy (amf-provision)`
- `create (amf-provision)`
- `delete (amf-provision)`
- `identity (amf-provision)`
- `license-cert (amf-provision)`
- `locate (amf-provision)`
- `show atmf provision nodes`
- `show atmf links`
- `switchport atmf-link`
- `switchport atmf-crosslink`

## atmf provision node

**Overview** Use this command to provision a replacement node for a specified interface. Node provisioning is effectively the process of creating a backup file-set on a master node that can be loaded onto a provisioned node some time in the future. This file-set is created just as if the provisioned node really existed and was connected to the network. Typically these comprise configuration, operating system, and license files etc.

You can optionally provision a node with multiple device-type backups. When a device is then attached to the network, AMF uses its device-type to find the correct configuration to use. For example you can create an x510 and an x530 provisioning configuration for a node called 'node1' and if either an x510 or an x530 is attached to that node the appropriate configuration will be used.

Use the **no** variant of this command to remove a provisioned node.

**Syntax** `atmf provision node <nodename> [device <device-type>]`  
`no atmf provision node <nodename> [device <device-type>]`

| Parameter     | Description                                                                                                                                                   |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <nodename>    | The name of the provisioned node that will appear on the AMF network.                                                                                         |
| device        | Optionally specify a device type.                                                                                                                             |
| <device-type> | Any valid device type e.g. AR3050s, ie200, x950. For a full list of valid device types use the command <b>atmf provision node &lt;nodename&gt; device ?</b> . |

**Mode** Privileged Exec

**Usage notes** This command creates the directory structure for the provisioned node's file-set. It also switches to the AMF provision node prompt so that the nodes backup file-set can be created or updated. This is typically done with the **create (amf-provision)** or **clone (amf-provision)** commands.

For more information on AMF provisioning, see the [AMF Feature Overview and Configuration Guide](#)..

**Example** To configure node named 'node1', use the command:

```
awplus# atmf provision node node1  
awplus(atmf-provision)#
```

To configure a node named 'node1' for device type 'x530', use the command:

```
awplus# atmf provision node node1 device x530  
awplus(atmf-provision)#
```

**Related commands**

- atmf provision (interface)**
- clone (amf-provision)**
- configure boot config (amf-provision)**
- configure boot system (amf-provision)**
- copy (amf-provision)**
- create (amf-provision)**
- delete (amf-provision)**
- identity (amf-provision)**
- license-cert (amf-provision)**
- locate (amf-provision)**
- show atmf provision nodes**

**Command changes** Version 5.4.9-0.1: command added

## atmf reboot-rolling

**Overview** This command enables you to reboot the nodes in an AMF working-set, one at a time, as a rolling sequence in order to minimize downtime. Once a rebooted node has finished running its configuration and its ports are up, it re-joins the AMF network and the next node is rebooted.

By adding the `url` parameter, you can also upgrade your devices' software one AMF node at a time.

The **force** parameter forces the rolling reboot to continue even if a previous node does not rejoin the AMF network. Without the **force** parameter, the unsuitable node will time-out and the rolling reboot process will stop. However, with the **force** parameter applied, the process will ignore the timeout and move on to reboot the next node in the sequence.

This command can take a significant amount of time to complete.

**Syntax** `atmf reboot-rolling [force] [<url>]`

| Parameter                | Description                                                                                                                                          |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>force</code>       | Ignore a failed node and move on to the next node. Where a node fails to reboot a timeout is applied based on the time taken during the last reboot. |
| <code>&lt;url&gt;</code> | The path to the software upgrade file.                                                                                                               |

**Mode** Privileged Exec

**Usage notes** You can load the software from a variety of locations. The latest compatible release for a node will be selected from your selected location, based on the parameters and URL you have entered.

For example `usb:/5.5.2-2/x*-5.5.2-2-*.rel` will select from the folder `usb:/5.5.2-2` the latest file that matches the selection `x(wildcard)-5.5.2-2-(wildcard).rel`. Because `x*` is applied, each device type will be detected and its appropriate release file will be installed.

Other allowable entries are:

| Entry                                 | Used when loading software                              |
|---------------------------------------|---------------------------------------------------------|
| <code>card:*.rel:</code>              | from an SD card                                         |
| <code>tftp:&lt;ip-address&gt;:</code> | from a TFTP server                                      |
| <code>usb:</code>                     | from a USB flash drive                                  |
| <code>flash:</code>                   | from flash memory, e.g. from one x930 switch to another |
| <code>scp:</code>                     | using secure copy                                       |
| <code>http:</code>                    | from an HTTP file server                                |

Several checks are performed to ensure the upgrade will succeed. These include checking the current node release boots from flash. If there is enough space on flash, the software release is copied to flash to a new location on each node as it is processed. The new release name will be updated using the **boot system<release-name>** command, and the old release will become the backup release file.

**NOTE:** *If you are using TFTP or HTTP, for example, to access a file on a remote device then the URL should specify the exact release filename without using wild card characters.*

On bootup the software release is verified. Should an upgrade fail, the upgrading unit will revert back to its previous software version. At the completion of this command, a report is run showing the release upgrade status of each node.

**NOTE:** *Take care when removing external media or rebooting your devices. Removing an external media while files are being written entails a significant risk of causing a file corruption.*

**Example 1** To reboot all x530 nodes in an AMF network, use the commands:

```
Bld2_Floor_1# atmf working-set group x530
```

This command returns the following type of screen output:

```
=====
node1, node2, node3:
=====

Working set join

AMF_NETWORK[3]#
```

```
ATMF_NETWORK[3]# atmf reboot-rolling
```

When the reboot has completed, a number of status screens appear. The selection of these screens will depend on the parameters set.

```
Bld2_Floor_1#atmf working-set group x530

=====
SW_Team1, SW_Team2, SW_Team3:
=====

Working set join

ATMF_NETWORK[3]#atmf reboot-rolling
ATMF Rolling Reboot Nodes:

## atmf recover

**Overview** This command is used to manually initiate the recovery (or replication) of an AMF node, usually when a node is being replaced.

**Syntax** atmf recover [*<node-name>* master *<node-name>*]  
atmf recover [*<node-name>* controller *<node-name>*]

| Parameter                           | Description                                                                                                                                                                                                                                  |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;node-name&gt;</i>            | The name of the device whose configuration is to be recovered or replicated.                                                                                                                                                                 |
| master <i>&lt;node-name&gt;</i>     | The name of the master device that holds the required configuration information.<br><br>Note that although you can omit both the node name and the master name; you cannot specify a master name unless you also specify the node name.      |
| controller <i>&lt;node-name&gt;</i> | The name of the controller that holds the required configuration information.<br><br>Note that although you can omit both the node name and the controller name; you cannot specify a controller name unless you also specify the node name. |

**Mode** Privileged Exec

**Usage notes** The recovery/replication process involves loading the configuration file for a node that is either about to be replaced or has experienced some problem. You can specify the configuration file of the device being replaced by using the *<node-name>* parameter, and you can specify the name of the master node or controller holding the configuration file.

If the *<node-name>* parameter is not entered then the node will attempt to use one that has been previously configured. If the replacement node has no previous configuration (and has no previously used node-name), then the recovery will fail.

If the master or controller name is not specified then the device will poll all known AMF masters and controllers and execute an election process (based on the last successful backup and its timestamp) to determine which to use. If no valid backup master or controller is found, then this command will fail.

No error checking occurs when this command is run. Regardless of the last backup status, the recovering node will attempt to load its configuration from the specified master node or controller.

If the node has previously been configured, we recommend that you suspend any AMF backup before running this command. This is to prevent corruption of the backup files on the AMF master as it attempts to both backup and recover the node at the same time.

**Example** To recover the AMF node named Node\_10 from the AMF master node named Master\_2, use the following command:

```
Master_2# atmf recover Node_10 master Master_2
```

**Related commands** [\*\*atmf backup stop\*\*](#)  
[\*\*show atmf backup\*\*](#)  
[\*\*show atmf\*\*](#)

## atmf recover guest

**Overview** Use this command to initiate a guest node recovery or replacement by reloading its backup file-set that is located within the AMF backup system. Note that this command must be run on the edge node device that connects to the guest node.

**Syntax** atmf recover guest [*<guest-port>*]

| Parameter                 | Description                                      |
|---------------------------|--------------------------------------------------|
| <i>&lt;guest-port&gt;</i> | The port number that connects to the guest node. |

**Mode** User Exec/Privileged Exec

**Example** To recover a guest on node1 port1.0.1, use the following command  
`node1# atmf recover guest port1.0.1`

**Related commands** [show atmf backup guest](#)

# atmf recover led-off

**Overview** This command turns off the recovery failure flashing port LEDs. It reverts the LED's function to their normal operational mode, and in doing so assists with resolving the recovery problem. You can repeat this process until the recovery failure has been resolved. For more information, see the [AMF Feature Overview and Configuration Guide](#).

**Syntax** atmf recover led-off

**Default** Normal operational mode

**Mode** Privileged Exec

**Example** To revert the LEDs on Node1 from recovery mode display to their normal operational mode, use the command:

```
Node1# atmf recover led-off
```

**Related commands** [atmf recover](#)

# atmf recover over-eth

**Overview** Use this command to enable AMF recovery over an AR-series device's Eth port. This setting persists even after restoring a device to a 'clean' state with the **erase factory-default** or **atmf cleanup** command.

Use the **no** variant of this command to disable AMF recover over an Eth port.

**Syntax** atmf recover over-eth  
no atmf recover over-eth

**Default** Eth ports cannot be used for recovery.

**Mode** Privileged Exec

**Usage notes** AMF links over Eth ports are only available if your network is running in AMF secure mode (see **atmf secure-mode** for more information on AMF secure mode).

**Example** To enable AMF recovery over an Eth port, use the command:

```
awplus# atmf recover over-eth
```

To disable AMF recovery over an Eth port, use the commands:

```
awplus# no atmf recover over-eth
```

**Related commands** **atmf-link**  
**atmf recover**  
**atmf secure-mode**  
**erase factory-default**  
**show atmf detail**

**Command changes** Version 5.5.0-1.1: command added

## atmf recovery-server

**Overview** Use this command on an AMF master to process recovery requests from isolated AMF nodes. An isolated node is an AMF member that is only connected to the rest of the AMF network via a virtual-link.

This option allows these nodes, which have no AMF neighbors, to be identified for recovery or provisioning purposes. They are identified using an identity token which is stored on the AMF master.

Use the **no** variant of this command to disable processing of recovery requests from isolated AMF nodes.

**Syntax** atmf recovery-server  
no atmf recovery-server

**Default** Recovery-server is disabled by default.

**Mode** Global Configuration

**Usage notes** Once **recovery-server** is enabled on an AMF network, the next time an isolated node is backed up its identity token will be stored in the AMF master's database. Should the device fail it can then be replaced and auto-recovery will occur as long as:

- the AMF master is accessible to the isolated node, and
- either, a DHCP server is configured to send the Uniform Resource Identifier (URI) of the AMF master to the recovering node, or
- a DNS server is configured to resolve the default recovery URI (<https://amfrecovery.alliedtelesis.com>) to the IP address of the AMF master.

Provisioning of isolated nodes is achieved by creating an identity token for the new node using the **identity (amf-provision)** command.

See the **AMF Feature Overview and Configuration Guide** for information on preparing your network for recovering or provisioning isolated nodes.

**Example** To enable recovery-server on an AMF master, use the commands:

```
awplus# configure terminal
awplus(config)# atmf recovery-server
```

To disable recovery-server on an AMF master, use the commands:

```
awplus# configure terminal
awplus(config)# no atmf recovery-server
```

- Command changes

Version 5.4.7-2.1: command added

# atmf remote-login

**Overview** Use this command to remotely login to other AMF nodes in order to run commands as if you were a local user of that node.

**Syntax** `atmf remote-login [user <name>] <nodename>`

| Parameter  | Description                                            |
|------------|--------------------------------------------------------|
| <name>     | The name of a user on the remote node.                 |
| <nodename> | The name of the remote AMF node you are connecting to. |

**Mode** Privileged Exec (This command will only run at privilege level 15)

**Usage notes** You do not need a valid login on the local device in order to run this command. The session will take you to the enable prompt on the new device. If the remote login session exits for any reason (e.g. device reboot) you will be returned to the originating node.

You can create additional user accounts on nodes. AMF's goal is to provide a uniform management plane across the whole network, so we recommend you use the same user accounts on all the nodes in the network.

In reality, though, it is not essential to have the same accounts on all the nodes. Users can remote login from one node to a second node even if they are logged into the first node with a user account that does not exist on the second node (provided that **atmf restricted-login** is disabled and the user account on the first node has privilege level 15).

Moreover, it is possible to use a RADIUS or TACACS+ server to manage user authentication, so users can log into AMF nodes using user accounts that are present on the RADIUS or TACACS+ server, and not present in the local user databases of the AMF nodes.

The software will not allow you to run multiple remote login sessions. You must exit an existing session before starting a new one.

If you disconnect from the VTY session without first exiting from the AMF remote session, the device will keep the AMF remote session open until the **exec-timeout** time expires (10 minutes by default). If the exec-timeout time is set to infinity (**exec-timeout 0 0**), then the device is unable to ever close the remote session. To avoid this, we recommend you use the **exit** command to close AMF remote sessions, instead of closing the associated VTY sessions. We also recommend you avoid setting the exec-timeout to infinity.

**Example** To remotely login from node Node10 to Node20, use the following command:

```
Node10# atmf remote-login node20
```

```
Node20>
```

To close the session on Node20 and return to Node10's command line, use the following command:

```
Node20# exit
```

```
Node10#
```

In this example, user User1 is a valid user of node5. They can remotely login from node5 to node3 by using the following commands:

```
node5# atmf remote-login user User1 node3
```

```
node3> enable
```

**Related commands** [atmf restricted-login](#)

**Command changes** Version 5.4.6-2.1: changes to AMF user account requirements

## atmf restricted-login

**Overview** By default, users who are logged into any node on an AMF network are able to manage any other node by using either working-sets or an AMF remote login. If the access provided by this feature is too wide, or contravenes network security restrictions, it can be limited by running this command, which changes the access so that:

- users who are logged into non-master nodes cannot execute any commands that involve working-sets, and
- from non-master nodes, users can use remote-login, but only to login to a user account that is valid on the remote device (via a statically configured account or RADIUS/TACACS+). Users are also required to enter the password for that user account.

Once entered on any AMF master node, this command will propagate across the network.

Use the **no** variant of this command to disable restricted login on the AMF network. This allows access to the **atmf working-set** command from any node in the AMF network.

**Syntax** `atmf restricted-login`  
`no atmf restricted-login`

**Mode** Privileged Exec

**Default** Master nodes operate with **atmf restricted-login** disabled.  
Member nodes operate with **atmf restricted-login** enabled.

**NOTE:** *The default conditions of this command vary from those applied by its “no” variant. This is because the restricted-login action is only applied by nodes, and in the absence of a master node, the default is to apply the restricted action to all nodes with AMF configured.*

**Usage notes** In the presence of a **master** node, its default of **atmf restricted-login disabled** will propagate to all its member nodes. Similarly, any change in this command’s status that is made on a master node, will also propagate to all its member nodes

Note that once you have run this command, certain other commands that utilize the AMF working-set command, such as the **include**, **atmf reboot-rolling** and **show atmf group members** commands, will operate only on master nodes.

Restricted-login must be enabled on AMF areas with more than 120 nodes.

**Example** To enable restricted login, use the command

```
Node_20(config)# atmf restricted-login node20
```

**Related commands** [atmf remote-login](#)  
[show atmf](#)

**Command changes** Version 5.4.6-2.1: changes to AMF user account requirements

## atmf retry guest-link

**Overview** Use this command to retry an AMF guest-link by restarting AMF guest discovery on a port if it is currently in the failed state.

If no port is specified then all configured AMF guest-link ports that are in the failed state are retried.

If a port is specified then that port will only be retried if it is both:

- configured as an AMF guest-link, and
- it is currently in the failed state.

**Syntax** `atmf retry guest-link [<interface>]`

| Parameter                      | Description                                                              |
|--------------------------------|--------------------------------------------------------------------------|
| <code>&lt;interface&gt;</code> | Name of the interface the guest-link you want to retry is configured on. |

**Mode** Privileged Exec

**Example** To retry all configured AMF guest-link currently in a failed state, use the command:

```
awplus# atmf retry guest-link
```

To retry an AMF guest-link configured on port1.0.2 currently in a failed state, use the command:

```
awplus# atmf retry guest-link port1.0.2
```

**Related commands** [show atmf links guest](#)  
[switchport atmf-guestlink](#)

## atmf secure-mode

**Overview** Use this command to enable AMF secure mode on an AMF node. AMF secure mode makes an AMF network more secure by:

- Adding an authorization mechanism before an AMF member is allowed to join an AMF network.
- The encryption of all AMF packets sent between AMF nodes.
- Adding support for user login authentication by RADIUS or TACACS+, and removing the requirement to have the same privileged user account in the local user database on all devices in the AMF network.
- Adding additional logging which enables network administrators to monitor attempts to gain unauthorized access to the AMF network.

Once the secure mode command is run on all nodes on an AMF network, the AMF masters and AMF controllers manage the addition of AMF nodes and AMF areas to the AMF network.

Use the **no** variant of this command to disable AMF secure mode on an AMF node.

**Syntax** atmf secure-mode  
no atmf secure-mode

**Default** Secure mode is disabled by default.

**Mode** Global Configuration

**Usage notes** When an AMF network is running in AMF secure mode the **atmf restricted-login** feature is automatically enabled. This restricts the **atmf working-set** command to users that are logged on to an AMF master. This feature cannot be disabled independently of secure mode.

When AMF secure mode is enabled the AMF controllers and masters in the AMF network form a group of certificate authorities. A node may only join a secure AMF network once it has been authorized by a master or controller. When enabled, all devices in the AMF network must be running in secure mode. Unsecured devices will not be able to join a secure AMF network.

**Example** To enable AMF secure mode on an AMF node, use the commands:

```
awplus# configure terminal
awplus(config)# atmf secure-mode
```

To disable AMF secure mode on an AMF node, use the commands:

```
awplus# configure terminal
awplus(config)# no atmf secure-mode
```

**Related commands**

- atmf authorize**
- atmf secure-mode certificate expiry**

**Command changes** Version 5.4.7-0.3: command added

# atmf secure-mode certificate expire

**Overview** Use this command on an AMF master to expire a secure mode certificate. Running this command will force the removal of the AMF node from the network.

**Syntax** `atmf secure-mode certificate expire <node-name> [area <area-name>]`

| Parameter                      | Description                                                            |
|--------------------------------|------------------------------------------------------------------------|
| <code>&lt;node-name&gt;</code> | Name of the AMF node you want to expire the certificate for.           |
| <code>area</code>              | Specify an AMF area.                                                   |
| <code>&lt;area-name&gt;</code> | Name of the AMF area you want to expire the AMF nodes certificate for. |

**Mode** Privileged Exec

**Example** To remove an AMF node named “node3” from an AMF network, use the following command on the AMF master:

```
awplus# atmf secure-mode certificate expire node3
```

To remove an AMF node named “node2” in an area named “area2”, use the following command on the AMF master:

```
awplus# atmf secure-mode certificate expire node2 area area2
```

**Related commands** [atmf secure-mode](#)  
[show atmf secure-mode](#)

**Command changes** Version 5.4.7-0.3: command added

# atmf secure-mode certificate expiry

**Overview** Use this command to set the expiry time of AMF secure mode certificates. Once an AMF node's certificate expires it must re-authorize and obtain a new certificate from the AMF master.

Use the **no** variant of this command to reset the expiry time to 180 days.

**Syntax** `atmf secure-mode certificate expiry {<days>|infinite}`  
`no atmf secure-mode certificate expiry`

| Parameter | Description                                                                                            |
|-----------|--------------------------------------------------------------------------------------------------------|
| <days>    | Length of time, in days, that an AMF secure mode certificate remains valid. A value between 1 and 365. |
| infinite  | The authorization certificate does not expire, in other words AMF nodes stay authorized indefinitely.  |

**Default** The default expiry time is 180 days.

**Mode** Global Configuration

**Example** To set AMF secure mode certificate expiry to 7 days, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# atmf secure-mode certificate expiry 7
```

To set AMF secure mode certificates to never expire, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# atmf secure-mode certificate expiry infinite
```

To reset the certificate expiry to 180 days, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no atmf secure-mode certificate expiry
```

**Related commands** [atmf secure-mode](#)  
[show atmf secure-mode](#)  
[show atmf secure-mode certificates](#)

**Command changes** Version 5.4.7-0.3: command added

# atmf secure-mode certificate renew

**Overview** Use this command to force all local certificates to expire and be renewed on an AMF secure mode network.

Secure mode certificates renew automatically but this command could be used to renew a certificate in a situation where the automatic renewal may happen while the device is not attached to the AMF network.

**Syntax** atmf secure-mode certificate renew

**Mode** Privileged Exec

**Example** To renew a local certificate on a AMF member or AMF master, use the command:

```
awplus# atmf secure-mode certificate renew
```

**Related commands** [show atmf secure-mode certificates](#)  
[show atmf secure-mode statistics](#)

**Command changes** Version 5.4.7-0.3: command added

# atmf secure-mode enable-all

**Overview** Use this command to enable AMF secure mode on an entire network. AMF secure mode makes an AMF network more secure by:

- Adding an authorization mechanism before an AMF member is allowed to join an AMF network.
- The encryption of all AMF packets sent between AMF nodes.
- Adding support for user login authentication by RADIUS or TACACS+, and removing the requirement to have the same privileged user account in the local user database on all devices in the AMF network.
- Adding additional logging which enables network administrators to monitor attempts to gain unauthorized access to the AMF network.

Once this command is run on an AMF network, the AMF masters and AMF controllers manage the addition of AMF nodes and AMF areas to the AMF network.

This command can only be run on an AMF master.

Use the **no** variant of this command to disable AMF secure mode on an entire network.

**Syntax** `atmf secure-mode enable-all`  
`no atmf secure-mode enable-all`

**Default** Secure mode is disabled by default.

**Mode** Privileged Exec

**Usage notes** When an AMF network is running in AMF secure mode the **atmf restricted-login** feature is automatically enabled. This restricts the **atmf working-set** command to users that are logged on to an AMF master. This feature cannot be disabled independently of secure mode.

When AMF secure mode is enabled the AMF controllers and masters in the AMF network form a group of certificate authorities. A node may only join a secure AMF network once it has been authorized by a master or controller. When enabled, all devices in the AMF network must be running in secure mode. Unsecured devices will not be able to join a secure AMF network.

Running **atmf secure-mode enable-all**:

- Groups all AMF members in a working set.
- Executes **clear atmf secure-mode certificates** on the working set of members, which removes existing secure mode certificates from all the nodes.
- Groups all the AMF masters in a working set.
- Executes **atmf authorize provision all** on the working set of masters, so all masters provision all nodes.
- Groups all AMF nodes in a working set.
- Runs a script which executes **atmf secure-mode** and then writes the configuration file on each node.
- Starts a timer that ticks every 10 seconds, for a maximum of 10 times, and checks if all the secure mode capable nodes rejoin the AMF network.

Running **no atmf secure-mode enable-all**:

- Groups all AMF nodes in a working set.
- Runs a script which executes **no atmf secure-mode** and then writes the configuration file on each node.
- Starts a timer that ticks every 10 seconds, for a maximum of 10 times, and checks if all the secure mode capable nodes rejoin the AMF network.

**NOTE:** Enabling or disabling secure mode on the network saves the running-config on every device.

**Example** To enable AMF secure mode on the entire network, use the command:

```
awplus# atmf secure-mode enable-all
```

You will be prompted to confirm the action:

```
Total number of nodes 21
21 nodes support secure-mode

Enable secure-mode across the AMF network ? (y/n): y
```

To disable AMF secure mode on the entire network, use the command:

```
awplus# no atmf secure-mode enable-all
```

You will be prompted to confirm the action:

```
% Warning: All security certificates will be deleted.
Disable secure-mode across the AMF network ? (y/n): y
```

**Related commands** **aaa authentication auth-web**  
**show atmf**

**Command changes** Version 5.4.7-0.3: command added

## atmf select-area

**Overview** Use this command to access devices in an area outside the core area on the controller network. This command will connect you to the remote area-master of the specified area.

This command is only valid on AMF controllers.

The **no** variant of this command disconnects you from the remote area-master.

**Syntax** `atmf select-area {<area-name>|local}`  
`no atmf select-area`

| Parameter                      | Description                                                   |
|--------------------------------|---------------------------------------------------------------|
| <code>&lt;area-name&gt;</code> | Connect to the remote area-master of the area with this name. |
| <code>local</code>             | Return to managing the local controller area.                 |

**Mode** Privileged Exec

**Usage notes** After running this command, use the **atmf working-set** command to select the set of nodes you want to access in the remote area.

**Example** To access nodes in the area Canterbury, use the command

```
controller-1# atmf select-area Canterbury
```

This displays the following output:

```
Test_network[3]#atmf select-area Canterbury
=====
Connected to area Canterbury via host Avensis:
=====
```

To return to the local area for controller-1, use the command

```
controller-1# atmf select-area local
```

Alternatively, to return to the local area for controller-1, use the command

```
controller-1# no atmf select-area
```

**Related commands** **atmf working-set**

# atmf topology-gui enable

**Overview** Use this command to enable the operation of Vista Manager EX on the Master device.

Vista Manager EX delivers state-of-the-art monitoring and management for your Autonomous Management Framework™ (AMF) network, by automatically creating a complete topology map of switches, firewalls and wireless access points (APs). An expanded view includes third-party devices such as security cameras.

Use the **no** variant of this command to disable operation of Vista Manager EX.

**Syntax** atmf topology-gui enable  
no atmf topology-gui enable

**Default** Disabled by default on AMF Master and member nodes. Enabled by default on Controllers.

**Mode** Global Configuration mode

**Usage notes** To use Vista Manager EX, you must also enable the HTTP service on all AMF nodes, including all AMF masters and controllers. The HTTP service is enabled by default on AlliedWare Plus switches and disabled by default on AR-Series firewalls. To enable it, use the commands:

```
Node1# configure terminal
Node1(config)# service http
```

On one master in each AMF area in your network, you also need to configure the master to send event notifications to Vista Manager EX. To do this, use the commands:

```
Node1# configure terminal
Node1(config)# log event-host <ip-address> atmf-topology-event
```

**Examples** To enable Vista Manager EX on Node1, use the commands:

```
Node1# configure terminal
Node1(config)# atmf topology-gui enable
```

To disable Vista Manager EX on Node1, use the commands:

```
Node1# configure terminal
Node1(config)# no atmf topology-gui enable
```

**Related** **atmf enable**  
**commands** **log event-host**  
**service http**

# atmf trustpoint

**Overview** Use this command to set a PKI trustpoint for an AMF network. This command needs to be run on an AMF master or controller.

The self-signed certificate authority (CA) certificate is distributed to every node on the AMF network. It is used to verify client certificates signed by the trustpoint.

Use the **no** variant of this command to remove an AMF trustpoint.

**Syntax** `atmf trustpoint <trustpoint-name>`  
`no atmf trustpoint <trustpoint-name>`

| Parameter                            | Description             |
|--------------------------------------|-------------------------|
| <code>&lt;trustpoint-name&gt;</code> | Name of the trustpoint. |

**Default** No trustpoint is configured by default.

**Mode** Global Configuration

**Usage notes** Before using the **atmf trustpoint** command you will need to establish a trustpoint. For example, you can create a local self-signed trustpoint using the procedure outlined below.

Create a self-signed trustpoint called 'our\_trustpoint' with keypair 'our\_key':

```
awplus# configure terminal
awplus(config)# crypto pki trustpoint our_trustpoint
awplus(ca-trustpoint)# enrollment selfsigned
awplus(ca-trustpoint)# rsakeypair our_key
awplus(ca-trustpoint)# exit
awplus(config)# exit
```

Create the root and server certificates for this trustpoint:

```
awplus# crypto pki authenticate our_trustpoint
awplus# crypto pki enroll our_trustpoint
```

For more information about the AlliedWare Plus implementation of Public Key Infrastructure (PKI), see the [Public Key Infrastructure \(PKI\) Feature Overview and Configuration Guide](#)

**Example** To configure an AMF trustpoint for the trustpoint 'our\_trustpoint', use the commands:

```
awplus# configure terminal
awplus(config)# atmf trustpoint our_trustpoint
```

To remove an AMF trustpoint for the trustpoint 'our\_trustpoint', use the commands:

```
awplus# configure terminal
awplus(config)# no atmf trustpoint our_trustpoint
```

**Related commands** [crypto pki trustpoint](#)  
[show atmf](#)

**Command changes** Version 5.4.7-2.1: command added

# atmf virtual-crosslink

**Overview** Use this command to create a virtual crosslink. A virtual crosslink connects an AMF master or controller on a physical device to a Virtual AMF Appliance (VAA) master or controller.

All AMF master nodes must reside in the same AMF domain and are required to be directly connected using AMF crosslinks. In order to be able to meet this requirement for AMF masters running on VAAs, a virtual crosslink connects the AMF master or controller on the physical device to the master or controller on the VAA.

Note that AlliedWare Plus CentreCOM Series switches are AMF Edge nodes and do not support virtual links or crosslinks. This is because each edge node can only have a single physical AMF link.

Use the **no** variant of this command to remove a virtual crosslink.

**Syntax** atmf virtual-crosslink id <local-id> ip <local-ip> remote-id <remote-id> remote-ip <remote-ip>  
atmf virtual-crosslink id <local-id> ip <local-ip> remote-id <remote-id> remote-host <domainname>  
no atmf virtual-crosslink id <local-id>

| Parameter                | Description                                               |
|--------------------------|-----------------------------------------------------------|
| id <local-id>            | ID of the local tunnel port, a value between 1 and 4094.  |
| ip <local-ip>            | IPv4 address of the local tunnel port in a.b.c.d format.  |
| remote-id <remote-id>    | ID of the remote tunnel port, a value between 1 and 4094. |
| remote-ip <remote-ip>    | IPv4 address of the remote tunnel port in a.b.c.d format. |
| remote-host <domainname> | The domain name of the remote node.                       |

**Default** No AMF virtual crosslinks are created by default.

**Mode** Global Configuration

**Usage notes** This command allows a virtual tunnel to be created between two remote sites over a Layer 3 link. The tunnel encapsulates AMF packets and allows them to be sent transparently across a Wide Area Network (WAN) such as the Internet.

Configuration involves creating a local tunnel ID, a local IP address, a remote tunnel ID, and a remote IP address or domain name. Each side of the tunnel must be configured with the same, but mirrored parameters.

**NOTE:** *Virtual crosslinks are not supported on AMF container masters, therefore if multiple tenants on a single VAA host are configured for secure mode, only a single AMF master is supported per area.*

**Example** To setup a virtual link from a local site, 'siteA', to a remote site, 'siteB', (assuming there is already IP connectivity between the sites), run the following commands at the local site:

```
siteA# configure terminal
siteA(config)# atmf virtual-crosslink id 5 ip 192.168.100.1
remote-id 10 remote-ip 192.168.200.1
```

At the remote site, run the commands:

```
siteB# configure terminal
siteB(config)# atmf virtual-crosslink id 10 ip 192.168.200.1
remote-id 5 remote-ip 192.168.100.1
```

To remove this virtual crosslink, run the following commands on the local site:

```
siteA# configure terminal
siteA(config)# no atmf virtual-crosslink id 5
```

On the remote site, run the commands:

```
siteB# configure terminal
siteB(config)# no atmf virtual-crosslink id 10
```

**Related commands** [atmf virtual-crosslink](#)  
[show atmf links](#)  
[switchport atmf-crosslink](#)

**Command changes** Version 5.5.2-0.1: **remote-host** parameter added  
Version 5.4.7-0.3: command added

## atmf virtual-link

**Overview** This command creates one or more Layer 2 tunnels that enable AMF nodes to transparently communicate across a wide area network using Layer 2 connectivity protocols.

Once connected through the tunnel, the remote member will have the same AMF capabilities as a directly connected AMF member.

Note that AlliedWare Plus CentreCOM Series switches are AMF Edge nodes and do not support virtual links or crosslinks. This is because each edge node can only have a single physical AMF link.

Use the **no** variant of this command to remove the specified virtual link.

**Syntax**

```
atmf virtual-link id <1-4094> ip <a.b.c.d> remote-id <1-4094>  
remote-ip <a.b.c.d> [remote-area <area-name>]  
atmf virtual-link id <1-4094> interface <interface-name> remote-  
id <1-4094> remote-ip <a.b.c.d> [remote-area <area-name>]  
atmf virtual-link id <1-4094> ip <a.b.c.d> remote-id <1-4094>  
remote-host <domainname> [remote-area <area-name>]  
atmf virtual-link id <1-4094> interface <interface-name> remote-  
id <1-4094> remote-host <domainname> [remote-area <area-name>]  
no atmf virtual-link id <1-4094>
```

| Parameter                     | Description                                                                                                                                                                                                                                                       |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id <1-4094>                   | ID of the local tunnel point, in the range 1 to 4094.                                                                                                                                                                                                             |
| ip <a.b.c.d>                  | Specify the local IP address of the local interface for the virtual-link (alternatively you can specify the interface's name, see below).                                                                                                                         |
| interface<br><interface-name> | Specify the local interface name for the virtual-link. This allows you to use a dynamic, rather than a static, local IP address.                                                                                                                                  |
| remote-id<br><1-4094>         | The ID of the (same) tunnel that will be applied by the remote node. Note that this must match the local-id that is defined on the remote node. This means that (for the same tunnel) the local and remote tunnel IDs are reversed on the local and remote nodes. |
| remote-ip<br><a.b.c.d>        | The IP address of the remote node.                                                                                                                                                                                                                                |
| remote-host<br><domainname>   | The domain name of the remote node.                                                                                                                                                                                                                               |
| remote-area<br><area-name>    | The name of the remote area connected to this virtual-link.                                                                                                                                                                                                       |

**Mode** Global Configuration

**Usage notes** The Layer 2 tunnel that this command creates enables a local AMF session to appear to pass transparently across a Wide Area Network (WAN) such as the Internet. The addresses configured as the local and remote tunnel IP addresses must have IP connectivity to each other. If the tunnel is configured to connect a head office and branch office over the Internet, typically this would involve using some type of managed WAN service such as a site-to-site VPN. Tunnels are only supported using IPv4.

Configuration involves creating a local tunnel ID, a local IP address, a remote tunnel ID and a remote IP address or domain name. A reciprocal configuration is also required on the corresponding remote device. The local tunnel ID must be unique to the device on which it is configured.

If an interface acquires its IP address dynamically then the local side of the tunnel can be specified by using the interface's name instead of using its IP address. When using a dynamic local address the remote address of the other side of the virtual-link must be configured with either:

- the IP address of the NAT device the dynamically configured interface is behind, or
- 0.0.0.0, if the virtual-link is configured as a secure virtual-link.

For instructions on how to configure dynamic IP addresses on virtual-links, see the [AMF Feature Overview and Configuration Guide](#).

The tunneled link may operate via external (non AlliedWare Plus) routers in order to provide wide area network connectivity. However in this configuration, the routers perform a conventional router to router connection. The protocol tunneling function is accomplished by the AMF nodes.

**NOTE:** *AMF cannot achieve zero touch replacement of the remote device that terminates the tunnel connection, because you must pre-configure the local IP address and tunnel ID on that remote device.*

**Example 1** Use the following commands to create the tunnel shown in the figure below.

### AMF virtual link example

```
Node_10(config)# atmf virtual-link id 1 ip 192.168.1.1 remote-id
2 remote-ip 192.168.2.1
Node_20(config)# atmf virtual-link id 2 ip 192.168.2.1 remote-id
1 remote-ip 192.168.1.1
```

**Example 2** To set up an area virtual link to a remote site (assuming IP connectivity between the sites already), one site must run the following commands:

```
SiteA# configure terminal
```

```
SiteA(config)# atmf virtual-link id 5 ip 192.168.100.1 remote-id
10 remote-ip 192.168.200.1 remote-area SiteB-AREA
```

The second site must run the following commands:

```
SiteB# configure terminal
```

```
SiteB(config)# atmf virtual-link id 10 ip 192.168.200.1 remote-
id 5 remote-ip 192.168.100.1 remote-area SiteA-AREA
```

Before you can apply the above **atmf virtual-link** command, you must configure the area names *SiteB-AREA* and *SiteA-AREA*.

**Command** Version 5.5.2-0.1: **remote-host** parameter added  
**changes** Version 5.4.9-0.1: **interface** parameter added

# atmf virtual-link description

**Overview** Use this command to add a description to an existing AMF virtual-link.

Note that AlliedWare Plus CentreCOM Series switches are AMF Edge nodes and do not support virtual links or crosslinks. This is because each edge node can only have a single physical AMF link.

Use the **no** variant of this command to remove a description from an AMF virtual-link.

**Syntax** `atmf virtual-link id <1-4094> description <description>`  
`no atmf virtual-link id <1-4094> description`

| Parameter                        | Description                         |
|----------------------------------|-------------------------------------|
| <code>id &lt;1-4094&gt;</code>   | ID of the local tunnel point.       |
| <code>&lt;description&gt;</code> | A description for the virtual-link. |

**Default** No description is set by default.

**Mode** Global Configuration

**Example** To add a description to the virtual-link with id '5', use the commands:

```
awplus# configure terminal
```

```
awplus(config)# atmf virtual-link id 5 description T0 SITE B
```

To remove a description from the virtual-link with id '5', use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no atmf virtual-link id 5
```

## atmf virtual-link protection

**Overview** Use this command to add protection to an existing AMF virtual-link. Secure AMF virtual-links encapsulate the L2TPv3 frames of the virtual-link with IPsec.

Note that AlliedWare Plus CentreCOM Series switches are AMF Edge nodes and do not support virtual links or crosslinks. This is because each edge node can only have a single physical AMF link.

Use the **no** variant of this command to remove protection from an AMF virtual-link.

**Syntax** `atmf virtual-link id <1-4094> protection ipsec key [8] <key-string>`

`no atmf virtual-link id <1-4094> protection`

| Parameter | Description                                                                                                                                                                         |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id        | Specify the link ID.                                                                                                                                                                |
|           | < Link ID in the range 1 to 4094                                                                                                                                                    |
| p         | Protection is on for this link.                                                                                                                                                     |
| i         | Security provided using IPsec.                                                                                                                                                      |
| k         | Set the shared key.                                                                                                                                                                 |
| 8         | Specifies a string in an encrypted format instead of plain text. The running config will display the new password as an encrypted string even if password encryption is turned off. |
| < s       | Specify the shared key for the link.                                                                                                                                                |

**Default** Protection is off by default.

**Mode** Global Configuration

**Usage notes** Considered the following limitations when creating a secure virtual-link:

- Switch devices support a maximum of 20 downstream AMF nodes when using a secure virtual-link as an uplink.
- When there are two or more AMF members behind a shared NAT device, only one of the members will be able to use secure virtual-links.
- An AMF multi-tenant environment supports a maximum cumulative total of 1200 secure virtual-links across all AMF containers.

**Example** To create and configure a virtual link with protection, first create the virtual-link:

```
Host-A# configure terminal
```

```
Host-A(config)# atmf virtual-link id 1 ip 192.168.1.1 remote-id  
2 remote-ip 192.168.2.1
```

The enable protection on the virtual link:

```
Host-A(config)# atmf virtual-link id 1 protection ipsec key  
securepassword
```

Repeat these steps on the other side of the link:

```
Host-B(config)# atmf virtual-link id 2 ip 192.168.2.1 remote-id  
1 remote-ip 192.168.1.1
```

```
Host-B(config)# atmf virtual-link id 2 protection ipsec key  
securepassword
```

**Command changes** Version 5.4.9-0.1: command added

# atmf working-set

**Overview** Use this command to execute commands across an individually listed set of AMF nodes or across a named group of nodes.

Note that this command can only be run on a master node.

Use the **no** variant of this command to remove members or groups from the current working-set.

**Syntax** `atmf working-set { [<node-list> ] | [group {<group-list> | all | local | current}] }`  
`no atmf working-set { [<node-list> ] | [group <group-list>] }`

| Parameter                       | Description                                                                                                                                                                                                                      |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;node-list&gt;</code>  | A comma delimited list (without spaces) of nodes to be included in the working-set.                                                                                                                                              |
| <code>group</code>              | The AMF group.                                                                                                                                                                                                                   |
| <code>&lt;group-list&gt;</code> | A comma delimited list (without spaces) of groups to be included in the working-set. Note that this can include either defined groups, or any of the Automatic, or Implicit Groups shown earlier in the bulleted list of groups. |
| <code>all</code>                | All nodes in the AMF.                                                                                                                                                                                                            |
| <code>local</code>              | Local node<br>Running this command with the parameters <b>group local</b> will return you to the local prompt and local node connectivity.                                                                                       |
| <code>current</code>            | Nodes in current list.                                                                                                                                                                                                           |

**Mode** Privileged Exec

### Usage notes

You can put AMF nodes into groups by using the **atmf group (membership)**.

This command opens a session on multiple network devices. When you change the working set to anything other than the local device, the prompt will change to the AMF network name, followed by the size of the working set, shown in square brackets. This command has to be run at privilege level 15.

In addition to the user defined groups, the following system assigned groups are automatically created:

- Implicit Groups
  - local: The originating node.
  - current: All nodes that comprise the current working-set.
  - all: All nodes in the AMF.
- Automatic Groups - These can be defined by hardware architecture, e.g. x510, x610, x8100, AR3050S or AR4050S, or by certain AMF nodal designations such as master.

Note that the Implicit Groups do not appear in **show atmf group** command output.

If a node is an AMF master it will be automatically added to the master group.

**Example 1** To add all nodes in the AMF to the working-set, use the command:

```
node1# atmf working-set group all
```

**NOTE:** This command adds the implicit group "all" to the working set, where "all" comprises all nodes in the AMF.

This command displays an output screen similar to the one shown below:

```
=====
node1, node2, node3, node4, node5, node6:
=====

Working set join

ATMF_NETWORK_Name[6]#
```

**Example 2** To return to the local prompt, and connect to only the local node, use the command:

```
ATMF_Network_Name[6]# atmf working-set group local
node1#
```

The following table describes the meaning of the prompts in this example.

| Parameter         | Description                                                           |
|-------------------|-----------------------------------------------------------------------|
| ATMF_Network_Name | The name of the AMF network, as set by the <b>atmf network-name</b> . |
| [6]               | The number of nodes in the working-set.                               |
| node1             | The name of the local node, as set by the <b>hostname</b> .           |

## bridge-group (amf-container)

**Overview** Use this command to connect an AMF container to a bridge created on a Virtual AMF Appliance (VAA) virtual machine for AMF Cloud. This allows the AMF container to connect to a physical network.

Note that this command is only available on AMF Cloud, not on AlliedWare Plus switches.

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

Use the **no** variant of this command to remove a bridge-group from an AMF container.

**Syntax** bridge-group <bridge-id>  
no bridge-group

| Parameter   | Description                                                    |
|-------------|----------------------------------------------------------------|
| <bridge-id> | The ID of the bridge group to join, a number between 1 and 64. |

**Mode** AMF Container Configuration

**Usage notes** Each container has two virtual interfaces:

1. Interface eth0, used to connect to the AMF controller on the VAA host via an AMF area-link, and configured using this [area-link](#) command.
2. Interface eth1, used to connect to the outside world using a bridged L2 network link, and configured using the **bridge-group** command.

Before using this command, a bridge must be created with the same bridge-id on the VAA host using the **bridge <bridge-id>** command.

See the [AMF Feature Overview and Configuration Guide](#) for more information on configuring the bridge.

**Example** To assign a bridge group to AMF container 'vac-wlg-1', use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# bridge-group 1
```

**Related** **atmf container**

**changes**

# clear application-proxy threat-protection

**Overview** Use this command to clear the threat protection for a specified address.

**Syntax** `clear application-proxy threat-protection {<ip-address>|<mac-address>|all}`

| Parameter     | Description                                                                 |
|---------------|-----------------------------------------------------------------------------|
| <ip-address>  | The IPv4 address you wish to clear the threat for, in A.B.C.D format.       |
| <mac-address> | The MAC address you wish to clear the threat for, in HHHH.HHHH.HHHH format. |
| all           | Clear the threat for all IPv4 and MAC addresses.                            |

**Mode** Privileged Exec

**Example** To clear the threat for 10.34.199.117, use the command:

```
awplus# clear application-proxy threat-protection 10.34.199.117
```

**Related commands**

- [application-proxy quarantine-vlan](#)

**Command changes** Version 5.4.7-2.2: command added

## clear atmf links

**Overview** Use this command with no parameters to manually reset all the AMF links on a device. You can optionally specify an interface or range of interfaces to reset the links on.

Certain events or topology changes can cause AMF links to be incorrect or outdated. Clearing the links forces AMF to relearn the information from neighboring nodes and create a fresh, correct, view of the network.

**Syntax** `clear atmf links [<interface-list>]`

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <interface-list> | <p>The interfaces or ports to perform the reset on. An interface-list can be:</p> <ul style="list-style-type: none"><li>• a switchport (e.g. port1.0.1)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li><li>• a local port (e.g. of0)</li><li>• You can specify a continuous range of interfaces separated by a hyphen, or a comma-separated list (e.g. port1.0.1, port1.0.4-port1.0.18).</li></ul> <p>The specified interfaces must exist.</p> <p>If this parameter is left out then all links of the specified type will be reset on the device.</p> |

**Mode** Privileged Exec

**Example** To clear all AMF links on a device, use the following command:

```
awplus# clear atmf links
```

To clear all AMF links on port1.0.1 to port1.0.4 and static aggregator sa1, use the following command:

```
awplus# clear atmf links port1.0.1-port1.0.4,sa1
```

**Related commands** [clear atmf links virtual](#)  
[show atmf links](#)

**Command changes** Version 5.4.8-2.1: command added

# clear atmf links virtual

**Overview** Use this command with no parameters to manually reset all the AMF virtual links on a device. You can, optionally, specify a comma separated list of virtual links to reset.

Certain events or topology changes can cause AMF links to be incorrect or outdated. Clearing the links forces AMF to relearn the information from neighboring nodes and create a fresh, correct view of the network.

**Syntax** `clear atmf links virtual [<virtuallink-list>]`

| Parameter          | Description                                                                                                                                                                                                                        |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <virtuallink-list> | A single, or list, of AMF virtual link identifiers to reset. This must be a comma separated list of links e.g. <i>vlink1</i> , <i>vlink2</i> , <i>vlink3</i> . Specifying a link range e.g. <i>vlink1-vlink3</i> is not supported. |

**Mode** Privileged Exec

**Example** To clear all AMF virtual links on a device, use the following command:

```
awplus# clear atmf links virtual
```

To clear AMF virtual links *vlink11* and *vlink21*, use the following command:

```
awplus# clear atmf links virtual vlink11,vlink22
```

**Related commands** [clear atmf links](#)  
[show atmf links](#)

**Command changes** Version 5.4.8-2.1: command added

# clear atmf links statistics

**Overview** This command resets the values of all AMF link, port, and global statistics to zero.

**Syntax** clear atmf links statistics

**Mode** Privilege Exec

**Example** To reset the AMF link statistics values, use the command:

```
node_1# clear atmf links statistics
```

**Related commands** [show atmf links statistics](#)

# clear atmf recovery-file

**Overview** Use this command to delete all of a node's recovery files. It deletes the recovery files stored on:

- the local node,
- neighbor nodes, and
- external media (USB or SD card).

**Syntax** clear atmf recovery-file

**Mode** Privileged Exec

**Usage notes** AMF recovery files are created for nodes with special links. Special links include:

- virtual links,
- area links terminating on an AMF master, and
- area virtual links terminating on an AMF master.

An AMF node with one of these special links pushes its startup configuration to its neighbors and to any attached external media. It then fetches and applies this configuration at recovery time. This configuration enables it to contact the AMF master and initiate a recovery.

Recovery files can become out of date if:

- a node's neighbor is off line when changes are made to its configuration, or
- when a node no longer contains a special link.

**Example** To clear a node's recovery files, use the command:

```
node1# clear atmf recovery-file
```

**Output** The following shows typical output.

**If AlliedWare Plus detects that a node contains a special link then the following message is displayed**

```
node1#clear atmf recovery-file
% Warning: ATMF recovery files have been removed.
ATMF recovery may fail. Please save running-configuration.
```

**Related commands** [show atmf recovery-file](#)

**Command changes** Version 5.4.8-0.2: command added

# clear atmf secure-mode certificates

**Overview** Use this command to remove all certificates from an AMF member or master. AMF nodes will need to be re-authorized once this command has been run.

**Syntax** clear atmf secure-mode certificates

**Mode** Privileged Exec

**Example** To clear all certificates from an AMF node, use the command:

```
awplus# clear atmf secure-mode certificates
```

If this is the only master on the network you will see the following warning:

```
% Warning: This node is the only master in the network!
All the nodes will become isolated and refuse to join any ATMF
network. The certificates on all the isolated nodes must be
cleared before rejoining an ATMF network will be possible.

To clear certificates a reboot of the device is required.
Clear certificates and Reboot ? (y/n):
```

On an AMF member you will see the following message:

```
To clear certificates a reboot of the device is required.
Clear certificates and Reboot ? (y/n):
```

# clear atmf secure-mode statistics

**Overview** Use this command to reset all secure mode statistics to 0.

**Syntax** clear atmf secure-mode statistics

**Mode** Privileged Exec

**Example** To reset the AMF secure mode statistics information, use the command:

```
awplus# clear atmf secure-mode statistic
```

**Related commands** [show atmf secure-mode](#)  
[show atmf secure-mode statistics](#)

**Command changes** Version 5.4.7-0.3: command added

## clone (amf-provision)

**Overview** This command sets up a space on the backup media for use with a provisioned node and copies into it almost all files and directories from a chosen backup or provisioned node.

Alternatively, you can set up a new, unique provisioned node by using the command **create (amf-provision)**.

**Syntax** clone <source-nodename>

| Parameter         | Description                                                                        |
|-------------------|------------------------------------------------------------------------------------|
| <source-nodename> | The name of the node whose configuration is to be copied for loading to the clone. |

**Mode** AMF Provisioning

**Usage notes** This command is only available on master nodes in the AMF network.

When using this command it is important to be aware of the following:

- A copy of <media>:atmf/<atmf\_name>/nodes/<source\_node>/flash will be made for the provisioned node and stored in the backup media.
- The directory <node\_backup\_dir>/flash/.config/ssh is excluded from the copy.
- All contents of <root\_backup\_dir>/nodes/<nodename> will be deleted or overwritten.
- Settings for the expected location of other provisioned nodes are excluded from the copy.

The active and backup configuration files are automatically modified in the following ways:

- The **hostname** command is modified to match the name of the provisioned node.
- The **stack virtual-chassis-id** command is removed, if present.

**Example** To copy from the backup of 'device2' to create backup files for the new provisioned node 'device3' use the following command:

```
device1# atmf provision node device3
device1(atmf-provision)# clone device2
```

#### Sample output from the clone command

```
device1# atmf provision node device3
device1(atmf-provision)#clone device2
Copying...
Successful operation
```

To confirm that a new provisioned node has been cloned, use the command:

```
device1# show atmf backup
```

The output from this command is shown in the following figure, and shows the details of the new provisioned node 'device3'.

#### Sample output from the show atmf backup command

```
device1#show atmf backup

Scheduled Backup ..... Enabled

**Command changes** Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

# configure boot config (amf-provision)

**Overview** This command sets the configuration file to use during the next boot cycle. This command can also set a backup configuration file to use if the main configuration file cannot be accessed for an AMF provisioned node. To unset the boot configuration or the backup boot configuration use the **no boot** command.

**Syntax** `configure boot config [backup] <file-path|URL>`  
`configure no boot config [backup]`

| Parameter       | Description                                         |
|-----------------|-----------------------------------------------------|
| backup          | Specify that this is the backup configuration file. |
| <file-path URL> | The path or URL and name of the configuration file. |

**Default** No boot configuration files or backup configuration files are specified for the provisioned node.

**Mode** AMF Provisioning

**Usage notes** When using this command to set a backup configuration file, the specified AMF provisioned node must exist. The specified file must exist in the flash directory created for the provisioned node in the AMF remote backup media.

**Examples** To set the configuration file 'branch.cfg' on the AMF provisioned node 'node1', use the command:

```
MasterNodeName# atmf provision node node1
```

```
MasterNodeName(atmf-provision)# configure boot config branch.cfg
```

To set the configuration file 'backup.cfg' as the backup to the main configuration file on the AMF provisioned node 'node1', use the command:

```
MasterNodeName(atmf-provision)# configure boot config backup  
usb:/atmf/amf_net/nodes/node1/config/backup.cfg
```

To unset the boot configuration, use the command:

```
MasterNodeName(atmf-provision)# configure no boot config
```

To unset the backup boot configuration, use the command:

```
MasterNodeName(atmf-provision)# configure no boot config backup
```

- clone (amf-provision)**
- configure boot system (amf-provision)**
- create (amf-provision)**
- delete (amf-provision)**
- identity (amf-provision)**
- license-cert (amf-provision)**
- locate (amf-provision)**
- show atmf provision nodes**

**Command changes** Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

# configure boot system (amf-provision)

**Overview** This command sets the release file that will load onto a specified provisioned node during the next boot cycle. This command can also set the backup release file to be loaded for an AMF provisioned node. To unset the boot system release file or the backup boot release file use the **no boot** command.

Use the **no** variant of this command to return to the default.

This command can only be run on AMF master nodes.

**Syntax** configure boot system [backup] <file-path|URL>  
configure no boot system [backup]

| Parameter       | Description                                   |
|-----------------|-----------------------------------------------|
| <file-path URL> | The path or URL and name of the release file. |

**Default** No boot release file or backup release files are specified for the provisioned node.

**Mode** AMF Provisioning

**Usage notes** When using this command to set a backup release file, the specified AMF provisioned node must exist. The specified file must exist in the flash directory created for the provisioned node in the AMF remote backup media.

**Examples** To set the release file x930-5.4.9-0.1.rel on the AMF provisioned node 'node1', use the command:

```
MasterNodeName# atmf provision node node1
MasterNodeName(atmf-provision)# configure boot system
x930-5.4.9-0.1.rel
```

To set the backup release file x930-5.4.8-2.5.rel as the backup to the main release file on the AMF provisioned node 'node1', use the command:

```
MasterNodeName# atmf provision node node1
MasterNodeName(atmf-provision)# configure boot system backup
card:/atmf/amf_net/nodes/node1/flash/x930-5.4.8-2.5.rel
```

To unset the boot release, use the command:

```
MasterNodeName# atmf provision node node1
MasterNodeName(atmf-provision)# configure no boot system
```

To unset the backup boot release, use the command:

```
MasterNodeName# atmf provision node node1
MasterNodeName(atmf-provision)# configure no boot system backup
```

- show atmf provision nodes**

**Command changes** Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

# copy (amf-provision)

**Overview** Use this command to copy configuration and release files for the node you are provisioning.

For more information about using the copy command see [copy \(filename\)](#) in the File and Configuration Management chapter.

**Syntax** copy [force] <source-name> <destination-name>

| Parameter          | Description                                                                                                                                         |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| force              | This parameter forces the copy command to overwrite the destination file, if it already exists, without prompting the user for confirmation.        |
| <source-name>      | The filename and path of the source file. See the <a href="#">Introduction</a> of the File and Configuration Management chapter for valid syntax.   |
| <destination-name> | The filename and path for the destination file. See <a href="#">Introduction</a> of the File and Configuration Management chapter for valid syntax. |

**Mode** AMF Provisioning

**Example** To copy a configuration file named current.cfg from Node\_4's Flash into the future\_node directory, and set that configuration file to load onto future\_node, use the following commands:

```
node_4# atmf provision node future_node
node_4(atmf-provision)# create
node_4(atmf-provision)# locate
node_4(atmf-provision)# copy flash:current.cfg ./future_node.cfg
node_4(atmf-provision)# configure boot config future_node.cfg
```

**Command changes** Version 5.4.9-2.1: command added

## create (amf-provision)

**Overview** This command sets up an empty directory on the backup media for use with a provisioned node. This directory can have configuration and release files copied to it from existing devices. Alternatively, the configuration files can be created by the user.

An alternative way to create a new provisioned node is with the command **clone (amf-provision)**.

This command can only run on AMF master nodes.

**Syntax** create

**Mode** AMF Provisioning

**Usage notes** This command is only available on master nodes in the AMF network.

A date and time is assigned to the new provisioning directory reflecting when this command was executed. If there is a backup or provisioned node with the same name on another AMF master then the most recent one will be used.

**Example** To create a new provisioned node named "device2" use the command:

```
device1# atmf provision node device2
device1(atmf-provision)# create
```

Running this command will create the following directories:

- `<media>:atmf/<atmf_name>/nodes/<node>`
- `<media>:atmf/<atmf_name>/nodes/<node>/flash`

To confirm the new node's settings, use the command:

```
device1# show atmf backup
```

The output for the **show atmf backup** command is shown in the following figure, and shows details for the new provisioned node 'device2'.

#### Sample output from the show atmf backup command

```
device1#show atmf backup
```

**Command changes** Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

## debug atmf

**Overview** This command enables the AMF debugging facilities, and displays information that is relevant (only) to the current node. The detail of the debugging displayed depends on the parameters specified.

If no additional parameters are specified, then the command output will display all AMF debugging information, including link events, topology discovery messages and all notable AMF events.

The **no** variant of this command disables either all AMF debugging information, or only the particular information as selected by the command's parameters.

**Syntax** debug atmf [link|crosslink|arealink|database|neighbor|error|all]  
no debug atmf [link|crosslink|arealink|database|neighbor|error|all]

| Parameter | Description                                                                       |
|-----------|-----------------------------------------------------------------------------------|
| link      | Output displays debugging information relating to uplink or downlink information. |
| crosslink | Output displays all crosslink events.                                             |
| arealink  | Output displays all arealink events.                                              |
| database  | Output displays only notable database events.                                     |
| neighbor  | Output displays only notable AMF neighbor events.                                 |
| error     | Output displays AMF error events.                                                 |
| all       | Output displays all AMF events.                                                   |

**Default** All debugging facilities are disabled.

**Mode** User Exec and Global Configuration

**Usage notes** If no additional parameters are specified, then the command output will display all AMF debugging information, including link events, topology discovery messages and all notable AMF events.

**NOTE:** An alias to the variant of this command is .

**Examples** To enable all AMF debugging, use the command:

```
node_1# debug atmf
```

To enable AMF uplink and downlink debugging, use the command:

```
node_1# debug atmf link
```

To enable AMF error debugging, use the command:

```
node_1# debug atmf error
```

**Related commands** [no debug all](#)

# debug atmf packet

**Overview** This command configures AMF Packet debugging parameters. The debug only displays information relevant to the current node. The command has following parameters:

**Syntax** debug atmf packet [direction {rx|tx|both}] [level {1|2|3}] [timeout <seconds>] [num-pkts <quantity>] [filter {node <name>| interface <ifname>} [pkt-type [1][2][3][4][5][6][7][8][9][10][11][12][13]]]

**Simplified Syntax**

|                   |                          |                                                        |
|-------------------|--------------------------|--------------------------------------------------------|
| debug atmf packet | [direction {rx tx both}] |                                                        |
|                   | [level {[1][2 3]}]       |                                                        |
|                   | [timeout <seconds>]      |                                                        |
|                   | [num-pkts <quantity>]    |                                                        |
| debug atmf packet | filter                   | [node <name>]                                          |
|                   |                          | [interface <ifname>]                                   |
|                   |                          | [pkt-type [1][2][3][4][5][6][7][8][9][10][11][12][13]] |

**NOTE:** You can combine the syntax components shown, but when doing so, you must retain their original order.

**Default** Level 1, both Tx and Rx, a timeout of 60 seconds with no filters applied.

**NOTE:** An alias to the variant of this command - - can be found elsewhere in this chapter.

**Mode** User Exec and Global Configuration

**Usage notes** If no additional parameters are specified, then the command output will apply a default selection of parameters shown below:

| Parameter  | Description                                                                                       |
|------------|---------------------------------------------------------------------------------------------------|
| direction  | Sets debug to packet received, transmitted, or both                                               |
| rx         | packets received by this node                                                                     |
| tx         | Packets sent from this node                                                                       |
| 1          | AMF Packet Control header Information, Packet Sequence Number. Enter 1 to select this level.      |
| 2          | AMF Detailed Packet Information. Enter 2 to select this level.                                    |
| 3          | AMF Packet HEX dump. Enter 3 to select this level.                                                |
| timeout    | Sets the execution timeout for packet logging                                                     |
| <seconds>  | Seconds                                                                                           |
| num-pkts   | Sets the number of packets to be dumped                                                           |
| <quantity> | The actual number of packets                                                                      |
| filter     | Sets debug to filter packets                                                                      |
| node       | Sets the filter on packets for a particular Node                                                  |
| <name>     | The name of the remote node                                                                       |
| interface  | Sets the filter to dump packets from an interface (portx.x.x) on the local node                   |
| <ifname>   | Interface port or virtual-link                                                                    |
| pkt-type   | Sets the filter on packets with a particular AMF packet type                                      |
| 1          | Crosslink Hello BPDU packet with crosslink links information. Enter 1 to select this packet type. |
| 2          | Crosslink Hello BPDU packet with downlink domain information. Enter 2 to select this packet type. |
| 3          | Crosslink Hello BPDU packet with uplink information. Enter 3 to select this packet type.          |

| Parameter | Description                                                                 |
|-----------|-----------------------------------------------------------------------------|
| 4         | Downlink and uplink hello BPDU packets. Enter 4 to select this packet type. |
| 5         | Non broadcast hello unicast packets. Enter 5 to select this packet type.    |
| 6         | Stack hello unicast packets. Enter 6 to select this packet type.            |
| 7         | Database description. Enter 7 to select this packet type.                   |
| 8         | DBE request. Enter 8 to select this packet type.                            |
| 9         | DBE update. Enter 9 to select this packet type.                             |
| 10        | DBE bitmap update. Enter 10 to select this packet type.                     |
| 11        | DBE acknowledgment. Enter 11 to select this packet type.                    |
| 12        | Area Hello Packets. Enter 12 to select this packet type.                    |
| 13        | Gateway Hello Packets. Enter 13 to select this packet type.                 |

**Examples** To set a packet debug on node 1 with level 1 and no timeout, use the command:

```
node_1# debug atmf packet direction tx timeout 0
```

To set a packet debug with level 3 and filter packets received from AMF node 1:

```
node_1# debug atmf packet direction tx level 3 filter node_1
```

To enable send and receive 500 packets only on vlink1 for packet types 1, 7, and 11, use the command:

```
node_1# debug atmf packet num-pkts 500 filter interface vlink1  
pkt-type 1 7 11
```

This example applies the **debug atmf packet** command and combines many of its options:

```
node_1# debug atmf packet direction rx level 1 num-pkts 60  
filter node x930 interface port1.0.1 pkt-type 4 7 10
```

# delete (amf-provision)

**Overview** This command deletes files that have been created for loading onto a provisioned node. It can only be run on master nodes.

**Syntax** delete

**Mode** AMF Provisioning

**Usage notes** This command is only available on master nodes in the AMF network. The command will only work if the provisioned node specified in the command has already been set up (although the device itself is still yet to be installed). Otherwise, an error message is shown when the command is run.

You may want to use the **delete** command to delete a provisioned node that was created in error or that is no longer needed.

This command cannot be used to delete backups created by the AMF backup procedure. In this case, use the command **atmf backup delete** to delete the files.

**NOTE:** *This command allows provisioned entries to be deleted even if they have been referenced by the command, so take care to only delete unwanted entries.*

**Example** To delete backup files for a provisioned node named device3 use the command:

```
device1# atmf provision node device3
device1(atmf-provision)# delete
```

To confirm that the backup files for provisioned node device3 have been deleted use the command:

```
device1# show atmf backup
```

The output should show that the provisioned node device3 no longer exists in the backup file, as shown in the figure below:

**Sample output showing the show atmf backup command**

```
device1#show atmf backup
Scheduled Backup ..... Enabled
  Schedule ..... 1 per day starting at 03:00
  Next Backup Time .... 01 Oct 2016 03:00
Backup Bandwidth ..... Unlimited
Backup Media ..... USB (Total 7446.0MB, Free 7297.0MB)
Server Config .....
  Synchronization ..... Unsynchronized
  Last Run ..... -
  1 ..... Unconfigured
  2 ..... Unconfigured
Current Action ..... Idle
Started ..... -
Current Node ..... -
```

| Node Name | Date        | Time     | In ATMF | On Media | Status |
|-----------|-------------|----------|---------|----------|--------|
| device1   | 30 Sep 2016 | 00:05:49 | No      | Yes      | Good   |
| device2   | 30 Sep 2016 | 00:05:44 | Yes     | Yes      | Good   |

**Command changes** Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

# discovery

**Overview** Use this command to specify how AMF learns about guest nodes.

AMF nodes gather information about guest nodes by using one of the internally defined discovery methods: dynamic, static, or agent.

**Dynamic** learning (the default method) means that AMF learns the guest's IP and MAC addresses from LLDP or DHCP snooping. Dynamic learning is only supported when using IPv4. For IPv6, use static learning.

With dynamic learning, ensure that the command **ip dhcp snooping delete-by-linkdown** is set.

**Static** learning uses the **switchport atmf-guestlink** command to specify the guest class name and IP address of the guest node attached to each individual switch port. AMF then learns the MAC addresses of each of the guests of that class from ARP or Neighbor discovery tables.

If you are using the static method, ensure that you have configured the appropriate class type for each of your statically discovered guest nodes.

**Agent** learning uses the AMF agent to retrieve the guest's IP and MAC address. It is only available on guest nodes that support ATMF agent, such as TQ5403 series access points. For step-by-step instructions on using agent discovery for auto-recovery of an TQ5403 series AP, see the **AMF Feature Overview and Configuration Guide**.

The **no** variant of this command returns the discovery method to **dynamic**.

**Syntax** discovery [dynamic|static|agent]  
no discovery

| Parameter | Description                          |
|-----------|--------------------------------------|
| dynamic   | Learned from DCHCP Snooping or LLDP. |
| static    | Statically assigned.                 |
| agent     | Learned from the AMF agent.          |

**Default** Dynamic

**Mode** AMF Guest Configuration

**Usage notes** This command is one of several modal commands that are configured and applied for a specific guest-class (mode). Its settings are automatically applied to a guest-node link by the **switchport atmf-guestlink** command.

**NOTE:** AMF guest nodes are not supported on ports using the OpenFlow protocol.

**Example 1** To configure static discovery for the guest-class 'camera', use the following commands:

```
Node1# configure terminal

Node1(config)# atmf guest-class camera

Node1(config-atmf-guest)# discovery static
```

**Example 2** To return the discovery method for the guest class TQ6602 to its default of **dynamic**, use the following commands:

```
Node1# configure terminal

Node1(config)# atmf guest-class TQ6602

Node1(config-atmf-guest)# no discovery
```

**Related commands** **atmf guest-class**

**switchport atmf-guestlink**

**show atmf links guest**

**show atmf nodes**

**Command changes** Version 5.5.3-0.1: **agent** parameter added

## description (amf-container)

**Overview** Use this command to set the description on an AMF container on a Virtual AMF Appliance (VAA).

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

Use the **no** variant of this command to remove the description from an AMF container.

**Syntax** `description <description>`  
`no description`

| Parameter                        | Description                                                      |
|----------------------------------|------------------------------------------------------------------|
| <code>&lt;description&gt;</code> | Enter up to 128 characters of text describing the AMF container. |

**Mode** AMF Container Configuration

**Example** To set the description for AMF container “vac-wlg-1” to “Wellington area”, use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# description Wellington area
```

To remove the description for AMF container “vac-wlg-1”, use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# no description
```

**Related commands** [atmf container](#)  
[show atmf container](#)

**Command changes** Version 5.4.7-0.1: command added

# erase factory-default

**Overview** This command erases all data from flash **except** the following:

- the boot release file (a .rel file) and its release setting file
- all license files
- the latest GUI release file

The device is then rebooted and returned to its factory default condition. The device can then be used for AMF automatic node recovery.

**Syntax** erase factory-default

**Mode** Privileged Exec

**Usage notes** This command is an alias to the **atmf cleanup** command.

Note that you cannot use this command if you have **strict-user-process-control** enabled. Disable it before entering the **erase factory-default** command.

**Example** To erase data, use the command:

```
Node_1# erase factory-default
```

This command will erase all NVS, all flash contents except for the boot release, a GUI resource file, and any license files, and then reboot the switch. Continue? (y/n):y

**Related commands** **atmf cleanup**

## firmware-url

**Overview** Use this command to specify the location of an AP guest node's firmware file when preparing the AP for auto-recovery. AMF cannot back up AP firmware files (only configuration files), so you need to store the firmware file somewhere accessible and use this command to provide the AlliedWare Plus device with the file's location.

For step-by-step instructions for auto-recovery of an TQ5403 series AP, see the [AMF Feature Overview and Configuration Guide](#).

Use the **no** variant of this command to remove the URL.

**Syntax** `firmware-url <name>`  
`no firmware-url`

| Parameter                 | Description                                                                                                                                                                                                                                                   |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;name&gt;</code> | The file's directory or filename. We recommend specifying a directory because that makes it easier to keep the firmware file up to date. The following protocols are supported: http, https, tftp, usb, and card. Do not change the firmware file's filename. |

**Default** No URL is configured

**Mode** AMF Guest Configuration

**Example** To specify, on a device named node2, that the firmware file for a TQ5403 AP is stored in the top level of a USB stick, use the commands:

```
node2# configure terminal
node2(config)# atmf guest-class TQ5403
node2(config-guest)# firmware-url usb:
```

To specify, on a device named node2, that the firmware file for a TQ5403 AP is stored on a TFTP server with an address of 192.168.2.1, use the commands:

```
node2# configure terminal
node2(config)# atmf guest-class TQ5403
node2(config-guest)# firmware-url tftp://192.168.2.1/
```

**Related commands** **atmf guest-class**  
**discovery**  
**login-fallback enable**  
**modeltype**  
**show atmf guests**  
**show atmf guests detail**  
**switchport atmf-guestlink**

**Command changes** Version 5.5.3-0.1: command added

# http-enable

**Overview** This command is used to enable GUI access to a guest node. When **http-enable** is configured, the port number is set to its default of 80. If the guest node is using a different port for HTTP, you can configure this using the **port** parameter.

This command is used to inform the GUI that this device has an HTTP interface at the specified port number so that a suitable URL can be provided to the user.

Use the **no** variant of this command to disable HTTP.

**Syntax** `http-enable [port <port-number>]`  
`no http-enable`

| Parameter     | Description                       |
|---------------|-----------------------------------|
| port          | TCP port number.                  |
| <port-number> | The port number to be configured. |

**Default** Not set

**Mode** AMF Guest Configuration

**Usage notes** If **http-enable** is selected without a **port** parameter the port number will default to 80.

**Example** To enable HTTP access to a guest node on port 80 (the default), use the following commands:

```
node1# configure terminal
node1(config)# atmf guest-class Camera
node1(config-atmf-guest)# http-enable
```

To enable HTTP access to a guest node on port 400, use the following commands:

```
node1# configure terminal
node1(config)# atmf guest-class Camera
node1(config-atmf-guest)# http-enable port 400
```

To disable HTTP access to a guest node, use the following commands:

```
node1# configure terminal
node1(config)# atmf guest-class Camera
node1(config-atmf-guest)# no http-enable
```

**Related commands** **atmf guest-class**  
**switchport atmf-guestlink**  
**show atmf links guest**  
**show atmf nodes**

## identity (amf-provision)

**Overview** Use this command to create an identity token for provisioning an isolated AMF node. An isolated node is an AMF member that is only connected to the rest of the AMF network via a virtual-link.

This command allows these nodes, which have no AMF neighbors, to be identified for provisioning purposes. They are identified using an identity token which is based on either the next-hop MAC address of the provisioned node, or the serial number of the device being provisioned. This identity token is stored on the AMF master.

Use the **no** variant of this command to remove the identity token for a node.

**Syntax** `identity mac-address <mac-address> prefix <ip-address/prefix-length>`  
`identity serial-number <serial-number> prefix <ip-address/prefix-length>`  
`no identity`

| Parameter                  | Description                                                                                 |
|----------------------------|---------------------------------------------------------------------------------------------|
| mac-address                | Specify the next-hop MAC address of the device being provisioned.                           |
| <mac-address>              | MAC address of the port the provisioned node is connected to, in the format xxxx.xxxx.xxxx. |
| serial-number              | Specify the serial number of the device to be provisioned.                                  |
| <serial-number>            | Serial number of the device that is being provisioned.                                      |
| prefix                     | IPv4 address, and prefix length, of the virtual-link interface on the isolated node         |
| <ip-address/prefix-length> | IPv4 address, and prefix length, in A.B.C.D/M format.                                       |

**Mode** AMF Provisioning

**Usage notes** To provision an isolated node, first create a configuration for the node using the **create (amf-provision)** and/or the **clone (amf-provision)** commands.

Then create an identity token for the provisioned node by either specifying its next-hop MAC address or by specifying the serial number of the replacement device. The advantage of using the next-hop MAC address is that any device, regardless of its serial number, can be added to the network but using the serial number maybe preferred in situations where the next-hop MAC address is not easy to obtain.

The **atmf recovery-server** option must be enabled on the AMF master before attempting to provision the device. This option allows the AMF master to process recovery requests from isolated AMF nodes.

See the **AMF Feature Overview and Configuration Guide** for information on preparing your network for recovering or provisioning isolated nodes.

**Example** To create a identity token on your AMF master for a device named "my-x930" with serial number "A10064A172100008", use the command:

```
awplus# atmf provision node my-x930
awplus(atmf-provision)# identity serial-number A10064A172100008
prefix 192.168.2.25/24
```

To create a identity token on your AMF master for a device named "my-x930" with next-hop MAC address "0000.cd28.0880", use the command:

```
awplus# atmf provision node my-x930
awplus(atmf-provision)# identity mac-address 0000.cd28.0880
prefix 192.168.2.25/24
```

To delete the identity token from your AMF master for a device named "my-x930", use the command:

```
awplus# atmf provision node my-x930
awplus(atmf-provision)# no identity
```

## license-cert (amf-provision)

**Overview** This command is used to set up the license certificate for a provisioned node.

The certificate file usually has all the license details for the network, and can be stored anywhere in the network. This command makes a hidden copy of the certificate file and stores it in the space set up for the provisioned node on AMF backup media.

For node provisioning, the new device has not yet been part of the AMF network, so the user is unlikely to know its product ID or its MAC address. When such a device joins the network, assuming that this command has been applied successfully, the copy of the certificate file will be applied automatically to the provisioned node.

Once the new device has been resurrected on the network and the certificate file has been downloaded to the provisioned node, the hidden copy of the certificate file is deleted from AMF backup media.

Use the **no** variant of this command to set it back to the default.

This command can only be run on AMF master nodes.

**Syntax** license-cert <file-path|URL>  
no license-cert

| Parameter       | Description                                                                   |
|-----------------|-------------------------------------------------------------------------------|
| <file-path URL> | The name of the certificate file. This can include the file-path of the file. |

**Default** No license certificate file is specified for the provisioned node.

**Mode** AMF Provisioning

**Usage notes** This command is only available on master nodes in the AMF network. It will only operate if the provisioned node specified in the command has already been set up, and if the license certification is present in the backup file. Otherwise, an error message is shown when the command is run.

**Example 1** To apply the license certificate 'cert1.txt' stored on a TFTP server for AMF provisioned node "device2", use the command:

```
device1# atmf provision node device2
device1(atmf-provision)# license-cert tftp://192.168.1.1/
cert1.txt
```

**Example 2** To apply the license certificate 'cert2.txt' stored in the AMF master's flash directory for AMF provisioned node 'host2', use the command:

```
device1# atmf provision node host2
device1(atmf-provision)# license-cert /cert2.txt
```

To confirm that the license certificate has been applied to the provisioned node, use the command **show atmf provision nodes**. The output from this command is shown below, and displays license certification details in the last line.

### Sample output from the show atmf provision nodes command

```
device1#show atmf provision nodes
ATMF Provisioned Node Information:
Backup Media .....: SD (Total 3827.0MB, Free 3481.1MB)
Node Name           : device2
Date & Time         : 06-Oct-2016 & 23:25:44
Provision Path      : card:/atmf/nodes
Boot configuration :
Current boot image  : x510-5.4.6-1.4.rel (file exists)
Backup boot image   : x510-5.4.6-1.3.rel (file exists)
Default boot config : flash:/default.cfg (file exists)
Current boot config : flash:/abc.cfg (file exists)
Backup boot config  : flash:/xyz.cfg (file exists)
Software Licenses :
Repository file     : ../configs/.sw_v2.lic
                   : ../configs/.swfeature.lic
Certificate file    : card:/atmf/lok/nodes/awplus1/flash/.atmf-lic-cert
```

- show atmf provision nodes**

**Command changes** Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

# locate (amf-provision)

**Overview** This command changes the present working directory to the directory of a provisioned node. This makes it easier to edit files and create a unique provisioned node in the backup.

This command can only be run on AMF master nodes.

**NOTE:** We advise that after running this command, you return to a known working directory, typically flash.

**Syntax** locate

**Mode** AMF Provisioning

**Example** To change the working directory that happens to be on device1 to the directory of provisioned node device2, use the following command:

```
device1# atmf provision node device2  
device1[atmf-provision]# locate
```

The directory of the node device2 should now be the working directory. You can use the command **pwd** to check this, as shown in the following figure.

## Sample output from the pwd command

```
device2#pwd  
card:/atmf/building_2/nodes/device2/flash
```

The output above shows that the working directory is now the flash of device2.

**Command changes** Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

# log event-host

**Overview** Use this command to set up an external host to log AMF topology events through Vista Manager. This command is run on the Master device.

Use the **no** variant of this command to disable log events through Vista Manager.

**Syntax** log event-host [<ipv4-addr>|<ipv6-addr>] atmf-topology-event  
no log event-host [<ipv4-addr>|<ipv6-addr>] atmf-topology-event

| Parameter   | Description                    |
|-------------|--------------------------------|
| <ipv4-addr> | ipv4 address of the event host |
| <ipv6-addr> | ipv6 address of the event host |

**Default** Log events are disabled by default.

**Mode** Global Configuration

**Usage notes** Event hosts are set so syslog sends the messages out as they come.  
Note that there is a difference between log event and log host messages:

- Log event messages are sent out as they come by syslog
- Log host messages are set to wait for a number of messages (20) to send them out together for traffic optimization.

**Example** To enable Node 1 to log event messages from host IP address 192.0.2.31, use the following commands:

```
Node1# configure terminal
```

```
Node1(config)# log event-host 192.0.2.31 atmf-topology-event
```

To disable Node 1 to log event messages from host IP address 192.0.2.31, use the following commands:

```
Node1# configure terminal
```

```
Node1(config)# no log event-host 192.0.2.31 atmf-topology-event
```

**Related commands** [atmf topology-gui enable](#)

# login-fallback enable

**Overview** Use this command to enable login fallback on TQ model AMF guest nodes. This allows AMF to try the factory default username and password if the guest node's saved username and password fail.

Use the **no** variant of this command to disable login fallback.

**Syntax** login-fallback enable  
no login-fallback enable

**Default** Disabled

**Mode** AMF Guest Configuration

**Usage notes** This feature is only supported on TQ model guest nodes.

Login fallback means: if a guest node's saved username and password fail, AMF will try to connect to the node using the factory default username and password (manager/friend). When a new TQ replaces an existing TQ, this allows the new TQ to be discovered and managed as an AMF guest node. AMF can then start the AMF guest node recovery procedure.

**Example** To use the login fallback feature, first create an AMF guest class for TQ model APs. Then enable the login fall back feature.

For example, to enable login fallback on the guest-class AT-TQ5k, use the commands:

```
node1#configuration terminal
node1(config)#atmf guest-class AT-TQ5k
node1(config-atmf-guest)#login-fallback enable
node1(config-atmf-guest)#end
node1#
```

**Related commands** [atmf guest-class](#)

**Command changes** Version 5.5.0-1.1: command added

# modeltype

**Overview** This command sets the expected model type of the guest node. The model type will default to **other** if nothing is set.

Use the **no** variant of this command to reset the model type to **other**.

**Syntax** modeltype {alliedware|aw+|onvif|tq|other}  
no modeltype

| Parameter  | Description                                                  |
|------------|--------------------------------------------------------------|
| alliedware | A legacy Allied Telesis operating system.                    |
| aw+        | The Allied Telesis AlliedWare Plus operating system.         |
| onvif      | ONVIF (Open Network Video Interface Forum) Profile Q devices |
| tq         | An Allied Telesis TQ Series wireless access point.           |
| other      | Used where the model type is outside the above definitions.  |

**Default** Default to **other**

**Mode** AMF Guest Configuration

**Examples** To assign the model type **tq** to the guest-class called 'tq\_device', use the commands:

```
node1# configure terminal
node1(config)# atmf guest-class tq_device
node1(config-vmf-guest)# modeltype tq
```

To remove the model type **tq** from the guest-class called 'tq\_device', and reset it to the default of **other**, use the commands:

```
node1# configure terminal
node1(config)# atmf guest-class tq_device
node1(config-vmf-guest)# no modeltype
```

**Related commands** [atmf guest-class](#)

**Command changes** Version 5.4.9-2.1: **onvif** parameter added

# service atmf-application-proxy

**Overview** Use this command to enable the AMF Application Proxy service. This service distributes messages across all AMF nodes.

Currently this is used for threat protection. When an AMF Security (AMF-Sec) Controller detects a threat, it issues a request to block the address the threat originated from. The AMF Application Proxy service distributes this message to all AMF nodes. An AMF master accepts this block request and instructs the subordinate AMF node to block the relevant device.

Use the **no** variant of this command to disable the AMF Application Proxy service.

**Syntax** service atmf-application-proxy  
no service atmf-application-proxy

**Default** The AMF Application Proxy service is disabled by default.

**Mode** Global Configuration

**Usage notes** The AMF master maintains a list of all threats and will send this list to any AMF node, or VCS member, when it boots and joins the AMF network.

In order for this to work the follow must be configured:

- the AMF Application Proxy service on all AMF nodes that need to receive the messages.
- the Hypertext Transfer Protocol (HTTP) service on all nodes that are running the AMF Application Proxy service (see [service http](#)).

**Example** To enable the AMF Application Proxy service, use the commands

```
awplus# configure terminal  
awplus(config)# service atmf-application-proxy
```

To disable the AMF Application Proxy service, use the commands

```
awplus# configure terminal  
awplus(config)# no service atmf-application-proxy
```

**Command changes** Version 5.4.7-2.2: command added

# show application-proxy threat-protection

**Overview** Use this command to list all the IP addresses blocked by the AMF Application Proxy service. It also shows the global threat-detection configuration.

**Syntax** show application-proxy threat-protection [all]

| Parameter | Description                               |
|-----------|-------------------------------------------|
| all       | Include information for non-local blocks. |

**Mode** Privileged Exec

**Example** To list the addresses blocked by the AMF Application Proxy service, use the command:

```
awplus# show application-proxy threat-protection
```

**Output** The following shows typical output.

**Example output from show application-proxy threat-protection**

```
awplus#show application-proxy threat-protection
Quarantine Vlan      : vlan200
Global IP-Filter     : Enabled
IP-Filter Limit Exceeded : 0
Redirect-URL         : http://my.dom/help.html

Client IP      Interface      MAC Address      VLAN      Action
-----
10.34.199.110  -                          -          -          link-down
10.34.199.116  port1.0.3      001a.eb93.ec5d  1          drop
10.1.179.1     *                *              *          ip-filter
...
```

**Parameters in the output from show application-proxy threat-protection**

| Parameter                | Description                                                                  |
|--------------------------|------------------------------------------------------------------------------|
| Quarantine Vlan          | The name of the quarantine VLAN.                                             |
| Global IP-Filter         | The status of global IP filtering.                                           |
| IP-Filter Limit Exceeded | The number of times an ACL failed to be installed due to insufficient space. |
| Redirect-URL             | The URL a blocked user is redirected to.                                     |

**Command changes** Version 5.4.9-0.1: command added

# show atmf

**Overview** Displays information about the current AMF node.

**Syntax** `show atmf [summary|tech|nodes|session]`

| Parameter | Description                                               |
|-----------|-----------------------------------------------------------|
| summary   | Displays summary information about the current AMF node.  |
| tech      | Displays global AMF information.                          |
| nodes     | Displays a list of AMF nodes together with brief details. |
| session   | Displays information on an AMF session.                   |

**Default** Only summary information is displayed.

**Mode** User Exec and Privileged Exec

**Usage notes** AMF uses internal VLANs to communicate between nodes about the state of the AMF network. Two VLANs have been selected specifically for this purpose. Once these have been assigned, they are reserved for AMF and cannot be used for other purposes

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Example 1** To show summary information on AMF node\_1 use the following command:

```
node_1# show atmf summary
```

## Output from the show atmf summary command

```
node_1#show atmf summary
ATMF Summary Information:

ATMF Status           : Enabled
Network Name          : Test_network
Node Name              : node_1
Role                   : Master
Restricted login       : Disabled
Current ATMF Nodes    : 3
```

**Example 2** To show information specific to AMF nodes use the following command:

```
node_1# show atmf nodes
```

**Example 3** The **show amf session** command displays all CLI (Command Line Interface) sessions for users that are currently logged in and running a CLI session.

To display AMF active sessions, use the following command:

```
node_1# show atmf session
```

For example, in the output below, node\_1 and node\_5 have active users logged in.

#### **Output from the show atmf session command**

```
node_1#show atmf session

CLI Session Neighbors

Session ID           : 73518
Node Name            : node_1
PID                  : 7982
Link type            : Broadcast-cli
MAC Address          : 0000.0000.0000
Options              : 0
Our bits             : 0
Link State           : Full
Domain Controller    : 0
Backup Domain Controller : 0
Database Description Sequence Number : 00000000
First Adjacency      : 1
Number Events        : 0
DBE Retransmit Queue Length : 0
DBE Request List Length : 0
Session ID           : 410804
Node Name            : node_5
PID                  : 17588

First Adjacency      : 1
Number Events        : 0
DBE Retransmit Queue Length : 0
DBE Request List Length : 0
```

**Example 4** The AMF tech command collects all the AMF commands, and displays them. You can use this command when you want to see an overview of the AMF network.

To display AMF technical information, use the following command:

```
node_1# show atmf tech
```

#### Output from the show atmf tech command

```
node_1#show atmf tech
ATMF Summary Information:

ATMF Status           : Enabled
Network Name          : ATMF_NET
Node Name              : node_1
Role                   : Master
Current ATMF Nodes    : 8

ATMF Technical information:

Network Name           : ATMF_NET
Domain                 : node_1's domain
Node Depth             : 0
Domain Flags           : 0
Authentication Type    : 0
MAC Address            : 0014.2299.137d
Board ID               : 287
Domain State           : DomainController
Domain Controller      : node_1
Backup Domain Controller : node2
Domain controller MAC   : 0014.2299.137d
Parent Domain          : -
Parent Domain Controller : -
Parent Domain Controller MAC : 0000.0000.0000
Number of Domain Events : 0
Crosslink Ports Blocking : 0
Uplink Ports Waiting on Sync : 0
Crosslink Sequence Number : 7
Domains Sequence Number : 28
Uplink Sequence Number  : 2

DBE Checksum            : 84fc6
Number of DBE Entries    : 0
Management Domain Ifindex : 4391
Management Domain VLAN   : 4091
Management ifindex       : 4392
Management VLAN          : 4092
```

#### Parameter definitions from the show atmf tech command

| Parameter    | Definition                                         |
|--------------|----------------------------------------------------|
| ATMF Status  | The Node's AMF status, either Enabled or Disabled. |
| Network Name | The AMF network that a particular node belongs to. |
| Node Name    | The name assigned to a particular node.            |

| Parameter          | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Role               | The role configured for this AMF device, either Master or Member.                                                                                                                                                                                                                                                                                                                                                                                               |
| Current ATMF Nodes | The count of AMF nodes in an AMF Network.                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Node Address       | An address used to access a remotely located node (.atmf).                                                                                                                                                                                                                                                                                                                                                                                                      |
| Node ID            | A unique identifier assigned to a Node on an AMF network.                                                                                                                                                                                                                                                                                                                                                                                                       |
| Node Depth         | The number of nodes in path from this node to level of the AMF root node. It can be thought of as the vertical depth of the AMF network from a particular node to the zero level of the AMF root node.                                                                                                                                                                                                                                                          |
| Domain State       | The state of Node in a Domain in AMF network as Controller/Backup.                                                                                                                                                                                                                                                                                                                                                                                              |
| Recovery State     | The AMF node recovery status. Indicates whether a node recovery is in progress on this device - Auto, Manual, or None.                                                                                                                                                                                                                                                                                                                                          |
| Management VLAN    | <p>The VLAN created for traffic between Nodes of different domain (up/down links).</p> <ul style="list-style-type: none"> <li>VLAN ID - In this example VLAN 4092 is configured as the Management VLAN.</li> <li>Management Subnet - Network prefix for the subnet.</li> <li>Management IP Address - The IP address allocated for this traffic.</li> <li>Management Mask - The subnet mask used to create a subnet for this traffic (255.255.128.0).</li> </ul> |
| Domain VLAN        | <p>The VLAN assigned for traffic between Nodes of same domain (crosslink).</p> <ul style="list-style-type: none"> <li>VLAN ID - In this example VLAN 4091 is configured as the domain VLAN.</li> <li>Domain Subnet. The subnet address used for this traffic.</li> <li>Domain IP Address. The IP address allocated for this traffic.</li> <li>Domain Mask. The subnet mask used to create a subnet for this traffic (255.255.128.0).</li> </ul>                 |
| Device Type        | The Product Series name.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| ATMF Master        | Whether the node is an AMF master node for its area ('Y' if it is and 'N' if it is not).                                                                                                                                                                                                                                                                                                                                                                        |
| SC                 | The device configuration, one of C - Chassis (SBx8100 Series), S - Stackable (VCS) or N - Standalone.                                                                                                                                                                                                                                                                                                                                                           |
| Parent             | The node to which the current node has an active uplink.                                                                                                                                                                                                                                                                                                                                                                                                        |
| Node Depth         | The number of nodes in the path from this node to the master node.                                                                                                                                                                                                                                                                                                                                                                                              |

**Related commands** [show atmf detail](#)

## show atmf area

**Overview** Use this command to display information about an AMF area. On AMF controllers, this command displays all areas that the controller is aware of. On remote AMF masters, this command displays the controller area and the remote local area. On gateways, this command displays the controller area and remote master area.

**Syntax** `show atmf area [detail] [<area-name>]`

| Parameter                      | Description                                                                     |
|--------------------------------|---------------------------------------------------------------------------------|
| <code>detail</code>            | Displays detailed information                                                   |
| <code>&lt;area-name&gt;</code> | Displays information about master and gateway nodes in the specified area only. |

**Mode** Privileged Exec

**Example 1** To show information about all areas, use the command:

```
controller-1# show atmf area
```

The following figure shows example output from running this command on a controller.

**Example output from the show atmf area command on a Controller.**

```
controller-1#show atmf area
```

ATMF Area Information:

\* = Local area

| Area Name   | Area ID | Local Gateway | Remote Gateway | Remote Master    | Node Count |
|-------------|---------|---------------|----------------|------------------|------------|
| * NZ        | 1       | Reachable     | N/A            | N/A              | 3          |
| Wellington  | 2       | Reachable     | Reachable      | Auth OK          | 120        |
| Canterbury  | 3       | Reachable     | Reachable      | Auth Error       | -          |
| SiteA-AREA  | 14      | Unreachable   | Unreachable    | Unreachable      | -          |
| Auckland    | 100     | Reachable     | Reachable      | Auth Start       | -          |
| Southland   | 120     | Reachable     | Reachable      | Auth OK          | 54         |
| Area count: | 6       |               |                | Area node count: | 177        |

The following figure shows example output from running this command on a remote master.

**Example output from the show atmf area command on a remote master.**

```
Canterbury#show atmf area
```

ATMF Area Information:

\* = Local area

| Area Name    | Area ID | Local Gateway | Remote Gateway | Remote Master          | Node Count |
|--------------|---------|---------------|----------------|------------------------|------------|
| NZ           | 1       | Reachable     | N/A            | N/A                    | -          |
| * Canterbury | 3       | Reachable     | N/A            | N/A                    | 40         |
| Area count:  | 2       |               |                | Local area node count: | 40         |

**Parameter definitions from the show atmf area command**

| Parameter      | Definition                                                                         |
|----------------|------------------------------------------------------------------------------------|
| *              | Indicates the area of the device on which the command is being run.                |
| Area Name      | The name of each area.                                                             |
| Area ID        | The ID of the area.                                                                |
| Local Gateway  | Whether the local gateway node is reachable or not.                                |
| Remote Gateway | Whether the remote gateway node is reachable or not. This is one of the following: |

| Parameter       | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | <ul style="list-style-type: none"><li>• Reachable, if the link has been established.</li><li>• Unreachable, if a link to the remote area has not been established. This could mean that a port or vlan is down, or that inconsistent VLANs have been configured using the <b>switchport atmf-arealink</b> command.</li><li>• N/A for the area of the controller or remote master on which the command is being run, because the gateway node on that device is local.</li><li>• Auth Start, which may indicate that the area names match on the controller and remote master, but the IDs do not match.</li><li>• Auth Error, which indicates that the areas tried to authenticate but there is a problem. For example, the passwords configured on the controller and remote master may not match, or a password may be missing on the remote master.#</li><li>• Auth OK, which indicates that area authentication was successful and you can now use the <b>atmf select-area</b> command.</li></ul> |
| Remote Master   | Whether the remote master node is reachable or not. This is N/A for the area of the controller or remote master on which the command is being run, because the master node on that device is local.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Node Count      | The number of nodes in the area.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Area Count      | The number of areas controlled by the controller.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Area Node Count | The total number of nodes in the area.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**Example 2** To show detailed information about the areas, use the command:

```
controller-1# show atmf area detail
```

The following figure shows example output from running this command.

#### Output from the show atmf area detail command

```
controller-1#show atmf area detail

ATMF Area Detail Information:

Controller distance      : 0

Controller Id           : 21
Backup Available        : FALSE

Area Id                 : 2
Gateway Node Name       : controller-1
Gateway Node Id         : 342
Gateway Ifindex         : 6013
Masters Count           : 1
Master Node Name        : well-master (329)
Node Count              : 2

Area Id                 : 3
Gateway Node Name       : controller-1
Gateway Node Id         : 342
Gateway Ifindex         : 4511
Masters Count           : 2
Master Node Name        : cant1-master (15)
Master Node Name        : cant2-master (454)
Node Count              : 2
```

**Related commands** [show atmf area summary](#)  
[show atmf area nodes](#)  
[show atmf area nodes-detail](#)

# show atmf area guests

**Overview** This command will display details of all guests that the controller is aware of.

**Syntax** show atmf area guests [<area-name> [<node-name>]]

| Parameter   | Description                                       |
|-------------|---------------------------------------------------|
| <area-name> | The area name for guest information               |
| <node-name> | The name of the node that connects to the guests. |

**Default** n/a

**Mode** User Exec/Privileged Exec

**Example 1** To display atmf area guest nodes on a controller, use the command,  
GuestNode[1]#show atmf area guests

**Output** The following shows typical output.

## Example output from the show atmf area guests command

|                                            |                |                |       |                 |
|--------------------------------------------|----------------|----------------|-------|-----------------|
| main-building Area Guest Node Information: |                |                |       |                 |
| Device Type                                | MAC Address    | Parent         | Port  | IP/IPv6 Address |

## Parameters in the output from show atmf area guests command

| Parameter   | Description                                                         |
|-------------|---------------------------------------------------------------------|
| Device Type | The device type as read from the guest node.                        |
| MAC Address | The MAC address of the guest-node                                   |
| Parent      | The device that directly connects to the guest-node                 |
| Port        | The port number on the parent node that connects to the guest node. |
| IP/IPv6     | The IP or IPv6 address of the guest node.                           |

# show atmf area guests-detail

**Overview** This command displays the local and remote guest information from an AMF controller.

**Syntax** show atmf area guests-detail [*<area-name>*] [*<node-name>*]

| Parameter                | Description                                                                                                  |
|--------------------------|--------------------------------------------------------------------------------------------------------------|
| <i>&lt;area-name&gt;</i> | The name assigned to the AMF area. An area is an AMF network that is under the control of an AMF Controller. |
| <i>&lt;node-name&gt;</i> | The name assigned to the network node.                                                                       |

**Mode** Privileged Exec

**Example** To display detailed information for all guest nodes attached to “node1”, which is located within the area named “northern”, use the following command:

```
AMF_controller#show atmf area guests-detail northern node1
```

**Output** The following shows typical output.

**Example output from the show atmf guest detail command.**

```
#show atmf guest detail

Node Name           : Node1
Port Name           : port1.0.5
Ifindex             : 5005
Guest Description    : tq4600
Device Type         : AT-TQ4600
Configuration Mismatch : No
Backup Supported     : Yes
MAC Address         : eccd.6df2.da60

**Parameters shown in the output of the show atmf guest detail command**

| Parameter         | Description                                                                                                                                           |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node Name         | The name of the guest's parent node.                                                                                                                  |
| Port Name         | The port on the parent node that connects to the guest.                                                                                               |
| Ifindex           | An internal index number that maps to the port number on the parent node.                                                                             |
| Guest Description | A brief description of the guest node as manually entered into the <b>description (interface)</b> command for the guest node port on the parent node. |
| Device Type       | The device type as supplied by the guest node itself.                                                                                                 |
| Backup Supported  | Indicates whether AMF supports backup of this guest node.                                                                                             |
| MAC Address       | The MAC address of the guest node.                                                                                                                    |
| IP Address        | The IP address of the guest node.                                                                                                                     |
| IPv6 Address      | The IPv6 address of the guest node.                                                                                                                   |
| HTTP Port         | The HTTP port enables you to specify a port when enabling http to allow a URL for the http user                                                       |

| Parameter        | Description                                                                      |
|------------------|----------------------------------------------------------------------------------|
|                  | interface of a Guest Node. This is determined by the <b>http-enable</b> command. |
| Firmware Version | The firmware version that the guest node is currently running.                   |

**Related commands** **show atmf area nodes-detail**  
**show atmf area guests**

## show atmf area nodes

**Overview** Use this command to display summarized information about an AMF controller's remote nodes.

Note that this command can only be run from a controller node.

**Syntax** show atmf area nodes *<area-name>* [*<node-name>*]

| Parameter                | Description                                             |
|--------------------------|---------------------------------------------------------|
| <i>&lt;area-name&gt;</i> | Displays information about nodes in the specified area. |
| <i>&lt;node-name&gt;</i> | Displays information about the specified node.          |

**Mode** Privileged Exec

**Usage notes** If you do not limit the output to a single area or node, this command lists all remote nodes that the controller is aware of. This can be a very large number of nodes.

**Example** To show summarized information for all the nodes in area 'Wellington', use the command:

```
controller-1# show atmf area nodes wellington
```

The following figure shows partial example output from running this command.

#### Output from the show atmf area nodes wellington command

```
controller-1#show atmf area nodes wellington
```

| Wellington Area Node Information: |               |             |    |               |            |
|-----------------------------------|---------------|-------------|----|---------------|------------|
| Node Name                         | Device Type   | ATMF Master | SC | Parent Domain | Node Depth |
| well-gate                         | x230-18GP     | N           | N  | well-master   | 1          |
| well-master                       | AT-x930-28GPX | Y           | N  | none          | 0          |

Wellington node count 2

#### Parameter definitions from the show atmf area nodes command

| Parameter     | Definition                                                                                            |
|---------------|-------------------------------------------------------------------------------------------------------|
| Node Name     | The name assigned to a particular node.                                                               |
| Device Type   | The Product series name.                                                                              |
| ATMF Master   | Whether the node is an AMF master node for its area ('Y' if it is and 'N' if it is not).              |
| SC            | The device configuration, one of C - Chassis (SBx8100 series), S - Stackable (VCS) or N - Standalone. |
| Parent Domain | The node to which the current node has an active uplink.                                              |
| Node Depth    | The number of nodes in the path from this node to the master node.                                    |

**Related commands** [show atmf area](#)  
[show atmf area nodes-detail](#)

## show atmf area nodes-detail

**Overview** Use this command to display detailed information about an AMF controller's remote nodes.

Note that this command can only be run from a controller node.

**Syntax** show atmf area nodes-detail *<area-name>* [*<node-name>*]

| Parameter                | Description                                                      |
|--------------------------|------------------------------------------------------------------|
| <i>&lt;area-name&gt;</i> | Displays detailed information about nodes in the specified area. |
| <i>&lt;node-name&gt;</i> | Displays detailed information about the specified node.          |

**Mode** Privileged Exec

**Usage notes** If you do not limit the output to a single area or node, this command displays information about all remote nodes that the controller is aware of. This can be a very large number of nodes.

**Example** To show information for all the nodes in area 'Wellington', use the command:

```
controller-1# show atmf area nodes-detail Wellington
```

The following figure shows partial example output from running this command.

**Output from the show atmf area nodes-detail Wellington command**

```
controller-1#show atmf area nodes-detail Wellington

Wellington Area Node Information:
Node name well-gate
Parent node name : well-master
Domain id       : well-gate's domain
Board type      : 368
Distance to core : 1
Flags           : 50

# show atmf area summary

**Overview** Use this command to display a summary of IPv6 addresses used by AMF, for one or all of the areas controlled by an AMF controller.

**Syntax** show atmf area summary [*<area-name>*]

| Parameter                | Description                                       |
|--------------------------|---------------------------------------------------|
| <i>&lt;area-name&gt;</i> | Displays information for the specified area only. |

**Mode** Privileged Exec

**Example 1** To show a summary of IPv6 addresses used by AMF, for all of the areas controlled by controller-1, use the command:

```
controller-1# show atmf area summary
```

The following figure shows example output from running this command.

## Output from the show atmf area summary command

```
controller-1#show atmf area summary

ATMF Area Summary Information:

Management Information
  Local IPv6 Address           : fd00:4154:4d46:1::15

Area Information
  Area Name                   : NZ (Local)
  Area ID                     : 1
  Area Master IPv6 Address    : -

  Area Name                   : Wellington
  Area ID                     : 2
  Area Master IPv6 Address    : fd00:4154:4d46:2::149

  Area Name                   : Canterbury
  Area ID                     : 3
  Area Master IPv6 Address    : fd00:4154:4d46:3::f

  Area Name                   : Auckland
  Area ID                     : 100
  Area Master IPv6 Address    : fd00:4154:4d46:64::17
Interface                     : vlink2000
```

# show atmf authorization

**Overview** Use this command on an AMF master to display the authorization status of other AMF members and masters on the network.

On an AMF controller this command will show the authorization status of remote area AMF masters.

**Syntax** show atmf authorization {current|pending|provisional}

| Parameter   | Description                                                                                                                                                                                            |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| current     | Show the status of all authorized nodes.                                                                                                                                                               |
| pending     | Show the status of unauthorized nodes in the pending queue.<br><br>These are nodes that enabled secure mode with <b>atmf secure-mode</b> but have not yet been authorized with <b>atmf authorize</b> . |
| provisional | Show the status of provisionally authorized nodes.<br>These are nodes that have been provisioned with <b>atmf authorize provision</b> .                                                                |

**Mode** Privileged Exec

**Example** To display all authorized AMF nodes on an AMF controller or AMF master, use the command:

```
awplus# show atmf authorization current
```

To display AMF nodes which are requesting authorization on an AMF controller or AMF master, use the command:

```
awplus# show atmf authorization pending
```

To display AMF nodes which have provisional authorization, use the command:

```
awplus# show atmf authorization provisional
```

**Output** The following shows typical output.

**Example output from show atmf authorization current**

|                      |          |            |
|----------------------|----------|------------|
| NZ Authorized Nodes: |          |            |
| Node Name            | Signer   | Expires    |
| -----                |          |            |
| master_1             | master_1 | 4 Mar 2017 |
| area_1_node_1        | master_1 | 4 Mar 2017 |
| area_1_node_2        | master_1 | 4 Mar 2017 |

**Parameters in the output from show atmf authorization current**

| Parameter | Description                                                                                                           |
|-----------|-----------------------------------------------------------------------------------------------------------------------|
| Node Name | AMF node name of the authorized node.                                                                                 |
| Signer    | Name of the AMF master that authorized the node.                                                                      |
| Expires   | Expiry date of the authorization. Authorization expiry time is set using <b>atmf secure-mode certificate expiry</b> . |

**Output** The following shows typical output.

**Example output from show atmf authorization pending**

|                         |            |             |           |
|-------------------------|------------|-------------|-----------|
| Pending Authorizations: |            |             |           |
| NZ Requests:            |            |             |           |
| Node Name               | Product    | Parent Node | Interface |
| -----                   |            |             |           |
| area_1_node_3           | x230-18GP  | master_1    | port1.2.9 |
| area_1_node_4           | x510-52GTX | master_1    | sa1       |

**Parameters in the output from show atmf authorization pending**

| Parameter   | Description                                          |
|-------------|------------------------------------------------------|
| Node Name   | Name of the node that is requesting authorization.   |
| Product     | Product name.                                        |
| Parent Node | Authorization authority of the requesting node.      |
| Interface   | Interface that the authorization request came in on. |

**Output** The following shows typical output.

**Example output from show atmf authorization provisional**

| ATMF Provisional Authorization:    |           |                     |                    |
|------------------------------------|-----------|---------------------|--------------------|
| Area - Node Name<br>or MAC Address | Interface | Start<br>Time       | Timeout<br>Minutes |
| -----                              |           |                     |                    |
| 3333.4444.5555                     |           | 5 Sep 2016 02:35:54 | 3                  |
| 1111.2222.3333                     |           | 5 Sep 2016 02:35:24 | 60                 |
| NZ - blue                          | port1.0.3 | 5 Sep 2016 02:35:06 | 60                 |

**Parameters in the output from show atmf authorization provisional**

| Parameter                          | Description                                                                  |
|------------------------------------|------------------------------------------------------------------------------|
| Area - Node Name<br>or MAC Address | MAC address or node name of the node that has been provisionally authorized. |
| Interface                          | Interface that the node has been provisioned on.                             |
| Start Time                         | Time the node was provisioned.                                               |
| Timeout Minutes                    | Length of time from Start Time until the provisional authorization expires.  |

**Command changes** Version 5.4.7-0.3: command added

## show atmf backup

**Overview** This command displays information about AMF backup status for all the nodes in an AMF network. It can only be run on AMF master and controller nodes.

**Syntax** show atmf backup  
show atmf backup logs  
show atmf backup server-status  
show atmf backup synchronize [logs]

| Parameter     | Description                                                                           |
|---------------|---------------------------------------------------------------------------------------|
| logs          | Displays detailed log information.                                                    |
| server-status | Displays connectivity diagnostics information for each configured remote file server. |
| synchronize   | Display the file server synchronization status                                        |
| logs          | For each remote file server, display the logs for the last synchronization            |

**Mode** Privileged Exec

**Example 1** To display the AMF backup information, use the command:

```
node_1# show atmf backup
```

To display log messages to do with backups, use the command:

```
node_1# show atmf backup logs
```

### Output from show atmf backup

```
Node_1# show atmf backup
ScheduledBackup .....Enabled
  Schedule.....1 per day starting at 03:00
  Next Backup Time...04 May 2019 03:00
Backup Bandwidth .....Unlimited
Backup Media.....SD (Total 1974.0 MB, Free197.6MB)
Current Action.....Starting manual backup
Started.....04 May 2019 10:08
CurrentNode.....atmf_testbox1
Backup Redundancy ....Enabled
  Local media .....SD (Total 3788.0MB, Free 3679.5MB)
  State .....Active
```

| Node Name     | Date        | Time     | In ATMF | On Media | Status      |
|---------------|-------------|----------|---------|----------|-------------|
| atmf_testbox1 | 04 May 2019 | 09:58:59 | Yes     | Yes      | In Progress |
| atmf_testbox2 | 04 May 2019 | 10:01:23 | Yes     | Yes      | Good        |

### Output from show atmf backup logs

```
Node_1#show atmf backup logs

Backup Redundancy ..... Enabled
Local media ..... SD (Total 3788.0MB, Free 1792.8MB)
State ..... Inactive (Remote file server is not available)

Log File Location: card:/atmf/ATMF/logs/rsync_<node name>.log

Node
Name Log Details
-----
atmf_testbox
2019/05/04 18:16:51 [9045] receiving file list
2019/05/04 18:16:51 [9047] .d..t.... flash/
2019/05/04 18:16:52 [9047] >f+++++++ flash/a.rel
```

**Example 2** To display the AMF backup synchronization status, use the command:

```
node_1# show atmf backup synchronize
```

To display log messages to do with synchronization of backups, use the command:

```
node_1# show atmf backup synchronize logs
```

### Output from show atmf backup synchronize

```
Node_1#show atmf backup synchronize
ATMF backup synchronization:
* = Active file server

  Id   Date       Time       Status
-----
  1    04 May 2016  22:25:57  Synchronized
* 2    -           -         Active
```

### Output from show atmf backup synchronize logs

```
Node_1#show atmf backup synchronize logs

Id     Log Details
-----
1      2019/05/04 22:25:54 [8039] receiving file list
      2019/05/04 22:25:54 [8039] >f..t.... backup_Box1.info
      2019/05/04 22:25:54 [8039] sent 46 bytes received 39 bytes total size 40
```

**Example 3** To display the AMF backup information with the optional parameter **server-status**, use the command:

```
Node_1# show atmf backup server-status
```

```
Node1#sh atmf backup server-status

Id   Last Check   State
-----
1    186 s       File server ready
2     1 s       SSH no route to host
```

### Parameter definitions from the show atmf backup command

| Parameter         | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Scheduled Backup  | Indicates whether AMF backup scheduling is enabled or disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Schedule          | Displays the configured backup schedule.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Next Backup Time  | Displays the date and time of the next scheduled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Backup Media      | The current backup medium in use.<br>This will be one of USB, SD, or NONE.<br>Utilized and available memory (MB) will be indicated if backup media memory is present.                                                                                                                                                                                                                                                                                                                                                                    |
| Current Action    | The task that the AMF backup mechanism is currently performing. This will be a combination of either (Idle, Starting, Doing, Stopping), or (manual, scheduled).                                                                                                                                                                                                                                                                                                                                                                          |
| Started           | The date and time that the currently executing task was initiated in the format DD MMM YYYY HH:MM                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Current Node      | The name of the node that is currently being backed up.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Backup Redundancy | Whether backup redundancy is enabled or disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Local media       | The local media to be used for backup redundancy; SD, USB, INTERNAL, or NONE, and total and free memory available on the media.                                                                                                                                                                                                                                                                                                                                                                                                          |
| State             | Whether SD or USB media is installed and available for backup redundancy. May be Active (if backup redundancy is functional—requires both the local redundant backup media and a remote server to be configured and available) or Inactive.                                                                                                                                                                                                                                                                                              |
| Node Name         | The name of the node that is storing backup data - on its backup media.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Date              | The data of the last backup in the format DD MMM YYYY.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Time              | The time of the last backup in the format HH:MM:SS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| In ATMF           | Whether the node shown is active in the AMF network, (Yes or No).                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| On Media          | Whether the node shown has a backup on the backup media (Yes or No).                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Status            | The output can contain one of four values: <ul style="list-style-type: none"> <li>• “-” meaning that the status file cannot be found or cannot be read.</li> <li>• “Errors” meaning that there are issues - note that the backup may still be deemed successful depending on the errors.</li> <li>• “Stopped” meaning that the backup attempt was manually aborted.</li> <li>• “Good” meaning that the backup was completed successfully.</li> <li>• “In Progress” meaning that the backup is currently running on that node.</li> </ul> |

| Parameter         | Definition                                                                                                                                                                                |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Log File Location | All backup attempts will generate a result log file in the identified directory based on the node name. In the above example this would be: card:/amf/office/logs/rsync_amf_testbox1.log. |
| Log Details       | The contents of the backup log file.                                                                                                                                                      |
| server-status     | Displays connectivity diagnostics information for each configured remove file server.                                                                                                     |

For information on filtering and saving command output, see the **“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide**.

## show atmf backup area

**Overview** Use this command to display backup status information for the master nodes in one or more areas.

Note that this command is only available on AMF controllers.

**Syntax** show atmf backup area [*<area-name>*] [*<node-name>*] [logs]

| Parameter                | Description                                             |
|--------------------------|---------------------------------------------------------|
| logs                     | Displays the logs for the last backup of each node.     |
| <i>&lt;area-name&gt;</i> | Displays information about nodes in the specified area. |
| <i>&lt;node-name&gt;</i> | Displays information about the specified node.          |

**Mode** Privileged Exec

**Example** To show information about backups for an area, use the command:

```
controller-1# show atmf backup area
```

### Output from the show atmf backup area command

```
controller-1#show atmf backup area
Scheduled Backup ..... Enabled
Schedule ..... 12 per day starting at 14:30
Next Backup Time .... 15 Oct 2016 04:30
Backup Bandwidth ..... Unlimited
Backup Media ..... FILE SERVER 1 (Total 128886.5MB, Free 26234.2MB)
Server Config .....
* 1 ..... Configured (Mounted, Active)
  Host ..... 10.37.74.1
  Username ..... root
  Path ..... /tftpboot/backups_from_controller-1

## show atmf backup guest

**Overview** This command displays backup status information of guest nodes in an AMF network. This command can only be run on a device configured as an AMF Master and has an AMF guest license.

**Syntax** show atmf backup guest [*<node-name>*] [*<guest-port>*] [logs]

| Parameter                 | Description                        |
|---------------------------|------------------------------------|
| <i>&lt;node-name&gt;</i>  | The name of parent guest node      |
| <i>&lt;guest-port&gt;</i> | The port number on the parent node |

**Mode** User Exec/Privileged Exec

**Example** On the switch named x930-master, to display information about the AMF backup guest status, use the command:

```
x930-master# show atmf backup guest
```

**Output** The following shows typical output.

**Example output from show atmf backup guest**

```
x930-master#sh atmf backup guest
Guest Backup ..... Enabled
Scheduled Backup ..... Disabled
  Schedule ..... 1 per day starting at 03:00
  Next Backup Time .... 20 Jan 2016 03:00
Backup Bandwidth ..... Unlimited
Backup Media ..... FILE SERVER 2 (Total 655027.5MB,
                          Free 140191.5MB)

Backup Redundancy ....Enabled
Local media ..... USB (Total 7376.0MB, Free 7264.1MB)
State ..... Active

Parent Node Name      Port Name      Id      Date          Time          Status
-----
x230                  port1.0.4      2       19 Jan 2016   22:21:46      Good
                      1       19 Jan 2016   22:21:46      Good
                      USB      19 Jan 2016   22:21:46      Good
```

**Parameters in the output from show atmf backup guest**

| Parameter        | Description                                                                                                                                                                |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Guest Backup     | The status of the guest node backup process                                                                                                                                |
| Scheduled Backup | The timing configured for guest backups.                                                                                                                                   |
| Schedule         | Displays the configured backup schedule.                                                                                                                                   |
| Next Backup Time | The time the next backup process will be initiated.                                                                                                                        |
| Backup Bandwidth | The bandwidth limit applied to the backup data flow measured in kilo Bytes /second. Note that unlimited means there is no limit set specifically for the backup data flow. |
| Backup Media     | Detail of the memory media used to store the backup files and the current memory capacity available.                                                                       |

# show atmf container

**Overview** Use this command to display information about the AMF containers created on a Virtual AMF Appliance (VAA).

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

**Syntax** show atmf container [detail] [<container-name>]

| Parameter        | Description                                                        |
|------------------|--------------------------------------------------------------------|
| detail           | Show detailed information.                                         |
| <container-name> | The name of the AMF container you wish to display information for. |

**Mode** Privileged Exec

**Output** The following shows typical output.

**Example output from show atmf container**

```
awplus#show atmf container

ATMF Container Information:

  Container      Area      Bridge  State      Memory      CPU%
  -----
  vac-wlg-1      wlg       br1      running    70.3 MB     1.2
  vac-akl-1      ak1       br2      stopped    0 bytes     0.0
  vac-nsn-1      nsn       br3      running    53.2 MB     0.7

Current ATMF Container count: 3
```

**Example output from show atmf container vac-wlg-1**

```
awplus#show atmf container vac-wlg-1

ATMF Container Information:

  Container      Area      Bridge  State      Memory      CPU%
  -----
  vac-wlg-1      wlg       br1      running    70.3 MB     1.2

Current ATMF Container count: 1
```

**Parameters in the output from show atmf container**

| Parameter | Description                                                                                        |
|-----------|----------------------------------------------------------------------------------------------------|
| Container | Name of the AMF container.                                                                         |
| Area      | Name of the area the container is in.                                                              |
| Bridge    | Name of the bridge connecting the container to the physical network.                               |
| State     | Container state, running or stopped. This is set with the <b>state</b> command.                    |
| Memory    | The amount of memory the container is using on the VAA host.                                       |
| CPU%      | The percentage of CPU time the container is using on the VAA, at the time the show command is run. |

**Example output from show atmf container detail vac-wlg-1**

```
awplus#show atmf container detail vac-wlg-1

ATMF Container Information:

Name: vac-wlg-1
State: RUNNING
PID: 980
IP: 172.31.0.1
IP: 192.168.0.2
IP: fd00:4154:4d46:3c::1
CPU use: 3.95 seconds
Memory use: 67.07 MiB
```

```
Memory use: 0 bytes
Link: vethP31UFA
TX bytes: 166.01 KiB
RX bytes: 141.44 KiB
Total bytes: 307.45 KiB
Link: vethYCT7BB
TX bytes: 674.27 KiB
RX bytes: 698.27 KiB
Total bytes: 1.34 MiB
```

### Parameters in the output from show atmf container detail

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name        | Name of the AMF container.                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| State       | Container state, RUNNING or STOPPED. This is set with the <a href="#">state</a> command.                                                                                                                                                                                                                                                                                                                                                                                 |
| PID         | Internal container id.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| IP          | This lists the IP addresses used by the container. These include the eth1 IP address and the AMF management IP address.                                                                                                                                                                                                                                                                                                                                                  |
| CPU use     | The CPU usage of the container since it was enabled.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Memory use  | Container memory usage.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Link        | Each container has two links:<br><ol style="list-style-type: none"><li>1. An AMF area-link, this connects the container to the AMF controller and uses virtual interface eth0 on the AMF container.</li><li>2. A bridged L2 network link, this connects the container to the outside world and uses the virtual interface eth1 on the AMF container.</li></ol> See the <a href="#">AMF Feature Overview and Configuration_Guide</a> for more information on these links. |
| TX/RX bytes | Bytes sent and received on a link.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Total bytes | Total bytes transferred on a link.                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**Command** Version 5.4.7-0.1: command added  
**changes**

# show atmf detail

**Overview** This command displays details about an AMF node. It can only be run on AMF master and controller nodes.

**Syntax** show atmf detail

| Parameter | Description                       |
|-----------|-----------------------------------|
| detail    | Displays output in greater depth. |

**Mode** Privileged Exec

**Example 1** To display the AMF node1 information in detail, use the command:

```
controller-1# show atmf detail
```

A typical output screen from this command is shown below:

```
atmf-1#show atmf detail
ATMF Detail Information:

Network Name           : Test_network
Network Mtu           : 1300
Node Name              : controller-1
Node Address           : controller-1.atmf
Node ID                : 342
Node Depth             : 0
Domain State           : BackupDomainController
Recovery State         : None
Recovery Over ETH Ports : Disabled
Log Verbose Setting    : Verbose
Topology GUI           : Disabled

```

#### Parameter definitions from the show atmf detail command

| Parameter      | Definition                                                                                                                                                                                                     |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Network MTU    | The network MTU for the ATMF network.                                                                                                                                                                          |
| Network Name   | The AMF network that a particular node belongs to.                                                                                                                                                             |
| Node Name      | The name assigned to a particular node.                                                                                                                                                                        |
| Node Address   | An address used to access a remotely located node. This is simply the Node Name plus the dotted suffix atmf (.atmf).                                                                                           |
| Node ID        | A unique identifier assigned to a node on an AMF network.                                                                                                                                                      |
| Node Depth     | The number of nodes in the path from this node to the level of the AMF root node. It can be thought of as the vertical depth of the AMF network from a particular node to the zero level of the AMF root node. |
| Domain State   | The state of a node in a Domain in an AMF network as Controller/Backup.                                                                                                                                        |
| Recovery State | The AMF node recovery status. Indicates whether a node recovery is in progress on this device - Auto, Manual, or None.                                                                                         |

| Parameter                  | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Recovery Over<br>ETH Ports | Allow AMF recovery over the Eth port on an AR-series device.                                                                                                                                                                                                                                                                                                                                                                                                           |
| Log Verbose<br>Setting     | The state of the <b>atmf log-verbose</b> command.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Topology GUI               | This feature allows your AMF network to interact with Vista Manager EX and must be enabled on your AMF master.                                                                                                                                                                                                                                                                                                                                                         |
| Management VLAN            | <p>The VLAN created for traffic between nodes of different domain (up/down links).</p> <ul style="list-style-type: none"><li>• VLAN ID - in this example VLAN 4092 is configured as the Management VLAN.</li><li>• Management Subnet - the network prefix for the subnet.</li><li>• Management IP Address - the IP address allocated for this traffic.</li><li>• Management Mask - the subnet mask used to create a subnet for this traffic (255.255.128.0).</li></ul> |
| Domain VLAN                | <p>The VLAN assigned for traffic between nodes of the same domain (crosslink).</p> <ul style="list-style-type: none"><li>• VLAN ID - in this example VLAN 4091 is configured as the domain VLAN.</li><li>• Domain Subnet - the subnet address used for this traffic.</li><li>• Domain IP Address - the IP address allocated for this traffic.</li><li>• Domain Mask - the subnet mask used to create a subnet for this traffic (255.255.128.0).</li></ul>              |
| Node Depth                 | The number of nodes in the path from this node to the core domain.                                                                                                                                                                                                                                                                                                                                                                                                     |

# show atmf group

**Overview** This command can be used to display the group membership within to a particular AMF node. It can also be used with the working-set command to display group membership within a working set.

Each node in the AMF is automatically added to the group that is appropriate to its hardware architecture, e.g. x510, x230. Nodes that are configured as masters are automatically assigned to the master group.

You can create arbitrary groups of AMF members based on your own selection criteria. You can then assign commands collectively to any of these groups.

**Syntax** show atmf group [user-defined|automatic]

| Parameter    | Description                             |
|--------------|-----------------------------------------|
| user-defined | User-defined-group information display. |
| automatic    | Automatic group information display.    |

**Default** All groups are displayed

**Mode** Privileged Exec

**Example 1** To display group membership of node2, use the following command:

```
node2# show atmf group
```

A typical output screen from this command is shown below:

```
ATMF group information
master, x510
node2#
```

This screen shows that node2 contains the groups **master** and **x510**. Note that although the node also contains the implicit groups, these do not appear in the show output.

**Example 2** The following commands (entered on *node2*) will display all the automatic groups within the working set containing *node1* and all nodes that have been pre-defined to contain the *sysadmin* group:

First define the working-set:

```
node1# #atmf working-set node1 group sysadmin
```

A typical output screen from this command is shown below:

```
ATMF group information
master, poe, x8100

=====
node1, node2, node3, node4, node5, node6:
=====

ATMF group information
sysadmin, x8100
AMF_NETWORK[6]#
```

This confirms that the six nodes (*node1* to *node6*) are now members of the working-set and that these nodes reside within the *AMF-NETWORK*.

Note that to run this command, you must have previously entered the command **atmf working-set**. This can be seen from the network level prompt, which in this case is *AMF\_NETWORK[6]#*.

**Sample output from the show atmf group command for a working set.**

```
AMF_NETWORK[6]#show atmf group
=====
node3, node4, node5, node6:
=====

ATMF group information
edge_switches, x510
```

**Parameter definitions from the show atmf group command for a working set**

| Parameter              | Definition                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ATMF group information | <p>Displays a list of nodes and the groups that they belong to, for example:</p> <ul style="list-style-type: none"><li>• master - Shows a common group name for Nodes configured as AMF masters.</li><li>• Hardware Arch - Shows a group for all Nodes sharing a common Hardware architecture, e.g. x8100, x230, for example.</li><li>• User-defined - Arbitrary groups created by the user for AMF nodes.</li></ul> |

## show atmf group members

**Overview** This command will display all group memberships within an AMF working-set. Each node in the AMF working set is automatically added to automatic groups which are defined by hardware architecture, e.g. x510, x230. Nodes that are configured as masters are automatically assigned to the master group. Users can define arbitrary groupings of AMF members based on their own criteria, which can be used to select groups of nodes.

**Syntax** show atmf group members [user-defined|automatic]

| Parameter    | Description                            |
|--------------|----------------------------------------|
| user-defined | User defined group membership display. |
| automatic    | Automatic group membership display.    |

**Mode** Privileged Exec

**Example** To display group membership of all nodes in a working-set, use the command:

```
ATMF_NETWORK[9]# show atmf group members
```

**Sample output from the show atmf group members command**

| ATMF Group membership |               |                            |
|-----------------------|---------------|----------------------------|
| Automatic Groups      | Total Members | Members                    |
| -----                 |               |                            |
| master                | 1             | Building_1                 |
| poe                   | 1             | HW_Team1                   |
| x510                  | 3             | SW_Team1 SW_Team2 SW_Team3 |
| x930                  | 1             | HW_Team1                   |
| x8100                 | 2             | Building_1 Building_2      |
| ATMF Group membership |               |                            |
| User-defined Groups   | Total Members | Members                    |
| -----                 |               |                            |
| marketing             | 1             | Bld1_Floor_1               |
| software              | 3             | SW_Team1 SW_Team2 SW_Team3 |

**Parameter definitions from the show atmf group members command**

| Parameter           | Definition                                                                                                                                                       |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Automatic Groups    | Lists the Automatic Groups and their nodal composition. The sample output shows AMF nodes based on the same Hardware type or belonging to the same Master group. |
| User-defined Groups | Shows the grouping of AMF nodes in user defined groups.                                                                                                          |
| Total Members       | Shows the total number of members in each group.                                                                                                                 |
| Members             | Shows the list of AMF nodes in each group.                                                                                                                       |

**Related commands** [show atmf group](#)  
[show atmf](#)  
[atmf group \(membership\)](#)

# show atmf guests

**Overview** This command is available on any AMF master or controller in the network. It displays a summary of the AMF guest nodes that exist in the AMF network, including device type, parent node, and IP address.

**Syntax** show atmf guests

**Mode** User Exec/Privileged Exec

**Usage notes** Use this command to display all guest nodes in a network. If you want to see only the guests attached to a single node, use the [show atmf links guest](#) command, which shows information about the guest nodes and also about their link to their parent node.

**Example** To display the AMF guest output, use the command:  
awplus# show atmf guests

**Output** The following shows typical output.

**Example output from the show atmf guests command**

```
master#show atmf guests

Guest Information:

Device      Device      Parent      Guest      IP/IPv6
Name        Type        Node        Port       Address
-----
node1-2.0.1 x600-24Ts   node1       2.0.1      192.168.2.10
wireless-zone1 AT-TQ4600   node2       1.0.1      192.168.1.10
wireless-zone2 AT-TQ4600   node2       1.0.2      192.168.1.12

Current ATMF guest node count 3
```

**Parameters shown in the output of the show atmf guests command**

| Parameter       | Description                                                                                                                                                                                                                                  |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Device Name     | The name that is discovered from the device, or failing that, a name that is auto-assigned by AMF. The auto-assigned name consists of:<parent node name>-<attached port number>You can change this by configuring a description on the port. |
| Device Type     | The product name of the guest node, which is discovered from the device. If no device type can be discovered, this shows the name of the AMF guest-class that has been assigned to the guest node by the <b>atmf guest-class</b> command.    |
| Parent Node     | The name of the AMF node that directly connects to the guest node.                                                                                                                                                                           |
| Guest Port      | The port on the parent node that directly connects to the guest node.                                                                                                                                                                        |
| IP/IPv6 Address | The address discovered from the node, or statically configured on the parent node's attached port.                                                                                                                                           |

**switchport atmf-guestlink**  
**show atmf backup guest**  
**show atmf links guest**

# show atmf guests detail

**Overview** This command is available on any AMF master in the network. It displays details about the AMF guest nodes that exist in the AMF network, such as device type, IP address, MAC address etc.

**Syntax** `show atmf guests detail [<node-name>] [<guest-port>]`

| Parameter                       | Description                          |
|---------------------------------|--------------------------------------|
| <code>&lt;node-name&gt;</code>  | The name of the guest node's parent. |
| <code>&lt;guest-port&gt;</code> | The port name on the parent node.    |

**Mode** User Exec/Privileged Exec

**Usage notes** If you want to see only the guests attached to a single node, you can use either:

- this command and specify the node name, or
- **show atmf links guest detail**, which shows information about the guest nodes and also about their link to their parent node.

Note that the parameters that are displayed depend on the guest node's model.

**Example** To display the AMF guest output, use the command:

```
awplus# show atmf guests detail
```

**Output** The following shows typical output.

**Example output from show atmf guests detail**

```
master#show atmf guests detail

ATMF Guest Node Information:

Node Name           : master
Port Name           : port1.0.9
Ifindex             : 5009
Guest Description    : red-1.0.9

```

**Parameters in the output from show atmf guests detail.**

| Parameter         | Description                                                                                                                                                                                                                               |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node Name         | The name of the parent node, which is the AMF node that directly connects to the guest node.                                                                                                                                              |
| Port Name         | The port on the parent node that connects to the guest.                                                                                                                                                                                   |
| IfIndex           | An internal index number that maps to the port number on the parent node.                                                                                                                                                                 |
| Guest Description | A description that is discovered from the device, or failing that, auto-assigned by AMF. The auto-assigned name consists of: <parent node name>-<attached port number>. You can change this by configuring a description on the port.     |
| Device Type       | The product name of the guest node, which is discovered from the device. If no device type can be discovered, this shows the name of the AMF guest-class that has been assigned to the guest node by the <b>atmf guest-class</b> command. |
| Username          | The user name configured on the guest node.                                                                                                                                                                                               |
| Backup Supported  | Whether the guest node supports AMF backup functionality.                                                                                                                                                                                 |

| Parameter        | Description                                                                                                                                                                                                                   |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MAC Address      | The MAC address of the guest node.                                                                                                                                                                                            |
| IP Address       | The IP address of the guest node.                                                                                                                                                                                             |
| IPv6 Address     | The IPv6 address of the guest node.                                                                                                                                                                                           |
| Firmware Version | The version of the firmware operating on the guest node.                                                                                                                                                                      |
| HTTP port        | The HTTP port as specified with the <a href="#">http-enable</a> command when defining a guest class. You can set this if the guest node provides an HTTP user interface on a non-standard port (any port other than port 80). |

# show atmf links

**Overview** This command displays information about AMF links on a switch. The display output contains link status state information.

**Syntax** show atmf links [brief]

| Parameter | Description                                                   |
|-----------|---------------------------------------------------------------|
| brief     | A brief summary of AMF links, their configuration and status. |

**Mode** User Exec and Privileged Exec

**Usage notes** The **show atmf links** and **show atmf links brief** commands both produce a table of summarized link information. For a more detailed view use the **show atmf links detail** command.

This command does not show links that are configured on provisioned ports.

**Example** To display a brief summary of the AMF links, use the following command:

```
node-1# show atmf links brief
```

## Example output from show atmf links brief

| Example-core# show atmf links |           |             |            |               |                  |            |

| Local Port        | Shows the local port on the selected node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Link Type         | Shows link type as Uplink or Downlink (parent and child) or Cross-link (nodes in same domain).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Link Status       | Shows the link status of the local port on the node as either Up or Down.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| ATMF State        | Shows AMF state of the local port: <ul style="list-style-type: none"><li>• Init - Link is down.</li><li>• Hold - Link transitioned to up state, but waiting for hold period to ensure link is stable.</li><li>• Incompatible - Neighbor rejected the link because of inconsistency in AMF configurations.</li><li>• OneWay - Link is up and has waited the hold down period and now attempting to link to another unit in another domain.</li><li>• OneWaySim - Device is running in secure mode and link is up but waiting for authorization from an AMF master.</li><li>• Full - Link hello packets are sent and received from its neighbor with its own node id.</li><li>• Shutdown - Link has been shut down by user configuration.</li></ul> |
| Adjacent Node     | Shows the Adjacent AMF Node to the one being configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Adjacent IF Index | Shows the IF index for the Adjacent AMF Node connected to the node being configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Link State        | Shows the state of the AMF link. Valid states are either Forwarding or Blocking.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## show atmf links detail

**Overview** This command displays detailed information on all the links configured in the AMF network. It can only be run on AMF master and controller nodes.

**Syntax** show atmf links detail

| Parameter | Description                     |
|-----------|---------------------------------|
| detail    | Detailed AMF links information. |

**Mode** User Exec

**Usage notes** For summarized link information see the [show atmf links](#) command. This command does not show links that are configured on provisioned ports.

**Example** To display the AMF link details use this command:

```
device1# show atmf links detail
```

The output from this command will display all the internal data held for AMF links. The following example gives details of the links that are summarized in the example in [show atmf links](#).

### Sample output from the show atmf links detail command

```
device1# show atmf links detail

# show atmf links guest

**Overview** This command displays information about guest nodes visible to an AMF device.

**Syntax** show atmf links guest [interface <interface-range>]

| Parameter                      | Description                                                                |
|--------------------------------|----------------------------------------------------------------------------|
| interface<br><interface-range> | Select a specific range of ports to display information about guest nodes. |

**Default** With no parameters specified this command will display its standard output for all ports with guest nodes connected.

**Mode** User Exec/Privileged Exec

**Usage notes** Use this command to display the guest nodes connected to a single parent node. If you want to see a list of all the guests in the AMF network, use [show atmf guests](#).

**Example 1** To display information about AMF guests that are connectible from node1, use the command:

```
node1# show atmf links guest
```

**Output** The following shows typical output.

## Example output from show atmf links guest

| node1#sh atmf links guest    |              |            |    |                |                   |
|------------------------------|--------------|------------|----|----------------|-------------------|
| Guest Link Information:      |              |            |    |                |                   |

### Parameters in the output from show atmf links guest

| Parameter         | Description                                                                                                                                                                                                        |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Local Port        | The port on the parent node that connects to the guest.                                                                                                                                                            |
| Guest Class       | The name of the ATMF guest-class that has been assigned to the guest node by the <b>atmf guest-class</b> command.                                                                                                  |
| Model Type        | The model type of the guest node, as entered by the <b>modeltype</b> command. Can be one of the following: <ul style="list-style-type: none"><li>• alliedware</li><li>• aw+</li><li>• tq</li><li>• other</li></ul> |
| DC                | The discovery method as applied by the <b>discovery</b> command. This can be either dynamic (D) or static (S).                                                                                                     |
| MAC Address       | The MAC address of the guest node.                                                                                                                                                                                 |
| IP / IPv6 Address | The IP address of the guest node.                                                                                                                                                                                  |

# show atmf links guest detail

**Overview** This command displays detailed information about guest nodes visible to an AMF device.

**Syntax** `show atmf links guest detail [interface <interface-range>]`

| Parameter                                          | Description                                                                |
|----------------------------------------------------|----------------------------------------------------------------------------|
| <code>interface<br/>&lt;interface-range&gt;</code> | Select a specific range of ports to display information about guest nodes. |

**Mode** User Exec and Privileged Exec

**Usage notes** Use this command to display the guest nodes connected to a single parent node. If you want to see a list of all the guests in the AMF network, use [show atmf guests detail](#).

Note that the parameters that are displayed depend on the guest node's model and state.

**Example** To display detailed information about AMF guests, use the command:  
`node1# show atmf links guest detail`

**Output** The following shows typical output.

**Example output from show atmf links guest detail**

```
node1#show atmf links guest detail

Detailed Guest Link Information:

Interface                : port1.0.13
Link State               : Down
Class Name               : test
Model Type               : Other
Discovery Method         : Static
IP Address               : 192.168.1.13
Node State               : Down

Interface                : port1.0.5
Link State               : Full
Class Name               : tq_device
Model Type               : TQ
Discovery Method         : Dynamic
IP Address               : 192.168.1.221
Username                 : manager
Login Fallback           : Yes
Node State               : Full
Backup Supported         : Yes
MAC address              : 001a.ebab.d2e0
Device Type              : AT-TQ4600
Description              : AP221
Firmware Version         : 3.2.1 B02
HTTP port                : 80
```

**Parameters in the output from show atmf links guest detail**

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface  | The port on the parent node that connects to the guest.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Link State | The state of the link to the guest node; one of: <ul style="list-style-type: none"><li>• Down: The physical link is down.</li><li>• Up: The physical link has come up, but it is still during a timeout period that is enforced to allow other links to come up.</li><li>• Learn: The timeout period described above has elapsed, and the link is now learning information from the AMF guest node. You can see what information it is learning from the "Node State" field below.</li><li>• Full: The node connected by this link has joined the AMF network.</li><li>• Fail: The port is physically up but something has prevented the guest node from joining the AMF network.</li></ul> |
| Class Name | The name of the ATMF guest-class that has been assigned to the guest node by the <b>atmf guest-class</b> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Model Type       | The model type of the guest node, as entered by the <b>modeltype</b> command. The mode type can be one of the following: <ul style="list-style-type: none"> <li>alliedware</li> <li>aw+</li> <li>onvif</li> <li>tq</li> <li>other</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Discovery Method | The discovery method as applied by the <b>discovery</b> command. This can be either dynamic or static.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| IP Address       | The IP address of the guest node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Username         | The user name configured on the guest node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Login Fallback   | Whether the guest node supports Login Fallback. For TQ model guest nodes, when login fallback is enabled, if a guest node is replaced, then AMF logs in to the new TQ using the factory default manager/friend settings. The new TQ is then discovered and managed as an AMF guest node by an AMF master or member. This means any backed up settings for the replaced guest node can also be recovered.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Node state       | The state of the guest node; one of: <ul style="list-style-type: none"> <li>Down: The initial state when a link to a guest node is first configured. This is also the state if the physical link goes down.</li> <li>Getting IP: The AMF device is in the process of retrieving the IP address of the guest node.</li> <li>Getting Mac: The AMF device is in the process of retrieving the MAC address of the guest node.</li> <li>Getting Info: The AMF device is in the process of retrieving any other available information from the guest (firmware version etc). The information available depends on what device the guest node is.</li> <li>Full: The AMF device has retrieved all necessary information and the guest node has joined the AMF network. Once this state is reached, the Link State also changes to "Full".</li> <li>Failure: The physical link is up but the AMF member has failed to retrieve enough information to allow the guest node to join the AMF network.</li> </ul> |
| Backup Supported | Whether the guest node supports AMF backup functionality.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| MAC Address      | The MAC address of the guest node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Device Type      | Model information for the guest node. This field shows the model information that AMF retrieved from the guest node. In contrast, the Model Type                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Parameter        | Description                                                                                                                                                                                                          |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                  | shows what a user entered as the type of device they intended this guest node to be.                                                                                                                                 |
| Description      | By default, this is a concatenation of the guest node's parent node and the port to which it is attached. You can change it by configuring a description on the port.                                                |
| Serial Number    | The serial number of the guest node.                                                                                                                                                                                 |
| Firmware Name    | The name of the firmware operating on the guest node.                                                                                                                                                                |
| Firmware Version | The version of the firmware operating on the guest node.                                                                                                                                                             |
| HTTP port        | The HTTP port as specified with the <b>http-enable</b> command when defining a guest class. You can set this if the guest node provides an HTTP user interface on a non-standard port (any port other than port 80). |

**Command changes** Version 5.5.0-1.1: **Login Fallback** parameter added

## show atmf links statistics

**Overview** This command displays details of the AMF links configured on the device and also displays statistics about the AMF packet exchanges between the devices.

It is also possible to display the AMF link configuration and packet exchange statistics for a specified interface.

This command can only be run on AMF master and controller nodes

**Syntax** `show atmf links statistics [interface [<port-number>]]`

| Parameter     | Description                                                                                                                                                                                                              |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| interface     | Specifies that the command applies to a specific interface (port) or range of ports. Where both the interface and port number are unspecified, full statistics (not just those relating to ports) will be displayed.     |
| <port-number> | Enter the port number for which statistics are required. A port range, a static channel or LACP link can also be specified. Where no port number is specified, statistics will be displayed for all ports on the device. |

**Mode** User Exec

**Example 1** To display AMF link statistics for the whole device, use the command:

```
device1# show atmf links statistics
```

**Sample output from the show atmf links statistics command**

| Type24                        | 0       | : Discard arealink hello packet - not in correct state      |          |                  |

```
Type25  0          : Discard arealink hello packet - failed basic processing
Type26  0          : Discard unicast packet - MAC address does not match node
Type27  0          : AMF Master license node limit exceeded
```

**Example 2** To display the AMF links statistics on interface port1.0.4, use the command:

```
device1# show atmf links statistics interface port1.0.4
```

### Sample output from the show atmf links statistics command for interface port1.0.4

```
device1# show atmf links statistics interface port1.0.4
```

ATMF Port Statistics:

|           |                        | Transmit | Receive |
|-----------|------------------------|----------|---------|
| port1.0.4 | Crosslink Hello        | 231      | 232     |
| port1.0.4 | Crosslink Hello Domain | 116      | 116     |
| port1.0.4 | Crosslink Hello Uplink | 116      | 115     |
| port1.0.4 | Hello Link             | 0        | 0       |
| port1.0.4 | Arealink Hello         | 0        | 0       |

### Parameter definitions from the show atmf links statistics command output

| Parameter            | Definition                                                             |
|----------------------|------------------------------------------------------------------------|
| Receive              | Shows a count of AMF protocol packets received per message type.       |
| Transmit             | Shows the number of AMF protocol packets transmitted per message type. |
| Database Entries     | Shows the number of AMF elements existing in the distributed database. |
| Database Full Ages   | Shows the number of times the entries aged in the database.            |
| ATMF Packet Discards | Shows the number of discarded packets of each type.                    |

## show atmf nodes

**Overview** This command displays nodes currently configured within the AMF network.

Note that the output also tells you whether or not node map exchange is active. Node map exchange improves the tracking of nodes joining and leaving an AMF network. This improves the efficiency of AMF networks. Node map exchange is only available if every node in your AMF network is running version 5.4.6-2.1 or later. We recommend running the latest version on all nodes in your network, so you receive the advantages of node map exchange and other improvements.

**Syntax** show atmf nodes [guest|all]

| Parameter | Description                                                  |
|-----------|--------------------------------------------------------------|
| guest     | Display only guest nodes in the AMF network.                 |
|           | Display all nodes in the AMF network, including guest nodes. |

**Mode** Privileged Exec

**Usage notes** You can use this command to display one of three sets of nodes:

- all nodes except guest nodes, by specifying **show atmf nodes**
- all nodes including guest nodes, by specifying **show atmf nodes all**
- only guest nodes, by specifying **show atmf nodes guest**

**Examples** To display AMF information for all nodes except guest nodes, use the command:

```
node1# show atmf nodes
```

### Sample output from show atmf nodes

```
node1#show atmf nodes guest
Node Information:
* = Local device
SC = Switch Configuration:
C = Chassis   S = Stackable   N = Standalone

Node Name      Device Type      ATMF Master  SC   Parent Domain      Node Depth
-----
* M1            x510-28GTX       Y            S    none                0
N3              x230-18GP        N            N    M1                  1
N1              AR4050S          N            N    M1                  1

Node map exchange is active
Current ATMF node count 3
```

To display AMF information for all nodes, including guest nodes, use the command:

```
node1# show atmf nodes all
```

**Sample output from show atmf nodes all. In this example, not all nodes support node map exchange, as shown by the message at the end**

```
node1#show atmf nodes all

Node and Guest Information:

* = Local device

SC = Switch Configuration:
C = Chassis    S = Stackable    N = Standalone G = Guest

Node/Guest      Device          ATMF      SC      Parent      Node
Name            Type            Master    SC      Domain      Depth
-----
* M1             x510-28GTX      Y         S       none        0
N3               x230-18GP       N         N       M1          1
N1               AR4050S         N         N       M1          1
N3-1.0.24        AT-TQ4600       N         G       N3          -

Node map exchange is inactive
Firmware on some nodes does not support node map exchange, eg AR4050S
Current ATMF node count 4 (guests 1)
```

To display AMF information for guest nodes only, use the command:

```
node1# show atmf nodes guest
```

**Sample output from show atmf nodes guest**

```
node1#show atmf nodes guest

Guest Information:
Device      MAC              Parent          Port          IP/IPv6
Name        Address           Node-1          Port          Address
-----
aastra-...  0008.5d10.7635   Node-1          1.0.2         192.168.4.7
poe-1.0.1   0013.1a1e.4589   Node-1          1.0.1         192.168.4.6
ip-camera   0800.239e.f1fe   Node-1          1.0.4         192.168.4.8
tq4600      eccd.6df2.da60   Node-1          1.0.5         192.168.4.50
```

# show atmf provision nodes

**Overview** This command displays information about each provisioned node with details about date and time of creation, boot and configuration files available in the backup, and license files present in the provisioned backup. This includes nodes that have joined the network but are yet to run their first backup.

This command can only be run on AMF master and controller nodes.

**Syntax** show atmf provision nodes

**Mode** Privileged Exec

**Usage notes** This command will only work if provisioned nodes have already been set up. Otherwise, an error message is shown when the command is run.

**Example** To show the details of all the provisioned nodes in the backup use the command:

```
NodeName# show atmf provision nodes
```

## Sample output from the show atmf provision nodes command

```
device1#show atmf provision nodes

ATMF Provisioned Node Information:

Backup Media .....: SD (Total 3827.0MB, Free 3481.1MB)

Node Name           : device2
Date& Time          : 06-Oct-2016 & 23:25:44
Provision Path       : card:/atmf/provision_nodes

Boot configuration :
Current boot image  : x510-5.4.9-0.1.rel (file exists)
Backup boot image   : x510-5.4.8-2.3.rel (file exists)
Default boot config : flash:/default.cfg (file exists)
Current boot config : flash:/abc.cfg (file exists)
Backup boot config  : flash:/xyz.cfg (file exists)

Software Licenses :
Repository file     : ../configs/.sw_v2.lic
                   : ../configs/.swfeature.lic
Certificate file     : card:/atmf/nodes/awplus1/flash/.atmf-lic-cert
```

# show atmf recovery-file

**Overview** Use this command to display the recovery file information for an AMF node.

AMF recovery files are created for nodes with special links. Special links include:

- virtual links,
- area links terminating on an AMF master, and
- area virtual links terminating on an AMF master.

**Syntax** show atmf recovery-file

**Mode** Privileged Exec

**Example** To display recovery file information for an AMF node, use the command:

```
node1# show atmf recovery-file
```

**Output** The following shows typical output.

## Example output from show atmf recovery-file

```
node1#show atmf recovery-file
ATMF Recovery File Info: Special Link Present
Location                Date       Time
USB storage device      30 Apr 2018 14:50:32
Master                  30 Apr 2018 14:56:45
node1                   30 Apr 2018 14:56:45
node3                   30 Apr 2018 14:56:45
```

## show atmf secure-mode

**Overview** Use this command to display an overview of the secure mode status of an AMF network.

**Syntax** show atmf secure-mode

**Mode** Privileged Exec

**Example** To display an overview of AMF secure mode on an AMF master or member node, use the command:

```
awplus# show atmf secure-mode
```

**Output** The following shows typical output.

**Example output from show atmf secure-mode on an AMF master**

```
ATMF Secure Mode:

Secure Mode Status           : Enabled
Certificate Expiry           : 180 Days
Certificates Total           : 8
Certificates Revoked         : 0
Certificates Rejected        : 0
Certificates Active          : 8

Provisional Authorization    : 0
Pending Requests            : 0

Trusted Master               : master_1
Trusted Master               : master_2

Key Fingerprint:
 48:37:d9:a0:37:32:22:9b:5c:22:da:a2:62:49:a7:e5:a9:bc:12:88
```

**Example output from show atmf secure-mode on an AMF node**

```
ATMF Secure Mode:

Secure Mode Status           : Enabled
Trusted Master               : master_1
Trusted Master               : master_2

Key Fingerprint:
 93:f0:52:a9:74:8f:ae:ea:5b:e2:ee:62:cb:6b:21:22:5a:08:db:98
```

**Parameters in the output from show atmf secure-mode**

| Parameter                 | Description                                                                                                                                        |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| Secure Mode Status        | Shows the status of secure mode, Enabled or Disabled.                                                                                              |
| Certificate Expiry        | Certificate expiry time. Set with <a href="#">atmf secure-mode certificate expiry</a>                                                              |
| Certificates Total        | Total number of certificates.                                                                                                                      |
| Certificates Revoked      | Certificates that have been revoked by the AMF master.                                                                                             |
| Certificates Rejected     | Certificates that have been rejected by the AMF master.                                                                                            |
| Certificates Active       | Certificates that are currently active.                                                                                                            |
| Provisional Authorization | Number of nodes with provisional authorization. For more information use the <a href="#">show atmf authorization provisional</a> command.          |
| Pending Requests          | Number of nodes waiting for authorization on the AMF master. For more information use the <a href="#">show atmf authorization pending</a> command. |
| Trusted Master            | List of trusted masters in the AMF area.                                                                                                           |

| Parameter       | Description                     |
|-----------------|---------------------------------|
| Key Fingerprint | The AMF node's key fingerprint. |

| Link Type      | Link type.                          |
| Discovered     | Date discovered                     |
| Node/Area Name | Node or area name of remote device. |

**Related commands** [show atmf](#)  
[show atmf secure-mode](#)

**Command changes** Version 5.4.7-0.3: command added

# show atmf secure-mode certificates

**Overview** Use this command to display the certificate status details when secure mode is enabled on an AMF network.

**Syntax** `show atmf secure-mode certificates [detail] [area <area-name>]  
[node <node-name>]`

| Parameter   | Description                                                   |
|-------------|---------------------------------------------------------------|
| detail      | Display detailed certificate information.                     |
| area        | Specify an AMF area.                                          |
| <area-name> | The AMF area you want to see the certificate information for. |
| node        | Specify an AMF node.                                          |
| <node-name> | The AMF node you want to see information for.                 |

**Mode** Privileged Exec

**Example** To display AMF secure mode certificates on a master or member node, use the command:

```
awplus# show atmf secure-mode certificates
```

To display detailed information about AMF secure mode certificates for a node named "area\_2\_node\_1" in an area named "area-2", use the command:

```
awplus# show atmf secure-mode certificates detail area area-2  
node area_2_node_1
```

**Output** The following shows typical output.

**Example output from show atmf secure-mode certificates**

| Area-1 Certificates: |          |             |          |
|----------------------|----------|-------------|----------|
| Node Name            | Signer   | Expires     | Status   |
| -----                |          |             |          |
| area_1_node_1        | master_1 | 11 Mar 2017 | Active   |
|                      | master_2 | 4 Mar 2017  |          |
| area_1_node_2        | master_1 | 11 Mar 2017 | Revoked  |
|                      | master_2 | 4 Mar 2017  |          |
| Area-2 Certificates: |          |             |          |
| Node Name            | Signer   | Expires     | Status   |
| -----                |          |             |          |
| area_2_node_1        | master_1 | 18 Mar 2017 | Active   |
| area_2_node_2        | master_1 | 18 Mar 2017 | Rejected |

**Parameters in the output from show atmf secure-mode certificates**

| Parameter | Description                                                                                                                                                      |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node Name | Name of AMF node the certificate was issued to.                                                                                                                  |
| Signer    | Name of AMF master that issued the certificate.                                                                                                                  |
| Expires   | Certificate expiry date.                                                                                                                                         |
| Status    | The status column will display Active before a member node is trusted, and can be accessed using AMF commands. Valid statuses are Active, Revoked, and Rejected. |

**Output** The following shows typical output.

**Example output from show atmf secure-mode certificates  
detail area area-2 node area\_2\_node\_1**

```
Certificates Detail:
-----
area_2_node_1 (area:area-2)
  MAC Address      : 0000.cd37.0003
  Status           : Active
  Serial Number    : A24SC8001
  Product          : x510-28GTX
  Key Fingerprint  : cd:b4:c9:cd:7b:87:6a:30:98:25:d7:3c:89:8e:cb:74:e8:91:56:9d
  Flags            : 00000011
  Signer           : master_1
  Expiry Date      : 18 Mar 2017 21:17:42
```

**Parameters in the output from show atmf secure-mode  
certificates detail**

| Parameter       | Description                                                                                                                                               |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| MAC Address     | MAC address of AMF node.                                                                                                                                  |
| Status          | The device status will show Active if a member node is trusted, and can be accessed using AMF commands. Valid statuses are Active, Revoked, and Rejected. |
| Serial Number   | Device serial number.                                                                                                                                     |
| Product         | Device product type.                                                                                                                                      |
| Key Fingerprint | AMF node key fingerprint.                                                                                                                                 |
| Flags           | Internal AMF information.                                                                                                                                 |
| Signer          | Name of AMF master that issued the certificate.                                                                                                           |
| Expiry Date     | Certificate expiry date.                                                                                                                                  |

**Command changes** Version 5.4.7-0.3: command added

## show atmf secure-mode sa

**Overview** Use this command to display the security associations on the network. This is the list of links and neighbors that are trusted.

**Syntax** `show atmf secure-mode sa [detail] [link|neighbor|broadcast]`

| Parameter | Description                                        |
|-----------|----------------------------------------------------|
| detail    | Display detailed security association information. |
| link      | Display security associations for type links.      |
| neighbor  | Display security associations for type neighbors.  |
| broadcast | Display security associations for type broadcast.  |

**Mode** Privileged Exec

**Example** To display an overview of AMF secure mode security associations on a master or member node, use the command:

```
awplus# show atmf secure-mode sa
```

To display a detailed overview of AMF secure mode neighbor security associations on a master or member node, use the command:

```
awplus# show atmf secure-mode sa detail neighbor
```

**Output** The following shows typical output.

**Example output from show atmf secure-mode sa**

| ATMF Security Associations: |               |          |            |
|-----------------------------|---------------|----------|------------|
| Type                        | State         | ID       | Details    |
| Neighbor Node               | Complete      | 175      | master_1   |
| Broadcast                   | Complete      | 4095     |            |
| CrossLink                   | Complete      | 4501     | sa1        |
| AreaLink                    | Cert Exchg    | 4511     | sa11       |
| Link                        | Complete      | 6009     | port1.2.9  |
| AreaLink                    | CA Exchg Init | 6013     | port1.2.13 |
| AreaLink                    | Cert Exchg    | 13001    | port1.9.1  |
| Link                        | CA Exchg Init | 16779521 | vlink3     |
| Neighbor Gateway            | Complete      | 83       | master_2   |
| Neighbor Gateway            | Complete      | 175      | master_1   |
| Neighbor Cntl-Master        | Complete      | 83       | master_2   |
| Neighbor Cntl-Master        | Complete      | 175      | master_1   |

**Example output from show atmf secure-mode sa detail neighbor**

# show atmf secure-mode statistics

**Overview** Use this command to display AMF secure mode statistics. These statistics are from when AMF secure mode was first enabled or the statistics were cleared with the **clear atmf secure-mode statistics** command.

**Syntax** show atmf secure-mode statistics

**Mode** Privileged Exec

**Example** To display AMF secure mode statistics on a master or member node, use the command:

```
awplus# show atmf secure-mode statistics
```

**Output** The following shows typical output.

**Example output from show atmf secure-mode statistics on an AMF master.**

```
ATMF Secure Mode Statistics:

Certificates:
New ..... 7                Expired ..... 0
Updated ..... 7            Deleted ..... 0
Revoked ..... 1            Renewed ..... 2
Rejected ..... 1           Re-authorized .... 1
Authorized ..... 0

Local Certificates:
Valid ..... 4                Invalid ..... 0
Certificates Validation:
Request Valid ..... 2
Request Invalid ..... 0
Common Valid ..... 13
Common Invalid ..... 0
Issuer Valid ..... 14
Issuer Invalid ..... 0
Signature Verified ..... 29
Signature Invalid ..... 0
Signature Purpose Invalid ..... 0

Signatures Signed ..... 12
Master Certificates:
Re-issued ..... 3
Downgraded to member ..... 0

Public key change ..... 2
Invalid SA public key ..... 0
```

**Output** The following shows typical output.

**Example output from show atmf secure-mode statistics on an AMF node.**

```
ATMF Secure Mode Statistics:

Local Certificates:
Valid ..... 3                Invalid ..... 0

Certificates Validation:
Request Valid ..... 0
Request Invalid ..... 0
Common Valid ..... 0
Common Invalid ..... 0
Issuer Valid ..... 12
Issuer Invalid ..... 0
Signature Verified ..... 12
Signature Invalid ..... 3
Signature Purpose Invalid ..... 0

Signatures Signed ..... 0

Master Certificates:
Re-issued ..... 0
Downgraded to member ..... 0

Public key change ..... 2
Invalid SA public key ..... 0
```

**Command changes** Version 5.4.7-0.3: command added

# show atmf tech

**Overview** This command collects and displays all the AMF command output. The command can thus be used to display a complete picture of an AMF network.

**Syntax** show atmf tech

**Mode** Privileged Exec

**Example** To display output for all AMF commands, use the command:

```
NodeName# show atmf tech
```

**Sample output from the show atmf tech command.**

```
node1#show atmf tech

**Parameter definitions from the show atmf tech command**

| Parameter    | Definition                                                   |
|--------------|--------------------------------------------------------------|
| ATMF Status  | Shows status of AMF feature on the Node as Enabled/Disabled. |
| Network Name | The name of the AMF network to which this node belongs.      |
| Node Name    | The name assigned to the node within the AMF network.        |

| Parameter          | Definition                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Role               | The role configured on the device within the AMF - either master or member.                                                                                                                                                                                                                                                                                                                                                 |
| Current ATMF Nodes | A count of the AMF nodes in the AMF network.                                                                                                                                                                                                                                                                                                                                                                                |
| Node Address       | The identity of a node (in the format name.atmf) that enables its access it from a remote location.                                                                                                                                                                                                                                                                                                                         |
| Node ID            | A unique identifier assigned to an AMF node.                                                                                                                                                                                                                                                                                                                                                                                |
| Node Depth         | The number of nodes in the path from this node to the core domain.                                                                                                                                                                                                                                                                                                                                                          |
| Domain State       | A node's state within an AMF Domain - either controller or backup.                                                                                                                                                                                                                                                                                                                                                          |
| Recovery State     | The AMF node recovery status. Indicates whether a node recovery is in progress on this device - either Auto, Manual, or None.                                                                                                                                                                                                                                                                                               |
| Management VLAN    | <p>The VLAN created for traffic between nodes of different domains (up/down links).</p> <p>VLAN ID - In this example VLAN 4092 is configured as the Management VLAN.</p> <p>Management Subnet - the Network prefix for the subnet.</p> <p>Management IP Address - the IP address allocated for this traffic.</p> <p>Management Mask - the Netmask used to create a subnet for this traffic 255.255.128.0 (= prefix /17)</p> |
| Domain VLAN        | <p>The VLAN assigned for traffic between Nodes of same domain (crosslink).</p> <p>VLAN ID - In this example VLAN 4091 is configured as the domain VLAN.</p> <p>Domain Subnet - the Subnet address used for this traffic.</p> <p>Domain IP Address - the IP address allocated for this traffic.</p> <p>Domain Mask - the Netmask used to create a subnet for this traffic 255.255.128.0 (= prefix /17)</p>                   |
| Device Type        | Shows the Product Series Name.                                                                                                                                                                                                                                                                                                                                                                                              |
| ATMF Master        | Indicates the node's membership of the core domain (membership is indicated by Y)                                                                                                                                                                                                                                                                                                                                           |
| SC                 | <p>Shows switch configuration:</p> <ul style="list-style-type: none"> <li>• C - Chassis (such as SBx8100 series)</li> <li>• S - Stackable (VCS)</li> </ul>                                                                                                                                                                                                                                                                  |

| Parameter  | Definition                                                                                     |
|------------|------------------------------------------------------------------------------------------------|
|            | <ul style="list-style-type: none"><li>• N - Standalone</li></ul>                               |
| Parent     | A node that is connected to the present node's uplink, i.e. one layer higher in the hierarchy. |
| Node Depth | Shows the number of nodes in path from the current node to the Core domain.                    |

**NOTE:** The command can produce very large output. For this reason only the most significant terms are defined in this table.

## show atmf virtual-links

**Overview** This command displays a summary of all virtual links (L2TP tunnels) currently in the running configuration.

**Syntax** show atmf virtual-links [macaddr]  
show atmf virtual-links [id <1-4094>] [remote-id <1-4094>]  
show atmf virtual-links detail [id <1-4094>]

| Parameter          | Description                                                                                                                                                                                |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| macaddr            | Display the virtual AMF links' MAC addresses.                                                                                                                                              |
| id <1-4094>        | ID of the local virtual link.                                                                                                                                                              |
| remote-id <1-4094> | ID of the remote virtual link                                                                                                                                                              |
| detail             | Display information about a specific virtual link ID or range of virtual link IDs. Displays information such as: local and remote IP address, link type, packets received and transmitted. |

**Mode** Privileged Exec

**Example 1** To display AMF virtual links, use the command:

```
node_1# show atmf virtual-links
```

### Example output from show atmf virtual-links

| ATMF Virtual-Link Information: |          |              |           |              |                |              |
|--------------------------------|----------|--------------|-----------|--------------|----------------|--------------|
| Local Port                     | Local ID | Local IP     | Remote ID | Remote IP    | Tunnel Protect | Tunnel State |
| vlink1                         | 1        | 172.16.24.2  | 2         | 1.0.0.2      | -              | Complete     |
| vlink2                         | 2        | 172.16.24.2* | 10        | 172.16.24.3* | ipsec          | Complete     |
| vlink3                         | 3        | (eth0)*      | 1         | 1.2.3.4      | -              | AcquireLocal |
| * = Dynamic Address.           |          |              |           |              |                |              |
| Virtual Links Configured: 3    |          |              |           |              |                |              |

In the above example, a centrally located switch has the IP address space 192.0.2.x/24. It has two VLANs assigned the subnets 192.0.2.33 and 192.0.2.65 using the prefix /27. Each subnet connects to a virtual link. The first link has the IP address 192.168.1.1 and has a Local ID of 1. The second has the IP address 192.168.2.1 and has the Local ID of 2.

**Example 2** To display details about AMF virtual link with ID 1, use the command:

```
node_1# show atmf virtual-links detail id 1
```

#### Example output from show atmf virtual-links

| Virtual Link Detailed Information: |                     |   |              |
|------------------------------------|---------------------|---|--------------|
| ID 1                               | Description         | : | None         |
| ID 1                               | Local IP Address    | : | 192.168.5.1  |
| ID 1                               | Remote ID           | : | 1            |
| ID 1                               | Remote IP Address   | : | 192.168.5.20 |
| ID 1                               | Link Type           | : | virtual-link |
| ID 1                               | Packets Received    | : | 236465       |
| ID 1                               | Packets Transmitted | : | 192626       |

**Example 3** To display AMF virtual links' MAC address information, use the command:

```
node_1# show atmf virtual-links macaddr
```

#### Example output from show atmf virtual-links macaddr

| ATMF Link Remote Information:       |                   |           |              |
|-------------------------------------|-------------------|-----------|--------------|
| ATMF Management Bridge Information: |                   |           |              |
| Bridge: br-atmfmgmt                 |                   |           |              |
| port no                             | mac addr          | is local? | ageing timer |
| 1                                   | 00:00:cd:27:c2:07 | yes       | 0.00         |
| 2                                   | 8e:c7:ae:81:7e:68 | yes       | 0.00         |
| 2                                   | 00:00:cd:28:bf:e7 | no        | 0.01         |

#### Parameters in the output from show atmf virtual-links

| Parameter      | Definition                                                                                                                                 |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| Local Port     | The tunnel name e.g. vlink1, vlink2, equivalent to an L2TP tunnel.                                                                         |
| Local ID       | The local ID of the virtual link. This matches the vlink<number>                                                                           |
| Tunnel Protect | Tunnel protection protocol.                                                                                                                |
| Tunnel State   | The operational state of the vlink (either Up or Down). This state is always displayed once a vlink has been created.                      |
| mac addr       | AMF virtual links terminate on an internal soft bridge. The "show atmf virtual-links macaddress" command displays MAC Address information. |
| is local?      | Indicates whether the MAC displayed is for a local or a remote device.                                                                     |
| ageing timer   | Indicates the current aging state for each MAC address.                                                                                    |

# show debugging atmf

**Overview** Use this command to see what debugging is turned on for AMF.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show debugging atmf

**Mode** Privileged Exec

**Example** To display the AMF debugging status, use the command:

```
node_1# show debugging atmf
```

**Sample output from the show debugging atmf command.**

```
node_1# show debugging atmf
ATMF debugging status:
ATMF arealink debugging is on
ATMF link debugging is on
ATMF crosslink debugging is on
ATMF database debugging is on
ATMF neighbor debugging is on
ATMF packet debugging is on
ATMF error debugging is on
```

**Related commands** [debug atmf packet](#)

# show debugging atmf packet

**Overview** Use this command to see what debugging is turned on for AMF Packet debug.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show debugging atmf packet

**Mode** User Exec and Privileged Exec

**Example** To display the AMF packet debugging status, use the command:

```
node_1# show debug atmf packet
```

**Sample output from the show debugging atmf packet command.**

```
ATMF packet debugging is on
=== ATMF Packet Debugging Parameters===

# show running-config atmf

**Overview** This command displays the running system information that is specific to AMF.

**Syntax** show running-config atmf

**Mode** User Exec and Global Configuration

**Example** To display the current configuration of AMF, use the following commands:

```
node_1# show running-config atmf
```

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Related commands** [show running-config](#)  
[no debug all](#)

# state

**Overview** This command sets the running state of an AMF container on a Virtual AMF Appliance (VAA).

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

**Syntax** state {enable|disable}

| Parameter | Description                                                        |
|-----------|--------------------------------------------------------------------|
| disable   | Stop the AMF container. The container's state changes to stopped.  |
| enable    | Start the AMF container. The container's state changes to running. |

**Default** By default, **state** is disabled.

**Mode** AMF Container Configuration

**Usage notes** The first time the **state enable** command is executed on a container it assigns the container to an area and configures it as an AMF master. This is achieved by automatically adding the following configuration to the AMF container:

```
atmf network-name <AMF network-name>
atmf master
atmf area <container area-name> <container area-id> local
atmf area <container area-name> password <container area-password>
atmf area <host area-name> <host area-id>

interface eth0
  atmf-arealink remote-area <host area-name> vlan 4094
```

For this reason the **state enable** command should be run after the container has been created with the **atmf container** command and an area-link configured with the **area-link** command.

Once the start-up configuration has been saved from within the AMF container, all further configuration changes need to be made manually.

**Example** To start the AMF container “vac-wlg-1” use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# state enable
```

To stop the AMF container “vac-wlg-1” use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# state disable
```

**Related commands** **atmf container**  
**show atmf container**

**Command changes** Version 5.4.7-0.1: command added

# switchport atmf-agentlink

**Overview** Use this command to configure a link between this device and an x600 Series switch, in order to integrate the x600 Series switch into your AMF network. The x600 Series switch is called an “AMF agent”, and the link between the x600 and this device is called an “agent link”.

The x600 Series switch must be running version 5.4.2-3.16 or later.

Use the **no** variant of this command to remove the agent link. If the x600 Series switch is still connected to the switch port, it will no longer be part of the AMF network.

**Syntax** switchport atmf-agentlink  
no switchport atmf-agentlink

**Default** By default, no agent links exist and x600 Series switches are not visible to AMF networks.

**Mode** Interface mode for a switch port. Note that the link between the x600 and the AMF network must be a single link, not an aggregated link.

**Usage notes** The x600 Series switch provides the following information to the AMF node that it is connected to:

- The MAC address
- The IPv4 address
- The IPv6 address
- The name/type of the device (Allied Telesis x600)
- The name of the current firmware
- The version of the current firmware
- The configuration name

AMF guestnode also makes most of this information available from x600 Series switches, but requires configuration with DHCP and/or LLDP.

AMF agent is simpler; as soon the x600 is connected to an appropriately configured port of an AMF node, it is immediately integrated into the AMF network.

To see information about the x600 Series switch, use the **show atmf links guest detail** command.

**Example** To configure port1.0.1 as an agent link, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# switchport atmf-agentlink
```

**Related** **show atmf links guest**  
**commands**

# switchport atmf-arealink

**Overview** This command enables you to configure a port or aggregator to be an AMF area link. AMF area links are designed to operate between two nodes in different areas in an AMF network.

Use the **no** variant of this command to remove any AMF area link that may exist for the selected port or aggregated link.

This command is only available on AMF controllers and master nodes.

**Syntax** switchport atmf-arealink remote-area <area-name> vlan <2-4094>  
no switchport atmf-arealink

| Parameter   | Description                                                                                                                          |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <area-name> | The name of the remote area that the port is connecting to.                                                                          |
| <2-4094>    | The VLAN ID for the link. This VLAN cannot be used for any other purpose, and the same VLAN ID must be used at each end of the link. |

**Default** No arealinks are configured.

**Mode** Interface Configuration for a switchport, a static aggregator, or a dynamic channel group.

**Usage notes** Run this command on the port or aggregator at both ends of the link.

Each area must have the area-name configured, and the same area password must exist on both ends of the link.

Running this command will automatically place the port or static aggregator into trunk mode (i.e. switchport mode trunk) and will synchronize the area information stored on the two nodes.

You can configure multiple arealinks between two area nodes, but only one arealink at any time will be in use. All other arealinks will block information, to prevent network storms.

For AMF links, we recommend not using VCStack ports that are configured as network ports. During AMF recovery, these ports revert to their default state of being VCStack ports, so AMF cannot use them for auto-recovery. We recommend using standard network ports instead of VCStack ports for AMF links, so you can take advantage of AMF recovery.

**NOTE:** See the command to configure an AMF area link on an AR-series Eth interface.

**Example** To make switchport port1.0.2 an arealink to the 'Auckland' area on VLAN 6, use the commands:

```
controller-1# configure terminal
controller-1(config)# interface port1.0.2
controller-1(config-if)# switchport atmf-arealink remote-area
Auckland vlan 6
```

To remove switchport port1.0.1 as an AMF area link, use the commands:

```
controller-1# configure terminal
controller-1(config)# interface port1.0.1
controller-1(config-if)# no switchport atmf-arealink
```

**Related commands**

- atmf area**
- atmf area password**
- atmf virtual-link**
- show atmf links**

# switchport atmf-crosslink

**Overview** This command configures the selected port, statically aggregated link or dynamic channel group (LACP) to be an AMF crosslink. Running this command will automatically place the port or aggregator into trunk mode (i.e. **switchport mode trunk**).

The connection between two AMF masters must utilize a crosslink. Crosslinks are used to carry the AMF control information between master nodes. Multiple crosslinks can be configured between two master nodes, but only one crosslink can be active at any particular time. All other crosslinks between masters will be placed in the blocking state, in order to prevent broadcast storms.

Note that AlliedWare Plus CentreCOM Series switches are AMF Edge nodes and do not support virtual links or crosslinks. This is because each edge node can only have a single physical AMF link.

Use the **no** variant of this command to remove any crosslink that may exist for the selected port or aggregated link.

**Syntax** switchport atmf-crosslink  
no switchport atmf-crosslink

**Mode** Interface Configuration for a switchport, a static aggregator or a dynamic channel group.

**Usage notes** Crosslinks can be used anywhere within an AMF network. They have the effect of separating the AMF network into separate domains.

Where this command is used, it is also good practice to use the **switchport trunk native vlan** command with the parameter **none** selected. This is to prevent a network storm on a topology of ring connected devices.

For AMF links, we recommend not using VCSocket ports that are configured as network ports. During AMF recovery, these ports revert to their default state of being VCSocket ports, so AMF cannot use them for auto-recovery. We recommend using standard network ports instead of VCSocket ports for AMF links, so you can take advantage of AMF recovery.

**Example 1** To make switchport port1.0.1 an AMF crosslink, use the following commands:

```
Node_1# configure terminal
Node_1(config)# interface port1.0.1
Node_1(config-if)# switchport atmf-crosslink
```

**Example 2** This example is shown twice. Example 2A is the most basic command sequence. Example 2B is a good practice equivalent that avoids problems such as broadcast storms that can otherwise occur.

**Example 2A** To make static aggregator sa1 an AMF crosslink, use the following commands:

```
Node_1# configure terminal
Node_1(config)# interface sa1
Node_1(config-if)# switchport atmf-crosslink
```

**Example 2B** To make static aggregator sa1 an AMF crosslink, use the following commands for good practice:

```
Node_1# configure terminal
Node_1(config)# interface sa1
Node_1(config-if)# switchport atmf-crosslink
Node_1(config-if)# switchport trunk allowed vlan add 2
Node_1(config-if)# switchport trunk native vlan none
```

In this example VLAN 2 is assigned to the static aggregator, and the native VLAN (VLAN 1) is explicitly excluded from the aggregated ports and the crosslink assigned to it.

**NOTE:** The AMF management and domain VLANs are automatically added to the aggregator and the crosslink.

**Related commands** [show atmf links statistics](#)

# switchport atmf-guestlink

## Overview

Guest links are used to provide basic AMF functionality to non AMF capable devices. Guest links can be configured for either a selected switch port or a range of switch ports and use generic protocols to collect status and configuration information that the guest devices make available.

Use the **no** variant of this command to remove the guest node functionality from the selected port or ports.

**NOTE:** AMF guest nodes are not supported on ports using the OpenFlow protocol.

**Syntax** `switchport atmf-guestlink [class <guest-class>] [ip <A.B.C.D>|  
ipv6 <X:X::X:X>]  
no switchport atmf-guestlink`

| Parameter     | Description                                                   |
|---------------|---------------------------------------------------------------|
| class         | Set a guest class                                             |
| <guest-class> | The name of the guest class.                                  |
| ip            | Specifies that the address following will have an IPv4 format |
| <A.B.C.D>     | The guest node's IP address in IPv4 format.                   |
| ipv6          | Specifies that the address following will have an IPv6 format |
| <X:X::X:X>    | The guest node's IP address in IPv6 format.                   |

**Default** No guest links are configured.

**Mode** Interface

**Example 1** To configure switchport port1.0.1 to be a guest link, that will connect to a guest node having a guest class of **camera** and an IPv4 address of **192.168.3.3**, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.1
node1(config-if)# switchport atmf-guestlink class camera ip
192.168.3.3
```

**Example 2** To configure switchport port1.0.1 to be a guest link, which will connect to a guest node having a guest class of **phone** and an IPv6 address of **2001:db8:21e:10d::5**, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.1
node1(config-if)# switchport atmf-guestlink class phone ipv6
2000:db8:21e:10d::5
```

**Example 3** To configure switchport port1.0.1 to be a guest link, using the default model type and learning method address, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.1
node1(config-if)# switchport atmf-guestlink
```

**Example 4** To configure switchports port1.0.1 to port1.0.3 to be guest links, for the guest class **camera**, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.1-port1.0.3
node1(config-if)# switchport atmf-guestlink class camera
```

**Example 5** To remove the guest-link functionality from switchport port1.0.1, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.1
node1(config-if)# no switchport atmf-guestlink
```

# switchport atmf-link

**Overview** This command enables you to configure a port or aggregator to be an up/down AMF link. Running this command will automatically place the port or aggregator into trunk mode. If the port was previously configured in access mode, the configured access VLAN will be removed.

Use the **no** variant of this command to remove any AMF link that may exist for the selected port or aggregated link.

**Syntax** switchport atmf-link  
no switchport atmf-link

**Mode** Interface Configuration for a switchport, a static aggregator or a dynamic channel group.

**Usage notes** Up/down links and virtual links interconnect domains in a vertical hierarchy, with the highest domain being the core domain. In effect, they form a tree of interconnected AMF domains. This tree must be loop-free. Therefore you must configure your up/down and virtual links so that no loops are formed.

Within each domain, cross-links between AMF nodes define those nodes as siblings within the same domain. You can form rings by combining cross-links with up/down links and/or virtual links, as long as each AMF domain links upwards to only a single parent domain. Each domain may link downwards to multiple child domains.

For AMF links, we recommend not using VCStack ports that are configured as network ports. During AMF recovery, these ports revert to their default state of being VCStack ports, so AMF cannot use them for auto-recovery. We recommend using standard network ports instead of VCStack ports for AMF links, so you can take advantage of AMF recovery.

**NOTE:** See the command to configure an AMF up/down link on an AR-series Eth interface.

**Example** To configure switchport port1.0.1 as an AMF up/down link, use the commands:

```
Node_1# configure terminal
Node_1(config)# interface port1.0.1
Node_1(config-if)# switchport atmf-link
```

To remove switchport port1.0.1 as an AMF up/down link, use the commands:

```
Node_1# configure terminal
Node_1(config)# interface port1.0.1
Node_1(config-if)# no switchport atmf-link
```

# type atmf guest

**Overview** This command configures a trigger to activate when an AMF guest node joins or leaves.

**Syntax** type atmf guest {join|leave}

| Parameter | Description            |
|-----------|------------------------|
| join      | AMF guest node joins.  |
| leave     | AMF guest node leaves. |

**Mode** Trigger Configuration

**Example** To configure trigger 86 to activate when an AMF guest node leaves, use the following commands:

```
awplus(config)# trigger 86
awplus(config-trigger)# type atmf guest leave
```

**Related commands** [show trigger](#)

**Command changes** Version 5.5.1-1.1: command added

## type atmf node

**Overview** This command configures a trigger to activate when an AMF node joins or leaves.

**Syntax** type atmf node {join|leave}

| Parameter | Description      |
|-----------|------------------|
| join      | AMF node joins.  |
| leave     | AMF node leaves. |

**Mode** Trigger Configuration

**Example 1** To configure trigger 5 to activate when an AMF node leaves, use the following commands. In this example the command is entered on node-1:

```
node1(config)# trigger 5
node1(config-trigger)# type atmf node leave
```

**Example 2** The following commands will configure trigger 5 to activate if an AMF node join event occurs on any node within the working set:

```
node1# atmf working-set group all
```

This command returns the following display:

```
=====
node1, node2, node3:
=====

Working set join
```

Note that the running the above command changes the prompt from the name of the local node, to the name of the AMF-Network followed, in square brackets, by the number of member nodes in the working set.

```
AMF-Net[3]# conf t
```

```
AMF-Net[3](config)# trigger 5
```

```
AMF-Net[3](config-trigger)# type atmf node leave
```

```
AMF-Net[3](config-trigger)# description "E-mail on AMF Exit"
```

```
AMF-Net[3](config-trigger)# active
```

Enter the name of the script to run at the trigger event.

```
AMF-Net[3](config-trigger)# script 1 email_me.scp
```

```
AMF-Net[3](config-trigger)# end
```

Display the trigger configurations

```
AMF-Net[3]# show trigger
```

This command returns the following display:

```
=====
node1:
=====

TR# Type & Details      Description      Ac Te Tr Repeat      #Scr Days/Date
-----
001 Periodic (2 min)    Periodic Status Chk Y  N  Y Continuous    1  smtwtfS
005 ATMF node (leave)   E-mail on ATMF Exit Y  N  Y Continuous    1  smtwtfS
-----

```

**Related** [show trigger](#)  
**commands**

# undebbug atmf

**Overview** This command is an alias for the **no** variant of the **debug atmf**.

# username (atmf-guest)

**Overview** This command enables you to assign a **username** to a guest class. Guests may require a username and possibly also a password. The password must be between 1 and 32 characters and will allow spaces.

**Syntax** username <name> password [8] <userpass>  
no username

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                 |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <name>     | User name of the guest node.                                                                                                                                                                                                                                                                                                                |
| 8          | The parameter <b>8</b> means that the password that follows is in hashed form, not plain text. Do not type this 8 when creating a password with this command; it is only used in configuration files. In configuration files, the device prints 8 in front of passwords, to indicate that it is displaying the password in its hashed form. |
| <userpass> | The password to be entered for the guest node.                                                                                                                                                                                                                                                                                              |

**Default** No usernames are configured

**Mode** AMF Guest Configuration

**Example** To assign the user name 'reception' and the password of 'secret' to an AMF guest node that has the guest class of 'phone1' use the following commands:

```
node1# configure terminal
node1(config)# amf guest-class phone1
node1(config-atmf-guest)# username reception password secret
```

To remove a guest node username and password for the user guest class 'phone1', use the following commands:

```
node1# configure terminal
node1(config)# atmf guest-class phone1
node1(config-atmf-guest)# no username
```

# Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure Device Discovery using STOAT (Standardized Topology Organizer and Transport).

Using LLDP and DHCP Snooping, STOAT can discover and gather information about devices in the local network. These devices may include IP cameras, IP phones, PCs, laptops, Wi-fi access points, printers, and so on.

Vista Manager EX merges the data from STOAT and existing discovery methods such as AMF, and AMF Plus Device Discovery, to provide a single, accurate and more complete view of the network.

For more information, see the [Device Discovery using STOAT Feature Overview and Configuration Guide](#).

# clear stoat collector session counters

**Overview** Use this command to clear the STOAT transport session counters.

**Syntax** clear stoat collector session counters [<1-4294967295>]

| Parameter      | Description |
|----------------|-------------|
| <1-4294967295> | Session ID  |

**Mode** Privileged Exec

**Example** To clear all STOAT transport session counters, use the command:

```
awplus# clear stoat collector session counters
```

To clear a specific STOAT transport session counter, use the command:

```
awplus# clear stoat collector session counters 234234234
```

**Command changes** Version 5.5.3-1.1: command added

## description (stoat-dest)

**Overview** Use this command to add an informative description to a STOAT destination.

Use the **no** variant of this command to remove a description from a STOAT destination.

**Syntax** `description <description>`  
`no description`

| Parameter                        | Description                                                                                                                                                                 |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;description&gt;</code> | A word or phrase that uniquely identifies this STOAT destination or its purpose. Valid characters are any printable character and spaces, up to a maximum of 40 characters. |

**Default** Not set.

**Mode** STOAT Destination Configuration

**Example** To add the description 'chc-collector-1' to a STOAT destination with IP address 192.0.2.6, use the commands:

```
awplus# configure terminal
awplus(config)# stoat destination 192.0.2.6
awplus(config-stoat-dest)# description chc-collector-1
```

To remove the description from a STOAT destination with IP address 192.0.2.6, use the commands:

```
awplus# configure terminal
awplus(config)# stoat destination 192.0.2.6
awplus(config-stoat-dest)# no description
```

**Related commands** [stoat destination](#)

**Command changes** Version 5.5.3-1.1: command added

# key (stoat-dest)

**Overview** Use this command to configure a key to use with a STOAT destination. The key allows the STOAT collector to authenticate this device as a valid source. The destination will not attempt to connect if no key is set.

A matching key must be configured on the STOAT collector device.

Use the **no** variant of this command to remove a key for a STOAT destination.

**Syntax** key [8] <key-string>  
no key

| Parameter    | Description                                                                                                                                                                                                                                      |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 8            | Specifies that you are entering a password as a string that has already been encrypted instead of entering a plain text password. The running config displays the new password as an encrypted string even if password encryption is turned off. |
| <key-string> | Shared key string applied, a value in the range 8 to 80 characters.                                                                                                                                                                              |

**Default** Not set.

**Mode** STOAT Destination Configuration

**Example** To configure the key 'verysecret' for STOAT destination 192.0.2.6, use the commands:

```
awplus# configure terminal
awplus(config)# stoat destination 192.0.2.6
awplus(config-stoat-dest)# key verysecret
```

To remove the key for STOAT destination 192.0.2.6, use the commands:

```
awplus# configure terminal
awplus(config)# stoat destination 192.0.2.6
awplus(config-stoat-dest)# no key
```

**Related commands** [stoat collector key](#)  
[stoat destination](#)

**Command changes** Version 5.5.3-1.1: command added

## name-check (stoat-dest)

**Overview** Use this command to enable or disable certificate name checking for the server certificate received from the STOAT collector.

Use the **no** variant of this command to disable name checking for the server certificate received from the STOAT collector.

**Syntax** name-check  
no name-check

**Default** Disabled.

**Mode** STOAT Destination Configuration

**Usage notes** If enabled, the received server certificate must contain the address configured for this STOAT destination . This setting only takes effect if the STOAT destination has been configured with a trustpoint.

**Example** To enable name-check for STOAT destination 192.0.2.6, use the commands:

```
awplus# configure terminal
awplus(config)# stoat destination 192.0.2.6
awplus(config-stoat-destination)# name-check
```

To disable name-check for STOAT destination 192.0.2.6, use the commands:

```
awplus# configure terminal
awplus(config)# stoat destination 192.0.2.6
awplus(config-stoat-destination)# no name-check
```

**Related commands** [service stoat](#)

**Command changes** Version 5.5.3-1.1: command added

# service stoat

**Overview** Use this command to enable or disable Standardized Topology Organizer and Transport (STOAT) functionality on a device. Once enabled, the device will accept STOAT collector and STOAT source configuration.

Use the **no** variant of this command to disable STOAT functionality on a device.

**Syntax** service stoat  
no service stoat

**Default** Disabled.

**Mode** Global Configuration

**Example** To enable STOAT functionality on a device, use the commands:

```
awplus# configure terminal  
awplus(config)# service stoat
```

To disable STOAT functionality on a device, use the commands:

```
awplus# configure terminal  
awplus(config)# no service stoat
```

**Related commands** [stoat collector trustpoint](#)  
[stoat collector expiry-period](#)  
[stoat collector key](#)  
[show stoat collector](#)

**Command changes** Version 5.5.3-1.1: command added

# show stoat collector

**Overview** Use this command to see the operational status of the STOAT collector.

**Syntax** show stoat collector [sessions|keys]

| Parameter | Description                    |
|-----------|--------------------------------|
| sessions  | Active session information     |
| keys      | Authentication key information |

**Mode** Privileged Exec

**Example** To show the STOAT collector status information, use the command:

```
awplus# show stoat collector
```

To show the STOAT collector active session information, use the command:

```
awplus# show stoat collector sessions
```

To show the STOAT collector authentication key information, use the command:

```
awplus# show stoat collector keys
```

### Output **Example output from show stoat collector**

```
awplus#show stoat collector
STOAT Collector Information:
-----
Status      : Enabled
Expiry-period : 60 seconds
Trustpoint   : default-selfsigned
```

### **Example output from show stoat collector sessions**

```
awplus#show stoat collector sessions
STOAT Collector Session Information:
-----
Sessions created           : 2
Sessions expired           : 0
Sessions failed            : 0
Sessions failed sync authentication : 0
Sessions failed update     : 0
Sessions failed update authentication : 0

Session ID                 : 3F4B5C27
Source Name                 : alice
State                       : Active
Counters
  Update success           : 0
  Update authentication failure : 0
  Update failure           : 0
  RX payload bytes         : 11
  RX payload apteryx set failure : 0
  RX payload json parse failure : 0
  RX payload json decode failure : 0

Session ID                 : 23DFBD7B
Source Name                 : bob
State                       : Active
Counters
  Update success           : 0
  Update authentication failure : 0
  Update failure           : 0
  RX payload bytes         : 0
  RX payload apteryx set failure : 0
  RX payload json parse failure : 0
  RX payload json decode failure : 1
```

### **Example output from show stoat collector keys**

```
awplus#show stoat collector keys
STOAT Collector Key Information:
-----
Key                               Description                               Last Used Time
                                   (H:M:S ago)
-----
CoA4E6riSbdWzzetHhHM5F5WdBFPXX2DH6jNzZmYtns= "generated key"                00:12:52
secret-key                               "super secret key"              -
```

**Related commands** [service stoat](#)  
[stoat collector expiry-period](#)  
[stoat collector enable](#)

**Command changes** Version 5.5.3-1.1: command added

# show stoat destinations

**Overview** Use this command to see the operational status of the configured STOAT destinations.

**Syntax** show stoat destinations [detail]

| Parameter | Description               |
|-----------|---------------------------|
| detail    | Show detailed information |

**Mode** Privileged Exec

**Example** To show summary information about STOAT destinations, use the command:

```
awplus# show stoat destinations
```

To show detailed information about STOAT destinations, use the command:

```
awplus# show stoat destinations detail
```

**Output** The following shows typical output.

**Example output from show stoat destinations**

```
awplus#show stoat destinations
STOAT Destination Summary Information:
-----|
Address      : 192.168.0.12
State        : Hold

Address      : 192.168.0.2
State        : Active
```

**Example output from show stoat destinations detail**

```
awplus#show stoat destinations detail
STOAT Destination Summary Information:
-----|
Address      : 192.168.0.12
State        : Hold
Session ID   : 0
Expiry-period : 0 seconds
Counters:
  Sync OK           : 0
  Sync failed - unreachable : 6612
  Sync failed - authentication : 0
  Sync failed - bad response  : 0
  Update OK         : 0
  Update failed - unreachable : 0
  Update failed - authentication : 0
  Update failed - unknown session : 0
  RX bytes          : 0
  TX bytes          : 0
Address      : 192.168.0.2
State        : Active
Session ID   : 200558F4
Expiry-period : 60 seconds
Counters:
  Sync OK           : 139
  Sync failed - unreachable : 10
  Sync failed - authentication : 0
  Sync failed - bad response  : 0
  Update OK         : 32773
  Update failed - unreachable : 52
  Update failed - authentication : 0
  Update failed - unknown session : 81
  RX bytes          : 4099
  TX bytes          : 16787801
```

**Related commands** [stoat destination shutdown \(stoat-dest\)](#)

**Command changes** Version 5.5.3-1.1: command added

# shutdown (stoat-dest)

**Overview** Use this command to disable a STOAT destination.  
Use the **no** variant of this command to enable a STOAT destination.

**Syntax** shutdown  
no shutdown

**Default** Enabled (no shutdown)

**Mode** STOAT Destination Configuration

**Example** To enable the STOAT destination 192.0.2.6, use the commands:  
awplus# configure terminal  
awplus(config)# stoat destination 192.0.2.6  
awplus(config-stoat-dest)# no shutdown

**Related commands** [stoat destination](#)  
[show stoat destinations](#)

**Command changes** Version 5.5.3-1.1: command added

# stoat collector enable

**Overview** Use this command to start or stop the Standardized Topology Organizer and Transport (STOAT) collector functionality on a device.

Note: The device must be able to receive requests from STOAT sources before this command is used. To enable a device to receive requests from STOAT, use the [service stoat](#) command.

Use the **no** variant of this command to stop the STOAT collector functionality on a device.

**Syntax** stoat collector enable  
no stoat collector enable

**Default** Disabled.

**Mode** Global Configuration

**Usage notes** The STOAT feature is responsible for discovering devices and network topology, organizing that information into a standardized format, and transporting it to a central location for use. AMF uses STOAT data to allow non-AMF devices and their links to be displayed in the AMF topology map.

There are two types of STOAT device:

- **Collector** - receives and aggregates topology data
- **Source** - sends data to a collector. The data contains information that it knows about itself and has learned through discovery protocols

**Example** To start the STOAT collector, use the commands:

```
awplus# configure terminal
awplus(config)# stoat collector enable
```

To stop the STOAT collector, use the commands:

```
awplus# configure terminal
awplus(config)# no stoat collector enable
```

**Related commands** [stoat collector trustpoint](#)  
[show stoat collector](#)  
[stoat collector expiry-period](#)  
[stoat collector key](#)

**Command changes** Version 5.5.3-1.1: command added.

# stoat collector expiry-period

**Overview** Use this command to modify the session expiry-period for all of the STOAT collector's sessions.

Use the **no** variant of this command to revert to the default expiry-period of 60 seconds.

**Syntax** stoat collector expiry-period <10-300>  
no stoat collector expiry-period

| Parameter | Description                            |
|-----------|----------------------------------------|
| <10-300>  | Expiry-period in seconds (default: 60) |

**Default** 60 seconds.

**Mode** Global Configuration

**Example** To configure an expiry-period of 15 seconds, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# stoat collector expiry-period 15
```

To revert the expiry-period to its default of 60 seconds, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no stoat collector expiry-period
```

**Related commands**

- [service stoat](#)
- [stoat collector trustpoint](#)
- [stoat collector key](#)
- [stoat collector enable](#)
- [show stoat collector](#)

**Command changes** Version 5.5.3-1.1: command added

# stoat collector key

**Overview** Use this command to configure the authentication key used by the STOAT collector.

Use the **no** variant of this command to remove a STOAT authentication key.

**Syntax** `stoat collector key [8]{auth-key|generate} [description <description>]`  
`no stoat collector key [8]{auth-key|generate} [description <description>]`

| Parameter     | Description                                                |
|---------------|------------------------------------------------------------|
| 8             | Specifies a key in encrypted format instead of plain text. |
| auth-key      | Authentication key                                         |
| generate      | Let STOAT generate a key                                   |
| description   | Add a useful description                                   |
| <description> | The useful description text                                |

**Default** Not set.

**Mode** Global Configuration

**Example** To configure a plain-text key 'secret-key' with no description, use the commands:

```
awplus# configure terminal
awplus(config)# stoat collector key secret-key
```

To configure a plain-text key 'secret-key' with a description, use the commands:

```
awplus# configure terminal
awplus(config)# stoat collector key secret-key description 'this
is my secret key'
```

To **generate** a key with a description, use the commands:

```
awplus# configure terminal
awplus(config)# stoat collector key generate description 'my
generated key'
```

To configure an encrypted key with a description, use the commands:

```
awplus# configure terminal
awplus(config)# stoat collector key 8
CFWzNguaqyoPDqYoCBGzff07CfQZ0J-eJ00JslX0N3E= description 'my
encrypted key'
```

To remove a configured encrypted key, use the commands:

```
awplus# configure terminal
awplus(config)# no stoat collector key 8
CFWzNguaqyoPDqYoCBGzff07CfQZ0J-eJ00JslX0N3E=
```

**Output** The following shows typical output.

**Example output from stoat collector key generate**

```
awplus(config)# stoat collector key generate
NttWCIS0KsyQ1-1_98qi4HcVdMRykeaE8IKfPe1Xv9o
```

**Related commands**

- [stoat collector trustpoint](#)
- [stoat collector expiry-period](#)
- [stoat collector enable](#)
- [show stoat collector](#)

**Command changes** Version 5.5.3-1.1: command added

# stoat collector trustpoint

**Overview** Use this command to add a crypto PKI trustpoint containing a server certificate and a key to the STOAT collector. This enables secure HTTPS API communication between the STOAT collector and STOAT source.

Use the **no** variant of this command to remove a configured PKI trustpoint from a STOAT collector.

**Syntax** stoat collector trustpoint <trustpoint-name>  
no stoat collector trustpoint

| Parameter         | Description          |
|-------------------|----------------------|
| <trustpoint-name> | PKI trustpoint name. |

**Mode** Global Configuration

**Example** To add an existing PKI trustpoint called 'chc' to the STOAT collector, use the commands:

```
awplus# configure terminal
awplus(config)# stoat collector trustpoint chc
```

To remove a configured PKI trustpoint from the STOAT collector, use the commands:

```
awplus# configure terminal
awplus(config)# no stoat collector trustpoint
```

**Related commands** [crypto pki authenticate](#)  
[crypto pki enroll](#)  
[crypto pki trustpoint](#)

**Command changes** Version 5.5.3-1.1: command added

## stoat destination

**Overview** Use this command to configure a remote STOAT collector destination.

Use the **no** variant of this command to remove a STOAT collector destination.

**Syntax** `stoat destination {<ip-address>|<host-name>|<ipv6-address>}`  
`no stoat destination {<ip-address>|<host-name>|<ipv6-address>}`

| Parameter                        | Description                                                                                             |
|----------------------------------|---------------------------------------------------------------------------------------------------------|
| <code>&lt;ip-address&gt;</code>  | The IPv4 address, using the format A.B.C.D.                                                             |
| <code>&lt;host-name&gt;</code>   | The host name specified in FQDN (Fully Qualified Domain Name).<br>For example, manager.your.domain.com. |
| <code>&lt;ip6-address&gt;</code> | The IPv6 address, using the format X:X::X:X.                                                            |

**Default** Not set.

**Mode** Global Configuration

**Example** To configure a remote STOAT collector at IP address 10.0.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# stoat destination 10.0.0.1
```

To remove a remote STOAT collector at IP address 10.0.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# no stoat destination 10.0.0.1
```

To configure a remote STOAT collector at stoat.com, use the commands:

```
awplus# configure terminal
awplus(config)# stoat destination stoat.com
```

To remove a remote STOAT collector at stoat.com, use the commands:

```
awplus# configure terminal
awplus(config)# no stoat destination stoat.com
```

To configure a remote STOAT collector at 2001:db8::1, use the commands:

```
awplus# configure terminal
awplus(config)# stoat destination 2001:db8::1
```

To remove a remote STOAT collector at 2001:db8::1, use the commands:

```
awplus# configure terminal
awplus(config)# no stoat destination 2001:db8::1
```

**Related commands** [stoat collector key](#)  
[show stoat collector](#)  
[stoat discovery](#)

**Command changes** Version 5.5.3-1.1: command added

# stoat discovery

**Overview** Use this command to enable a device to import Standardized Topology Organizer and Transport (STOAT) discovery information learned by a given protocol. This command allows the device to act as a STOAT collector. STOAT collectors receive and aggregate topology data used in the AMF topology map.

Use the **no** variant of this command to disable the import of STOAT discovery information learned by a given protocol.

**Syntax** `stoat discovery dhcp-snooping`  
`stoat discovery lldp`  
`no stoat discovery dhcp-snooping`  
`no stoat discovery lldp`

| Parameter                  | Description                                                    |
|----------------------------|----------------------------------------------------------------|
| <code>dhcp-snooping</code> | Import information learned through the DHCP Snooping protocol. |
| <code>lldp</code>          | Import information learned through the LLDP protocol.          |

**Default** Disabled.

**Mode** Global Configuration

**Example** To enable a device to import information learned by the DHCP Snooping protocol, use the commands:

```
awplus# configure terminal
awplus(config)# stoat discovery dhcp-snooping
```

To disable a device from importing information learned by the DHCP Snooping protocol, use the commands:

```
awplus# configure terminal
awplus(config)# no stoat discovery dhcp-snooping
```

**Related commands** [ip dhcp snooping](#)  
[lldp run](#)  
[stoat destination](#)

**Command changes** Version 5.5.3-1.1: command added  
Version 5.5.3-2.1: **dot1x** and **wireless** parameters added

# trustpoint (stoat-dest)

**Overview** Use this command to specify the trustpoint to use when authenticating the STOAT collector. If no trustpoint is specified, the STOAT collector will be implicitly trusted without authentication.

Use the **no** variant of this command to stop the use of trustpoints with a specified STOAT destination.

**Syntax** trustpoint <trustpoint-name>  
no trustpoint

| Parameter         | Description             |
|-------------------|-------------------------|
| <trustpoint-name> | Name of the trustpoint. |

**Default** Not set.

**Mode** STOAT Destination Configuration

**Example** To configure the STOAT destination 192.0.2.6 to use trustpoint 'chc', use the commands:

```
awplus# configure terminal
awplus(config)# stoat destination 192.0.2.6
awplus(config-stoat-dest)# trustpoint chc
```

To stop the use of trustpoints with STOAT destination 192.0.2.6 use the commands:

```
awplus# configure terminal
awplus(config)# stoat destination 192.0.2.6
awplus(config-stoat-dest)# no trustpoint
```

**Related commands** [stoat collector trustpoint](#)  
[stoat destination](#)  
[name-check \(stoat-dest\)](#)

**Command changes** Version 5.5.3-1.1: command added

## unique-id

**Overview** Use this command to generate a new unique ID for a device. This ID is used to uniquely identify a device in the STOAT topology.

Some circumstances may require you to generate a new unique ID, for example after recovering a device from an AMF provisioned backup.

**Syntax** unique-id

**Mode** Privileged Exec

**Example** To generate a new unique ID for a STOAT device, use the command:

```
awplus# unique-id
```

**Related commands** [service stoat](#)

**Command changes** Version 5.5.3-1.1: command added

## Management Stacking Commands

- Contents**
- **Introduction** on page 2393
  - **mstack command-node** on page 2394
  - **mstack enable** on page 2395
  - **mstack remote-login** on page 2396
  - **show mstack nodes** on page 2398
  - **switchport mstack-link** on page 2399

# Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure management stacking.

For introductory information about management stacking in AlliedWare Plus, including overview and configuration information, see the **[Management Stacking Feature Overview and Configuration Guide](#)**.

# mstack command-node

**Overview** This command configures the device as an management stacking command node. This is considered the core of the management stack.

From the command node, you can use the remote-login command to access and configure other nodes in the management stack.

**Syntax** mstack command-node  
no mstack command-node

**Mode** Global Config

**Usage notes** A management stacking command node has to be present for a management stack to form. Only one device in the management stack can be the command node.

**Example** To make the device called command-node into the management stacking command node, use the commands:

```
command-node#configure terminal
command-node(config)#mstack command-node
```

To disable the device from being the management stacking command node, use the commands:

```
command-node# configure terminal
command-node(config)#no mstack command-node
```

# mstack enable

**Overview** This command manually enables (turns on) the management stacking feature for the switch being configured.

Use the no variant of this command to disable (turn off) the management stacking feature on the node.

**Syntax** mstack enable  
no mstack enable

**Mode** Global Configuration

**Usage notes** To use management stacking you need to enable management stacking on each switch in the management stack.

**Examples** To turn on the management stacking feature:

```
MyNode# config terminal  
MyNode(config)# mstack enable
```

To turn off the management stacking feature:

```
MyNode(config)# no mstack enable
```

# mstack remote-login

**Overview** Use this command to remotely log in from the command node to another management stacking node. This lets you run commands as if you were a local user of that node.

**Syntax** `mstack remote-login [user <name>] <nodename>`

| Parameter  | Description                |
|------------|----------------------------|
| <name>     | User name.                 |
| <nodename> | The host name of the node. |

**Mode** Privileged Exec (This command will only run at privilege level 15)

**Usage notes** You do not need a valid login on the local device in order to run this command. The session will take you to the enable prompt on the new device. If the remote login session exits for any reason (e.g. device reboot) you will be returned to the originating node.

The software will not allow you to run multiple remote login sessions. You must exit an existing session before starting a new one.

In the remote login command, the hostname is not case sensitive. For example, the following commands all let you log into a host named node-02:

```
command-node# mstack remote-login node-02
command-node# mstack remote-login Node-02
command-node# mstack remote-login NODE-02
```

**Example 1** To remotely login from command-node to node20, use the following command:

```
command-node# mstack remote-login node20
```

The following information is displayed:

```
Type 'exit' to return to command-node.
AlliedWare Plus (TM) 0.0.0 01/07/15 20:00:58
node20>
```

You can then enter commands on node20:

```
node20> enable
node20# <other-commands>
```

To close the remote login session, use the following command:

```
node20# exit
```

**Example 2** In this example, user whitney is a valid user of command-node and node3. She can remotely login from command-node to node3 by using the following commands:

```
command-node# mstack remote-login user whitney node3  
node3>
```

# show mstack nodes

**Overview** This command displays all nodes currently configured within the management stacking network.

**Syntax** show mstack nodes

**Mode** Privileged Exec

**Example** To display management stacking information for all nodes in the management stack, use the command:

```
awplus# show mstack nodes
```

**Output** The following shows typical output.

**Sample output from the show mstack nodes command.**

|                                                |                |        |    |        |       |  |
|------------------------------------------------|----------------|--------|----|--------|-------|--|
| Node Information:                              |                |        |    |        |       |  |
| * = Local device                               |                |        |    |        |       |  |
| SC = Switch Configuration:                     |                |        |    |        |       |  |
| C = Chassis    S = Stackable    N = Standalone |                |        |    |        |       |  |
| Node                                           | Device         | MSTACK |    |        |       |  |
| Node Name                                      | Type           | C-Node | SC | Parent | Depth |  |
| -----                                          |                |        |    |        |       |  |
| * x240_1                                       | AT-x240GTXm/10 | Y      | N  | none   | 0     |  |
| x240_2                                         | AT-x240GTXm/10 | N      | N  | x240_1 | 1     |  |
| x240_3                                         | AT-x240GTXm/10 | N      | N  | x240_2 | 2     |  |
| Node map exchange is active                    |                |        |    |        |       |  |
| Current MSTACK node count 3                    |                |        |    |        |       |  |

# switchport mstack-link

**Overview** This command enables you to configure a link to be a management stack link.

Use the no variant of this command to remove any mstack-link that may exist for the selected link.

**Syntax** switchport mstack-link  
no switchport mstack-link

**Mode** Interface Configuration

**Usage notes** Running this command will automatically place the port or aggregator into trunk mode. The link can be a link between switch ports or aggregated ports.

**Example** To make a switchport into a management stack link, use the following commands:

```
command-node# configure terminal
command-node(config)# interface port1.0.1
command-node(config-if)# switchport mstack-link
```

# Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure DHCP.

For more information, see the **DHCP Feature Overview and Configuration Guide**.

For information on filtering and saving command output, see the **“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide**.

## ip address dhcp

**Overview** This command activates the DHCP client on the interface you are configuring. This allows the interface to use the DHCP client to obtain its IP configuration details from a DHCP server on its connected network.

The **client-id** and **hostname** parameters are identifiers that you may want to set in order to interoperate with your existing DHCP infrastructure. If neither option is needed, then the DHCP server uses the MAC address field of the request to identify the host.

The DHCP client supports the following IP configuration options:

- Option 1— the subnet mask for your device.
- Option 51—lease expiration time.

The **no** variant of this command stops the interface from obtaining IP configuration details from a DHCP server.

**Syntax** `ip address dhcp [client-id <interface>] [hostname <hostname>]`  
`no ip address dhcp`

| Parameter                | Description                                                                                                                                                                                                                                |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| client-id<br><interface> | The name of the interface you are activating the DHCP client on. If you specify this, then the MAC address associated with the specified interface is sent to the DHCP server in the optional identifier field.<br><br>Default: no default |
| hostname<br><hostname>   | The hostname for the DHCP client on this interface. Typically this name is provided by the ISP.<br><br>Default: no default                                                                                                                 |

**Mode** Interface Configuration for VLAN interfaces.

**Examples** To set the interface vlan2 to use DHCP to obtain an IP address, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip address dhcp
```

To stop the interface vlan2 from using DHCP to obtain its IP address, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip address dhcp
```

**Related commands** **ip address (IP Addressing and Protocol)**  
**show ip interface**  
**show running-config**

## ip dhcp-client default-route distance

**Overview** Use this command to specify an alternative Administrative Distance (AD) for the current default route (from DHCP) for an interface.

Use the **no** variant of this command to set the AD back to the default of 1.

**Syntax** ip dhcp-client default-route distance [<1-255>]  
no ip dhcp-client default-route distance

| Parameter | Description                                               |
|-----------|-----------------------------------------------------------|
| <1-255>   | Administrative Distance (AD) from the range 1 though 255. |

**Default** 1

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** DHCP client interfaces can automatically add a default route with an AD of 1 into the IP Routing Information Base (RIB).

Any pre-existing default route(s) via alternative interfaces (configured with a higher AD) will no longer be selected as the preferred forwarding path for traffic when the DHCP based default route is added to the IP routing table.

This can be problematic if the DHCP client is operating via an interface that is only intended to be used for back-up interface redundancy purposes, such as an interface with lower bandwidth or a particular role like the management interface.

Use this command to set the AD of the default route (via a specific DHCP client interface) to a non-default (higher cost) value, ensuring any pre-existing default route(s) via any other interface(s) continue to be selected as the preferred forwarding path for network traffic.

When the command is used, the static default route is deleted from the RIB, the distance value of the route is modified to the configured distance value, then it is reinstalled into the RIB.

**Examples** To configure vlan10 as a DHCP client and to set the AD for the default route added by DHCP to 150, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# ip address dhcp
awplus(config-if)# ip dhcp-client default-route distance 150
```

To set the AD for the default route back to the default value of 1, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip dhcp-client default-route distance
```

**Related commands** [show ip route](#)  
[show ip route database](#)

**Command changes** Version 5.4.7-0.2 Command added.

# ip dhcp-client request vendor-identifying-specific

**Overview** Use this command to add vendor-identifying vendor-specific information (option 125) requests to the DHCP discovery packets sent by an interface. This option, along with option 124, can be used to send vendor-specific information back to a DHCP client.

See RFC3925 for more information on Vendor-Identifying Vendor Options for DHCPv4.

Use the **no** variant of this command to remove the vendor-identifying-specific request from an interface.

**Syntax** `ip dhcp-client request vendor-identifying-specific`  
`no ip dhcp-client request vendor-identifying-specific`

**Default** The vendor-identifying-specific request is not configured by default.

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** The DHCP client must be activated on the interface, using the **ip address dhcp** command, so that DHCP discovery packets are sent.

**Example** To add the vendor-identifying-specific request on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-client request vendor-identifying-specific
```

To remove the vendor-identifying-specific request on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-client request vendor-identifying-specific
```

**Related commands** **ip address dhcp**  
**ip dhcp-client vendor-identifying-class**

**Command changes** Version 5.4.7-2.1: command added

# ip dhcp-client vendor-identifying-class

**Overview** Use this command to add a vendor-identifying vendor class (option 124) to the DHCP discovery packets sent by an interface. This option places the Allied Telesis Enterprise number (207) into the discovery packet. Option 124, along with option 125, can be used to send vendor-specific information back to a DHCP client.

See RFC3925 for more information on Vendor-Identifying Vendor Options for DHCPv4.

Use the **no** variant of this command to remove the vendor-identifying-class from an interface.

**Syntax** ip dhcp-client vendor-identifying-class  
no ip dhcp-client vendor-identifying-class

**Default** The vendor-identifying-class is not configured by default.

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** The DHCP client must be activated on the interface, using the **ip address dhcp** command, so that DHCP discovery packets are sent.

**Example** To remove the vendor-identifying-class on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-client vendor-identifying-class
```

**Related commands** **ip address dhcp**  
**ip dhcp-client request vendor-identifying-specific**

**Command changes** Version 5.4.7-2.1: command added

## ip dhcp-relay agent-option

**Overview** This command enables the DHCP Relay Agent to insert the DHCP Relay Agent Information Option (Option 82) into the client-request packets that it relays to its DHCP server. This allows the DHCP Relay Agent to pass on information to the server about the network location of the client device. The DHCP Relay Agent strips the DHCP Relay Agent Option 82 field out of the DHCP server's response, so that the DHCP client never sees this field.

When the DHCP Relay Agent appends its DHCP Relay Agent Option 82 data into the packet, it first overwrites any pad options present; then if necessary, it increases the packet length to accommodate the DHCP Relay Agent Option 82 data.

The **no** variant of this command stops the DHCP Relay Agent from appending the Option 82 field onto DHCP requests before forwarding it to the server.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**NOTE:** *ip dhcp-relay agent-optionip dhcp-relay information policy*

**Syntax** ip dhcp-relay agent-option  
no ip dhcp-relay agent-option

**Default** DHCP Relay Agent Information Option (Option 82) insertion is disabled by default.

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** Use this command to alter the DHCP Relay Agent Option 82 setting when your device is the first hop for the DHCP client. To limit the maximum length of the packet, use the [ip dhcp-relay max-message-length](#) command.

This command cannot be enabled if DHCP snooping is enabled on your device ([service dhcp-snooping](#)), and vice versa.

**Examples** To make the DHCP Relay Agent listening on vlan2 append the DHCP Relay Agent Option 82 field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay agent-option
```

To stop the DHCP Relay Agent from appending the DHCP Relay Agent Option 82 field on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay agent-option
```

**Related commands** [\*\*ip dhcp-relay agent-option remote-id\*\*](#)  
[\*\*ip dhcp-relay information policy\*\*](#)  
[\*\*ip dhcp-relay max-message-length\*\*](#)  
[\*\*service dhcp-relay\*\*](#)

# ip dhcp-relay agent-option checking

**Overview** This command enables the DHCP Relay Agent to check DHCP Relay Agent Information Option (Option 82) information in response packets returned from DHCP servers. If the information does not match the information it has for its own client (downstream) interface then the DHCP Relay Agent drops the packet. Note that **ip dhcp-relay agent-option** must be configured.

The DHCP Relay Agent Option 82 field is included in relayed client DHCP packets if:

- DHCP Relay Agent Option 82 is enabled (**ip dhcp-relay agent-option**), and
- DHCP Relay Agent is enabled on the device (**service dhcp-relay**)

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the **DHCP Feature Overview and Configuration Guide**.

**Syntax** ip dhcp-relay agent-option checking  
no ip dhcp-relay agent-option checking

**Mode** Interface Configuration for VLAN interfaces.

**Examples** To make the DHCP Relay Agent listening on vlan2 check the DHCP Relay Agent Information Option (Option 82) field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay agent-option
awplus(config-if)# ip dhcp-relay agent-option checking
```

To stop the DHCP Relay Agent on vlan2 from checking the DHCP Relay Agent Information Option (Option 82) field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay agent-option checking
```

**Related commands** **ip dhcp-relay agent-option**  
**ip dhcp-relay agent-option remote-id**  
**ip dhcp-relay information policy**  
**service dhcp-relay**

# ip dhcp-relay agent-option remote-id

**Overview** Use this command to specify the Remote ID sub-option of the DHCP Relay Agent Option 82 field the DHCP Relay Agent inserts into clients' request packets. The Remote ID identifies the device that is inserting the DHCP Relay Agent Option 82 information. If a Remote ID is not specified, the Remote ID sub-option is set to the device's MAC address.

Use the **no** variant of this command to return the Remote ID for an interface.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** ip dhcp-relay agent-option remote-id <remote-id>  
no ip dhcp-relay agent-option remote-id

| Parameter   | Description                                                                                                                                                       |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <remote-id> | An alphanumeric (ASCII) string, 1 to 63 characters in length. Additional characters allowed are hyphen (-), underscore (_), and hash (#). Spaces are not allowed. |

**Default** The Remote ID is set to the device's MAC address by default.

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** The Remote ID sub-option is included in the DHCP Relay Agent Option 82 field of relayed client DHCP packets if:

- DHCP Relay Agent Option 82 is enabled ([ip dhcp-relay agent-option](#)), and
- DHCP Relay Agent is enabled on the device ([service dhcp-relay](#))

**Examples** To set the Remote ID to myid for client DHCP packets received on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay agent-option remote-id myid
```

To remove the Remote ID specified for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay agent-option remote-id
```

**Related commands** [ip dhcp-relay agent-option](#)  
[ip dhcp-relay agent-option checking](#)  
[show ip dhcp-relay](#)

# ip dhcp-relay agent-option subscriber-id

**Overview** Use this command to set an ASCII string as a subscriber identifier for a port.

Use the **no** variant of this command to unset the string as a subscriber identifier for a port.

**Syntax** `ip dhcp-relay agent-option subscriber-id <subscriber-id>`  
`no ip dhcp-relay agent-option subscriber-id`

| Parameter                          | Description                                                                                                                                                           |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;subscriber-id&gt;</code> | An alphanumeric string to use as a client identifier. It is from 1 to 63 characters in length. This string may also contain special characters '#', '-', '_' and '.'. |

**Default** No string is set.

**Mode** Interface Configuration

**Usage notes** The subscriber identifier is used by the relay agent to add a subscriber identifier sub-option to the relay-agent information option added by the relay-agent before forwarding the client packets coming from the switch port to the server. The agent option fields in responses sent from the servers to clients are stripped before forwarding such responses back to the client.

**Example** To set subscriber identifier 'office-1' to packets coming from the client directly connected to port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# ip dhcp-relay agent-option subscriber-id
office-1
```

**Output** The following shows typical output.

**Example output from show interface**

```
awplus#show interface port1.0.1
Interface port1.0.1
  Scope: both
  Link is DOWN, administrative state is UP
  Thrash-limiting
    Status Not Detected, Action learn-disable, Timeout 1(s)
  Hardware is Ethernet, address is e01a.ea60.087f
  index 5010 metric 1 mru 1500
  configured duplex auto, configured speed auto, configured polarity auto
  <UP,BROADCAST,MULTICAST>
  SNMP link-status traps: Disabled
  DHCP subscriber-id substitution for client-id is not enabled
  DHCP subscriber-id is office-1
    input packets 0, bytes 0, dropped 0, multicast packets 0
    output packets 0, bytes 0, multicast packets 0, broadcast packets 0
    input average rate : 30 seconds 0 bps, 5 minutes 0 bps
    output average rate: 30 seconds 0 bps, 5 minutes 0 bps
  Time since last state change: 0 days 17:51:00
```

**Command** Version 5.5.2-0.1: command added  
**changes**

## ip dhcp-relay information policy

**Overview** This command sets the policy for how the DHCP relay deals with packets arriving from the client that contain DHCP Relay Agent Option 82 information.

If the command **ip dhcp-relay agent-option** has not been configured, then this command has no effect at all - no alteration is made to Option 82 information in packets arriving from the client side.

However, if the command **ip dhcp-relay agent-option** has been configured, this command modifies how the DHCP relay service deals with cases where the packet arriving from the client side already contains DHCP Relay Agent Option 82 information.

This command sets the action that the DHCP relay should take when a received DHCP client request contains DHCP Relay Agent Option 82 information.

By default, the DHCP Relay Agent replaces any existing DHCP Relay Agent Option 82 field with its own DHCP Relay Agent field. This is equivalent to the functionality of the **replace** parameter.

The **no** variant of this command returns the policy to the default behavior - i.e. replacing the existing DHCP Relay Agent Option 82 field.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**NOTE:** *ip dhcp-relay agent-optionip dhcp-relay information policy*

**Syntax** ip dhcp-relay information policy {append|drop|keep|replace}  
no ip dhcp-relay information policy

| Parameter | Description                                                                                                                                                    |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| append    | The DHCP Relay Agent appends the DHCP Relay Agent Option 82 field of the packet with its own DHCP Relay Agent Option 82 details.                               |
| drop      | The DHCP Relay Agent discards the packet.                                                                                                                      |
| keep      | The DHCP Relay Agent forwards the packet without altering the DHCP Relay Agent Option 82 field.                                                                |
| replace   | The DHCP Relay Agent replaces the existing DHCP Relay Agent details in the DHCP Relay Agent Option 82 field with its own details before forwarding the packet. |

**Mode** Interface Configuration for VLAN interfaces.

**Examples** To make the DHCP Relay Agent listening on vlan2 drop any client requests that already contain DHCP Relay Agent Option 82 information, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay information policy drop
```

To reset the DHCP relay information policy to the default policy for interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay information policy
```

**Related commands** [ip dhcp-relay agent-option](#)  
[ip dhcp-relay agent-option checking](#)

## ip dhcp-relay maxhops

**Overview** This command sets the hop count threshold for discarding BOOTP messages. When the hops field in a BOOTP message exceeds the threshold, the DHCP Relay Agent discards the BOOTP message. The hop count threshold is set to 10 hops by default.

Use the **no** variant of this command to reset the hop count to the default.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** `ip dhcp-relay maxhops <1-255>`  
`no ip dhcp-relay maxhops`

| Parameter | Description                  |
|-----------|------------------------------|
| <1-255>   | The maximum hop count value. |

**Default** The default hop count threshold is 10 hops.

**Mode** Interface Configuration for VLAN interfaces.

**Example** To set the maximum number of hops to 5 for packets received on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay maxhops 5
```

**Related commands** [service dhcp-relay](#)

## ip dhcp-relay max-message-length

**Overview** This command applies when the device is acting as a DHCP Relay Agent and DHCP Relay Agent Option 82 insertion is enabled. It sets the maximum DHCP message length (in bytes) for the DHCP packet with its DHCP Relay Agent Option 82 data inserted. From this value it calculates the maximum packet size that it will accept at its input. Packets that arrive greater than this value will be dropped.

The **no** variant of this command sets the maximum message length to its default of 1400 bytes.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** `ip dhcp-relay max-message-length <548-1472>`  
`no ip dhcp-relay max-message-length`

| Parameter                     | Description                                                                                                 |
|-------------------------------|-------------------------------------------------------------------------------------------------------------|
| <code>&lt;548-1472&gt;</code> | The maximum DHCP message length (this is the message header plus the inserted DHCP option fields in bytes). |

**Default** The default is 1400 bytes.

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** When a DHCP Relay Agent (that has DHCP Relay Agent Option 82 insertion enabled) receives a request packet from a DHCP client, it will append the DHCP Relay Agent Option 82 component data, and forward the packet to the DHCP server. The DHCP client will sometimes issue packets containing pad option fields that can be overwritten with Option 82 data.

Where there are insufficient pad option fields to contain all the DHCP Relay Agent Option 82 data, the DHCP Relay Agent will increase the packet size to accommodate the DHCP Relay Agent Option 82 data. If the new (increased) packet size exceeds that defined by the **maximum-message-length** parameter, then the DHCP Relay Agent will drop the packet.

**NOTE:** [ip dhcp-relay agent-option](#)

**Example** To set the maximum DHCP message length to 1200 bytes for packets arriving in interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay max-message-length 1200
```

To reset the maximum DHCP message length to the default of 1400 bytes for packets arriving in interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay max-message-length
```

**Related commands** [service dhcp-relay](#)

# ip dhcp-relay server-address

## Overview

This command adds a DHCP server for the DHCP Relay Agent to forward client DHCP packets to on a particular interface. You can add up to five DHCP servers on each device interface that the DHCP Relay Agent is listening on.

The **no** variant of this command deletes the specified DHCP server from the list of servers available to the DHCP relay agent.

The **no ip dhcp-relay** command removes all DHCP relay settings from the interface.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** `ip dhcp-relay server-address {<ipv4-address>|<ipv6-address> <server-interface>}`  
`no ip dhcp-relay server-address {<ipv4-address>|<ipv6-address> <server-interface>}`  
`no ip dhcp-relay`

| Parameter                       | Description                                                                                                                                                                   |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;ipv4-address&gt;</i>     | Specify the IPv4 address of the DHCP server for the DHCP Relay Agent to forward client DHCP packets to, in dotted decimal notation. The IPv4 address uses the format A.B.C.D. |
| <i>&lt;ipv6-address&gt;</i>     | Specify the IPv6 address of the DHCPv6 server for the DHCPv6 Relay Agent to forward client DHCP packets to, in hexadecimal notation.                                          |
| <i>&lt;server-interface&gt;</i> | Specify the interface name of the DHCPv6 server. It is only required for a DHCPv6 server with an IPv6 address.                                                                |

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** For a DHCP server with an IPv6 address you must specify the interface for the DHCP server. See examples below for configuration differences between IPv4 and IPv6 DHCP relay servers.

See also the [service dhcp-relay](#) command to enable the DHCP Relay Agent on your device. The [ip dhcp-relay server-address](#) command defines a relay destination on an interface on the device, needed by the DHCP Relay Agent to relay DHCP client packets to a DHCP server.

**Examples:** To enable the DHCP Relay Agent to relay DHCP packets on interface vlan2 to the DHCP server with the IPv4 address 192.0.2.200, use the commands:

**DHCP for IPv4**

```
awplus# configure terminal
awplus(config)# service dhcp-relay
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay server-address 192.0.2.200
```

To remove the DHCP server with the IPv4 address 192.0.2.200 from the list of servers available to the DHCP Relay Agent on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay server-address 192.0.2.200
```

**Examples:** To enable the DHCP Relay Agent on your device to relay DHCP packets on interface vlan10 to the DHCP server with the IPv6 address 2001:0db8:010d::1 on interface vlan20, use the commands:

**DHCPv6**

```
awplus# configure terminal
awplus(config)# service dhcp-relay
awplus(config)# interface vlan10
awplus(config-if)# ip dhcp-relay server-address
2001:0db8:010d::1 vlan20
```

To remove the DHCP server with the IPv6 address 2001:0db8:010d::1 on interface vlan20 from the list of servers available to the DHCP Relay Agent on interface vlan10, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip dhcp-relay server-address
2001:0db8:010d::1 vlan20
```

**Example:** To disable DHCP relay on vlan2, use the commands:

**disabling DHCP relay**

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay
```

**Related commands** [service dhcp-relay](#)

## ip dhcp-relay short-lease

**Overview** Use this command to reduce the amount of time an IP address is assigned to a client device.

Long lease times can cause issues in dynamic networks where client devices frequently move between segments, such as VLANs. These device may retain an outdated IP address from its previous VLAN, disrupting communication.

This command is particularly useful in networks with a high turnover of devices or in environments where IP addresses are scarce.

Use the **no** variant of this command to remove the short lease time configuration.

**Syntax** `ip dhcp-relay short-lease <20-3600>`  
`no ip dhcp-relay short-lease`

| Parameter | Description                               |
|-----------|-------------------------------------------|
| <20-3600> | The lease time for DHCP relay in seconds. |

**Default** Not set

**Mode** Interface Configuration

**Example** To configure a DHCP Relay on interface vlan1 with a lease time of 200 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip dhcp-relay short-lease 200
```

**Related commands** [show ip dhcp-relay](#)

**Command changes** Version 5.5.4-2.1: command added

# ip dhcp-relay use-client-side-address

**Overview** Use this command to configure DHCP-Relay to use the client-side interface (that is the interface receiving the DHCP client packets) IP address as the source address of the relayed DHCP packets.

Use the **no** variant of this command to disable the use of the client-side interface IP address as the source IP address for relayed DHCP packets.

**Syntax** ip dhcp-relay use-client-side-address  
no ip dhcp-relay use-client-side-address

| Parameter               | Description                                                                                 |
|-------------------------|---------------------------------------------------------------------------------------------|
| use-client-side-address | Use the client side interface IP address as the source IP address for relayed DHCP packets. |

**Default** By default, the server-side interface IP address is used as the source IP address of DHCP relayed packets.

**Mode** Global Configuration

**Usage notes** In most cases, there are filters placed between the DHCP relay and DHCP server which only allow DHCP packets from the client subnet to the server and back. This command allows you to configure the DHCP relay so that the relay will use the IP address of the interface **receiving** clients' DHCP requests to be used as the source IP address of the relayed DHCP packets.

**Example** To configure the client-side IP address as the source IP address of DHCP relayed packets, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp-relay use-client-side-address
```

**Output** The following shows typical output.

## Example output from show ip dhcp-relay

```
awplus#sh ip dhcp-relay
DHCP Relay Service is enabled
Use of client side address as source address is enabled
...
```

The second line of the display output shows the status of the client-side address being enabled as the source IP address.

**Related commands** [ip dhcp-relay server-address](#)

**Command changes** Version 5.4.9-0.7: command added

## ip dhcp-relay use-dhcp-relay-ip

**Overview** Use this command to configure the device to use its own IP address in the "Server ID" option, when acting as a DHCP relay agent. By default, the device uses the address of the DHCP server instead.

You may find this command useful if the relay agent is configured to provide short lease times. This command can prevent the client from bypassing the relay agent and ending up with a longer lease from the server.

Use the **no** variant of this command to return to the default behavior.

**Syntax** ip dhcp-relay use-dhcp-relay-ip  
no ip dhcp-relay use-dhcp-relay-ip

**Default** Disabled

**Mode** Global Configuration

**Example** To use the device's own IP address as the server ID, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp-relay use-dhcp-relay-ip
```

To return to using the DHCP server's IP address as the server ID, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp-relay use-dhcp-relay-ip
```

**Related commands** [show ip dhcp-relay](#)

**Command changes** Version 5.5.5-0.1: command added

## ip dhcp use-subscriber-id

**Overview** Use this command in Global Configuration mode to configure the DHCP server to use the subscriber identifier substitution for the client identifier on all DHCP packets coming from all switch ports.

Use this command in Interface Configuration mode to configure a DHCP server to use the subscriber identifier substitution for the client identifier on all DHCP packets coming from a DHCP client directly connected to an interface.

Use the **no** variant of this command to disable the configuration.

**Syntax** ip dhcp use-subscriber-id  
no ip dhcp use-subscriber-id

**Default** Disabled

**Mode** Global Configuration  
Interface Configuration

**Usage notes** In Global Configuration mode, other DHCP packets coming from other interface types, for example Ethernet, are not affected by this command.

In Interface Configuration mode, the subscriber-id used in the substitution is derived from the port name of an interface. For example, for a DHCP packet coming in from a DHCP client directly attached to switchport port1.0.1, the subscriber-id is port1.0.1. This subscriber identifier for the client identifier substitution can only be applied to packets coming from switchport interfaces, consequently this command is only applicable to switchport interfaces.

**Example 1** In Global Configuration mode, to configure the subscriber-id client-id substitution for the DHCP packets coming from all switch port interfaces, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp use-subscriber-id
```

**Output** The following shows typical output.

**Example output from show ip dhcp server summary**

```
awplus#show ip dhcp server summary

DHCP Server service is enabled
DHCP Server is running
BOOTP ignore is disabled
DHCP leasequery support is disabled
DHCP subscriber-id substitution for client-id is enabled
Pool list: pool_direct pool_relay Campus-1
```

**Example 2** In Interface Configuration mode, to configure subscriber identifier substitution for the client identifier on packets sent by a DHCP client directly attached to port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# ip dhcp use-subscriber-id
```

**Output** The following shows typical output.

**Example output from show interface**

```
awplus#show interface port1.0.1
Interface port1.0.1
  Scope: both
  Link is DOWN, administrative state is UP
  Thrash-limiting
    Status Not Detected, Action learn-disable, Timeout 1(s)
  Hardware is Ethernet, address is e01a.ea60.087f
  index 5010 metric 1 mru 1500
  configured duplex auto, configured speed auto, configured
  polarity auto

  SNMP link-status traps: Disabled
  DHCP subscriber-id substitution for client-id is enabled
  DHCP subscriber-id is office-1
    input packets 0, bytes 0, dropped 0, multicast packets 0
    output packets 0, bytes 0, multicast packets 0, broadcast
    packets 0
    input average rate : 30 seconds 0 bps, 5 minutes 0 bps
    output average rate: 30 seconds 0 bps, 5 minutes 0 bps
  Time since last state change: 0 days 17:51:00
```

**Related commands** [show interface](#)

**Command changes** Version 5.5.2-0.1: command added

## service dhcp-relay

**Overview** This command enables the DHCP Relay Agent on the device. However, on a given IP interface, no DHCP forwarding takes place until at least one DHCP server is specified to forward/relay all clients' DHCP packets to.

The **no** variant of this command disables the DHCP Relay Agent on the device for all interfaces.

**Syntax** service dhcp-relay  
no service dhcp-relay

**Mode** Global Configuration

**Usage notes** A maximum number of 400 DHCP Relay Agents (one per interface) can be configured on the device. Once this limit has been reached, any further attempts to configure DHCP Relay Agents will not be successful.

**Default** The DHCP-relay service is enabled by default.

**Examples** To enable the DHCP relay global function, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
```

To disable the DHCP relay global function, use the commands:

```
awplus# configure terminal
awplus(config)# no service dhcp-relay
```

# show counter dhcp-client

**Overview** This command shows counters for the DHCP client on your device.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show counter dhcp-client

**Mode** User Exec and Privileged Exec

**Example** To display the message counters for the DHCP client on your device, use the command:

```
awplus# show counter dhcp-client
```

**Output** The following shows typical output.

**Example output from the show counter dhcp-client command**

```
show counter dhcp-client

DHCPDISCOVER out      ..... 10
DHCPREQUEST out       ..... 34
DHCPDECLINE out       ..... 4
DHCPRELEASE out       ..... 0
DHCPOFFER in          ..... 22
DHCPACK in            ..... 18
DHCPNAK in            ..... 0
```

**Parameters in the output of the show counter dhcp-client command**

| Parameter        | Description                                                                  |
|------------------|------------------------------------------------------------------------------|
| DHCPDISCOVER out | The number of DHCP Discover messages sent by the client.                     |
| DHCPREQUEST out  | The number of DHCP Request messages sent by the client.                      |
| DHCPDECLINE out  | The number of DHCP Decline messages sent by the client.                      |
| DHCPRELEASE out  | The number of DHCP Release messages sent by the client.                      |
| DHCPOFFER in     | The number of DHCP Offer messages received by the client.                    |
| DHCPACK in       | The number of DHCP Acknowledgement messages received by the client.          |
| DHCPNAK in       | The number of DHCP Negative Acknowledgement messages received by the client. |

|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                          | Note that Agent Option counters only increment on errors occurring if the <b>ip dhcp-relay agent-option</b> command is configured for an interface. Messages generating the errors are only dropped if the <b>ip dhcp-relay agent-option checking</b> command is configured on the interface as well as the <b>ip dhcp-relay agent-option</b> command                                                                                                                                                                                                                                       |
| Option Insert Failed     | The number of incoming DHCP Request messages dropped due to an error adding the DHCP Relay Agent information (option-82). This counter increments when: <ul style="list-style-type: none"><li>the DHCP Relay Agent is set to drop packets with the DHCP Relay Agent Option 82 field already filled by another DHCP Relay Agent. This policy is set with the <b>ip dhcp-relay information policy</b> command.</li><li>there is a packet error that stops the DHCP Relay Agent from being able to append the packet with its DHCP Relay Agent Information Option (Option 82) field.</li></ul> |
| DHCPv6 Requests In       | The number of incoming DHCPv6 Request messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| DHCPv6 Replies In        | The number of incoming DHCPv6 Reply messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| DHCPv6 Relayed to Server | The number of DHCPv6 messages relayed to the server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| DHCPv6 Relayed to Client | The number of DHCPv6 messages relayed to the client.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

# show dhcp lease

**Overview** This command shows details about the leases that the DHCP client has acquired from a DHCP server for interfaces on the device.

For information on filtering and saving command output, see “Controlling “show” Command Output” in the **“Getting Started with AlliedWare\_Plus” Feature Overview and Configuration Guide**.

**Syntax** show dhcp lease [<interface>]

| Parameter   | Description                                       |
|-------------|---------------------------------------------------|
| <interface> | Interface name to display DHCP lease details for. |

**Mode** User Exec and Privileged Exec

**Example** To show the current lease expiry times for all interfaces, use the command:

```
awplus# show dhcp lease
```

To show the current lease for vlan2, use the command:

```
awplus# show dhcp lease vlan2
```

**Output** The following shows typical output.

## Example output from the show dhcp lease vlan1 command

|                        |                             |
|------------------------|-----------------------------|
| Interface vlan1        |                             |
| -----                  |                             |
| IP Address:            | 192.168.22.4                |
| Expires:               | 13 Mar 2022 20:10:19        |
| Renew:                 | 13 Mar 2022 18:37:06        |
| Rebind:                | 13 Mar 2022 19:49:29        |
| Server:                |                             |
| Options:               |                             |
| subnet-mask            | 255.255.255.0               |
| routers                | 19.18.2.100,12.16.2.17      |
| dhcp-lease-time        | 3600                        |
| dhcp-message-type      | 5                           |
| domain-name-servers    | 192.168.100.50,19.88.200.33 |
| dhcp-server-identifier | 192.168.22.1                |
| domain-name            | alliedtelesis.com           |

**Related commands** [ip address dhcp](#)

# show ip dhcp-relay

**Overview** This command shows the configuration of the DHCP Relay Agent on each interface.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show ip dhcp-relay [interface <interface-name>]

| Parameter        | Description                                                                                          |
|------------------|------------------------------------------------------------------------------------------------------|
| <interface-name> | Name of a specific interface. This displays the DHCP configuration for the specified interface only. |

**Mode** User Exec and Privileged Exec

**Example** To display the DHCP Relay Agent’s configuration on the interface vlan2, use the command:

```
awplus# show ip dhcp-relay interface vlan2
```

**Output** The following shows typical output.

## Example output from the show ip dhcp-relay command

```
DHCP Relay Service is enabled
vlan2 is up, line protocol is up
Maximum hop count is 10
Maximum DHCP message length is 1400
DHCP Relay short lease time for IPv4 is 200 seconds
DHCP Relay short lease time for IPv6 are 2000/1900 (valid/
preferred) seconds
Insertion of Relay Agent Option is disabled
Checking of Relay Agent Option is disabled
The Remote Id string for Relay Agent Option is 0000.cd28.074c
Relay information policy is to append new relay agent
information
List of servers : 192.168.1.200
```

# Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure DHCPv6. For more information, see the [DHCPv6 Feature Overview and Configuration Guide](#).

DHCPv6 is a network protocol used to configure IPv6 hosts with IPv6 addresses and IPv6 prefixes for an IPv6 network. DHCPv6 is used instead of SLAAC (Stateless Address Autoconfiguration) at sites where centralized management of IPv6 hosts is needed. IPv6 routers require automatic configuration of IPv6 addresses and IPv6 prefixes.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**NOTE:** *The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical networks (other than for testing purposes) nor should they appear on any public network.*

# clear counter ipv6 dhcp-client

**Overview** Use this command in Privileged Exec mode to clear DHCPv6 client counters.

**Syntax** clear counter ipv6 dhcp-client

**Mode** Privileged Exec

**Example** To clear DHCPv6 client counters, use the following command:

```
awplus# clear counter ipv6 dhcp-client
```

**Related commands** [show counter ipv6 dhcp-client](#)

## clear ipv6 dhcp client

**Overview** Use this command in Privileged Exec mode to restart a DHCPv6 client on an interface.

**Syntax** `clear ipv6 dhcp client <interface>`

| Parameter   | Description                                               |
|-------------|-----------------------------------------------------------|
| <interface> | Specify the interface name to restart a DHCPv6 client on. |

**Mode** Privileged Exec

**Example** To restart a DHCPv6 client on interface vlan1, use the following command:  
`awplus# clear ipv6 dhcp client vlan1`

## ipv6 address dhcp

**Overview** Use this command to activate the DHCPv6 client on the interface that you are configuring. This allows the interface to use the DHCPv6 client to obtain its IPv6 configuration details from a DHCPv6 server on its connected network.

The command also enables IPv6 on the interface, which creates an EUI-64 link-local address as well as enabling RA processing and SLAAC.

Use the **no** variant of this command to stop the interface from obtaining IPv6 configuration details from a DHCPv6 server.

The DHCPv6 client supports the following IP configuration options:

- Option 1—the subnet mask for your device.
- Option 3—a list of default routers.
- Option 6— list of DNS servers.
- Option 15—a domain name used to resolve host names.
- Option 51—lease expiration time.

**Syntax** `ipv6 address dhcp [default-route-to-server]`  
`no ipv6 address dhcp`

| Parameter               | Description                                                                                                                                                              |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| default-route-to-server | Allow the automatic configuration of a default route to the DHCPv6 server.<br><br>This option is not enabled by default when you enable the DHCP client on an interface. |

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** Use the **default-route-to-server** option to allow the automatic configuration of a default route to the DHCPv6 server. Note that this option is not enabled by default when you enable the DHCP client on an interface.

**Examples** To set the interface vlan2 to use DHCPv6 to obtain an IPv6 address, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 address dhcp
```

To stop the interface vlan2 from using DHCPv6 to obtain its IPv6 address, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 address dhcp
```

**Related commands**

- clear ipv6 dhcp client**
- ipv6 address**
- show ipv6 dhcp interface**
- show running-config**

# show counter ipv6 dhcp-client

**Overview** Use this command in User Exec or Privilege Exec mode to show DHCPv6 client counter information.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show counter ipv6 dhcp-client

**Mode** User Exec and Privileged Exec

**Example** To display the DHCPv6 client counter information, use the command:

```
awplus# show counter ipv6 dhcp-client
```

**Output** The following shows typical output.

**Example output from the show counter ipv6 dhcp-client command**

```
awplus#show counter ipv6 dhcp-client
SOLICIT out          ..... 20
ADVERTISE in         ..... 12
REQUEST out          ..... 1
CONFIRM out          ..... 0
RENEW out            ..... 0
REBIND out           ..... 0
REPLY in             ..... 0
RELEASE out          ..... 0
DECLINE out          ..... 0
INFORMATION-REQUEST out ..... 0
```

**Parameters in the output of the show counter ipv6 dhcp-client command**

| Parameter               | Description                                                                   |
|-------------------------|-------------------------------------------------------------------------------|
| SOLICIT out             | Displays the count of SOLICIT messages sent by the DHCPv6 client.             |
| ADVERTISE in            | Displays the count of ADVERTISE messages received by the DHCPv6 client.       |
| REQUEST out             | Displays the count of REQUEST messages sent by the DHCPv6 client.             |
| CONFIRM out             | Displays the count of CONFIRM messages sent by the DHCPv6 client.             |
| RENEW out               | Displays the count of RENEW messages sent by the DHCPv6 client.               |
| REBIND out              | Displays the count of REBIND messages sent by the DHCPv6 client.              |
| REPLY in                | Displays the count of REPLY messages received by the DHCPv6 client.           |
| RELEASE out             | Displays the count of RELEASE messages sent by the DHCPv6 client.             |
| DECLINE out             | Displays the count of DECLINE messages sent by the DHCPv6 client.             |
| INFORMATION-REQUEST out | Displays the count of INFORMATION-REQUEST messages sent by the DHCPv6 client. |

# show ipv6 dhcp interface

**Overview** Use this command in User Exec or Privileged Exec mode to display DHCPv6 information for a specified interface, or all interfaces when entered without the interface parameter.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show ipv6 dhcp interface [<interface-name>]

| Parameter        | Description                                                                                                                                                                          |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <interface-name> | Optional. Specify the name of the interface to show DHCPv6 information about. Omit this optional parameter to display DHCPv6 information for all interfaces DHCPv6 is configured on. |

**Mode** User Exec and Privileged Exec

**Example** To display DHCPv6 information for all interfaces DHCPv6 is configured on, use the command:

```
awplus# show ipv6 dhcp interface
```

**Output** The following shows typical output.

## Example output from the show ipv6 dhcp interface command

```
awplus# show ipv6 dhcp interface
vlan1 is in client mode
Address 1001::3c0:1
    preferred lifetime 9000, valid lifetime 5000
    starts at 20 Jan 2021 09:21:35
    expires at 20 Jan 2021 10:25:32
```

## Parameters in the output of the show counter dhcp-client command

| Parameter                     | Description                                                 |
|-------------------------------|-------------------------------------------------------------|
| <interface> is in client mode | Displays that the specified interface is in client mode.    |
| Address                       | Displays the address of the DHCPv6 server on the interface. |
| Preference                    | Displays the preference value for the DHCPv6 server.        |

# Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure the Network Time Protocol (NTP). For more information, see the [NTP Feature Overview and Configuration Guide](#).

The device can act as an NTP client to receive time from one or more NTP servers, and as an NTP server.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare\\_Plus” Feature Overview and Configuration Guide](#).

# ntp authentication-key

**Overview** This command defines each of the authentication keys. Each key has a key number, a type (MD5 or SHA1), and a value.

The **no** variant of this disables the authentication key.

**Syntax** `ntp authentication-key <keynumber> md5 <key-string> [trusted]`  
`ntp authentication-key <keynumber> sha1 <key-string> [trusted]`

When in secure mode, MD5 is not available and the syntax in config files will be:

`ntp authentication-key <keynumber> sha1-encrypted <encrypted-key-string> [trusted]`

`no ntp authentication-key <keynumber>`

| Parameter              | Description                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <keynumber>            | <1-4294967295> An identification number for the key.                                                                                                                                                                                                                                                                                                                                                                     |
| md5                    | Define an MD5 key.                                                                                                                                                                                                                                                                                                                                                                                                       |
| sha1                   | Define an SHA1 key.                                                                                                                                                                                                                                                                                                                                                                                                      |
| <key-string>           | The authentication key. For SHA1, this is a 20 hexadecimal character string. For MD5, this is a string of up to 31 ASCII characters.                                                                                                                                                                                                                                                                                     |
| sha1-encrypted         | <p>This parameter indicates in running config that the key is in its encrypted form instead of in plaintext.</p> <p>If secure mode is enabled and you enter a SHA1 key, the running config will display this sha1-encrypted parameter instead of sha1, and will display the key in encrypted form.</p> <p>Do not enter a key using the sha1-encrypted parameter. Instead, enter sha1 and the unencrypted key string.</p> |
| <encrypted-key-string> | The encrypted authentication key.                                                                                                                                                                                                                                                                                                                                                                                        |
| trusted                | Add this key to the list of authentication keys that this server trusts.                                                                                                                                                                                                                                                                                                                                                 |

**Mode** Global Configuration

**Examples** To define an MD5 authentication key number 134343 and a key value 'mystring', use the commands:

```
awplus# configure terminal
awplus(config)# ntp authentication-key 134343 md5 mystring
```

To disable the authentication key number 134343 with the key value 'mystring', use the commands:

```
awplus# configure terminal
awplus(config)# no ntp authentication-key 134343
```

**Command changes** Version 5.4.9-2.1 sha1-encrypted parameter added.

# ntp broadcastdelay

**Overview** Use this command to set the estimated round-trip delay for broadcast packets.

Use the **no** variant of this command to reset the round-trip delay for broadcast packets to the default offset of 0 microseconds.

**Syntax** ntp broadcastdelay <delay>  
no ntp broadcastdelay

| Parameter | Description                                     |
|-----------|-------------------------------------------------|
| <delay>   | <1-999999> The broadcast delay in microseconds. |

**Default** 0 microsecond offset, which can only be applied with the **no** variant of this command.

**Mode** Global Configuration

**Examples** To set the estimated round-trip delay to 23464 microseconds for broadcast packets, use these commands:

```
awplus# configure terminal
awplus(config)# ntp broadcastdelay 23464
```

To reset the estimated round-trip delay for broadcast packets to the default setting (0 microseconds), use these commands:

```
awplus# configure terminal
awplus(config)# no ntp broadcastdelay
```

# ntp master

**Overview** Use this command to make the device to be an authoritative NTP server, even if the system is not synchronized to an outside time source.

Use the **no** variant of this command to stop the device being the designated NTP server.

**Syntax** ntp master [<stratum>]  
no ntp master

| Parameter | Description                                                                                                                                    |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <stratum> | <1-15> The stratum number defines the configured level that is set for this master within the NTP hierarchy. The default stratum number is 12. |

**Mode** Global Configuration

**Usage notes** The stratum levels define the distance from the reference clock and exist to prevent cycles in the hierarchy. Stratum 1 is used to indicate time servers, which are more accurate than Stratum 2 servers. For more information on the Network Time Protocol go to: [www.ntp.org](http://www.ntp.org)

**Examples** To stop the device from being the designated NTP server, use the commands:

```
awplus# configure terminal
awplus(config)# no ntp master
```

To make the device the designated NTP server with stratum number 2, use the commands:

```
awplus# configure terminal
awplus(config)# ntp master 2
```

## ntp peer

**Overview** Use this command to configure an NTP peer association. An NTP association is a peer association if this system is willing to either synchronize to the other system, or allow the other system to synchronize to it.

Use the **no** variant of this command to remove the configured NTP peer association.

**Syntax** `ntp peer {<peeraddress>|<peername>} [prefer] [key <key>]  
[version <version>]  
no ntp peer {<peeraddress>|<peername>}`

| Parameter         | Description                                                                                                                       |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <peeraddress>     | Specify the IP address of the peer, entered in the form A.B.C.D for an IPv4 address, or in the form X:X::X:X for an IPv6 address. |
| <peername>        | Specify the peer hostname. The peer hostname can resolve to an IPv4 and an IPv6 address.                                          |
| prefer            | Prefer this peer when possible.                                                                                                   |
| key <key>         | <1-4294967295><br>Configure the peer authentication key.                                                                          |
| version <version> | <1-4><br>Configure for this NTP version.                                                                                          |

**Mode** Global Configuration

**Examples** To set an NTP peer association for this peer with an IPv4 address of 192.0.2.23, use the commands:

```
awplus# configure terminal
awplus(config)# ntp peer 192.0.2.23
```

To remove an NTP peer association for this peer with an IPv4 address of 192.0.2.23, use the commands:

```
awplus# configure terminal
awplus(config)# no ntp peer 192.0.2.23
```

To set an NTP peer association for this peer with an IPv6 address of 2001:0db8:010d::1, use the commands:

```
awplus# configure terminal
awplus(config)# ntp peer 2001:0db8:010d::1
```

To remove an NTP peer association for this peer with an IPv6 address of 2001:0db8:010d::1, use the following commands:

```
awplus# configure terminal
awplus(config)# no ntp peer 2001:0db8:010d::1
```

To set the preferred peer to be IPv4 192.0.2.23 and the version to 4, with the authentication key '1234', use the commands:

```
awplus# configure terminal
awplus(config)# ntp peer 192.0.2.23 prefer version 4 key 1234
```

**Related commands** [ntp server](#)  
[ntp source](#)

# ntp rate-limit

**Overview** Use this command to enable NTP server response rate-limiting. Limiting NTP server responses can reduce network traffic when occurrences such as misconfigured or broken NTP clients poll the NTP server too frequently. Excessive polling can lead to network overload.

Use the **no** variant of this command to remove the rate-limit configuration.

**Syntax** `ntp rate-limit {interval<1-4096>|burst <1-255>|leak <2-16>}`  
`no ntp rate-limit`

| Parameter | Description                                                                                                                                                                                                |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| interval  | The minimum interval between responses configured in seconds. The default interval is 8 seconds.                                                                                                           |
| burst     | The maximum number of responses that can be sent in a burst, temporarily exceeding the limit specified by the interval option. The default burst is 8 responses.                                           |
| leak      | The rate at which responses are randomly allowed even if the limits specified by the interval and burst options are exceeded. The default leak is 4, i.e. on average, every fourth request has a response. |

**Mode** Global Configuration

**Default** Interval - 8 seconds.  
Burst - 8 responses.  
Leak - 4.

**Example** To configure an NTP rate-limiting interval of 30 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# ntp rate-limit interval 30
```

**Related commands**  
**Command changes**

**ntp restrict**  
Version 5.4.8-1.1: command added

# ntp restrict

**Overview** Use this command to configure a restriction (allow or deny) on NTP packets or NTP functionality for a specific host/network or all hosts of a given IP family.

This means you can control host access to NTP service and NTP server status queries.

Use the **no** variant of this command to remove a restriction from one or more hosts.

**Syntax**

```
ntp restrict {default-v4|default-v6|<host-address>|<host-subnet>}
{allow|deny}

ntp restrict {default-v4|default-v6|<host-address>|<host-subnet>} query {allow|deny}

ntp restrict {default-v4|default-v6|<host-address>|<host-subnet>} serve {allow|deny}

no ntp restrict {default-v4|default-v6|<host-address>|<host-subnet>}
```

| Parameter      | Description                                                                                                                                                          |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| default-v4     | Apply this restriction to all IPv4 hosts.                                                                                                                            |
| default-v6     | Apply this restriction to all IPv6 hosts.                                                                                                                            |
| <host-address> | Apply this restriction to the specified IPv4 or IPv6 host.<br>Enter an IPv4 address in the format A.B.C.D.<br>Enter an IPv6 address in the format X:X::X:X.          |
| <host-subnet>  | Apply this restriction to the specified IPv4 subnet or IPv6 prefix.<br>Enter an IPv4 subnet in the format A.B.C.D/M.<br>Enter an IPv6 prefix in the format X:X::X/X. |
| query          | Control NTP server status queries to matching hosts.                                                                                                                 |
| serve          | Control NTP time service to matching hosts.                                                                                                                          |
| allow          | Allow the configured restriction.                                                                                                                                    |
| deny           | Deny the configured restriction.                                                                                                                                     |

**Default** By default, time service is allowed to all hosts, and NTP server status querying is denied to all hosts.

**Mode** Global Configuration

**Example** To prevent all IPv4 hosts from accessing a device for NTP service, use the commands:

```
awplus# configure terminal
awplus(config)# ntp restrict default-v4 deny
```

To prevent the host 192.168.1.1 from accessing a device for NTP service, use the commands:

```
awplus# configure terminal
awplus(config)# ntp restrict 198.168.1.1 deny
```

To allow all hosts in the 10.10.10.0/24 subnet to access a device for NTP server status, use the commands:

```
awplus# configure terminal
awplus(config)# ntp restrict 10.10.10.0/24 query allow
```

Version 5.4.8-1.1: command added

## ntp server

**Overview** Use this command to configure an NTP server. This means that this system will synchronize to the other system, and not vice versa. You can configure an NTP server association by hostname or IP address.

Use the **no** variant of this command to remove the configured NTP server.

**Syntax** `ntp server {<serveraddress>|<servername>} [prefer] [key <key>]  
[version <version>]  
no ntp server {<serveraddress>|<servername>}`

| Parameter         | Description                                                                                                                       |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <serveraddress>   | Specify the IP address of the peer, entered in the form A.B.C.D for an IPv4 address, or in the form X:X::X.X for an IPv6 address. |
| <servername>      | Specify the server hostname. The server hostname can resolve to an IPv4 and an IPv6 address.                                      |
| prefer            | Prefer this server when possible.                                                                                                 |
| key <key>         | Configure the server authentication key from the range 1 to 4294967295.                                                           |
| version <version> | Configure for this NTP version from the range 1 to 4.                                                                             |

**Mode** Global Configuration

**Examples** To obtain the time by synchronizing with the server at 192.0.1.23, use the commands:

```
awplus# configure terminal
awplus(config)# ntp server 192.0.1.23
```

To obtain the time by synchronizing with the server at 192.0.1.23, and specify that this is the best server to use, use the commands:

```
awplus# configure terminal
awplus(config)# ntp server 192.0.1.23 prefer
```

To obtain the time by synchronizing with the server at 2001:0db8:010e::2, use the commands:

```
awplus# configure terminal
awplus(config)# ntp server 2001:0db8:010e::2
```

To obtain the time by synchronizing with the server at 2001:0db8:010e::2, and specify that this is the best server to use, use the commands:

```
awplus# configure terminal
awplus(config)# ntp server 2001:0db8:010e::2 prefer
```

To stop using the time server at 2001:0db8:010e::2, use the commands:

```
awplus# configure terminal
awplus(config)# no ntp server 2001:0db8:010e::2
```

**Related commands** [ntp peer](#)  
[ntp source](#)

## ntp source

**Overview** Use this command to configure an IPv4 or an IPv6 address for the NTP source interface. This command defines the socket used for NTP messages, and only applies to NTP client behavior.

Note that you cannot use this command when using AMF (Allied Telesis Management Framework) or VCStack.

Use the **no** variant of this command to remove the configured IPv4 or IPv6 address from the NTP source interface.

**Syntax** ntp source <source-address>  
no ntp source

| Parameter        | Description                                                                                                                                       |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <source-address> | Specify the IP address of the NTP source interface, entered in the form A.B.C.D for an IPv4 address, or in the form X:X::X.X for an IPv6 address. |

**Default** An IP address is selected based on the most appropriate egress interface used to reach the NTP peer if a configured NTP client source IP address is unavailable or invalid.

**Mode** Global Configuration

**Usage notes** Adding an IPv4 or an IPv6 address allows you to select which source interface NTP uses for peering. The IPv4 or IPv6 address configured using this command is matched to the interface.

When selecting a source IP address to use for NTP messages to the peer, if the configured NTP client source IP address is unavailable then default behavior will apply, and an alternative source IP address is automatically selected. This IP address is based on the most appropriate egress interface used to reach the NTP peer. The configured NTP client source IP may be unavailable if the interface is down, or an invalid IP address is configured that does not reside on the device.

Note that this command only applies to NTP client behavior. The egress interface that the NTP messages use to reach the NTP server is determined by the **ntp peer** and **ntp server** commands.

**Examples** To configure the NTP source interface with the IPv4 address 192.0.2.23, enter the commands:

```
awplus# configure terminal
awplus(config)# ntp source 192.0.2.23
```

To configure the NTP source interface with the IPv6 address 2001:0db8:010e::2, enter the commands:

```
awplus# configure terminal
awplus(config)# ntp source 2001:0db8:010e::2
```

To remove a configured address for the NTP source interface, use the following commands:

```
awplus# configure terminal
awplus(config)# no ntp source
```

**Related commands** [ntp peer](#)  
[ntp server](#)

# show ntp associations

**Overview** Use this command to display the status of NTP associations.

**Syntax** show ntp associations

**Mode** User Exec and Privileged Exec

**Example** To display the status of NTP associations, use the command:

```
awplus# show ntp associations
```

**Output** The following shows typical output.

### Output from show ntp associations

| awplus#show ntp associations                                    | remote      | refid | st | t | when | poll | reach | delay | offset | disp  |

### Parameters in the output from show ntp associations

| Parameter      | Description                                                                                                                                                                                                                                      |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| * system peer  | The peer that NTP uses to calculate variables like the offset and root dispersion of this AlliedWare Plus device. NTP passes these variables to the clients using this AlliedWare Plus device.                                                   |
| # backup       | Peers that are usable, but are not among the first six peers sorted by synchronization distance. These peers may not be used.                                                                                                                    |
| + candidate    | Peers that the NTP algorithm has determined can be used, along with the system peer, to discipline the clock (i.e. to set the time on the AlliedWare Plus device).                                                                               |
| - outlier      | Peers that are not used because their time is significantly different from the other peers.                                                                                                                                                      |
| x false ticker | Peers that are not used because they are not consider trustworthy.                                                                                                                                                                               |
| space          | Peers that are not used because they are, for example, unreachable.                                                                                                                                                                              |
| remote         | The peer IP address                                                                                                                                                                                                                              |
| refid          | The IP address of the reference clock, or an abbreviation indicating the type of clock (e.g. GPS indicates that the server uses GPS for the reference clock). INIT indicates that the reference clock is initializing, so it is not operational. |
| st             | The stratum, which is the number of hops between the server and the accurate time source such as an atomic clock.                                                                                                                                |
| t              | Type, one of:<br>u: unicast or multicast client<br>b: broadcast or multicast client!<br>s: symmetric peer<br>A: multicast server<br>B: broadcast server<br>M: multicast server                                                                   |

| Parameter | Description                                                                                                                                                                                                                                                                            |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| when      | When last polled (seconds ago, h hours ago, or d days ago).                                                                                                                                                                                                                            |
| poll      | Time between NTP requests from the device to the server.                                                                                                                                                                                                                               |
| reach     | An indication of whether or not the NTP server is responding to requests. 0 indicates there has never been a successful poll; 1 indicates that the last poll was successful; 3 indicates that the last two polls were successful; 377 indicates that the last 8 polls were successful. |
| delay     | The round trip communication delay to the remote peer or server, in milliseconds.                                                                                                                                                                                                      |
| offset    | The mean offset (phase) in the times reported between this local host and the remote peer or server (root mean square, milliseconds).                                                                                                                                                  |
| disp      | The amount of clock error (in milliseconds) of the server due to clock resolution, network congestion, etc.                                                                                                                                                                            |

# show ntp counters

**Overview** This command displays packet counters for NTP.

**Syntax** show ntp counters

**Mode** Privileged Exec

**Example** To display counters for NTP use the command:

```
awplus# show ntp counters
```

```
awplus#show ntp counters
Server Received      4
Server Dropped      0
Client Sent         90
Client Received      76
Client Valid Received 76
```

## Parameters in the output from show ntp counters

| Parameter             | Description                                                  |
|-----------------------|--------------------------------------------------------------|
| Server Received       | Number of NTP packets received from NTP clients.             |
| Server Dropped        | Number of NTP packets received from NTP clients but dropped. |
| Client Sent           | Number of NTP packets sent to servers.                       |
| Client Received       | Number of NTP packets received from servers                  |
| Client Valid Received | Number of valid NTP packets received from servers.           |

# show ntp counters associations

**Overview** Use this command to display NTP packet counters for individual servers and peers.

**Syntax** show ntp counters associations

**Mode** Privileged Exec

**Examples** To display packet counters for each NTP server and peer that is associated with a device, use the command:

```
awplus# show ntp counters associations
```

**Output** The following shows typical output.

## Example output from show ntp counters associations

```
awplus#show ntp counters associations
Peer 2001::1
  sent:          -
  received:      -
Peer 10.37.219.100
  sent:          7
  received:      7
```

## Parameters in the output from show ntp counters associations

| Parameter | Description                                                        |
|-----------|--------------------------------------------------------------------|
| Peer      | An NTP peer or server that the device is associated with.          |
| sent      | The number of NTP packets that this device sent to the peer.       |
| received  | The number of NTP packets that this device received from the peer. |

**Related commands** [ntp restrict](#)

# show ntp status

**Overview** Use this command to display the status of the Network Time Protocol (NTP).

**Syntax** show ntp status

**Mode** User Exec and Privileged Exec

**Example** To see information about NTP status, use the command:

```
awplus# show ntp status
```

For information about the output displayed by this command, see [ntp.org](http://ntp.org).

## Example output from show ntp status

```
awplus#show ntp status
Reference ID      : C0A8010A (192.168.1.10)
Stratum          : 4
Ref time (UTC)   : Fri Jun 15 05:32:38 2018
System time      : 0.000002004 seconds fast of NTP time
Last offset      : -0.002578615 seconds
RMS offset       : 0.000928071 seconds
Frequency        : 5.099 ppm slow
Residual freq    : -9.120 ppm
Skew             : 17.486 ppm
Precision        : -21 (0.000000477 seconds)
Root delay       : 0.031749818 seconds
Root dispersion  : 0.133974627 seconds
Update interval  : 65.3 seconds

# Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure Precision Time Protocol (PTP) and Transparent Clock.

For more information, see the **Precision Time Protocol (PTP) and Transparent Clock Feature Overview and Configuration Guide**.

# clock-enable

**Overview** Use this command to enable the PTP Clock currently being configured. Once the PTP Clock is enabled, it can then be added to an interface using the **clock-port** command.

Use the **no** variant of this command to change the current PTP Clock configuration.

**Syntax** clock-enable  
no clock-enable

**Mode** PTP Clock Configuration Mode

**Example** To enable the PTP Clock with Ethernet transport, peer to peer delay mechanism, and two-step step type, use the commands:

```
awplus# configure terminal
awplus(config)# ptp clock clock1
awplus(config-ptp-clock)# transport-type ethernet
awplus(config-ptp-clock)# delay-mechanism p2p
awplus(config-ptp-clock)# step-type twostep
awplus(config-ptp-clock)# clock-enable
awplus(config-ptp-clock)#
```

**Related commands** [ptp clock](#)  
[transport-type](#)  
[step-type](#)  
[show ptp clock](#)

**Command changes** Version 5.5.5-2.1: command added

# clock-port

**Overview** Use this command to assign a PTP clock to an interface. The specified clock must already exist and be enabled using the `clock-enable` command.

If no clock name is provided, the migrated PTP clock named 'migrated\_inst' (created when running the deprecated 'ptp-clk' command) will be added to the interface.

Use the **no** variant of this command to remove the currently assigned PTP clock.

**Syntax** `clock-port [<clock-name>]`  
`no clock-port`

| Parameter                       | Description                                                                                                                                             |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;clock-name&gt;</code> | Enter the name of the PTP clock to assign to the interface. Ensure the clock already exists and is enabled using the <code>clock-enable</code> command. |

**Mode** Interface Configuration

**Example** To assign PTP Clock 'clock1' to port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# clock-port clock1
```

To remove PTP Clock 'clock1' from port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no clock-port
```

**Related commands** [ptp clock](#)  
[transport-type](#)  
[step-type](#)  
[clock-enable](#)

**Command changes** Version 5.5.5-2.1: command added

## debug ptp

**Overview** Use this command to enable debugging for PTP.  
Use the **no** variant of this command to stop PTP debug.

**Syntax** debug ptp [ptp41|all]  
no debug ptp [ptp41|all]

| Parameter | Description                                                                                                             |
|-----------|-------------------------------------------------------------------------------------------------------------------------|
| all       | Enable all debug options for PTP.                                                                                       |
| ptp41     | Show debug for ptp41. This includes device discovery and clock selection at startup, and continuous timing information. |

**Mode** Privileged Exec

**Example** To display all PTP debug output, use the command:  
awplus# debug ptp all

## Output Example output from `debug ptp all`

```
awplus#debug ptp all
08:28:37 awplus ptp4l: [129.923] port 1 (port1.0.1): peer port id
set to 00900b.ffffe.2bd9ea-1
08:28:37 awplus ptp4l: [129.925] port 1 (port1.0.1): received link
status notification
08:28:37 awplus ptp4l: [129.925] interface index 5001 is up
08:28:37 awplus ptp4l: [129.932] selected local clock
000c25.ffffe.2c246c as best master
08:28:38 awplus ptp4l: [130.759] port 1 (port1.0.1): new foreign
master 00900b.ffffe.2bd9ea-1

```

**Related commands** `show ptp counters`

**Command changes** Version 5.5.5-2.1: command added

# delay-mechanism

**Overview** Use this command to set the delay mechanism of a PTP Clock. You can select either e2e (End-to-End) or p2p (Peer-to-Peer).

End-to-End transparent clocks measure path delay by observing timing messages between master and secondary clocks, while Peer-to-Peer transparent clocks measure delay between directly connected devices using peer delay messages.

Use the **no** variant of this command to remove the delay mechanism from a PTP Clock.

**Syntax** delay-mechanism {e2e|p2p}  
no delay-mechanism

| Parameter | Description                           |
|-----------|---------------------------------------|
| e2e       | Use the End-to-End delay mechanism.   |
| p2p       | Use the Peer-to-Peer delay mechanism. |

**Default** Not set.

**Mode** PTP Clock Configuration Mode

**Usage notes** This command sets the delay mechanism for a PTP clock to either E2E (End-to-End) or P2P (Peer-to-Peer). Before **clock-enable** is configured, either option can be set. Once clock-enable is applied, the system validates whether the selected delay mechanism is compatible with other configuration settings.

**Example** To set the Peer-to-Peer delay mechanism for PTP Clock 'clock1', use the commands:

```
awplus# configure terminal
awplus(config)# ptp clock clock1
awplus(config-ptp-clock)# delay-mechanism p2p
awplus(config-ptp-clock)#
```

**Related commands** [ptp clock](#)  
[transport-type](#)  
[step-type](#)  
[show ptp clock](#)

**Command changes** Version 5.5.5-2.1: command added

# ptp clock

**Overview** Use this command to create a new PTP clock and enter configuration mode. Once in configuration mode, you can configure the transport type, delay mechanism, and step type. The system validates the configuration when you add 'clock-enable' to the PTP clock..

Use the **no** variant of this command to remove the corresponding PTP clock.

**Syntax** ptp clock <clock-name>  
no ptp clock <clock-name>

| Parameter    | Description                |
|--------------|----------------------------|
| <clock-name> | The name of the PTP clock. |

**Mode** Global Configuration

**Example** To add a PTP clock named 'clock1', use the commands:

```
awplus# configure terminal
awplus(config)# ptp clock clock1
awplus(config-ptp-clock)#
```

**Related commands** [transport-type](#)  
[step-type](#)  
[show ptp clock](#)

**Command changes** Version 5.5.5-2.1: command added

# ptp global

**Overview** Use this command to enable 1588v2 based timing support on the device.  
Use the **no** variant of this command to disable the timing support.

**Syntax** ptp global  
no ptp global

**Default** Disabled

**Mode** Global Configuration

**Example** To enable 1588v2 timing support on the switch, use the commands:

```
awplus# configure terminal  
awplus(config)# ptp global
```

To disable 1588v2 timing support on the switch, use the commands:

```
awplus# configure terminal  
awplus(config)# no ptp global
```

**Related commands** [clock-port](#)  
[show ptp data transparent](#)  
[show ptp port](#)

**Command changes** Version 5.5.5-1.2: added to x240, x250, x540L Series  
Version 5.5.4-0.1: supported with VCStack on x930 Series  
Version 5.5.3-2.1: supported with VCStack on SBx908 GEN2, x950, x550, and x530L Series  
Version 5.5.3-1.1: added to x530L, x950, SBx908 GEN2 Series  
Version 5.4.8-0.2: added to x230, x550 Series  
Version 5.4.7-0.1: command added

# show ptp clock

**Overview** Use this command to show the currently configured PTP clocks. If no clock name is supplied, then all currently configured clocks are displayed.

**Syntax** show ptp clock [*<clock-name>*]

| Parameter                 | Description                           |
|---------------------------|---------------------------------------|
| <i>&lt;clock-name&gt;</i> | The name of the PTP clock to display. |

**Mode** Privileged Exec

**Example** To show the PTP clock named 'clock1', use the command:

```
awplus# show ptp clock clock1
```

**Output** Example output from **show ptp clock clock1**

|                              |                 |               |
|------------------------------|-----------------|---------------|
| awplus#show ptp clock clock1 |                 |               |
| PTP Clocks                   |                 |               |
| Abbreviations:               |                 |               |
| (A) = Active                 |                 |               |
| E2E = End to End             |                 |               |
| P2P = Peer To Peer           |                 |               |
| Clock Name                   | Parameter       | Configuration |
| -----                        |                 |               |
| clock1 (A)                   | Clock Type      | Transparent   |
|                              | Delay Mechanism | P2P           |
|                              | Step Type       | 2-Step        |
|                              | Transport Type  | Ethernet      |

**Command changes** Version 5.5.5-2.1: command added

## show ptp counters

**Overview** Use this command to display the software maintained counters for PTP packet processing. This information is available only when the active clock is operating in E2E two-step mode or when the P2P delay mechanism is in use. If neither condition is met, the system outputs the message *"This information is not available for the current PTP configuration"*.

**Syntax** show ptp counters [<port-list>]

| Parameter   | Description                                                                                                                           |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <port-list> | An interface range. For example, port1.0.23-port1.0.25. If not specified, the command will print all information for all valid ports. |

**Mode** Privileged Exec

**Example** To show the port counters for all valid PTP ports, use the command:

```
awplus# show ptp counters
```

**Output** Example output from **show ptp counters**

```
awplus#show ptp counters
port1.0.23 packet counters
rx_Sync 0
rx_Delay_Req 0
rx_Pdelay_Req 0
rx_Pdelay_Resp 0
rx_Follow_Up 0

[delay-mechanism](#)

**Command changes** Version 5.5.5-2.1: command added

## show ptp identities

**Overview** Use this command to display the mapping between front panel port numbers and the PTP port identity. The PTP port identity is derived from the device's MAC address.

This information is available only when the active clock is operating in E2E two-step mode or when the P2P delay mechanism is in use. If neither condition is met, the system outputs the message *"This information is not available for the current PTP configuration."*

**Syntax** show ptp identities [<port-list>]

| Parameter   | Description                                                                                                                                     |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <port-list> | An interface range. For example, port1.0.23-port1.0.25. If not specified, the command will display all mapping information for all valid ports. |

**Mode** Privileged Exec

**Example** To display the mapping for all ports and their PTP port identities, use the command:

```
awplus# show ptp identities
```

**Output** Example output from **show ptp identities**

```
awplus#show ptp identities
PTP Port Identities

Port          Identity
-----
port1.0.1     e01aea.ffffe.89d901-1
port1.0.2     e01aea.ffffe.89d901-2

# step-type

**Overview** Use this command to set the step-type of a PTP Clock.

Step-type refers to how the timestamp correction is applied by the clock when forwarding timing messages: One Step embeds the correction directly in the Sync message, while Two Step sends a separate Follow\_Up message with the correction.

Use the **no** variant of this command to remove the step-type from the PTP Clock.

**Syntax** step-type [onestep|twostep]  
no step-type

| Parameter | Description                 |
|-----------|-----------------------------|
| onestep   | Use the One Step step type. |
| twostep   | Use the Two Step step type. |

**Default** Not set.

**Mode** PTP Clock Configuration Mode

**Example** To set the step type to One Step for PTP clock 'clock1', use the commands:

```
awplus# configure terminal
awplus(config)# ptp clock clock1
awplus(config-ptp-clock)# step-type onestep
awplus(config-ptp-clock)#
```

**Command changes** Version 5.5.5-2.1: command added

# show ptp data transparent

**Overview** Use this command to display configuration information for the PTP transparent clock.

**Syntax** show ptp data transparent

**Mode** Privileged Exec

**Example** To display configuration for PTP transparent clock, use the following command:

```
awplus# show ptp data transparent
```

**Output** The following shows typical output.

## Example output from show ptp data transparent

```
awplus#show ptp data transparent
CLOCK(Transparent)
Global Enable      : Enabled
Clock Identity     : 00:0c:25:ff:fe:03:92:47
Number Of Ports    : 2
Transport Type     : Ethernet
Delay Mechanism    : End To End
Primary Domain     : 0
Step-type          : One Step
```

**Related commands** [ptp clock](#)

**Command changes**

- Version 5.5.5-1.2: added to x240, x250, x540L Series
- Version 5.5.3-1.1: added to x530L, x950, SBx908 GEN2 Series
- Version 5.4.8-0.2: added to x230, x550 Series
- Version 5.4.7-0.1: command added

## show ptp port

**Overview** Use this command to display the configuration and status information of the individual port or ports that have been associated with the PTP clock. In the output, the information shown under 'PTP daemon port information' is displayed only when the active clock is E2E two-step or when the clock uses the P2P delay mechanism.

**Syntax** show ptp port [*<port-list>*]

| Parameter                | Description                                                                   |
|--------------------------|-------------------------------------------------------------------------------|
| <i>&lt;port-list&gt;</i> | An interface range. If not specified, the command will print all valid ports. |

**Mode** Privileged Exec

**Example** To display configuration and status information of the individual ports associated with the clock, use the command:

```
awplus# show ptp port
```

**Output** The following shows typical output.

**Example output from show ptp port**

```
awplus#show ptp port
PTP Ports

Abbreviations:
  (A) = Active
  E2E = End to End
  P2P = Peer To Peer

Port Name      State  Clock Name  Clock Type  Delay Mechanism  Step
Transport
-----
port1.0.23    Down   wow(A)      Transparent P2P          2-Step
Ethernet
port1.0.24    Down   wow(A)      Transparent P2P          2-Step
Ethernet

PTP daemon port information:

port1.0.23 data
portState FAULTY
logMinDelayReqInterval 0
peerMeanPathDelay 0
logAnnounceInterval 1
announceReceiptTimeout 3
logSyncInterval 0
master_sync_timeout 0
delayMechanism 2
logMinPdelayReqInterval 0
versionNumber 2
port1.0.24 data
portState FAULTY
logMinDelayReqInterval 0

  - Version 5.5.5-1.2: added to x240, x250, x540L Series
  - Version 5.5.3-1.1: added to x530L, x950, SBx908 GEN2 Series
  - Version 5.4.8-0.2: added to x230, x550 Series
  - Version 5.4.7-0.1: command added

# transport-type

**Overview** Use this command to set the transport type of a PTP clock.

Use the **no** variant of this command to remove a transport type from the PTP clock.

**Syntax** transport-type ethernet  
transport-type udp {v4|v6}  
no transport-type ethernet  
no transport-type udp {v4|v6}

| Parameter | Description                                   |
|-----------|-----------------------------------------------|
| ethernet  | Timing protocol forwarded in Ethernet frames. |
| udp       | Use the UDP transport type.                   |
| v4        | Use the UDP transport type with IPv4.         |
| v6        | Use the UDP transport type with IPv6.         |

**Default** Not set.

**Mode** PTP Clock Configuration Mode

**Usage notes** This command specifies the transport type used by a PTP clock. You can configure multiple transport types (Ethernet, UDPv4, and UDPv6) before the clock is enabled. However, once the **clock-enable** setting is applied, the system will validate the configuration. The only supported transport types are:

- Ethernet
- UDPv4
- UDPv6
- UDPv4 and UDPv6

**Example** To add UDPv4 and UDPv6 to the PTP clock named 'clock1', use the commands:

```
awplus# configure terminal
awplus(config)# ptp clock clock1
awplus(config-ptp-clock)# transport-type udp v4
awplus(config-ptp-clock)# transport-type udp v6
```

# Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure SNMP. For more information, see:

- the [Support for Allied Telesis Enterprise MIBs in AlliedWare Plus](#), for information about which MIB objects are supported.
- the [SNMP Feature Overview and Configuration Guide](#).

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

# alias (interface)

**Overview** Use this command to set an alias name for a port, as returned by the SNMP ifMIB in OID 1.3.6.1.2.1.31.1.1.18.

Use the **no** variant of this command to remove an alias name from a port.

**Syntax** alias <ifAlias>  
no alias

| Parameter | Description                                                                                            |
|-----------|--------------------------------------------------------------------------------------------------------|
| <ifAlias> | 64 character name for an interface in a network management system. All printable characters are valid. |

**Default** Not set.

**Mode** Interface Configuration

**Usage notes** The interface alias can also be set via SNMP.  
Third-party management systems often use standard MIBs to access device information. Network managers can specify an alias interface name to provide a non-volatile way to access the interface.

**Example** To configure the alias interface name 'uplink\_a' for port1.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# alias uplink_a
```

To remove an alias interface name from port1.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no alias
```

**Command changes** Version 5.4.8-2.1: command added

# clear mac address-table notification mac-change

**Overview** Use this command to clear the MAC address table change history and counters. This command clears the change history and resets the counters to zero.

**Syntax** clear mac address-table notification mac-change

**Mode** User Exec

**Example** To clear the MAC address table change history and counters, use the command:

```
awplus# clear mac address-table notification mac-change
```

**Related commands** [mac address-table notification mac-change interval](#)  
[mac address-table notification mac-change history-size](#)  
[show mac address-table notification mac-change](#)  
[snmp trap mac-change](#)

**Command changes** Version 5.5.1-2.1: command added

# debug snmp

**Overview** This command enables SNMP debugging.

The **no** variant of this command disables SNMP debugging.

**Syntax** debug snmp [all|detail|error-string|process|receive|send|xdump]  
no debug snmp [all|detail|error-string|process|receive|send|xdump]

| Parameter    | Description                                                                               |
|--------------|-------------------------------------------------------------------------------------------|
| all          | Enable or disable the display of all SNMP debugging information.                          |
| detail       | Enable or disable the display of detailed SNMP debugging information.                     |
| error-string | Enable or disable the display of debugging information for SNMP error strings.            |
| process      | Enable or disable the display of debugging information for processed SNMP packets.        |
| receive      | Enable or disable the display of debugging information for received SNMP packets.         |
| send         | Enable or disable the display of debugging information for sent SNMP packets.             |
| xdump        | Enable or disable the display of hexadecimal dump debugging information for SNMP packets. |

**Mode** Privileged Exec and Global Configuration

**Example** To start SNMP debugging, use the command:

```
awplus# debug snmp
```

To start SNMP debugging, showing detailed SNMP debugging information, use the command:

```
awplus# debug snmp detail
```

To start SNMP debugging, showing all SNMP debugging information, use the command:

```
awplus# debug snmp all
```

**Related** **show debugging snmp**  
**commands** **terminal monitor**  
**undebug snmp**

# mac address-table notification mac-change

**Overview** Use this command to enable the mac-change history table. You also need to use the command **snmp trap mac-change** to set up the trap and **snmp-server enable trap** to enable the trap for transmission.

Use the **no** variant of this command to disable the mac-change history table.

**Syntax** mac address-table notification mac-change  
no mac address-table notification mac-change

**Default** Disabled

**Mode** Global Configuration

**Usage notes** To set up the mac-change trap use the command:

- **snmp trap mac-change**

To enable transmission of the mac-change trap, specify the parameter **mac-change**, use the command:

- **snmp-server enable trap**

**Example** To enable the mac-change history table, use the commands:

```
awplus# configure terminal
awplus(config)# mac address-table notification mac-change
```

**Related commands** **clear mac address-table notification mac-change**  
**mac address-table notification mac-change history-size**  
**mac address-table notification mac-change interval**  
**mac address-table notification mac-threshold**  
**show mac address-table notification mac-change**  
**snmp-server enable trap**  
**snmp trap mac-change**

**Command changes** Version 5.5.1-2.1: command added

# mac address-table notification mac-change history-size

**Overview** Use this command to set the MAC address table history size to an upper limit on the number of entries that the SNMP table may contain.

Use the **no** variant of this command to set the history size back to the default (1).

**Syntax** mac address-table notification mac-change history-size <0-500>  
no mac address-table notification mac-change history-size

| Parameter | Description                                                                               |
|-----------|-------------------------------------------------------------------------------------------|
| <0-500>   | Set the upper limit on the number of entries that the SNMP MAC address table may contain. |

**Default** Table size is set at 1 entry.

**Mode** Global Configuration

**Usage notes** If the mac-change history table is not enabled, then the history size is stored for when it is enabled.

To enable the mac-change history table, use the command:

- **mac address-table notification mac-change**

**Example** To configure the size of the MAC change history table to 40, use the commands:

```
awplus# configure terminal
awplus(config)# mac address-table notification mac-change
history-size 40
```

**Related commands**

- clear mac address-table notification mac-change**
- mac address-table notification mac-change**
- mac address-table notification mac-change interval**
- mac address-table notification mac-threshold**
- show mac address-table notification mac-change**
- snmp trap mac-change**

**Command changes** Version 5.5.1-2.1: command added

# mac address-table notification mac-change interval

**Overview** Use this command to set the maximum time that a MAC change SNMP notification is delayed in the MAC address table.

Use the **no** variant of this command to set the interval back to the default (1).

**Syntax** `mac address-table notification mac-change interval`  
`<0-2147483647>`  
`no mac address-table notification mac-change interval`

| Parameter                         | Description                  |
|-----------------------------------|------------------------------|
| <code>&lt;0-2147483647&gt;</code> | Set the interval in seconds. |

**Default** Interval is set at 1 second.

**Mode** Global Configuration

**Usage notes** If the mac-change history table is not enabled, then the interval is stored for when it is enabled.

To enable the mac-change history table, use the command:

- **mac address-table notification mac-change**

**Example** To configure an interval of 5 seconds for the time between two MAC change SNMP notifications being sent, use the commands:

```
awplus# configure terminal
awplus(config)# mac address-table notification mac-change
interval 5
```

**Related commands**

- clear mac address-table notification mac-change**
- mac address-table notification mac-change**
- mac address-table notification mac-change history-size**
- mac address-table notification mac-threshold**
- show mac address-table notification mac-change**
- snmp trap mac-change**

**Command changes** Version 5.5.1-2.1: command added

# mac address-table notification mac-threshold

**Overview** Use this command to change the default interval and threshold values for storing and sending Layer 2 forwarding database (FDB) utilization information. These settings are stored in the running configuration.

Use the **no** variant of this command to set the threshold configuration back to the default.

**Syntax** `mac address-table notification mac-threshold {interval <120-214783647>|limit <0-100>}`  
`no mac address-table notification mac-threshold`

| Parameter       | Description                                                                                             |
|-----------------|---------------------------------------------------------------------------------------------------------|
| interval        | Change the default interval value. The interval value controls the interval between utilization checks. |
| <120-214783647> | Set the interval in seconds.                                                                            |
| limit           | Change the limit value. When this limit is reached, an SNMP trap is sent.                               |
| <0-100>         | Set the limit as a percentage.                                                                          |

**Default** Interval default is 120 seconds and the limit default is 50 percent.

**Mode** Global Configuration

**Usage notes** To enable transmission of the mac-threshold trap, specify the parameter **mac-threshold**, use the command:

- **snmp-server enable trap**

**Example** To configure the MAC threshold notifications to be sent if the L2 FDB table utilization is more than or equal to 70%, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# mac address-table notification mac-threshold  
limit 70
```

To set the MAC threshold notifications interval and limit back to default values, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no mac address-table notification mac-threshold
```

**Related** **show running-config**  
**commands** **snmp-server enable trap**

## show counter snmp-server

**Overview** This command displays counters for SNMP messages received by the SNMP agent.

**Syntax** show counter snmp-server

**Mode** User Exec and Privileged Exec

**Example** To display the counters for the SNMP agent, use the command:  
awplus# show counter snmp-server

**Output** The following shows typical output.

**Example output from the show counter snmp-server command**

|                      |    |
|----------------------|----|
| SNMP-SERVER counters |    |
| inPkts               | 11 |

**Parameters in the output of the show counter snmp-server command**

| Parameter           | Meaning                                                                                                                                                                   |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| inPkts              | The total number of SNMP messages received by the SNMP agent.                                                                                                             |
| inBadVersions       | The number of messages received by the SNMP agent for an unsupported SNMP version. It drops these messages. The SNMP agent on your device supports versions 1, 2C, and 3. |
| inBadCommunityNames | The number of messages received by the SNMP agent with an unrecognized SNMP community name. It drops these messages.                                                      |
| inBadCommunityUses  | The number of messages received by the SNMP agent where the requested SNMP operation is not                                                                               |

| Parameter      | Meaning                                                                                                                                                                                                                                                                                             |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                | permitted from SNMP managers using the SNMP community named in the message.                                                                                                                                                                                                                         |
| inASNParseErrs | The number of ASN.1 or BER errors that the SNMP agent has encountered when decoding received SNMP Messages.                                                                                                                                                                                         |
| inTooBigs      | The number of SNMP PDUs received by the SNMP agent where the value of the error-status field is 'tooBig'. This is sent by an SNMP manager to indicate that an exception occurred when processing a request from the agent.                                                                          |
| inNoSuchNames  | The number of SNMP PDUs received by the SNMP agent where the value of the error-status field is 'noSuchName'. This is sent by an SNMP manager to indicate that an exception occurred when processing a request from the agent.                                                                      |
| inBadValues    | The number of SNMP PDUs received by the SNMP agent where the value of the error-status field is 'badValue'. This is sent by an SNMP manager to indicate that an exception occurred when processing a request from the agent.                                                                        |
| inReadOnlyls   | The number of valid SNMP PDUs received by the SNMP agent where the value of the error-status field is 'readOnly'. The SNMP manager should not generate a PDU which contains the value 'readOnly' in the error- status field. This indicates that there is an incorrect implementations of the SNMP. |
| inGenErrs      | The number of SNMP PDUs received by the SNMP agent where the value of the error-status field is 'genErr'.                                                                                                                                                                                           |
| inTotalReqVars | The number of MIB objects that the SNMP agent has successfully retrieved after receiving valid SNMP Get-Request and Get-Next PDUs.                                                                                                                                                                  |
| inTotalSetVars | The number of MIB objects that the SNMP agent has successfully altered after receiving valid SNMP Set- Request PDUs.                                                                                                                                                                                |
| inGetRequests  | The number of SNMP Get-Request PDUs that the SNMP agent has accepted and processed.                                                                                                                                                                                                                 |
| inGetNexts     | The number of SNMP Get-Next PDUs that the SNMP agent has accepted and processed.                                                                                                                                                                                                                    |
| inSetRequests  | The number of SNMP Set-Request PDUs that the SNMP agent has accepted and processed.                                                                                                                                                                                                                 |

| Parameter            | Meaning                                                                                                                                                                                                                              |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| inGetResponses       | The number of SNMP Get-Response PDUs that the SNMP agent has accepted and processed.                                                                                                                                                 |
| inTraps              | The number of SNMP Trap PDUs that the SNMP agent has accepted and processed.                                                                                                                                                         |
| outPkts              | The number of SNMP Messages that the SNMP agent has sent.                                                                                                                                                                            |
| outTooBigs           | The number of SNMP PDUs that the SNMP agent has generated with the value 'tooBig' in the error-status field. This is sent to the SNMP manager to indicate that an exception occurred when processing a request from the manager.     |
| outNoSuchNames       | The number of SNMP PDUs that the SNMP agent has generated with the value 'noSuchName' in the error-status field. This is sent to the SNMP manager to indicate that an exception occurred when processing a request from the manager. |
| outBadValues         | The number of SNMP PDUs that the SNMP agent has generated with the value 'badValue' in the error-status field. This is sent to the SNMP manager to indicate that an exception occurred when processing a request from the manager.   |
| outGenErrs           | The number of SNMP PDUs that the SNMP agent has generated with the value 'genErr' in the error-status field. This is sent to the SNMP manager to indicate that an exception occurred when processing a request from the manager.     |
| outGetRequests       | The number of SNMP Get-Request PDUs that the SNMP agent has generated.                                                                                                                                                               |
| outGetNexts          | The number of SNMP Get-Next PDUs that the SNMP agent has generated.                                                                                                                                                                  |
| outSetRequests       | The number of SNMP Set-Request PDUs that the SNMP agent has generated.                                                                                                                                                               |
| outGetResponses      | The number of SNMP Get-Response PDUs that the SNMP agent has generated.                                                                                                                                                              |
| outTraps             | The number of SNMP Trap PDUs that the SNMP agent has generated.                                                                                                                                                                      |
| UnsupportedSecLevels | The number of received packets that the SNMP agent has dropped because they requested a securityLevel unknown or not available to the SNMP agent.                                                                                    |
| NotInTimeWindows     | The number of received packets that the SNMP agent has dropped because they appeared                                                                                                                                                 |

| Parameter          | Meaning                                                                                                                             |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------|
|                    | outside of the authoritative SNMP agent's window.                                                                                   |
| UnknownUserNames   | The number of received packets that the SNMP agent has dropped because they referenced an unknown user.                             |
| UnknownEngineIDs   | The number of received packets that the SNMP agent has dropped because they referenced an unknown snmpEngineID.                     |
| WrongDigest        | The number of received packets that the SNMP agent has dropped because they didn't contain the expected digest value.               |
| DecryptionErrors   | The number of received packets that the SNMP agent has dropped because they could not be decrypted.                                 |
| UnknownSecModels   | The number of messages received that contain a security model that is not supported by the server. Valid for SNMPv3 messages only.  |
| InvalidMsgs        | The number of messages received where the security model is supported but the authentication fails. Valid for SNMPv3 messages only. |
| UnknownPDUHandlers | The number of times the SNMP handler has failed to process a PDU. This is a system debugging counter.                               |

**Related commands** [show snmp-server](#)

# show debugging snmp

**Overview** This command displays whether SNMP debugging is enabled or disabled.

**Syntax** show debugging snmp

**Mode** User Exec and Privileged Exec

**Example** To display the status of SNMP debugging, use the command:

```
awplus# show debugging snmp
```

**Output** The following shows typical output.

## Example output from the show debugging snmp command

```
Sntp (SMUX) debugging status:  
Sntp debugging is on
```

**Related commands** [debug snmp](#)

# show mac address-table notification mac-change

**Overview** Use this command to show the MAC change configuration. It includes the MAC change history.

**Syntax** show mac address-table notification mac-change

**Mode** User Exec

**Example** To show the MAC change configuration and history, use the command:  
awplus# show mac address-table notification mac-change

**Output** The following shows typical output.

**Example output from show mac address-table notification mac-change**

```
awplus#show mac address-table notification mac-change
MAC Change Feature: Enabled
MAC Change Notification Traps: Enabled
Wait time for MAC Change Notification Traps: 1 seconds
Number of MAC Address Add events: 1
Number of MAC Address Remove events: 0
Number of MAC Change Notification Traps sent: 1
Maximum Number of entries configured in History Table: 1
Number of entries currently in History Table: 1
History Table contents
-----
History Index 1, Timestamp(uptime) 0 days 00:39:25 (236500)
MAC Change message:
  Operation: Added   Vlan: 2       MAC Addr: 000d.b950.0c26
  Dot1dBasePort: 2
```

**Parameters in the output from show mac address-table notification mac-change**

| Parameter                                             | Description                                                                                                                                                                                              |
|-------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MAC Change Feature                                    | Displays if the feature is enabled or not. If this is disabled, then no more MAC change events will be generated, no events are added to the history, and no traps are logged.                           |
| MAC Change Notification Traps                         | Displays if MAC change traps are sent when MAC change events are generated. This only affects traps, (MAC change history is not affected).                                                               |
| Wait time for MAC Change Notification Traps           | The maximum time a MAC change event waits before a MAC change trap is sent. This is also the maximum time a MAC change event waits before being added to the MAC change history. The time is in seconds. |
| Number of MAC Address Add events                      | The number of MAC-added events processed by the feature.                                                                                                                                                 |
| Number of MAC Address Remove events                   | The number of MAC-removed events processed by the feature.                                                                                                                                               |
| Number of MAC Change Notification Traps sent          | The number of MAC notification traps sent by the feature.                                                                                                                                                |
| Maximum Number of entries configured in History Table | The maximum number of entries present in the MAC change table.                                                                                                                                           |

# show running-config snmp

**Overview** This command displays the current configuration of SNMP on your device.

**Syntax** show running-config snmp

**Mode** Privileged Exec

**Example** To display the current configuration of SNMP on your device, use the command:

```
awplus# show running-config snmp
```

**Output** The following shows typical output.

## Example output from the show running-config snmp command

```
snmp-server contact AlliedTelesis
snmp-server location Philippines
snmp-server group grou1 auth read view1 write view1 notify view1
snmp-server view view1 1 included
snmp-server community public
snmp-server user user1 group1 auth md5 password priv des
password
```

**Related commands** [show snmp-server](#)

# show snmp-server

**Overview** This command displays the status and current configuration of the SNMP server.

**Syntax** show snmp-server

**Mode** Privileged Exec

**Example** To display the status of the SNMP server, use the command:  
awplus# show snmp-server

**Output** The following shows typical output.

## Example output from the show snmp-server command

```
SNMP Server ..... Enabled
IP Protocol ..... IPv4
SNMPv3 Engine ID (configured name) ... Not set
SNMPv3 Engine ID (actual) ..... 0x80001f888021338e4747b8e607
```

# show snmp-server community

**Overview** This command displays the SNMP server communities configured on the device. SNMP communities are specific to v1 and v2c.

**Syntax** show snmp-server community

**Mode** Privileged Exec

**Example** To display the SNMP server communities, use the command:  
awplus# show snmp-server community

**Output** The following shows typical output.

## Example output from the show snmp-server community command

```
SNMP community information:
Community Name ..... public
Access ..... Read-only
View ..... none
```

**Related commands** [show snmp-server](#)

# show snmp-server group

**Overview** This command displays information about SNMP server groups. This command is used with SNMP version 3 only.

**Syntax** show snmp-server group

**Mode** Privileged Exec

**Example** To display the SNMP groups configured on the device, use the command:  
awplus# show snmp-server group

**Output** The following shows typical output.

## Example output from the show snmp-server group command

```
SNMP group information:
  Group name ..... guireadgroup
  Security Level ..... priv
  Read View ..... guiview
  Write View ..... none
  Notify View ..... none

  Group name ..... guiwritegroup
  Security Level ..... priv
  Read View ..... none
  Write View ..... guiview
  Notify View ..... none
```

**Related commands** [show snmp-server](#)  
[snmp-server group](#)

# show snmp-server trap

**Overview** Use this command to display the status of the SNMP traps.

**Syntax** show snmp-server trap

**Mode** Privileged Exec

**Example** To display the SNMP traps status, use the commands:

```
awplus# show snmp-server trap
```

**Output** The following shows typical output.

## Example output from: show snmp-server trap

```
awplus#show snmp-server trap
ATMF traps ..... Disabled

## show snmp-server user

**Overview** This command displays the SNMP server users and is used with SNMP version 3 only.

**Syntax** show snmp-server user

**Mode** Privileged Exec

**Example** To display the SNMP server users configured on the device, use the command:

```
awplus# show snmp-server user
```

**Output** The following shows typical output.

### Example output from the show snmp-server user command

| Name   | Group name   | Auth  | Privacy |
|--------|--------------|-------|---------|
| -----  | -----        | ----- | -----   |
| freddy | guireadgroup | none  | none    |

**Related commands** [show snmp-server](#)  
[snmp-server user](#)

# show snmp-server view

**Overview** This command displays the SNMP server views and is used with SNMP version 3 only.

**Syntax** show snmp-server view

**Mode** Privileged Exec

**Example** To display the SNMP server views configured on the device, use the command:

```
awplus# show snmp-server view
```

**Output** The following shows typical output.

## Example output from the show snmp-server view command

```
SNMP view information:
View Name ..... view1
OID ..... 1
Type ..... included
```

**Related commands** [show snmp-server](#)  
[snmp-server view](#)

## snmp trap link-status

**Overview** Use this command to enable SNMP to send link status notifications (traps) for the interfaces when an interface goes up (linkUp) or down (linkDown). Use the **no** variant of this command to disable the sending of link status notifications.

**Syntax** snmp trap link-status [enterprise]  
no snmp trap link-status

| Parameter  | Description                                          |
|------------|------------------------------------------------------|
| enterprise | Send an Allied Telesis enterprise type of link trap. |

**Default** Disabled

**Mode** Interface Configuration

**Usage notes** The link status notifications can be enabled for the following interface types:

- switch port (e.g. port1.0.1)
- VLAN (e.g. vlan2)
- static and dynamic link aggregation (e.g. sa2, po2)

To specify where notifications are sent, use the **snmp-server host** command. To configure the device globally to send other notifications, use the **snmp-server enable trap** command.

**Examples** To enable SNMP to send link status notifications for port1.0.1 to port1.0.3 use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.3
awplus(config-if)# snmp trap link-status
```

To disable the sending of link status notifications for port1.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no snmp trap link-status
```

**Related commands**

- show interface**
- snmp trap link-status suppress**
- snmp-server enable trap**
- snmp-server host**

## snmp trap link-status suppress

**Overview** Use this command to enable the suppression of link status notifications (traps) for the interfaces beyond the specified threshold, in the specified interval.

Use the **no** variant of this command to disable the suppression of link status notifications for the ports.

**Syntax** `snmp trap link-status suppress {time {<1-60>|default}}|threshold {<1-20>|default}}`  
`no snmp trap link-status suppress`

| Parameter | Description                                                                                                                                                                                       |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| time      | Set the suppression timer for link status notifications.                                                                                                                                          |
| <1-60>    | The suppress time in seconds.                                                                                                                                                                     |
| default   | The default suppress time in seconds (60).                                                                                                                                                        |
| threshold | Set the suppression threshold for link status notifications. This is the number of link status notifications after which to suppress further notifications within the suppression timer interval. |
| <1-20>    | The number of link status notifications.                                                                                                                                                          |
| default   | The default number of link status notifications (20).                                                                                                                                             |

**Default** By default, if link status notifications are enabled (they are enabled by default), the suppression of link status notifications is enabled: notifications that exceed the notification threshold (default 20) within the notification timer interval (default 60 seconds) are not sent.

**Mode** Interface Configuration

**Usage notes** An unstable network can generate many link status notifications. When notification suppression is enabled, a suppression timer is started when the first link status notification of a particular type (linkUp or linkDown) is sent for an interface.

If the threshold number of notifications of this type is sent before the timer reaches the suppress time, any further notifications of this type generated for the interface during the interval are not sent. At the end of the interval, the sending of link status notifications resumes, until the threshold is reached in the next interval.

**Examples** To suppress link status notifications for port1.0.1 to port1.0.3 after 10 notifications in 40 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.3
awplus(config-if)# snmp trap link-status suppress time 40
threshold 10
```

To stop suppressing link status notifications for port1.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no snmp trap link-status suppress
```

**Related commands** [show interface](#)  
[snmp trap link-status](#)

## snmp trap mac-change

**Overview** Use this command to enable the MAC notification feature to apply mac-change notifications via the mac-change trap. This command configures the trap so that you are notified when MAC addresses are added or removed from the forwarding database (FDB). This is applied to interfaces via a specified port or a range of ports.

Use the **no** variant of this command to disable the MAC notification feature.

**Syntax** snmp trap mac-change {[add] [remove]}  
no snmp trap mac-change [add] [remove]

| Parameter | Description                                                 |
|-----------|-------------------------------------------------------------|
| add       | Enable SNMP mac-change traps when a MAC address is added.   |
| remove    | Enable SNMP mac-change traps when a MAC address is removed. |

**Default** Disabled

**Mode** Interface Configuration

**Usage notes** To enable transmission of the mac-change trap, specify the parameter **mac-change**, use the command:

- **snmp-server enable trap**

To enable the mac-change history table, use the command:

- **mac address-table notification mac-change**

**Example** To get mac-change notifications whenever a MAC address associated with port1.0.1 is added or removed from the FDB table, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# snmp trap mac-change add remove
```

**Related commands** **clear mac address-table notification mac-change**  
**mac address-table notification mac-change**  
**show interface**  
**snmp-server enable trap**

**Command changes** Version 5.5.1-2.1: command added

## snmp-server

**Overview** Use this command to enable the SNMP agent (server) on the device. The SNMP agent receives and processes SNMP packets sent to the device, and generates notifications (traps) that have been enabled by the **snmp-server enable trap**.

Use the **no** variant of this command to disable the SNMP agent on the device. When SNMP is disabled, SNMP packets received by the device are discarded, and no notifications are generated. This does not remove any existing SNMP configuration.

**Syntax** snmp-server [ip|ipv6]  
no snmp-server [ip|ipv6]

| Parameter | Description                                |
|-----------|--------------------------------------------|
| ip        | Enable or disable the SNMP agent for IPv4. |
| ipv6      | Enable or disable the SNMP agent for IPv6. |

**Default** By default, the SNMP agent is enabled for both IPv4 and IPv6. If neither the **ip** parameter nor the **ipv6** parameter is specified for this command, then SNMP is enabled or disabled for both IPv4 and IPv6.

**Mode** Global Configuration

**Examples** To enable SNMP on the device for both IPv4 and IPv6, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server
```

To enable the SNMP agent for IPv4 on the device, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server ip
```

To disable the SNMP agent for both IPv4 and IPv6 on the device, use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-server
```

To disable the SNMP agent for IPv4, use the commands:

```
awplus(config)# no snmp-server ipv4
```

## snmp-server community

**Overview** This command creates an SNMP community, optionally setting the access mode for the community. The default access mode is read-only. If the view parameter is not specified, the community allows access to all the MIB objects. The SNMP communities are only valid for SNMPv1 and v2c and provide very limited security. Communities should not be used when operating SNMPv3.

The **no** variant of this command removes an SNMP community. The specified community must already exist on the device.

**Syntax** `snmp-server community <community-name> [view <view-name>|ro|rw|<access-list>]`  
`no snmp-server community <community-name>`

| Parameter        | Description                                                                                                           |
|------------------|-----------------------------------------------------------------------------------------------------------------------|
| <community-name> | Community name. The community name is a case sensitive string of up to 20 characters.                                 |
| view             | Configure SNMP view. If view is not specified, the community allows access to all the MIB objects.                    |
| <view-name>      | View name. The view name is a string up to 20 characters long and is case sensitive.                                  |
| ro               | Read-only community.                                                                                                  |
| rw               | Read-write community.                                                                                                 |
| <access-list>    | <1-99> Access list number. Warning: Do not use an ACL with deny rules. This is because only permit rules are applied. |

**Default** The default access mode is Read-only.

**Mode** Global Configuration

**Example** Use the following commands to create an SNMP community called 'public' with read-only access to all MIB variables from any management station:

```
awplus# configure terminal
```

```
awplus(config)# snmp-server community public ro
```

Use the following commands to remove an SNMP community called 'public'

```
awplus# configure terminal
```

```
awplus(config)# no snmp-server community public
```

**Related** **show snmp-server**  
**commands** **show snmp-server community**  
**snmp-server view**

# snmp-server contact

**Overview** This command sets the contact information for the system. The contact name is:

- displayed in the output of the **show system** command
- stored in the MIB object sysContact

The **no** variant of this command removes the contact information from the system.

**Syntax** snmp-server contact <contact-info>  
no snmp-server contact

| Parameter      | Description                                                                                                                     |
|----------------|---------------------------------------------------------------------------------------------------------------------------------|
| <contact-info> | The contact information for the system, from 0 to 255 characters long. Valid characters are any printable character and spaces. |

**Mode** Global Configuration

**Example** To set the system contact information to "example@example.com", use the command:

```
awplus# configure terminal
awplus(config)# snmp-server contact example@example.com
```

**Related commands** **show system**  
**snmp-server location**  
**snmp-server system-name**  
**snmp-server group**

## snmp-server enable trap

**Overview** Use this command to enable the transmission of the specified notifications (traps) on your device.

Note that the Environmental Monitoring traps defined in the AT-ENVMONv2-MIB are enabled by default.

Use the **no** variant of this command to disable the transmission of the specified notifications.

**Syntax** snmp-server enable trap <trap-list>  
no snmp-server enable trap <trap-list>

Depending on your device model, you can enable some or all of the traps in the following table:

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| atmf          | AMF traps.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| atmfguestnode | AMF guest node traps.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| atmflink      | AMF link traps.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| nsm                     | NSM traps.                                                                                                                           |
| ospf                    | OSPF traps.                                                                                                                          |
| pim                     | PIM traps.                                                                                                                           |
| power-inline            | Power-inline traps (Power Ethernet MIB RFC 3621).                                                                                    |
| qsp                     | QoS Storm Protection.                                                                                                                |
| rmon                    | RMON traps.                                                                                                                          |
| thrash-limit            | MAC address Thrash Limiting traps.                                                                                                   |
| vcs                     | VCS traps. Note that to see VCS resiliency link traps, you have to use the <b>vcs-resiliency-link</b> parameter too, as shown below. |
| vcs vcs-resiliency-link | VCS resiliency link traps. You will only see these traps if you enter both <b>vcs</b> and <b>vcs-resiliency-link</b> .               |
| vrrp                    | Virtual Router Redundancy (VRRP) traps.                                                                                              |
| ufo                     | Upstream Forwarding Only (UFO) traps.                                                                                                |

**Default** Disabled

**Mode** Global Configuration

**Usage notes** This command cannot be used to enable link status notifications globally. To enable link status notifications for particular interfaces, use the **snmp trap link-status** command.

To specify where notifications are sent, use the **snmp-server host** command.

Note that you can enable (or disable) multiple traps with a single command, by specifying a space-separated list of traps.

**Examples** To enable the device to send a notification if an AMF node changes its status, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap atmfnode
```

To enable the device to send MAC address Thrash Limiting traps, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap thrash-limit
```

To disable the device from sending MAC address Thrash Limiting traps, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server enable trap thrash-limit
```

To disable OSPF traps being sent out by the device, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server enable trap ospf
```

**Related commands**

**Command changes**

- Version 5.5.4-2.3: **low-memory** parameter added
- Version 5.5.4-0.1: **vcs vcs-resiliency-link** parameter added
- Version 5.5.1-2.1: **mac-change**, **mac-move**, and **mac-threshold** parameters added
- Version 5.5.1-1.1: **atmfguestnode** and **cwmap** parameters added
- Version 5.4.7-2.1: **ufo** parameter added

## snmp-server engineID local

**Overview** Use this command to configure the SNMPv3 engine ID. The SNMPv3 engine ID is used to uniquely identify the SNMPv3 agent on a device when communicating with SNMP management clients. Once an SNMPv3 engine ID is assigned, this engine ID is permanently associated with the device until you change it.

Use the **no** variant of this command to set the user defined SNMPv3 engine ID to a system generated pseudo-random value by resetting the SNMPv3 engine. The **no snmp-server engineID local** command has the same effect as the **snmp-server engineID local default** command.

Note that the **snmp-server engineID local reset** command is used to force the system to generate a new engine ID when the current engine ID is also system generated.

**Syntax** snmp-server engineID local {<engine-id>|default}  
no snmp-server engineID local

| Parameter   | Description                                                                                                                                                                                                                                                                             |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <engine-id> | Specify SNMPv3 Engine ID value, a string of up to 27 characters.                                                                                                                                                                                                                        |
| default     | Set SNMPv3 engine ID to a system generated value by resetting the SNMPv3 engine, provided the current engine ID is user defined. If the current engine ID is system generated, use the <b>snmp-server engineID local reset</b> command to force the system to generate a new engine ID. |

**Mode** Global Configuration

**Usage notes** All devices must have a unique engine ID which is permanently set unless it is configured by the user.

**Example** To set the SNMPv3 engine ID to 800000cf030000cd123456, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server engineID local
800000cf030000cd123456
```

To set a user defined SNMPv3 engine ID back to a system generated value, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server engineID local
```

**Output** The following example shows the engine ID values after configuration:

```
awplus(config)#snmp-server engineid local asdgdfh231234d
awplus(config)#exit
awplus#show snmp-server

SNMP Server ..... Enabled
IP Protocol ..... IPv4
SNMPv3 Engine ID (configured name) ... asdgdfh231234d
SNMPv3 Engine ID (actual) ..... 0x80001f888029af52e149198483

awplus(config)#no snmp-server engineid local
awplus(config)#exit
awplus#show snmp-server

SNMP Server ..... Enabled
IP Protocol ..... IPv4
SNMPv3 Engine ID (configured name) ... Not set
SNMPv3 Engine ID (actual) ..... 0x80001f888029af52e149198483
```

**Related commands** [show snmp-server](#)  
[snmp-server engineID local reset](#)  
[snmp-server group](#)

## snmp-server engineID local reset

**Overview** Use this command to force the device to generate a new pseudo-random SNMPv3 engine ID by resetting the SNMPv3 engine. If the current engine ID is user defined, use the **snmp-server engineID local** command to set SNMPv3 engine ID to a system generated value.

**Syntax** snmp-server engineID local reset

**Mode** Global Configuration

**Example** To force the SNMPv3 engine ID to be reset to a system generated value, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server engineID local reset
```

**Related commands** **snmp-server engineID local**  
**show snmp-server**

## snmp-server group

**Overview** This command is used with SNMP version 3 only, and adds an SNMP group, optionally setting the security level and view access modes for the group. The security and access views defined for the group represent the minimum required of its users in order to gain access.

The **no** variant of this command deletes an SNMP group, and is used with SNMPv3 only. The group with the specified authentication/encryption parameters must already exist.

**Syntax** `snmp-server group <groupname> {auth|noauth|priv} [read <readname>|write <writename>|notify <notifysname>]`  
`no snmp-server group <groupname>`

| Parameter     | Description                                                                                 |
|---------------|---------------------------------------------------------------------------------------------|
| <groupname>   | Group name. The group name is a string up to 20 characters long and is case sensitive.      |
| auth          | Authentication.                                                                             |
| noauth        | No authentication and no encryption.                                                        |
| priv          | Authentication and encryption.                                                              |
| read          | Configure read view.                                                                        |
| <readname>    | Read view name.                                                                             |
| write         | Configure write view.                                                                       |
| <writename>   | Write view name. The view name is a string up to 20 characters long and is case sensitive.  |
| notify        | Configure notify view.                                                                      |
| <notifysname> | Notify view name. The view name is a string up to 20 characters long and is case sensitive. |

**Mode** Global Configuration

**Examples** To add SNMP group, for ordinary users, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# snmp-server group usergroup noauth read  
useraccess write useraccess
```

To delete the SNMP group called 'usergroup', use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# no snmp-server group usergroup
```

**Related commands**

- snmp-server**
- show snmp-server**
- show snmp-server group**
- show snmp-server user**

## snmp-server host

**Overview** This command specifies an SNMP trap host destination to which Trap or Inform messages generated by the device are sent.

For SNMP version 1 and 2c you must specify the community name parameter. For SNMP version 3, specify the authentication/encryption parameters and the user name. If the version is not specified, the default is SNMP version 1. Inform messages can be sent instead of traps for SNMP version 2c and 3.

Use the **no** variant of this command to remove an SNMP trap host. The trap host must already exist.

The trap host is uniquely identified by:

- host IP address (IPv4 or IPv6)
- inform or trap messages
- community name (SNMPv1 or SNMP v2c) or the authentication/encryption parameters and user name (SNMP v3).

**Syntax** `snmp-server host {<ipv4-address>|<ipv6-address>} [traps]  
[version 1] <community-name>`  
`snmp-server host {<ipv4-address>|<ipv6-address>} [informs|traps]  
version 2c <community-name>`  
`snmp-server host {<ipv4-address>|<ipv6-address>} [informs|traps]  
version 3 {auth|noauth|priv} <user-name>`  
`no snmp-server host {<ipv4-address>|<ipv6-address>} [traps]  
[version 1] <community-name>`  
`no snmp-server host {<ipv4-address>|<ipv6-address>} [informs|  
traps] version 2c <community-name>`  
`no snmp-server host {<ipv4-address>|<ipv6-address>} [informs|  
traps] version 3 {auth|noauth|priv} <user-name>`

| Parameter                     | Description                                                                     |
|-------------------------------|---------------------------------------------------------------------------------|
| <i>&lt;ipv4-address&gt;</i>   | IPv4 trap host address in the format A.B.C.D, for example, 192.0.2.2.           |
| <i>&lt;ipv6-address&gt;</i>   | IPv6 trap host address in the format x:x::x:x for example, 2001:db8::8a2e:7334. |
| informs                       | Send Inform messages to this host.                                              |
| traps                         | Send Trap messages to this host (default).                                      |
| version                       | SNMP version to use for notification messages. Default: version 1.              |
| 1                             | Use SNMPv1 (default).                                                           |
| 2c                            | Use SNMPv2c.                                                                    |
| 3                             | Use SNMPv3.                                                                     |
| auth                          | Authentication.                                                                 |
| noauth                        | No authentication.                                                              |
| priv                          | Encryption.                                                                     |
| <i>&lt;community-name&gt;</i> | The SNMPv1 or SNMPv2c community name.                                           |
| <i>&lt;user-name&gt;</i>      | SNMPv3 user name.                                                               |

**Default** No host is defined.

**Mode** Global Configuration

**Usage notes** You can test connectivity to the host by using the command **test snmp trap snmp**.

**Examples** To configure the device to send generated traps to the IPv4 host destination 192.0.2.5 with the SNMPv2c community name 'public', use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# snmp-server host 192.0.2.5 version 2c public
```

To configure the device to send generated traps to the IPv6 host destination 2001:db8::8a2e:7334 with the SNMPv2c community name 'private', use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# snmp-server host 2001:db8::8a2e:7334 version 2c private
```

To remove a configured trap host of 192.0.2.5 with the SNMPv2c community name 'public', use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# no snmp-server host 192.0.2.5 version 2c public
```

**Related commands** [snmp trap link-status](#)  
[snmp-server enable trap](#)  
[snmp-server view](#)  
[test snmp trap snmp](#)

**Command changes** Version 5.5.2-1.1: **vrf** parameter added for products that support VRF

# snmp-server legacy-ifadminstatus

**Overview** Use this command to set the ifAdminStatus to reflect the operational state of the interface, rather than the administrative state.

The **no** variant of this command sets the ifAdminStatus to reflect the administrative state of the interface.

**Syntax** snmp-server legacy-ifadminstatus  
no snmp-server legacy-ifadminstatus

**Default** Legacy ifAdminStatus is turned off by default, so by default the SNMP ifAdminStatus reflects the administrative state of the interface.

**Mode** Global Configuration

**Usage notes** Note that if you enable Legacy ifAdminStatus, the ifAdminStatus will report a link's status as Down when the link has been blocked by a process such as loop protection.

**Example** To turn on Legacy ifAdminStatus, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server legacy-ifadminstatus
```

**Related commands** [show interface](#)

## snmp-server location

**Overview** This command sets the location of the system. The location is:

- displayed in the output of the **show system** command
- stored in the MIB object sysLocation

The **no** variant of this command removes the configured location from the system.

**Syntax** snmp-server location <location-name>  
no snmp-server location

| Parameter       | Description                                                                                                         |
|-----------------|---------------------------------------------------------------------------------------------------------------------|
| <location-name> | The location of the system, from 0 to 255 characters long. Valid characters are any printable character and spaces. |

**Mode** Global Configuration

**Example** To set the location to "server room 523", use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server location server room 523
```

**Related commands** **show snmp-server**  
**show system**  
**snmp-server contact**  
**snmp-server system-name**

## snmp-server source-interface

**Overview** Use this command to specify the originating interface for SNMP traps or informs. An interface specified by this command must already have an IP address assigned to it.

Use the **no** variant of this command to reset the interface to its default value (the originating egress interface).

**Syntax** `snmp-server source-interface {traps|informs} <interface-name>`  
`no snmp-server source-interface {traps|informs}`

| Parameter        | Description                                                |
|------------------|------------------------------------------------------------|
| traps            | SNMP traps.                                                |
| informs          | SNMP informs.                                              |
| <interface-name> | Interface name (must already have an IP address assigned). |

**Default** The originating egress interface of the traps and informs messages

**Mode** Global Configuration

**Usage notes** When an SNMP server sends an SNMP trap or inform message, the message carries the notification IP address of its originating interface. Use this command to assign this interface.

**Example** The following commands set vlan2 to be the interface whose IP address is used as the originating address in SNMP informs packets.

```
awplus# configure terminal
```

```
awplus(config)# snmp-server source-interface informs vlan2
```

The following commands reset the originating source interface for SNMP trap messages to be the default interface (the originating egress interface):

```
awplus# configure terminal
```

```
awplus(config)# no snmp-server source-interface traps
```

**Validation Commands** **show running-config**

# snmp-server startup-trap-delay

**Overview** Use this command to set the time in seconds after following completion of the device startup sequence before the device sends any SNMP traps (or SNMP notifications).

Use the no variant of this command to restore the default startup delay of 30 seconds.

**Syntax** snmp-server startup-trap-delay *<delay-time>*  
no snmp-server startup-trap-delay

| Parameter                 | Description                                                                   |
|---------------------------|-------------------------------------------------------------------------------|
| <i>&lt;delay-time&gt;</i> | Specify an SNMP trap delay time in seconds in the range of 30 to 600 seconds. |

**Default** The SNMP server trap delay time is 30 seconds. The no variant restores the default.

**Mode** Global Configuration

**Example** To delay the device sending SNMP traps until 60 seconds after device startup, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server startup-trap-delay 60
```

To restore the sending of SNMP traps to the default of 30 seconds after device startup, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server startup-trap-delay
```

**Validation Commands** **show snmp-server**

# snmp-server system-name

**Overview** Use this command to set the name of the system. The name is stored in the MIB object sysName.

Note that this command does not set the hostname or change the name in the command prompt. Use the [hostname](#) command to do that.

Use the **no** variant of this command to remove the system name.

**Syntax** snmp-server system-name <name>  
no snmp-server system-name

| Parameter | Description                                                                                                     |
|-----------|-----------------------------------------------------------------------------------------------------------------|
| <name>    | The name of the system, from 0 to 255 characters long. Valid characters are any printable character and spaces. |

**Default** None

**Mode** Global Configuration

**Example** To set the system name to ExampleDevice, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server system-name ExampleDevice
```

**Related commands** [hostname](#)  
[show snmp-server](#)

**Command changes** Version 5.5.5-2.1: command added

## snmp-server user

**Overview** Use this command to create or move users as members of specified groups. This command is used with SNMPv3 only.

The **no** variant of this command removes an SNMPv3 user. The specified user must already exist.

**Syntax** `snmp-server user <username> <groupname> [encrypted]  
[auth {md5|sha|sha-256} <auth-password>] [priv {des|aes}  
<privacy-password>]  
no snmp-server user <username>`

| Parameter          | Description                                                                                         |
|--------------------|-----------------------------------------------------------------------------------------------------|
| <username>         | User name. The user name is a string up to 20 characters long and is case sensitive.                |
| <groupname>        | Group name. The group name is a string up to 20 characters long and is case sensitive.              |
| encrypted          | Use the encrypted parameter when you want to enter encrypted passwords.                             |
| auth               | Authentication protocol.                                                                            |
| md5                | MD5 Message Digest Algorithms.                                                                      |
| sha                | SHA Secure Hash Algorithm.                                                                          |
| sha-256            | SHA-256 Secure Hash Algorithm. Note: SHA-256 authentication is required in crypto secure-mode.      |
| <auth-password>    | Authentication password. The password is a string of 8 to 20 characters long and is case sensitive. |
| priv               | Privacy protocol.                                                                                   |
| des                | DES: Data Encryption Standard. DES is not available if you enable <b>crypto secure-mode</b> .       |
| aes                | AES: Advanced Encryption Standards.                                                                 |
| <privacy-password> | Privacy password. The password is a string of 8 to 20 characters long and is case sensitive.        |

**Mode** Global Configuration

**Usage notes** Additionally this command provides the option of selecting an authentication protocol and (where appropriate) an associated password. Similarly, options are offered for selecting a privacy protocol and password.

- Note that each SNMP user must be configured on both the manager and agent entities. Where passwords are used, these passwords must be the same for both entities.
- Use the **encrypted** parameter when you want to enter already encrypted passwords in encrypted form as displayed in the running and startup configs stored on the device. For example, you may need to move a user from one group to another group and keep the same passwords for the user instead of removing the user to apply new passwords.
- User passwords are entered using plaintext without the **encrypted** parameter and are encrypted according to the authentication and privacy protocols selected.
- User passwords are viewed as encrypted passwords in running and startup configs shown from **show running-config** and **show startup-config** commands respectively. Copy and paste encrypted passwords from running-configs or startup-configs to avoid entry errors.

**Examples** To add SNMP user authuser as a member of group 'usergroup', with authentication protocol MD5, authentication password 'Authpass', privacy protocol AES and privacy password 'Privpass' use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server user authuser usergroup auth md5
Authpass priv aes Privpass
```

Validate the user is assigned to the group using the **show snmp-server user** command:

|                              |            |       |         |
|------------------------------|------------|-------|---------|
| awplus#show snmp-server user |            |       |         |
| Name                         | Group name | Auth  | Privacy |
| -----                        | -----      | ----- | -----   |
| authuser                     | usergroup  | md5   | aes     |

To enter existing SNMP user 'authuser' with existing passwords as a member of group 'newusergroup' with authentication protocol MD5 with the encrypted authentication password 0x1c74b9c22118291b0ce0cd883f8dab6b74, and privacy protocol AES with the encrypted privacy password 0x0e0133db5453ebd03822b004eeacb6608f, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server user authuser newusergroup encrypted
auth md5 0x1c74b9c22118291b0ce0cd883f8dab6b74 priv aes
0x0e0133db5453ebd03822b004eeacb6608f
```

**NOTE:** Copy and paste the encrypted passwords from the or the displayed, using the and commands respectively, into the command line to avoid key stroke errors issuing this command.

Validate the user has been moved from the first group using the **show snmp-server user** command:

|                              |              |       |         |
|------------------------------|--------------|-------|---------|
| awplus#show snmp-server user |              |       |         |
| Name                         | Group name   | Auth  | Privacy |
| -----                        | -----        | ----- | -----   |
| authuser                     | newusergroup | md5   | aes     |

To delete SNMP user 'authuser', use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server user authuser
```

**Related commands** [show snmp-server user](#)  
[snmp-server view](#)

## snmp-server view

**Overview** Use this command to create an SNMP view that specifies a sub-tree of the MIB. Further sub-trees can then be added by specifying a new OID to an existing view. Views can be used in SNMP communities or groups to control the remote manager's access.

**NOTE:** The object identifier must be specified in a sequence of integers separated by decimal points.

The **no** variant of this command removes the specified view on the device. The view must already exist.

**Syntax** snmp-server view <view-name> <mib-name> {included|excluded}  
no snmp-server view <view-name>

| Parameter   | Description                                                                                             |
|-------------|---------------------------------------------------------------------------------------------------------|
| <view-name> | SNMP server view name.<br><br>The view name is a string up to 20 characters long and is case sensitive. |
| <mib-name>  | Object identifier of the MIB.                                                                           |
| included    | Include this OID in the view.                                                                           |
| excluded    | Exclude this OID in the view.                                                                           |

**Mode** Global Configuration

**Examples** The following command creates a view called "loc" that includes the system location MIB sub-tree.

```
awplus(config)# snmp-server view loc 1.3.6.1.2.1.1.6.0 included
```

To remove the view "loc" use the following command

```
awplus(config)# no snmp-server view loc
```

**Related commands** [show snmp-server view](#)  
[snmp-server community](#)

# test snmp trap snmp

**Overview** Use this command to test connectivity between the AlliedWare Plus device and an SNMP manager. The command tests the connectivity by sending a one-off coldStart or warmStart trap.

It does not matter whether you send a coldStart or warmStart trap; either trap lets you test the connectivity.

**Syntax** test snmp trap snmp coldstart  
test snmp trap snmp warmstart

| Parameter | Description                                                                                                          |
|-----------|----------------------------------------------------------------------------------------------------------------------|
| coldstart | Send a one-off coldStart trap. This trap indicates that the SNMP agent is restarting with a configuration change.    |
| warmstart | Send a one-off warmStart trap. This trap indicates that the SNMP agent is restarting without a configuration change. |

**Default** n/a

**Mode** Privileged Exec

**Example** To send a one-off coldStart trap to the SNMP manager configured on the device, use the command:

```
awplus# test snmp trap snmp coldstart
```

**Related commands** [snmp-server host](#)

**Command changes** Version 5.5.4-2.3: command added

# Introduction

**Overview** LLDP and LLDP-MED can be configured using the commands in this chapter, or by using SNMP with the LLDP-MIB and LLDP-EXT-DOT1-MIB (see the [Support for Allied Telesis Enterprise MIBs in AlliedWare Plus](#)).

The Voice VLAN feature can be configured using commands in the [VLAN Commands](#) chapter.

For more information about LLDP, see the [LLDP Feature Overview and Configuration Guide](#).

LLDP can transmit a lot of data about the network. Typically, the network information gathered using LLDP is transferred to a Network Management System by SNMP. For security reasons, we recommend using SNMPv3 for this purpose (see the [SNMP Feature Overview and Configuration Guide](#)).

LLDP operates over physical ports only. For example, it can be configured on switch ports that belong to static or dynamic channel groups, but not on the channel groups themselves.

# clear lldp statistics

**Overview** This command clears all LLDP statistics (packet and event counters) associated with specified ports. If no port list is supplied, LLDP statistics for all ports are cleared.

**Syntax** `clear lldp statistics [interface <port-list>]`

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| <port-list> | The ports for which the statistics are to be cleared. |

**Mode** Privileged Exec

**Examples** To clear the LLDP statistics on port1.0.1 and port1.0.4 use the command:

```
awplus# clear lldp statistics interface port1.0.1,port1.0.4
```

To clear all LLDP statistics for all ports, use the command:

```
awplus# clear lldp statistics
```

**Related commands** [show lldp statistics](#)  
[show lldp statistics interface](#)

**Command changes** Version 5.5.3-1.1: Command added to AR1050V  
Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# clear lldp table

**Overview** This command clears the table of LLDP information received from neighbors through specified ports. If no port list is supplied, neighbor information is cleared for all ports.

**Syntax** `clear lldp table [interface <port-list>]`

| Parameter   | Description                                                          |
|-------------|----------------------------------------------------------------------|
| <port-list> | The ports for which the neighbor information table is to be cleared. |

**Mode** Privileged Exec

**Examples** To clear the table of neighbor information received on port1.0.1 and port1.0.4, use the command:

```
awplus#clear lldp table interface port1.0.1,port1.0.4
```

To clear the entire table of neighbor information received through all ports, use the command:

```
awplus# clear lldp table
```

**Related commands** [show lldp neighbors](#)

**Command changes** Version 5.5.3-1.1: Command added to AR1050V

## debug lldp

**Overview** This command enables specific LLDP debug for specified ports. When LLDP debugging is enabled, diagnostic messages are entered into the system log. If no port list is supplied, the specified debugging is enabled for all ports.

The **no** variant of this command disables specific LLDP debug for specified ports. If no port list is supplied, the specified debugging is disabled for all ports.

**Syntax** debug lldp {[rx][rxpkt][tx][txpkt]} [interface [<port-list>]]  
debug lldp operation  
no debug lldp {[rx][rxpkt][tx][txpkt]} [interface [<port-list>]]  
no debug lldp operation  
no debug lldp all

| Parameter   | Description                                      |
|-------------|--------------------------------------------------|
| rx          | LLDP receive debug.                              |
| rxpkt       | Raw LLDPDUs received in hex format.              |
| tx          | LLDP transmit debug.                             |
| txpkt       | Raw Tx LLDPDUs transmitted in hex format.        |
| <port-list> | The ports for which debug is to be configured.   |
| operation   | Debug for LLDP internal operation on the switch. |
| all         | Disables all LLDP debugging for all ports.       |

**Default** By default no debug is enabled for any ports.

**Mode** Privileged Exec

**Examples** To enable debugging of LLDP receive on port1.0.1 and port1.0.4, use the command:

```
awplus# debug lldp rx interface port1.0.1,port1.0.4
```

To enable debugging of LLDP transmit with packet dump on all ports, use the command:

```
awplus# debug lldp tx txpkt
```

To disable debugging of LLDP receive on port1.0.1 and port1.0.4, use the command:

```
awplus# no debug lldp rx interface port1.0.1,port1.0.4
```

To turn off all LLDP debugging on all ports, use the command:

```
awplus# no debug lldp all
```

**Related commands** [show debugging lldp](#)  
[show running-config lldp](#)  
[terminal monitor](#)

**Command changes** Version 5.5.3-1.1: Command added to AR1050V

## lldp faststart-count

**Overview** Use this command to configure the fast start count for LLDP-MED. The fast start count determines the number of fast start advertisements a port sends when initiating LLDP-MED advertisements. This occurs, for example, when a new LLDP-MED capable device is detected.

The **no** variant of this command resets the LLDP-MED fast start count to the default (3).

**Syntax** `lldp faststart-count <1-10>`  
`no lldp faststart-count`

| Parameter                 | Description                                      |
|---------------------------|--------------------------------------------------|
| <code>&lt;1-10&gt;</code> | The number of fast start advertisements to send. |

**Default** The default fast start count is 3.

**Mode** Global Configuration

**Examples** To set the fast start count to 5, use the command:

```
awplus# configure terminal
awplus(config)# lldp faststart-count 5
```

To reset the fast start count to the default setting (3), use the command:

```
awplus# configure terminal
awplus(config)# no lldp faststart-count
```

**Related commands** [show lldp](#)

**Command changes** Version 5.5.3-1.1: Command added to AR1050V

## lldp holdtime-multiplier

**Overview** This command sets the holdtime multiplier value. This value is multiplied by the transmit interval to determine the advertised Time To Live (TTL) value advertised to neighbors.

The **no** variant of this command sets the multiplier back to its default.

**Syntax** `lldp holdtime-multiplier <2-10>`  
`no lldp holdtime-multiplier`

| Parameter | Description            |
|-----------|------------------------|
| <2-10>    | The multiplier factor. |

**Default** The default holdtime multiplier value is 4.

**Mode** Global Configuration

**Usage** The Time-To-Live (TTL) specifies how long the advertised information remains valid for neighbors. If the TTL expires before receiving an update, the neighbor removes the information from its database.

**Examples** To set the holdtime multiplier to 2, use the commands:

```
awplus# configure terminal
awplus(config)# lldp holdtime-multiplier 2
```

To set the holdtime multiplier back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp holdtime-multiplier 2
```

**Related commands** [show lldp](#)

**Command changes** Version 5.5.3-1.1: Command added to AR1050V

# lldp management-address

**Overview** This command sets the IPv4 address to be advertised to neighbors (in the Management Address TLV) via the specified ports. This address will override the default address for these ports.

The **no** variant of this command clears the user-configured management IP address advertised to neighbors via the specified ports. The advertised address reverts to the default.

**Syntax** `lldp management-address <ipaddr>`  
`no lldp management-address`

| Parameter | Description                                                                                                                                      |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <ipaddr>  | The IPv4 address to be advertised to neighbors, in dotted decimal format. This must be one of the IP addresses already configured on the device. |

**Default** The local loopback interface's primary IPv4 address, if configured. Alternatively, the primary IPv4 interface address of the lowest numbered VLAN that the port belongs to, or if no VLAN IP addresses are configured, the MAC address of the device's baseboard.

**Mode** Interface Configuration

**Usage notes** To see the management address that will be advertised, use the [show lldp interface](#) command or [show lldp local-info](#) command.

**Examples** To set the management address advertised by port1.0.1 and port1.0.2 to 192.168.1.6, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# lldp management-address 192.168.1.6
```

To clear the user-configured management address advertised by port1.0.1 and port1.0.2, and revert to using the default address, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# no lldp management-address
```

**Related commands** [show lldp interface](#)  
[show lldp local-info](#)

**Command changes** Version 5.5.3-1.1: Command added to AR1050V  
Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# lldp med-notifications

**Overview** Use this command to enable LLDP to send LLDP-MED Topology Change Detected SNMP notifications relating to the specified ports. The switch sends an SNMP event notification when a new LLDP-MED compliant IP Telephony device is connected to or disconnected from a port on the switch.

Use the **no** variant of this command to disable the sending of LLDP-MED Topology Change Detected notifications relating to the specified ports.

**Syntax** `lldp med-notifications`  
`no lldp med-notifications`

**Default** The sending of LLDP-MED notifications is disabled by default.

**Mode** Interface Configuration

**Examples** To enable the sending of LLDP-MED Topology Change Detected notifications relating to ports port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# lldp med-notifications
```

To disable the sending of LLDP-MED notifications relating to port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# no lldp med-notifications
```

**Related commands** [lldp notification-interval](#)

[show lldp interface](#)

**Command changes** Version 5.5.3-1.1: Command added to AR1050V  
Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

## lldp med-tlv-select

**Overview** Use this command to enable LLDP-MED Organizationally Specific TLVs for transmission in LLDP advertisements via the specified ports. The LLDP-MED Capabilities TLV must be enabled before any of the other LLDP-MED Organizationally Specific TLVs are enabled.

Use the **no** variant of this command to disable the specified LLDP-MED Organizationally Specific TLVs for transmission in LLDP advertisements via these ports. In order to disable the LLDP-MED Capabilities TLV, you must also disable the rest of these TLVs. Disabling all these TLVs disables LLDP-MED advertisements.

**Syntax** `lldp med-tlv-select [capabilities] [network-policy] [location]  
[inventory-management]  
lldp med-tlv-select all  
no lldp med-tlv-select [capabilities] [network-policy]  
[location] [inventory-management]  
no lldp med-tlv-select all`

| Parameter            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| capabilities         | LLDP-MED Capabilities TLV. When this is enabled, the MAC/PHY Configuration/Status TLV from IEEE 802.3 Organizationally Specific TLVs is also automatically included in LLDP-MED advertisements, whether or not it has been explicitly enabled by the <b>lldp tlv-select</b> command.                                                                                                                                                                                         |
| network-policy       | Network Policy TLV. This TLV is transmitted if Voice VLAN parameters have been configured using the commands: <ul style="list-style-type: none"> <li>• <b>switchport voice dscp</b></li> <li>• <b>switchport voice vlan</b></li> <li>• <b>switchport voice vlan priority</b></li> </ul>                                                                                                                                                                                      |
| location             | Location Identification TLV. This TLV is transmitted if location information has been configured using the commands: <ul style="list-style-type: none"> <li>• <b>location elin-location-id</b></li> <li>• <b>location civic-location identifier</b></li> <li>• <b>location civic-location configuration</b></li> <li>• <b>location coord-location identifier</b></li> <li>• <b>location coord-location configuration</b></li> <li>• <b>location elin-location</b></li> </ul> |
| inventory-management | Inventory Management TLV Set, including the following TLVs: <ul style="list-style-type: none"> <li>• Hardware Revision</li> <li>• Firmware Revision</li> <li>• Software Revision</li> <li>• Serial Number</li> <li>• Manufacturer Name</li> <li>• Model Name</li> <li>• Asset ID</li> </ul>                                                                                                                                                                                  |
| all                  | All LLDP-MED Organizationally Specific TLVs.                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**Default** By default, LLDP-MED Capabilities, Network Policy, Location Identification, and Extended Power-via-MDI TLVs are enabled. Therefore, if LLDP is enabled using the **lldp run** command, by default LLDP-MED advertisements are transmitted on ports that detect LLDP-MED neighbors connected to them.

**Mode** Interface Configuration

**Usage notes** LLDP-MED TLVs are only sent in advertisements via a port if there is an LLDP-MED-capable device connected to it. To see whether there are LLDP-MED capable devices connected to the ports, use the **show lldp neighbors** command.

**Examples** To enable inclusion of the Inventory TLV Set in advertisements transmitted via port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# lldp med-tlv-select inventory-management
```

To exclude the Inventory TLV Set in advertisements transmitted via port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# no lldp med-tlv-select inventory-management
```

To disable LLDP-MED advertisements transmitted via port1.0.1 and port1.0.2, disable all these TLVs using the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# no lldp med-tlv-select all
```

# lldp non-strict-med-tlv-order-check

**Overview** Use this command to enable non-strict order checking for LLDP-MED advertisements it receives. That is, use this command to enable LLDP to receive and store TLVs from LLDP-MED advertisements even if they do not use standard TLV order.

Use the **no** variant of this command to disable non-strict order checking for LLDP-MED advertisements, that is, to set strict TLV order checking, so that LLDP discards any LLDP-MED TLVs that occur before the LLDP-MED Capabilities TLV in an advertisement.

**Syntax** `lldp non-strict-med-tlv-order-check`  
`no lldp non-strict-med-tlv-order-check`

**Default** By default TLV non-strict order checking for LLDP-MED advertisements is disabled. That is, strict order checking is applied to LLDP-MED advertisements, according to ANSI/TIA-1057, and LLDP-MED TLVs in non-standard order are discarded.

**Mode** Global Configuration

**Usage notes** The ANSI/TIA-1057 specifies standard order for TLVs in LLDP-MED advertisements, and specifies that if LLDP receives LLDP advertisements with non-standard LLDP-MED TLV order, the TLVs in non-standard order should be discarded. This implementation of LLDP-MED follows the standard: it transmits TLVs in the standard order, and by default discards LLDP-MED TLVs that occur before the LLDP-MED Capabilities TLV in an advertisement. However, some implementations of LLDP transmit LLDP-MED advertisements with non-standard TLV order. To receive and store the data from these non-standard advertisements, enable non-strict order checking for LLDP-MED advertisements using this command.

**Examples** To enable strict TLV order checking, use the commands:

```
awplus# configure terminal
awplus(config)# lldp tlv-order-check
```

To disable strict TLV order checking, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp tlv-order-check
```

## lldp notification-interval

**Overview** This command sets the notification interval. This is the minimum interval between LLDP SNMP notifications (traps) of each kind (LLDP Remote Tables Change Notification and LLDP-MED Topology Change Notification).  
  
The **no** variant of this command sets the notification interval back to its default.

**Syntax** `lldp notification-interval <5-3600>`  
`no lldp notification-interval`

| Parameter                   | Description              |
|-----------------------------|--------------------------|
| <code>&lt;5-3600&gt;</code> | The interval in seconds. |

**Default** The default notification interval is 5 seconds.

**Mode** Global Configuration

**Examples** To set the notification interval to 20 seconds, use the commands:  
`awplus# configure terminal`  
`awplus(config)# lldp notification-interval 20`  
  
To set the notification interval back to its default, use the commands:  
`awplus# configure terminal`  
`awplus(config)# no lldp notification-interval`

**Related commands** [lldp notifications](#)  
[show lldp](#)

# lldp notifications

**Overview** This command enables the sending of LLDP SNMP notifications (traps) relating to specified ports.

The **no** variant of this command disables the sending of LLDP SNMP notifications for specified ports.

**Syntax** lldp notifications  
no lldp notifications

**Default** The sending of LLDP SNMP notifications is disabled by default.

**Mode** Interface Configuration

**Examples** To enable sending of LLDP SNMP notifications for port1.0.1 and port1.0.2, use the commands:

```
awplus(config)# interface port1.0.1,port1.0.2  
awplus(config-if)# lldp notifications
```

To disable sending of LLDP SNMP notifications for port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal  
awplus(config)# interface port1.0.1,port1.0.2  
awplus(config-if)# no lldp notifications
```

**Related commands** **lldp notification-interval**  
**show lldp interface**  
**snmp-server enable trap**

## lldp port-number-type

**Overview** This command sets the type of port identifier used to enumerate, that is to count, the LLDP MIB local port entries. The LLDP MIB (IEEE Standard 802.1AB-2005, Section 12, LLDP MIB Definitions.) requires the port number value to count LLDP local port entries.

This command also enables you to optionally set an interface index to enumerate the LLDP MIB local port entries, if required by your management system.

The **no** variant of this command resets the type of port identifier back to the default setting (number).

**Syntax** `lldp port-number-type [number|ifindex]`  
`no lldp port-number-type`

| Parameter | Description                                                                                         |
|-----------|-----------------------------------------------------------------------------------------------------|
| number    | Set the type of port identifier to a port number to enumerate the LLDP MIB local port entries.      |
| ifindex   | Set the type of port identifier to an interface index to enumerate the LLDP MIB local port entries. |

**Default** The default port identifier type is number. The no variant of this command sets the port identifier type to the default.

**Mode** Global Configuration

**Examples** To set the type of port identifier used to enumerate LLDP MIB local port entries to port numbers, use the commands:

```
awplus# configure terminal
awplus(config)# lldp port-number-type number
```

To set the type of port identifier used to enumerate LLDP MIB local port entries to interface indexes, use the commands:

```
awplus# configure terminal
awplus(config)# lldp port-number-type ifindex
```

To reset the type of port identifier used to enumerate LLDP MIB local port entries the default (port numbers), use the commands:

```
awplus# configure terminal
awplus(config)# no lldp port-number-type
```

**Related commands** [show lldp](#)

**Command changes** Version 5.5.3-1.1: Command added to AR1050V

# lldp reinit

**Overview** This command sets the value of the reinitialization delay. This is the minimum time after disabling LLDP on a port before it can reinitialize.

The **no** variant of this command sets the reinitialization delay back to its default setting.

**Syntax** `lldp reinit <1-10>`  
`no lldp reinit`

| Parameter | Description           |
|-----------|-----------------------|
| <1-10>    | The delay in seconds. |

**Default** The default reinitialization delay is 2 seconds.

**Mode** Global Configuration

**Examples** To set the reinitialization delay to 3 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# lldp reinit 3
```

To set the reinitialization delay back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp reinit
```

**Command changes** Version 5.5.3-1.1: Command added to AR1050V

# lldp run

**Overview** This command enables the operation of LLDP on the device.

The **no** variant of this command disables the operation of LLDP on the device. The LLDP configuration remains unchanged.

**Syntax** lldp run  
no lldp run

**Default** LLDP is disabled by default.

**Mode** Global Configuration

**Examples** To enable LLDP operation, use the commands:

```
awplus# configure terminal  
awplus(config)# lldp run
```

To disable LLDP operation, use the commands:

```
awplus# configure terminal  
awplus(config)# no lldp run
```

# lldp timer

**Overview** This command sets the value of the transmit interval. This is the interval between regular transmissions of LLDP advertisements.

The **no** variant of this command sets the transmit interval back to its default.

**Syntax** `lldp timer <5-32768>`  
`no lldp timer`

| Parameter | Description                                                                                                                                       |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <5-32768> | The transmit interval in seconds. The transmit interval must be at least four times the transmission delay timer ( <b>lldp tx-delay</b> command). |

**Default** The default transmit interval is 30 seconds.

**Mode** Global Configuration

**Examples** To set the transmit interval to 90 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# lldp timer 90
```

To set the transmit interval back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp timer
```

**Related commands** **lldp tx-delay**  
**show lldp**

**Command changes** Version 5.5.3-1.1: Command added to AR1050V

## lldp tlv-select

**Overview** This command enables one or more optional TLVs, or all TLVs, for transmission in LLDP advertisements via the specified ports. The TLVs can be specified in any order; they are placed in LLDP frames in a fixed order (as described in IEEE 802.1AB). The mandatory TLVs (Chassis ID, Port ID, Time To Live, End of LLDPDU) are always included in LLDP advertisements.

In LLDP-MED advertisements the MAC/PHY Configuration/Status TLV will be always be included regardless of whether it is selected by this command.

The **no** variant of this command disables the specified optional TLVs, or all optional TLVs, for transmission in LLDP advertisements via the specified ports.

**Syntax** `lldp tlv-select {[<tlv>]...}`  
`lldp tlv-select all`  
`no lldp tlv-select {[<tlv>]...}`  
`no lldp tlv-select all`

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <tlv>     | The TLV to transmit in LLDP advertisements. One of these keywords: <ul style="list-style-type: none"><li>• port-description (specified by the <b>description (interface)</b>)</li><li>• system-name (specified by the <b>hostname</b>)</li><li>• system-description</li><li>• system-capabilities</li><li>• management-address</li><li>• port-vlan</li><li>• port-and-protocol-vlans</li><li>• vlan-names</li><li>• protocol-ids</li><li>• mac-phy-config</li><li>• power-management (Power Via MDI TLV)</li><li>• link-aggregation</li><li>• max-frame-size</li></ul> |
| all       | All TLVs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**Default** By default, no optional TLVs are included in LLDP advertisements. The MAC/PHY Configuration/Status TLV (**mac-phy-config**) is included in LLDP-MED advertisements whether or not it is selected by this command.

**Mode** Interface Configuration

**Examples** To include the management-address and system-name TLVs in advertisements transmitted via port1.0.1 and port1.0.4, use the commands:

```
awplus#configure terminal
awplus(config)# interface port1.0.1,port1.0.4
awplus(config-if)# lldp tlv-select management-address system-name
```

To include all optional TLVs in advertisements transmitted via port1.0.1 and port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.4
awplus(config-if)# lldp tlv-select all
```

To exclude the management-address and system-name TLVs from advertisements transmitted via port1.0.1 and port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.4
awplus(config-if)# no lldp tlv-select management-address system-name
```

To exclude all optional TLVs from advertisements transmitted via port1.0.1 and port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.4
awplus(config-if)# no lldp tlv-select all
```

# lldp transmit receive

**Overview** This command enables transmission and/or reception of LLDP advertisements to or from neighbors through the specified ports.

The **no** variant of this command disables transmission and/or reception of LLDP advertisements through specified ports.

**Syntax** `lldp {[transmit] [receive]}`  
`no lldp {[transmit] [receive]}`

| Parameter | Description                                                                   |
|-----------|-------------------------------------------------------------------------------|
| transmit  | Enable or disable transmission of LLDP advertisements via this port or ports. |
| receive   | Enable or disable reception of LLDP advertisements via this port or ports.    |

**Default** LLDP advertisement transmission and reception are enabled on all ports by default.

**Mode** Interface Configuration

**Examples** To enable transmission of LLDP advertisements on port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# lldp transmit
```

To enable LLDP advertisement transmission and reception on port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# lldp transmit receive
```

To disable LLDP advertisement transmission and reception on port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# no lldp transmit receive
```

**Related commands** [show lldp interface](#)

**Command changes** Version 5.5.3-1.1: Command added to AR1050V  
Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

## lldp tx-delay

**Overview** This command sets the value of the transmission delay timer. This is the minimum time interval between transmitting LLDP advertisements due to a change in LLDP local information.

The **no** variant of this command sets the transmission delay timer back to its default setting.

**Syntax** `lldp tx-delay <1-8192>`  
`no lldp tx-delay`

| Parameter | Description                                                                                                                                       |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <1-8192>  | The transmission delay in seconds. The transmission delay cannot be greater than a quarter of the transmit interval ( <b>lldp timer</b> command). |

**Default** The default transmission delay timer is 2 seconds.

**Mode** Global Configuration

**Examples** To set the transmission delay timer to 12 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# lldp tx-delay 12
```

To set the transmission delay timer back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp tx-delay
```

# location civic-location configuration

**Overview** Use these commands to configure a civic address location. The country parameter must be specified first, and at least one of the other parameters must be configured before the location can be assigned to a port.

Use the **no** variants of this command to delete civic address parameters from the location.

**Syntax** country <country>  
state <state>  
no state  
county <county>  
no county  
city <city>  
no city  
division <division>  
no division  
neighborhood <neighborhood>  
no neighborhood  
street-group <street-group>  
no street-group  
leading-street-direction <leading-street-direction>  
no leading-street-direction  
trailing-street-suffix <trailing-street-suffix>  
no trailing-street-suffix  
street-suffix <street-suffix>  
no street-suffix  
house-number <house-number>  
no house-number  
house-number-suffix <house-number-suffix>  
no house-number-suffix  
landmark <landmark>  
no landmark  
additional-information <additional-information>  
no additional-information

**Syntax** name *<name>*  
**(cont.)** no name  
postalcode *<postalcode>*  
no postalcode  
building *<building>*  
no building  
unit *<unit>*  
no unit  
floor *<floor>*  
no floor  
room *<room>*  
no room  
place-type *<place-type>*  
no place-type  
postal-community-name *<postal-community-name>*  
no postal-community-name  
post-office-box *<post-office-box>*  
no post-office-box  
additional-code *<additional-code>*  
no additional-code  
seat *<seat>*  
no seat  
primary-road-name *<primary-road-name>*  
no primary-road-name  
road-section *<road-section>*  
no road-section  
branch-road-name *<branch-road-name>*  
no branch-road-name  
sub-branch-road-name *<sub-branch-road-name>*  
no sub-branch-road-name  
street-name-pre-modifier *<street-name-pre-modifier>*  
no street-name-pre-modifier  
streetname-post-modifier *<streetname-post-modifier>*  
no streetname-post-modifier

| Parameter              | Description                                                                       |
|------------------------|-----------------------------------------------------------------------------------|
| <i>&lt;country&gt;</i> | Upper-case two-letter country code, as specified in ISO 3166.                     |
| <i>&lt;state&gt;</i>   | State (Civic Address (CA) Type 1): national subdivisions (state, canton, region). |

| Parameter                                     | Description                                                                        |
|-----------------------------------------------|------------------------------------------------------------------------------------|
| <code>&lt;county&gt;</code>                   | County (CA Type 2): County, parish, gun (JP), district (IN).                       |
| <code>&lt;city&gt;</code>                     | City (CA Type 3): city, township, shi (JP).                                        |
| <code>&lt;division&gt;</code>                 | City division (CA Type 4): City division, borough, city district, ward, chou (JP). |
| <code>&lt;neighborhood&gt;</code>             | Neighborhood (CA Type 5): neighborhood, block.                                     |
| <code>&lt;street-group&gt;</code>             | Street group (CA Type 6): group of streets below the neighborhood level.           |
| <code>&lt;leading-street-direction&gt;</code> | Leading street direction (CA Type 16).                                             |
| <code>&lt;trailing-street-suffix&gt;</code>   | Trailing street suffix (CA Type 17).                                               |
| <code>&lt;street-suffix&gt;</code>            | Street suffix (CA Type 18): street suffix or type.                                 |
| <code>&lt;house-number&gt;</code>             | House number (CA Type 19).                                                         |
| <code>&lt;house-number-suffix&gt;</code>      | House number suffix (CA Type 20).                                                  |
| <code>&lt;landmark&gt;</code>                 | Landmark or vanity address (CA Type 21).                                           |
| <code>&lt;additional-information&gt;</code>   | Additional location information (CA Type 22).                                      |
| <code>&lt;name&gt;</code>                     | Name (CA Type 23): residence and office occupant.                                  |
| <code>&lt;postal-code&gt;</code>              | Postal/zip code (CA Type 24).                                                      |
| <code>&lt;building&gt;</code>                 | Building (CA Type 25): structure.                                                  |
| <code>&lt;unit&gt;</code>                     | Unit (CA Type 26): apartment, suite.                                               |
| <code>&lt;floor&gt;</code>                    | Floor (CA Type 27).                                                                |
| <code>&lt;room&gt;</code>                     | Room (CA Type 28).                                                                 |
| <code>&lt;place-type&gt;</code>               | Type of place (CA Type 29).                                                        |
| <code>&lt;postal-community-name&gt;</code>    | Postal community name (CA Type 30).                                                |
| <code>&lt;post-office-box&gt;</code>          | Post office box (P.O. Box) (CA Type 31).                                           |
| <code>&lt;additional-code&gt;</code>          | Additional code (CA Type 32).                                                      |

| Parameter                                      | Description                                           |
|------------------------------------------------|-------------------------------------------------------|
| <code>&lt;seat&gt;</code>                      | Seat (CA Type 33): seat (desk, cubicle, workstation). |
| <code>&lt;primary-road-name&gt;</code>         | Primary road name (CA Type 34).                       |
| <code>&lt;road-section&gt;</code>              | Road section (CA Type 35).                            |
| <code>&lt;branch-road-name&gt;</code>          | Branch road name (CA Type 36).                        |
| <code>&lt;sub-branch-road-name&gt;</code>      | Sub-branch road name (CA Type 37).                    |
| <code>&lt;street-name-pre-modifier&gt;</code>  | Street name pre-modifier (CA Type 38).                |
| <code>&lt;street-name-post-modifier&gt;</code> | Street name post-modifier (CA Type 39).               |

**Default** By default no civic address location information is configured.

**Mode** Civic Address Location Configuration

**Usage notes** The **country** parameter must be configured before any other parameters can be configured; this creates the location. The country parameter cannot be deleted. One or more of the other parameters must be configured before the location can be assigned to a port. The country parameter must be entered as an upper-case two-letter country code, as specified in ISO 3166. All other parameters are entered as alpha-numeric strings. Do not configure all the civic address parameters (this would generate TLVs that are too long). Configure a subset of these parameters—enough to consistently and precisely identify the location of the device. If the location is to be used for Emergency Call Service (ECS), the particular ECS application may have guidelines for configuring the civic address location. For more information about civic address format, see the [LLDP Feature Overview and Configuration Guide](#).

To specify the civic address location, use the **location civic-location identifier** command. To delete the civic address location, use the **no** variant of the **location civic-location identifier** command.

To assign the civic address location to particular ports, so that it can be advertised in TLVs from those ports, use the command **location civic-location-id** command.

**Examples** To configure civic address location 1 with location "27 Nazareth Avenue, Christchurch, New Zealand" in civic-address format, use the commands:

```
awplus# configure terminal
awplus(config)# location civic-location identifier 1
awplus(config-civic)# country NZ
awplus(config-civic)# city Christchurch
awplus(config-civic)# primary-road-name Nazareth
awplus(config-civic)# street-suffix Avenue
awplus(config-civic)# house-number 27
```

**Related commands** **location civic-location-id**  
**location civic-location identifier**

**Command changes** Version 5.5.3-1.1: Command added to AR1050V

# location civic-location identifier

**Overview** Use this command to enter the Civic Address Location Configuration mode to configure the specified location.

Use the **no** variant of this command to delete a civic address location. This also removes the location from any ports it has been assigned to.

**Syntax** location civic-location identifier <civic-loc-id>  
no location civic-location identifier <civic-loc-id>

| Parameter      | Description                                                 |
|----------------|-------------------------------------------------------------|
| <civic-loc-id> | A unique civic address location ID, in the range 1 to 4095. |

**Default** By default there are no civic address locations.

**Mode** Global Configuration

**Usage notes** To configure the location information for this civic address location identifier, use the **location civic-location configuration** command.

To associate this civic location identifier with particular ports, use the **location elin-location-id** command.

Up to 400 locations can be configured on the switch for each type of location information, up to a total of 1200 locations.

**Examples** To enter Civic Address Location Configuration mode for the civic address location with ID 1, use the commands:

```
awplus# configure terminal
awplus(config)# location civic-location identifier 1
awplus(config-civic)#
```

To delete the civic address location with ID 1, use the commands:

```
awplus# configure terminal
awplus(config)# no location civic-location identifier 1
```

**Related commands** **location civic-location-id**  
**location civic-location configuration**  
**show location**  
**show running-config lldp**

**Command changes** Version 5.5.3-1.1: Command added to AR1050V

## location civic-location-id

**Overview** Use this command to assign a civic address location identifier to the ports. The civic address location must already exist. This replaces any previous assignment of civic address location for the ports. Up to one location of each type can be assigned to a port.

Use the **no** variant of this command to remove a location identifier from the ports.

**Syntax** location civic-location-id <civic-loc-id>  
no location civic-location-id [<civic-loc-id>]

| Parameter      | Description                                        |
|----------------|----------------------------------------------------|
| <civic-loc-id> | Civic address location ID, in the range 1 to 4095. |

**Default** By default no civic address location is assigned to ports.

**Mode** Interface Configuration

**Usage notes** The civic address location associated with a port can be transmitted in Location Identification TLVs via the port.

Before using this command, create the location using the following commands:

- **location civic-location identifier** command
- **location civic-location configuration** command

If a civic-address location is deleted using the **no** variant of the **location civic-location identifier** command, it is automatically removed from all ports.

**Examples** To assign the civic address location 1 to port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# location civic-location-id 1
```

To remove a civic address location from port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no location civic-location-id
```

**Related commands** **lldp med-tlv-select**

**Command changes** Version 5.5.3-1.1: Command added to AR1050V  
Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# location coord-location configuration

**Overview** Use this command to configure a coordinate-based location. All parameters must be configured before assigning this location identifier to a port.

**Syntax** latitude <latitude>  
lat-resolution <lat-resolution>  
longitude <longitude>  
long-resolution <long-resolution>  
altitude <altitude> {meters|floor}  
alt-resolution <alt-resolution>  
datum {wgs84|nad83-navd|nad83-mlw}

| Parameter         | Description                                                                                                                       |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <lat-resolution>  | Latitude resolution, as a number of valid bits, in the range 0 to 34.                                                             |
| <latitude>        | Latitude value in degrees in the range -90.0 to 90.0                                                                              |
| <long-resolution> | Longitude resolution, as a number of valid bits, in the range 0 to 34.                                                            |
| <longitude>       | Longitude value in degrees, in the range -180.0 to 180.0.                                                                         |
| <alt-resolution>  | Altitude resolution, as a number of valid bits, in the range 0 to 30. A resolution of 0 can be used to indicate an unknown value. |
| <altitude>        | Altitude value, in meters or floors.                                                                                              |
| meters            | The altitude value is in meters.                                                                                                  |
| floors            | The altitude value is in floors.                                                                                                  |
| datum             | The geodetic system (or datum) that the specified coordinate values are based on.                                                 |
| wgs84             | World Geodetic System 1984.                                                                                                       |
| nad83-navd        | North American Datum 1983 - North American Vertical Datum.                                                                        |
| nad83-mlw         | North American Datum 1983 - Mean Lower Low Water vertical datum.                                                                  |

**Default** By default no coordinate location information is configured.

**Mode** Coordinate Configuration

**Usage** Latitude and longitude values are always stored internally, and advertised in the Location Identification TLV, as 34-bit fixed-point binary numbers, with a 25-bit fractional part, irrespective of the number of digits entered by the user. Likewise altitude is stored as a 30-bit fixed point binary number, with an 8-bit fractional part. Because the user-entered decimal values are stored as fixed point binary numbers, they cannot always be represented exactly—the stored binary number is converted to a decimal number for display in the output of the **show location** command. For example, a user-entered latitude value of “2.77” degrees is displayed as “2.7699999809265136718750000”.

The **lat-resolution**, **long-resolution**, and **alt-resolution** parameters allow the user to specify the resolution of each coordinate element as the number of valid bits in the internally-stored binary representation of the value. These resolution values can be used by emergency services to define a search area.

To specify the coordinate identifier, use the **location coord-location identifier** command. To remove coordinate information, delete the coordinate location by using the **no** variant of that command.

To associate the coordinate location with particular ports, so that it can be advertised in TLVs from those ports, use the **location coord-location-id** command.

**Example** To configure the location for the White House in Washington DC, which has the coordinates based on the WGS84 datum of 38.89868 degrees North (with 22 bit resolution), 77.03723 degrees West (with 22 bit resolution), and 15 meters height (with 9 bit resolution), use the commands:

```
awplus# configure terminal
awplus(config)# location coord-location identifier 1
awplus(config-coord)# lat-resolution 22
awplus(config-coord)# latitude 38.89868
awplus(config-coord)# long-resolution 22
awplus(config-coord)# longitude -77.03723
awplus(config-coord)# alt-resolution 9
awplus(config-coord)# altitude 15 meters
awplus(config-coord)# datum wgs84
```

**Related commands** **location coord-location-id**

# location coord-location identifier

**Overview** Use this command to enter Coordinate Location Configuration mode for this coordinate location.

Use the **no** variant of this command to delete a coordinate location. This also removes the location from any ports it has been assigned to.

**Syntax** location coord-location identifier *<coord-loc-id>*  
no location coord-location identifier *<coord-loc-id>*

| Parameter                   | Description                                                      |
|-----------------------------|------------------------------------------------------------------|
| <i>&lt;coord-loc-id&gt;</i> | A unique coordinate location identifier, in the range 1 to 4095. |

**Default** By default there are no coordinate locations.

**Mode** Global Configuration

**Usage** Up to 400 locations can be configured on the switch for each type of location information, up to a total of 1200 locations.

To configure this coordinate location, use the **location coord-location configuration** command.

To associate this coordinate location with particular ports, so that it can be advertised in TLVs from those ports, use the **location coord-location-id** command.

**Examples** To enter Coordinate Location Configuration mode to configure the coordinate location with ID 1, use the commands:

```
awplus# configure terminal
awplus(config)# location coord-location identifier 1
awplus(config-coord)#
```

To delete coordinate location 1, use the commands:

```
awplus# configure terminal
awplus(config)# no location coord-location identifier 1
```

**Related commands** **location coord-location-id**  
**location coord-location configuration**

**Command changes** Version 5.5.3-1.1: Command added to AR1050V

# location coord-location-id

**Overview** Use this command to assign a coordinate location to the ports. The coordinate location must already exist. This replaces any previous assignment of coordinate location for the ports. Up to one location of each type can be assigned to a port.

Use the **no** variant of this command to remove a location from the ports.

**Syntax** location coord-location-id <coord-loc-id>  
no location coord-location-id [<coord-loc-id>]

| Parameter      | Description                                     |
|----------------|-------------------------------------------------|
| <coord-loc-id> | Coordinate location ID, in the range 1 to 4095. |

**Default** By default no coordinate location is assigned to ports.

**Mode** Interface Configuration

**Usage notes** The coordinate location associated with a port can be transmitted in Location Identification TLVs via the port.

Before using this command, configure the location using the following commands:

- **location coord-location identifier** command
- **location coord-location configuration** command

If a coordinate location is deleted using the **no** variant of the **location coord-location identifier** command, it is automatically removed from all ports.

**Examples** To assign coordinate location 1 to port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# location coord-location-id 1
```

To remove a coordinate location from port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no location coord-location-id 1
```

# location elin-location

**Overview** Use this command to create or modify an ELIN location.

Use the **no** variant of this command to delete an ELIN location, and remove it from any ports it has been assigned to.

**Syntax** `location elin-location <elin> identifier <elin-loc-id>`  
`no location elin-location identifier <elin-loc-id>`

| Parameter     | Description                                                                                                                                                                |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <elin>        | Emergency Location Identification Number (ELIN) for Emergency Call Service (ECS), in the range 10 to 25 digits long. In North America, ELINs are typically 10 digits long. |
| <elin-loc-id> | A unique ELIN location identifier, in the range 1 to 4095.                                                                                                                 |

**Default** By default there are no ELIN location identifiers.

**Mode** Global Configuration

**Usage** Up to 400 locations can be configured on the switch for each type of location information, up to a total of 1200 locations.

To assign this ELIN location to particular ports, so that it can be advertised in TLVs from those ports, use the **location elin-location-id** command.

**Examples** To create a new ELIN location with ID 1, and configure it with ELIN "1234567890", use the commands:

```
awplus# configure terminal
awplus(config)# location elin-location 1234567890 identifier 1
```

To delete existing ELIN location with ID 1, use the commands:

```
awplus# configure terminal
awplus(config)# no location elin-location identifier 1
```

**Related commands** **location elin-location-id**  
**show lldp local-info**  
**show location**

**Command changes** Version 5.5.3-1.1: Command added to AR1050V

# location elin-location-id

**Overview** Use this command to assign an ELIN location to the ports. The ELIN location must already exist. This replaces any previous assignment of ELIN location for the ports. Up to one location of each type can be assigned to a port.

Use the **no** variant of this command to remove a location identifier from the ports.

**Syntax** location elin-location-id <elin-loc-id>  
no location elin-location-id [<elin-loc-id>]

| Parameter     | Description                                       |
|---------------|---------------------------------------------------|
| <elin-loc-id> | ELIN location identifier, in the range 1 to 4095. |

**Default** By default no ELIN location is assigned to ports.

**Mode** Interface Configuration

**Usage notes** An ELIN location associated with a port can be transmitted in Location Identification TLVs via the port.

Before using this command, configure the location using the **location elin-location** command.

If an ELIN location is deleted using the **no** variant of one of the **location elin-location** command, it is automatically removed from all ports.

**Examples** To assign ELIN location 1 to port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# location elin-location-id 1
```

To remove ELIN location 1 from port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no location elin-location-id 1
```

## show debugging lldp

**Overview** This command displays LLDP debug settings for specified ports. If no port list is supplied, LLDP debug settings for all ports are displayed.

**Syntax** show debugging lldp [interface <port-list>]

| Parameter   | Description                                            |
|-------------|--------------------------------------------------------|
| <port-list> | The ports for which the LLDP debug settings are shown. |

**Mode** User Exec and Privileged Exec

**Examples** To display LLDP debug settings for all ports, use the command:  
awplus# show debugging lldp  
To display LLDP debug settings for port1.0.1 to port1.0.4, use the command:  
awplus# show debugging lldp interface port1.0.1-port1.0.4

**Output** The following shows typical output.

### Example output from the show debugging lldp command

|                                                                     |     |       |     |       |
|---------------------------------------------------------------------|-----|-------|-----|-------|
| LLDP Debug settings:<br>Debugging for LLDP internal operation is on |     |       |     |       |
| Port                                                                | Rx  | RxPkt | Tx  | TxPkt |
| -----                                                               |     |       |     |       |
| 1.0.1                                                               | Yes | Yes   | No  | No    |
| 1.0.2                                                               | Yes | No    | No  | No    |
| 1.0.3                                                               | No  | No    | No  | No    |
| 1.0.4                                                               | Yes | Yes   | Yes | No    |

### Parameters in the output of the show debugging lldp command

| Parameter | Description                                                            |
|-----------|------------------------------------------------------------------------|
| Port      | Port name.                                                             |
| Rx        | Whether debugging of LLDP receive is enabled on the port.              |
| RxPkt     | Whether debugging of LLDP receive packet dump is enabled on the port.  |
| Rx        | Whether debugging of LLDP transmit is enabled on the port.             |
| RxPkt     | Whether debugging of LLDP transmit packet dump is enabled on the port. |

**Related commands** debug lldp

**Command changes** Version 5.5.3-1.1: Command added to AR1050V

# show lldp

**Overview** This command displays LLDP status and global configuration settings.

**Syntax** show lldp

**Mode** User Exec and Privileged Exec

**Example** To display LLDP status and global configuration settings, use the command:

```
awplus# show lldp
```

**Output** The following shows typical output.

**Example output from the show lldp command**

```
awplus# show lldp

LLDP Global Configuration:                [Default Values]
LLDP Status ..... Enabled                [Disabled]
Notification Interval ..... 5 secs       [5]
Tx Timer Interval ..... 30 secs           [30]
Hold-time Multiplier ..... 4              [4]
(Computed TTL value ..... 120 secs)
Reinitialization Delay .... 2 secs        [2]
Tx Delay ..... 2 secs                     [2]

Port Number Type..... Ifindex            [Port-Number]
Fast Start Count ..... 5                  [3]

LLDP Global Status:
Total Neighbor Count ..... 47
Neighbors table last updated 0 hrs 0 mins 43 secs ago
```

**Parameters in the output of the show lldp command**

| Parameter                    | Description                                                                                                                                                   |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LLDP Status                  | Whether LLDP is enabled. Default is disabled.                                                                                                                 |
| Notification Interval        | Minimum interval between LLDP notifications.                                                                                                                  |
| Tx Timer Interval            | Transmit interval between regular transmissions of LLDP advertisements.                                                                                       |
| Hold-time Multiplier         | The holdtime multiplier. The transmit interval is multiplied by the holdtime multiplier to give the Time To Live (TTL) value that is advertised to neighbors. |
| Reinitialization Delay       | The reinitialization delay. This is the minimum time after disabling LLDP transmit on a port before it can reinitialize again.                                |
| Tx Delay                     | The transmission delay. This is the minimum time interval between transmitting advertisements due to a change in LLDP local information.                      |
| Port Number Type             | The type of port identifier used to enumerate LLDP MIB local port entries, as set by the lldp port-number-type command.                                       |
| Fast Start Count             | The number of times fast start advertisements are sent for LLDP-MED.                                                                                          |
| Total Neighbor Count         | Number of LLDP neighbors discovered on all ports.                                                                                                             |
| Neighbors table last updated | The time since the LLDP neighbor table was last updated.                                                                                                      |

[show running-config lldp](#)

**Command changes** Version 5.5.3-1.1: Command added to AR1050V

# show lldp interface

**Overview** This command displays LLDP configuration settings for specified ports. If no port list is specified, LLDP configuration for all ports is displayed.

**Syntax** show lldp interface [*<port-list>*]

| Parameter                | Description                                                          |
|--------------------------|----------------------------------------------------------------------|
| <i>&lt;port-list&gt;</i> | The ports for which the LLDP configuration settings are to be shown. |

**Mode** User Exec and Privileged Exec

**Examples** To display LLDP configuration settings for port1.0.1 to port1.0.4, use the command:

```
awplus# show lldp interface port1.0.1-port1.0.4
```

To display LLDP configuration settings for all ports, use the command:

```
awplus# show lldp interface
```

**Output** The following shows typical output.

### Example output from the show lldp interface command

```
awplus# show lldp interface port1.0.1-1.0.4

## show lldp local-info

**Overview** This command displays local LLDP information that can be transmitted through specified ports. If no port list is entered, local LLDP information for all ports is displayed.

**Syntax** `show lldp local-info [base] [dot1] [dot3] [med] [interface <port-list>]`

| Parameter   | Description                                               |
|-------------|-----------------------------------------------------------|
| base        | Information for base TLVs.                                |
| dot1        | Information for 802.1 TLVs.                               |
| dot3        | Information for 802.3 TLVs.                               |
| med         | Information for LLDP-MED TLVs.                            |
| <port-list> | The ports for which the local information is to be shown. |

**Mode** User Exec and Privileged Exec

**Usage notes** Whether and which local information is transmitted in advertisements via a port depends on:

- whether the port is set to transmit LLDP advertisements (**lldp transmit receive** command)
- which TLVs it is configured to send (**lldp tlv-select** command, **lldp med-tlv-select** command)

**Examples** To display local information transmitted via port1.0.1, use the command:

```
awplus# show lldp local-info interface port1.0.1
```

To display local information transmitted via all ports, use the command:

```
awplus# show lldp local-info
```

**Output** The following shows typical output.

**Example output from show lldp local-info**

```
LLDP Local Information:

Local port1.0.1:
  Chassis ID Type ..... MAC address
  Chassis ID ..... 0015.77c9.7453
  Port ID Type ..... Interface alias
  Port ID ..... port1.0.1
  TTL ..... 120
  Port Description ..... [not configured]

System Name ..... awplus
System Description ..... Allied Telesis router/switch, AW+
                          v5.5.2
System Capabilities - Supported .. Bridge, Router
                  - Enabled .... Bridge, Router
Management Address ..... 192.168.1.6
Port VLAN ID (PVID) ..... 1
Port & Protocol VLAN - Supported . Yes
                  - Enabled ... No
                  - VIDs ..... 0
VLAN Names ..... default

Protocol IDs ..... 9000, 0026424203000000, 888e01, aaaa03,
                  88090101, 00540000e302, 0800, 0806, 86dd
MAC/PHY Auto-negotiation ..... Supported, Enabled
  Advertised Capability ..... 1000BaseTFD, 100BaseTXFD, 100BaseTX,
                              10BaseTFD, 10BaseT
  Operational MAU Type ..... 1000BaseTFD (30)
Power Via MDI (PoE) ..... Supported, Enabled
  Port Class ..... PSE
  Pair Control Ability ..... Disabled
  Power Class ..... Unknown

Link Aggregation ..... Supported, Disabled
Maximum Frame Size ..... 1522
LLDP-MED Device Type ..... Network Connectivity
LLDP-MED Capabilities ..... LLDP-MED Capabilities, Network Policy,
                              Location Identification,
                              Extended Power - PSE, Inventory
Network Policy ..... [not configured]
Location Identification ..... Civic Address
  Country Code ..... NZ

  City ..... Christchurch
  Street Suffix ..... Avenue
  House Number ..... 27
  Primary Road Name ..... Nazareth
Location Identification ..... ELIN
  ELIN ..... 123456789012
LLDP-MED Device Type ..... Network Connectivity
LLDP-MED Capabilities ..... LLDP-MED Capabilities, Network Policy,
                              Location Identification,
                              Extended Power - PSE, Inventory

Extended Power Via MDI (PoE) ..... PSE
  Power Source ..... Primary Power
  Power Priority ..... Low
  Power Value ..... 4.4 Watts
Inventory Management:
  Hardware Revision ..... A-0
  Firmware Revision ..... 1.1.0
  Software Revision ..... v5.5.2
  Serial Number ..... G1Q78900B
  Manufacturer Name ..... Allied Telesis Inc.
  Model Name ..... AT-x930-52GPX
```

### Parameters in the output of show lldp local-info

| Parameter                        | Description                                                                                                        |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Chassis ID Type                  | Type of the Chassis ID.                                                                                            |
| Chassis ID                       | Chassis ID that uniquely identifies the local device.                                                              |
| Port ID Type                     | Type of the Port ID.                                                                                               |
| Port ID                          | Port ID of the local port through which advertisements are sent.                                                   |
| TTL                              | Number of seconds that the information advertised by the local port remains valid.                                 |
| Port Description                 | Port description of the local port, as specified by the <b>description (interface)</b> .                           |
| System Name                      | System name, as specified by the <b>hostname</b> .                                                                 |
| System Description               | System description.                                                                                                |
| System Capabilities (Supported)  | Capabilities that the local port supports.                                                                         |
| System Capabilities (Enabled)    | Enabled capabilities on the local port.                                                                            |
| Management Addresses             | Management address associated with the local port. To change this, use the <b>lldp management-address</b> command. |
| Port VLAN ID (PVID)              | VLAN identifier associated with untagged or priority tagged frames received via the local port.                    |
| Port & Protocol VLAN (Supported) | Whether Port & Protocol VLANs (PPV) is supported on the local port.                                                |
| Port & Protocol VLAN (Enabled)   | Whether the port is in one or more Port & Protocol VLANs.                                                          |
| Port & Protocol VLAN (VIDs)      | List of identifiers for Port & Protocol VLANs that the port is in.                                                 |
| VLAN Names                       | List of VLAN names for VLANs that the local port is assigned to.                                                   |
| Protocol IDs                     | List of protocols that are accessible through the local port.                                                      |
| MAC/PHY Auto-negotiation         | Auto-negotiation support and current status of the 802.3 LAN on the local port.                                    |

| Parameter                    | Description                                                                                                     |
|------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Power Via MDI (PoE)          | PoE-capability and current status on the local port.                                                            |
| Port Class                   | Whether the device is a PSE (Power Sourcing Entity) or a PD (Powered Device).                                   |
| Pair Control Ability         | Whether power pair selection can be controlled.                                                                 |
| Power Pairs                  | Which power pairs are selected for power ("Signal Pairs" or "Spare Pairs") if pair selection can be controlled. |
| Power Class                  | The power class of the PD device on the port (class 0, 1, 2, 3 or 4).                                           |
| Link Aggregation             | Whether the link is capable of being aggregated and it is currently in an aggregation.                          |
| Aggregated Port-ID           | Aggregated port identifier.                                                                                     |
| Maximum Frame Size           | The maximum frame size capability of the implemented MAC and PHY.                                               |
| LLDP-MED Device Type         | LLDP-MED device type.                                                                                           |
| LLDP-MED Capabilities        | Capabilities LLDP-MED capabilities supported on the local port.                                                 |
| Network Policy               | List of network policies configured on the local port.                                                          |
| VLAN ID                      | VLAN identifier for the port for the specified application type.                                                |
| Tagged Flag                  | Whether the VLAN ID is to be used as tagged or untagged.                                                        |
| Layer-2 Priority:            | Layer 2 User Priority (in the range 0 to 7).                                                                    |
| DSCP Value                   | Diffserv codepoint (in the range 0 to 63).                                                                      |
| Location Identification      | Location configured on the local port.                                                                          |
| Extended Power Via MDI (PoE) | PoE-capability and current status of the PoE parameters for Extended Power-Via-MDI TLV on the local port.       |
| Power Source                 | The power source the switch currently uses; either primary power or backup power.                               |

| Parameter            | Description                                                                                                                                              |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Power Priority       | The power priority configured on the port; either critical, high or low.                                                                                 |
| Power Value          | The total power the switch can source over a maximum length cable to a PD device on the port. The value shows the power value in Watts from the PD side. |
| Inventory Management | Inventory information for the device.                                                                                                                    |

## show lldp neighbors

**Overview** This command displays a summary of information received from neighbors via specified ports. If no port list is supplied, neighbor information for all ports is displayed.

**Syntax** `show lldp neighbors [interface <port-list>]`

| Parameter   | Description                                                  |
|-------------|--------------------------------------------------------------|
| <port-list> | The ports for which the neighbor information is to be shown. |

**Mode** User Exec and Privileged Exec

**Examples** To display neighbor information received via all ports, use the command:

```
awplus# show lldp neighbors
```

To display neighbor information received via port1.0.1 and port1.0.4 with LLDP-MED configuration, use the command:

```
awplus# show lldp neighbors interface port1.0.1,port1.0.4
```

**Output** The following shows typical output.

**Example output from the show lldp neighbors command**

```

LLDP Neighbor Information:
Total number of neighbors on these ports .... 4

System Capability Codes:
  O = Other   P = Repeater   B = Bridge           W = WLAN Access Point
  R = Router  T = Telephone  C = DOCSIS Cable Device  S = Station Only
LLDP-MED Device Type and Power Source Codes:
  1 = Class I   3 = Class III  PSE = PoE      Both = PoE&Local  Prim = Primary
  2 = Class II  N = Network Con.  Locl = Local  Unkn = Unknown  Back = Backup

```

| Local Port | Neighbor Chassis ID | Neighbor Port ID | Neighbor Sys Name       | System Cap. | MED Ty Pwr |
|------------|---------------------|------------------|-------------------------|-------------|------------|
| 1.0.1      | 002d.3044.7ba6      | port1.0.2        | awplus                  | OPBWRCS     |            |

**Command changes** Version 5.5.3-1.1: Command added to AR1050V

## show lldp neighbors detail

**Overview** This command displays in detail the information received from neighbors via specified ports. If no port list is supplied, detailed neighbor information for all ports is displayed.

**Syntax** `show lldp neighbors detail [base] [dot1] [dot3] [med] [interface <port-list>]`

| Parameter   | Description                                                  |
|-------------|--------------------------------------------------------------|
| base        | Information for base TLVs.                                   |
| dot1        | Information for 802.1 TLVs.                                  |
| dot3        | Information for 803.1 TLVs.                                  |
| med         | Information for LLDP-MED TLVs.                               |
| <port-list> | The ports for which the neighbor information is to be shown. |

**Mode** User Exec and Privileged Exec

**Examples** To display detailed neighbor information received via all ports, use the command:

```
awplus# show lldp neighbors detail
```

To display detailed neighbor information received via port1.0.1, use the command:

```
awplus# show lldp neighbors detail interface port1.0.1
```

**Output** The following shows typical output.

**Example output from the show lldp neighbors detail command**

```
awplus#show lldp neighbors detail interface port1.0.1

**Parameters in the output of the show lldp neighbors detail command**

| Parameter       | Description                                       |
|-----------------|---------------------------------------------------|
| Chassis ID Type | Type of the Chassis ID.                           |
| Chassis ID      | Chassis ID that uniquely identifies the neighbor. |
| Port ID Type    | Type of the Port ID.                              |

| Parameter                        | Description                                                                               |
|----------------------------------|-------------------------------------------------------------------------------------------|
| Port ID                          | Port ID of the neighbor.                                                                  |
| TTL                              | Number of seconds that the information advertised by the neighbor remains valid.          |
| Port Description                 | Port description of the neighbor's port.                                                  |
| System Name                      | Neighbor's system name.                                                                   |
| System Description               | Neighbor's system description.                                                            |
| System Capabilities (Supported)  | Capabilities that the neighbor supports.                                                  |
| System Capabilities (Enabled)    | Capabilities that are enabled on the neighbor.                                            |
| Management Addresses             | List of neighbor's management addresses.                                                  |
| Port VLAN ID (PVID)              | VLAN identifier associated with untagged or priority tagged frames for the neighbor port. |
| Port & Protocol VLAN (Supported) | Whether Port & Protocol VLAN is supported on the LLDP neighbor.                           |
| Port & Protocol VLAN (Enabled)   | Whether Port & Protocol VLAN is enabled on the LLDP neighbor.                             |
| Port & Protocol VLAN (VIDs)      | List of Port & Protocol VLAN identifiers.                                                 |
| VLAN Names                       | List of names of VLANs that the neighbor's port belongs to.                               |
| Protocol IDs                     | List of protocols that are accessible through the neighbor's port.                        |
| MAC/PHY Auto-negotiation         | Auto-negotiation configuration and status                                                 |
| Power Via MDI (PoE)              | PoE configuration and status of 802.3 Power- Via-MDI TLV                                  |
| Link Aggregation                 | Link aggregation information                                                              |
| Maximum Frame Size               | The maximum frame size capability                                                         |
| LLDP-MED Device Type             | LLDP-MED Device type                                                                      |
| LLDP-MED Capabilities            | LLDP-MED capabilities supported                                                           |

| Parameter                    | Description                       |
|------------------------------|-----------------------------------|
| Network Policy               | List of network policies          |
| Location Identification      | Location information              |
| Extended Power Via MDI (PoE) | PoE-capability and current status |
| Inventory Management         | Inventory information             |

**Related commands** [show lldp neighbors](#)

**Command changes** Version 5.5.3-1.1: Command added to AR1050V

# show lldp statistics

**Overview** This command displays the global LLDP statistics (packet and event counters).

**Syntax** show lldp statistics

**Mode** User Exec and Privileged Exec

**Example** To display global LLDP statistics information, use the command:  
awplus# show lldp statistics

**Output** The following shows typical output.

**Example output from the show lldp statistics command**

```
awplus# show lldp statistics
Global LLDP Packet and Event counters:

Frames:   Out ..... 345
          In ..... 423
          In Errored ..... 0
          In Dropped ..... 0
TLVs:     Unrecognized ..... 0
          Discarded ..... 0
Neighbors: New Entries ..... 20
           Deleted Entries ..... 20
           Dropped Entries ..... 0
           Entry Age-outs ..... 20
```

**Parameters in the output of the show lldp statistics command**

| Parameter                        | Description                                                                                                                                        |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| Frames Out                       | Number of LLDPDU frames transmitted.                                                                                                               |
| Frames In                        | Number of LLDPDU frames received.                                                                                                                  |
| Frames In Errored                | Number of invalid LLDPDU frames received.                                                                                                          |
| Frames In Dropped                | Number of LLDPDU frames received and discarded for any reason.                                                                                     |
| TLVs Unrecognized                | Number of LLDP TLVs received that are not recognized but the TLV type is in the range of reserved TLV types.                                       |
| TLVs Discarded                   | Number of LLDP TLVs discarded for any reason.                                                                                                      |
| Neighbors New Entries            | Number of times the information advertised by neighbors has been inserted into the neighbor table.                                                 |
| Neighbors Deleted Entries        | Number of times the information advertised by neighbors has been removed from the neighbor table.                                                  |
| Neighbors Dropped Entries        | Number of times the information advertised by neighbors could not be entered into the neighbor table because of insufficient resources.            |
| Neighbors Entry Age-outs Entries | Number of times the information advertised by neighbors has been removed from the neighbor table because the information TTL interval has expired. |

**Command changes** Version 5.5.3-1.1: Command added to AR1050V

## show lldp statistics interface

**Overview** This command displays the LLDP statistics (packet and event counters) for specified ports. If no port list is supplied, LLDP statistics for all ports are displayed.

**Syntax** show lldp statistics interface [*<port-list>*]

| Parameter                | Description                                         |
|--------------------------|-----------------------------------------------------|
| <i>&lt;port-list&gt;</i> | The ports for which the statistics are to be shown. |

**Mode** User Exec and Privileged Exec

**Examples** To display LLDP statistics information for all ports, use the command:

```
awplus# show lldp statistics interface
```

To display LLDP statistics information for port1.0.1 and port1.0.4, use the command:

```
awplus# show lldp statistics interface port1.0.1,port1.0.4
```

## Output Example output from the show lldp statistics interface command

```
awplus# show lldp statistics interface eth1,eth2

LLDP Packet and Event Counters:

eth1
  Frames:    Out ..... 27
             In ..... 22
             In Errored ..... 0
             In Dropped ..... 0
  TLVs:      Unrecognized ..... 0
             Discarded ..... 0
  Neighbors: New Entries ..... 3
             Deleted Entries ..... 0
             Dropped Entries ..... 0
             Entry Age-outs ..... 0

eth2
  Frames:    Out ..... 15
             In ..... 18
             In Errored ..... 0
             In Dropped ..... 0
  TLVs:      Unrecognized ..... 0
             Discarded ..... 0
  Neighbors: New Entries ..... 1
             Deleted Entries ..... 0
             Dropped Entries ..... 0
             Entry Age-outs ..... 0
```

## Parameters in the output of the show lldp statistics interface command

| Parameter                 | Description                                                                                                                             |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| Frames Out                | Number of LLDPDU frames transmitted.                                                                                                    |
| Frames In                 | Number of LLDPDU frames received.                                                                                                       |
| Frames In Errored         | Number of invalid LLDPDU frames received.                                                                                               |
| Frames In Dropped         | Number of LLDPDU frames received and discarded for any reason.                                                                          |
| TLVs Unrecognized         | Number of LLDP TLVs received that are not recognized but the TLV type is in the range of reserved TLV types.                            |
| TLVs Discarded            | Number of LLDP TLVs discarded for any reason.                                                                                           |
| Neighbors New Entries     | Number of times the information advertised by neighbors has been inserted into the neighbor table.                                      |
| Neighbors Deleted Entries | Number of times the information advertised by neighbors has been removed from the neighbor table.                                       |
| Neighbors Dropped Entries | Number of times the information advertised by neighbors could not be entered into the neighbor table because of insufficient resources. |

| Parameter                           | Description                                                                                                                                        |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| Neighbors Entry<br>Age-outs Entries | Number of times the information advertised by neighbors has been removed from the neighbor table because the information TTL interval has expired. |

                          **show lldp statistics**

**Command changes**   Version 5.5.3-1.1: Command added to AR1050V

## show location

**Overview** Use this command to display selected location information configured on the switch.

**Syntax** `show location {civic-location|coord-location|elin-location}`  
`show location {civic-location|coord-location|elin-location}`  
`identifier {<civic-loc-id>|<coord-loc-id>|<elin-loc-id>}`  
`show location {civic-location|coord-location|elin-location}`  
`interface <port-list>`

| Parameter      | Description                                                      |
|----------------|------------------------------------------------------------------|
| civic-location | Display civic location information.                              |
| coord-location | Display coordinate location information.                         |
| elin-location  | Display ELIN (Emergency Location Identifier Number) information. |
| <civic-loc-id> | Civic address location identifier, in the range 1 to 4095.       |
| <coord-loc-id> | Coordinate location identifier, in the range 1 to 4095.          |
| <elin-loc-id>  | ELIN location identifier, in the range 1 to 4095.                |
| <port-list>    | Ports to display information about.                              |

**Mode** User Exec and Privileged Exec

**Examples** To display a civic address location configured on port1.0.1, use the command:

```
awplus# show location civic-location interface port1.0.1
```

**Example output from the show location command**

| Port  | ID | Element Type      | Element Value |
|-------|----|-------------------|---------------|
| 1.0.1 | 1  | Country           | NZ            |
|       |    | City              | Christchurch  |
|       |    | Street-suffix     | Avenue        |
|       |    | House-number      | 27            |
|       |    | Primary-road-name | Nazareth      |

To display coordinate location information configured on the identifier 1, use the command:

```
awplus# show location coord-location identifier 1
```

**Example output from the show location command**

| ID | Element Type         | Element Value                         |
|----|----------------------|---------------------------------------|
| 1  | Latitude Resolution  | 15 bits                               |
|    | Latitude             | 38.8986481130123138427734375 degrees  |
|    | Longitude Resolution | 15 bits                               |
|    | Longitude            | 130.2323232293128967285156250 degrees |
|    | Altitude Resolution  | 10 bits                               |
|    | Altitude             | 2.50000000 meters                     |
|    | Map Datum            | WGS 84                                |

The coordinate location information displayed may differ from the information entered because it is stored in binary format. For more information, see the [location coord-location configuration](#) command.

To display all ELIN location information configured on the switch, use the command:

```
awplus# show location elin-location
```

**Example output from the show location elin-location command**

| ID | ELIN       |
|----|------------|
| 1  | 1234567890 |
| 2  | 5432154321 |

# Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure mail. The mail feature uses Simple Mail Transfer Protocol (SMTP) to transfer mail from an internal email client operating within the AlliedWare Plus device. This feature is typically used to email event notifications to an external email server from the AlliedWare Plus device.

For information on using the mail feature, see the [Mail \(SMTP\) Feature Overview and Configuration Guide](#).

# debug mail

**Overview** This command turns on debugging for sending emails.  
The **no** variant of this command turns off debugging for sending emails.

**Syntax** debug mail  
no debug mail

**Mode** Privileged Exec

**Examples** To turn on debugging for sending emails, use the command:  
awplus# debug mail  
To turn off debugging for sending emails, use the command:  
awplus# no debug mail

**Related commands** [delete mail](#)

# delete mail

**Overview** This command deletes mail from the queue.

You need the *mail-id* from the **show mail** command output to delete specific emails, or use the **all** parameter to clear all messages in the queue completely.

**Syntax** delete mail [mail-id <mail-id>|all]

| Parameter | Description                                                                                              |
|-----------|----------------------------------------------------------------------------------------------------------|
| mail-id   | Deletes a single mail from the mail queue.                                                               |
|           | <mail-id> A unique mail ID number. Use the <b>show mail</b> command to display this for an item of mail. |
| all       | Delete all the mail in the queue.                                                                        |

**Mode** Privileged Exec

**Examples** To delete the unique mail item "20060912142356.1234" from the queue, use the command:

```
awplus# delete mail 20060912142356.1234
```

To delete all mail from the queue, use the command:

```
awplus# delete mail all
```

# mail

**Overview** This command sends an email using the SMTP protocol. If you specify a file the text inside the file is sent in the message body.

If you do not specify the **to**, **file**, or **subject** parameters, the CLI prompts you for the missing information.

Before you can send mail using this command, you must specify the sending email address using the **mail from** command and a mail server using the **mail smtpserver** command.

**Syntax** mail [to <to>] [subject <subject>] [file <filename>]

| Parameter | Description                                                                                      |
|-----------|--------------------------------------------------------------------------------------------------|
| to        | The email recipient.                                                                             |
|           | <to> Email address.                                                                              |
| subject   | Description of the subject of this email. Use quote marks when the subject text contains spaces. |
|           | <subject> String.                                                                                |
| file      | File to insert as text into the message body.                                                    |
|           | <filename> String.                                                                               |

**Mode** Privileged Exec

**Usage notes** When you use the **mail** command you can use parameter substitutions in the subject field. The following table lists the parameters that can be substituted and their descriptions:

| Parameter Description |                                                                                                                        |
|-----------------------|------------------------------------------------------------------------------------------------------------------------|
| <%N>                  | When this parameter is specified, the %N is replaced by the host name of your device.                                  |
| <%S>                  | When this parameter is specified, the %S is replaced by the serial number of your device.                              |
| <%D><%L><             | When any of these parameters is specified, they are replaced by the current date and time (local time) on your device. |
| <%U>                  | When this parameter is specified, the %U is replaced by the current date and time (UTC time) on your device.           |

**NOTE:** If no local time is configured, it will use UTC.

**Examples** To send an email to "admin@example.com" with the subject "test email" and with the message body inserted from the file "test.conf", use the command:

```
awplus# mail to admin@example.com subject "test email" filename test.conf
```

To send an email using parameter substitutions for the host name, serial number and date, use the commands:

```
awplus# mail to admin@example.com subject "Sending email from Hostname:%N Serial Number:%S Date:%T"
```

# mail from

**Overview** This command sets an email address as the sender. You must specify a sending email address with this command before you can send email. Use the **no** variant of this command to remove the “mail from” address.

**Syntax** mail from <from>  
no mail from

| Parameter | Description                                                                |
|-----------|----------------------------------------------------------------------------|
| <from>    | The email address that the mail is sent from (also known as the hostname). |

**Mode** Global Configuration

**Example** To set up your email address as the sender “kaji@nerv.com”, use the command:

```
awplus(config)# mail from kaji@nerv.com
```

# mail smtpserver

**Overview** This command specifies the IP address or domain name of the SMTP server that your device sends email to. You must specify a mail server with this command before you can send email.

Use the **no** variant of this command to remove the configured mail server.

**Syntax** mail smtpserver {<ip-address>|<name>}  
no mail smtpserver

| Parameter    | Description                                                           |
|--------------|-----------------------------------------------------------------------|
| <ip-address> | Internet Protocol (IP) address for the mail server.                   |
| <name>       | Domain name (FQDN) for the mail server (also known as the host name). |

**Mode** Global Configuration

**Usage notes** If you specify the server by specifying its domain name, you must also ensure that the DNS client on your device is enabled. It is enabled by default but if it has been disabled, you can re-enable it by using the **ip domain-lookup** command.

**Examples** To specify a mail server at "192.168.0.1", use the command:

```
awplus(config)# mail smtpserver 192.168.0.1
```

To specify a mail server that has a host name of "smtp.example.com", use the command:

```
awplus(config)# mail smtpserver smtp.example.com
```

To remove the configured mail server, use the command:

```
awplus(config)# no mail smtpserver
```

# mail smtpserver authentication

**Overview** Use this command to configure SMTP mail server authentication.

Use the **no** variant of this command to remove the configured SMTP mail server authentication.

**Syntax** mail smtpserver authentication {crammd5|login|plain} username <username> password [8] <password>  
no mail smtpserver authentication

| Parameter  | Description                                                                                                                                                                |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| crammd5    | This is a Challenge Request Authentication Mechanism based on the HMAC-MD5 mechanism and is the most secure option.                                                        |
| login      | A BASE64 encryption method                                                                                                                                                 |
| plain      | A BASE64 encryption method                                                                                                                                                 |
| <username> | Registered user name                                                                                                                                                       |
| 8          | The registered user password is presented in an already encrypted format. This is how the running configuration stores the plain text password and is not for general use. |
| <password> | Registered user password                                                                                                                                                   |

**Default** No authentication option is set by default.

**Mode** Global Configuration

**Usage notes** You cannot change the IP address or Domain Name of the SMTP server if authentication is configured. If you attempt to change it when authentication is configured, the following error message is displayed:  
% Error: authentication configuration still exists

**Examples** To configure the SMTP mail server authentication to crammd5, use the commands:

```
awplus# configure terminal
awplus(config)# mail smtpserver authentication crammd5 username
admin password unguessablePassword
```

To remove SMTP mail server authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no mail smtpserver authentication
```

**Output** The following shows typical output.

**Example output from show mail:**

```
awplus#show mail
Mail Settings
-----
State                               : Alive
SMTP Server                         : 1.2.3.4
Host Name                           : admin@example.com
Authentication                       : crammd5
Username                            : admin
Debug                               : Disabled

awplus#show running-config

**Command changes** Version 5.4.8-1.1: command added

# mail smtpserver port

**Overview** Use this command to configure the SMTP mail client/server communication port.

Use the **no** variant of this command to remove the configured port and set it back to the default port.

**Syntax** mail smtpserver port <port>  
no mail smtpserver port

| Parameter | Description                           |
|-----------|---------------------------------------|
| <port>    | Port number from the range 1 to 65535 |

**Default** The default port value is 25 if TLS is not enabled for the SMTP server, 587 if TLS is enabled with STARTTLS, and 465 if TLS is enabled with SMTPS.

**Mode** Global Configuration

**Examples** To configure the mail server communication over port 587, use the commands:

```
awplus# configure terminal
awplus(config)# mail smtpserver port 587
```

To revert to the default SMTP mail server communication port, use the commands:

```
awplus# configure terminal
awplus(config)# no mail smtpserver port
```

**Output** The following shows typical output.

**Example output from show mail:**

```
awplus#show mail
Mail Settings

Command changes

Version 5.4.8-1.1: command added

# mail smtpserver tls

**Overview** Use this command to configure the device to send emails over a TLS connection to the SMTP server instead of sending in clear-text. If the SMTP server does not support receiving emails over a TLS connection, sending emails from the device will fail.

Use the **no** variant of this command to configure the device to send emails over an unencrypted TCP connection (clear text).

**Syntax** mail smtpserver tls [starttls|smtps]  
no mail smtpserver tls

| Parameter | Description                                                                                                                   |
|-----------|-------------------------------------------------------------------------------------------------------------------------------|
| starttls  | The connection starts as clear-text SMTP first and then the client establishes a TLS connection using the STARTTLS extension. |
| smtps     | Use a TLS connection from the start.                                                                                          |

**Default** By default, TLS is disabled and the device sends emails in clear-text.

**Mode** Global Configuration

**Examples** To send emails to the SMTP server over a TLS connection that will be established by the STARTTLS method, use the commands:

```
awplus# configure terminal
awplus(config)# mail smtpserver tls starttls
```

To send emails to the SMTP server over a TLS connection from the beginning, use the commands:

```
awplus# configure terminal
awplus(config)# mail smtpserver tls smtps
```

To send emails to the SMTP server in clear text, use the commands:

```
awplus# configure terminal
awplus(config)# no mail smtpserver tls
```

**Command changes** Version 5.5.3-0.1: command added

# show counter mail

**Overview** This command displays the mail counters.

**Syntax** show counter mail

**Mode** User Exec and Privileged Exec

**Example** To show the emails in the queue use the command:

```
awplus# show counter mail
```

**Output** The following shows typical output.

## Example output from the show counter mail command

```
Mail Client (SMTP) counters
Mails Sent      ..... 2
Mails Sent Fails ..... 1
```

## Parameters in the output of the show counter mail command

| Parameter        | Description                                                                   |
|------------------|-------------------------------------------------------------------------------|
| Mails Sent       | The number of emails sent successfully since the last device restart.         |
| Mails Sent Fails | The number of emails the device failed to send since the last device restart. |

  - **show rmon event** on page 2656
  - **show rmon history** on page 2657
  - **show rmon statistics** on page 2659

# Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure Remote Monitoring (RMON).

For an introduction to RMON and an RMON configuration example, see the [RMON Feature Overview and Configuration Guide](#).

RMON is disabled by default in AlliedWare Plus™. No RMON alarms or events are configured.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

## rmon alarm

**Overview** Use this command to configure an RMON alarm to monitor the value of an SNMP object, and to trigger specified events when the monitored object crosses specified thresholds.

To specify the action taken when the alarm is triggered, use the event index of an event defined by the **rmon event** command.

Use the **no** variant of this command to remove the alarm configuration.

**NOTE:** *You can only configure alarms for switch port interfaces, not for VLANs.*

### Syntax User-defined alarm:

```
rmon alarm <alarm-index> <oid.index> interval <1-2147483647>
{delta|absolute} rising-threshold <1-2147483647> event <rising-
event-index> falling-threshold <1-2147483647> event <falling-
event-index> [alarmstartup {1|2|3}] [owner <owner>]
```

### Eventwatch alarm, do not use (used by Vista Manager EX only):

```
rmon alarm <alarm-index> <oid.index> interval <1-4294967295>
{delta|absolute} rising-threshold <1-2147483647> event
eventwatch falling-threshold <1-2147483647> event eventwatch
[owner <owner>]
```

```
no rmon alarm <alarm-index>
```

| Parameter                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <alarm-index>                      | Alarm entry index value from the range 1 to 65535 seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <oid.index>                        | <p>The variable SNMP MIB Object Identifier (OID) name to be monitored, for either etherStats or etherHistory entries. The entries can be either of the following formats:</p> <ul style="list-style-type: none"> <li>- etherStatsEntry.&lt;field&gt;.&lt;stats-index&gt; or etherHistoryEntry.&lt;field&gt;.&lt;history-index&gt;, or</li> <li>- etherStatsFieldName.&lt;stats-index&gt; or etherHistoryFieldName.&lt;history-index&gt;.</li> </ul> <p>To define the &lt;stats-index&gt;, use the <b>rmon collection stats</b> command.</p> <p>To define the &lt;history-index&gt;, use the <b>rmon collection history</b> command.</p> |
| interval<br><1-2147483647>         | Polling interval in seconds from the range 1 to 2147483647.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| delta                              | The RMON MIB alarmSampleType: the change in the monitored MIB object value between the beginning and end of the polling interval.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| absolute                           | The RMON MIB alarmSampleType: the value of the monitored MIB object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| rising-threshold<br><1-2147483647> | Rising threshold value of the alarm entry in seconds from the range 1 to 2147483647.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <rising-event-index>               | From the range 1 to 65535 seconds. The event to be triggered when the monitored object value reaches the rising threshold value. This is the event index of an event specified by the <b>rmon event</b> command.                                                                                                                                                                                                                                                                                                                                                                                                                        |
| eventwatch                         | The alarm triggers an eventwatch event. This mechanism is used by Vista Manager EX, the Allied Telesis network management and                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Parameter                           | Description                                                                                                                                                                                                                            |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                     | monitoring tool. Do not use this parameter; use the <i>&lt;rising-event-index&gt;</i> parameter instead.                                                                                                                               |
| falling-threshold<br><1-2147483647> | Falling threshold value of the alarm entry in seconds from the range 1 to 2147483647.                                                                                                                                                  |
| <falling-event-index>               | From the range 1 to 65535 seconds. The event to be triggered when the monitored object value reaches the falling threshold value. This is an event index of an event specified by the <b>rmon event</b> command.                       |
| eventwatch                          | The alarm triggers an eventwatch event. This mechanism is used by Vista Manager EX, the Allied Telesis network management and monitoring tool. Do not use this parameter; use the <i>&lt;rising-event-index&gt;</i> parameter instead. |
| alarmstartup {1 2 3}                | Whether RMON can trigger a falling alarm (1), a rising alarm (2) or either (3) when you first start monitoring. See the Usage section for more information.<br><br>The default is setting 3 (either).                                  |
| owner <owner>                       | Arbitrary owner name to identify the alarm entry.                                                                                                                                                                                      |

**Default** By default, there are no alarms.

**Mode** Global Configuration

**Usage notes** RMON alarms have a rising and falling threshold. Once the alarm monitoring is operating, you cannot have a falling alarm unless there has been a rising alarm and vice versa.

However, when you start RMON alarm monitoring, an alarm must be generated without the other type of alarm having first been triggered. The **alarmstartup** parameter allows this. It is used to say whether RMON can generate a rising alarm (1), a falling alarm (2) or either alarm (3) as the first alarm.

Note that you specify the SNMP MIB Object Identifier (OID) as a dotted decimal value, using one of the following forms:

- etherStatsEntry.<field>.<stats-index> or etherHistoryEntry.<field>.<history-index>. For example, etherHistoryEntry.8.8
- or, etherStatsFieldName.<stats-index> or etherHistoryFieldName.<history-index>. For example, etherHistoryMulticastPkts.8

If you enter the first form (etherHistoryEntry.8.8), the device will save it as the second form (etherHistoryMulticastPkts.8) in the running-config.

**Example** To configure an alarm to:

- monitor the change per minute in the etherStatsPkt value for interface 22 (defined by stats-index 22 in the **rmon collection stats** command)
- and trigger event 2 (defined by the **rmon event** command) when the change reaches the rising threshold 400
- and trigger event 3 when it reaches the falling threshold 200
- and identify this alarm as belonging to the user with username Maria

use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# rmon alarm 229 etherStatsEntry.22.5 interval 60  
delta rising-threshold 400 event 2 falling-threshold 200 event  
3 alarmstartup 3 owner maria
```

To configure an alarm that:

- every 10 seconds, checks the number of multicast packets
- in the latest history control table entry controlled by history-index 8
- to see if the number of packets has increased to 15 or dropped to 5
- and if it has, triggers event 10

use either of the following commands:

```
awplus(config)# rmon alarm 56 etherHistoryMulticastPkts.8  
interval 10 absolute rising-threshold 15 event 10 falling-  
threshold 5 event 10
```

```
awplus(config)# rmon alarm 56 etherHistoryEntry.8.8 interval 10  
absolute rising-threshold 15 event 10 falling-threshold 5 event  
10
```

## rmon collection history

**Overview** Use this command to create a history statistics control group to store a specified number of snapshots (buckets) of the standard RMON statistics for the switch port, and to collect these statistics at specified intervals. If there is sufficient memory available, then the device will allocate memory for storing the set of buckets that comprise this history control.

Use the **no** variant of this command to remove the specified history control configuration.

**NOTE:** A history can only be collected for switch port interfaces, not for VLANs.

**Syntax** `rmon collection history <history-index> [buckets <1-65535>]  
[interval <1-3600>] [owner <owner>]  
no rmon collection history <history-index>`

| Parameter         | Description                                                                                          |
|-------------------|------------------------------------------------------------------------------------------------------|
| <history-index>   | A unique RMON history control entry index value from the range 1 to 65535.                           |
| buckets <1-65535> | Number of requested buckets to store snapshots from the range 1 to 65535. The default is 50 buckets. |
| interval <1-3600> | Polling interval in seconds. Default 1800 second polling interval from the range 1 to 3600.          |
| owner <owner>     | Owner name to identify the entry.                                                                    |

**Default** The default interval is 1800 seconds and the default number of buckets is 50.

**Mode** Interface Configuration

**Example** To create a history statistics control group with ID 200 to store 500 snapshots with an interval of 600 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# rmon collection history 200 buckets 500
interval 600 owner herbert
```

To disable the history statistics control group, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no rmon collection history 200
```

## rmon collection stats

**Overview** Use this command to enable the collection of RMON statistics on a switch port, and assign an index number by which to access these collected statistics.

Use the **no** variant of this command to stop collecting RMON statistics on this switch port.

**NOTE:** Statistics can only be collected for switch port interfaces, not for VLANs.

**Syntax** `rmon collection stats <collection-index> [owner <owner>]`  
`no rmon collection stats <collection-index>`

| Parameter          | Description                                                                                                                                                                                            |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <collection-index> | Give this collection of statistics an index number to uniquely identify it. This is the index to use to access the statistics collected for this switch port. Use a number in the range of 1 to 65535. |
| owner <owner>      | An arbitrary owner name to identify this statistics collection entry.                                                                                                                                  |

**Default** RMON statistics are not enabled by default.

**Mode** Interface Configuration

**Example** To enable the collection of RMON statistics with a statistics index of 200, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# rmon collection stats 200 owner myrtle
```

To stop collecting RMON statistics, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no rmon collection stats 200
```

[rmon collection history](#)  
[rmon event](#)

## rmon event

**Overview** Use this command to create an event definition for a log or a trap or both. Then you can use this event index in the **rmon alarm** command to indicate whether to send an SNMP trap or log message (or both) when an alarm is triggered.

Use the **no** variant of this command to remove the event definition.

**Syntax**

```
rmon event <event-index> [description <description>|owner <owner>| trap <trap>]  
rmon event <event-index> [log [description <description>|owner <owner>|trap <trap>] ]  
rmon event <event-index> [log trap [description <description>|owner <owner>] ]  
no rmon event <event-index>
```

| Parameter                | Description                               |
|--------------------------|-------------------------------------------|
| <event-index>            | <1-65535> Unique event entry index value. |
| log                      | Log event type.                           |
| trap                     | Trap event type.                          |
| log trap                 | Log and trap event type.                  |
| description<description> | Event entry description.                  |
| owner <owner>            | Owner name to identify the entry.         |

**Default** No event is configured by default.

**Mode** Global Configuration

**Example** To create an event definition with an index of 299 for a log, use this command:

```
awplus# configure terminal  
awplus(config)# rmon event 299 log description cond3 owner  
alfred
```

To remove the event definition, use the command:

```
awplus# configure terminal  
awplus(config)# no rmon event 299
```

**Related commands** **rmon alarm**

# show rmon alarm

**Overview** Use this command to display the alarms and threshold configured for the RMON probe.

**Syntax** show rmon alarm

**Mode** User Exec and Privileged Exec

**Example** To display the alarms and threshold, use this command:

```
awplus# show rmon alarm
```

**Related commands** [rmon alarm](#)

# show rmon event

**Overview** Use this command to display the events configured for the RMON probe.

**Syntax** show rmon event

**Mode** User Exec and Privileged Exec

**Output** The following shows typical output.

## Example output from the show rmon event command

```
awplus#sh rmon event
event Index = 787
  Description TRAP
  Event type log & trap
  Event community name gopher
  Last Time Sent = 0
  Owner RMON_SNMP

event Index = 990
  Description TRAP
  Event type trap
  Event community name teabo
  Last Time Sent = 0
  Owner RMON_SNMP
```

**NOTE:** The following etherStats counters are not currently available for Layer 3 interfaces:

- etherStatsBroadcastPkts
- etherStatsCRCAlignErrors
- etherStatsUndersizePkts
- etherStatsOversizePkts
- etherStatsFragments
- etherStatsJabbers
- etherStatsCollisions
- etherStatsPkts64Octets
- etherStatsPkts65to127Octets
- etherStatsPkts128to255Octets
- etherStatsPkts256to511Octets
- etherStatsPkts512to1023Octets
- etherStatsPkts1024to1518Octets

**Example** To display the events configured for the RMON probe, use this command:

```
awplus# show rmon event
```

**Related commands** [rmon event](#)

# show rmon history

**Overview** Use this command to display the parameters specified on all the currently defined RMON history collections on the device.

**Syntax** show rmon history

**Mode** User Exec and Privileged Exec

**Output** The following shows typical output.

## Example output from the show rmon history command

```
awplus#sh rmon history
history index = 56
    data source ifindex = 4501
    buckets requested = 34
    buckets granted = 34
    Interval = 2000
    Owner Andrew

```

**NOTE:** The following etherStats counters are not currently available for Layer 3 interfaces:

- etherStatsBroadcastPkts
- etherStatsCRCAlignErrors
- etherStatsUndersizePkts
- etherStatsOversizePkts
- etherStatsFragments
- etherStatsJabbers
- etherStatsCollisions
- etherStatsPkts64Octets
- etherStatsPkts65to127Octets
- etherStatsPkts128to255Octets
- etherStatsPkts256to511Octets
- etherStatsPkts512to1023Octets
- etherStatsPkts1024to1518Octets

**Example** To display the parameters specified on all the currently defined RMON history collections, us the commands:

```
awplus# show rmon history
```

**Related** [rmon collection history commands](#)

# show rmon statistics

**Overview** Use this command to display the current values of the statistics for all the RMON statistics collections currently defined on the device.

**Syntax** show rmon statistics

**Mode** User Exec and Privileged Exec

**Example** To display the current values of the statistics for all the RMON statistics collections, use the commands:

```
awplus# show rmon statistics
```

**Output** The following shows typical output.

## Example output from the show rmon statistics command

```
awplus#show rmon statistics
  rmon collection index 45
  stats->ifindex = 4501
  input packets 1279340, bytes 85858960, dropped 00, multicast packets 1272100
  output packets 7306090, bytes 268724, multicast packets 7305660 broadcast
  packets 290
  rmon collection index 679
  stats->ifindex = 5013
  input packets 00, bytes 00, dropped 00, multicast packets 00
  output packets 8554550, bytes 26777324, multicast packets 8546690 broadcast
  packets 7720
```

**NOTE:** The following etherStats counters are not currently available for Layer 3 interfaces:

- etherStatsBroadcastPkts
- etherStatsCRCAlignErrors
- etherStatsUndersizePkts
- etherStatsOversizePkts
- etherStatsFragments
- etherStatsJabbers

# Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure Secure Shell (SSH). For more information, see the **SSH Feature Overview and Configuration Guide**.

## banner login (SSH)

**Overview** This command configures a login banner on the SSH server. This displays a message on the remote terminal of the SSH client before the login prompt. SSH client version 1 does not support this banner.

To add a banner, first enter the command **banner login**, and hit [Enter]. Write your message. You can use any character and spaces. Use Ctrl +D at the end of your message to save the text and re-enter the normal command line mode.

The banner message is preserved if the device restarts.

The **no** variant of this command deletes the login banner from the device.

**Syntax** banner login  
no banner login

**Default** No banner is defined by default.

**Mode** Global Configuration

**Examples** To set a login banner message, use the commands:

```
awplus# configure terminal
awplus(config)# banner login
```

The screen will prompt you to enter the message:

Type CNTL/D to finish.

... banner message comes here ...

Enter the message. Use Ctrl+D to finish, like this:

^D

```
awplus(config)#
```

To remove the login banner message, use the commands:

```
awplus# configure terminal
awplus(config)# no banner login
```

**Related commands** [show banner login](#)

## clear ssh

**Overview** This command deletes Secure Shell sessions currently active on the device. This includes both incoming and outgoing sessions. The deleted sessions are closed. You can only delete an SSH session if you are a system manager or the user who initiated the session. If **all** is specified then all active SSH sessions are deleted.

**Syntax** `clear ssh {<1-65535>|all}`

| Parameters | Description                                                                |
|------------|----------------------------------------------------------------------------|
| <1-65535>  | Specify a session ID in the range 1 to 65535 to delete a specific session. |
| all        | Delete all SSH sessions.                                                   |

**Mode** Privileged Exec

**Examples** To stop the current SSH session 123, use the command:

```
awplus# clear ssh 123
```

To stop all SSH sessions active on the device, use the command:

```
awplus# clear ssh all
```

**Related commands** [service ssh](#)  
[ssh](#)

# crypto key destroy hostkey

**Overview** This command deletes the existing public and private keys of the SSH server.

**Syntax** `crypto key destroy hostkey {dsa|ecdsa|ed25519|rsa|rsa1}`

| Parameters | Description                                                                                                                                                                          |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dsa        | Deletes the existing DSA public and private keys.                                                                                                                                    |
| ecdsa      | Deletes the existing ECDSA public and private keys.                                                                                                                                  |
| ed25519    | Deletes the existing Ed25519 public and private keys.                                                                                                                                |
| rsa        | Deletes the existing RSA public and private keys that were configured for SSH version 2 connections.                                                                                 |
| rsa1       | Deletes the existing RSA public and private keys that were configured for SSH version 1 connections. From AlliedWare Plus version 5.5.1-1.1 onwards, SSH version 1 is not supported. |

**Mode** Global Configuration

**Example** To destroy the RSA host key used for SSH version 2 connections, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key destroy hostkey rsa
```

**Related commands** [crypto key generate hostkey](#)  
[service ssh](#)

**Command changes** Version 5.5.2-2.1: **ed25519** parameter added

# crypto key destroy userkey

**Overview** This command destroys the existing public and private keys of an SSH user configured on the device.

**Syntax** `crypto key destroy userkey <username> {dsa|ecdsa|ed25519|rsa|rsa1}`

| Parameters | Description                                                                                                                                                                            |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <username> | Name of the user whose userkey you are destroying. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols. |
| dsa        | Deletes the existing DSA userkey.                                                                                                                                                      |
| ecdsa      | Deletes the existing ECDSA userkey.                                                                                                                                                    |
| ed25519    | Deletes the existing Ed25519 userkey.                                                                                                                                                  |
| rsa        | Deletes the existing RSA userkey that was configured for SSH version 2 connections.                                                                                                    |
| rsa1       | Deletes the existing RSA userkey that was configured for SSH version 1 connections. From AlliedWare Plus version 5.5.1-1.1 onwards, SSH version 1 is not supported.                    |

**Mode** Global Configuration

**Example** To destroy the RSA user key for the SSH user remoteuser, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key destroy userkey remoteuser rsa
```

**Related commands**

- [crypto key generate hostkey](#)
- [crypto key generate userkey](#)
- [show ssh](#)
- [show crypto key hostkey](#)

**Command changes** Version 5.5.2-2.1: **ed25519** parameter added

# crypto key generate hostkey

**Overview** This command generates public and private keys for the SSH server.

When you enable the SSH server, if no host keys exist, the server automatically generates SSHv2 host key pairs using Ed25519 with a keysize of 256, ECDSA with a curve length of 384, and RSA with a 3072-bit key (unless in secure mode, when it only generates the ECDSA key).

If you need a key with different parameters than this, you can use this command to generate that key before you enable the SSH server. If a host key exists with the same cryptography algorithm, this command replaces the old host key with the new key.

This command is not saved in the device configuration. However, the device saves the keys generated by this command in the non-volatile memory.

**Syntax** `crypto key generate hostkey rsa [<1024-16384>]`  
`crypto key generate hostkey ecdsa [<256|384|521>]`  
`crypto key generate hostkey ed25519`

| Parameters    | Description                                       |
|---------------|---------------------------------------------------|
| rsa           | Creates an RSA hostkey.                           |
| ecdsa         | Creates an ECDSA hostkey.                         |
| ed25519       | Creates an Ed25519 hostkey with a keysize of 256. |
| <1024-16384>  | The length in bits of the generated key.          |
| <256 384 521> | The ECDSA key size in bits.                       |

**Default** The default key length for RSA is 3072 bits.  
The default key size for ECDSA is 384 bits.

**Mode** Global Configuration

**Examples** To generate an RSA host key that is 4096 bits in length, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# crypto key generate hostkey rsa 4096
```

To generate an ECDSA host key with an elliptic curve size of 521 bits, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# crypto key generate hostkey ecdsa 521
```

To generate an Ed25519 host key with a keysize of 256, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# crypto key generate hostkey ed25519
```

**Related commands** [crypto key destroy hostkey](#)  
[service ssh](#)  
[show crypto key hostkey](#)

**Command changes** Version 5.5.5-1.1: default RSA key length increased to 3072  
Version 5.5.2-2.1: **ed25519** parameter added  
Version 5.5.2-0.1: changes to key length and key size ranges and defaults  
Version 5.5.1-1.1: support removed for the ssh-rsa algorithm in OpenSSH and for SSH protocol v1

# crypto key generate userkey

**Overview** This command generates public and private keys for an SSH user using an RSA, ECDSA, or ED25519 cryptography algorithm. To use public key authentication, copy the public key of the user onto the remote SSH server.

This command is not saved in the device configuration. However, the device saves the keys generated by this command in the non-volatile memory.

**Syntax** `crypto key generate userkey <username> rsa [<1024-16384>]`  
`crypto key generate userkey <username> ecdsa [<256|384|521>]`  
`crypto key generate userkey <username> ed25519`

| Parameters    | Description                                                                                                                                                                              |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <username>    | Name of the user that the user key is generated for. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols. |
| rsa           | Creates an RSA userkey.                                                                                                                                                                  |
| ecdsa         | Creates an ECDSA userkey.                                                                                                                                                                |
| ed25519       | Creates an Ed25519 userkey with a keysize of 256.                                                                                                                                        |
| <1024-16384>  | The length in bits of the generated key. The default is 2048 bits.                                                                                                                       |
| <256 384 521> | The ECDSA key size in bits. The default is 384.                                                                                                                                          |

**Default** The default key length for RSA is 2048 bits.  
The default key size for ECDSA is 384 bits.

**Mode** Global Configuration

**Examples** To generate a 4096-bit RSA user key for SSH version 2 connections for the user 'bob', use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate userkey bob rsa 4096
```

To generate an ECDSA user key of key size 521 for the user 'lapo', use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate userkey lapo ecdsa 521
```

To generate an Ed25519 user key of key size 256 for the user 'lapo', use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate userkey lapo ed25519
```

**Related commands** [crypto key pubkey-chain userkey](#)  
[show crypto key userkey](#)

**Command changes** Version 5.5.2-2.1: **ed25519** parameter added  
Version 5.5.2-0.1: changes to key length and key size ranges and defaults  
Version 5.5.1-1.1: support removed for the ssh-rsa algorithm in OpenSSH and for SSH protocol v1

# crypto key pubkey-chain knownhosts

**Overview** This command adds a public key of the specified SSH server to the known host database on your device. The SSH client on your device uses this public key to verify the remote SSH server.

The key is retrieved from the server. Before adding a key to this database, check that the key sent to you is correct.

If the server's key changes, or if your SSH client does not have the public key of the remote SSH server, then your SSH client will inform you that the public key of the server is unknown or altered.

The **no** variant of this command deletes the public key of the specified SSH server from the known host database on your device.

**Syntax** `crypto key pubkey-chain knownhosts [ip|ipv6] <hostname> [ecdsa|rsa]`  
`no crypto key pubkey-chain knownhosts <1-65535>`

| Parameter  | Description                                                                                                                                |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| ip         | Keyword used prior to specifying an IPv4 address                                                                                           |
| ipv6       | Keyword used prior to specifying an IPv6 address                                                                                           |
| <hostname> | IPv4/IPv6 address or hostname of a remote server in the format a.b.c.d for an IPv4 address, or in the format x:x::x:x for an IPv6 address. |
| ecdsa      | Specify the ECDSA public key of the server to be added to the known host database.                                                         |
| rsa        | Specify the RSA public key of the server to be added to the known host database.                                                           |
| <1-65535>  | Specify a key identifier when removing a key using the <b>no</b> parameter.                                                                |

**Default** If no cryptography algorithm is specified, then **rsa** is used as the default cryptography algorithm.

**Mode** Privilege Exec

**Usage notes** This command adds a public key of the specified SSH server to the known host database on the device. The key is retrieved from the server. The remote SSH server is verified by using this public key. The user is requested to check the key is correct before adding it to the database.

If the remote server's host key is changed, or if the device does not have the public key of the remote server, then SSH clients will inform the user that the public key of the server is altered or unknown.

**Examples** To add the RSA host key of the remote SSH host IPv4 address 192.0.2.11 to the known host database, use the command:

```
awplus# crypto key pubkey-chain knownhosts 192.0.2.11
```

To delete the second entry in the known host database, use the command:

```
awplus# no crypto key pubkey-chain knownhosts 2
```

**Validation** **show crypto key pubkey-chain knownhosts**  
**Commands**

# crypto key pubkey-chain userkey

**Overview** This command adds a public key for an SSH user on the SSH server. This allows the SSH server to support public key authentication for the SSH user. When configured, the SSH user can access the SSH server without providing a password from the remote host.

The **no** variant of this command removes a public key for the specified SSH user that has been added to the public key chain. When a SSH user's public key is removed, the SSH user can no longer login using public key authentication.

**Syntax** `crypto key pubkey-chain userkey <username> [<filename>]`  
`no crypto key pubkey-chain userkey <username> <1-65535>`

| Parameters | Description                                                                                                                                                                                                                  |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <username> | Name of the user that the SSH server associates the key with. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols.<br><br>Default: no default |
| <filename> | Filename of a key saved in flash. Valid characters are any printable character. You can add a key as a hexadecimal string directly into the terminal if you do not specify a filename.                                       |
| <1-65535>  | The key ID number of the user's key. Specify the key ID to delete a key.                                                                                                                                                     |

**Mode** Global Configuration

**Usage notes** You should import the public key file from the client node. The device can read the data from a file on the flash or user terminal.

Or you can add a key as text into the terminal. To add a key as text into the terminal, first enter the command **crypto key pubkey-chain userkey <username>**, and hit [Enter]. Enter the key as text. Note that the key you enter as text must be a valid SSH RSA key, not random ASCII text. Use [Ctrl]+D after entering it to save the text and re-enter the normal command line mode.

Note you can generate a valid SSH RSA key on the device first using the **crypto key generate host rsa** command. View the SSH RSA key generated on the device using the **show crypto hostkey rsa** command. Copy and paste the displayed SSH RSA key after entering the **crypto key pubkey-chain userkey <username>** command. Use [Ctrl]+D after entering it to save it.

**Examples** To generate a valid SSH RSA key on the device and add the key, use the following commands:

```
awplus# configure terminal
awplus(config)# crypto key generate host rsa
awplus(config)# exit

awplus# show crypto key hostkey
rsaAAAAB3NzaC1yc2EAAAABIwAAAIEAr1s7SokW5aw2fc0w1TStpb9J20bWluhnUC768EoWhyP
+7jtjDcoGWHb2u4sFwRpXwJZcgYrXW16+6NvNbk+h+c/
pqGDijj4SvfZZfeITzvvyZW4/I4pbN8=

awplus# configure terminal
awplus(config)# crypto key pubkey-
chain userkey joeType CNTRL/D to
finish:AAAAB3NzaC1yc2EAAAABIwAAAIEAr1s7SokW5aw2fc0w1TStpb9J20bWluhnUC768Eo
+7jtjDcoGWHb2u4sFwRpXwJZcgYrXW16+6NvNbk+h+c/
pqGDijj4SvfZZfeITzvvyZW4/I4pbN8=control-D
awplus(config)#
```

To add a public key for the user graydon from the file key.pub, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key pubkey-chain userkey graydon key.pub
```

To add a public key for the user tamara from the terminal, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key pubkey-chain userkey tamara
```

and enter the key. Use Ctrl+D to finish.

To remove the first key entry from the public key chain of the user john, use the commands:

```
awplus# configure terminal
awplus(config)# no crypto key pubkey-chain userkey john 1
```

**Related commands** [show crypto key pubkey-chain userkey](#)

# debug ssh client

**Overview** This command enables the SSH client debugging facility. When enabled, any SSH, SCP and SFTP client sessions send diagnostic messages to the login terminal.

The **no** variant of this command disables the SSH client debugging facility. This stops the SSH client from generating diagnostic debugging message.

**Syntax** debug ssh client [brief|full]  
no debug ssh client

| Parameter | Description               |
|-----------|---------------------------|
| brief     | Enables brief debug mode. |
| full      | Enables full debug mode.  |

**Default** SSH client debugging is disabled by default.

**Mode** Privileged Exec and Global Configuration

**Examples** To start SSH client debugging, use the command:

```
awplus# debug ssh client
```

To start SSH client debugging with extended output, use the command:

```
awplus# debug ssh client full
```

To disable SSH client debugging, use the command:

```
awplus# no debug ssh client
```

[undebug ssh client](#)

**Command changes** Version 5.5.3-1.1: added to AR1050V

# debug ssh server

**Overview** This command enables the SSH server debugging facility. When enabled, the SSH server sends diagnostic messages to the system log. To display the debugging messages on the terminal, use the **terminal monitor** command.

The **no** variant of this command disables the SSH server debugging facility. This stops the SSH server from generating diagnostic debugging messages.

**Syntax** debug ssh server [brief|full]  
no debug ssh server

| Parameter | Description               |
|-----------|---------------------------|
| brief     | Enables brief debug mode. |
| full      | Enables full debug mode.  |

**Default** SSH server debugging is disabled by default.

**Mode** Privileged Exec and Global Configuration

**Examples** To start SSH server debugging, use the command:

```
awplus# debug ssh server
```

To start SSH server debugging with extended output, use the command:

```
awplus# debug ssh server full
```

To disable SSH server debugging, use the command:

```
awplus# no debug ssh server
```

**Related commands** **debug ssh client**  
**show ssh server**  
**undebug ssh server**

## service ssh

**Overview** Use this command to enable the Secure Shell server on the device. Once enabled, connections coming from SSH clients are accepted.

When you enable the SSH server, if no host keys exist, the server automatically generates SSHv2 host key pairs using ECDSA with a curve length of 384, and RSA with a 1024-bit key (unless in secure mode, when it only generates the ECDSA key).

If you need a key with different parameters than this, you can use the **crypto key generate hostkey** command to generate that key before you enable the SSH server.

Use the **no** variant of this command to disable the Secure Shell server. When the Secure Shell server is disabled, connections from SSH, SCP, and SFTP clients are not accepted. This command does not affect existing SSH sessions. To terminate existing sessions, use the **clear ssh** command.

**Syntax** `service ssh [ip|ipv6]`  
`no service ssh [ip|ipv6]`

**Default** The Secure Shell server is disabled by default. Both IPv4 and IPv6 Secure Shell server are enabled when you issue **service ssh** without specifying the optional **ip** or **ipv6** parameters.

The server supports SSH version 2 only (not SSH version 1).

**Mode** Global Configuration

**Examples** To enable both the IPv4 and the IPv6 Secure Shell server, use the commands:

```
awplus# configure terminal
awplus(config)# service ssh
```

To enable the IPv4 Secure Shell server only, use the commands:

```
awplus# configure terminal
awplus(config)# service ssh ip
```

To enable the IPv6 Secure Shell server only, use the commands:

```
awplus# configure terminal
awplus(config)# service ssh ipv6
```

To disable both the IPv4 and the IPv6 Secure Shell server, use the commands:

```
awplus# configure terminal
awplus(config)# no service ssh
```

To disable the IPv4 Secure Shell server only, use the commands:

```
awplus# configure terminal
awplus(config)# no service ssh ip
```

To disable the IPv6 Secure Shell server only, use the commands:

```
awplus# configure terminal
awplus(config)# no service ssh ipv6
```

**Command changes** Version 5.5.1-1.1: support removed for the ssh-rsa algorithm in OpenSSH and for SSH protocol v1

# show banner login

**Overview** This command displays the banner message configured on the device. The banner message is displayed to the remote user before user authentication starts.

**Syntax** show banner login

**Mode** User Exec, Privileged Exec, Global Configuration, Interface Configuration, Line Configuration

**Example** To display the current login banner message, use the command:  
awplus# show banner login

**Related commands** [banner login \(SSH\)](#)

# show crypto key hostkey

**Overview** This command displays the public keys generated on the device for the SSH server.

When you enable the SSH server, if no host keys exist, the server automatically generates SSHv2 host key pairs using Ed25519 with a keysize of 256, ECDSA with a curve length of 384, and RSA with a 3072-bit key (unless in secure mode, when it only generates the ECDSA key).

The private key remains on the device secretly. The public key is copied to SSH clients to identify the server. This command displays the public key.

**Syntax** show crypto key hostkey [ecdsa|ed25519|rsa]

| Parameter | Description                                                          |
|-----------|----------------------------------------------------------------------|
| ecdsa     | Displays the ECDSA algorithm public key.                             |
| ed25519   | Displays the Ed25519 algorithm public key.                           |
| rsa       | Displays the RSA algorithm public key for SSH version 2 connections. |

**Mode** User Exec, Privileged Exec and Global Configuration

**Examples** To show the public keys generated on the device for SSH server, use the command:

```
awplus# show crypto key hostkey
```

To display the RSA public key of the SSH server, use the command:

```
awplus# show crypto key hostkey rsa
```

**Output** The following shows typical output.

**Example output from the show crypto key hostkey command**

| Type                                               | Bits | Fingerprint |
|----------------------------------------------------|------|-------------|
| -----                                              |      |             |
| rsa                                                | 2048 |             |
| SHA256:K7hes31yK6uuN04sprZtFcyX9sUuXP42gou110348n8 |      |             |
| ecdsa                                              | 384  |             |
| SHA256:qhBXhkcUCC6FKwy3+pRlrRs0NtZhibreqDv9vLs9tVQ |      |             |
| ed25519                                            | 256  |             |
| SHA256:S8e/9WjCZHsUTEAHMYkIKEoxusmrLOIGe2oSs34clbA |      |             |

**Parameters in output of the show crypto key hostkey command**

| Parameter   | Description                         |
|-------------|-------------------------------------|
| Type        | Algorithm used to generate the key. |
| Bits        | Length in bits of the key.          |
| Fingerprint | Checksum value for the public key.  |

**Related commands** [crypto key destroy hostkey](#)  
[crypto key generate hostkey](#)

# show crypto key pubkey-chain knownhosts

**Overview** This command displays the list of public keys maintained in the known host database on the device.

**Syntax** show crypto key pubkey-chain knownhosts [<1-65535>]

| Parameter | Description                                                                           |
|-----------|---------------------------------------------------------------------------------------|
| <1-65535> | Key identifier for a specific key. Displays the public key of the entry if specified. |

**Default** Display all keys.

**Mode** User Exec, Privileged Exec and Global Configuration

**Examples** To display public keys of known SSH servers, use the command:

```
awplus# show crypto key pubkey-chain knownhosts
```

To display the key data of the first entry in the known host data, use the command:

```
awplus# show crypto key pubkey-chain knownhosts 1
```

**Output** The following shows typical output.

**Example output from the show crypto key public-chain knownhosts command**

| No | Hostname                                 | Type | Fingerprint                                     |
|----|------------------------------------------|------|-------------------------------------------------|
| 1  | 172.16.23.1                              | rsa  | c8:33:b1:fe:6f:d3:8c:81:4e:f7:2a:aa:a5:be:df:18 |

**Parameters in the output of the show crypto key public-chain knownhosts command**

| Parameter   | Description                             |
|-------------|-----------------------------------------|
| No          | Number ID of the key.                   |
| Hostname    | Host name of the known SSH server.      |
| Type        | The algorithm used to generate the key. |
| Fingerprint | Checksum value for the public key.      |

**Related commands** [crypto key pubkey-chain knownhosts](#)

**Command changes** Version 5.5.3-1.1: added to AR1050V  
Version 5.4.6-2.1: VRF-lite support added for AR-Series devices

# show crypto key pubkey-chain userkey

**Overview** This command displays the public keys registered with the SSH server for SSH users. These keys allow remote users to access the device using public key authentication. By using public key authentication, users can access the SSH server without providing password.

**Syntax** show crypto key pubkey-chain userkey <username> [<1-65535>]

| Parameter  | Description                                                                                                                                                                                          |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <username> | User name of the remote SSH user whose keys you wish to display. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols. |
| <1-65535>  | Key identifier for a specific key.                                                                                                                                                                   |

**Default** Display all keys.

**Mode** User Exec, Privileged Exec and Global Configuration

**Example** To display the public keys for the user manager that are registered with the SSH server, use the command:

```
awplus# show crypto key pubkey-chain userkey manager
```

**Output** The following shows typical output.

**Example output from the show crypto key public-chain userkey command**

| No | Type | Bits | Fingerprint                                     |
|----|------|------|-------------------------------------------------|
| 1  | dsa  | 1024 | 2b:cc:df:a8:f8:2e:8f:a4:a5:4f:32:ea:67:29:78:fd |
| 2  | rsa  | 2048 | 6a:ba:22:84:c1:26:42:57:2c:d7:85:c8:06:32:49:0e |

**Parameters in the output of the show crypto key userkey command**

| Parameter   | Description                             |
|-------------|-----------------------------------------|
| No          | Number ID of the key.                   |
| Type        | The algorithm used to generate the key. |
| Bits        | Length in bits of the key.              |
| Fingerprint | Checksum value for the key.             |

**Related** [crypto key pubkey-chain userkey](#)  
**commands**

# show crypto key userkey

**Overview** This command displays the public keys created on this device for the specified SSH user.

**Syntax** show crypto key userkey <username> [dsa|rsa|rsa1]

| Parameter  | Description                                                                                                                                                                                         |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <username> | User name of the local SSH user whose keys you wish to display. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols. |
| dsa        | Displays the DSA public key.                                                                                                                                                                        |
| rsa        | Displays the RSA public key used for SSH version 2 connections.                                                                                                                                     |
| rsa1       | Displays the RSA key used for SSH version 1 connections.                                                                                                                                            |

**Mode** User Exec, Privileged Exec and Global Configuration

**Examples** To show the public key generated for the user, use the command:

```
awplus# show crypto key userkey manager
```

To store the RSA public key generated for the user manager to the file "user.pub", use the command:

```
awplus# show crypto key userkey manager rsa > manager-rsa.pub
```

**Output** The following shows typical output.

## Example output from the show crypto key userkey command

| Type | Bits | Fingerprint                                     |
|------|------|-------------------------------------------------|
| rsa  | 2048 | e8:d6:1b:c0:f4:b6:e6:7d:02:2e:a9:d4:a1:ca:3b:11 |

# show running-config ssh

**Overview** This command displays the current running configuration of Secure Shell (SSH).

**Syntax** show running-config ssh

**Mode** Privileged Exec and Global Configuration

**Example** To display the current configuration of SSH, use the command:  
awplus# show running-config ssh

**Output** The following shows typical output.

**Example output from the show running-config ssh command**

```
!  
ssh server session-timeout 600  
ssh server login-timeout 30  
ssh server allow-users manager 192.168.1.*  
ssh server allow-users john  
ssh server deny-user john*.a-company.com  
ssh server
```

**Parameters in the output of the show running-config ssh command**

| Parameter                              | Description                                                                 |
|----------------------------------------|-----------------------------------------------------------------------------|
| ssh server                             | SSH server is enabled.                                                      |
| ssh server v2                          | SSH server is enabled and only support SSHv2.                               |
| ssh server<port>                       | SSH server is enabled and listening on the specified TCP port.              |
| no ssh server scp                      | SCP service is disabled.                                                    |
| no ssh server sftp                     | SFTP service is disabled.                                                   |
| ssh server session-timeout             | Configure the server session timeout.                                       |
| ssh server login-timeout               | Configure the server login timeout.                                         |
| ssh server max-startups                | Configure the maximum number of concurrent sessions waiting authentication. |
| no ssh server authentication password  | Password authentication is disabled.                                        |
| no ssh server authentication publickey | Public key authentication is disabled.                                      |
| ssh server allow-users                 | Add the user (and hostname) to the allow list.                              |
| ssh server deny-users                  | Add the user (and hostname) to the deny list.                               |

## show ssh

**Overview** This command displays the active SSH sessions on the device, both incoming and outgoing.

**Syntax** show ssh

**Mode** User Exec, Privileged Exec and Global Configuration

**Example** To display the current SSH sessions on the device, use the command:  
awplus# show ssh

**Output** The following shows typical output.

**Example output from the show ssh command**

| Secure Shell Sessions: |      |        |                                         |          |           |             |
|------------------------|------|--------|-----------------------------------------|----------|-----------|-------------|
| ID                     | Type | Mode   | Peer Host                               | Username | State     | Filename    |
| 414                    | ssh  | server | 172.16.23.1                             | root     | open      |             |
| 456                    | ssh  | client | 172.16.23.10                            | manager  | user-auth |             |
| 459                    | scp  | client | 172.16.23.12                            | root     | download  | example.awd |
| 463                    | ssh  | client | 5ffe:33fe:5632:ffbb:bc35:ddee:0101:ac51 | manager  | user-auth |             |

**Parameters in the output of the show ssh command**

| Parameter | Description                                                                                              |                                                 |
|-----------|----------------------------------------------------------------------------------------------------------|-------------------------------------------------|
| ID        | Unique identifier for each SSH session.                                                                  |                                                 |
| Type      | Session type; either SSH, SCP, or SFTP.                                                                  |                                                 |
| Mode      | Whether the device is acting as an SSH client (client) or SSH server (server) for the specified session. |                                                 |
| Peer Host | The hostname or IP address of the remote server or client.                                               |                                                 |
| Username  | Login user name of the server.                                                                           |                                                 |
| State     | The current state of the SSH session. One of:                                                            |                                                 |
|           | connecting                                                                                               | The device is looking for a remote server.      |
|           | connected                                                                                                | The device is connected to the remote server.   |
|           | accepted                                                                                                 | The device has accepted a new session.          |
|           | host-auth                                                                                                | host-to-host authentication is in progress.     |
|           | user-auth                                                                                                | User authentication is in progress.             |
|           | authenticated                                                                                            | User authentication is complete.                |
|           | open                                                                                                     | The session is in progress.                     |
|           | download                                                                                                 | The user is downloading a file from the device. |
|           | upload                                                                                                   | The user is uploading a file from the device.   |
|           | closing                                                                                                  | The user is terminating the session.            |
|           | closed                                                                                                   | The session is closed.                          |

| Parameter | Description                                                           |
|-----------|-----------------------------------------------------------------------|
| Filename  | Local filename of the file that the user is downloading or uploading. |

**Related** [clear ssh](#)  
**commands**

# show ssh client

**Overview** This command displays the current configuration of the Secure Shell client.

**Syntax** show ssh client

**Mode** User Exec, Privileged Exec and Global Configuration

**Example** To display the current configuration for SSH clients on the login shell, use the command:

```
awplus# show ssh client
```

**Output** The following shows typical output.

## Example output from the show ssh client command

```
Secure Shell Client Configuration
-----
Port                               : 22
Version                           : 2,1
Connect Timeout                   : 30 seconds
Session Timeout                   : 0 (off)
Debug                             : NONE
```

## Parameters in the output of the show ssh client command

| Parameter       | Description                                                                                                                                                 |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port            | SSH server TCP port where the SSH client connects to. The default is port 22.                                                                               |
| Version         | SSH server version, either "2" or "2,1". From AlliedWare Plus 5.5.1-1.1 onwards, SSH version 1 is not supported.                                            |
| Connect Timeout | Time in seconds that the SSH client waits for an SSH session to establish. If the value is 0, the connection is terminated when it reaches the TCP timeout. |
| Debug           | Whether debugging is active on the client.                                                                                                                  |

**Related commands** [show ssh server](#)

**Command changes** Version 5.5.3-1.1: added to AR1050V

# show ssh server

**Overview** This command displays the current configuration of the Secure Shell server.

Note that changes to the SSH configuration affects only new SSH sessions coming from remote hosts, and does not affect existing sessions.

**Syntax** show ssh server

**Mode** User Exec, Privileged Exec, and Global Configuration

**Example** To display the current configuration of the Secure Shell server, use the command:

```
awplus# show ssh server
```

**Output** The following shows typical output.

**Example output from the show ssh server command**

```
Secure Shell Server Configuration
-----
SSH Server                : Enabled
Protocol                  : IPv4,IPv6
Port                      : 22
Version                   : 2
Services                  : scp, sftp
User Authentication       : publickey, password
Resolve Hosts             : Disabled
Session Timeout           : 0 (Off)
Login Timeout             : 60 seconds
Maximum Authentication Tries : 6
Maximum Startups          : 10
Debug                     : NONE
Ciphers                   : aes128-cbc, aes128-ctr, aes192-ctr, aes256-ctr
KEX                       : curve25519-sha256@libssh.org,
                           ecdh-sha2-nistp256, ecdh-sha2-nistp384,
                           ecdh-sha2-nistp521,
                           diffie-hellman-group-exchange-sha256,
                           diffie-hellman-group-exchange-sha1,
                           diffie-hellman-group14-sha1
```

**Parameters in the output of the show ssh server command**

| Parameter           | Description                                                                                                                                                                          |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SSH Server          | Whether the Secure Shell server is enabled or disabled.                                                                                                                              |
| Port                | TCP port where the Secure Shell server listens for connections. The default is port 22.                                                                                              |
| Version             | SSH server version; either '2' or '2.1'. From AlliedWare Plus 5.5.1-1.1 onwards, SSH version 1 is not supported.                                                                     |
| Services            | List of the available Secure Shell services; one or more of SHELL, SCP or SFTP.                                                                                                      |
| User Authentication | List of available authentication methods.                                                                                                                                            |
| Login Timeout       | Time (in seconds) that the SSH server will wait the SSH session to establish. If the value is 0, the client login will be terminated when TCP timeout reaches.                       |
| Idle Timeout        | Time (in seconds) that the SSH server will wait to receive data from the SSH client. The server disconnects if this timer limit is reached. If set at 0, the idle timer remains off. |
| Maximum Startups    | The maximum number of concurrent connections that are waiting authentication. The default is 10.                                                                                     |
| Debug               | Whether debugging is active on the server.                                                                                                                                           |

| Parameter | Description                                |
|-----------|--------------------------------------------|
| Ciphers   | List of ciphers permitted.                 |
| KEX       | List of available Key Exchange algorithms. |

**Related** [show ssh](#)  
**commands** [show ssh client](#)

# show ssh server allow-users

**Overview** This command displays the user entries in the allow list of the SSH server.

**Syntax** show ssh server allow-users

**Mode** User Exec, Privileged Exec and Global Configuration

**Example** To display the user entries in the allow list of the SSH server, use the command:

```
awplus# show ssh server allow-users
```

**Output** The following shows typical output.

## Example output from the show ssh server allow-users command

| Username | Remote Hostname (pattern) |
|----------|---------------------------|
| -----    | -----                     |
| awplus   | 192.168.*                 |
| john     |                           |
| manager  | *.alliedtelesis.com       |

## Parameters in the output of the show ssh server allow-users command

| Parameter                 | Description                                                                                                                                                                               |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Username                  | User name that is allowed to access the SSH server.                                                                                                                                       |
| Remote Hostname (pattern) | IP address or hostname pattern of the remote client. The user is allowed requests from a host that matches this pattern. If no hostname is specified, the user is allowed from all hosts. |

**Related commands** [ssh server allow-users](#)  
[ssh server deny-users](#)

# show ssh server deny-users

**Overview** This command displays the user entries in the deny list of the SSH server. The user in the deny list is rejected to access the SSH server. If a user is not included in the access list of the SSH server, the user is also rejected.

**Syntax** show ssh server deny-users

**Mode** User Exec, Privileged Exec and Global Configuration

**Example** To display the user entries in the deny list of the SSH server, use the command:

```
awplus# show ssh server deny-users
```

**Output** The following shows typical output.

## Example output from the show ssh server deny-users command

| Username | Remote Hostname (pattern) |
|----------|---------------------------|
| -----    | -----                     |
| john     | *.b-company.com           |
| manager  | 192.168.2.*               |

## Parameters in the output of the show ssh server deny-user command

| Parameter                 | Description                                                                                                                                                                             |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Username                  | The user that this rule applies to.                                                                                                                                                     |
| Remote Hostname (pattern) | IP address or hostname pattern of the remote client. The user is denied requests from a host that matches this pattern. If no hostname is specified, the user is denied from all hosts. |

**Related commands** [ssh server allow-users](#)  
[ssh server deny-users](#)

## ssh

**Overview** Use this command to initiate a Secure Shell connection to a remote SSH server.

If the server requests a password to login, you need to type in the correct password at the "Password:" prompt.

An SSH client identifies the remote SSH server by its public key registered on the client device. If the server identification is changed, server verification fails. If the public key of the server has been changed, the public key of the server must be explicitly added to the known host database.

**NOTE:** A hostname specified with SSH cannot begin with a hyphen (-) character.

**Syntax** `ssh [ip|ipv6] [user <username>|port <1-65535>|version 2]  
<remote-device> [<command>]`

**Syntax in secure mode** `ssh [cipher {aes128-cbc|aes256-cbc|aes128-ctr|aes192-ctr|aes256-ctr}] [hmac {hmac-sha2-256}]  
[public-key {ecdsa-sha2-nistp256|ecdsa-sha2-nistp384}] [key-exchange {ecdh-sha2-nistp256|ecdh-sha2-nistp384}] [ip|ipv6]  
[user <username>|port <1-65535>|version 2] <remote-device>  
[<command>]`

| Parameter                    | Description                                                                                                                                                                                                                                  |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cipher                       | The supported cipher name.<br>Select either: aes128-cbc or aes256-cbc.                                                                                                                                                                       |
| hmac                         | The supported hmac name: hmac-sha2-256                                                                                                                                                                                                       |
| public-key                   | The supported public-key name.<br>Select either:<br>ecdsa-sha2-nistp256 or ecdsa-sha2-nistp384                                                                                                                                               |
| key-exchange                 | The supported key-exchange name.<br>Select either:<br>ecdsa-sha2-nistp256 or ecdsa-sha2-nistp384                                                                                                                                             |
| ip                           | Specify IPv4 SSH.                                                                                                                                                                                                                            |
| ipv6                         | Specify IPv6 SSH.                                                                                                                                                                                                                            |
| user                         | Login user. If user is specified, the username is used for login to the remote SSH server when user authentication is required. Otherwise the current user name is used.                                                                     |
|                              | <i>&lt;username&gt;</i> User name to login on the remote server.                                                                                                                                                                             |
| port                         | SSH server port. If port is specified, the SSH client connects to the remote SSH server with the specified TCP port. Other- wise, the client port configured by "ssh client" command or the default TCP port (22) is used.                   |
|                              | <i>&lt;1-65535&gt;</i> TCP port.                                                                                                                                                                                                             |
| version                      | SSH client version. From 5.5.1-1.1 onwards, SSH only supports version 2.                                                                                                                                                                     |
| <i>&lt;remote-device&gt;</i> | IPv4/IPv6 address or hostname of a remote server. The address is in the format A.B.C.D for an IPv4 address, or in the format X:X::X:X for an IPv6 address. Note that a hostname specified with SSH cannot begin with a hyphen (-) character. |
| <i>&lt;command&gt;</i>       | A command to execute on the remote server. If a command is specified, the command is executed on the remote SSH server and the session is disconnected when the remote command finishes.                                                     |

### Mode User Exec and Privileged Exec

**Usage notes** This command contains some additional security parameters (cipher, hmac, public-key, and key exchange). To access these parameters you must enable Secure Mode on the device by using the command: **crypto secure-mode**.

```
awplus(config)# crypto secure-mode
```

**Examples** To login to the remote SSH server at 192.0.2.5, use the command:

```
awplus# ssh ip 192.0.2.5
```

To login to the remote SSH server at 192.0.2.5 as user 'manager', use the command:

```
awplus# ssh ip user manager 192.0.2.5
```

To login to the remote SSH server at 192.0.2.5 that is listening on TCP port 2000, use the command:

```
awplus# ssh port 2000 192.0.2.5
```

To login to the remote SSH server 'example\_host' using an IPv6 session, use the command:

```
awplus# ssh ipv6 example_host
```

To run the **cmd** command on the remote SSH server at 192.0.2.5, use the command:

```
awplus# ssh ip 192.0.2.5 cmd
```

**Related commands**

**Command changes**

- Version 5.5.3-1.1: added to AR1050V
- Version 5.5.1-1.1: support removed for SSH protocol v1
- Version 5.4.8-2.1: secure mode syntax added for x950, SBx908 GEN2.
- Version 5.4.8-1.2: secure mode syntax added for x220, x930, x550, XS900MX.
- Version 5.4.6-2.1: VRF-lite support added for AR-Series devices.

## ssh client

**Overview** This command modifies the default configuration parameters of the Secure Shell (SSH) client. The configuration is used for any SSH client on the device to connect to remote SSH servers. Any parameters specified on SSH client explicitly override the default configuration parameters.

The change affects the current user shell only. When the user exits the login session, the configuration does not persist. This command does not affect existing SSH sessions.

The **no** variant of this command resets configuration parameters of the Secure Shell (SSH) client changed by the **ssh client** command, and restores the defaults.

This command does not affect the existing SSH sessions.

**Syntax** `ssh client {port <1-65535>|version 2|session-timeout <0-3600>|connect-timeout <1-600>}`  
`no ssh client {port|version|session-timeout|connect-timeout}`

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| port            | <p>The default TCP port of the remote SSH server. If an SSH client specifies an explicit port of the server, it overrides the default TCP port.</p> <p>Default: 22</p> <hr/> <p>&lt;1-65535&gt; TCP port number.</p>                                                                                                                                                                                                       |
| version         | <p>The SSH version used by the client for SSH sessions.</p> <p>From 5.5.1-1.1 onwards, the SSH client supports only version 2</p>                                                                                                                                                                                                                                                                                          |
| session-timeout | <p>The global session timeout for SSH sessions. If the session timer lapses since the last time an SSH client received data from the remote server, the session is terminated. If the value is 0, then the client does not terminate the session. Instead, the connection is terminated when it reaches the TCP timeout.</p> <p>Default: 0 (session timer remains off)</p> <hr/> <p>&lt;0-3600&gt; Timeout in seconds.</p> |
| connect-timeout | <p>The maximum time period that an SSH session can take to become established. The SSH client terminates the SSH session if this timeout expires and the session is still not established.</p> <p>Default: 30</p> <hr/> <p>&lt;1-600&gt; Timeout in seconds.</p>                                                                                                                                                           |

**Mode** Privileged Exec

**Examples** To configure the default TCP port for SSH clients to 2200, and the session timer to 10 minutes, use the command:

```
awplus# ssh client port 2200 session-timeout 600
```

To configure the connect timeout of SSH client to 10 seconds, use the command:

```
awplus# ssh client connect-timeout 10
```

To restore the connect timeout to its default, use the command:

```
awplus# no ssh client connect-timeout
```

[ssh](#)

**Command changes** Version 5.5.3-1.1: added to AR1050V  
Version 5.5.2-1.1: **vrf** parameter added for products that support VRF  
Version 5.5.1-1.1: support removed for the ssh-rsa algorithm in OpenSSH and for SSH protocol v1

# ssh client allow-legacy-ssh-rsa

**Overview** Use this command to enable support for the legacy ssh-rsa algorithm on the SSH client. Support for this algorithm was removed in version 5.5.1-1.1 due to security concerns. Support for it is still disabled by default and you should only enable it if you cannot avoid using ssh-rsa. It cannot be enabled when the device is in Secure Mode.

Use the **no** variant of this command to disable support for the legacy ssh-rsa algorithm on the SSH client.

**Syntax** ssh client allow-legacy-ssh-rsa  
no ssh client allow-legacy-ssh-rsa

**Default** Disabled

**Mode** Global Configuration

**Example** To enable SSH client support for the legacy ssh-rsa algorithm, use the commands:

```
awplus# configure terminal
awplus(config)# ssh client allow-legacy-ssh-rsa
```

**Related commands** [show ssh client](#)  
[ssh client](#)

**Command changes** Version 5.5.3-1.1: added to AR1050V  
Version 5.5.3-0.1: command added

## ssh server

**Overview** Use this command to modify the configuration of the SSH server. Changing these parameters affects new SSH sessions connecting to the device.

Use the **no** variant of this command to restore the configuration of a specified parameter to its default. The change affects the SSH server immediately if the server is running. Otherwise, the configuration is used when the server starts.

To enable the SSH server, use the **service ssh** command.

**Syntax** `ssh server <1-65535>`  
`ssh server {[session-timeout <0-3600>] [login-timeout <1-600>]  
[max-startups <1-128>]}`  
`no ssh server {[session-timeout] [login-timeout] [max-startups]}`

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <1-65535>       | The TCP port number that the server listens to for incoming SSH sessions.<br><br>Default: 22                                                                                                                                                                                                                                                                               |
| session-timeout | The maximum time period that the server waits before deciding that a session is inactive and should be terminated. The server considers the session inactive when it has not received any data from the client, and when the client does not respond to keep alive messages.<br><br>Default: 0 (session timer remains off).<br><br>Enter a timeout between 0-3600 seconds. |
| login-timeout   | The maximum time period the server waits before disconnecting an unauthenticated client.<br><br>Default: 60<br><br>Enter a timeout between 1- 600 seconds.                                                                                                                                                                                                                 |
| max-startups    | The maximum number of concurrent unauthenticated connections the server accepts. When the number of SSH connections awaiting authentication reaches the limit, the server drops any additional connections until authentication succeeds or the login timer expires for a connection.<br><br>Default: 10<br><br>Enter a number of sessions in the range of 1-128.          |

**Mode** Global Configuration

**Examples** To set the session timer of the SSH server to 10 minutes (600 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# ssh server session-timeout 600
```

To set the login timeout of the SSH server to 30 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server login-timeout 30
```

To limit the number of SSH client connections waiting for authentication from the SSH server to 3, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server max-startups 3
```

To return the limit on the number of waiting connections to the default of 10, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server max-startups
```

To support the SSH server with TCP port 2200, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server 2200
```

**Command changes** Version 5.5.3-0.1: command added

## ssh server allow-users

**Overview** This command adds a username pattern to the allow list of the SSH server. If the user of an incoming SSH session matches the pattern, the session is accepted.

When there are no registered users in the server's database of allowed users, the SSH server does not accept SSH sessions even when enabled.

SSH server also maintains the deny list. The server checks the user in the deny list first. If a user is listed in the deny list, then the user access is denied even if the user is listed in the allow list.

The **no** variant of this command deletes a username pattern from the allow list of the SSH server. To delete an entry from the allow list, the username and hostname pattern should match exactly with the existing entry.

**Syntax** `ssh server allow-users <username-pattern> [<hostname-pattern>]`  
`no ssh server allow-users <username-pattern> [<hostname-pattern>]`

| Parameter                             | Description                                                                                                                                                                                                              |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;username-pattern&gt;</code> | The username pattern that users can match to. An asterisk acts as a wildcard character that matches any string of characters.                                                                                            |
| <code>&lt;hostname-pattern&gt;</code> | The host name pattern that hosts can match to. If specified, the server allows the user to connect only from hosts matching the pattern. An asterisk acts as a wildcard character that matches any string of characters. |

**Mode** Global Configuration

**Examples** To allow the user john to create an SSH session from any host, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server allow-users john
```

To allow the user john to create an SSH session from a range of IP address (from 192.168.1.1 to 192.168.1.255), use the commands:

```
awplus# configure terminal
awplus(config)# ssh server allow-users john 192.168.1.*
```

To allow the user john to create a SSH session from a -company.com domain, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server allow-users john *.a-company.com
```

To delete the existing user entry john 192.168.1.\* in the allow list, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server allow-users john 192.168.1.*
```

**Related commands** [show running-config ssh](#)  
[show ssh server allow-users](#)  
[ssh server deny-users](#)

# ssh server authentication

**Overview** This command enables RSA public-key or password user authentication for SSH Server. Apply the **password** keyword with the **ssh server authentication** command to enable password authentication for users. Apply the **publickey** keyword with the **ssh server authentication** command to enable RSA public-key authentication for users.

Use the **no** variant of this command to disable RSA public-key or password user authentication for SSH Server. Apply the **password** keyword with the **no ssh authentication** command to disable password authentication for users. Apply the required **publickey** keyword with the **no ssh authentication** command to disable RSA public-key authentication for users.

**Syntax** ssh server authentication {password|publickey}  
no ssh server authentication {password|publickey}

| Parameter | Description                                             |
|-----------|---------------------------------------------------------|
| password  | Specifies user password authentication for SSH server.  |
| publickey | Specifies user publickey authentication for SSH server. |

**Default** Both RSA public-key authentication and password authentication are enabled by default.

**Mode** Global Configuration

**Usage** For password authentication to authenticate a user, password authentication for a user must be registered in the local user database or on an external RADIUS server, before using the **ssh server authentication password** command.

For RSA public-key authentication to authenticate a user, a public key must be added for the user, before using the **ssh server authentication publickey** command.

**Examples** To enable password authentication for users connecting through SSH, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server authentication password
```

To enable publickey authentication for users connecting through SSH, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server authentication publickey
```

To disable password authentication for users connecting through SSH, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server authentication password
```

To disable publickey authentication for users connecting through SSH, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server authentication publickey
```

**Related commands** [crypto key pubkey-chain userkey](#)  
[service ssh](#)  
[show ssh server](#)

## ssh server deny-users

**Overview** This command adds a username pattern to the deny list of the SSH server. If the user of an incoming SSH session matches the pattern, the session is rejected.

SSH server also maintains the allow list. The server checks the user in the deny list first. If a user is listed in the deny list, then the user access is denied even if the user is listed in the allow list.

If a hostname pattern is specified, the user is denied from the hosts matching the pattern.

The **no** variant of this command deletes a username pattern from the deny list of the SSH server. To delete an entry from the deny list, the username and hostname pattern should match exactly with the existing entry.

**Syntax** `ssh server deny-users <username-pattern> [<hostname-pattern>]`  
`no ssh server deny-users <username-pattern> [<hostname-pattern>]`

| Parameter                             | Description                                                                                                                                                                                                                                                                 |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;username-pattern&gt;</code> | The username pattern that users can match to. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen, full stop and asterisk symbols. An asterisk acts as a wildcard character that matches any string of characters. |
| <code>&lt;hostname-pattern&gt;</code> | The host name pattern that hosts can match to. If specified, the server denies the user only when they connect from hosts matching the pattern. An asterisk acts as a wildcard character that matches any string of characters.                                             |

**Mode** Global Configuration

**Examples** To deny the user john to access SSH login from any host, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server deny-users john
```

To deny the user john to access SSH login from a range of IP address (from 192.168.2.1 to 192.168.2.255), use the commands:

```
awplus# configure terminal
awplus(config)# ssh server deny-users john 192.168.2.*
```

To deny the user john to access SSH login from b-company.com domain, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server deny-users john*.b-company.com
```

To delete the existing user entry john 192.168.2.\* in the deny list, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server deny-users john 192.168.2.*
```

**Related commands**

- show running-config ssh**
- show ssh server deny-users**
- ssh server allow-users**

# ssh server disallow-cbc-ciphers

**Overview** Use this command to disallow CBC mode ciphers on SSH servers. You can only use this command when your device is in Secure Mode (see the [crypto secure-mode](#) command).

Use the **no** variant of this command to allow CBC mode ciphers.

**Syntax** `ssh server disallow-cbc-ciphers`  
`no ssh server disallow-cbc-ciphers`

**Default** CBC mode ciphers are allowed by default.

**Mode** Global Configuration

**Example** To disallow CBC mode ciphers for SSH server in Secure Mode, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server disallow-cbc-ciphers
```

**Related commands** [crypto secure-mode](#)  
[service ssh](#)  
[ssh server](#)

**Command changes** Version 5.5.1-2.1: command added

# ssh server max-auth-tries

**Overview** Use this command to specify the maximum number of SSH authentication attempts that the device will allow.

Use the **no** variant of this command to return the maximum number of attempts to its default value of 6.

**Syntax** `ssh server max-auth-tries <1-32>`  
`no ssh server max-auth-tries`

| Parameter | Description                                                          |
|-----------|----------------------------------------------------------------------|
|           | Maximum number of SSH authentication attempts the device will allow. |

**Default** 6 attempts

**Mode** Global Configuration

**Usage** By default, users must wait one second after a failed login attempt before trying again. You can increase this gap by using the command [aaa login fail-delay](#).

**Example** To set the maximum number of SSH authentication attempts to 3, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server max-auth-tries 3
```

**Related commands** [show ssh server](#)

# ssh server resolve-host

**Overview** This command enables resolving an IP address from a host name using a DNS server for client host authentication.

The **no** variant of this command disables this feature.

**Syntax** `ssh server resolve-hosts`  
`no ssh server resolve-hosts`

**Default** This feature is disabled by default.

**Mode** Global Configuration

**Usage notes** Your device has a DNS Client that is enabled automatically when you add a DNS server to your device.

**Example** To resolve a host name using a DNS server, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server resolve-hosts
```

**Related commands**

- [ip name-server](#)
- [show ssh server](#)
- [ssh server allow-users](#)
- [ssh server deny-users](#)

## ssh server scp

**Overview** This command enables the Secure Copy (SCP) service on the SSH server. Once enabled, the server accepts SCP requests from remote clients.

You must enable the SSH server as well as this service before the device accepts SCP connections. The SCP service is enabled by default as soon as the SSH server is enabled.

The **no** variant of this command disables the SCP service on the SSH server. Once disabled, SCP requests from remote clients are rejected.

**Syntax** ssh server scp  
no ssh server scp

**Mode** Global Configuration

**Examples** To enable the SCP service, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server scp
```

To disable the SCP service, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server scp
```

**Related commands** [show running-config ssh](#)  
[show ssh server](#)

# ssh server secure-algs

**Overview** Use this command to force the SSH server to only use ciphers, key exchange algorithms and Message Authentication Code (MAC) algorithms that are currently considered best-practice.

This command is the same as using all of the commands **ssh server secure-ciphers**, **ssh server secure-hostkey**, **ssh server secure-mac**, and **ssh server secure-kex**. However, it does not include the optional **exclude-nist-curves** parameter of **ssh server secure-kex**.

Use the **no** variant of this command to stop forcing the SSH server to use this restricted set of algorithms.

**Syntax** `ssh server secure-algs`  
`no ssh server secure-algs`

**Default** Disabled.

**Mode** Global Configuration

**Usage notes** To see the list of algorithms, use the **show ssh server** command.

This command is not available in Secure Mode because Secure Mode already forces the device to use only FIPS-approved algorithms.

**Example** To force the SSH server to use best-practice algorithms, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server secure-algs
```

**Related commands** **show ssh server**  
**ssh server**  
**ssh server secure-ciphers**  
**ssh server secure-hostkey**  
**ssh server secure-kex**  
**ssh server secure-mac**

**Command changes** Version 5.5.1-1.1: command added

# ssh server secure-ciphers

**Overview** Use this command to force the SSH server to only negotiate ciphers regarded as current best-practice.

Use the **no** variant of this command to stop forcing the SSH server to use this restricted set of ciphers.

**Syntax** `ssh server secure-ciphers`  
`no ssh server secure-ciphers`

**Default** Not set

**Mode** Global Configuration

**Usage notes** To see the list of ciphers, use the [show ssh server](#) command.  
This command is not available in Secure Mode because Secure Mode already forces the device to use only FIPS-approved algorithms.

**Example** To configure the SSH server to use best-practice ciphers, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server secure-ciphers
```

**Related commands** [show ssh server](#)  
[ssh server](#)  
[ssh server secure-algs](#)  
[ssh server secure-hostkey](#)  
[ssh server secure-kex](#)  
[ssh server secure-mac](#)

**Command changes** Version 5.5.0-1.1: command added

# ssh server secure-hostkey

**Overview** Use this command to force the SSH server to only use hostkey algorithms that are currently considered best-practice. This excludes NIST curve-based hostkey algorithms.

Use the **no** variant of this command to stop forcing the SSH server to use this restricted set of hostkey algorithms.

**Syntax** `ssh server secure-hostkey`  
`no ssh server secure-hostkey`

**Default** Disabled

**Mode** Global Configuration

**Usage notes** Using this command may reduce compatibility with older SSH clients.  
To see the list of hostkey algorithms, use the [show ssh server](#) command.  
This command is not available in Secure Mode because Secure Mode already forces the device to use only FIPS-approved algorithms.

**Example** To force the SSH server to use best-practice hostkey algorithms, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server secure-hostkey
```

**Related commands** [show ssh server](#)  
[ssh server](#)  
[ssh server secure-algs](#)  
[ssh server secure-ciphers](#)  
[ssh server secure-kex](#)  
[ssh server secure-mac](#)

**Command changes** Version 5.5.2-2.1: command added

## ssh server secure-kex

**Overview** Use this command to force the SSH server to only use key exchange algorithms that are currently considered best-practice.

For example, using this command stops the device from using the diffie-hellman-group-exchange-sha1 key exchange algorithm.

Use the **no** variant of this command to stop forcing the SSH server to use this restricted set of key-exchange algorithms.

**Syntax** `ssh server secure-kex [exclude-nist-curves]`  
`no ssh server secure-kex`

| Parameter                        | Description                                                                                                                 |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <code>exclude-nist-curves</code> | Also exclude all NIST key exchange algorithms.<br><br>Using this parameter may reduce compatibility with older SSH clients. |

**Default** Disabled.

**Mode** Global Configuration

**Usage notes** To see the list of key exchange algorithms, use the [show ssh server](#) command.

This command is not available in Secure Mode because Secure Mode already forces the device to use only FIPS-approved algorithms.

**Example** To force the SSH server to use best-practice key-exchange algorithms, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server secure-kex
```

**Related commands** [show ssh server](#)  
[ssh server](#)  
[ssh server secure-algs](#)  
[ssh server secure-ciphers](#)  
[ssh server secure-hostkey](#)  
[ssh server secure-mac](#)

**Command changes** Version 5.5.2-2.1: **exclude-nist-curves** parameter added  
Version 5.5.0-2.3: command added

# ssh server secure-mac

**Overview** Use this command to force the SSH server to only use Message Authentication Code (MAC) algorithms that are currently considered best-practice.

Use the **no** variant of this command to stop forcing the SSH server to use this restricted set of MAC algorithms.

**Syntax** ssh server secure-mac  
no ssh server secure-mac

**Default** Disabled.

**Mode** Global Configuration

**Usage notes** To see the list of MAC algorithms, use the **show ssh server** command. This command is not available in Secure Mode because Secure Mode already forces the device to use only FIPS-approved algorithms.

**Example** To force the SSH server to use best-practice MAC algorithms, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server secure-mac
```

**Related commands** **show ssh server**  
**ssh server**  
**ssh server secure-algs**  
**ssh server secure-ciphers**  
**ssh server secure-hostkey**  
**ssh server secure-kex**

**Command changes** Version 5.5.1-1.1: command added

## ssh server sftp

**Overview** This command enables the Secure FTP (SFTP) service on the SSH server. Once enabled, the server accepts SFTP requests from remote clients.

You must enable the SSH server as well as this service before the device accepts SFTP connections. The SFTP service is enabled by default as soon as the SSH server is enabled. If the SSH server is disabled, SFTP service is unavailable.

The **no** variant of this command disables SFTP service on the SSH server. Once disabled, SFTP requests from remote clients are rejected.

**Syntax** ssh server sftp  
no ssh server sftp

**Mode** Global Configuration

**Examples** To enable the SFTP service, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server sftp
```

To disable the SFTP service, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server sftp
```

**Related commands** [show running-config ssh](#)  
[show ssh server](#)

# ssh server tcpforwarding

**Overview** Use this command to enable TCP port forwarding on the SSH server. It is disabled by default, to enhance security.  
Use the **no** variant of this command to disable TCP port forwarding again.

**Syntax** ssh server tcpforwarding  
no ssh server tcpforwarding

**Default** Disabled

**Mode** Global Configuration

**Example** To enable TCP port forwarding, use the commands:

```
awplus# configure terminal  
awplus(config)# ssh server tcpforwarding
```

To disable it again, use the commands:

```
awplus# configure terminal  
awplus(config)# no ssh server tcpforwarding
```

**Related commands** [show ssh server](#)

**Command changes** Version 5.5.2-1.1: command added

# undebug ssh client

**Overview** This command applies the functionality of the **no debug ssh client** command.

**Command changes** Version 5.5.3-1.1: added to AR1050V

# undebug ssh server

**Overview** This command applies the functionality of the **no debug ssh server** command.

# Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure Triggers. For more information, see the [Triggers Feature Overview and Configuration Guide](#).

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

# active (trigger)

**Overview** This command enables a trigger. This allows the trigger to activate when its trigger conditions are met.

The **no** variant of this command disables a trigger. While in this state the trigger cannot activate when its trigger conditions are met.

**Syntax** active  
no active

**Default** Active, which means that triggers are enabled by default

**Mode** Trigger Configuration

**Usage notes** Configure a trigger first before you use this command to activate it.  
For information about configuring a trigger, see the [Triggers\\_Feature Overview and Configuration Guide](#).

**Examples** To enable trigger 172, so that it can activate when its trigger conditions are met, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 172
awplus(config-trigger)# active
```

To disable trigger 182, preventing it from activating when its trigger conditions are met, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 182
awplus(config-trigger)# no active
```

**Related commands** [show trigger](#)  
[trigger](#)  
[trigger activate](#)

# day

**Overview** This command specifies the days or date that the trigger can activate on. You can specify one of:

- A specific date
- A specific day of the week
- A list of days of the week
- A day of any month of any year
- A day of a specific month in any year
- Every day

By default, the trigger can activate on any day.

**Syntax** day every-day  
day <1-31>  
day <1-31> <month>  
day <1-31> <month> <year>  
day <weekday>

| Parameter | Description                                                                                                                                                                                                                                                                            |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| every-day | Sets the trigger so that it can activate on any day.                                                                                                                                                                                                                                   |
| <1-31>    | Day of the month the trigger is permitted to activate on.                                                                                                                                                                                                                              |
| <month>   | Sets the month that the trigger is permitted to activate on. Valid keywords are: <b>january</b> , <b>february</b> , <b>march</b> , <b>april</b> , <b>may</b> , <b>june</b> , <b>july</b> , <b>august</b> , <b>september</b> , <b>october</b> , <b>november</b> , and <b>december</b> . |
| <year>    | Sets the year that the trigger is permitted to activate in, between 2000 and 2035.                                                                                                                                                                                                     |
| <weekday> | Sets the days of the week that the trigger can activate on. You can specify one or more week days in a space separated list. Valid keywords are: <b>monday</b> , <b>tuesday</b> , <b>wednesday</b> , <b>thursday</b> , <b>friday</b> , <b>saturday</b> , and <b>sunday</b> .           |

**Default** **every-day**, so by default, the trigger can activate on any day.

**Mode** Trigger Configuration

**Usage notes** For example trigger configurations that use the **day** command, see "Restrict Internet Access" and "Turn off Power to Port LEDs" in the [Triggers Feature Overview and Configuration Guide](#).

**Examples** To permit trigger 55 to activate on the 1 June 2019, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 55
awplus(config-trigger)# day 1 jun 2019
```

To permit trigger 12 to activate on Mondays, Wednesdays and Fridays, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 12
awplus(config-trigger)# day monday wednesday friday
```

To permit trigger 17 to activate on the 5th day of any month, in any year, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 17
awplus(config-trigger)# day 5
```

To permit trigger 6 to activate on the 20th day of September, in any year, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 6
awplus(config-trigger)# day 20 september
```

To permit trigger 14 to activate on the 1st day of each month, in any year, at 11.00am, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 14
awplus(config-trigger)# day 1
awplus(config-trigger)# type time 11:00
```

**Command changes** Version 5.4.8-2.1: day of the month functionality added

# debug trigger

**Overview** This command enables trigger debugging. This generates detailed messages about how your device is processing the trigger commands and activating the triggers.

The **no** variant of this command disables trigger debugging.

**Syntax** debug trigger  
no debug trigger

**Mode** Privileged Exec

**Examples** To start trigger debugging, use the command:

```
awplus# debug trigger
```

To stop trigger debugging, use the command:

```
awplus# no trigger
```

**Related commands** [show debugging trigger](#)  
[show trigger](#)

[undebug trigger](#)

# description (trigger)

**Overview** This command adds an optional description to help you identify the trigger. This description is displayed in show command outputs and log messages.

The **no** variant of this command removes a trigger's description. The show command outputs and log messages stop displaying a description for this trigger.

**Syntax** `description <description>`  
`no description`

| Parameter                        | Description                                                                                                                                                       |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;description&gt;</code> | A word or phrase that uniquely identifies this trigger or its purpose. Valid characters are any printable character and spaces, up to a maximum of 40 characters. |

**Mode** Trigger Configuration

**Examples** To give trigger 240 the description `daily status report`, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 240
awplus(config-trigger)# description daily status report
```

To remove the description from trigger 36, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 36
awplus(config-trigger)# no description
```

**Related commands** [show trigger](#)

[trigger](#)

# repeat

**Overview** This command specifies the number of times that a trigger is permitted to activate. This allows you to specify whether you want the trigger to activate:

- only the first time that the trigger conditions are met
- a limited number of times that the trigger conditions are met
- an unlimited number of times

Once the trigger has reached the limit set with this command, the trigger remains in your configuration but cannot be activated. Use the **repeat** command again to reset the trigger so that it is activated when its trigger conditions are met.

By default, triggers can activate an unlimited number of times. To reset a trigger to this default, specify either **yes** or **forever**.

**Syntax** repeat {forever|no|once|yes|<1-4294967294>}

| Parameter      | Description                                          |
|----------------|------------------------------------------------------|
| yes   forever  | The trigger repeats indefinitely, or until disabled. |
| no   once      | The trigger activates only once.                     |
| <1-4292967294> | The trigger repeats the specified number of times.   |

**Mode** Trigger Configuration

**Examples** To allow trigger 21 to activate only once, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 21
awplus(config-trigger)# repeat no
```

To allow trigger 22 to activate an unlimited number of times whenever its trigger conditions are met, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 22
awplus(config-trigger)# repeat forever
```

To allow trigger 23 to activate only the first 10 times the conditions are met, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 23
awplus(config-trigger)# repeat 10
```

**commands** [trigger](#)

# script

**Overview** This command specifies one or more scripts that are to be run when the trigger activates. You can add up to five scripts to a single trigger.

The sequence in which the trigger runs the scripts is specified by the number you set before the name of the script file. One script is executed completely before the next script begins.

Scripts may be either ASH shell scripts, indicated by a **.sh** filename extension suffix, or AlliedWare Plus scripts, indicated by a **.scp** filename extension suffix. AlliedWare Plus scripts only need to be readable. You can't use ASH scripts when the device is in Secure Mode.

The **no** variant of this command removes one or more scripts from the trigger's script list. The scripts are identified by either their name, or by specifying their position in the script list. The **all** parameter removes all scripts from the trigger.

**Syntax** `script <1-5> {<filename>}`  
`no script {<1-5>|<filename>|all}`

| Parameter  | Description                                                                                          |
|------------|------------------------------------------------------------------------------------------------------|
| <1-5>      | The position of the script in execution sequence. The trigger runs the lowest numbered script first. |
| <filename> | The path to the script file.                                                                         |

**Mode** Trigger Configuration

**Examples** To configure trigger 71 to run the script flash:/cpu\_trig.sh in position 3 when the trigger activates, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 71
awplus(config-trigger)# script 3 flash:/cpu_trig.sh
```

To configure trigger 99 to run the scripts flash:reconfig.scp, flash:cpu\_trig.sh and flash:email.scp in positions 2, 3 and 5 when the trigger activates, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 99
awplus(config-trigger)# script 2 flash:/reconfig.scp 3 flash:/
cpu_trig.sh 5 flash:/email.scp
```

To remove the scripts 1, 3 and 4 from trigger 71's script list, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 71
awplus(config-trigger)# no script 1 3 4
```

To remove the script flash:/cpu\_trig.sh from trigger 71's script list, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 71
awplus(config-trigger)# no script flash:/cpu_trig.sh
```

To remove all the scripts from trigger 71's script list, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 71
awplus(config-trigger)# no script all
```

**Related commands** [show trigger](#)  
[trigger](#)

# show debugging trigger

**Overview** This command displays the current status for trigger utility debugging. Use this command to show when trigger debugging has been turned on or off from the **debug trigger** command.

**Syntax** show debugging trigger

**Mode** User Exec and Privileged Exec

**Example** To display the current configuration of trigger debugging, use the command:

```
awplus# show debugging trigger
```

**Output** The following shows typical output.

## Example output from the show debugging trigger command

```
awplus#debug trigger
awplus#show debugging trigger
Trigger debugging status:
  Trigger debugging is on

awplus#no debug trigger
awplus#show debugging trigger
Trigger debugging status:
  Trigger debugging is off
```

**Related commands** **debug trigger**

# show running-config trigger

**Overview** This command displays the current running configuration of the trigger utility.

**Syntax** show running-config trigger

**Mode** Privileged Exec

**Example** To display the current configuration of the trigger utility, use the command:

```
awplus# show running-config trigger
```

**Output** The following shows typical output.

**Example output from the show running-config trigger command**

```
trigger 1
type card in
trigger 2
type card out
!
```

**Related commands** [show trigger](#)

# show trigger

**Overview** This command displays configuration and diagnostic information about the triggers configured on the device. Specify the **show trigger** command without any options to display a summary of the configuration of all triggers.

**Syntax** `show trigger [<1-250>|counter|full]`

| Parameter | Description                                                                           |
|-----------|---------------------------------------------------------------------------------------|
| <1-250>   | Displays detailed information about a specific trigger, identified by its trigger ID. |
| counter   | Displays statistical information about all triggers.                                  |
| full      | Displays detailed information about all triggers.                                     |

**Mode** Privileged Exec

**Example** To get summary information about all triggers, use the following command:

```
awplus# show trigger
```

### Example output from show trigger

| awplus#show trigger |                   |                      |    |    |            |      |           |
|---------------------|-------------------|----------------------|----|----|------------|------|-----------|
| TR#                 | Type & Details    | Name                 | Ac | Te | Repeat     | #Scr | Days/Date |
| 001                 | CPU (80% any)     | Busy CPU             | Y  | N  | 5          | 1    | smtwtfs   |
| 005                 | Periodic (30 min) | Regular status check | Y  | N  | Continuous | 1    | -mtwtf-   |
| 007                 | Memory (85% up)   | High mem usage       | Y  | N  | 8          | 1    | smtwtfs   |
| 011                 | Time (00:01)      | Weekend access       | Y  | N  | Continuous | 1    | -----s    |
| 013                 | Reboot            |                      | Y  | N  | Continuous | 2    | smtwtfs   |
| 019                 | Ping-poll (5 up)  | Connection to svr1   | Y  | N  | Continuous | 1    | smtwtfs   |

### Parameters in the output of show trigger

| Parameter      | Description                                                                                                                                                                                                         |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TR#            | Trigger identifier (ID).                                                                                                                                                                                            |
| Type & Details | The trigger type, followed by the trigger details in brackets.                                                                                                                                                      |
| Name           | Descriptive name of the trigger configured with the <b>description (trigger)</b> command.                                                                                                                           |
| Ac             | Whether the trigger is active (Y), or inactive (N).                                                                                                                                                                 |
| Te             | Whether the trigger is in test mode (Y) or not (N).                                                                                                                                                                 |
| Repeat         | Whether the trigger repeats continuously, and if not, the configured repeat count for the trigger. To see the number of times a trigger has activated, use the <b>show trigger &lt;1-250&gt;</b> command.           |
| #Scr           | Number of scripts associated with the trigger.                                                                                                                                                                      |
| Days/Date      | Days or date when the trigger may be activated. For the days options, the days are shown as a seven character string representing Sunday to Saturday. A hyphen indicates days when the trigger cannot be activated. |

To display detailed information about trigger 3, use the command:

```
awplus# show trigger 3
```

### Example output from show trigger for a specific trigger

### Parameters in the output of show trigger full and show trigger for a specific trigger

| Parameter | Description            |
|-----------|------------------------|
| Trigger   | The ID of the trigger. |

| Parameter             | Description                                                                                                                                                                                                                                   |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                  | Descriptive name of the trigger.                                                                                                                                                                                                              |
| Type and details      | The trigger type and its activation conditions.                                                                                                                                                                                               |
| Days                  | The days on which the trigger is permitted to activate.                                                                                                                                                                                       |
| Date                  | The date on which the trigger is permitted to activate. Only displayed if configured, in which case it replaces "Days".                                                                                                                       |
| Active                | Whether or not the trigger is permitted to activate.                                                                                                                                                                                          |
| Test                  | Whether or not the trigger is operating in diagnostic mode.                                                                                                                                                                                   |
| Trap                  | Whether or not the trigger is enabled to send SNMP traps.                                                                                                                                                                                     |
| Repeat                | Whether the trigger repeats an unlimited number of times (Continuous) or for a set number of times. When the trigger can repeat only a set number of times, then the number of times the trigger has been activated is displayed in brackets. |
| Modified              | The date and time of the last time that the trigger was modified.                                                                                                                                                                             |
| Number of activations | Number of times the trigger has been activated since the last restart of the device.                                                                                                                                                          |
| Last activation       | The date and time of the last time that the trigger was activated.                                                                                                                                                                            |
| Number of scripts     | How many scripts are associated with the trigger, followed by the names of the script files in the order in which they run.                                                                                                                   |

To display counter information about all triggers use the command:

```
awplus# show trigger counter
```

### Example output from show trigger counter

```
awplus# show trigger counter
Trigger Module Counters
-----
Trigger activations                      4
Last trigger activated                  55

- Related commands

active (trigger)

debug trigger

script

trigger

trigger activate

# test

**Overview** This command puts the trigger into a diagnostic mode. In this mode the trigger may activate but when it does it will not run any of the trigger's scripts. A log message will be generated to indicate when the trigger has been activated.

The **no** variant of this command takes the trigger out of diagnostic mode, restoring normal operation. When the trigger activates, the scripts associated with the trigger will be run, as normal.

**Syntax** test  
no test

**Mode** Trigger Configuration

**Usage notes** Configure a trigger first before you use this command to diagnose it. For information about configuring a trigger, see the [Triggers\\_Feature Overview and Configuration Guide](#).

**Examples** To put trigger 5 into diagnostic mode, where no scripts will be run when the trigger activates, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 5
awplus(config-trigger)# test
```

To take trigger 205 out of diagnostic mode, restoring normal operation, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 205
awplus(config-trigger)# no test
```

**Related commands** [show trigger](#)  
[trigger](#)

# time (trigger)

**Overview** This command specifies the time of day when the trigger is permitted to activate. The **after** parameter specifies the start of a time period that extends to midnight during which trigger may activate. By default the value of this parameter is 00:00:00 (am); that is, the trigger may activate at any time. The **before** parameter specifies the end of a time period beginning at midnight during which the trigger may activate. By default the value of this parameter is 23:59:59; that is, the trigger may activate at any time. If the value specified for **before** is later than the value specified for **after**, a time period from "after" to "before" is defined, during which the trigger may activate. This command is not applicable to time triggers ( **type time** ).

The following figure illustrates how the **before** and **after** parameters operate.

**Syntax** time {[after <hh:mm:ss>] [before <hh:mm:ss>]}

| Parameter        | Description                                                 |
|------------------|-------------------------------------------------------------|
| after<hh:mm:ss>  | The earliest time of day when the trigger may be activated. |
| before<hh:mm:ss> | The latest time of day when the trigger may be activated.   |

**Mode** Trigger Configuration

**Usage notes** For example trigger configurations that use the **time (trigger)** command, see "Restrict Internet Access" and "Turn off Power to Port LEDs" in the [Triggers Feature Overview and Configuration Guide](#).

**Examples** To allow trigger 63 to activate between midnight and 10:30am, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 63
awplus(config-trigger)# time before 10:30:00
```

To allow trigger 64 to activate between 3:45pm and midnight, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 64
awplus(config-trigger)# time after 15:45:00
```

To allow trigger 65 to activate between 10:30am and 8:15pm, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 65
awplus(config-trigger)# time after 10:30:00 before 20:15:00
```

**Related commands** [show trigger](#)  
[trigger](#)

# trap

**Overview** This command enables the specified trigger to send SNMP traps.

Use the **no** variant of this command to disable the sending of SNMP traps from the specified trigger.

**Syntax** trap  
no trap

**Default** SNMP traps are enabled by default for all defined triggers.

**Mode** Trigger Configuration

**Usage notes** You must configure SNMP before using traps with triggers. For more information, see:

- [Support for Allied Telesis Enterprise\\_MIBs\\_in AlliedWare Plus](#), for information about which MIB objects are supported.
- the [SNMP Feature Overview and Configuration\\_Guide](#).
- the [SNMP Commands](#) chapter.

Since SNMP traps are enabled by default for all defined triggers, a common usage will be for the **no** variant of this command to disable SNMP traps from a specified trap if the trap is only periodic. Refer in particular to AT-TRIGGER-MIB in the [Support for Allied Telesis Enterprise\\_MIBs\\_in AlliedWare Plus](#) for further information about the relevant SNMP MIB.

**Examples** To enable SNMP traps to be sent from trigger 5, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 5
awplus(config-trigger)# trap
```

To disable SNMP traps being sent from trigger 205, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 205
awplus(config-trigger)# no trap
```

**Related commands** [trigger](#)  
[show trigger](#)

# trigger

**Overview** This command is used to access the Trigger Configuration mode for the specified trigger. Once Trigger Configuration mode has been entered the trigger type information can be configured and the trigger scripts and other operational parameters can be specified. At a minimum the trigger type information must be specified before the trigger can become active.

The **no** variant of this command removes a specified trigger and all configuration associated with it.

**Syntax** trigger <1-250>  
no trigger <1-250>

| Parameter | Description   |
|-----------|---------------|
| <1-250>   | A trigger ID. |

**Mode** Global Configuration

**Examples** To enter trigger configuration mode for trigger 12, use the commands:

```
awplus# configure terminal  
awplus(config)# trigger 12
```

To completely remove all configuration associated with trigger 12, use the commands:

```
awplus# configure terminal  
awplus(config)# no trigger 12
```

**Related commands** [show trigger](#)  
[trigger activate](#)

# trigger activate

**Overview** This command is used to manually activate a specified trigger from the Privileged Exec mode, which has been configured with the **trigger** command from the Global Configuration mode.

**Syntax** trigger activate <1-250>

| Parameter | Description   |
|-----------|---------------|
| <1-250>   | A trigger ID. |

**Mode** Privileged Exec

**Usage notes** This command manually activates a trigger without the normal trigger conditions being met.

The trigger is activated even if it has been configured as inactive by using the command **no active**. The scripts associated with the trigger will be executed even if the trigger is in the diagnostic test mode.

Triggers activated manually do not have their repeat counts decremented or their 'last triggered' time updated, and do not result in updates to the '[type] triggers today' counters.

**Example** To manually activate trigger 12 use the command:

```
awplus# trigger activate 12
```

**Related commands** [active \(trigger\)](#)  
[show trigger](#)  
[trigger](#)

# type atmf guest

**Overview** This command configures a trigger to activate when an AMF guest node joins or leaves.

**Syntax** type atmf guest {join|leave}

| Parameter | Description            |
|-----------|------------------------|
| join      | AMF guest node joins.  |
| leave     | AMF guest node leaves. |

**Mode** Trigger Configuration

**Example** To configure trigger 86 to activate when an AMF guest node leaves, use the following commands:

```
awplus(config)# trigger 86
awplus(config-trigger)# type atmf guest leave
```

**Related commands** [show trigger](#)

**Command changes** Version 5.5.1-1.1: command added

## type atmf node

**Overview** This command configures a trigger to activate when an AMF node joins or leaves.

**Syntax** type atmf node {join|leave}

| Parameter | Description      |
|-----------|------------------|
| join      | AMF node joins.  |
| leave     | AMF node leaves. |

**Mode** Trigger Configuration

**Example 1** To configure trigger 5 to activate when an AMF node leaves, use the following commands. In this example the command is entered on node-1:

```
node1(config)# trigger 5
node1(config-trigger)# type atmf node leave
```

**Example 2** The following commands will configure trigger 5 to activate if an AMF node join event occurs on any node within the working set:

```
node1# atmf working-set group all
```

This command returns the following display:

```
=====
node1, node2, node3:
=====

Working set join
```

Note that the running the above command changes the prompt from the name of the local node, to the name of the AMF-Network followed, in square brackets, by the number of member nodes in the working set.

```
AMF-Net[3]# conf t
```

```
AMF-Net[3](config)# trigger 5
```

```
AMF-Net[3](config-trigger)# type atmf node leave
```

```
AMF-Net[3](config-trigger)# description "E-mail on AMF Exit"
```

```
AMF-Net[3](config-trigger)# active
```

Enter the name of the script to run at the trigger event.

```
AMF-Net[3](config-trigger)# script 1 email_me.scp
```

```
AMF-Net[3](config-trigger)# end
```

Display the trigger configurations

```
AMF-Net[3]# show trigger
```

This command returns the following display:

```
=====
node1:
=====

TR# Type & Details      Description      Ac Te Tr Repeat      #Scr Days/Date
-----
001 Periodic (2 min)    Periodic Status Chk Y  N  Y Continuous    1  smtwtf
005 ATMF node (leave)  E-mail on ATMF Exit Y  N  Y Continuous    1  smtwtf
-----

=====
Node2, Node3,
=====

TR# Type & Details      Description      Ac Te Tr Repeat      #Scr Days/Date
-----
005 ATMF node (leave)  E-mail on ATMF Exit Y  N  Y Continuous    1  smtwtf
-----
```

Display the triggers configured on each of the nodes in the AMF Network.

```
AMF-Net[3]# show running-config trigger
```

This command returns the following display:

```
=====
Node1:
```

```
=====

trigger 1
  type periodic 2
  script 1 atmf.scp
trigger 5
  type atmf node leave
description "E-mail on ATMF Exit"
  script 1 email_me.scp
!

=====
Node2, Node3:
=====

trigger 5
  type atmf node leave
description "E-mail on ATMF Exit"
  script 1 email_me.scp
!
```

**Related** [show trigger commands](#)

# type cpu

**Overview** This command configures a trigger to activate based on CPU usage level. Selecting the **up** option causes the trigger to activate when the CPU usage exceeds the specified usage level. Selecting the **down** option causes the trigger to activate when CPU usage drops below the specified usage level. Selecting **any** causes the trigger to activate in both situations. The default is **any**.

**Syntax** type cpu <1-100> [up|down|any]

| Parameter | Description                                                            |
|-----------|------------------------------------------------------------------------|
| <1-100>   | The percentage of CPU usage at which to trigger.                       |
| up        | Activate when CPU usage exceeds the specified level.                   |
| down      | Activate when CPU usage drops below the specified level                |
| any       | Activate when CPU usage passes the specified level in either direction |

**Mode** Trigger Configuration

**Usage notes** For an example trigger configuration that uses the **type cpu** command, see "Capture Unusual CPU and RAM Activity" in the [Triggers Feature Overview and Configuration Guide](#).

**Examples** To configure trigger 28 to be a CPU trigger that activates when CPU usage exceeds 80% use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 28
awplus(config-trigger)# type cpu 80 up
```

To configure trigger 5 to be a CPU trigger that activates when CPU usage either rises above or drops below 65%, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 5
awplus(config-trigger)# type cpu 65
```

or

```
awplus# configure terminal
awplus(config)# trigger 5
awplus(config-trigger)# type cpu 65 any
```

**Related** [show trigger](#)  
**commands** [trigger](#)

## type env-sensor

**Overview** Use this command to create a trigger that will run a script when the device's environment sensors detect an event. Environment sensors are shown in the output of the command **show system environment**, and include things like device temperature, power settings and voltage.

Depending on the device and sensor, you can create a trigger to run when:

- the sensor's state changes, for example when a loss of power is detected for a power supply, or when power is restored, or both.
- the sensor's reading crosses a high or low threshold, for example when the device temperature becomes too high, or returns to normal, or both.

**Syntax when  
a sensor  
changes  
state**

```
type env-sensor [node <number>] resource <resource-id> sensor
<sensor-id> state {true|false|any}
```

| Parameter              | Description                                                                                                                             |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| node <number>          | The VCStack member ID that the sensor is on, for example, 3 for stack member 3. You can leave this parameter out on standalone devices. |
| resource <resource-id> | The 'Resource ID' for the device, as shown in output of the command <b>show system environment</b> .                                    |
| sensor <sensor-id>     | The 'ID' for the sensor, as shown in output of the command <b>show system environment</b> .                                             |
| state true             | The trigger will activate if this sensor reading changes to 'Yes' or 'Open' in the output of <b>show system environment</b> .           |
| state false            | The trigger will activate if this sensor reading changes to 'No' or 'Closed' in the output of <b>show system environment</b> .          |
| state any              | The trigger will activate if this sensor reading changes to any of 'Yes', 'Open', 'No', or 'Closed'.                                    |

**Syntax when  
a sensor  
crosses a  
threshold**

```
type env-sensor [node <number>] resource <resource-id> sensor
<sensor-id> {low-limit|high-limit} {exceeded|cleared|any}
```

| Parameter              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| node <number>          | The VCStack member ID that the sensor is on, for example, 3 for stack member 3. You can leave this parameter out on standalone devices.                                                                                                                                                                                                                                                                                                                                                                                                         |
| resource <resource-id> | The 'Resource ID' for the device, as shown in output of the command <b>show system environment</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| sensor <sensor-id>     | The 'ID' for the sensor, as shown in output of the command <b>show system environment</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| low-limit              | The trigger will activate when the sensor reading falls below the 'Low Limit' alarm threshold shown in <b>show system environment</b> , or returns to an acceptable value after being too low, or both. The alarm threshold values are pre-defined within the device and cannot be changed.                                                                                                                                                                                                                                                     |
| high-limit             | The trigger will activate when the sensor reading rises above the 'High Limit' alarm threshold shown in <b>show system environment</b> , or returns to an acceptable value after being too high, or both. The alarm threshold values are pre-defined within the device and cannot be changed.                                                                                                                                                                                                                                                   |
| exceeded               | If you chose low-limit, the trigger will trigger if the sensor's reading falls below the low limit.<br><br>If you chose high-limit, the trigger will trigger if the sensor's reading goes above the high limit.                                                                                                                                                                                                                                                                                                                                 |
| cleared                | If you chose low-limit, the trigger will trigger if the sensor's reading rises to above the low limit again.<br><br>If you chose high-limit, the trigger will trigger if the sensor's reading falls below the high limit again.<br><br>Some temperature sensors include a hysteresis value and will not clear until the temperature has changed significantly. For example, if a sensor has a high alarm threshold of 75 degrees Celsius, the hysteresis value may mean that the alarm clears when the temperature falls to 63 degrees Celsius. |
| any                    | The trigger will trigger if the low or high limit is either exceeded or cleared.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**Mode** Trigger Configuration

**Example** To configure trigger 1, which will activate when the internal temperature becomes too high or drops to a low-enough value after being too high, use the following commands. This example monitors the internal temperature of stack member 2, and has a resource ID of 3 and a sensor ID of 8:

```
awplus# configure terminal
awplus(config)# trigger 1
awplus(config-trigger)# type env-sensor node 2 resource 3 sensor
8 high-limit any
```

**Related commands** [show system environment](#)

**Command changes** Version 5.5.2-1.1: command added

# type interface

**Overview** This command configures a trigger to activate based on the link status of an interface. The trigger can be activated when the interface becomes operational by using the **up** option, or when the interface closes by using the **down** option. The trigger can also be configured to activate when either one of these events occurs by using the **any** option.

**Syntax** type interface <interface> {up|down|any}

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| <interface> | Interface name.                                       |
| up          | Activate when interface becomes operational.          |
| down        | Activate when the interface closes.                   |
| any         | Activate when any interface link status event occurs. |

**Mode** Trigger Configuration

**Example** To configure trigger 19 to be an interface trigger that activates when port1.0.1 becomes operational, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 19
awplus(config-trigger)# type interface port1.0.1 up
```

**Related commands** [show trigger](#)  
[trigger](#)

## type linkmon-probe

**Overview** Use this command to create a trigger that will run a script when a Link Health Monitoring probe reports that a link becomes “good”, “bad”, or “unreachable”.

**Syntax** type linkmon-probe <probename> <profilename> {good|bad|unreachable|any}

| Parameter     | Description                                                                                                                                                  |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <probename>   | The name of the Link Health Monitoring probe that will be used for executing the trigger.                                                                    |
| <profilename> | The name of the Link Health Monitoring performance profile that will be used for determine if the Link Health Monitoring probe is good, bad, or unreachable. |
| good          | If the Link Health Monitoring probe becomes 'good' according to the Link Health Monitoring performance profile then the trigger will be executed.            |
| bad           | If the Link Health Monitoring probe goes 'bad' according to the Link Health Monitoring performance profile then the trigger will be executed.                |
| unreachable   | If the Link Health Monitoring probe becomes 'unreachable' according to the Link Health Monitoring performance profile then the trigger will be executed.     |
| any           | If the Link Health Monitoring probe changes state according to the Link Health Monitoring performance profile then the trigger will be executed.             |

**Mode** Trigger Configuration

**Example** When the Link Health Monitoring probes sent to the “test-probe” destination no longer meet the performance profile “test-profile” the link will be deemed “bad”. To create a trigger that will run a script when a Link Health Monitoring probe is deemed “bad”, use the following commands:

```
awplus(config)# trigger 1
awplus(config-trigger)# script 1 link-bad.scp
awplus(config-trigger)# type linkmon-probe test-probe test-profile bad
```

To create a trigger that will run a script when the link is deemed “good” again, use the following commands:

```
awplus(config)# trigger 2
awplus(config-trigger)# script 1 link-good.scp
awplus(config-trigger)# type linkmon-probe test-probe test-profile good
```

**commands**

**Command** Version 5.4.8-1.1: command added  
**changes**

## type log

**Overview** Use this command to configure a trigger to activate based on the content of log messages matching a string or regular expression.

**Syntax** `type log <log-message-string>`

| Parameter                               | Description                                                                              |
|-----------------------------------------|------------------------------------------------------------------------------------------|
| <code>&lt;log-message-string&gt;</code> | A string or a regular expression (PCRE) to match a log message or part of a log message. |

**Default** There is no type or log message string set by default.

**Mode** Trigger Configuration

**Usage notes** Log type triggers fully support regular expressions using PCRE (Perl-Compatible Regular Expression) syntax.

Only log messages of severity level notice or higher can activate a trigger.

Note that any command executed by the script will generate a log message with level notice, and will include '[SCRIPT]' before the command string. Therefore, if something in the script matches the configured log message trigger string, it will retrigger indefinitely.

**Example** To configure trigger 6 to activate when a log message of level notice or higher indicates that any port has 'failed', use the commands:

```
awplus# configure terminal
awplus(config)# trigger 6
awplus(config-trigger)# type log port.+ failed
```

**Related commands** [show trigger](#)  
[trigger](#)

**Command changes** Version 5.4.7-2.1: command added

## type main-pse

**Overview** Use this command to monitor the total Power over Ethernet (PoE) power usage on the switch. This trigger activates if the amount of power being drawn exceeds the switch's PoE budget, or if it falls back within the budget again.

Note that the switch will take corrective action when the budget is exceeded. This means the amount of power will drop soon after the fault occurs.

**Syntax** `type main-pse [member <stack-id>] {up|down|any}`

| Parameter         | Description                                                                                                                  |
|-------------------|------------------------------------------------------------------------------------------------------------------------------|
| member <stack-id> | Activate for PoE budget events for the specified VCStack member. Not using this option activates the trigger for any member. |
| up                | Activate when the total power being drawn exceeds the PoE budget for the switch                                              |
| down              | Activate when the total power drawn falls back within the PoE budget for the switch                                          |
| any               | Activate both when the total power drawn exceeds the PoE budget for the switch and when it falls back within budget again    |

**Mode** Trigger Configuration

**Example** To configure trigger 1, which will activate if the switch's power usage exceeds the PoE budget, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 1
awplus(config-trigger)# type main-pse up
```

To configure trigger 2, which will activate if stack member 2's power usage exceeds the PoE budget or falls back within budget again, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 2
awplus(config-trigger)# type main-pse member 2 any
```

**Related commands** [script](#)  
[show trigger](#)  
[type pse-port](#)

**Command changes** Version 5.5.3-1.1: command added

# type memory

**Overview** This command configures a trigger to activate based on RAM usage level. Selecting the **up** option causes the trigger to activate when memory usage exceeds the specified level. Selecting the **down** option causes the trigger to activate when memory usage drops below the specified level. Selecting **any** causes the trigger to activate in both situations. The default is **any**.

**Syntax** type memory <1-100> [up|down|any]

| Parameter | Description                                                                |
|-----------|----------------------------------------------------------------------------|
| <1-100>   | The percentage of memory usage at which to trigger.                        |
| up        | Activate when memory usage exceeds the specified level.                    |
| down      | Activate when memory usage drops below the specified level.                |
| any       | Activate when memory usage passes the specified level in either direction. |

**Mode** Trigger Configuration

**Examples** To configure trigger 12 to be a memory trigger that activates when memory usage exceeds 50% use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 12
awplus(config-trigger)# type memory 50 up
```

To configure trigger 40 to be a memory trigger that activates when memory usage either rises above or drops below 65%, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 40
awplus(config-trigger)# type memory 65

or

awplus# configure terminal
awplus(config)# trigger 40
awplus(config-trigger)# type memory 65 any
```

**Related commands** [show trigger](#)  
[trigger](#)

# type periodic

**Overview** This command configures a trigger to be activated at regular intervals. The time period between activations is specified in minutes.

**Syntax** type periodic <1-1440>

| Parameter | Description                                |
|-----------|--------------------------------------------|
| <1-1440>  | The number of minutes between activations. |

**Mode** Trigger Configuration

**Usage notes** A combined limit of 10 triggers of the type periodic and time can be configured. If you attempt to add more than 10 triggers the following error message is displayed:

```
% Cannot configure more than 10 triggers with the type time or periodic
```

For an example trigger configuration that uses the **type periodic** command, see "See Daily Statistics" in the [Triggers\\_Feature Overview and Configuration Guide](#).

**Example** To configure trigger 44 to activate periodically at 10 minute intervals use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 44
awplus(config-trigger)# type periodic 10
```

**Related commands** [show trigger](#)  
[trigger](#)

## type ping-poll

**Overview** This command configures a trigger that activates when Ping Polling identifies that a target device's status has changed. This allows you to run a configuration script when a device becomes reachable or unreachable.

**Syntax** type ping-poll <1-100> {up|down}

| Parameter | Description                                                                     |
|-----------|---------------------------------------------------------------------------------|
| <1-100>   | The ping poll ID.                                                               |
| up        | The trigger activates when ping polling detects that the target is reachable.   |
| down      | The trigger activates when ping polling detects that the target is unreachable. |

**Mode** Trigger Configuration

**Example** To configure trigger 106 to activate when ping poll 12 detects that its target device is now unreachable, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 106
awplus(config-trigger)# type ping-poll 12 down
```

**Related commands** [show trigger](#)  
[trigger](#)

# type pse-port

**Overview** Use this command to monitor an individual Power over Ethernet (PoE) port. This trigger activates if the amount of power being drawn by a port exceeds the capabilities of the port, or if it falls back within the limit again. Note that the switch will take corrective action when the port limit is exceeded, such as shutting down the affected port. This means the amount of power will drop soon after the fault occurs.

**Syntax** type pse-port <interface> {up|down|any}

| Parameter   | Description                                                                                                                                                 |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <interface> | The name of a PoE port.                                                                                                                                     |
| up          | Activate when the power drawn from the PoE port starts to exceed the port's capability to supply power.                                                     |
| down        | Activate when the power drawn from the PoE port stops exceeding the port's capability to supply power.                                                      |
| any         | Activate both when the power drawn from the PoE port starts to exceed the port's capability to supply power, and when it drops to a low enough value again. |

**Mode** Trigger Configuration

**Example** To configure trigger 1, which will activate if port1.0.1 draws too much power, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 1
awplus(config-trigger)# type pse-port port1.0.1 up
```

To configure trigger 1, which will activate if port1.0.1 draws too much power and also when it stops drawing too much power, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 1
awplus(config-trigger)# type pse-port port1.0.1 any
```

**Related commands** [script](#)  
[show trigger](#)  
[type main-pse](#)

**Command changes** Version 5.5.3-1.1: command added

# type reboot

**Overview** This command configures a trigger that activates when your device is rebooted.

**Syntax** type reboot

**Mode** Trigger Configuration

**Example** To configure trigger 32 to activate when your device reboots, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 32
awplus(config-trigger)# type reboot
```

**Related commands** [show trigger](#)  
[trigger](#)

# type stack disabled-master

**Overview** This command (configured to the stack) configures a trigger to activate on a stack member if it becomes the disabled master.

A disabled master has the same configuration as the active master, but has all its links shutdown.

Although this command could activate any trigger script, the intention here is that the script will reactivate the links from their previously shutdown state, to enable the user to manage the device. An appropriate trigger script must already exist that will apply the **shutdown** command on the deactivated links.

**CAUTION:** *It is important that any ports that are configured as trunked ports across master and stack members are disabled at their stack member termination when operating in the fallback configuration. Otherwise, the trunked ports will not function correctly on the device that is connected downstream.*

If the **stack virtual-mac** command is enabled, the stack uses a virtual MAC address. The stack will always use this MAC address and the new elected master will still retain the originally configured virtual MAC address. If the **stack virtual-mac** command is disabled, the stack will use the MAC address of the current master. If the stack master fails, the stack MAC address changes to reflect the new master's MAC address. For more information about virtual MAC addresses, see the **VCStack Feature Overview and Configuration Guide**.

**Syntax** type stack disabled-master

**Mode** Trigger Configuration

**Examples** To configure trigger 82 to activate on a device if it becomes the disabled master, use the following commands. These commands enter the Trigger Configuration mode for trigger 82, specify the trigger type, and then specify the script to run.

```
awplus# configure terminal
awplus(config)# trigger 82
awplus(config-trigger)# type stack disabled master
awplus(config-trigger)# script 1 flash:/disabled.scp
awplus(config-trigger)# exit
```

[type stack member](#)  
[type stack link](#)

# type stack link

**Overview** This command (configured to the stack) initiates the action of a pre-configured trigger to occur when a stacking link is either activated or deactivated.

**Syntax** type stack link {up|down}

| Parameter | Description           |
|-----------|-----------------------|
| up        | Stack link up event   |
| down      | Stack link down event |

**Mode** Trigger Configuration

**Example** To configure trigger 86 to activate when the stack link down event occurs, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 86
awplus(config-trigger)# type stack link down
```

**Related commands** [show trigger](#)  
[trigger](#)  
[type stack master-fail](#)

# type stack master-fail

**Overview** This command (configured to the stack) initiates the action of a pre-configured trigger to occur when the stack enters the fail-over state.

**Syntax** type stack master-fail

**Mode** Trigger Configuration

**Example** To configure trigger 86 to activate when stack master fail-over event occurs, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 86
awplus(config-trigger)# type stack master-fail
```

**Related commands**

- stack disabled-master-monitoring**
- trigger**
- type stack disabled-master**
- type stack member**
- type stack link**

# type stack member

**Overview** This command (configured to the stack) initiates the action of a pre-configured trigger to occur when a device either joins or leaves the stack.

**Syntax** type stack member {join|leave}

| Parameter | Description          |
|-----------|----------------------|
| join      | Neighbor join event  |
| leave     | Neighbor leave event |

**Mode** Trigger Configuration

**Example** To configure a pre-configured trigger number 86 to activate when a new device joins the stack.

Note that the number 86 has no particular significance: you can assign any (previously created) numbered trigger.

```
awplus# configure terminal
awplus(config)# trigger 86
awplus(config-trigger)# type stack member join
```

**Related commands** [trigger](#)  
[type stack master-fail](#)  
[type stack link](#)

# type time

**Overview** This command configures a trigger that activates at a specified time of day.

**Syntax** type time <hh:mm>

| Parameter | Description                       |
|-----------|-----------------------------------|
| <hh:mm>   | The time to activate the trigger. |

**Mode** Trigger Configuration

**Usage** A combined limit of 10 triggers of the type time and type periodic can be configured. If you attempt to add more than 10 triggers the following error message is displayed:

```
% Cannot configure more than 10 triggers with the type time or periodic
```

**Example** To configure trigger 86 to activate at 15:53, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 86
awplus(config-trigger)# type time 15:53
```

**Related commands** [show trigger](#)  
[trigger](#)

# type usb

**Overview** Use this command to configure a trigger that activates on either the removal or the insertion of a USB storage device.

**Syntax** type usb {in|out}

| Parameter | Description                                             |
|-----------|---------------------------------------------------------|
| in        | Trigger activates on insertion of a USB storage device. |
| out       | Trigger activates on removal of a USB storage device.   |

**Mode** Trigger Configuration

**Usage notes** USB triggers cannot execute script files from a USB storage device.

**Examples** To configure trigger 1 to activate on the insertion of a USB storage device, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 1
awplus(config-trigger)# type usb in
```

# Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure Ping Polling. For more information, see the [Ping Polling Feature Overview and Configuration Guide](#).

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**The following table lists the default values when configuring a ping poll**

| Default           | Value                                                                       |
|-------------------|-----------------------------------------------------------------------------|
| Critical-interval | 1 second                                                                    |
| Description       | No description                                                              |
| Fail-count        | 5                                                                           |
| Length            | 32 bytes                                                                    |
| Normal-interval   | 30 seconds                                                                  |
| Sample-size       | 5                                                                           |
| Source-ip         | The IP address of the interface from which the ping packets are transmitted |
| Time-out          | 1 second                                                                    |
| Up-count          | 30                                                                          |

## active (ping-polling)

**Overview** This command enables a ping-poll instance. The polling instance sends ICMP echo requests to the device with the IP address specified by the **ip (ping-polling)** command.

By default, polling instances are disabled. When a polling instance is enabled, it assumes that the device it is polling is unreachable.

The **no** variant of this command disables a ping-poll instance. The polling instance no longer sends ICMP echo requests to the polled device. This also resets all counters for this polling instance.

**Syntax** active  
no active

**Mode** Ping-Polling Configuration

**Examples** To activate the ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# active
```

To disable the ping-poll instance 43 and reset its counters, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# no active
```

**Related commands** **debug ping-poll**  
**ip (ping-polling)**  
**ping-poll**  
**show ping-poll**

# clear ping-poll

**Overview** This command resets the specified ping poll, or all ping poll instances. This clears the ping counters, and changes the status of polled devices to unreachable. The polling instance changes to the polling frequency specified with the **critical-interval** command. The device status changes to reachable once the device responses have reached the **up-count**.

**Syntax** `clear ping-poll {<1-100>|all}`

| Parameter | Description                                                                                                                                        |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| <1-100>   | A ping poll ID number. The specified ping poll instance has its counters cleared, and the status of the device it polls is changed to unreachable. |
| all       | Clears the counters and changes the device status of all polling instances.                                                                        |

**Mode** Privileged Exec

**Examples** To reset the ping poll instance 12, use the command:

```
awplus# clear ping-poll 12
```

To reset all ping poll instances, use the command:

```
awplus# clear ping-poll all
```

**Related commands** **active (ping-polling)**  
**ping-poll**  
**show ping-poll**

# critical-interval

**Overview** This command specifies the time period in seconds between pings when the polling instance has not received a reply to at least one ping, and when the device is unreachable.

This command enables the device to quickly observe changes in state, and should be set to a much lower value than the **normal-interval** command.

The **no** variant of this command sets the critical interval to the default of one second.

**Syntax** critical-interval <1-65536>  
no critical-interval

| Parameter | Description                                                                                        |
|-----------|----------------------------------------------------------------------------------------------------|
| <1-65536> | Time in seconds between pings, when the device has failed to a ping, or the device is unreachable. |

**Default** The default is 1 second.

**Mode** Ping-Polling Configuration

**Examples** To set the critical interval to 2 seconds for the ping-polling instance 99, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 99
awplus(config-ping-poll)# critical-interval 2
```

To reset the critical interval to the default of one second for the ping-polling instance 99, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 99
awplus(config-ping-poll)# no critical-interval
```

**Related commands** **fail-count**  
**normal-interval**  
**sample-size**  
**show ping-poll**  
**timeout (ping polling)**  
**up-count**

# debug ping-poll

**Overview** This command enables ping poll debugging for the specified ping-poll instance. This generates detailed messages about ping execution.

The **no** variant of this command disables ping-poll debugging for the specified ping-poll.

**Syntax** debug ping-poll <1-100>  
no debug ping-poll {<1-100>|all}

| Parameter | Description                       |
|-----------|-----------------------------------|
| <1-100>   | A unique ping poll ID number.     |
| all       | Turn off all ping-poll debugging. |

**Mode** Privileged Exec

**Examples** To enable debugging for ping-poll instance 88, use the command:

```
awplus# debug ping-poll 88
```

To disable all ping poll debugging, use the command:

```
awplus# no debug ping-poll all
```

To disable debugging for ping-poll instance 88, use the command:

```
awplus# no debug ping-poll 88
```

**Related commands**

- active (ping-polling)**
- clear ping-poll**
- ping-poll**
- show ping-poll**
- undebug ping-poll**

# description (ping-polling)

**Overview** This command specifies a string to describe the ping-polling instance. This allows the ping-polling instance to be recognized easily in show commands. Setting this command is optional.

By default ping-poll instances do not have a description.

Use the **no** variant of this command to delete the description set.

**Syntax** `description <description>`  
`no description`

| Parameter                        | Description                                                                                                                   |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;description&gt;</code> | The description of the target. Valid characters are any printable character and spaces. There is no maximum character length. |

**Mode** Ping-Polling Configuration

**Examples** To add the text "Primary Gateway" to describe the ping-poll instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# description Primary Gateway
```

To delete the description set for the ping-poll instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# no description
```

**Related commands** [ping-poll](#)  
[show ping-poll](#)

# fail-count

**Overview** This command specifies the number of pings that must be unanswered, within the total number of pings specified by the **sample-size** command, for the ping-polling instance to consider the device unreachable.

If the number set by the **sample-size** command and the **fail-count** commands are the same, then the unanswered pings must be consecutive. If the number set by the **sample-size** command is greater than the number set by the **fail-count** command, then a device that does not always reply to pings may be declared unreachable.

The **no** variant of this command resets the fail count to the default.

**Syntax** fail-count <1-100>  
no fail-count

| Parameter | Description                                                                                                                        |
|-----------|------------------------------------------------------------------------------------------------------------------------------------|
| <1-100>   | The number of pings within the sample size that a reachable device must fail to respond to before it is classified as unreachable. |

**Default** The default is 5.

**Mode** Ping-Polling Configuration

**Examples** To specify the number of pings that must fail within the sample size to determine that a device is unreachable for ping-polling instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# fail-count 5
```

To reset the fail-count to its default of 5 for ping-polling instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# no fail-count
```

- timeout (ping polling)**
- up-count**

# ip (ping-polling)

**Overview** This command specifies the IPv4 address of the device you are polling.

**Syntax** `ip {<ip-address>|<ipv6-address>}`

| Parameter                         | Description                                        |
|-----------------------------------|----------------------------------------------------|
| <code>&lt;ip-address&gt;</code>   | An IPv4 address in dotted decimal notation A.B.C.D |
| <code>&lt;ipv6-address&gt;</code> | An IPv6 address in hexadecimal notation X:X::X:X   |

**Mode** Ping-Polling Configuration

**Examples** To set ping-poll instance 5 to poll the device with the IP address 192.168.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 5
awplus(config-ping-poll)# ip 192.168.0.1
```

To set ping-poll instance 10 to poll the device with the IPv6 address 2001:db8::, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 10
awplus(config-ping-poll)# ip 2001:db8::
```

**Related commands**

- [ping-poll](#)
- [source-ip](#)
- [show ping-poll](#)

## length (ping-poll data)

**Overview** This command specifies the number of data bytes to include in the data portion of the ping packet. This allows you to set the ping packets to a larger size if you find that larger packet types in your network are not reaching the polled device, while smaller packets are getting through. This encourages the polling instance to change the device's status to unreachable when the network is dropping packets of the size you are interested in.

The **no** variant of this command resets the data bytes to the default of 32 bytes.

**Syntax** length <4-1500>  
no length

| Parameter | Description                                                                 |
|-----------|-----------------------------------------------------------------------------|
| <4-1500>  | The number of data bytes to include in the data portion of the ping packet. |

**Default** The default is 32.

**Mode** Ping-Polling Configuration

**Examples** To specify that ping-poll instance 12 sends ping packet with a data portion of 56 bytes, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 12
awplus(config-ping-poll)# length 56
```

To reset the number of data bytes in the ping packet to the default of 32 bytes for ping-poll instance 3, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 12
awplus(config-ping-poll)# length
```

**Related commands** [ping-poll](#)  
[show ping-poll](#)

# normal-interval

**Overview** This command specifies the time period between pings when the device is reachable.

The **no** variant of this command resets the time period to the default of 30 seconds.

**Syntax** normal-interval <1-65536>  
no normal-interval

| Parameter | Description                                                 |
|-----------|-------------------------------------------------------------|
| <1-65536> | Time in seconds between pings when the target is reachable. |

**Default** The default is 30 seconds.

**Mode** Ping-Polling Configuration

**Examples** To specify a time period of 60 seconds between pings when the device is reachable for ping-poll instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# normal-interval 60
```

To reset the interval to the default of 30 seconds for ping-poll instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# no normal-interval
```

# ping-poll

**Overview** This command enters the ping-poll configuration mode. If a ping-poll exists with the specified number, then this command enters its configuration mode. If no ping poll exists with the specified number, then this command creates a new ping poll with this ID number.

To configure a ping-poll, create a ping poll using this command, and use the **ip (ping-polling)** command to specify the device you want the polling instance to poll. It is not necessary to specify any further commands unless you want to change a command's default.

The **no** variant of this command deletes the specified ping poll.

**Syntax** ping-poll <1-100>  
no ping-poll <1-100>

| Parameter | Description                   |
|-----------|-------------------------------|
| <1-100>   | A unique ping poll ID number. |

**Mode** Global Configuration

**Examples** To create ping-poll instance 3 and enter ping-poll configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 3
awplus(config-ping-poll)#
```

To delete ping-poll instance 3, use the commands:

```
awplus# configure terminal
awplus(config)# no ping-poll 3
```

**Related commands**

- debug ping-poll**
- description (ping-polling)**
- ip (ping-polling)**
- length (ping-poll data)**
- show ping-poll**
- source-ip**

## sample-size

**Overview** This command sets the total number of pings that the polling instance inspects when determining whether a device is unreachable. If the number of pings specified by the **fail-count** command go unanswered within the inspected sample, then the device is declared unreachable.

If the numbers set in this command and **fail-count** command are the same, the unanswered pings must be consecutive. If the number set by this command is greater than that set with the **fail-count** command, a device that does not always reply to pings may be declared unreachable.

You cannot set this command's value lower than the **fail-count** value.

The polling instance uses the number of pings specified by the **up-count** command to determine when a device is reachable.

The **no** variant of this command resets this command to the default.

**Syntax** sample-size <1-100>  
no sample size

| Parameter | Description                                             |
|-----------|---------------------------------------------------------|
| <1-100>   | Number of pings that determines critical and up counts. |

**Default** The default is 5.

**Mode** Ping-Polling Configuration

**Examples** To set the sample-size to 50 for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# sample-size 50
```

To reset sample-size to the default of 5 for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# no sample-size
```

# show counter ping-poll

**Overview** This command displays the counters for ping polling.

**Syntax** show counter ping-poll [<1-100>]

| Parameter | Description                                                                                                                                                                           |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <1-100>   | A unique ping poll ID number. This displays the counters for the specified ping poll only. If you do not specify a ping poll, then this command displays counters for all ping polls. |

**Mode** User Exec and Privileged Exec

**Example** To display counters for the polling instances, use the command:

```
awplus# show counter ping-poll
```

**Output** The following shows typical output.

**Example output from the show counter ping-poll command**

```
Ping-polling counters
Ping-poll: 1
PingsSent           ..... 15
PingsFailedUpState  ..... 0
PingsFailedDownState ..... 0
ErrorSendingPing     ..... 2
CurrentUpCount       ..... 13
CurrentFailCount     ..... 0
UpStateEntered       ..... 0
DownStateEntered     ..... 0

Ping-poll: 2
PingsSent           ..... 15
PingsFailedUpState  ..... 0
PingsFailedDownState ..... 0
ErrorSendingPing     ..... 2
CurrentUpCount       ..... 13
CurrentFailCount     ..... 0
UpStateEntered       ..... 0
DownStateEntered     ..... 0

Ping-poll: 5
PingsSent           ..... 13
PingsFailedUpState  ..... 0
PingsFailedDownState ..... 2
ErrorSendingPing     ..... 2
CurrentUpCount       ..... 9
CurrentFailCount     ..... 0
UpStateEntered       ..... 0
DownStateEntered     ..... 0
```

**Parameters in output of the show counter ping-poll command**

| Parameter            | Description                                                                                                                                                      |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ping-poll            | The ID number of the polling instance.                                                                                                                           |
| PingsSent            | The total number of pings generated by the polling instance.                                                                                                     |
| PingsFailedUpState   | The number of unanswered pings while the target device is in the Up state. This is a cumulative counter for multiple occurrences of the Up state.                |
| PingsFailedDownState | Number of unanswered pings while the target device is in the Down state. This is a cumulative counter for multiple occurrences of the Down state.                |
| ErrorSendingPing     | The number of pings that were not successfully sent to the target device.<br><br>This error can occur when your device does not have a route to the destination. |
| CurrentUpCount       | The current number of sequential ping replies.                                                                                                                   |

| Parameter        | Description                                                                                        |
|------------------|----------------------------------------------------------------------------------------------------|
| CurrentFailCount | The number of ping requests that have not received a ping reply in the current sample-size window. |
| UpStateEntered   | Number of times the target device has entered the Up state.                                        |
| DownStateEntered | Number of times the target device has entered the Down state.                                      |

- [show ping-poll](#)

# show ping-poll

**Overview** This command displays the settings and status of ping polls.

**Syntax** `show ping-poll [<1-100>|state {up|down}] [brief]`

| Parameter | Description                                                                                                    |
|-----------|----------------------------------------------------------------------------------------------------------------|
| <1-100>   | Displays settings and status for the specified polling instance.                                               |
| state     | Displays polling instances based on whether the device they are polling is currently reachable or unreachable. |
|           | up<br>Displays polling instance where the device state is reachable.                                           |
|           | down<br>Displays polling instances where the device state is unreachable.                                      |
| brief     | Displays a summary of the state of ping polls, and the devices they are polling.                               |

**Mode** User Exec and Privileged Exec

**Examples** To display the ping poll settings and the status of all the polls, use the command:

```
awplus# show ping-poll
```

To display a summary of the ping poll settings, use the command:

```
awplus# show ping-poll brief
```

To display the settings for ping poll 6, use the command:

```
awplus# show ping-poll 6
```

To display a summary of the state of ping poll 6, use the command:

```
awplus# show ping-poll 6 brief
```

To display the settings of ping polls that have reachable devices, use the command:

```
awplus# show ping-poll state up
```

To display a summary of ping polls that have unreachable devices, use the command:

```
awplus# show ping-poll state down brief
```

**Output** The following shows typical output.

**Example output from the show ping-poll brief command**

| Ping Poll Configuration |         |       |               |
|-------------------------|---------|-------|---------------|

**Parameters in output of the show ping-poll brief command**

| Parameter   | Meaning                                                                                                                                                         |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Id          | The ID number of the polling instance, set when creating the polling instance with the <b>ping-poll</b> command.                                                |
| Enabled     | Whether the polling instance is enabled or disabled.                                                                                                            |
| State       | The current status of the device being polled:                                                                                                                  |
|             | Up                      The device is reachable.                                                                                                                |
|             | Down                    The device is unreachable.                                                                                                              |
|             | Critical Up            The device is reachable but recently the polling instance has not received some ping replies, so the polled device may be going down.    |
|             | Critical Down          The device is unreachable but the polling instance received a reply to the last ping packet, so the polled device may be coming back up. |
| Destination | The IP address of the polled device, set with the <b>ip (ping-polling)</b> command.                                                                             |

| Down                   | The device is unreachable.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |    |                          |      |                            |             |                                                                                                                                       |               |                                                                                                                                          |
| Critical Up            | The device is reachable but recently the polling instance has not received some ping replies, so the polled device may be going down.                                                                                                                                                                                                                                                                                                                                                                                                                       |    |                          |      |                            |             |                                                                                                                                       |               |                                                                                                                                          |
| Critical Down          | The device is unreachable but the polling instance received a reply to the last ping packet, so the polled device may be coming back up.                                                                                                                                                                                                                                                                                                                                                                                                                    |    |                          |      |                            |             |                                                                                                                                       |               |                                                                                                                                          |
| Enabled                | Whether the polling instance is enabled or disabled. The <b>active (ping-polling)</b> and <b>active (ping-polling)</b> commands enable and disable a polling instance.                                                                                                                                                                                                                                                                                                                                                                                      |    |                          |      |                            |             |                                                                                                                                       |               |                                                                                                                                          |
| Source IP address      | The source IP address sent in the ping packets. This is set using the <b>source-ip</b> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |    |                          |      |                            |             |                                                                                                                                       |               |                                                                                                                                          |
| Critical interval      | The time period in seconds between pings when the polling instance has not received a reply to at least one ping, and when the device is unreachable. This is set with the <b>critical-interval</b> command.                                                                                                                                                                                                                                                                                                                                                |    |                          |      |                            |             |                                                                                                                                       |               |                                                                                                                                          |
| Normal interval        | The time period between pings when the device is reachable. This is set with the <b>normal-interval</b> command.                                                                                                                                                                                                                                                                                                                                                                                                                                            |    |                          |      |                            |             |                                                                                                                                       |               |                                                                                                                                          |

| Parameter   | Description                                                                                                                                                                                                                              |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Fail count  | The number of pings that must be unanswered, within the total number of pings specified by the <b>sample-size</b> command, for the polling instance to consider the device unreachable. This is set using the <b>fail-count</b> command. |
| Up count    | The number of consecutive pings that the polling instance must receive a reply to before classifying the device reachable again. This is set using the <b>up-count</b> command.                                                          |
| Sample size | The total number of pings that the polling instance inspects when determining whether a device is unreachable. This is set using the <b>sample-size</b> command.                                                                         |
| Length      | The number of data bytes to include in the data portion of the ping packet. This is set using the <b>length (ping-poll data)</b> command.                                                                                                |
| Timeout     | The time in seconds that the polling instance waits for a response to a ping packet. This is set using the <b>timeout (ping polling)</b> command.                                                                                        |
| Debugging   | Indicates whether ping polling debugging is <b>Enabled</b> or <b>Disabled</b> .<br><br>This is set using the <b>debug ping-poll</b> command.                                                                                             |

**ping-poll**

## source-ip

**Overview** This command specifies the source IP address to use in ping packets.

By default, the polling instance uses the address of the interface through which it transmits the ping packets. It uses the device's local interface IP address when it is set. Otherwise, the IP address of the interface through which it transmits the ping packets is used.

The **no** variant of this command resets the source IP in the packets to the device's local interface IP address.

**Syntax** `source-ip {<ip-address>|<ipv6-address>}`  
`no source-ip`

| Parameter                         | Description                                        |
|-----------------------------------|----------------------------------------------------|
| <code>&lt;ip-address&gt;</code>   | An IPv4 address in dotted decimal notation A.B.C.D |
| <code>&lt;ipv6-address&gt;</code> | An IPv6 address in hexadecimal notation X:X::X:X   |

**Mode** Ping-Polling Configuration

**Examples** To configure the ping-polling instance 43 to use the source IP address 192.168.0.1 in ping packets, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# source-ip 192.168.0.1
```

To configure the ping-polling instance 43 to use the source IPv6 address 2001:db8:: in ping packets, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# source-ip 2001:db8::
```

To reset the source IP address to the device's local interface IP address for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# no source-ip
```

# timeout (ping polling)

**Overview** This command specifies the time in seconds that the polling instance waits for a response to a ping packet. You may find a higher time-out useful in networks where ping packets have a low priority.

The **no** variant of this command resets the set time out to the default of one second.

**Syntax** `timeout <1-30>`  
`no timeout`

| Parameter | Description                                                                                        |
|-----------|----------------------------------------------------------------------------------------------------|
| <1-30>    | Length of time, in seconds, that the polling instance waits for a response from the polled device. |

**Default** The default is 1 second.

**Mode** Ping-Polling Configuration

**Examples** To specify the timeout as 5 seconds for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# timeout 5
```

To reset the timeout to its default of 1 second for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# no timeout
```

# up-count

**Overview** This command sets the number of consecutive pings that the polling instance must receive a reply to before classifying the device reachable again.

The **no** variant of this command resets the up count to the default of 30.

**Syntax** up-count <1-100>  
no up-count

| Parameter | Description                                                                      |
|-----------|----------------------------------------------------------------------------------|
| <1-100>   | Number of replied pings before an unreachable device is classified as reachable. |

**Default** The default is 30.

**Mode** Ping-Polling Configuration

**Examples** To set the upcount to 5 consecutive pings for ping-polling instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# up-count 5
```

To reset the upcount to the default value of 30 consecutive pings for ping-polling instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# no up-count
```

# Introduction

**Overview** This chapter provides an alphabetical reference for sFlow commands.  
For more information, see the **sFlow Feature Overview and Configuration Guide**.

# debug sflow

**Overview** This command enables sFlow® debug message logging, for sFlow sampling and polling activity on the specified ports. If no ports are specified, sampling and/or polling debug messages are enabled for all ports.

The **no** variant of this command disables sFlow sampling and or polling debug message logging on the ports selected. If no ports are specified, sampling and/or polling debug messages are disabled on all ports.

**Syntax** debug sflow [interface <port-list>] [sampling][polling]  
no debug sflow [interface <port-list>] [sampling][polling]

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| interface   | Interface information.                                                                                                                                                                                                                                                                                                                                                                        |
| <port-list> | The ports for which sFlow debug is to be enabled. The ports to display information about. The port list can be: <ul style="list-style-type: none"><li>• a switchport (e.g. port1.0.4)</li><li>• a continuous range of ports separated by a hyphen (e.g. port1.0.1-1.0.4)</li><li>• a comma-separated list (e.g. port1.0.1,port1.0.3-1.0.4). Do not mix port types in the same list.</li></ul> |
| sampling    | Debug sFlow sampling for the specified port(s).                                                                                                                                                                                                                                                                                                                                               |
| polling     | Debug sFlow polling for the specified port(s).                                                                                                                                                                                                                                                                                                                                                |

**Default** The sFlow sampling and or polling debug is disabled.

**Mode** Privileged Exec

**Examples** To enable sFlow debug message logging for polling and sampling on port1.0.1 and port1.0.2, use the commands:

```
awplus# debug sflow interface port1.0.1,port1.0.2 sampling  
polling
```

To enable logging and polling of sFlow debug messages for polling and sampling on all ports, use the command:

```
awplus# debug sflow sampling polling
```

**Related commands** [show debugging sflow](#)  
[no debug all](#)

# debug sflow agent

**Overview** This command enables sFlow® debug message logging that is not specific to particular ports. For example, sending an sFlow datagram to the collector.

The **no** variant of this command applies the command default.

**Syntax** debug sflow agent  
no debug sflow agent

**Default** The sFlow agent debug message logging (that is not port specific) is disabled.

**Mode** Privileged Exec

**Example** To enable logging of sFlow agent debug messages, use the following command:

```
awplus# debug sflow agent
```

**Related commands** [show debugging sflow](#)  
[debug sflow](#)

# sflow agent

**Overview** This command sets the sFlow® agent IP address on the switch. This address is inserted into every sFlow datagram sent from the sFlow agent switch to the sFlow collector device. The sFlow collector can then use this address to uniquely identify and to access the switch, such as for SNMP. We therefore recommend that you change this address as little as possible.

Although the agent address can be set to any valid IPv4 or IPv6 address; we recommended that you set the sFlow® agent IP address to be the **local address** that is configured on the switch. For information on local addresses and how to set them up, see the [interface \(to configure\)](#). This ensures that the sFlow collector can maintain connectivity to the switch irrespective of the addition or deletion of interfaces (each of which will have its own specific IP address). Note that sFlow is rendered inactive whenever the agent address is not set.

The **no** variant of this command applies its default setting to remove a configured address.

**Syntax** sflow agent {ip <ip-address>|ipv6 <ipv6-address>}  
no sflow agent {ip|ipv6}

| Parameter      | Description                                                                                                         |
|----------------|---------------------------------------------------------------------------------------------------------------------|
| <ip-address>   | The IPv4 address of the switch that is acting as the sFlow agent.                                                   |
| <ipv6-address> | The IPv6 address of the switch that is acting as the sFlow agent.<br><br>The IPv6 address uses the format X:X::X:X. |

**Default** The sFlow agent address is unset.

**Mode** Global Configuration

**Examples** To set the sFlow agent (IPv4) address to 192.0.2.23, use the command:

```
awplus# configure terminal
awplus(config)# sflow agent ip 192.0.2.23
```

To remove the sFlow agent (IPv4) address, use the command:

```
awplus# configure terminal
awplus(config)# no sflow agent ip
```

To set the sFlow agent (IPv6) address to 2001:0db8::1, use the command:

```
awplus# configure terminal
awplus(config)# sflow agent ipv6 2001:0db8::1
```

To remove the sFlow agent (IPv6) address, use the command:

```
awplus# configure terminal
awplus(config)# no sflow agent ipv6
```

**Related commands** [show running-config sflow](#)  
[show sflow](#)

# sflow collector

**Overview** This command has been deprecated. It has been replaced by the **sflow collector id** command.

This command sets the sFlow® agent's collector IP address and/or UDP port.

**Command changes** Version 5.5.1-1.1: command deprecated.

## sflow collector id

**Overview** Use this command to set the sFlow® agent's collector IP address and optionally the port and maximum datagram size. This is the destination IP address and UDP port, for sFlow datagrams sent from the sFlow agent. The IP address can be any valid IPv4 or IPv6 address.

Use the **no** variant of this command to remove the configuration for that collector and render it inactive.

**Syntax** sflow collector id <1-5> ip <ip-address> [port <1-65535>|max-datagram-size <200-1500>]  
sflow collector id <1-5> ipv6 <ipv6-address> [port <1-65535>|max-datagram-size <200-1500>]  
no sflow collector id <1-5>

| Parameter         | Description                                                                                             |
|-------------------|---------------------------------------------------------------------------------------------------------|
| <ip-address>      | IPv4 address of the remote sFlow collector.                                                             |
| <ipv6-address>    | IPv6 address of remote sFlow collector.<br>The IPv6 address uses the format X:X::X:X.                   |
| port              | Destination UDP port for sFlow datagrams sent to the collector.                                         |
| <1-65535>         | UDP port number (default: 6343).                                                                        |
| max-datagram-size | The maximum number of bytes that can be sent in an sFlow datagram sent from the agent to the collector. |
| <200-1500>        | The value set for the max-datagram-size.                                                                |

**Default** By default the collector does not exist until configured with a valid IP address.

**Mode** Global Configuration

**Examples** To set the address of collector 1 to 192.168.1.36 with default port and max-datagram size, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# sflow collector id 1 ip 192.168.1.36
```

To set the address of collector 2 to 12ae::213d::213d::333f and use UDP port 500, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# sflow collector id 2 ipv6 12ae::213d::213d::333f  
port 500
```

To set the address of collector 5 to 10.42.2.70 and use UDP port 7777 and have a max-datagram-size of 800, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# sflow collector id 5 ip 10.42.2.70 port 7777  
max-datagram-size 800
```

To delete collector 5, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no sflow collector id 5
```

**Related commands** [show running-config sflow](#)  
[show sflow](#)

**Command changes** Version 5.5.1-1.1: command added.

# sflow collector max-datagram-size

**Overview** This command has been deprecated. It has been replaced by the **sflow collector id** command.

This command sets the maximum size of the sFlow® datagrams sent to the collector.

**Command changes** Version 5.5.1-1.1: command deprecated

# sflow enable

**Overview** This command enables sFlow® globally on the switch.

The **no** variant of this command disables sFlow globally on the switch.

Note that enabling sFlow does not automatically set its operational status to active. To activate sFlow the following conditions need to be met:

- sFlow is enabled.
- The sFlow agent address is set.
- The sFlow collector address is set to a valid (non zero) IPv4 or IPv6 address.
- Polling or sampling is enabled on the ports to be sampled or polled.

**Syntax** sflow enable  
no sflow enable

**Default** sFlow is disabled globally on the switch.

**Mode** Global Configuration

**Example** To enable sFlow operation, use the command:

```
awplus# configure terminal
awplus(config)# sflow enable
```

**Related commands** [show running-config sflow](#)  
[show sflow](#)

## sflow max-header-size

**Overview** This command sets the maximum header size of the Ethernet frames sampled on a specified port. The maximum header size is measured in bytes, referenced from the first byte of the Ethernet destination address and excludes the Ethernet FCS fields.

If a sampled Ethernet frame is longer than the maximum header size set by this command, then the frame will be truncated to the first N bytes before being placed in the sFlow datagram, where N is the maximum header size set by this command.

The **no** variant of this command resets the max-header-size to its default.

**Syntax** sflow max-header-size <14-200>  
no sflow max-header-size

| Parameter | Description                                       |
|-----------|---------------------------------------------------|
| <14-200>  | The maximum number of header bytes to be sampled. |

**Default** The max-header-size is 128 bytes.

**Mode** Interface Configuration

**Usage notes** The header size is measured from the first byte of the Ethernet frame MAC Destination Address.

- For an environment using standard TCP IPv4 over Ethernet frames, consider the following basic protocol structure:

Ethernet header (including the 4 byte 802.1Q header component) = 18 bytes

IPv4 header = 24 bytes

TCP header = 24 bytes

Total = 66 bytes

**CAUTION:** For IPv4, any data existing between 66 bytes and the value set by this command will be included in the sFlow packet samples. For example, with the default of 128 applied, up to  $128 - 66 = 62$  bytes of user data could be included in the sFlow datagram samples sent between the Agent and the Collector.

For more information, see the [sFlow Feature Overview and Configuration Guide](#).

- A similar consideration can be made for an environment using TCP IPv6 over Ethernet:

Ethernet header (including the 4 byte 802.1Q header component) = 18 bytes

IPv6 header = 40 bytes

TCP header = 24 bytes

Total = 82 bytes

**CAUTION:** For IPv6, any data existing between 82 bytes and the value set by this command will be included in the sFlow packet samples. For example, with the default of 128 applied, up to  $128 - 82 = 46$  bytes of user data could be included in the sFlow datagram samples sent between the Agent and the Collector.

Note that the agent-to-collector datagrams contain their own UDP headers, which are outside this calculation.

**Example** To set the maximum header size to 160 bytes for port1.0.1 and port1.0.8, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.8
awplus(config-if)# sflow max-header-size 160
```

**Related commands** [show running-config sflow](#)  
[show sflow interface](#)  
[sflow max-header-size](#)

# sflow polling-interval

**Overview** This command sets the sFlow® counter polling interval (in seconds) for the specified ports. A value of 0 disables polling. A counter sample is taken every N seconds where N is the value set by this command.

The **no** variant of this command applies the default.

**Syntax** sflow polling-interval {0|<1-16777215>}  
no sflow polling-interval

| Parameter    | Description                      |
|--------------|----------------------------------|
| 0            | Disable polling (the default).   |
| <1-16777215> | The polling interval in seconds. |

**Default** The polling-interval is 0 (polling disabled).

**Mode** Interface Configuration

**Example** To set the polling interval to 60 seconds for port1.0.1 and port1.0.4, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.4
awplus(config-if)# sflow polling-interval 60
```

**Related commands** [show running-config sflow](#)  
[show sflow interface](#)

## sflow sampling-rate

**Overview** This command sets the mean sFlow® sampling rate for the specified ports. Sampling occurs every N frames (on average), where N is the rate value set via this command. The sampling rate applies to ingress and egress frames independently. For example, a value of 1000 will sample one frame in every 1000 frames received, i.e. one in every 1000 frames sent from the specified port. A value of 0 disables sampling on the specified port(s).

The **no** variant of this command applies the default.

**Syntax** sflow sampling-rate <50-2147483647>  
no sflow sampling-rate

| Parameter       | Description                                       |
|-----------------|---------------------------------------------------|
| <50-2147483647> | The sampling rate N, measured in Ethernet frames. |

**Default** The sampling-rate is 0 (sampling disabled).

**Mode** Interface Configuration

**Example** To set the sampling rate to 500 for port1.0.1 and port1.0.3, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.3
awplus(config-if)# sflow sampling-rate 500
```

**Related commands** [show running-config sflow](#)  
[show sflow interface](#)

## show debugging sflow

**Overview** This command displays sFlow® debug settings for agent operation, and for sampling and polling on specific interface ports. If no interface ports are specified, sampling and polling will be applied to all ports.

**Syntax** show debugging sflow [interface <port-list>]

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| interface   | The interface information.                                                                                                                                                                                                                                                                                                                                                                                |
| <port-list> | The ports for which the sFlow debug settings are to be shown. The ports to display information about. The port list can be: <ul style="list-style-type: none"><li>• a switchport (e.g. port1.0.4)</li><li>• a continuous range of ports separated by a hyphen (e.g. port1.0.1-1.0.4)</li><li>• a comma-separated list (e.g. port1.0.1,port1.0.3-1.0.4). Do not mix port types in the same list.</li></ul> |

**Mode** User Exec and Privileged Exec

**Example** To display sFlow debug settings for all ports, use the command:

```
awplus# show debugging sflow
```

To display sFlow debug settings on the agent, and for sampling and polling on port1.0.1 to port1.0.8, use the command:

```
awplus# show debugging sflow interface port1.0.1-port1.0.8
```

**Output** The following shows typical output.

### Sample obtained for an sFlow agent

|                                                            |                |               |
|------------------------------------------------------------|----------------|---------------|
| awplus# show debugging sflow interface port1.0.1-port1.0.8 |                |               |
| sFlow Agent Debug: Enabled                                 |                |               |
| Port                                                       | Sampling Debug | Polling Debug |
| -----                                                      |                |               |
| port1.0.1                                                  | Enabled        | Enabled       |
| port1.0.2                                                  | Enabled        | -             |
| port1.0.3                                                  | -              | -             |
| port1.0.4                                                  | -              | -             |
| ...                                                        |                |               |
| port1.0.8                                                  | -              | Enabled       |

**Related commands** [show running-config sflow](#)  
[show sflow interface](#)

# show running-config sflow

**Overview** This command displays the running system information specific to the sFlow feature.

**Syntax** show running-config sflow

**Mode** Privileged Exec and Global Configuration

**Example** To display the sFlow running configuration information, use the command:  
awplus# show running-config sflow

**Output** The following shows typical output.

## Example output from the show running-config sflow command

```
awplus#sh run sflow
!
sflow agent ip 192.0.2.33
sflow collector ip 192.0.2.65
sflow collector max-datagram-size 1200
sflow enable
!
interface port1.0.1-port1.0.4
  sflow sampling-rate 512
```

**Related commands** [show running-config](#)

## show sflow

**Overview** This command displays non-port-specific sFlow agent configuration and operational status.

**Syntax** show sflow

**Mode** Privileged Exec

**Example** To display sFlow configuration and operational status, use the command:  
awplus# show sflow

**Output** The following shows typical output.

**Example output from the show sflow command**

|                                             |           |                |
|---------------------------------------------|-----------|----------------|
| sFlow Agent Configuration:                  |           | Default Values |
| sFlow Admin Status .....                    | Disabled  | [Disabled]     |
| sFlow Agent Address .....                   | [not set] | [not set]      |
| Collector Address .....                     | 0.0.0.0   | [0.0.0.0]      |
| Collector UDP Port .....                    | 6343      | [6343]         |
| Tx Max Datagram Size .....                  | 1200      | [1400]         |
| sFlow Agent Status:                         |           |                |
| Polling/sampling/Tx ..... Inactive because: |           |                |
| - sFlow is disabled                         |           |                |
| - Agent Addr is not set                     |           |                |
| - Collector Addr is 0.0.0.0                 |           |                |
| - Polling & sampling disabled on all ports  |           |                |

**Parameters in the output of the show sflow command**

| Output Parameter     | Description                                                                                                                                                    |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sFlow Admin Status   | Whether sFlow agent operation is administratively enabled.                                                                                                     |
| sFlow Agent Address  | The sFlow agent IPv4 or IPv6 address for the device. sFlow is rendered inactive whenever the agent address is not set.                                         |
| Collector Address    | The IPv4 or IPv6 collector address to which sFlow datagrams are sent. sFlow is rendered inactive whenever the collector address is set to 0.0.0.0 or 0:0::0.0. |
| Collector UDP Port   | The UDP port on the collector to which sFlow datagrams are sent.                                                                                               |
| Tx Max Datagram Size | The maximum size of the sFlow datagrams sent to the collector.                                                                                                 |
| Polling/sampling/Tx  | Whether sFlow sampling and/or polling (and hence sFlow datagram transmission) are active. If inactive the reasons are listed.                                  |

**Related commands** [show running-config sflow](#)  
[show sflow interface](#)

# show sflow interface

**Overview** This command displays sFlow agent sampling and polling configuration for all ports or a specified port.

**Syntax** show sflow interface [<ifrang>]

| Parameter | Description                                                                                                                                                                                                                                                                   |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ifrang>  | <ul style="list-style-type: none"><li>• a switchport (e.g. port1.0.4)</li><li>• a continuous range of ports separated by a hyphen (e.g. port1.0.1-1.0.4)</li><li>• a comma-separated list (e.g. port1.0.1,port1.0.3-1.0.4). Do not mix port types in the same list.</li></ul> |

**Mode** Privileged Exec

**Example** To display the sFlow sampling and polling configuration for port1.0.1, use the command:

```
awplus# show sflow interface port1.0.1
```

**Output** The following shows typical output.

## Example output from the show sflow interface command

|                                            |               |            |          |
|--------------------------------------------|---------------|------------|----------|
| awplus#show sflow interface                |               |            |          |
| sFlow Port Configuration:                  |               |            |          |
| Default Values:                            |               |            |          |
| Sampling Rate ..... 0 pkts (= disabled)    |               |            |          |
| Max Sample Header Size .. 128 bytes        |               |            |          |
